ANNUAL POSTAL SUBSCRIPTION £3 • VOLUME CLXIX. NUMBER 5745

Having had a visit earlier this year
from a manufacturer of oxygen equipment for
the Everest expedition we weren't at all surprised to see
the Directors were right up the pole
on the factory roof at Accles & Pollock
they were clearly anxious to get down
to a practical test of Bourdon coil steel tubes
used for oxygen pressure gauges
judging from their dials they rose to very great heights
before falling back smartly on their bases
they signalled for work to proceed
on the tubes quickly reaching bottom
they accepted our congratulations
with distinctly more than their usual sang froid

Accles & Pollock Ltd. Birmingham. A Company. Makers and manipulators of seamless tubes, in stainless and other steels

HALIFAX —

*Old in the
Ways of the New World*

HAVING recently celebrated her 200th Birthday, Halifax, Nova Scotia, has taken on a new lease of life . . . welcoming such diversified industries from England as airplanes and electronics and radar and having room for many more.

Her magnificent year-round harbour, with facilities for handling exports and imports with dispatch and economy, is the CLOSEST mainland port to European and South American markets. Likewise her location provides her with first access to the Nine Hundred Million Dollar Market of the Maritimes—including New Brunswick, Prince Edward Island, Nova Scotia and Newfoundland.

State briefly what size and type of site you want and our Mayor will promptly send you full information of available locations.

MAYOR OF HALIFAX

WEIR FEED HEATERS

An original fundamental patent on regenerative feed heating was taken out by one of the founders of G. & J. Weir, Ltd. It has since become world-wide standard practice, and one of the most important factors in improving power station efficiency. Leadership in this specialised sphere of engineering is maintained by constant research and technical development with land and marine applications.

ask the typist

She notices things about a typewriter that even a technician might miss, because eight hours of work every working day make her the best typewriter critic there is. Little things, like the free running of the ribbon and the setting of the margin, become very important things after a day's work. And who is better fitted to judge these little and important things than the typist? Good design and precision engineering ensure that every Imperial typewriter will pass that most exacting of tests, the typist's.

New opportunities in the greatest of all National Trade Fairs

Bookings are now open for the 1954 BIF and—this year exhibitors who apply early will be able to choose the site they prefer.

More—the earlier you book the surer you are of getting into the advance catalogues; world-wide publicity to 25,000 business men before they travel to Britain.

Apply now to your Regional Office of the Board of Trade for space at the London sections of the Fair and for full information about exhibiting. If you have not exhibited before, they can tell you what the Fair can now offer to your particular business. For space in the Engineering and Hardware Section at Castle Bromwich apply, Chamber of Commerce, 95 New St., Birmingham.

The BIF of 1954, profiting by the experience of 32 previous Fairs, will be even better organised to show British goods to the world.

It will again provide contacts, inquiries, and orders—unobtainable in any other way—for every British industry represented.

BIF MEANS BUSINESS

A good reputation is the finest form of all public relations. It spreads by word of mouth and the printed word—and benefits the Company concerned.

Many companies, however, neglect to take full advantage of the printed word. They have around their products or within their organisations, considerable news value which merits publication, but through lack of knowledge of the mechanics of public relations, these stories remain unprinted.

It is the function of the Public Relations Division of S. C. Peacock Ltd. to act as the link between the manufacturer and his public. If you would like to know more about this division, please write on your business letter-heading for the pamphlet "Public Relations for the Advertiser."

International Editions

LIFE IN ENGLISH — average net paid circulation 250,000—300,000 copies in English, circulating in 120 countries outside North America.

LIFE EN ESPAÑOL — average net paid circulation 200,000—250,000 copies in Spanish, circulating in Central and South America.

These are the INTERNATIONAL EDITIONS of LIFE MAGAZINE with a combined circulation of over 500,000 copies every fortnight.

Wherever you go in the world, LIFE INTERNATIONAL is the one magazine you are never surprised to see. Its brilliant pictorial journalism has created world-wide reputations for advertisers who once were known only within a limited market.

Every fortnight, the English-language edition of LIFE INTERNATIONAL goes to more than 120 countries outside the U.S. and Canada.

The new Spanish-language edition circulates in the Republics of Latin America. In every country these editions are read not only by families who can afford the best of the world's products, but by executives and officials responsible for the purchase of capital equipment. In the large, beautifully printed pages of LIFE INTERNATIONAL, these people see advertisements for the foremost names in the business world. Your company or products can be counted among them. The Advertisement Director will always be pleased to send you further information.

Corrosive Myth

IF the Labour party's statement on foreign policy looks visionary when it was published a week ago, it looks even more now that the Soviet government has poured another bucketful cold war on to the world's flickering hopes. Many of the aims set in the Labour statement were admirable; but as for the means of attaining the more important of them, the men of Margate could only offer a single mystic word—negotiation. They called for negotiation on Germany, on Austria, on Korea and on Indo-China, as if, in each case, this was a shining new idea; and they deplored the West's loss of "initiative in efforts to break the East-West deadlock." An uninformed reader of the statement would, indeed, gain a clear impression that a stubborn western world had long been cold-shouldering a Russia eager to discuss each of these problems. *Pravda* itself could hardly have put it better.

But the facts are about as different as they could be. Since July, the western governments have been repeating to the Russians their long-standing invitations to discuss Germany and Austria; since the end of August, the United Nations has held out to both Russia and China an invitation to a conference on Korea; the French have shown their willingness to negotiate about Indo-China; and the West has clearly indicated that, after making reasonable progress with the affairs of Korea and Germany, it will gladly talk to the Communists about the wider problems of the Far East and of Europe.

For Moscow, as for Margate, these are facts to be glossed over as quickly as possible or, better still, ignored altogether. But at least the Soviet Note has served to bring public attention back to the existence of the western invitations. In making the Lugano meeting impossible, the Soviet government has publicised it; in demanding that Communist China be at once given a full voice in deciding all major international issues, the Russians have given the West another chance to say quietly but firmly that the Korean situation must be further stabilised before the aggressor can join the world's councils.

But that is all that can be said in the Soviet Note's favour. Some of the early comment on it, which suggested that it could be interpreted either as accepting or as rejecting the invitation to Lugano, was over hasty. The Note contains no hint of acceptance, or even of awareness of that invitation. The Lugano hoteliers who had been standing by for a diplomatic invasion on October 15th are already relaxing. Moscow has made it quite clear—even clearer than was implied in its Note of August 4th—that the only kind of conference it is prepared to consider would be one so loaded with ponderous conditions that it would sink before it got under way. (Yet, perversely enough, it is the western governments who get blamed by their oppositions for imposing conditions.)

Indeed, on reading the new Note, one sighs for the relative simplicity of the days when the Soviet government's price for an Austrian treaty seemed to be satisfaction over Trieste. Today, its

price for a free Austria is acceptance not only of its plans for Germany and of the disruption of the European Defence Community, but also of a global ding-dong—which could easily outlast the winter—in which the Russians would apparently demand the liquidation of Nato's defence system and the satisfaction of all Communist China's claims before even beginning to discuss the immediate fate of Central Europe. Every old and new topic in the Soviet repertoire—"propaganda for a new war," atomic weapons, foreign bases, neo-Nazism and Syngman Rhee—is piled on to the obligatory agenda. It is difficult to avoid the conclusion that the Russians have taken unprecedented pains to make their proposals unacceptable; that by tying so many tin cans on to the dog's tail, they hope not simply to wag the poor beast, but to paralyse it.

Yet there is one omission from the catalogue. No reference whatever is made to "talks at the highest level." On the contrary, the Soviet Note—like its predecessors—speaks entirely in terms of foreign ministers. But top-level talks are now enshrined as a key point in the official policy of western Communist parties; the national executive of the British party sounded a clarion call for them just a week ago. Has Mr Pollitt once again broken away from Moscow in order to support Sir Winston Churchill?

In fact, the Note has considerably clarified the situation in this respect. The intimate, informal meeting of heads of states envisaged by the Prime Minister is poles apart from the cumbrous form of negotiation proposed by Moscow. The latter, far from having no agenda and no defined objectives, would involve the foreign ministers in discussing a massive list of obligatory subjects, so arranged that the least manageable of them must be worked through first. In comparison with this appalling prospect, the long and futile rigours of the debates at the Palais Rose in 1951 pale into off-white.

All through this summer public opinion in this country and in some other western European countries has been enamoured of a myth. This has been the myth that there is an alternative way of dealing with the Russians open to the western governments, somehow wrapped up with a top-level meeting, which was both practicable (in the sense of offering an even chance of an honourable and speedy end to the cold war) and acceptable to the Russians. The myth was started by the Prime Minister's speech on May 11th—although he himself made neither claim: he neither held out his proposal as an alternative to the policy that had been pursued theretofore, nor did he raise any expectations of sweeping results. If the Russian Note has any meaning at all it proves the myth to be a myth indeed. It is very difficult after reading it to believe that the Russians will agree to any talks that might yield immediate and practical results; they also have a marked lack of enthusiasm for any kind of top-level intimacy.

No doubt the Russians have good reasons for this. Malenkov's personal position can hardly be safe enough yet for him to contemplate entering a private room with three western statesmen without acute embarrassment. This does not prevent him from employing British Communists to bang a drum which he knows to be broken; but his only reason for so doing is to exploit what he sees as a promising rift in the western ranks. He himself, rejecting both the piecemeal and the intimate approach, invites the West to join him only in a prolonged banging together of his long string of tin cans, the din of which would conceal Moscow's quiet withdrawal from the posture of willingness to negotiate which it has assumed—or which it has allowed the world to believe it has assumed—since Stalin died.

★

Where, then, do matters stand? Exactly where they stood before Stalin died? Much as one would like to believe that there really is a new look in Soviet foreign policy—possible though it may be that one was in the making before Beria's fall—the evidence of the past few weeks, of Vyshinsky's speech and of Molotov's Note, is really convincing. It would take the eye of faith, assisted by powerful rose-tinted spectacles, to detect any difference now between the old attitude of Moscow and the new.

It is not in Russia but in the West that the death of Stalin seems to have made the greater difference. Few people take the trouble to read the text of diplomatic messages or long speeches. The belief that Soviet obduracy was melting chimed in so perfectly with the desperate hopes of millions of ordinary people that the smallest and most irrelevant events are seized on as final proofs. For large sections of the public, the release of one Soviet wife, the admission of one capitalist journalist, outweighs anything that Vyshinsky may say, that Molotov may write or that Malenkov may do. To those who will trouble to study the evidence, it is now as plain as a pikestaff that "high-level talks" would solve nothing. But the odds are that millions of people will go on believing that they represent a magic formula which only American obstinacy withholds.

And so the myth, disproved though it has been, will go on eating away the solidarity of the free peoples. That is why the Prime Minister's proposal was, from the start, so mischievous—not because high-level talks, when they were held, would do any particular harm, but because to suggest that they would do a great deal of good created false hopes whose frustration will be corrosive. The intervening months have shown how very great is the harm that has been done. Conceivably, if the State Department had realised how public opinion in Europe would seize upon the proposal, they might not have been so quick to turn it down. Conceivably they may be changing their minds. It is perfectly argu-

able that, though the proposal of high level talks by the Prime Minister always promised far more harm than good, the harm has already been done, while a serious attempt to hold the talks could now only do good—either (one chance in a hundred) by making some real progress or (the other ninety-nine chances) by convincing even the headline-reader that it was a blind alley. The Prime Minister is said to be persisting in his proposal. His persistence at least may be right.

Yet, whatever the fate of the Churchill thesis, the

M. Laniel before the Assembly

A NEW stage of the endemic French crisis will have been reached when the National Assembly meets next week. The old questions will be asked once more, as they have been asked many times before. Can the present type of government really survive? If it does, can it ever put the stumbling French economy on its feet again? And if not, what will succeed the Fourth Republic, and with what consequences to the fabric of Europe? These are questions to which no final answers may be forthcoming any more than they have in the past. But as the new session develops it is likely to produce at least some clearer indications than any hitherto. For with every government crisis the deadlock becomes harder to break. And that is not a process which can go on for ever.

The Assembly will be meeting a few days ahead of the original date, in response—one cannot help feeling a rather futile response—to the special demand for its recall which sprang from the recent wave of strikes. These were precipitated rather than caused by the Laniel government's undiplomatic handling of its decree powers. Yet, before any verdict is passed on this government, allowance must certainly be made for the handicaps under which it has worked and the immensity of the task it faces. M. Laniel belongs to the same right-wing Independent Party as M. Pinay, whose price cuts ended in failure at the beginning of the year when his supporters refused to follow him in his effort to come to real grips with the antiquated fiscal machinery. As the leader of a government further to the right than the mood of the country, M. Laniel has in effect been in the same predicament as his party colleague.

The full extent of the French economic problem, which has played an increasingly sinister part in bringing down every government of the last few years, is only now becoming generally understood. Successive governments have devised, or rather improvised, a complex system of trade barriers—tariffs, controls, quotas, price supports and state purchases of surpluses—not as a temporary protection during a period of adjustment, but as a permanent attempt to preserve an outworn system of small-scale production. Champion of modernism in so many other fields, France has tried

need for the West to continue its present policy of offering practical talks on practical problems remains quite unaffected. The doors that the West has already opened for discussion of the most urgent problems in both Europe and the Far East are still open, despite the draught from Moscow; indeed, some noteworthy efforts to prop them even wider open have lately been made. If and when the Communists conceive any genuine desire to begin settling outstanding problems, they have only to walk in.

to reject the twentieth-century economics of both Right and Left. It has kept up the artificially small and insufficiently capitalised units in agriculture, trade and industry of a third-class power. In agriculture, government policy has done little to disturb the innate conservatism of the peasants, who still form nearly one-third of the population. In industry and commerce, it is only too widely true that the survival of the unfit has become perpetuated by tacit agreement and the toleration of fiscal laxity. Admittedly some of the basic industries have been reconstructed and in some measure modernised since the war under the Monnet plan. But the benefits of their cheaper productive capacity are either lost in the byways of distribution or largely nullified by the high level of other prices. And on top of all this France has had to spend about one-tenth of its income on defence, including the burden of the long and costly war in Indo-China. American aid has been given on a large scale, but not large enough to change the nature of the basic problem.

This was the real background to the Laniel decrees. Since these special powers had once more been entrusted to a government without left-wing support—even most of the Socialists had withheld their approval—it was hardly surprising that the unfortunate priority given to interference with the pension rights of state employees led to the wave of summer strikes. Since then, on the other hand, the government has not done too badly. Much of its energy has had to be devoted to dividing the trade unions and preventing the Communists from renewing the conflict. But a genuine drive has been launched against the twin evils of fiscal fraud and high prices; the former has included certain tax reliefs and the latter self-imposed reductions by trade associations. The wages of the lowest paid state employees have been raised and the government has launched a host of minor decrees which should in the long run help to smooth out the economic life of the country. A windfall of \$385 million as supplementary American aid for Indo-China has enabled M. Faure, the Finance Minister, to go a long way towards balancing his budget for 1954, which promises for the first time in many years to be smaller in total than its predecessor.

None of this can be said, however, to do much more than scrape the surface. And although that is not M. Laniel's fault, it is not enough to enable him either to appeal seriously to public opinion over the heads of the Assembly or to avoid a hard debate in the Assembly itself. The test will come during the next few weeks, and he would be an optimist who committed himself to M. Laniel's political survival. Private industry is by no means certain to follow the state's lead in granting a bonus, and even if it did, the industrial workers, who are far more under the control of the Communist trade unions than the state employees, may well take up the fight for still greater rewards. To restore the confidence of the workers the government must show its willingness to attack the privileges of its own supporters and to carry through its anti-fraud campaign by the proposed introduction of a radical fiscal reform. Yet who can say that parliament is really more prepared to back such a measure than it was when M. Pinay was in power?

★

The economic dilemma, in fact, is perpetuated and magnified by the political deadlock. Although the centre rules in France, it is a prisoner of its own pressure groups. The centre became the accepted government of the Fourth Republic in 1951 when the democratic parties devised an electoral law and formed electoral alliances to defeat the opponents of the parliamentary regime. The trick worked and the Communists and Gaullists, while polling nearly half the total vote, received only one third of the seats in the Assembly. Yet this device could only be justified as a temporary expedient to give time to the parliamentary forces to gain new adherents, and this they have not done.

During the Pinay episode a breach was made in the Gaullist citadel, through which first the dissident and then the orthodox members joined the parliamentary majority. This shift to the right, however, has pushed the Socialists into semi-permanent opposition; it has also increased the centre's dependence on lobbies which range from beetroot growers to colonial diehards. The discontent and resentment of the workers—and who shall say they are not justified?—meanwhile keeps the Communist forces intact. The average French worker now feels worse off than before the war and that he has avoided a worse fate only by fighting hard. In spite of the lead which the Socialists took in August, the Communists, by staying out only a few days longer, restored their prestige as the principal champions of workers' rights. And as long as the worker continues to feel an outsider in the national community, the Communist preaching of a united front is likely to have far more effect on Socialist and Christian trade unionists than the Socialist slogan of a "social and democratic front" has on the Stalinist rank and file.

Nevertheless, distasteful and dangerous as the prospect of the Communists keeping their five million supporters or even of increasing their numbers may be,

this does not necessarily present the most immediate or direct threat to the democratic regime. It is difficult to see how the French Communists could obtain real power in France without seizing it illegally; and the powers of the regime more than suffice to prevent that. The fear of Communism, however, can still do much to precipitate a movement to the right. Although the Gaullists are disbanded and General de Gaulle himself is probably no longer in the running as a national leader, his diagnosis of the diseases of French democracy cannot be dismissed as dead. The propertied classes could yet rally round another military figure, and Marshal Juin's supposed hand in the recent developments in Morocco has already led people to mention his name in the same breath as Buonapartism.

It was the French themselves who coined the phrase *ce n'est que le provisoire qui dure*. In theory the Fourth Republic is not provisional—even less so than the Third. Yet few who possess a sense of history would lay a heavy wager on the present regime enduring. Only last month M. Mendès-France declared with an air of drama that already we are in 1788. This may seem fanciful. It probably is; the French have a greater gift than most for doing acrobatics on the edge of a precipice. But in the last hundred and seventy years they have lived through four revolutions, two Napoleons and a near miss. In a country that can claim so little legitimacy for any of its institutions, it is even more true than elsewhere that a regime unable to adapt its economic and political mechanisms to the needs of the country is doomed.

It is painful and unfruitful to mull over the ailments of this sick man of Europe too long. For all their logic the French do not in the end act logically. It may even be a false argument to say that extreme contrasts between ostentatious wealth and great poverty cannot last indefinitely in the Western Europe of the twentieth century; Spain and Italy prove in their very different ways that they can. But it would be naïve to watch the French scene and not to draw conclusions. For, while it would have been possible at almost any time in the past twenty-five years to say that the situation in France was critical, two things have happened this summer to make the French people stop shrugging their shoulders over their politics. One is the sharpness of the contrast between the nearly total paralysis of the parliamentary system revealed by the five weeks of governmental crisis this summer, and the startling intensity of bitterness and distrust shown among the people by the subsequent strikes, which were the worst since 1947, and at one moment almost turned into something more serious. The other new factor is the resurgence of Germany. The massive support for Dr Adenauer and the rising self-confidence of the Germans have created a more profound sense of alarm in France than is generally realised. If, in spite of this new urgency, parliamentary government fails once again this autumn to shoulder its responsibilities, it will be difficult for France's friends to sustain their hopes.

Parties on the Screen

THE conference that has been settling the policy of the Labour party at Margate this week may well be the last of its kind. The BBC has proposed that the annual conferences of the two main parties should in future be televised; the idea was to be considered at Margate after this issue of *The Economist* went to press. If either party accepts the invitation it will be difficult for the other to refuse, but it is a matter to be carefully pondered. There is no doubt that the presence of television cameras would work an important change in the attitude of delegates; and from that might follow a change in the way the party conference works and even in the function it performs within the democratic process of government.

Party conferences as now conducted can hardly be regarded as ideal. But would the change wrought by television be, on the whole, for good or for ill? Though voices have already been raised against it, the proposal has some merits. The televising of party conferences is, first and foremost, a new means by which the public can learn more about politics. Whatever may be said about the limitations and dangers of television as a medium of popular instruction—and there is certainly much to be said—it by no means destroys this main point. Television is in principle welcome in politics because it can make democracy better informed. Certainly the televising of the party conferences could be condemned out of hand only by those high-minded persons who have become the priests of a managerial society. For them, television represents an intrusion on the inner working of politics, on the techniques of "managing mass democracy" that ought to be preserved—since a hereditary governing class is no longer respectable—for whomsoever the politicians may be.

It is important to dispose of this snobbish element in the opposition to television. It rests on a distrust of democracy that finds expression in this case simply because television is new and unfamiliar; logically, it has far wider implications. What is fundamentally the same point may be put another way. Readers of the serious newspapers can already get as full an impression of what happens at party conferences as most people have time or appetite for. Television offers alternative facilities to those with more leisure but less training in solid reading. In principle, the widening of information is to be welcomed. The presumption surely ought to be that where the press legitimately goes the television camera is entitled, if it is technically possible, to follow. Certainly this is a presumption, not a rigid rule. But the burden of proving their case rests on those who would keep television out of party conferences, not on those who propose to take it in.

Such a case cannot be based on any fundamental difference, from the public's point of view, between seeing a conference on television and reading about it

in the newspapers. The watcher of the television screen may feel that he is seeing the thing really happen, but in fact he is not an active observer. He cannot look round. What he sees at any moment is what the producer selects from among the various views provided by different cameras. The public's impression of the conference may depend considerably on whether the producer chooses, at some critical moment in (say) Mr Deakin's speech, to show Mr Attlee doodling indifferently, Mr Morrison smiling happily, or Mr Bevan looking scornful. In television, as in the words of a newspaper report, human agency intervenes between the event and the public.

This would be true even of a full-scale programme covering the whole conference—if anybody wanted to watch it. To televise merely some pre-arranged parts of the conference is open to the objection that it would inevitably make those parts artificial, distort the whole procedure of the conference, and satisfy no one. The proper technique would be to televise the whole proceedings during the day, partly for the few who want them but mainly as the material from which to show each evening a telefilm summarising the day's proceedings. Such a film does not necessarily give any better picture of the conference than a good newspaper report. But it can certainly be as good; to make it reasonably impartial presents no special difficulties; and it reaches a different audience.

★

These are the arguments for television. The argument against is that it makes a great difference not to the public but to the conference delegates. They do not know what moments and what views are going to be picked out for a viewing audience of millions in the evening. They must continually be conscious of television, bringing the eyes and ears of voters into the conference hall, in a way that they are rarely conscious of the reporters' pencils. Already, it is true, part of the function of annual conferences is to provide an occasion for the party to address itself, through the press, to the public at large. But, to a rather greater extent, it is an internal discussion in which active members of the party appeal to each other, with the voters as very remote listeners, about the policies they ought to follow.

In theory, the attitude of the parties to this discussion diverges. A Labour conference is supposed actually to determine policy. In the Conservative party, the leader lays down policy and the conference merely expresses some opinions. Both theories are unrealistic. In fact, neither a large conference nor a single leader, however able and popular, can in the British political system have more than an occasional and marginal influence on policy. Whatever the formal procedure,

the bulk of party policy is the product of a group of the party's principal leaders, most of whom owe their position to their colleagues in the House of Commons rather than to mass support in the party. And unless they are seriously disunited, neither the conference nor an individual leader can upset their main decisions.

But this does not make the party conference artificial or unimportant. Its discussions show the leaders how the minds of the active rank and file of party workers are moving. It helps those workers, the men who in their spare time collect the subscriptions and do the canvassing, to gain some refreshment of spirit and to confirm their sense of purpose. Above all, it does something to educate the party workers, to increase understanding of the difficulties and compromises inseparable either from government or from day-to-day opposition. Behind it all, it is true, there lurks the conference's occasionally decisive voice either on policy or on personalities. But if this creates the sense of drama and importance, the solid value of the conference lies in the education that comes from discussions in which the speakers are addressing each other, not the party's friends and enemies outside.

Television would quite inevitably make the conference much less of a discussion and more of a show. That would have its compensations. It would encourage moderation and inhibit arguments that are mere appeals to party prejudice. "We believe in socialism (private enterprise); therefore this particular nationalisation (denationalisation) proposal must be approved by all sincere party members" is an argument of some effectiveness if it is put less crudely and addressed to conference delegates. It would not be so well received if they were conscious of a television audience including floating voters. In this and many other ways—including the suppression of personal animosities—television would put party conferences on better behaviour. The danger is that with the excesses it would also remove their main virtues. No party can be entirely frank. The face it presents to the electorate is a continual compromise between its own doctrines and the promises and proposals that about half of the electorate can be expected to approve. Both the doctrines and the right forms of compromise should be subject to frequent reconsideration within the party, and while that cannot be private it will not be seriously and honestly done if it is very public. In this respect, tonight's telefilm would affect the delegates far more than tomorrow's newspaper reports ever do.

★

The result would almost certainly be to push the real process of policy-making yet further into the inner recesses of the party machines. At the conference the power of the platform would, normally, be further enhanced. Minorities within the parties could more easily be persuaded not to expose their disagreements in public, and the grip of the machine on the individual would once again be strengthened. The moderation

that resulted might be of a somewhat dubious kind. If there were less discussion, party policies might in the end change by violent explosions instead of by gradual adjustments. And in the long intervening periods the cost of agreement might more than ever be to ignore the issues of principle. Conference delegates who felt that serious argument was dangerous, and uninteresting to television audiences, would not only over-dramatise agreed party points; they might address themselves more exclusively than before to the mere trivialities of public discontents, to unrealistic promises of new popular benefits. The real issues on which the prosperity and security of the country depend would then be pushed yet further out of political discussion. Many politicians would be all too ready to assume that most people view a political programme in the evening not in order to think about the party policy but in order to feel about it.

These are the dangers that the televising of party conferences must present. They are important because the same tendencies are strong already. It is possible, but it is far from certain, that television would make too little difference to weigh against its other advantages. At this stage the need is to set out the conflicting considerations. There is, fortunately, no reason why the parties should make a snap decision.

Two Views of Bank Rate

It is not easy to understand the extent of the panic which has existed during the last week in the money market. . . . It is no doubt a formidable fact that the minimum rate of discount at the Bank is now 5 per cent, whereas it was but 2½ per cent a few months back; and if the present high rate of discount is regarded without the discrimination which it deserves, there is no doubt much in it well calculated to excite alarm. The rise has been so sudden and to a point so elevated as compared with past times, that people are very apt to imagine that there must be some extraordinary and remarkable reasons not known to the public to induce the Bank Directors to raise the rate of discount so high. For our own part, we are rather disposed to regard those facts . . . as the best guarantees against the extreme inconvenience to which we have been exposed on some former occasions. It is the first time that we have seen the Bank Directors act with what we have regarded as a sufficient degree of energy and foresight in the earliest stages of a drain of bullion. . . . If the Bank Directors had acted with the same vigour in the end of 1846 and the beginning of 1847, we should never have witnessed the extreme depressions and panics which prevailed in the April and September of the latter of those two years. In place of watching when a turn had actually taken place in the exchanges, it was the fashion to disregard it . . . as long as the bullion in the Bank was of such an amount as excited no anxiety as to its own safety. . . . Thus . . . we see that at the present time the bullion in the Bank exceeds in amount that held in any former year, except 1852, at this period. But strange as it may appear in the face of such a fact that the minimum rate of discount is 5 per cent, yet there can be no doubt that with the strong adverse current which set in with the foreign exchanges a few weeks ago, the Directors of the Bank exercised a wise discretion.

Doctors under the Microscope

IN 1944, a majority of doctors approved in principle the establishment of a free and comprehensive health service. In 1948 a smaller majority voted against working for the service constituted by the Act of 1946; of these, two-thirds were general practitioners. By the appointed day nearly the whole of the medical profession had, in fact, joined the service either full-time or part-time. What do doctors think of the service now that it has been in force for over five years?

For general practitioners, an answer can be given. In 1950 the British Medical Association set up a committee to examine and discuss experience of general practice under the health service, and its report was published in the *British Medical Journal* last week. So much has been heard of grievances against the service—on the part of both doctors and patients—that the committee's main finding is fairly reassuring. A field survey among nearly 200 representative practices and a postal inquiry to a larger number of doctors found over half (about 55 per cent) of them reasonably contented—except with their income, which has since been increased by the Danckwerts award. Further, the postal inquiry also showed that only a minority (19 per cent) would like a practice consisting wholly of private patients. Many doctors would like to have mostly health service patients, with some private patients to provide variety and to create a demand for higher standards of medicine. Whatever is wrong with general practice would evidently not be put right by a return to the old fee-paying system, even if it were practicable. A solution will have to be found within the health service, not by jettisoning its main principle. It is good to have this firmly established as the attitude of the medical profession, as well as of all political parties.

★

It is, however, important to determine how far the health service itself is responsible for the ills of general practice. As the committee recognises, the decline of the family doctor had set in well before 1948. The big advances in medical science in the last thirty years, though they have enabled general practitioners to do far more for their patients, have inevitably been accompanied by increased specialisation. Doctors have found it quite impossible to keep abreast of all the advances that have been made; and since the application of the advances has often needed the facilities of a large hospital, the emphasis of modern medicine is on the hospital and the specialist rather than on general practice. Doctors have been compelled to send their patients to hospital if they are to have the advantage of many new procedures, and the inevitable consequences have been a loss of confidence in themselves and a fall in their patients' esteem.

Before 1948, therefore, the hospitals were already becoming overloaded and expensive to run; and each new generation of medical students tended to see in specialisation a much more promising career than was offered by general practice, particularly when the bulk of their clinical training was in the hands of specialists.

The national health service is thus not responsible for starting the decline in the status of general practice. But the new report bears out the view that in many ways the service has accentuated the trend. It has done this partly because of defects in its own structure and partly because of a wrong attitude towards it in both patients and doctors. The committee lays great stress on the division of the service into three distinct parts for administrative purposes. The hospitals are organised by one set of authorities, the public health services by another, and the general medical services by a third. In theory, there is scope for co-ordination between them; but in practice the cleavage is sharp. Instead of one health service, embracing preventive and environmental medicine, personal medical care and the hospitals, there are three separate services, whose practitioners are often ignorant of each other's views.

★

If the general practitioner comes off worst from this tripartite structure, it is mainly because his responsibilities are greatest. It is to him that ill people first come for advice, and it is to him that they will be returned for treatment, however long an interlude they spend in hospital. Co-operation with the general practitioner is therefore essential if patients are to have continuity of medical care and advice. Instead, a health visitor of the local authority may call on a patient without the doctor's knowledge and give quite different advice from his own. The local authority midwives may persuade mothers to attend the clinics rather than their own doctors for antenatal care—indeed, it is sometimes only by doing so that they can be booked for admission to the local maternity hospital. A hospital may not tell a doctor as soon as his patient has been discharged and needs treatment at home. Sometimes he is not even told when a patient dies in hospital.

This lack of contact with the hospitals is the main cause of the general practitioner's sense of isolation. The health service has encouraged the growth of virtually a separate profession of specialists and specialists in training, often without any knowledge of the conditions and problems of general practice. Before 1948 the general practitioner often had a cottage hospital, where he could place and treat his patients with such specialist help as was needed and available. Moreover, consultants were dependent on the good will of general practitioners for a livelihood.

In the health service, the cottage hospitals are swallowed up by hospital boards, and consultants are salaried. It is interesting to find in the committee's report, and elsewhere, a plea, if not for the return of cottage hospitals, at least that beds should be available in general hospitals for general practitioners' cases.

Although the committee's report is written from the point of view of the general practitioner, it does not think that all but he are out of step. It does not gloss over the shortcomings of those doctors who scamp their work, who regard health service patients as needing no more than the minimum of attention and consequently encourage people to believe that only the hospitals can provide proper medical care. There are some, estimated in the field survey at 7 per cent of those seen—with a higher proportion in the towns than in the country and a higher proportion among the elderly than among the young—whose work is assessed as inadequate. There is also a minority of patients, whose numbers tend to be exaggerated because they turn up so frequently in a surgery, who are determined to get all they can out of the health service. Much more serious is the considerable body of doctors whose work is no

more than adequate because they have neither the time nor the incentive to make it good, and of patients who regard their doctor either as a supplier of drugs or as a turnkey to the hospitals.

It can perhaps be argued that the general practitioner is doomed—quite apart from the health service—and that there is no point in attempting to reinstate him. But if there is one lesson that the health service has taught, it is that hospital care is extremely expensive. Doctors' and chemists' bills together cost the state little more than a third of what it pays to maintain the hospitals, even with the present strict limit on hospital budgets. On this ground alone there is a strong case for making general practitioners more efficient, quite apart from the fact that most people want the personal and continued care that only they can provide. But general practice will not be more efficient if it cannot attract good doctors, and it will not attract good doctors if the present frustrations persist. In so far as improvements in the structure of the health service can remove these frustrations, they should be undertaken. But it may be specialised medicine rather than socialised medicine that represents the graver danger.

Notes of the Week

Labour's Truce

Two things stand out from the Labour party's annual conference, held at Margate this week. The counter-attack by the party's right wing has succeeded; the policy on domestic affairs that last year seemed to be veering far to the Left has been pushed a good way back to moderation. Secondly, with this policy settled, both wings have recognised that a deadlock has been reached in the struggle for power within the party, and have perfectly agreed to call it a day—for the time being. It is also clear that many Labour leaders take seriously the possibility of a general election quite soon, and they are brought closer to the realities of government by the Gallup Poll's evidence that Labour's popularity has risen. All this has combined to make the Margate conference freer from personal dissension than any Labour assembly since the victory parade of 1946. It is too much to describe this state of affairs as peace within the movement. A more accurate description is that of an armed truce; and both sides are well equipped with Syngman Rhee who might reopen hostilities at any time.

Mr Herbert Morrison, with his strong political instinct and his deep loyalty to the Labour movement, made the chief personal contribution to bringing about this truce. On

the eve of the conference, he withdrew from the contest with Mr Arthur Greenwood for the treasurership. This not only cost Mr Morrison what might have been a safe place on the party executive; it also angered his supporters among the trade union leaders, who saw in it one more example of the reluctance of the politicians to do their share in the battle against Bevanism. But it was a sensible move. It removed the one big issue of personalities from the conference. At the same time it ensured the adoption of the constitutional amendment giving a place on the executive to the party's deputy leader in the House of Commons. This brings Mr Morrison back immediately on to the executive, but in a less certain position than he would have had as treasurer. It depends on his being able to hold, session by session, the post of deputy leader. For some time to come, however, he should have little anxiety on this score.

The other elections to the executive reflected faithfully the deadlock within the party. The Bevanites held their existing six seats in the constituency section and Mr James Griffiths retained the other. In the women's section, the anti-Bevanites saw that the place vacated by Mrs Eirene White was faithfully filled by Mrs Mann. In the trade union sector all twelve places went to safe men. One other outcome of these elections is noteworthy. Mr Gaitskill failed to win a place in the constituency group. Had he done so, he would have been a strong candidate for future support from the unions as their next man after Mr Morrison.

All Goes Right

WHEN the distribution of power within the Labour party had been settled on these lines, the Margate conference turned to endorse its executive committee's statement of policy in the "Challenge to Britain." The debate on further nationalisation was confused, but it was certainly the most important discussion on the foundations of its policies that the party has had for a couple of decades. The speeches advocating more nationalisation contained much romanticism and prejudice, but in that they illuminated faithfully the forces struggling to shape a political philosophy. On the other side, the opponents of specific proposals for more nationalisation rarely faced the logical implications of their attitude. They argued the case for going slow in practice without admitting the doubts about socialism in principle that prompt the case. But this again is representative—of the happier side of British political empiricism.

The confusion in debate did not prevent the conference from knowing quite well what it was doing. As one delegate forcibly remarked, the nationalisation of shipbuilding and marine engineering was opposed because of their international ramifications, but the logical conclusion would be that these industries must remain under private enterprise for ever. A Labour conference would still shrink from formally admitting this, for shipbuilding or for many other industries, but it nevertheless accepted the arguments against nationalisation and voted for the policy that commits another Labour Government to nothing but water. All the other proposals were rejected by large majorities.

It is true that the votes were, as always, mostly those of the trade unions. But the size of the majorities indicates that even the political socialists from the constituency parties were by no means solidly for more nationalisation now. Second thoughts have been at work right through the movement since the first joys of opposition swept it leftwards. Indeed, the revival of realism went so far as to bring Sir Hartley Shawcross to the conference rostrum to talk about the next Labour Government in two or three years' time; those who thought that he was dropping out of Labour politics seem to have been mistaken. For the present, however, it is Mr Deakin who has grown most in political stature; it is thanks to him rather than the politicians that the right wing of the Labour party has won a famous victory and now has a policy that, for all its defects, is settled and is what it believes.

Bases in Spain

BOTH the Spaniards and the Americans have had to compromise in order to reach agreement on American military bases in Spain. This is not surprising. When the negotiations began two years ago each side pitched its demands high because it thought the other was desperate for agreement; since then each has learned better and scaled down its requirements accordingly. General Franco has had to be content with much less economic help than he originally hoped for; and his former dream of getting his

army completely re-equipped and modernised at American expense has proved if not illusory at least premature. The Americans, for their part, have agreed to pay out more than it is believed they originally intended, and they have had to make a good many concessions to Spanish national pride.

All the same, both sides stand to gain by the agreement. The acquisition of naval bases, particularly at Cartagena and Cadiz, will improve enormously the facilities available to the US Sixth Fleet and will confirm the United States' standing as a major Mediterranean naval power; while the air bases, near Madrid, Barcelona and Seville, will allow B47 bombers to be stationed within range of the Urals, but deep enough within the western defence system to be relatively sheltered from attack. General Franco, on the other hand, is to receive indispensable outside help in building up

his country's defences—particularly its air defences—with the minimum of outside interference. Moreover, the injection of even \$85 million of economic aid, to be spent mainly on improving transport and communications, together with the money spent on the construction of the bases and the employment this will provide, should give a much needed fillip to the Spanish economy. But no lasting improvement is likely so long as the Spaniards are so chary of admitting foreign capital; in spite of American promptings, the share of foreign capital in any enterprise is still limited to 25 per cent.

The Caudillo has succeeded in ending Spain's long diplomatic isolation. But his foothold in the western camp is only precarious; there is no question of admitting him to Nato, either by the front door or the back. Nevertheless, he will no doubt reap increased prestige at home from the hard bargain he has driven with the Americans. The western democracies will not welcome this by-product of an arrangement whose only justification lies in the military and strategic necessities of the West.

Alternatives on the Canal

SITUATED, emotionally as well as physically, rather nearer to Persia than to Spain, President Neguib is more provident about foreigners than the former has lately been,

rationing does not depend on agreement with the Ministry of Agriculture. Butter, as everyone now recognises, will never be plentiful at the present subsidised price. Derationing must mean a sharp jump to an economic price. Politically, that cannot be done without more, and better, margarine; margarine depends on fats and oils, and they depend on dollars. The Ministry estimates that a supply of margarine sufficient for safety in derationing would require £22 million of extra fats and oils, of which £10 million would need to be in dollars. But dollars were found for sugar, and discontent at the continuance of the rationing machinery is bound to grow when there is so little left for it to do.

Official Sources

A CAREER in the Civil Service is less attractive to able young men and women than it was before the war. If there were any doubt about this, it is removed by the Civil Service Commissioners, who published this week their report for the three years that ended in March, 1952. They did not, indeed, encounter any difficulty in filling the vacancies in the top grade of the service, the administrative class; but they do consider that the number of outstanding candidates has declined.

For most grades of the service the position is worse. Throughout the period covered by this report it was impossible to fill all the vacancies in the scientific classes. Salaries had to be increased, and the upper age limit raised, in order to rope in enough engineers, surveyors and architects. For postmen the bait of almost immediate establishment, with a uniform on the nail, had to be substituted for the previous system of starting men in a temporary capacity for six months. The clerical classes have perhaps suffered most from chronic shortages. A quarter even of those who sat and passed the entry examinations never took up their appointments. The executive class, which recruits its candidates at eighteen, was about the only one to get what it wanted.

The chief political interest of the report lies in the sources from which the senior civil servants of the future are recruited. The new methods of selection for the administrative class used since the war—partially discarding the traditional written examinations—have made little difference. The spread over public and grammar school boys is wide; it is rare for any school to provide more than one entrant a year, though over the three years a few schools—notably Eton and Christ's Hospital—stand out. For the Foreign Service alone, a few "better" schools still provide most of the recruits, and the predominance of Oxford and Cambridge among the universities is far greater than in the home service. The combined figures for the three years are:

	Foreign Service	Home Administrative Class
Oxford	31	72
Cambridge	15	45
London	2	24
Others	2	18

There is still little evidence on which to judge the value of the new selection method, but it certainly cannot restore

the diminished appeal of the public service. In part that reflects full employment, relatively lower salaries and overwork, but probably the intangible quality of prestige is also important: officialdom is now too widespread for its poohbahs to have suffered no depreciation.

From Bricks to Earth

THE Ministry of Housing has now shifted the emphasis, within its search for economies in house-building, from the bricks of which the houses are constructed to the ground on which they are built. The latest supplement* to the Housing Manual, published this week, is principally concerned with ways of reducing the costs of land, roads and services. In the early postwar years great open spaces were the fashion; pairs of houses either sprawled among grassy expanses or exposed their longest frontages to the street, while the roads themselves were more suited for heavy traffic than for fetching fish and chips. This was not only wildly expensive in land, in road construction and in the costs of sewers and service pipes; often it was also untidy and both architecturally and socially displeasing.

The handbook attempts to show how houses can be more concentrated without a needless sacrifice of comfort or amenity. The experience of the new towns, and particularly of Harlow, is heavily drawn on. The two main points are, first, a reduction in the length of frontages and, secondly, the grouping of houses in cul-de-sacs or with access by footpaths from a more distant road. Both methods lower the costs of roads and services per house and reduce the total area required, without necessarily affecting the size of the house or garden. It is claimed that such economies can reduce costs per house by as much as £50. When put into practice by a skilful architect the results can be extremely satisfactory.

Last year the Ministry was hammering away at the need to reduce costs by building smaller houses, and considerable progress has been made in this direction; over three-quarters of the 3-bedroomed houses recently approved by the Ministry show savings of about £150 each—equal to 2s. 8d. a week in rent. Probably this change, for the house

T & N Cases helped them on Everest

UP THE GREAT ICE-FALL; up the Western Cwm; up the Lhotse face to the South Col went the great 'carry' of stores for the assault on the summit. Stores for the Expedition, especially in these arduous final stages, with their appalling weather conditions, had to be carried in containers combining lightness, strength, and weatherproof qualities to a remarkable degree. Thompson & Norris weatherproof corrugated fibreboard cases were chosen for this most important role as the success of the Expedition depended a great deal on the satisfactory packaging of all the stores and equipment. Before the assault on the mountain these same cases carried the rations halfway across the world.

Extract from "The Times Mount Everest Supplement July, 1953"—"Prelude to Adventure" by Colonel John Hunt:—

"It is a remarkable testimony to the excellence of the packing that not one package has suffered damage during the journey from England."

with three bedrooms, has gone far enough. At the same time local authorities are also building a more reasonable proportion of still smaller dwellings, with only two bedrooms, for old people and small families. All these things are helping at least to keep some check on the volume of resources absorbed by the Government's housing programme.

Polish Church Beheaded

THE struggle between church and state in Poland has reached a new climax. Shortly after the first public trial of a Polish bishop—Monsignor Kaczmarek of Kielce—for alleged espionage and "anti-state activities," the Communists have struck at the head of the Roman Catholic Church in Poland. Last weekend Cardinal Wyszyński, the Primate of Poland, who from the pulpit had indirectly protested against the condemnation of Bishop Kaczmarek, was suspended from his duties, arrested and "allowed to retire to a monastery"; he is, it seems, to suffer the fate not of Cardinal Mindszenty of Hungary, but of Archbishop Beran of Czechoslovakia.

Some such developments as these were bound to come sooner or later. The Polish bishops have never interpreted the 1950 church-state agreement in the way the Communists intended. Above all they have never wavered in their allegiance to the Vatican, and they have failed to persuade the Pope to set up permanent Polish dioceses in the regained Western Territories. The real villain of the piece at Bishop Kaczmarek's trial was indeed the Vatican; according to the Communists it "has always backed German militarism" and is now doing a great deal to perpetuate uncertainty over the future of the Western Territories. From every point of view, domestic as well as international, the Polish government must be extremely anxious to end this uncertainty.

The Polish Communists realise that to attack religion as such is a hopeless undertaking. On the contrary, they insist over and over again that there is full freedom of religious worship in Poland. But they clearly intend to make every effort to impress on both clergy and people that their duty to the Pope does not extend beyond purely religious matters. At his trial Bishop Kaczmarek told the court that he had "undergone a spiritual liberation from harmful political influences" and "the Bishop is now on a different road from the Pope." His words were echoed by one of the defence witnesses, who declared:

As Catholics it is our duty to obey the Head of the Church in matters of religion, morals and clerical discipline; but in political and economic matters, and therefore in the matter of the Western Territories, we have freedom of action.

The trial of Bishop Kaczmarek and the coup against the Primate are plainly designed to sow fear and confusion among the bishops and thereby make them more amenable to the regime's wishes. It looks as if they may have had some success. In a special declaration issued after the suspension of Cardinal Wyszyński, the Polish Episcopate, under its new chairman, Bishop Klepacz, appears to accept the new situation and to toe the party line. This is the biggest capitulation the Polish bishops have yet made to the Communists.

Jugoslav Bishops in Trouble

PRESIDENT TITO has at last seen fit to condemn the "physical assaults" on the clergy which have been occurring with distressing frequency in Yugoslavia in recent months. Both Catholic and Orthodox church dignitaries have been the victims of what can only be described as organised hooliganism; in recent weeks six Catholic bishops or other high dignitaries were assaulted while going about their normal duties. The local Communists who are reported to have been responsible for these attacks have recently been under fire from above for their lack of political zeal; they have, it seems, chosen this method of proving their enthusiasm.

The incidents have been glossed over and condoned in the Yugoslav press on the grounds that the clergy involved were either engaged in political activities, or were wartime collaborators who should not take any part in public life. Perhaps the authorities would not have been so inclined to turn a blind eye if relations between the churches and the state had not in any case been taking a turn for the worse. They are seriously worried by the increase and persistence of religious practices even among Communist party members; in this year's census 86 per cent of the population described themselves as belonging to some religion. This gives an added urgency to the government's efforts to achieve a *modus vivendi* with the churches by persuading the clergy to join the semi-official priests' associations; and the refusal of both the Catholic and the Orthodox bishops to give their official blessing to these associations may well have helped to make the authorities unsympathetic to those who have been pelted with eggs and tomatoes or even ducked repeatedly in the sea. Moreover, the more liberal tendencies recently shown by Marshal Tito's government have brought the church-state conflict into the open and have undoubtedly encouraged the clergy to walk less warily. The Roman Catholic church in particular is making its contribution to the pre-election propaganda campaign and is throwing its weight against the government. This, however, is no excuse for condoning hooliganism. On the contrary, in the more liberal atmosphere which, to his credit, Marshal Tito has created, such excesses are particularly inappropriate; as he himself now recognises, they only suggest that the Communists are unable to oppose the churches with more civilised weapons.

Japan's Defence Force

THE agreement between Mr Yoshida and Mr Shigemitsu, who are respectively the leaders of the Japanese Liberal and Progressive parties, to turn Japan's "national safety corps" into a "defence force" marks a decisive step in the rearmament of Japan. The existing force, which during the Allied occupation was first established as a "police reserve," has retained in theory since the peace treaty the character of a police organisation for internal security only, though it has acquired heavier weapons. The transformation of this service into a national army openly undertaking the task of defence against external attack has been impeded by three

factors: first, the prohibition in Japan's postwar constitution against the maintenance of armed forces; second, the anti-rearmament stand of the two Socialist parties, which hold between a quarter and a third of the seats in the present Diet; and third, the unwillingness of the business classes, mainly represented by Mr Yoshida's Liberal party, to accept heavier taxation. Mr Shigemitsu's Progressive party, however, has come out definitely in favour of rearmament, and though it lost seats in the last general election, it has strengthened its position politically because the Liberals, who also lost seats, have become dependent on its support.

The Progressives have now, it appears, been able to win over Mr Yoshida to the essentials of their policy, and, somewhat paradoxically, the agreement between the parties of the Right has been aided by the campaign which the Socialists have been carrying on against the presence of American garrisons. The Socialists have been doing their best to whip up nationalist feeling against America and have had no little success in creating a very embarrassing situation. But as the great majority of Japanese wish to see Japan defended in one way or another, the anti-American campaign of the Left has promoted Japanese rearmament, for the only alternative to American garrisons is that Japan should become strong enough to defend itself. This development is, in fact, entirely in accordance with the wishes of the Americans, who would greatly prefer to see the Japanese in a position to look after themselves, with an American pledge of such additional assistance as might be required in the event of war.

Troubles in Nyasaland

THE latest reports from Nyasaland encourage the hope that the worst of the rioting may be over. After his last visit to the disturbed areas Lieutenant-General Sir Alexander Cameron, the deputy Commander-in-Chief in East Africa, said that though the "disease" was still there the situation had greatly improved. Disturbances have never spread outside those areas in the Southern Province where there are long-standing land troubles, and where for historical reasons the native authorities are government-appointed and not traditional. Fears of federation have been only a contributory factor in the situation, although they are a good talking point for agitators who can attribute any unpleasant occurrence to the new dispensation. Itinerant agitators have whipped up demonstrations against those native authorities who co-operate with the government, and have then disappeared before the security forces arrive. Meanwhile the crowds have grown angry and refused to disperse when ordered to do so; inevitably there has sometimes been bloodshed.

The Nyasaland African Congress, which is the Africans' political organisation, denies that it has had anything to do with the outbreak, and in fact some of its leaders have co-operated with the government in trying to stop the riots. Although they campaigned hard against federation and called a boycott by Africans of the organs of government, they have always publicly advocated a policy of non-violence. It is encouraging that Congress now seems prepared to call off its non-co-operation campaign and, like the Africans in Northern Rhodesia, is turning instead to demands for increased power on the legislative and executive councils.

Another hopeful sign is the formation of a new African party explicitly recognising that federation may bring benefits and ready to accept the *fait accompli*. Its power and following have yet to be tested; but it is to be hoped that if a body of moderate African opinion does emerge, its political aspirations will be given adequate recognition.

Crime and the Police

THERE is little satisfaction to be found in the annual statistics of crime in the United Kingdom, published by the Home Office at the end of last week. They show that the volume of crime—of crime sufficiently serious to be indictable—is still lamentably high. In 1952, 260 people in every 100,000 of the population over the age of seventeen were guilty of an indictable offence, a figure to be compared with 259 in 1951, 222 in 1950, and 148 in 1935. House-breaking, crimes of violence and sexual offences all increased. There was a slight fall in cases of larceny, receiving stolen goods and in various categories of fraud. But if there is a bright spot in the picture, it is that fewer crimes were committed by people under seventeen. It seems

that the wave of characters unsettled by the war is rising up the age scale, leaving something of a trough behind it. But, even if that is so, it follows that all the efforts of the last seven years have not cured the solid core of addicts to crime created by wartime conditions. That is perhaps the most serious conclusion of all to be drawn from this report.

A second feature of the report is the apparent inability of the authorities to improve on the rate of detection. Before the war just over half the indictable offences known to the police were cleared up. The rate for 1952 was 47.5 per cent, against 47.1 per cent for 1951. In crimes of murder, however, the authorities were much more successful. In the 132 cases of murder last year, 108 suspects concerned with 126 murders were known to the police; 72 of them were arrested and 36 committed suicide before

The BBC

arrest. This high proportion of successes reflects the inherent difference between many murders and other crimes, which makes the murderer easier to detect than the thief. There is the further point that the police can, and do, put out a much greater effort to catch the murderer than any other class of criminal. To the extent to which this is the case, the inference is that the police forces are still under strength, not only on paper but in operation, and from there the argument could lose itself in the swamps of motoring offences and the cost to the community of the number of policemen engaged on the supervision of urban parking.

The Policeman's Lot

At the same time as the crime returns were published, the Home Office announced the setting up of a new negotiating body for pay and conditions of service in the police forces. At last the Police Federation has won its argument that the police should have the equivalent of a Whitley Council. The new body will have an independent chairman, twenty-six members drawn from the police authorities and twenty-seven from the police forces. It will have power to make agreements but not to bind the Home Secretary or the Scottish Office. It will not be competent to deal with discipline or the promotion of individuals. But the council will, it is to be hoped, make a serious study of all the factors that influence recruitment into the police forces, of which wages are only one.

Wise Man of Berlin

THE death of Professor Ernst Reuter is not a loss for Berlin alone. The western leaders, including those in Bonn, have lost the counsel of a wise, experienced man who knew the Russians far better than most Soviet experts. His own short career as a Communist party leader over thirty years ago had ended when he rejoined the Social Democrats in 1926, but it stood him in good stead when it came to dealing with Russian and German Communists on his own home ground. The sober courage which he showed was due not only to his own personality, but to his conviction that initiative and firmness pay in dealing with Moscow. He believed this even when Stalin was at the head of Soviet affairs; and he was far more confident after Stalin's death and the revolt of the East Germans in June.

Even before the fall of Beria, Professor Reuter argued that the government of the Soviet Union must be much weaker than it was under Stalin. Rule by triumvirate, he pointed out, was inevitably unstable and difficult, and old rivalries must eventually wreck collective government in Moscow. From this, he argued that the best policy for the western powers was to press the Soviet rulers hard to reunite the western and Soviet zones of Germany. He would have liked a demand to be made for all-Berlin elections at once, and he thought the western high commissioners ought to assert their right to show concern over bad conditions in the Soviet zone. The Lord Mayor of Berlin

was the moving spirit behind the distribution of food parcels to East Germans last summer, and he had recently been negotiating with the Americans about supplies of clothing for the same purpose.

Events have justified Professor Reuter's calculated disregard for risk. Berlin is, after all, the place where, in 1949, Stalin had most decisively to acknowledge defeat. Great credit is due to Professor Reuter for this victory, but it is only fair to recall that an essential part was played by General Clay, a man unlike him in almost every way; and that Berlin would still have been lost if it had not been for American funds to bolster up its economy. It speaks well for the open-mindedness of the Americans that—in spite of Senator McCarthy—Professor Reuter, the Socialist and former Communist, had a great success this year on his visit to Washington. And he himself came back convinced that President Eisenhower had consulted his conscience and had made up his mind to do everything possible to reach real peace with Russia. It will be a miracle if the Socialist ranks in Berlin produce another Lord Mayor who can achieve such good relations with the Americans.

Freedom for the German Press

A HEARTY protest from the Bonn correspondents of the German newspapers has forced Dr Adenauer to deny that he intends to set up a super-ministry of information and propaganda that would revive some of the practices of Dr Goebbels. Reports had leaked out that Dr Lenz, state secretary in the Chancellor's office, was aiming to co-ordinate the work of the Bonn foreign office news department, government propaganda, the independent news agency and political work among the Germans behind the iron curtain. It was even feared that he would also take over the security services now run by Dr Otto John, who escaped to England after taking part in the July 20th plot against Hitler.

For several years past, German government propaganda has been expanded over the world. Bulletins, a "diplomatic correspondence" and short-wave broadcasts now spread the official view, with special regard to the United States and Latin America; and a draft press law with penalties for sensationalism or malicious charges damaging to the state is under consideration. The tendency to exert influence on the press is, indeed, unmistakable.

Dr Lenz himself suffered in a concentration camp and is close to the Chancellor today, while the Bonn foreign office press department is said to oppose his plans. But the fact remains that Dr Adenauer's ministries (and the foreign office in particular) contain large numbers of men who held responsible posts under Herr Ribbentrop or his colleagues. Though they are loyal supporters of the present regime, they may be expected to have at least the average German's urge to suppress critics and conduct one-sided propaganda. Better machinery for co-ordination with the western governments as regards political warfare will have to be set up, as the confusion over food gifts to East Germans proved; but this should not be made the excuse for controlling the West German press. In spite of this week's victory, the German journalists will have to fight for their freedom time and again.

Here's dictation with a difference . . .

... the Dictaphone TIME-MASTER*
with its revolutionary plastic Dictabelt!

See for yourself the amazing Dictaphone Time-Master—the neatest, most compact, most time-saving dictating machine ever! This superb machine was only made possible by Dictaphone's invention of the revolutionary Dictabelt.

Hear for yourself what a difference these amazing little plastic belts make. Just slip in a Dictabelt and speak your notes and letters—your every word or whisper will be recorded crystal-clear. Each Dictabelt takes 15 minutes' flaw-

less dictation, and there's no risk that your recording will be spoilt or damaged!

*Prove for yourself how utterly simple the Time-Master is to operate. A few days' free trial or a demonstration at your local Dictaphone office, will convince you how revolutionary it is in design and efficiency! Full particulars at your local Dictaphone office.

Immediate delivery. Dictaphone can now offer you immediate delivery. Order your Time-Master now.

DICTAPHONE GREATEST NAME

Address _____

You'll find that the Time-Master faithfully records your every word! No time wasted, because controls are automatic.

Secretary transcribes easily, accurately using feather-light "Magic Ear." Controls are simple and recording is of constant quality.

Letters to the Editor

Pay as You Wear

SIR—In the informed article on various forms of working-class credit for clothing, published in your issue of September 19th, you write that the Drapers' Chamber of Trade denounces check trading as an interloper into legitimate commerce—and bids members copy its methods. This comment misconceives its attitudes. The Drapers' Chamber of Trade has not been concerned to make moral judgments about this or any other form of credit trading. The latest public statement it made on this matter was in 1949, in conditions of price control; it pointed out to its members and to the check-trading companies that out of maximum retail margins on utility goods ranging from 20 per cent to 27½ per cent on retail selling prices the payment of 12½ per cent or more of the selling price to the check trader for what was, in effect, the introduction of new business was an uneconomic price for the retailer to pay, especially as in conditions of scarcity the business might well have been obtained for cash anyway.

Since the abolition of price control the position has not greatly altered. If retail margins have somewhat widened competition has kept them in check; the costs of retailing have risen and there has been some tendency for the check trader to drive a harder bargain.

Many shopkeepers, including members of the Chamber, have built up successful businesses by selling their goods on the one hand for cash and on the other for checks. The check trading companies not unnaturally require them to sell the same goods to customers tendering checks as to those paying cash. Such traders claim that many customers will tender a check for, say, £5 for a coat and pay the balance in cash. The increased business resulting and the greater volume of settlement discounts arising make it possible for them, they claim, to operate this system. It is undeniable, however, that the introduction of checks tends to drive away the cash business and a shopkeeper can only successfully maintain a business based on the receipt of checks if the market rate of discount demanded by the check companies is low enough. For these reasons in some towns, notably Hull, certain retailers have successfully joined together to form their own companies to provide this facility at lower rates. Other retailers issue their own checks. This would seem to us a suitable way of improving the retailers' bargaining position.—Yours faithfully,

JOHN RAMAGE,
Director, Drapers' Chamber of Trade
London, W.1

Farmers' Fury

SIR—Your comment on the farmers' objections to the extension of the deficiency payment principle to fat stock marketing reveals a *sancta simplicitas*.

May I suggest that you should reconsider the problem bearing in mind that, if I want to sell my wheat, I can take a sample to market in my pocket, and, if I do not like the price, can keep the wheat with every prospect of its improving in price thereby; but if I take a beast to market and fail to sell him the costs of transport there and back and of feeding him till another sale will probably land me in a loss.

The problem of marketing lies at the root of the adequate production of perishable articles, and is not to be solved by academic pronouncements about the blessings of competition, or you will find that there are no competitors.—Yours faithfully,

G. R. Y. RADCLIFFE
New College, Oxford

[The perishability of meat indeed lies at the root of the matter, for the farmer and also for the consumer. It makes the consumer concerned to get regular supplies, and this is reflected in the fluctuations of prices. The farmer who takes his beast to market when few others are doing so performs an extra service and gets a good price. The stick that operates with this carrot falls on the farmer who goes to market when supplies are large. A meat market is not unique in this respect, and some competitors usually remain in business.—EDITOR.]

Ceiling for Houses

SIR—Once again it is taken for granted (in your issue of September 26th) that private building of houses costs the Treasury nothing; while I have no objections to private ownership, I feel that the reasons usually put forward are not entirely accurate.

It has always been assumed that the ownership of houses brings in an annual income, either in cash or by benefit derived from occupation, and in either case tax is payable. Before the war this placed house ownership in line with any other investment, but today the gross annual sum which a house is deemed to be worth is so low in relationship to the capital value that the income tax received by the Treasury must be lower per unit of capital than for almost any other form of investment.

It may be that this state of affairs will one day be adjusted, but in the meantime low assessments of annual values represents, in effect, a concealed subsidy which should be taken into account when presenting facts and figures to support arguments on housing.

It will come as a nasty shock for mortgagees if annual assessments are ever again brought into line with capital values. At present the mortgagee usually gets considerably more tax relief on the interest he pays than his liability under Schedule A.—Yours faithfully,
MORTGAGEE

Sugar's Cinderellas

SIR,—In discussing the new International Sugar Agreement in your issue of August 29th, you have unfortunately overlooked a central link between American sugar imports and the "free market." When commodity prices generally are depressed, US sugar consumption tends to be low, its beet sugar production high, its imports from Cuba doubly reduced, and correspondingly more sugar is left for free-market importers. On a rising market, the United States absorbs more Cuban sugar and less remains for the free market. These perverse fluctuations in available supplies, quite as much as changes in demand, can and do generate variations in the free market price.

Difficulties thereby created for the agreement would endanger the top rather than the bottom of the "zone of stabilised prices." The floor in any case is implemented not by guaranteed importer purchases, as under the International Wheat Agreement, but merely by lower export quotas, heavier production restriction in countries enjoying export quotas, and in the end, presumably, a lower target price. Nor are there, as in the wheat agreement, specific allocations of supplies among eager importers at the ceiling. But the sugar agreement does make minimal provision against the risk of free market shortage. Exporters must hold reserve stocks, earmarked to meet increased free market requirements at the call of the council. Besides, a council request that the Cuban Stabilisation Reserve (now held for future disposal in the US) be made available instead to the free market must be "considered" by Cuba. In the past, out of obvious long-run interest, Cuba has attempted to fill any increase in its US quota, regardless of incidental effects on the free market. Despite a somewhat contrary obligation under the agreement, Cuba can hardly be expected to act otherwise in the future.—Yours faithfully,

VLADIMIR P. TIMOSHENKO
BORIS C. SWERLING

Books & Publications

Asians Look at China

WINDOW ON CHINA.

By Raja Hutheesing.

Verschoyle. 191 pages. 12s. 6d.

THROUGH THE IRON CURTAIN VIA THE BACK DOOR.

By U Kyaw Min.

Ernest Benn. 287 pages. 10s. 6d.

BOTH these books are of real interest to all concerned with the new China. Both are by Asians, and the authors are therefore free from the emotional limitations and feelings of guilt or condescension that afflict so many western writers in dealing with the Far East. Moreover, both authors have consistently tried to penetrate the official smokescreens and to give a factual picture of what they saw with their own eyes.

To say that the first of these books disappoints in some respects a reflection not on the author, but on officialdom in China. Mr Raja Hutheesing, having undergone the ennui of a conducted and supervised visit to China as a member of an unofficial delegation from India in 1951, went back the following year as a press correspondent in the hope of being able to get away from his official guides and of seeing what really lies behind the propaganda façade. This he very rarely succeeded in doing, but a trained observer can learn also from the amount of effort taken to conceal things from him. He cannot give us the figures behind the percentages or extensive factual evidence of the success or failure of the regime; but he is able to show where there are grounds for doubting official claims, and his persistent questions occasionally succeed in catching his subjects off their guard.

Raja Hutheesing is intensely interested in developments in China, since there is great similarity between its problems and those of India. Both have emerged during the last decade from the limitations of colonialism, and both have to integrate far-reaching plans for raising the standard of living of the peasant, for water conservancy and irrigation, for increasing agricultural output and for industrialisation. Each should have much to learn from and to teach the other. He comes to the conclusion that whereas China may achieve an initial material success, the regime is sowing the seeds of its own destruction.

He is greatly concerned that international communism is seeking to disrupt the freedom of Asiatic countries by painting false pictures of China and that the millions of Asia are thereby being slowly led to accept the principles of a totalitarian dictatorship which will deny the very things they seek. In 1952 China

started a call for Asian unity with the emphasis on friendship with India. Raja Hutheesing is convinced that this is an attempt to counterbalance the risk of Russian domination and to achieve regional collective security against both East and West. It would hardly be reasonable to expect to find such views as these supported by a complete chain of reasoned argument, but coming as they do from an Indian observer of the China scene they are most certainly thought provoking.

There are some extremely interesting chapters in this book. Land reform is a major issue throughout the East and China is a country where it has been forced through with great speed and ruthlessness. Raja Hutheesing concludes that it was more a political measure than an attempt to improve the life of the people. He was conducted through the germ warfare exhibit, which of itself he felt proved nothing, and his pointed questions to the commission produced nothing but evasive and hostile tirades. One of the rare occasions on which he appears to have been allowed to move with freedom was on a visit to Shanghai when he was able to talk individually with a number of the remaining foreign business men, whose views he gives.

U Kyaw Min did not enjoy even the limited amount of free movement obtained by Raja Hutheesing. His glimpse of the Communist world was achieved by his agreeing to join the Burmese delegation to last year's Moscow economic conference, and he was closely shepherded throughout his journey. However, he took every opportunity to linger not only in Russia but also in China, through which he passed both in going to Moscow and in returning to Rangoon, and he, too, sometimes succeeded in shaking off his pertinacious and often stern mentors.

His book is all the more interesting because he makes little attempt to judge broad issues on the basis of his few weeks' experience. On the contrary, what he has written is virtually a diary, in which he records the smallest everyday details with charm and humour. Good things and bad things are thus chronicled exactly as they occurred, and when U Kyaw Min encounters something that he fails to understand he describes it with modest objectivity instead of trying to fit it into a preconceived idea. One result of this engaging technique is to give an extraordinarily vivid picture of the niggling and almost infantile restrictions to which even approved foreign visitors are subject in Russia and China.

THE ECONOMIST, OCTOBER 3, 1953

Murder—of Innocents?

HANGED—AND INNOCENT?

By R. T. Paget and Sydney Silverman. Epilogue by Christopher Hollis. Gollancz. 278 pages. 12s. 6d.

THIS book is a tract; that is a statement of fact, intended neither in praise nor blame. It has been written by three members of Parliament who oppose capital punishment and desire its abolition. Two of them, Mr Paget and Mr Silverman, use as their argument—almost as their weapon—the facts of three comparatively recent murder cases, in each of which, they assert, there was some doubt if the man executed was guilty. The third, Mr Hollis, writes a more conventional—at least a wider—attack on the institution of capital punishment. He believes it to be wrong, and he says so. Such a book, published within a week of the report of the Royal Commission, is certainly topical.

Of the three murder trials discussed in the book, Mr Silverman takes the case of Walter Graham Rowland, Mr Paget those of Derek Bentley and Timothy John Evans. Mr Paget is not only a partisan; he writes as a partisan. Derek Bentley was hanged because he had joined with the boy Craig in a criminal enterprise at Croydon which culminated in the shooting of a policeman. Mr Paget thinks that the joint enterprise was over before the policeman was shot and that therefore Bentley was legally innocent of the crime of murder. He feels that, in any case, Bentley should not have been hanged because he was young and stupid and could not weigh up the consequences of what he was doing. Over the fantastically involved story of Evans and Christie, whether Evans murdered his wife and child or made false confessions that he had, knowing that Christie had murdered one or both of them, Mr Paget is even more emotional. One is either swayed or repelled by the partisan in Mr Paget.

Mr Silverman's case is more closely argued. Rowland was accused of murdering a prostitute in Manchester with a hammer. After his conviction, a man named Ware confessed to the murder; there was an inquiry by a KC; Ware's confession was withdrawn; and Rowland was hanged. Four years later Ware attempted to murder another woman at Bristol with a hammer. He was found guilty but insane and is now in Broadmoor. What Mr Silverman does is to underline a number of unsatisfactory features in the original trial and in the investigation of Ware's confession, and to leave behind, no doubt intentionally, the not entirely novel suspicion that on occasion the police do make up their minds in advance and can be loth to change them afterwards. That is not surprising; it is still disturbing. But all Mr Silverman says over Rowland, and all Mr Paget says over Bentley and Evans, is this: if you hang a man for murder and afterwards find out that you may well have been mistaken, there is nothing you can do about it. Is that argument sufficient to destroy the case

THE ECONOMIST, OCTOBER 3, 1953

for capital punishment? They say that it is.

Capital punishment is a moral question and moral questions demand individual answers. This book is solid enough to be thought of as a supplement to the report of the Royal Commission and as such to be read.

Diplomatic History

THE ORIGINS OF THE WAR OF 1914, VOL. II.

By Luigi Albertini.

Oxford University Press. 727 pages. 63s.

THIS is diplomatic history with a vengeance. Dr Massey's translation of the late Senator Albertini's second volume consists of 688 large pages devoted to the month between the assassination of the Archduke Francis Ferdinand and the Austrian general mobilisation. He who plods may read what A told B to say to C about D—and how B got it slightly wrong by accident or design.

It must be said that, especially in the opening chapters on the planning, execution and immediate aftermath of the assassination, Albertini reveals a narrative skill which some writers of detective fiction may well envy; and throughout this work he has clearly been at great pains to get at the truth by squeezing the last ounce out of a comparative study of the complex mass of documents and by questioning surviving persons of the drama. He orders his material with skill and without rancour, but the result cannot be anything but intricate, and there are few self-contained incidents to relieve the reader. One such incident is, however, provided by the sudden death of the Russian Minister to Serbia, the result of a heart attack in the house of his Austrian colleague. The dead man's daughter, summoned to the scene, went round sniffing in vases and carried off two cigarette ends to be tested for poison. The Russian Minister's death had the incidental result of depriving the *entente* powers of senior representatives in Belgrade, since the British Minister was on leave and the French Minister was being changed.

Albertini is careful to distinguish between the origins of the war and the guilt of individuals for its outbreak, but for few of the actors involved has he much sympathy. Of the more prominent politicians only Tisza, the Hungarian Prime Minister, escapes condemnation for either dishonesty or stupidity. While the principal personages of the central powers are the most heavily censured, others come in for severe criticism; upon San Giuliano Albertini pours out the vials of wrath and contempt, and Grey (with all his ambassadors except Buchanan in St. Petersburg) is portrayed as betraying complete incomprehension of the state of affairs. Of the diplomats, Paléologue in St. Petersburg and Tschirschky, the German Ambassador in Vienna, rank as villains as opposed to the two Cambons at the other end of the scale.

This exposure of human frailties is all

the more depressing in a book of this kind, where the action of the drama is entirely moved by the deeds or omissions of the various characters. Other forces do not enter into Albertini's scheme of the month of July, 1914. In his indictment Albertini doubly underlines the failure of nearly all concerned to realise that mobilisation meant war; those who wanted at the last moment to put their policies into reverse had in fact already gone too far without realising the extent of their commitment.

Tudor Political Thought

POLITICAL THOUGHT IN ENGLAND: TYNDALE TO HOOKER.

By Christopher Morris.

Oxford University Press. 220 pages. 6s.

MR MORRIS was faced with a particularly difficult task in writing this volume for the Home University Library. For although its achievements in other fields were rich and varied, Tudor England produced very little political theory in the strict sense. Hooker at the close of the period attempted the grand articulated treatise expounding fundamental principles, but he is the only thinker to whom Mr Morris is able to devote a whole chapter. Some have held that it was because Tudor rule was so successful that fundamental principles were little discussed. Yet at the time that rule seemed much more precarious than it does in retrospect, and as Mr Morris shows there was an abundance of political controversy and propaganda. Most of this discussion took the form of an appeal to precedent and not a systematic examination of principles. Mr Morris candidly recognises this; and he has been extremely successful in elucidating the political ideas of this period without oversimplifying them. To do this he has had to range widely, drawing his material from Parliamentary debates, sermons, pamphlets and poetry.

Mr Morris gives coherence to his book by taking the impact of Protestantism on Tudor political thought as his main theme. He justifies this emphasis, not merely because the religious issue bulked so large at the time, but because "it was the Protestant religion which, in the end, did more than anything else to bar the way to despotism." Yet Mr Morris at once goes on to stress that the immediate effects of the breach with Rome on political thought were very different and far less agreeably clearcut. Those who engineered the Henrician revolution were too anxious to disguise what was being done to produce theories of absolutism or divine right. Those genuinely concerned with religious reform oscillated uneasily between the claims of a godly prince and those of conscience. And throughout the period the ever present fear of anarchy or rebellion was expressed in endless variations on the theme of "degree, priority and place." Respect for tradition and a preference for arguments which were persuasive rather than consistent combined to re-

strict the flights of thought.

The range of Mr Morris's reading and his skill in selecting material make this a penetrating and highly readable survey, though it is of more value as a contribution to the understanding of the Tudor period than as an important chapter in the general history of political thought. Sometimes he makes overstatements, as when he writes that "the Reformation lifted English politics on to a higher plane," or describes Shakespeare as "the greatest of all Tudor thinkers," or suggests that Bishop Ponet had "outlined almost the whole of the Whig political philosophy more than two centuries before it came into its own." And his plan has meant that he has largely excluded from his survey those writings concerned with the functions of government, particularly in the economic and social spheres. But within his chosen limits Mr Morris has produced an admirably compact, lively and often illuminating account.

Endless Story

THE STORY OF ENGLISH.

By Mario Pei.

Allen and Unwin. 381 pages. 21s.

PROFESSOR MARIO PEI is already well known in the United States and elsewhere for two readable, lucid and scholarly works of popularisation: "The World's Chief Languages" and — possessing a yet wider appeal—"The Story of Language."

SUPPOSE YOU WERE Sir Winston?

What would you do? Well, whatever your decision, you could count on Facts and Figures on Current Affairs being presented to you in ship-shape order.

As an intelligent citizen and voter you, too, need the Facts and References. That is why KEESING'S was started (as far back as 1931). That is also why so many Economist readers have become subscribers to this unique news-cum-reference service.

Each week they receive by post a bulletin which is, in fact, the essential news, facts and figures of the world. The items are clearly arranged and there is a cumulative Index by which any item, whether it be on Politics, Economics, Social Questions, etc., can be instantly turned up. A special loose-leaf Binding Case is supplied, making reference simplicity itself.

The Service is neither costly nor clumsy. Its selection and presentation of news items are absolutely unbiased. Designed for rapid reference, it is as often used for leisurely reading.

In "The Story of English" he shows himself one of the modern school of writers upon that ever-changing subject. He does not regard slang as a sin nor colloquialism as a social error nor a dialect as something essentially different from a language. He respects the past but refuses to allow it to drown the present or to stifle the future. Indeed, he divides this book into three parts, on Past, Present, and Future. "The Present" includes such chapters as "The Geography of English," "On the Border-Line of Language" and "The Genius of the Language." "The Future," so far from being merely vatic, includes an excellent chapter on "The Teaching of English." In both parts, he often refers to the past, so that the book says more about the history of English than might at first appear.

"The Past" is the most compact of the three divisions. Here, necessarily, the author is much indebted to such British scholars as Skeat, Sweet, Bradley, Craigie, Wrenn, Potter (but "What! no Wyld?") and to such Americans as McKnight, Sapir, Baugh, Robertson, Kurath, Mathews (but neither Logan, Pearsall Smith nor Sturtevant) and to such European scholars as Jespersen and Zachrisson.

In short, Professor Pei has performed his very difficult task with knowledge, skill and tact. If, in the chapter on "The Genius of the Language," he understates his case, he does so for the best of reasons: he knows that the public knows that he well knows that

Save yourself...

Almost certainly, you will be able to save yourself a great deal of time and trouble if you apply first to us for books on economics and on the political and social sciences. We make no claim to infallibility. Yet, inevitably, a bookshop reflects the interests of its clients. Our clients include Universities, Government Departments, libraries, banks, learned bodies—and learned men. Their discriminating custom has enabled us to build up a stock, and a service, that we are told is unrivalled in its field.

South-American Travel Tale

THE LAND OF THREE WORLDS.

By Everild Young.

Andrew Melrose. 256 pages. 18s.

THIS book is written with sympathy which is free from sentimentality and imagination without flights of fancy. The author is an experienced traveller, blessed with the sort of courage that weighs and accepts risks in awareness and without fanfare. Perhaps, in the beginning, she betrays a certain smugness in contrasting her own eager receptivity with the torpid indifference of "other passengers" whom she had "no inclination to imitate"; she overlooks in her enthusiasm the inevitable difference in outlook between those escaping for a brief respite from servitude to nature in the raw, and those making an exciting visit terminable at will. She also exaggerates somewhat the prevalence of people who suppose that Bolivar and San Martin were Indians and that Peruvians wear feathers in their hair; but, once she is among people who are living and working in the isolation of mountains or forest, Miss Young becomes the objective chronicler of arduous lives caught in an overwhelming environment.

The book is divided into four sections. "The Coast" deals with sophisticated and cosmopolitan cities set in macabre landscape against the background of the Andes, and permeated by the splendours of past civilisations. "The Sierra" describes various ventures into the mountains: drives in inadequate vehicles over the highest motor road in the continent to inspect the highest smelting plant in the world, or journeys along perilous tracks to tiny market towns tucked away in a seemingly unattainable fastness. "The Montana" shows us the jungle stretching from the eastern foothills to the Atlantic coast. Here, small sporadic settlements of Indians go their way in a seclusion that is increasingly threatened by the white man, who, with ineradicable faith in progress, pursues them with feats of road engineering and dogged indoctrination with scientific agricultural method. The last part of the book tells of the author's journey, alone except for two fortuitously acquired guides, on a raft down the Aguaytia river, and her three days' tramp through rain sodden jungle back to her base.

Her descriptions are masterly. She accepts the trials of heat, cold, sickness, delays, squalor and pain with philosophy and humour; and she appreciates the rapid strides made in development in spite of the inherent lack of initiative resulting from centuries of domination by Inca and Spanish totalitarian systems.

The illustrations are excellent, and would be adequate if only Miss Young

the many colour films she took, which are not included, and if only they marched with the text and did not require a constant fluttering of pages to run the relevant one down. But—let it be emphasised—among some forty-five photographs there is only one of the author—in her garden in England, where we salute and thank her.

Well Met

ENCOUNTER: A Monthly Review of Literature, the Arts and Politics.

Secker and Warburg. 80 pages. 2s. 6d.

THE decline of the serious literary monthly has been lamented and explained often enough since *Horizon* followed *Life and Letters* and other more august titles into limbo. Social change has impoverished the class that was its natural consumer; those whom social change has enriched have other tastes. The serious weeklies and the literary supplements survive and thrive in the new conditions much as the fourteen-foot racing dinghy survives and thrives in a world which has willy-nilly scrapped the J-class yacht. No new *Britannias* will be commissioned; is there really scope for a full-sized, full-powered monthly devoted to literature, the arts and politics? Not, certainly, if it only offers an enlarged version of existing literary sections or supplements; nor if it is intrinsically second-rate and secondhand; nor yet if its excellence is that of an *avant-garde* raiding too far ahead of the main force. An appropriate scale of treatment, a basis of opinion and taste wide enough to escape cliquiness but unified enough to generate an authentic voice, a certain difficult balance between novelty and continuity—these are essential specifications for success, or a chance of success.

Encounter should have a good chance. It is internationally based, with Mr Stephen Spender and Mr Irving Kristol as its editors and the Congress for Cultural Freedom as sponsor. Its first number contains—in addition to some enchanting extracts from the diary of Virginia Woolf—articles and essays by Denis de Rougemont, Albert Camus, and Christopher Isherwood; a penetrating "Postscript" on the Rosenberg case by an American writer, Leslie A. Fiedler, of whom the country ought to hear much more; poems, splendidly characteristic, by Dr Edith Sitwell and Mr Day Lewis; a range of book reviews which shows what perceptive and intelligent criticism can do when released from the thousand-word (or more often six-hundred-word) trammels of the weeklies; and other good things. Its tone is serious without Pharisaism and civilised without preciosity; and it gives the reader quantity as well as quality for his half-crown. In fact, it is a periodical to be bought for personal satisfaction and not out of a sense of cultural duty; and when one has said that one has said a good deal about its prospects of survival as a permanent

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The Little Conventions

Washington, D.C.

WHEN the Democrats decided to have a little rally in Chicago to welcome Mr Adlai Stevenson home from his trip round the world and to use the occasion as an excuse for one of those \$100-a-head dinners which can help so much towards the reduction of overdrafts, they had no intention of starting the midterm election campaign so early. But everything conspired to provide the kind of publicity that gave the meeting national, rather than local, importance. There was nothing much else happening at the moment; the President was still on holiday in Colorado. So stories of impending quarrels were written, Southern Governors were encouraged to announce that they were travelling north to "have a showdown" about the loyalty oath, which was exacted last year in an attempt to keep the wavering South in line, and the claims of various gentlemen to the chairmanship of the National Committee, from which, it was said, Mr Stephen Mitchell was going to be ejected, were canvassed at length.

Then the Republicans, who had arranged a minor regional women's meeting later in the week, began to envy the opposition their headlines and started to inflate their own gathering into a conference. And, before anybody knew quite how or why it had happened, the battle lines were drawn, preliminary plans for the conduct of next year's campaign were drafted and, almost imperceptibly, the President moved from the role of national leader, immune from attack, to that of a political leader who would be fair game, along with his party. When a Southerner, Senator Olin Johnston of South Carolina, began referring to President Eisenhower as "Alibi Ike" it was clear that the short breathing-space between American

The Democrats, in the opinion of most observers, had the better of the week. For a party which seldom meets without a row between its two wings it had an unusually harmonious time. Old enemies were meeting with new friendship in their eyes and slapping each other on the back; Mr Truman was everybody's hero; nobody challenged Mr Stevenson's leadership of the party; North and South were both equally desirous of sweeping the loyalty oath under the carpet; and Mr Mitchell got \$25,000 a year, paid back to January 1st, instead of the sack. More

important, perhaps, the Democrats, even if the confidence which they managed to instil into each other seemed rather synthetic, or at best exaggerated, got through their meeting without giving the enemy any ammunition.

The Republicans were not so fortunate. A field organiser for their Congressional Campaign Committee, while giving the ladies a few hints on tactics, told them not to hold their meetings at the country club but to "meet the women on the other side of the tracks with five dirty-faced children." This self-portrait of Republican womanhood, painted in the same colours which the Democrats delight to use every four years, must be worth, Mr Joseph Harsch estimated, a million dollars to the Democratic National Committee.

Herblock in the Washington Post

The main speaker, Senator Ferguson of Michigan, had been given a speech specially prepared for him by the Republican National Committee, which he proceeded to deliver, apparently unaware that the arrows he was aiming at Mr Stevenson were burying themselves instead in Mr Dulles, who had, at the United Nations the day before, adopted all the positions which had encouraged the Senator's ghost writer, in a fine frenzy of originality, to call Mr Stevenson an "appeaser."

Meanwhile, the Secretary of Agriculture was in Wisconsin speaking to a large audience of farmers. The *New York Times* reported that

somewhat extraordinary precautions for an occasion of this kind were taken. A fence had been erected in a perimeter about 25 feet from the speaker's platform and, shortly before Mr Benson was to speak, an additional barrier of barbed wire and steel posts was put up 15 feet outside the first fence. Uniformed state police patrolled the 10-foot-wide "no-man's land" between the fences.

Mr Benson, who in the past has been critical of high supports for farm prices, is not popular with farmers at a time when prices are falling. But the unknown organiser of these precautions exaggerated the discontent.

Nevertheless, the Republicans are said to be considerably disturbed by some soundings they have taken recently in the middle western farm states. If their findings resemble the results of a poll taken at the Minnesota State Fair and published by Mr Marquis Childs, they have every reason to be disturbed. As might be expected, the President fared better than Congress: 71 per cent of those questioned said that Congress was doing a bad job and only 32.5 per cent thought that the President was. But it is Congress which must be elected next year and Republican candidates will not have his coat-tails to ride on this time.

The Democrats, who have been taking the same kind of soundings with the same kind of results settled down in Chicago to making the most of their opponents' indecision over agricultural policies. Moreover, they were able, thanks to Mr Durkin's retirement from the Cabinet and his well-publicised reasons for going, to feel confident at last that labour was back in their ranks in full force. And they could use the knowledge that the Administration is considering a sales tax—an injudicious admission by the Secretary of the Treasury unless he has already made up his mind to ask for one—as further evidence that a big business administration was only concerned with the fortunes of the rich. All in all, they had a happy time.

★

But it is a little early for the Democrats to be as confident as they pretend to be about the result of elections which will not be held for more than a year. Issues which look good today, and which give every promise of looking even better, could disappear by next summer. For example, thirty-six hours after Mr Stevenson had given his party a splendid exhibition of how to be bipartisan in foreign affairs without forgoing the right to criticise, Mr Dulles stole his thunder and proclaimed that he, too, believed in flexibility and the value of negotiation. If the Secretary of the Treasury drops all idea of a sales tax the memory of its frustrated life will not be a very potent weapon for the opposition.

It is admittedly hard to see what the Administration can do about labour except to wave it goodbye. But much may happen on the agricultural front. The House Committee on Agriculture is busily touring the country in search of a new policy and there is no doubt that, if it can find one which promises to make the farmers forgive the President and forget his Secretary of Agriculture, Mr Benson, the Administration will embrace it with joy.

But that week in Chicago proved one thing which may grow progressively more important: that in power the

Republicans are as divided as the Democrats ever were. In opposition, the Democrats, North and South, right and left, can join in denouncing the failures of the Administration. The Republican ladies of the Middle West, on the other hand, judging from the fact that over half of those assembled signed a petition in favour of the Bricker Amendment, which the President is trying to defeat because it would cripple his power to conduct foreign affairs, have become no more receptive of Mr Eisenhower's ideas than they were when they were trying to nominate Senator Taft. It may well be that the chasm that divides the two wings of the Republican party is every bit as deep and as wide as that which divides the Democrats, and it may also be that a greater proportion of active Republicans are to be found on the right bank of the chasm.

American Notes

New Chief Justice

IN raising Mr Earl Warren to the Chief Justiceship, perhaps the most important appointment in his gift, Mr Eisenhower is reaffirming his own position in the middle of the road. Mr Warren would not now be in the third term of his governorship of the theoretically Democratic State of California unless he had had support throughout his political career from members of both parties, and on most issues he and the President think very much the same way. Apart from his political position, his relative youth—he is 62—and his robust health are important qualifications for a lifetime appointment in which continuity of service is desirable. Although he has never been a judge he has the benefit of the wide legal experience he gained as attorney general of his state; and it says most for his immense reputation for personal integrity and administrative ability that the President should have made the appointment during the Congressional recess, in the confident expectation that it will subsequently be confirmed by the Senate. George Washington is the only President who has done this before with the Chief Justiceship, and he received such a rebuke that none of his successors until now has ventured to do it again.

The Supreme Court will therefore open on Monday with a full complement of nine members; and it looks as though the new Chief Justice's mature political wisdom may be called in aid more than once in the course of a strenuous term. The most important decision awaiting the Court is on whether the fourteenth amendment to the constitution forbids racial segregation in the elementary schools in the South. This decision was put off from last June, when the justices showed themselves fully aware of the politically explosive implications of the issue. They called for more arguments about the intentions of the framers of the amendment and about what the Court itself would need to do to carry out any new finding against segregation.

Meanwhile in California the succession goes automatically

to the Lieutenant Governor, Mr Goodwin Knight, for the remaining fifteen months of Mr Warren's term. This should give Mr Knight a good start in the struggle for power that will inevitably follow the withdrawal of the dominating personality of Mr Warren.

War on the Waterfront?

THE dock strike that has broken out in New York is likely to prove a final invitation to the violence that has been threatening on the waterfront since the leading dockers' union, the International Longshoremen's Association, was expelled from the American Federation of Labour at its recent annual convention. The union had completely failed to convince anyone that it was capable of cleansing itself of the crime and corruption that had been brought home to it by one inquiry after another; and the AFL was therefore driven back on organising a rival union to capture its membership.

In this situation Mr Joseph Ryan, the ILA's lifetime president, has been striving desperately to retain his union's status as the official representative of the dockers by obtaining a new contract from the shipping companies to replace the one that expired at midnight on Wednesday. Despite the pressure of public opinion, the companies were strongly induced to reach an agreement with him by memories of the strike of 1951, which arose from inter-union warfare and caused them crippling loss. But they were not prepared to accept his final demand for ten cents an hour more in wages and three cents more in payments to the dockers' welfare fund, particularly as he ignored their own stipulation that an arbitrator should be appointed to decide disputes about the interpretation of the contract. The ILA, which had already retreated from an initial demand for a total increase of 60 cents an hour, dared not retreat further. So work ceased with the old contract, and Mr Ryan, who had been under fire from his rivals in the union for making such large concessions, retired to hospital for "observation."

Meanwhile the AFL leaders, who are under no illusion that turning the ILA out of the convention hall in St Louis is the same thing as turning it out of the docks in New York, have already taken the offensive. Mr Hall of the seamen's union and Mr Beck of the lorry drivers, who are among the temporary leaders of the new dockers' union, are providing it with recruiting agents from among their own members. For the moment they are concentrating on Brooklyn, the domain of Mr Anthony ("Tough Tony") Anastasia, the ILA's most formidable boss, and few would care now to contradict the prediction that some men will soon be "taking a long walk on a short pier."

The reliance which Mr Meany, the president of the AFL, must place on Mr Beck and his lorry drivers in conducting this campaign will probably make it more difficult for him to curb their own empire-building proclivities. These are now the principal obstacles both to the peaceful settlement of jurisdictional disputes within the federation, for which a new council of union presidents has been set up, and to the success of the no-raiding agreement with the Congress of Industrial Organisations. This was ratified by the AFL's convention, but two-thirds of the delegates were absent at the time and it still has to be signed by the individual unions before it comes into effect.

Depression in Washington

WHATEVER the signs of a recession now coming to the American economy as a whole there have been plenty of signs of one throughout this year in Washington. Gross sales by department stores have gone up in the country as a whole, but in the capital they are down by five per cent. Credit is more difficult to come by, foreclosures on housing property have doubled since last year and, instead of a chronic shortage of houses, there are signs everywhere offering them to let or for sale. All this is the result of the high proportion of civil servants in the city's population and from no one knowing which jobs the government is in the course of its economy drive going to get rid of next.

In August the Internal Revenue Service was struck. A thousand jobs, filled by tax experts some of whom had been working there for most of their lives, disappeared without trace. A \$6½ million cut in its budget had forced the agency to put into effect an old plan for transferring most of its assessment and enforcement work to the regional offices, and from now on only major policy decisions will be taken in Washington. While there is, for once, a good deal of sympathy for the tax collectors, the most indignation has been aroused by the way Mr Stassen has been cutting the cloth of his Foreign Operations Administration to suit its rather small budget. To help him in this task he made his staff sit down to a number of aptitude tests, assessing both their knowledge and judgment. The marks awarded were supposed to be only one factor in deciding who was to go, but civil servants, unconvinced of the fairness of the method even by the announcement that Mr Stassen had taken a test himself and passed, complained bitterly at being "Stassened" in a way peculiarly wounding to the *amour propre*.

Tax Hero Unsung

COLD-water has been poured from several directions on the attempt of Mr Beardsley Ruml, the economist who fathered pay-as-you-go income tax, to equip the United States with a pay-as-you-go budget. This must be rather disappointing to a man who had come as the bearer of good tidings. He had told a Treasury, which was casting around for new ways of bridging its deficit, that there was no deficit to bridge; and a Ways and Means Committee of the House of Representatives, which had been listening to long tales of woe about the "inequities" of indirect taxation, that all indirect taxes, except those on petrol, tobacco and alcohol, could be dropped. All that was needed to work this miracle was a saving of \$2 billion through greater efficiency and economy, and a change to the methods of accounting normally used in private business.

Mr Ruml considers that the budget, as at present drawn up, is a meaningless collection of figures, because it includes under expenditure \$6 billion devoted to capital items and fails to include under revenue \$4 billion of surplus income from the special taxes imposed to create trust funds for old-age pensions, ex-servicemen's insurance and a special

pension scheme for railway workers. Under his plan this surplus would be counted as part of the general revenue. On the other hand the capital items would be kept completely separate, so that the same kind of accounting distinction would be made that Sir Stafford Cripps aimed at when he introduced his "alternative classification" into the British budget statement.

But Mr Ruml goes a stage further by arguing that only the current expenses of government need to be covered by revenue from taxation. Capital expenditure would be covered entirely by private saving. The loans would be raised by special "authorities," which would be set up to build public works and atomic energy plants. These authorities would possess revenues derived from charges to the public or from sales and leases to government departments, and would pay off the loans over a period of years. Similarly, the government would borrow when acquiring disposable assets, such as farm products taken over in the course of price support operations, housing mortgages, and loans for the expansion of small businesses. Only the cost of administration and of liquidation at a loss would be met out of taxation.

Despite its glittering attractions, the new Ruml plan has been laid by the Secretary of the Treasury austerely on one side, as a device to conceal rather than reduce Federal spending. The Ways and Means Committee has likewise been admonished by one of its senior members, Senator Byrd of Virginia, to have no truck with a scheme that would create "a paradise for political spenders."

The Surplus Counter

AMERICAN agricultural surpluses are likely to appear on European tables, and perhaps Asian and African ones, after November 1st, by grace of the Mutual Security Act. When it was extended, the President was empowered to use up to \$250 million of aid funds to finance the sale of surpluses to friendly countries. Sale will be made for

What has held up this nibble at the mountain of American surpluses, now valued at \$2.6 billion, is the difficulty of making sure that the new transactions, which are to take place at world prices, are all in addition to normal purchases from the United States and other friendly countries. The American Farm Bureau Federation, which has been the moving spirit behind the scheme, believes that, if the govern-

ment had moved more rapidly, India, for example, instead of buying a million tons of wheat from the Soviet Union, might have bought it from American stocks. But although wheat, maize, cotton and cottonseed will all be displayed on the surplus counter, it is thought that sales of beef may be the easiest to arrange to western Europe, where the consumption of cereals cannot be greatly increased.

The Secretary of Agriculture will be relieved if foreigners can help Americans eat their way through the beef surplus. The government has already bought about 100 million pounds of beef, and has promised to buy as much again to steady the price of cattle, which this summer was 40 per cent lower than it was last year. Retail prices have fallen, too, and Americans are eating more beef, but they have not fallen as far as cattle prices, and indignant livestock raisers have demanded, and obtained, an investigation of the profits of middlemen. The problem is one of over-production, but it has been made worse because live cattle, whose prices are not supported by the government, must eat feed whose price is. Pig-keepers have been more prudent; they have cut back production and seen their prices soar. Spam, it is certain, will not be included in the bargains offered by the Foreign Operations Administration.

Small Man's Aid

THE Reconstruction Finance Corporation, which started life as a temporary device of President Hoover's for propping up banks and railway companies during the depression, and which has since made 63,000 loans to industry totalling \$10 billion, is at last fading away. Since the end of last month it has had no power to make fresh loans, and between now and the end of June, when it goes out of existence altogether, it will be trying to sell off its \$700 million worth of assets: business loans, securities, and properties, including an Alaskan gold-mine, on which it has had to foreclose. Anything that is left in June will be taken over by the Treasury.

Although the RFC dies, one aspect of its work—the provision of help for small business—lives on. Congress's unfailing regard for the interests of the small man remains well-grounded on political realities so long as three-quarters of all firms still employ less than four people. A business is small by definition of the Department of Commerce if it is a manufacturing plant employing less than 2 hundred workers, a wholesale firm with under \$200,000 in annual sales, or a retail store or catering establishment whose sales or receipts do not go above \$50,000 a year. These standards have been changed several times in the past, and are about to be reviewed again. Firms that find themselves inside any new definition, consider themselves good risks, and yet cannot get the capital they need if they are to expand, will be able to apply after the end of the month to a new Small Business Administration.

Even here, though, the government is keeping itself as much out of business as it decently can. The Administrator, Mr Mitchell, with a revolving fund of only \$55 million at his disposal, cannot go beyond a loan of \$150,000, maturing in ten years or less, to any one firm, and is placing most reliance on the creation of "local pools of credit," similar to those already operating in Maine and Massa-

man and tree

If nature is kind, a man may live in health
to a hundred years, a tree to a thousand.

Man's knowledge of the chemistry of health
is increasing. Through science man is gradually
making nature kinder and more predictable.

Fisons are in the business of chemicals.

Their main manufacture over the
last hundred years has been
chemical fertilizers to enrich the soil.

But they make chemicals
for medicine and industry, too.

Fisons contribute to Britain's harvests,
health and wealth.

chusetts. The government would then participate in loans largely contributed to by local banks, businesses and lending institutions. There is still considerable uncertainty about the rates of interest at which government loans will be obtainable, an uncertainty that was not lessened last week when the Loan Policy Board, on which Mr. Mitchell sits with the Secretaries of Commerce and the Treasury, issued a statement that the rate would be 6 per cent, and then immediately withdrew it.

The new agency is also taking over the work of the Small Defence Plants Administration, which has acted as an official lobby within the government for small firms wanting defence contracts. Mr. Mitchell will need all his powers of persuasion if these are not to be squeezed out by the present tendency to concentrate military orders on a few large suppliers.

Bankers Vindicated

THE six-year-old suit of the federal government against seventeen of the country's largest investment banking firms has been ignominiously dismissed. Judge Medina, who listened for almost three years to the prosecution, has concluded that it had not even a *prima facie* case and threw out the suit "on the merits and with prejudice." Such a verdict prevents the government from bringing another similar action, except in the unlikely circumstance of its taking, and winning, an appeal to the Supreme Court.

The judge's final opinion, which is expected to run to 500 or 600 pages and to provide a unique guide to the business of floating securities, on which he has been forced to become an expert, will not be published for a fortnight or so. But in his preliminary memorandum Judge Medina declares that he found no such combination, conspiracy or agreement as the government alleged to lie behind the group's control of the issuance of nearly 70 per cent of all securities offered between 1938 and 1947. He found no substance, either, in the government's charge, which he called the "guts of the case," that investment bankers conspired to respect each others' traditional preserves, and that this worked to the disadvantage both of corporations issuing securities and the investors who bought them. Bankers will regret only that the syndicate method of floating new issues was not given a similar certificate of immunity from further prosecution. At the last moment the government attempted to add a charge that the practice of price-fixing by underwriting associates during the period of distribution was, in itself, a violation of the anti-trust law. This the judge refused to permit, apparently on the grounds that it constituted a separate case and would increase the already heavy burden on the defendants.

This has been heavy enough, particularly in view of the fact that the defence was never even called upon to produce its case: costs come to over \$5,000,000 for the defendants and about half that for the government. The suit was a hold-over from the period of the Fair Deal and had its roots in the suspicions of bigness, particularly where money was concerned, which produced the arraignment of the investment bankers by the Temporary National Economic Committee in 1938 and 1940. The official climate has now changed; the American Bankers Association can hold its

annual meeting in Washington for the first time since 1934 and be assured of a welcome. But the most obdurate New Dealer must concede that the collapse of what was probably the longest and most expensive anti-trust suit in history is an argument for more careful preparation in the anti-trust division, and a justification of the steps now being taken to reduce the amount of anti-trust litigation by helping businessmen to understand and obey the law and seeking agreements out of court whenever possible.

SHORTER NOTES

The Treasury now expects to be able to avoid calling a special session of Congress to raise the federal debt ceiling above its present \$275 billion. In spite of the fact that the September tax collections have been a little smaller than expected, the Treasury will try to "scrape by" until the end of the year, rather than renew such an unpopular request. Just before Congress adjourned the Senate rejected a Treasury appeal to raise the limit by \$15 billion.

★

Although gleeful Democrats seized on reports that a Republican party official, Mr. Warren Stephenson, who worked on the inaugural committee, had tried to sell his services, for 4 per cent of any contracts he secured, as an intermediary between an armaments firm and the Navy Department, no one but Mr. Stephenson himself has incurred any blame. The firm promptly reported the matter to the Navy, and a House Armed Services subcommittee, which interviewed Mr. Stephenson to find out where he had received secret information about contracts, discovered that it came, not from any government official, but from conversations overhead in the Pentagon snack bar.

★

One of the major film companies has released the first film made in CinemaScope, "The Robe," which is setting attendance records in New York. Using the process invented by Professor Chretien of France, which its sponsors hope will provide an effective answer to television, the film is thrown on an exceptionally wide screen, and does not require the audience to wear spectacles. CinemaScope is also being used for animated cartoons by the Disney Studios; a ten minute short on musical instruments has been completed for showing with "The Robe," and a full length cartoon feature is now in production.

★

It is understood that Mr. Truman has been saved about \$170,000 by a ruling of the tax bureau that the \$600,000 which, it is reported, he is to receive for his memoirs, may be spread over a six-year period for tax purposes. He will pay about \$332,000 instead of the \$502,000 which would have been exacted if the income had been treated as the earnings of a single year. New legislation prevents Mr. Truman from profiting from Mr. Eisenhower's example; "Crusade in Europe," for which the General received \$635,000, was taxed as a long-term capital gain at a rate of 25 per cent.

The World Overseas

Mr Stassen on East-West Trade

AMERICAN legislators seem to have a genius for inventing the most awkward, embarrassing and unworkable laws. Representative Battle's Mutual Defence Assistance Control Act of 1951 is an outstanding example. The purpose of this Act is to give the President power to suspend economic, military, or technical assistance from any country that sells strategic goods to the Communist bloc. How fortunate it is that under the discreet and sensible direction of Mr Harold Stassen (and his predecessor, Mr Harriman) there has never been occasion to wield this crude weapon. Indeed in admitting that "it cannot be used lightly" Mr Stassen, in his third semi-annual report to Congress, recognises the folly of trying to coerce allies by the use of threats. On the whole, America's allies have played the game, and on the infrequent occasions when lapses have occurred, the President has felt able to use his mandatory power to grant dispensation. But there are at least as many critics at home as there are abroad, and Senator McCarthy is not alone in condemning the supposedly soft policy of America towards its wicked allies. Thus in preparing his report Mr Stassen had to take into account not only the susceptibilities of America's friends abroad, but also the charges of the critics at home. The case is skilfully presented.

A chapter is devoted to exploding myths about East-West trade. Apparently there are people in the United States who are convinced that America's perfidious allies are doing a roaring trade in strategic goods through the iron curtain. The report firmly rejects this fairy tale. Mr Stassen is apparently well satisfied with the machinery set up in Paris to co-ordinate controls and provide a forum for continuing international consultation about them. He speaks of a remarkable though "little-known story of international co-operation" which lies behind the strengthening of strategic trade controls. Of course there are weak points, but these have been steadily plugged by such means as the Import Certificate Delivery Verification (ICDV), the expanded shipping controls, and the measures to control goods in transit.

Again addressing himself mainly to the critics at home, Mr Stassen explains that non-strategic trade with the Communists "is not necessarily harmful to the West." Indeed, if on balance there is a net advantage to the free world it is most important that this trade should continue. "To try to force a stoppage of all East-West commerce would be precisely the wrong way to assure peace in the world." As Senator McCarthy and his sympathisers are likely to

dispute just this point, it would have been advisable to develop the argument further.

For overseas consumption the report deals adequately with the myth of the great lost markets in the East. Though, no doubt, the policy of self-sufficiency in the Soviet bloc is one cause of the decline in East-West trade, it is rather surprising that the report does not discuss the apparent retreat from this policy in recent months. At present a major hindrance to East-West trade is the classic question of comparative costs. But the report is right in exploding the propaganda myth that trade with the Communist bloc is strangled by the strategic controls. There is ample scope for the expansion of non-strategic trade, and the items embargoed are on the whole selected with sense and discrimination.

It is a pity that the report left unshaken one very prevalent myth: that the controls were forced on to the free world by American pressure. That the Battle Act lends itself to that interpretation is regrettable; but the fact remains that the various countries independently decided in their own interest to restrict the movement of strategic goods to a potential enemy. After all, Britain in 1947—before the Marshall dollars started to flow, and years before the Battle Act—had started to control the shipment of military materials to Communist countries. As for shipments to China, Britain (and 44 other nations) voluntarily agreed to the United Nations resolution embargoing strategic goods, and many countries had on their own accord previously banned this trade.

To enliven the report, or perhaps to emphasise the difficulty of enforcing controls (and the diligence of the enforcement agencies) a selection of case histories is included. There are some fascinating stories: of a "man called Magura" who cloaked his illegal operations in strategic goods under his diplomatic immunity as Rumanian commercial attaché in Berne; of a "frogman smuggler" attaching bags of tool-bits to the hull of the Hongkong-Macao ferry-boat; of a whole boring and turning mill being switched from one destination to another until finally aboard 12 flat-cars it rolled into Hungary. There are other still more fantastic tales of smugglers and forgers: there is even a character called Peter Pan, but sadly no Wendy or Tinkerbell.

In a chapter dealing with the special problem of China, the report is less convincing—perhaps because of Senator McCarthy's well-known antipathy to any trade with China at all. But the policy of non-strategic trade with China

does win nodding approval from Mr Stassen. Again, no doubt with the McCarthy report in mind, the report describes the "helpful strides in shipping controls . . . made during the 6 months"; but it does not enter into this famous controversy. Perhaps the most striking indication of policy comes into this section; in discussing the embargo after the Korean truce the report is at pains to insist that no relaxation is contemplated, "for winning an armistice on a single battleground does not mean that we have won peace in the world."

Sooner or later the whole question of the embargo will have to be re-examined. It is a pity, therefore, that Mr Stassen did not attempt to evaluate the broad effects of the policy. How effective has it been in hampering the Communist war machine? What harm, if any, has been done to the economy of the free world? What are the political consequences? It is all too easy to lose sight of the ultimate purpose of the embargo which was designed to safeguard the security of the West. It was never intended to be a permanent mechanism. At some point in the future it will be necessary to see which way the balance of advantage lies. It might then be advisable to toss in concessions on the embargo against corresponding concessions by the other side.

Grievances of Italian Workers

FROM OUR ROME CORRESPONDENT

THE twenty-four hour token strike of September 24th is regarded by many observers in Rome as the most imposing trade union demonstration since the war. Over five million workers of all three trade union organisations (Communist, Catholic and Social Democrat) came out. In the north the strike was almost 100 per cent effective in the bigger factories and over 80 per cent in the others. Stripped to their essentials (the Italian pay-system is horribly complicated), the workers' demands are for a wage rise of 10 to 15 per cent. More token strikes followed; and the farm hands (numbering two million) are to come out on October 5th, while the State employees are on the verge of registering a public protest as well. As there is no provision for arbitration in Italy and the government is unwilling, for the time being at least, to intervene, there seems little prospect of the deadlock being overcome.

The industrialists justify their refusal even to start negotiations by pointing to the heavy additional burden (they put it at about 250 million lire a year) the extra wages would involve. They admit that the wealthier firms might be able to shoulder such costs, but claim that the overall effect would be an increase in unemployment, a decline in investment, and inflation. In any case, they add, the workers' share of net output has gone up from 56 per cent in 1938 to over 70 per cent in 1952. If you try to probe further into the causes of industrial discontent, the industrialists will argue that the Communists are at the bottom of the trouble, that it is all Moscow's doing and that, if everything is not perfect in Italy, that stems from its lack of colonies and raw materials and to its over-population. A closer examination, however—and there is remarkable unanimity among informed foreigners here on this point—suggests that the explanation lies elsewhere.

Basically it is to be sought in the long standing weakness of the country's middle class. There has never been a revolution in Italy and it accordingly still bears the marks of its feudal past—a tendency towards paternalism in the best factories, towards inefficiency in the worst; a hatred of taxes; a dependence on State support; a desire to get rich quick; an unwillingness to invest capital with an expectation of a moderate return over a period of years; and a concentration on luxury high cost, but also high profit, production. In agriculture and the state services, the relics of outworn systems are even stronger.

The result inevitably is poverty made more intolerable by the sharp contrasts in living standards. A fifth of all families has an income of £10 a month, two thirds have about £30 and the rest have £60 or over. The per caput intake of calories has remained at roughly the same level as in 1911 and is far down in the scale of European countries. Conversely, the proportion of carbohydrates to other foods, which has also been stationary since 1911, is unusually high—65 per cent. In spite of blocked rents and increased wages, food accounts for 65 per cent of the average working family's bill. The situation is particularly bad in the predominantly agricultural south, where sugar, butter and meat are practically unknown. It is made worse by the reliance of the fiscal system on indirect taxation, which falls specially heavily on such items as sugar and coffee. It has been calculated that, to earn a pound of coffee, an Italian workman has to put in 248 minutes of labour against his Swiss mate's 97. The comparative figures for sugar are 43 and 12. Part of the trouble lies in a wasteful distributive system by means of which the price of an article quadruples in passing from the wholesale market to the shop in the same town.

Homes in hovels and caves

But if life is hard for the less well-to-do, it is doubly so for the unemployed who are estimated at between 1.3 and 2 million and the underemployed who number a great deal more. Housing is the other great grievance. Suffice it to say that 12 per cent of the population lives in hovels, caves and shanties, while over 2 million rooms (60 per cent of total accommodation) are vacant for want of a tenant with the necessary means. A great deal has been written on Italy's achievements in the housing field, but it is not generally realised that this has been mainly directed towards luxury flats and that little has been done to provide good cheap dwellings. As rents are gradually unfrozen, the issue is likely to become even more red hot. The health service is very limited in scope; in practice, medicines and treatment generally have to be paid for.

The Communists' strength lies in their tireless agitation (uninhibited by realistic considerations) on all these issues. In particular they are the driving force behind the trade unions' campaign for higher wages and better conditions and they have an impressive record of successes on that score. Possibly owing to Togliatti's influence with the Kremlin, the party has followed a more flexible, less parrot-like line than its fellow-Reds in Europe. It has a generous share of the discontented intellectuals whom Italy turns out in too great numbers to absorb and a mastery of modern propaganda techniques which makes its rivals' output seem dated and irrelevant. The other parties will have to make a much greater effort than at present both in remedying deficiencies and in presenting their case, if they are to avoid that unfortunate impression from becoming a reality.

Linguistic States in India

FROM OUR CORRESPONDENT IN BOMBAY

THE inauguration of the new state of Andhra on October 1st was the first step in a process which will end by redrawing the map of most of India. This formation of a separate state for the 20 million Telugu speakers of Madras represents the final surrender of the Central Government to the principle that the dozen great linguistic groups into which India is divided should each have a state of its own in which it can develop and feel at home. All that now remains is for the commission which will be set up once Andhra is established to recommend what states there should be, and with what boundaries. This may take two or three years, and meanwhile a good deal of heat will doubtless be generated. Within five years, however, the new states should be set up and running smoothly, and one of the oldest grievances, especially of the south, should be finally out of the way.

In principle hardly anybody objects to linguistic states. Even before 1914 when the British created Assam and Bihar out of Bengal, and the North-West Frontier Province out of the Punjab, the new creations were largely linguistic, though, with a typically British disregard of consistency, not completely so; Punjabi speaking Hazara went to the North-West Frontier Province, Bengali speaking Sylhet and Cachar to Assam.

The demand for Andhra goes back to the first war. The Congress party organised itself on a linguistic basis as early as 1922, and the linguistic states have been part of its policy since the late twenties. The Communists and the Praja Socialists are more fervent still. No organised party opposes their formation; the only voices raised against are those of a few liberals from British days.

Nevertheless, since independence there has been a notable cooling of enthusiasm. The Dar Commission appointed by the Constituent Assembly found every possible reason for postponement. The new states would be financially insolvent; they could not be properly formed until the old Indian states had been finally integrated (the Karnatak must include Mysore, for example); the cities of Bombay and

Madras would create a problem; above all linguistic states would create a sub-nationalism based on the most intimate of all ties, that of language, and, therefore, bound to militate against the wider loyalty to India as a whole. They admitted that some reorganisation was necessary, that some groups felt themselves unfairly treated within the old artificial provinces, but they urged that when reorganisation did come, it should be on administrative rather than linguistic grounds. A committee appointed by the Congress, and which included both Pandit Nehru and Sardar Patel, was equally cool. The present time was not propitious; there would be administrative and financial dislocation; the Andhras would have to give up all claims to Madras city, the Mahrattas to sacrifice Bombay; there were states to be absorbed; everybody would have to agree on boundaries; controversies over boundaries might upset national unity and divert the people's efforts from the real problems, which were economic.

These were powerful arguments, and the government of India has acted on them ever since. But India is a democracy, and the people have made up their minds. Andhra was conceded after a social worker called Potti Sriramulu had starved himself to death to obtain it. The failure to agree to a Karnatak state has produced hunger strikes, riots and the loss of safe seats to the Congress in the only two by-elections held recently. Even Congress ministers from Maharashtra have been working and talking openly for a Maharashtra

state. The new commission represents the Centre's surrender to the strength of these feelings but the surrender has hardly been graceful. Many at the Centre are really anxious about the possibility that linguistic states will attract loyalty away from India as a whole, overlooking the fact that this has not happened in Rajasthan, or the United Provinces or Bengal, which are linguistic states already. Others fear that the result will be more states, more deficits, and more need for Central assistance. In fact the number of states would be reduced by half a dozen—for example Pepsu and Himachal Pradesh would be absorbed into the Punjab, Bhopal into Madhya Bharat, Coorg and Mysore into the Karnatak, Manipur and Tripura perhaps into Assam, and Hyderabad would cease to exist.

ARE YOU A MAN OR A HOUSE ?

Your Grandfather may have started your firm, and insisted on maintaining the furnishings in the sombre style to which he was accustomed.

But surely if you are Managing Director it is time you put your foot down on something other than

Victorian Haircord? This isn't a vulgar incitement to revolt, to

introduce riotous colours and bizarre furniture. Far from it. Have a word with Mr. Peter Catesby and his staff. They respect tradition.

They can transform a board-room into a pleasant, modern place without losing a bit of its dignity. They will even retain Grandfather in his gilt frame —if you insist.

Canteen Kitchen showing 4-oven 701 range, G3 grill on stand, 803 roasting ovens and elevated general-purpose ovens.

*For Gas, Electricity, Oil,
Steam or Solid Fuel,*

Falkirk Heavy Duty cooking equipment

EVERYTHING YOU REQUIRE is included in the Falkirk Range of Equipment — be it a complete kitchen installation for a luxury hotel or merely a replacement item for a small canteen. There are Falkirk cooking appliances for use with every known type of fuel: gas, steam, electricity, solid fuel and oil.

Strongly constructed from really tough cast-iron, all Falkirk Equipment will stand up to the heaviest wear. It is labour saving and extremely economical in space.

Ask the Falkirk people for a quotation. You will be pleasantly surprised at their competitive prices.

Even Andhra is in difficulty only because the refusal to disintegrate Hyderabad has deprived it of its natural capital, Hyderabad city. This refusal indeed is one of the major stumbling blocks in the way of linguistic states. None of his subjects has any affection for the Nizam, but he is a Moslem ruling over Hindus, and Delhi is afraid of being called communal if he is removed; the Maharajah of Kashmir, who was a Hindu ruling over Moslems, and who was at least popular in Hindu Jammu, was let go without scruples. Moreover, there is in Delhi a belief that Hyderabad has a "composite culture" which it is worth considerable sacrifices to preserve. There seems here to be a confusion between culture and polish. Hyderabad has not created anything in any of the arts since 1687. But unless Hyderabad is disintegrated, neither Andhra, nor the Karnatak, nor Maharashtra, will be complete.

Delhi's fears are not all as chimerical as these. There are real difficulties and points of dispute, as hunger strikes and minor riots have already shown. That most of Manbhum should be transferred from Bihar to Bengal the vote of its people for a Bengali party has made clear; but in the Dhanbad subdivision they are a minority, and to whom should next door Singhbhum, with its majority of aboriginal Hos and Santals, its Bengali middle class and its great steel city of Jamshedpur be given? How valid is Orissa's claim to take Seraikella and Kaarwan from Bihar? Admittedly these two areas have hardly any Hindi speakers, but their Orya speakers were in 1931 less than one-third of the population. There is a large Telugu minority in Ganjam, now in Orissa; should it be split? Parts of East Mysore, including the Kolar gold fields, have a Telugu majority, but Mysore is an old historic entity with a strong local loyalty; should these areas go to Andhra when Mysore becomes part of the Karnatak? Travancore-Cochin has large Tamil areas in the extreme south and in the tea-growing hills; when Travancore-Cochin is absorbed in Kerala should they go to Tamil Nad although the southern areas are rice-surplus in a rice deficit state, and the Tamils of the tea estates are mainly immigrants? Above all, should Bombay city, which is historically Mahratta and half of whose population speaks Marathi, go to Maharashtra or should it be a separate unit to appease its Gujerati and Parsi businessmen and the ghost of the late Sardar Patel?

Moreover there are reluctances. If Mysore becomes part of the Karnatak, its Vokkaligars will lose their delicate advantage over the Lingayats; if Berar becomes part of Maharashtra, Mr Brijlal Biyani will lose some of his importance if Manipur becomes part of Assam, it may lose some of its individuality.

There will, therefore, be much heat and not much light engendered before the commission finishes its work. Yet one need have no fear of the result. The 1951 census provides the basic facts. There are no real minority problems in the European sense. Religion and class divisions do not, as so often in Europe, follow linguistic lines. Except perhaps for Bengali in Bihar, there has never been the slightest discrimination against existing linguistic minorities. Borders are reasonably clear cut; there are no majorities in islands within another language, like the Hungarians in Transylvania. Above all, India's underlying unity, a unity compounded of many elements, from Hinduism to cricket, is deep, and deeply felt. It will not be disturbed because in the Legislative Assemblies members will at last be able to talk in their mother tongues and still understand each other.

Fishy Tales for Argentines

FROM A CORRESPONDENT

ARGENTINES, citizens of a beef-producing country and themselves addicted by tradition and preference to the succulent *bife*, have lately been regaled with free fish—and free cookery lessons—during a "fish week" decreed by the government in a further effort to economise meat supplies. And Buenos Aires housewives may now, by dialling a telephone number, obtain the "menu of the day," mainly based on fish.

This latest move in a campaign begun several years ago coincided with another threatened beef crisis. Entries of cattle in the Buenos Aires market during August and early September were running at unprecedentedly low levels, even for this time of year when a seasonal slump is usual—in August the daily average of entries was 42 per cent below the corresponding 1949-52 average; and the packing houses were ordered to draw on the stockpile of frozen beef built up on government instructions after the similar crisis last March and April. In the meantime, beef exports have been running at a little over a third, and mutton and lamb at just over half the average figure for the five postwar years.

This evident shortage of beef, not only for export but for home requirements, again brings to the fore the controversial question of Argentina's cattle stocks, and throws a curious light on the last census figures. The cattle census was taken last November, and in spite of General Perón's promise that the figure would be released without delay, no official announcement had been made five months later. In April, when serious shortages coupled with black-market profiteering (with which the name of Perón's late brother-in-law and private secretary, Juan Duarte, became linked) led to a major political crisis, Perón himself, who often has a highly individual approach to statistical questions, said in a broadcast that cattle stocks were the highest ever, more than 45 million; and the official census figure, when announced a few weeks later, put the total at 45,263,000. This figure is still received with reserve in well-informed cattlebreeding and trade circles, where estimates of probable stocks vary from 25 to 28 million. It is difficult to reconcile it with the 1947 census figure of 41 million, since losses from mortality and enforced slaughtering during the first of the disastrous droughts of recent years (1949-50) were reliably put at 10 million head.

No Biological Miracles

Even recent comments in the Peronista press tend to throw doubt on the accuracy of the census. *Democracia*, which reflects official opinion, recently printed an article calling for measures to "build up stocks to the necessary production capacity so drastically curtailed by drought"; and a couple of days later the government paper which now calls itself *La Prensa*, referring to the cattlebreeders' call for more ample bank credits, remarked with a surprising return to objectivity that "credits cannot work biological miracles." So much for the "highest ever" cattle herds.

Most of General Perón's recent political difficulties have had their roots in discontent over rising prices and food shortages; and of all food shortages, a shortage of beef (as was shown last April) is most calculated to provoke discontent. So far there are no visible signs of renewed unrest amongst Argentina's working population; but it appears unlikely that Perón, despite drastic police measures,

will be able to hold down the cost of living unless some cheap substitute for beef can be conjured up: hence the campaign to popularise fish. Some grumbling is heard about beef exports ("the English are taking all our beef"); but it is fair to state that this point of view is not getting any government support, as the government is anxious to keep exports at as high a level as possible. Nevertheless it is highly unlikely, to say the least, that the beef quota called for under the latest protocol to the Anglo-Argentine Trade Agreement will be complied with by the end of this year. Another question perforce presents itself. If Argentina's cattle census is apparently so wildly wide of reality, what degree of credibility attaches to other Argentine official statistics?

Norway at the Polls

FROM OUR SCANDINAVIAN CORRESPONDENT

"SET the People free" might well be the opposition slogan for the general elections which are to be held in Norway on October 12th. It would be more effective if the four anti-socialist parties were not wasting their strength in unco-ordinated efforts, leaving the active, but outnumbered, Conservatives to carry the main burden. It is unlikely that the right-wing and centre candidates will win a majority of the 150 seats in the *Storting*, although the ruling Labour Party is bound to lose seats by the operation of the new rules which favour the smaller parties. On the other hand, the same changes are expected to bring at least two Communists back into the *Storting*.

The prime purpose of the new electoral rules, which were adopted last November, was to give urban constituencies a fairer representation than the old law permitted. Under the 1814 constitution the rural districts, according to the famous "farmers' clause," were entitled to two representatives to every one for urban districts. The growth of towns since then had long made this provision inequitable. The new law allots seats between the twenty electoral districts more in accordance with their population—Oslo, for instance, has 13 instead of seven seats—and the distinction between town and country is abolished. So also is the stipulation that members must live in their constituencies. Finally, the "first divisor" used in allocating seats to the political parties on the basis of their total votes on the electoral lists in each constituency is changed from 1 to 1.4—a technical change which favours the smaller parties.

With so many new and uncertain factors, forecasting is particularly difficult, but the election is virtually certain to prolong Labour rule in Norway. The Socialists maintain that they have governed fairly well, that the bulk of the people are satisfied with their performance. But the bloom is undoubtedly wearing off the experiment. From, however, the electoral angle, the divided opposition prevents full advantage being taken of the government's weaknesses.

Yet, beneath all this, there are uneasy stirrings. Has the capital investment programme, which is the heaviest in Western Europe and accounts for 28 per cent of the national income, been a success? Can it be kept up without imposing continuing and increasingly irksome restrictions on the

country, even if foreign capital is forthcoming? Will foreign capital be forthcoming when dividends are strictly limited in Norway and terms in other countries are more favourable? Why is the trade deficit so large (Kr. 590 million in the first six months of the year), and so much larger than "planned"? Is the real remedy to cut government spending and introduce a greater measure of freedom in the economic life of the country? Or does the comparative failure—comparative in regard to what was expected, not in regard to the magnificent work already done—call for even stronger controls and better plans? Finally, how long will the enterprising and strongly individualistic Norwegians put up with "emergency" conditions?

Since the war Norway has maintained a high degree of economic direction and control. The considerable powers granted during the postwar emergency were always understood to be temporary. In the spring of last year, however, the committee which had been considering their fate proposed that they should be incorporated in permanent legislation. Its report, modified to meet the comments of interested parties, formed the kernel of the law which was debated and passed by the *Storting* this spring, and is to take effect on July 1st next year.

This Price Regulation Law sets up a Price Council of five persons to supervise through local offices its detailed execution on principles laid down by the Cabinet. Prices, profits, the level and type of production, the quality of goods and conditions of business may all be controlled. Firms may be compelled to publish accounts. Dividends are limited to that proportion of capital that is laid down each year by the *Storting* for particular groups of shareholders; the Price Council, however, has the right to make individual modifications.

Stupidity and Shock

The significance of this law is that it epitomises a doctrinal schism. The Socialists have put into practice the theory that the state should have control of the economy; the Right, while admitting that some controls are at present unfortunately necessary, maintain that they should be as few as possible. In practice there is much common ground; but there is, nevertheless, a basic principle involved.

In essence, the Law contains little that cannot be found in the 1945 measure on economic controls, the *Lex Thagaard*, and the government can point with justice to the fact that the extreme provisions of this earlier measure have never been employed. But, inevitably, no matter how altruistic and well intentioned legislators may be, the operation of numerous controls and regulations by a large bureaucracy produces instances of official stupidity and injustice to the individual. Several such cases, publicised in the last year or so, have caused shocked doubts in many Norwegian minds. One senses a feeling that, although so much of the government's policy is accepted, even when irksome, there is a growing restlessness and an uneasy, ill-defined belief that, if it is continued and perpetuated, it may develop into a threat to that individual freedom which Norwegians cherish so highly. Until the Opposition is either united or dominated by the Conservatives, or until international developments place a greater strain on the structure of the Norwegian economy as built by years of socialism, this mood is not politically important. But it may decide the 1957 elections.

Federal Politics in Central Africa

A GENERAL election of vital importance will be held in December to fill the legislature of the new Central African federation. In anticipation of this event there has been an unprecedented surge of political activity in the three constituent territories—the two Rhodesias and Nyasaland. New parties have been formed; new alliances made and old ones dissolved; and new personalities have appeared on the political scene. When the dust settles a straight fight between two main parties—the Federal party and the Confederate party—will probably emerge. But the picture is not entirely clear and new forces may yet appear.

At one time Sir Godfrey Huggins, who has resigned his premiership of Southern Rhodesia to take over the interim federal administration, hoped that federal politics, at least in the formative years, would be put above party or sectional squabbles. But it was rather an ingenuous hope since opposition to federation, or more precisely to the form of federation, is not confined to the Africans. As a step towards his ideal of floating the new federation off on a tide of bi-partisanship, Sir Godfrey, in concert with the leaders from the other two territories—Sir Roy Welensky and Sir Malcolm Barrow—formed the Federal party. This organisation is open to anyone—European, African or Asian—in the three territories who subscribes to the general objective of racial partnership expressed in the preamble to the federal constitution. It has gathered into its ranks most of Sir Godfrey's United party, some of the Southern Rhodesian opposition parties, followers of Sir Roy Welensky in Northern Rhodesia and of Sir Malcolm Barrow in Nyasaland, and some influential African leaders. Though it was intended at first to take part only in the federal elections, the advent of the Confederate party, bent on contesting both territorial and federal seats, has caused the party to revise its ideas; but it has not as yet committed itself to fight territorial elections.

Definition of Partnership

On August 7th the Federal party held its inaugural congress at Salisbury. It soon became clear that the new party would be forced to take an unequivocal stand on its native policy. Sir Godfrey and his colleagues had originally intended to pass lightly over the question of partnership; but the appearance of the Confederate party with its main emphasis on racial questions forced them to abandon this intention. A congress resolution attempting to define partnership in terms of senior and junior partners, who by mutual desire preferred separate social and residential existence, was a disappointment to the liberal element. But it was a consolation that the definition of partnership finally evolved did at least exclude any reference to junior and senior partners even though it retained its emphasis on traditional segregation.

First in the field to oppose the Federal party was the Democratic party, formed primarily by Afrikaans immigrants from South Africa, and unashamedly in favour of the Malan principle of "apartheid." The party had scarcely begun to build up a permanent organisation and had yet to be tested at an election, when its leaders became asso-

ciated with dissident groups from other parties in the formation of the Confederate party.

The Confederate party, which is open to Europeans only, is openly hostile to the policy of partnership and integration which it assumes is proposed by the Federal party. It favours rather a policy of parallel development of black and white races in separate states, which would ultimately be joined in some—still nebulous—form of federation. In effect this is the Bantustan proposal put forward in South Africa by Dr Oswald Pirow. It is doubtful, however, whether the whole of this heterogeneous party subscribes to the idealistic concepts of parallel development, or indeed whether many of the confederates are any more high minded on this matter than the South African Nationalists. But the principle is one which appeals intrinsically to the white settler mentality.

Incompatible Political Strains

The party is handicapped by its lack of personalities in contrast to the galaxy of stars who have thrown in their lot with the Federal party. The party leader, Mr J. Dendy Young, an advocate and former cabinet minister in Sir Godfrey Huggins's government, is the leading light. He has a personal following in Southern Rhodesia, but unfortunately has estranged himself in the northern territories by proposing that Northern Rhodesia and Nyasaland should, with the exception of certain small enclaves, be "black" states. Other personalities include Mr Max Danziger, a former minister of finance, Mr A. B. Mentz, former leader of the Democratic party, and Mr G. R. Musgrave, a member of the Rhodesia party. These incongruous personalities and the equally incompatible political strains they represent are united only in their hostility towards the integration of the African into the political and social structure. It will be difficult for the party to avoid ruptures on any other subject, such as the connection with the mother country.

A third party in federal politics is the Progressive party, formed in Northern Rhodesia by Dr Alexander Scott. It is openly liberal in sentiment, and though its numerical following is small, its influence may ultimately be quite important. It may for instance gain the support of the elected African members, who number six out of the total assembly of 35. The Rhodesian Labour party has recently announced its intention of entering the federal field. How serious its challenge will be depends not only on its own cohesion—there are signs of a split—but also on its appeal to European trade unionists in the copper belt. Another potential contestant is the Rhodesia Party which opposes the United Party in Southern Rhodesia. Its policy towards federal politics is still obscure, but it is unlikely to command much support in the two northern territories.

No purely African party has yet emerged to take part in the federal elections, and indeed it is most unlikely that the discordant African politicians could find sufficient common ground. In Northern Rhodesia and Nyasaland, for example, many of the Africans reject the whole federal scheme outright, while others adopt a suspicious wait-and-see attitude. In Southern Rhodesia many of the African leaders, encouraged by demonstrations of European goodwill, such as the open membership of the Federal party and the multi-racial university, are preparing to co-operate, but others remain hostile and suspicious. The African electorate in all three territories is politically inexperienced and there is no means of forecasting how they will use their new democratic right.

Steps to hygiene...

The Greeks worshipped Hygieia as the goddess of health. We do not worship hygiene but we practise it more and more, and the importance of food cleanliness is being increasingly recognised. Here a vital part is played by paper. Paper bags, paper wrappings and for bulk deliveries the multi-wall paper sack, protecting its contents from contamination as no other sack can. The Medway multi-wall sack is ideal for the packaging of sugar, flour and all sorts of human food and animal feeding stuffs. It is tough, resilient, sift-proof and resistant to moisture. It is indeed a revolution in hygienic packing and a typical example of the way in which the Reed Paper Group—with its great resources for the development and manufacture of paper products—is continually seeking to contribute better products to serve the nation's daily needs.

THE BUSINESS WORLD

Conversion without Strings

THE Treasury's plan for its much-discussed refinancing operation was announced after the close of business on Wednesday, less than a fortnight after the surprise reduction of Bank rate. The shortness of this interval, which to some people may imply that the Treasury has acted with indecent haste to seize its advantage, is leading the City to scrutinise both the strategy and the tactics with more than usual care. In one sense, every government issue is an act of monetary policy; but this time the connection between issuing technique and wider policy is peculiarly intimate and fundamental. This operation is the first practical test of the principles of monetary flexibility officially expounded a fortnight ago in explanation of the change in the Bank rate. It provides an objective means of judging how far that move was indeed a mainly technical adjustment for a technical purpose—as distinct from being either the “green light” or the mere lubricant for funding that many still suppose. On the information so far available, it can be said at once that those official explanations, fully discussed in these columns last week, come through the test pretty well.

The refinancing takes the form of a double-choice conversion offer to holders of the nearest bond maturities, the £577 million of 1½ per cent serial funding stock due at mid-November, and a cash offer of unlimited amount. Holders of the maturing bonds have the option until next Saturday to convert at par either into the existing 1½ per cent Serial Funding Stock, 1954, or into a new 2½ per cent Serial Funding Stock, 1957. If they choose the former, they will also receive a cash payment of 7s. per cent (equivalent to the difference between the market prices of the 1953 and 1954 stocks before the offer); if they choose the latter they will get 15s. per cent in cash (the difference between the 1953 price and a notional price computed

for the new stock from Wednesday's market pattern). In addition, there is to be a straight offer for cash of a new 3 per cent Exchequer Stock, 1962-63, at 99½, which is not available for conversion applications; the lists for this stock will open and close on Monday next.

★

Any appraisal of the strategy of this operation has to start from the fact that its immediate purpose is to deal with the 1953 stock, which itself stems from the unprecedented funding operation of November, 1951, when £1,000 million of 1952, 1953 and 1954 stocks were placed in exchange for Treasury bills as a means of buttressing the first move from an atrophied monetary policy towards a “positive” one. Half that sum, it will be recalled, was allocated among the clearing banks in proportion to their deposits, in order to cut away their abnormal excess of liquid assets and thus to make the reviving sanctions of monetary discipline the more effective. The rigidities of that compulsory funding of bank holdings of Treasury bills were not repeated last autumn, when the first of the 1951 issues matured, but the operation of 1952 was still an abnormal one. The banks were obviously “expected” to convert their maturing funding stock, by the method of “leap-frogging” into either of the two later issues or into a new 1955 issue; and they were likewise “persuaded” to take additional slices of these stocks—actually to an amount approaching £250 million—ostensibly for cash but in practice in exchange for bills. The technique of persuasion was more flexible than on the first occasion, but the banks were left in no doubt that the authorities wished them severally to subscribe in “cash” for amounts approximately sufficient to reduce their liquidity ratios (i.e., the ratio of cash, call money and bills to gross deposits) to a given target level.

On both occasions, therefore, pressure was brought to bear on the banks and was used as a means of controlling bank liquidity, creating fears that this technique of pressure and "leap-frogging" of maturities might become a regular autumn habit. But devices such as these make a mockery of the principles of freedom and flexibility in the monetary system, and could be regarded as tolerable expedients only in the first difficult phases of the transition to an effective monetary policy. Any repetition of them this year would have been a clear denial by the authorities of the very principles that led them, according to the official explanations, to the recent "unification" of Bank rate—and would have gone far towards frustrating the objectives of monetary flexibility to which they then committed themselves. The drive for flexibility in the banking system, in order to restore the full sensitiveness of orthodox control by the central bank, requires the fullest co-operation from the commercial banks; and they could hardly be expected to break down their own rigidities if the authorities themselves continued to set a bad example.

★

The first and most significant fact about this year's operation is that it has avoided these dangers by dropping the ugly precedents of the two previous years. The authorities have affirmed categorically that the banks have now been left entirely free to judge these offers as they please—to take cash for their maturities if they wish, to abstain from the cash offer if it does not appeal to them, or to participate in it on any scale they please. Their average liquidity ratio is now very high; at 37.4 per cent, it is only a little below the 38 per cent shown on the eve of last year's funding. But there has been no request that they should aim now at any given reduction—or even, apparently, at any reduction at all.

If this is so, the operation harmonises precisely with the welcome principles emphasised a fortnight ago, and goes far to confirm that the "technical" objective of the Bank rate reduction was indeed the primary one.

The more detailed characteristics of the refinancing follow logically from this fundamental one, the move towards freedom. Had the authorities been intending to repeat the pressure tactics, they could not reasonably have gone beyond the three-year echelon of maturities adopted in the two previous years. But, as it is, they have felt free to vary the pattern in two ways, both of which improve upon those hand-to-mouth tactics. The investment needs and present habits of the banks diverge considerably from one institution to another. For those holders of 1953 stock who are anxious to keep very close to the shore, there still is the option to move into the 1954 stock—but to pay the present high price for that kind of liquidity, for the yield is no better than that from a Treasury bill. But there is also an innovation, the dropping of 1956, the next date in the old echelon, because it is now heavily burdened with the 1954-56 stock recently exchanged for 1952-54s; the choice of the new 1957 stock has the advantage that it will mature in a year in which there are only £101 million of possible existing maturities (the 2½ per cent Funding Stock, 1952-57). The gross yield to redemption is £2 8s. 10d. per cent, which is less than that on the 2½ per cent stock to final date, but it is probably sufficient to make the single-dated stock attractive to some institutions.

The most interesting consequence of the new freedom is the offer for cash of a stock with a life of 8½-9½ years, a substantially longer life than was open to the authorities so long as they relied upon pressure tactics. Because of the offer earlier this year of two tranches of 3 per cent Exchequer stock, 1960, the market had lately discussed the possibility of further issues at or

about this date; but it had not envisaged the further forward move, to 1962-63, both of which dates have a special attraction for the authorities in that they are at present entirely free from compulsory maturities. This stock may look too long to a few of the banks, but the interest recently shown by others in the 1960 stock suggests that it may make an appeal to them, as well as to the particular needs of other financial institutions, including some pension funds. The authorities, at all events

All redemption yields are to latest dates.

have obviously taken care to make it attractive; the redemption yield of about 3½ per cent makes both the nearest competitors (the 1960 and 1956-61 stocks) look dear.

It is hoped, apparently, that perhaps £200 to £300 million may be secured from this cash offer; and to judge from first impressions in the banks and the market, that may not be an unreasonable hope. At a guess, the higher of these figures would probably leave the Treasury with a fair net margin in hand for redemption of Treasury bills; whilst the lower figure should at least ensure that the £577 million of maturities are approximately covered—either by cash or conversion. It seems certain that the authorities themselves already hold a significant proportion, but outside holdings are not confined to the banks—they include some private holders and also some overseas moneys (since an important slice of the original issues in 1951 replaced Treasury bill holdings in the overseas sterling balances). The attitude of such holders to the conversion offer is quite unpredictable. But there seems a reasonable chance that the immediate objective will be attained—and, conceivably, may be comfortably exceeded.

The very fact that the authorities have focused upon their immediate task is, however, significant. The notable omission from this operation is any offer to the holders of the £412 million of 1952-54 National War

Making Airlines Pay

THE reports of the two British air corporations for the past financial year to March show that expansion of traffic alone does not put air transport on its feet. Costs have been rising faster than revenue. The income of British Overseas Airways went up nearly 8 per cent to £36 million, but the final result was a net deficiency, after meeting all charges, of more than £800,000. British European Airways secured 21 per cent more revenue, taking £13 million; but it lost £1.5 million on the year's operations. Taken all round, 1952-53 was a poor year for airlines as a whole; the International Air Transport Association's annual meeting in Montreal next week will echo the general story of rising costs and falling net income. If a single reason is sought for this disappointment, it is that the air transport operators have provided more capacity in the air than was justified by the increase in traffic. But to take this as the sole reason why British airlines lost money would be an over-simplification that would ignore many factors in their complex environment.

The two corporations are not directly competitive. BOAC carries the long-range traffic (though it handles, incidentally, a good deal of short-range traffic) and BEA is mainly but not exclusively concerned with short-haul traffic. These operations are basically different, but for

Bonds that remained unconverted after the operation of last July; this is likewise a departure from the precedent of last autumn. And it is also clear that the authorities, though doubtless hoping that the outcome will be some funding of Treasury bills and therefore some reduction in the banks' excess of liquidity, have not made any forthright effort to bring this about. For the present, they are content to rely upon the healthier condition of the market, the new squeeze upon bank earnings (because advances rates have fallen more than deposit allowances), and the implications of their more flexible monetary policy.

In the circumstances, the authorities are perhaps entitled to claim that they have not unreasonably sought to capitalise the opportunity created in the market by the Bank rate reduction. They have concentrated upon the one task—the meeting of the mid-November obligation—that could not be delayed. They have, of course, reaped some advantage from their Bank rate decision; in the past fortnight about ¼ per cent has been lopped from the yield basis of the 1954 stock, and the corresponding gains for them on the two new stocks might be guessed at between 1/16 and ½ per cent. But, if this is the measure of the cost of freedom from "persuasion," and the promise of a genuinely more flexible monetary policy, the bankers ought to regard it as cheap at the price.

each of them three factors decide whether or not they are profitable. One is traffic; the second is aircraft; and the third is overheads.

BOAC's report (analysed in some detail last week) revealed that the traffic carried last year was not up to its expectations. In the previous year, 1951-52, the corporation made its first real surplus of £275,000 after meeting all charges. In that year BOAC offered for sale 20 per cent more capacity; it needed to sell 65 per cent of that capacity to break even and, in fact, sold 65.7 per cent, tipping the balance from loss to profit. The formula that worked so successfully in 1951-52 was not so fruitful in 1952-53. The amount of capacity offered was again increased, this time by 10 per cent, from 195 million to 215 million ton-miles. At the same time, higher costs pushed up the cost of flying each ton-mile from 38.8 pence to 40.1 pence. The result of this was to raise BOAC's break-even point to 66 per cent of the capacity it offered last year. But extra traffic did not match the extra flying and higher costs and only 64.5 per cent of the capacity offered was sold, compared with 65.7 per cent of the lower capacity offered in 1951-52. BOAC's expenses rose by 12.4 per cent, revenue rose by only 7.7 per cent; the corporation's operating profit was negligible, and after paying interest it was well in the red.

By now, traffic has probably caught up with the extra capacity offered for sale, and the sharp contraction in international trade that reduced the amount of freight and mail traffic well below the figure that the airlines expected has been corrected. But this demonstration that expansion of services alone does not make airlines pay is salutary, for both corporations are at the stage of making major advances in their fleets and in their scale of operations. When the same kind of expansion is taking place in most of the other major airlines as well there is a prospect that, for the immediate future at least, there may be more capacity offered for sale by the world's airlines as a whole than there is traffic to make it pay. If airlines generally failed to sell enough capacity to do well last year, they will be having hard thoughts about the success of tourist services. No doubt reduced-price services attract new passengers, but there are signs that they draw passengers away from the first-class services. Tourist services are not confined, as was first intended, to obsolescent aircraft, with a cheap fare to compensate for their "less eligibility." Sometimes there is little to choose between the amenities offered on the so-called first-class services and on tourist flights—or not enough difference to attract enough passengers to the more expensive flights. BOAC's Comet services are a possible exception; the Comet has proved to have such appeal for passengers that it has earned more than enough to cover its relatively high costs of operation.

Contrary to BOAC's experience, there has been no shortage of traffic on the routes flown by British European Airways and is not likely to be one in the immediate future. Tourist services were not introduced into Europe until April, 1953, after the period covered by BEA's accounts, but during the summer it might have been possible to sell most of the available seats at first-class fares, whereas those sold at tourist rates carried an average discount of 20 per cent.

The financial difficulties of BEA in 1952-53 arose partly from the nature of the traffic carried and partly from the aircraft used. BOAC has had modern aircraft, Constellations, Stratocruisers and now Comets for some years; BEA operated more than 90 per cent of its services last year with fairly old machines like the Viking, comparatively uneconomic to operate and less able to attract traffic than newer machines belonging to rival airlines. The 12 Ambassadors that went into service during the financial year 1952-53 had more than their share of teething troubles to keep them on the ground. Nevertheless, it is due to them (and to the withdrawal from service of some highly uneconomic Rapides used in Scotland) that BEA's costs per ton-mile actually fell 3 per cent, from 51.1 pence to 49.5 pence when BOAC's costs were going up. This is a measure of the power of aircraft to influence an airline's financial out-turn.

In this financial year, 1953-54, BEA really enters the stage of being able to operate a modern and efficient fleet. Its fleet of 20 Ambassadors and 26 turbo-prop Viscounts is gradually being built up and the Vikings

are being sold. Yet the profit earned in the first six months of the year is no higher than in the same six months of 1952, when there were no Viscounts and only a handful of Ambassadors in service. Possibly the provision of maintenance facilities, including the training of engineers, for the new aircraft, has eaten up some of their profits, but it is also likely that the profits are smaller than they might have been if all the new aircraft had been flying on first-class and not largely on tourist services. Whether this is a fair assumption or not, BEA is modifying its policy of all-tourist services and re-introducing first-class flights on all major routes in its new winter schedules.

*

There was one negative consolation last year; BEA's revenue rose faster than its expenditure. Total earnings rose by 21 per cent to £13 million, while expenditure rose by 19 per cent to £14.6 million. Capacity was increased by 22 per cent to 69 million ton-miles and the amount needed to be sold to break even was reduced from 73.2 per cent to 69.9 per cent; however, the total capacity sold averaged only 62.9 per cent. Lack of modern economic aircraft alone does not explain the persistent inability of BEA to cover its costs. Its operations, being largely of short-haul character impose on it a special handicap—that of an erratic pattern of traffic. There is the inevitable seasonal fall in winter, but more marked than in long-range traffic; in addition, traffic fluctuates violently during the holiday season, when there is a mass exodus of British travellers to Europe that is not balanced by a compensating flow of foreign visitors to Britain. The extreme case is that during the holiday weekends an aircraft flies full one way and empty the other—at a load factor, that is, of 50 per cent. Capacity over short and medium ranges tends to be greater than can be economically employed all the year round, and so the most efficient use of aircraft on such services is likely to fall a long way short of the ideal.

A second feature of BEA's operations is that the impact of the overheads incurred in handling passengers is much heavier on short-distance bookings than on long journeys. The average single ticket sold by BEA is about 7 guineas, compared with an average sale for BOAC of about £80. But it costs BEA £2 to handle each passenger, which is a big bite out of the 7 guineas revenue from the sale of the ticket and, moreover, is incurred every few hundred miles. Much of this cost is involved in complying with all the formalities laid down when a passenger goes from one country to another and is outside the control of BEA. But before the corporation can hope to improve its financial position these handling expenses will surely have to be drastically cut.

In 1953-54, BEA will be operating with modern and more efficient aircraft, but it will also have to service the £10 million loan raised to pay for them—which probably means the doubling, to about £600,000, of

the interest charges carried by BEA—and it may still not be possible to break even. But besides the general liabilities peculiar to short haul operation, BEA carries the mill-stone of the so-called "social services" to Scotland and to the outer islands. The corporation has to operate these services—indeed the Minister of Civil Aviation can make it do so—but there seems no prospect of anything but a continued heavy loss until an aircraft can be found that can operate from primitive landing fields at a cost that can be covered by small traffic. These services were responsible last year for about £500,000 of the £1.5 million deficit and there is much to be said for the offer put forward by BEA to forgo all claims to a government subsidy on its main operations, including the major internal routes, if the government would make a payment for "services rendered," such as a guaranteed revenue per ton-mile, on these recognisably uneconomic routes.

Such a suggestion, at any rate, has more to commend it as a way of putting the corporation's affairs in order than the frequently aired proposal that the two corporations should be amalgamated. There is no likely scope for economy by combining the two under one management; their operations are poles

apart and the aircraft that they need for them are totally different. There is no reason to believe that one corporation would perform the two very different operations more successfully than BOAC and BEA. The different factors that govern their working would not disappear if they were merged into one body. There would be an end to competitive emulation between them, and an increasing risk of diseconomies of large scale. Both corporations meet stiff competition from foreign airlines for traffic, and there is no reason why their joint arrangements for the handling of transit traffic should be less efficient than similar arrangements made between two departments of a single corporation. It is only too easy to find extenuating circumstances for an airline that loses money; the reports of both corporations include plenty of them. But it is never easy to bring home to a single management that these are the normal commercial risks of air transport for which they should make provision. In spite of last year's set-backs, the prospect that the two corporations should be able to pay their way are quite fair. So long as that is so, a single airline would in the long run almost certainly cost the taxpayer a good deal more than BEA and BOAC.

Business Notes

Industrials Still Improving

WHILE gilt-edged were shifting their stance in preparation for the cash-cum-conversion issue, industrial equities gained further ground in this second week following the change in Bank rate. By Wednesday's close the *Financial Times* index of industrial ordinary shares stood at 126.9, compared with 125.2 a week before and with the previous 1953 peak of 126.0 (reached three days after the Bank rate reduction). Equities were helped in this improvement by the fact that the Dow Jones index of industrial stocks on Wall Street rose from 262.35 to 264.04 in the week, and has thus now made good all but 1½ of the 10 points that it lost in the four days of panic selling in early September. But the main influence on the London market this week was undoubtedly the decision of the directors of Imperial Chemical Industries to raise their interim dividend for 1953 from 5 to 6 per cent (a decision that is discussed in Company Notes on page 55 of this issue), coupled with further evidence from other company reports that the current level of industrial profits is considerably higher than in the second half of last year. Indeed it is possible that, for consumer goods industries at least, profits may be very

nearly back to the level they had reached before the Australian import cuts in March, 1952.

As with profits, so with industrial production. The Central Statistical Office's index of industrial production for August is provisionally estimated at 105.106, compared with 99 for the same month a year ago and with 104 in August, 1951. It has thus maintained its lead of around 7 per cent over a year ago, as did the index for July (which is now estimated at 110 compared with 102 in July, 1951); within the separate components of the July index, manufacturing output was estimated at 112 per cent of the 1948 average compared with 102 in July, 1952, but the index of output in the mines and quarries (thanks largely to the fact that the miners enjoyed a second week's holiday for the first time this year) was down to 84 compared with 94 in July, 1952. It would not be altogether surprising if the rise in industrial production flattened out in the next few months. For one thing, unemployment, which fell continuously up to July (to only 1.3 per cent of the labour force) rose slightly more than seasonally—to 293,500, or 1.4 per cent of the labour force—in the month to mid-August. But meanwhile company profits statements have still to reflect the very substantial rises in output and sales that have been enjoyed since the spring of this year.

Commonwealth Confers

AN imposing programme of Commonwealth economic discussions stretches over the months immediately ahead, even although nobody seems to expect any really significant decisions to be taken at any of them. This week the Economic Secretary to the Treasury, Mr Reginald Maudling, who is beginning to rank for the title of Britain's peripatetic financial envoy, sets out for a series of visits that will take him via Bagdad, Karachi, Colombo, and Bombay to New Delhi. At Delhi he will attend the meeting of the Consultative Committee for Development in South and South East Asia (that is, the authority in charge of the Colombo Plan) from October 13th to 19th. After this meeting Mr Maudling will be taken on a tour arranged by the Government of India to inspect the Modar Valley project and other symbols of the Colombo Plan in action. In all these sterling area capitals Mr Maudling is expected "to hold informal talks on matters of general interest to the sterling area." After his recent visit to Washington he is likely to be in a mood to discuss generalities—but nothing else.

Three months hence it will be the Chancellor of the Exchequer himself who will take wings and represent Britain at the meeting of Commonwealth Finance Ministers that is to be convened in Sydney on January 8th. The meeting will be preceded, as was the last Commonwealth Economic Conference, by discussions among officials. The Australian Prime Minister, Mr Menzies, this week described the agenda for the meeting: it will "enable the Finance Ministers to review together such subjects as the balance of payments prospects for the sterling area in 1954, progress with the plans for moving toward a system of freer trade and payments covering the widest possible area, and co-operation in development of the economic resources of the Commonwealth." This is indeed a vague field of debate; but since the Finance Ministers will be meeting before they will have any indication of the recommendations that may be made by the Randall Commission on Foreign Economic Policy in the United States—and, still less of what the Congressional reaction to that report may be—this vagueness is hardly surprising. It is no doubt desirable that the Finance Ministers of the Commonwealth should meet as often as is reasonably possible and that they should occasionally assemble when they are not pulled together by the compulsion of a sterling crisis. Added sentimental justification may be attached to the meeting by its coincidence with the Royal Tour of Australia. But, sentiment apart, it is difficult to avoid questioning whether this particular journey is really necessary.

Exchequer Accounts on Target

THE Exchequer accounts for the first half of the financial year 1953-54 show an above-the-line deficit of £277 million (compared with £293 million in the first half of 1952-53), and an overall deficit of £503 million (compared with £589 million a year ago). This is comfortably in accordance with—in fact, slightly better than—estimate.

Last April Mr Butler estimated that ordinary revenue would fall by £71 million this financial year, but that ordinary expenditure would fall by £92 million, giving a net accretion of £21 million to his surplus; in fact, in the first six months, ordinary revenue has fallen by £44 million and ordinary expenditure by £60 million, thus leaving his ordinary deficit in this customarily adverse half-year some £16 million smaller than in the equivalent six months of 1952-53. Below the line, the outturn has been even better. Mr Butler had estimated that his net below-the-line payments would rise by £25 million this year, but they have in fact fallen by £71 million in these first six months. It should be noted, however, that net issues from the civil contingencies fund (which are entered below the line) are shown as £15 million at the end of this September compared with £35 million at the end of last. But for this distortion, which may be connected with the transfer of commodity stocks to private hands, the above-the-line accounts would have been some £36 million better than a year ago and the below-the-line accounts some £51 million better. This is probably the right perspective in which to view the figures.

The fall of £44 million in ordinary revenue in the half-year is wholly accounted for by a decline in profits tax, income tax and surtax, the greater part of which are always garnered in the last three months of the financial year. Despite the cuts in purchase tax rates, customs and excise receipts have actually been £11 million higher than in the first half of 1952-53 (compared with an expected drop of £39 million for the whole year). The whole of the fall of £60 million in ordinary expenditure has occurred in supply expenditure; this figure is, of course, distorted by the fact that in 1953-54 as a whole £140 million of defence expenditure (compared with £85 million in 1952-53) is to be cavalierly credited as "paid for" by American defence aid. This means that some £27½ million of the apparent reduction in expenditure between the first half of last year and the first half of this is rather bogus; but, as this bogus element was already included in the year's estimates, there is no need to labour the point now.

The story behind these figures is that production and consumption have both kept well up to the estimates made at budget time, and have thus prevented any deterioration in the accounts such as was caused by the unexpectedly stringent pinch of disinflation in the first half of 1952-53. On the other hand, prices have not risen more rapidly than the Government had anticipated, so that the artificial inflation of revenue that gave such a misleading and unhealthy gloss to the Exchequer accounts in 1951-52 and some earlier years has again been absent. The budget accounts are therefore on target—and, much more important, the outturn in the economy as a whole is so far on target too.

Electricity Recovers Too

IN the first five months of its financial year to last March, the British Electricity Authority experienced a marked falling off of maximum demand and output. These are not conditions that BEA could be expected to enjoy. For a period, they must have rocked, if only gently, traditional

assumptions about the natural growth in the demand for electric power. But industry picked up and the winter was agreeable, for BEA at least; "the cold weather . . . was more remarkable for its duration than its severity." So winter power cuts were kept down to six; sales of units increased by 3.7 per cent at an average price 7½ per cent above that of 1951-52; and the combined surpluses of BEA and the Area Boards (six of which were "in the red") reached £7,280,823 after provision for depreciation, based on historical cost, and interest. After a year which produced the smallest surplus (£2,918,837), 1952-53 provided the largest surplus since vesting day five years before.

Such results, for a year in which output capacity increased by 9.3 per cent and seven large new power stations were brought into commission, must have been much less spectacular than BEA had hoped in its original planning, and yet much better than they might have feared early in the year. The load factor behaved perversely by dropping from 46.9 per cent to 44.7 per cent but more of the load was supplied by new plant and there was a further

n million units ("Standard Months" Output shown for 1952-53 above or below same month of previous year).
Industrial Production shows variation from same month in 1951-52.

improvement in thermal efficiency from 22.04 per cent to 22.72 per cent. This last improvement went some way towards counteracting the rise of 5.8 per cent in the delivered cost of heat to BEA and limited the rise in fuel costs per unit to 2.6 per cent.

"Electricity," observed Lord Citrine this week, "is still cheap." There are, indeed, few things that the consumer buys which cost a mere 25 per cent more than in 1939. Part of that cheapness comes from the rooted conviction that BEA does its duty as a public corporation by provid-

ing for depreciation on the basis of historical cost; as history moves on and more plant at current costs has to be depreciated, the provision will have to be increased. A rising burden for interest and depreciation is one of the spectres that is bound to attend BEA's expansive planning. So, perhaps, is the future structure of tariffs for bulk supplies to the Area Boards; in fixing these, BEA exhibits none of the inhibitions about charging the cost of peak hour production that are to be seen in retail tariffs. There are to be no changes in 1953-54, but in the following year three major revisions are contemplated including, as a first principle, "the revision of the relationship of the fixed and running charges in the tariff, so as to reflect more closely the fixed and running costs of production."

Planning without Prices?

BUT if there are signs of progress here, and in the belated acceptance of the idea of outdoor boiler plant, there are few in retail tariffs. The possibility that it might cost less to save a kilowatt than to install it is not discussed, much less put to the proof. Indeed, the argument about future plans and prices is stated in explicit and expansionist terms. "To give full supplies at all times, sufficient

plant must be provided to meet the peak demands for electricity; the more fully this plant is used outside the peak periods, the lower is the charge per unit required to cover the capital charges involved." This argument—meet the peak and build the load to it—is presented with all the usual appeals to the national interest and to the need for a "well-balanced" expansion of consumption.

It is no doubt churlish to mention once again the matter of price. By what criterion are the estimates of new generating plant requirements—reaching 1.9 million kilowatts in 1959—calculated? The report does not say. But it complains that government sanctions for new plant have pared down BEA's programme and Lord Citrine this week extracted full value from the prospect—as he saw it—of power cuts and load spreading in 1958-59. Are these prospective requirements unaffected by price—some kind of natural phenomenon that has no economic reference? The

cost of meeting them will run at £150 million a year, which is certainly a fact of economic consequence stretching well beyond the electricity industry. These estimates of future plant requirements would be more acceptable if BEA had shown something more than a grudging acceptance of the Ridley Committee's recommendation that tariffs should discriminate in charges between peak and off peak use; area boards are enjoined to use the tariff structure to encourage the maximum diversity of load but they are "also turning their attention" to tariffs covering non-peak loads. It is none too soon.

Deposits on the Eve

THE clearing banks' statement for September, made up on the very eve of the Bank rate reduction, carries a stage further the rather more reassuring story that began to emerge at the beginning of this half-year. Bank deposits are still rising, but the trend is much less sharply upwards than in the first half of this year. In the four weeks to September 16th, net deposits rose by £54 million (com-

pared with a rise of £59 million in the similar period last year), bringing their rise in the past three months up to £72 million (compared with £109 million). This latest modest improvement on last year's trend principally reflects the behaviour of bank advances, which for the first time show a larger decline than in 1952; they dropped in the four weeks by £14 million, whereas last year's corresponding fall was slightly less than £7 million. This, however, is a slightly misleading comparison, because the figures this year reflect the payment of the first call—£24 million on August 26th—on the Gas loan. Hence, if it is assumed that the whole of these moneys were applied in redemption of previous borrowings by the Gas Council from the banks, it appears that total advances to all other borrowers have started to rise again, whereas at this time last year they were still tending to contract. The central Government, as expected, was again a heavy borrower from the banking

system. Indeed, in this latest period, unlike the two preceding ones, its borrowings were actually slightly larger than in the similar period last year—at around £70 million, compared with rather more than £60 million. This difference is, however, probably more than accounted for by the "departmental" contribution to the month's call on the Gas loan. Apart from this, the Treasury's domestic needs for finance seem to have been slightly less this year than last, when account is taken of the trend of tax certificates, savings securities and the note circulation.

These continued borrowings have raised the banks' aggregate liquid assets by a further £69 million to £2,366 million, which contrasts with only £1,962 million at the seasonal low point last April. Hence, despite the decline in portfolios of commercial bills (these dropped by another £1.4 million during the month), the average liquidity ratio has risen over the five months from 32.4 per cent to 37.4 per cent (compared with 36.8 per cent in August). Despite the minor funding operation attempted by the Treasury in the early summer, the ratio had been carried almost back to the high point of 38 per cent shown on the eve of last autumn's funding operation. Before the 1951 funding the ratio was 39 per cent.

Cotton Futures Next Year?

IT now seems likely that the Liverpool Cotton Exchange will be reopened next summer, to fulfil its traditional role of providing private cover facilities for purchases of raw cotton. The Government committed itself to ending the present system—in which the public buying agency, the Raw Cotton Commission, provides cover both to spinners that buy their cotton from it and to those that import raw cotton on their own account—when it accepted the Hopkins Report last June. That report concluded that the use of public funds for cover facilities was intrinsically undesirable, and that methods of providing private cover should be urgently examined. The subsequent discussions between the Government and the cotton trade are apparently making good progress. So far, the Government does not seem too frightened of the fact that the reopening of the Liverpool market would mean that spinners would have to be allowed to buy freely in the cheapest market, and that the existing restrictions on imports of United States cotton would have to be removed. Prices of non-dollar growths are still competitive with, if not cheaper than, United States cotton, so that the initial dollar cost to Britain would not be large; the contingent risk, however, is that if a world dollar famine should again develop, outside growths might command substantial premiums, as they did two years ago, and Lancashire would then buy more heavily in the United States. The Liverpool authorities, for their part, are no doubt prepared to agree that, as in the grain markets, the right to take delivery of dollar imports for sterling against a maturing futures contract should not extend to foreign operators.

The logical, though not inevitable, corollary of reopening the Liverpool market would be to wind up the Raw Cotton Commission; it would be technically difficult to continue it as a purely merchanting body for the minority of spinner that might still wish to trade with it. The Governmen-

An outstanding development...

Assembling the component parts of a Mullard thyatron.

PROGRESS IN ELECTRONICS

THE utilisation factor of an electrically powered machine is often dependant upon the flexibility of its motor. Until quite recently all motors were controlled by conventional electro-mechanical equipment. To-day, however, an increasing number are controlled by an electronic valve known as a thyatron.

The thyatron is a device which can convert alternating current to direct current and, at the same time, can regulate the amount of current—and thus the amount of power—released to the motor.

The great advantage of the

thyatron is its extreme flexibility which permits infinitely variable control of motor speed and direction. It thus enables full advantage to be taken of recent developments in the field of automatic control with all its attendant economies in overheads and manpower.

Mullard produce a wide range of thyatrons for a great variety of applications. In addition to motor control, Mullard thyatrons are today leading to increased efficiencies in lighting and heating systems, in servo-mechanisms, in resistance welders, relays and regulated voltage devices.

will have to make a decision on the whole subject fairly soon. The Commission could not be disbanded without legislative sanction, and the Liverpool market would have to be functioning well before the 1953-54 importing season ends on August 31st of next year.

Ford's New Cars

FORD's new Anglia and Prefect cars shown this week are neither baby cars nor austerity cars. Each is powered by a 1,172 cc. engine, and they fall into the same 10-12 horse-power group as the Hillman Minx and the Austin A40. They are two variants of a basic single model, differing in finish and comfort and in price by £35. On the home market, the incidence of purchase tax will raise this difference to £50, for which buyers of the Prefect will obtain four doors instead of two on the Anglia, two windscreen wipers and rather more chrome. The accompanying table shows the order of battle for the smaller car market; in price as well as in power the two new Fords fall midway between the "baby" and the slightly larger models of the other major producers. Vauxhall Motors is the only big British manufacturer without a stake in this market.

In this departure towards more power and modern styling for its new small cars, Ford abandons—at least for the time being—its claim to produce the cheapest British car. The old Anglia cost £313 the new Anglia—only the name is the same—costs £360 and is now third on the list. Ford's emphasis has been laid on body styling and comfort; the

	Date of Introduction	Basic Price	Price After Tax	Cubic Capacity	Gear-box Speed	Length	Doors
Standard 8	Sept. 1953	£339	£481	803	4	11 10	4
Austin A30	Oct. 1951	355	504	800	4	11 4½	4
Ford Anglia	Oct. 1953	360	511	1,172	3	12 7½	2
Morris Minor 2-door	1949	373	529	800	4	12 4	2
Ford Prefect	Oct. 1953	395	561	1,172	3	12 7½	4
Morris Minor 4-door	1947*	405	576	800	4	12 4	4
Austin A40	1947	467	663	1,200	4	13 3½	4
Rootes Hillman	1948	470	667	1,265	4	13 1½	4

* Redesigned March, 1952. † Redesigned October, 1953.

new models have front-wheel suspension like their big brothers the Consul and the Zephyr, and unlike the other small cars in the table they also have, in the long Ford tradition, a 3-speed gear-box. The new 1,172 cc. engine should be pre-eminently cheap to make, and it has side valves; most of the small engines of other makers have overhead valves and also higher compression ratios than the 7:1 of the new Ford.

The difference in engine size alone makes a direct comparison between the new Standard and the new Anglia impossible, but the two cars represent two different assessments of what the "average" motorist wants. Both companies make similar claims for economy and speed, and if the Standard is shorter by 9½ inches, it is also £30 cheaper. In any case Ford still hold a card in reserve—a "baby" car that might sell for less than the Standard—if it wanted to play it. And the two companies have certainly set a hot pace, both in price and value, for some of the older models that up to now have largely had the market to themselves.

Japan Before Gatt

THE meeting of contracting parties of the General Agreement on Tariffs and Trade has continued this week in a commendably (and rather surprising) business-like atmosphere. There has been no further hard news about two of the main outstanding points before the meeting—namely the extension of existing tariff schedules for twelve or eighteen months and Britain's request for a tariff waiver—but an active discussion and a sharp clash of opinion have emerged over the Japanese application for associate membership of Gatt. The motion to accept Japan as a member was sponsored by the United States on the ground that the admission of Japan was essential in the West's common political and security interests. The principal American spokesman, Mr Waugh, US Assistant Secretary for Economic Affairs, argued with some conviction that if the opposition to Japan was based on memories of past transgressions in Japan's code of international commercial conduct, there was surely much to be said for including Japan in the membership of Gatt and thus imposing the duties as well as the privileges of membership on it. Britain's opposition to Japan's application was pleaded by the President of the Board of Trade in a more than usually unconvincing speech, the curious logic of which seemed to be that Japan's admission to membership would cause other contracting parties to raise their tariffs in self-defence against Japanese goods; this, declared Mr Thorneycroft, would cause a general increase in tariffs, a movement that would prove the admission of Japan to be a development wholly contrary to the basic philosophy of the Agreement. Britain has been supported in its opposition to Japan by France, Australia and New Zealand; but America's sponsorship of Japan's application has been strongly backed by India, Pakistan and a sufficient number of other countries to make it virtually certain that Japan's associate membership of Gatt will have been assured by the end of the meeting.

Among the minor but potentially important items that appear to have been settled at Geneva was the complaint against Belgium's recent decision to raise a special tax

PLANT REPLACEMENT COSTS

INDEX NUMBERS showing changes in the replacement cost of various classes of plant and machinery are available on subscription to companies wishing to adjust their depreciation provisions in accordance with fluctuating price levels. Details of this and other services of interest to industry can be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

of 7½ per cent *ad valorem* on all products imported by the Belgian central and local government authorities, to balance the family allowances to workers that are paid direct from contributions by Belgian employers. If this increase in tariffs had been admitted it might have opened the door to a flood of comparable attempts to balance differences in social security charges by appropriate changes in tariffs. Belgium appears to have realised the dangerous potential of its initiative and has promised to introduce appropriate amending legislation.

Shops and the Budget

SIX months before the budget, the retailers' associations are already discussing its possible effect on trade. They are obsessed by two fears—a general buyers' strike in the months before the budget in anticipation of further reductions in purchase tax; and the losses that they will incur on tax-paid stocks if tax reductions are made. The solution proposed by the Retail Distributors' Association has a breathtaking simplicity—namely that changes in the purchase tax should be moved forward from budget day to the end of January. It is a date late enough not to affect the Christmas trade; it marks the end of the retailing year when stocks are at their lowest; at that time so little business is done that a buyers' standstill before the tax changes were announced could hardly make it worse. The proposal is rapidly gaining support in the retail trade. Whether it will attract the Chancellor depends, in part, on whether he feels moved to make a gesture of goodwill to the shopkeepers, who are thought to have lost about £13 million on their tax paid stocks last year when the purchase tax rates were cut by one-quarter. With these losses still painfully fresh in their memory, retailers are determined that at the next budget their stocks will be cut to the minimum. Once Christmas stock has been delivered, trade in taxed goods is likely to be carried out on a strictly hand-to-mouth basis until after the budget. This will not be easy; even in the peculiar conditions that prevail before the budget the retailer will still have to guess where the buyer's strike will start and when, and if he guesses wrongly, he will once again find that his stocks have mounted up.

This is no new problem, but during all the years that retailers have discussed it with the Customs and Excise authorities, it has apparently been impossible to devise a satisfactory scheme for rebates on the taxed goods in stock at the time of the budget. The committee set up last year under the chairmanship of Sir Thomas Hutton came to the same unsatisfactory conclusion. The retailers themselves have meanwhile invented a number of stratagems, based on the idea of delivering goods to the retailer on a "sale-or-return" basis. But local customs officials have been able to find flaws in many of these agreements, and they are hardly satisfactory from several points of view. The Radio Wholesalers' Federation, in a memorandum to the Chancellor, has pointed out that shop-soiled goods may be returned to the manufacturer that he cannot sell to another trader as "new"; and the credit of many shops is not good enough for this form of business agreement.

These difficulties become acute where goods carry a con-

siderable amount of tax, as do most durable household articles. This year, if retailers follow the advice of their associations, they will cease ordering from manufacturers for three months before the budget, and perhaps even longer. When a major dislocation of trade threatens to take place every time a budget is pending, the case for re-examining even the soundest technical arguments about the administrative difficulties of a tax rebate scheme is strong.

Unrationed Sugar

THE end of sugar rationing last weekend is unlikely to lead to much increase in demand from the housewife, but it probably will lead to larger purchases by industry, particularly by the confectionery and soft drinks trades. In the last few months before derationing a two-ounce increase in the ration, and more liberal bonuses, had raised the weekly rate of domestic consumption to 16 ounces per head, which was already slightly more than the estimated rate before the war. Supplies to industrial consumers were also increased in this period, but they were still about 6 per cent below the prewar level. For what they are worth, estimates by the Ministry of Food suggest that total domestic consumption, which was running at the rate of about 2.5 million tons a year between July and September, will rise to about 2.8 million tons in the first year of derationing. This estimate includes 200,000 to 300,000 tons for the initial buying surge and re-stocking, and also attempts to allow for the effect of ending the subsidy of ½d. per lb on sugar sold to the public and certain rebates to the trade. The Ministry is hoping that consumption will eventually settle down at about 2,550,000 tons a year, some 450,000 tons more than in 1952.

Derationing was made possible by the special purchase of 1,000,000 tons of Cuban sugar, at a total cost of \$65 million. This will cover most of the increase in consumption that is expected during the next two years. The exportable surplus from the Commonwealth is expected to reach the "target" figure of 2,375,000 tons by 1955-56, and to reach about 2,450,000 tons in the following year. These figures compare with a prospective Commonwealth surplus of about 2,050,000 tons this year and about 2,200,000 in 1954. If Commonwealth production does obediently rise according to this schedule, it could therefore nearly cover the estimated real increase in Britain's requirements. But not all of the increase in Commonwealth production would necessarily come to this country. Canada, which now takes about 400,000 tons of Commonwealth sugar, may take another 75,000 tons next year if it does not renew its contracts with certain free market suppliers. On the other hand, other Commonwealth countries may reduce their requirements of Commonwealth sugar by about 100,000 tons from next year onwards, and production of beet sugar in Britain could perhaps be increased by some 50,000 tons in the next few years. Britain may also be able to obtain supplies in the free market from non-dollar sources. This is the statistical background to the hope that the additional dollar cost of derationing may be marginal. But sugar and statistics do not always mix.

One of the many assignments entrusted to us—placing back into position the Queen Victoria Monument in Victoria Square, Birmingham, after renovations had been completed.

Film Agreement as Before

THE Anglo-American film agreement, which was due to expire last Wednesday, has been renewed in the same form for another year. It provides for the unconditional transfer to America of \$17 million from the American companies' earnings in this country—plus such further amounts as they may be able to wriggle through the twenty-six different legal loopholes that they have discovered in the original agreement. In the year to September 30th last they transferred about \$3 million through these loopholes, but their total transfers (at some \$20 million) were still \$5½ million less than in 1951-52. This was because the biggest of the loopholes (which cost Britain \$5.9 million

in 1951) was plugged last year when the Americans agreed not to claim the share of the Eady levy that they had earned by making pictures in this country.

As the American companies' total earnings in Britain are still running at an annual rate of around \$40 million, their frozen dollar balances must be accumulating at a rate of about \$20 million a year, although the Americans have managed to find useful employment for these funds. With their domestic profits hard hit by competition from television, their eagerness for easier repatriation of earnings is growing; but in the present state of uncertainty in the cinema industry—which in Britain is heightened by uncertainty about the future of the Eady plan itself—any negotiations for an entirely new basis of agreement would have been conducted in a hopeless fog.

Company Notes

IMPERIAL CHEMICAL INDUSTRIES AND MONSANTO CHEMICALS.

The news that the directors of Imperial Chemical Industries have recommended an interim dividend of 6 per cent on the £1 ordinary shares for the calendar year 1953, against an interim of 5 per cent a year ago, helped to cause a general strengthening of ordinary share values on the stock markets at the end of last week. Some pessimists were inclined to relate the new dividend to the announcement made by the directors a year ago, when raising the interim from 3 to 5 per cent, that it was their intention that "for 1952 and subsequent years" the interim should represent a greater proportion of the total annual distribution than before; in accordance with that decision, the final dividend for 1952 was later reduced from 10 to 8 per cent, keeping the total distribution for the year unchanged at 13 per cent. But there was no similar cautionary statement to accompany this year's announcement of an increase in the interim, and the market immediately marked up the price of ICI's £1 ordinary shares by 2s. 7½d. to 48s. 9d. By the close of business on Wednesday of this week the shares stood at 48s. 6d. At this price they would offer the somewhat lean yield of around 5½ per cent if the total dividend for 1953 should merely be maintained at 13 per cent; but they would offer the reasonably attractive yield of 6½ per cent if the total dividend should be increased to 15 per cent, as some investors expect.

There seem to be some grounds for such an expectation. Although ICI's net profits fell from £23½ million in 1951 to £15½ million in 1952, last year's dividend was still comfortably covered. Moreover, the fall in profits in 1952 was believed to be the resultant of brisk trading in the first four or five months of the year followed by a downturn in the last seven or eight months—and the ground lost in that downturn is likely to have been regained in the first half of 1953. Some confirmation of this can be gleaned from the preliminary results just announced by the

directors of Monsanto Chemicals, who have maintained their interim ordinary dividend at 6½ per cent. This company's net sales fell from £5,175,802 in the first half of 1952 to £4,778,487 in the second half, and then rose again to £5,208,182 in the first six months of 1953; its net income after tax fell even more sharply, from £226,625 to £67,093 between the first and second half of 1952, but then came back to £223,665 in the first half of 1953. The directors' report almost gleefully that Montanto has reduced its production costs, increased its sales tonnage, substantially decreased its inventories, and increased the volume of shipments to export markets during the year to date; moreover, despite increasing competition, "prices of certain major lines are firmer and present indications are that the good demand for most of our products will continue during the remainder of 1953." With the recent relaxation of Australian and other import restrictions, it will not be surprising if many other companies (particularly in consumer goods trades) that were hard hit in the second half of 1952 are able to report a substantial recovery during 1953; the economic weather in America permitting, their reports could bring some sunshine to the markets during the autumn and winter months.

POWELL DUFFRYN. Since the nationalisation of its coal properties in Britain the Powell Duffryn group, whose total assets now exceed £50 million, has flung its already wide net across a varied assortment of activities in the most diverse corners of the world; and it is not altogether surprising that the chairman, Sir Herbert Merrett, is now obliged to report that "we have not been entirely successful in everything we have attempted." The fall in group profits from £1,789,939 to £1,523,372 in the year to March 31 last was due mainly to two disappointments. First, the production of carbon brushes has proved an expensive failure, and was responsible for £341,000 out of a total of £460,543 that was written

off investments last year; this branch of the group's activities is to be reduced and ultimately discontinued, although manufacture in the chemical carbon field (especially of heat exchangers) will continue. Secondly delays in delivery of plant and last February's flooding, have caused setbacks at the new refinery of Vacuum Oil Company, the group's largest trade investment. It had been hoped that all units of the refinery (the total cost of which "will exceed the original estimate") would be in full production by the beginning of 1953, but in the event only the distillation unit could be started up. Consequently no income has yet been received from Vacuum Oil; nor can any be expected in 1953 even though full produc-

tion at the refinery should be achieved before the year is out.

Against this, negotiations for compensation for the group's nationalised coal assets seem to be proceeding reasonably smoothly. So far, compensation received totals £12,945,784 in respect of assets written down from £19½ million to just over £12½ million; but this written down value is arrived at after the deduction of substantial reserves, and compensation for some assets ancillary to the collieries is still to come in. The recent transfer of the group's interest in Wankie Colliery to the Anglo American Corporation of South Africa also seems likely to prove mutually advantageous. The fee that the group received for its former managerial

function was more or less absorbed by managerial expenses; but the yield from the Rhodesian Anglo American shares received as consideration for the transfer "far exceeds" the yield on Powell Duffryn's previous investment in Wankie, and Anglo American should be able to recruit sufficient technical staff locally to allow a substantial increase in production. Among Powell Duffryn's other investments, the business of Cory Brothers (with its shipping, oil bunkering, timber and other activities in diverse—and sometimes politically vulnerable—parts of the world) continues to thrive; the wagon shop of Cambrian Wagon and Engineering has secured a contract that ensures it will run in full employment for the next five years; the coal distributing business of Stephenson Clarke has earned a satisfactory revenue, despite restrictions in France; and the group's general engineering, manufacturing and technical advisory services continue to be profitably employed. A litter as large as this may still contain some pups; but the £1 ordinary shares which yield £6 3s. per cent at the current price of 26s. x.d. on the maintained ordinary dividend of 8 per cent, should be regarded as a risk investment that may yet reward the brave.

★

WATNEY COMBE REID. In the year to June 30th last, Watney Combe Reid reported only a fractional increase in trading profits (from £1,733,469 to £1,785,502) and it maintained its dividend at 17 per cent. Its export trade and beer sales outside London increased, but in London itself sales are still flagging. Yet Mr S. H. Combe is not a disappointed man; the results merely confirm the warning he gave a year ago—and it will be remembered that the weather before June 30 was not especially conducive to a seasonal thirst. The company has been able to go some way towards offsetting the decline in consumption of draught

beer since the war by tapping other sources of revenue. It achieved a turnover of more than £3,500,000 in wines and spirits last year, representing an increase of 80 per cent in gallonage within the last seven years. It is also planning to expand sales of Coca-Cola after the end of sugar rationing, but the chairman puts a damper on "fantastic estimates" about this product: in his opinion it would be extremely rash to assume either that Britons will drink as much Coca-Cola as Americans do, or that the company's profits are likely to benefit to any great extent from this drink in the near future. During the year the group have obtained several new sites for licensed houses. It

LONDON STOCK EXCHANGE

Next Account begins October 14th.
Next Contango Day: October 14th.
Next Settlement Day: October 6.

MARKETS have continued firm in the past week. Industrials have risen steadily to bring the *Financial Times* index to a new peak for the year, at 126.9 by Wednesday's close compared with 125.2 a week before. In the gilt-edged market, undated stocks were at first inclined to sag, although medium dated issues were in demand; but price movements in the week to Wednesday's close were only fractional—with 3½ per cent War Loan down from 86 to 85½, but 3 per cent Savings Bonds 1955-65 up from 97 to 97½. After market hours on Wednesday came the Government's offer to holders of the £577 million of maturing 1½ per cent Serial Funding Stock 1953 to convert into 1½ per cent Serial Funding Stock 1954 or into a new 2½ per cent Serial Funding Stock 1957 (at par, but with cash bonuses of 7s. per cent and 15s. per cent. respectively); and also the announcement of an unlimited issue of 3 per cent Exchequer Stock 1962-63 at the apparently attractive price of 99½. At Thursday's opening prices of competing stocks were necessarily adjusted to come into line with the new offer, but elsewhere in the list gilt-edged showed little change.

The widespread gains made by industrials in the week were largely occasioned by favourable company statements. ICI shares jumped 2s. 6d. to 48s. 6d. when the news of the increased interim dividend came through; and most blue chips moved up in sympathy. The news of a one-for-one scrip issue by Elder Dempster brought its shares up by 7s. 9d. to 55s. 6d. and gave a general fillip to shipping shares. Engineering and textile shares have also been in demand.

Elsewhere in the market oils have maintained their recent firmness; but Kaffirs, after some improvement led by uranium issues, have tended to weaken. Base metals have continued firm, tea shares have been in fair demand, but rubbers have remained decidedly weak. Dealings in foreign bonds have been active, particularly in German issues; potash bonds jumped 10 points in two days following Swiss buying.

THE MONEY MARKET

LOMBARD STREET has still to witness any sign of the authorities' expected new policy of showing less consistent leniency in relieving the short loan market. Both on Thursday before the weekend and on the first three days of this week credit was in considerable demand in the market and on all occasions the authorities gave the special help necessary to enable the discount houses to balance their books without resort to the Bank at the penal rate. Despite the shortage of funds, the commercial bill rate still did not rise above 2½ per cent, and was, indeed, weak at that, so that the margin over the Treasury bill rate has almost run off. The softer appearance of the whole rate structure was also apparent on Friday and Saturday of last week, when overnight money was down to 1 per cent and some balances went unlent.

There was a further fall of 1/64th per cent, to £2 2s. 8.05d. per cent, in the average rate of discount at the Treasury bill tender last week, which included the popular year-end bills. Last week's fall was probably wholly caused by the increase of 1d. in the market's bid, to £99 9s. 4d., made in anticipation of the considerable increase in outside applications; in the event last week's exceptionally high market allotment was reduced to 70 per cent. The offer at yesterday's tender was raised to £280 million; the excess of new bills will rise correspondingly to £30 million.

The Bank return showed a small outflow of notes. Government securities fell by £19.1 million, "securities" rose by £10.5 million and bankers' deposits fell by £11.4 million.

EXPORT QUESTIONS NEED EXPERT ANSWERS

Can we send
locomotives
to Latin
America?

Whether you are exporting locomotives or machine tools, ships or switchgear, the markets of Latin America pose special questions about currency, import regulations and exchange control. As the only British Bank with branches throughout Latin America, we are particularly well equipped to answer these questions promptly and accurately, and to advise and assist you in many other ways.

Our *Fortnightly Review*, a digest of reports sent in from our 56 branches in South and Central America, is an invaluable summary of economic information for all who trade in these markets. We shall be glad to send you a specimen copy on application to:—

Responsible advice ON INVESTMENT

AS AN EXECUTOR

AS A TRUSTEE

AS A SOLICITOR

AS AN ACCOUNTANT

Professional men, business men, even private individuals are often asked for advice on the safe investment of substantial sums of money, whether arising from a will, a maturing policy, the sale of property or other sources.

The investments offered by the Co-operative Permanent provide an ideal answer to such problems. Money so invested enjoys the security assured by a large financial institution with interests throughout the country. Moreover, capital is free from fluctuation. Interest at 2½% is paid with unfailing regularity and income tax is paid by the Society making the return equivalent to more than 4½% where there is liability to income tax at 9/- in the £. Invested money is always at call on short notice and can be realised without loss or expense.

Full details of the complete financial service made available by the Society will be forwarded on request.

Everything points to the
advantages of investment

COMPANY MEETINGS

GEORGE COHEN SONS AND COMPANY, LIMITED

(Engineers and Iron, Metal and Machinery Merchants)

ATTAINMENT OF EXCEPTIONAL LEVEL OF TURNOVER

IMPACT OF HEAVY TAXATION

MR CYRIL M. COHEN ON GROUP'S WIDESPREAD RAMIFICATIONS

The twenty-ninth annual general meeting of George Cohen Sons and Company, Limited, was held on September 29th at Grosvenor House, Park Lane, London, W.

Mr Cyril M. Cohen, chairman and managing director, presided.

The following is an extract from the statement by the chairman which had been circulated with the report and accounts.

At nearly £22 millions, turnover was almost 50 per cent greater than last year's. This fact itself is a measure of the initiative, skill and loyalty displayed by the managements, staffs and workpeople of your group. I know you will wish me to voice our praise to them all.

In my last statement I forecast a smaller profit for the year now under review. It is, I think, creditable, in a period which brought its special problems of rising costs, reduced trading margins and mounting complexities in our overseas trading, that the group's profit before tax was only £60,000 less than the exceptional result for the year ended March 31, 1952.

MANUFACTURING PLANTS

K. and L. Steelfounders and Engineers, Limited: In May, this large concern celebrated the 25th anniversary of its becoming a member of the "600" Group of companies. This company's silver jubilee year was fittingly marked by a record output and record profits.

K. and L. have an exceedingly fine plant and are reaping the benefit of a policy of modernisation and expansion. Although heavily engaged throughout the year on government work, they were able to maintain a high level of output for the home and export markets.

However, before the end of the financial year it was apparent that new orders were coming in more slowly. This state of affairs has, so far, persisted and although they have a substantial volume of orders on hand, the trend is a little disquieting. Naturally, every effort is being made to correct it but exchange difficulties and import controls in many countries add to the burden of the task. Since about 60 per cent of their production has been going directly or indirectly to export, K. and L.'s prosperity stands to be materially affected by restrictions on international trading.

We have for some time appreciated that Canada, with its spectacular industrial growth and its goodwill towards Britain, represents an important potential market for our Jones KL mobile cranes. Following a comprehensive survey, undertaken by our own experts, we decided to establish ourselves in that great country.

Official approval has been given to the formation of a subsidiary company, with its headquarters in Toronto, and premises, which we now occupy, have been built very speedily to our own designs. Here we shall

take every measure for the promotion of sales, including the provision of a first-class service organisation. The difficulties of getting to grips with this rather special and competitive market have not been under-estimated, and whilst we do not expect quick results, we consider the venture to be a sound long-term, dollar-earning proposition.

T. C. Jones and Company, Limited: The extensions to the structural engineering works of T. C. Jones and Company, Limited, at Treorchy, have now been approved. The military bridging programme, to which I referred last year, is in its initial stages and full production should be attained early in 1954.

Within the limits of the steel supply position, which happily has been improving, both our works, at Treorchy and Wood Lane, have been employed to full capacity during the year.

The experience of this company, too, was that orders came forward rather less readily in the closing months of the year, but with the prospect of adequate supplies of steel, it is hoped that the Steel Economy Bulletin issued by the Ministry of Works in August, 1952, will soon be withdrawn. In that event architects and engineers will doubtless consider themselves free again to specify steel framework in place of substitute materials which have been urged upon them.

Western Metallurgical Industries Limited: Following steep and repeated falls in the prices of metals—particularly tin—we decided to make various modifications and additions to the refining plant at Neath. These added to its flexibility and at the same time gave us end-products that were both more valuable and more readily marketable. Nevertheless, the necessary alterations unavoidably interrupted the process, so that revenue suffered and unit costs mounted. As might be expected, these influences, combined to cause a relatively substantial loss on the year's operations, and full provision for this has been made in the parent company's accounts.

The construction of the much larger plant at Morriston for the extraction of lead and zinc from residues is practically finished. Production will commence during the current financial year. The future of this impressive plant is also, of course, interlinked with the prices of metals.

Subject to there being no further inordinate falls in these markets, we look to WMI to make a useful contribution to the earnings of the group.

F. Burnerd and Company, Limited: This company, which has been established for about 40 years, is very well known for the manufacture of precision chucks. A chuck is, of course, an item of equipment indispensable to many types of machine tools for holding the work-piece in position.

In December last, we purchased a 51 per cent interest in Burnerd's and our old friends, The Colchester Lathe Company, Limited, likewise acquired a 29 per cent interest.

In the succeeding months our main activities were concentrated on equipping the works to produce a more comprehensive range and reorganising the selling arrangements both at home and in many countries overseas.

THE GROUP'S MERCHANTING ACTIVITIES

Margins in our merchanting activities were severely cut during the year, due to increased competition, to the types of plant and materials which became available, and to rising costs. The fall in margins was counteracted, to some extent, by a striking increase in turnover, but although we were able to improve slightly the aggregate profits of our merchanting subsidiaries, the parent company's profit was sharply reduced.

The exceptionally high level of turnover was maintained until the end of the calendar year, but at that time several sections experienced a fall in demand and their trade has only recently shown signs of picking up. However, our large hire fleet of contractors' plant continue to be fully occupied and sales of contractors' plant and of machine tools remain at a satisfactory level.

The Selson Machine Tool Company, Limited, also increased its turnover substantially. This company holds sole agencies in this country for some of the most famous machine tool manufacturers in the world and its name is held in great repute in the industry.

From home sources we, in conjunction with our subsidiary and associated companies, have delivered to the consuming works still larger tonnages of iron and steel scrap and we have played an important part in the national scrap drive, which has so successfully produced vitally needed supplies.

As regards our overseas quest for scrap, it is no exaggeration to say that our experts have visited the four corners of the earth. The valuable outcome of these operations is indicated by the fact that we have imported over 200 cargoes for the steelworks from 28 countries, many of them exceedingly remote.

Our very skilled and experienced dismantling department has been constantly active in the scrapping of obsolete plant and structures, and also in undertaking industrial contracts for the uplifting, transference and reinstallation of productive machinery.

NET PROFITS

Before charging taxation, the profit applicable to the members of the holding company amounted to £1,712,000—only £88,000 short of last year's record figure which, for reasons I explained, we did not expect to equal on the present occasion.

We have this year borne the full brunt of the Excess Profits Levy. The punitive effect of this deplorable impost on a progressive

business such as ours, is revealed by the figure of net profit which, after taxation, is £253,000 down at £451,000. The impending withdrawal of this tax and partial restoration of initial allowances will afford some measure of relief, but further and more courageous reductions in the general level of corporate taxation are imperative. If industry is to compete successfully in world markets and play the major part in maintaining a desirable standard of life in these islands, it must be permitted to retain earnings fully adequate for its modernisation and re-equipment. Only in this way can it respond effectively to the exhortations which are repeatedly made to it and which, under present circumstances, are as tedious as they are unrealistic.

PENSION SCHEMES

Your group is in the forefront of enlightened employers in its relations with its personnel and the conditions of service it provides. We have always been eager that those who give us a lifetime of work should be well treated when they retire and, further, that when we need recruits the best should be attracted to our ranks. We have therefore reviewed our pensions schemes in the light of changes in the value of money which have occurred during the last few years, and have brought the benefits up to the standard which your board considers right.

DIVIDEND AND OTHER APPROPRIATIONS

After transferring £150,000 to subsidiary companies' general reserves and carrying forward in their accounts £103,220, there remains a figure of £198,508 which, together with the balance brought in from the previous year, £73,084, leaves to be dealt with £271,592.

We have written off £5,520, being the stamp duty and other expenses relating to the capitalisation of reserves, which increased the nominal ordinary capital to £1,500,000.

We have paid the dividend on the 4½ per cent preference stock, and an interim dividend on the increased ordinary stock at 3½ per cent. We are now proposing a final dividend of 8½ per cent on the ordinary stock, leaving a balance to be carried forward in the accounts of the parent company of £79,030.

If you approve this proposal, the total ordinary dividend will be 12 per cent for the year. Last year's dividend, when related to the now revised nominal ordinary capital, was equal to 10.4 per cent and your board is convinced that the year's results and the financial position of your group fully justify the modest increase. The new dividend is equivalent to 5.4 per cent on the total capital invested by ordinary stockholders.

OUTLOOK

The charts and summaries given in the report depict the impressive expansion of your Group since the parent company became public in 1947 and its evident financial strength.

Our efforts continue to be directed towards the consolidation of the Group's resources, achieving the highest possible degree of modernisation of its plants and expanding them where we see profitable opportunities. Despite manifold difficulties, we have successfully contrived to bring our works up to a very high pitch of efficiency, and good progress has been made with the heavy programme of extensions at Letchworth to which I made reference last year. At Treorchy also the creation of additional factory space is in hand. We do not doubt that our manufacturing plants will continue to justify the confidence we have in them.

As regards the parent company and our merchanting companies, we have every reason to be proud of their resilience and ability to solve the many problems which confront them in their complex and widespread businesses.

I have, however, indicated that in the year under review we attained an exceptional level of turnover, while the year ended March 31, 1952, yielded exceptional margins. I have also spoken of the slackening in the flow of orders to most companies in the Group. For the current year we cannot hope to maintain the extraordinary levels of the last two years—indeed, we are expecting a substantial reduction in turnover, with a consequent fall in earnings.

On the other hand, the brutal impact of taxation has guillotined the top layer of this year's profits. At the lower level which I predict, taxation will not make such sweeping inroads into our retainable profits. Thus the effects of the drop will be largely absorbed.

I feel that we have no need at all to be despondent at the return to less abnormal times. Your Group, with its many ramifications and diverse interests, is well equipped to face whatever the future may hold and acquit itself commendably.

The report was adopted.

NYASALAND RAILWAYS, LIMITED

RECORD OPERATING RECEIPTS

MR W. M. CODRINGTON ON SUGGESTED TRANSFER OF CONTROL

The twenty-second annual general meeting of Nyasaland Railways, Limited, was held on September 24th in London, Mr W. M. Codrington, CMG, MC (chairman and managing director), presiding.

The following are extracts from his circulated statement:

Operating receipts during 1952 were £652,843 compared with £583,594 in 1951, an increase of nearly 12 per cent, and constituted a record. Operating expenditure, on the other hand, also increased and amounted to £547,443 compared with £458,240 in 1951. The ratio of expenditure to receipts was 83.85 per cent, compared with 78.52 per cent in the previous year. After referring to record traffics, Mr Codrington's statement continues:

It has been necessary to make increased provision for the renewal of additional assets and assets replaced at higher prices and we have put aside £89,001 compared with £77,273 in 1951. Available as provision for the increased cost of the replacement of fixed assets is the reduced sum of £16,283, compared with the 1951 figure of £27,885.

After providing for interest on the first debenture stock, we are able to pay £79,719 as interest on the 5 per cent consolidated income debenture stock, which is equivalent to a payment at the rate of 2½ per cent.

CONTINUED RISE IN COSTS

There is no doubt that it is only by greater operating efficiency and the use of our new rolling stock, that we have managed to absorb some part of the continually increasing operating expenditure; but costs unfortunately still continue to rise, mainly as a result of salary and wage increases.

The lake service continues to be an unremunerative burden. The tonnage carried

declined from last year's figure of 8,255 tons to 7,857 tons; and the revenue earned was only £24,664 against expenditure, including provision for renewals, of £68,523. As I reported to you last year, representations were made to the Nyasaland Government on the matter, but I regret we have not yet achieved what we can regard as an equitable solution of this problem. I still feel that the heavy burden of providing and maintaining a development service of this nature is not one which should fall on the railway, even though in the long run the loss falls on the Nyasaland Government by way of reduced interest on our consolidated income debenture stock held wholly by them.

The Federation of Northern and Southern Rhodesia and Nyasaland has now been achieved. The only immediate effect so far as the railway is concerned will be that the powers hitherto exercised by the Nyasaland Government and the right they at present possess under our contract with them to terminate our concession, after due notice and on payment of compensation, will pass to the Federal Government. If this right were exercised, the portion of the Nyasaland-Beira route which lies in British territory might be amalgamated with the Rhodesia Railways; and it is sometimes argued that if this were done their charges would be applied in Nyasaland and considerable operational and administrative economies would be achieved. This can only be regarded as wishful thinking.

It is true that the Rhodesia Railways with their much heavier traffic and longer hauls can in many cases afford to charge lower rates than those charged by us, but it is at least doubtful whether Rhodesia Railways and its customers would be willing to subsidise rail transport in Nyasaland to make good the loss resulting from a reduction of rates. Moreover, it must be stressed that any reduction in rates resulting from amalgamation would only apply on that part of the system which is in British territory, that is to say, on roughly half the total distance between Salima and Beira. There is also little scope for securing administrative and operating economies by this means; since our line is separated from the Rhodesia Railways system by some 400 miles of railway in Portuguese territory. Indeed the inevitable creation of a separate management for the section in Portuguese territory, coupled with the risk of the introduction of Rhodesian labour regulations on the section in Nyasaland, would be bound to increase costs considerably. If at any time, for reasons of policy, it appeared desirable that Rhodesian Railway rates should be introduced on our system, this could quite easily be done through a subsidised rates equalisation fund without in any way disturbing the existing unification of the rail route from Lake Nyasa to Beira under British management. The new federal government will need to find finance on a large scale for the development of their territories. It seems probable, therefore, that they, like the Nyasaland government in the past, will hesitate to exercise their right to buy out our company; since the considerable capital which would be needed for this operation can be more profitably employed in direct development of the country, rather than in replacing the British capital already invested in the railway.

TRANSFER OF CONTROL

After referring to the proposal of the Governor of Nyasaland that control of the company be transferred to Nyasaland, Mr Codrington stated that the company was subsequently informed by the Secretary of State for the Colonies that it had been decided that the suggestion for the transfer of control was now in abeyance.

The report was adopted.

JOHN BROWN AND COMPANY, LIMITED

(Shipbuilders and Engineers)

WIDELY SPREAD FIELD OF INTERESTS

LORD ABERCONWAY ON CHANGING TRADING CONDITIONS

The eighty-ninth annual general meeting of John Brown and Company, Limited, was held on September 25th at 4 The Sanctuary, Westminster, London, S.W.

The Right Hon Lord Aberconway, the Chairman, presided, and in the course of his speech said:

I rise to move that the balance sheet and accounts of the Company and the proceedings of the directors for the year ended March 31, 1953, be and are hereby approved and adopted.

THE LATE CHAIRMAN

Since the last general meeting the Company has suffered a severe loss through the death of its Chairman, the late Lord Aberconway. Those of us who have worked with him know how unflinching was his enthusiasm in supporting every side of the Company's business and how sound was the judgment which he brought to bear upon the affairs of the company and its associated companies during the twenty years or so of his chairmanship. His experience and his counsel will be sadly missed. My colleagues have honoured me by electing me to be Chairman and you can be assured that I shall spare no effort to promote the interest and well-being of the Company.

To the deep personal regret of the directors, Sir Donald M. Skiffington, after sixty years of service to the Company, has resigned his seat on the board. He was shipyard manager at Clydebank for 30 years and was responsible for the construction of many large and famous ships: the reputation of Clydebank for good workmanship and punctual delivery is due not a little to the standards which he set and maintained. The board have elected the Company's secretary, Mr J. W. Beck, to be a Director. In this capacity we look forward to receiving from him, with his great business experience and his knowledge of the affairs of all our companies, even more assistance than hitherto.

AMPLE COVERAGE FOR ORDINARY DIVIDEND

There has been a considerable diminution in the consolidated profit from the abnormally high figures of last year; even after taxation, however, it remains ample for the maintenance of the company's ordinary dividend. A substantial part of this diminution in profits has resulted from a fall in tungsten values; a further considerable part has been due to the difficulties experienced in the supply of steel plate, especially thin plate; and trading conditions generally have been more competitive. The first factor, particularly by contrast with the rise of tungsten prices to unprecedented levels during the previous year, has this year adversely affected profits and stock values of some of our businesses which use this material. The shortage of steel plate has limited activity in shipbuilding at Clydebank and has also affected to a greater degree the output of rolling stock at Cravens works. However, the diversity of our engineering interests has within limits a compensating effect such that in a year when one company or establishment does less well others may do rather better. If you look at the consolidated profit and loss account, and at the comparative figures of last year shown thereon, you will see that this year we are carrying forward a balance greater by some £725,000 than the balance

brought forward from 1951, two years earlier, and that some £280,000 has been added to the reserves of subsidiary companies in the same period.

INVESTMENT CHANGES

We have made a number of changes in our investments. In particular, we have sold the balance of our Iron and Steel stock and have used the proceeds to finance the business of our subsidiaries; and we have acquired those ordinary shares of Webster and Bennett, Limited, which were not already held by Wickman, Limited, and have thus obtained a substantial extension to our range of machine tools. The £39,588 of first mortgage debentures shown on the consolidated balance sheet are in respect of Webster and Bennett, Limited.

In accordance with the resolution passed at the extra-ordinary general meeting held on March 27, 1953, John Brown and Company, Limited, ceased to trade at the end of its financial year; all its trading activities are accordingly now conducted through subsidiary and associated companies. Each subsidiary company is administered by its own board generally consisting of the principal executives engaged in the daily work of such company and of some members of the board of the parent company. With the cessation of trading by the Company, it is thought no longer appropriate to publish a profit and loss account of the company: the consolidated profit and loss account gives stockholders a more informative view of our trading results.

CLYDEBANK'S SUCCESSFUL YEAR

The shipyard and engineering works at Clydebank now operated as John Brown and Company (Clydebank), Limited, have had a successful year. This company has on hand a very large order book covering contracts, some of them for delivery several years hence, with many distinguished clients. Our Clydebank management is making every effort to see that there is no falling back in scheduled deliveries of ships. It is difficult, if not almost impossible, to recover lost time, and any hindrance to production, of whatever nature, seriously affects the earnings of the company, its customers, and its workpeople. Regular, timely and sufficient supplies of steel are essential, both to ourselves and to the many suppliers of auxiliary equipment which we have to instal in the ships we build.

Her Majesty the Queen, accompanied by His Royal Highness the Duke of Edinburgh, visited Clydebank on April 16th to name and launch the Royal Yacht *Britannia*. This vessel is now being fitted out for commissioning at the end of the year. The large P and O liner *Arcadia* is also fitting out and will leave Clydebank not very long after the Royal Yacht.

Good progress has been made in gas turbine development. The first 12,500-kw set has been erected at Dundee. Largely as a result of success achieved at Clydebank in the technique of burning peat, important developments in power generation from peat are to be carried out by the North of Scotland Hydro Electric Board.

We obtained possession at the end of May, 1952, of the works erected by Scottish Industrial Estates, Limited, at Whitecrock in the

borough of Clydebank. An effective staff and working force has now been built up. Primarily the works will serve the needs of the Land Boiler Division, but their size and equipment enables them to undertake efficiently an additional wide range of engineering work. The company concluded an agreement with Riley Stoker Corporation of Worcester, Massachusetts, securing to the Land Boiler Division the use of the technical standards and the resources in engineering design of one of the most progressive steam generating plant designers and builders in the USA. The Land Boiler Division continues to build up its organisation, and continues to be entrusted with further contracts by the British Electricity Authority.

SUBSIDIARY COMPANIES

Wickman, Limited, has had a successful year; but the results of its hard metal business have been adversely affected by tungsten price fluctuations. On the machine tool side, the order book is substantial and new developments in the six-spindle automatic field and in other metal-cutting equipment and processes continue satisfactorily. Webster and Bennett, Limited, now owned jointly by the company and by Wickman, Limited, manufactures first-class vertical boring mills; this company has a large order book and is working substantially to capacity.

Although the profits earned by Fifth Brown Tools, Limited, were considerably lower than the quite exceptional earnings of the previous year, they have been satisfactory. A high level of output has been maintained, but towards the end of the year incoming orders diminished as customers, being able to obtain shorter deliveries of tools, reduced their own stocks before placing orders; this situation continues. Overseas trade in this company's products, beset by import quotas and currency restrictions, has been very difficult.

CONTRIBUTION TO BRITISH AVIATION

John Brown's attach great importance to the contribution they are able to make to the development of British aviation through their shareholding in Westland Aircraft, Limited. By their courageous pioneering, at their own risk, of the S.51 or "Dragonfly" helicopter, and more recently of the larger S.55 machines, Westland have accumulated a volume of helicopter experience unequalled in this country. It is hoped that thereby they will be able to play an increasing part in the great developments of this new vehicle which are certain to occur in the next decade in both military and civil spheres. The technical difficulties of applying a high-powered gas turbine to driving the propellers of a fighter aircraft have been overcome and a squadron of "Wyverns" is now in service with the Royal Navy. Westland's subsidiary, Normalair, Limited, has continued to develop and supply equipment for many aircraft and was also responsible for the oxygen equipment used by the successful Everest climbers.

OVERSEAS

Rhodesian Alloys, Limited, in which we are partners with the British South Africa Company and with Rhodesian Anglo American Corporation, has now commenced the production of ferro-chrome at Gwelo in Southern Rhodesia.

DEVELOPMENT POLICY

It is not, of course, practicable to review in detail the full field of the activities of our subsidiary and associated companies. You will see from what I have said that our interests, which are principally in the field of engineering and the building of engineering equipment, are widely spread. Some of our enterprises are companies with long-established businesses; some we have created from the beginning and have brought to maturity; some are in their early growth and are not yet remunerative. To foster these last, though our most difficult task, is, we believe, the right course for the company's future well-being.

COMPETITIVE CONDITIONS

In most of the industries in which we participate trade has become more competitive, both in price and in delivery. In export markets this is especially noticeable. If this country is to hold these markets and thus maintain a high level of employment, manufacturers must be assured of reasonable stability, both of costs and of supplies of materials. Until this is achieved our export trade will remain under a grave disability in the increasingly competitive markets of the world.

The altering conditions of trade have thrown a heavy load upon our various managements and staffs, to whom we owe a great debt of gratitude for their skill and diligence.

The report and accounts were adopted.

SCRIBBANS-KEMP

RECORD SALES

The twenty-sixth annual general meeting of Scribbans-Kemp, Limited, was held on October 1st in London, Mr H. Oliver-King (chairman and managing director) presiding.

The following is an extract from his circulated statement:

During the year just closed the total sales were the highest in the group's history, but the margin of profit on all goods manufactured by our various companies narrowed considerably.

I am happy to be able to report that our export trade is up, particularly in regard to those two difficult dollar markets—Canada and the USA.

The Barker and Dobson purchase is proving very satisfactory, and is showing excellent results. This is the well-renowned Liverpool company manufacturing sweets and chocolate, and their main difficulty is to meet the heavy demand made upon them for their products.

The profit is £1,556,062 as against £1,370,515 last year—a result which I feel sure the shareholders will regard as satisfactory, considering the uneven trading conditions and the uncertainty of the supply of raw materials. The total tax liability is not far short of a million on the profits earned to March 31, 1953. The total revenue and capital reserves now amount to £4,020,140. The surplus of current assets over current liabilities stands at £3,234,671.

At the time of writing, sugar confectionery sales are well up, although flour confectionery sales do not show the same buoyancy as last year and we may be entering a keenly competitive period. However, the board has every confidence in the future of the business and its expansion.

The report was adopted and the total dividend of 12½% for the year was approved.

THE GENERAL ELECTRIC COMPANY, LIMITED

FURTHER PROGRESS

The fifty-third annual general meeting of the General Electric Company, Limited, was held on September 24th in London.

Sir Harry Railing, the chairman, in the course of his speech, said: After allowing £1,151,000 for depreciation, £58,000 more than last year, and other provisions, we show a profit of £4,230,000 before taxation. Taxation absorbs 69 per cent, and we are allowed to keep 31 per cent of the profit we have earned. During the last six years taxation has withdrawn £18,500,000 from your company's capital, whilst the net dividends paid to the stockholders amounted to £4,150,000.

The directors, after allocating in respect of the Holding Company £800,000 to general reserve, £950,000 to reserve for stock depreciation and £500,000 to reserve for increased cost of plant replacement, and after paying dividends on the preference stocks and an interim dividend of 3½ per cent on the ordinary stock, have recommended a final dividend of 7½ per cent, making 11½ per cent for the year. Our current assets exceed current and deferred liabilities by £25 million, and thus show again the inherent strength of your company.

Your company's activities last year show overall a further increase both in total production and in sales. We continued the uninterrupted progress made each year since the war. These increases were mainly due to the higher output of capital goods, the great demand for which has been maintained ever since the end of the war, and has led to a large volume of long-term contracts.

THE OUTLOOK

The future of every British company in the electrical field depends fundamentally on the progressive development of the world and the part we in Great Britain are capable of playing in it. The field in front of our company and the need for our help is unlimited. The world is crying out for fuller use of existing applications and for research in many fields hardly yet surveyed. The forward march in certain countries, or in certain fields, may be delayed by lack of capital, by artificial restrictions, by adherence to ideological labels, or by ill-conceived demands, but it cannot be stayed. There is no industry from which greater progress is expected than the electrical industry.

Your company will continue, as in the past, with full confidence in its strength and in the possibilities of the wide sphere it covers, irrespective of difficulties in one field or another. Our confidence is based on past performance and on the assets and facilities which we have created.

We have a reputation for quality second to none. Our conservative policy has built up a reserve of £22,500,000 and an excess of total assets over liabilities of £40 million. We have expanded in all fields of heavy engineering, cable and communications, and thus created a capacity which enables us to take our proper share of the demand for capital goods; we are equipped and determined to maintain the leading position due to us over the complete range of domestic equipment and our predominant position in lighting.

Given that understanding of unity of purpose, which has always existed in the GEC, I am confident that in the future, as in the past, we shall make our full contribution to any tasks which may face us.

The report and accounts were adopted.

FODENS LIMITED

The fifty-first annual general meeting of Fodens Limited was held on September 30th at Elworth Works, Sandbach. Mr James Wild, the chairman, said in his report:

The turnover this year is well in excess of last year, with a resulting increase of £59,553 in the gross profit after providing for depreciation.

The introduction of the excess profits levy has had the effect of increasing the company's total taxation liability to such a degree that, whilst our gross profit is greater than last year, our net profit, after taxation, is £18,631 lower. The taxation liability is approximately 70 per cent of the profit as compared with 60 per cent for the previous year.

In addition to our usual range of transport vehicles, the "Foden" heavy duty dumper truck has been developed to work under most arduous conditions. The output of the "Foden" two-stroke engine has increased considerably.

Our export trade has been steady, although still impeded by adverse legislation which is holding up a number of orders.

Our subsidiary company in South Africa has enjoyed another successful year's trading.

Regarding the outlook for the future, it is difficult to forecast, but we have a satisfactory and healthy order book, and prospects for the current year are encouraging.

There are signs of increasing competition. We face this competition, however, with every confidence in our ability to secure a full share of the available business.

Finally, I wish to refer to the good relationship between management and employees, and to thank them all for their good work.

The report was adopted.

A. LEWIS & CO. (WESTMINSTER), LIMITED
MULTIPLE TOBACCONISTS

The twenty-fourth annual general meeting of the company was held on September 29th, and the following are extracts from the statement of the chairman, Mr P. L. Fleming, circulated with the accounts for the year ended March 31, 1953.

In the years when the Tobacco Duty was being stepped up from 9s. 6d. to 58s. 2d. per lb, our turnover, measured in weight, used to drop sharply after the Budget and then recover. Last autumn, however, the suggestion was made that smoking has a serious effect on health. This suggestion is always being made and never proved; but on this occasion it received more than usual publicity and consumption fell sharply. The temporary drop left it 3 per cent down on the year, with the result that trading profits declined from £197,097 to £181,192.

With most other retailers the margin of gross profit bears some relation to the cost of selling the goods, but on proprietary brands of cigarettes and tobacco the margin is quite insufficient to carry the cost of selling. That is why we are seeking to use our shops to sell a wider variety of goods in addition to the fancy goods associated with smoking; and when sweets came off ration in March we lost no time in adapting some of our branches to the handling of sweets in conjunction with tobacco, and we have already re-equipped 24 of them. The results, so far, are most encouraging. We are making strenuous efforts to adjust ourselves to the changing conditions in our trade and, while we think our profits have now reached the low ebb, we cannot recommend a final dividend of more than 15 per cent, making 30 per cent for the year.

The report and accounts were adopted.

MUREX LIMITED

EFFECT OF RAW MATERIAL PRICE FALL

The thirty-fourth annual general meeting of Murex Limited was held on September 30th in London.

Sir Arthur Smout (the chairman) presided, and in the course of his speech said: Special mention was made in the last two annual reports of the artificial character of part of the profits, which arose fortuitously on the turnover of stocks purchased at prices below replacement cost. The board prudently set aside out of the profits of those years, after provision for taxation, £500,000 as a specific stock contingency reserve to meet losses that were bound to arise as the abnormally high prices of certain raw materials returned to more normal levels. The past year was quite different; the pendulum swung, as was to be expected, in the opposite direction. There have been welcome reductions in the prices of wolfram, copper and other raw materials which form a substantial part of the company's operations, and losses of an abnormal character were incurred on stocks necessarily carried.

These losses amounted, before taxation, to about £250,000, compared with fortuitous profits in the previous year of nearly £500,000. Thus, of the decrease of approximately £900,000 in trading profits for the year nearly £750,000 is of a fortuitous nature.

Last year the board set aside £400,000 for the replacement of fixed assets and they have added £150,000 to this reserve out of the profits of the year towards the full replacement cost of buildings, plant and equipment. After making these appropriations and providing for the annual dividend of 15 per cent on the ordinary stock, which we recommend, the balance of the available group profits (£182,000) has been transferred to general reserve.

We are by no means through our programme for the modernisation, improvement and expansion of our buildings, production plants and services, and further authorisations of capital expenditure will be made whenever there is real necessity, and where the expected economic benefit to be derived from such expenditure is justified. The board anticipates that the present programme of future capital development will be met out of earnings and that falling prices of raw materials will reduce working capital requirements.

GRATIFYING INCREASE IN OVERSEAS TRADE

The company is principally a supplier of specialised metallurgical and engineering products to the ferrous and non-ferrous industries in the United Kingdom, and its fortunes are, to a large extent, dependent on the activities of those industries.

While there was a gratifying increase in our overseas trade during the year, particularly in the dollar areas, exports of the parent company's basic products are unlikely to show any significant overall expansion.

We are constantly striving to improve our manufacturing processes and to extend the range of our products to meet the widening demands of modern industry, and the company's research department is in the forefront in the study and application of science to our industry.

Your board is confident that the company will continue to obtain its share of business offering and that the outlook will improve as industry adjusts itself to changing world conditions.

The report was adopted.

COAST LINES, LIMITED

INCREASED PROFIT

The fortieth annual general meeting of Coast Lines, Limited, was held on September 29th in London, Capt A. R. S. Nutting, OBE, MC, chairman, presiding.

The following is an extract from his circulated statement for the year 1952:

The consolidated profit and loss account shows that the trading profit for the year amounted to £1,580,624, an increase of £215,987 over the figure of the previous year's account. I regard the increase in the trading profit in 1952 as a tangible result of years of effort by your board to establish a flexible group organisation able to act quickly in changing circumstances so as to use the total tonnage at our disposal economically and with full regard to our shippers' requirements.

The net profit of the company and subsidiaries amounts to £790,147, against £467,306 in the previous year. The final dividend we recommend on the ordinary stock is 5 per cent, making 7½ per cent for the year, against 6½ per cent for the previous year.

The total number of vessels owned by the group at the end of 1952 (excluding trawlers) was 112. Our various freight services round the coasts of Great Britain and with Ireland, the Channel Islands and the Continent were satisfactorily maintained throughout the year with due regard to their normal regularity.

So far as the current year is concerned, those difficulties still remain, but there is no doubt in my mind that they will continue to be met as they have been in the past, and I am hopeful that we shall be able at any rate to maintain our position in 1953.

The report was adopted.

CELLACTITE & BRITISH URALITE

MR GEORGE V. PARKER'S STATEMENT

The annual general meeting of Cellactite & British Uralite, Limited, was held on September 29th at Higham, Kent, Mr George V. Parker (the chairman) presiding.

The following is an extract from his circulated statement:

The accounts disclose a trading loss of £37,062. At the beginning of last year we were fully justified in maintaining the progressive programme, based upon our increasing trade of the last few years, but the lower turnover, due to the decline in the demand for our products, and lower selling prices to meet intensified competition, entirely upset our profit ratio.

Let me remind you that we are manufacturers, and our chief raw materials are imported from overseas, for which we have to budget many months ahead. Moreover, many of our asbestos-cement products have to mature before going into stock. On the other hand, many of our customers, chiefly for financial reasons, do not now buy for stock, but only as and when they have definite orders. To ease the position your directors recently decided to cease production of both flat and corrugated asbestos-cement sheets, and concentrate on the manufacture of Urastone, rainwater, flue goods and ducting of which, in the art of manufacture, we are without equal.

I cannot attempt to forecast the future as up-to-date deliveries are still disappointing. All I can say is, that every effort is being made to bring about a more satisfactory state of affairs. In this I feel we shall succeed.

The report was adopted.

PURCHASING OFFICERS ASSOCIATION

NATIONAL CHAIRMAN'S REPORT

At the annual general meeting of the Purchasing Officers Association, held during the twenty-second National Conference at Brighton on September 26, 1953, the retiring National Chairman, Mr F. J. White (Chance Brothers, Limited) reported a year of progress and expansion in the Association's work of increasing the national recognition of the importance of efficient purchasing and advancing the professional interests of buyers in industrial and public undertakings.

Membership had increased from 2,900 in 1952 to a present total of 3,300.

New Branches and Groups had been formed in four centres, and now numbered 41; and the Branches in Australia and South Africa had made notable progress.

The Education Scheme was progressing favourably. The number of registered students had increased by 75 per cent during the year, and the number of colleges throughout the country holding courses for the Association's final examination had risen from seven in 1952-3 to twelve in the 1953-4 session. A new development was the formation of student societies throughout the country.

The Association's monthly *Purchasing Journal* had made further strides, while the weekly *Purchasing Bulletin* had increased its circulation by 20 per cent.

At the conclusion of the Conference Mr H. H. C. Wood (Igranic Electric Company, Limited) and Mr J. Ferguson, BSc(Tech) (United Ebonite and Lorival Limited) were elected President and National Chairman, respectively, for the year 1953-4.

THE BRITISH HOMOPHONE COMPANY, LIMITED

MR J. LESSER'S SPEECH

The annual general meeting of this company was held on September 30th in London.

Mr J. Lesser, chairman and managing director, in the course of his speech, said: The profit of the group for the year under review to March 31, 1953, was lower than last year, being £33,949 as against £42,168. Consequently the taxation charge for this year is correspondingly lower, the profit after taxation being £14,393 as compared with the previous year's figure of £17,078. The consolidated balance sheet continues to show a strong and healthy position.

As I stated at the last annual general meeting your subsidiary company—Ebonestos Industries Limited—in common with other concerns in the plastic moulding industry, was experiencing a recession in trade. To a period extending to within the last month or so conditions had become progressively more difficult and it was increasingly difficult to work on an overall profitable basis. However, since last month there have been some signs of a revival of demand which we hope will persist and enable us to report better results for the later part of the current trading year.

The British Homophone Company is engaged in a more specialised type of business, which is not subject to the peaks and troughs in trading conditions as is your subsidiary company. We are glad to be able to state that the Homophone Company is maintaining its trading profit since the termination of the year under review.

The report was adopted.

PALESTINE ELECTRIC CORPORATION

VISCOUNT SAMUEL ON NEGOTIATIONS WITH GOVERNMENT

The thirtieth annual general meeting of the Palestine Electric Corporation Limited, held on September 30th in London, The Hon Viscount Samuel, PC, GCB, GBE, chairman, presiding.

The following is an extract from his circulated statement:

Sales of electricity in 1952—638 million kwh—represented an increase of 106 million kwh, or 19.8 per cent over the sales in 1951.

Our directors made strong representations to the government regarding the inadequacy of the rates introduced in July, 1952. After negotiations, new rates were approved and brought into force, as from January 1, 1953. The Corporation is now operating at a profit and should be in a position to resume payment of a dividend.

The Corporation has in recent years made enormous efforts to meet the ever-increasing demand for electrical energy. It is proposed to construct a new power station in the South

to house generating plant with a capacity of 140,000 kW, part of which is already on order. The generating capacity of the undertaking is thus expected to reach 370,000 kW by 1956.

PROBLEM OF FINANCE

The further expansion of the electricity supply is a matter of primary importance in the economic life and development of the country, which concerns greatly both the government and ourselves. As the cause of the present difficulties in raising capital for the financing of such expansion lies entirely beyond the control of the Corporation negotiations have been conducted with the government as to the best practicable solution of this problem. As a result of these negotiations Heads of Agreement have been reached in which are embodied the following financial terms:

(a) The government to provide the finance required for the expansion of the undertaking and to receive against such finance shares of a special class in Israel currency denomination, to be known as "B" ordinary shares, which rank for dividend after the ordinary and "A" ordinary stock and shares.

(b) The government to guarantee the fixed dividend on the preference and second pre-

ference stock and an agreed dividend on the ordinary stock and shares and "A" ordinary stock of the Corporation, and to provide the sterling necessary to pay such dividends.

(c) The government to have an option within an agreed period to purchase the ordinary and "A" ordinary stock and shares of the Corporation at a price in sterling to be agreed upon, or, failing agreement, on the basis of the net sterling value of the undertaking as assessed by independent valuers.

(d) If the government do not exercise their option, the holders of the ordinary and "A" ordinary stock and shares to receive "C" ordinary shares, in sterling denomination, to an amount equal to the difference between the paid-up capital and the value of the assets according to the above-mentioned valuation. The holders of the ordinary stock and shares to have also the right to give notice to the government requiring the latter to purchase all the ordinary, "A" ordinary and "C" ordinary stock and shares.

As soon as the final documents are completed and any assents that are requisite have been obtained, an extraordinary general meeting will be called to pass the resolutions necessary to carry the agreement into effect.

The report was adopted.

ASHANTI GOLDFIELDS CORPORATION LIMITED

NOTICE IS HEREBY GIVEN that the Board of Directors have today declared an Interim Dividend (No. 114) on the Issued Capital of the Corporation at the rate of 9.6d. per Unit of Stock, less Income Tax at 9s. in the £. Retreat to What?

ON the last morning of the Labour party conference Mr David Low's cartoon in the *Manchester Guardian* showed the Labour leaders in the style of Napoleon's Grand Army of 1812, on the way back. The drawing was called "Retreat to Liberalism." Of the retreat there is no doubt. The upshot of the conference's debates on nationalisation is that socialist doctrine has been set aside. It is true that the withdrawal may not be permanent. Certainly the left wing of the party hopes to lead it boldly forth again another day. But that, if it comes at all, is some way off; at the earliest, it will be the next general election but one before the British people are again invited to endorse a specifically socialist programme. At the next election, Labour will offer itself as an alternative government committed to only one old-style act extending national ownership of the means of production—and that, since the production involved is water, can hardly figure prominently among election issues.

The question is where Labour is retreating to. Mr Low's answer probably expresses what is widely felt. Certainly it is what most people of middle opinions—people who are neither socialists nor convinced adherents of the Tory party—would like to believe. It recalls the days, twenty and thirty years ago, when radicals of good will felt impelled to join their cause with Labour's as the only practicable way of fighting the entrenched Tories who seemed to be letting the happiness, prosperity and safety of these islands slip away. If the Labour party really is now turning to liberalism, many honest men may feel with relief that after all their prewar and wartime politics have been justified. The retreat would fit into an historical pattern, and that in itself is a powerful influence making men believe that it is happening. There are many other influences. Nothing would do more to revive optimism in this country—to restore confidence about the health of its politics and the virility of its economy—than the restoration of a left-wing party acting on positive principles of progressive liberalism. Nor, it may be added, would anything so much encourage the friends of Britain abroad: if most of them have of late years been appalled by the defeatist restrictionism of socialist policy applied to foreign trade, few have ever been happy about the face that British Conservatism usually presents to the world. A retreat to liberalism in the Labour movement of Britain is a thought to conjure with, to quicken pulses and generate new hopes, throughout the free world.

There are good excuses for letting the wish father the thought. The conference at Margate last week certainly expressed a change that reflects greatly to the credit of those responsible for it. But what, in sober fact, is the change? There is no exaggeration in saying that a year ago Labour was failing in the first duty of an opposition. It could not be taken seriously as an alternative government. The left wing was making all the running, and its policies, domestic and external, had every mark of rashness, spite and irresponsibility. The

more moderate party leaders were, indeed, putting up some fight; but they themselves seemed to believe that they could retain control of the party machine only by fitting themselves to the mood of the rank-and-file and accepting the policies of the Left. To keep the Bevanites out of the whole party had to embrace Bevanism.

That, if it had been left to the politicians, is how things might stand now. But Mr Deakin and other trade union leaders said No to the sweeping measures of nationalisation that the Morecambe conference declared for last year. Mr Attlee and the politicians accordingly found their courage, or were driven to it, and this year's conference has registered their success. It has stabilised, for a time, a balance of power within the party. Mr Bevan and his friends are there as counter-weights to the union leaders, but it is nevertheless perfectly clear that the right wing of the party is on top. Labour policy is restored to the comparative moderation of 1950 and 1951. This, achieved despite all the leftward pulls to which an opposition is subject, is a very considerable triumph for the realists. While the divisions of opinion within the party remain real, the Margate conference has done much more than paper them over. It has established a truce and a compromise that have some chance of lasting not only through this Parliament but also through the next. And that, as political parties go, is not too bad.

★

All this is important and welcome, but is it really a movement to liberalism or, indeed, to any positive new outlook at all? It should be said that in spirit, in the emotive associations of its phrases rather in anything tangible, the new policy of the Labour party is in truth even less socialistic than the equally cautious programmes of 1950 and 1951. In the interval, disillusionment about state ownership has become stronger, while some sections of Labour opinion have grown more conscious of the virtues of private enterprise. But the result is to revive caution about further nationalisation, not to substitute a new economic doctrine for it. The Margate policy is to go back to 1950 by restoring the nationalisation of steel and road transport that the Conservatives are undoing. For the rest there is, in precise form, only water; but there is also, in place of the sugar and cement proposals of 1950, an intention to have some form of partial state ownership in some sections of the chemical and other industries. If it may fairly be said that socialist plans for continuously expanding the area of state ownership have been put on the shelf, they still weigh far too heavily on the Labour conscience for any active non-socialist policy to take their place.

In other matters the retreat from traditional socialist attitudes is less definite. On education, as is argued in another article in this issue, the cruder sort of egalitarianism colours a confused and probably very damaging set of ideas. Again, the party has committed itself to increasing all social security benefits every year if prices have risen, in order that their real value should

never be reduced. This would create a rigid first charge on the economy that hardly smacks of liberalism. Indeed, on social policy generally, on controls and foreign trade and financial policy, the "Challenge to Britain" echoes most of the traditional emotions and nostrums of the socialist Left.

This does not signify much. The policy statement is of the kind that can mean all things to all men. It need not prevent the practice of another Labour Government from being pretty cautious on most things besides nationalisation. The right wing has fought its battle on that particular issue, which is the most distinctively socialist; and, having won, it can, if it keeps the initiative, widen the area for caution at its discretion. This is the real nature of Labour's retreat. It is just a retreat, not a retreat to anything. The charitable way to put it is to say that Labour policy has become avowedly empirical. The party conference has in effect agreed not to tie the leaders' hands. Labour will now appeal to the electorate less on a specific programme than on a general promise to do its best in some vaguely radical direction. The next general election will be presented as a choice between cautious empiricists.

It is on this basis that the Labour party now has to be re-assessed. What would be the empirical policies of its leaders, as they have now established the balance of power among themselves, if they returned to office, say, next year? The evidence on which to judge is slight. The Labour party has turned to empiricism not because it wants to but because it cannot find anything else. It is not retreating to any prepared lines; it has no new doctrine. It has reached not liberalism but almost a vacuum. And with this the idealism that used to inspire the Labour movement, the constructive urge to right the wrongs of the underdog, has largely disappeared. This is the real price of Labour's disillusionment. And what, after the idealism, survives? Certainly not any clear conviction. It must regretfully be said that if there is one motive that remains to give life and consistency to Labour politics, it is envy: it is resentment against all those who have more than others for any reason.

That does not condemn Labour out of hand. It may also be said that the main impulse within the Conservative party is the desire to defend what privileges are still intact. The difference is that nowadays no one really feels that the defence of privilege is respectable, or even to any great extent practicable, and therefore the politicians do not try to do much about it. But it is still relatively easy to dress mere destructive spite in a cloak of high principle. The danger of the new empiricism on the Left is that it provides plenty of scope for spiteful policies to fill the vacuum, not from deliberate intent but for lack of anything else. It may be hoped that the party leaders who have won so great a victory for caution can also make themselves proof against such tendencies. But it will be difficult to believe so unless the new realism is quickly reflected in a more constructive policy in opposition.

Security for Russia

MR DULLES'S remarks on Tuesday about security guarantees to Russia have given the problem of peace a refreshing twist. The idea is not novel. It was not new when Sir Winston Churchill first gave it authoritative expression in his famous speech of May 11th, and since then a number of other voices have been raised in support of variants of the same general notion that, if peace is to be brought to Europe, it is not the western nations alone, but the Russians also who need to have their security assured. M. Maurice Schumann, the French Deputy Foreign Minister, blessed the idea in his speech to the General Assembly of the United Nations; Dr Adenauer, with all his new authority, has spoken in much the same sense; and Mr Adlai Stevenson, reporting on his world tour, commended it to his countrymen. But what lends the subject its new importance is the revelation that it is being taken seriously in Washington. Whether it is being taken seriously as a promising means to a genuine settlement is less certain. But if the Russians were to reject this approach as they have rejected so many others, there would be the alternative advantage of demonstrating that it is not after all American rigidity that blocks the way to peace—a demonstration to the urgent necessity of which American official eyes seem at last to be wide open.

The form that any such guarantee of Russian security could take is still quite vague, as Mr Dulles admitted. Sir Winston Churchill's suggestion of last May was of a Locarno-type treaty—that is, of a non-aggression pact between two or more neighbouring states countersigned and guaranteed by other powers. Dr Adenauer's version is that the European Defence Community, when it is constituted, should join with the United States, Britain and the Soviet Union in a set of mutual non-aggression guarantees, each party undertaking to come to the aid of any that is attacked. A variant of this that is apparently under examination in Washington is that there should be five parties to the treaty, America, Britain, France, Western Germany and Soviet Russia. Still another proposal, which is really to be regarded as an adjunct of any of the foregoing, is that there should be a demilitarised zone between East and West.

That minds are turning in this general direction is all to the good. It has long been clear that if the present period of tension between the great powers is to be brought to an end quickly and peacefully it can only be by some form of bargain between them, and a bargain cannot be struck without some advantage to both parties. Hitherto the difficulty has been to see what the West was prepared to offer. A bargain still seems a very long way off, but it is at least helpful that minds are beginning to turn to the contemplation of the fact that a bargain requires some give as well as take.

The new concern with Russian security is thus welcome on every count. But before optimism runs riot,

it is as well to realise that one formidable obstacle stands in the way. The various differing forms that a security proposal might take would each raise their special problems; but they all also share in one preliminary difficulty, which can be put in a single word—where? Every proposal of security—unless it is of the disembodied and futile Kellogg-Briand variety—comes down to a promise, backed by guarantees, not to send troops over a stated line drawn on a map. If Russia's security is to be guaranteed, where is the line?

The difficulty can be seen at its clearest in the proposal for a demilitarised zone. Where is it to be? Is it to include Western Germany? Surely not, for that would be to abandon the European Defence Community, and it is certain that neither the American nor the British nor the German Government would agree to that. It would be to accept after all the neutralisation of Germany against which so many diplomatic battles have been fought and so many notable victories won. But if the demilitarised zone is to be east of the Elbe, it is to be wholly in territory that is now held by the Soviet Army, and where is the gain to Soviet security in any such proposal?

★

The same problem arises in only slightly less obvious form in the various proposals to guarantee frontiers. Which frontiers? Clearly the Russians are not likely to be interested in the offer to guarantee the western frontier of the Soviet Union itself, for the omission of all the satellites would seem to them to be tantamount to a confession that the western powers had designs on them. (What would Britain think if Russia guaranteed the inviolability of the shores of England but refused to give any guarantee to Holland, Belgium or France?) But once the argument turns to the question of guaranteeing any of the frontiers that the Red Army drew in Eastern Europe, it raises some very awkward questions indeed. Are the Western powers prepared to guarantee the frontier of the Communist Empire on the Elbe? Certainly no free German statesman will bring himself to admit the justice of the Oder-Neisse frontier, or even

THE IRISH ECONOMY

Recapturing Lost Opportunities

Page 139

to abandon the hope of altering it; the most that he might conceivably promise is not to try to alter it by force, and it is questionable whether the Russians would put overmuch confidence in such a qualified undertaking. Even apart from the German attitude, which is central to the problem, the western powers themselves might well hesitate before they formally recognised the permanence of the Russian conquests in Eastern Europe. Is it in accordance with their professions of justice to acquiesce in the repression of whole nations which there is every reason to believe would escape from the Russian yoke if they could? Is it in their self-interest to accept as permanent so great an aggrandisement of so menacing a rival? Mr Dulles's talk, during last year's election, of "liberating" the satellites raised a howl of dissent in Europe. But can he—would even his critics—run so far to the other extreme as to ratify their enslavement? Yet without doing so can any security be

offered to the Russians that would seem to them attractive enough to form part of a general settlement?

This is not a question that anybody ought to rush into answering without deep thought. A real release from the nightmare in which the world is living would be worth a very heavy price indeed. But is a price that revolts conscience ever worth paying? In a democracy, can it ever be offered? For the moment, only two things can be said with any certainty. The first is that very little, if any, progress can be made with a sincere offer of security to Russia until the western nations have cleared their minds about what they propose for Eastern Europe. And the second is that nothing but good can result if public debate is now to be focused on this issue which has been consistently dodged in the West ever since the end of the war, and which lies very close to the centre of the problem of peace in Europe.

Second Thoughts on Education

IT is difficult to understand why the Labour Party is so frightened of its own educational achievements. They are both revolutionary and rewarding, and yet not a syllable was said in their praise in the Labour Party statement of policy "Challenge to Britain"; hardly a voice applauded them at the Labour conference at Margate last week. The Labour Party cannot claim to have been the sole agent of securing free secondary education for all in the Education Act of 1944, but it was responsible for the ambitious development plans for secondary education that are now maturing. It was a Labour minister who vastly extended the system of university awards. These revolutionary changes were unrecognised at Margate.

Fortunately, the conference overthrew the crassest of the proposals in "Challenge to Britain" for an educational counter-revolution, which would have abolished the grammar schools, kept all children together up to the school-leaving age, and then moved on all those who stayed at school after 15 into one class of high schools. In its place the conference accepted an amendment which reasserted the party's predilection for comprehensive schools within the framework of the existing system, and even added a new and illuminating argument in their favour:

Access to a variety of courses and opportunity to work alongside children of higher cultural standard may itself be an important educative factor at the secondary stage.

Compared with the proposals in "Challenge to Britain" even the comprehensive school is a reversion towards orthodoxy. And it was apparent from the temper of the conference and the speeches made that for some delegates even this was too radical. The critics of the comprehensive school secured a good hearing, and when

Miss Jennie Lee set out to attack Mr Gaitskell's suggestion that it would be a good thing to get working-class boys into the public schools (which is about as far removed from the comprehensive idea as can well be imagined) her criticism was ill received. Perhaps the tide is turning against excessive egalitarianism.

However this may be, the Labour party remains pledged to the comprehensive school. It is alarming that the party's executive committee, which was responsible for framing the policy statement of "Challenge to Britain," was willing not only to propose that the grammar school be submerged in the *omnium gatherum* of the comprehensive school but even to subscribe to the total extinction of advanced or grammar school teaching before the age of fifteen. All boys, however poor their parents, are now for the first time enjoying equal opportunities of a university education in direct competition with the public schools. Great imperfections still exist, but vigorous administrative action could extinguish many of them and even in eight years the prospects before the working-class child have become immeasurably brighter. Yet the system by which this has been achieved, much of it directly to the Labour party's credit, is to be swept away. Why?

The explanation is possibly to be found in the familiar fact that the world changes much more quickly than the human mind. Those members of the Labour party who now influence policy were educated thirty or forty years ago, either (exceptionally) at public schools or (more usually) at elementary schools. At that time the state secondary school could easily be overlooked by the former; and by the latter it tended to be regarded (and with some justification) as the preserve of the middle classes. Times but not persons have changed.

Furthermore, the influence of the middle-aged elementary school teachers on Labour party policy is strong, and these tend to harbour an inextinguishable prejudice against schools in which they were debarred from opportunities to teach and against the universities they were too poor to enter. To these pressures may be added the over-developed consciences of the party's intellectuals who, while straining every nerve to send their own children to expensive public schools, bend over backwards to support a troglodyte egalitarianism. It is hardly surprising that the Labour party's approach to education is more emotional than objective. In a year when, on the main issues of economic policy, the party was struggling back to realism and common sense, it was perhaps inevitable that emotionalism should boil over in the field of education. It may well have done the party's electoral prospects considerable harm, for it is precisely in what may be called the "grammar school class" that the floating voter is to be found in his heaviest concentration.

★

The indignation that Labour's educational antics have aroused should not, however, be allowed to obscure the fact that the issues raised in the debate are real ones. There are serious defects in the educational system which call for careful study. If they cannot be remedied simply by ironing out all differences, they do nevertheless call for more careful treatment. One of the obvious defects of English education is the great divide between the public schools and the state schools, which splits one people into what Disraeli long ago called two nations. This is a state of affairs which exists hardly anywhere else on earth and the inhibitions to which it gives rise are unquestionably a source of weakness to the community. Another valid criticism is that levelled against the entrance examination to the grammar schools that is taken at or about 11 years old. It is wrong that so much in after life should be determined so absolutely by a child's performance on a single occasion at so early an age. And thirdly, it is an unfortunate fact that the ratio of grammar school places to the child population varies from perhaps 10 per cent in some areas to 30 or even 40 per cent in others, and that the opportunities open to a child are thus very unequal and depend on accidents of residence. In the immediate present this is a very real objection to the existing system of selecting children for grammar schools, but it does not lead irresistibly to the abolition of all grammar schools. It would be much simpler and cheaper to build more grammar schools in the ill-provided areas, or to experiment with comprehensive schools designed as such, particularly in districts that cannot fill a fair-sized grammar school.

The problem of the public schools is much more difficult to deal with. They may be an anachronism, but an anachronism that is very much alive. The length of the waiting lists, in spite of the crushingly high

burden on parents' pockets, is evidence of the esteem they enjoy, and it is pure fantasy to say that so many otherwise level-headed people will put themselves to so much trouble for reasons of snobbery. There is no doubt that the education the public schools provide is the best available; the record of university open scholarships is proof of this, if proof were needed. That this is coming to be more widely appreciated in the Labour party was shown at Margate. Not only were the resolutions which visualised the capture of the public schools or of their pupils by the state system withdrawn; Mr Deakin came out warmly in support of Mr Gaitskell's proposal that half of their places should be thrown open to competition, presumably at the public expense.

This clearly is the right direction of advance—a middle course between those who want to destroy the public schools and those who think they can survive for ever unchanged. Indeed, the obvious precedent exists in the universities. Two generations ago, Oxford and Cambridge were almost as completely the strongholds of the privileged classes as ever the public schools were. And yet a transformation has been effected that is as nearly complete as it has been nearly painless. With the public schools, as with the universities, the essential thing will be to preserve two freedoms: the freedom of these educational institutions to govern themselves judicially and independently, without dictation from elected authorities who cannot help but be ignorant of their nature and might easily be prejudiced; and the freedom of the parent to buy for his children, if he chooses to do so, an education better than the state provides.

★

Both of these principles are recognised by the present relationship between the universities and the state, and there is no inherent reason why they should not equally be preserved in the gradual development of relations between the public schools and the state along the lines that Mr Gaitskell presumably (for his intentions were not made quite clear) envisages. There would be plenty of practical difficulties, some of which Miss Bacon herself pointed out. A system of selection which gives to a few children an education worth £350 a year at public expense is open to objections. The "creaming off" of the brightest children is not attractive to the local authorities, and the selection only of "problem children" is rejected by the public schools. And there is always the danger that public money might be used to bolster up second-rate schools which are hardly worth preserving. These are real obstacles, but they can surely be overcome on the one condition that the problem is approached in a constructive spirit of mutual respect. If Mr Gaitskell's spirit is typical of the Labour party, there are many far-sighted men in the public schools who will be ready to come half-way to meet the reformers. Unfortunately, the face that the party most usually presents is that of Miss Jennie Lee's unreasonable hostility and destructiveness. If that persists, the opposition will merely harden.

The problem of the examination at eleven plus resembles that of the public schools in one respect: its peculiar difficulty arises from the fact that social distinctions are created by educational decisions. And as the number of children who are affected is very much greater, it is unquestionably the more urgent of the two. In both cases, also, the outline of a constructive solution is the same—it is not to pretend that there is any merit in educational uniformity, but to remove, or at least lessen, the social consequences that follow from the drawing of quite proper educational distinctions. After all, even in a comprehensive school, there would have to be tests to separate the different “streams.” Educationists appear to be agreed that only about 20 per cent to 25 per cent of the school population can fully benefit from the type of education now provided in grammar schools. There are, in fact, many children in grammar schools now who would be happier elsewhere, and few children in the secondary modern schools in well-provided areas (to whose level the deficient areas should be progressively raised) who ought to be in grammar schools. Efforts to improve the selection methods should not be relaxed, but it would be madness to throw away the whole grammar school system because the selection is imperfect.

The whole controversy is really a matter of priorities.

Scandinavian Insularity

THE present condition of the Scandinavian countries cannot be regarded by their friends in the West as either strategically or politically reassuring. If this state of affairs has led to very little expression of disquiet, it is mainly for two reasons: first, preoccupation with the more obvious problems of Germany and France, and second, a habit of taking the northern countries for granted. Scandinavia's reputation for stability and restraint, and the normally unexciting course of its political life, involve the area in some danger of oblivion. In recent years, the rare incidents that have made it a temporary centre of interest have mostly been military ones, such as naval manoeuvres in the Baltic or the arrival of Polish aircraft on Bornholm. It is, indeed, the military planners who are most painfully conscious of the problems presented by Scandinavia; the recent visits to Denmark and Norway by General Gruenther and Field Marshal Montgomery, as well as the emphasis laid on the northern waters in current Nato exercises, bear witness to this.

Nato's concern over weaknesses in its northern sectors is understandable. When compared with the size of the geographical and physical task, the manpower and arms available for defence in the huge area between the North Cape and the Kiel Canal are clearly inadequate. There is room for differences of opinion whether small nations like Denmark and Norway could

The Labour party, in its hatred of real or supposed social differences, wishes to suppress for as long as possible the unquestionable fact that human beings are born with real differences in intellectual ability; it prefers a system of “equality” on one flat level to the system of “equality of opportunity” which it has itself largely created. Is it that equality of opportunity reveals all too early that children are not equal and that the possession of brains creates differences as great as those of wealth? Is it that the party of the common man wishes to deny the existence of the uncommon man? Yet the interest of the country is surely to select and educate those with the highest intellectual endowments, for which its educational system is already highly adapted. Very great progress has already been made in the last few years in raising the standards of education provided for those who are not selected for the grammar schools. It is not chimerical to suppose that if this rate of progress is maintained (especially if building becomes easier), “parity of esteem” will be reached within a generation—or at least a sufficient degree of it to take the edge off the social frustrations that now exist. Is it not far better to press on with this programme than in a fit of jealous impatience to destroy the main foundations of what has already been achieved in the transformation of English education?

make a substantially greater effort for their own defence. (Nato's third Scandinavian member, Iceland, is strictly non-combatant.) Individual geographical difficulties must be considered. Norway has to contend with great distances, a sparse and scattered population, and a single, exposed line of communication; Denmark, with the vulnerability of dozens of flat islands bunched within easy striking range of a potential attacker. But it is obvious that a further, artificial difficulty has been created by these two countries' reluctance to have any allied forces based on their territory.

The trend now is not towards, but away from, a solution of this problem. Whatever the precise result of next week's elections in Norway, that country's consistent exclusion of all possibility of Nato bases is the policy least likely to be affected. Meanwhile, the chances of allied air bases being established in Jutland have been sharply reduced by the return to power in Denmark last week of a Social Democratic government whose leader, Hr Hedtoft, declared on Tuesday that to accept bases was not expedient at present.

It would be going too far to see in this any clear movement in Scandinavia away from the essential aims of the Atlantic Pact. The two Social Democratic parties which took Norway and Denmark into the pact, and the right-wing and centre parties which have always sup-

ported it, still command the votes of an overwhelming majority of the two electorates. But some modification of mood may be detected. It must therefore be asked how far this limited, but hardly encouraging, trend reflects the impact on Scandinavia of the new tactics of the Soviet government.

Moscow's “new look” has undoubtedly made some mark in the north. It affected the Danish election campaign, and also—but less obviously—the Norwegian one, now reaching its quiet climax. Throughout Scandinavia, where the idea of a European army evokes little enthusiasm and the German Social Democrats have many contacts, belief that Russia is now more disposed towards a general settlement has gained ground. At the same time, it is noteworthy that Malenkov and Molotov have paid little direct attention to Scandinavia itself. The impressive, if empty, gestures of good will scattered in so many other directions by Stalin's successors have had no obvious counterpart in the north. Two interesting exceptions to this rule have been the hints that Scandinavians might be the first to benefit if Intourist facilities were restored in Russia, and the restoration of train-ferry services from Sweden to Berlin by way of the formerly prohibited Rügen island; but neither of these can be granted much significance.

Yet the negative character of the current Soviet attitude towards Scandinavia is interesting in itself. Stalin's postwar policy in this area embraced a series of truculent notes addressed by turns to Norway, Sweden and Denmark; the shooting down of Swedish aircraft over the open Baltic; repeated seizures of Danish and Swedish fishing vessels; demonstrations by the Soviet air force over Bornholm; intensive and often barely concealed espionage in Sweden; and the maintenance of a firm grasp on Finland, including the exaction of a far-reaching “mutual defence” treaty in 1948. Against such a background, the present lull has a significance of its own. It has, perhaps, made the greatest impression on the Finns, who were inclined to regard Stalin as better disposed towards them than other Soviet leaders, and learnt of his death with some unease; but the other Scandinavian countries, too, have taken the point.

Will this Baltic calm last? It is arguable, of course,

that the new masters in the Kremlin have been too busy with their many more urgent problems to turn their attention to an area where they have no immediate objectives to gain. Again, concessions to the Scandinavian countries are hardly a necessary part of Malenkov's plans. There is, moreover, little to concede in the area; Finland has conscientiously paid off its reparations, and these cannot, therefore, be now remitted, while the other northern nations have taken care to avoid embroilment with Russia at any point. It may be taken for granted that Moscow has never contemplated any such step as relinquishment of its new bases at Porkkala, near Helsinki, or Petsamo on the Norwegian frontier; gestures of good will are one thing, but strategic positions another, in Soviet eyes.

There is, however, good reason to suppose that Malenkov's inaction as regards Scandinavia represents a deliberate policy, and an intelligent one. The Kremlin may well have concluded that Scandinavians as a whole are best pleased when they are left alone. For, although Norway, Sweden and Denmark are all geographically linked with the continent of Europe, their peoples are by instinct truer islanders than the British, whose traditions are those of world-wide involvement. The prominence of individual Scandinavians in international enterprises—as mediators and secretaries-general for Uno, in Red Cross work and in succouring prisoners of war—is less a contradiction than a natural personal reaction against this basic

insularity.

The Russian rulers have found that cat and mouse tactics—or gestures made alternately with the olive branch and the hydrogen bomb—work effectively upon the neurotic type of neutralism found in central and western Europe, which springs from the weariness of peoples repeatedly scourged by wars. But Scandinavian insularity is a rather different thing. Many of the great wars that have ravaged Europe have left the northern peoples unscathed. Their concepts of neutrality date not from the atomic age but from that of Florence Nightingale and Henry Dunant, an age when a dedicated withdrawal from the power struggle was a practical as well as a pious aim. Today, however, the nightmare of involvement into which Hitler plunged them in 1940 has been perpetuated by the appearance along the Baltic

coasts, as far west as the outskirts of Lübeck, of a vastly increased Russian military power. The result is a psychological conflict, not, as in other countries, between traditional patriotism and a new neutralism, but between traditional pacifism and a new realisation of danger. The extent to which tradition has been rejected may be seen not only in the entry of Norway and Denmark into the Atlantic Pact, but also in the vigorous measures taken by neutral Sweden for its own defence.

This conflict cuts across party lines. While the Conservative parties in all three countries are the most vocal champions of defence and alignment with the West, it was Social Democratic governments that led Norway and Denmark into Nato and that, in these countries as in Sweden, introduced the burdens of rearmament to their peoples. Criticism of these new-fangled policies has largely come, as could be expected, from groups and factions that are conservatively minded in the broad sense of the term; such groups can be found at both ends of the party spectrum, but are naturally stronger in rural areas. In terms of voting strength, they represent only small minorities. But in the present balance of political forces in Scandinavia, there is an unhappy tendency for small parties of a parochial character to acquire decisive positions. In Sweden, the Social Democrats have lately become more dependent on the good will of their coalition partners, the Farmers; in Denmark, the isolationist Radicals and the single-taxers have now come to hold the balance between the larger parties; and even in Norway the long established Labour

government, which faces the loss of several seats in next week's elections, may soon have to cultivate the good will of similar factions.

Parochialism and innate conservatism, which lurk so close beneath Scandinavia's social-democratic and culturally modernistic surface, provide no breeding ground for Communism as such, and indeed account for a good deal of the steadiness with which the northern countries have each responded to Soviet bluff and bluster. But they are inevitably hostile to any far-sighted foreign policy involving definite commitments. If the new rulers of Russia now deliberately leave Scandinavia in uninterrupted peace, they will undoubtedly make a strong appeal to some basic elements among the northern peoples. But it is scarcely possible to argue that the only course for the West is to follow Malenkov's example of masterly inaction. An ill-defended Scandinavia means an exposed flank for the whole Atlantic partnership—a flank, moreover, of peculiar concern to Britain. The denial to a potential enemy of, for example, submarine bases on the Norwegian coast, is of as much strategic consequence as many defensive undertakings further south. Logic and discretion would seem, then, to point the major Atlantic partners, and particularly Britain, towards a policy not of didactic pressure upon the northern countries as a whole, but of sympathetic support for those Scandinavian leaders who are themselves struggling to hold their fellow countrymen on the new and difficult road they have undertaken. This is a task that cannot be left to military personalities alone.

Notes of the Week

Indians in No Man's Land

GENERAL THORAT'S Indian Army contingent in Korea is now not only physically sited in the demilitarised zone along the former battlefield; it is also politically in no man's land, exposed to crossfire from both north and south. So, too, is its directing authority, the five-nation commission of which General Thimayya is chairman. There is a good deal of indignation in India at the seeming failure of the United Nations to support the two generals against the South Korean accusations provoked by the Indian shooting of riotous prisoners; and Mr Rhee's threats to drive the Indian force out have led Delhi to drop heavy hints that it may have to withdraw it.

A policeman's lot is not, and is never likely to be, a happy one. Even India's friends are not altogether sorry to see hard facts of this kind being brought home to Mr

Nehru and his colleagues. Excusable irritation has been caused throughout the hard and weary Korean campaign by the tendency of some Indian spokesmen to represent their country's inaction as a sign of superior virtue. It was unfortunate for Mr Krishna Menon that the shooting of prisoners occurred just after he had lectured the UN Assembly about the "glorious" role of India's "unarmed army" in Korea, which, he said, was "full of lessons for others who have to resolve political problems."

But to say this is not to criticise General Thorat's men. On the contrary, all reports agree that in the first stages of their difficult undertaking they have done extremely well. In this matter of the prisoners, neither the Communists nor the South Koreans have the least intention of playing fair, and it is obvious that both have an interest in damaging the Indians' relations with the UN Command. Further trials and tribulations undoubtedly await the two parties which, in different capacities, have taken on the policeman's role in Korea; and both will need to combine

firmness with patience and a degree of statesmanship if they are to complete the experiment in combining peace with justice on which they have embarked.

Moscow Misses a Date

MOSCOW, once so punctilious about every sort of commemoration, has been conspicuously silent this week about the first anniversary of the 19th All-Union Congress of the Communist party. It was just a year ago that Stalin made his swan song, amid the thunderous applause of the party delegates. On the eve of the congress, his pamphlet on "Economic Problems" was published and hailed immediately as a work of genius and a vital contribution to Marxist thinking. On the basis of this pamphlet, a textbook of political economy was to be written by February of this year. Nothing more has been heard of this textbook since Stalin's death. "Economic Problems" is no longer quoted as revolutionising all branches of science, and some of its conclusions are in fact indirectly criticised. To complete the picture, the anniversary is now recalled by the Rumanian paper *Scanteia* and the Cominform journal, but apparently ignored by *Pravda* and *Izvestia*.

There are many reasons for Moscow's reluctance to refresh memories. The cult of Stalin is no longer the supreme religion. True, it was last year that Malenkov addressed the congress for the first time as heir-apparent, but his picture of the Soviet economy then was much more uncritical than the one he recently presented to the Supreme Soviet. Besides, many of the works of last year's congress have already been undone; for example, the fabric of party leadership with a large presidium at its head was shattered immediately after Stalin's death.

Many of the actors who played a part in the congress have by now been swept from the Soviet stage. Soon after Stalin's death the minister of security, Ignatiev, was expelled from the party secretariat, and three other important members of the Central Committee—the first secretaries of the party in Georgia, Ukraine and Azerbaijan—fell into disgrace. The fall of Beria has brought about a further purge of important personalities, the full extent of which cannot yet be assessed. With such a toll of victims in its mind, the party may understandably look not backward but forward to a new congress at which gaps in leadership could be filled and a new hierarchy crystallised. Beria's fall, however, did not end the struggle for power among the leaders, and until one of the rival groups emerges victorious it may be difficult to apply the party's rubber stamp.

Canter for Conservatives

MR EDEN'S return to the Foreign Office came just in time to relieve the annual Conservative conference from distracting uncertainty about the immediate future of the leadership. It removed the last doubt about Sir Winston Churchill's intention to carry on at 10, Downing Street for a while longer, and it dispelled any likelihood of a

General Election before next spring. The more thoughtful Conservatives must realise that stiff obstacles have merely been moved a little further down the course, but for the present a canter becomes possible; with the political scene at least set for the winter, the annual conference has been able to discuss Government policy with more sense of purpose than seemed likely in the rumour-ridden atmosphere of the past few weeks.

Conservatives in conference always adopt a more trusting attitude than their opponents and criticism of the official policy is further dispelled by judicious selection of the motions for discussion. But the conference usually manages to drop a few hints and this year it gave notice that many Conservatives intend to keep the Government up to scratch over competitive television; that they have sadly realised that there is more to solving the housing problem than building 300,000 a year; and that they are nervous about coal and agriculture (as well they might be). On foreign affairs the conference showed itself suspicious of the Government's intentions over Suez, and such fears can hardly have been allayed when Lord Salisbury used arguments that would justify a British withdrawal. As the man in charge of the Foreign Office for the past three months, Lord Salisbury spoke on recent diplomatic events, leaving Mr Eden free to mark his return to public life with a more personal speech. In this he explained that he felt that his experience of foreign affairs made it essential for him to return to the Foreign Office at so crucial a time, rather than take up a less exacting role which some people had suggested. As the role usually proposed was that of Leader of the House of Commons, this description is a little surprising.

But the conference is inevitably overshadowed by the prospect of Sir Winston Churchill's speech on the last afternoon. The party leader's address always forms rather a top-heavy climax to Conservative conferences, and this year circumstances add special significance to the event. Not only is Sir Winston making his first public speech since his illness—an emotional prospect in itself—but he is bound to attempt in some way to recapture or to replace the spirit of his speech on May 11th. It seems to be very widely believed that, in Sir Winston's absence, the rump of the Cabinet failed to take a diplomatic opportunity. Unjustified though this belief may be, it certainly lays upon Sir Winston the main burden of restoring public confidence in the Government.

TUC Tomboy

THIS time Mr Tom O'Brien has raised a storm in more than a teacup, and the end of it is by no means in sight. The details of the episode, which began at Margate last week, have provided some good detective-story fun; but the issues that it has brought into the open are real and important.

The main facts are these. On the fourth day of the Labour party conference Mr O'Brien, in the course of pronouncing the fraternal greetings of the TUC, declared that there should be a "candid examination" of the association between the Labour party and the TUC. He did not make it clear whether he meant that the association might be looser or tighter. But afterwards he discussed the question with

a representative of the *Manchester Guardian*. According to the report the following day, Mr O'Brien believed that the General Council of the TUC would agree with him that the time had come to separate the activities of the TUC from those of the party without destroying the underlying unity of the Labour movement. He himself apparently thought that the unions should withdraw from membership of the party; they might make a block grant to it, through the TUC and on a year to year basis, and a permanent joint committee of TUC and party should be created.

The several and various opinions that Mr O'Brien has since expressed about this report have not created much doubt that it conveyed what a reasonable man would have understood Mr O'Brien to be saying in the interview. In the meantime, Mr Deakin had been given special leave to address the Labour party conference on its last day and make a thunderous denunciation of Mr O'Brien's reported views. This showed the delegates that Mr Deakin's weight was not directed solidly against the left-wing alone, and it helped to send them home in a warm glow of unity. But there is more to it than that. Whatever Mr O'Brien said, or was understood to say, reflected the thoughts of men more discreet and more influential in the trade union movement. Two years of Tory government and of Bevanism in the Labour party have produced two distinct reactions among the right-wing union leaders. There are those, somewhat despairing of the Labour party and conscious of the industrial advantages of getting on with the Tories, who would like to weaken or break the political link. There are others, Mr Deakin apparently among them, who are more bothered about combating Bevanism than about getting on with the Tories. They share their colleagues' dislike of socialist policy, but the moral for them is that the unions must stay within the Labour movement in order to keep control of the politicians. This is pretty certainly the majority view, but the knowledge that some union leaders are inclined to draw back from the party struggle may have an important bearing on Labour politics.

Facts Against More Pay

THE Engineering Employers' Federation has turned down the unions' claim for a 15 per cent rise that would add about £125 million to the industry's annual costs. The rejection was what everyone expected, but it has a novel—and welcome—feature. Too often in these matters a flat negative comes first and explanation, if at all, long after. On this occasion the engineering employers have immediately set out their reasons for rejection, at length and persuasively.

That was not difficult to do. The engineers' claim is an attempt to carry the postwar habit of annual wage increases—their last one was obtained eleven months ago—into greatly changed conditions. Since last year's claim was considered, the index of retail prices has risen comparatively little (by 4.4 per cent) while the average earnings of men in the industry are estimated to have increased by 6.4 per cent. This means not only that the claim cannot be justified as being necessary to prevent real wages from falling. It also means that the extra purchasing power in the hands of the engineers would have

a more directly inflationary effect than that of previous wage increases which were simply chasing prices.

The other half of the employers' case is still more important. They say that for some time new orders received by engineering firms have been falling below the current level of output. The actual volume of orders, in the year ended last May, was a quarter less than it had been in the previous twelve months. A figure of this kind cannot, it should be recognised, be altogether convincing. The engineering industry is a hard one to generalise about, and statistics of orders are not the most reliable variety. No doubt the unions will argue on this and other points, but about the broad truth of the employers' contention there cannot be any serious doubt. The tide of demand is no longer running so strongly that the engineering industry can stand either an increase in its costs or a squeezing of its profits that would remove the capital needed for re-equipment.

Shuffle and Cut in Capetown

AFTER a bewildering final week of move and counter-move, the South African parliament has risen and will not meet again until January. Dr Malan's last moves took everybody by surprise. Without warning, he suddenly decided temporarily to withdraw his Bill for the reconstruction of the Supreme Court, and introduced instead a new shortened version of the Bill to remove the Cape Coloured voters from the common roll. A joint sitting of both houses of parliament last Thursday gave it a first reading, and during the course of the second reading it was, on the government's motion, remitted for study during the vacation to a select committee of parliament. The United Party opposition, though voting against the Bill in the first reading, voted in favour of the select committee. Unhappily, the country cannot look forward to even a temporary lull in the political conflict, since the scene now shifts to the inner councils of both the main parliamentary parties, where the leadership of both Dr Malan and Mr Strauss is in question.

Dr Malan's adroit last-minute manoeuvre undoubtedly turned the tables on the opposition; but he may live to regret his temporary triumph. It is now clear that there are two factions in the government party. The one favoured riding roughshod over the niceties of ethics and constitutional law; the other, more cautious, was afraid of the long-term effect of any revolutionary changes. By yielding to the opposition's main demand for a select committee Dr Malan has deeply offended the extremist wing. A struggle for power within the Nationalist Party now seems likely, and the prime minister will have to make a heavy call on the party's loyalty.

The United Party is even more divided. By being manoeuvred into voting in favour of the select committee, it has been made to appear as though it supports the government's proposals, though of course a dissenting minority report will in all probability be made by the opposition members. The challenge to Mr Strauss comes from two directions: from those who despise his personal leadership, and believe that the party has been made to look silly simply because he has bungled things; and from the

"liberals," who want the party to make an unequivocal stand on the colour issue. It seems impossible that the party can remain united much longer. For throughout this whole distasteful chapter of South African political history, one fact stands out with crystal clarity: in racial polemics it is very difficult to find a middle road.

America Still Aids Europe

WHENEVER European economic experts meet nowadays they tend to bask in a glow of self-satisfaction at the progress made toward closing the dollar gap. While the improvement in the past year is undeniable, it is sometimes overlooked that in one form or another most European countries are still receiving a substantial amount of American help, without which the picture would not look so rosy.

In the year ending June, 1953, Western Europe received \$1.4 billion worth of goods in the form of "defence support and economic aid." This kind of assistance is now rapidly being replaced by offshore procurement—the purchase for dollars of military equipment produced by West European firms. During the same period, the US Services have signed \$1.5 billion worth of contracts with European producers, as opposed to only \$600 million during the previous year. Of the latest total, France has again been awarded the largest share of contracts—some \$693 million; Britain runs a close second with \$460 million. While Europe does not receive immediately the total sums involved, dollars in the form of "progress payments" start to flow as soon as production gets under way.

A further source of dollars for Western Europe is provided by the expenditure of American forces, and there is still another important transfer of dollars through American contributions to such Nato projects as the building of airfields. Together, these have totalled at least \$500 million in the past year.

A tally of the direct flow of dollars through these channels, however, does not tell the whole story. In addition, the United States has sent to Europe within the past year alone nearly \$3 billion worth of military equipment manufactured in America. The time for complacency will come when Western Europe is able to do without aid and without special facilities for earning dollars, which now add up to a grand total of over \$6 billion a year.

Lesson for Colombo Planners

THE fifth meeting of the consultative committee of the Colombo Plan is now taking place in Delhi. For the past ten days officials have been clearing the ground for the ministers who will assemble next week. Their main task will be to review the Plan's progress in this its third year; by next summer it will in fact be nearing the half-way mark in the original six-year span. The ministers will also consider the work of the £8 million Technical Co-operation Scheme, which is somewhat behind in its spending; under

this scheme Britain has sent 80 experts of various kinds to South-East Asia during the past two years, and has provided training facilities in this country for 420 Asian students.

The chief, and indeed dominating, economic development which has affected all the Colombo Plan countries during the past year has been the decline in commodity prices following the collapse of the Korean boom. This fall has made nonsense of some of the original estimates on which planning was based and has already caused a slowing down of the Colombo Plan programme. It has meant that countries like Ceylon, which seemed to be able to finance a considerable part of their projected investment themselves, cannot now do so. On the one hand, revenues based on export duties and on the taxation of staple industries which depend on the export of primary goods have fallen. And, on the other, there has been a sharp drop in earnings of foreign exchange. There is thus neither the internal capital nor the foreign currency to buy some of the essential requirements of the investment programme. This is the greater pity in that it has shifted the emphasis from the difficulty of securing actual supplies of capital equipment to the difficulty of financing its purchase, at a time when, for the first time since the war, much of that equipment itself is now becoming available with reasonable delivery dates and from non-dollar sources.

These setbacks do not affect the food producing countries so much; Burma and Siam can still sell rice at prices which, although at last dropping a little from their peak levels, are high. But for the area as a whole the net effect has been a vivid lesson in the dangers of loose planning. The Colombo Plan was launched at a moment when many of the countries concerned had only recently won their independence. Inexperience and over-optimism were common to almost every government in the area. The problem now, however, is to restore the original momentum. And that almost certainly means an increase in the aid being given by other countries, over and above the original estimates, if this great scheme is to be fully successful.

Troops for British Guiana

IN many respects the crisis in British Guiana is familiar. A new constitution, which came into force earlier this year, gave the colony universal suffrage and a considerable measure of responsible government, leaving, however, the usual reserved powers in the hands of the Governor. At the first general election held under this constitution an extreme left-wing party—the People's Progressive Party—won 18 out of the 24 elected seats and thereupon took the six portfolios in the Executive Council allotted to elected members of the House of Assembly. Hardly was it elected when the party's leaders began to press for full self-government. In particular, they object to the Governor's reserved powers and to the upper house or State Council, which is intended to act as a check on irresponsible legislation and is largely composed of members nominated by the Governor at his discretion.

There is nothing novel in all this. An inexperienced electorate almost inevitably returns to power the best organised party, especially when that party can espouse the cause not only of full self-government, but also of better living

conditions for the people, who in British Guiana are often as wretchedly housed as anywhere in the Caribbean. Nor is the immediate cause of the crisis one that by itself justifies the dispatch of naval and military forces: the ministers are boycotting the Assembly because the Speaker refused to allow a Bill, compelling employers to recognise specific trade unions, to be passed through all its stages in a day. The unusual—and disturbing—feature of the crisis is that it has been officially declared to be the result of Communist intrigue. For some time Communist propaganda has been pouring into the colony. The leaders of the People's Progressive party—including Dr Jagan, the Prime Minister, and his American wife, and another minister—have avowed Communist sympathies. The recent strike on the sugar estates, though ostensibly over trade union recognition, was undoubtedly fostered by ministers themselves and provoked the State Council to record a resolution regretting their action as "the negation of good and responsible democratic government."

This threat of a Communist coup in a British colony—if such is indeed the case—sets a difficult problem for the British Government. Caution would seem to be the wisest course. The Jagans must realise that British Guiana needs foreign capital for development, which will not be forthcoming to a Communist state. The Government would, therefore, be wise to refrain from any drastic step, such as revoking the constitution, that might rally people to the support of the Communists. There is a danger that even the precautionary movement of troops, in case disorder breaks out, will have just that effect.

Twelve Men and the Vote

THE Government is in a dilemma over the university vote, and the pamphlet* issued this week by the Bow Group (an independent research organisation of young Conservatives) may be looked at eagerly as suggesting a way out. The election pledge to restore the twelve university members to the House of Commons, or some of them, is repeated from time to time, but it is hard to see how it can be done, at least with any grace. When Parliamentary majorities may be counted in single figures the university members returned to a new Parliament might well decide a Government's victory or defeat. In those circumstances few politicians will argue the case on its merits or expose themselves to obvious charges of rigging the constitution.

The abolition of the university seats in 1949 was wrong on many counts; but restoration is not the simple matter of cancelling a minus with a plus that some Conservatives would like to think. The value of the university members lay precisely in their being to some extent outside the political battle, in their freedom to act without an eye always on the electorate. But restored university members would be a continual bone of contention, liable to be voted in or out of the House, like the old people in the weather machines, with every change in the political climate. It would be bad for the House and bad for them; forced into the arms of one of the two big parties, they could not maintain the element of independence that was their chief

* "The University Vote." By Colin Jones. 1s.

virtue. By linking the future of university members to the Conservatives, the Labour party has in truth made out half a case for itself.

The Bow Group's way over this hurdle amounts to attaching it to a slightly higher one. The Government is not only pledged to restore the university vote; it also wants to reform the House of Lords. Could not two birds be killed with one stone by bringing back the university members, but sending them to an upper house partly reconstituted on corporate or functional lines? Admittedly, this solution sidetracks one of the main issues, which is whether some independent members can be restored where they are most needed, in the House of Commons. But it is probably necessary to recognise that this cause is lost. The voice of the universities could suitably be heard in a second chamber. The proposal is sensible but for one difficulty: all-party agreement on Lords reform is just as hard to get as on the lesser issue.

Taking Work to Miners

THE Lancashire coalfield is small, employing about 51,000 men, and costly to work. But it occupies an important place in the economic life of parts of the country. Several communities are wholly dependent on coal, and more are jointly dependent on coal and textiles. Fears of renewed depression in these basic industries are real in Lancashire, and it is natural that in its new pamphlet* the county's Industrial Development Association should carefully scrutinise the plans of the National Coal Board.

These plans, covering the next twelve years, in fact call for only a small decline—perhaps, indeed, too small—in the coalfield's output. But employment in the mines is expected to fall by a quarter, with improving productivity. And this has to be viewed against a high rate of natural population increase in the coalfield. Clearly something should be done. Part of the coalfield is already a development area, but the association is not satisfied with present progress. Instead of sporadic assistance, it wants the Government to secure a steady flow of industry into all parts of the coalfield. This is surely to ask for too much. It is true that the boundaries of development areas are somewhat arbitrary and a more flexible system is desirable. But it cannot be right to prop up every mining community that loses its original function, irrespective of its suitability for other industries. The most that public policy can do in many such cases—and it is a great deal—is to alleviate the inevitable process of migration.

The total amount of public aid to decaying areas cannot be unlimited, and it loses effectiveness if it is too widely spread. It should be concentrated where it will do most good, economically as well as socially. In Lancashire, such rehabilitation needs to be tied in closely with the planning authorities' schemes (which the association's pamphlet does not mention) for dispersing people from the overcrowded areas of Manchester and Merseyside, and with linked proposals for improving transport and social facilities. What is required is the choice of a number of key places, for which some suitable sites exist on the coalfield, where new industry would be encouraged to provide work both for the overspill from the great cities and for displaced workers

* "The Lancashire Coalfield." Lancashire and Merseyside Industrial Development Association. 6d.

from coal or other industries. As yet there is no integrated plan for Lancashire, and the Board of Trade, the local authorities and (seemingly) industrialists go on thinking in separate compartments.

Troubles in Schumania

TRADE in steel across the borders of the six countries which make up the European Coal-Steel Community is not moving as freely as the architects intended. In fact, with few exceptions, trade has congealed into much the same pattern as existed five months ago before the common market for steel started operating. This situation was clearly revealed last week in an admonitory statement delivered by a member of the High Authority to the Advisory Council.

The spokesman noted that, when the common market first opened, prices had been fixed not independently by individual firms but by mutual agreement between them. Such behaviour was perhaps to be expected at the outset of a new experiment, but it was disturbing to find that no change had since occurred. There seemed to be an almost total absence of the competitive instinct. Price lists had been changed on only two occasions, and both adjustments took place only after agreement on a nation-wide basis. It was true, however, that in some isolated instances the consumer of steel had benefited because of the geographical accident of finding himself nearer one of the new basing points than to his former source of supply; where this had occurred the traditional supplier usually absorbed the difference, as the Treaty encourages him to do.

Part of the producers' timidity undoubtedly stems from the fear that, with the present stagnation of demand, any price reductions may precipitate a price war. The High Authority constantly reminds its charges that it is fully empowered to deal with any such crisis, but mere words may not induce them to rely on the High Authority and to play the game. For this reason, no doubt, M. Monnet and his colleagues have hinted at the use of more effective weapons. They will, for example, make a searching investigation of producers' organisations, and they are considering the possibility of a large increase in the number of basing points.

The High Authority has one further problem on its hands. Some producers and member countries are anxious to revert to discrimination, particularly where it would help a steel-using industry working for the export market. In an ideal world such indirect subsidies for dumping would be banned; but, looking at the position realistically, the High Authority is trying to work out means by which the element of discrimination, where the Community itself is concerned, can be reduced to a minimum.

Triangles for Finns?

FINLAND has asked the British Government to explore the possibilities of a triangular trade agreement between the two countries and the Soviet Union. It is probably no coincidence that this approach, and a similar one to France, come at a time when a Finnish delegation is in Moscow to

negotiate a new trade agreement. Perhaps it is also possible to detect the hand of Mr Myrdal, the secretary of the United Nations Economic Commission for Europe, whose enthusiasm for tripartite deals is well known.

Finland's interest in such an arrangement is obvious: in trading with Russia it has built up a large surplus of inconvertible roubles. From Britain's point of view, there is the possibility of expanding trade with both the Finns and the Russians, although, as both countries are in the sterling transferable account, it is not really necessary to enter into any new formal agreement. But it is not easy to see what the Russians stand to get out of a triangular agreement. The only explanation is that they are thinking of the undesirable appearance of forcing the Finns to extend credits to them.

The proposal is interesting in that it reveals something more of the Soviet Union's foreign trade policy. It is, for instance, further evidence of the Russians' shortage of sterling, for the whole transaction would be unnecessary if they were able to pay Finland in a convertible currency, or if they could supply the Finns with the quantities and qualities of goods they want. The Finns, for example, have had to buy much more wheat than they need, and when they sold this to the West—at a loss—the Russians put their foot down. Neither of these Finnish experiences is encouraging to those advocates of increased east-west trade who believe that Russia could provide Britain with more varied supplies at competitive prices.

Mau Mau in the Capital

THE recent outburst of terrorism in Nairobi is at least in part a reflection of the success of the government's campaign against Mau Mau elsewhere. Mountain life has been made increasingly harsh for the Mau Mau gangs, and Nairobi offered what looked like easier ground. Nevertheless the fact remains that after more than twelve months a small group of rebels are still able to strike fear into the African population of Kenya's capital, to the extent of forcing them to collective acts of non-co-operation. This is not a situation to encourage complacency.

The police and the Inniskillin Fusiliers are now engaged in an ambitious programme of clearing Nairobi of all its drifting population. Between 15,000 and 20,000 Kikuyu—or nearly one-fifth of the total inhabitants—are being rounded up and returned to the already overcrowded reserves—a process described by Mr Timmerman, chief of the Nairobi police, as "blowing away the chaff, so that we can get down to the Mau Mau terrorists." The reputed leader of the Mau Mau gangs in Nairobi has already been captured together with many other suspects; and Mr Mathu, the leader of the Africans in the Kenya legislature, has called it the best thing that has happened since the emergency started. Lawlessness had been increasing in Nairobi for some time before the Mau Mau infiltration began and drastic measures were needed to restore order.

Yet these massive forced migrations, with all the misery involved, underline the tragedy of unemployment and overcrowding which will have to be eliminated before peace comes back to Kenya. This week in the Kenya legislature the Member for Finance showed how seriously the emer-

agency has affected the colony's economy. The deficit on this year's budget will run to nearly £2 million, and though expenditure next year is bound to stay near its present level, revenue will drop. Higher taxation may choke off the foreign capital so badly needed to develop the colony and provide employment for Africans crowded out from the land. But without more revenue the programmes for rehousing and land clearance cannot be effectively carried out. Mr Attlee has said that there is now a chance of an all-party parliamentary delegation going to Kenya to look into things on the spot. If Great Britain is to be asked for financial help the time for such a delegation has certainly arrived.

Racial Politics in Rhodesia

THE recent statements by leaders of the Confederate party in Rhodesia, which have made clear the party's *apartheid* policy, have had one good effect. They have stimulated the Federal party to greater forthrightness. It is true that the statement issued on Monday came from the action committee of the Federal party in Northern Rhodesia; it does not necessarily have the endorsement of Sir Godfrey Huggins, the party's leader. But it is none the less welcome. It denounces strongly the policy of the Confederates, which it declares to be "morally, if not legally, in conflict with the federal constitution," as well as reactionary, economically unsound, quite impracticable, and likely to lead to a "racial clash, where justice and moderation will not be on the side of the European."

The statement did not, it is true, contain anything new or inspiring about the Federal party's own attitude towards partnership, which merely reaffirms that the door to political advancement will not be closed to Africans who conform to civilised standards. But by appealing to the electorate's sense of responsibility, and by recognising that the federal scheme is a grave experiment "in statecraft and in human relationships," it attempted to put the coming federal elections on a higher plane than has been apparent hitherto.

The speech made in Lusaka at the weekend by Mr Dendy Young, leader of the Confederates, was a sharp contrast. He went so far as to attack Sir Roy Welensky for undertaking the recent talks on Northern Rhodesian constitutional reform without consulting the other members of the federation; this, he said, resulted in increased representation being given to the Africans. Yet the political advancement of the two protectorates remains within the control of the Colonial Office and outside the federal sphere. Mr Dendy Young has, in fact, shown himself and his party to be completely out of sympathy with the spirit of the federal constitution. People in this country can only hope that the electorate of Central Africa will not be persuaded by them.

Clearing the Air

THE London County Council is soon to consider whether it can establish a smokeless zone in the capital; such moves are already gathering force in many industrial cities. The lessons of the great fog that muffled London last winter have gone home. That fog attracted less comment than,

say, the flood disaster this spring, but it cost far more in life. Four thousand people died, and losses to industry and commerce must have been considerable.

At its annual conference last week the National Smoke Abatement Society held its own medical post-mortem on the London fog. Disturbingly little is known about the effect of smoke and fog on the human body. Most of those who actually died last December were either very old or very young, and hardly any were completely fit; their deaths were mostly recorded under such headings as bronchitis or pneumonia. But the fog probably made invalids of many more. Recent experiments in the United States seem to show that the dangerous effects are due to the combined action of smoke particles and sulphur acids; the particles act as carriers and take the acids deep into the lungs.

The conference got down to brass tacks when it began to discuss not cure but prevention. Much industrial smoke could be prevented by more efficient stoking methods which would at the same time reduce fuel consumption. But the problem is largely one of producing sufficient quantities of solid smokeless fuels, and of persuading consumers to use them. Industry uses most of the 37 million tons at present produced annually, and only a fraction—5 million tons—goes to the domestic grates that produce half the country's smoke. At least another 10 million tons must be produced and sold before smoke pollution disappears from the worst industrial areas. At the best, this will take a long time; it will not be achieved by incantations about a national fuel policy.

In Defence of the Right

The critical moment long foreseen has arrived at last. The Russians are in force on one bank of the Danube—the Turks on the other. . . . It is, therefore, peculiarly important to look the matter steadily and closely in the face, so that if matters come to the worst and we must fight we may clearly understand for what we pay our money and for what we sacrifice our men. And, first, we are not fighting to uphold an Infidel dominion. We are not espousing the cause of Mahometans against Christians. . . . We can have no preference for the professors of a faith which, theoretically beautiful as in many points it unquestionably is, is yet widely discrepant from our own. We can have no close or native sympathies with a race whose traditions, whose tastes, whose habits, whose pursuits are the very opposite of ours. They are languid and lethargic: we are boiling over with life and energy. . . . They place the *summa felicitas* in sublime inaction: we in ceaseless and pushing progress. . . . It is against the nature of things that we should have any personal predilection for the Turks. But they are our allies, we are bound to sacred duties towards them by solemn European treaties, bound to aid them; they are the victims of oppression, and we are bound to see them righted. We interpose here, not because we prefer Mahometanism to even a corrupt and degrading form of Christianity, but because we prefer to the skeleton of either creed those eternal principles of duty, equity, and right which lie at the root of every religion, and are of prior and paramount obligation to any sectarian claims; . . . and because when powerful nations stand tamely by, and see wrong perpetrated and might abused, they render themselves accessories and participators in the guilt.

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasec Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos . . .

Letters to the Editor

Federal Politics in Central Africa

SIR—I wish to refer to the article
appearing on page 38 of the issue of *The
Economist* dated October 3rd, in which
you state that the Confederate party
leader, Mr J. Dendy Young, is an
advocate and a former cabinet minister
in Sir Godfrey Huggins's government.

May I point out that Mr J. R. Dendy
Young has, in fact, never been a cabinet
minister in Sir Godfrey Huggins's
government. He is one of the leading
members of the Rhodesian Bar and is a
Queen's Counsel. He was elected a
United Party member of Parliament on

Farmers' Fury

SIR—In spite of Mr Radcliffe's having
helped you, you still do not seem to have
got at the dilemma of livestock trading,
which is the contradiction between effi-
cient production and clever marketing.
From the point of view both of farm
organisation and of the individual live-
stock being sold, there is an optimum
selling moment. Retention of the animal
beyond this moment upsets the through-
put of its successors and incurs mainten-
ance expenses not justified by its further
improvement.

But there is no necessity at all for this
production optimum to coincide with
the market optimum—indeed rather the
opposite, because gluts occur as a con-
sequence of certain periods of year,
under particular systems of production,
being more efficient than other periods.
Your farmer who markets when few
others are doing so is very likely to have
produced his animal, from that point of
view, inefficiently. His function of
ensuring regularity of supply should be
entrusted to an adequate cold-storage
organisation. It is certainly odd to find
you thinking his high-cost methods
deserve reward, but I console myself
with the reflection that he no doubt will
not get it when the butchers' rings start
again.—Yours faithfully,

R. N. HIGINBOTHAM
Robertsbridge, Surrey

SIR—There are two answers to your
note on my letter. Firstly that your
argument is not relevant to the choice
of a system of fixing prices, for any
system can attempt by varying prices to

counter the unfortunate fact that Nature
intends grass to grow in the spring, and
animals to be fat for the winter.
Secondly that the farmer's risk is not
confined, as you assume, to an autumn
sale. Whatever time of year he takes
his beast to the local market he knows
that if he has to take it back he makes
a loss, and that the buyers, the local
butchers, know this, and know each
other, too.

For the rest, I gather, you are content
that, if this risk is reimposed, some
farmers will brave it. No doubt they
will, as they did in the past, in suffi-
cient numbers to produce an *article de
luxe*. The blessings of free competition
for the consumer will then be con-
fined to having to meet much more com-
petition from the world in the market
for beef overseas than he did before the
war.—Yours faithfully,

G. R. Y. RADCLIFFE
New College, Oxford

[The farmer who produces at higher
costs, for periods of scarcity, certainly does
deserve the reward that consumers are
willing to pay in higher prices. Mr
Radcliffe now accepts this, and it surely
points to freely moving market prices as
the means of resolving Mr Higinbotham's
dilemma—of balancing the consumer's
interest in regular supplies against the
farmer's interest in raising and delivering
his beast at the lowest cost.

It is true that before the war meat
marketing was often wasteful and that the
scales were almost always weighted against
the farmer. But the reason why he could
do little about it was, surely, the plentiful-
ness of meat in world markets that, as Mr
Radcliffe rightly suggests, has now dis-
appeared. With this altered relation
between demand and supply, and with the
support of a deficiency payments system in
the background, it is surely reasonable to
expect the farmers co-operatively to see
that they get what they really need in the
way of feeding arrangements for beasts held
over between markets, cold stores, and
action to break butchers' rings. All this is
a case for improving markets, not a case
against them.—EDITOR.]

ABC of Input-Output

SIR—Your two recent articles have
rightly pointed out that the input-
output information which is now being
assembled in the Department of Applied
Economics at Cambridge, in co-opera-
tion with the Board of Trade, will be of
use not only to Government planners,
but also to industrial managements.

In a parallel field this company has
already made considerable progress of
value not only in the formulation of its
own policy but also in providing outside
contacts with useful information. In
1939 we were asked to provide the Con-
troller of Tinplate Distribution with an

analysis of the uses to which tinplate
was being put both by ourselves and the
country as a whole. Regular returns by
trade use were made to him to provide
a basis for exercising a control which
worked smoothly throughout the war
and until 1952.

Early in the war, the returns had to
be based partly on estimated figures, but
over the course of years we have been
able to substitute actual figures which
are now automatically produced as a
by-product of our sales analysis. The
precise trade use of some containers is
sometimes in doubt, but these represent
a small proportion only of our total busi-
ness, as we usually supply packers direct
with containers specially prepared for
the product to be packed. Our indirect
contribution to the export trade of our
customers is also brought out in these
figures.

This information has been of vital use
in forecasting and in other spheres of
management, and many other industries
supplying producers' goods might find
it advantageous to establish a similar
analysis of sales, if they have not already
done so to meet the needs of war
controls.

We understand that the work at Cam-
bridge is partly based on the analysis of
purchases supplied under the Census of
Production 1948. If the draft tables
compiled from this Census could be
made available before publication, to the
trade associations or significant firms,
the latter might be able to supplement
this analysis from recent experience.

To obtain the initial data will take
time, but thereafter its value will be very
much enhanced by prompt publication.
This kind of inquiry is exactly of the
type where in future more up-to-date
information could probably be obtained
by sampling, once the nature of the
"universe" is known.—Yours faithfully,

JOHN RYAN, Vice-Chairman
The Metal Box Company

Linguistic States in India

SIR—Your correspondent in Bombay is
very wide of the mark in his sweeping
assertion that "Hyderabad has not
created anything in any of the arts since
1687."

Painting of the Deccani School
reached its apogee in the eighteenth
century and continued well into the
nineteenth. Throughout this period the
state was famous for its calligraphers,
whose excellence has persisted to the
present day. Poetry (Urdu and Persian)
was appreciated and practised by the
ruling class well into the present cen-
tury. Architecture has flourished, both
Indo-Saracenic and modern, the
Osmania University being an outstand-
ing example; and Hyderabad is un-
rivalled in its handicrafts.

The belief, said by your correspondent
to be held in Delhi, "that Hyderabad
has a 'composite culture' which it is
worth considerable sacrifices to pre-
serve" may be less "chimerical" than
he would have us believe.—Yours faith-
fully,

Writtle, Essex

P. J. DONNELLY

Books & Publications

Time Bomb for Welfare Economics

THE POLITICAL ELEMENT IN THE DEVELOPMENT OF ECONOMIC THEORY.

By Gunnar Myrdal.

Routledge and Kegan Paul. 248 pages. 25s.

THE history of this book, as narrated in the author's prefaces, is rather curious. It begins a quarter of a century ago with Dr Myrdal's revolt against the "very uncompromising *laissez faire* doctrine" dominant in Sweden in the middle nineteen-twenties. A course of lectures delivered at the University of Stockholm in 1928 served as basis for the original Swedish edition of 1929, now long out of print; the German edition of 1932 was wiped out in an RAF raid on Leipzig; the present English edition, translated from the German, was commissioned in 1943; and—dishearteningly enough for the distinguished contributors to the welfare controversies of the last twenty-five years—nothing that has happened in the interim has made Dr Myrdal feel that either his matter or his exposition is obsolete. The concept of welfare was dead and damned before ever Dr Kaldor and Professor Hicks were born; and the appendix, in which the translator, Mr Paul Streeter, relates modern welfare theory to the main argument of the book, does no more than demonstrate that its proponents, in spite of some ingenious improvements in terminology, have failed to provide any new wine to put in the old bottles. The most self-denyingly positive "neutral" economic theory is—such is Dr Myrdal's thesis—shot through and vitiated by disguised value judgments.

It is indeed the metaphysical rather than the political element which he traces from the Physiocrats to Professor Pigou, and any ordinary reader following his argument may be forgiven for wondering whether it is really much more relevant to practical policy (which is always both economic and political) than the brawls between Homoousians and Homoiousians were to the Golden Rule. It is, however, very highly relevant indeed; it blows up the entire logical foundations not only of the "very uncompromising *laissez faire* doctrine" which stimulated it but also of the Socialist theory which stems back to utilitarianism and the concept of measurable utilities. What is left, or should according to Dr Myrdal be left, is a purely factual science of causal connections due to be supplemented by a sociological study of "economic interests," their occasional coincidence and their relative strength in the never-

ending social tug-of-war. The function of economics is not to postulate universal laws and norms but "to keep political arguments rational." The economic problem is "a problem of social psychology, not of logic."

Dr Myrdal's own logic cannot be readily faulted, whether he is winking out the notion of the harmony of interests from an apparently innocuous mathematical generalisation or pinpointing the value judgment implied in the concept "national income." But it can, perhaps, be partially answered in terms of his own conclusion that social psychology is paramount. The formation of concepts and of language itself is a process of social psychology; not only in economics but in every argument dealing with human relationships the observer, the commentator, and the verbal tools which they use, are inextricably part of that which they observe and comment upon. To a greater or lesser extent every political and social generalisation is a distortion; at best a vital lie. That corrective common sense to which Dr Myrdal frequently pays tribute has, besides its other functions, that of checking both the eager logician who tries to build on any system of "objective" premises more than its necessarily flawed foundation can carry, and the destructive analyst who deduces that no man can recognise another man's hunger, cold or frustration.

Radical Surgery

A DECADE OF DECISION.

By Fred Hoyle.

Heinemann. 175 pages. 6s.

WHEN a man of outstanding intellectual attainments uses them to cultivate a field in which he has no special expertise the results may be illuminating or plain silly. Mr Hoyle's "Decade of Decision" is both. For well-canvassed reasons—vulnerability in the atomic age, world population pressure on exportable food surpluses, industrialisation of primary-producing countries—Great Britain is, in Mr Hoyle's view, incapable of supporting fifty million people at tolerable standards. Now is the time to reduce the population to half that number (Mr Hoyle would prefer an even lower total) by a massive migration of a million a year, coupled with industrial expansion in the Dominions. The cost would be less than that of a major war (though of the same order of magnitude); the result would

be prosperity and security; and the alternative is disaster.

Meanwhile—here Mr Hoyle turns from economics to politics—Russia should be given a free hand in the east and a straight warning that aggression in the west will be met with all-out atomic attack. (Echoes sound from the nineteen-thirties: let Hitler eat bear!) Russia and Asia will do one another a power of good; for Asia will keep Russia quiet, and Russia, once made aware of the facts of life and of geometrical progression, will be ruthless enough to impose contraception on Asia, thus removing the worst of the Malthusian threat from mankind. The tropics can be cleared and tamed (the groundnuts scheme was, *pace* Dr Dudley Stamp, merely ill-sited and inadequately supplied with bulldozers) and will supply enough food-stuffs for the present and, by scientific use of the sun's nuclear energy, a promising source of power against the future shortage of coal, oil and uranium.

These projects for the "decade of decision" are set in perspective by a swift survey of human history recalling Wells and Spengler in equal parts; they represent the necessary measures against just such a decline and breakdown of civilisation as has occurred—with observably parallel symptoms—at intervals in the past. The balance of population and resources is, and always has been, the major determinant of national and world history. If man is to survive (for any future civilisation would get a poor heritage after the breakdown of our own) that balance must become a matter of deliberate decision rather than of blind chance.

One could say a good deal about the politics—and the strategy—of Mr Hoyle's Agenda for Survival. Sticking (with an effort) to the economics, one may wonder at the naivety which allows him to ignore, in his crude balance sheet of British resources and population, everything that is organic in the relations of interacting economic units; all considerations of scale, specialisation and indivisibility; all that makes the difference between the *tabula rasa* of his imaginary empty Britain and the infinitely complex palimpsest of a modern industrial society. One cannot change a Clydesdale into a Shetland to fit an inadequate pasture. The simile may be exaggerated, but it is nearer reality than the inorganic statistics of Mr Hoyle's calculation. And a fraction of the cost—in resources, in subjective dislocation, in loss of liberty through war-style regimentation prolonged through a quarter of a century—of Mr Hoyle's grand design would, if applied to home re-equipment and adaptation to the world's service, ensure that stability which postwar Britain admittedly lacks. Mr Hoyle deals in perspectives and related magnitudes; one relevant magnitude is that of Britain's deficit at the worst point of the worst postwar crisis—a deficit of five per cent. There ought to be better ways of dealing with that five per cent than a hundred-per-cent dismantling of the British economy.

Writer and Thinker

THE COAST OF INCENSE. *Autobiography, 1933-1939.*

By Freya Stark.

John Murray. 287 pages. 25s.

AUTHORS who tell their life stories in a succession of books are faced with a problem when they get to their middle and later volumes. Shall they write for old readers at the price of unexplained allusions or shall they cater for new readers at the cost, perhaps, of boring the old? Two modern writers, Mr Osbert Sitwell and Miss Freya Stark, have sidestepped the difficulty with notable success. They do so not because each volume is self-contained—this it can never be—but because both of them are not only writers, but thinkers, of distinction. In this book Miss Stark is able to arrest and hold attention both by telling her story and by giving new twists to usual and unusual ideas.

Miss Stark's old readers need no book review. They found the first two volumes of her life so invigorating that they will stretch with pleasure for the third. This review, then, is to tell new ones that they need have no fear of being left in the cold because they do not know who Whiffey is or what were past relations with B. For, stimulating and hard by their elbow, they will find Miss Stark the philosopher, Miss Stark the word painter of Arabia, and Miss Stark the budding politician.

By her standards, life is what you make it, and as "mine is hitherto a happy one," her recipes for living are worth study; they are scattered here and there among descriptions of the Middle East that will cause smiles—some wry, some nostalgic—even among those who only knew it from an army lorry. There are glimpses of road-making where this is the operation of myriad women collecting "expanses of tiny gravel with their hands or with flimsy palm leaf brushes"; of Arab meals at which, to the protest that too much bounty is spread, the answer is "Why didn't you bring more people?"; of constant stumblings upon hewn stones that denote other civilisations and ancient prosperity. For the connoisseur, there is a new account of much interest, of a journey to the holy Shiah towns of Kerbela and Nezeef in Iraq, and a description of Kuwait before the oil came.

The last years covered by the book are heavy with foreboding of war. Here the element of political judgment enters the story:

it continues to surprise me that British authorities neglect the encouragement of suitable visitors for difficult places, their only means—just because it is unceremonial and done at odd and accidental times—of preparing knowledge and friendship for any coming strain.

In 1939, she upbraids Whitehall for not stocking Bulgarian attar of roses and "preserving an ally by buying useless

stores." All this foreshadows her war service. "Perhaps," says a letter of 1937, "I shall have some hand yet in the future." One facet of a good book is this engaging preview of talents that later furnished some of Britain's most inventive propaganda devices. With that foretaste, her many admirers must for the moment be content. She has decided not to write immediately of the war years, though "I still hope to live long enough to write about an opening door."

Essays in Economic History

ENTERPRISE AND SECULAR CHANGE: *Readings in Economic History.* Edited by Frederick C. Lane and Jelle C. Riemersma.

Allen and Unwin. 556 pages. 32s.

THIS collection of twenty-seven essays, most of them from various journals, appears under the joint auspices of the American Economic Association and the American Economic History Association, and is modelled on the well-known series of "Readings in Economics." It is clear after reading it that economic history is less well adapted than economics to this sort of venture. At least since 1936, economics has progressed largely by clearing up specific logical muddles—article-sized muddles—and it is not difficult to identify the leading contributions. History, on the

STAPLES

SOVIET DOCUMENTS ON FOREIGN POLICY

Selected, edited, and translated by JANE DEGRAS

VOLUME III
1933-1941

42s. net

This is the third and last volume of Selected Soviet Documents on Foreign Policy, and it covers the period 1933-1941. The Soviet Government's continual preoccupation with its relations with Germany, and with Japanese policy in the Far East, become clear, and help to explain the non-aggression pact with Germany, and the conciliation of Japan. It was a period in which the revolutionary accents which marked the Soviet Union's foreign relations in earlier years, became less emphatic.

OXFORD
UNIVERSITY PRESS

other hand, is written in books; its themes are larger and its interests much more diverse. The historian needs space to exhibit his characteristic virtues. Doubtless much good work has appeared in article form, but the important articles do not identify themselves so clearly as do the seminal contributions to economics. The choice of any Readings in Economic History must therefore be rather arbitrary.

The ambitions entertained by the editors of the present Readings have aggravated these inevitable difficulties. They have tried not only to display the diversity of problems studied by economic historians, but to show the advances made in the subject since the 1890s, and also to illustrate various views on methodology. With so large a programme they have not unnaturally had to exclude certain branches of the subject altogether—industrial history and agrarian history for example—and it cannot be said that "Enterprise and Secular Change" is an altogether apt umbrella for the two subjects mainly dealt with—"business units" and "money and prices." As a result the collection lacks unity and balance.

It is nevertheless a very useful collection. Most of the items are articles from inaccessible periodicals, and, though one might argue about one or two of them, they are articles of importance. Fourteen of the twenty-five contributors come from America, but this preponderance is not perhaps more than is warranted, in a book published under American auspices, by the substantial contributions made by American scholars to the history of business organisation and prices. For English readers the most useful feature of the book is its excellent translations of the work of the great continental scholars. Schmoller, Sombart, Sapor, Einaudi, Spiethoff, Simiand and Marc Bloch among others are represented here by work which exhibits their characteristic virtues and methods.

These selections from continental scholars show a surprisingly wide range of approach and flavour. Economists now talk an international language; historians—and we may be glad of it—still retain a touch of local dialect. Each of these scholars has a markedly individual approach to the subject, partly a product of personality and partly the result of his national culture. English economic history since the days of Cunningham has tended to be insular, and the work of continental historians has not had the impact on English scholarship which its originality warrants, because it has been locked up in a foreign language. This collection will help to promote a fruitful exchange of ideas. Anyone who wants to know what economic historians in the United States and on the Continent have been up to can turn with confidence to this book. It will not, however, tell him much about their activities in England; of the three items by which English scholarship is represented two strike one as curious choices.

Sketch of Vulgarly

MUSSOLINI: AN INTIMATE LIFE.
By Paulo Monelli.
Thames and Hudson. 304 pages. 21s.

ONE of the more curious remarks in this sketch of the late Italian dictator is that "the chief role of Margherita Sarfatti in Mussolini's life was to teach him a little social refinement." Signor Monelli's whole book reads like a gradual discovery of Mussolini's vulgarities, of his continual inconsistencies, of his dislike for washing and of his bad taste in clothes, in archaeology, in handling the violin and in love-making. Many Italians have still to make these discoveries, and they are discoveries especially dear to the Italian brain, which seems to be desperately searching for a code of behaviour, and therefore always in danger of being trapped into the wrong code.

Signor Monelli was a journalist during Fascist rule. He has now gleaned all the facts and much gossip from scores of German and Italian memoirs and hundreds of conversations concerning Mussolini's behaviour with his family, his associates and his mistresses. The treatment is not unlike Sinkiewicz's portrait of Nero in *Quo Vadis*, pretty black, fairly luscious, and frequently relieved by a little shower of pathos. Imperial Rome, however, had a large slave population. Signor Monelli fails to explain this particular enslavement of modern Rome, although the question occasionally worries him. The book is reportage, not history, nor yet more than sketchy biography.

Southern African Survey

NATIVE ADMINISTRATION IN THE
BRITISH AFRICAN TERRITORIES.

Part V. *The High Commission Territories: Basutoland, The Bechuanaland Protectorate and Swaziland.*

By Lord Hailey.

H.M.S.O. 447 pages. £1 2s. 6d.

THIS massive volume concludes Lord Hailey's survey of native administration in the African dependencies of the United Kingdom; the earlier parts were published in 1951. It will take its place beside the preceding volumes as an authoritative reference work for all concerned with constitutional developments in British African territories. Those who, considering the colonial crisis of our times, may have hoped for more—for, perhaps, a "Dual Mandate" for the fifties—will be disappointed by Lord Hailey's somewhat academic caution. Here and there he looks aside from his main task of judicious compilation to express criticism or commendation of some past act of policy or measure of administration. But the cumulative impression he conveys is of being fairly satisfied with the structure of government in the High Commission Territories as it has been taking shape since the last big reorganisation after the war.

He achieves this guarded optimism by dealing with each territory strictly on its own and by confining his attention to the organisation and working in it of the machinery of justice, finance, economic development and social services. Moreover, Lord Hailey makes suggestions for improving this machinery separately for each territory, on the assumption that the long-term aim of policy is some form of self-government for each. How the affairs of these territories are connected with one another through falling under the direction of the High Commissioner's Office receives no examination. But what makes Lord Hailey's assessment of the immediate outlook for native administration in the territories seem unrealistic is his punctilious disregard of the Union of South Africa. And the curb of diplomatic exigency is the more to be regretted since the most valuable lesson of this survey is that British policy in the three territories has always been decisively influenced, if not determined, by political events in the Union.

Many of the facts Lord Hailey assembles are well known to specialist scholars and to senior government officers. But they are nowhere brought together in such an illuminating historical context as here. One can see how the motive of avoiding responsibility for administering the territories governed Imperial policy and led to a form of indirect rule by default. There were and are, of course, striking differences between the territories. A relatively non-intervening administration no doubt suited the powerful and politically astute chiefs of Bechuanaland and Basutoland more than it did the Swazi with their constant fear of domination by white settlers. The results, as can be seen from the statistical and other information compiled by Lord Hailey, were however much the same for all. In spite of increasing revenues and some progress in education, the territories remained more or less stagnant, especially in regard to social services and to agriculture and cattle husbandry, the people's principal source of livelihood. The first big step in the direction of a more positive policy arose from the Pim reports of 1933-35; but it is only quite recently, with the possibility of substantial help from Colonial Development and Welfare funds, that solid advances are becoming visible. Lord Hailey is in his element in discussing, documenting and commenting on these changes.

This book shows that Lord Hailey's interests are primarily those of the scholar and the historian, not those of the statesman and maker of policy. Here the student will find admirably summarised and arranged the most important information on the ethnology, population, natural resources, finances, political history, constitutional development and so on of the High Commission Territories. He will not find a blue-print for the future of these territories or a philosophy for the next stage of British colonial policy in Southern Africa.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Feeling for Flexibility

Washington, D.C.

IN the days before the war when Washington was, from a diplomatic point of view, a capital of not much greater significance than Ankara or Brussels, the foreign embassies and many senior American officials used virtually to abandon it for some cool and elegant New England watering place from the beginning of July until the middle of September. Even today, when no important official can snatch more than a week or two of holiday, and the lights in the government departments burn late in summer as in winter, there is a noticeable quickening of initiative and decision each year as summer turns to autumn. Thus it is not surprising, after a summer in which American foreign policy seemed to reproduce only the stereotypes of the election campaign, that the last four weeks should have brought a more active and original approach to the problems of the cold war than has been apparent in the past three—or even six—months. What is surprising is the degree of unanimity which appears to exist between the leaders of opinion on both sides of the political fence about the kind of approach that the United States should make to those problems.

On September 15th Mr Adlai Stevenson, making, in the form of a report on his world tour, his first major speech since his defeat, spoke of the necessity to consider avenues of negotiation with the Soviet Union that would elicit its real intentions, and also of the need "to provide durable assurances of non-aggression for Russia as well as for France, for Germany and the rest of us." Delighted Democrats, anxious that their leader should not remain too far above the political battle, construed this as a strong implicit criticism of the "tough" or "American" foreign policy of Mr Dulles. Yet two days later Mr Dulles in his speech to the United Nations made the same points in language that differed from Mr Stevenson's only in the gracefulness of the phraseology.

Similarly, the President anticipated to some extent another implied criticism, this time from Mr Dean Acheson, who was making his first public speech since he left office. At the annual dinner of the Woodrow Wilson Foundation in New York on October 1st Mr Acheson stressed the importance of maintaining at all costs the coalition of free nations which the United States had constructed after the war. "At the heart of our policy always, day in and day out, lies the strengthening of our coalition, of our united front." And earlier in the speech he insisted that

whatever issues appear upon the conference agenda, whatever debates occupy the columns of the press and the news

hours of the radio—the supreme issue, the central point around which all else revolves, is the health and strength and cohesiveness of our coalition.

Yet the day before he spoke the President, in much less clear language, had told his press conference, in reference to his forthcoming and several times delayed speech on atomic weapons and defence, that

we have friends abroad; we must be very careful that they understand always we have one intention in the world, peace. . . . They say we are pugnacious or we are impulsive or we have lost faith in the conference table. Those things are far from the truth.

Finally, on October 1st there was union at the apex when Mr Stevenson called upon the President at the White House and was able to tell reporters afterwards that the President thought that his proposal for guarantees to Soviet Russia of non-aggression "has merit and it is under serious study by the State Department," a statement which was confirmed by Mr Dulles at his press conference on Tuesday and which gave the final answer to Senator Homer Ferguson's strictures on Mr Stevenson's original proposal of the idea as "appeasement."

★

The hints—which have burgeoned like autumn crocuses—that the United States is ready to consider a non-aggression pact and the reminders that it has not closed the door to negotiated settlements probably would be misleading if they were construed as the approach of a new American diplomatic initiative. Mr Stevenson's remarks were clearly inspired by the appalling decline in the confidence in American leadership that he found in the rest of the free world, and by a desire to get American foreign policy off dead centre. At the same time they made it clear to the Administration that any shift in the American position, even if it meant a modification of the containment policy which was the Democrats' contribution to history and to the results of which Mr Acheson pointed with so much pride, would not be made the subject of party political advantage.

Mr Dulles and the President for their part have, it would seem, finally been made aware of the almost universal criticism outside the United States of the "inflexibility" of American policy. Their references to possible diplomatic approaches to Russia have been intended as much to set the record straight with European and Asian opinion as to lure the Russians to the conference table, something

which in any case seems unlikely in view of the latest Russian note. It is an irony which will no doubt amuse some future historian that the death of Joseph Stalin produced a Russian *détente* at the time when the new Republican Administration was suffering from the political necessity of proving its refusal to be taken in by soft words, and that the hardening of the Russian position comes at the moment when the Republican Administration has acquired sufficient confidence to suggest that diplomacy has a future.

What is not clear, despite the similarity in the tones of the main spokesmen of the two parties, and despite the fact that Republican newspapers have praised Mr Acheson and Democratic ones Mr Dulles, is the extent to which the public or Congress has as yet appreciated the significance of the more patient, and less dogmatic approach to the problems of the cold war which has been displayed in recent weeks. It is more than possible that references to a non-aggression pact with Russia are as much a trial balloon to test American opinion as to test Russian intentions. The statement of Mr Knowland, the Senate majority leader, on his return from his world tour, that any non-aggression pact would be another Yalta or Munich unless it were preceded by a Soviet agreement to hold free elections in all the satellite countries suggests that the Administration has a major job of leadership and education ahead of it.

But it is not only the public which has failed to keep pace with the development of its leaders' ideas; they have not yet penetrated the United States delegation to the United Nations. Mr Henry Cabot Lodge, whose position as a full member of President Eisenhower's Cabinet is so different from that, say, of Sir Gladwyn Jebb, made one concession on the composition of the Korean political conference two weeks ago, but has since reverted to fixed positions again.

It is clear that there is now a gap between Mr Lodge's actions and the desire of the State Department to avoid needless frictions with the allies. This was clearly illustrated when, on September 25th, a senior official of the Administration brought into play a well-known weapon of democracy—a calculated leak to the *New York Times*. The suggestion it conveyed, that the United States was considering the possibility of a unified, neutralised Korea under an international guarantee to which Russia and China would be asked to subscribe, was an attempt to move beyond the unprofitable dispute over the composition of the Korean political conference by proposing solutions to the main problem which would confront it. Unfortunately Mr Lodge is not the only stubborn man with whom the State Department has to deal, and the vociferous protests of President Rhee, echoed by his Foreign Minister in Washington last week, against any such proposal except on his own terms, make it clear that a decision of a much more brutal kind must be taken by the Administration before intelligent diplomatic solutions can be applied in that quarter of the globe.

THE IRISH ECONOMY

Recapturing Lost Opportunities

Page 139

Whose Public Domain?

FROM A CORRESPONDENT IN COLORADO

THE future of the public lands, 90 per cent of which lie within the eleven westernmost states, may provide some of the bitterest disputes to come before the next session of Congress. A third of a billion acres of mountain, forest, and plain are still owned by the federal government, mainly because, in the early days, no one wanted this wild land, or could make a living from it.

In more recent times, however, there has grown up a sharp dispute over whether this land should be allowed to pass into private hands, chiefly to round out livestock ranches, or be transferred to the states, or whether it should be kept under federal control for the sake of its timber and mineral wealth, its value as a recreation area, and its water and water-power.

At first there seemed to be little use except grazing for these remote lands, and the cattlemen and sheep farmers came to think of themselves almost as owning them. In 1936, however, a Senate committee under Senator George Norris reported that the original ability of the federal lands in the west to support animal life had been cut in half by

over-use and erosion. Even if over-grazing ended at once, the report added, it would take many years to end the deterioration which was still going on.

Since then, federal agencies, led by the Forest Service of the Department of Agriculture, have reduced grazing rights year after year. They have been resisted at every step by the growers of livestock, who tried several times, but failed, to secure the passage of laws which would allow them to buy the choicer grazing lands at low prices, or would weaken the authority of the federal government over their use.

When the Eisenhower Administration took office, these

private interests renewed their attempts to secure a freer hand. Their first Bill proved so unpopular in the west, however, that it had to be dropped. A congressional committee has been taking testimony in the west on a much milder proposal: one which would permit holders of grazing-permits for federal forest lands to carry appeals against the decisions of federal agencies to the courts. This measure has the formidable support of the chairmen of the agriculture committees of both the Senate and the House and carries the formal endorsement of the Secretary of Agriculture. Nevertheless, it will probably stir up as many storms as its predecessors. Westerners who are interested in conservation oppose it, on the grounds that the Bill would, in effect, make the courts the administrators of the forest lands and subject them to endless litigation. Conservative western newspapers are extremely critical of the measure.

The great value of mountain land today is as the generator of water. An uninterrupted water supply is literally the basis of the existence of such great western cities as Los Angeles and Denver and of irrigated farms covering millions of acres and producing billions of dollars worth of food every year. A healthy covering of grass and trees is necessary for land which is to produce a pure water supply and also helps to attract the tourists who have become such a source of income for the west.

It is estimated in a book which is both recent and authoritative ("Western Land and Water Use" by Mr Mont Saunderson) that the federal forest lands generate water for irrigation purposes alone worth about \$250 million a year and supply timber worth \$20 million, as well as tourist attractions of equal value. The grazing rights held by fewer than 25,000 ranchers are estimated to be worth about \$3 million a year in forage.

It must be said, on the other hand, that the Forest Service and the Department of the Interior, which controls most of the rest of the public lands, have never had enough money to carry out an effective programme of reseedling and range improvement. They have checked the deterioration and shown how a future large-scale attack on the problem might be made, but that is all. Lack of money also explains the failure to enforce the eighty year old law on mining in the public domain. The law limits the use of the surface to what is needed for actual mining operations, but its critics maintain that, in fact, mining claims have been used to appropriate lands for other purposes, such as summer cabins, resorts, and "dude-ranches" and to secure timber, which may bring as much as \$25,000 for the harvest of a claim of 20 acres.

★

Water, which is so precious in the west, can also be dangerous, particularly in the great plains. In this semi-arid region where rain falls violently when it does fall, floods have continued to increase in volume and in the amount of damage done. The great Kansas River flood of 1951 caused damage of more than a billion dollars, more than any other such catastrophe in the nation's history. The Soil Conservation Service estimated that nearly half of this occurred above the big dams and above the sites chosen for future big dams in the gigantic plan for the Missouri Basin.

People who live above these sites, far up the tributaries, are convinced that they will derive no benefit from these ambitious and costly projects. They protest that they will

still be flooded and that their precious top-soil will be carried downstream to fill up the big reservoirs. Their protests brought to a halt the work on the huge Tuttle Creek dam being constructed by the Army Engineers, after several million dollars had been spent on it. Kansas even sent a Democrat to Congress—something unheard of—because he opposed the building of Tuttle Creek.

Some sixty or more groups have been formed to agitate for "stopping the rain where it falls" by the use of contour ploughing and the construction of small dams high up the tributaries. The Department of Agriculture, which wants to build thousands of these, has just secured, after a stiff fight, an appropriation of \$5 million for small watershed improvements.

Work is continuing, although at a reduced rate, on most of the big dams in the \$10 billion Missouri Basin project. But the related questions of the control of water and of soil in the western states—the foundation on which their economy rests—are undergoing sharp scrutiny, although it is too early to say how great the changes will be.

American Notes

The Need for Candour

It is denied at the White House that the President's speech at Atlantic City, which dealt only in general and familiar terms with the horrors of atomic warfare, marked the launching of the much-heralded policy of telling the American people the truth about their vulnerability to an attack by atomic or hydrogen bombs. But the longer the President hesitates, the more officials and experts rush in with alarming and contradictory statements of their own. Are Americans to believe Mr Wilson, the Secretary of Defence, who declares that the Soviet Union is still incapable of launching a hydrogen bomb attack, or the chairman of the Joint Congressional Atomic Energy Committee, who said this week that the choice lay between "financial ruination and atomic devastation" and that \$10 billion a year should be spent to strengthen American defences?

The head of the Office of Defence Mobilisation, in a report which revealed that since May special tax incentives have been available for firms who strengthen their plants against atomic attack, also believes that the Soviet Union is capable of delivering, without warning, "the most destructive weapon ever devised by man"—a belief in which he is only a year or two more pessimistic than Mr Gordon Dean, the former head of the Atomic Energy Commission.

The reasoning behind what has been called "Operation Candour" is that only a great relaxation of secrecy will awaken Americans to their danger and lead them to accept the new tax burdens which would be needed to pay for effective protection. In fact, it seems that the National Security Council and the Joint Chiefs of Staff have rejected, for the time being at least, the immensely costly projects for defence against atomic attack submitted by various study groups. Mr Wilson said flatly this week that less than \$1

billion would be requested for continental defence in the new budget, presumably to round out an early warning system, the first step in any comprehensive programme. This may well be as much as can usefully be spent in the first year; trained manpower, rather than dollars, is the limiting factor. Moreover there is the risk that any Maginot line of the air would become obsolete even more rapidly than its famous predecessor. But it is unfortunate that it should have been Mr Wilson, who is held responsible for clipping the wings of the Air Force in the name of economy, who let the cat out of the bag. Only the President can inspire confidence that the decision is the right one and that it does not represent the victory of economy-minded businessmen over the military experts.

Easier Money

COMPLAINTS against the Administration's "hard money" policy, which the Secretary of the Treasury prefers to call honest money, are becoming more difficult to sustain. The lower rates at which both the Treasury and businessmen were able to borrow in September reflected not only a lagging demand for credit, but also the determination of the monetary authorities not to be taken unawares by any falling-off in business activity. The yield on Treasury 91-day bills has fallen from 2.40 per cent in June to 1.39 per

cent at the end of last week; the Treasury has been able to replace its May issue of savings notes with one bearing lower rate of interest; and businessmen have seen rates on commercial paper fall for the first time in over two years, from $2\frac{3}{4}$ per cent to $2\frac{1}{8}$ per cent.

Part of the explanation is that the expectation of a great upsurge in demands for credit this autumn, which led the reserve authorities to loosen-up last spring, has not materialised. Business loans have expanded much less than is usual in the third quarter, and government borrowing of new

money in the rest of 1953 cannot exceed about \$2 billion because of the limit on the public debt.

Nevertheless, as the chart shows, the federal reserve system has once more been buying government securities—\$271 million worth since mid-August—and thus providing additional funds to a market already amply supplied. The banks, which were heavily in debt to the federal reserve system last spring, now have free reserves in hand. The season of the greatest demand for credit still lies ahead. But there is a firm belief that the reserve authorities will not hesitate to provide more funds, either through open market operations or through a further reduction in reserve requirements, if any signs of strain appear or the deflationary clouds on the horizon come any closer.

Taft-Hartley to the Rescue

THE Taft-Hartley Act, the abominable "slave labour law" of trade union oratory, is proving a useful ally to the American Federation of Labour in its struggle for the allegiance of the dockers in the East Coast ports. Under its terms the government is empowered to intervene in labour disputes that might cause "immediate and irreparable injury" to the national welfare. Consequently a court injunction, applied for by the Department of Justice, has suspended for ten days the strike of dockers in all the ports from Virginia to Maine. This had been launched last week by the racketeering International Longshoremen's Association, which the AFL has expelled and is trying to destroy. A second injunction will probably follow, putting off further strike action until Christmas Eve.

This eighty days' grace gives the AFL its chance to carry out a full-scale recruiting campaign for the rival union it has set up. If this union can produce the signatures of 30 per cent of the dockers on a petition form it can demand, under another Taft-Hartley clause, that an election be held by the National Labour Relations Board to decide whether or not the ILA is any longer to be regarded as the official bargaining body. Until this happens the government's mediating officers have to go through the motions of bringing together the claims of the ILA and the employers—just at the very moment that Mr Dewey, the Governor of New York, is putting the strongest pressure on the shipping companies not to have anything to do with such a hopelessly corrupt union.

Fortunately, the mediating officers are unlikely to be embarrassed with success. The companies, which did not relish having to foot the bill for the long struggle which public-spirited citizens were promising themselves against crime on the waterfront, seem to have been reassured by the President's willingness to treat the situation as a national emergency. At any rate they are insisting that any new contract must include a firm commitment by the dockers to carry out the new arrangements for hiring labour which the Waterfront Commission, set up by the States of New Jersey and New York, is to bring into force on December 1st. This would seem, as the President's fact-finding board reported, to make any understanding with the ILA "exceedingly unlikely," as the union is threatening to fight the new waterfront legislation all along the line.

Steel Pays its Fare Again

COMPETITION officially returned to the steel industry when the US Steel Corporation announced, as it did last week, that it will once more absorb freight charges. Other companies can hardly avoid following the example of the firm which produces one-third of the nation's steel output. Freight charges have not been paid by the producer since 1948 when the industry, under government pressure and in a booming market, abandoned the complex multiple basing-point system. There is no thought of reviving anything similar, which would run afoul of the anti-trust laws, but simply of individual firms paying freight costs in order to obtain new business or retain old customers.

The steel mills have not run at 100 per cent of capacity since last May. They have been down as low as 90 per cent, which accounts in part for the slide of the Federal Reserve index of industrial production in September, but they are now operating at about 95 per cent of capacity. Order books are thinning out, although this is partly due to consumers using up their stocks and ordering steel only when it is needed. Premium prices are disappearing and conversion deals, in which users of steel bought ingots and had them converted into finished products at high prices, are now things of the past.

All this, however, for the moment at least, is more a matter of supply catching up with demand than of demand falling off, although in farm areas there has been a drop in demand for agricultural machinery which could be heard as far as Pittsburgh. Steel capacity has risen by 25 million tons since 1946, and production this year, if the 90 per cent rate is maintained, will total 112 million tons, seven million more than in 1951, the previous peak year.

Freight absorption is likely to be confined at first to products affected by the keenest competition. Freight rates are twice as high as they were in 1946 and the industry would be happier, too, if Congress would pass the Bill sponsored by Senator Capehart legalising the absorption of freight charges when this is done in good faith to meet competition. The Federal Trade Commission has given its blessing to the practice, but the industry would like it in writing.

Point Two-and-a-Half?

BY resorting to the now familiar device of setting up a study group Mr Stassen, the director of the Foreign Operations Administration, is seeking to remove the impression that when all forms of foreign aid were placed under one roof it was at the expense of Point Four. Certainly no room has been found for many of the senior officials of the old technical assistance agency, which had built up a reputation in underdeveloped countries for giving disinterested advice. Fears have been expressed that this reputation may be quickly lost if the programme comes under the direction of officials whose main purpose is to mobilise resources for the cold war.

Mr Stassen is running true to this Administration's form in two other respects: he wants to devolve much of his responsibility on to regional directors, because in the

past "too much energy has been lost in programming and reprogramming in Washington," and he also wants to take the government out of the actual application of Point Four aid as much as possible. He thinks assistance given on an "individual-to-individual" basis by unofficial bodies will appear less "patronising" to the recipients than if governments are involved. His critics reply, out of much hard-won experience, that in each country there must be central direction by an official American agency if the work of scattered groups of technicians is not to be dissipated, and if proper co-operation is to be obtained from local governments.

Mr Stassen hopes to get guidance on these questions from the International Development Advisory Board, which President Eisenhower has just reconstituted under its old chairman, Mr Eric Johnston, the president of the Motion Picture Association of America. It has been given two months in which to study the proper relation between technical assistance and other forms of foreign aid, and the respective parts to be played in the giving of technical assistance by the American Government, private American organisations and the United Nations, for whose programme the United States subscribes 60 per cent of the funds. When he receives its report Mr Stassen will have a chance of showing that he does not intend to allow Point Four, which has become something of a symbol of American goodwill, to lose its identity or become devalued, as the American Veterans Committee fears, until it has become only "Point Two-and-a-Half."

SHORTER NOTES

A bond issue that would hardly do well on Wall Street is being distributed by the United Hatters Union to help finance its strike, which has been going on since July, against the largest hat company in America. The union is selling its members \$500,000 worth of 3 per cent three year bonds in denominations of \$100 and \$500 so that it will not have to deprive its treasury of funds for regular activities by its weekly payments to the 1,400 members on strike.

Mr Vincent Impellitteri, who was elected Mayor of New York in 1950 as an independent, has announced he will stand again this November in spite of his resounding defeat in the recent Democratic primary election. His chief opponents will be Mr Robert Wagner, the Democratic candidate, Mr Rudolph Halley of the Liberal party, and Mr Harold Riegelman, the Republican nominee; there are also candidates from three minor parties.

In spite of assurances that chlorophyll-treated dog food will not destroy the odours that lead to "romantic impulses," suppliers of chlorophyll have found their market shrinking in both the canine and the human world. Chlorophyll, the compound derived from alfalfa and widely advertised as a deodorising agent, has fallen in price from \$110 a pound last year to \$45, and the number of products containing it have been reduced from over 200 to less than 50.

The World Overseas

Malaya's New Nationalists

BY A CORRESPONDENT

WHATEVER may have been said about the neutralism of the Malayan Chinese in 1949 and 1950, they have now certainly come down off the fence. Many of them are now Malaya's new "nationalists," opposed both to the Communists and the British. Among older, more prosperous Malayan Chinese two things above all hardened them against Communism. In Malaya itself it was the Communists' campaign of senseless terrorism, which found most of its victims among the Malayan Chinese. And in China they frequently found that their relations, many of whom had been converted from poor tenants into petty landlords or rich peasants by means of their remittances, were among the chief victims of Peking's land reforms. They themselves were frequently subjected to "blood money" blackmail.

The Malayan Chinese have not come to love the Malayan administration more because they like Peking less. The Malayan Chinese Association (MCA), like the Indian National Congress a half-century before it, did start as a pro-government movement. It was launched in 1948 by Sir Cheng-lock Tan, with Mr Malcolm MacDonald's encouragement. It was meant to be a focus for the "loyalists" among the Malayan Chinese, particularly the businessmen, when the predominantly Chinese Communists had taken to the jungle and made all Malayan Chinese slightly suspect. The MCA played an important role in resettling some 500,000 Malayan Chinese squatters in the "new villages." It picked up confidence as its coffers filled with the proceeds of its gigantic lottery and its representatives found they were more effective in resettlement work than were government representatives.

This new self-confidence made them hold back when Mr MacDonald encouraged Sir Cheng-lock Tan to join with Dato Onn in forming the Independence for Malaya party (IMP) as a moderate, non-communal party to which political power might one day be transferred. The MCA found it had strong political muscles when it flexed them in the 1951 Kuala Lumpur elections. It then swept the board in alliance with the United Malays National Organisation (Umno), which had become less restrained after the withdrawal of Dato Onn and his friends.

Tungku Abdul Rahman, the present leader of Umno, blames this alliance of supposedly antagonistic communities on the Colonial Secretary, Mr Lyttelton. In his 1951 visit to Malaya, Mr Lyttelton assured Malayan leaders that Malaya would be given its independence as soon as the

Malays and Chinese showed they could get on together. More cynical observers feel the MCA-Umno alliance is opportunistic and based on the common desire of both organisations for early elections and fairly early self-government. With the departure of Dato Onn and other senior, aristocratic administrators, Umno has increasingly come to represent the Malay peasantry and youth. Apart from the contagion of nationalism, particularly from Indonesia, some Umno leaders feel early independence will help the Malays. With the present Malay domination of the army, police and administration, they feel that Chinese and European economic predominance could be cut down by nationalising the tin mines and rubber estates.

Some of the MCA leaders, particularly Col. H. S. Lee, a wealthy tin mine owner, clearly have a different picture of an independent Malaya. The MCA's present position is a product of long-distilled resentments. Malayan-born, English-educated professionals resent their almost automatic exclusion from top-bracket civil service posts. The large number of Chinese-educated teachers in Chinese schools resent very strongly the belated establishment of national schools with English as the means of instruction—leaving them without much future and pushing to one side a culture in which all overseas Chinese take much pride, if not too much pains. The Malayan Chinese businessman—like all businessmen—dislikes administrative control. In Malaya he attributes its quixotic impositions to the anti-Chinese attitude of its British-headed administration. For example, the patent medicine millionaire Aw Boon Haw complains through his *Singapore Standard* if the Singapore government will not allow tax exemption on a pagoda or puts a steep valuation on a godown.

However divergent the sources of the nationalism of the Umno and MCA, in alliance they have demonstrated themselves to be the most powerful political movement in Malaya today; they have succeeded in virtually every election they have entered. Their confidence was reflected at their convention in August when they demanded elections to the Federal Council in 1954, as the first major step to independence within the Commonwealth. They are also entering this winter's elections in Singapore.

The Malayan government has shown its concern with the MCA's growing strength and antagonism by closing down its highly profitable lottery. Even more flattering has been the emergence of the competitive Malayan National Conference. Convened by the *Mentris Besar* (Prime

Ministers) of the Malay states, this largely represents Malay officials in the administration. Its unofficial leader is Dato Onn, who has apparently stopped trying to blow life into the IMP. The conference shows no desire to face the electorate, preferring gifts from above rather than pressure from below. It would be "a mockery of democracy," the conference decided in August, to "force elections" for the Federal Council before 1956 at the very earliest. The reform it proposes is the expansion of the present appointed Federal Council from 75 to 90 members.

This perpetuation of government from above is opposed not only by the powerful MCA-Umno alliance but also by the fledgling Pan-Malayan Labour party. Although at present this has little more than enthusiastic leaders, it is expected to be strengthened by the pending removal of the ban, imposed at the suggestion of a British trade union adviser, forbidding Malayan trade unions to contribute funds to a political party. The party at which this ban was aimed—the Communists—are still trying to escape from the insurrectionary *cul de sac* into which they got themselves in 1948. They have been able to sustain their numbers—5,000 under arms—but quality has declined as veterans are killed or surrender and are replaced by callow youths from the *Min Yuen* auxiliaries. They have changed their tactics to cut their losses, but these mount slowly but steadily as the government forces gain in experience and armaments. Malaya's Communists would like to transfer their mischief-making capacities to the political and trade union fields, particularly during a period of increasing economic stringency. But this would demand an amnesty; and the Malayan government does not seem to have as much confidence in its own ability to handle such a new situation as did the Indian government when the Hyderabad Communists laid down their arms to fight the elections.

Soviet Economy After Stalin—IV

The Customer is Partly Right

THE Soviet standard of life has been generally viewed up to now through two distorting pairs of spectacles. Soviet propaganda has spoken of the "workers' paradise" and contrasted it with the wretchedness of living conditions in the West, while American commentators have been eager to disprove such nonsense. In doing so, however, they often ignored or played down the very low level from which the Soviet experiment started, the calamities which plagued it, and last but not least the stress laid in the Soviet Union on the development of basic production. Because they boasted instead of pleading their case realistically, Soviet propagandists have hitherto invited comparisons with the West that were bound to be unfavourable. Now, however, Soviet statesmen have recognised that the consumer has been neglected for the sake of the development of heavy industry, and that with the present Soviet economic potential something must be done rapidly to improve his lot. It is therefore worth while to see how much the average Russian has already got from his country's greatly increased national cake and what he is promised for the near future.

To assess and compare standards of life is always a difficult task, but particularly so in the case of the Soviet Union where one is working under the additional handicap of scanty statistical evidence. The method of comparing

wages and prices yields little since the Russians have ceased supplying data on average wages. Besides, some low prices conceal the very poor quality of the service rendered (for example, rent for housing), while other prices have little importance in view of the scarcity of certain commodities (such as motor-cars or television sets). All that can be gathered from Soviet figures is that the average Russian is now somewhat better off than before the war. From the available evidence it would appear that the average wage is now somewhere above 7,000 roubles a year, i.e. about three-quarters higher than in 1940. The price level does not seem to have risen in the same proportion.

This view is confirmed by the alternative method of calculating average consumption per head. This method is also fraught with great difficulties. It is necessary, among other things, to estimate what proportion of the peasantry does not get its foodstuffs on the spot and to what extent supplies to the state are supplemented by sales on the free—or so-called collective—market. Still the figures quoted below can serve as a rough yardstick of urban consumption of foodstuffs and general consumption of industrial consumer goods. The Russians are getting an increasing ration of fats fast approaching Western standards. Consumption of sugar is also rising fast, but at less than 40 lb per annum it is still less than half the British level. Figures of meat consumption are contradictory and range from less than 40 lb to over 65 lb per annum. Yet even the higher figure is still less than half the American standard and about two-thirds of the British and French level. This is already quite an achievement for the Russian consumer. He is not, however, so well off with milk and even for this year he is not promised more than one egg per week.

SOVIET PER CAPUT CONSUMPTION OF FOODSTUFFS (lb)

	1940	1945	1950	1953 Plan	1955 Plan
Sugar	25	5	28	38	46
Butter	6½	3½	8½	10	13
Vegetable fats...	12	4½	15	17	21
Margarine	4	...	5½	8½	9½

There is a curious contrast between these claims of increased supply of foodstuffs and the gloomy picture of livestock stagnation painted by Mr Khrushchev. This may be partly explained by a better utilisation of available resources, but it must also mean that an increased share of agricultural production has been taken over for use in the towns. On the other hand, there is no reason why, with a rural population of over 120 million and with the projected increase in agricultural investment, supplies of foodstuffs should not improve fast. The bread problem has apparently been solved and consumption of meat and dairy products should next be stepped up and the vegetable varied.

The real challenge to the planners, however, lies in the field of industrial consumer goods. Here the average Russian is only now beginning to get the rewards he had been promised for 1942 and which were wiped out by the war. This still leaves him far behind his American or even British counterpart. The Russian should soon be getting about three pairs of shoes every two years, while the average American or Briton is already receiving that quantity every year. This is probably a fair yardstick. A comparison of cotton fabrics—not taking into account the quality—would be more favourable to the Soviet Union; of woollen goods

THE UNITED
STEEL
COMPANIES LTD

Investment in efficiency

The United Steel company has always considered that efficient and up-to-date equipment is a first essential to success. In its leanest periods maintenance of plant was never neglected, and prior to the war much development was undertaken. After the inevitable interruption during the war years this work was resumed to the maximum extent possible and £30,000,000 was spent on capital development between 1945 and 1952. This expansion and modernisation was carried out at a considerably lower cost than would be possible today, and it is now earning a return in improved efficiency and better quality. Further schemes are in progress and development work must always continue, but the promptness with which it was resumed after the war has placed the company in a particularly advantageous position.

WORKERS IN THE TEAM

Number 4 in a series

Barnabas Siankombo, a member of the Tonga tribe, was born at Simwambwa, in Northern Rhodesia, twenty-one years ago.

Now, he drives a big diesel tractor and scraper which can excavate and carry hundreds of tons of earth in a day.

For nearly four years Barnabas has been with the same team, helping to build the first modern all-weather road linking the capitals of Northern and Southern Rhodesia. He has learned to handle the powerful machines efficiently—and that is no easy matter in virgin mountain country. On the hottest, dustiest day he goes cheerfully on with the

job, for he is happy and proud and feels that his work is worth while. It is more important than he knows, for the road he is helping to build is part of a great scheme that will mean much to Central Africa.

"A good type and a good worker", his supervisors say. They are as glad to have him as he is to be there. It is because this mutual spirit prevails that, whatever the hardships and difficulties, the job gets done.

much less favourable; and the gap widens the further one goes up the luxury scale.

Obviously, however, the average Russian does not measure his satisfaction by statistical comparisons with Western countries. Looking back at the dismal years of war and its immediate aftermath he cannot fail to feel better off. Even a small share of the increment in the national income has meant a great deal to the mass of consumers. At the same time, and partly because they have left the semi-starvation level behind, the consumers seem now to be pressing with their promissory note for greater comforts which has not been honoured for so many years. And what is more, the government behaves as if it were aware that it cannot delay the payment much longer. Already during the current plan each Soviet family should get a clock or watch. But if production is not stepped up there will be only one sewing machine for every tenth family and one bicycle for every thirtieth citizen. The demand for these and similar semi-luxuries is insatiable and the buyers are also apparently clamouring for better quality goods.

SOVIET PER CAPUT CONSUMPTION

	1940	1942 Plan	1945	1950	1953 Plan	1955 Plan
Cotton fabrics (yds.)	20	28	9	19	25	28
Woollen fabrics (yds.)	0.6	1.0	0.3	0.8	1.0	1.2
Leather shoes (pairs)	1.0	1.3	0.3	1.0	1.2	1.5

This in turn sets a poser for the planners. Should they concentrate on producing luxuries for the few or improve the standard of goods of general consumption? After Stalin's death many argued that the privileged bureaucrats and managers would be still better off and the discrepancies in Soviet society widened. It appears, however, that under pressure from below, the government now tolerates more appeals for cheap but well-produced goods for the masses. Typical of the new mood was a *feuilleton* published some time ago describing the wanderings of a newly wed Moscow couple in search of furniture. They were shown around most impressive displays, but could not find anywhere a single room suite. Is it forgotten, the author questioned, that most families do live in one room?

Housing indeed is the Russian town-dweller's worst headache. One hundred million square metres of floor space were built or rebuilt in the towns during the five years after the war. The tempo of building was then quickened and over 50 million square metres have been added during the last two years. Yet taking war damage into account, even this does not give more than about 4 square metres of floor space per person.

Thus something has been done for the consumer in the Stalinist era, but the bulk is still to be done. The Soviet Union is neither a hotbed of discontented radio listeners peering enviously across the curtain at their luckier Western brothers nor is it a paradise of happy and contented workers. It used to be said in the thirties that it is easier in the Soviet Union to get a tractor or a machine tool than a needle or a suit. At this cost a powerful industrial machine was built in a short time. Now a Russian can get a needle or a suit more easily. In fact he is slightly better off than ever before. But he has by no means reached a standard of life worthy of the citizen of the second industrial power in the world. He has not even reached the level which used to prevail in, say, Weimar Germany. With a powerful engineering

industry at its disposal the Soviet government could launch a race with the West not only in tanks and machine tools, but in consumer goods as well. This is indeed what Mr Malenkov implied and there could be no better opportunity for the new regime to strengthen its popularity. Will Mr Malenkov, however, feel justified in carrying out the industrial reorganisation necessary to keep his pledge or will the rewards of those who labour to industrialise Russia continue to be doled out by the planners drop by drop?

(Concluded)

Algerians in France

FROM A CORRESPONDENT IN PARIS

THERE are today 300,000 Algerians in France, of whom 100,000 are unemployed and, to quote the Minister of the Interior, M. Martinaud-Deplat, "only about 60,000 are satisfactorily housed." It is not therefore entirely surprising that these Africans, removed from their accustomed milieu and often workless, provide an acute problem not only for the Ministry of the Interior but also for the police, and that during the past two and a half years they have been involved in eight serious disorders as well as hundreds of less grave incidents.

The French government believes that the worst of these incidents, that on July 14th last, was directly inspired by the Communist party, through the MTLD—the *Mouvement pour le Triomphe des Libertés Démocratiques*—an extreme left wing organisation of which the membership is mainly North African and which maintains close contact with the Communist-controlled *Confédération Générale de Travail*. But whilst it is true that many unemployed Algerians gravitate to the Communists, it is incorrect to try to find a political basis for troubles that are essentially economic. Similarly, although Algerians who find work are persuaded to join the CGT on the grounds that it is the only syndicate which defends their interests, they are equally welcomed by the Socialist *Force Ouvrière*.

Since 1947, when the Algerian Statute was signed, Algerians have, in theory, enjoyed all the privileges and obligations of French citizens. They are free to enter and leave the French mainland at will. This is a privilege not shared by Tunisians and Moroccans, who can only enter metropolitan France as *bona fide* students or workers holding special permits and with contracted work awaiting them.

The influx of Algerians comes principally from the more congested parts of the territory, and its principal cause, therefore, would seem to be the growing ratio of births to deaths and the ever diminishing area of cropped land per head of the population. But other powerful causes are discernible not in Algeria itself but in metropolitan France; the better salaries and allowances of which there is—or has been—promise there, and the deliberate demand for overseas labour created during the immediate postwar years in order to make good the loss of Italian labour in the south of France. By and large, the majority of Algerians cross the Mediterranean with the sole object of making money. They live frugally so that they can make an allowance to their wives or families in Algeria and save as much as possible of their earnings so that they can return home and eke out their meagre livelihood with their savings or perhaps buy a small business or more land.

Seven years ago when Algerians began pouring into France there was considerable sympathy for them. They

were called the "pilgrims of hunger" and certain municipalities and large industries were glad to have them, for they willingly accepted the dirtiest, lowest paid and most unpleasant jobs which in many cases European Frenchmen would not then take on. But as the tide of invasion has mounted the attitude has changed. The figure for arrivals rose from 83,500 in 1949 to 148,900 in 1952, and, in the winter of 1952-3, jobs for metropolitan Frenchmen grew scarcer. There is therefore far less sympathy today for what is now generally called "this lamentable invasion." There is a widespread but inaccurate belief that once an Algerian has established himself in France he does not wish to return to his own country and former way of life. Reliable statistics are lacking but from a check made at all ports, it emerges that almost as many Algerians return home each year as enter France to seek their fortune. In 1952, while 148,911 Algerians landed in France, 134,083 returned to Algeria.

Lure of the Left Bank

Paris estimates that there could be steady employment in France for around 100,000 Algerians—who could remit money to their families at home. In 1949 (latest statistics available) 125,000 Algerians sent fcs. 4,500 million back to Algeria; this very considerable sum represents some fcs. 35,000 per head and it is said that the post office at Fort National in the mountains of Kabylie, handles more money orders annually than any post office in France. The total would be larger except that, even in semi-official employment, Algerians rarely obtain the same wages as other French citizens. Many small firms, restaurants and cafés will employ them at cut rates on condition that the employer does not pay social security taxes for them, estimated at nearly 50 per cent of the total wage bill. And, of course, in times of economic depression, it is always the Algerian who is the first to be paid off. At the same time, a poll in a large industrial firm (Renault's) disclosed that 85 per cent of the Algerian employees were considered "satisfactory" and 25 per cent "excellent." There might have been a greater tendency to "train on" these 25 per cent of excellent workers for better jobs, but it has been found that Algerians rarely remain for more than three years with the same establishment.

There are some indications that this high rate of turnover could be altered if desired. The government, through the ministries of labour and education, has set up eight training centres for Algerians who are not only unskilled but "unused to city life," and there is already a list of 12,000 waiting for admission. But there is little doubt that the most serious deterrent to a long stay is lack of housing. Of the 138,000 men in employment at the end of 1952, only 49,000 were housed, 41,900 of them by employers and 7,000 in government or municipal hostels. But even here the quarters assigned to them are vastly inferior to those provided for *Français de France*. Medical treatment, of course, is supplied on equal terms; the fact that sometimes as many as 15 per cent of the free beds in French hospitals are occupied by Algerians can be directly ascribed to malnutrition and insanitary living conditions, not only in Algeria but in France.

Those who do wish to remain for ever in France are chiefly the intelligentsia, the small minority of literate and sometimes highly educated Algerians who are fascinated by the bright lights of the Latin Quarter and the intellectual and emotional stimulus of life in Paris. They may be

desperately poor, unemployed, homeless, but, after Paris, nothing will drive them back to the duller life in North Africa. They have become misfits, and it is from amongst this class that many of the petty criminals, whose exploits fill columns in the French newspapers, are drawn. Now that jobs are scarce, Algerians turn out to be misfits in other ways. Although there is supposed to be no colour-bar in France and the streets and cafés of the Latin Quarter are full of dark-skinned North Africans out with white-skinned French girls, there is a growing discrimination against them in more bourgeois parts of Paris. Algerians feel the slight more acutely than do other members of overseas France because they are full French citizens.

Paradoxically, few of the ex-students are interested in French politics or attracted by the ceaseless blandishments of the Communist Party. The 2,000 or so who can be relied upon to take an active part in Communist activities are drawn from the semi-literates who can with difficulty read the French newspapers and write a little French or Arabic. A far greater number do, on the urgings of their own leaders, turn out in purely nationalistic parades or demonstrations, for their stay in France and their obvious attachment to the French way of life seems to heighten rather than decrease their desire that their own country should be independent. This desire is cleverly used by the Communists who do not care what banners the North Africans march under, what slogans they shout, so long as they swell the numbers at any Communist rally. For the nationalist-minded Algerians—or for that matter Tunisians and Moroccans—it is far easier to participate in a parade organised by the Communists than to arrange one of their own—and so they fall into the trap and help to intensify the popular belief that these "nègres" are all Communists anyhow. The new class that they form—that of a lower-paid proletariat—is not yet a force in Metropolitan French politics, but might become so if the Communists were to produce tactics that would capitalise its discontent on their behalf.

New Deal for Yugoslav Farmers

FROM A SPECIAL CORRESPONDENT

IN a speech last week at Ruma, in the Vojvodina, Yugoslavia's richest agricultural region, President Tito admitted that agriculture had been "neglected" because, he said, "of the force of circumstances." In fact the circumstances which forced this neglect were the mistaken belief that industrialisation could be pushed through rapidly without a parallel development of agriculture. The fallacy of this belief has now been demonstrated. It is clear that as industry develops, it absorbs much of its own profit in reinvestment, and that during the period of its development economic viability must depend on agricultural exports. In short, agriculture must help pay for industrialisation and it cannot do so if neglected. Now that this basic truth has been accepted, a new policy is being put into practice.

Agricultural policy in Yugoslavia has fluctuated between the economic realists who know that food has to be produced and will not be forthcoming without a compromise with the peasants who demand their capitalist profits and the ideological extremists who believe that in the Marxist state "profitability" must be abolished and the peasants made to conform. For the first five years of Marshal Tito's regime the ideologists were in the ascendant. Investments went to

industry; peasants were dragooned into forced deliveries to the state at low prices (the OTKUP); co-operative farms were established and those who refused to join were crushed under a monstrous weight of taxation to prevent them making profits. The result was a foregone conclusion. Production dropped, land went out of cultivation, numbers of livestock decreased or failed to increase. A peasant in the Vojvodina recently put the matter in a nutshell—"If I have one pig I am a poor peasant; if I have two I show a capitalist profit. It is better to eat one quickly."

The most surprising, and to the government most disappointing development of these years, was the failure of the "Peasant Working Co-operatives," which were to be the "socialist" solution for agriculture. Between 1947 and 1952, 6,000 of them were founded, but when at the beginning of this year it was announced that peasants might leave the co-operatives, the rush to get out was so great that according to Marshal Tito's figures only one-third of the co-operatives now remain. This was not only because many peasants had been forced to join against their will, but even more because many co-operatives had been a hopeless economic failure. It was the poorest, least hardworking, least skilled and least knowledgeable people who had joined co-operatives where they tended to work and produce even less than in private life.

Blow to Carpetbaggers

Even more important was the official neglect of agriculture. Because industrialisation was the main aim, foreign currency, even foreign aid and credits, were not made available for the machinery, livestock, fertilisers, etc., which had to be imported if co-operatives were to flourish. All the best brains and organising ability were assigned to industry, and agriculture had to get on with the leftovers—and that meant for the most part the untrained, the ignorant and a lot of carpetbaggers who had joined the Communist party for soft jobs. All this, coupled with a policy of easy internal credit for co-operatives, meant that if and when true figures could be arrived at, most co-operatives would show a deficit—in some cases an enormous one.

The decision to allow peasants to leave, and to liquidate the uneconomic co-operatives, was a courageous one and a triumph for the economic realists. The landslide that followed the decision was a severe blow to the staunch Marxist ideologists and a sharp awakening for those who had soft jobs. It was probably to please these—the discontented and the idealists—that the decision was then taken to reduce all holdings to a limit of ten hectares. In fact this had more political than economic significance as, except in the Vojvodina, only a very small percentage of the peasants were affected. And then, having cleared the decks for action, the new policy was announced.

According to Tito's speech at Ruma, 640,000 million dinars is to be invested in agriculture in Yugoslavia in the next ten years (compared with 116,000 million invested in industry in the past five years). Immediate benefits are tractors—of which Marshal Tito says Yugoslavia now has 9,500 out of an estimated need of 45,000; livestock, including breeding pigs, poultry and cattle; equipment for bacon factories, slaughter houses and refrigeration plant; seeds, fertilisers, pesticides, irrigation plant both for land reclamation and for drought control. The object of this investment will be to step up production and to prevent

waste. The realism of the new approach is nowhere more apparent than in the reasonable target of a 50 per cent increase in production over the next ten years. President Tito spoke at some length about waste prevention and said that in addition to refrigeration plant, food processing factories are to be established. But waste cannot really be prevented until the communications system and methods of collection and marketing are modernised. This forms part of the new ten-year plan.

The aspect of the new policy most discussed in the villages at present is the new taxation system. Last year the government took 18,000 million dinars in taxes from the peasants—mostly from private peasants; this took away the profit that might have been used for reinvestment and acted as a disincentive to more productive farming. The worst aspect of the system was that taxation was retrospective and assessed on estimated (often a hostile estimate) earnings. Now taxation is to be based on the landholding and assessed in advance; if the peasant produces more he will keep the profit himself. Credits are now available through the general co-operatives to private peasants—the state farms and the remaining workers' co-operatives have their own methods of obtaining loans. The general co-operatives to which 90 per cent of all peasants belong are having something of a renaissance. They are developing their activities (until now somewhat limited since the war) and are being organised more on specialist lines so that in addition to buying and selling co-operatives on the prewar model there

The Economist

1843-1943

This book was originally published to mark the centenary of the first issue of *The Economist*, which appeared on September 2, 1843. Owing to wartime restrictions, the edition had to be a small one, and it went out of print almost at once. It has now been reprinted and the new edition was published on September 2, 1953, the paper's 110th birthday.

In addition to chapters dealing with the history of *The Economist* and with the role that it played in its first century of publication, the book contains contributions by a number of distinguished individuals, including the following:

WALTER BAGEHOT
by the late Francis W. Hirst.

The Economist AS A SOURCE FOR THE HISTORIAN
by the late Sir John Clapham

A POLITICAL RETROSPECT
by Sir Llewellyn Woodward

The Economist, 1843-1943 is published by the Oxford University Press. Copies can be obtained through any bookseller.

Price 8s. 6d. net.

are now new co-operatives for special purposes—cattle-breeders, pig-keepers, viniculture, etc. This is more in line with modern development in agricultural co-operatives in western countries.

Three-quarters of Yugoslav farming is still in the hands of private peasants; if agricultural output is to be stepped up by 50 per cent it is they who must contribute the major share and for this they need two things—incentives and security. The new policy seems to offer both these things, but it is important that it should be maintained for some years so that the peasants may recover the confidence and stability lost by the frequent changes of policy towards them over the past eight years. In the villages in Yugoslavia today there seems to be an undercurrent of hope that this may be so and there is an atmosphere of greater confidence and optimism than at any time since the war.

China Prepares for Elections

THE time-table for elections for the People's Congress in China has been extended; the Government has now decided that the preliminary local elections cannot be completed until next April and it thus seems unlikely that the Congress itself can be convened before the autumn of 1954. From the comment in the Chinese press on the preparations which have been going on, and on the "experimental" elections which have been held, it appears that the task has proved to be one of some political and administrative difficulty. In one sense, of course, there is no problem; the Peking government does not have to worry about how to win the election because there will be no opposition. Official publicity constantly affirms that the entire people "loves and supports" Chairman Mao, and no election can be anything else but a demonstration of this love and support.

But because such elections are not really elections at all by Western democratic standards, since there is no possibility of challenging the government in power, it does not follow that they are unimportant. Elections under a totalitarian regime are not merely goals for propaganda; they are themselves propaganda whereby the electorate is persuaded to believe in what it has voted for.

The electoral system in the Chinese People's Republic differs from that now in force in the Soviet Union, but resembles that which existed in the Soviet Union before 1936, in that elections to the national legislature are to be indirect and not direct. Indirect election is evidently considered the more suitable one for the initial phase of development of the party-state, when power is not yet fully concentrated and consolidated and the revolution still retains something of the character of a popular movement. Indirect elections make it possible for the masses to exercise some influence on the choice of candidates at the lowest level, and thus gain a sense of genuine participation in politics, while enabling the party leadership to weed out undesirables at the later stages of the process and thus make sure of a rubber-stamp assembly at the top.

The disadvantage of this system from the point of view of the ruling clique in the party is that it gives too much power to local party bosses whom it is difficult to control; when tens of thousands of local candidates are involved, it is not as easy to arrange everything from the centre as when it is a matter of drawing up a single list for direct

national election. Time tends, therefore, to bring a transition from indirect to direct election, as part of the tendency towards more complete central control which is characteristic of the development of a totalitarian state.

In China the basic-level elections are to be in village and municipal districts. They are not all to be held at the same time, but are to be spread out over a period of months; in general, elections in the towns are to be held earlier than in the villages, the reason officially given being that the peasants will have more leisure after the harvest, though the procedure has also the advantage from the Communist point of view that the results in the towns, where political control is more firmly established, can be used to set an example to the peasants. After the basic-level elections have been completed, deputies will be elected from the primary units to county, municipal and provincial congresses, and finally from these to the All-China People's Congress, which is to be the national parliament.

"Race With Only One Entry"

Much energy is being put into the task of electioneering. According to Peking radio more than 75,000 workers, peasants, civil servants and students have been recruited in Manchuria since May for election work; after a period of training they were sent out into all parts of that region "to lead the election campaign." Manchuria, as the part of China where Communist economic policies have been so far most fully put into effect, has also apparently been foremost in the demonstration of political duty. The city of Peking itself is to be another pace-setter; "experimental" elections have already been carried out in selected areas of the city and its suburbs "to gain experience."

Reporting on these experiments, Liu Jen, chairman of the Municipal Election Committee, recently declared that discussion of the list of candidates was the key for expanding democracy; the Election Committee should guide the electors in free and thorough discussion of the list and finally decide the formal list in accordance with the will of the majority. Since all Chinese citizens will have vivid memories of the sanguinary "accusation rallies" of the last three years and the great numbers of persons who have been executed or sent to forced labour camps as "counter-revolutionaries," it may be anticipated that the "guidance" given by the Election Committee will be considerably more in evidence at the public meetings than the "freedom" of the discussions. But the forms will be duly observed, and if hypocrisy is the homage which vice pays to virtue, it is at any rate a remarkable tribute to the ultimate power of the democratic idea that so much trouble should be taken to create the appearance of free choice.

The contradictions of this "race with only one entry"—as Mr Attlee recently called it at his press conference in Belgrade—are no greater in China than in eastern Europe, but they are perhaps even more remarkable there because the Chinese people as a whole has hitherto been so little touched by democratic ideology, and it would be so easy to declare official candidates returned without all the elaborate electioneering now in progress. If even in China there must be this ritual of appealing to the electorate when the result is determined in advance, it is because Communism always seeks not merely to gain and hold political power, but also to indoctrinate the whole population under its sway, and in this process the holding of elections can play a very important part.

YOU'LL FOLLOW THE TRACKS

Of The BIG Yellow 'CATS'

Many people on the east coast of England have been astounded at the speed with which Caterpillar earthmovers have helped to rebuild the shattered sea defences.

One day—perhaps soon—you'll be travelling the new roads which such Caterpillar equipment as this has helped to build. They'll be fine roads, a credit to Britain; the ultra-powerful, fast-working 'Cats' (world-recognised nickname for

world-famous machines) will have done an incomparable job, going a long way towards solving the country's transport problems.

Scotch Whisky
at its best

Even in these hurrying days there are no short cuts to greatness in Scotch whisky. Slowly and steadfastly Old Angus comes of age, gathering wisdom and authority with every passing year until maturity brings true perfection.

Then—and only then—when it is smooth and subtle and full of years, this noble Scotch is sent out into the world to show men the miracle that careful blending and rare patience in the ageing have achieved.

OLD ANGUS

A Noble Scotch—Blended for Connoisseurs

"Morning, Mr. Painter! It's about time we got acquainted. After all, I've been working for you a good many years now, in a manner of speaking. My name's sulphur dioxide. That's right—working for you. Not actually here, but at an oil refinery. You see, I clear the impurities from the paraffin you use in this blow lamp of yours. Without what you might call my 'refinement', the woodwork you're cleaning up would be covered with a thick layer of greasy soot. Just as, if I weren't used, paraffin lamps, cookers and heaters would smoke and smell horribly. But they don't—thanks to me and Brotherton. There's another name for you to remember. Brotherton—one of the largest manufacturers of liquid sulphur dioxide in the world."

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds, 1. Also at Manchester, Glasgow, Wakefield, Birmingham and Birkenhead.

THE BUSINESS WORLD

Bulls in the Market

WHEN the Stock Exchange temperature rises from simmering to seething, innocents are apt to get scalded. During the summer, buyers of ordinary shares have watched the *Financial Times* index rise from its low point of 113.9 towards the end of May, break through the early-March high of 125.0, and bound up to a new peak of 128.5 last Friday. Nearly fifteen points in little over four months is fast going. Is it too fast? The market's answer this week certainly showed that it wanted a pause after its breathless ascent of more than a couple of points in a single week. When the weekend lambs, bringing in so many orders that the number of bargains marked on Monday touched 12,250, did not succeed in moving the index by a fraction of a point a temporary shake-out, at least, was bound to follow.

This, then, is a boom with a question mark. There has been little time for questions when one of the most certain ways of making money has been to job in and out of Great Universal Stores, or to pick up the latest breeze of a rumoured offer and sail comfortably home with a profit before it is denied. The game of "spot the offer" has been fast and furious, and it has mattered little whether the offer was admitted, denied, undisclosed or simply never made at all. By comparison with some earlier—and genuine—offers where a buyer could see an opportunity to turn undervalued real property into hard cash or to buy his way into an existing business (usually a store business) on advantageous terms, the recent stories, half-truths and plain fabrications have shown all the mark of speculative excess. In some sections of the share markets the background of boom has been scarcely more restrained than it was at the beginning of 1947 when the cheap money drive was over-reaching itself. The *Financial Times* index itself is now only thirteen points below the dizzy heights that it then reached. And bad habits are

spreading well beyond the fringe of "special situations" in unfamiliar shares in the property and store lists; Union-Castle modestly acknowledges a toast to its centenary with one hand, and with the other fends off fictitious "bids" by P & O and by United Molasses that have never in fact been made.

Regrettable though all this may be, it is part of the price of having a securities market; to say that the Stock Exchange should stop it (if it could) is in fact to deny the need for a market at all. There are, indeed, more serious grounds for alarm among those whose memories can job back to 1929, for then speculators not only

THE SPREAD OF YIELDS

burned their fingers (as many present-day speculators assuredly will) but also set fire to a highly combustible economy. No parallel drawn over a quarter of a century and a world war is likely to be very exact, and there are many ways in which economic conditions are wholly different today—among them the absence of the crazy inverted pyramids of credit that then tottered at a touch. But any serious investor in British equities has first to convince himself that Wall Street this year has not been giving a more accurate signpost to the way ahead than

London has been giving. The significance of the Dow Jones average has been easy to read this year; it has reflected the state of a market, once its election enthusiasms had abated, that was plainly fearing some slackening in American business activity during the next twelve months. But of what dimensions? If the average falls two dollars a day, the cry of "slump" goes up; if it recovers, some people begin to think that there may not even be any slackening. The only inherently probable conclusion is that even the American economy could not indefinitely stretch out at the fantastic pace it showed earlier this year; some fall in demand for consumers' durables and in industrial investment is only to be expected. Translated into British terms, an adjustment that left the American economy

INDUSTRIALS—WALL STREET AND LONDON

some slight distance below the peak reached in the second quarter of this year would still be painful. Cuts in American costs would be sharp and complete; here they would be lingering and partial—with so much the less chance of competing in the independent export markets and of avoiding another crisis for sterling.

It is risky, therefore, except on calculations over the shortest range, to take too much credit for the fact that Britain's industrial production is running about $7\frac{1}{2}$ per cent ahead of last year; it is not remarkably ahead of 1951 and it must be regarded as vulnerable to any change in the trade winds from the west. But on a strictly short-term outlook, this year's higher level of production promises to provide some truly remarkable profits figures during the spring and early summer of 1954. Already there have been signs of what may be

in store: the ICI interim, with the confident interpretation that has been placed upon it; the great improvement shown by Monsanto between the second half of last year and the first half of this; the impressive signs of prosperity regained in the wool and cotton textile industries. None of this has yet convincingly appeared in published profits figures; indeed, the reports of 576 companies in the comparatively light quarter that ended ten days ago show a fall in trading profits of about 12 per cent, from £258.7 million to £228 million. But that result was for a composite year that ended somewhere near last March—a year that included the worst of the setback in production and the awkward price adjustments and stock losses that attended it; a poor comparison with 1951-52 was inevitable, but in six or nine months' time the comparison will be as inevitably buoyant.

In another direction, speculative buyers are hoping—whether justifiably or not remains to be proved—for assistance from a further reduction in Bank rate. The reasons for keeping an entirely open mind about the direction of future changes in Bank rate have already been set down explicitly in these columns; but it is not logic that counts in this matter so much as the general expectation, logical or otherwise, about the future. And in the market, at any rate, a straw vote on the simple question: 3 per cent or 4 per cent? would show a comfortable majority for the possibility of a reduction. Since the middle of the year, the influence of interest rates on ordinary share values has been conspicuous; the blue chip yield basis is now $5\frac{1}{4}$ per cent or less, whereas little more than a year ago it would have been fully one per cent more. In the same period, moreover, the first-class 5 per cent industrial debenture has given place to a rate little more than $4\frac{1}{4}$ per cent, which still has a strong appeal—as the reception of this week's issue of the Babcock and Wilcox debenture has demonstrated.

To find the best in debentures and industrial preference issues now involves paying a stiffer price than was demanded a year ago. For a time, the midsummer fall in equities—based primarily on sentimental ideas about a sudden outbreak of real peace throughout the world—lifted the running yield on representative ordinary shares somewhat beyond the normal margin between equity and fixed interest yields. The argument for holding bullish views about equity stocks over the next six months or so must rest partly on a wider margin than now obtains, by virtue of increased dividend payments. On present indications, there is every likelihood that some such hopes will be realised. But while boards of directors are generally prepared to increase their ordinary dividend recommendations when the outlook for profits is good—they have done so in the latest quarter in disregard of the past year's fall in trading profits—they might act a good deal more cautiously next spring if, by that time, there were more tangible indications of some setback in trade.

There is one other matter to which the bulls might give their consideration. In a short time, there will

"Most kind of Your Excellency to say so. We think rather well of it, too: it's White Horse."

MAXIMUM PRICES: — Bottles 35/-, $\frac{1}{2}$ Bottles 18/3, $\frac{1}{4}$ Bottles 9/6, Miniature Bottles 3/8, as fixed by the Scotch Whisky Association.

How freely may a newspaper speak?

THERE IS, as everyone knows, freedom for the Press. A newspaper may print what it likes. But to become a 'popular' paper, a newspaper must print what its readers like. This the Manchester Guardian has never deliberately done. It prefers to speak frankly.

Not deflected by dreams of winning millions of readers, the Manchester Guardian goes on its way regardless. It respects its readers—as they respect it—but it does not woo them.

Here then is a newspaper for those who do not need to be curtsied or kotowed to. Here is a newspaper which puts truthfulness before popularity. Here is a newspaper with a mind of its own—for those with a mind of their own.

Your choice is simple. You may read a newspaper which is your humble servant. Or you may read one which is your intellectual equal. Which do you prefer?

*If you have any difficulty in getting your Manchester Guardian regularly, please write to:
The Manchester Guardian, Manchester.*

FIRE! GENII GALORE IN EVERY NU-SWIFT!

Sealed pressure charges explain the speed, reliability and efficiency of Nu-Swift Fire Extinguishers. Strike the knob—the genii instantly leap out to slay your fire!

be a new supply of steel shares to compete with existing ordinary share issues. What is the yield differential at which a good steel share—and the first re-sales to the public will certainly include the good ones—begins to vie with the blue chip? If 5 per cent to 5½ per cent is the bracket that includes the best of the leaders, is a margin of 2 per cent sufficient to attract investment money on any scale into steel shares? It is not solely the private investor who is concerned—perhaps he may not be attracted at the most favourable price, since he would also be buying a threat of a second expropriation, it is the institutional investor whose purchases of steel shares, whatever they may amount to, are likely to be much more important. It may prove easily possible to exaggerate the extent to which the steel issues will challenge the existing basis of ordinary shares; if the terms were pitched unreasonably, they might not have any very great appeal. But if it is assumed—as in practice it must be—that every effort will be made to make the steel issues as attractive as possible, then some degree of competition is bound to arise for the funds

that would otherwise find their way into existing ordinary share issues. The shortage of the very best equities becomes daily more acute as each new quota finds its way into the deep freeze of institutional portfolios. The steel issues—depending always on their terms—could alleviate, temporarily at least, the acuteness of that shortage.

There are, in short, as many factors on the longer view to give the serious investor pause as there are on the shorter view to raise the spirits of those buyers who have now found themselves marooned on speculative reefs as a result of this week's fall in the tide. This may be a good time to be holding the best of the equities; for jobbing in and out of the best, even if timing is perfect (which it never is) is an expensive business. But it may equally be a good time for a review of equity portfolios of the kind that is always called for after a period of sharp advance. On all the signs, it may be better to be rid of the second class well before the end of the year rather than wait until afterwards.

Deficiencies in Dry Docks

MOST of the larger dry docks in the United Kingdom were built 40 or more years ago; the increasing size of merchant ships is beginning to reveal the physical limitations of the existing docks. The size of modern ships, and especially of modern oil tankers, has outstripped the capacity of many of the commercial dry docks built a couple of generations ago. A few exceptionally large dry docks were built at the principal passenger terminals of Southampton, Liverpool and London, to accommodate the exceptional dimensions of the prewar passenger ships, and the Admiralty provided floating and dry docks, strategically situated, to deal with the large capital ships of the prewar era. New warships and passenger liners are smaller today; but tankers, and many dry-cargo ships also, are getting bigger.

Even at the end of the war, after large numbers of American T2 tankers of about 16,000 tons deadweight had been built, the average size of the world tankers was still no higher than 12,500 tons d.w. The many vessels of 18,000 to 32,000 tons d.w. that have since come into service have raised the average size to about 15,000 tons d.w.; and tankers now under construction or on order, for delivery within the next five years or so, will average more than 21,000 tons d.w. In ship design, draught is the major limiting factor; a vessel must be able to pass through the Suez Canal or approach channels, and to come alongside its terminals. Increased capacity has therefore been obtained both by increasing the average vessel's length and breadth, and by increasing its breadth in proportion to the length.

The following dimensions of typical tankers in service show this trend at work:

TYPICAL TANKER DIMENSIONS

Tons d.w.	Length overall ft.	Beam ft.	Relation of length to beam (one-tenth of length plus x ft.)
12,000	487	59	48½ plus 10½
18,000	555	70	55 " 15
26,000	635	82½	63½ " 19
32,000	665	85½	66½ " 19
38,000	707	93	71 " 22
46,000	775	95	77½ " 17½

Except for the last vessel (a tanker of this size has been launched in Germany), increased capacity has been obtained by increasing the proportion of beam to length; beam measurements are absolutely and relatively much wider than they were. Twenty-five years ago there were only ten ships, including passenger liners, with a beam greater than 80 feet, and only 70 vessels with a beam between 70 and 80 feet. By next year, it is expected, there will be about 500 vessels with a beam of 70 to 80 feet, about 150 having a beam of 80 to 90 feet, and more than a dozen with a beam exceeding 90 feet. Tankers are still getting bigger and they may require dry dock facilities almost anywhere, whereas the larger passenger ships are generally in regular service between particular ports.

An impression of the sizes of dry docks and of the ships that have to use them is given in the diagram, which is based on a similar chart presented in a paper on "Large Dry Docks," read by Mr Leslie Champness

before the Institution of Naval Architects last March. It plots the size of privately owned or public dry docks in the United Kingdom with an entrance of 70 feet or more, either existing or planned. Naval establishments are not shown because they are rarely available for merchant ships; nor are certain exceptionally large dry docks. Foreign docks have not been plotted in detail, but a curve shows the average dimensions of all existing dry docks, British and foreign. Most existing dry docks in the United Kingdom fall below this line, though they are big enough to accommodate the dimensions of the principal passenger liners.

But the plot of typical tanker dimensions shows that existing British dry docks are not well placed for dealing with the larger vessels, particularly when allowance is made for a clearance of at least 5 feet on either side of the vessel. Docks with entrances of 75 feet and over have to deal with ten times the number of vessels that existed when they were built; and the increasing number of tankers with beam measurements exceeding 80 feet require at least 90 feet entrances. The 32,000-tonner needs a dry dock at least 700 feet long and 95 feet wide, and such minimum dimensions have been chosen for most of the new dry docks which are either under construction or planned. At present only three dry docks in the United Kingdom are large enough to take the biggest tankers now on the stocks.

Present plans for new dry docks in this country include three on the North-East Coast, two in South Wales and one on the Clyde, and others are under consideration, including, it is believed, one on the Mersey. The length of the proposed docks is known, though the entrance widths have not in all cases been revealed, but all will be wide enough to take tankers up to 32,000 tons d.w. The proposed dry dock at Greenock will be exceptionally large—1,200 feet long and 160 feet wide—and will remedy a long-standing deficiency in that area; the larger vessels built on the Clyde, as well as those built at Belfast, have hitherto had to go elsewhere, usually to Liverpool, for drydocking purposes before completion.

But these are plans. It would take two or three years to build them; and there are plenty of obstacles before building can start. It is difficult to find suitable sites in the principal ship repairing districts. And there is the important question of cost. At today's prices, without including the cost of land and necessary ancillary buildings and services, between £1 million and £2 million, according to the civil engineering problems at the site,

would be required to build a dry dock capable of taking vessels up to 32,000 tons d.w. The new Greenock dock may cost about £3,500,000, and that is comparatively low for its size because the site favours easy excavation. The Captain Cook Dock at Sydney, built during the war, is rather smaller than the Greenock project, but reclamation work and the necessary facilities brought its total cost to about £8 million. The prospects that a commercial enterprise could secure a reasonable return on capital outlays of this order on a dry dock are not rosy. Present charges for the use of dry docks are based on original construction costs, which were perhaps one-fifth of present costs; at present rates, continuous occupancy of a dock by large tankers would not bring in more than about £90,000 gross per annum, from which operating and maintenance expenses must first be met. But full occupancy is rarely achieved, and a net return of about £35,000 per annum would be considered good at prevailing rates. Even if capital expenditure on a new dock were as low

as £1 million, such a return to meet depreciation and interest would be totally unattractive but for the fact that ownership of a dry dock would bring in ship repairing business that would otherwise go elsewhere.

While the need exists for dry docks capable of taking the larger tankers that are coming into service—and it is a need that applies to publicly as well as privately owned docks, since most of

the smaller ship-repairing firms have to use public docks for carrying on their business—they cannot be expected to be occupied wholly by the largest vessels. Much of the time, indeed, they may be uneconomically used for repairing or examining smaller vessels, for which smaller docks would serve better. It is possible to work on two smaller vessels in one large dry dock if both jobs take about the same length of time, or to use intermediate lock gates to carry out a long-term job in the inner section and routine short-term dockings in the seaward section. Such arrangements are not always easy, particularly in the smaller docks. But in the larger docks that are coming into service, there ought to be considerable scope for improving their occupancy; two or more intermediate gates would give greater flexibility in the number and size of vessels which could be docked simultaneously. Such arrangements make longer docks the more desirable, and access at both ends is the ideal.

Questions of occupancy and size for dry docks need

further study. They determine, in the long run, how best to meet the varied requirements of the shiprepairing trade. It may also be possible to put dry docks to new uses; on the Continent and elsewhere, they are increasingly used for shipbuilding, and this idea is now being developed in South Wales. By modern methods of prefabrication, more and more shipbuilding work is carried out away from the actual building berth, and it may become possible to reduce the time required for berth assembly so radically that a dry dock can be used for new construction as well as repair.

At the moment, however, British shiprepairers are at some disadvantage, particularly with competitors on the Continent, owing to shortage of drydocking facilities for the influx of larger tankers. This is partly an accident of timing, which time will put right. The comparatively sudden advance in the size of ships has come

when the majority of United Kingdom dry docks are approaching "block obsolescence." Their replacement has been delayed successively by the war and by restrictions on capital expenditure. Continental dry docks are generally of more recent construction, and more suitable for larger ships; they are taking advantage of their lead, and of their lower wage costs, to add floating docks, which are quicker to build, although they have a shorter life. There need be no despairing thought that the British shiprepairing industry is suffering a permanent setback through these causes. But if it is to overhaul its competitors, it will want better dry docks than now exist; and it will also have to secure the intelligent development of shipbuilding and shiprepairing technique and the sensible co-operation of labour before it can come forward with a clear conscience in search of the Government's support.

Business Notes

Success for the New Policy

THE first round of the Treasury's autumn refinancing has gone with a swing. When the list for the new 3 per cent Exchequer Stock, 1962-63, offered only for cash, closed on Monday, £341 million had been subscribed, or £41 million beyond the most optimistic guess hazarded last week. The result of the second round—the offer to holders of the £577 million of maturing Serial Funding Stock to convert into 1954 or 1957 stock—will not be known until next week, since the conversion remained open until today. But the size of the cash response has already shown the whole operation to have been a real success, since the amount of unconverted stock is not expected to be large. Hence the seemingly cautious tactics of omitting the March maturities of 1952-54 War Bonds from the operation have already been vindicated; after provision for the mid-November maturities, there is likely to be a substantial sum in hand towards the £412 million due in March. Moreover, there are promising signs of a cash demand for the new 1957 stock, formally offered only on conversion; so that in the coming weeks, by meeting this and other possible demands from their own portfolios, the authorities may be able to absorb considerable slices of the 1952-54 stock without net expenditure of cash.

Here, in short, is a practical tribute not only to the shrewdness of the detailed terms of the operation but to the wisdom of employing normal marketing tactics in the place of the pressures resorted to in 1951 and 1952. The entirely voluntary cash subscriptions to this nine-to-ten-year stock have actually exceeded the cash put up by "persuasion" for the three very short stocks placed last

autumn—the £317 million of 1953, 1954 and 1955 issues then made for cash (plus £719 million issued on conversion). It is important to note, however, that by no means all the £341 million came from banking or other outside quarters. Last year the formula indicated to the clearing banks for control of their liquidity ratios implied subscriptions by them to an amount approaching £250 million, whereas this year's voluntary subscriptions from the banking system as a whole are generally guessed at less than £200 million; and other outside subscriptions are

GILT EDGED YIELDS SINCE BANK RATE

not likely to have been large. Hence the general assumption in the market is that the authorities themselves have put up around £100 million.

But this does not mean that the operation has been no more than ostensibly successful. To have secured some £250 million from a ten-year stock that is primarily addressed to the banks and other highly specialised

investors is a notable achievement. Their willingness to take such a stock reflects, of course, the more confident feeling about the future of interest rates that had been growing throughout the summer, a feeling that was then apparently justified by the Bank rate reduction—despite the official explanation that the purpose was to enable it to move flexibly “in either direction.” The banks have been influenced, too, by the desire to make good the loss of revenue implicit in the fall in advances rates, as well as by the fact that their high liquidity ratios left them scope to exchange some liquidity for a higher yield. The result will be some decline in these ratios, but a more modest one than was enforced upon them last autumn. Meanwhile, the attractions of the new stock—and, indeed, of the 1957 stock as well—have been plainly shown by the adjustments in the market. While the gilt-edged market generally has been steady to firm, the yields on the nearest competing stocks have been perceptibly raised.

Faltering Dollar Surplus

THE gold and dollar reserves rose by only \$17 million last month. The mid-September payment of \$15 million of gold to the European Payments Union was more than offset by the receipt of \$28 million of American aid, and there was a “residual” dollar surplus of \$4 million with non-European countries. This “residual” surplus,

* After taking account of the payment of \$181 million on December 31st for the service of United States and Canadian lines of credit, the United States lend-lease loan and the ERP loan.
† EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.

which for the most part reflects the sterling area's direct balance with North America, was the most disappointing for some time. It is true, as the accompanying table shows, that the residual surplus had also been at a low level in four of the previous months of this year (March, May, June and August); but each of these months carried the burden of some specially large outpayment (the spring-

time tobacco purchase, the Cuban sugar purchase, the repatriation of A.E.I. shares and the Canadian debt agreement respectively). When struck net of these special factors, the residual surplus would seem to have run happily along at between \$30 and \$80 million a month from October, 1952, to August, 1953—and then to have dropped with a bump back to approximate balance last month. As far as is known there was no special outpayment to account for this drop in September, although grain purchases will have been seasonally high.

Nobody should read too much into a relatively marginal change in the accounts in a single month; as dollar sales of certain sterling area commodities, especially cocoa, will come back into season soon, the accounts in the next few months may well make more cheerful reading again. But it would be unwise to count upon this. For one thing, some sterling area restrictions on dollar imports—especially the old bugbear of imports of dollar machinery into the dominions—seem to have been easing recently. For another, American purchases of sterling area raw materials tend to move very closely in step with the US index of industrial production; and that index (which is nominally, if imperfectly, seasonally adjusted) has been wobbling nervously of late. It was down to 234 in September, compared with the peak of 241-242 reached in the four months March to June. If the mountain of talk about an American recession brings forth only a mouse of this size, nobody should have very much to worry about. But the latest dollar figures may be a reminder that there is a mouse—a very small one—already there.

Balance with Europe

THE trend of the sterling area's balance with western Europe in September was also slightly disappointing—even although the provisional figures show a surplus of £4.3 million, half of which will be financed by a gold transfer to Britain next week. This surplus, however, was wholly due to the receipt of £8.7 million from France, as an annual instalment in the repayment of the Anglo-French loan of 1946. When allowance is made for this, the trend of the sterling area's balance with western Europe has been: a deficit of £11.5 million in July (excluding a transfer of £7½ million which, it is now revealed, was made by Germany in respect of its debt commitments in that month); a deficit of £10.5 million in August; and a deficit of £4.4 million in September. The tapering off of the tourist season last month has therefore not returned this account to surplus, as some people had hoped it would.

In the next three months seasonal influences in trade with Europe should turn gradually but increasingly in the sterling area's favour. It will be disappointing if this account does not swing back into genuine surplus soon; and it will be still more disappointing if Britain recoils from announcing further liberalisation of imports—and probably an increase in the travel allowance—at the OEEC meeting at the end of this month. But it should be remembered that Australia and the other Dominions are also increasing their imports from Europe; there is no reason to expect imminent and serious sickness in either the dollar or the EPU accounts, but neither can now be regarded as any too comfortably cosseted against a winter cold.

Working and Spending

ANOTHER 120,000 people were absorbed into the working population in August, as the annual crop of school leavers came on to the market and found little difficulty in getting jobs. In fact, in the month to September 14th, the number of unemployed fell slightly again, by 1,600 to 292,000 (or 1.4 per cent of the labour force). It is true that this decrease in unemployment was the net result of a reduction of 12,600 in the number of young people on the register but of an increase of 11,000 in the number of unemployed women; it may thus be connected with the registration habits of those who have recently left school as much as with anything else. A year ago the number of unemployed fell by as much as 14,000 in the month to mid-September, but that was because the minor summer recession of 1952 was then beginning to tail off; in September, 1951, the number of unemployed actually increased slightly. Moreover, figures published by the Ministry of Labour this week show that the number of people working short-time in the manufacturing establishments that report to it fell from 62,000 to 30,000 between the end of May and the end of September of this year, while the number of operatives working overtime rose slightly to 1,324,000. There has certainly been no summer recession in 1953, and the conclusion that must be drawn from these figures is that there is no visible sign of any autumn downturn yet.

As with the summer, so with the spring. The latest Monthly Digest of Statistics, published this week, contains the Central Statistical Office's usual and valuable estimate of personal consumption in the second quarter of 1953. Total personal expenditure nearly always rises in the second quarter of the year, and at first sight the increase this year in terms of current market prices (by £188 million to £2,742 million) may seem only slightly greater than the increase last year (by £156 million to £2,568 million). But this was because prices have been more stable in 1953; in terms of constant (1948) prices personal consumption rose

British Wholesale Prices

Many requests have been received for a continuation of the record of British Wholesale Prices which appeared for many years in *The Economist* and thereafter in the *Records and Statistics Supplement*. Accordingly it has been decided to provide a similar service with a somewhat extended list of commodities, on a subscription basis. The list will be issued every four weeks and will give prices for some 160 commodities for each week. Subscription £2 post free at home or abroad (air mail additional).

Subscriptions and enquiries (marked “Prices”) should be sent to:

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, St. James's, London, S.W.1.

by £118 million (or between 5½ and 6 per cent) to £2,187 million in the second quarter of 1953, compared with a rise of only £64 million (or 3½ per cent) to £2,076 million in the second quarter of 1952. In other words, real consumption was running at an annual rate that was some £450 million (or 5½ per cent) higher between March and June, 1953, than between March and June, 1952; this must have been a rather bigger increase than the Chancellor bargained for at Budget time. Among the separate categories, real consumption of food was some 3½ per cent higher this spring than a year before, and that of clothing some 4 per cent higher; while in the generic group “other goods and services” (which covers a wide range of manufactured consumer goods) real consumption was up by as much as 8½ per cent and in household goods by no less than 21½ per cent. A rough estimate suggests that these increases may have been covered approximately twice over by the rise in real incomes generated by expanding production and the exceptionally favourable turn in the terms of trade; but let nobody suppose that the rate of improvement in the standard of living that they indicate is a rate that can continue for long.

Bleak Prospect for Rubber

THE price of natural rubber, which has been falling more or less steadily all this year, dropped by nearly 1d. a lb this week under the weight of supplies in Singapore. The spot quotation closed in London on Thursday at 17½d. a lb, compared with 24d. a lb. last January, and despondency in the market has deepened as prices have dropped. The prospect of an international marketing agreement, which would attempt to stabilise supplies and prices, is now recognised to be extremely distant, whatever happens at the Rubber Study Group's discussions in London next week. American strategic purchases, which have absorbed nearly 40,000 tons of the surplus of natural rubber this year, are believed to be virtually completed. Consumption of rubber in the United States, the largest consumer, has been declining for most of this year; and the state of the motor industry at Detroit does not suggest that the demand for tyres is going to become buoyant again in the near future. Between March and August total American consumption of synthetic fell by 18,700 tons to 59,200; consumption of natural fell less sharply—but still sharply enough—by 7,200 tons to 43,500. So much for the brash forecast of the American representatives at the Study Group meeting last May—that a relatively small decline in the price of natural rubber should lead to a substantial rise in American usage.

The new regulations for sales of synthetic rubber in the United States, which have just been announced by the Reconstruction Finance Corporation after consideration for several months, add another touch of gloom. They make it slightly—although admittedly only slightly—less easy for American manufacturers to switch at will from synthetic to natural rubber. Manufacturers must now place firm orders for synthetic thirty or ninety days ahead, according to volume, and will have to pay a small penalty of one quarter of a cent per lb on orders submitted after the required date. They have been assured of protection against any increase in prices during the life of their contracts, and of

the benefit of any reductions announced before shipment. The RFC hopes that these regulations will enable it to adjust its production more closely to demand and thus to keep a tighter control over its stocks. Although production of synthetic has been reduced considerably in recent months—and is expected to be down to the minimum permitted rate of 500,000 tons a year in the last quarter of 1953—the RFC's stocks have risen to within 5,000 tons of its maximum permitted holding of 85,000 tons. If the price of American synthetic was increased above its present allegedly subsidised level, natural rubber prices might become resilient too; but this does not look like a background against which an increase in price will be as eagerly canvassed in Washington as it is here.

Brazil Agreement at Last

AFTER five months of laborious negotiations, a preliminary agreement on the settlement of Brazil's commercial debts to British exporters was signed in Rio de Janeiro last week. The terms of agreement had in fact been pretty accurately foreshadowed by unofficial leaks as early as the beginning of August; the official statement now confirms that the agreement provides for an immediate initial payment of £10 million, which Brazil intends to obtain from the International Monetary Fund (though there have been murmurings that the IMF will not grant this advance without a further investigation into Brazil's economy). The remainder of the £63 million now outstanding will be paid off by annual instalments starting from the beginning of this month. These annuities will be at a minimum of £6 million; the debt can thus take up to nine years to clear. But if Brazil's total sterling earnings exceed £35 million in any one year, additions will be made to the annual payment at the rate of 10 per cent of earnings between £35 and £45 million a year and a steadily increasing percentage of annual earnings up to £60 million; sterling earnings in excess of £60 million will be wholly used for repayment of the debt. Interest on the debt outstanding will be paid each year at 3½ per cent.

British exporters who have already been waiting many months for payment for goods exported in the normal course of trade can hardly be expected to give a great welcome to an agreement that will oblige them to extend their credit for up to nine further years—while American exporters wait only three years for full settlement of their credits and while new British exports are apparently to be paid for without delay. There has, indeed, been no announcement of the arrangements for current trade and payments (except that Brazilian purchases of British oil products are to be restricted to £15 million a year); it is certain, however, that such arrangements will be made, as the resumption of commercial relations provided the main incentive to the British Government for acceptance of terms such as these—and the one excuse for its compromise on the basic principle that commercial debts require commercial settlement. Whether the Government's or the private creditor's view of the situation is accepted depends largely on one's estimation of the prospects for the Brazilian economy. The Government has accepted a calculated risk in the hope that Brazil will take the further steps necessary

to restore a competitive economy and thus will justify the restoration of normal trade relations; and it is certainly too early to say that it has taken much too big a risk.

Financing the Small Business

TWO new financial institutions—Safeguard Industrial Investments Ltd. and the Private Enterprises Investment Company—deserve a warm welcome in the City. They are experiments to tackle two major financing problems before the small businessman, one of which is set by the impact of death duties and the other of which is the familiar Macmillan "gap" in borrowing facilities for companies that are too small to make public issues of shares.

The first problem, with which Safeguard Ltd. will be concerned, arises from the difficulties into which private companies fall when one of their principal shareholders dies and his shares have to be sold to meet death duties; all too often the consequence of such sales is that the continuity of control and management in a given family or group is broken up—even when such continuity is essential to maintain good will, efficiency and progress. This problem is exacerbated by certain anomalies in the tax laws—particularly those arising from section 55 of the Finance Act of 1940—which a Government committee is now reviewing. But even if these anomalies are smoothed out, a real problem will remain; and there should still be plenty of work for Safeguard Ltd., which has announced that "its primary object will be to provide capital for estate duty purposes for the proprietors of businesses which are somewhat too small satisfactorily to permit of a public offer for sale or placing of shares." The new company, which will have a capital of £1,000,000 and is sponsored by the London and Yorkshire Trust, will therefore follow the trail blazed six months ago by "Edith" (the Estate Duties Investment Trust), an offshoot of the Industrial and Commercial Finance Corporation. Edith, whose initial capital was also £1,000,000, is reported to have been a busy young lady; and she has studiously stuck to the role of a "neutral" purchaser of shares, who strives to avoid interference with the policy or management of the businesses in which she invests. It will be interesting to see, however, whether these institutions' definition of "neutrality" can reasonably be squared with the definition that some private companies, with their rather easy-going tradition of financial control, will wish to propagate.

The other newcomer, Private Enterprises Investment, has defined its objects as "first to strengthen the capital resources of companies which find it difficult to raise funds through public issues; and second, to provide money for estate duties payments." It makes its bow under impressive sponsorship: that of four merchant banking houses—S. G. Warburg and Co., N. M. Rothschild and Sons, Samuel Montagu and Co., and M. Samuels and Co.—together with the Industrial Finance and Investment Co. It, too, will have an initial capital of £1,000,000 (of which only 10 per cent will at first be called up), divided into £400,000 of deferred shares subscribed by the banking houses and £600,000 of preferred ordinary shares subscribed by a group of insurance and finance companies; as and when fresh capital is needed it may be raised by public

It can cost you less to stay longer where summer spends the winter

B.O.A.C. "LOW BUDGET" AIR FARES MAKE THIS POSSIBLE!

Fly to Bermuda, Trinidad or Barbados . . . to East Africa, Cyprus or Ceylon . . . and stay well within your winter holiday budget. To Trinidad, for example, you can fly Tourist Class by B.O.A.C. *Constellation* from London for as little as £252.10.0* return. Compare this "low budget" air fare with fares (plus tips and extras) by other transport. Comparison proves that it *can* cost less to fly. And the travelling time you save by air is extra time to add to your winter holiday in the sun. The flight is swift and sure. Meals are complimentary. No tips or extras.

* Between Nov. 1st and March 31st.

ALL-IN TOUR TO BERMUDA ... 225 GNS.

Includes 19 glorious days in sunny Bermuda, hotel accommodation with full board, island sight-seeing tours and air fare. Ask for details of this and other all-in tours by air this winter.

Consult your local B.O.A.C. Appointed Agent or B.O.A.C., Airways Terminal, Victoria, S.W.1 (VIC 2323), 75 Regent Street, W.1 (MAY 6611) or offices in Glasgow, Manchester, Birmingham and Liverpool.

issues of prior charge securities. The object of the new company, it will be noted, is not so much to meet the problem of death duties as that of the Macmillan gap. This furrow, of course, is already being ploughed by the I.C.F.C. itself and by the Charterhouse Development Co. But the field is not so overpopulated that the entry into it of two modest institutional millionaires will turn a risky lenders' market into a small borrowers' dream.

Airlines at Montreal

THE annual meeting of the International Air Transport Association now taking place in Montreal will be the occasion for some thoughtful stocktaking by the member airlines, who between them carry about 95 per cent of the world's scheduled air traffic. The president of IATA, Sir William Hildred, set the tone for the meeting during his survey of the past year's operations, when he said bluntly that air transport was not yet paying its way. The airlines are expanding their capacity, and have reduced their fares—or rather introduced the new tourist rates—in order to attract enough new traffic to fill the extra space offered for sale. There has indeed been an expansion of traffic; in 1952, the first year of the tourist rates on the North Atlantic, 15 per cent more passengers were carried than in 1951—and they travelled, on the average, a greater distance. But, said Sir William, "the rate of expansion must be high enough to compensate for the fact that a passenger is now worth so much less in terms of revenue," and this has not yet happened. His point is hammered home by the fact that the Civil Aeronautics Board in America is asking for \$80 million with which to subsidise American airlines in the next financial year; of this, it wants \$50 million for the international services.

Tourist services now account for more than 50 per cent of the traffic across the North Atlantic, and there is every sign that they are becoming the standard form of air transport. They are also becoming a more competitive form. Sir William's address contained several direct references to the tendency to relax the restrictions that were originally imposed on the amenities that the airlines said they could provide on tourist flights; more ominously still, as IATA no doubt sees it, there has been a tendency to reduce the seating density on tourist aircraft, even although the original intention of the tourist system was that a reduction in fares could be offset by an increase in the number of passengers carried. The big airlines have so far devised two methods of meeting this increased competition in tourist fares. One has been adopted by KLM, which is offering three kinds of service (tourist, first-class, and sleeper) in a single aircraft; and, incidentally, is thereby meeting the problem of how to fill the vast number of seats provided in airliners like the Super-Constellation. The second method is typified by BOAC's Comet services where the attraction of the aircraft makes a first-class ticket worth while. Nevertheless KLM's experiment—which is starting between Amsterdam and Johannesburg, a route served by the Comet—must be slightly disturbing to BOAC. Meanwhile, a second European rival, Sabena, has started flights from Manchester to New York, a convenience for provincial travellers that BOAC does not provide.

Wool Markets Settle Down

PRICES of raw wool now seem to have settled down at levels more or less in line with last season's close. The early weakness in the primary markets soon disappeared when buyers found that the undertone was firm, and began to buy more vigorously. Fine merino wools are now only a shade below the closing levels of last season, with good topmaking 64's at about 141d. per lb, clean landed basis UK. Prices of fine crossbred wools, and of medium and low qualities, are fully firm, for these types will be short until the New Zealand season opens at the end of October. The spot wools available in London continue to command a premium. The Bradford top market has advanced slightly, and 64's B quality tops are now about 155d. per lb. Competition has been brisk at all auctions, with Britain and the Continent setting the pace. Japan has been active and a little buying is reported on Russian account. The United States does not usually enter the market until later in the season, when the better class wools come to auction.

The stability of the wool markets has established confidence, and prices seem likely to hold their present levels for some time. Manufacturing activity in Britain and in most Continental countries and Japan is still running at a high level, and has improved slightly in the United States. In Bradford, most topmakers are fully sold forward until the end of the year, and a little business has been done for delivery in the New Year. Price resistance from the public would almost certainly check any appreciable advance in prices, and there are several possible developments which might depress them somewhat. Stocks of semi-manufactured wool must now be near normal, with correspondingly less prospect of aggressive buying to come. Again, the United States may impose higher duties on imports of raw wool and manufactures. At present prices, sterling area wool hardly attracts American buyers, and higher duties would not therefore directly affect American purchases of raw wool; but they would probably depress imports of European woollen cloth, and so indirectly react on raw wool prices. Moreover, Japan has threatened to reduce imports of sterling area wool. Much depends on retail demand during the winter; and though wool is statistically healthy, some caution about the longer-term outlook seems justified.

Competition in Commercial Fuel

A GENERAL reduction of ½d. a gallon in commercial grades of petrol and of ¼d. a gallon in derv is a mark of keener competition in the bulk petroleum fuel business. This is a market that has always been sensitive to price considerations—certainly more so than the ordinary private motorist choosing among the various premium grades. It seems doubtful whether recent reductions in crude oil prices and tanker freights would account for the whole of the reductions that have been made. Part of the explanation may well lie in the success of the oil companies in persuading the motoring public that premium petrol is well worth its extra cost. About 40 per cent of the 2½ million gallons of petrol sold in this country during

the first half of the year is believed to have been premium grade, on sale for only five months out of the six. Before the war, premium sales accounted for about 30 per cent of the total. To have exceeded this proportion so handsomely in the first stage of postwar freedom may not necessarily mean that it will always be so, for tastes may change and price may come to mean more to the average motorist than it apparently does now. But, whether the division of the market in these proportions is temporary or permanent, the result has been to increase the volume of commercial fuel for disposal.

One reason for the popularity of premium petrols may rest upon the relatively slight difference between the prices of the different grades. Before the war, premium petrol (with tax) cost 1s. 7d. a gallon, 3d. a gallon more than the commercial grade. This was a difference of very nearly 20 per cent. Before this week's price reduction, the price margin was the same—4s. 2½d. a gallon for commercial grade petrol and 4s. 5½d. a gallon for some typical premium grades—but it represented a mere 6 per cent. There is the added complication of an intermediate grade marketed by Esso, and the companies supplied by Esso, now costing 2½d. more than commercial petrol and 1d. less than the standard premium grades. The relative lack of sensitivity to these differences in price is further exhibited by the success of the still more expensive grade marketed by Esso. This costs 1d. more than the standard premium grades and is intended for highly tuned engines; but it appears to be bought in quantity by ordinary motorists.

Cheaper Cars at Paris

THE Paris motor show, which opened a week ago, has been well supported by American, Italian, German, Spanish, and British exhibitors; in fact several American manufacturers have brought over experimental cars for the express purpose of pitting them against new European designs. But the most striking feature of the show has not been the styling trends displayed. The tone has been set instead by the decision of several British manufacturers to choose this occasion to announce significant price reductions—a decision in which they have been accompanied by some of their French competitors.

Among the British manufacturers, the Austin Motor Company has left the price of its small A.30 unchanged for the time being at £355, but has reduced the price of its medium powered A.40 by £18 to £449 (without purchase tax) and the price of its larger A.70 by £31 to £596. The cuts announced by the Rootes group follow much the same pattern; the price of its smallest car, the Hillman, remains (probably temporarily) at £470, but the Humber Hawk has come down by £30 to £695, and the Sunbeam Talbot by £49 to £825. Prices of bigger Austin and Rootes models have also been reduced. Ford, Standard, and Vauxhall—all with new or fairly new models in production—have not felt it necessary to cut prices at this stage; and nothing has yet been said about the future prices of Nuffield cars, now under the same management as Austin. These British reductions have found a parallel in cuts made by French manufacturers; the Simca Aronde has come down by roughly £46 to Frs. 599,000 (say, £600),

the small Renault by £15 to Frs. 414,000, and token cuts of £10 or less have been made in the prices of the bigger Renault and the Peugeot models.

The Paris show owes much of its importance to the fact that this is the season when new models are usually introduced, in order to give dealers time to place orders for delivery by the spring; in consequence, the Paris salon has acquired the reputation of being the place where the pace is set, in matters of price as well as style, for car sales during the twelve months until the next show. Because of its import restrictions, France is not an important market for any motor manufacturers but the French. In the first quarter of the year, France imported only 666 British cars, 537 from the United States, 101 from Canada and 24 from Italy (figures for Western Germany are not available); and some of these must have been cars imported by foreign residents in France for their own use. A rough comparison between the home sales of French manufacturers (188,000 cars produced and 43,000 exported in six months) and the level of imports suggests that only about two per cent of the new cars going on to the French roads come from abroad. The timing of last week's price reductions was therefore prompted by the recognition that the 1954 crop of new models is coming forward at a time of stiff and world wide competition for sales; they were not intended as a special bait for the singularly unpromising market in France itself.

Another Irish Loan

THE Irish Government is building wisely upon the success of its much-publicised 5 per cent loan of last autumn and upon the general improvement in economic conditions since then. Subscription lists open in Ireland on Monday, and will close not later than Friday, for a £25 million issue of 4½ per cent stock, 1973-78, offered for cash at 97. This is a big loan for Ireland, and surpasses last year's offer by £5 million; yet the circumstances have looked sufficiently propitious to justify a six-year addition to the maximum life (the dates of the 5 per cent loan are 1962-72) and a reduction of the gross redemption yield by about ¼ per cent—to 4½ per cent at the issue price. Even so, this year's offer compares at least as favourably with British Government stocks as last year's did. The most nearly comparable British stock—this year's 4½ per cent Electricity Stock, 1974-79—offers 4½ per cent to the final date.

British investors may feel that the margin offered by the Irish stock comfortably compensates for the fact that it is not a British trustee stock. It has, of course, trustee status in Ireland, and also carries tax privileges of interest both inside and outside the Republic. Interest is payable without deduction of income tax, and both principal and interest will be exempt from all Irish taxation, present or future, if the stock is in the beneficial ownership of a person neither domiciled nor ordinarily resident in Ireland. Exemption from Irish income tax will, moreover, be granted to all persons "ordinarily" non-resident, irrespective of domicile. For Irish residents there is the special privilege that the stock will be accepted at face value in payment of Irish death duties.

Fish-hooks (AND FREIGHTERS)

Which earns more—a ton of steel for freighters or a ton of steel for fish-hooks? Fish-hooks, every time. All fish-hooks are made of steel. They are sold all over the world. And every ton sold to America earns 350,000 dollars.

Fish-hooks are made from high carbon, 5-gauge wire rod and are usually bench drawn. The highest proportion of this hand working is done in Sheffield. It can be as fine as .008"; and is seldom thicker than .166" diameter. Thus does steel service Britain's quality exports.

Note for anglers: A reassuring fact is that Izaak Walton was not only a Freeman of the Ironmongers' Company but gave his occupation on his marriage certificate as "ironmonger".

STEEL

is at your service

FOR THE PETROLEUM CHEMIST there are unknown continents to be explored in his laboratory.

Already crude petroleum has yielded chemicals that play an indispensable part in the manufacture of new materials as diverse as plastics, paints, cosmetics and detergents. Oil and water DO mix—in your own home on washing day.

This is but a beginning. In the research laboratories of Anglo-Iranian Oil Company new uses are still being discovered for this, one of the world's most versatile minerals.

THE BP SHIELD IS THE SYMBOL OF THE

G 731

Forward Arbitrage

AFTER five months of successful operation, the scheme for arbitrage between the seven main foreign exchange markets of Western Europe has now been extended to cover forward as well as spot transactions. Until Monday of this week forward dealings were subject to the same bilateral restrictions as had impeded spot dealings until May of this year. An authorised British bank could buy, say, forward guilders from another British bank or from a Dutch one—but it could not buy forward guilders in Belgium, Denmark, France, Western Germany, Sweden or Switzerland (unless prior approval had been obtained from the exchange control authorities of the countries concerned). Now it is allowed to do so, provided the forward purchase is for a period of three months or less.

When they introduced the original arbitrage scheme last May, the authorities made no secret of the fact that this extension of the arrangements was contemplated, provided the trial run in spot dealings did not run upon any unforeseen rocks. In consequence of this, and of the fact that no real distortions had sprung up in cross forward rates of the currencies concerned, the market has taken the new freedom in its stride without any significant rate adjustments. Meanwhile sterling continues to bump around fairly happily just above the middle point of its parity against the dollar; at Wednesday's close the spot rate in London was \$2.80½, while forward dollars were quoted at ¼-⅓ cent premium.

Wheat's Stable Front

WHEAT prices are magnificently insensitive to the massive world surpluses. The steep fall in Chicago future prices was halted weeks ago and they have recently fluctuated by only a few cents on either side of \$1.90 a bushel. The Canadian Wheat Board's class 11 price, which now seems to be setting the standard for "non-agreement" wheat in the world market, dropped by a few cents last month but has since been very steady at about \$1.97 to

\$1.98 cents a bushel for No. 1 Northern Manitoba wheat. Its class 1 price for the same quality wheat sold under the International Wheat Agreement has had to come down to the same level. The two prices have in fact been virtually identical since the new agreement began on August 1st.

But taking into account the premium of the Canadian dollar over the American, the class 1 price was for several weeks only fractionally below the IWA maximum of US 2.05 cents a bushel and is now a mere six cents below it.

The relative stability of wheat prices at present levels, for which American support operations can take the credit, would prompt the conclusion that the adjustment to conditions of glut has gone far enough. It would be incredible if that were to prove to be the case. The pressure on wheat prices may in any event soon be increased by the recent passage of a bill which requires the American Administration to sell some of its huge surpluses of farm products to foreign countries for payment in local currencies. In the financial year ending next June the Administration must sell farm products to a value of not less than \$100 million and not more than \$250 million in this way. Though wheat may at first be outside this new type of American export promotion scheme it is unlikely that it will be excluded for ever. Other wheat-exporting nations could hardly allow such competition to go unchallenged. Canada, which has been blessed with three bumper harvests in succession, would certainly react sharply for, unlike the United States, it is wholly dependent on the export market for disposing of its wheat, and it cannot afford to give it away.

Bigger Business in Shoes

THE shoe industry, which was badly hit by last year's retail slump, has shared the general recovery of the consumer goods trades. If the experience of this week's two shoe exhibitions is any guide, active trade seems likely to continue. Both appeared to be far better attended than they were in previous years and the holding of two separate exhibitions simultaneously, one of which is supported only by a handful of manufacturers whose business lays more stress on fashion than on quantity production, does not appear to dissipate the interest in them.

The market for shoes is highly sensitive to price, and the industry's troubles in past years have been directly due to high selling prices. Considerable reductions have been effected during the past eighteen months, to the great benefit of the industry, largely by a change in methods. The two most important developments in the industry are the change from stitching as a means of joining the sole to the upper of the shoe and the adoption of various cementing techniques in its stead, and the general introduction of a variety of synthetic sole materials as highly competitive alternatives to leather. Neither of these developments is new, but it has taken some time for their effects to spread through the industry, and also for the technique of using them to be perfected so that the consumer sees no discernible difference in quality. It seems probable that the use of synthetic sole materials will be carried a stage further, reducing the process of moulding the sole and attaching it to the upper to a single operation; at least one major manufacturer has gone a long way in this direction and has greatly reduced his costs and prices.

The production of shoes was running at a rate of nearly 12 million a month by midsummer, compared with less than 9.5 million in the same period of 1952. At the same time, the value of shoe sales by the retailers have fallen.

During the first half of the retail year—that is February to July—sale of the big shops were 2 per cent lower in value, those of the independent retailers, unchanged. Since this period of 1952 was one of generally poor business, the rise in production coupled with a drop in the value of sales indicates that the fall in prices must have been considerable to offset to this extent the market rise in turnover.

Private Trading in Magnesium

LORD WOOLTON, the new Minister of Materials, has lost little time in ridding his department of one of the last five materials in which it deals. Public trading in magnesium will end on January 1st, and licences to import from dollar and non-dollar sources will be freely issued to private traders. Thereafter, only jute, tungsten, sulphuric acid materials and flax will remain under the Ministry's control.

Magnesium, which is an ultra-light metal of special interest to the aircraft and motor industries, reverted to Government control in 1951, when world supplies became extremely short as a result of rearmament. Consumption in this country has declined this year, owing mainly to increased competition from aluminium and to the stretching out of the defence programme. Supplies available to the Ministry have been in excess of Britain's present requirements of some 4,000 tons a year and the surplus has been transferred to the strategic reserve.

The Ministry's contracts with Canadian and Norwegian suppliers expire on December 31st or March 31st. Production at the Government-owned plant near Manchester will cease at the end of March. The privately-owned plant on the same site will cease producing on Government account at the same time, but it hopes to continue operations for the private trade. Although costs of production have always been lower in countries like Canada and Norway, which have ample supplies of cheap hydro-electric power, the British company believes it can secure economies from a modified process based on imported raw material, and it also has the advantage of being a large producer of magnesium alloys.

The Ministry's price for virgin magnesium is £322 a ton, delivered. This is an equalised price that takes into account the higher costs of domestic production. Private

buyers should be able to obtain Canadian aluminium for about £285 a ton, delivered UK. Import licences will initially be issued by the Board of Trade on an individual basis to enable the Ministry to follow the trend of demand for the imported product, but it is intended to grant open general licences later on. If private buyers have any difficulty in arranging contracts for next year the Ministry will no doubt help them out from its own stocks.

SHORTER NOTES

The latest productivity report to be published by a team from the Anglo-American Council on Productivity deals not with a single industry but with methods of production control applicable to all industries. The possible value of these reports to British manufacturers seems to diminish sharply when the teams switch from the technicalities of a single industry to broad generalities; in this case the members reported, in part, that "there was little seen with which the team was not already familiar either from personal experience . . . or from written information available in this country."

Wholesalers' sales of textiles rose sharply during the late summer from 67 in July to 78 in August (1950=100). There is usually a seasonal rise in sales at this time of year, when the wholesalers begin to deliver autumn and winter stock to the shops, but the rise is much sharper than it was twelve months ago when the index moved only 4 points, from 63 to 67. The value of stocks has been rising during the past four months and by August the index had reached 104; but this is only 6 points higher than in August, 1952, when the level of sales was 11 points lower than it was this year. These figures suggest that the expansion in retail sales is expected to continue.

The president of the Society of Motor Manufacturers and Traders indicated this week that the motor industry is beginning to think in terms of long-term credits for its export customers, who are in a better position to demand them than they were when cars were scarcer. Like the aircraft industry, the motor industry may turn to the City for help in financing such credits rather than attempt to meet them out of its own resources.

proportionate" falls in profitability, of delays in receiving payment for goods already shipped and of the need to set

aside special provisions in an exchange reserve. In these circumstances, it is a

little surprising that the market had apparently expected better results and a bigger increase in the dividend than the 2½ per cent now recommended. Shortly before the release of the preliminary statement, the 10s. ordinary shares stood at 44s., which would have offered a yield of only about 4 per cent on the 17½ per cent dividend. By Wednesday evening they had come back to 41s. 9d., to yield about 4½ per cent. This is still not a generous yield. Even when all allowance is made for the company's progressive record in chemical research—where its activities are so widespread that the name "Glaxo" is now rather a misnomer—and for the ample cover to the new dividend, the shares seem quite high enough. The fact that a fall in net profits was apparently originally expected as a result of the recession of 1952—which did not, in the event, fully develop—may be a warning of disappointments to come if the long-forecast world recession of 1954 should after all get under way.

★

MONTAGUE BURTON. For the year to March 31st last, Montague Burton, the tailors and manufacturing clothiers, have been able to show a net profit of £182,646, compared with a loss of £566,188 for the previous year; but this has been made possible only by the transfer of £487,045 net from the £1,000,000 that was taken out of general reserve last year to cover losses on forward commitments. The two main problems that the group has had to face have been its large overdraft and its high level of stocks. The overdraft was reduced, last year from £6,176,461 to £3,954,890, but this was effected only during the last five months of the year; previously the overdraft was running "at a very high figure" and necessitated an increased charge for bank interest that ate severely into profits. Stocks have been reduced from £13,716,331 to £10,511,472; but they are still disquietingly high, and the chairman

declares that they present "difficult realisation problems."

In order to be ready to face these problems the group (which last year applied no less than £1,600,000 towards writing off stocks in hand) has stripped the general reserve of its last £500,000, and has used this for strengthening the stock contingencies reserve. Although it is true that the accounts reflect the after effects of the debacle of 1951-52 rather than fresh disappointments in 1952-53, they must be regarded as bringing dismal news to ordinary shareholders, who receive no dividend this year and who received no final dividend for 1951-52.

Since the end of the financial year the company has acquired control of Jackson the Tailors Limited, and has strengthened its board of directors thereby. But the

chairman, Air Commodore C. F. Benson, sees no reason to hope for any "marked improvement" in the current year's trading results, though he views the "succeeding years" with confidence. The chairman makes no reference to take-over rumours in his statement. The 10s. ordinary shares, which have been as low as 12s. during this year, now stand at about 23s. 3d. At that price they are a purely speculative investment.

LONDON STOCK EXCHANGE

Next Account Begins October 14th
Next Contango Day October 14th
Next Settlement Day October 20.

THE markets continued in cheerful fettle until the middle of this week. On Monday, markings reached 12,250, the highest level for any day since May 7, 1951, and the *Financial Times* index of industrial ordinary shares stood at 128.5, its peak for the year. Gilt-edged in this period were steady—the undated stocks perhaps barely so, but the dated stocks were firm. It was not until after business hours on Monday that the Bank of England announced the satisfactory response to the new 3 per cent Exchequer Stock 1962-63 offered at 99½; applications totalled £341 million—perhaps £100 million higher than originally expected—and they received allocation in full. Dealings in the stock opened on Tuesday around the issue price.

Then, on Wednesday, profit-taking set in; and there was a sharp reversal of trend, particularly in shares that had previously been forced up by speculative buying. Other adverse factors were a renewal of weakness on Wall Street, the disturbing news from British Guiana and some sharp falls in commodity prices. The effect on gilt-edged was comparatively slight; losses rarely exceeded ½ although 3½ per cent War Loan came back by ½, to 85½ compared with 85½ a week before. In the industrial section, however, particularly in draperies and stores, falls were substantial. "Gussies," which had risen by 3s. 9d. to 61s. on Monday, came back to 58s. 6d. on Wednesday. Unilevers and BSA were among the few exceptions to the general weakness. The *Financial Times* index of industrial ordinary shares had relapsed to 127.7 by Wednesday's close, but this was still 0.8 points higher than a week before.

Among other sections of the market, foreign bonds have steadily lost ground throughout the week, particularly Japanese issues. Kaffirs have been quietly firm, but base metal shares have moved irregularly with declines predominating. Oils have kept steady, and there has been a slightly better tendency in teas. Rubbers lost ground on the further fall in the price of the commodity.

Company Notes

GLAXO LABORATORIES.

Despite import restrictions abroad, world-wide over-production of antibiotics and general fears of a puncturing of the "wonder drug" boom, the Glaxo group has been able to report another increase in net profits, from £1,503,000 to £1,585,000, for the year to June 30th last. Trading profits have fallen from £3,278,000 to £2,823,000; but taxation has absorbed only £1,238,000, compared with £1,775,000. The directors of this

traditionally cautious company have, therefore, decided to increase the final dividend to 12½ per cent, making 17½ per cent for the year; the dividend for 1951-52 was the equivalent of 15 per cent on the present capital, after allowance for the one-for-one scrip issue made last year.

The fall in trading profits had been foreshadowed in the chairman's statement a year ago. Sir Harry Jephcott spoke then of stringent import licensing, of unfavourable export sales and "more than

(1) Petroleum production in Canada in 1938 and 1951 includes natural gasoline. Annual figures of electricity production in Australia are for 12 months ended June 30th of year stated and for New Zealand 12 months beginning April 1st; monthly figures for New Zealand represent about 87 per cent of total generation. (2) Copper production is smelter; tin is primary metal. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa relates to Europeans only.

Financial Statistics

EXCHEQUER RETURNS

For the eleven days ended September 30th there was an "above-line" deficit (after allowing for Sinking Funds) of £6,139,000 compared with a deficit of £43,296,000 in the previous week and a surplus of £26,215,000 in the corresponding period last year, raising the cumulative deficit to £277,202,000 (£293,211,000 in 1952-53). Net expenditure "below-line" absorbed £6,226,000, bringing the total cumulative deficit to £502,634,000 (£590,406,000 in 1952-53).

THE MONEY MARKET

LOMBARD STREET experienced one of the largest credit turnovers in many years when the lists opened for the new 1962-63 Exchequer stock on Monday. The heavy take-up by banking institutions at first led to an acute shortage of funds, as money was withdrawn from the market, but the authorities soon stepped in to make very heavy purchases of bills both from the banks and from the market direct. Special purchases, though naturally on a much smaller scale, were needed and made on all other days except Saturday in the week to Wednesday last.

In anticipation of receipts from the loan, allotments against the £280 million of Treasury bills offered at last week's tender were scaled down to £250 million. This eliminated the excess of new bills over maturities in the following week. Next week maturities will exceed new issues by at least £10 million; the excess will, of course, be larger than that if the big response to the loan leads to a second under-allotment (the amount offered at yesterday's tender was £250 million). The average allotment rate last week showed scarcely any change from the previous tender—a sign that the new pattern of rates is settling down. The fact that the authorities had "Cut the top off the tender" caused a decline in the market's allotment to 63 per cent of its bid, despite the fall of £14 million in total applications.

The Bank return shows a further outflow of notes of £2.8 million. Government securities held in the banking department rose by £5.3 million, discounts and advances by £4.1 million, and "securities" fell by £9.9 million; the Treasury Special Account fell by £2.3 million and bankers' deposits were virtually unchanged.

all I possess
to my family...
the worries
to the 'General'

It's no kindness to saddle a friend or a relative with one's estate problems! So I handed mine over to the 'General'. They have long experience of investment and financial administration, and in these days, even a small estate can give rise to complicated problems. The 'General' is quite happy for

you to appoint a friend as co-executor and your own family lawyer assolicitor. I'd certainly advise any friend of mine to write to the manager, Trustee Dept., General Buildings, Aldwych, London, WC2 for advice regarding the administration of trust estates, however large or small.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE
CORPORATION LTD.

Bankers for INTERNATIONAL TRADE

Whatever your banking needs in the field of international trade, the facilities of the world's largest bank are at your disposal. Bank of America offers complete international banking service... letters of credit, collections, remittances, foreign exchange, even Travelers Cheques.

So for your international banking needs, write or call the office of Bank of America nearest you.

PRIVATE TREATMENT in ILLNESS

NO FINANCIAL WORRY

In the event of serious illness or operation many people want private advice and treatment for themselves and their families, but are afraid of the cost. B.U.P.A. offers an inexpensive solution. For a very reasonable annual subscription, the Association pays all or a major part of the cost of private nursing home, hospital, and specialist treatment, members being entirely free to make their own arrangements.

The Association's sole aim is to assist its members; it is entirely non-profit-making.

Attractive special schemes are available for Staff Groups.

COMPANY MEETINGS

LONDON TIN CORPORATION

CHAIRMAN'S SPEECH

The twenty-seventh annual general meeting of London Tin Corporation, Limited, was held on October 6th at The Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

Mr J. Ivan Spens, OBE, chairman of the corporation, who presided, said:

ACCOUNTS

The profit for the year before taxation is £1,358,893, compared with the previous twelve months of £1,139,577, an increase of £219,316. Taxation, however, takes £910,000 this year, against £723,070 last year, an increase of £186,930, so that our net profit, after taxation, comes out at only £32,386 above last year. The excess profits levy for the year is estimated at £170,000, as against £40,000 for the four months of the previous year, to which this tax applied. Further appeals to the Board of Inland Revenue against the basis on which this corporation is assessed for E.P.I. were unsuccessful. This corporation has, since its inception, passed through many difficult years, including the years of the war when the Japanese were in occupation of Malaya, where two-thirds of the corporation's interests are situated, and when no dividends were paid.

The Malayan companies were still rehabilitating during the years 1947, 1948 and 1949, and it was not until 1950 that dividends again began to flow.

The Finance Act, 1952, gave a certain measure of relief to companies whose business was in territory occupied by the Japanese during the war years, by bringing in the year 1950 for calculation of the standard profit and also by applying an overriding limit of 10 per cent for companies operating overseas, instead of the 15 per cent limit for other companies. The Revenue, however, would not allow the corporation to have the benefit of any of these concessions, although the corporation's profits arise almost wholly from companies operating overseas. There can be no regrets that this unfair and burdensome tax is to be withdrawn at the end of 1953.

Your directors on reviewing the provisional results of the year's working considered that it would be in the interests of shareholders if the profits were distributed as early as possible after the end of the corporation's financial year instead of as in recent years by declaring an interim dividend in May and recommending a final dividend payable after the accounts had been passed. To this end they declared an interim dividend of 22 per cent, and do not recommend any further dividend for the year under review.

PRICE OF TIN

What is needed in the tin industry, by the producer and consumer, is a reasonably stable price. Violent fluctuations in the price are embarrassing to everyone concerned and cause uncertainties which make economic planning most difficult. Also what is needed by both producer and consumer is an industry which is working on a sound basis, a basis which the producer finds remunerative and which encourages him fully to meet the market's requirements and to plan and make provision for the continuity of production at a level which will satisfy any demands made. It is to this end that it has been decided to reconvene the International Commodity Con-

ference held in Geneva under the auspices of the United Nations in 1950 and which was adjourned.

It must be borne in mind that in the tin industry there is special need for large reserves of money to be held by producing companies. In Malaya and Siam the area on which a dredge works has only a fixed life. To find new areas needs continuous and large-scale prospecting as and when conditions permit. This prospecting is done for us by Anglo-Malayan Development, Limited, in which company this corporation and the producing companies which are under the management of your subsidiary, Anglo-Oriental (Malaya), Limited, who supervise its activities, are interested.

Any dredge being moved to a new area has to be dismantled, transported and re-erected on its new site, and more often than not requires considerable alteration during re-erection, to make it suitable for the new area. This work now costs some three to four times the prewar figure. The finance for all this must be accumulated over the years, and unless this can be done there can be no continuity in the production of tin.

The problem in Nigeria is similar. The grade of ground available is declining and the ground itself is becoming more difficult to work. To meet these conditions, new and high-costing plant has to be ordered and, consequently, reserves of cash must continuously be built up.

MALAYA

Conditions in Malaya continued to improve during the year. There is still the threat of a large number of well-armed bandits in the jungles, but shooting incidents have become fewer and the number of bandits accounted for has increased. There remains, however, for the staffs on the mines every need to ensure that they and the valuable mining equipment in their charge are adequately protected, and I am glad to say that during the year our staff, European and Asian, suffered no fatal casualties, and there was no damage to plant or equipment. Malaya, during the period under review, maintained production at the previous level, and to this extent Communist activities have failed in their object to disorganise industry. The output of the mines under the management of Anglo-Oriental (Malaya), Limited, was 16,636 tons of concentrates, as compared with 17,588 in the previous 12-monthly period, but this reduction was due to the fact that six dredges worked out their areas during the year, whereas only one dredge started up after transfer to a new area.

Of these six dredges three are being re-erected on new areas and three are waiting the acquisition of new areas. Prospecting has, as shareholders are aware, been almost completely in abeyance due to the security position, but the High Commissioner has recently offered special protection in certain areas so that a resumption of prospecting work can be made. It must necessarily be some time before results are obtained.

I advised shareholders in my speech last year that a large number of war damage compensation claims had been agreed and that 75 per cent of the awards had been paid. It is disappointing that the balance of these claims, which I understand will be about 15 per cent, has not yet been settled, but there is reason to believe that the final settle-

ment may take place in the not too distant future.

I am happy to report that after a recent inspection of a number of the mines under Anglo-Oriental Malaya's management Anglo-Oriental Malaya were congratulated on the excellent arrangements made on the mines for the welfare of the staffs, both European and Asian.

SIAM

Two of the dredges situated in Siam have now worked out their areas and are in course of transfer to new properties. One other dredge which has not been in operation since the war is in course of rehabilitation and it is hoped will be ready to run trials by the end of 1953.

BURMA

Conditions of unrest in Lower Burma, where the mines of Tavoy Tin Dredging Corporation, Limited, are situated, are still such that any mining activities are out of the question and European staff are not permitted by the Government of Burma to visit the mines.

The Burma Government has quite lately called a meeting of the tin-producing companies in Burma and proposed that they should be formed into a joint venture with Government. The implications of this suggestion are not yet clear, but are being carefully studied.

NIGERIA

Production of tin concentrates from the mines managed by A. O. Nigeria, Limited, remained on the level at which the mines have been running now for some years and which is the level of their most economic production. Columbite output increased from 310 tons in 1951 to 604 tons in 1952, equivalent to some 39 per cent of the world's total production. The 100 per cent bonus on the price for columbite which has been offered by the Government of the USA until 1956 or until their stockpile is completed, is acting as a stimulant to production and every effort is being made to find new sources of supply. Considerable quantities of columbite ore have been found in the biotite granite of the plateau in Nigeria and Keffi Tin Company, Limited, a wholly owned subsidiary of Amalgamated Tin Mines of Nigeria, Limited, is now working on this and has lately commenced production.

Political conditions in Nigeria have been most difficult, but it is hoped that the recent conference between the Secretary of State for the Colonies and representatives of the Nigerian political parties will stabilise the position and that the machinery of government will run more smoothly.

NYASALAND

This corporation has formed a locally registered company, London Nyasaland Mining Corporation, Limited, to prospect for minerals in that country. Government geological reports have indicated mineralisation in certain areas, but it is too early yet to say whether they can be worked economically.

GENERAL PROSPECTING

The lead-zinc deposits in Nigeria to which I referred in my speech last year have been
(Continued on page iii)

THE IRISH ECONOMY

Recapturing Lost Opportunities

The Paradox of Protection

WHEN the state that now forms the Republic of Ireland obtained self-government in 1922 it inherited an economy possessing strongly marked characteristics. Some were the result of climate and geographical position, others could be attributed to the course of Irish history. Apart from some well-known and highly developed concerns engaged in brewing, distilling, foodstuffs and textiles, by far the greater part of Irish industry had been established in the six counties of Ulster that remained part of the United Kingdom. The new state was thus overwhelmingly dependent on agriculture. The type of agriculture practised was principally the rearing of livestock for the British market, joined with a certain amount of dairying. Though considerable progress had been made in improving the technique of agricultural production and marketing, the Irish trade was not at all as highly developed as its competitors.

Nevertheless, agriculture had prospered in the first two decades of the century. The Irish farmer traditionally places his savings in the banks as time deposits. Such deposits began to grow in the later decades of the nineteenth century. The total of time deposits in the Irish banking system grew very rapidly in the period of rising prices before 1914 and still more rapidly during the war years. If the new state inherited an economy that was lopsided and undeveloped, it was nevertheless a creditor economy.

This was a considerable initial advantage. But, many Irishmen maintained, it was an advantage that had been dearly purchased. The dominant fact of Irish economics was the constant loss of population by emigration. The population of the twenty-six counties had fallen to 3,140,000 in 1911 from a peak of 6,529,000 in 1841, four years before the beginning of the Great Famine, and there seemed no reason why the decrease should not continue indefinitely. The loss was attributed to two main causes: to a pastoral economy which gave a minimum of employment and to the lack of industries. Ireland, the argument

continued, should not export both its people and its savings; an economic policy that looked first to the needs of the domestic market would soon stimulate the growth of native industry; it would stem emigration and recapture the lost opportunities of the nineteenth century.

The instrument by which these aims were to be attained was a thorough-going policy of protection. Self-government afforded the power to use it. Moreover, the course of events has provided fresh arguments for this policy. In 1932, the depression was used as a justification for full-scale protection; since then, the war and currency restrictions have assisted the protectionist case. But in the last resort this case does not rest on the accidents of contemporary politics or economics; it has deeper roots in a feeling that Ireland was deprived of industrial development and a stable population in the nineteenth century, by the combination of Free Trade and the Legislative Union, and that the first business of a self-governing country must be to make up the time then lost. There is a tendency now to reconsider some of the assumptions on which protectionist policy has been based but its emotional impetus is still strong enough to carry it forward.

Over the last thirty years, therefore, economic development has occurred in industry rather than in agriculture; agricultural production has changed in form but not in volume. It has been directed towards supplying the domestic market, so that some forms of produce that were freely exported in the 1920s are now either not available for export at all or cannot be sold at competitive prices. The necessity of importing butter in the last two years is symbolic. On the other hand, industrial production and employment have shown an impressive expansion.

This industrialisation, accompanied by a shift of population to the cities and an increase in the number of wage-earners, has been reflected in increased consumption. It has not reduced Ireland's dependence on agriculture. The country can, as its citizens learned during the war, provide much of the necessities of life from its own resources. But

luxuries and semi-luxuries have to be imported, whether they come in ready-made or in the shape of raw materials to be manufactured by native concerns. Generally speaking, the new industries must import their materials. The result is a greater and more immediate need to import than was the case thirty years ago, and accordingly there is a more pressing necessity to sell abroad in order to earn imports. And, to complete the circle, those sales abroad are mainly composed of agricultural produce. Thus twenty years of concentration on industrial production has produced in fact an increased dependence on agriculture. That is the paradox.

Urban Expansion

Meanwhile, however, the usual results of industrialisation have not been lacking. There seems to be no present prospect of arresting the growth of Dublin, although its effective population has already grown from 419,000 in 1911 to 634,000 in 1951 and now forms over 21 per cent of the total population of the state. In sympathy, building has become a major industry, increasingly difficult to finance now when there are so many other claims on an inadequate volume of savings. The number of agricultural workers has not only fallen; the rate of loss seems to be increasing. Between 1938 and 1946 the fall was 17,000; between 1946 and 1951 it was a further 79,000, reducing the number to 441,000. In contrast, the numbers engaged in industry have risen from 166,000 in 1938 to 219,000 in 1952; and the disparity between urban and rural wages seems certain to intensify these trends.

An important political result is a great increase in the economic power of the state. This, of course, has happened everywhere, but the process has been unusually rapid in Ireland. It is not a matter merely of state intervention by tariffs and import controls. The energy with which industrialisation has been pursued has led to considerable economic centralisation. As elsewhere, the state has been

forced to salvage such wrecks of private enterprise as the railways. It has also sponsored a number of public utilities, such as the bodies set up for the production of electricity, for the production and processing of sugar-beet, for the use and development of the turf-bogs, for aviation services and the construction of air-fields. All these enterprises are, with minor qualifications, financed out of public funds and administered by semi-state bodies. Certainly they would not have yet progressed far had they been left to private initiative; but the implications of public intervention on such a scale have still to be studied. Paradoxically, an individualistic and still capitalistic-minded society is now socialised to a very high degree. The process has been aggravated by the postwar policy of high annual capital investment by the state. Between 1948 and 1951, public issues of stock amounted to £62 million, of which £54 million was issued on behalf of the state, public authorities or semi-state bodies.

The concomitants of this energetic, widely spreading state activity are high taxation and a high cost of living. These bear hardly in a country where extraordinarily few people (less than 200,000) pay direct taxes and where there are special reasons to encourage individual enterprise and investment. Social services, which are certainly in need of an overhaul, tend to be framed along British lines; they work less efficiently in a community that is still far from being predominantly wage-earning. There is real danger that the general increase in public expenditure and the level of costs will weaken still further the capacity of the economy to sell abroad and pay its way. It is true that the decline in population has been arrested. The 1951 Census showed an addition of some 5,000 to the population since 1946—a modest increase that is the first recorded at a Census since 1841. But it remains to be seen whether these trends can be continued in an increasingly competitive world or whether they are only temporary results of the favoured position of Ireland in the postwar period.

From Cattle to Wheat—and Back?

AGRICULTURE in Ireland depends on the family farm. It is a small unit: of a total of 317,000 holdings exceeding one acre, 173,000 are of less than 30 acres. This is the result of the Land Purchase Acts by which, between 1885 and 1909, property in land was transferred from the landlord to the tenant. In the circumstances of that period, and indeed for long afterwards, the family farm had many economic advantages. It was carried on by unpaid labour, and costs could be easily reduced in any period of falling prices. It provided, when material wants were modest, a considerable degree of self-sufficiency. It encouraged and facilitated thrift. Thus the greater part of the savings made by the community were the product of its agricultural sector. These characteristics persist in some degree to the present day. The Irish farmer must be one of the few of his kind who has more money on deposit than he owes to the bank.

These advantages of the small family farm were balanced by some inherent drawbacks. So many individual producers suffered serious disadvantages in marketing their

produce. It was also difficult for them to keep abreast of changes in technique. The object of the co-operative movement which grew up in the concluding years of the nineteenth century was to remedy these weaknesses. It still does excellent work, though it has had to surrender many of its functions in this field to the state. But its activities have been concentrated in the dairying areas. Moreover, the trend of the times is against the small farm; mechanisation and collective marketing present problems which the individual producer with limited resources meets with increasing difficulty. A change of outlook is also needed. Expenditure on equipment makes demands which the farmer is not always willing, even if he is able, to meet. The savings which have been, and are still being, made are earmarked as provision for the family, for education and dowries as much as for old age; they will not usually be put back into the land. There is more to it than that. The Irish farmer might do all the things that he is exhorted to do—re-seed his grasslands or adopt winter dairying—if he could abandon the suspicion that his interests do not

rank high in official priorities and that economic policy is directed towards the cities and factories at the expense of the countryside and farms. However that may be, the fact remains that the input of fertilisers and the degree of mechanisation are both extraordinarily low (though the latter has increased lately) by western European standards. These may stand as examples of a reluctance to invest which is possibly inherent in a small farm economy, but has been greatly strengthened by a distrust of official policy.

Irish farming has rested on livestock production. The beef and dairying trades are closely connected in so far as the graziers do not usually rear their own beasts, but buy calves from the dairying areas. In their turn, the production of pigs and poultry—which are of exceptional importance to the small farmer—depends largely on the dairying trade. Traditionally, tillage was directed towards the provision of feedingstuffs for livestock, rather than for direct human consumption. Ireland's was an agricultural economy designed to produce exports.

A Static Agriculture

The first ten years of the new state did not alter this much, but the change of government in 1932 produced an insistence on encouraging wheat-growing, which had almost disappeared during the second half of the nineteenth century. The depression and the Anglo-Irish dispute over the land annuities also caused production to be diverted to the needs of the home market. Subsidies and tariffs were granted or imposed and a number of marketing bodies were set up, after the fashion generally prevailing in the 1930s. The measures then taken have not been substantially revised since. Indeed, it is difficult to think of any occasion, except when the Anglo-Irish Trade Agreement of 1938 gave promise of a new start, when they could have been. The trade agreement was overtaken almost at once by the enforced self-sufficiency of war; and since 1945 the export trade has been governed by currency restrictions and government controls; so also has the capacity to import fertilisers and feedingstuffs. But the change in the world economic situation in the last two years makes the need for a re-examination of policy more urgent.

In all these changes, the total volume of agricultural pro-

duction has remained stable or, if the word be preferred, static. If 1938-39 (not itself a good year) is taken as a base, the volume of output in the principal agricultural commodities was last year only one half of one per cent higher. But there were significant changes in the composition of the output; from 1938 to 1952 the volume of output of crops and turf rose by 10 per cent, while the volume of output of livestock and livestock products fell by 2.6 per cent. Some detailed comparisons may be made over the last twenty years. The number of dry cattle was 2,707,000 in 1931 and 3,060,000 in 1952; of dairy cattle, 1,300,000 in 1931 and 1,245,700 in 1952. The number of sheep fell from 3,575,000 to 2,837,000; of pigs from 1,227,000 to 712,000; and of poultry from 22,782,000 to 19,563,000. The acreage under wheat rose from 21,000 in 1931 to 253,000 in 1952; under beet from 5,000 to 56,000. The acreage under oats was 623,000 in 1931 and 608,000 in 1952. The total tillage area was 1,418,000 acres in 1931 and 1,692,000 acres in 1952.

Three conclusions may be drawn from these comparisons. The first is that the exportable content of agricultural production has decreased in the last twenty years. In 1929-30, 50 per cent of Ireland's agricultural output was exported; the proportion in 1952 was 34 per cent. The second conclusion is that the position of the larger farmer, who can use mechanisation to advantage, has been strengthened while the small farmer, whose fortunes depend on dairying, has been weakened. The third conclusion is that the predominance of cattle, within the exports of Irish agriculture, has actually been enhanced in spite of, or partly

AGRICULTURAL OUTPUT

because of, policies that were adopted as a reaction against it.

Ireland depends even more now than it did twenty or thirty years ago on the capacity of its farmers to sell abroad. Moreover, greater food supplies from Ireland must be important to a world where the long-term tendency seems to be set against the food importing countries. Spokesmen for the farmers place the responsibility for the stagnation of output on the deflectionary policies of the state. They say that in encouraging industry governments have injured the agricultural interest in many ways. In the first place, the postwar policy of capital investment has been directed principally to schemes of importance to city-dwellers, and

From Top... ... To Bottom an Irish Holiday is Best

A happy holiday is a necessary investment in the interests of continued health and energy; it is false economy to do without. But it is not essential to make long, uncomfortable, expensive journeys to enjoy yourself overseas. Nor, in the interests of economy, do you have to spend another vacation in the same old local seaside resort.

Ireland has everything to offer that you expect from the Continent—and a unique, instantly contagious, intrinsic joie-de-vivre besides, rare in this modern world. Look at the happy, smiling faces on this page. They mirror that carefree, friendly atmosphere which will make your Irish holiday a heart-warming experience.

little has been done to restore soil fertility. Labour has been drawn from the farm to the factory and building site. This, the argument continues, is only an aggravation of the urban bias already disclosed by the policy of industrial protection. The farmer cannot be blamed for not putting his earnings back into the land when everything that he uses, from fertilisers to wheelbarrows, is subject to a tariff. Agriculture must sell in an export market and yet must bear the costs of a small domestic market which is heavily protected. In the second place, the critics emphasise that milk yields are absurdly low and that the overheads of the dairy farmers are thus greatly increased.

The consequences of neglecting agriculture are already shown in the disappearance or precarious survival of some forms of export that were taken for granted twenty years ago—such as butter, pork, eggs and poultry. If the same conditions continue, even the food-processing industries that have grown up lately, such as chocolate-crumbs and the dead meat trade, will not be able to expand and may not maintain themselves. Other results have been the

impoverishment of the small farmer, who is now turning to cattle on his own account, and the shift of population from the land.

Whether or not this is a full analysis, it is certain that the volume of production is capable of considerable expansion, which would greatly and almost immediately increase the exportable surplus. The doubt is whether the comparatively modest effort needed will be made. It depends on whether present policies can be revised—whether, that is, the agricultural interest receives a higher priority than it has at present. Until it obviously does so, the farmer is not likely to be moved by appeals to redress the balance of payments for the benefit of the city dweller. But if he could be convinced that government policy will be both favourable and stable, an appreciable increase in output could be obtained. There would then remain the long-term problems, the solution of which is not even in sight, of agricultural credit, of better research into agricultural technique and costings, and of passing on the results of such research to the farmer.

The Fruits of the Tariff

IN the history of Anglo-Irish relations, commercial and political issues have never been separated for long; and to Irishmen the fiscal power is accordingly one of the most important attributes of political independence. But the force of protectionist feeling must also be related to the exceptional problem of a country whose population has been reduced by emigration. The other arguments for Irish protection are those that appealed with great force in all the nation states of 1918: unwillingness to remain dependent on the fortunes of a few great industries; desire to introduce new trades and skills; and, transcending economic considerations, the wish to create a more diversified and yet more integrated society. Rightly stated, the traditional Irish arguments for protection are positive, not negative; they look to a building-up, not to restrictionism. But they are deeply coloured by the desire to retain population and there is therefore a tendency to look simply to increased employment and to ignore its real cost in terms of the capital and labour that might be employed in more productive ways elsewhere.

Between 1922 and 1932 the protectionist case was not pushed far. Government policy recognised the prior claims of agriculture. A thriving agriculture, it was argued, would provide the best possible market for industrial production, indeed the only possible market for most of it. The farmers had to sell their produce in an export market which, in the 1920s, was open to the world. Their costs of production therefore must not be increased unnecessarily, and so the onus lay on those who sought industrial protection; they had to show that the granting of a tariff would be offset in a measurable period by increased production and employment at lessening costs. By modern standards the test seems severe. Nevertheless, a number of protective tariffs were imposed between 1924 and 1931 and a standard by which industrial development might be measured was provided by the first census of industrial production, taken in 1926.

Many of the assumptions on which this selective policy was based had been gravely weakened as the 1930s opened.

The depression strengthened the general arguments for extended and intensified protection. A special argument was added by the return of many emigrants from the United States. When Great Britain adopted protection in the autumn of 1931—under a government, moreover, that was committed to regulating the market for agricultural produce and to assisting British agriculture—the case against a full-scale tariff was undermined. Nevertheless, the end did not come at once: for some months in the winter of 1931-32 Ireland enjoyed the unexpected distinction of being the last surviving adherent of free trading in a protectionist world.

A thorough-going revision of policy was thus inevitable: but the vigour with which it was adopted owed something to extrinsic factors. Happily the tangled issues of the Anglo-Irish dispute over the land amenities need not now be discussed. But the British Government's decision to recoup itself by imposing penal duties on Irish agricultural produce served to underline the dependence of the Irish economy on agriculture and of agriculture on the British market. All the more reason, the Irish concluded, to press on with industrialisation through tariffs.

The Growing Industries

The system then developed has lasted in all essentials until the present day. It was, however, substantially modified during the period of war and postwar shortages. Tariffs now cover pretty well all articles of consumption from swaddling clothes to shrouds. As every type of industry has been fostered, it is almost impossible to generalise about the efficiency of the new industries or to find phrases that will equally apply to the concerns that have sought an export trade with some success, to those that have brought their prices to competitive levels, and to those that obviously are content to enjoy the easier life made possible for them by protection.

The degree to which new industrial employment has

been provided is shown by the increase in the number of workers from 103,000 in 1926 to 219,000 in the relatively unfavourable circumstances of 1952. Of these totals, 45,000 were engaged in building and services in 1926, 81,000 in 1952. Both the degree of development and the possibility of further expansion vary greatly from one industry to another. The textile and clothing industries have gone furthest; for them, as for others such as furniture, the normal demand can now be met from domestic sources. There has also been a considerable development in sisal spinning and in jute spinning and weaving. A number of potteries have been opened or extended. By the operation of a far-flung tariff, a wide range of miscellaneous household goods are also produced. The variety of the industrial expansion prevents generalisation, though mention should be made of cement, the output of which has grown greatly in the last twenty years.

The processing of food has combined—though, as some would say, not yet to the full extent possible—with agricultural production. The sugar beet industry has developed steadily in the past twenty-five years and it is providing a useful lead in spreading co-operative methods and improved techniques among the beet growers. Food preserving has been greatly extended since the war and now covers a wide field from confectionery to tinned beef and preserved vegetables. The meat processing trade has developed in a spectacular fashion in the last few years but it is necessarily dependent, as so many other industries of this kind ultimately are dependent, on expanding primary production and keeping domestic costs low enough to permit entry into foreign markets.

A succession of surveys has so far failed to discover mineral deposits on a scale sufficient to provide materials for competitive industry. In many cases, therefore, the necessity to import materials cannot be escaped. The Irish manufacturer also faces the necessity of training his labour. Though this has presented surprisingly little difficulty, it means that the average rate of wages for skilled labour tends to be higher in Ireland than in Great Britain. These are formidable obstacles to the development of an export trade although they have been overcome in the case of some industries and, more fleetingly, of some individuals whose success in profiting by import restrictions in Great Britain would make highly diverting reading. From other handicaps the Irish manufacturer suffers in common with his

English neighbour: from, as he claims, inadequate depreciation allowances and from heavy taxation. This last may not seem so heavy by British standards; but many Irish industries are still growing and the necessary capital is not easy to find in competition with the public investment programme. On the other hand, the Irish manufacturer has enjoyed a reasonable freedom from industrial disputes and his path is smoothed by the state if he proposes to engage in new branches of production.

There are other aspects that are not so happy. The greatly increased cost of living bears heavily on the earners of salaries and wages, the class that has borne the cost of development. Capital and labour have been diverted from an agriculture that still shows the scars of depression and war. Moreover it would seem that protection has been so freely bestowed that the growth of some promising industries has been impeded by the virtual obligation to use domestically produced or processed materials. Protection and high prices have come to be taken for granted in many quarters. For some manufacturers, the fall in prices since 1951 has been the first they have experienced since they set up business in the 1930s. It is perhaps no wonder that

EMPLOYMENT IN PRINCIPAL INDUSTRIES

they should describe the process as "deflation"; it is more surprising that the expedient of still higher tariffs should have been adopted as a nostrum. Such psychology provides a severe handicap to the manufactures that show the greatest promise.

But even if instincts that have deep roots in history could be disregarded, it is difficult to direct economic criticism against industrial protection in itself. "Defence is greater than Opulence," and it was of considerable importance in the 1940s that the new industries were able to provide in part for the needs of an isolated community. These industries can be regarded as an insurance against being left totally unprovided for: if the premium seems high at times, so is the risk. Criticism rests rather on the belief that the expansion of agriculture, on which industrial prosperity must depend, was not pursued with an equal vigour and sense of purpose. Had things been otherwise it is safe to state that industrial development would have gone still further, that it would be more firmly based, and that it would now share in and utilise the benefits of an expanding economy.

TO
IRISH FIRMS

DOLLAR TRADE

TO
DOLLAR FIRMS

There is a profitable outlet in the dollar market for Irish exporters. Initial obstacles may have to be overcome. CTT can help Irish exporters to solve these difficulties. CTT's service covers market prospects, prices, product suitability, customs duties and import regulations, samples of competing products, selection of agents, export guarantees, etc.

Ireland's imports from the United States and Canada averaged \$95 millions over the past three years, while her exports to these countries amounted to less than 10% of this figure. Continuing imports on this scale from Canada and the United States must depend on increased purchases by these countries. Ireland offers a wide range of quality products: bloodstock, food products, beverages, textiles and textile fibres, agricultural and marine products, pharmaceuticals, handicrafts and many other items.

CTT—ESTABLISHED BY THE GOVERNMENT OF IRELAND TO PROMOTE IRISH EXPORTS TO THE DOLLAR AREA—WE INVITE ENQUIRIES

Across the world from Ireland...

To over a score of countries throughout the world go the products of our factory—hard fibre yarns, twines, cords, ropes (dyed and natural), cotton, hemp, jute and rayon polished twines as well as our renowned Tintawn sisal cord carpeting and carpet squares. We welcome all export enquiries.

Pictured here is the famous Custom House in the port of Dublin. Designed by James Candon, an architect of French-Welsh parentage, and adorned with magnificent sculptures by the Irish sculptor, Edward Smyth, it took ten years to complete (1781-91). The interior was destroyed when fired by Irish forces in 1921 during the War of Independence, but it has since been restored to its original splendour.

IRISH ROPES, LTD., NEWBRIDGE, CO. KILDARE, IRELAND

You're only 40 winks from Ireland by air!

Make your next trip to Ireland *by air*. It's the restful way to hurry. Frequent Aer Lingus flights. Services regular as clockwork. No fuss or tips. No cluttering luggage—it's checked right through to Dublin. And what does this unruffled travel cost? Far less than you'd think.

● FLY YOUR FREIGHT, TOO!

Use the big Aer Lingus freight carriers to get your goods to Dublin. Air freight cuts packing, insurance and warehouse costs. And it's safer.

Capital by Disinvestment

IN tables that claim to compare the income per head in various countries of the world, Ireland ranks fairly high in the second division. Its place is about the same as that of France. In money terms, the national income has expanded continuously since 1938, the first year for which the Central Statistics Office published an official estimate. In real terms, it has remained virtually unchanged in the last two years at a level about one-sixth higher than in 1938.

Since the war national expenditure has been able to exceed income, thanks to loans under ERP, money entering Ireland for investment, and the sale of foreign investments. Personal expenditure in 1952 was about 18 per cent higher, in real volume, than in 1938. Current expenditure by the state and local authorities has risen considerably. Above all, there is the investment programme. In the three years 1950-52, gross domestic capital formation is estimated as having been £182 million. It can fairly be said that only a small proportion of this capital expenditure will help to increase the earning power of the economy. Indeed, in so far as it deflects capital and labour from where they are most needed, it tends to weaken that earning power both at present and for the future. The position can be summed up by noting that of the £182 million of capital formation in 1950-52, total savings were sufficient to finance £45 million, provision for depreciation provided £36 million, and no less than £101 million depended on foreign disinvestment.

The degree to which imports are covered by exports has diminished in recent years, both because the forms of agricultural export have contracted and because the capital investment programme requires extra imports. Perhaps the most favourable trading year that the state has known was 1928; it is significant that it is necessary to go back so far. Exports were then valued at 77 per cent of imports. By 1938 the proportion had fallen to 58 per cent. Even that figure, however, seems admirable in comparison with the postwar years; the proportion fell to as little as 36 per cent and did not regain 50 per cent until 1952. The improvement, which is very largely due to a gratifying increase in exports, continued in the first half of this year, when it was 58 per cent. But if this is useful and encouraging, so far it has only brought the export ratio back to the level of 1938, when the Irish economy was emerging from the effects of the depression and the "economic war" with Great Britain.

Agricultural Exports

In 1952 livestock provided 33 per cent of the total value of exports. A further 28 per cent came from foodstuffs of animal origin—such as eggs, tinned beef, chilled or frozen meat. Other foodstuffs, such as confectionery, drink and tobacco, formed a further 23 per cent, leaving manufactured goods and raw materials to provide only 16 per cent of Irish exports. Such is the overwhelming importance of agriculture to the export trade. The figures also show, however, the lines along which a measure of industrialisation can profitably proceed. To kill the animals first, and export meat rather than livestock, has long been desired by Irish economists and, of more immediate importance, by politicians. The change represents a new form of employment, makes further employment possible because the offals

and hides are retained, and (a factor that both economists and politicians may welcome) it makes new trading contacts possible. In view of the predominance of the British market for Irish exports, any commodity that may also be sold elsewhere has a natural attraction. The extent to which Irish meat could be sold abroad can, however, be exaggerated. Irish exporters have grown accustomed to easy sales in the last ten years and have yet to reconcile themselves to competitive markets. Their continued success will largely depend on whether the level of costs in Ireland can be reduced. It is only necessary to recall that in 1929 it was not thought anything out of the way that the country should export £2 million worth of pigs, £3 million worth of bacon and £4 million worth of butter—forms of trade that have now almost disappeared.

Changes in British agricultural policy will be closely watched in Ireland. In 1952, 86 per cent of all exports was consigned to the United Kingdom. The trade with North America brought in the equivalent of £3.5 million, and almost all the rest of Ireland's export trade was with the non-sterling members of the European Payments Union.

The volume of imports in 1952 was 134 (on the base of 1938 equals 100), and the volume of exports 135. The growth of Irish manufacturing has not reduced imports. On the contrary, they have grown, though they have changed considerably from the finished goods of thirty or twenty years ago to the raw materials or semi-processed goods or today. Imports are needed in growing volume to

keep domestic industry going and to provide the goods, manufactured at home or abroad, that the consumer has come to expect. And, to make possible the financing of these imports, the only exporting industry in sight is agriculture.

The balance of payments has of late been a live issue in Irish politics, though its importance has at least temporarily been diminished by the fall in imports and rise in exports since 1951. Its violent fluctuations in recent years are shown in the accompanying chart. The deficits must be set against a still impressive total of foreign, mainly

sterling, assets. The external assets of the banking system were estimated at £78 million at the end of 1938 and at £234 million at the end of 1946. At the end of 1951, the comparable figure was £213 million. No figure is available for the total of privately owned external assets though a recent calculation put it at about £163 million in 1949. It seems almost certain that the heavy balance-of-payments deficits since the war have been financed mainly by disinvestment in this sector. But, besides ERP, there has also been a degree of foreign investment in Ireland which, in an economy that still happily preserves some freedoms and privacies, eludes analysis.

It should not be assumed that everyone regrets these deficits. The pros and cons of "repatriation of the external assets" are vigorously contested in Ireland. It is difficult to analyse issues that are often emotionally defined. In the first place, it should be remarked that a considerable drawing-down of these assets represented merely the realisation of forced savings imposed by wartime shortages. In the second place, the rise in prices during 1950-51 and the rush to pile up stocks meant a further considerable, if inevitable, reduction in money assets. The Irish economy is particularly exposed to the consequences of a violent change in world prices—which might explain deficits in the balance of payments and at the same time offers an argument against deliberate reduction of the remaining assets. In the third place, with state-sponsored investment running far ahead of current saving it may be said that the realisation of past savings held abroad is simply a transfer from one form of investment to another. It need not be criticised if the new investment increased the country's power to

export. But the external assets do provide an invaluable cushion against times of bad trade, and a great part of postwar investment has in fact gone into projects which are socially desirable, such as housing, but do not represent earning assets. The true criticism should not be directed against a realisation of the assets *per se*, but against the exchange of earning for non-earning assets. As it is, Ireland's external disinvestment must be regarded as the expression of a continuing inflation against which no effective measures have yet been taken.

Many of the policies adopted in Ireland have had results clean contrary to their aims. Encouragement of industrial production has led to a greater dependence on the earning power of agriculture; encouragement of tillage has helped to increase the importance of the cattle trade. Too great attention to secondary industry and services at the expense of primary production is, indeed, an error that many countries have committed in the last twenty or twenty-five years. In Ireland, no irreparable damage has yet been done. The problems that face the country are largely of its own creation and within its power to solve. The creation of uneconomic industries, the realisation of past savings, the prolonged encouragement of inflationary tendencies—all these have come from pursuing too energetically policies whose ultimate results have not been sufficiently examined. Nevertheless, being still a strong creditor country, Ireland retains room for manoeuvre. It could frame and implement agricultural policies that would transform its national income and generate an expanding economy, in which greater opportunities for employing its population at home could be provided.

When Understanding is All-Important...

... it is a saving of time and money to find skilled, courteous assistance, instantly available! International House and the International Trade Mart give tangible expression to the good-neighbor policy of the port of New Orleans, assisting importers and exporters, their customers and their shippers to get together to mutual profit. Foreign Trade Zone No. 2

provides New Orleans with the advantages of a free port for landing, storing, processing, manufacturing or re-exporting goods with no customs expenses or formalities.

Ship New Orleans... Port of All-Important Savings

CHECK ALL THESE ADVANTAGES:

- Ample supply of friendly labor
- Favorable location for trade with entire Mid-Continent area of the United States
- Foreign Trade Zone No. 2
- Ample equipment for all types of cargo
- Connecting rail, truck, barge, air transport
- Ample marginal wharfage
- International House and International Trade Mart facilitating foreign trade
- No lighterage needed

*Canada's Wharf
to the World!*

AS Phillips' "Table of Distances" clearly shows Halifax is actually NEARER than any other North American mainland port to the leading ports of Europe and Africa—to the principal Atlantic ports of South America—and to all Asiatic ports, as far east as Hong Kong.

Manufacturers using the Port of Halifax are thus brought hundreds of miles closer to the most important overseas markets. They save long, costly hauls on imported raw materials and on their fabricated exports.

In addition, a Halifax location gives them first access to the nine hundred million dollar market of the Maritimes—including Nova Scotia, Newfoundland, New Brunswick and Prince Edward Island.

We are particularly interested in submitting surveys to meet the needs of any inquiring industrialist.

SIR WINSTON CHURCHILL'S WAR MEMOIRS

The Sixth and Final Volume

IN the context of 1953 this last volume of Sir Winston Churchill's War Memoirs is the most enthralling.

It is an account not so much of the series of great victories that ended the War as the story of the personal negotiations between Churchill, Stalin and Roosevelt, and later Truman, about the shaping of the post-war world.

In American eyes, at least, the word Yalta has become synonymous with Munich. Sir Winston now tells what really was agreed there and in what manner the Russians voided their pledges.

Equally absorbing is his account of how the Western armies failed to carry out the occupation of Berlin, Vienna and Prague, all of which would have had a profound effect upon the present situation. How, too, America's feeling that British "ambition" after the war must be curbed led to fatal divergence between American and British dealings with Russia.

The whole volume is summed up in Sir Winston's words "How the Great Democracies triumphed, and so were able to resume the follies which had so nearly cost them their life".

That is why he has named it—

'TRIUMPH & TRAGEDY'

'ENGLISH ELECTRIC'

Lakes and rivers in many countries now produce millions of units of electricity by means of 'ENGLISH ELECTRIC' plant. Specialists for many years in water power projects, The ENGLISH ELECTRIC Company is the only British firm which both designs and manufactures water-turbines and the electric generators coupled to them. At Loch Sloy—the most ambitious project yet completed in Great Britain—all the turbines and electrical equipment are 'ENGLISH ELECTRIC'.

bringing you

'ENGLISH ELECTRIC' equipment supplies electricity not only to industry but also to millions of householders—and helps them to make the best use of it. 'ENGLISH ELECTRIC' refrigerators, cookers, washing machines and food mixers are making life easier in countless homes all over the world.

Wherever electricity can play its part 'ENGLISH ELECTRIC' generates and adapts it for the use of mankind.

Adriatic Solomon

THE task before Solomon was child's play compared with that confronting the Allies in Trieste. When he threatened to cut the infant in half, only one of the ladies shrieked and he knew which way to decide. In the Free Territory of Trieste, both sides have been shouting so loud and long that the Allies have very little to go on. Indeed, one of the main features of the serious crisis which has blown up since last week is that it no longer bears any very direct relation to the merits of the case. The danger now springs not from the irreconcilability of conflicting Italian and Yugoslav claims, which have long been known, but from the fact that of the parties in the dispute, three at least—the Yugoslavs, the British and the Americans, and very possibly (in their private hearts) the Italians also—have suddenly found themselves in new and mutually untenable positions from which none can climb down very easily, however much they may wish to.

If London and Washington could have foreseen last week what has in fact happened during the past few days, they ought never to have made the declaration they did. The question is: Could they? What is surprising about Marshal Tito's threat to move into Trieste, if the Allies carry out their declaration that they will withdraw, is that he had not apparently given any real inkling of it beforehand. No one supposed he could accept the handing over of Zone A to Italian control with anything but great hostility. But this, after all, is no more than the culmination of a logical process which has been going on for some time. When the Allies announced in May of last year that they would appoint an Italian political adviser to their zone commander, and would make Italian administrators responsible for certain departments in Zone A, full Italian control was ultimately implicit in what they said. Marshal Tito replied by disputing the assumption that Zone A is mainly Italian and by reserving "the right to protect the interests of Yugoslavia." But the partial handover to the Italians was carried out by September of last year, and Marshal Tito remained careful throughout to leave loopholes in anything he might say.

Now he has not. Nor have the two western allies. If they misjudged the Marshal's fervour, the error has been made. What can no longer be wished aside is the strong probability that, if the British and Americans do move out of Zone A, Yugoslav troops will in fact move in. After all the brave talk in Italy, no Italian government could refuse to fight. The only apparent way of averting this clash would be for the Americans and British to withdraw their statement of last week and keep their troops in Trieste. But this, too, would not only be unwelcome but would have unpleasant consequences. The only possible step at the moment is therefore to accept Marshal Tito's suggestion of a conference between America, Britain, Italy and Yugoslavia. If the conference is to be held, nobody will have to be asked to retreat beforehand from any position taken up. In particular, the two western governments should not withdraw their statement, but merely

postpone its application. Their only hope of achieving an agreed solution is to preserve their own freedom of action, and the British Government at least should emphasise its own interest in the matter, which is to get out of an expensive piece of public service for which it has been rewarded only with abuse.

The conference may not succeed. But to jump to the conclusion that it will fail would be wrong. Nor can anything be gained by speculating on the precise outcome at this stage—whether the meeting will cut the Gordian knot, unravel it after all, or leave it as tight as ever. One thing, however, must be done now to ensure a reasonable chance of success. Both London and Washington should insist in Rome that Italy must attend. It is no use pretending either that the British and American position remains unaffected by Marshal Tito's reaction or that it will not depend to some extent on Italy's own future attitude. The western powers can hardly afford to make an enemy of either party.

There is a fairly general view both in this country and in America that the city of Trieste should be Italian. But it needs to be said quite bluntly to the extreme nationalists in Italy that nobody in America or Britain holds this view strongly enough to risk upsetting the precarious balance of world peace for it, and that in any case it does not now extend to supporting Italy's claim to the whole Free Territory. Indeed, it was a cardinal error of last week's Anglo-American declaration not to state categorically that no further support would be given to Italy's claim on Zone B. If the time has come to fulfil in respect of Zone A part of the three-power declaration of 1948, promising the whole of the Free Territory to Italy, then it is also time to cancel what was never a particularly honest undertaking in regard to Zone B.

It is a fortunate chance that Mr Eden, Mr Dulles and M. Bidault had arranged to meet this week. Trieste has, at least temporarily, taken the place of Germany or a "top level" meeting with the Russians at the head of the diplomats' European priority list. This priority does not spring from any question of the legality of the Anglo-American declaration—which does in fact infringe the Italian peace treaty—or from the infinite

complexity of the ethnic problems of Trieste itself. It rests on the naked fact of power politics. For, as the three ministers sit down to discuss the very real threat to peace in Trieste, they are bound to assess above all what they can and what they cannot afford to do in the state of Europe as it is today.

It was the Russians who first used the Trieste problem for their own ruthless purpose of causing disunity and friction, when they refused to agree on an international governor of Trieste; this, as they well knew, prevented the establishment of the permanent type of regime envisaged in the Italian peace treaty. The cynicism, therefore, of the Russians' action this week, in suddenly going into reverse and nominating a governor whom they rejected six years ago, will not be lost on the world. There is no possibility of reviving the project of an international territory unless the opposition of both Italy and Yugoslavia is withdrawn—of which there is little sign. But the western ministers will have to calculate very carefully how far this shift in the Kremlin's tactics, combined with Russian support at the United Nations for Marshal Tito's protest, may end by ensnaring Yugoslavia back into the satellite net. At present Belgrade is suspicious of this sudden and not very welcome friendliness in Moscow. Marshal Tito's quarrel, however, was fundamentally a personal one with Stalin, and there has lately been a slight relaxation in his relations with the new regime in Moscow; earlier this year ambassadors were exchanged for the first time since 1948.

If the western powers can ill afford to undo the patient work of the last few years in making friends with Marshal Tito, they are scarcely in a better position to disregard the possibilities in Italy either. Yugoslavia is strategically valuable and the fact of having this one Communist ally has been of immeasurable ideological help to the West. But Italy occupies a crucial position astride the Mediterranean, and it is a member of Nato and of the Schuman coal-steel pool, an essential factor in the proposed EDC, and a large, industrialised nation. To back down on the support now shown for its claims would be to risk seeing the last chance of moderate government in Italy go down before the extremism of right or left, with grave potential consequences in terms, for example, of an Italian withdrawal from the Atlantic Pact.

There is some temptation to cry a plague on both their houses and to let Italy and Yugoslavia fight it out themselves, if necessary with bullets, and in the actual streets of Trieste. But, even apart from the moral aspect, to accept the use of force would be to start a chain of events without in the least knowing where it would end. If nothing else, an Italo-Yugoslav clash would certainly stand a good chance of pushing Marshal Tito right back into the arms of Russia or of provoking a civil war in Italy, and perhaps of both together. With pitfalls as ominous as this on either side, the safest (though possibly the most inglorious) position for America and Britain is on the fence. They had better see if they cannot find a new one to perch on.

Colonies on Parole

THE political storm over British Guiana is both sudden and serious. The dispatch of warships and troops, Orders in Council, and the solemn suspension of a constitution are appropriately grave as well as dramatic steps with which to forestall, as the Government believes, a Communist-inspired seizure of power. In a characteristically forthright statement to the Conservative party conference, Mr Lyttelton declared that Her Majesty's Government was not willing to allow a Communist state to be organised within the British Commonwealth. Most people are prepared to suspend judgment until the Government has published its White Paper and presented its case fully in Parliament next Thursday; but few can be entirely happy about the hurried sequence of events.

The general outline of the story is tolerably clear. The Guianese ministers were certainly subject to Communist influence and there is some evidence to show that they were using their position as ministers to gain control over the trade union movement and to exercise a political influence on the police and the Civil Service. The Governor became convinced that they were aiming at a proletarian dictatorship, and that incidentally they were ruining the economy; he recommended that the constitution be suspended, and his advice was followed.

There are several degrees of doubt about this policy. The first line of criticism, coming from the extreme Left, is that a Tory Government has seen its chance of reverting to type over this defenceless little colony cut off from all outside help; Sir Winston can play gunboats without fear of the consequences. The implication is that it is always wrong for the home government to overrule a colony. Such criticism can be sustained only by rejecting the colonial policy that was accepted by the Labour Government itself. The essence of the policy is to introduce responsible government while providing, in the early stages, safeguards should the newly elected politicians fall gravely short of their tasks. All the constitutions introduced since the war, in the Caribbean and in West Africa, have left certain reserve powers in the hands of the Governor and have retained in the Crown the right to revoke or suspend the constitution.

The second and more serious doubt is rather one of tactics: may not intervention, as a cure, be worse than the disease? The question is empirical and the answer in any particular case must depend on the circumstances. The power of suspension is certainly not one to be used lightly, and the Government will be accused of using a sledgehammer to crack a nut that might have been prised open unobtrusively with a little diplomacy. What, after all, will follow the suspension of the constitution? If the forthcoming commission produces a revised constitution that gives the Guianese much less independence than the present one, will not that

strengthen the hands of the extremists by giving them another rallying cry? If, on the other hand, the constitution is modified without changing essentials, what happens if the same party and the same people are returned to power again? If an ignorant electorate continues to use its constitutional rights by electing people who are determined to subvert the constitution (if that was indeed the ministers' intention), can the British Government intervene a second time?

★

This is a formidable argument. It illustrates clearly how precariously founded is the whole policy of constitutional progress in the colonies. That policy rests on the assumption that a quick and generous grant of self-government is the only way to bring out responsibility in the new leaders thrown up by the political commotion in the colonies. Even if untrained for executive positions they will be educated by responsibility to become loyal and democratic members of the Commonwealth. So far, everyone admits, the policy has been successful. The most extreme parties have been returned to power by inexperienced electorates; yet tact and good faith on the part of the Governor and his civil servants have paid dividends. Relations with Britain have remained remarkably good. Indeed, given a desire on both sides to work the constitution, postwar policy will probably justify itself.

But if goodwill does not exist, if there is a determined effort to break with all that British rule has stood for, then the Governor and British Government find themselves faced with a dilemma: they must either take drastic action or no action at all. It is true that in theory the Governor's reserve powers—of vetoing or forcing through legislation—exist for the purpose of preserving good government if local politicians prove intractable. If colonial experience has shown anything, it is that the reserve powers of a Governor cannot be brought down to the level of the market place. As a weapon behind closed doors they serve as a useful deterrent; but they cannot be brought into the open without giving agitators an opportunity to use them as a whipping-boy for working up hate against the colonial power. In other words, given goodwill, the reserve powers are a salutary check on minor forms of irresponsibility; they cannot be used against a determined effort to remove British power altogether.

The Governor of British Guiana appears to have become convinced that he was confronted with just that situation. Short of complete abdication, anything less drastic than he could have done would have had all the disadvantages, without the possible merits, of a dramatic suspension of the constitution. This is a peculiarly difficult judgment to make. It is open to

others to argue that in time the People's Progressive Party would have turned opinion against itself and an effective local opposition to it would have grown up. But it is equally possible, and perhaps more likely, that if the party had been given more rope, it would have hanged others rather than itself.

★

On these lines the Government may well make out a convincing case in Parliament. One important reservation should, however, be emphasised at once. The suspension of the Guianese constitution does not mean that similarly drastic action would be possible or effective elsewhere. It is one thing to suspend a constitution in the year it is introduced, as in Guiana. It would be quite another to suspend a constitution that the local politicians and their supporters have operated for some time. To say that there are dangerous possibilities, in this one case of suspension, is to say that it would be all but unthinkable in a less immature colony.

That, however, may not be so clearly seen by politicians in West Africa and elsewhere who are still not entirely without suspicion of British intentions. This is one reason why British Guiana cannot be isolated from the wider colonial setting. There is also a purely domestic reason: the people who have always feared that constitutional advance in the colonies was being pushed too fast have had their fears strengthened. Will the extremism of British Guiana be repeated elsewhere, on a larger scale, and with less hope of effective counter-action?

There is certainly a case to be made out against present policy. It is not necessarily progress, the

Policy Plain or Purl?

THE three men who, at various times during the past year, have exercised the functions of Britain's Foreign Secretary last week in turn reviewed the world situation and the tasks that lie before this country. The Prime Minister, as he reminded his audience at Margate, had not spoken in public since his celebrated speech in May, and Mr Eden had been involuntarily silent for an even longer period. Their words—especially those of Sir Winston Churchill—were therefore awaited with almost painful expectancy, and not only by the party stalwarts to whom they were addressed. The world was as anxious as any of the early devotees who read Dickens in weekly parts to know what would emerge in the second instalment of the serial that the Prime Minister began on May 11th, and which was then so abruptly broken off. The anxiety might have been expressed, as that of Dickens's readers was, in a simple question: was Little Nell dead?

Sir Winston assured his hearers that she was not. He was careful—rather more careful than he had been

critics say, to make a paradise for the barrack-room lawyers but to leave everyone else in disorganisation and poverty. Other colonial powers, with less overt idealism, may have done more for the happiness of ordinary people. Perhaps we should at least have waited until a cadre of administrators had been trained and the elements of a balanced economy introduced.

But it is surely too late to indulge in these doubts. For generations Britain has been promising self-government to the colonies. And it has been taken at its word. The history of the last few years has shown that once a class of indigenous politicians is created—as it is bound to be created once a start is made in associating the people with the government—the progress towards independence goes on at breakneck speed. The engines cannot now be reversed. We have to take the risk because, in a real sense, we have already taken it.

Colonial leaders are sensitive to any reflection on their political maturity and would react strongly to suggestions that there are strings attached to their freedom of action—that they are, as it were, on parole. There are, fortunately, strong practical and sentimental reasons why the new states that are emerging in the Commonwealth should choose to remain within it and friendly to the West. But they will not be cajoled or frightened into doing so, and in the long run there is no compelling them. The Government will justify its handling of the crisis in British Guiana on one main condition. It must be perfectly clear that the powers of constitutional suspension, rightly used in this case, are regarded here as a measure of last resort that will be used not against a developing democracy but only against a rising dictatorship.

in May—to emphasise the “humble, modest” character of his project for a meeting of heads of governments, and he was quite remarkably brief in his reference to “the master-thought of Locarno”; the fact that discussion of possible means of reassuring Russia is now at last widespread did not, apparently, encourage him to develop this theme, except in regard to the necessity of American participation. But he gave no indication that his brain-child was any less alive than she had been in May—although a close observer might have deduced that she had grown up a little.

This confirmation, seen against the background of three comprehensive reviews of world affairs by the leaders of Her Majesty's Government, makes it imperative now to examine somewhat closely the general nature of that government's foreign policy. One question in particular must be answered. Is Britain's present foreign policy definably divergent from that of its chief allies?

Sir Winston Churchill, in his speech last Saturday,

spoke much of independence. He did so primarily in the context of a plea for economic self-respect. But he must have been fully aware that in many parts of the world an impression had grown up that, since May 11th, Britain has been striking out on its own in matters that concern the balance of power as well as the balance of payments. This impression is not confined to those circles in Europe for whom wishful thinking is a necessary foundation for neutralism. Last week it was expressed, in a surprisingly extreme form, by Mr Walter Lippmann, who declared his belief that, in May the grand alliance was disintegrating, because it offered no positive prospect of peace. Churchill has rallied the alliance to the hope and effort of an active diplomacy meant to prevent a great war.

The successive statements by leaders of the Labour party to the effect that the Prime Minister's “great peace initiative” of May 11th has been halted only by American intransigence, abetted by Tory saboteurs, reveal the same basic assumption under a different but equally exaggerated guise.

How much reason, if any, is there for this assumption? Let it be granted at once that Sir Winston's speech in May made a deep impression on a great many people. Indeed, one is entitled to conclude from what Sir Winston and Mr Eden said last week that it had much more effect than it either sought or deserved. The impression widely retained was that the Prime Minister, deeming the policies formerly pursued by the Atlantic allies to be inadequate, rigid and unfruitful, deeming also, perhaps, that the United States was no longer giving the allies the leadership they needed, had abandoned them and launched out boldly on a new approach to the most important of international problems.

How can this impression be reconciled with the content of the speech that the Prime Minister himself delivered last Saturday? He repeated, trenchantly, the essential outlines of the policies which Britain and its allies have shaped during the past five years. The cause of freedom must be sustained by strength; German military aid is essential to the defence of Western Europe; the European Defence Community is the best means of building up that defence; Britain and America will keep their forces in Europe to hold the balance of equality that France demands. Sir Winston covered all this ground, and took particular pleasure in assailing former Labour ministers who had committed Britain to German participation in EDC and who now argued against it. If it was somewhat noticeable that the need for loyalty to the North Atlantic alliance was a prominent theme in Mr Eden's speech but not an explicit one in the Prime Minister's, it would be going altogether too far to base a serious conjecture on this discrepancy. None of Sir Winston's words suggested that he even contemplated jettisoning any of those policies common to the Atlantic allies that would inevitably be Malenkov's first targets at a meeting of heads of governments.

The truth is that there is no separatist British policy

as regards the largest affairs of the Atlantic alliance. There is none, there should be none, and indeed there can be none. If there were such a policy, the alliance would be at an end. Within the alliance, however, there is scope for divergence on tactics and methods of interpreting the common policy to other nations. There is scope, in fact, for embroidery, or for purl as well as plain stitches. But these exercises in adornment have to be kept within bounds, lest they completely obscure the plain surface beneath them, which holds all together. Last week's speeches suggest that all three speakers were to some extent concerned to trim the design of May 11th down to more seemly proportions. Unfortunately, however, this operation is likely to reveal only too clearly the extent of the damage already done to the fabric underneath.

★

The passage in the Prime Minister's speech that has produced immediate and sharp reactions in Europe, and was clearly intended to do so, was his warning that

if EDC should not be adopted by the French, we shall have no choice in prudence but to fall in with some new arrangement which will join the strength of Germany to the western allies through some rearrangement of the forces of Nato.

By an unhappy mischance, a translator's error in the report of the speech that reached most French newspapers made Sir Winston appear to say that Britain would have no alternative “in the face of such imprudence.” Some of the most resentful French comments therefore derive their tartness partly from this substitution of *m* for *n*. (Mercifully, the agencies did not lose the *r*.) On the other hand, it may be doubted whether even the most honeyed wheedling on this matter would fall pleasantly on French ears in present circumstances. Admittedly, the idea of aligning Germany with Nato as an alternative to EDC has often been publicly vented, and by distinguished Frenchmen as well as others; there is, indeed, a considerable segment of French opinion, not confined to any one party, which has long thought it preferable to the loss of French sovereignty that EDC involves. Sir Winston Churchill, in contrast, made it unmistakably clear that a Nato solution would be a very poor second best. But he was lending an unrivalled authority to a hypothesis which has been steadfastly shunned by governmental spokesmen throughout the long period of uncertainty since the signing of the still unimplemented EDC treaty, and his words created almost as much unease in Bonn as in Paris.

Two questions arise. First, has the Prime Minister given enough detailed consideration to the problem of a “rearrangement of the forces of Nato” which he postulates? It is a known fact that France, or any other of the Atlantic allies, could veto the admission of Germany as an equal partner in Nato. It is hardly conceivable that Dr Adenauer would agree to associate Germany with Nato on any terms other than full

equality. Sir Winston Churchill has given no indication of the existence of a formula that would resolve this difficulty. It must be concluded that he has again, as in the case of his allusions to Locarno, attached a specific label to a general thought without looking closely enough at the intricacies involved.

Secondly, was he wise to put his unique weight so abruptly into the scales at a moment when almost all Frenchmen, whether inclined in favour of EDC or against it, are painfully conscious that a decision is now a matter of urgency? His action contrasts somewhat strikingly with the phrases he used, earlier in the same speech, about the need for a period of calm free from

any vigorous pursuit of clear-cut solutions. But he was, after all, doing no more than state the truth. France's allies cannot wait indefinitely for Paris to make up its mind about EDC. Indeed, one of the Prime Minister's severest critics in the French press this week concluded his judgment on the Margate speech by saying that it should be taken not as blackmail but as a forecast. It is undoubtedly essential that when the National Assembly in Paris at last nerves itself to bite the EDC apple, it should do so, unlike Eve, in full knowledge of both the consequences and the alternatives. Sir Winston Churchill, for one, cannot thereafter be accused of having played the soft-tongued serpent.

The Courts of St James's

THE publication this week of the report of the inquiry into the dispute about electricians' wages emphasises the part now played by the Ministry of Labour in preserving industrial peace. While its importance has been greatly increased during the twentieth century, this does not mean that the state is becoming more inclined to interfere with industry's own arrangements for settling wages and working conditions. The principles of modern legislation and practice are that industry must manage its own affairs, and that the role of the state is simply to supplement the machinery of negotiation and arbitration that industry has set up. The present powers of the Minister of Labour are essentially the same as were given to the Board of Trade under the Conciliation Act of 1896. They permit three kinds of action: conciliation, arbitration, and inquiry or investigation.

It is in helping industry to find its own solutions that the work of the Ministry has had most effect. Conciliation officers take no action until all other chances of a settlement are exhausted. During this century there has been a steady growth of joint negotiating machinery. It has been a piecemeal development, and the arrangements in different industries vary widely. But the agreement between a union and an employers' association commonly specifies the procedure that should be followed in case of a dispute. The coal industry and the railways have their own standing arbitration tribunals, and in many industries there is an agreement to go to arbitration if negotiations break down. There are, however, some notable exceptions. In the engineering and shipbuilding industries the agreement makes no provision for arbitration at any stage; the court of inquiry now urges the electrical contracting industry to remedy the same deficiency.

In those industries that have their own machinery of arbitration the assistance of the Ministry of Labour is little required, except sometimes in nominating independent chairmen. In the rest of industry its part begins when the ordinary negotiating machinery has

failed to find a solution. Some 40 conciliation officers are continually dealing with minor local disputes. If the dispute is nation-wide the two sides are invited to come to the Ministry, where they have separate meetings with conciliation officers. Last month, for example, these officers were shuttling from Mr Stevens of the Electrical Trades Union in one room to Mr Penwill, representing the employers, in another. When that process had completely failed to discover the basis for a settlement the next step was either arbitration in some form, or else an inquiry or investigation.

Arbitration is called voluntary when both parties consent to it; such cases are more often than not referred by the Minister to the Industrial Court. This court was set up, following the recommendations of the Whitley Committee, as long ago as 1919. It is now used mainly by the nationalised industries, public utilities, other Government undertakings and some smaller industries. This is not, however, the only form of voluntary arbitration. If the parties prefer it, the Minister of Labour can appoint a special board of arbitration (such as the one that has this week awarded the dockers an extra 1s. 6d. a day on their time rates); or, again if they prefer it, he can appoint a single arbitrator. The reason for this preference is usually a desire to have a say in the choice of arbitrators.

If one side refuses to accept arbitration the dispute cannot be referred to the Industrial Court. But it can still come under "compulsory arbitration," which may be brought into action at the request of only one of the disputants—the compulsion thus being not by the state on the parties, but by one of the parties on the other. Compulsory arbitration was introduced at the beginning of the last war. It was first provided by the National Arbitration Tribunal, set up under the famous Order 1305 that made strikes illegal. When that Order was repealed in 1951 the tribunal for compulsory arbitration (at the wish of one party) was continued, with slight modifications, under the new name of the Industrial Disputes Tribunal.

This tribunal still has no foundation in permanent industrial legislation, but it is beginning to look as if it is here to stay. Any move to get rid of it is likely to come from the employers. The trade unions have no objection now that their right to strike has been restored. Indeed, nine-tenths of the disputes that come before the tribunal are reported by the unions. It enables them to drag unwilling employers to arbitration and to sue them if they disregard the tribunal's awards. But while an award can fairly easily be enforced against individual employers, it is not practicable to enforce it against the workers if they unite in ignoring it. The system works only if the unions are amenable. For this reason the Minister can refuse arbitration even though one party wants it, if a strike or lockout is in progress. If tempers were high the tribunal's theoretically enforceable decisions would not in fact be observed, and its prestige could only be lowered. In the electricians' dispute a strike was in full swing and the employers did not even call for arbitration.

In that particular case the Minister adopted his third form of procedure, provided as a last resort to enable him to act without the consent of either party: a court of inquiry. The purpose of this is to set out the facts of a dispute, and to apportion praise and blame, so that the side that remains obstinate may be weakened by loss of public sympathy. This method often leads to a settlement, mainly, perhaps, because it allows time for tempers to cool. The report of the court of inquiry into the electricians' dispute did not make any suggestions for a settlement. It handed the problem firmly back to the industry's own negotiating machinery, which it says was not fully used, with the recommendation that it go to voluntary arbitration if necessary. Most courts of inquiry, however, do make proposals for a settlement.

★

The primary aim of state intervention in industrial disputes is to avoid the economic damage and public inconvenience of a strike, and only proposals that have a chance of acceptance are worth putting forward at all. Courts of inquiry and arbitration tribunals are equally bound to be guided by the practical politics of the industrial situation they are dealing with. The arbitrators or investigators will compare the disputed wages with the trend of the cost of living and will usually seek to maintain the workers' real standards; they will try to bring those wages into line with the pay in comparable occupations; they will judge what the industry can afford; they will consider whether it is in the national interest generally that wages should rise. But they must also consider the facts of power. Arbitrators will rarely propose anything that goes flatly against the side that is in a strong position.

In theory, a settlement that simply reflected the bargaining strength of the two sides would give the same result that would have been obtained by resorting to an

actual trial of strength by strike or lockout. Before the war the success of the arbitrators probably depended on their ability to anticipate the outcome of such conflicts. The impression that the workers did no worse by going to arbitration than by going on strike, and this at no cost to themselves, steadily built up the union's confidence in this method.

Since the war settlements by arbitration or conciliation clearly have not reflected the relative strength of the parties. With full employment the workers could have forced, temporarily at least, larger wage advances than they have received. Aware that in the long run they could only suffer by prolonged inflation, they accepted wage restraint—by which they meant, broadly speaking, that they would be content to keep money wages roughly in line with increasing prices, not to try to push them ahead. In this situation the wage increases secured by arbitration have not been, on the whole, less than those obtained by ordinary collective bargaining. If any such discrepancy had occurred the unions would soon have refused to go to arbitration. But there is little doubt that the arbitrators have generally had a livelier awareness of the national interest in wage restraint than could have been shown by the leaders of individual unions. The habit of accepting arbitration awards thus had an important influence throughout industry, helping to induce workers to accept smaller wage increases than they claimed and than their bargaining power could have extracted from the employers.

In time, the cost might have been to weaken the habit of arbitration. But in fact arbitration is playing, so far, a steadily increasing part in the settlement of disputes. The Industrial Court hears about 60 cases a year, about twice as many as before the war. To this total must be added some 200 cases a year (many of them petty matters) that come before the Industrial Disputes Tribunal; and some 40 a year are resolved by single arbitrators or boards. On the face of it, the greater willingness to go to arbitration is excellent; it is certainly partly responsible for the steady decline over the past thirty years in the number of working days lost through strikes. The danger is that it is succeeding so well in curing one evil at the cost of creating another. More and more, wages are being settled by arbitrators on principles that are neither clear nor fixed but yet are not easily modifiable. They include some reference to the interests of the nation as a whole but the reference is by no means sure and it certainly does not rest on any coherent concept of general economic policy. The tendency must be for arbitration to slow down economic change by keeping wages in a contracting industry relatively higher than uninhibited bargaining—and strikes—would achieve, and wages in an expanding industry relatively lower. But dangerous as such rigidity is for the British economy, any attempt to overcome it must start from a recognition that the unions' acceptance of arbitration has done nothing to shake their opposition to a deliberate national policy for "planning" wages.

Notes of the Week

Government Renewed

SIR WINSTON CHURCHILL'S speech at Margate last Saturday has considerably clarified the political situation facing Parliament when it reassembles on Tuesday. In renouncing an election for next year (as well as this) Sir Winston added the qualification "to my immediate knowledge." This gives him considerable freedom of manoeuvre and avoids any commitment for his successor, should Sir Winston decide to retire in the meantime. But the point is likely to prove academic. By repeating the broad hint already given by Mr Macmillan, Sir Winston left little doubt that the Government is at last ready to tackle the chaos of rents. If that is the case, no words from Sir Winston are needed to make an early election unlikely. It is hard to see any Prime Minister risking an election until the odium of the decision to allow rents to rise has been tempered by practical evidence of its benefit to the community as a whole.

But if the prospect of an election has been moved some way off, that of a change at 10, Downing Street has been moved only a little. At Margate Sir Winston furnished ample evidence that his intellectual powers are undimmed, but at the end he seemed to imply thoughts of a not too distant retirement. Severe strains lie ahead, and now that Sir Winston has publicly said that he is remaining in office only in the hope of achieving some success in international affairs, it is all the more surprising that Mr Eden is not to act as full-time deputy Prime Minister, able to relieve his chief of much parliamentary work. Confidence about Mr Eden's own state of health is therefore restrained.

It seems certain that the new session will give the Government a harder, not an easier, time. For the past year Labour has been in no state to offer sustained and coherent opposition, but the truce reached this year carries with it a unity none the less genuine because it may well be temporary. The electoral interests of the two parties have thus shifted. If they do launch next month on an active programme, the Conservatives will need time; Labour knows that each month without an election will increase the strain on its hard-won unity. Its parliamentary strategy may therefore turn to the main aim of driving the Government to the polls.

Parliamentary Business

FOR the first two weeks after its re-assembly, Parliament will be disposing of the remnants of the 1952-53 session. Two small Bills remain to be dealt with in the

House of Commons, but general debates will occupy most of its time. It is now becoming a tradition to leave the annual debates on the nationalised industries for these autumn epilogues, and two will take place in the coming fortnight. British Guiana will occupy next Thursday, a debate has been promised on Wales, and probably one will be sought on foreign affairs. The Opposition has yet to work off its indignation over the terms, and above all the timing, of the sixteen-nation declaration on Korea which appeared within a few days of the summer adjournment. On Guiana the Labour leaders are at present confining themselves to demands for fuller information, some at least being inclined to caution by the possibility of Moscow inspiration behind the colony's troubles.

When the 1952-53 session finally ends, one measure will remain suspended in mid-air, without even a second reading—the Judges' Remuneration Bill. It is due to appear in amended form next session and will further enliven a legislative programme that now promises to be fairly substantial. The new session will be opened by the Queen on November 3, and several measures likely to be mentioned in the speech from the throne can already be foreseen. At various times during the summer the Government committed itself to a Regency Bill, to a measure dealing with the finances of Town and Country Planning, and to some sort of road traffic Bill. Then at the Conservative conference ministers strongly hinted at a rents Bill and, by promising a measure of competitive television, almost certainly foreshadowed legislation in this contentious field also.

Legislation may still, however, provide the lesser part of the Government's political difficulties. It seems to be thoroughly alarmed about the farmers; the winter coal problem is no less urgent and substantial sections of the Opposition are preparing to launch a formidable case on capital punishment in general and the Evans affair in particular. Careful attention will also have to be given to the resale of the assets of the nationalised steel and road transport industries, operations that will certainly be closely scrutinised from Transport House.

The Snail Sets Out in Korea

CHINA'S acceptance of the American offer that representatives should meet to discuss arrangements for a Korean peace conference gives every impression of being carefully and cleverly staged. The representatives are now to meet on October 26th, just two days before the expiry of the three-month period in which it was established under the armistice that a political conference should assemble. And the place is to be not Honolulu or San Francisco or

Geneva—or even Timbuctu—but the well-trampled soil of Panmunjom. Having delayed and then rejected the United Nations invitation to an actual conference, the Communists have ensured that the snail's pace is just not too slow to miss getting in sight of the first milestone in time.

This is not a Korean peace conference. But it is a move towards one, and it is in Korea. Will it be enough to take the wind out of the sails of Mr Syngman Rhee, who threatens to resume the war if nothing is done by October 28th? The chances are that it will; if so, even the free world may for once heave a sigh of relief at the tortuous inscrutability of Communist tactics. The period immediately after October 28th is still likely to be one of renewed tension and danger. Once this critical moment is past, however, Mr Rhee's chances of successfully re-igniting the peninsula look like growing less. The cease-fire, designed to be only a temporary stage, may then endure indefinitely, like those in Kashmir and Palestine. Under cover of the armistice, the Panmunjom discussions about the time, place and composition of a real conference seem capable of infinite variety.

Meanwhile, there are the prisoners. On Thursday, the "explanations" were due to begin to the first thousand of the 22,000 Chinese and North Korean prisoners who do not want to return home; no date has yet been set for "explanations" to the 359 pro-Communist United Nations prisoners. Whatever justification there may have been for the mutual criticisms which recently flew back and forth between Seoul, Delhi and Washington about India's handling of the prisoner of war compounds, the actual arrangements for staging these "explanations," under the supervision of the five-nation neutral commission, appear to be sensible and fair. And if, by the turn of the year, the fate of the prisoners has in fact been decided without serious bloodshed, the world will owe India a heavy debt of gratitude.

France Between Four and Five

BEFORE leaving for this weekend's three-power talks in London, the French Foreign Secretary, M. Bidault, had apparently won the day in the French cabinet. M. Paul Reynaud, who as vice-premier particularly concerned with Indo-China has a great say in the shaping of French foreign policy, had looked favourably upon the idea of a five-power conference mooted in the recent Soviet Note. M. Bidault, however, argued that a four-power meeting should come first, and his view prevailed because of the known American hostility to the inclusion of China. His final argument really was that even if all the five were invited "it would still be a four-power conference, but without the United States." To this there can be no valid answer, but a temporary defeat does not mean that M. Reynaud will now leave M. Bidault in undisputed control of French policy.

Indeed, whatever its tactical drawbacks, M. Reynaud has quite a strong case. He has repeated several times that a conference primarily concerned with Germany could lead nowhere, since the Russians would be unwilling to budge an inch without western concessions, and the West has no intention of making any over Germany. By inviting China and extending the scope of the conference, M. Reynaud hopes to tag Indo-China on to the agenda. This, in fact,

is the crux of the matter. French politicians are fast becoming conscious of the fact that the problem of German rearmament cannot be sidestepped through legal niceties. The conviction is gaining ground in many quarters that France cannot stand up to its dynamic neighbour without an almost revolutionary change in the economic life of the country, and that this is impossible as long as scarce resources are being thrown down the Indo-Chinese drain.

The second part of this argument is more debatable. As an article on page 183 shows, the United States is now shouldering a larger share of the Indo-China burden. M. Faure, the finance minister, did not conceal the fact that he would like this share to grow still larger and France to get rid of its commitments in the Far East. Above all, it needs two to make a bargain, and there are still no signs that Ho Chi-minh is warming to the idea of immediate negotiations. It is this that makes so many Frenchmen pin their hopes on a solution within a broader framework. The hopes may be illusory, but in many cases they are coupled with the firm intention of restoring France to its proper place in Europe. M. Reynaud, for one, cannot be accused of seeking the easy road out, since he has repeatedly uttered stern expositions of French national weakness.

The Farm Lobby

IF the Government is not frightened by the National Farmers' Union it will not be for lack of trying—either by the NFU itself or by its political friends in the Conservative Party. When the agricultural interest is involved a considerable section of the party loses its usual inhibitions. Politicians who in other matters are most concerned to preserve party unity in the eyes of the world, whatever their private differences with the leadership, are quite willing to show a palely Bevanite bitterness in defence, as they believe, of the rural vote. The upshot of the debate on agriculture at the party conference last week is that whatever the Government now does it will be in political difficulties. If it introduces any real freedom into agricultural marketing many of its supporters can at best swallow their words and silently toe the line, with much Opposition merry-making. On the other hand, if the Government shirks a radical change in agricultural policy the Opposition can make even more play, in urban constituencies, with the Government's surrender of consumers' interests (which its own statements have identified with free markets) to those of the farmers.

Either choice is unpleasant and whatever emerges from all the present feverish discussions it is at least certain that the National Farmers' Union will not have earned the love of any responsible Conservative. It is not clear that this week's meeting, when a delegation of ministers headed by Mr Butler talked to the farmers' leaders, was much more than an attempt to pour oil and soothe feelings. Sir Thomas Dugdale's speech at Margate had clarified nothing. He defined the policy of freedom as cautiously as he could—"to put producers more closely in touch with consumers through the influence of the markets"—and did not explain how it could be reconciled with his assurance that the Government was not in principle opposed to marketing boards.

At the level of political manoeuvring that the dispute has now reached, the most interesting question is whether the Government's fears have any real basis at all. It is faced with a powerful pressure group, but are there many votes behind the pressure? The Margate delegate who said that unless the Government regained the farmers' confidence it would lose 30 to 40 seats at the next general election was surely making a wild exaggeration. Free markets, with deficiency payments, will make the farmers grumble, but would they really be converted to socialism? And in how many constituencies are their votes, and those of the farm workers who are not already Labour supporters, decisive? It would be a pity if the Government made a cowardly retreat, and it would look only the more foolish if what frightened it was in fact a myth.

New Policy for Housing

MOST Conservatives have always regarded the housing drive in terms of a military operation and, by this simplified criterion, Mr Macmillan has made a success of it. The party conference naturally registered its delight that the promised output of 300,000 houses a year is nearing realisation, to the undeniable discomfiture of Labour critics. But the conference also showed some recognition that the mere production of heavily subsidised new houses does not of itself constitute a housing policy. Ministers are plainly now looking for a broader and sounder policy, and on this they need not fear excessive criticisms from their own supporters.

That was made plain by the response to the Prime Minister's speech. He clearly indicated that the Government was now ready to amend the Rent Restriction Acts and would not be deterred by the political prejudices that are certain to be excited. It remains to be seen whether the amendment will be large and swift enough to restore to the private landlord the economic function of which he has been so pointlessly deprived. But at least a first step towards a realistic housing policy can now be expected, and it will deserve a warm welcome.

Beyond this first step, Conservative housing policy

seems to remain somewhat confused. Mr Macmillan clearly expects that the scope of private building, now largely freed from control, will progressively widen. It is a necessary and proper corollary that the scope of public housing should progressively contract to the point where its benefits are concentrated on the poorest and worst-housed sections of the community. Ministers paved the way for this development by emphasising the interest of Conservatives in the renewal of slum clearance schemes. But there are many awkward issues to be faced before a sounder equilibrium is reached, and the task of the Government is made no easier by the demands of some of its supporters for new types of subsidy for house purchasers. If Mr Macmillan means, as he said, "to disentangle the country from the bog of subsidies," he must firmly set his face against anything of the kind.

Bulldog and Mongrels

MR. DEAKIN'S successes at Margate opened up a path by which he might follow Ernest Bevin from his union to a commanding position in Parliament, and he also helped to bring moments of unity to the Labour party. But he created havoc in the Confederation of Shipbuilding and Engineering Unions. His description of the engineering unions' plan to nationalise large sections of their own industry as "a mumbo-jumbo of meaningless words," and as "the worst abortion ever conceived in the mind of man," has given great offence; and the executive council of the confederation is calling on the executive council of Mr Deakin's union for an explanation of his attitude. They have also written to the TUC.

As a union that was a party to the "Plan for Engineering" the Transport and General Workers' Union will find it hard to "explain" the vigorous denunciations of their general secretary. It is true that the official attitude of the TGWU, ever since the plan was published two years ago, has been to maintain "reservations" about it, emphasising that it must be fitted in with the general programme of the industrial and political sections of the Labour movement. But this is a far cry from the bulldog ferocity of Mr Deakin, who has since added insult to injury by describing his critics on the executive of the confederation as "a lot of mongrels snapping at my heels," and by implying that the plan is a Communist plot to disrupt the engineering industry.

The cleavage between the craft unions and the general unions in the Confederation of Shipbuilding and Engineering Unions may once again become apparent now that the employers have rejected outright the confederation's claim for an all-round increase of 15 per cent. Last year the moderation of the general unions was a considerable brake on the belligerence of the craft unions, who wanted to ban overtime and piecework to enforce the extravagant claim for an extra £2 a week. On the other hand, the fighting spirit recently shown by the Electrical Trades Union, which is affiliated to the confederation, may prove infectious—even if it proves to be less bellicose now that the court of inquiry has tried to clear up the misunderstandings that sharpened that dispute.

On the mid-day train to Paris

She is cutting up a salad for the children's lunch—but in her thoughts she is leaving Victoria en route for Paris and the autumn collections. As a matter of fact, there is a connection; her table is surfaced with WARERITE Plastics—the material used by British Railways in standard compartments, toilets, dining and sleeping cars. For making brighter living and lighter work in home, factory, office and school there is nothing to touch WARERITE. It is widely fitted to new furniture and can be used to resurface old furniture to make brighter homes everywhere. The growing popularity of WARERITE is just one of the many successes of the Bakelite organisation, whose pioneering efforts have been mainly responsible for making plastics a part of daily life.

ELECTRICITY

spells

PROSPERITY

BRITAIN IS WORKING HARD and British Electricity is building more and more power stations to meet Industry's needs.

Year after year new records of construction are being achieved.

Britain's electrical generating plant today adds up to many millions of horsepower more than it did a few years back. That plant could easily produce MORE electricity. As things are, the plant is giving full output only for short periods once or twice a day; continuous full operation would cheapen the cost of electricity production.

That is why British Electricity welcomes an increasing use by the housewife of electricity for cooking and water heating, as well as an increasing industrial demand for electricity.

The more our factories use electricity, the higher Britain's productivity will be — and the higher our productivity, the higher will be the prosperity of the country.

Communist Trade Unions' Plans

THE World Federation of Trade Unions, which held its third congress in Vienna last weekend, is preparing to make greater efforts than ever to split the free trade unions of the non-Communist world, and to gain control of labour in under-developed countries. The WFTU may already be said to be the Soviet Communist party's most effective political weapon in the colonies, in Latin America, and in those areas, such as Indonesia, that have defied Marxist-Leninist theories by ceasing to be colonies without becoming Communist states.

One of the main items on the Vienna agenda was a report by an Indonesian trade union leader, and one of the decisions taken was to increase the number of representatives from the "colonial and semi-colonial countries" on the executive and general council. There were three representatives from British Guiana, one of whom spoke during "Russian Hour" on the Vienna radio about the "meagre rights given by the reactionary constitution that was dictated to us by the British."

M. Louis Saillant, the WFTU's secretary-general, emphasised that demands for trade union rights in the colonies must be linked with political aims in co-operation with the "peace movement." His report also dealt with the campaign to split the non-Communist unions. The WFTU had done well, he indicated, in securing united action with members of unions that were affiliated to the International Confederation of Free Trade Unions. In Italy, the world had recently been shown how a short general strike for higher wages and against dismissals could be organised together with other unions, and the Italian example should be followed. Boasting about his release from prison, M. Le Léap declared that this was due to the fact that the French bourgeoisie "dreaded the working people." The government, he claimed, was forced to retreat because the CGT, the Communist-dominated French labour organisation, supported the great strike this year.

The attendance of representatives from free trade unions seems to have been very small, in spite of the preliminary work that was done to secure them, and the funds that were collected to pay their fares. The British TUC, which left the WFTU some years ago on account of

its Communist bias, naturally did not send representatives, and the presence of only "four British observers" was reported. However, the WFTU is much more effective in areas where unions are still only rudimentary. Responsibility for Communist success in the colonies rests heavily with the free trade union organisers, who have done too little to canalise the demands for better conditions and greater labour rights that inevitably go with increased political power.

Norway Holds Course

THE Labour party that has governed Norway for eighteen years, except for the break caused by the war, has been rewarded by the electorate with another four years of power. Thus the Norwegians maintain their reputation for rugged individualism, not by accepting their right-wing parties' argument that it is time to shake off the fetters of socialism, but by maintaining in office what is now the only Labour majority government in Europe.

The result of Monday's elections was by no means to be taken for granted, in spite of Labour's long tenure of power. An electoral reform favourable to smaller parties had been conscientiously enacted by Hr Torp's government last year. Its effect is such that, whereas in 1949 Labour won 85 out of 150 seats, it would have been lucky to get 76 this week with the same proportion of votes.

In fact, Labour secured 46.6 per cent of the votes on Monday, one per cent more than in 1949, and emerged with a small but absolute majority, the effectiveness of which is increased by the reappearance in the *Storting* of the Communists, who got less votes than in the 1949 elections but profited more than others from the new electoral law. The three Communists are unlikely to support the right-wing parties in any attack on Hr Torp's social or economic policies; the Right can be counted on to swell his majority if Norway's Atlantic policy is questioned. In this last respect his hands are much freer than those of the new Social Democratic premier of Denmark, Hr Hedtoft, whose minority government depends uncomfortably on the fickle favour of the neutralist Danish Radicals.

Peking's New Deal with Ceylon

IN sharp contrast to the previous occasion, the signing of this year's contracts for the exchange of rubber and rice has aroused little enthusiasm in either Colombo or Peking. The negotiations, which lasted three weeks, were supposed only to touch on prices, and even then the actual prices were withheld until they had been considered by the cabinet in Colombo. It is probable that the Ceylon delegation found the Chinese in a much less accommodating mood than hitherto, since their need for rubber was less urgent as a result of the truce, and, from all accounts, a rice surplus is going to be even harder to find in China than last year.

The terms of the new contract have been shrewdly drawn

with an eye to political repercussions. The Chinese will now pay 28d. per pound, compared with 32d. previously, for the top grades of rubber. Ceylon will get its rice for £47 per metric ton (about £49 per long ton) compared with £54 last year. On the surface this looks like a handsome bargain, since rubber on the free market now fetches only 17d. per pound, while rice has been sold on an inter-government basis for £55-£60 per long ton in the past year. But there is always the chance that the price of rubber may recover—it was as high as 28d. as recently as last December—and the Ceylonese were optimistically hoping for a somewhat higher price. And, as for rice, the present agreement happened to coincide with the announcement of a new five-year agreement with Burma, which gives Ceylon better quality rice at only £1 per long ton more than the Chinese price, and assures it of lower prices in the subsequent four years. Though Ceylon can reflect on its good fortune in selling rubber above the world price and buying rice relatively cheaply, the Chinese are evidently beginning to tighten the screw. It is rather ironic that Ceylon is one of the few non-Communist countries that stands to lose if the United Nations' strategic embargo, which it has refused to apply, is relaxed; for the Chinese—hard businessmen as they are—would not pay premium prices if they could buy rubber more cheaply on world markets.

Meanwhile, as a result of the Ceylon government's bargains, there is mounting pressure to have the benefits passed on to the consumer. Indeed the controlled price of rice has already been reduced, but the call to restore the food subsidies, which were cut in Ceylon's recent budget, remains strong. As regards rubber, the producers, whose expectations have been disappointed, are now asking the government to reduce the levy which it earmarks for rehabilitation and replanting. It can only be hoped that the new Prime Minister, Sir John Kotalawala, will continue his predecessor's austere but sensible policy.

The New Socialism

THE lecture delivered at Bromwich last weekend by Mr Hugh Gaitskell provides an important example of the attempt to establish a resting place for intellectuals in reluctant retreat from nationalisation. Private saving and investment will, "there is every reason to fear," be inadequate in "a society advancing towards true equality of opportunity." So public saving and investment must take

Next week's issue of *The Economist* will include a survey of the

British Motor Industry

with articles on the new cars, market prospects at home and abroad, and comparisons of price and performance for all current models.

its place, not merely in industry which has been nationalised in the usual sense, but by a process of infiltration into particular private enterprises. Suitable public institutions should, for instance, accept ordinary shares in discharge of death duties; they should "find the risk capital to finance investment" in existing firms; and they should carry through such particular investment projects as appear to be in the interests of the economy as a whole but are being neglected by private enterprise.

Such proposals have the obvious advantage of harmonising the decencies of Socialist conformity with a respect for the virtues of competitive enterprise, of flexibility and decentralisation. And indeed there may well be a role for such a form of public ownership, just as there is for nationalisation proper. The harmony, however, is deceptive. Let public ownership of equity capital largely supersede private ownership; let the state, in the person of an appropriate official, use the power of its holdings to determine the policy of private firms, to vote their directors into and out of office, to blow them up or kill them off according to the requirements of the current "plan"; let the flow of fresh capital into industry be channelled, not by the judgment of the market, but by the tug-of-war of political interests and departmental wire-pullers. Would enterprise and efficiency then fare better than under straightforward nationalisation? They might fare worse; for while a tough head of a public corporation may achieve real independence, Government nominees in private boardrooms would have none.

Private saving and investment may, indeed, be rather lethargic. A certain lethargy might be expected from Gordon Pirie himself were he heavily doped and equipped with a ball and chain. It does not follow, however, that he should therefore be retired from marathon running in favour of a bureaucrat; it might be better to try a little less dope and fewer shackles.

France's Backward Farms

THE French government, brought to judgment last week before the Assembly on charges of misusing its special powers during the recess, has survived the first Communist and Socialist assaults. But, having weathered this storm, M. Laniel must be anxiously counting the ranks of his own supporters. Not only have many Radicals and Christian Democrats (MRP), both of whose parties are represented in the cabinet, openly criticised the government's economic policy, but in view of peasant discontent even conservative deputies representing farming districts have become restive. Public servants had already struck in August to redress their grievances; now farmers are resorting to "direct action" to protest against falling agricultural prices.

It is true that the "barricades" raised this week by smallholders on many French roads smacked more of a Raimu film than of a revolutionary outburst; at some of them, frustrated motorists were offered surplus wine as a consolation. But the purpose of the whole action was to show that peasant patience is drawing to an end, not to paralyse the life of the country. It was a timely reminder for the government that agriculture is even more in need of a drastic overhaul than industry. Relatively primitive forms of farm-

ing have been kept alive behind a tariff wall; the failure to extend scientific methods, the lack of modern equipment and fertilisers, and the artificial maintenance of small inefficient farms, divided into still smaller strips, have resulted in low yields and high prices. Thus, despite the low income of a large part of the French peasantry, prices of French agricultural products are not competitive in European markets, nor are they low enough to step up home consumption. Even when a bumper crop, like this year's, brings farm prices down, the benefits for the urban population are lost on the way in the channel of distribution. This last is a leading item on the list of farmers' complaints in the present campaign, and the argument carries weight with the rest of the population.

But the cutting down of middlemen's profits is not enough. Official experts are well aware that what is necessary above all is to modernise antiquated techniques, and they have prepared a four-year plan for that purpose. It looks for a 20 per cent rise in agricultural production by 1957. Half of this increment would go to the home market, and the other half—at first receiving government support—is destined for export. This should enable France at last to turn its agricultural deficit in foreign trade into a surplus and to lay the foundations of further development. The plan, however, involves a bold policy of investment. The government, before embarking on the perilous debate on European defence, has switched its attention to the countryside. To parry the dangers of an immediate outburst it has decided to purchase some meat and other foodstuffs. But will it rest on its laurels as soon as the immediate danger has died down, or press on with the urgent task of reconstruction?

Comrades in the Countryside

THE new Soviet policy of incentives and concessions for farmers places a heavier burden of responsibility on the Communist party cadres in the countryside. It will be their task to see that the new appeal to the peasant property instinct does not lead to any encroachment on the collective farm system. The party machine is better equipped for controlling the peasantry than it was before the war. There are now about one million Communist cardholders in the

SOVIET POPULATION AND PARTY MEMBERSHIP

	Population (million)			Party Membership ('000)		
	Urban	Rural	Total	Urban	Rural	Total
1939	55	115	170	1,447	153	1,600
1953 (est.)...	80	130	210	5,500	1,000	6,500

countryside, and the number of rural party centres has risen from 12,000 before the war to 76,000. At the same time the number of collective farms has been reduced through amalgamation from 243,000 to about 93,000, so that the party's hold on the countryside has been greatly strengthened. Even so, there are still many farms without party cells, and not

all new recruits can be relied upon. Above all, the Soviet Communist party has always been a predominantly industrial organisation, and even now, while there is one cardholder for every eight urban workers and employees, only one out of eighty adults in the countryside belongs to the party.

To strengthen his rural front, the first secretary of the party, Nikita Khrushchev, has ordered the transfer of 50,000 activists from the towns into the countryside. Thus, once again, as after the civil war and during collectivisation, urban reinforcements are being called for. Khrushchev hopes that his task will be made easier next year, when 100,000 agricultural specialists, who up to now had worked in governmental offices or were still at college, will be sent to work on the land. But the enthusiasm with which Soviet propaganda describes the departure for rural work of a few urban "volunteers" shows that it is not easy to induce town-dwellers to migrate. Nevertheless, the quota will have to be filled, since the government depends largely on the party cadres and on these town-trained specialists to keep in check the peasant aspirations to greater freedom that have been encouraged by the new policy of concessions.

Older Manpower

IT has long been clear that the customary ages of retirement are too low for the needs of the times. The National Advisory Council for the employment of older men and

COAL PRODUCTION in GREAT BRITAIN

WEEKLY AVERAGES

women, whose first report was published this week, would abolish them altogether; it insists that capacity, not age, should be the only criterion when taking on new workers or retiring old ones.

The problem that has prompted these recommendations is illustrated in the chart. Old age pensions will become a crippling burden unless more old people stay at work. And if this change is needed for the sake of those who would otherwise support the old, it is also needed for the older workers themselves. As the general health and expectation of life steadily improve, fixed retiring ages condemn many able and active people to an idleness and boredom that may be more ageing than any amount of work. From the nation's point of view such premature retirements are a waste of skill, and—particularly in the case of those with professional and managerial experience—a waste of public and private investment in their education and training.

The report recommends ways in which the obstacles to employing older workers can be overcome. Pensions schemes, which now make it expensive to employ older

workers, could be adjusted so that the ultimate pension of the elderly recruit is related to the actuarial value of his contributions. A greater difficulty is that older workers block the promotion of those in middle life. But frustration is largely a matter of being denied something one has learnt to expect. It could easily become taken for granted that the peak of a man's career occurred two or three years later than it does now. On the other hand, the committee perhaps shows a theoretical ruthlessness that would be hard to put into practice. It would be unpleasant to sack the man who was past his prime while retaining his more vigorous colleague. It would be still more difficult, if he has held a position of authority, to ask him to step down into an inferior one, as the committee suggests should be done. The great advantage of the fixed retiring age is that it makes such invidious decisions unnecessary. But at least the age can be raised and the exceptions to its ruling be frequent.

Crichel Down

MINISTERS cannot be feeling altogether happy about the Ministry of Agriculture's action over the former bombing range at Crichel Down, in Dorset, between

Salisbury and Blandford. Some 726 acres of land are involved, all compulsorily acquired from private ownership for wartime needs. Now it appears that the land has been transferred to the Commissioners of Crown Lands and let, entirely by private treaty, and that the original owners have been given no chance to buy back their former holdings.

In reply to a demand for a public inquiry, the Ministry has this week blandly stated that "no new fact or consideration" justifying such a course has been disclosed, as though the whole circumstances of the transaction are not of themselves matters that should be ventilated in public. The sole ground for the Ministry's decision, it would seem, was the advice tendered by its own officials, and there is some evidence that its soundness may be questioned. But what is at stake is something more fundamental. The powers that were given to officials during the war to take property away from individuals were temporary, based only on the needs of that day. They were never intended to give officials the right, years later, to decide among themselves what permanent use should be made of the property, and by whom. That is an abuse of power.

It is surprising that a Conservative minister should, by implication, defend both the illusion that Whitehall always knows best and the arrogance that holds that Whitehall need not justify its actions to the public. It is perhaps less surprising that, having done so, he should refuse any public inquiry bearing on these most dubious beliefs.

HM Bank Collector

Possibly the time may come when every village or parish may have its banker—as it has its draper or its grocer—or a person whose business it will be to settle and liquidate all the payments which individuals have to make to each other. Such a condition already almost exists in the United States, and when that stage of division of labour is reached, it will certainly be feasible to make the banker the collector of taxes at a very small cost. It would be a natural part of his business, and he would carry it into effect in the manner the most convenient to his customers, realising one of Smith's axioms of taxation. Banking, in fact, approximates to that condition amongst ourselves. In Scotland and in some parts of England almost every village has branch banks in it, and almost every tax-payer employs a banker. Might not, then, the banker be the tax-collector; or might not Mr Collector, if one must still be paid distinct from the professional man whose business it is to liquidate all the interpayments of individuals, be referred to the banker for the taxes of each one? Nobody can tell beforehand how exactly such improvements will come to pass, but we may all foresee that something of the kind will be the necessary consequence of the growth of that branch of division of labour called banking. Bankers are found the most convenient means for collecting the debts and making the payments of individuals:—why should not this principle be extended to the debts and payments of the State? At any rate, it cannot be denied, after the example of Dublin and some other places, and after looking theoretically at the subject, that great improvements may yet be made in the whole art of levying taxes.

The most luxurious airliner ever built

All details from your Travel Agent or KLM Royal Dutch Airlines, London, Manchester, Birmingham, Glasgow and Dublin.

It is only natural that KLM, the air-line with the highest reputation for comfort, should choose the new Super-Constellation.

Here is space that permits a galley and a bar, compartments in which passengers can relax with scope to move about, more restful seating.

Speedier journeys are a great advantage too. Longer range means fewer refuelling stages. Fly KLM—There's comfort in the air.

Cheaper Air Travel!

Available from 1st October, New Tourist Fares to Africa and Middle East. Off-Season Tourist fares to North America and Caribbean.

KLM
ROYAL DUTCH AIRLINES

ROLLS-ROYCE

introduce

THE FULLY AUTOMATIC GEAR BOX

All Rolls-Royce models are now available with the fully automatic gearbox. Produced by the company as an optional fitting, it greatly simplifies driving—gear changes being carried out automatically and calling for no effort on the part of the driver in manipulating a gear lever or clutch. At the same time a measure of manual control over the gearbox is provided enabling the owner to select the method of gear control best suited to his own style of driving.

THE SILVER DAWN

The Silver Dawn now introduced, has been developed to conform with the changing needs of the times. Designed for the owner-driver who requires all that the Rolls-Royce traditionally bestows, it is fitted with 5-seater Saloon coachwork built by the Company.

NEW RANGE OF COACHWORK

Rolls-Royce announce a new range of coachwork on the longer Silver Wraith chassis. Advantage has been taken of the extra length available to introduce a new beauty of line, providing, at the same time, increased accommodation for both passengers and luggage.

THE CASE OF THE SHOP THAT WAS OVER SUCCESSFUL

Getting customers in was easy—but not getting them out!

LIPTON LTD., the famous grocers, were quick to accept a popular demand for provisions sold on a self-service basis. But, in one of the shops they opened—in Leeds—the very popularity of this way to shop was causing the management some concern.

Space was limited, and it was essential that when shoppers had made their purchases they should be able to pay for them quickly and make room for new customers. But at the check-outs—that part of the store where the value of goods is totalled, cash taken, and receipts issued—there were hold-ups. However hard the staff worked it was proving impossible to handle transactions fast enough to get customers through the check-outs without congestion.

With this problem, Liptons invited Burroughs' collaboration in an experiment, asking one of their machine-accounting specialists to demonstrate a Burroughs Itemizing Cash Registering Machine in action. The speed at which one girl could use the machine to register purchases, give tickets and change, was timed.

Result: So satisfactorily did this Burroughs machine work under pressure, that Lipton Ltd. installed one straight away (later two more) in their

Seen demonstrating the use of a Burroughs Itemizing Cash Registering Machine is Mr. Paul Stark, the Burroughs representative who helped Lipton Ltd. to solve the Case of the Shop that was Over Successful.

Books & Publications

Reason in Politics

PRINCIPIA POLITICA.

By Leonard Woolf.

Hogarth Press. 319 pages. 25s.

"THE society which has developed during the last 50 years in Europe is not viable." This uncompromising judgment provides Mr Woolf's point of departure for the third volume of his study of communal psychology. (Two volumes of "After the Deluge," now reprinted, came out before the war from the same press; Keynes suggested the present title.) Appalled by the catastrophe of 1914, Mr Woolf has spent many years looking into its causes. In this latest analysis of the ills of society, he does not conceal the nasty facts of political life which, we all try to pretend to ourselves, do not really exist: "the almost incredible stupidity and cruelty of communal beliefs and actions, the suicidal savagery of nations, churches, parties, sects, and classes." He observes the "continual feeling at the back of the mind of apprehension, obstruction, helplessness" by which ordinary people are dogged today; he cannot forget that the stable Victorian society into which he was born lost all its stability in the war of 1914, and that "progress" since then has been more backwards than forwards. And he wants to know why.

He begins by disposing of the argument too often used by "realists": that politics is only about power and that ideas are therefore without political importance. Knowing that there can be no simple answers to the highly complex questions of modern history, he advances, through discussions of Greek religion and of the processes of education which are only apparent divagations, to a critique of the modern authoritarian state. He finds a "loss of the sense of values through the confusion of political means with social ends... one of the commonest and most corrupting of historical phenomena," and sees that "the pattern of human behaviour inevitably compels all who choose authoritarianism to follow the same fatal path in order to maintain themselves in power"—hence the distressing similarity in method between communist and fascist regimes, which began from such different premises. For "in politics it is the logic of the means adopted, not the end aimed at, which inexorably determines events."

Moreover it seems clear to him, after describing the gyrations by which Stalin kept his supremacy, that "the means adopted are precisely those which cannot produce the ends desired" by the original conceivers of communist policy: "The police state remains; the ideals of

Marx and Lenin are interred in communist resolutions." Mr Woolf's account is coloured by some robust, old-fashioned anti-clericalism, as well as by an honest man's hatred of tyranny; the dogmatic element in Stalinism repels him almost as forcibly as the terroristic. He concludes that "The values in an authoritarian society are fundamentally wrong and the longer it exists the more corrupt they become." Yet he suggests this ground for hope:

The dictator will either make his subjects so stupid, so ignorant of facts, so frightened of thinking for themselves that they will no longer be capable of performing their jobs efficiently, or they will remain sufficiently intelligent to endanger the stability of the régime.

Just occasionally the lesson of history is not only that nothing is learned from history, and "the injection of a moderate amount of reason into our communal thought and action" for which Mr Woolf pleads may yet save the world from some of the worst disasters—if the dictators' dilemma which he describes does not lead, as such dilemmas have done before, to war.

"Principia Politica" will annoy many readers, especially those of a conservative turn of mind, and may exasperate students of politics by what it leaves out as well as by what it puts in; but few will deny that this provocative book was worth publishing. In a further volume Mr Woolf hopes to expound a reasonable, libertarian system of government, a system which "creates for the individual a framework of freedom, limited for him only by the minimum possible number of rules and regulations in the making of which he himself must have a say." Readers of this book can look forward with interest to a constructive sequel.

Mirror Image

PUBLISH AND BE DAMNED!

By Hugh Cudlipp.

Andrew Dakers. 292 pages. 12s. 6d.

Publication of this book will not damn either Mr Cudlipp or the *Daily Mirror*, even though neither comes out of the narrative with anything more than haloes of impudence and business acumen. Indeed, it should be read by those who condemn the newspaper without having read it attentively. For the book explains how—and to some extent why—educated men feel it their mission to write down to what Mr H. G. Nicholas has called "the lowest level of pungent comprehensibility."

Here, chapter after chapter, is the very style of the paper; Mr Cudlipp on Mr Godfrey Winn's appeal to the public is sheer joy; on Richard Jennings, the leader writer, and Cassandra, the columnist, there is some admirable stuff, even though it begins with this specimen of style:

It is now necessary to select a fine fretwork saw, stand on a chair, cut around the craniums of two men, lift up the lid and peer into their brains.

Here are revealing photographs of the key men, past and present: Mr Cecil Harmsworth-King, the quietly spoken chairman, of whom Mr Churchill is said to have remarked during the war, "Well, you look innocent enough"; and Mr Sylvester Bolam, in the posture of an eminent consulting surgeon saying: "We believe in the sensational presentation of news and views, as a necessary and valuable public service in these days of mass readership and democratic responsibility." Here are some of the secrets of how to shock not the bourgeoisie but the other ranks.

Unfortunately Mr Cudlipp's treatment of his theme throbs with inverted snobbery. His digs at the *Daily Express* and the *Daily Sketch* (later *Graphic*) are unfair, for it is clear to anyone every Sunday morning in this country that circulation will rise if an editor and proprietor are prepared to go really downward with the people. He claims that the *Mirror's* manner is free of humbug; but there are passages in this book as much like humbug as anything one has read. What, for example, is to be thought of "God Save the King" as front-page banner-line for the issue which harried Mr Baldwin for the truth about the abdication crisis in 1936 and devoted two pages "to the stories I had collected from the American press"?

None the less, there is plenty of material here to show how the *Daily Mirror* has become a political and social power in the land. The war gave it the chance to decide, the tabloid revolution having been completed, what its purpose and serious content might be. It came into the traditional stream of patriotic radicalism (something like William Cobbett) and made a splash big enough to awe the Prime Minister and cow his Home Secretary. The new material about the Government's threat to suppress the paper is of the highest interest, and the description of a lecturing by Mr Herbert Morrison is a gem of reporting.

To the eternal question "How does Fleet Street know what the public wants?" Mr Cudlipp returns a better answer than is usually given. He quotes liberally from the 3½ million letters received from readers in the years. Describing the Bartholomew changes of the middle thirties he writes:

Behind the barking and the tinsel, however, was a closely reasoned scheme. The plan which these young men evolved was simply this—to get under the readers' skin and stay there. They were all, in their way, lay psychologists. Most of

them had come from working-class or middle-class families in the provinces; they really knew and had personally experienced the aspirations and setbacks, the joys and heartaches of the millions of ordinary people whom they set out to entertain and instruct.

That explains everything except the quite ridiculous conventions of style that Mr Cudlipp and his colleagues inflict on themselves. Simple, clear, vivid writing will do all they want to do; indeed, it has done it regularly in the leaders of B.B.C. It will be interesting to see whether the *Daily Mirror* can be sensational without being turbid, serious without becoming pompous, and human without gross sentimentalism. It shows signs in this book of aspiring to all three achievements.

Colonies in the Pacific

THE SOUTH SEAS IN TRANSITION.
A study of Post-war Rehabilitation and Reconstruction in Three British Pacific Dependencies.

By W. E. H. Stanner.
Harper, 448 pages. 45s.

THE drama of events in Africa sometimes obscures the fact that colonies in other areas are also in the grip of change, political, economic, social and demographic. Pacific islands may seem small and remote, but they reproduce many of the intractable features of the colonial dilemma elsewhere. In Samoa, for example, a native population is pressing for immediate self-government with all the firmness of West African nationalists, and is no less ready to sacrifice some of the efficiency of the West—which in any case they esteem lightly—to get it. In Fiji, a philoprogenitive population of Indian ryots is encroaching upon a limited cultivable area and the rights of a pro-British race of Polynesians whose system of values leaves them at as great a disadvantage as that of the Malays vis-à-vis the Chinese. In New Guinea, some of the aspects of the Kenya problem are emerging. In providing so detailed an analysis of these territories, even though he was able to carry the story only to 1950, Dr Stanner has done a most useful service.

New Guinea, in particular, promises to become an issue of moment, in view of both the Indonesian claims on it and the revival of Japanese interest. The Australian attitude towards it has fluctuated. Before the war there was an indifference born of sentimental anti-colonialism. In the war came awareness of its strategic importance, and the southern area was held at high cost in Australian blood. Then came the Labour "New Deal" so shrewdly dissected by Dr Stanner—a policy grounded on a revulsion from capitalist "exploitation," even though private enterprise alone provided the revenues for welfare. This policy, while modified subsequently, has notably failed to solve the problems of a primitive population and has prevented a return to prewar production—just at a time when Aus-

tralia is challenged to develop this underdeveloped area or to justify a dog-in-the-manger attitude. Dr Stanner, however, deals effectively with the school of thought that thinks New Guinea is bursting with "vast resources," which only await a bit of push and bulldozers to bring them to bearing.

New Guinea, like Fiji and Samoa, is a poor country; but it may well be asked—as Dr Stanner, who alternates convincingly between the armchair economist and the field-working anthropologist throughout the book, does not omit to ask—just what a "low" living standard really means in terms of a primitive people. True, there is only a 0.001 density of telephones per inhabitant in New Guinea (including four that do not work), but to change all this will produce discontent and unhappiness. Yet the damage is done. Not the least interesting part of Dr Stanner's story is his description of the "cargo cults" among rebellious New Guinea or Papuan natives—anti-white movements in which, however, the motive power is some prophecy that all the material blessings of white civilisation will be delivered, untold for, by miraculous means. Whatever the cost in loss of happiness, the "blessings" will come; the question is one of timing.

Practical administrators may find some of Dr Stanner's anthropology indigestible; business men will find some of his economics defeatist; but this book is a serious attempt—one of the few—to evaluate just how much Western culture particular primitive societies can assimilate, and how quickly, without causing the strains that lead to the sort of breakdowns which have manifested themselves elsewhere.

Shorter Notices

ECONOMIC TRENDS AND ECONOMIC POLICIES: Developments and Discussions in Sweden after the First World War.

By Erik Lundberg.
Norstedt and Söner, Stockholm, 550 pages. S.Kr. 28.50; with stiff back, S.Kr. 32.50.

As head of the Business Research Institute in Stockholm since the war, Professor Erik Lundberg has had excellent opportunities to observe, analyse, record and, particularly through the institute's regular publications, influence economic thought and policy in Sweden, quite apart from his position as probably the foremost Swedish economist. This book by him, originally started on the initiative of the League for Economic and Social Studies (an organisation founded and financed by Swedish business and banking circles to study economic and commercial problems), is now published by it in collaboration with the Business Research Institute. Its scope, as it must be for a country so closely affected by international movements as Sweden, is far wider than its title suggests. The various theories adopted at different times to explain economic developments since the First World War are submitted to critical examination, with especial emphasis on the depression of the thirties. Its conclusion, rather startling in view of the esteem (considered undeserved by Professor Lundberg)

in which Swedish national planning is widely held, is that true planning is impossible, and is often irrelevant (being frequently dictated by administrative convenience rather than economic significance). In any case, it depends for the accuracy of its premises on information best supplied by a free market—which the very planning circumscribes.

Such a brief review cannot give more than the barest indication of the book's scope and its contribution to discussions of the technique and effects of the national budget, of the effects of full employment and the other pressing economic problems of modern society. It is to be hoped that an English version will soon be available for a wider public.

ELEMENTS OF AMERICAN FOREIGN POLICY.

Edited by L. Larry Leonard.
McGraw-Hill, 611 pages. 52s.

For this volume of the McGraw-Hill Series in Political Science, Mr Larry Leonard has assembled and slightly pre-digested some of the materials needed for a study of American foreign policy in its historical setting. Many of the famous documents appear, although, as the editor explains in the preface, they are "tailored" to suit his purpose of providing a "basic textbook." With them are extracts from public reports, congressional hearings and even magazine articles, grouped in sections covering the constitutional and administrative framework within which foreign policy has to be evolved, as well as the policy itself.

Much of the material is interesting enough in its own right (though here and there it is already a little out of date), but in his presentation of it Mr Leonard falls between stools. The texts are not full enough for the scholar, while for the general reader the less momentous of them occupy space that could have been filled more profitably with analysis which took into account a wider range of sources. Although the publisher speaks of "a dynamic new approach [which] abandons the outdated treatment of foreign policy . . ." it is difficult to see what advantage this has over a monograph with an appendix or companion volume of untailored documents.

"THE GOOD FOOD GUIDE, 1953-54."

By Raymond Postgate.
Cassell, 354 pages. 5s.

An article on "Guide Books" in *The Economist* of August 1st complained of the shortage of guide books to this country that discriminated "the hotel that is pleasant to stay in from the one that is a licensed robbery." Mr Postgate's guide (of which this is the third edition) does not deal with hotels as such, but with eating places in general. Discrimination is its main purpose and the method of compilation that Mr Postgate has devised ensures objectivity; he prints the names, or at least the initials, of those of his correspondents who have approved the entry. Unfortunately, tastes differ, and the uniformity of standards applied may suffer. But those who rely on Mr Postgate are unlikely to go badly wrong—even if they start with the sceptical conviction that he must be overplaying his hand when he claims to have found over 750 places in this dyspeptic isle where really good food can be had.

A SOCIALIST ANTHOLOGY.

Compiled by Norman Longmate.
Phoenix House, 256 pages. 21s.

The purpose of this collection is to glorify the rebel. Mr Michael Foot complains in a foreword that, owing to the success of compromise and moderation in English history, the rebel, who is the moving force, has never been given his due; Mr Foot would like to see Tom Paine acclaimed as the greatest Englishman of the eighteenth century. Mr Longmate, it is true, puts his purpose rather differently—to assemble documents to illustrate the development of Socialism and the rise of the Labour Party—but it is clear that the moral which the reader is intended to draw is "Keep Left." This is a book to cheer on the missionary militant, whether by filling him with a new fervour or an old bitterness. The latter is the easier way. Most of the material relates to the nineteenth century (with Jarrow and Ellen Wilkinson providing stirring copy of more recent date), and lest anyone should think that Socialism is something new, Moses and Plato are introduced to provide a touch of Back to Methuselah.

There is inevitably much that is grand and much that is petty in the literature of a movement of this kind which was battling against human ills. The enemies are poverty, oppression and injustice, embodied in landlords, capitalists and the House of Lords, and some people will no doubt feel that in the circumstances of a century ago, or even a generation ago, some of the rebels had no cause to fight too cleanly. But it is surely a monstrous piece of casuistry for the historian of those fights now to describe

the Taff Vale case as intervention by the House of Lords; the case came up through the courts to the House, where it was heard and decided by five law lords. Such perversions as this do less than justice to the ideals which animated the most memorable among the rebels.

THE THEORY OF MONEY AND CREDIT.

By Ludwig von Mises.

Jonathan Cape, 493 pages, 28s.

This massive classic, first translated into English in 1934, is now re-published with a postscript on "Monetary Reconstruction" inspired by the events of the intervening decades. Those events have not altered Professor von Mises's views; unchangeably, magnificently, he remains the limiting case, some would say the *reductio ad absurdum* of liberal economic opinion. Monetary theory is part of the grand apparatus of catallactics, the theory of rational choice with the accent on rational. Any apparatus of thought, or any policy, based on observations of imperfectly rational behaviour, incurs his unmeasured scorn. Keynesian theory, his particular bugbear, is largely based on an observed uniformity of preference for taking an increase in real income in the form of higher money rewards rather than of lower prices, and a decline in the form of higher prices rather than of lower money incomes. This preference is admittedly irrational. It puts an intolerable strain on the workings of any objective monetary standard; it pushes the administrators of a managed currency

and credit system incessantly and dangerously towards inflation; and it joins hands, in a manner equally sinister from the economic and the political point of view, with the powers of monopoly in every guise.

It remains, however, an undeniable datum, which any practical policy must take into account. It is certainly arguable that its internal inconsistencies should be shown up; that it is the economist's duty to conduct an untiring educational campaign against it. Professor von Mises elects to do so, however, by methods which defeat his own ends. His debating style, packed with innuendo, imputation of motive, arrogance, and plain misrepresentation, recalls that of the Marxists themselves; and he never explicitly faces the political necessities—the outlawing of trade unionism, the total razing of the welfare state, the extirpation of every form of group solidarity—implicit in his proposals for economic salvation. These are, simply, the return to a gold standard of more-than-classical purity, with 100 per cent gold cover for all currency and 100 per cent currency cover for all credit. The steps by which this reconstruction should be achieved are described with beautiful clarity. Professor von Mises's warnings against the choice of a deflationary parity are as unequivocal as his condemnation of "functional finance." But the capacity of the resulting system to work freely, smoothly, and without intolerable strain and wastage in face of the facts of human psychology and social habit is considerably more dubious than the capacity of the detested Keynesian system to resist the pressure towards inflation and regimentation.

capital and output. Although a large proportion of the national income is spent on capital formation, little is known of the investment required (in both fixed capital and stocks) for the annual production of an additional million pounds' worth of food, clothing or motor-cars. This seems to me the greatest gap in our present information.

Mention was made of the 36-industry table for 1935 published by me, and I should like to add that input-output relations were actually computed for some 150 industries (and for many times that number of commodities), but details have not been printed. Over 110 manufacturing industries were distinguished, as against 144 in the American study for 1947.—Yours faithfully,
T. BARNA

Letters to the Editor

Troops for British Guiana

SIR—In the Note in your issue of October 10th you say that "Caution would seem to be the wisest course."

This accords, of course, with our English ideas about freedom of expression for the individual, freedom of the Press and the theory that one must be careful, when suppressing sedition, not to drive it underground.

These liberal tenets are, no doubt, nearly always wise and valid in this country, and at times and under certain circumstances valid everywhere. But surely one occasion when they are not applicable is in dealing with Communism as at present organised and propagated amongst dependent peoples. We have before our eyes the terrible example of Malaya where over-caution allowed the Communist conspiracy to establish itself with all its appalling consequences.

As a former member of the Malayan Civil Service, I know that if the man on the spot had in 1946 and 1947 been allowed to deal with the preliminary

symptoms as he wanted to, it is almost certain that Malaya would not have had to face a struggle which has lasted over five years and has cost so much in human suffering and resources which could have been put to better ends.—Yours faithfully,
London, S.W.1 W. C. STEWART CORRY

ABC of "Input-Output"

SIR—In your article of September 19th and 26th I felt that you put the claims of tables showing transactions between industries too high. I think that statistical detail beyond a certain point (say, a 100-industry table) is of little use in economic forecasting, mainly because of the possibility of substitution between narrowly defined industries. If the structural changes in the economy were known, it would perhaps be possible to forecast demand for, e.g., non-ferrous metals or hard fibres, but hardly for individual metals or fibres.

One important point has been ignored in your articles: the relationship between

Indians in No Man's Land

SIR—In what was otherwise a balanced comment, you appeared rather over-caustic in referring to India's alleged inaction in the Korean campaign. It seems incorrect to evaluate every move in terms of military action. Even today one wonders what the objectives of the Korean war were and what was actually achieved. Neither side has won a military victory, though both have paid heavily, while Korea has suffered tremendous destruction. The crossing of the 38th Parallel, against which neutrals like India had warned, proved to be one of the main factors that prolonged the war. And now both sides are groping

their way to the *status quo*. Can India be accused of inaction if she did not participate in a war of vague objectives and of doubtful benefits?

Let it not be forgotten that India contributed a medical unit, helped to bring about the truce, and agreed to serve on the repatriation commission and to provide a custodian force. Only India's critics (and not friends as you suggest) would perhaps rejoice in the belief that the recent anti-Indian incidents in Korea would bring home to Mr Nehru and his colleagues the hard facts of the Korean war and the unhappy nature of India's task. This belief is mistaken, for India undertook the task of providing the custodian force with the full knowledge that it was a thankless one.

These few points have been made not to assert any "superior virtue," but to emphasise that participation in a war is not the sole criterion for judging a country's action or inaction. I, of course, concede that at times some utterances of India's spokesmen may have been irritating. But these are characteristics which its politicians probably share with many others in the world. I hold no brief for Mr Menon's pronouncements, but may I point out that on more than one occasion Indian soldiers of the custodian force did, in fact, quell disturbances unarmed?—Yours faithfully,

D. K. RANGNEKAR

London, W.2

[The objective of the Korean war was to repel an invading aggressor. This was achieved, thanks to the joint sacrifices of 16 nations, whose soldiers died to prove that aggression no longer pays. India, in June, 1950, officially endorsed the United Nations' appeal to member states to help defend South Korea; but it sent no fighting men itself. The fact that it has now provided 5,000 soldiers to guard the disputed prisoners is to be warmly welcomed, and tribute to them has been paid in our columns.—EDITOR.]

Cold Fish War

SIR—In the Note about the Anglo-Icelandic fishing dispute in your issue of September 19th you suggest "an international inquiry into the problems of overfishing." May I point out that such an inquiry has already been made, with regard to Iceland, by the so-called Faxa Bay sub-committee—composed of 9 scientists from 8 countries—set up in 1937 by the International Council for the Exploration of the Sea. This body recommended that some important fishing areas around Iceland should be closed for trawler fishing because they were important breeding grounds for fish.

This has, however, been completely ignored in the fierce propaganda of the British trawler owners, who accuse the Icelandic Government of arbitrary actions, and who are—I believe—more interested in excluding a powerful competitor from the market than in the truth.—Yours faithfully,

MAR ELISSON

Australia's Incentive Budget

SIR—May I correct a surprising statement by your Melbourne correspondent? In your issue of September 19th he asserts that: "the present Commonwealth Government did practically nothing to prevent the full blast of the inflationary rise in wool values from assailing the economy. No attempt was made in Australia, as in New Zealand, to set up any form of stabilisation funds so that the abnormal returns from wool would be set aside against the inevitable day when prices should fall."

In point of fact a very energetic attempt to do exactly that was made by the Commonwealth Government in the crucial period of early 1951. The proposal involved a fund of £82 million operated by a Central Authority in London on behalf of the United Kingdom, South Africa, New Zealand and Australia; to this the Australian wool industry was to contribute £48,070,000, to be raised by a wool levy. The levy was set at 7½ per cent for the 1950-51 season, and was expected to yield £47 million; proceeds of the levy were to be placed in a revolving fund to guarantee a floor price for wool to be set each year. In anticipation of the industry's support for the scheme, the 1950-51 levy was actually collected, and had later to be refunded.

In February, 1951, woolgrowers' organisations approved the Reserve Price Plan in principle, and after formulating it in greater detail, the Australian Government submitted it to a referendum of woolgrowers in August, 1951.

The growers rejected it. Their main reason for this was the resentment they felt over the Wool Tax which was provided in the 1950-51 Budget, and which deducted 20 per cent from growers' wool cheques as an income tax pre-payment. The purpose of this effective but most unpopular tax was to cushion the inflationary effect of the wool boom by syphoning off woolgrowers' surplus spending power; its introduction took some courage on the part of the Treasurer, Sir Arthur Fadden, since it inevitably alienated that very section on whose financial contributions the Country Party largely depends for its continued existence.

It is indeed curious that such a drastic step should be dismissed by your correspondent as "practically nothing."—Yours faithfully,

W. NEWTON, Research Officer,
Queensland Division,
Liberal Party of Australia

Brisbane

Polish Church Behheaded

SIR—From what I know about the situation in Poland your pessimism concerning "the biggest capitulation" of the Polish bishops seems to be quite unfounded. The Polish bishops have, unfortunately, no means of protesting to the free world against the wording of a communique which is certainly not a correct version of Bishop Klepacz's

declaration. Of course, you should also have mentioned that Cardinal Wyszyński is the third Polish archbishop to be arrested together with his auxiliary bishop. (In Cracow and Katowice the archbishops Baziak and Adamski are in prison with their auxiliary bishops!)—Yours faithfully,

ADAM ROMER

[Our Note did not suggest that the Polish bishops willingly issued their communique on the arrest of Cardinal Wyszyński. But the fact remains that they are not free agents and that they have been forced to fall in with the regime's wishes. Monsignor Baziak was formerly Archbishop of Lvov, but in Cracow he was Vicar Capitular; Katowice is a bishopric, not an archbishopric.—EDITOR.]

Civil Service Pensions

SIR—May I add a few words to the Note appearing on page 12 of *The Economist* of October 3rd with reference to the recent falling off in the quality of entrants to the administrative class of the Civil Service?

Any such falling off is a serious matter in view of the scale and complexity of the Government's business, which calls for the highest ability which can be secured. Its causes should therefore be removed without delay, one of them being the breakdown of the Civil Service pension arrangements. The facts with regard to this matter are briefly as follows.

By a series of superannuation Acts beginning in 1859 Parliament aimed at providing reasonably adequate pensions for civil servants at retirement. These pension arrangements used to be regarded as holding out to entrants to the administrative class of the Civil Service the certainty of receiving a reasonably adequate pension after an averagely successful career. Regarded as such they proved attractive to the best leavers from the universities, and were among the factors which brought many of them into the administrative class.

But these pension arrangements no longer possess the same attraction, owing to neglect to adjust the pensions of retired officers of the administrative class to the huge increase in the cost of living, which has been brought about by the war and the postwar inflation. Thus senior officers who retired in, say, 1939 or 1947 are still receiving the same pensions as they were awarded at retirement, although money has lost more than half its value since 1939 and nearly 30 per cent of its value since 1947. In these circumstances an entrant to the administrative class can no longer be sure of receiving a reasonably adequate pension after an averagely successful career.

Nor is this the end of the matter. Not only do the Civil Service pension arrangements no longer possess the same attraction, but the Government's neglect of its old servants, which is inflicting on them a cruel curtailment of their standard of living, has begun to be widely regarded as reflecting on the Government as an employer.—Yours faithfully,

G. D. ROKELING

Arundel, Sussex

THE COST OF DRYING THINGS

Millions of tons of fuel are used in Britain every year in drying processes, many of which are inefficient and wasteful.

When coal was cheap no one worried unduly, but today the cost of fuel used in drying is a serious expense item which tends to get buried in general overhead without receiving the close control given to economy of raw materials. Furthermore, many drying processes are as ineffective as they are extravagant.

Eight years ago, we started a specialised service to the Metal Goods Industries by providing Gas Infra-Red Tunnels for drying paints and varnishes. Today our techniques have wide application as varied as those employed in fish curing and textiles.

We are ever looking for new drying problems to solve. Nearly every industry has one. Send yours to:

On the trail of trade

THE National City Bank of New York was the first American national bank to open a foreign branch. Since that day it has always been a leader on the trail of trade.

Wherever trade has been active, The National City Bank has opened a branch. Today the bank commands a world-wide network of 57 overseas branches, staffed by men with a first-hand knowledge of local business practices and regulations. In addition, The National City Bank has correspondents in every commercially important city in the world.

The London branches offer the facilities of this world-wide organization and are, as well, uniquely equipped to advise on trade with the dollar countries.

THE NATIONAL CITY BANK OF NEW YORK

(ESTABLISHED 1812)

Incorporated with limited liability under the National Bank Act of the U.S.A.

Head Office: 55 WALL STREET, NEW YORK. London Offices—City: 117 OLD BROAD STREET, E.C.2. West End: 11 WATERLOO PLACE, S.W.1

ON YOUR TRIP TO
NEW YORK
YOU CAN FLY TO

Bermuda

AT NO EXTRA COST!

Something extra special lies ahead of you on your flight to New York. Your first-class fare, via any international airline, can include a trip to Bermuda—and at no extra cost.

When business is over, refresh yourself with a delightful week-end in Bermuda. Stay longer, if you wish, for Bermuda is in the sterling area. Bermuda's less than three hours from New York, and there are frequent daily flights.

And there's nothing like Bermuda for sunning on pink sandy beaches . . . for leisurely living far from bustling routine . . . for rest and utter contentment.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Air Defence in Perspective

Washington, D.C.

ON Thursday of last week President Eisenhower read to his press conference a statement whose closing sentence he accompanied with both a glance of defiance and a smile which seemed to anticipate the amusement it elicited:

I have asked all members of this Administration to refrain from comment on Soviet nuclear capabilities unless they first check their statements with the Chairman of the Atomic Energy Commission.

The President thus hoped to conclude a period in which totally contradictory statements about risk from Soviet atom and hydrogen bombs had been made by one important Congressman and almost every member of the Administration concerned with the problem.

For example, on the very afternoon that Mr Wilson had attempted to introduce a more orderly perspective on the subject of the Soviet threat by arguing that it would be about three years before the Soviet Union had the bombs and aircraft to carry on a war, Mr Val Peterson, the Civil Defence Administrator, was painting a horrifying picture of American vulnerability and of a war with Russia in which the enemy would use against the United States every known form of atomic bomb and guided missile, germ warfare, "sabotage, psychological panic and possibly gas." And even after the President issued his request for restraint, both Mr Wilson and Mr Cole, the chairman of the Joint Congressional Committee on Atomic Energy, reaffirmed their own and contradictory views.

The Republican Administration took office with a strong belief in the value of psychological warfare. But if the events of last week had been interpreted at their face value it would have been fair to assume that the offensive had been against the American citizen, who must have found it difficult indeed to make sense of this barrage of conflicting advice.

In fact, of course, the battle was directed by the various members of the Administration against their own colleagues. October is the month when the final budget estimates for the next fiscal year have to be submitted by each department, and it is therefore the month in which every official draws attention to the importance of his own work. Beneath his portentous predictions, what Mr Fleming, the defence mobiliser, was really saying was that his office needed more funds than it had been allocated for industrial dispersion, and Mr Peterson that the estimates for civil defence were inadequate, while Mr Wilson was concerned to show that no amount of Halloween skeletons would deflect the Defence

Department from going about the business of armaments in its own way.

The real casualty of this babel has been the President's plan to make a statement or series of speeches, similar to the Roosevelt "fireside chats," attempting to bring home to the American public—and thereby the world—the essential facts about the developments in Soviet and American atomic weapons, and their effect upon strategy, home defence and international relations. This has been christened "Operation Candour." The project has been delayed from week to week while the National Security Council wrestled with the competing views on strategy which must be resolved before the budget estimates can be fixed. The result is that if and when the President does speak, the calm and clear presentation of the facts by the highest authority in the land will suffer from having been preceded by the confused counsels of his subordinates.

★

The President did make it clear in his statement last Thursday that he would not reveal the size of the American stockpile of atomic weapons as a deterrent to Russia and a tonic to the free world. It had been doubtful at any time whether he would, despite the urgings of many scientists and laymen, and any doubts were set at rest in a speech by Mr Lewis Strauss, the Chairman of the Atomic Energy Commission, in New York on September 30th when he indicated that the figure would mean little to the public and a great deal to a potential enemy. Mr Strauss also made clear the limits within which "Operation Candour" would be conducted when he said that, while some outdated security precautions would be revised, "in the more limited highly sensitive areas, our security should not only be maintained but intensified." (Mr Strauss was mistakenly described in *The Economist* of September 12th as having opposed, three years ago, the shipment of a radioactive isotope to a Norwegian military hospital. The isotope was, in fact, for metallurgical research in problems connected with jet engines and according to Mr Strauss "the material was delivered directly into the hands of a technician who was subsequently found to have been working for the Soviets.")

The effect of the Soviet atomic threat on defence expenditure and the strategic disposition of American forces will not be known for certain until the Budget is published at the beginning of next year. But it seems unlikely, even if the President has had to postpone his cherished aim of balancing the budget, as he seemed to indicate at his press conference last week, that any drastic action is contemplated

outside the field of purely military development. The problem of an adequate civil defence system will remain unsolved because it is insoluble in a nation where fifty per cent of the workers live in fifty key target areas. Similarly, although Mr Peterson may assert that "if we want to maintain production uninterrupted the only thing we can do is to go down under the rocks or into the Rockies and build our factories," any serious system of industrial dispersion founders on the impossibility of reconciling it with an economic system of production.

There have been cases, such as the shift of production lines from the Boeing Aircraft plant at Seattle to Wichita, Kansas, where plants have been deliberately relocated with an eye to war. But American labour is no longer highly mobile and prefers to remain in "target areas" rather than to follow a job wherever it may be moved. One has only to pick up the industrial section of any American newspaper to see tempting advertisements from the governments of Delaware, Michigan or New Jersey inviting firms to settle there, for the very reason that they are highly developed industrial areas. In the six months in which the Office of Defence Mobilisation has offered tax amortisation certificates to companies that conform to the specifications laid down by the civil defence authorities only one firm has been granted a certificate.

Similarly, there is little evidence to show that the new Joint Chiefs of Staff, in the basic review of American defence policy which they were directed to undertake by the President, have arrived at any conclusions which emphasise the importance of American continental defence at the expense of other areas, or the specialised means of air defence at the expense of conventional weapons. The Air Force will increase in size, and according to current indications may have its eventual goal of 143 wings reaffirmed, reaching 127 wings by the middle of 1956. But as the services begin to draw on the children of the lean depression years, manpower is becoming as much a determinant of the size of the forces as money or weapons.

It seems probable, however, that the visit to Washington last week of Mr C. D. Howe, the Canadian Minister of Defence Production, has resolved an argument about the right kind of radar screen for the protection of the continent on its northern approaches. This concerns the American espousal of the Lincoln Line (named after the study of that name carried out at the Massachusetts Institute of Technology), a highly complex radar system needing considerable skilled manpower, and the Canadian preference for their own or McGill Line (named after McGill University, where a cheaper, more automatic, system has been devised) which they claim is more suited to the vast northern spaces it would have to cover. It is this argument, as much as lack of money, although some \$300 million is believed to have been spent already on the radar chain, which has held back speedier development of the northern defences.

There is another problem of continental defence which every official of the Defence Department shudders to contemplate, namely the appointment of a Commander North America, presumably with a Canadian Deputy. For such a command would almost certainly have to be given to an Air Force Officer, whose authority would have to extend not only over ground forces concerned with continental defence, but also over the large naval forces which would be responsible for providing early warning and the first line of defence on the two sea flanks of the continent. When that command is organised it will be possible to feel, for

the first time, that the policy of unification of the armed forces has been accepted.

In theory, preoccupation with continental defence might give rise to a dangerous attitude towards the overseas commitments of the United States, to a feeling that the legions must be withdrawn to Rome. In fact, however, a great many American bases and installations overseas will play an important part in the early warning chain, and the defence of the continent would be more difficult without them. What is more probable is that the realisation that for the first time since 1812, the continental United States may be in direct physical danger has played an important part in the seriousness with which the idea of a non-aggression guarantee with Russia is being considered in every corner of the American press.

Illinois Without Stevenson

FROM A CORRESPONDENT IN SPRINGFIELD

ON the night of November 4, 1952, reliable reports from the executive mansion at Springfield suggested that Mr Adlai Stevenson was sorry to lose the Presidency, but heartbroken that his party had lost the governorship of Illinois. Mr Stevenson had always been of two minds about seeking the Presidency, and was undoubtedly prepared, in some measure, for defeat. When he not only lost that office but saw his Lieutenant-Governor go down to defeat, in the Eisenhower landslide, before a Republican, Mr William G. Stratton, Mr Stevenson feared that the four years he had devoted to raising the standards of state government in Illinois had been wasted.

Illinois has now lived through the better part of a year without Mr Stevenson. The record of Mr Stratton, who at 38 is the youngest governor in the state's history, is mixed. He has not proved as disastrous a contrast as some of Mr Stevenson's partisans expected when they recalled that in 1941, as a very young Congressman and a Member of America First, he allowed George Sylvester Viereck, a Nazi propagandist, to use his congressional mailing privileges for the circulation of anti-British and pro-Nazi material. But the high moral fervour which Mr Stevenson and his eager reformers brought to Springfield has been replaced with the less heady atmosphere of machine politics.

So far, Mr Stratton's brand of machine politics appears to be an improvement on that of Governor Dwight Green, whose partisan excesses enabled Mr Stevenson, in 1948, to win by the largest margin ever given a state executive. The new governor has been shrewd enough to disappoint his right-wing supporters by courting some of the liberal elements that backed Mr Stevenson so enthusiastically. He has accomplished some things which Mr Stevenson failed to achieve. And he is very much in the forefront of Illinois Republicans; he is considered a leading contender for the seat in the US Senate now held by Mr Paul H. Douglas, who must seek re-election in 1954.

Governor Stratton got off to a bad start last January with the appointment to his cabinet of a group of politicians whose principal qualification for office was their loyalty to him during the campaign. The pro-Eisenhower *Chicago Daily News* called his appointees "Governor Stratton's team of Republican retracds" (a retread is an automobile tyre which has undergone a renovating process to prolong

its life), and warned the governor that such an administration as he seemed to be putting together would come to the same scandalous end as that of Governor Green.

That remains to be seen. There have been no open scandals yet. Governor Stratton has even used the state police, as Mr Stevenson did and as Mr Green did not, to suppress local gambling, which in Illinois has so often been the source of the corruption of county officials. On the other hand, one immediate result of the replacement of high-minded by machine-minded men has been a threat to the state welfare services.

Mr Stevenson did a great deal, by careful administration, to improve the level of care in the state mental hospitals. Within a few months of Governor Stratton's inauguration, several key officials in the welfare administration had resigned, alleging that spoils politics were now in the saddle. A non-political committee on mental health, headed by the author of "The Snake Pit," a much-quoted novel about the institutional care of mental illness, bitterly denounced the Stratton administration for cutting the mental health budget and forcing out professional staff.

★

Governor Stratton has been more successful in his relations with the legislature, partly because, unlike Mr Stevenson, he has a majority in both houses. He presented a programme which, with some exceptions, might have been offered by his predecessor. One exception was a Bill to lighten the taxes placed upon the motor transport industry to help finance highway construction. Mr Stevenson had insisted that the lorries pay their full share of the cost of the highways which they pound to pieces, but Mr Stratton had promised the industry relief in exchange for its support in his campaign, and he kept his promise. The Governor also backed, though not very vigorously, a fair employment practices Bill, to outlaw racial discrimination in hiring workers; the Republican legislators, as usual, would have none of it. He supported revision of the mine safety laws, judicial reform to take the courts out of politics, and a youth commission to combat juvenile delinquency.

The most surprising turn of the legislative session was Governor Stratton's opposition to the Broyles Bills, the local manifestation of McCarthyism. For vetoing this proposed apparatus of loyalty oaths and anti-Communist investigations, Mr Stevenson has incurred the wrath of the McCarthyites and the American Legion specialists in "Americanism." To all appearances, Governor Stratton was the darling of these elements, but he confounded them by persuading the legislature to kill one Broyles Bill and by vetoing the other. Unlike Mr Stevenson, he has so far escaped being branded a fellow traveller for his pains.

Governor Stratton scored a notable victory when, at the price of abandoning most other parts of his programme, he induced the Republican legislature to pass a Bill to reapportion the state's electoral districts, something governors have been trying to do for more than a generation. For fifty years Cook County (Chicago) has been under-represented at Springfield. If the voters at next year's referendum approve Governor Stratton's reform, one house of the legislature will have a rural majority and the other a Cook county majority, which is about as close as any state evenly divided between rural and urban populations can come to fair representation.

Governor Stratton has displayed a degree of political skill in handling the legislature. But the record of his first year would be incomplete without mention of the case of Dr George Stoddard. A distinguished educator and leading member of the American delegation to Unesco, Dr Stoddard was forced to resign as president of the University of Illinois in what the *St. Louis Post-Dispatch* called a "dirty political intrigue."

Dr Stoddard was the victim of isolationist hatred of the United Nations and Unesco, of the anti-liberal spirit, of anti-intellectualism and, some suspect, of Roman Catholic hostility. The American Legionnaires accused him of appointing 50 "reds or pinks" to the faculty. The Catholic bishop of Springfield once accused him of "godlessness." The isolationists said he made the University radio station an "outlet for globalist propaganda," and fought his campaign for non-commercial television under University auspices. His critics were able to make out a better case against Dr Stoddard on the grounds that he was a poor administrator.

Governor Stratton describes himself as an innocent bystander in the whole affair, but he is a trustee of the University, and he has made it clear that he is glad that Dr Stoddard is gone. If Governor Stratton reaches the Senate, few observers in Illinois will be surprised to find him on the right wing, among the nationalists and neo-isolationists with whom he started out.

American Notes

Business Past the Peak?

FOR the first time since the recession year of 1949, there has been a slight decline in the gross national product, from a seasonally adjusted rate of \$372.4 billion in the second quarter to \$371.0 billion in the third. This is the estimate of the Council of Economic Advisers in its monthly statistical bulletin. Personal expenditures continued to climb, but not fast enough to offset completely the fall in government spending on security programmes and the drop in the rate of inventory accumulation, as is shown in the right hand chart on the following page. Other slight warning signals appeared: manufacturers' new orders, seasonally adjusted, fell in July and again in August, mainly because of cancellations of defence orders, but partly, it is suspected, through falling civilian demand. Industrial production sagged slightly in September instead of springing back with its usual autumnal briskness. Personal income slipped back slightly in August for the first time this year. The labour market is easier, due to scattered lay-offs.

These are all mere ripples, of course, on the surface of the vast bulk of American prosperity. Business activity in 1953 is higher than ever before; all the indices, with the exception of that of farm income, are more favourable than they were last year. The spokesmen of the Administration

are understandably anxious that businessmen should keep the whole picture in focus, recognise that adjustments are inevitable in a dynamic economy, and refrain from talking themselves into a depression. Nevertheless, even if no sharp downturn is in sight, the second quarter of this year may mark the peak of the postwar boom.

Assurances of government help if it is needed are regularly forthcoming; there are even some fears that the Administration in its nervousness may shoot off its ammunition too early. But consumer spending still has prizes for the businessman willing to offer more attractive products at more attractive prices. Americans are saving at the rate of \$17 billion a year, which is nearly 7 per cent of their income after taxes. And after January 1st, personal income taxes will drop by 10 per cent. If this should not be enough to take up the slack next spring, Congress will not be hard to convince that the excise taxes which the Administration would like to extend should be allowed to die on schedule in April.

Mr Durkin's Successor

WITH the appointment of a labour relations expert, Mr James Mitchell, to fill Mr Durkin's empty chair as Secretary of Labour President Eisenhower has abandoned his experiment of including a trade unionist in the Administration. The idea was never a very promising one, if only because the trade union movement is divided and Mr Durkin's motives were inevitably suspect outside the American Federation of Labour, but it broke down completely over the drafting of amendments to the Taft-Hartley Act. Under Mr Durkin the Department of Labour negotiated with the Department of Commerce and the White House rather as if it were engaging in collective bargaining with an employer. The result was that Mr Durkin's resignation took place amid a flurry of allegations and denials that the President had withdrawn from an undertaking that a draft 19-point programme, which sought to meet some of the trade union's demands, should be the Administration's final word on the subject, to be presented as such to Congress.

The new Secretary of Labour has been on leave from his post as chief personnel officer of a large department store in New York in order to handle manpower and reserve problems for the Army. Since, like Mr Durkin, he is a Roman Catholic, his appointment ensures that that faith continues to be represented in the Cabinet, while the fact that he is a businessman with experience of working for the government should make it easier for him than for a trade unionist to secure a hearing from the other businessmen in the Administration for labour's point of view.

One of Mr Mitchell's first tasks will be to choose a new Assistant Secretary in place of Mr Lloyd Mashburn, a trade unionist who was appointed by Mr Durkin and who has now followed his chief back to the trade union movement. Then he will have to devote himself in earnest to the preparation of legislation for the next session. At least he starts off with a good reputation for the handling of labour relations—his appointment was recommended by the chairman of the New York State Mediation Board, who is a supporter of Mr Dewey on the liberal wing of the Republican party, and was welcomed by Mr Reuther, the president of the Congress of Industrial Organisations. But his efforts will be judged by his ability to influence the drafting of the amendments to the Taft-Hartley Act and by his success in defending his department from further attacks on its budget of the kind which this year have severely restricted its ability to check the observance of labour conditions guaranteed by law.

Taxes in a Revolving Door

THE order to reduce all payments on account to armament manufacturers to the lowest possible level is a sign of how the Administration is having to pinch pennies to keep within the debt limit until Congress reassembles in the new year. But this is a financial flea-bite compared with the difficulty of constructing a new tax programme and persuading Congress to accept it. The Administration, which is dedicated, in principle, to balancing the budget and lowering taxes, is now faced with the unhappy realisation that any tax reliefs must be replaced by new levies, simply to avoid running a larger deficit in the fiscal year which begins next June than in the present one.

The Administration is committed to allowing the excess profits tax to die and personal income taxes to revert to their pre-Korean level on January 1st. Assuming that spending and other receipts remain the same, this would add \$3.2 billion to this year's estimated deficit of \$3.8 billion. But both Mr Reed, the stubborn chairman of the House Ways and Means Committee, and Mr Millikin, his respected opposite number in the Senate have given notice that they will not support the Administration in its request that two other automatic tax reductions scheduled to take place in April, one on corporate income and one on excises, should be postponed. They insist that expenditures should be cut instead. But even Mr Wilson, the Secretary of Defence, now says that a further \$2 billion reduction is all that his department can absorb next year unless there is a cut in the armed forces. In addition, the Administration would like to make a start, at least, on the job of bringing some order into the hodge-podge of tax laws, relieving inequities,

and some of the burdens which hamper business expansion.

It is no wonder, therefore, that the President at a recent press conference refused to shut the door on a manufacturers' excise tax, though he slammed it on a retail sales tax, which is very similar, but sounds worse and is harder to collect. The cries of outrage from both sides of the party aisle would suggest that excise taxes were something new in federal finance. In fact, the government collects \$10 billion a year from this source, about 15 per cent of all its receipts, and some tax experts believe that this proportion should be increased to give greater stability to the revenue in times of lower business activity. An excise tax is politically vulnerable, on the ground that it "soaks the poor" and 1954 is an election year. Congress may reject it out of hand. But the Treasury appears convinced that a broadening of the field from which excise taxes is collected is the only alternative to falling even further behind in the race for solvency.

Curbs for Cotton

PAINFUL adjustments will have to be made in the cotton belt unless Congress speedily comes to the rescue. Faced with probable supplies of nearly 21 million bales, over 4 million above the expected demand, Mr Benson, the Secretary of Agriculture, has cut next year's acreage allotment to 17.9 million acres, from plantings this year of 24.5 million, and proclaimed a marketing quota of 10 million bales, compared with a crop this year which the latest estimates put at 15.6 million bales.

Cotton is one of the six basic crops whose price is supported at 90 per cent of parity, the theoretical figure which, by relating the prices the farmer gets to those he pays, is supposed to represent a fair return. But this has priced American cotton out of world markets, and more and more is left on the government's hands. The cut is drastic because farmers have been taking advantage of the absence of restrictions since the Korean war began. Although they responded this year to Mr Benson's appeal for self-restraint by reducing their acreage by 9 per cent from last year, their crop is going to be 3 per cent larger, because of the good weather and the increasing use of fertiliser.

Cotton farmers will have to decide on December 15th

whether they will accept the marketing quotas, as they have always done before, and as the wheat farmers did this summer. If they do, they will be assured of continued price support at 90 per cent of parity, but there will be cash penalties for farmers who exceed their allotments. If they reject quotas, the support level falls to 50 per cent of parity.

Congress may come to the rescue after the event and raise the minimum acreage to which cotton may be cut back, as it did for wheat. Its failure to do so last summer was due to the difficulty of deciding whether the old or the new cotton states in the west should bear the brunt of restrictions. But this would leave Mr Benson much where he is today—smothered in cotton. Farm Congressmen also talk of raising the price supports on the non-basic grains, such as oats and barley, which farmers may plant on the over 20 million acres of land to be withdrawn from wheat and cotton. The Department of Agriculture would rather reduce them, to prevent surpluses from bursting out in new places. But the totally unexpected victory of a Democrat in a traditionally Republican farm constituency in Wisconsin lengthens the odds against the introduction of more flexibility into the present rigid system.

The only bright spot on Mr Benson's horizon is that he will not be forced to add maize to the other four basic crops for which quotas will be needed. The maize crop is turning out to be smaller than expected: it is estimated to total 3.2 billion bushels, or 3 per cent less than last year.

SHORTER NOTES

An order to the General Electric Company to make its 200 patents on lamp bulbs and their parts available, free of royalties, to its competitors has concluded a lengthy anti-trust suit. The court has also decreed that the company must let competitors have its designs for bulb-making machines and must end any agreements with other lamp firms on manufacture of bulbs. While the company has not decided whether it will appeal against this decision, it has reached agreement with the Department of Justice in another separate action by promising not to pool its patents or sales territories abroad with foreign competitors, and to make over 600 patents acquired under the previous cartel agreements available on a "reasonable royalty and non-exclusive basis."

★

The problem of Christmas gifts for winter sports addicts may be made easier by the appearance of electric socks. A battery at the waist furnishes current for wires woven into the socks which sell for \$19.95 a pair.

★

The second ransom kidnapping case to be investigated by the Federal Bureau of Investigation since 1938, that of Robert Greenlease, who was kidnapped and shot early this month, will be prosecuted by the government, not by courts of the State of Missouri. The "Lindbergh" kidnapping law of 1932, which allows the death penalty when the victim is not returned unharmed, also provides for intervention by the Federal Bureau of Investigation when a kidnapping victim has been transported from one state to another. In this case the child was taken from Missouri to Kansas.

The World Overseas

Japan Seeks a Policy

FROM OUR CORRESPONDENT IN TOKYO

WITH the reluctant departure for South-East Asia of Mr Katsuo Okazaki, the harassed Foreign Minister, Japan has begun a half-hearted search for a post-peace foreign policy. It is significant and appropriate that this first simulation of independent action, untrammelled by considerations of American policy, should have been undertaken only after diplomatic but impatient promptings by Washington. The Japanese government is now suffering humiliations far worse than the benevolent discipline imposed by General MacArthur: it would like to rattle the sabre, but it needs a sabre; it would like to spurn US aid, but it needs the dollars.

The once mighty Foreign Office literally wears a hangdog look; last week a visitor, speaking his most fluent Japanese, was able to direct a postwar taxi-driver to the imposing official building only after he remembered that it was opposite a popular night-club. A policy of calculated drift and opportunism has spread irresistibly from the Treasury to the Foreign Office. Until now, something has kept turning up. First there was the Korean war; then followed anticipation of Korean reconstruction windfalls, MSA aid, American off-shore buying and even the bright prospect of renewed heavy fighting in Indo-China. However, with a brave smile if a heavy heart, Mr Okazaki has now had to fly south to explore the possibilities of Filipino ratification of the San Francisco peace treaty and of bilateral peace treaties with Burma and Indonesia.

These negotiations cannot be undertaken without some sort of discussion of war reparations (theoretically aggregating more than \$20,000 million), a terrifying problem from which the Japanese have shuddered away as from a bad nightmare. It is now clear that any development of export markets and sources of raw materials in South East Asia awaits decisive attention to improved goodwill generally and reparation demands in particular. But, until Washington pressure became urgent, the Japanese hesitated, hedged and looked the other way.

Poppy-Smoke Mood

Japan wants independence without commitments, aid without strings, the ability to have her rice and eat it too. A poppy-smoke mood of unreality has drugged the nation's leaders since the shock of defeat, the hothouse convalescence of the occupation and the extravagant outpouring of aid from the US cornucopia. India's "neutralism" is a heady and glittering lure. Not that wishful thinking has com-

pletely blinded the Japanese rulers. As Asians, they have no faith in the Washington policy for Asia. Privately, they do not disguise their conviction that the British policy towards Mao Tse-tung is the only logical course. They dismiss Chiang Kai-shek as a defeated leader, without face, future or successor. They are no more pro-Communist than they ever were, but they believe that they must do business with China, whoever is in control in Peking, and somehow restore their influence in Asia. Their dilemma is to reconcile these aspirations with the implicit and explicit commitments of dollar aid.

Britain, the Japanese believe (with a sigh), has withdrawn as an influential force from Asia. Australia, still more fearful of the 1942 memory of Japan than of the 1953 threat of Asian Communism, has become the British Commonwealth spokesman in the Pacific, and has deliberately preferred America to Britain as an ally. The contending forces in the Orient are now Asian Communism and Americanism. Japan's leaders want no part of either, and would dearly like to play off one against the other; there are many industrialists who are recklessly confident that this feat is practicable.

Eyes on Britain

Nearer home, the Japanese government is enraged but helpless in the face of South Korean shooting attacks on any Japanese fishing-boats that venture inside the lapsed "MacArthur Line," up to 70 miles distant from the South Korean coast. Japan's interest in a Korean settlement is historic and paramount, but the nation must apparently watch any East-West negotiations from the sidelines. Hopes of UN membership are recognised to be so remote that a modest proposal for a form of associate status has been seriously made by Mr Okazaki.

Mr Yoshida and his advisers, harassed by charges that they are American puppets, would genuinely welcome closer and friendlier associations with Britain. They feel, however, that Lancashire antagonism represents Britain's only current interest in Japan, and Britain's dogged opposition to Japan's entrance to Gatt has genuinely shocked them by its implacability. But Sir Esler Dening, as British Ambassador, has had greater personal success in Tokyo than the former American Ambassador, Mr Robert Murphy, whose methods the very correct Foreign Office regarded, rightly or wrongly, as overbearing. (Mr John Allison, Mr Murphy's unfairly underrated successor, is adopting a

more tactful and reticent line.) Sir Esler, however, is handicapped by the absence of any positive British post-peace policy towards Japan, and also by definite Japanese resentment that he was appointed to Tokyo only after his projected appointment to Peking fell through. The Japanese are a sensitive people.

Meanwhile, the possibility of an attractive peace offensive by Russia and Communist China overhangs the Japanese scene. This possibility could become a disturbing probability if the present conservative government in Tokyo were replaced by a socialist one, wearing an Oriental Nenni kimono and eager to snatch at any promising alternative to American aid and influence—which is now so obviously loaded and is, ironically, therefore calculated to hasten that very replacement. While Mr Okazaki, with some perplexity, looks to the south for advantages, Britain might, with profit, look to the east.

France and American Aid

FRANCE is the country that most vividly illustrates the extent to which western Europe still depends on American aid. For some nations, it is true, aid has nowadays become marginal—that is, it tends merely to turn small deficits into small surpluses. But for France, among others, American assistance is crucial. Its extreme reliance is partly the result of heavy military expenditure both at home and in Indo-China; but partly, too, it reflects the truth of the recent statement by M. Marjolin, Secretary-General of the Organisation for European Economic Co-operation, that France is the "black spot" of the European economy and therefore holds the key to further progress toward freeing intra-European trade. Moreover, its malaise makes nonsense of any claims that western Europe is ready to stride into convertibility, for to leave France behind in any such undertaking would be politically unthinkable.

There are two obvious ways of assessing the importance of American aid to the French economy. One is to see what contribution it makes to the deficit in the French balance of payments, and the other is to examine how it helps to support the national budget. France gets some US funds which are specifically earmarked to finance certain budgetary expenditure, thus taking a load off the French taxpayer, or, alternatively, reducing the borrowing needs of the French Treasury. The French government's need for revenue is so urgent, and at the same time the sources are so limited, that American aid directly bolsters the French budgetary position far more than in most other countries receiving American help. An analysis of this kind can, of course, give only a rough picture, because much of America's military aid to France is concealed from the public for security reasons and because of technical difficulties: the French budget is based on the calendar year, while American aid is allocated on the basis of a fiscal year from July to June.

A Vital Drop

During the year ending June, 1953, the French balance of payments deficit is estimated at \$542 million. This figure reflects the true position, however, only if the \$230 million derived from US military expenditure in France is regarded

as receipts on current account. If it were counted instead as American aid, then the French deficit would rise by \$230 million to a total of \$772 million.

France has also received from the United States, by way of the Mutual Security Programme, \$460.5 million. When this sum is added to US military expenditure, the grand

TABLE I—FRENCH ESTIMATED BALANCE OF PAYMENTS
(millions of dollars—current prices)

	In gold and dollars	
	Year ending June, 1953	Year ending June, 1954
1. Imports (f.o.b.).....	475.0	541.0
2. Exports (f.o.b.).....	265.0	265.0
3. Receipts from US military expenditure.....	230.0	330.0

5. Total MSP receipts.....	460.5	1,132.4

* Money allocated but not yet spent.

total of "extraordinary US payments" to France reached, in the year ending last June, the sum of \$690 million. Next year the United States intends to double this amount, so that aid to France, over and above direct shipments of arms, will reach the huge total of \$1.46 billion.

More light is shed on the nature and budgetary significance of all this assistance by the estimates in Table II. Of the items shown in this table, the two most important are offshore procurement under the "Lisbon" agreement, and mutual defence financing. In the year that ended last June they totalled between them \$556 million, and a good part of this money helped the French Treasury to balance accounts. Together they provided the Treasury with about two per cent of its total revenue and relieved it of the need to finance

another two per cent—a drop in the bucket, perhaps, but a vital drop.

A word of explanation is required about how, precisely, this happens. Offshore procurement (overseas purchases by the Americans of arms for free distribution among the Nato allies) is, where France is concerned, of two kinds. First there are the purchases agreed at the Nato Lisbon conference nearly two years ago. These were goods whose production was originally financed by the French Government only on the understanding that it would be reimbursed by the United States. For this expenditure to be taken over by the Americans, therefore, is a considerable saving to the French taxpayer. "Other" offshore purchases are those which the French armament industry has been able to sell to the US Services more or less on a competitive basis; the contribution of the latter to the French economy is confined to the dollars they provide towards the balance of payments deficit.

Counterpart for Navarre

Mutual defence financing is still another item. It represents the value of goods provided by the American government under its Mutual Defence Programme—goods such as cotton and machinery. These commodities are given free, but the recipient is called upon to establish in a special fund its counterpart in the local currency—hence the term "counterpart funds." In the year ending June, 1953, France was allowed to spend \$166 million of this fund on capital investment in French public utilities and industrial expansion—an expenditure which appears in the investment section of the French budget. Another \$60 million of these counterpart funds went to help finance the war in Indo-China.

In the following year—the one ending June, 1954—such counterpart funds will provide \$785 for the Indo-China war alone. This figure includes the \$385 million which the United States has recently agreed to provide for the build-up of forces in Indo-China called for by the Navarre plan. Altogether, American aid will be meeting two-thirds of all France's expenditure on the Indo-China war, or over one quarter of its total military expenditure.

None of these figures takes account of the very substantial amount of American help that is flowing into France in the form of "end item" aid—that is, gifts of American military equipment to the French forces. In the year that ended last June, such gifts to Nato Europe as a whole reached \$3 billion. The detailed composition of this total is not divulged, but at a reasonable estimate probably at least one-third went to France.

The "Bevaniste" Error

It is facts such as these which suggest that the French neutralists and their "Bevaniste" supporters are somewhat superficial in their economic thinking. France's rearmament programme and its contribution to western security undoubtedly weigh heavily on the economy, but Washington has helped to lighten that burden, and in ways which hold down French taxes, broaden the French production base and help to balance the French trade deficit. Without its rearmament programme and the war in Indo-China, and therefore without American aid, France's economic problems might well be greater. Certainly its military status and its voice in international affairs would be negligible.

When is a Dependency Not?

FROM OUR UNITED NATIONS CORRESPONDENT

A REPORTER watching the Fourth Committee of the United Nations Assembly lose itself in procedural smog last week was humming the tag line from an American bar room ballad, "But who put the overalls in Mrs Murphy's chowder?" The fact is that the overalls, in the shape of a pervasive anti-colonialism, have been there ever since the UN chowder was concocted. Sometimes they simmer quietly at the bottom of the pot; sometimes steam forms under them and sends them ballooning to the top, as awkward as they are unfragrant.

The current extrusion was not anticipated. Anti-colonialism usually boils to the surface on the simpler issues, and this year it was supposed to lie quiescent until something obvious, such as South-West Africa, was reached. Instead, and for reasons which may be not unconnected with events in British Guiana, it overflowed in a confusion so complete that even the intrepid Guatemalan delegate was caught in his own swirls.

The trouble arises from the old business of trying to push colonial powers into ceding more than they meant to grant when they signed the UN charter. Since 1946, when eight of the more co-operative member nations sent in lists of their dependencies (totalling 74) and began to transmit information about them to the Secretary-General, there has been a steady effort to widen the area of UN authority in this field. Chapter XI of the Charter, originally a benevolent expression of good intentions towards dependent territories, has become a cat-o-nine-tails to be wielded over the backs of the eight powers (Australia, Belgium, Britain, Denmark, France, Netherlands, New Zealand, United States) which admit that they administer such territories. Others which have similar responsibilities, but do not admit it to Uno, may some day find their zeal in flogging turned against them, but thus far they are not impressed by such argument. There is no sign that Latin American countries intend to report on their non-voting Indians, or Asian governments on their neglected tribesmen, or Soviet administrators on their suppressed Asian nationalities.

Ten Words for One

On the contrary, the roll of administrators and administered is shrinking, and this too is cause for complaint. So useful a weapon has anti-colonialism become that its manipulators resent that very progress into self-government which they pretend to promote. Charges have been made before the Fourth Committee that the new independence of Puerto Rico is a sham, and this year the Netherlands must defend its proposal to stop telling Uno about the Dutch Antilles and Surinam because they are no longer "non-self-governing" within the meaning of the Charter.

It is the problem of defining such progress that brought about last week's confusion. Neither the Trusteeship Council nor the Fourth Committee has ever been able to define self-government, but they have laboured mightily to list the "Factors which should be taken into account in deciding whether a territory is or is not a territory whose people have not yet attained a full measure of self-government." The negatives in that phrase tell their own story of struggle and compromise, and the last ten words

AIRCRAFT NOSE-DOCKS

In ALUMINIUM

S.M.D. Engineers now build Aluminium Nose Docks to provide cover and facilities for servicing aeroplane engines—eliminating the expense of complete hangars. These "Wing Hangars" are easily transported, and erected; delivery is rapid and, of course, no painting is required. Let us send you details.

ALMIN LTD · FARNHAM ROYAL · BUCKS

FARNHAM COMMON 595

Aluminium Hangars and Nose Docks are built by S.M.D. Engineers Ltd., of Slough, the construction company of the Almin Group.

should be joined by hyphens to denote an entity for which there is as yet no shorter expression than the rejected word "colony."

For more than three years a succession of committees has tried to formulate these factors. The most recent one finished its work at the end of July, and the list it approved was handed to the Fourth Committee. "Factors" had been divided into three groups, those "indicative of the attainment of independence or of other separate systems of self-government," those "indicative of the attainment of other systems of self-government in continuing association with the metropolitan country or in other forms," and those "indicative of the free association of a territory with the metropolitan or other country as an integral part of that country." Independence, for example, was to include a showing of international responsibility, eligibility for membership in Uno, freedom to arrange one's own national defence, and complete autonomy in economic, social and cultural matters. The other two classifications were spelt out with similar care.

Until last week it was assumed that the Fourth Committee's discussion of so earnest a draft would at least be reasonable. Then it began to be rumoured that the Latin Americans did not see eye to eye with the Arab nations, or even with themselves. The matter came into the open with the introduction of a Brazilian resolution which approved the report of the "Factors" Committee and recommended that it be "taken by the Administering Members and the General Assembly as a guide." The administering powers boggled at that, and both Britain and the United States stated flatly that the decision in the case of their territories was their own, and they would not share it with the United Nations.

Farce and Factors

But the real harm was done before they spoke. Eleven anti-colonial nations (Bolivia, Egypt, Guatemala, Indonesia, Iraq, Mexico, Saudi Arabia, Syria, Venezuela, Yemen and Yugoslavia) had gone to work on the Brazilian resolution and the factor list. In a few hours they whipped up a list of amendments which should properly have thrown the whole project back into the hands of a drafting sub-committee. Instead, and with the aid of an ineffable chairman open to the pleas of every delegate who raised a hand, the Fourth Committee was finally led to accept the amended list. After two days of contradiction and confusion, the proceedings became so farcical that even some of the nations which most delight in wielding the anti-colonial whip were abashed; the final vote was 27 to 23, with Brazil and the Soviet Union among those who voted on the losing side with Britain and the United States.

QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

The matter will go before the full Assembly, unless more sober minds can muster the two-thirds majority needed to revoke the whole procedure. British and American delegates have given warning that they do not intend to abide by the amended resolution, a warning which, however justified, is regrettable in that it encourages revolt in other quarters. Absurd as much of the language in this sector has become, it is still reasonable that, as long as Chapter XI stays in the Charter, some means should be found to judge whether progress towards independence is really taking place.

Too Late to Kill Germs

"TO get there fustest with the mostest" is a principle that can be applied to political warfare too; the essential thing is to be first in the field with a detailed and plausible story, and to repeat it incessantly. With a sufficient volume of assertion, an impression will be made which for great numbers of minds will be permanent. After that, it does not matter if subsequent disclosures show the whole story to be a fake; few people will be interested in the fresh evidence, which bears only on something which is no longer news.

This principle cannot be better illustrated than by the Communist world's accusations against the United States of waging bacterial warfare in Korea. The campaign to convince the world of the truth of these charges was without precedent for sustained intensity. It claimed decisive confirmation of the story from confessions made by five captured American airmen, which were written and signed, recorded for broadcasting, and repeated before international commissions created by the Communists to "investigate." Since the release of prisoners of war in Korea the airmen have returned to America, and have publicly repudiated their confessions and told how they were induced to make them. But for purposes of counter-propaganda their repudiations have come too late. Germ warfare is no longer news, as has been demonstrated by the very slight notice which the British press has taken of the pilots' statements.

"The World Would Be No Wiser"

The statements are nevertheless of great interest, both in their bearing on the charges and in the light they shed on the techniques used by Communist states for extracting concocted confessions. The accounts given by the five officers are broadly similar. All were agreed that, before being captured, they had never heard anything about bacterial weapons being used, except for reports that Communist propaganda was alleging it. When they had fallen into Communist hands, the subject was not broached immediately, but was only introduced after long interrogation on other matters and after solitary confinement and increasing severity of living conditions had had time to reduce the prisoners' morale. Thus Colonel Schwable, the most senior of the officers concerned, stated:

Until early September, two months after my capture, the subject (of germ warfare) had hardly been mentioned. . . . Early in September I was moved from the tent in which I had lived into a little stick-and-mud lean-to on the outside of a Korean house that was located at the head of a very remote little valley . . . a place where one could

readily be dispensed with and the world would be none the wiser. Here, as I squatted cross-legged on the floor of my 3-by-7-foot hovel for weeks and weeks as fall passed into early but cold winter, I was told that I had only one more problem to clear before I was turned over to a main camp where suitable facilities were available against the rigours of a North Korean winter and where I would be with other prisoners of war.

The one remaining "problem to be cleared" turned out, of course, to be germ warfare, in which it was demanded that the colonel should confess to having participated on instructions from the higher command. Describing the pressure put upon him, Colonel Schwable goes on:

It is a cruelty that is hard for anyone to understand who has not undergone the misfortune of being subjected to it. . . . I was under the constant surveillance of a guard who was never more than perhaps ten yards away, and who at night would awaken me at least hourly by shining his flashlight in my eyes until I woke up. . . . I could lie down only when told, and was kept just sitting and sitting for weeks on end, the result of which was that my back became strained to a point where it was impossible for me to sit still more than fifteen minutes at a time. This became physical torture to me and it was continuous. . . . I deteriorated physically and became dull of mind. . . . Some knuckles on my right hand had already become frostbitten. . . . I was convinced that at my age and in my condition I would freeze to death in that exposed little hovel during the winter. The final threat was direct, forceful and unmistakable. The colonel commanding the pick-up camp informed me that "unless you clear this problem, you will never leave this valley, not even after the peace is signed."

Confession by Cramp

Finally Colonel Schwable capitulated, and he then had to compose his confession, using his own words but incorporating material which his interrogators provided, particularly with regard to dates and places of alleged acts of bacterial warfare. He had to implicate by name all the personalities in the chain of command, from the Joint Chiefs of Staff down to his own unit, as the interrogators said that the directive must have followed this chain of command. He had to revise the confession several times before it satisfied his examiners, and then write out the final version in his own hand-writing "on smooth, heavy legal type paper, and to initial each page and all corrections." He also had to make a wire recording and be photographed while reading the statement.

Physical torture was traditionally employed in the old Chinese judicial system to obtain confessions in criminal trials, but the methods used by the Chinese Communists in getting the germ warfare confessions did not consist primarily of bodily violence—though Major Bley testified that he was repeatedly struck in the face while his hands were tied behind his back. The main factors were cold, were tied behind his back. The main factors were cold, cramp, and lack of sleep, resulting from the form of confinement imposed, and helping to produce gradual exhaustion and collapse, accompanied by endless interrogation with arguments, promises and threats. This predominantly "psychological" type of compulsion, in contrast to the old-fashioned kind of judicial torture, is the characteristic Soviet procedure for prisoners who are to be produced in public, and the Chinese have evidently taken it over from their Russian mentors along with Marxist-Leninist doctrine and Soviet techniques of economic planning.

Tito in Search of Super-Men

FROM A SPECIAL CORRESPONDENT

THE Yugoslav Communist Party—or Union of Communists as it is now called—has run into difficulties in interpreting the role of the Communist in the new liberal society of "socialist democracy." At the sixth party congress last November, Yugoslav Communists were told that they must cease to be bosses in privileged positions, imposing their will from above. They must henceforth take their place in government and society only if accepted and chosen by the mass of the electorate; they must win support by outstanding achievement and efficiency, and above all they must educate people to be good socialists.

This new role proved very difficult to carry out. Over centuries of alien occupation the Yugoslav peoples have developed a constitutional resistance to political education and propaganda. Between 1945 and 1951 Communists had absolute power, backed by the apparatus of a police state, and it left them with little experience of educating their fellow men. The new theory of power through education had to be tried out in the atmosphere of Marshal Tito's new liberalism, surrounded by all sorts of non-Communist influences—the insidious lure of British and American newspapers and periodicals easily available in reading rooms in the big towns, and the renewed activities of the churches now able to parade their doctrines and political beliefs more actively. For the first time since 1945 the Communists were up against something like opposition, and it is small wonder that many of them failed to measure up to what was expected of them.

It was in the light of these experiences that Marshal Tito called a conference of high officials of the Union of Communists at Brioni last June. After the conference a letter was sent round to all Communist organisations which described at length shortcomings in the party and called for immediate improvement. It described many "weaknesses" in the party—a slackening of discipline; the loss of a "militant approach" to Communist objectives; the acceptance of alien foreign influences and bourgeois theories; the preoccupation of certain leaders with specialist economic problems to the exclusion of political work; the pursuit of local objectives in the republics without regard to the overriding importance of federal objectives.

Stalinists and Pilates

Criticism was aimed at both right and left wing backsliders. On the left there were those who continued to work in the old Stalinist manner, giving bureaucratic orders and allowing no play for democracy. On the right there were those whose subjection to anti-Marxist alien foreign influences and petty-bourgeois inspiration had reached "alarming proportions." And in between these two extremes there were those who, having failed to understand the decisions of the sixth congress, had washed their hands of active party work. In fact the impression left by the letter is that very few can have achieved what was expected of them.

The final section of the letter contained instructions on how these weaknesses were to be overcome. Further work was necessary inside the Union of Communists to develop "ideological-political unity" and to eradicate from Com-

munist heads "the remnants of old bourgeois theories"; Communists must also develop their "fighting political reflex" against "phenomena which damage our system"; they must train themselves to react quickly "not in an administrative manner nor with general political slogans"; nor must they approach political, social and economic problems in a narrow, specialist or pragmatic way. Finally, Communists were urged to work through the SAWPY—the Socialist Alliance of Working People of Yugoslavia—and, above all, to root out weaknesses in their own ranks.

The letter confirmed what was already becoming obvious to all observers—that there had been considerable confusion and dissatisfaction in the party in the past six months. The new role of educator was much more difficult than that of party boss, and many Communists did not know what was expected of them; moreover, with freely elected local government, there was no guarantee that Communists would retain their positions of influence. The reversal of policy about collectives, which resulted in two-thirds of all co-operative farms being broken up, came as a great shock to some Communist ideologists and an even greater shock to those party members who had had soft jobs as co-operative officials.

Threat from Top Hats

There was also the vexed problem of Yugoslavia's foreign policy, which troubled some of the left-wing theorists. Marshal Tito's visit to London, hobnobbing with royalty and top-hats in a most bourgeois-capitalist way, was considered by some as a sign that Yugoslavia was abandoning its independence and leaning more and more to the West. Hence the pointed reference in the Brioni letter to "hostile interpretations of our foreign policy" and its insistence that the basic principle of this policy, the "principle of independence," had not been understood.

In short, dissatisfaction was strong amongst both rigid ideologists and time-servers. The latter are now being got rid of—not by a purge, but by a steady process of weeding

out the weaker brethren. The former, providing they are not Cominformists, as most of them at present are not, must be appeased, and appeasement means some sort of gesture to the political left wing at the expense of the economic realists. But aside from these, many of the party members seem to be not so much dissatisfied as bewildered and in need of a positive guide on beliefs and behaviour under the new Communism.

This is difficult to provide, and does not seem to be contained in the Brioni letter, which on the whole contented itself with plenty of negative advice. With the exception of Kardelj and Pijade, who are too busy on other jobs, and Djilas, whose writings are incomprehensible to the ordinary human being (for whom he states he does not write), the party has no outstanding philosophers or theorists. Yet a clarification of ideas is essential; for the party is faced with a basic conflict now that the principle of compulsion has been abandoned. The party must be kept in power, yet according to the new beliefs it must not use force to achieve this. Its weapons must be precept, example and education—of which it has a virtual monopoly. The optimistic belief that these will be effective is based on what is likely to prove a misconception that Communist aims for Yugoslavia, being both good and right, will, if properly explained, be accepted by the majority of the people. In practice Yugoslav Communists may find that people if given a free choice do not necessarily accept the good even when they see it. The theory also makes other great demands on human nature; rapid economic development such as is now being attempted—and has partially been achieved—in Yugoslavia, demands austerity and sacrifices from the workers. In the past these sacrifices have been imposed from above; now they are to be made by the people themselves on the persuasion of the Communists.

Not Even Socrates

In short the Communists are now expected to be a caste of super-men, recognised and accepted as such by the people, who will elect them to positions of power and trust because of their shining virtues. It is a beatific vision which even Socrates did not dare to postulate. Yet in the meantime there is little doubt that Communists—whether they mend their ways or not—will be elected in large numbers at the general election in November. They still have great advantages; the aura of past authority has not yet worn away; they have the monopoly of newspapers and radio for propaganda purposes; they have an outstanding leader in Marshal Tito; they have undoubted achievements to their credit in the past eight years; and they have no organised opposition.

But at some stage in the future Yugoslav Communists will have to produce a more positive political philosophy and resolve some of the conflicts in their present position. Without it they will find it difficult to retain their position of dominance in a relatively free society such as Yugoslavia today aspires to be. Without it, too, they will not be able to give to other Communist countries the successful example of true Communism which in their view the Soviet Union has failed to provide.

★

Correction: In the article "Grievances of Italian Workers," which appeared on October 3rd, the proportion of total living accommodation in Italy that is vacant for want of a tenant with the necessary means should have been given as 6 per cent.

Pure Knowledge

IN THIS AGE OF TECHNOLOGY, unceasing scientific research is the nation's best guarantee of a prosperous future. To compete on the markets of a rapidly changing world, Industry must make full use of Science, both to improve its established products and to develop new ones. It is not enough, however, to concentrate on immediate practical problems. There must also be a continual advance in man's knowledge of the fundamental principles of nature. Aware of the importance of research to an efficient concern, I.C.I. spends £7,500,000 a year on research and development. Part of this substantial sum goes to pay for fundamental research in the laboratories of I.C.I.'s manufacturing Divisions, and the company has also established laboratories at Welwyn in Hertfordshire where its scientists can carry on the long-term investigation of fundamental problems without any regard to immediate commercial considerations. The results of such research are published and thus made available to the entire nation.

In the advancement of pure Science, however, the spearhead is—and must remain—the Universities. For that reason I.C.I. gives them support, both material and financial. There are 92 I.C.I. research fellowships—worth more than £73,000 a year—at 11 British Universities. These are open to graduates of any race, religion or nationality, and are awarded by the Universities entirely at their own discretion. I.C.I. also provides funds, amounting to about £100,000 a year, to help Universities in various other ways, including the provision of chemicals and apparatus for research purposes. Such contributions bring benefit not only to I.C.I. but to the whole community, and help Britain to maintain that leadership in Science which alone can secure her competitive efficiency.

Imperial Chemical Industries Limited

PIONEERS IN PINSTRIPE

They don't plant flags—they place contracts. In fifty Commonwealth countries they're the brains and the buying power behind today's vast development schemes. They've millions to spend on plant, machinery, components, supplies. They won't wave flags but they will 'buy British'. They want to know what you can offer them.

Tell them. Tell them about your firm and its products in the one journal they all read. Publicity can't work miracles. But by intelligent advertising in NEW COMMONWEALTH you can be sure of increasing sales in territories where you are already represented; sure of a warm welcome and an established name when you come to break new ground.

NEW COMMONWEALTH is the business man's fortnightly review of Commonwealth affairs. By reading it you keep in close touch with important developments in every Commonwealth country. By advertising in it you ensure that all important buyers and distributors throughout the Commonwealth keep in touch with you.

That's what "3 in 1 posting" means

OPERATORS have just one pair of hands. However heavy the accounting load, they can work only as fast as the machines they use will let them. Adding staff or machines may help—but not in keeping office costs down.

The *economical* answer is to provide an operator with an accounting machine that gives the greatest output for the least manual effort—whatever job is being done.

The Burroughs M800 achieves this in two ways. First, because it enables three or more related items in a routine to be prepared *simultaneously*. Secondly, because it reduces posting, totalling and proving to one single, continuous operation.

Ask Burroughs to demonstrate how this machine will improve your complete accounting system—giving better results *faster*.

Call Burroughs today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

For expert advice on business figuring

CALL IN  Burroughs

MANAGEMENT. Many questions of importance to a business are posed, and answers suggested, in the Burroughs booklet "Ways to Save Time in an Office." Write for it today, to Burroughs at the above address.

... on general accounts. Below is a normal flow-chart for Payroll. On this work, the Burroughs M800 prepares Earnings Record Card, Payroll, and Payslip, in one operation. Similar reductions in effort apply to Sales or Purchase Accounts, Receipt or Cheque writing, Stores Accounts, etc.

**THE
BURROUGHS
M800**

No less than 18 work-saving features make this Burroughs Typewriter-Accounting Machine faster in operation, and the records more fully informative. Debit and credit balances or totals are printed and designated automatically. Amounts can be subtracted from any register or the cross-footer separately or simultaneously.

THE BUSINESS WORLD

Profits before the Upturn

BETWEEN the beginning of July and the end of September the reports of 576 public companies ere received in this office; they showed an average 11 in trading profits of nearly 12 per cent below those the previous year, another step down the ladder compared with the average fall of just over 10 per cent own in the 941 company reports received between pril and June, and the average fall of about 8½ per nt shown in the 503 company reports (excluding those nationalised steel concerns) received between January d March. It is probable, however, that this is the end the downward progression. Most of the company ports received between now and the end of 1953 are ely to continue to show some drop in profits, but the erage fall should be less than the 12 per cent revealed it quarter; by the turn of the year the period of cline should be just about over, and in the early onths of next year published profits should be rising rly consistently.

This forecast of better things to come is arrived at t by staring at the stars but by studying the statistics. e 576 reports received last quarter referred, for the st part, to a trading year that ended as long ago as t spring; in fact, of the 450 industrial companies in : sample, 241 had accounting dates in March (with arch 31st the favourite date), 85 actually had account- ; dates before March and only 124 had accounting tes since then. A financial year to March 31st last uld have started three weeks after the Australian port restrictions punctured Britain's post-Korean om, and would have ended two weeks before Mr tler's stimulus budget of 1953 touched off the current surge of reflation; it therefore embraced the twelve- nth period of deepest decline in industrial produc- n, as measured by a fall of over 3 per cent in the cial index. It also embraced a period when whole-

sale prices fell by 1½ per cent, after having risen by 6 per cent in the year to March 31, 1952; if it is assumed that the artificial element of stock appreciation or depreciation in published profits can be assessed by applying the percentage changes in the wholesale price index to the published figures of stocks—an improper assumption if one is pretending to be accurate, but

NOTE: The bold line in this chart shows the average increases or falls in trading profits reported in each quarter since the beginning of 1950. The dotted line shows the approximate trend that might be shown in reports published in the next six months, on the assumption that the movements that have already taken place in wholesale prices and industrial production between March and September, 1953, have the same effect on reports published between now and next March as previous movements in these two indices appear to have had on reports published between last June and last September.

excusable if one is only discussing broad trends—then this turn-round in wholesale prices can be shown with glib tidiness to have accounted for almost exactly the whole of the 12 per cent fall in profits in the 576 company statements published last quarter.

There is, inevitably, a temptation to carry this sort of arithmetic further; and the temptation is yielded to—with due warning—in the accompanying chart. The calculation that has conceived the tentative dotted line in that chart is that if the companies in last quarter's sample had had a mean accounting date around June 30th, instead of around March 31st, their reports would have covered a twelve-month period when industrial production was approximately the same as a year before, instead of more than 3 per cent lower; and (on the assumptions set down in the last paragraph) when the ending of stock appreciation was cutting profits back by only about 2 per cent, instead of by about 12 per cent. Similarly, if these companies had had a mean accounting date around September 30th, their statements would have embraced a period when industrial production actually rose by around 3 per cent (assuming that the index for September itself shows no significant setback) and when the element of stock appreciation was neutral. These accounting dates—June 30th and September 30th respectively—should be the approximate mean for reports appearing in the next two quarters.

It should be added that if—it is a big if—production and prices should stabilise at their present level, the tale of rising published profits should continue (though with a slower upward gradient) until it reaches a peak in reports for the year to March 31st next; for not until these returns begin to appear—from nine to twelve months hence—will companies be able to compare results for a period that fell wholly after the last budget with those for a period that fell wholly before it.

But these are flights of fancy, and analysis must now return to the existing bathysphere. The point that has been emphasised above is that the 576 returns published last quarter probably do represent a bathysphere, plumb-

ing the lowest depths of the fall in profits that is likely to be recorded for some time; for even if a world recession should suddenly develop tomorrow, it would have no effect on most of the company reports published in the next six months (most of which will refer to trading years that have already—though recently—ended). The question must now be asked whether the descent that has already been recorded has left British industry in a debilitated state, where it will be unable to be more generous in dividend policy during the period of recovery that has already taken place but still falls due to be recorded—and where it will be very badly placed to absorb any new downturn in world trading conditions.

The answer can be moderately cheering. The 12 per cent fall in gross trading profits recorded last quarter amounted, in round figures, to a fall of just under £31 million for the 576 companies in the sample. This, however, was comfortably cushioned by a fall of nearly £24 million in income and profits tax, a rise of over £4 million in income from investments and non-recurring credits, and a fall of nearly £5 million in the item "contingencies, provisions, etc." (which shows that industry is less scared about stock losses now than a year ago). After reducing retentions of profits by subsidiaries by just over £3 million, reducing allocations to revenue reserves by less than £2 million, and making marginal changes elsewhere, these companies were therefore able to increase their carry forward by over £5 million and their ordinary dividend payments by nearly £2 million (or around 7 per cent). If this is a bathysphere, most investors will not be too afraid of another submersion in it.

A similar robustness is shown in the composite balance sheet. A year ago the balance sheets of companies reporting between July and September (there were 564 of them, against this year's 576) showed an

alarming rise in stocks. It amounted to £91 million (or 24 per cent), partly because of price inflation and partly because of the accumulation of inventories of both raw materials and of unsold goods; by contrast, in reports published in the same quarter of this year stocks were shown to have fallen by £7 million or 1½ per cent—in other words, they have been as near to stability as makes no matter. Net fixed assets are shown to have risen by about £40 million in both years, and in both this has been accompanied by an increase of just under £20 million each in capital reserves and ordinary capital outstanding; these figures, of course, are affected by differing accounting practices about depreciation, scrip issues and the like, but they cannot be read as showing any signs of strain. Net new borrowing on debentures (at nearly £14 million) has been some £9 million higher in 1952-53 than in 1951-52, but the turn-round in stocks has led to a dramatic improvement in the companies' liquidity. A year ago, reports published by companies in the third quarter showed that their short-term debts—including those to the banks and the tax collector—had risen by some £49 million more than the short-term debts owed to them; this year, thanks to the turn-round of £98 million in their stock commitments, their net debtor position has improved by some £44 million instead, and their holdings of cash and marketable securities have risen by over £8½ million (against a fall of £4½ million last year). The resources for a further increase in dividend payments in the next six months are there—provided that the expected recovery in published profits does not take place against a background of falling current profits and world slump.

★

The differing experience as between industries in last quarter's sample is shown in the detailed analysis in the statistical section on pages 210 and 211 of this issue. The figures show that profits rose, against the general trend, in eight of the twenty-three groups—broadly, they were either capital goods industries or else consumer goods industries that started their recession before March, 1952, and their recovery before March, 1953; the increases concerned were shown in wool very markedly), clothing and footwear, food and confectionery, shops and stores, engineering, shipbuilding, motors, cycles and aircraft, and oil. All other groups showed falls in profits, with certain consumer goods industries, led by silk and rayon, especially hard hit. Similarly, only ten of the twenty-three groups showed rises in stocks, and six of them (wool, food and confectionery, engineering, shipbuilding, motors, cycles and aircraft, and oil) were among those that also showed increases in profits; the other four were iron and steel, electrical manufacturing, tea and the residual "other companies." In some of these groups the sample of reporting companies was too small to bear the weight of ponderous analysis; but, as a general rule, it will not be surprising if those groups that have already recorded

some measure of recovery (or have never shown any significant downturn) prove to have least scope for increases in profits in the months ahead.

The picture that emerges, therefore, is that the 2,656 profits statements that have been published in the last twelve months have shown the progressive stages by which Mr Butler's disinflationary monetary policy of 1952 started to march profits down to the bottom of the hill; and that the 1,000-odd statements to be expected in the next six months may show the progressive stages by which his reflationary budget policy of 1953 has already marched them back again. The prospect is probably not as rosy as this summary may imply for the capital goods industries, which cannot show a substantial recovery in profits because they have not yet shown a substantial fall; and it may also be blurred for some of the big international trading organisations, since com-

Too Much Consumption?

THE retail slump is over; and some people might say this suggests that balance of payments troubles are about to begin. The disappointing news given by Mr Butler at the Bankers' Dinner on Wednesday night that Britain's balance of payments surplus in the first half of 1953 was only £25 million—excluding £55 million of American defence aid—has inevitably re-awakened the controversy whether the tax reductions accorded in the last budget were too generous, at any rate those that went to the consumer. In the first half of this year, the Central Statistical Office has estimated, real personal consumption (at current 1948 prices) was running at an annual rate that was some £340 million, or about 4 per cent, higher than in the first half of 1952; and in the second quarter of this year (that is, the first post-budget quarter) it was at an annual rate nearly £450 million, or 5½ per cent, higher. Even although the rise in production this year may have added £400 or £500 million to Britain's annual real income, and the improvement in the terms of trade may have added another £250 or £350 million, this is a very big bite out of the cake. When allowance is made for an increase in stocks, including an increase in retail stocks in line with the increased spending, it is perhaps not surprising that there have not been enough real resources to spare to maintain the balance of payments surplus.

How far has this new spending been a temporary phenomenon, a mere reaction from the recession that went before it? Retailers regard it not so much as a boom but rather as a return to normal. They note, too, that by no means all of the increase in personal expenditure finds its way into their tills. Until the autumn of 1950, as they see it, retail trade was very slowly getting back to normal, as the supply of consumer goods improved. The start of fighting in Korea, which broke out only 18 months after the ending of clothes rationing, started a run on the shops that lasted until the early summer of 1951. But eventually the fear of rising prices and returning shortages that brought customers crowding to buy turned full circle into a refusal by the public to

pay those prices. For nearly twelve months, from the early summer of 1951 to the spring of 1952, buyers stayed out of the shops. The weather played directly into their hands, because a chilly summer in 1951 discouraged them from buying summer clothes and the unseasonably mild winter that followed it gave them no inducement to buy winter clothes either. The weather in 1952 was more seasonable and the signal for recovery was the budget of 1952. The winding up of the utility schemes and with them the ending of price control on clothing and textiles made it possible for retailers and traders all down the chain of distribution to set about liquidating their abnormally high stocks. These goods were sold off in large quantities at cut prices during most of last year. By the autumn, wholesale and retail stocks were looking less inflated; by this spring, the mills were clear of stocks of cloth and yarn; today, the factories are producing goods for the home market as fast as they can. The trade exhibitions are packed with buyers, where a year before a pony and trap could drive down the empty aisles; and the mills are actually running short of yarn.

The result of all this is that in the first seven months of the current retail year—that is, from February to August—the value of retail sales has risen 7 per cent above the level in the same period of 1952. But these figures need careful qualification. A great deal more food has been available this year than last, and at prices higher than those prevailing in 1952. The value of food sales has risen 8 per cent during the seven months; meat sales have been 28 per cent higher; fruit, vegetable and flower sales, 13 per cent higher; and grocery sales 10 per cent higher than they were in 1952. When food sales are subtracted from the total, the rise in sales comes to only 4 per cent compared with 1952.

Compared with 1951, the increase has been even more modest.

Total sales in the first seven months of the retail year 1952 were 3 per cent lower than in the same period of 1951. By this reckoning, the amount of money that people have been spending this year on what the Board of Trade calls "non-food merchandise," a description that

does not include sales of cars and motor cycles and probably not many bicycles either, has been only one per cent higher than it was during 1951, when the slump first hit the retail trade. This, at its most sophisticated, is the retailers' answer to the complaint that present sales are much too high.

Unfortunately, however, there is some reason to believe that the official statistics may understate the real volume of consumer goods now pouring on to the home market. The reason for this is that the figures, even when they are deflated by a mythical price index to translate them into terms of 1948 prices, do not give full weight to the number of transactions now concluded at low prices. To take a specific illustration: at one point last summer, when stocks were being liquidated at cut prices, department store sales of the cheaper types of fabrics were 50 per cent higher, in terms of yards sold, than they were in 1951—yet the value of those sales was only 8 per cent up on the previous year. The official price indices certainly did not show the full effect of this fall.

A suspicion that the pulling power of the home market has had more to do with the fall in the balance of payments surplus than either the official statistics purport to show or official spokesmen would care to admit is reinforced by an analysis of the changes that have taken place this year in the distribution of certain products between the home and export markets. The accompanying chart attempts to show some of these changes, in what is inevitably a rough and ready fashion. It leaves no doubt that the recovery that has taken place in the consumer goods industries this year owes almost everything to the sales expansion at home and little to exports. The bulk of this year's higher production is being sold at home; whether it could have been sold abroad if home demand had been less voracious is, of course, another matter.

The question remains: is the present high rate of demand likely to last? This leads, of course, to consideration of the frequently heard forecast of a recession in retail sales in the pre-budget, first quarter of next year. In spite of the retailers' present pre-occupation with the possible effects of further tax changes on sales—before the budget as well as after—there is certainly no sign yet that either the shops or their customers are holding back orders in expectation of further reductions. And for all the strong arguments to the contrary current in Lancashire, purchase tax is no longer believed to have any marked effect on sales of "soft" goods such as clothing and textiles. The ending of price control and the introduction of the "D" schemes have given retailers so much discretion in pricing their goods that the consumer can rarely tell—and indeed hardly cares—whether goods do or do not carry tax. This does not mean to say that they are not price

conscious, but the "D" scheme is probably taking much of the blame for sales resistance.

Purchase tax, however, is still an important element in the selling price of the more durable household goods such as washing machines, heaters and television sets, not to mention cars. Hardware and electrical sales have expanded sharply since rates of purchase tax were reduced in the last budget; they are on average 13 per cent higher than last year, while sales of television and radio sets went up 25 per cent. It is in these categories that pre-budget sales are likely to feel the draught, and it may be significant that, although wholesale and retail stocks are generally rising, stocks of these kinds of goods are falling. They were 6 per cent lower in August than they were a year before, while the general level of stocks had risen by 4 per cent; simultaneously the general level of wholesale stocks was 5.5 per cent higher than a year before.

In August, for the first time in twelve months, the figures showed a rise in the value of stocks. Twelve months ago traders were emptying their shelves as rapidly as they could. While prices were falling, the shops bought on a hand-to-mouth basis. Their willingness now to re-invest in stocks is a sign that they believe prices have stabilised, and it must surely also be a sign that they do not expect a real recession in sales early next year. It is exceedingly difficult, however, to measure the extent of their new investment. The Census of Distribution showed that at the end of January, 1951, clothing stocks stood at about £160 million. Because some of the department stores (but by no means all the shops normally classed as department stores) are classified elsewhere, the figure is probably on the low side. A comparison of this total with the Board of Trade's index of clothing stocks suggests that the sum invested in clothing rose from £160 million, or thereabouts, in January, 1951, to £185 million in January last year; but that it had been cut back again to a figure in the region of £165 million by this January. By August, clothing stocks had risen to practically £200 million, £10 million more than in July and £15 million more than in August last year. These are big sums for retailers.

The combined value of all retail stocks taken together (including food and excluding cars and most kinds of vehicles) was put by the Census at £571 million in January, 1951. The general level of stocks may have moved to roughly £640 million in January, 1952, and then fallen to £525 million in January this year. January marks the point at which stocks are at their lowest, so if the movement of clothing stocks is any guide, by August retailers had probably invested between £600 million and £650 million in their stocks, and have in all likelihood considerably increased this figure by now. All this suggests that retailers are expecting a period of either stability or increases in home consumption. Will the country be able to afford stability at so high a level?

Business Notes

Diminished Surplus

THE surplus on Britain's balance of payments in the first half of this year was disappointingly small. It is provisionally estimated at £25 million, compared with provisional estimates (which may, apparently, be slightly revised downwards in a White Paper next week) of surpluses of £109 million in the second half of 1952 and of £61 million in the first half of it. All these figures are struck without counting receipts of American defence aid, which amounted to £55 million in the first half of 1953, as part of Britain's overseas income.

In announcing this deterioration in his speech at the annual Bankers' Dinner at the Mansion House this week, Mr Butler put the main blame on "the higher imports we have had in the first half of this year as compared with the second half of last year, when we were feeling the full weight of the import cuts and also producing less." The rider to this explanation, of course, is that although an increase in production—and the increased need for stocks and work-in-progress that goes with it—naturally tends to lead to higher imports of raw materials, some part of the increase in production should also have gone to exports; but today, in Mr Butler's words, British exports are merely "keeping up." No details are yet available about the division of the deterioration as between sterling and non-sterling markets, but in his speeches both at Margate and at the Mansion House Mr Butler has given one hard fact and one hard hint that can provide some comfort about the Government's outlook on the non-sterling balance. The hard fact was that the apparently disquieting fall in the sterling area's dollar surplus in September was due to heavy seasonal imports of tobacco and grain; the very modest increase in the reserves last month was therefore actually slightly better than he had expected. The hard hint was that the Chancellor is looking forward to a good reception from European Finance Ministers when he takes the chair at the OEEC meeting in Paris at the end of this month. Since all Europe is expecting some further easing of British import restrictions—and some increase in the British travel allowance—this must surely mean that he will be going to Paris with opening hands.

An Even Course?

IN Britain's internal economy Mr Butler still considers that a delicate balance is being maintained between inflation and deflation—"so far as I can tell, we are steering a fairly

even course at present between the primrose path and the waste land." He recognised, however, that if "we are to keep up and increase our strength so that we can weather the troughs which are more likely than the tempest" both exports and production must be increased; and he expressed especial anxiety about the production of coal, where "three million tons of the five million lost through extra holidays have been regained, but that still leaves a deficit of two million." He uttered a warning that in the financial year 1954-55, the Exchequer will have to take the burden of a full year's cost of the recent concessions in purchase tax and income tax, of the first year's cost of the restoration of initial allowances, and of continuing heavy defence expenditure (with less offset in the way of American aid); but he went on at once to say that a modern budget is not designed merely to raise money to meet the Government's bills, but to ensure that there is neither too much nor too little pressure on resources. In judging this pressure the Government must watch "a number of things, such as the demand for labour—unfilled vacancies and unemployment—whether prices are rising or falling, and particularly the extent of saving and running down of savings." The most important indicator omitted from this list was the diversion of resources from export to home markets; this also happens to be the one indicator that at present suggests some drift towards the primrose path.

The whole tenor of the Chancellor's speech, however, as also of that of the Governor of the Bank of England, was that the future of economic and monetary policy will depend on "how we all behave during the next half year." Sir John Braithwaite, the chairman of the Stock Exchange, responded to this speech by declaring that he was looking forward "with confidence . . . barring some stroke of fate which no one could foresee" to a further reduction in Bank Rate, and also for "a Budget next April which will take us some modest step further along the road to . . . lower taxation." But Sir John seemed to be the only person who was looking in that direction. The Governor of the Bank, by contrast, was insistent that the one thing that the recent change in Bank Rate "did not imply was any prophecy about the future"; he did not believe that "anybody can be sure in which direction, if at all, the influence of monetary policy may be needed in coming months."

A 95 per cent Conversion

THE second stage of the Treasury's refinancing operation has proved to be no less strikingly successful than the first. Holders of a mere 5 per cent of the £577 million of 1½ per cent Serial Funding stock 1953 have elected for cash repayment at the maturity date next month. The

remainder have tendered £552 million of stock in response to the Government's conversion offer, and over 90 per cent of them have chosen the longer of the two stocks offered. Conversion applications for the 2½ per cent Serial Funding stock, 1957 (which offered a gross redemption yield of £2 8s. 10d. per cent on the basis of market prices at the time of the announcement) totalled £503 million, whereas only £49 million was tendered for the 1954 stock (which on the same basis offered only £2 2s. 3d. per cent). This highly satisfactory result of course owes a good deal to participation by the "departments," but it seems evident that bank holdings have been converted almost in their entirety and that miscellaneous holders have also participated.

In consequence, the volume of free cash put at the Treasury's disposal is even larger than seemed likely last week, when the unexpectedly large response to the cash offer of 3 per cent Exchequer Stock, 1962-63, was announced. After providing for the £25 million of unassented 1953 stock, there will be £315 million in hand towards the £412 million of 1952-54 War Bonds that mature on March 1st next, so that it now seems unlikely that any further issue will be made solely for the purpose of dealing with that obligation. The authorities themselves certainly already hold a substantial slice of the 1952-54 bonds, and they are likely to be able to finance further acquisitions in the coming months by resales of their take-up of the 1957 and 1962-63 stocks.

In other words, the true cash result of this autumn's operation may in the end be a good deal larger even than the immediate result. It was suggested here last week that around £100 million of the initial cash subscription of £341 million came from the "departments," so that the authorities' immediate cash receipt will have exceeded the mid-November liability by at least £200 million. Except to the extent that it is employed in financing the Exchequer's current deficit or in paying for any excess purchases of the March maturities (over and above those financed by selling other stocks), this cash will be employed in redeeming floating debt held by the banking system. Indeed, it has been automatically used in this way already, because the Exchequer never carries more than a working balance in cash, and the banks' liquid assets have therefore declined. The full effect will not be apparent in the banks' next statement, because of the offsetting influence of the Exchequer deficit; but it is generally expected that the ratio of liquid assets to deposits will fall from its high September level of 37.4 per cent to around 35 per cent. The corresponding movement last year, when the banks were "persuaded" to take stock precisely with the object of curtailing their excessive liquidity, was from 38 per cent to 34.4 per cent.

United Steel Gets Set

IT is now clear that the first offer of steel shares will consist of 14 million £1 ordinary shares of United Steel Companies to be issued, on present indications, at 25s. The lists will be open in about ten days' time, and the prospectus is likely to hold out the expectation of a 9 per cent dividend. Hence the yield basis on which the shares are to be offered will be little short of 7½ per cent, a figure which is likely to

make a more attractive impression on potential subscribers than the earlier suggestions that something well below 7 per cent would be appropriate. It remains to be seen, even so, whether the private investor will be encouraged to subscribe on a significant scale. In United Steel he will certainly be buying one of the best equities that the British steel industry has to offer. He is likely to find, too, that a material allowance has been made in the prospectus estimates against the possibility that profits may not be maintained at recent high levels. United Steel has made its full contribution to the record outputs that the industry has been winning this year, and some realistic discounting of what has lately been achieved has justifiably been made before striking an estimate of net maintainable profits in future years.

This operation, and its successors, will still need co-operative support from the institutions. Pink forms for former shareholders and the acceptance of certain gilt-edged stocks at stated prices in respect of applications notwithstanding, it is clear that the basic ingredient of success will be firm underwriting of the issues and firm holding after allotment. The effect of the tendering arrangements for Government stocks on the gilt-edged market and the stability of market in United Steel shares after allotment (particularly if the issue goes with such a swing as to secure a modest premium) will be important features of the issue. It cannot fail to be helped, however, by the news that discussions are proceeding between Vickers and Cammell Laird and the Iron and Steel Realisation Agency for the repurchase of their two companies' interests in English Steel and between Guest Keen and Nettlefolds and the Agency on the possibility of a resale of the various steel works taken over from the Guest Keen group.

Selling Back the Lorries

THE plans for the Government's other denationalisation sale have also been disclosed this week. After steel, come lorries; and, equitably, the haulier with limited means is to be given one of the first bites when the re-sale begins next month. Within the next three months the Road Haulage Disposal Board will ask for tenders (through the medium of press advertisements) for about 10,000 vehicles—in monthly batches of about 3,300 vehicles; these will be offered in about 1,500 lots, widely spread geographically up and down the country. More than a fifth of the vehicles offered for sale will be in lots of not more than four vehicles, and none of these small offerings will include operating premises as well. In the first auctions, the largest lots will not exceed 50 vehicles, though nearly half of them will embrace operational premises. To facilitate the disposal of these units, any associated stores will be excluded from the auctions as such, and will instead be offered separately to a prospective buyer of a unit "at a price as between willing buyer and willing seller." The disposal of units other than these may not follow this pattern; the size and make-up of the units to be sold later on will be specifically designed to meet any demands unsatisfied by the first arrangements.

In particular, during the first six months of next year, a large number of vehicles and properties will be offered as "going concerns" through the sale of the share capital of

road haulage companies. No precise estimate of the number of vehicles to be sold in this way has yet been made, but the Disposal Board hopes that "a fairly high proportion" of the 32,000 vehicles to be sold will have changed hands by the end of next May—a year after the Disposal Board came into being.

Stable Investment?

IN the first half of this year increases in consumption, in defence expenditure, and in stocks and work-in-progress have probably absorbed more than the whole of Britain's expansion in production and gain on the terms of trade. That is the disappointing conclusion to be drawn from the deterioration in the external balance and from the latest indications of the level of fixed investment. In the second half of the year the gain from the expansion of production should be rather larger than in the first; but fixed investment must be expected to increase too.

There are two—admittedly tenuous—items of evidence from which these judgments about fixed investment can be drawn. First, in the middle of 1953 there were 1,189 factories under construction in Britain of a total value of some £147 million, quite significantly fewer than the 1,337 factories of a total value of £152 million that were under construction in the middle of 1952. It is probable, however, that the number will rise in future. In the first half of this year 856 factory-building projects of a total value of £53 million were approved by the licensing authorities, compared with only 516 of a total value of £27 million in the first half of last year. Secondly, orders on hand for new machinery for home industry fell very sharply indeed between March, 1952, and March, 1953—the engineering employers talked recently of a fall of one quarter in the total volume of new orders in the year to this spring; apparently this fall is still proceeding, but the current issue of the Treasury's "Bulletin for Industry" reports that the rate of fall "was much slower in the second quarter of the year."

From these statistics the Bulletin suggests that total investment in manufacturing industry in 1953 as a whole should be "at least maintained" at its 1952 levels. For a year in which industrial production has already increased by between 4 and 5 per cent and in which the terms of trade have already improved by 9 or 10 per cent, mere stability of investment is hardly inspiring. Something better had been hoped for from the expansion in real incomes this year than that all of it should go into the bellies or on to the bodies of consumers, into stock, or up in Woomera smoke.

Home Truths for Lancashire

Two speeches to the exhibitors of textile machinery at the *Textile Recorder* exhibition in Manchester this week were really addressed to their British customers, particularly the Lancashire cotton industry. The criticisms made will no doubt raise a chorus of disavowals and counter-

charges when the industry meets for its annual conference at Harrogate this week-end, but they are no less near the mark for that. Sir Andrew Naesmith, the former general secretary of the Weavers' Amalgamation and now a member of the Steel Board, said that progress in modernisation and re-equipment had been far too slow and far too limited. He wanted to see—and who does not?—the backward firms taking examples from the more progressive units so that the whole tempo of production could be increased. "It is no exaggeration to say that between the best mills and the worst there is a difference of something like 30 per cent in productive efficiency." Perhaps he made too much of the point that greater liberality by the Government on depreciation allowances would help to stimulate new investment, for many firms are only too ready to postpone re-equipment in the hope that the Government will make it easier. Nor is it certain that more liberal depreciation allowances would be an effective incentive. The spinning industry has only spent some £40 million on re-equipment since the war, of which £10 million was an outright grant from the Government.

Mr. W. A. Grierson, a managing director of a spinning firm, had the hardihood to suggest that the sanctions of the American anti-trust Acts in Britain would lead to a far quicker tempo of re-equipment. "Re-equipment goes with a belief in the challenge of competition, not with the feather-bedding of monopoly." Another reason for the slowness of re-equipment was perhaps because it had been considered in isolation, instead of in conjunction with its natural hand-maidens, method study, work measurement and double day-shift working. To Lancashire's complaint of a shortage of 42,000 operatives, 15 per cent of those currently employed in spinning and weaving, Mr Grierson held up the Platt Mission report of 1944 and the productivity reports of 1950 to show that far larger increases than 15 per cent in productivity could be obtained by adopting well-tryed management techniques. A few firms had proved that many of the recommendations of these reports could rapidly be applied in Lancashire's mills. There was now "a golden opportunity" to reach 1950 production figures with a smaller, compact, well-paid and highly skilled labour force. How long will it take Lancashire as a whole to recognise that greater productivity and its survival as a major industry go hand-in-hand?

Futures Trading in Grains

WHEAT futures will be traded on the Liverpool market on December 1, for the first time since 1939. The months of delivery that will be quoted have not yet been settled, but can hardly be earlier than March. Futures trading in maize will probably begin early in the New Year. The London grain market is expected to announce the resumption of trading in futures in the next two weeks or so. A start will be made with maize and barley, probably in mid-November or early December, and wheat is expected to follow a few months later. If the market were to open in mid-November, the first shipment month could be January. The two markets differ in that Liverpool, which was the principal futures market in Britain before the war, is a landed market, that is, the contracts apply to grain in store at that port, whereas in London the contracts apply to grain at port of shipment, c.i.f. UK.

PLASTICS inspire new ideas

The trays used for food display in Lyons' tearooms, like all their equipment, are carefully selected and thoroughly tested. They must combine strength and durability with dainty and tasteful appearance. Economical to make, they must be easily cleaned and above

suspicion of affecting the food placed in contact with them.

Again the great virtue of plastics in providing wide combinations of properties is brought into play. Moulded from Cobex (rigid vinyl sheet), these trays fulfil all the demands made upon them and enhance the

appearance of window and self-service counter

So a BX Plastics material solves another problem, and our technical service is ready to go into action on your behalf if you will only give the opportunity.

The delay in reopening the futures markets is mainly an indirect result of the Ministry of Food's prudence in building up very large stocks of imported grain before the trade was decontrolled last August. The authorities in Liverpool and London evidently decided that it would be imprudent to resume futures trading while these stocks were overhanging the market. The Liverpool market must in any case have storage facilities, and the warehouses there are still crammed with grain. But by the end of the year the Ministry's stocks of imported coarse grains should be down to a reasonably low level, and its stocks of imported wheat should be virtually cleared by the spring. The private grain trade will then be almost entirely dependent on the world market, and will be thankful to be able to hedge its purchases. The futures markets will not have as much freedom as before the war. They will miss the prewar facilities of the Winnipeg exchange, and they will have to operate within the ambit of exchange control. But the other commodity markets have managed to work pretty successfully under their restrictions, and Liverpool and London will undoubtedly do everything possible to provide an adequate futures market.

Exports in a Rut

LITTLE satisfaction can be derived from the provisional returns of Britain's overseas trade in September. The value of exports rose by only £3.6 million, to £201.8 million (f.o.b.); while the value of imports rose by £20.4 million, to £269.7 million (c.i.f.). With a drop of £900,000, to £7.9 million, in re-exports, the gross visible trade deficit therefore deteriorated to £60.0 million, compared with £42.2 million in August. The increase in imports last month was no more than seasonal, but the sluggishness of direct exports was disappointing for a month that had one more working day than August and that was affected much less by holidays. On a working day basis, total exports in September were the lowest this year—at just under £8.1 million, compared with £8.3 million in August and an average of £8.9 million in June and July. Even when allowance is made for holiday influences, this is obviously a disturbing trend.

Thanks to the increases in the early summer, the monthly average of exports in the third quarter compares favourably with those of the second and first quarters, but at best it tells a story of recovery at snail's pace. The average in the third quarter was £211.5 million a month, almost the same as the average of £210.0 million in the second quarter and only slightly above the first quarter average of £208.5 million. Exports to the important North American markets fell away to £26.7 million a month from the high average of £29.5 million in the second quarter, but they were still £2.6 million higher than in the first. Fortunately, imports have fallen as exports have flagged. The average of £275.7 million in the third quarter was well below the average of £291.7 in the second, although still £3.3 million above the first quarter's average. In consequence, the gross visible trade deficit was running at an average of £55.9 million a month in the third quarter; this was £17.8 million better than in the second quarter but just £2.0 million worse than in the first.

Austrian Debt Terms

RANKING far below the German and Japanese debt settlements in importance, the Austrian debt settlement is at least equal to its predecessors in the complexity of its details. The "news" of the settlement that has reached London in such an inconsequent way this week is in fact many months old. But it has made its impression on the market nevertheless. There are two Austrian loans of interest to British investors. The first is the 1930 International Loan, of which about £2,800,000 is outstanding in this country. This loan was originally issued with a 7 per cent coupon (later scaled down to 5 per cent) and was due for final redemption in 1957. Service on this loan, which has been continually in default since 1939, will be resumed in January at the lower rate of 4½ per cent; final redemption is postponed to 1980 and the sinking fund will begin to operate in 1959. Interest arrears from 1945 to 1952 will be paid off by Austria at 4½ per cent, in nine annual instalments beginning in January; interest arrears for 1939-45 will be a German responsibility—the Federal Republic has informally accepted the obligation to pay these off at an effective rate of 5½ per cent. These terms are very much what the market had expected; and after the report of the settlement the price of the bonds remained unchanged at 87½; this compares with this year's low point of 54.

The second Austrian issue is the 4½ per cent International Guaranteed Loan of 1934-39, of which there is £4,300,000 outstanding in Britain. The detailed settlement of this loan has been complicated by the Czech refusal to fulfil its bargain as a guarantor. Recently, the other guarantors of the loan have kept interest payments up to date by paying a rate of 4½ per cent on 75½ per cent of the face value of the bond (that is excluding the portion of the loan originally guaranteed by the Czechs); drawings of the bonds have been made on a similar basis. From next January, Austria will take the place of these guarantors and will pay interest at 4½ per cent on the full face value of the bonds; the effective rate that bondholders receive will really be raised from just under 3½ per cent to the full 4½ per cent. The amortisation of the loan will be spread over 22 years from 1959 to the new redemption date of 1980; and within the next eight years Austria will wipe out the interest arrears accruing from the Czech refusal to pay since 1949—though only at a rate of 3 per cent. These terms, and those relating to drawn bonds (which favour those drawn since 1945), are slightly better than had been expected; after the details were known in the market, the bonds were marked up 2 points to 86½.

Next week's issue of *The Economist* will include a survey of the

British Motor Industry

with articles on the new cars, market prospects at home and abroad, and comparisons of price and performance for all current models.

The Complicated Cruzeiro

FOLLOWING hard on the heels of the agreement on the settlement of its commercial debts to Britain, Brazil has announced drastic changes in its exchange control regulations and exchange rates. The official exchange rate had previously been 52 cruzeiros to the pound; but as this rate was wholly out of line with the market value of the cruzeiro, the Brazilian government permitted up to 50 per cent of export proceeds to be sold at the free rate—which had lately settled down at around 104 cruzeiros to the pound, or exactly one half the official rate. Imports were subject to a strict licensing control. The basic change now made is that exports are to be encouraged by premiums on the official rate, and imports are to be controlled by a discriminatory price mechanism rather than by physical controls. Coffee exports will qualify for a bonus of 14 cruzeiros to the pound, bringing the effective sterling rate up to £1=66 cruzeiros. The bonus on all other commercial exports is to be 28 cruzeiros, and the effective sterling rate will thus be £1=80 cruzeiros. This should give a particular boost to cotton and cocoa exports, as only a small portion of the proceeds from these exports was previously eligible for conversion at the free rate. Capital transactions will still be subject to the official rate.

The new import arrangements are more intriguing. Control through licence by the Bank of Brazil is to cease; instead, the Bank is to auction off 70 per cent of its foreign exchange proceeds in the open market, the 30 per cent being set aside for settlement of commercial debts. The exchange is to be sold in the form of certificates divided into five categories of ascending essentiality; and since more exchange certificates will be granted by the authorities for the lower than for the higher categories, the cruzeiro rate that will balance demand to supply should make more essential goods much cheaper than less essential goods. Not everybody can participate at the auctions for exchange certificates, and those who may will not be allowed to tender for an unlimited amount; it remains to be seen how far this sanction proves to be one of the real factors that will control imports. In theory, however, the emphasis is now supposed to be wholly on the price system; indeed the scheme, as published, might have come straight out of the bonnet of some neo-liberal—but peculiarly academic—professor of economics. At first sight, the scheme seems to augur well for the debt settlement—though it will be surprising if Brazil succeeds in limiting its imports to 70 per cent of its exports for any length of time; and the cruzeiro certainly has been brought somewhat nearer its true market value. But arrangements of this sort, with their petty advantages and their frightening complexity, are greatly inferior to straightforward reform. Until theory is translated into practice, the new arrangements can best be regarded as more promising than the old ones, but still full of loopholes and very, very odd.

Economy in Power Stations

THE report of the committee under Sir Hugh Beaver which has been considering the possibility of saving materials and manpower in the construction of power

stations is a workmanlike document, with two principal merits. First it shows that the British Electricity Authority has made at least a useful beginning towards the achievement of more scrupulous standards of economy in power station design and equipment. Secondly, while the report gives BEA all proper credit for what it has so far been able to do, it urges that further savings during the next decade can readily be made. There was bound to be a reference to power stations "like cathedrals" which the Fine Art Commission had criticised four years ago. But the report shows that extravagant architectural treatment is less common in station design than it was, and that simpler and more functional solutions of the problems of design should be encouraged by the placing of many new power stations in the coalfields. High church is giving place to nonconformist chapel.

BEA itself has some grounds for complaint, for it is a victim of inter-departmental negotiation and long delays occur in the interlocutories of planning before it can usually make a start with construction. It is possible to endorse the Beaver Committee's suggestion that these processes can be speeded up without wholly following them in asking BEA to table long-term estimates of future site requirements and locations based on such general propositions as that "the demand for electricity is doubling, we are informed, about every ten years." The arbitrament of cost and price is ultimately the only sound criterion for expansion.

But on many technical matters, the report is fully appreciative of cost considerations. Greater standardisation of station design might produce economies of 10 or even 15 per cent of ultimate cost. Much ancillary equipment could be standardised or at least made to set dimensions. It may be possible to dispense with permanent overhead cranes in the power stations themselves. A further reduction in the amount of covered space in relation to the capacity installed within it ought to be possible; the old lavish provision of 60 cubic feet per kilowatt installed has been steadily reduced until the average for stations with 100,000 kW sets under design or construction comes to 26 cubic feet. And in two stations where boilers are being put out of doors the covered space will be cut to 17½ cubic feet. With programmes of new construction stretching out towards 1¼ million kW a year, and with present building costs of 4s. a cubic foot, the scope for economy in future construction is too obvious to need further argument. There are signs that new ideas are taking a firmer grip of old vested interests in conservatism and lavishness; they deserve encouragement—and perhaps an occasional prodding.

Tea Prices Off Peak

LONDON tea blenders sighed with relief this week on learning of the recovery of production in North India, and promptly trimmed their bids at auction. Prices of all grades of tea at Mincing Lane eased slightly from their recent peaks, the fall being accentuated by the seasonal decline in quality in North Indian teas. Clean common pekoe was quoted 1½d. cheaper at 3s. 4½d. a lb. The reports indicated that this season's output in North India, the largest tea-growing area, had recovered to 350.3 million lb by the end of September. This is only 21.8 million lb lower than at the same time last year, whereas output up to the end of August was 32 million lb below the com-

MICROFILM

and

BEA

Setting up new records every day!

ANOTHER great organization using Burroughs Microfilm-ing* is British European Airways. This famous airline, which currently carries more passengers than any other outside the U.S.A., installed microfilm to solve the problems of the cost of record storage space and equipment, together with quicker reference and security against loss or misfiling.

MICROFILM AND OFFICE COSTS

From its installation, Burroughs microfilming starts saving a firm money—money invested in office-space, money paid out in costly staff-time, money spent in operating-costs.

It effects an outright reduction of over 99% in space allotted to the storage of documents—bringing back into use whole rooms that were given over to paper-files, transfer boxes, etc.

It provides a complete system of record-control, by which any document can be referred to in 60 seconds—saving all the time that used to be wasted on "paper-chasing."

Actual, day-to-day running costs are also extremely low—the choice of three film-patterns in recording, for example, making the system admirably flexible, and allowing the maximum economy in the use of film. If you wish, Burroughs offer a fast, efficient service for all processing.

You owe it to your business to

consult Burroughs about micro-filming today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

RECORDING

A choice of film patterns—documents photographed back and front simultaneously, or one side only. A speedy Processing Service, operated in Burroughs' own laboratories by a highly qualified technical staff, is available to all users of this microfilm equipment.

FILING

Over 200 spools of Microfilm (the facts and figures content of 800 filing-drawers) fit in a cabinet only 36" x 10½" x 16½" — all records in order and clearly indexed.

REFERENCE

Any document recorded on microfilm can be viewed in its original size on the screen of the Reader within 60 seconds. The sharp, clear images can be read easily under normal office lighting. Original-size prints of any image can be quickly made right in your own office without photographic experience.

*British made for Burroughs by G.-B. Equipments Ltd., to Bell & Howell design

CALL IN **Burroughs** ON MICROFILMING

parable figure in the previous season. In Ceylon output rose to 232.3 million lb at the end of August, 11.8 million lb higher than in the corresponding period of last year. If the improvement in the North India crop continues, as seems likely, the shortage of low and medium grades teas will be further relieved, and prices may fall by another few pence.

This would remove a problem that has nagged the London tea trade for some weeks past. Prices at auction, especially of the low grade teas that are used to cheapen the price of the good quality blends, had soared to a level at which blenders considered they would have to raise their own prices. But they were reluctant to risk discouraging home consumption. Demand in Britain, where nearly half the world's tea is drunk, dropped immediately after derationing last October, because the public lived off its "hidden" stocks, but it has risen appreciably since then. This improvement in British demand coincided with a fall in output in North India, owing mainly to poor weather, but also to the voluntary restriction of production that had been introduced to prevent a repetition of the depressed conditions of the 1952-53 season. The shortage of North Indian teas this season lifted prices from 2s. a lb for clean common broken pekoe last January to 3s. 6d. a lb early this month. The recovery in prices led to the easing of the restrictions, and they were virtually abandoned last week.

Anglo-Iranian in Canada

THE £1 ordinary stock units of Anglo-Iranian, which had been exceptionally buoyant for some months past, took a sudden jump last Wednesday, by 11/32 to 8 5/32, on the news that the company is staking a claim in Canada's oil boom. The market's welcome to this news is understandable, but the excitement looked rather disproportionate, for the participation at this stage is only a modest one. Through its wholly-owned subsidiary, D'Arcy Exploration, the company has purchased a 23 per cent shareholding in Triad Oil Company of Alberta at a cost of about \$5 million; and it has also acquired the right to subscribe additional finance to bring its shareholding up to not less than 50 per cent. Anglo-Iranian is doubtless looking to the substantial exploration rights that Triad possesses rather than to its current rate of oil production, now running at a modest 400,000 barrels a year. But, by comparison both with the huge sums that others have already poured into the development of the Canadian fields and with the size of Anglo-Iranian's own investments elsewhere in the world, this initial investment of about £1,800,000 is a minor one. The development of Canada's oil is still a costly and speculative business and, while Anglo-Iranian was obviously anxious to get its foot in the door, it has been wise not to stride through it forthwith.

In itself, therefore, this new venture does not significantly alter the valuation basis for the group's own equity stock. Its earlier rise—from under £6 five months ago—had been founded on a gamble on other prospects than those in Canada. At the back of investors' minds is the hope that the Persian oil dispute will be settled, and in the front there is the hope of a bonus issue of shares and another increase in the dividend. The testing time for the market will come at the end of this month, when the interim declaration is due.

Axial Argument

THE Comet II and its successor the Comet III, have been a bone of contention between the British and American security authorities since the de Havilland company began to seek customers. The two Comets use two civil versions of the Avon engine, one of 6,500 pounds thrust and a more powerful, newer version of 10,000 pounds thrust; these engines are almost identical with the ones that power the majority of the new British and Nato military aircraft. Therefore the Americans argue that there are security reasons for restricting the sales of civil Comets to carefully approved purchasers; the list would not include the Japanese airline that ordered Comet IIs last year. Moreover, the Americans would like to end the giving of any information about the Comet III's engines to prospective buyers.

The security grounds for this attitude are that the later Comets use engines with axial-flow compressors, whereas the Comet I uses the older type of engine with a centrifugal compressor to which no objection is raised. The MIG has a centrifugal compressor, in common with most of the older gas turbine engines. But new engines are all designed with axial compressors and no one knows, apparently, whether the Russians have developed such engines for themselves.

The general reaction among the British authorities has been to laugh these fears out of court. The American attitude is not backed by any sanctions, and it would be incorrect to imply that the Americans have imposed any "ban" on British sales of axial flow engines. But they have made their wishes felt, and it is clear that these may have commercial implications as well as a security angle. Is there, in fact, any justification for the belief that sales of civil jet aircraft might constitute a security leak? The Air Ministry, which would suffer directly from premature disclosures, believes that there can be little harm in selling a design abroad once it is in squadron service in quantity, as the Canberras and American Sabres already are. This gives the air forces a technical need of about 3 years, by which time new types should be coming forward. It is also about as long as anyone can reasonably expect to maintain an effective security blanket. To argue, as the Americans appear to have done, that an engine should not be sold until it is obsolete by service standards is to suggest, in this case, that no country outside Nato is capable of designing an axial flow engine. This is asking a lot of British credulity, particularly after the recent evidence of the advance of Russian technology to match American knowledge of the hydrogen bomb. It would also be difficult to square this view with the declared intention of the American aircraft industry to export jet airliners, when, eventually, they have such aircraft to sell.

Relief for Hydrocarbon Oils

THE cut of 6d. a gallon that was made this week in the excise duty on home-produced hydrocarbon oils, bringing the duty down to 1s. 3d. a gallon, had been foreshadowed by the Chancellor of the Exchequer as long ago as May, but the amount by which the duty should be reduced has been under discussion all through the summer. In the early thirties, when production of hydrocarbons from

local materials began, they went tax free while the same products imported, or made from imported materials, bore import duty at 9d. a gallon. This preference of 9d. a gallon on home production has been maintained through each successive increase in import duties, by corresponding increases in the excise duty on the home product. Home producers have complained that the rise in costs that has taken place since the 9d. preference was first granted has made it increasingly difficult for them to sell at ruling market prices, and they have more recently backed their arguments by taking the less economic plants out of production. Many gas companies can get a higher return from their benzol by leaving it in the gas than they would obtain by recovering it and selling it as a separate product.

Production of benzol this year had reached a total of 69.5 million gallons by the end of August, roughly the same rate as last year when a total of 104.5 million gallons was produced. The return of premium grade petrols, some of which incorporate benzol, has meant that demand is coming perilously close to outstripping available supplies, and the main purpose of the new concession is to bring back some of the closed benzol plants into production. The reduction of 6d. a gallon brings the excise duty to 1s. 3d. a gallon compared with an import duty of 2s. 6d. a gallon on imported hydrocarbons. This new preference of 1s. 3d. is not expected to leave any room for reductions in selling prices except those that may eventually be expected to follow on increased output and lower distribution costs.

SHORTER NOTES

As if to emphasise the plight of the natural rubber growers to the American representatives at the Rubber Study Group's conference in London, the price dropped by another ¼d. lb early this week. It later gained ¼d. lb to close on Thursday at 16¼d. Liquidation in New York and Malaya seems to have stopped for the time being, and the lower prices have attracted a certain amount of trade buying.

★

At the EPU settlement for September Germany showed another surplus, of \$26.8 million, in its trade with other West European countries; this increased its cumulative surplus with EPU to \$634 million, or \$134 million in excess of its quota. The Federal Republic has agreed, however, to accept payment half in credit and half in gold for any further surpluses up to a cumulative total of \$700 million (compared with a ceiling of \$650 million hitherto). France's deficit with other EPU countries in September, at \$24.8 million, was almost exactly accounted for by its debt repayment of £8,700,000 to the United Kingdom last month; while the United Kingdom's surplus (which, as already reported, was \$12.2 million) was more than accounted for by that special receipt.

Company Notes

ROAN ANTELOPE AND MUFULIRA. The latest dividends from the Rhodesian Selection Trust group of copper companies must be appraised—as were their preliminary sales and profit figures, discussed in *The Economist* on September 12th—in the light of two conflicting influences. First, the outlook for copper is very uncertain; its price has been firmer in London in the last three weeks, but this is partly because supplies have been held up by strikes and threatened strikes in the Americas—and it must be remembered that Chile's current production has still not come on to the market. Secondly, these companies—Rhodesian Selection Trust and the two operating companies, Roan Antelope and Mufulira—migrated to Rhodesia at the beginning of July. This will have brought some savings in tax to the operating companies even for the year now reported (to June 30th last), for tax provisions entered in the accounts are to some extent projected against forward profits; and there should be many more savings still to come. In deciding on dividend payments, however, the directors must weigh this prospect against the recent fall in copper prices and the threat of a still more rainy day.

Their answer to this dilemma is to be found in the latest dividends. Roan Antelope's total equity distribution for the year to June 30th last has been raised

from 45 to 52½ per cent; but Mufulira's dividend has been left unchanged at 41½ per cent, as has the 40 per cent dividend paid by Rhodesian Selection Trust (most of whose income comes from its 64 per cent shareholding in Mufulira). Yet the increases in net profits for all three companies have been large. Mufulira's net profits have risen by over £1 million, from £2,617,816 to £3,625,276 after its provision for taxation had been reduced

from £5,651,927 to £3,842,041; while Roan Antelope's net profits have actually risen by over £2 million, from £2,642,914 to £4,787,574 following a fall in its tax bill from £5,888,767 to £4,565,101. In both cases, however, the operating companies have prudently made much bigger appropriations to replacement and general reserves. Rhodesian Selection Trust's net profits have risen from £1,117,000 to £1,797,000. Until the full accounts are published, however, it will be impossible to say how large a proportion of the tax savings following the change in domicile has already been reaped—and how much is still in prospect; indeed, it may not be

* Final dividend of 40 per cent, absorbing £3,595,075, appropriated as if free of British taxation.
† Final dividend of 26½ per cent, absorbing £2,138,882, appropriated as if free of British taxation.
‡ Final dividend of 25 per cent, absorbing £1,323,461, appropriated as if free of British taxation.

possible to make an accurate assessment even then.

The migration of these companies to Rhodesia has affected not only the prospective size of their dividends but also the form in which dividends will be paid. The final dividends just declared by the three companies have been entered in the accounts as tax free payments, but British shareholders will still have to pay the full British standard rate of tax on them—without any relief for double taxation. Future dividends that are received by British residents, however, will be subject to the standard rate of British tax less a relief for the Northern Rhodesian taxes already paid by the companies on these dividends. But it is on the taxes levied upon the companies' incomes (not upon their dividends)—and on the trend of the copper price—that any decision about future equity distributions is likely to turn.

FAIREY AVIATION. Some investors may be a little puzzled by the practice adopted by Fairey Aviation of including profits relating to deliveries made in previous years—but arising from the settlement of contracts in the current trading year—in the consolidated trading profit shown in its preliminary announcement. Yet so long as these credits occur regularly—as they must do in an aircraft company—there should be little difficulty in interpreting the current trend of profits. For Fairey Aviation, which has ample orders from the Government for Gannets and expanding interests in guided missiles, this trend appears to be definitely upward. For the year to March 31st last the company showed a trading profit of £948,638, although about £400,000 of this came from the completion

of contracts on deliveries made earlier; in the year before the company had shown a profit of £804,832, of which well over half (about £525,000) had come from deliveries made in earlier years.

Unfortunately, although trading profits (whether including or excluding these special credits) have continued to advance, net earnings have dropped from £382,994 to £295,686; the immediate cause of this was a sharp increase in taxation from £417,501 to £641,654. The directors have put more than the full weight of this reduction in net earnings onto a reduction in

	Years to Mar. 31, 1952	1953

Next Settlement Day: October 20.

INTERNATIONAL political uncertainties cast a rather deeper shadow over the boom in stock markets when they reopened after the week-end. The news from Trieste, British Guiana and Egypt, caused some scattered selling from the outset on Monday, especially in those stores shares in which a speculative position had been built up; and even the very satisfactory response to the Government's conversion offer failed to prevent a slide in the gilt-edged market, which showed losses of up to ½ on the day. The *Financial Times* ordinary share index eased another 0.2, to 127.3 (compared with 128.5 at the peak reached a week before). Monday's dullness was, however, relieved by active dealings in the new Babcock and Wilcox debenture stock, which opened at 1½ premium on the issue price of 97½ and, after rising to 1½ premium, closed around the opening price.

Tuesday brought some recovery in gilt edged, though industrials sagged further. They rallied, however, when dealings started for the new account. By Wednesday's close, most gilt-edged stocks were ½ or more above their depressed Monday level; 3½ per cent War Loan had regained ½, at 85½, and thus was restored to its level of a week before. Rises were also fairly general in most of the principal sections of the industrial market, raising the ordinary share index to 127.1, against 126.7 on Tuesday. A contributory factor in this recovery was the knowledge that several important dividend announcements, of which the market has high hopes, are due shortly. A notable feature on Wednesday was a jump in Anglo Iranian by ½ to 8½, the highest price since 1949, on the news that the company had entered the Canadian oil industry and also on hopes of an increased dividend. Most of the other oil leaders scored modest gains. In contrast to their recent dullness, a general revival occurred in Kafirs, led by uranium shares; and there was also some active buying in base-metals. Tea shares were in fair demand, but rubbers continued idle and flat.

Industrial Profits and Assets

THE tables below continue the analysis of company balance sheets and profit and loss accounts which was introduced in *The Economist* of January 22, 1949; the figures are discussed in this issue on page 191.

Comparative analysis of 576 profit and loss accounts published July-September, 1953 (£'000)

Funds Transferred for Capital Expenditure	£26,796
Taxation	84,349
Forfeited Dividends Account	2,523
	113,669
	£765,635

Dividends declared during the year:—

No. 85 of 2s. 3d. per share and No. 87 of 1s. 9d. per share

Leaving a balance unappropriated of

£516,116

The estimated Ore Reserve as at 30th June, 1953, was as follows:—

REEF	AVAILABLE			SHAFT AND SAFETY PILLARS			TOTAL		
	Tons.	Value, Dwt.	Width, Inches.	Tons.	Value, Dwt.	Width, Inches.	Tons.	Value, Dwt.	Width, Inches.
Kimberley Reef	440,000	2.7	59.8	86,000	3.5	66.3	526,000	2.8	60.8
Bird Reef	610,000	2.9	58.8	279,000	2.9	66.0	889,000	2.9	60.9
South Reef	525,000	3.7	46.0	131,000	3.9	47.7	656,000	3.7	46.3
Main Reef	710,000	4.4	46.7	748,000	4.5	49.2	1,458,000	4.5	49.0
Leader	410,000	4.2	53.7	44,000	3.8	60.6	454,000	4.1	54.3
Total	2,695,000	3.6	51.9	1,288,000	4.0	53.2	3,983,000	3.7	52.3

Compared with the previous year's estimate, the available reserve decreased by 1,642,000 tons the value increasing by 0.2 dwt. and the width being 1.7 inches less. Rising costs and the resultant increase in the pay limits accounted for 855,000 tons of the decrease in the available reserve. The full Report and Accounts may be obtained from the London Secretaries, A. MOIR & CO., No. 4, London Wall Buildings, London, E.C.2.

This is Road Safety Week . . .

We believe

that if all road-users

saw as much as we have to see

of the tragic consequences

of road accidents—

we should see fewer accidents

THE LONDON ASSURANCE

1 KING WILLIAM STREET • E.C.4

Perhaps you didn't know that
LUGANO

today a famous national holiday resort, was one of Switzerland's richest artistic centres during the 15th, 16th and 17th centuries. The great artist Bernardo Luini painted frescoes in the old abbey church of Santa Maria degli Angeli there, for which he allegedly received 29 golden Thalers (1530).

But everybody knows

that the Lugano Branch of the Union Bank of Switzerland could not advise Bernardo Luini how to make the best use of his 29 Thalers because, unfortunately, it did not exist at that time. However, were Luini alive today, the Lugano Branch would gladly place its services at his, and also of course at your disposal, in order to settle financial problems.

Company Meeting: J. ARTHUR RANK ORGANISATION

ODEON THEATRES AND SUBSIDIARY COMPANIES

FURTHER PROGRESS RECORDED—RESULTS AT NEW HIGH LEVEL

IMPROVED EFFICIENCY OVERCOMING GROUP'S PROBLEMS

PRODUCTION FUND EXTENSION NOW VITAL TO FILM MAKING

The 16th annual general meeting of Odeon Theatres, Ltd., and the annual meetings of its subsidiary companies, British and Dominions Film Corporation, Ltd., Gaumont-British Picture Corporation, Ltd., Odeon Associated Theatres, Ltd., and Odeon Properties, Ltd., were held on Oct. 9 at the Dorchester Hotel, London, W., Mr. J. ARTHUR RANK, D.L., J.P. (the chairman), presiding.

The following is an extract from his circulated statement:

In my last statement on the 1952 accounts I was able to report trading results which were an all-time record for the Group. I emphasised, at the same time, the difficult conditions through which the entertainment industry was passing and said that I could do no more than promise that we would do our best to deal with these problems and maintain our important position in the industry.

The year under review has fulfilled these expectations. There has been no relief from the unfair and unreasonable burden of Entertainment Tax, although operating costs, principally wages, have continued to rise. The impact of television has had an increasing effect on theatre attendances. I am glad to report that in spite of these problems the Group profits for 1953 have exceeded those for the record year of 1952. This achievement is in a large measure the result of the skill, imaginative anticipation of trends in the industry, hard work and foresight of Mr. John Davis, ably assisted by the management team which he has built up around him to whom great credit is due. The profits earned in the year reflect the intensive drive for economies and improved efficiency in all branches of our operations.

ODEON THEATRES LIMITED

Consolidated Balance Sheet: Revenue Reserves £2,423,441 again show a substantial increase of £1,001,796 due principally to the retention of net profits in the Group. Thus the total reserves at 27th June, 1953, amounted to £3,124,524 or over three times the issued Ordinary capital of Odeon Theatres Limited.

During the year under review Bank indebtedness has been reduced by £971,740 and now amounts to £5,804,998. Compared with June, 1949,

the aggregate reduction is approximately £10,500,000.

The consolidated trading profits, less losses, before providing for depreciation and interest, show an all-time record at £6,762,467 compared with £6,397,278 for the previous year. It is satisfactory to note from the analysis of trading profits that film production and distribution before depreciation show a profit of £155,247. This is the result for which we have been working since the disastrous days of 1949, but this result has only been achieved with the help of the British Film Production Fund. Taxation remains a heavy burden and required £2,612,257 notwithstanding the fact that relief for past losses amounting to £618,000 has been received during the year. I must emphasise that but for this tax relief the net balance available would be appropriately reduced. Virtually the whole of these past losses have now been recovered. In consequence next year's accounts will bear a much heavier charge for tax. We have paid two years' dividend on the 6 per cent Cumulative Preference Shares of Odeon Theatres Limited during the year under review. The payment is thus brought up to date—a matter of extreme satisfaction to your directors.

GAUMONT-BRITISH PICTURE CORPORATION LIMITED

The consolidated trading profits less losses for the year subject to depreciation, interest, &c., are £3,103,467 and compare with £2,895,094 in the previous year. The directors recommend the payment of a dividend on the Ordinary shares at the rate of 7½ per cent, less tax.

BRITISH AND DOMINIONS FILM CORPORATION LIMITED

The principal assets of this company and its subsidiaries consist of studios at Pinewood and Denham with their equipment, Denham Laboratories and the 5½ per cent loan of £1,750,000 to General Film Distributors Limited. I explained in my last report that it had been decided to close Denham and offer this studio for sale, and centralise the Group production arrangements at Pinewood. Denham has remained closed on a care and maintenance basis during the year under review but I am happy to report that a satisfactory arrangement has been

concluded with the United States Air Force for the leasing of this studio.

FILM PRODUCTION

We decided in the latter part of last year to terminate the agreement which we had with the National Film Finance Corporation with whom we were producing at Pinewood a group of films under the auspices of a company entitled British Film Makers Limited. We felt it was in the interests of the Group and of the Industry as a whole that we should be free and independent to produce films in the way which we felt best.

The financial effect of this policy does not mean that we are entering into heavy new production commitments.

It is well known that many new ideas in regard to picture production and exhibition are being considered in the motion picture studios of the world at this time. Your directors are fully alive to the problems which are developing and propose to watch the position closely. They will not commit themselves to any one form of new technique or theory until it is possible to assess the public reaction thereto and form an opinion as to which, if any, are generally acceptable.

It is our considered view that whilst these mechanical aids are of assistance in making films acceptable to the public they will not eliminate the basic requirement of our industry—that is the story and entertainment value of the film and whether it is presented in a form acceptable to the mass cinema-going public.

THE BRITISH FILM PRODUCTION FUND

It is with regret that I have to report that an extension of the present scheme which expires in July, 1954, has not yet been negotiated within the industry. The President of the Board of Trade in the House of Commons on the 10th March, 1953, intimated that it was Her Majesty's Government's wish that the industry should work out a voluntary scheme but if this could not be done then a compulsory scheme would be introduced. I and my colleagues have used every effort to persuade those concerned of the desirability of meeting the Government's wishes, but so far with little success.

I have said before, but it does not seem to be fully appreciated, that film production is not something which you can turn off and on like a tap at will.

Any action taken has a far-reaching effect, be it for good or ill. Consequently if we are forced to stop film production, which we may well be later this year in the absence of any agreed scheme to extend the British Film Production Fund beyond July, 1954, then that stoppage is not for a matter of months or weeks while negotiations proceed, but will affect production contemplated 12 or 15 months ahead, which will certainly not be available on the screens before that time. This inescapable fact was made very clear as a result of the debacle in film production following the introduction of the *ad valorem* duty in 1947.

I intimated last year that unless arrangements had been completed by the spring of 1953 for an extension of the scheme we would reduce our present level of production and that we would largely bring it to a standstill by August of this year. We are believers in British production and because of this and in the light of the statement made by the President of the Board of Trade in the House of Commons on 10th March, 1953, we decided to continue production beyond these dates relying on the statement of Government policy. If, however, a voluntary scheme has not been worked out within the next month or so or alternatively Her Majesty's Government has not indicated to the industry its proposals for legislation for a statutory scheme, we see no alternative than to reduce materially our production programme after the films which are now shooting and which will be coming off the floor in October or November of this year are completed. I sincerely trust that such a course of action will not be forced upon us.

[At the meeting of Odeon Theatres Limited Mr. RANK made the following additional comment:

I am pleased to advise you that since the publication of this statement, discussions have taken place between the representatives of the Board of Trade and representatives of the Four Trade Associations of the Industry, as a result of which I am satisfied that there will be an extension of the Fund, either on a voluntary or a statutory basis.

I have had also correspondence with the President of the Board of Trade, who has given us also an assurance that the Fund will be continued. I am happy to advise you that in these circumstances we do not propose to curtail our production programme, but to continue it on the present basis.]

QUOTA

I am happy to say that all our theatres satisfied their first feature quota obligation for the year ending September, 1952, and that for the year ending 30th September, 1953, they will also achieve this result.

ENTERTAINMENT TAX

I regret, notwithstanding the representations made to Her Majesty's Government, no relief was given from the discriminative burden of Entertainment Tax in spite of the industry's urgent need. I am coming to the conclusion, reluctantly, that in Exhibition the Government will allow a similar situation to develop to that which developed in Production a few years ago, namely that the production industry had virtually to go bankrupt before its basic problem was seriously considered. It is of some consolation to

know that the Chancellor of the Exchequer has stated that he will give consideration to this problem in his next Budget.

We are in the unfortunate position of "being ground between two millstones" represented on the one hand by the high admission prices we are forced to charge the public through the incidence of unfairly high Entertainment Tax and on the other hand by the steeply rising costs of operation. In this country, we took in at the Box Office this year £28,737,691 and paid Entertainment Tax of £11,136,915 as against the corresponding figures of last year of £30,018,278 and £11,808,831. We operate 550 theatres in this country and of these during the year under review 236 operated at a loss of approximately £725,000 before providing for interest on capital employed and excluding profits on the sales made in the theatres. Even allowing for profits on theatre sales an overall net loss was incurred in these theatres before charging interest on capital. This in spite of the fact that these same theatres paid £3,449,000 in Entertainment Tax. Obviously if the present situation continues we must in the interests of the shareholders close many of these theatres in order to protect the activities of our business as a whole.

EXHIBITION

In our own operation out of the 12 best films shown this year six were British. Many new mechanical aids are being developed in the industry to endeavour to combat the present difficulties, such as the 3-D films, the use of large screens, CinemaScope (the panoramic picture), &c. It is our intention not to commit our theatres extensively to any one method until such time that it has been proved by public appreciation. In this connection I can only reiterate what I have said elsewhere in this statement that the basic test must be in the long run the entertainment value in the programmes which are presented.

The competition of television continues to increase. We believe however, that this competition can be met and successfully dealt with if the industry is given reasonable working conditions in which to work out its own salvation and not be unreasonably hamstrung by the incidence of the unreasonable burden of Entertainment Tax.

Our overseas theatres, both those directly operated by us and those in which we are in association with partners, have made with one exception further material progress during the year. Attendances have been maintained and the demand from the public for British films has increased.

DISTRIBUTION

Domestic: The relationship between our General Film Distributors Limited and our exhibitor customers has been maintained at a high level of goodwill.

Eastern Hemisphere: I am happy to advise you that the cash remittances to London from J. Arthur Rank Overseas Film Distributors Limited during the past year are near an all-time record. This in itself is a great achievement bearing in mind the increasing difficulties which films are encountering all over the world as markets contract. The demand for our films has been maintained in spite of the general tendency of falling box-office attendances.

Western Hemisphere: We have maintained our position in Canada during the year under review although we have not made as much progress as we would have liked. We see signs

that the effect of television is beginning to be felt to an increasing extent. I have been far from satisfied with the results which have been obtained in the United States. The position is being examined carefully at the present time and I hope in the future to see a material improvement in the results.

STUDIOS

Our studios are in a highly efficient condition. We are watching with great interest the new production techniques which are taking place and shall adjust our methods to meet these conditions when the future is a little clearer as to the system likely to be adopted universally.

"A QUEEN IS CROWNED"

It would not be right if I did not refer particularly to this film which we produced recording the ceremony of the Crowning of Her Majesty The Queen and the reception of The Queen by her peoples when she proceeded through London. We can be proud indeed that the opportunity was ours, not only to make an historic picture but to take it successfully to the farthest corners of the earth in a way that has never before been attempted.

MANUFACTURING COMPANIES

British Optical and Precision Engineers Limited maintained its profit for the year which was an outstanding achievement in a very difficult period. There are, as you know, many new techniques in production and exhibition being developed in the cinema industry at the present time. The B.O.P.E. Group is in first-class order to meet the demands which will arise in this connection and hopes to secure large additional manufacturing orders.

Whilst we have continued to spread the activities of Cinema-Television Limited we have maintained our efforts in the development of large screen television. A record turnover and a record profit has again been achieved by Bush Radio Limited. The company's productions have maintained a high reputation for reliability resulting in a steadily increasing public demand.

THE FUTURE

I have been able to give a good account of the Group's activities for the year under review, but I must emphasise that there are many problems ahead of the industry, some of which cannot be solved by the industry itself, and it is therefore quite impossible to make any forecast as to future results.

The conditions under which the industry operates are constantly changing, and it is in such circumstances that management is proved and tested. I can say with confidence that we are in the forefront with all the new developments in technique and showmanship and that whilst the industry must obviously meet increasing competition from television we believe that the cinema will always maintain its important position in the way of life of the people of the world. The industry has to fight, however, with its hands tied by the cords of unfair taxation, but even so it is still resilient.

I believe that this Group, which is soundly established in all branches of the cinema and allied industries, will continue to give a good account of itself and, provided the problems of Entertainment Tax and the British Film Production Fund are dealt with should show a satisfactory return to its shareholders.

THE KAMUNING (PERAK) RUBBER AND TIN COMPANY, LIMITED

SIR JOHN HAY'S STATEMENT

The forty-fourth annual general meeting of The Kamuning (Perak) Rubber and Tin Company, Limited, will be held at 52-54, Gracechurch Street, London, E.C.3, on November 5th. In the statement circulated to stockholders with the directors' report and accounts, Sir John Hay, after reviewing the domestic affairs of the company, proceeded to deal with:

THE RUBBER OUTLOOK

At the beginning of the calendar year there was a widespread belief that a considerable surplus of supplies was in prospect. As the year has progressed this view has been somewhat modified. The price has for some time now exhibited an unusual stability, albeit at a level which gives only a very fine margin of profit to the best producers, with less or nothing to others. The view is now advanced from some quarters that such surplus as may eventuate will be readily absorbed in stocks and that the price may improve to a modest extent. Whether this better prospect will be realised must depend largely on the rubber policy which the USA will adopt now that buying for stockpile is virtually completed.

We had reason to hope that the transfer of the synthetic rubber industry from Government to private enterprise would be accomplished within a matter of months from now and that a condition of free competition between the two products would then ensue. The legislatures of the USA have decreed otherwise; disposal has been postponed until 1955 and then subject to conditions which may prove frustrating.

This postponement, with its doubts and uncertainties regarding the eventual outcome, serves to renew the fear that the manufacture of synthetic rubber will continue indefinitely as a Government monopoly, pressing harshly on the economy of Far Eastern territories and aggravating their political difficulties. It is only fair, however, to acknowledge that the high cost alcoholic plants have recently been closed down with a consequent contraction in output and a larger proportionate use of natural. Also that the USA rubber manufacturers have not been wholly unmindful of assurances given at the last Study Group meeting. But as I write this, another USA announcement has been issued, the effect of which would seem to be to fetter the freedom of consumers' choice as between the two products. If the claims so frequently and emphatically asserted regarding the merits of synthetic are well founded, it seems strange indeed that it should be deemed necessary to continue to protect and support it by a policy of enforcement and restriction.

As befits a great creditor nation, the USA has, in the postwar period, extended to less fortunate countries an unexampled generosity. This renders more bewildering the denial of freedom and fair trading in respect of an industry upon which depends so largely the welfare and perhaps, too, the security of the peoples of Far Eastern territories. It may well be that under conditions of free and fair trading, the synthetic product might prove a strong competitor to natural, but even so the establishment of such conditions would remove the occasion for a not unwarranted resentment, as well as dissipate the uncertainties which bedevil the rubber outlook. Natural rubber producers would then be encouraged to embark on long-term improvement programmes, stimulated to greater effort along practical lines and less disposed to seek relief by resort to doubtful expedients.

TAP & DIE CORPORATION

MR D. G. N. LLOYD-LOWLES'S SPEECH

The third annual general meeting of this Corporation was held on October 14th in London.

Mr D. G. N. Lloyd-Lowles, chairman, in the course of his speech, said: Last year I warned you that a continuance of the high level of profit then reached was not likely. You will not be surprised, therefore, to see that our net profits (subject to tax) have dropped from £470,241 to £315,814, which is, however, still above those for 1951, £295,000, and those forecast in the statement published in 1950, £235,000.

As regards the future trend of business, although sales for the last six months of the financial year were not as good as in the first six months, there has been an improvement in trading conditions since, which it is hoped will gather momentum as the year progresses.

Last year our products accounted for some 37 per cent of the total exports in this trade. We are now facing strong competition and it is clear that neither we nor any other exporters can retain our customers unless we are prepared to reduce prices. We in this country have too long relied on quality as the main selling point. The majority of our overseas customers are not willing to pay extra for this. Unless British manufacturers can cheapen production we may be priced out of many Continental markets. So far as your company is concerned, important changes taking place with a view to increasing efficiency and lowering costs will help us to meet this competition and any difficulties in the future.

The report was adopted.

SIR WINSTON CHURCHILL'S WAR MEMOIRS

The Sixth and Final Volume

IN the context of 1953 this last volume of Sir Winston Churchill's War Memoirs is the most enthralling.

It is an account not so much of the series of great victories that ended the War as the story of the personal negotiations between Churchill, Stalin and Roosevelt, and later Truman, about the shaping of the post-war world.

In American eyes, at least, the word Yalta has become synonymous with Munich. Sir Winston now tells what really was agreed there and in what manner the Russians voided their pledges.

Equally absorbing is his account of how the Western armies failed to carry out the occupation of Berlin, Vienna and Prague, all of which would have had a profound effect upon the present situation. How, too, America's feeling that British "ambition" after the war must be curbed led to fatal divergence between American and British dealings with Russia.

The whole volume is summed up in Sir Winston's words "How the Great Democracies triumphed, and so were able to resume the follies which had so nearly cost them their life".

That is why he has named it—

PHILIPS ELECTRICAL INDUSTRIES LIMITED

have the following vacancies:

PLANT PERSONNEL OFFICER at a new factory to be opened shortly in the North of England. This is a pioneer position and the department will be expected to cover the whole range of the personnel management function. The factory will eventually employ about 1,500. This vacancy is only open to men.—Ref. A.1.

PERSONNEL OFFICER at a large plant in the London area. The officer will report to the Plant Personnel Officer but will cover the full range for a section of the plant and while being a member of the P.D. team will have a considerable degree of independence. The vacancy is only open to men.—Ref. B.1.

PERSONNEL OFFICER at a large plant in the London area. The officer will report to the Plant Personnel Officer but will be specially responsible for assisting technically qualified junior managers with the personnel aspects of their work. A mature man is required in the sense that he grasps the significance of social change and appreciates its resulting responsibilities falling upon men already taxed by the technical problems facing a rapidly developing industry.—Ref. C.1.

CENTRAL PERSONNEL DEPARTMENT. There is a vacancy for a senior assistant who, while working as a member of a team, would have special responsibilities for salary and grading control throughout the group. There is a well-developed salary policy and the company is anxious to keep it advanced and up-to-date. A man is preferred for this vacancy but a woman with suitable qualifications and experience would be considered.—Ref. D.1.

The company is anxious to fill all these vacancies with people of considerable experience who are forward looking and keenly interested in the work. Breadth of experience rather than specialist knowledge is especially desirable for the first two.

Applications should be sent, quoting appropriate Reference, to Mr D. F. Hutchison, Central Personnel Department, Philips Electrical Industries, Ltd., Century House, Shaftesbury Avenue, W.C.2.

ECONOMIC RESEARCH ASSISTANT required by International Wool Secretariat. Applicants should have a 1st or Upper 2nd Honours Degree in Economics, with some branch of economic theory as special subject. Starting salary £175-£600 with superannuation benefits. Apply, in writing, giving reference and full particulars of qualifications, experience, etc., to the Secretary, International Wool Secretariat, Dorland House, 13-29, Regent Street, London, S.W.1, marking cover "Confidential E."

THE INTERNATIONAL LABOUR OFFICE, Geneva, invites applications for posts of translator. Qualifications required: 1. Mother tongue, English; 2. Age between 23 and 35 years; 3. University education or equivalent experience; 4. Extensive knowledge of French and Spanish.—For further particulars and application forms apply, enclosing stamped addressed foolscap envelope, to the International Labour Office, 33-39 Parliament Street, London, S.W.1. The closing date for the receipt in this Office of completed application forms is November 14, 1953.

THE CANTON INSURANCE OFFICE LIMITED

CHANGE OF NAME

As the present name is no longer appropriate, The Canton Insurance Office Limited, a British Company established in 1936 and having had its Head Office in Hongkong for over 100 years, will change its name from November 1, 1953, to the LOMBARD INSURANCE COMPANY, LIMITED. Matheson and Company, Limited, Agents, 3 Lombard Street, London, E.C.3. Underwriting Room: 3/4 Lime Street, London, E.C.3.

EXPORT AND OVERSEAS TRADE.—Advertiser seeks touch with Chairman, Managing Directors, or others influentially interested in need of the substantial contribution he could make towards securing share or increased share of world trade. Has 30 years' experience of marketing, manufacture, and related activities in all continents, mostly as Director. Skilled in selecting and interesting staff, examining and reporting on situation, negotiating all levels. Will experience to guide, confident of prospects before large or small concerns interested in building goodwill, turnover and profit. Highest credentials. Shortly available.—Replies from above-named, only, please, in confidence, to Box 351.

MANAGEMENT Consultants are required by the Wallace Attwood Company. Applicants between the ages of 30 and 45 must possess a University degree or technical equivalent in engineering and hold responsible executive positions. A thorough practical and current knowledge of the organisation and routines of industrial concerns is essential. Substantial salary and excellent prospects are available.—Replies in confidence to Chantrey House, Eccleston Street, S.W.1.

CONSUMER RESEARCH.—Graduate Psychologist or equivalent, with experience of personnel or research work in some branch of industry, required by Consumer Research Department in London of large commercial concern. Interest in qualitative aspects of attitude research essential. Applicants should be between 30 and 35 years of age.—Box 352.

CLOTH BUYING (Rayon, Wool, Cotton). Composite organisation (Manufacturing, Wholesale and Retail) in the ladies' garment industry requires high-salaried man with thorough knowledge of cloth market and sources of supply; also adequate technical knowledge and fashion sense, to develop new cloths, designs, etc. Only first-class men should apply. Applications, which should give full particulars of career, will be treated in strictest confidence.—Apply Box 356. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

Craven

his

first

love

THE MAN who has been tempted to smoke something else for a while comes back to Craven like the prodigal returning to peace after suffering. And how bewitchingly his "first love" welcomes him. Slowly, yet irresistibly, the cool, slow burning Craven captivates once again and holds him in its deeply satisfying spell. How right Sir James Barrie was when he said Craven "is a tobacco to live for".

Try CRAVEN

As the first pipeful casts its spell you'll agree that here is real smoking luxury... as every Craven man knows.

Three mellow, slow burning, deeply satisfying blends
Craven Mixture 4/7 oz. Craven Empire de luxe
Mixture 4/3 oz. Craven Empire Curly Cut 4/4 oz.

Millions of People miss your advertising...

unless your campaign includes the DAILY HERALD—for here is a reader market of 6,750,000 men, women and children with over £1,000,000,000 a year to spend on every conceivable kind of commodity and service necessary to their well-being. These are people who are today one-third better off than pre-war (despite the increased cost of living) and who, for the most part, have two or more wage packets per family each week.

To all who think that any other national daily or combination of dailies already covers this market, may we point out that in the homes of 53 per cent. of these 6,750,000 consumers, only one national daily newspaper—the DAILY HERALD—is taken and read.

Copies of QUANTUPLICATION—a media planner's guide to the better use of the DAILY HERALD—and copies of the first three of a new series of Commodity Reports on "The Buying Habits and Purchasing Power of DAILY HERALD Readers"—Boat and Shoe Cleaners, Pet Foods, and Footwear—will be sent on application. Other reports in this series will deal with Outerwear, Buying by Mail, Holidays, Bicycles and Accessories, Razor Blades, Shaving Soaps and Dentifrice.

A series of high speed flashes from 5 Mazda electronic flash tubes enabled Roger Wood, F.I.B.P., F.R.P.S., to take this remarkable photograph of "The Four Hurricanes".

THE SAME RESEARCH and manufacturing resources which produced the first jet engine of Whittle design and the electrical power system of the Comet are also behind Mazda lamps.

For half a century BTH has maintained its reputation for leadership in lighting. During that time many of its developments have become standard throughout the world.

Here are three examples from literally hundreds of recent achievements in the field of lighting.

Almost every

important

lighting development

in the last 50 years

owes something

to BTH

A LAMP BRIGHTER THAN THE SUN

British Thomson-Houston is now making, in regular production, a lamp no more than six inches long, but some 25 per cent brighter than the sun. This lamp is prosaically catalogued as the Mazda FA.5, but it gives the brightest light on earth.

What is the Mazda FA.5 used for? Ophthalmologists wanted to photograph the inside of the human eye in colour. But colour photography needs a lot of light. If a bright light is shone into the eye, the pupil will automatically close, so the light must be a flash fast enough to beat the pupil. But if the flash is short enough to do this it must have extreme brightness to compensate.

It took BTH Research eighteen months to produce the Mazda FA.5 and thus solve the problem.

CLEVER DESIGN BEATS THE TIDE

At the new oil refinery at Shell Haven large numbers of tankers and oil barges have to be unloaded. At first the highly inflammable cargo could only be unloaded in daylight because the risk of fire from an artificial light was too great. They missed the night tide, and this caused a great delay in the turn round of the vessels.

Then the Oil Company brought BTH into the picture. Drawing on their experience of fluorescent lighting in mines, where safety is of paramount importance, BTH Engineers designed a Mazda Flameproof Fitting. BTH research tested this fitting over and over again by deliberately trying to cause explosions under the most carefully thought out and diabolical conditions. It also underwent the most exacting tests at the Buxton Testing Station of the Ministry of Fuel and Power, and came through with flying colours.

They unload now by day and night at the Shell Haven jetties.

MILLIONS OF FLASHES FOR ZEBRAS

All over the country the zebra crossings are getting their flashing beacons. There might not seem to be anything difficult about that.

But there was a problem indeed. Was there a lamp that would stand up to such sustained flashing? Could such a lamp be made?

The answer was surprising: the most suitable lamp was the perfectly normal Mazda lamp that we all buy in the shop. This lamp, operated with a slight voltage adjustment, can be flashed literally millions of times. It is not said for nothing that Mazda lamps stay brighter longer.

Korean Deadlines

FROM Korea, this week, come distant but clear reminders that there is still no more explosive problem than that of the Far East. New anxieties in Europe have lately drawn attention away from the fact that a million and a half armed men are still poised behind the former Korean battlefronts. Although diplomatic representatives are due to meet at Panmunjom on Monday, the Korean political conference itself is not yet in sight; and next Wednesday the world will have crossed the deadline originally set for that conference. South Korean officials are now dropping heavy hints that Mr Rhee's promise to respect the armistice is already made void by this delay. The question must at once be asked whether the whole precarious structure of agreement that halted the fighting is now in danger.

Three months have passed since the signing of the armistice, and people may well be forgiven if they have lost track of the complex arrangements that it set in train. In those arrangements, and in the undertakings given by various parties concerned, periods of ninety, sixty, and thirty days were piled one on top of the other to such an extent that officials actually handling the affairs of Korea must now be working with profusely marked calendars and muttering "Thirty days hath November. . . ."

The clear, if intricate, chronological pattern envisaged in the armistice has been overlaid not only by subsequent agreements and pledges, but also by distracting divergences. As far as Britain is concerned, the superficial impression left on the public mind by the course of Korean developments since July 27th is somewhat as follows. First there was the exhilaration of getting the exchange of prisoners started. There followed a brief period of sharp exchanges about the sixteen-nation pledge, signed at the same time as the armistice but not published until August 7th, to resist any fresh Communist attack in Korea. Then, with the convening of the United Nations Assembly, the argument about Indian participation in the political conference swept all else aside; and, by the time that had died down, attention was focused on the extraordinary scene in the demilitarised zone, where 22,000 Chinese and Korean prisoners had been brought to decide their fate.

None of these episodes was strictly relevant to the main question of a Korean settlement. It may, indeed, be said with some truth that a settlement is no nearer now than it was after the signing of the armistice. That does not mean that nothing has been achieved since July. When the United Nations signed the armistice, it sought four main objectives: to stop the fighting, to rescue the prisoners from North Korea, to ensure that the prisoners in its own hands could choose where they should go, and to protect Korea from further ordeals. It has been substantially successful in the first three of these aims, although there is disturbing evidence that the Communists have not produced all their prisoners; and not until January will the men

now in Indian hands be set completely free. However, the progress made under these three headings is in striking contrast with the lack of motion towards a general settlement. Yet, paradoxically, a general settlement along the-only lines that are possible in present circumstances would involve less definite action than has been required to solve the problems concerning prisoners. For, as things stand, the only conceivable "settlement" must take the form of the *status quo ante*. The peaceful reunification of Korea remains hopelessly out of reach.

★

If, then, the only prospect before Korea is a freezing of the present state of division, who stands to gain by obstructing an agreement on those lines? President Rhee evidently thinks that he does. It must never be forgotten that, according to his own account, he swallowed the armistice only because he was sure that the Americans would join him in a new campaign if, at the political conference, the Communists rejected unification on his terms. As late as the end of September, he was reaffirming that, if the conference failed to achieve unification within ninety days from its opening,

we shall naturally resume the battle for our national independence and unity. . . . We expect all friendly forces now in Korea will assist us towards that objective if the Communists force us to resume the war.

However, no assurance of such help has been given. When Mr Dulles hastened to meet him in August, Mr Rhee evidently expected, at the very least, two American promises: first, that United States troops would be kept in Korea as long as he wanted them; second, that Washington's representatives would automatically follow South Korea's out of the political conference after ninety days. He was given neither. In the mutual security pact and supplementary agreements that were drawn up in Seoul in August and signed in Washington on October 1st (but which have not yet been ratified), the United States undertook only to act against any attack on South Korea, to keep troops in Korea only as long as it thought fit, and to withdraw from the conference with South Korea only if it thought fit. Mr Dulles made it clear that the United States would not automatically resume fighting after withdrawing from the conference; he also explained that the security pact would not prevent American troops being taken out of Korea if a general agreement on withdrawal of forces was concluded. These were by no means the kind of automatic assurances that Mr Rhee had sought; yet they sufficed to win from him an undertaking to respect the armistice for the time being. If the political conference had begun work before October 28th, Mr Rhee would have been bound to give it a fair chance for ninety days; and that would at least have carried things past the vexatious business of "explanations" to prisoners.

Blame for the fact that the conference has not yet started can now be laid squarely at the door of the

Communists. Their only response to the UN invitation has been to reiterate conditions that they already knew to be unacceptable. They still insist on the attendance at the conference of India, Pakistan, Indonesia and Burma—which implies the non-attendance of South Korea—and on a broadening of the agenda that would enable China to make a Korean settlement depend on the satisfaction of its ambitions in other directions. It may well be that the United Nations would have been wiser to endorse Indian participation; but that does not alter the fact that the Communists, by piling up new terms, have done their utmost to make a conference impossible.

In paragraph 60 of the armistice agreement, the military commanders recommended to the governments on both sides that, within three months of July 27th,

a political conference of a higher level of both sides be held by representatives appointed respectively to settle through negotiation the questions of the withdrawal of all foreign forces from Korea, the peaceful settlement of the Korean question, etc.

Apart from Communist reluctance, there has been nothing to prevent a conference of this character from being convened before October 28th.

When the armistice was signed, it was possible to hope that the same factors that had led the Communists finally to sign it would lead them also to co-operate in reaching a settlement. Now, regrettably, it is clear that those factors do not apply. Nor is it difficult, at this stage, to explain the Communists' obstructive attitude. The armistice relieved them from military pressure without weakening their iron discipline; but the same relaxation of pressure produced in the non-Communist world a revival of many differences of opinion that had been suppressed only for the duration of the fighting. To the Communists Mr Rhee is a godsend; the UN dispute over Indian participation was another; the friction between Americans and Indians in the prisoner-of-war camps a third. They have had considerable success in diverting attention to these matters and away from their own intransigence.

★

However, they have not yet succeeded in so embroiling their antagonists among themselves as to make a settlement impossible. More than one of Mr Rhee's deadlines may yet be passed without disaster. The South Korean president has already shown signs that his bite is less effective than his bark; and the recent demonstrations against him by the widows of his soldiers suggest that his army would not go into battle again with all the enthusiasm he desires. Again, the latest developments in the prison camps seem to indicate that the worst dangers of conflict between the Indians and the Americans have passed. However, the nations that fought side by side during the three-year campaign will have to stand closely together throughout this new time of testing. Only patience and resolution can bring about the first United Nations peace.

A Fresh Start for Kenya

AFTER twelve months of an official state of emergency and a longer period of violence and bloodshed, the forces of law and order in Kenya now have the upper hand. So much is clear from the Governor's speech to the Legislative Council this week. A large part of it was, it is true, given up to security measures. But they are measures for consolidation and for preventing a recurrence of violence in areas pacified, rather than for carrying on the present campaign; and the rest of his speech was concerned with long-term plans for rehabilitation and development. In the past, the Kenya Government has been criticised for being so concerned with the immediate emergency that it failed to show how it would tackle the deep-seated causes of Mau Mau once peace was restored. That criticism cannot be made of Sir Evelyn Baring's speech this week.

All this means that Mau Mau is now on the defensive, not that a speedy end to the emergency can be looked for. During the year of violence the chief sufferer has been the African himself. Whatever their ultimate object, the Mau Mau terrorists have pursued it by inflicting heavy casualties on their fellow Kikuyu. Their bands steal white farmers' cattle, but they have concentrated their killing fury on Africans. Hundreds of Africans have been hacked to bits, burned alive, buried alive, strangled and decapitated. Mau Mau's method of achieving its ultimate aims is to impress on the Africans that it is stronger than the white man's government, police and soldiers. So far it has certainly proved far more ruthless.

It is significant, therefore, that part of the Governor's speech was concerned with impressing on the Kikuyu that the Government has more power than Mau Mau's leaders. The drastic penalty of forfeiture of their lands is to be imposed both on those convicted of offences showing them to be closely concerned with the direction of Mau Mau and on certain gang leaders still at large. This land will be put to public purposes—for schools, clinics or agricultural experiment. A penalty of this gravity shows that there are certain Mau Mau leaders whom the Government considers irreclaimable. Equally important are the measures proposed to reclaim the thousands of Kikuyu who have gone back to the reserve and all those who have become the shuttlecock between security measures and terror tactics, shifted from place to place, evicted from one because they are believed to be tainted with Mau Mau and unable, for the same reason, to enter another. The Commissioner for Community Development has been put in charge of a special "rehabilitation department" which, applying the tactics used in Malaya, will attempt to win back those "whose minds have been polluted with Mau Mau propaganda." For the Kikuyu reserve itself the Provincial Commissioner will be given a special staff to undertake the work of reconstruction and of maintaining peace. The Governor also gave the welcome

promise that loyal Kikuyu will be encouraged to play a part in the restoration of their homeland. In the remarkable growth of the Kikuyu home guard Mau Mau produced its own "antibody," and the Kenya Government has wisely recognised that, given encouragement and trust, these Kikuyu can be of more use in combating the poison of Mau Mau than an increase in the police and security forces.

★

These, then, are the main measures for restoring and enforcing security. But they cannot be completely successful without a long-term plan for building up Kenya's resistance to another such attack. Although it has been the Africans who have borne the brunt of Mau Mau's savagery, the Europeans cannot disclaim responsibility for the fact that it existed and for the ease with which it obtained a hold. They have assumed the leadership of the colony and prided themselves on it; yet Mau Mau can be regarded as the result of their failure, extending over many years, to understand African feelings and to take responsibility for the effects of European civilisation on African culture. The settlers have consistently blamed the Africans for "not measuring up to the job," for lack of gratitude, for unteachability. But, in reality, this attitude condemns the settlers, who are supposed to supply the wisdom and forethought of the leading race. The Kikuyu became increasingly overcrowded in their reserve, but not enough was done to find them more land, to teach them better husbandry, or to find them alternative employment. Between them, the European communities in Kenya, official and unofficial alike, failed to see that the situation had become intolerable in Kikuyuland. Because the Kikuyu reserve abuts on the white highlands, the contrast between the two areas made that failure visible to African eyes. The immense difficulty of the race problem is not an excuse. Settlers and officials took it on, of their own free will, by the act of going to Kenya.

Settlers as well as officials have, therefore, to shoulder responsibility for Kenya's future once the emergency is over. The work of economic expansion and social reform, which was started immediately after the war, will have to be carried on at an accelerated rate, even though it will mean higher taxation. Broadly, the process has been to teach the growing African population better methods of cultivation, while meeting any deficit in subsistence agriculture from the more efficient large-scale farming of the highlands; to improve African education and training; to find and settle, where possible, more cultivable land by irrigation or clearance; and finally to provide, through the steady industrial expansion of the country, alternative employment for the Africans who have moved to the towns.

Sir Evelyn Baring enlarged upon this programme in his speech to the Legislative Council. In particular, he announced that in the highlands the system of squatters will be replaced where possible by cottage labour. Africans will live in small groups of houses on the farms where they work, forming in some instances small villages which can be provided with essential services. He also dealt with the measures needed to enable the Kikuyu reserve to support an increasing Kikuyu population, and he mentioned an experiment in consolidating land holdings by giving efficient farmers special land titles.

The difficulty about this programme is that it will be very costly, and even if financial help is forthcoming from Britain—as the Governor suggested—it will take a long time to put into effect. Each remedy, moreover, brings problems of its own. For instance, in spite of the emergency industrial development is still going on; but it cannot provide jobs fast enough for all the Africans displaced from the reserves and it creates a shocking housing shortage for those who do find employment. Moreover, there is a particular difficulty in finding land for the resettlement of the surplus Kikuyu population. Irrigation of land on the Tana river may cost £200 an acre or, say, £600 to £800 to settle one family. This compares with the investment of £25 per acre which Mr L. G. Troup estimated to be necessary in order to raise the production of the European highlands (exclusive of plantation crops) from £6,645,000 to £28 million. To bring technology to bear in conditions of modern and of primitive farming are two completely different things.

Yet there is no alternative but to persevere, and to hope that Kenya's problem can be solved by all-round development of the colony's economic resources, which

are great and still in some ways unassessed. Mr Troup reported, for example, that production in the highlands could be tripled in ten years; and the geological survey is producing some hopeful results. But it is doubtful how far this development can go on until trust, respect and social harmony are restored between the races. All communities should accept the fact that Kenya needs the presence, indefinitely, of an industrial and agricultural managerial cadre of Europeans.

To put it bluntly, the process of "rehabilitation," which is to be applied to the Kikuyu, will *mutatis mutandis* have to be applied to the other races as well, and it is unfortunate that no recognition of this appeared in the Governor's speech. He took the Africans to task for adhering to Mau Mau and for believing that prosperity could come without their having to work hard for it. But he made no suggestions for a change of attitude in the Europeans. Yet a new outlook on leadership is clearly called for. Throughout East and Central Africa, there are a surprising number of African political leaders who remain quite moderate in their views. But when they ask for a progressive implementation of "partnership" between white and black, they mean what they say. If these "moderate" leaders find themselves, as an African has put it, "talking down a toy telephone" into unreceptive white ears, they will lose heart and probably be replaced by much tougher elements. Once that happens, the Europeans, so few in numbers, will find themselves in an exceedingly difficult position. There have fortunately been some signs that Kenya's year of terror has persuaded men of all races to look at their country from a new angle. The Kenya Government's measures will have to be inspired by this new vision if they are to lead to peace as well as economic advance.

Storm over Livestock

MEAT has become the crucial test of the Government's general policy of stopping state trading in food and letting the mechanisms of the market operate for farm produce, while honouring the obligations to farmers embodied in the Agriculture Act of 1947. The test is, indeed, the proper one. Livestock is the branch of British farm production where consumers stand to gain most from the restoration of a market which would reflect for producers the wide variety of their individual tastes and pockets. But livestock marketing is also the matter on which the National Farmers' Union feels most strongly. After its advertising at the Conservative conference, the issue is being thrashed over again in the departments; if the Government has not yet made up its mind, it must do so quite soon, since the intention of removing controls and meat rationing next summer has become known and could not now be set aside without doing the Government considerable harm politically.

There is no question of restoring a free market and leaving the farmers' incomes to be determined solely by it. At the least, they will also have a system of deficiency payments, under which the Government would promise to bridge any gap between the average prices prevailing on the market and the minimum prices endorsed by the Government in its annual review of the agricultural position. This method gives to the farmer the minimum of security which he rightly expects without taking from the consumer any of the benefits of a free market. It is already being applied to the marketing of cereals and it is equally applicable in principle to the marketing of livestock, where its use has been commended by the representatives of the meat trades. The National Farmers' Union, however, has flatly declared that it will not tolerate a system of deficiency payments for livestock—although what right it has to make such a threat, or how it could be enforced, remains obscure.

The union has now brought forward a new scheme of its own for livestock marketing. This provides for two alternative methods of marketing to exist side by side, for an experimental period of three years or so; meanwhile the situation would be reviewed by a new committee of inquiry. Under one alternative, live cattle and sheep would be bought from the farmers at fixed prices by the Government, and then sold by the Government at auctions. Under the other alternative—the one the farmers prefer and hope will eventually prevail—livestock would be dispatched directly to slaughterhouses and sold on a dead-weight basis to a producers' marketing board, which would have exclusive responsibility for its subsequent disposal. Pigs would be dealt with solely by the second method.

The union blandly describes these proposals as a compromise, when they are in fact nothing of the sort. They are a nice example of the heads-we-win, tails-you-lose philosophy. The proposed restoration of livestock auctions is apparent, not real. A market with the Government as sole seller would not reward the farmer who produces what the consumer wants when he most wants it. It would transfer the risks of marketing to the Government, leaving it to carry any loss incurred at the livestock auctions and also, presumably, to make good any deficit incurred by the producer marketing board. On pigs, which are not to be entrusted to even a nominal free market, the loss would presumably be substantial.

★

Ministers surely cannot take these proposals seriously, except for the light which they shed on the farmers' state of mind. Even on this point, however, it is important that the signs be read aright. Without question, most—not all—farmers have a genuine horror of returning to the type of free market in livestock which existed before the war. Their bargaining position *vis-à-vis* the butchers was then weak. The market situation today is fundamentally altered. The consumption of meat is still below its prewar level, yet with full employment and the redistribution of incomes the potential demand is almost certainly higher than before the war. And while the volume of meat imports will no doubt fluctuate with prices and the state of the balance of payments, the quantity is unlikely to be greater and may often be less than before the war. As long, therefore, as they can produce meat at prices bearing some reasonable relation to other prices, British farmers will generally face a sellers' rather than a buyers' market; and the greater their efficiency in meeting consumers' requirements the better still become their prospects. In such changed conditions, the farmers' preference for fixed prices, insulating them from the market, must be regarded as an unrealistic failure to see the possibilities open to them.

Though farmers often talk as if prewar auctions and butchers' rings were the same thing, it is doubtful whether the power of the rings was often great or con-

tinuous. In a sellers' market it cannot be—unless the NFU succeeds in reviving it by the scheme for making the Government the sole seller, in which case the buyers might indeed seek to combine. Moreover, quite apart from the state of demand and supply, the effect of the long period of control will almost certainly be to reduce the number of small livestock markets, where the rings exerted their pressure. The legacy of control also suggests that the farmers who dislike auctions will enjoy increasing scope for contractual sales direct to slaughterhouses.

Behind the markets, moreover, there would lie the system of deficiency payments which—however much farmers may fume about it—would give them a real measure of protection that they did not enjoy before the war. It is true that, since the payments have to be averaged out over the whole range of livestock transactions, they cannot be used to guarantee a specific price to any individual producer. But to ask for more is to say that the farmer who is less efficient than his fellows in satisfying the market ought not to get any less in consequence. This is the spirit of self-protection run riot, at the expense of the efficient producer as well as the public. Deficiency payments give a perfectly good guarantee of profitable returns to the average run of farmers. To provide more than that is to deny the virtues of competition. And to deny the virtues of competition, even for the sake of votes in rural constituencies, would surely be to take the life out of the Conservative Party in the long run, even if not to discredit it in the short run.

That the farmers' fears of free marketing are unreasonable does not, of course, make them less real. But it is curious that while trade unionists and industrial employers are continually being asked to abandon prewar prejudices and restrictive practices, Bourbonism among farmers is so widely accepted. The Government is understandably afraid of an open breach with the farmers. Quite apart from the electoral repercussions of such an event (which are probably greatly exaggerated), its agricultural policy is based on close co-operation with the farmers' representatives. The extreme sanction of the farmers' displeasure would presumably be wholesale resignations from the county agricultural committees. And this loss of confidence might be reflected, it is said, in reduced investment and perhaps even in an actual fall in output.

But if these dangers cannot be ignored, they seem to get more weight at Westminster than they warrant. The NFU's bark is habitually much stronger than its bite, and it is open to question how far its intransigence might be matched by the resistance of ordinary farmers. In any event, it is surely not beyond the Government's power to dispel most of their fears. The protection given by a deficiency payments system is obvious enough if Ministers have courage to expound it. There would have to be also, no doubt, some generous initial gesture. Fortunately, demand is strong enough to make it reasonable to promise that for two or three years at least the standard prices for cattle and sheep

would not be reduced below the present guaranteed prices—though the same promise cannot be given for pigs.

The Government can also sincerely accept the farmers' case, and at least save the NFU's face, to the extent of agreeing that the prewar system of marketing was responsible for some unfairness, waste and inefficiency. It would be entirely right to attempt to improve the physical facilities for marketing, and to this end an independent regulatory committee should be set up. It would be responsible for grading all livestock, on either hoof or hook at the farmer's wish, in order to provide an independent guide for both buyers and sellers; it should have licensing powers, controlling the number and location of markets and slaughter-houses; and it should be generally charged with responsibility for suggesting ways of improving distribution.

Without doubt the farmers will also expect the Government to honour its election pledges by permitting the formation of a producers' marketing board.

On Israel's Frontier

ONCE again the Palestine problem has been thrust on public attention in brutal and frightening fashion, and last Monday the Security Council returned without enthusiasm to the persistent question—how is there to be a *modus vivendi* between Jew and Arab unless it is imposed and maintained from outside by unchallengeable force?

The question is revived by an outrageous act of violence on the part of the Israelis. On the night of October 14th, they violated their frontier with Jordan in retaliation for a stream of Arab violations on a scale smaller but so steady that they have sapped the morale and snapped the nerves of the Jews. A heavily armed Israel force crossed the frontier, penetrated into the heart of a village called Qibya, burnt and demolished over forty houses and killed forty-two men, women and children; it also shelled two other villages. Qibya lies in the frontier region where nerves are tautest—the area of low hills adjoining Israel's wasp-waist opposite Qalqilya, where Arab territory comes to within 10 miles of the sea, and where Arab villages are at their most destitute because they have lost their former lands and livelihood in the coastal plain.

By a coincidence, a second major frontier trouble has come to a head simultaneously in the dispute over sharing the waters of the Jordan river and its tributary the Yarmuk. At Lake Huleh, in the extreme north, the Israelis have long been draining marshes which border with Syria, for the purpose of land settlement, power development, and preventing loss of water by evaporation. By providing this extra water they claim that they will enhance their right to future privileges. The scheme has entailed digging a new channel which must run through a zone at present demilitarised. Lately, the new chairman of the United Nations

The farmers claim that they can improve the efficiency of the livestock industry by devising sounder methods of marketing and slaughtering. There is every reason for letting them try to do so, but not for giving them statutory powers to compel all producers and distributors to join their scheme. Producer-controlled marketing monopolies were a desperate and unfortunate expedient of prewar depression, quite unjustified in the changed circumstances of today. It would, however, be reasonable and timely to amend the Agricultural Marketing Acts so as to assist the formation of producers' co-operatives on a voluntary basis.

These considerations are secondary to the main issue. The advantages of a free market, which it is the Government's aim to realise, cannot possibly be reaped under the farmers' proposals or indeed under any scheme that has yet been advanced save that of deficiency payments. The Government's task should be to hold firm to the principle of free markets while giving farmers those assurances that are reasonable and adequate.

Armistice Commission, the Danish General Bennike, has ruled that this channel is an unfair diversion of water and that digging must stop. His order has been defied and, in consequence, the United States Government has deferred allocation to Israel of urgently needed sums made available under the Mutual Security Act. According to Mr Dulles, this decision has nothing to do with the Qibya attack but resulted from the "cumulative effect" of evidence that the Israeli Government defies such UN rulings as do not suit it. He was doubtless thinking also of its recent decision to move its foreign office to Jerusalem despite a Trusteeship Council injunction not to prejudice that city's future status; and despite the advice he gave during his Middle Eastern tour. All told, considerable provocation has been given, and the Israelis have only themselves to thank if other tempers besides their own have reached the state of exasperation expressed in the British and American Notes delivered this week.

The crux of the water problem is the disposition of both Jews and Arabs to put politics before economics, that is to say, to persist with separate schemes that were described in *The Economist* of June 20th. Since then Washington, which would have been the principal source of funds for both schemes, has produced a "comprehensive desk study by the Tennessee Valley Authority" which, being a plan of unified development for the region, ignores politics and is an engineer's dream. It is safe to predict that neither government will like this as much as a scheme entirely within its own control; but since neither can finance even its own scheme without western aid, whoever paid the piper could to some extent call the tune. A settlement of this matter is feasible only if such pressure is exercised effectively and persistently from outside.

The human situation in the other danger zone—the frontier settlements and villages to the north and south of Qalqilya—is one the full tragedy of which no "desk study" can convey. On the Jewish side of the frontier, where the land is flat and the soil fertile, there lie sprinkled like orderly clusters of lump sugar the endless little white or corrugated aluminium homes that are Jewish agricultural settlements. They house new and often inexperienced farmers, pampered by the Jewish Agency, which is the body responsible for persuading newcomers to take to agriculture. These settlers have, on the whole, much better tools than the previous owners of these frontier fields, but they are not yet such natural or skilled farmers.

The Arabs on the other side of the border are crowded into villages which contain perhaps twice or three times their normal complement because they have taken in refugee cousins or friends. These villages have lost their lands in the plain and with them all, or nearly all, their prosperity. Their inhabitants are not refugees in the UN sense of the term, because they have not lost their homes; therefore they do not receive UN rations. They exist on meals of vetch and on occasional distributions of soup and clothing from Christian missionaries. Everywhere there is unemployment, overcrowding and starvation.

Unequal economic conditions on either side of a frontier are a proverbial source of international trouble. When, as here, the frontier is marked only by white stones across which all can behold the inequality, and when the lands on the richer side used to belong to the men on the poorer one, tragedy ensues. The dispossessed cross the line to help themselves to what they regard as their rightful property. These forays by individual Arabs take place almost nightly: the booty is a piece of roofing, a length of metal piping, a sack of oranges, or even perhaps a mule. Destitute men will risk their lives for such things: if caught, they are likely to be shot; if surprised, they defend themselves and may well commit murder. On the Jewish side these incursions are dreaded by the frontier settler. He is new to farming, and his daily burden is multiplied by the necessity of bringing in every piece of equipment every night.

★

The Israel Government argues that there are far more Arab than Jewish violations of the frontier. This is true. Between June, 1952, and June, 1953, the Mixed Armistice Commission ruled against Jordan in 159 cases and against Israel in only 25. But number can be outweighed by scale. The Mixed Armistice Commission's list of incidents contains many such as that in which an Arab peasant, taking a short cut from field to field in daylight across a tongue that is now Israel, was challenged by nine Israel soldiers, started to run, and was out of hand shot dead from behind. It would take many such incidents to offset deliberate army

onslaughts on whole villages. Admittedly the Mau Mau climate created by Arab incursions is an immense strain on Israel's settlers, and threaten the economy of the country. This is why retaliation is officially planned and executed.

About Qibya, Mr Ben Gurion has broadcast the equivocal statement that the attackers were frontier settlers mad with rage at recent murders, since "not a single army unit was absent from its base on the night of the attack." General Bennike, by contrast, mentioned on his way through Beirut this week that inquiry had proved that regular forces were engaged. The world awaits his evidence. The force that conducted a similar though smaller attack on the village of Falama, near Qalqilya, in April were soldiers; for when forced to retreat they left behind them the kind of equipment—for example, a Bangalore torpedo—not available to settlers. Israeli army officers, if asked about the raids, have till now explained with commendable frankness that they are needed to keep up the morale of the

settlers. They strike, they say, not so much to frighten Arabs—who are destitute beyond frightening—as to reassure their own people.

These facts are enough to show how constant is the pattern of possible pacification in Palestine. Only force applied from outside can achieve it. Distasteful though it

is to those who apply it, this was the only recipe for quiet living throughout the years of the British mandate; and so it remains today. Bitterness of feeling between Jew and Arab is greater now than it has ever been. The only prospect of abating it is for the western powers to strengthen their Anglo-French-American Declaration of May, 1950 (which simply said that there shall be no forcible change of the frontier) and to dictate, if necessary themselves to man, a permanent frontier line. Unless they do so, grave consequences will follow. Arab and Israel forces will grow, as they are growing this week, on either side of the armistice frontier. The prospect of peace will be hopeless and so, also, will be the conversion of both Israel and Jordan into viable states. Without peace both must live on western charity. Arab refugees, nearly a million strong, will remain indefinitely on the West's ration list and payroll, or else will die of starvation. What, too, will become of the next generation of Israelis if their leaders encourage at home a violence that they feel bound to condemn abroad?

Notes of the Week

Doubts on Guiana

MORE facts are now unlikely to settle for most people the controversy over British Guiana. The Government's White Paper, published after the reassembly of Parliament on Tuesday, confirms in greater detail much that the Colonial Office had already said. It leaves little doubt in the mind of any objective person that the dismissed ministers were both disaffected and incompetent, and that they used their offices to further party political ends rather than to act as a government set on improving the present state of the colony. That they had Communist affiliations is also pretty clear. But the White Paper contains nothing approaching "proof" that a definite plot was being hatched, in order to overthrow the constitution and set up a Communist government. This may simply reflect the nature of Communist plots; they are not easy things to track down. But since the Government's early pronouncements rested the case on the existence of a plot, the White Paper has not cleared up many people's doubts.

In the House of Commons on Thursday, Mr Lyttelton was most effective in arguing against the alternatives to suspending the constitution that some of the Government's critics have suggested. He showed how difficult it would be either to take any legal action against the Ministers themselves or to make continuous use of the Governor's reserved powers. But this still leaves the main point unsettled and, though the debate was still in progress when this issue of *The Economist* went to press, the Government plainly had not satisfied the Opposition. The policy of the People's Progressive Party seems to have been one of attrition rather than of immediate coup, and it presented Mr Lyttelton with a conundrum fortunately more familiar in this country to political philosophers than to politicians: at what point should those who believe in liberty restrict, in self-defence, the actions of those who do not believe in liberty?

If there are legitimate doubts about his action, it is still up to the critics to outline another policy with a better chance of success. Those who say that the Governor's reserved powers were sufficient to meet the needs of the case have yet to show how a constitutional expedient designed to minimise the incompetence and inexperience of ministers could be used to counteract a deliberate policy of bad faith and obstruction. Nevertheless, Mr Lyttelton's drastic remedy will be vindicated only if the colony's progress along the hard road to self-government is not long delayed. The test is a severe one, for it will not be easy for more reasonable local politicians to build up a popular following as long as the leaders of the PPP are able to assist their own cause by exploiting their "martyrdom."

Lugano Lobbying

THE latest western Note to Moscow is conciliatory in style and contains a significant concession. Instead of repeating the long-standing western demand that talks on Germany must start with the topic of all-German elections, it suggests that the conference in Lugano proposed for November 9th "should enable the Soviet Government to state its views on any aspect of the German and Austrian questions which it may wish to present." The western delegates would presumably stand firm, if the conference took place, on the need to hold free elections before there was any discussion of the terms of a peace treaty; but Molotov may none the less think that he has won a point and feel encouraged to hold out for more.

There is no evidence that Moscow is anxious for a conference so long as the Communist position in Germany is so manifestly weak. It would be different if the East German Communists could induce West Germans to meet them and discuss formation of a provisional, nominated all-German government, such as Moscow wants. So far, however, all efforts to create a German pressure group that would serve Soviet purposes at a peace conference have failed. While this state of affairs continues it must be expected that Molotov will agree to a conference only to encourage dissension in western ranks, a tactic in which he may count on influential French support.

The western powers have dealt logically and fairly with the Soviet proposal for another five-power conference that would discuss all sorts of causes of international tension. They point out that they have already agreed to the political conference on Korea in the form proposed by the Communists, and China will be represented at the Panmunjom meeting that is to make the arrangements. Disarmament, like other matters raised by Moscow, is already on the agenda of the UN General Assembly; and, of course, diplomatic channels are always there to be used. The idea that the Soviet will to peace is being frustrated by red tape and striped pants is merely comic.

Security and Conspiracy

INDEED, the desire to make things easier for Malenkov and Molotov is taking curious forms, especially in European comment. The fact is being forgotten that Moscow was obstinate about Germany, hysterical about America, and rude to Britain long before German rearmament, Nato or European unity were serious factors. It is exceptional to see any suggestion that free Europe, as well

as the Soviet Union, needs reassurances about its security; and seldom is there any acknowledgment that its persistent and avowed conspiracy against the free world is a matter on which Britain, above all powers, is entitled to seek assurances from the Kremlin, which conducts diplomacy with one hand and international agitation with the other.

One wonders whether Sir Winston Churchill has recently called for a report on the activities of the World Federation of Trade Unions, and their relation to events in Africa and Asia. If he did so he would doubtless be shown *Pravda's* recent praises of the work done by that body in fostering colonial strikes and "liberation movements," or the arguments of the Moscow press that what has happened and is happening in China is the model for all colonial revolutions. It is a subject on which he used to feel and express himself strongly; indeed, one of the very few reasons for supporting the idea that he should meet Soviet statesmen alone lies in the hope that he might explain to Malenkov and others that they must not expect an understanding with the West if they are hoping for the early collapse of the capitalist system and its alliance. They cannot have their peace and break it. Nor can they hope to pick off the allies of the United States one by one. It is to make clear points such as these that informal talks at Sir Winston's level might be useful; and it would, of course, be helpful to learn more about the thinking of Stalin's successors. There, however, the pros end; for if these men want serious negotiation, the Lugano offer gives them full opportunity.

Return with Zest

PARLIAMENT has resumed with a zest not wholly due to the physical and nervous refreshment of a ten week recess. The Government has gained confidence from the restoration to health of Sir Winston Churchill, Mr Eden and Mr Macmillan who, quite apart from their importance within the Cabinet, are probably its three most polished Parliamentarians. They provide renewed strength where it is most needed, on the floor of the House of Commons. All three were promptly tested, for between them they practically monopolised the despatch box for the first 80 minutes after reassembly. It is too early to reach firm conclusions but for the moment all three men seem able to play their important roles.

The Opposition returned to Westminster anxious to show off its new-found unity and sense of direction and quickly chose, in the Trieste and Guiana crises, two issues on which to show its mettle. Whether these were well chosen time will show, but Labour MPs are already faced with a threat to the accord reached at Margate. Mr Bevan is challenging Mr Morrison in the election for the deputy leadership of the Parliamentary Party. This must partially revive the former personal bitterness and undo much of the harmony recently achieved.

To the items of political interest expected to engage Parliament's attention—Trieste, Guiana and the Evans case—the Government made an unexpected addition when Sir Winston Churchill announced the abandonment of the plan to restore the university seats in the House of Commons. As

restoration was firmly promised in the last two Conservative election manifestos, Sir Winston understandably had to accept a good deal of ribaldry from his opponents. No one, however, seemed to notice at the time that he was at pains to specify that what he was dropping was restoration in the House of Commons. The possibility of university representatives sitting in a reformed House of Lords—an idea taken up in the recent Bow Group pamphlet—is therefore not excluded. There seems no chance of the Government being able to give this problem early legislative attention, but the Conservatives retain a general desire to revise the composition of the House of Lords much on the lines discussed at the all-party talks in 1948. The proposals then agreed could without difficulty comprehend a block of University representatives.

Tory Infiltration

THERE is no reason to disbelieve the Tories when they say that their councils of conservative trade unionists are not designed to "undermine or impair in any way the necessary and legitimate functions of the TUC." The councils, as the Conservative Central Office pointed out last week, are neither new nor industrial. Mr Harold Watkinson, the Parliamentary Secretary to the Minister of Labour, has described them as part of his party's domestic organisation; and that is what they seem to be, however loudly Mr Morgan Phillips may protest that they comprise "a great army of industrial secret agents," all working for the Tory party.

The Tories want to loosen the trade union movement's intimate connection with the party that it helped to found more than fifty years ago. They hope to do so by encouraging the Tory "minority opinion" within that movement.

HOUSING PROGRESS
Permanent Houses Completed in Great Britain
THOUSANDS

Mr Phillips sought to blacken the plan by comparing it to Communist infiltration, and it is perfectly true that the Communists have tried to do the same, although with more success. But neither party has yet tried to form a trade union movement of its own. The very thought is absurd in a country where the unions have gained so much by their unity. In Britain, unlike France, the trade unions are united and will stay united, even though some trade unionists vote Tory and a few Communist while the majority vote Labour. What the Conservatives are trying to do is to convert the unions from within. The conversion process, as they see it, can best be done by Conservative working men who know their party's policy. If these working men are encouraged to consult together in the trade unionists' councils they can not only learn the party's policy but also help to form it by transmitting their suggestions from the workshop to the "Trade Unionists' National Advisory Committee." This committee, as Mr Harold Watkinson emphasised at the Tory conference at Margate, can advise the executive committee of the National Union, which is the Conservatives' nearest equivalent to the Labour party's national executive.

Such a piece of organisation is perfectly logical and probably has its Communist equivalent. It may not suit Mr Phillips, but it is legitimate and has never been secret. The Keatinge Committee's report, which provoked Mr Phillips' wrath, put the issue plainly enough.

... The winning of the next election by a working majority may well depend on the party's capacity to retain and increase its influence among trade unionists. Moderate trade unionists are looking for a lead and the opportunity was never greater.

It is votes that the Tories are after, not the trade union movement, and Mr Tom O'Brien, of all people, is not well placed to complain because other people are seeking to alter the political fixation of the unions.

Strike against Efficiency

THE strike that has this week threatened to bring most transport in London to an early standstill, for lack of fuel, has no shadow of justification. The strikers, who are the drivers of oil and petrol tankers, have been acting without the support of their union.

Obviously, the men's chief demand is that they should not have to work with non-union labour, and they have thrown in a claim for an extra 10s. a week. But the real motive for the strike seems to be an attempt to resist the oil companies' efforts to rationalise the distribution of oil and petrol. The companies want to handle with their own lorries only the biggest loads, distributing these to large depots. Local contractors and agents would then be used to parcel out the small deliveries. The companies also want to eliminate as far as possible the mate who sits almost uselessly beside the driver. On these points they have been negotiating, properly and cautiously, with the Transport and General Workers' Union. But the men, fearing that the new arrangements would mean fewer jobs, less overtime, and lower pay from the local contractors than they have been getting from the oil companies, have taken matters into their own hands. Their wage claim

itself is an additional gesture against their own union leaders, who were in negotiation with the employers about an offer of 5s. 6d., conditional on an agreement about unnecessary mates.

The public, in short, has been threatened with great inconvenience and a breakdown of food distribution largely because a few thousand men, by-passing their own leaders, are resisting measures to raise productivity. It will do great damage if this kind of blackmail is allowed to succeed. Firmness on the part of the employers should be matched by strong union condemnation of the rebels. The use of troops to drive the tankers would certainly be legitimate if it is the only way to keep food distributors' vans and other essential services working.

Case for Delay in Trieste

TIME has not, so far, made the situation in Trieste any easier. The London meeting of Mr Eden, Mr Dulles and M. Bidault has come and gone without providing any pronouncement about their next move except to invite the Italians and Yugoslavs to a conference. Plainly there ought to be such a conference, but the Italians are refusing to attend unless the British and Americans first carry out their promise to let them have Zone A. Marshal Tito, on the other hand, says adamantly that if there is to be a conference—as he originally suggested—then it must be without prior conditions of any sort. Since this is, in fact, the only basis on which it could reasonably be held the centre of the deadlock lies for the present in Rome.

Politicians and statesmen often give the impression that they must have something up their sleeves. They could not, it seems to the public, be so foolish as to embark on some of the courses they choose, unless they know more than can be revealed to the outside world. Unhappily, history shows time and again that there was not, after all, more up the sleeve than met the eye. It seems almost incredible that Italy should have been promised Zone A in such public fashion without very great care being taken to see what Belgrade's reaction would be. If Marshal Tito did not appear likely to react as strongly as he has done, one of the factors that may have prompted him to do so and might have been better anticipated, is the approach of the elections now due in Yugoslavia next month. Communist elections are customarily dismissed in the West as deceit, but Marshal Tito is known to consider them important. The allies, therefore, having postponed their move in the Trieste question until well after the Italian elections, would have been well advised to wait until the Yugoslavs had gone to the polls. As it is, Marshal Tito has felt it necessary to indulge in the sort of talk that was common among dictators in the thirties, so making himself more popular than he has been since the break with Moscow and the Cominform.

Unless Signor Pella, the Italian prime minister, can retract—which is unlikely—it seems that the question of the meeting may have to be postponed till after the Yugoslav elections. Provided that the allies reassure the people of Trieste that their troops will not leave meanwhile, a delay of this kind might let tempers cool.

Opening Day in Bonn

THE most unhappy member of Dr Adenauer's new cabinet must be the Minister of Finance, Dr Schaeffer. In spite of his warnings that there must be economies in view of a serious uncovered budget deficit, the cabinet has been enlarged to nineteen members, four more than before. The fact that some of the new ministers are without portfolios is hardly likely to prevent them from setting up new bureaucracies in the already over-governed Federal state. This inflation in jobs was necessary in order to accommodate all the various claimants from the coalition parties, and to ensure that more attention is paid to social welfare. A newcomer, the refugee party (BHE or All-German Block) had opted for Dr Adenauer in the elections, after frankly announcing that it was ready to support whichever side offered the best terms to the refugees and disfranchised former Nazis. Now its leader, Herr Kraft, has become a minister without portfolio. The former mild minister for refugee affairs, Herr Lukaschek, has been replaced by a more vigorous champion of this discontented group, Herr Oberlaender from Bavaria. Indeed, the strengthening of the nationalistic refugee influence is the most notable, and the least welcome, change in the new government.

There were no surprises in the economic policy outlined by Dr Adenauer in his inaugural survey to the *Bundestag*. The liberal-conservative line is to be pursued. The state is to relax its grip on the capital market. Dr Schaeffer is to reform the extremely complicated tax system. Building will be made more attractive to private capital, presumably by relaxing rent restrictions, while family allowances will be raised. The government will work for convertibility in co-operation with other countries—which means that the cautious Dr Schaeffer will continue to place a brake on the exuberant Dr Erhard, who sees no good reason why foreign exchange restrictions should not be abolished overnight.

On foreign affairs, Dr Adenauer again made it plain that

he does not envisage any alternative to the European Defence community which must be established before any "Locarno" is offered to the Soviet Union. The German people, he insisted, further, could never recognise the Oder-Neisse frontier though this problem must be settled by peaceful negotiation. These are all well-known and respected principles of the Chancellor's. It would be wrong, however, to conclude that there will be no stiffening of the German attitude towards the western powers as the result of the elections. Dr Adenauer himself demanded that the Federal Republic should have the freedom granted by the Bonn treaties without waiting for their ratification by other interested governments, and it would be unfair to refuse this proposal. It will not be the last. There will be many other ways, such as demands for the return of confiscated assets abroad, in which the Germans' increased self-confidence will be asserted.

Japanese Export Drive

THE government of Mr Yoshida, faced with an increasing deficit in its foreign trade, has drawn up an emergency plan which relies heavily on the willingness of the sterling area, France and other countries to relax import restrictions. It proposes also to foster "switch" deals, in which Japan will sell dollar goods to countries with which it is running the largest overdrafts. It will be recalled that the Bank of England tried an experiment of this kind in order to reduce

the British deficit in the European Payments Union, but had to abandon the scheme after a few days, owing to the rush that ensued from foreign, particularly German, buyers. The Japanese have it in mind to sell to West Germany \$8 million worth of "switched" goods, as well as to increase their present exports by \$15 million. The Netherlands and Sweden are also to be sold dollar goods in this way. "Switch" trade is to be carried on in raw cotton, raw wool and soya beans, and \$30 million are to be set aside for this purpose out of funds for special imports from the dollar area.

Another plan is to couple "hard" imports and exports in trade with thirteen countries with which Japan has a

2908, 2910, 2912, 2914, 2916, 2918, 2920, 2922, 2924, 2926, 2928, 2930, 2932, 2934, 2936, 2938, 2940, 2942, 2944, 2946, 2948, 2950, 2952, 2954, 2956, 2958, 2960, 2962, 2964, 2966, 2968, 2970, 2972, 2974, 2976, 2978, 2980, 2982, 2984, 2986, 2988, 2990, 2992, 2994, 2996, 2998, 3000, 3002, 3004, 3006, 3008, 3010, 3012, 3014, 3016, 3018, 3020, 3022, 3024, 3026, 3028, 3030, 3032, 3034, 3036, 3038, 3040, 3042, 3044, 3046, 3048, 3050, 3052, 3054, 3056, 3058, 3060, 3062, 3064, 3066, 3068, 3070, 3072, 3074, 3076, 3078, 3080, 3082, 3084, 3086, 3088, 3090, 3092, 3094, 3096, 3098, 3100, 3102, 3104, 3106, 3108, 3110, 3112, 3114, 3116, 3118, 3120, 3122, 3124, 3126, 3128, 3130, 3132, 3134, 3136, 3138, 3140, 3142, 3144, 3146, 3148, 3150, 3152, 3154, 3156, 3158, 3160, 3162, 3164, 3166, 3168, 3170, 3172, 3174, 3176, 3178, 3180, 3182, 3184, 3186, 3188, 3190, 3192, 3194, 3196, 3198, 3200, 3202, 3204, 3206, 3208, 3210, 3212, 3214, 3216, 3218, 3220, 3222, 3224, 3226, 3228, 3230, 3232, 3234, 3236, 3238, 3240, 3242, 3244, 3246, 3248, 3250, 3252, 3254, 3256, 3258, 3260, 3262, 3264, 3266, 3268, 3270, 3272, 3274, 3276, 3278, 3280, 3282, 3284, 3286, 3288, 3290, 3292, 3294, 3296, 3298, 3300, 3302, 3304, 3306, 3308, 3310, 3312, 3314, 3316, 3318, 3320, 3322, 3324, 3326, 3328, 3330, 3332, 3334, 3336, 3338, 3340, 3342, 3344, 3346, 3348, 3350, 3352, 3354, 3356, 3358, 3360, 3362, 3364, 3366, 3368, 3370, 3372, 3374, 3376, 3378, 3380, 3382, 3384, 3386, 3388, 3390, 3392, 3394, 3396, 3398, 3400, 3402, 3404, 3406, 3408, 3410, 3412, 3414, 3416, 3418, 3420, 3422, 3424, 3426, 3428, 3430, 3432, 3434, 3436, 3438, 3440, 3442, 3444, 3446, 3448, 3450, 3452, 3454, 3456, 3458, 3460, 3462, 3464, 3466, 3468, 3470, 3472, 3474, 3476, 3478, 3480, 3482, 3484, 3486, 3488, 3490, 3492, 3494, 3496, 3498, 3500, 3502, 3504, 3506, 3508, 3510, 3512, 3514, 3516, 3518, 3520, 3522, 3524, 3526, 3528, 3530, 3532, 3534, 3536, 3538, 3540, 3542, 3544, 3546, 3548, 3550, 3552, 3554, 3556, 3558, 3560, 3562, 3564, 3566, 3568, 3570, 3572, 3574, 3576, 3578, 3580, 3582, 3584, 3586, 3588, 3590, 3592, 3594, 3596, 3598, 3600, 3602, 3604, 3606, 3608, 3610, 3612, 3614, 3616, 3618, 3620, 3622, 3624, 3626, 3628, 3630, 3632, 3634, 3636, 3638, 3640, 3642, 3644, 3646, 3648, 3650, 3652, 3654, 3656, 3658, 3660, 3662, 3664, 3666, 3668, 367

bilateral clearing agreement. In this way, foreign trade merchants will receive priority import licences for such commodities as sugar, pulp and raw wool if they sell increased quantities of iron and steel products, fertilisers, whale oil and industrial equipment. Increased exports to the sterling area are to be rewarded by special rights for importing dollar goods. This system is expected to cost up to \$30 million. In addition, various restrictions on trade with the Near and Middle East and Latin America are to be removed, and the Japanese Export-Import Bank has been empowered to grant better credit terms to facilitate investments or sales overseas, and to foster imports of commodities that will help the export drive.

In view of the continued fall in Japan's sterling holdings the authorities are anxious not to wait until the trade talks with Britain that are due in December, and a special envoy is said to be arriving in London this month to sound out the British attitude towards concessions. Japan has been securing sterling against dollars by the so-called "swap deals" with the Bank of England and will presumably want to continue this hand-to-mouth method. But, in addition, it is evident that the Japanese will press for relaxation of import restrictions in the Commonwealth countries.

Fishy Dealers

FOR the first time for nearly eighteen months, an Icelandic trawler landed fish at a British port last week. It thereby launched the long-heralded contest between British trawler-owners and Mr George Dawson, who is attempting to break their boycott of Icelandic fish. The arrival of the trawler found both sides well prepared. Under pressure from the trawler-owners, only one of the local merchants bought Mr Dawson's fish at public auction. He hopes, however, that his own merchanting and processing organisation will be able to deal with all the fish he proposes to bring in under long-term contract from Iceland and elsewhere. When the attempt to sell by local auction failed, he transported the fish direct to Billingsgate; and he has announced that he hopes to bring twelve Icelandic trawlers a week to Britain by the end of November. But an important firm has turned to different tactics, trying to price the Dawson fish out of the wider market.

There is no doubt that Mr Dawson, though self-confessedly no Sir Galahad on a white horse, has the housewife's sympathy. But who will win, and whether on points or by a knock-out, is far from clear. The serious issue behind a story that makes such good breakfast-time reading is that of monopoly practices. Mr Dawson is bringing to the notice of the Monopolies Commission his failure to buy ice from a Grimsby company; it is also reported that a merchant's bids for other fish were refused at a Grimsby auction after he had bought Icelandic fish. The dispute is also showing signs of moving into the courts. The Grimsby Town Council decided not to prosecute Mr Dawson for an alleged failure to have some of his fish examined by the port health officers, but he himself has issued a writ against another trader for alleged slander.

It may be wrong to think that all this has much to do with the future price of fish, whoever wins, but the trade

has not won public sympathy by its actions. What started as a protest against the Icelandic government's action in an international matter has become a domestic squabble that certainly appears to involve, whether rightly or wrongly, attempts to hamper competition as economists (though not, necessarily, lawyers) would see it. The result is that it has become virtually impossible for the British Government to intervene effectively in the original dispute.

Credits Discredited

HARD cases make bad economic policy as well as bad law; that, in sum, has been the answer of successive Chancellors to pleas for the repayment of postwar credits, whether *in toto* or merely to other special groups besides old-age pensioners. Such a release of purchasing power would certainly have been entirely inappropriate to an economy suffering both from inflation and from excessively high taxation. None of the speakers at the recent Conservative conference argued that this situation had greatly changed. They called for a lowering of the age qualification but did not claim that the time has come to use the postwar credits—as it was originally supposed that they would be used—as a weapon against depression.

There is, however, another aspect of the issue, which rests neither on the argument from hard cases nor on fantasies about an approaching depression. It is that unless the postwar credits are released fairly soon it will never be possible, however urgent the need, to use any such device again. The state is well equipped with devices for encouraging production and consumption simultaneously. But to restrict consumption without simultaneously damping down production is extremely hard; taxation at a sufficient level may paralyse incentives, controls of sufficient efficiency may fill the bearings of the economic machine with grit. The merit of deferred credits (postwar or post-crisis) is that they can restrict current spending while leaving people with something to work for—provided they have a reasonable faith in the value of the pledges. Forced savings are in this respect better than taxes, if people believe that they will not be forced for ever. As matters now stand, with the stigma of a "monstrous swindle" attached to the postwar credit scheme, no pledge of eventual repayment would have the slightest sweetening effect on a necessary pill of higher taxation. The promise would elicit no effort but a resounding horse-laugh.

To reinstate this potential weapon in the armoury against future inflation is not, certainly, worth an actual inflationary move today. But the value of doing so, and therefore at some point of choosing this rather than other budgetary reliefs, should be kept in the Chancellor's mind.

Private School Paradise

SMALL classes, inappropriate buildings and nice manners seem to be the hallmarks of the private day school. Or so it is in Surrey, where as many as one child in every five

goes to a private school. This predilection for paying school fees is no reflection on the local education authority, but a mirror of the county's attraction for the middle class. While father commutes he puts his money on the grounding or the gloss that the private schools will, he hopes, give to his children.

The Surrey Education Committee naturally does not quarrel with this attitude, but it is concerned to know that the 38,000 children withdrawn from its direct responsibility are adequately educated and that the parents are getting some at least of their money's worth. It has carried out an inspection of 307 schools. While the Education Act of 1944 provides for the compulsory registration of all independent schools and gives power to close them, this section is not yet operative. But the Surrey authorities have now published a summary of their findings.

About a quarter of the children are in schools that are good or very good and 8 per cent in schools that are poor. Only one per cent are in very poor schools. The most important difference between the private schools as a whole and the state schools lies in the ratio between teachers and pupils. In the private schools of Surrey there is one teacher to every 17 pupils. In England as a whole the average in primary schools is 1 to 32 and in secondary schools one to twenty-one. The extra teachers' time is clearly something worth paying for. On the other hand, private school buildings have rarely been constructed for the purpose; they are frequently cramped, overcrowded and ill-plumbed, and the equipment compares unfavourably with state schools. The curriculum is often more formal and restricted than that of state schools. He who pays the schoolmaster calls the tune, and the private schools reflect the anxieties and hopes of parents; the bad schools reflect their ignorance and misdirected ambitions for their children.

No Limelight for the Colombo Plan

THE free press has shown an extraordinary lack of interest in the recent meeting in Delhi of the Commonwealth Committee of the Colombo Plan. Not so the organs of Moscow. For the ordinary British reader the long-drawn-out complexities of the plan may be thought dull, but for the Communist propagandist capital investment is exploitation, whether the money comes from local capitalists or from distant imperialists: and, since no credit for sincerity of purpose can be given to the non-Communist world, Moscow has been using the Colombo Plan as a welcome target for its salvoes of lies.

The Consultative Committee concluded its work last Saturday under the chairmanship of Mr Deshmukh, India's able Finance Minister, and got through a full and useful agenda. One of the most important functions of these more or less regular meetings is to draw up an annual report on the progress of the plan. This one is expected to be ready for publication, simultaneously in each of the capitals which are members of the plan, by about December 15th. Among other things, the meeting also decided to set up a small permanent information unit, which would help to stimulate "increased understanding of, and interest in, the Colombo Plan and its aims and objectives." To judge from the growth of a rather cynical apathy in Britain—in spite of

a certain political "interest" in the problem of developing underdeveloped territories—this effort has come none too soon.

The Consultative Committee was created at the meeting of the Commonwealth Foreign Ministers in January, 1950. It met at Sydney in May, 1950, London in September of the same year, Colombo in February, 1951, and Karachi in March, 1952. The next meeting is to be held in about a year's time in Canada. By then, it will be possible to assess the amount by which achievement may have fallen behind the original programme during the first half of the chosen span of six years. If the proper decisions are then to be taken for accelerating progress in the second half, western as well as Asian public opinion must appreciate the issues and problems better than it appears to do at present.

Saudi Arabians on Strike

FOR the first time in twenty years of work for their American oil company (Aramco), Saudi Arabian oil workers have gone on general strike. About 13,000 out of the company's 15,000 Saudi Arabian employees are involved. The immediate cause of the strike was an act by the Saudi

Wage Demands

SIR,—I believe it is a maxim of the political economists that every man should be allowed peaceably to get as much as he can for his commodity, and that the seller will probably be a better judge than any uninterested party, however learned in their science, of what that maximum is. Public writers who censure violently the workmen's demands, and counsel the masters not to yield to them, appear to me sometimes to lose sight of these maxims.

It is also, if I am not mistaken, admitted by these same political economists . . . that A's refusal to sell is at least as good a proof that the market price has not been offered, as B's refusal to buy is a proof of the contrary. Writers who point to the simple fact of the refusal to comply with the men's demands as irrefutable evidence that they should not have been made, appear to me to forget this maxim also. . . . A general bullying of the "bears," or an overbearing attack upon the "bulls," might probably have some influence on the Stock Exchange; but it would neither be fair towards the "bulls" or the "bears." I suppose we feel this, for no writer interferes with them to damage or uphold either side. Now, we are simply "bulls," and our employers (without offence) are "bears." Might it not, then, be wiser, after all, to let us alone too?—I am, Sir, yours very respectfully, W. M. T.

(W. M. T. misunderstands the question at issue. . . . All sellers are justified in getting as much money as they can in the open market for their commodities—all buyers are justified in getting those commodities for as little money as possible; but all sellers and all buyers do not combine to force the other party to come into their terms. What is condemned . . . is the combination of one set of men to compel another set to agree to what they propose. The demand is accompanied by a threat, which is not the custom of open markets.—Ed. Econ.)

The Economist

October 22, 1853

Arabian government which—possessing as it does most of the characteristics of a competent mediæval court—forbade the oil workers in its eastern coastal province of al Hasa to form unions, and arrested about 100 of the ringleaders who wished to do so. In the programme of the would-be trade unionists are the classic demands for wages equal to those of Americans who, as yet, have higher capacities. But no such demands have actually been put to the company. The government has declared martial law in al Hasa province, and, apart from a few stonings of cars and overturnings of buses, little physical damage seems to have been done. Oil output continues unimpaired because the company's non-Saudi complement of some 10,000 Americans, Pakistanis, Indians, Palestinians, Italians and Adenese (given in order of numerical importance) have kept all plant running.

The material losses caused by the strike may be unimportant, but its psychological effects are highly significant. Aramco has long prided itself on behaving as a guest in King Ibn Saud's country and therefore on making many less mistakes than some of its counterparts in other states. This strike reveals that, no matter how it handles its labour relations, it is not proof against inconveniences and onslaughts caused by local growing pains. These onslaughts are quicker to mature in more developed countries, such as Persia or Iraq, than in backwaters such as al Hasa province or Qatar, but in due course they blossom there also.

Across the Water

THE London County Council is to be congratulated on its plans for development along the south bank of the Thames. The opportunities provided by a famous river winding through the midst of the city have been scandalously neglected in the past. "The water" has been allowed to be a drab barrier instead of an aid to variety, gaiety and good architecture.

The area for development has been lying fallow since the Festival Exhibition ended, except for the Waterloo terminal for air services and the Festival Hall itself. Several public bodies have had their eyes on the spot, but the Ministry of Works has finally given up its claim to build government offices there and the LCC is free to make its plans. The area in itself is not large, but the essence of the scheme is that it should create a sense of ease and open space. The river front is to remain a public promenade 100 feet wide and there are to be two squares with open strips running down to the Thames and garages underneath. But within the area bounded by County Hall and Westminster Bridge the LCC proposes to fit an international conference hall, office buildings for the Shell Petroleum Company, a national theatre, a large hotel and an exhibition gallery, as well as the existing air terminal (the site of which will probably be moved) and the Festival Hall. The list has a pleasing variety, and this extends to the architectural scheme which aims at breaking up the line of the river by variations in height and by design in depth. The aim is to give as wide a view of the river as possible, and the buildings that stand furthest back, notably the Shell offices—will have a commanding look.

That plan is still at an early stage, but the LCC has hopefully included it all in a five-year development

schedule. No one will pass final judgment until it can be seen what manner of architecture is intended, but at least it seems likely that a dent will be made in the dismal inconsequence of the south bank.

The Third Men

THE BBC has been finding out whether the Third Programme is heard by the people for whom it is intended. The people interviewed were classified by investigators according to their education, intelligence, interest in Third Programme subjects, and finally according to the kind of newspapers and periodicals that they read. (To read *The Economist*, be it said in all modesty, is taken as one indication of ripeness for the Third Programme.) The audience research unit then decided what combinations of these four ingredients made a person a "good prospect" for the Third Programme, what made him a fair prospect, and what poor or very poor.

The results are published in the current *BBC Quarterly*. It appears that, on this reckoning, 2 per cent of the sample were good prospects, 6 per cent were fair, 12 per cent poor and 80 per cent very poor. Of the good prospects one quarter listened to the Third Programme at least once a week, but over a third never listened to it at all. If the good and fair prospects together are taken as the Third Programme's proper market it appears that only a fifth hear it once a week or more. On the other hand, of the poor prospects 9 per cent do hear it at least once a week and even of the very poor prospects 3 per cent do so. As these groups are so much larger, the odd result emerges that the Third Programme has a far bigger market among the supposedly philistine than among the cultured.

The fact that the Third Programme cannot be heard all over the country does not explain its failure to reach all the people who might be expected to listen. Fourteen per cent of the good and fair prospects said they had never even tried to hear it. The programme makes least appeal to the unmusical, since over half its broadcasting time is spent on serious music. Its talks, discussions and features are of high quality; but those who are capable of appreciating them are also those who have least lost the habit of reading, as opposed to looking and listening. Finally, the Spoken Word can be very trying when the technique of good broadcasting has been sacrificed to erudition.

Letters to the Editor

Too Much Consumption?

SIR—Many experienced distributors in Manchester would not agree with your suggestion that purchase tax no longer has any marked effect on sales of "soft" goods such as clothing and textiles, but even if such were the case it would be only part of the story. The public have switched to the cheaper type of fabrics—i.e., they now predominantly buy below the D line, especially in furnishing fabrics and household textiles so that the question of purchase tax does not arise. Lancashire's regret is that her valuable export trade in types above the D line is injured by lack of home market trial ground and backing for stocks. According to my information the position here is getting worse rather than the contrary. The better quality lines in cotton, rayon and linen are definitely not being adequately stocked by the retailer, and are not being sold in consequence; and therefore the ranges are being unavoidably cut down or even discontinued by the producers.

The following extract from a letter received by one of my colleagues from the merchandise director of one of the best department stores in Europe who recently visited this country on a buying mission strikes me as evidence of real significance:

My further experiences in England made me realise that you will really do a very good job if you can abolish the purchase tax. To my mind it is seriously hampering the industry to make their best efforts in the top end market, and I do think this has a great importance for the development of better qualities and new designs.

—Yours faithfully,

E. RAYMOND STREAT, Chairman
The Cotton Board, Manchester

Cold Fish War

SIR—You mentioned a dispute between the Icelandic Government and British trawler owners. The latter are at best self-appointed campaigners in the dispute over the Icelandic territorial waters and unhappily their intervention has only succeeded in disrupting normal trade between the two countries, and, it seems, in preventing this dispute, to which the two Governments are the only parties, being submitted to the International Court at the Hague for settlement.

Your Note stated that the British trawler owners "succeeded in putting a total stop to imports of Icelandic fish into this country." Whilst this, no doubt, is meant to refer only to Icelandic trawler fish, fresh on ice, as such fish is normally imported, this state-

ment may be misunderstood. The fact is that a few thousand tons of quick frozen fish, fish fillets and wet salted fish have been imported from Iceland into the United Kingdom since the trawler owners commenced their crusade against Iceland.

"The proper approach," your Note said, "would be an international inquiry into problems of overfishing in the breeding grounds." As Mr Elisson pointed out in his letter in your issue of October 17th, this inquiry was held in 1937 and besides there was the Over-Fishing Convention of 1947. The fate of the fishing grounds off the coast of Scotland, once prolific, would surely help at least those most affected, namely British fishermen, to understand the necessity and inevitability of Iceland's action. It is difficult to imagine who would object to the fishing grounds around Scotland, the Orkneys, the Hebrides and the Shetlands being protected in the same way as those of Iceland and Norway now are.

By now the cold war has warmed up through Mr Dawson's importation of Icelandic caught trawler fish. If Mr Dawson wins, perhaps the trade between the two countries will get back to its normal and legitimate course and the relations generally regain their traditional character. If Mr Dawson loses, then British trawler owners and wholesale merchants can put back on their prices the sixpence they took off to undercut Mr Dawson, but Iceland is not likely to barter her future existence for a few trawler landings.—Yours faithfully,
SIGURST MAGNUSSON
Icelandic Consulate General, Edinburgh

Supports for Farming

SIR—Your articles present a regrettably one-sided picture of the situation. In discussing agricultural marketing, no one would dispute that there ought to be extra rewards for quality, whatever the commodity may be. That there should be extra rewards for "skill in selling" is a very different proposition. With cereals this implies anticipation of the movements of the international grain trade and the buying policy of the millers; this is the prospect that farmers (and, therefore, the NFU) view with some misgiving. With livestock it calls to mind prewar conditions when buyers' rings too often prevailed. As the Lucas Report points out, several hundred thousand individual farmers who sell their stock at irregular intervals cannot hope to bargain on equal terms with buyers who are increasingly well

organised and in constant touch with the trade concerned. On the other hand, a marketing board as proposed by the farmers for fat stock would have to face the competition of imports and would be subject to stringent safeguards under the marketing Acts.

The expansion in agricultural production has been stimulated as much by the publicity campaign which is still being run by the Ministry of Agriculture as by the prices which have been announced from time to time. Surely it is not suggested seriously that the Government, having stimulated production by promises and ballyhoo, should now invoke the law of supply and demand to reduce prices steadily to the level of the bargain basement. Apart from any considerations of ethics, would this really be in the national interest?

Be it remembered that our exports are dependent on the whims of overseas buyers, that the surplus of North American grain is not necessarily permanent; indeed, it is largely illusory; as the recent FAO report points out, it arose through a succession of good harvests, and 70 per cent of mankind is still underfed. Be it remembered, too, that the recent award to agricultural workers was made on the grounds of disparity between agricultural and industrial wages; that farmers' incomes are modest when increased capital, increased effort and the effects of inflation are taken into account; that farmers have for 14 years accepted prices lower than could have been obtained on a free market; that other industries have a wide spread of costs with far less justification; and that there is no valid reason why the rural community should be expected to return to prewar conditions of inferiority.—Yours faithfully,

H. J. TOOLY

Bransford, Nr. Worcester

Polish Church Beheaded

SIR—In the Note in your issue of October 3rd, you conclude by stating that it appears the Polish Episcopate has accepted the situation created by the arrest of Cardinal Wyszyński, the Polish Primate. Apart, however, from the fact that Cardinal Wyszyński did not appear at the evening service on Saturday, September 26th, and that the government has announced his suspension, we have as yet received no reliable news about the attitude of the Polish Episcopate. All we know comes from Communist official sources and is very much open to doubt. In view of the great distances involved, it seems unlikely that even a majority of the bishops could meet in Warsaw by Monday morning, September 28th, since the Cardinal was arrested in the early hours of Saturday, September 26th, but this fact was not made public till Monday, September 28th. What is even more astonishing is that the Episcopate should have made a statement of vital importance in the heat of the moment before consulting all the bishops, as has been the practice hitherto. Moreover, this statement appeared all over the Polish press with-

out any signature. Up till now, any statement of the Polish Hierarchy, even on routine matters, has invariably been signed at least by the Bishop-Secretary of the Episcopate.

I suggest that before we pass an opinion on these tragic events we should at least have some reliable evidence that the facts on which we base such an opinion are true. Otherwise, we might well fall into a trap set by the Communists, who could easily broadcast false information.—Yours faithfully,

JULIUS LADA

London, W.1

[Our Note was clearly a provisional judgment on the basis of the evidence then available. Since then we have learned that the Episcopate's statement was in fact unsigned and that only eight of the Polish bishops were present when it was drawn up.—EDITOR.]

Moscow Misses a Date

SIR,—May I add to your Note of October 10th that not only *Scanteia* but all the Rumanian newspapers commemorated on October 4th the anniversary of the Congress of the Soviet Communist Party? In the long anniversary articles there was no mention of Stalin's speech, so often quoted in the past year, nor of his famous "work of genius" on economic problems. Finally it is worth noting that the only name printed in these articles is that of Malenkov.—Yours faithfully,

Russia and China

SOVIET POLICY IN THE FAR EAST: 1944-1951

By Max Beloff.
Oxford University Press (under the auspices of the Royal Institute of International Affairs). 278 pages. 21s.

IN this admirable book Mr Beloff provides chapter and verse to bear out his general theme that the Russians are by no means the all-seeing, self-controlled planners they would like us to think. Their Far Eastern policy during the last few years, Mr Beloff suggests, has been quite as haphazard and hand-to-mouth as that of any bungling bourgeois. They were taken by surprise when the Chinese Communists did at last snowball their way to power. And, though Mr Malenkov is now making up for lost time by falling over backwards in his efforts to conciliate Mao Tse-tung, it is a historical fact that Stalin went on recognising the Nationalists for some time after they were doomed. Soviet historians have since had a little difficulty in accounting for this Russian attitude.

As a historian himself, Mr Beloff has done a useful and excellent job in charting the course which events have taken in the Far East since the war. He covers the ground in an unusual way, and he includes the results of a good deal of his own expert research. This volume forms, in fact, a companion in a limited but crucial field to his earlier "The Foreign Policy of Soviet Russia, 1929-1941." It is something of a pity, therefore, that many of his own comments are so guarded—a limitation which is in part due to the reservations imposed by the type of documentary publication that Chatham House no doubt had in mind when sponsoring the book. It would be of interest, for instance, to know more of what Mr Beloff personally thinks about the development of Sino-Soviet relations. As regards the past, how far was help from Moscow a significant factor in the eventual success of the Chinese Communist revolution? Mr Beloff does not leave any clear impression about this most interesting point. Discussing the present, he plays down the idea that there is anything to cause real friction between Moscow and Peking in the early future; but, although he might be going beyond the brief of a historian proper, Mr Beloff would be less tantalising if he were to let the reader a little more into his own expert confidence.

Apart from Moscow's dealings with China and its relations with the United States on the consequent international

issues—to all of which a hundred pages and four chapters are devoted—Mr Beloff has written fifty pages each on the Soviet Union's handling of Japan and of Korea. He throws out the striking observation, incidentally, that, in contrast to the agreements concluded by the Soviet Union with other Communist states, Moscow appears never to have concluded a general treaty of friendship and mutual assistance with North Korea—possibly because it "wished to avoid public commitments, which would directly oblige . . . [it] to go to the assistance of the North Koreans." There is also a rather briefer chapter on Soviet policy in South East Asia contributed by Mr. J. Frankel. It is surprising that neither the author nor the publisher has thought it necessary to include a map.

In a final chapter on conclusions, Mr Beloff sums up with the view that "the opportunities afforded to Communism by the collapse of the European and Japanese empires in Asia have been fully exploited." But, he adds, we should remember that

the extension of the actual area of Sovietisation has resulted, with the partial exception of Manchuria, rather from the weakness of the opposition to it than from positive contributions of strength from the Soviet Union.

This is to some extent a comforting thesis. It hammers home, however, the lesson that Soviet policy is expansionist and provocative when the outside world is weak but cautious and pliable when faced with resolute containment.

Unturned Key

ANEURIN BEVAN.

By Vincent Brome.

Longmans. 244 pages. 15s.

THERE are purists who would say that a biography whose subject is barely 56 must be a failure. A comparatively youthful politician like Mr Bevan cannot be shown in the round. The biographer is too close to the man to take a long view, to assess even part of a political career and achievements in their context. Yet he is also unable to provide the full illumination of details that might compensate for lack of perspective; too much of the intimate political history of the past twenty-five years is not yet known, or if known cannot be frankly written about. What exactly were, for example, the "manœuvres" by which, on his own account, Mr Bevan sought to get his way within the Labour Cabinet? And how often, before 1951, did he fail? These are among the many important ques-

tions, in any assessment of Mr Bevan, about which little can yet be told.

Nevertheless, a book about Mr Bevan at this juncture should, in principle, be welcome. For more than two years he has been the most distinctive and interesting figure in British politics. Even if his power should now prove to have faded entirely and permanently, his part in wartime and postwar history can never be ignored. An interim assessment of him is worth attempting. If it cannot analyse Mr Bevan in politics, it can at least offer an explanation of the man, and the influences that fashioned him, up to the time when he leaped into wartime prominence as the scorpion plaguing the Prime Minister.

But if his purpose deserves defence against the purists, Mr Brome's achievement deserves nothing of the kind. The main interest of his work lies, indeed, in the variety of the reactions to it. It has angered Mr Bevan's friends as well as his enemies. It reads for the most part as a eulogy, perhaps because so much consists either of quotation from Mr Bevan or of summary of what Mr and Mrs Bevan have written about themselves. Nevertheless, the book has been fiercely denounced in the left-wing journals. The reasons for this anger are not clear, but the section that seems most likely to give offence is the one dealing with Mr Bevan's wartime role as a Parliamentary critic. This is described by Mr Brome largely in terms of a personal antagonism between Mr Bevan and Sir Winston Churchill. The purport of the criticism, however, was to throw doubt on the whole conduct of the war, and but for the attention he thus attracted Mr Bevan's rise to influence in the Labour Party would probably have been much slower and might never have gone even as far as it has. It would therefore be natural if Mr Bevan preferred to see his wartime struggle in wider terms than Mr Brome depicts it.

The difficulty for the reader, in this and other matters, is that Mr Brome gives him almost no help towards making his own judgment. His technique is that of the occasional snapshot: he does not provide even a sketchily continuous account of Mr Bevan's life. The documentation is throughout poor or negligible, outside the Bevan's own writings, and hardly a single fact emerges that is new to anyone who reads the newspapers. Mr Brome is, therefore, wise in attempting little assessment of character or judgment of action beyond the most trivial or non-committal.

This is a pity. A close study of Mr Bevan's early years could have been written now and would be most rewarding as a demonstration of some of the forces that have gone to make the British Labour Party of the nineteen-fifties. It might even make possible some moderately confident judgments about the Mr Bevan whose flights from irresponsibility to responsibility and back have been so often surprising. But if the key to any of this history—and to Mr Bevan's future—can be turned now, it will not be with the help of this book.

American Politics Re-examined

THE GENIUS OF AMERICAN POLITICS.

By Daniel J. Boorstin.

University of Chicago Press (London: Cambridge University Press). 202 pages. 24s.

THAT the University of Chicago breathes the last enchantments of the Middle Ages seems to be no longer true. In its restless pursuit of modernity the windy city has thrown off its Thomist dogmatism and is moving towards a new, conservative empiricism. Of this the latest manifestation—a very compelling and attractive one too—is to be found in "The Genius of American Politics." Is it too early to hail Mr Boorstin as the Burke of the Wabash? At least he has written a book which by its freshness, its wit and its *sagesse* compels one to re-examine all the dusty stereotypes about the nature of American politics.

Mr Boorstin starts with disbelief in the thesis held by so many of his fellow-countrymen: that American institutions are articles for export, that American democracy should proselytise. They are the product of the unique circumstances of America itself, the country and its history. There is no theory that can be abstracted from the practice and sold overseas. American history is the story of a successful marriage of practice and theory, but a marriage in which practice has been the better half. The very success of the American experiment has encouraged Americans to make the "is" the guide to the "ought," to use sociology or at most legal theory as a substitute for political theory. "It was not necessary here to develop a theory to prove that man could begin anew. . . . Life in America seemed itself sufficient proof." The result has been a persistent tendency to play down all clashes of values, to have a party system that blurred political distinctions, to develop an "American religion" that minimised doctrinal differences, to seek in creed and in culture the common denominator rather than the absolute.

Mr Boorstin elaborates his thesis by examining successive phases of American development—the Puritan beginnings, the American Revolution, the Civil War. His emphasis on the "seamlessness" of American development and the "givenness" of American values obliges him to make a drastic rereading of certain famous figures and movement in American history. We are told that the trumpet calls of "life, liberty and the pursuit of happiness" are much less important than the legal quibbles that make up the rest of the Declaration of Independence. We have to ignore all the revolutionary aspects of the break with Britain. Lincoln's references to slavery as a "moral wrong" and to the Messianic role of American democracy must be treated as the aberrations of a politician normally dedicated to compromise and concession. These are large questions, and Mr Boorstin's

thesis, it can be seen, raises as many problems as it solves. For that very reason this challenging and even at moments slightly arrogant book deserves a warm welcome.

Science and Society

SCIENCE AND THE SOCIAL ORDER.

By Bernard Barber.

Allen and Unwin. 288 pages. 20s.

PUT very briefly, the theme of Mr Barber's book is this: the successful development of any human activity depends upon the characteristics of the human society in which it operates; some forms of society foster its growth, and some retard it. The characteristics most suitable for a particular activity will depend, of course, on the nature of this activity; they will not necessarily be the same for all. Mr Barber is interested in the form of activity known as "science," meaning by this "western" science. By analysing the essential features of the scientific method, he specifies certain conditions which a society must provide if it is to be an "ideal type" for the encouragement of science, and he then goes on to show how western "liberal" society approximates fairly closely to this, providing a framework more congenial for scientific development than any other known alternative. The concrete achievements of physical science, and the support and respect accorded to science in western society, are presented as a demonstration of this.

The social sciences, however (economics, sociology, psychology, etc.), do not enjoy the same degree of support, and in fact face a barrier of distrust and scepticism similar to that which the physical sciences overcame two or three centuries ago, though their basic "morals" are the same. Mr Barber argues that it is irrational to adopt a rational attitude to physical science, and an intuitive one to social science; and he is confident that the latter will achieve successes just as spectacular as soon as western society grants its wholehearted confidence to the scientific method in fields where "common sense" and "human nature" are still the guides most widely trusted.

In many ways Mr Barber's analysis is excellent. It is careful, patient and clear, and in many places displays a quality of reasonableness which can see both sides of a question and discern the area of truth where they overlap. Unfortunately, however—perhaps because he is determined to raise no point that he cannot discuss thoroughly and carefully—he sticks very close to the orthodox line, presenting something more like an exposition of the standard outlook than a thorough-going vindication of it. All through the book, the reader will feel that he is being presented with conclusions against which he feels sure that powerful counter-arguments exist, even though they may be ultimately unavailing. There is one serious weakness: one suspects that western society is not, perhaps, the "ideal type" for the successful development of the social

sciences, which may require additional conditions not demanded by the physical sciences; this Mr Barber does not discuss. Several other unanswered questions, provoked by the arguments of this book, would provide scope for other volumes, which Mr Barber should be encouraged to tackle.

A considerable part of this book is occupied by a fairly detailed "case history" of scientific activity in present-day America—the forms it takes in universities, industry and Government, the status of the profession, and the degree of its general contentedness, problems of publication, and so on. This is a useful and interesting survey, but it does not go quite deep enough to serve properly as a living illustration of the arguments which have preceded it. Once again, one feels that this subject needs a larger canvas, and the human striving and tension lying beneath so many of the bald statements of the survey need exploring more fully. As it is, the two sections of the book seem to a great extent to be discussing different matters.

The style of the book is rather reminiscent of certain commercial varieties of American food—easily digested, of unexceptionable flavour, and seasoned according to formula with quotations and statistics, but for all that rather lacking in character. Here and there, however, one is brought up sharp by some startling American-style innovations, as, for instance, the use of the word "structure" as a verb.

The Sikhs in the Past

THE SIKHS

By Khushwant Singh
Allen & Unwin. 215 pages. 16s.

SARDAR Khushwant Singh's book is as good as his proof reading is careless. He combines the mastery of language which is to be expected from a novelist of his quality with a considerable scholarship and the artist's sensitiveness to the attitudes and feelings of his community. What he has to say is always said simply, clearly and with understanding. Nor does he ever try to make a case by twisting facts; he can admit that the British did so much for the Punjab in the few years after annexation that not a Sikh moved against them in 1857, and he reminds us that it was the members of the Central Khalsa Diwan, long attacked as reactionaries, who led the revival of education at the end of the nineteenth century and first created modern Punjabi literature.

Nevertheless, his book is an expression of a point of view rather than history. This is how the modern, educated Sikh of somewhat Leftist views looks at the Sikhs' past; it is not quite the past as it really was. The British annexation of the Punjab was not an undiluted aggression; the Sikhs gave considerable provocation. The Namdhan troubles in the early 1870s were isolated murders and raids of no great importance. The Ghadr rebellion of

1915 was, in fact, mainly significant for the Communist leaders it bequeathed to the future; one Sikh in 14 still volunteered to fight for the Government. The space Sardar Khushwant Singh gives to these events prevents his investigating the more interesting problem of how the Sikhs became pillars of British rule, and why their support continued till the day it became clear the British were going; the Akali troubles of the early twenties themselves never really shook the Sikh-British alliance, even though the Sikhs had an almost unanswerable case and lost 400 lives to establish it; only the Mutiny and 1942 cost more.

Sardar Khushwant Singh is at his best when he is talking of the Sikh religion. Nowhere else can there be found so concise and readable a summary of Sikh origins, sects and beliefs. Indeed the Sikh morning prayer, which he prints, is so inspiring, and has been so well translated, that it is enough by itself to make the whole book memorable.

Psychiatric Sermon

TO DEFINE TRUE MADNESS.

By Henry Yellowlees.
Sidgwick and Jackson. 215 pages. 12s. 6d.

"BEYOND all doubt, psychiatry holds a lower place in public regard than any other branch of medicine." This statement, which is at least debatable, forms the author's text for his loosely-knit series of essays.

Dr Yellowlees finds some grounds for his assertion in the exaggerated claims which a small minority of psychiatrists have made in the past few years; but more in the irrational fears which the insane have always aroused in lay people; and more still in the ignorance which other doctors and otherwise well-informed laymen still have of the facts of mental illness.

In an attempt to dispel this ignorance he deals in simple terms with elementary psychopathology, delusion, suggestion, hypnotism, anxiety neurosis, and inferiority, and there is an excellent description of morbid depression. His method is dogmatic and his manner arrogant, and there is an undertone of exasperation which in its turn will exasperate others. A curiously old-fashioned air, too, pervades the book, and much of it could indeed have been written a quarter of a century ago. In fact, referring to a gross symptom of conversion hysteria, Dr Yellowlees says "such cases were common during the war," meaning quite clearly the 1914-18 war. Such cases were to everyone's surprise uncommon during Hitler's war.

Dr Yellowlees is much concerned with the relations between psychiatry and the law, and his discussion of criminal responsibility is quite the best section of the book. Perhaps this is because it is derived from an address delivered to a legal faculty and he felt no need to talk down to his audience. He even finds something new to say about the M'Naghten rules.

In a final nostalgic chapter he

describes what it was like to grow up in a mental hospital at the turn of the century. With this unusual glimpse, and a defence of the "bad old psychiatry" practised there, he provides an end to the book that is very much better than its beginning.

Soviet Law

LAW AND SOCIAL CHANGE IN THE USSR.

By John N. Hazard.
Stevens and Sons, Ltd. 310 pages. 25s.

THIS is a knowledgeable and temperately written book which aims at "relating the Soviet system of law as an entirety to . . . the avowed aim of moulding a new society" and showing how "the formulae of the law and the institutions of the lawyer have been utilised to achieve political ends." Its author, Professor Hazard, was formerly a student at a Soviet law school and is now Professor of Public Law at Columbia University.

The first ten chapters describe the successive changes which have had to be made in various branches of law, as the Soviet leaders drove and strove towards a new society, first through war communism, then through the New Economic Policy, and eventually through Stalinist socialism based on comprehensive state planning, rapid industrialisation under state ownership, and the collectivisation and state control of agriculture. The eleventh and final chapter discusses the Soviet approach towards international law and indicates how it has shifted in a number of particulars to suit the changing needs of Soviet foreign policy. In every branch of law examined, the developments over the years have been considerable and sometimes unexpected; and perhaps nowhere more unexpected than in labour law, as Stalin wielded his dictatorship of the proletariat to impose increasingly harsh labour discipline on the Soviet Union's growing army of industrial workers.

Throughout the book Professor Hazard makes skilful use of summaries of cases from Soviet law reports to illustrate how the courts have administered the law in practice. These case summaries help to give life to the dry bones and add greatly to the book's interest and usefulness. A few misstatements and errors occur in places. For example, in the chapter headed "Establishing a new Economic Leadership," which is partly concerned with the freedom of choice enjoyed by factory managers, Professor Hazard says that "centralised control maintains a heavy hand over the managers and influences many of their decisions." The word "influences" in this connection is surely a misleading understatement hardly justified even on the limited evidence of the case summaries given. A more serious criticism is that Professor Hazard nowhere describes how Soviet laws are enacted or how the courts which administer them are organised and staffed. Such subjects as these would seem to be part of his brief, and his book would have been all the better if he had dealt with them.

is movement

TI, through its range of manufactures, is concerned with the details of mechanical movement . . . from the speed of a plane flying faster than sound to the power of a truck shifting ten times its weight . . . from the flash of a bicycle downhill to the ceaseless activity of some very small component, so balanced that it does not appear to be moving at all.

TI is a group of interrelated engineering companies whose manufacturing activities are wide, including precision tubes, components for cars and ships, aeroplanes, locomotives, wrought aluminium, bicycles, metal sections, pressure vessels, electrical equipment and appliances, mechanical handling, machine tools, gland packings, bus body framing and seating, paints, road signs, tubular furniture.

'I prefer the second-rate'

WHAT a man will seldom openly say, he will often openly do. Unashamedly he will be seen with a daily newspaper which he knows is not good enough for him.

Such a man will admit the virtues of the Manchester Guardian. He admires it. He wishes it well. But he does not read it. Habit holds him to his usual newspaper. He may even think that by comparison the Manchester Guardian is not sufficiently exciting.

An odd idea—that truth is less exciting than half-truth! The Manchester Guardian is always 'exciting', simply *because* it tells the truth. It is also well-written, and good writing is far more exciting than journalese.

Were you to try the Manchester Guardian (as we hope you will) you would soon feel its peculiar charm. You would know that you were subscribing to a fine newspaper.

*If you have any difficulty in getting your Manchester Guardian regularly, please write to:
The Manchester Guardian, Manchester.*

A NEW SOURCE OF OXYGEN

The importance of oxygen as a factor in the smooth running of many works is fully recognized. It is as vital as the power supply, and any interruption of its availability can cause a costly breakdown of production. It is an important on-cost factor, too, and you may well be surprised when you review your consumption figures.

Our Oxygenators, which can produce both oxygen and nitrogen, are available in capacities that cover every requirement, and we are confident that your time will be well spent in investigating the possible economies which can be derived from the installation of this equipment in your works.

Full details, in our latest booklet just received from the printers, will be gladly sent on request.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Returns of the Day

Washington, D.C.

ON Tuesday, October 13th, the President went to spend the evening at Hershey, Pennsylvania, where the Republicans of the state gave him "the biggest old-fashioned birthday party in history"—at the old-fashioned price of \$100 a head—in the biggest circus tent in the world. Somebody had baked the biggest birthday cake of recent times: it was seven feet high and rose through the floor like a cinema organ after Mr and Mrs Eisenhower had driven slowly round the arena in an old-fashioned buggy while Fred Waring and His Pennsylvanians played, not altogether inappropriately, "Where, Oh, Where, But in America?," which is said to be one of the President's favourite tunes.

None of this fervour, however, seemed to have communicated itself to the Republicans in the Ninth Congressional District of Wisconsin, most of whom, as was discovered all too soon, had spent the day sitting quietly at home instead of going to the polls. Long before the festivities at Hershey finished the Republican candidate had admitted that the Democrats had, in a by-election, won the Ninth District for the first time in history and he added a bitter little statement about the dislike of the farmer and the labouring man for the policies of the present Administration.

This astonishing result and the appointment of Mr Thomas Burke, a Democrat and the Mayor of Cleveland, to succeed Senator Taft provide plenty of problems for Congress when it meets again in January. The Senate will now contain 48 Democrats, 47 Republicans and one unpredictable independent, Mr Wayne Morse, and the President's party will only be able to retain control of the committee chairmanships because the opposition and Mr Morse are determined that the Republicans shall not avoid responsibility. Mr Morse will vote with them when the Senate is organised, leaving the Vice-President to cast the deciding vote.

That, however, is only the beginning of the trouble. Nobody is quite clear how it is mathematically possible to give each Senator two committee assignments (as the La Follette-Monroney Act provided, having failed to solve the problem of what happened when the majority party was really in a minority) and still leave the Republicans with a majority of at least one on each committee. One suggestion is that the Vice-President should have a roving proxy, but it is not clear whether this would be used on behalf of the President's policies or those of the chairman of the committee in question.

So much attention has been concentrated on the Senate that it has hardly been noticed that Mr Lester Johnson's victory in Wisconsin takes the House of Representatives one step nearer to the same impasse. There are now 218 Republican Congressmen, one of whom presides, 214 Democrats, one independent, Mr Frazer Reams, who is more Democratic than Republican, and two vacant seats. The elections for both the Twenty-fourth District of California and the Sixth District of New Jersey will be held in November and, though both are normally safe Republican seats, neither is as safe as the Ninth in Wisconsin was supposed to be. They are, however, suburban districts and not, therefore, as apprehensive of the Secretary of Agriculture's belief in rugged individualism as agricultural ones. If they were lost—and the Republicans are nervous after some municipal elections in suburban areas of Connecticut in which they did worse than at any time since 1930—control of the House, as of the Senate, would depend on the presiding officer.

★

The organisational difficulties, though fascinating in their way to the political scientist, are as nothing to the political problems that now face the Administration. There is every indication that the President's own popularity and prestige are as high as ever while those of his party in Congress are sinking. Yet it was the agricultural policies of the executive, policies which all Republicans in Congress have been fighting bitterly, that lost the election in Wisconsin. It is true that, in the few sizable towns, the labour vote was solidly Democratic, but that was only to be expected so soon after the Durkin incident, which will be forgotten a year from now, when the Congressional elections take place, though its consequences in terms of failure to do anything about the Taft-Hartley Act may not.

The real blow, however, was the attitude of the farmers and those who, in small towns, depend on the prosperity of the farmers. Governor Dewey, with bitter recollections of his last defeat, has said that his party seems to be doing everything it can to convince the farmers that they were right not to trust the Republicans in 1948. Luckily, the blow came early and they have a year in which to try to regain the farmers' confidence. It seems unlikely that it will be regained as long as Mr Benson remains and there will be growing pressure on the President from within his own party to get a new Secretary of Agriculture. But if the Democrats know their business they will demand his head loudly enough to

make it appear a surrender to the opposition to remove him. Mr Benson may well turn out to be the Acheson of this Administration: a man of infinitely greater quality than most of his colleagues but who, because he insists on being right rather than popular, becomes a grievous political liability.

The Republicans have other troubles which may develop into more than local liabilities. A gentleman called Mr Joseph Fay, at present serving a prison sentence in Sing-Sing for extortion in connection with labour contracts, seems to have an irresistible attraction for some of their more prominent personalities. The Lieutenant-Governor of New York has visited Mr Fay in gaol more than once and the Republican candidate for the Governorship of New Jersey once wrote to the New York Parole Board asking for leniency for him. Mr Dewey, whose perennial presidential ambitions are in danger of being badly hurt, is desperately trying to get rid of his embarrassing lieutenant who refuses to resign. A racing scandal which may make the whole Republican regime in New York look rather less savoury than it is supposed to do, is likely to complicate the situation.

★

There must, obviously, be something very wrong with an Administration that can, despite having a phenomenally popular man at its head, be proved—and the evidence coming in from all the farm states agrees with that provided by Wisconsin—to have lost so much ground in a few months. It is not likely to be regained by such illustrations of what Mr Stevenson meant by "government by postponement" as the President gave at Kansas City last week. All observers in Washington have long been aware that, as Mr Joseph Harsch said recently in the *Christian Science Monitor*,

the Eisenhower Administration has been moving for some time in a pink cloud of composure, complicated by a detectable case of complacency towards its own tendency to indecision

but it was not thought that this knowledge was widespread in the country. Now it seems that domestic opinion has begun to match foreign opinion and to do so on the same rather illogical grounds.

Probably no Secretary of State has ever done so much for his allies in a short time as Mr Dulles has. He took the risk of allowing Dr Mossadegh to stew in his own juice; he welcomed the arrival of British troops in Guiana; and he has underwritten the French war in Indo-China—to give only three examples. Yet no Secretary of State has ever been more unpopular abroad because words, in the modern world, speak louder than deeds and many of his words gave offence. In the same way, at home, the Secretary of Agriculture could produce figures to show that he is in fact doing more to support agricultural prices than Mr Brannan, his Democratic predecessor, ever did; but figures are no use as long as he goes on making the wrong noises.

Mr Harsch finds the explanation for this state of affairs in the fact that "something is wrong with the approach of this Administration to applied political science"—which is another way of saying that it has not yet learned the art of popular government. And there is no sign yet that any of its members, with a few exceptions, of which Mr Harold Stassen, who had previous experience as Governor of Minnesota, is the most outstanding example, have begun, or intend to begin to learn.

Judicial Legacy

FROM A CORRESPONDENT IN NEW YORK

IT is part of the present sensitiveness to differences between Britain and the United States that sensational court cases now attract attention not only for their substance, but also for the way in which they are handled. Americans marvel at the quiet speed with which Christie was tried and sentenced. Visiting Britons ask Americans how it is that cases take so long to pass through the American courts, that newspapers are allowed to comment so passionately on trials in progress, that so many appeals to different judges seem to be permitted, that courts allow such spectacles as were presented in two recent Communist trials and (though much more politely) in the trial of the seventeen investment banking houses charged with violating the anti-trust laws.

Some of these puzzles are made worse by the distortion of distance. Some arise from the primary fact that, though the American system is founded on the British system, it has developed divergences over the years. Moreover, it is confusing to foreigners to find Americans living under a double judicial umbrella, with each of the forty-eight states having its own court system, while the country as a whole functions under the federal system.

The relationship between the forty-eight state jurisdictions and the one big federal one, both in the matter of their respective powers and of the kind of cases each can handle, is established by the Constitution. By and large, the systems function independently, and without undue collision. The great majority of litigation comes within state jurisdiction and is settled there; in a population of 160 million only about 7,000 cases a year are brought to federal courts.

In no sense does the federal system have an appellate relation to the state systems, but in rare cases the highest court of the federal system does hear appeals from the highest courts of individual states. Most of the cases with which federal courts concern themselves come in the first instance to those courts. They include admiralty cases, interstate commerce cases, suits between states, citizenship cases, anti-trust cases, and espionage trials.

Such actions begin in one of the eighty-six district courts, and they may move on appeal to one of the eleven intermediate federal courts of appeal. The final appeal is to the Supreme Court of the United States, which is free to accept or refuse most cases as it sees fit. That is the usual federal pattern. In the matter of the Rosenbergs two more appeals were made possible through a rare and complex procedure allowed on the grounds of a discovery of a new applicable point of law; this the Supreme Court took up because of the great public interest in the case.

★

The state court systems range from very good to rather bad, without arousing much more than local interest. They turn out their daily grist, and it is the business of the citizens of the individual state and no other whether they do it well or not, always provided that they observe certain minimum standards of due process laid down by the Supreme Court.

The federal courts, on the other hand, with their 350 or so judges, are everybody's business. Under the American theory of separation of powers they are the judicial branch

of the federal government, and by no means sacrosanct. Ever since the late President Roosevelt tried to add Supreme Court justices of his own political persuasion to the nine already on that bench the federal system has been peculiarly subject to the pressure of conflicting political ideas. Not only did the heat of the court-packing argument burn away from the Supreme Court itself a certain encrusted dignity which in quieter times had protected its members from common criticism. The lower courts also, in their turn, suffered from the President's weakness for handling judicial appointments like any other political plums, and awarding them to party favourites rather than to leaders in the realm of law. Matters were not improved by the fact, shown in the delays in filling posts, that there were not enough party favourites to go around.

Thus the Republicans inherited a federal court structure which was overworked, understaffed, and below standard in ability. Moreover, a number of judges had reached the age of retirement, and had to be replaced. The federal Court of Appeals for the Second Circuit (which includes New York) for instance, recently lost its two famous cousins, Judge Learned Hand and Judge Augustus Hand, and a third member of that court, Judge Swan, has also retired. The number of district judges has not kept pace for a decade with the increases in judicial business. Metropolitan congestion is particularly bad.

Meanwhile, lack of funds has added its pressures to the lack of judicial manpower. The entire federal judiciary receives for running costs, about \$26 million a year, or one-thirtieth of one per cent of the national budget. (The Department of Justice, which is the prosecuting arm of the executive branch, had \$198 million to spend in 1952.) Despite the efforts made to find more efficient ways of handling cases, the costs rise faster than the appropriations. In 1951 the Director of the Administrative Office of the US Courts, observing that "more judges must be provided if the litigants are to have prompt disposition of their cases in the Federal Courts," also noted that he needed more money for such elementary items as law books and typewriters.

What the Republicans will do about the situation remains to be seen. So far their best publicised appointments have tended to follow the Democratic pattern rather than to refurbish the proud Republican tradition established by the appointment of a brilliant legal mind like Charles Evans Hughes, or a skilled legal administrator like William Howard Taft to the Supreme Court. The new Chief Justice, Mr Warren, of California, may prove himself in the second category, or at least that is what some of his friends hope. Meanwhile, Mr Danaher, of Connecticut, a politician whose rumoured appointment to a vacant post in the Second Circuit evoked protests from the New York bar associations, has been shifted to the District of Columbia, where standards seem to be less jealously guarded.

The shortage of judges and the crowded calendars explain to a certain extent the length of time it takes to get cases through the courts. But the actual record is better than it looks. Long cases, like spectacular ones, catch the public eye and are remembered. The Investment Bankers' case, which was prepared in Washington about 1940, filed in 1947, and came to trial in 1950, was dismissed in mid-October of 1953, after 309 court days spent in hearing. But it was an exceptional monster. Out of 5,051 civil trials in US District Courts during the year ending on June 30, 1951, only four cases took a month or more, while 3,862 (78 per cent of them) were disposed of in a day or two.

The record in criminal trials, despite such dragged-out horrors as the Rosenberg case, was almost as good.

This record has been made possible by the new Federal Rules of Civil Procedure, which were introduced about fifteen years ago in an attempt to save time by having lawyers for both sides free to examine all witnesses before the case came to trial. The hope was that the element of surprise would be eliminated, and the judge would be free to concentrate his attention mainly on the relevant points of law. It seems not to have been foreseen that legal costs would rise as lawyers find themselves caught in endless detail during the examination of witnesses when there is no presiding officer competent to cut short or control the scope of inquiry. Similarly, the time a judge must spend on a case in court has apparently dropped, but the time he spends in chambers reading records may have increased.

American Notes

Good Neighbours on the Rio Grande

THE opening of the Falcon Dam on the Rio Grande, which forms a large part of the border between Mexico and the United States, has provided a welcome symbol of renewed life in the good neighbour policy. Latin Americans complain that it withered while Washington was concentrating on Europe's problems. The early dispatch of Dr Milton Eisenhower on a good-will tour showed how anxious the President was to dispel any feeling of neglect. Mr Cabot, the Assistant Secretary for Inter-American Affairs, who accompanied the President's brother, promised recently that government aid, including technical assistance, would continue to supplement private investment; indeed, technical aid, which is so badly needed, will be 10 per cent greater this year than last. The President's ready response to Bolivia's plea for help shows that even radical governments, with a propensity for nationalisation,

can count on emergency assistance, provided they are not as clearly under the Communist thumb as Guatemala. It is not overlooked that the United States might be dependent on Bolivia for tin in the event of war.

Both the American and the Mexican President paid tribute, when they met, to the co-operation which has made it possible to harness the Rio Grande for the benefit of both peoples. The \$50 million Falcon Dam is the first of three which are designed by the International Boundary and Water Commission to rescue northern Mexico and southern Texas from such droughts and floods as they have experienced this summer and to provide hydro-electric power. The cost has been apportioned according to the storage capacity allocated to each: 58.6 per cent to the United States, 41.4 per cent to Mexico. The other two dams are expected to be built at El Paso and Laredo.

If the meeting had not been so determinedly confined to a good will festival, and some mutual irritations had been aired doubts might have been raised, however, about the future of the grand conception. The Americans suspect that there is not going to be enough water for one, let alone three reservoirs, because the Mexicans have not honoured their gentleman's agreement not to dam the rivers which flow into the Rio Grande from their side. The tributaries on the American side have long been dammed. The new reservoir will become an unhappy symbol of inter-American co-operation if it is allowed to run dry.

McCarthy's Second Wind

IT looks as though Senator McCarthy may have struck pay-dirt at last in his search for Communist activities and thus secured a new lease of life for his own objectionable methods. At the Fort Monmouth, New Jersey, radar centre of the Army Signal Corps, the Senator and his fellow investigators claim to have uncovered evidence that secret documents were purloined by a spy ring headed by Julius Rosenberg, who was executed in June for atomic espionage, and that some of these documents have turned up in Soviet laboratories in East Berlin. It is hinted that the ring may still be active, but Senator McCarthy has been careful not to say so; some of the other investigators complain that the trail is over five years old and cold.

The Secretary of Defence has conceded, however, that "something more than a mere security leak may be involved"—though this would be bad enough where secrets of atomic defence are concerned—and the Secretary of the Army has been attending the hearings, although he may have been keeping an eye on Mr McCarthy as well as the witnesses. A search for secret documents alleged to be missing from Fort Monmouth was conducted by the Army in 1951 and last year a clean bill of health was issued. The Army is still sticking to its guns; it claims it has no evidence that any documents were tampered with and that those in Russian hands, if they really exist, might be accounted for quite legitimately, as information was shared with the allies during the war. But it has suspended ten civil servants at Fort Monmouth for "security reasons."

Senator McCarthy has other reasons to be gratified. The Attorney-General has announced that he finds no grounds for prosecuting him, although his income tax returns are still being examined. The State Department has demoted

two officers who incurred the Senator's displeasure. And one of his friends, Mr Lee, has been appointed to the Federal Communications Commission, although he has no experience in that field.

Some critics will also see Senator McCarthy's hand in the President's order that government employees may be dismissed if they invoke their constitutional right to refuse answers to questions about their loyalty; it coincided very patly with the Fort Monmouth investigation, although Mr Brownell, the Attorney-General, insists there is no connection. But few Americans, even if they detest McCarthyism, are alarmed at this whittling down of civil servants' rights. There has been too much brazen abuse of the Fifth Amendment to the Constitution, which says that a man cannot be forced to incriminate himself. Most comment is satisfied with the argument that whatever a man's constitutional rights, he has no inherent right to a government job. There is less agreement, on practical grounds, with the Attorney-General's proposal that other stubborn tongues should be loosened by a promise of immunity from subsequent prosecution. Bills to authorise such bargains have been put before Congress already, but there are difficulties: they could not protect a witness from state action, and they empower Congressional committees, whom Mr Brownell fears might be subjected to political pressure, to decide when an offer of immunity should be made.

Automobiles Shifting Gears

COMPETITION for sales in the first normal market since the war is making automobile manufacturers wonder whether they may not have to put a brake on the assembly line. Most of the 42,000 retail dealers, hard pressed to dispose of the monthly quota of new cars they must take to retain their franchises, would probably applaud a decline in the present high rate of production. They point out that, although 4,400,000 cars were turned out in the first eight months of this year, only 3,900,000 were sold. The slow autumn season finds most dealers with very high stocks and sales are increasingly difficult unless big sums are spent on promotion, discounts and trade-ins. Only those dealers with a large volume of sales are satisfied with the present low unit profits.

Main Street's view has so far been supported in Detroit only by Mr Paul Hoffman, chairman of the board of the Studebaker Corporation, who describes the present position of dealers as "profitless prosperity." Most manufacturing executives, however, are still acting on the assumption that for every car there must be a buyer, and do not agree with Mr Hoffman that the industry should reduce its output from the present "unhealthy state" as his firm has done. Even though the industry's forecast of a home market for 6 million cars this year has proved too sanguine, it is hoped that domestic sales may reach 5,750,000 and export sales over 300,000, against an estimated production of 6,250,000 cars. This was surpassed only in 1950, when 6,658,000 were produced. The automobile firms argue that dealers must adjust themselves to a market in which their customers have to be courted, not simply received. If the dealers had not been pressed to work for business, sales would have fallen even lower. Admittedly, however, production has been forced higher by the battle between the

two most popular models, the Chevrolet and the Ford, for first place, and the smaller independent firms, caught between these rivals, have been left with less and less of the market. Their share has declined from 14 per cent of all automobile sales in 1952 to about 9 per cent in 1953, and rumours of mergers may indicate the solution that some of them will adopt.

The struggle will be even sharper next year; it is believed that sales, now that the scarcities caused by controls have been overcome, will drop by 10 per cent, and probably more

if there is a recession—though full production in the automobile industry is so important to the economy that any curtailment may help set off the very decline the industry fears. The 1954 models now being shown have many changes in style and also in engineering details; prices are not higher, and credit terms are expected to be easier. Detroit hopes that this combination of attractions will coax at least 5,500,000 buyers into the seats of new cars, for it is still convinced that salesmanship, rather than drastic reductions in price or output, can carry the day.

Full Employment for Mr Nixon

MR. NIXON'S arrival in Australia on the first leg of a goodwill tour as the personal representative of the President confirms other evidence that under this Administration the Vice-Presidency is no longer what its first incumbent, John Adams, described as "the most insignificant office that the invention of man ever contrived." Mr Eisenhower seems not to share the reluctance of his predecessors to contemplate the kind of contingency that would throw the spotlight on the heir apparent, and to be taking steps to see that in case of need Mr Nixon shall not be unprepared. In the process he seems to be turning a brash young politician, whom he nearly had to repudiate during the election campaign because of allegations about a private expenses fund, into a quiet, hard-working understudy.

In its way the Vice-Presidency is a unique institution, in that here the executive and legislative branches, otherwise kept apart, are allowed to overlap. Although he is a

member of the Administration, the Vice-President is also the presiding officer of the Senate, holding a casting vote which is particularly important when, as now, the parties are evenly divided. Taking advantage of this duality, Mr Nixon, who has far more legislative experience than any other member of Mr Eisenhower's team, has been able to act as a channel of communication between the White House and Congress. This service may be all the more necessary in the second session of this Congress because of the death of Senator Taft.

On the executive side, Mr Nixon has, contrary to all precedent, been taking the chair at meetings of the Cabinet and the National Security Council in the President's absence. The Vice-President is a statutory member of the Security Council, which has greatly increased in importance as a policy-making body under Mr Eisenhower. Moreover, outside the council chamber the President has been trying him out on tasks of some delicacy. It was Mr Nixon who had to deliver a soothing message to the annual convention of the American Federation of Labour immediately after the resignation of Mr Durkin, and his appointment to head the commission which is to make employers understand that they cannot hope for government contracts if they practise racial discrimination was intended to show the President's special interest in that issue.

So far Mr Nixon has performed most of these tasks with credit, though his rather strained efforts to act the peacemaker provoked some derision among the assembled trade unionists. But he will have to face many more tests yet, in the knowledge that his performance is being watched with care by the professionals who may have to assess presidential timber if Mr Eisenhower should decide not to shoulder the burden for a second term.

SHORTER NOTES

Rising expenditures on foreign military aid in the year which ended on June 30th more than balanced a decline in economic assistance, bringing total American foreign aid to an all-time high. Gross foreign aid totalled \$7 billion, of which \$4.3 billion was spent on military aid and \$6 billion on economic aid; in the previous year, economic assistance grants totalled \$3.2 billion and military aid \$1.9 billion.

★

In order to keep the public debt under its \$275 billion ceiling, the Commodity Credit Corporation has invited commercial banks to take over a \$360 million "pool" of price support loans on tobacco and grains. The banks, who will receive certificates bearing 2.5 per cent annual interest, have previously purchased cotton loan certificates, but this is the first time the government has asked for such investment in its programme for other commodities.

Some considerate corporations are delaying their dividend payments from the usual December posting until January, when their stockholders will benefit from the 10 per cent reduction in personal income tax on January 1st.

THE UNITED
STEEL
COMPANIES LTD

United Steel does not stand still

During the last years the United Steel company, by research and full-scale experiment, has introduced and sponsored many completely new products, improvements in existing products and opened up new markets. Amongst these are: Fortiweld, a new high-tensile weldable low-alloy steel; advanced techniques in the production of stainless steel; developments in precision cold-rolling of razor blade strip and clock springs formerly imported from abroad; for the structural engineer low-alloy steels and castellated beams have conserved steel in building. Such developments and innovations, ranging from the heaviest products to the lightest, are typical of contributions made to every steel-consuming industry and are tangible evidence that a basic industry such as the United Steel company is as live and progressive as any in the country.

The World Overseas

Atom-Minded Australia

FROM OUR CORRESPONDENT IN SYDNEY

DURING the past six months Australians have become more atom-minded, if that is the right word, than almost any other nation. They have been helped towards this state of mind by the decision of the British Government to test atomic weapons, first at Monte Bello off the west coast, and then near Woomera in the centre of their spacious but barren land. But the real reason for this intense interest is the sudden discovery that Australia probably has larger reserves of uranium than any other country in the democratic world.

One writes "probably" because the plain truth is, as Mr Menzies himself has said, that nobody yet knows how much uranium there is. But in addition to the fields which are already being worked at Rum Jungle in the Northern Territory and Radium Hill in South Australia—both of which are more extensive than was first thought—new fields are being found almost every month. The Australian Atomic Energy Commission, usually a somewhat retiring and secretive body, has just begun to exhibit for public inspection a map showing radioactive areas in the Northern Territory which have been discovered by aerial survey. These show 900 radioactive anomalies of different degrees of intensity—indeed, the map is covered with a rash of these significant dots. If only one in a hundred of these anomalies proved to be uranium deposits of economic importance, the prospect would be staggering.

The question which is now exercising the Australian public is how best to exploit this unsuspected store of wealth which has been found in some of the most remote and arid parts of their continent. At present all the uranium that is being mined at Rum Jungle and Radium Hill—as yet in small quantities—is being sold to the Anglo-American Combined Development Agency, which is providing substantial loans for the development of these fields, as well as technical advice and special equipment. The terms of this ten-year agreement, including the price, have been kept secret, ostensibly for reasons of security; but Australians were taken aback by a report in a London newspaper that Britain was paying 31s. 3d. per lb for Canadian uranium ore, but only 16s. 3d. per lb for Australian ore. This may or may not be true, but the result was unfortunate. It immediately gave rise to suspicions, never far below the surface of the Australian consciousness, that in some way Australia was being exploited by selfish and calculating men "in striped pants" in Whitehall. The situation was not helped by a failure of public relations over the Woomera

tests, about which the British Government certainly showed a remarkable insensitivity to Australian feelings.

It was at this moment that Lord Cherwell, moving in an atmosphere of almost aggressive secrecy, entered the scene. While the Australian press was waiting patiently for the first atomic bomb to go off at Woomera, Lord Cherwell went to Canberra for talks with the Federal Government. A report was published on good authority that he was trying to negotiate a thirty-year agreement under which Australia would sell its surplus production of uranium to Britain as part of a long-term plan to use atomic energy for industrial purposes. This was too much for the Australian public. Almost every paper came out with leading articles, many of them well-reasoned and moderate in tone, pointing out that Australia's uranium deposits represented its wealth for the future and could not be disposed of in this furtive way without at least some thought and discussion. Dr Evatt, the leader of the Opposition, took up the matter in Parliament, and Mr Menzies was quick to give the required assurances. Whether Lord Cherwell had in fact asked for a thirty-year agreement of this kind is uncertain; it is certain that he did not get one.

It should be said here that the great majority of the Australian people are perfectly prepared to sell all the uranium wanted for making atomic weapons. If necessary, indeed, they would give it to Britain and the United States, whose friendship they value and on whose protection they rely. What they are not prepared to do is to sell their uranium for industrial purposes until they are quite certain that they have enough for their own use. Rightly or wrongly, many Australians are now convinced that uranium holds the key to the industrial development of their own country and that Australia's day will come when the rest of the world has consumed its reserves of oil and coal.

Unfortunately useful discussion of these subjects is made almost impossible by lack of information and by the often maddening restrictions of security. Since no one knows what Lord Cherwell's offer was, it is impossible to say whether the Federal Government acted wisely or foolishly in rejecting it. Without even knowing the price which is at present being paid for uranium ore, it is extremely difficult to discuss what price should be asked for future exports. There is a school of thought which believes that the present relatively high price for uranium will not last more than twenty years and that Australia would be well advised to cash in while the going is good. After that time so little

uranium will be needed and so much will have been found that the price will collapse. But this is still a matter for speculation rather than calculation.

Quite clearly the first thing for Australia to do is to find out, so far as it is possible to do so, just how much uranium it has. And it is here, as Lord Cherwell is said to have complained, that the Federal Government has been somewhat dilatory. Indeed, until quite recently it almost seemed as though the Government's policy was to do as little as possible itself and to discourage private enterprise from doing any more. The price first offered—17s. per pound of uranium oxide—was ridiculously low, and prospectors were given no security that their titles to mines would be respected. Indeed the Atomic Energy (Control of Materials) Act of 1946 was so ambiguous on this point that some discoveries of uranium are said to have been deliberately suppressed. Moreover, the Federal Government, unlike the State Government of South Australia, was for a long time unco-operative in giving private industry access to technical resources and geological information. Recently this policy has changed. In February the internal price offered for uranium ore was more than doubled though it is still far below the prices offered by the United States Government. The development of the Rum Jungle field has been given to the Consolidated Zinc Proprietary Limited as agent for the Commonwealth Government. And the uranium map of the Northern Territory has been deliberately published—against, it is said, the advice of Lord Cherwell—in order to encourage prospectors to go out and try for themselves. There is still, however, a great deal to be done not only in prospecting but in developing roads and railways which will certainly be needed if uranium is found in any quantity.

Security Blackout on Uranium

When more is known about the extent of its uranium resources, Australia will be in a far better position to decide how to use them. If, as seems probable, it has enough to export on a large scale without seriously affecting its own future needs, it will be in a very happy position. But it will still not have taken even the first step towards the use of atomic energy for industry in Australia. At present Australia cannot even convert its uranium ore into uranium oxide. Next year, when refining plants go into production at Rum Jungle and Port Pirie (in South Australia) it will be able to do this but it will still be unable to produce uranium 238 let alone convert it into industrial power. So far there is not even an experimental reactor in Australia though smaller countries, like Norway, have had them for two years.

One of the first things to be decided, therefore, after more is known about uranium resources, is at what point Australia should enter the technical field. Should it, for instance, build a refinery to produce metallic uranium, which would cost at least £1 million, or reimport its metallic uranium already refined in Britain? Should it, as Mr Playford, the energetic Premier of South Australia, and others say, build an experimental reactor—at anything from £1 million to £7 million—or continue to send its scientists to Britain to take advantage of what has already been learnt there and to wait for still further advances?

The frightening thing is that such questions, which involve national pride and personal jealousies as well as the most difficult scientific and economic considerations,

are not being discussed at all because of the mystic word, "Security." Perhaps they will never be discussed until after the decisions have been made. But there is no doubt that the British Government could help greatly both in public and private discussions by taking into account Australia's own aspirations and by trying to carry the Australian public along with it. Would it be possible, for instance, as part of any further agreement, for Britain to help Australia to build an experimental reactor in Australia even if this were not strictly justified on practical grounds? What must be avoided at all costs is any suggestion that Britain regards Australia as some Arab State whose deserts can be used for dangerous experiments and whose uranium can be bought at the cost of a few Rolls-Royces for the local sheikhs.

Nyasaland: Storm in a Teacup?

FROM OUR SPECIAL CORRESPONDENT

"ALL quiet"; "no major disturbances"; "situation very much improved"—official reports from Nyasaland have a flavour of almost monotonous tranquillity. But at the same time it is casually mentioned that in one district (Mlolo) "fifty-one people were arrested," while penalties against Africans have been greatly increased—life imprisonment for taking part in a riot (instead of five years); life for "doing grievous harm to another person"; fourteen years for stealing or wounding a cow; fourteen years for "helping to manage an unlawful society." It is perhaps not surprising that Lieutenant-General Sir Alexander Cameron, after his second visit to Zomba, said in Nairobi that "the disease which caused the recent disturbances is still there." What precisely is it?

The disturbances began at Cholo, an area of white settlement and large tea estates. They appear to have taken the Nyasaland African Congress by surprise, though Congress immediately climbed on the band-wagon and said the disturbances were a protest against federation. The Africans in the Cholo area have had a land grievance for a long time, and the Nyasaland Government recognised this by setting aside some thousands of acres for African settlement. At the same time, the Government admits that more land for Africans is still required. But federation did play a part. Congress has repeatedly warned Africans that federation will mean more white settlement in Nyasaland, consequently less land for Africans. This propaganda acting on existing land hunger helped to precipitate the explosion. It is significant that the unrest quickly spread to areas where Africans have no land grievance.

In his *boma* at Chikwawa, across the crocodile-haunted Shiré River and below the escarpment of Nyasaland's little "White Highlands," Mr Commissioner Saunders has very successfully and benevolently ruled over some 75,000 fairly primitive Africans, occupying about 2,000 square miles of bush country, with the aid of only four African policemen. This is fairly typical of conditions in Nyasaland, a pretty country about the size of Scotland, with a black population of 2,500,000 and a white population of only 4,400 of whom more than half are civil servants and missionaries. After the spread of the disturbances, police and troop reinforcements began to roll slowly—for there is only one ferry—across the Shiré River into Mr Commissioner Saunders's

ALUMINIUM

World supplies of aluminium, that valuable and versatile metal, will be increased by nearly half a million tons a year when the Aluminum Company of Canada's new smelting plant goes into full production at Kitimat in British Columbia. For this great project Simon Handling Engineers are designing and building a travelling pneumatic plant to discharge alumina (aluminium oxide) from ocean vessels to the Kitimat works at 180 tons an hour. This will be among the biggest Simon travelling pneumatic plants yet built, and the first of its kind to handle alumina at so high a capacity.

territory. Mr Saunders' formerly peaceful people built hundreds of rather ineffectual road-blocks, then disappeared sullenly into the bush, deserting their villages. This is typical of what happened in several parts of Nyasaland after the disturbances had begun.

A senior official said frankly: "It was quite simple to rule a large area with only four policemen while the people still had faith in the white man. Now that they seem to have lost that faith, can we rule the same area with even 400 policemen?" This is a good summing-up of the problem. What caused the loss of faith? Federation seems to be the answer, or rather the interpretation of federation which Congress gave to the Africans and which they believed. The significant thing is that they refused to believe the official white interpretation; Mr Kittermaster of Lusaka Radio has reported that government broadcasts on federation were very unfavourably received, in the Rhodesias as well as in Nyasaland. There can be

little doubt that the mass of Africans, rightly or wrongly, were strongly opposed to federation.

The attitude of many of Nyasaland's white settlers has not helped matters. The disturbances immediately revealed a wide gap between official thinking, and that of the farming and commercial interests. Not a single white person was or has been molested by rioting Africans, who vented their dissatisfaction on inanimate objects such as orange trees; build-

ings and telegraph poles. Nevertheless, at the first sign of trouble, the Europeans in places like Blantyre were all for "shooting them down and burning their villages." The Nyasaland Government was quite wise to ask for trained and disciplined police units from the Rhodesias and Tanganyika, and to depend as little as possible on local white volunteers. White officials in Nyasaland have in the past been fairly sympathetic towards Congress—which the Government helped to start—but the country's handful of white settlers and businessmen have, with some exceptions, always been hostile. They are opposed to any political activity among Africans. After the disturbances began, they showed strong resentment against British and other newspapermen who tried to find out what Congress policy was, and who were seen speaking to Congress leaders.

Nyasaland has not, in the past, been a country where things moved fast. African land grievances, where they are admitted to exist, have been smouldering since 1903. The Nyasaland African Congress did not come into existence until the nineteen-forties, and is still very much an infant organisation. Nobody works very hard in Nyasaland. The country is poor and undeveloped. Blantyre, the commercial capital, has a white population of only 500. It snoozes very comfortably in the sun and shows little disposition to grow. African wages are low, averaging about

30s. a month, if the food ration is included. Thousands of Nyasaland Africans emigrate each year.

The white farming and commercial interests appear to have imagined—and to imagine—an indefinite continuation of this tranquil if unprogressive state of affairs. But Congress exists, and so does severe and growing African land hunger in certain important areas. A surprising and disquieting feature has been the apparent absence, before the disturbances began, of any appreciation of the bearing which events in Kenya might have on the situation in Nyasaland. It is true that there is no evidence as yet of anything like a Mau Mau organisation in Nyasaland. On the contrary, the Africans in their campaign of civil disobedience have not attacked persons, though they have destroyed property. But this situation could easily change for the worse.

A restraining factor has been the attitude of the chiefs. Some very influential chiefs supported Congress, but set their faces resolutely against violence. Others agreed to support federation; many of them were deposed by their villagers for doing so. Some of the chiefs who sided with Congress in opposing federation are now anxious for a settlement, in order to put an end to the disturbances. But the sort of settlement they have in mind does not imply surrender. Since federation is an accomplished fact, they are prepared to "make it work" provided it means what the Government says it does. This proviso is important. The African leaders in Nyasaland, both Congressmen and chiefs, will, like African leaders elsewhere, continue to press for more education, more land for African use where it is needed, and a larger political voice in the country's affairs. Their deep distrust of federation will be lessened only if it can be shown that it is not incompatible with these aspirations.

But the common white attitude in Nyasaland, outside official circles, is to resent these healthy and inevitable African growing pains as "insolence," and to call loudly for the suppression of even moderately conducted African political activities, if necessary by force. This sort of attitude, only too common, makes the situation both dismaying and frightening for the outside observer. Before the recent disturbances, Nyasaland was an eminently peaceful country, though with a good deal of simmering unrest just below the surface. There is still time to restore peace, but it will not be done merely by stepping up the penalties for Africans.

Bucharest After the Festival

BY A CORRESPONDENT

THE Bucharest which enchanted some 30,000 young people from all over the world during its recent World Youth Festival is slowly disappearing, as the Rumanian capital again puts on its drab workaday garb. The diversity of flags, with their gay colours, which greeted the visitors has been replaced by the shabby red flags which, as before, outnumber the red, yellow and blue Rumanian flags by three to one. Gone, too, are the friendly "peace" posters which for a couple of weeks took the place of the huge ugly anti-"warmonger" cartoons; and the street newspapers which distort the facts about the western world are now back in place on the walls.

In only ten days, the young French delegates, who were prevented from returning home by the railway strikes in their own country, witnessed a strange transformation of the city as they had seen it on their first arrival. They reported that all the big hoardings for the Festival had been painted in red—a colour which had been outlawed in order to please the visitors from the west. They were also struck by the sudden influx of Russian soldiers, who had been almost completely absent during the Festival. According to a Bucharest newspaper, the very streets have been allowed to return to their ill-kempt pre-Festival condition; “rubbish deposited here and there has begun to putrefy,” and in some districts of the city nobody has troubled to repair the water conduits which have been broken for more than a month, although some streets are literally flooded.

As for the famous “23rd August Park for rest, culture and sport,” it is closed and apparently constitutes something of a public nuisance to the inhabitants of the neighbourhood who have to make what amounts to an “excursion” right round the enormous enclosure, instead of traversing it in under ten minutes as they did when it was open. The writer who reported this in a Bucharest newspaper was passed on from the “Parks and Gardens Service of the People’s Council” to the “Physical Culture and Sports Service,” and from there to the Executive Committee of the Council, only to discover that the Park was not shut down for any particular reason, but only because nobody had given the necessary orders. It is clear that the old oriental administrative indifference is coming into its own again.

But the alteration in the food situation is even more striking than the changed aspect of the city. White bread, which was never rationed and used to cost 5.35 lei the kilo, was sold during the Festival at 3 lei; it is now up to 4.80 lei again—a rise in price representing more than an hour’s pay for the average worker; and this after an exceptionally good harvest and only a few weeks after the announcement of a new policy designed to raise the standard of living.

Pastries With a Past

The quality, quantity and diversity of pastries, cakes and all kinds of confectionery was one of the things that greatly impressed many of the young visitors to the Festival. They would have been surprised to read in *Informatica Bucurestiului* on September 26th of the “almost complete disappearance from the shops of many very popular varieties of gateaux,” to say nothing of a sudden lowering of the quality and reduction in the assortment of “petit fours,” sweets and fondants which are “often in unjustifiably short supply.” It must be admitted that with fancy cakes at 3 lei each not many of Bucharest’s citizens were in a position to take full advantage of the short-lived Festival plenty.

The quality of the clothing available in the shops is now so poor that the customers prefer to do without; in any case the supplies now arriving in the shops often consist of thin summer clothes instead of the warm winter clothes which people now need. The supply situation is best illustrated by the reply of a young salesgirl in a children’s shop in central Bucharest, when questioned by a newspaper reporter: “I find it very hard to be unable to offer my customers the goods they need, which now that autumn is so near are absolutely necessary. I have only got cotton goods in stock, and when a mother asks for a baby’s woollen bonnet, how can I suggest that she buys a sun-suit?”

Alberta’s Natural Gas

FROM OUR OTTAWA CORRESPONDENT

CANADA’S “oil province,” Alberta at the foot of the Rocky Mountains, is in trouble. Oil production is being held down, extractive industries are being discouraged, and thousands of dollars are being burnt daily, because no outlets have yet been provided for natural gas. It is a paradoxical situation. Large potential markets for Alberta gas have been trying to get access to it for these past three years. The Pacific northwest states of the United States got in first. They were put off by an Alberta decision, which the Canadian government supported, that their supply should come, not from the large and accessible reserves in the southern part of the province, but from the equally promising but more remote deposits up in the north. A company called Westcoast Transmission got permission from all the Canadian authorities to build a pipeline from the Peace River valley, drawing on wells both in Alberta and British Columbia, down to Vancouver and over the border to Seattle and the other major American cities of the northwest. Canada proposes, but the United States disposes. In this case the pipeline into Washington State requires a licence from the Federal Power Commission, which has a conflicting application from an American company anxious to supply the same area from the mid-continent field. The FPC is still examining the two applications.

In the meanwhile, great quantities of gas are released from Alberta’s wells in the process of drawing off oil, for which there is a market. The wastage in the first half of this year was more than 10 billion cubic feet, and the rate is rising. It will probably reach 25 billion before the end of the year. At a wellhead price of at least 10 cents per thousand, the direct financial loss runs into millions of dollars per year. The city of Toronto, with something over a million inhabitants, has at last pulled off a deal to pipe in 22 billion cubic feet of natural gas a year from the southern American fields; this is somewhat less than Alberta is wasting.

Government Guesses Wrong

The long delay over Alberta’s natural gas is due to the provincial government’s idea that the gas should be kept at home. It has insisted that the province’s foreseeable needs for 30 years must be safeguarded before any gas is exported; it obviously hoped that new industries would move to the gas if the gas did not go to them. This conception has now proved self-frustrating. The group of industries known as “petro-chemicals” can, as Alberta’s Premier, Mr Ernest Manning now admits, only profitably extract many valuable by-products from natural gas provided they have a market for the remaining fuel. Alberta therefore has now become eager to export its gas.

After all this delay, however, it is not quite so easy to get the gas out. It is necessary to have a gathering grid of pipelines feeding into some central point, probably near the south-eastern boundary of the province, from which a large diameter pipeline can carry the gas to market. But this involves a major argument. Rival pipeline promoters, each with formidable financial backers in the United

States as well as in Canada, are in fierce competition for the right to build the pipeline. It requires a big investment, but provided all goes well it offers a steady annual return at a high rate to the equity stockholders.

The nearest market to Alberta’s major wells, now that the short route to the Pacific Northwest has been ruled out, is in Minnesota. One of the two rival companies seeking a licence from the Alberta Conservation Board wants to build its line east across the Canadian prairies to Winnipeg and then south to the American border for sale to an American utility company. By this scheme the line could probably be built by the end of 1954 and Alberta could start selling its gas within about a year from now. The other competing company has a more ambitious scheme. It wants to bring it clear across Canada to serve the industrial areas of Ontario and eastern Quebec.

This vision of an all-Canadian gas line, running approximately along the same route as the Canadian Pacific Railway, has revived very many of the same feelings as the building of that railway did seventy years ago. Its supporters have been saying that it might mean almost as much to Canada, providing clean, cheap and economical fuel right across the country from a Canadian source which is still expanding instead of using a United States source which is already beginning to dwindle. The Federal Government has proclaimed its acceptance of this view. “Gas from Alberta,” Mr Howe, the Minister of Trade and Commerce, has declared, “must be available to potential users in the provinces of Ontario and Quebec, and in the intervening provinces, before further export of gas (to the United States) could be authorised.”

If the Government is to maintain this policy it will have to face two rather delicate consequences. The first is to stop the deal for importing American gas for Toronto. The all-Canadian line clearly cannot be economic if the richest plums in the eastern Canadian market are to fall into the American lap. It may also have to deny Alberta the Minnesota outlet which appears to offer the quickest returns.

It looks at the moment as though the provincial Social Credit government and the Federal Liberal government may be in for a tussle about where Alberta gas shall go. And in the background, though hardly in the shadows, stand the rival promoters with a stake of hundreds of millions of dollars. Ottawa is also very conscious of American feelings on the whole subject. It is not altogether easy for Canada, which is always talking about more liberal trade, to adopt what seems to be a strictly nationalist attitude on the use of its own energy resources. But it is

felt here that a gas pipeline is not a trade in commodities. It is a source of energy, more nearly parallel to an electric power supply. It is virtually irrevocable. Industries and city-wide power supplies are built on it. Prevailing sentiment here is strongly in favour of keeping it in Canada.

Trieste Through Italian Eyes

FROM OUR ROME CORRESPONDENT

THE man on the spot in Italy cannot see the whole of the Trieste picture, but the pro-Tito bias of large sections of the London press and the obvious contrast between their comments and the facts observable in Italy leaves foreigners here taken aback and moderate Italians spluttering with fury. The Trieste issue may have been influenced by the chauvinist fight in Italy, but Italians of all parties find it difficult to understand why there should be such difficulties about returning a city with a predominantly Italian population and why the Italians of Zone B should be exposed to a stream of vexations in direct defiance of the terms and intentions of the Peace Treaty.

Much has been written in the English press about Italian imperialism. But Yugoslav papers and official statements are full of provocative bluster of which the less offensive examples claim that the natural frontier between the two countries is the Isonzo (in purely Italian territory). The worst that can be said of the Italians is that they have laid claim to the whole of the Free Territory, which contains a Slovene minority. But they have some excuse for their attitude. Apart from the predominance of their countrymen in the Territory as a whole, they can point to the famous Tripartite Declaration of March, 1948, which promised to ensure the return to Italy of both Zones.

What official Italian circles have always insisted on is that any discussions for a definitive solution should take place on an equal footing. This means in effect that Italy should go to the conference table after having occupied Zone A, as a counterweight to Yugoslavia’s possession of Zone B. It also refuses to renounce beforehand any claims to Zone B, since the aim of the negotiations would be to secure the return of the coastal cities (inhabited mainly by Italians) in the Yugoslav Zone, by using as bargaining counters the grant of port facilities in Trieste itself or rectifications of the Zone A frontier in Marshal Tito’s favour. It was in reaction to the report that Yugoslavia was proposing formally to annex Zone B, and thus put an end to any such Italian hopes, that Signor Pella ordered his troops to the frontier.

The step was misguided, but showed the strength of Italian feeling. Thereafter, by adopting Saragat’s idea of the plebiscite, he succeeded for the first time since 1945 in scoring a distinct tactical success over Tito. The Yugoslavs’ argument that the plebiscite could not be accepted because Mussolini had driven out the Slovene minority was met by an offer to allow anyone born in the Free Territory area before November 4, 1918, to vote.

Signor Pella’s new tactics bore fruit in the Allied offer to hand over Zone A to Italy. No strings, but equally no time

limit were attached to the transfer. But such was the Italian fear that acceptance of the offer would lead to the definite partition of the Free Territory that only Signor Pella's personal appeal induced Parliament to approve the proposal. And representatives of all parties qualified their approval by defining the transfer as a payment on account, with something (most hoped for the whole) still to come from Zone B. The Left went further and denounced the scheme lock stock and barrel as equivalent to partition. There was bitterness in Trieste itself. The people of the border area have always been strongly opposed to any move which might prejudice the position of their countrymen across the demarcation line. In spite of these difficulties, Pella won the day and he might well have worked out a reasonable solution which Italian public opinion was prepared to accept had it not been for the Yugoslav threat to invade Zone A if a single Italian soldier set foot in it. Instead of firmly ignoring the blackmail, the Allies hedged and suggested a conference at which the Italians would have been armed merely with a promise that, by a certain date, the civil (but not military) powers would be handed over to them. Pella, not unreasonably and (as always) in very moderate terms, insisted on the prior execution of the Allies' undertaking; his demands were refused.

The effect on Italian public opinion has been disastrous. The Tripartite Declaration was never implemented. Now, says the man in the street, it will be just the same again with the latest offer. The Allied troops will stay and, apart from minor concessions, everything will remain as before, unless, of course, Tito decides to annex Zone B.

The practical effect of the blow is to make the ratification of the European Defence Community Treaty by Italy most unlikely and to discourage those who have put their money, in a country where extremism is endemic, on a moderate and rational policy of "Atlanticism." The Left, which will in any case vote against the EDC, stand to gain from a weakening of the centre. But the rift between them and the rest of Parliament over Trieste is now so sharp that no further attempt by Saragat to smuggle Nenni into the government is likely. The short term danger comes from the Right. A new government is almost certain to be led by Signor Pella, whose stock has been rising steadily. But his position now rests on right wing support and the trend is away from internationalism and towards chauvinism.

Economic Setback for Indonesia

FROM OUR CORRESPONDENT IN INDONESIA

LAST month, the Communist-controlled trades unions (Sarbupri) on the Indonesian estates staged crippling strikes in defiance of the government. Their demands, if granted, would be ruinous, especially as they were made within a few weeks of a wage increase which was already causing grave concern to exporters. In the event, the strike leaders called off the strikes after receiving a promise from the Minister of Labour that the arbitration board would reconsider the strikers' wage claims. Behind these demands and the strikes for which they are the overt reason, there is a political motive. The Communists want to whip up feeling against the presence of foreign capital in Indonesia. They also want to revive the "fighting spirit" of the unions which have tended of late to creep away from Communist tutelage. Their recent qualified success should help them

to re-assert and extend their dominance over the unions.

The factious and irresponsible behaviour of these unions encourages the low productivity of the Indonesian workers which, in its turn, is largely responsible for the difficulty which Indonesia is now experiencing in competing in the world markets. During 1953 there has been a rubber conference in Copenhagen, a tin conference in Brussels and a sugar conference in London. All these conferences have ended in disappointment for the Indonesians. They have been unable to maintain their prices or re-establish pre-war quotas and markets.

Rubber and tin enjoyed boom trading conditions during the early stages of the Korean war and while America was stock-piling strategic materials. So great was the rubber boom that enterprises in South Sumatra found it advantageous to compromise with the gangs of employee-thieves looting the estates by allowing them to tap for their own benefit for part of each working day. Wage rates were astronomic and every labourer seemed to sport a new watch and, however illiterate, the latest expensive fountain-pen set. The government was not sufficiently organised to reap the full benefit of the boom. Even so, a large amount of foreign exchange poured into its coffers. Unfortunately, the cabinet of the day seems to have assumed that the boom would continue for ever and committed itself to a vast programme of future expenditure.

The prospects for rubber since the Copenhagen conference are not encouraging. Stockpiling has long been slowing down and the end of the Korean war will certainly not reverse the process. It is thought that the American price of synthetic rubber is to be increased and that this may cause some recovery in the natural product; but no one is confident enough to forecast a period of even comparative prosperity.

In London, during the international sugar conference the Indonesian delegates drew the attention of the members to the urgent need for increased sugar exports to counteract the severe losses in foreign exchange earnings due to the fall in rubber and tin prices. But they were unable to obtain agreement on an export figure in any way approaching the quota they demanded. The other delegates seemed doubtful about Indonesia's ability to produce even the comparatively small allotted quota. The Indonesian delegates were rather indignant at the doubts cast upon their production figures, but recent events scarcely encourage observers to feel confident in the country's ability to use its valuable resources to the best advantage.

Indonesians, however, including those who realise their own shortcomings, feel that they are not getting a square deal. They cannot understand why, as it appears to them, America should insist on holding down the price of the goods they have to sell while at the same time allocating them funds and technical assistance; this looks to Indonesian eyes like "aid not trade."

It is plain that increased productivity on the estates and a government in which the outside world has confidence are basic essentials for Indonesia's recovery. The prospects of fulfilling either of these conditions in the near future are very small; in the long run and under firm and responsible government there is hope, but only if the first positive steps are not too long delayed. At the same time the policy of the western powers needs careful overhaul to make sure that it is not earning resentment over what it takes away with one hand, and gaining little thanks for what it gives, with the other.

"Acqua alle corde!" The Obelisk in the Piazza di San Pietro in Rome was erected in 1586 with the help of 800 workmen and 140 horses. This detail from Carlo Fontana's engraving gives some idea of the splendid grandeur of the operation. It was a close thing, so the story goes. The architect had not allowed for the enormous strain on the ropes and their consequent stretching. But, though silence was imposed under pain of death, one of the workmen—a sailor from San Remo—shouted at the critical moment:

"Acqua alle corde!" And the water on the ropes, tautening them, saved the day. These days the builder works with far more manageable materials. Some of the most versatile are made by the Building Boards Division of the Bowater Organisation. Made from compressed wood fibre, these boards are used, among a thousand other uses, as insulating materials in ceilings, as partitions in houses, as panelling in railway coaches or in ships... all over the world they are essential to the architect and builder of today.

THE BUSINESS WORLD

South Africa and Sterling

BY abolishing from January 1, 1954, its discriminatory controls on imports from the dollar area—while at the same time issuing the warning that its total import licensing next year may be more stringent—the South African government has taken a step that liberals presumably ought to, and that the Americans certainly will, applaud as a model for other countries in difficulties in their balance of payments. For this is a decision that is strictly in line with the rules of GATT and other international codes of commercial conduct: namely, that when a country has to keep down its imports by licensing restrictions, it should do so against imports from all countries indiscriminately. It is easy to understand why South Africa has taken this step. It will be generally welcomed in the Union, where importers will now be able to satisfy their requirements in the cheapest market—and, perhaps more important, in those that offer the earliest delivery. It will also be welcomed in America; and South Africa is very eager for a welcome from America at the moment, for its hopes of an increase in the dollar price of gold are not yet dead, however deeply they may be sleeping. But should it also be welcomed in Britain, which has recently been receiving about £70 million of gold a year from South Africa in return for allowing a free flow of capital to it?

Ever since the agreement of January, 1948, South Africa has occupied a unique position within the sterling area. Unlike most of the other members of the sterling group, the Union undertakes the responsibility of settling its own hard currency debts. This arrangement became necessary because during 1947 South Africa was actually a net drawer on the central gold and dollar pool, to the tune of £19 million, despite the fact that it produced £100 million (now £150 million) of gold a year. But once the agreement of 1948 was signed, the Union became in effect an important hard-

currency market for British exports. And, by a succession of special arrangements between the two countries, Britain was enabled to earn substantial amounts of South African gold. From the end of 1949 to the end of 1951 more than £120 million of gold was earned in this way.

Under the existing arrangements the South African government undertakes to ship to Britain a minimum of four million ounces of fine gold annually (worth approximately £50 million); and it has promised that this undertaking will remain in force in future. But actual sales in the past two years seem to have been £15 or £20 million higher than this minimum. This has resulted from the odd arrangements whereby South Africa has offered Britain a *quid pro quo* for allowing it to finance essential imports from soft currency countries by sterling payments through London (the imports that can be so financed include not only imports from Britain, but also those from other sterling dominions and from "transferable account" countries such as those in the European Payments Union). The formula laid down has been that when these sterling disbursements on South African account have not been covered by South Africa's current sterling earnings, plus the annual £50 million gold transfer to London—and they generally have failed to be so covered—then South Africa will make up the balance with another shipment of gold.

It should be emphasised that since the beginning of 1951 South Africa has not discriminated between currency areas in its imports of these essential goods; these imports are therefore not affected by the liberal part of the new dispensation, although they may be affected by the illiberal part of it—since total licences for goods that have hitherto been in this category may be cut back. For example, Mr Louw, the Minister of

Economic Affairs, announced this week that in 1954 preliminary quotas for imports of agricultural and industrial machinery (of less than £1000 unit value) will be only 50 per cent of total quotas granted for 1953, and that for "raw materials, consumable stores and maintenance spares for industries generally, letters of authority for 1954 are being prepared on the basis of 55 per cent of the total allocations made to importers for the whole of 1953." Fortunately this probably does not mean what at first sight it appears to mean—namely, that South Africa's imports of essential goods in 1954 will be virtually cut in half; alarm and despondency always are spread among foreign exporters to the Union at this time of the year, because the South African government likes to announce low initial quotas and then to increase them later. But Mr Louw warned traders this week that "in view of the generally difficult position expected for 1954 it may not be possible to grant a very substantial second round," although he went on to say that policy will be adjusted "to ensure that there will be no serious scarcities of the more necessary goods next year."

★

Side by side with this system of non-discrimination in essential imports, however, South Africa has hitherto practised severe discrimination in its inessential imports; and it is in this field that Britain and other soft currency countries are now to lose their sheltered markets. For example, permits for imports from Britain of textile piece goods below a certain ceiling price have for some time been freely granted against proof of firm orders; from January 1st next this permission will be extended to imports of piece goods from dollar countries as well. Now the rule of non-discrimination will stretch over the whole field, although—once again—total permitted imports may be cut. Preliminary quotas for imports of all consumer goods in 1954 will be at only 25 per cent of the inflated 1948 level (compared with 30 per cent this year); and some items such as crockery, women's garments, soapless detergent powders and certain classes of "pulp literature" will be added to the rigidly restricted list.

Hitherto South Africa's discriminatory imports of all inessential goods have been paid for in sterling; and attempts have been made to equate its spending on these discriminatory imports with the flow of sterling capital into the country. But it has always been doubtful whether this strange formula—of paying for inessential imports with the proceeds of the sterling capital inflow plus any running down of sterling balances that the Union feels able to allow, whilst paying for imports of essential goods with sterling from soft currency earnings plus a gold payment—has really had very much meaning. Those who have found the formula so complicated that they have been unable to understand it may draw comfort from the fact that the authorities themselves have found it so complicated that they have been unable

to make it work. The new arrangements, by abolishing the distinction between essential and inessential imports (and throwing them together into a non-discriminatory free-for-all) has the great advantage of greater simplicity. There will now be free competition between dollar and non-dollar suppliers in meeting all the import requirements that South Africa allows to be satisfied. The Union's dollar imports will still have to be paid for from dollar earnings or from newly mined gold. Unless there has been some gentleman's agreement behind the scenes about the sterling capital inflow and the sterling balances, it is to be presumed that all its non-dollar imports will now be paid for, in the first instance, in sterling; but to the extent that these sterling payments exceed South Africa's sterling earnings and the inflow of sterling capital (plus any running down of existing sterling holdings that the Union allows) the balance will be settled by a gold transfer to London. This gold transfer will not, in any circumstances, be less than £50 million a year; and if Britain and other soft currency suppliers gain a fair share of this non-discriminatory market, it should be bigger than that.

The effect on Britain of the new arrangements will therefore depend on two factors: on the one hand, the size of South Africa's sterling holding and the extent to which South Africa allows it to be run down; on the other hand, the competitive power of British and other soft-currency exports in this now entirely non-discriminatory market. At the moment, South Africa's sterling holdings are not large. During the past nine months, they have fallen from just under £60 million to just over £25 million; concurrently, the Union's total gold and foreign exchange holdings have fallen from £129 million to £94 million. The total capital inflow in the first six months of this year was only £14 million, compared with the peak inflow of £182 million—most of it in sterling—in 1947, before Dr Malan became Prime Minister. Thus, unless (for some at present unforeseeable reason) capital should again begin to move out to the Union on a heavy scale, South Africa will almost certainly have to meet the greater part of its non-dollar deficit by a transfer to London of some of its newly mined gold.

But is that non-dollar deficit likely to continue to run at over £50 million a year, now that discrimination in import policy is to cease? Mr Havenga suggested this week that it would, because British goods are now fully competitive with dollar goods. This suggestion must be treated with reserve. It was only a few months ago that South African government spokesmen were solemnly warning British exporters of the need to reduce prices and to advance their delivery dates if they wanted to keep their foothold in this market, and it is an historical fact that the South African consumer has always shown a strong preference for American goods whenever he has been allowed to do so. But in the first eight months of this year British exports to the Union—admittedly thanks partly to the discriminatory import licensing system—were £10 million higher (at £110 million) than in the first eight months of last year. The

fact that this market will no longer be sheltered should be regarded as a challenge, but in no sense a challenge that Britain should find it impossible to meet.

Although the immediate outlook for some of South Africa's staple commodity exports does not look bright, and although the excessive prices now being paid for farm land there may be helping to build up a top-heavy agricultural economy, the Union should become an increasingly important market in the future—if its internal political conditions allow. Once uranium production and the new gold mines in the Orange Free State are running at full blast, it should enjoy a substantial increase in its hard currency earnings; and the country is a hive of hidden reserves of precisely those raw materials for which the Paley Commission forecast a large long-term expansion in American demand. This, in short, is a goose that should be able to lay more and more golden eggs as the years go by, and it is only by superior competitive power that British exporters can

Economics of the Super-Grid

WHEN power began to flow along the first forty miles of the new super-grid at 275,000 volts a few months ago, leaders of the British Electricity Authority showed that they were aware of criticism of their new transmission scheme, which will cost £52 million and take seven years to complete. That criticism has been aired most publicly, and most significantly by an American productivity team that looked at the British electricity system in 1951 and published a report on it in April of this year. Among the recommendations made by the Americans was a suggestion that the "275-kV investment" might be postponed for a year or more, by making greater use of the existing 132,000 volt grid. This expert criticism has been answered, to the British Electricity Authority's satisfaction at least; but its answer has perhaps not stilled all the questioning in the electricity industry.

The existing power transmission grid in Great Britain, covering 4,000 route miles, operates at 132,000 volts; and the highest voltage used commercially anywhere in the world is that of 380,000 volts employed to bring Swedish water-generated energy to the industrial south. The decisions to instal a super-grid, and to fix its voltage at 275,000 volts, were taken after BEA had made an elaborate study of the transmission demands likely to be made upon the system in future years, and the economics of different ways of meeting them. Basically, the earlier grid scheme was not intended to do more than balance the loads between efficient and inefficient power stations within the seven independent areas into which it was divided. Transfers of power from one area to another were almost incidental, since the planning of power supplies at that time had not progressed far beyond the

gain the contract to feed it. There are some features of the new arrangements about which Britain may not be too happy. One is that there is presumably more danger now that an increase in any capital inflow from this country into the Union may lead to an increase in the proportion of British exports for which South Africa will pay in sterling rather than gold; another is that, more by accident than design, Britain is now settling part of South Africa's EPU debts in hard currency and receiving payment for them from South Africa partly in sterling. But if these shoes pinch, there should still be room for some co-operative shuffling of the shoehorn. The rationale of the new arrangements is that the shuffling should take the form of an agreement that the Union will in no circumstances cut down its gold payments to London if the flow of sterling capital should increase; such an understanding would be infinitely preferable to any return to discrimination against American goods.

idea of a power station in each town, supplying the load in the surrounding countryside.

As the load grew, it became evident that a choice would have to be made between the transport of energy from the coalfields to the user's neighbourhood, either by physical movement of coal in railway trucks, or by converting coal into electrical energy near the pithead and transporting the power. This choice had to be made because the existing grid was being increasingly used as a means of bulk energy transmission, mainly from the North and Midlands to the South, instead of fulfilling its original function of internal balance within a single area with no more than marginal imports and exports between areas.

The first problem was to estimate future loads on the system in different parts of the country. On this the Authority's engineers were realistic. They produced carefully worked out estimates of production and demand in different areas for the next fifteen years, but they bore in mind that if the errors in the load forecasts were only of the order of 10 per cent, and if these errors were taken in conjunction with an even chance whether or not power station sites in the coal producing areas could be obtained where they were strategically needed, then the result of this "double" would be to show the need either for a 4,000,000 kW load transfer between areas in 20 years' time—or for none at all!

These figures alone might be regarded as shaky foundations on which to build 1,100 miles of steel towers, reaching 130 feet high. But the overriding need to conserve coal required the building of power stations of high efficiency. This in turn implied large size, which meant large-scale coal transportation. Thus it was necessary to compare the cost of energy move-

ment by rail (or sea) with the cost incurred in electrical transmission. The latest available figures for this comparison, given in a paper last year by Mr Sayers and Mr Cash of the British Electricity Authority, relate to 1949 price levels. The average transport cost for coal delivered to the power stations in the Scottish, Northern, Mid-East and Central Areas was 76½d. per ton: for the area round London it was over 180d. per ton, and this latter figure included a considerable proportion of coal transported by the cheapest method, the coastal shipping route from Scotland, where the cost was 130d. per ton. The comparable costs of electrical transmission showed that it could not compete with the sea transport of coal if there were very short rail hauls at the pithead end, and direct delivery into dockside power stations at the receiving end. But such conditions are not very common. Strategic as well as technical considerations are involved in any plan to put a number of large stations on the coastline (another suggestion of the American team, to save expense on cooling towers); and in any case, neither the pits nor the loads—the industrial areas—are predominantly near the sea.

For distances between 25 and 45 miles (according to the voltage used), the BEA experts held that the cost of electrical transmission of energy shows an advantage that grows as the distance increases. At 140 miles, the cost of transmitting the energy equivalent to the output of a 360,000 kW power station was £950,000 per annum (at 1949 price levels), by hauling the coal; £680,000 per annum by using the 132,000 volt grid lines; and £650,000 per annum using the new 275,000 volt system. The margin between rail transport of coal and any sort of electrical system is thus obvious; the margin between an extension of the existing system and the inception of a new one is not, on these figures alone, great enough to be significant. Further justification is required for the choice of a higher voltage system that brings with it great expenditure of an indirect nature, such as the erection of experimental lines, research over a number of years, and extensive development programmes in the works of the manufacturers of the plant necessary. But the only feasible alternative to a new, higher-voltage system, would have been to extend the present 132,000 volt grid by the addition of more inter-area links, and by increasing the capacity of those links that already exist. To improve the transmission capacity of a given line, the power-factor, or the proportion of wattage that is fully useful, could be improved. The American team thought this might have been done on the existing 132,000 volt grid.

If the load varies widely during the day or during the seasons, it will make smaller use, on the average, of the generating capacity installed to cater for it than would a load more evenly spread. To correct this under-use of power station capacity—that is, to improve the power factor—usually involves the employment of new equipment at the consumer's installation, and the consumer usually has to pay for it—for which he gets a relief in the tariff he pays. He is

not obliged to do so; indeed, in the vast number of factories where comparatively little electricity is used, he has little interest in doing so. The Americans' point was that more useful load carrying could be got out of the existing distribution grid.

The Authority's official answer to the American suggestion that the unused capacity of transmission lines might be brought into useful service was that "It is by no means conclusive that power-factor correction offers all the advantages claimed." But their statement, made early this summer, went on to say that while conditions in the United States generally differ from those in this country, there were particular instances here where corrective equipment would be economically justified. Consumers do not, of course, deliberately choose apparatus that will cause a low power factor, any more than road users deliberately choose, for example, tyres that may cause greater wear on road surfaces. But there is no argument about the general responsibility of the highway authorities to maintain the roads and to repair the surfaces and to spread the cost over all the users equally. Further paragraphs in the Authority's answer to the American criticism contain clear implications that they expect the expense of this power factor correction to be undertaken, if at all, mainly by the consumer himself. But only the large users work on tariffs with power factor clauses; and the grocer, installing a much-advertised fluorescent lighting fitting, cannot be expected to know, or care, that its power factor is likely to be less favourable than that of the filament lamp it replaces.

Even if power factor correction and other technical improvements resulted in better utilisation of the present 132,000 volt system, new loads in areas where there are no power stations will create a need for more transmission capacity. Could this need be met by extending the present grid? Technically, it was found to be just possible, and a phrase from one of the papers read last year is significant: "Investigation showed that the cost of a 275 kV grid system meeting the minimum requirements would be no more, and *probably* (our italics) less than that of an equivalent 132 kV superimposed system." With no overwhelming bias towards the higher voltage grid from the point of view of first-cost, other factors remained to be considered. The practical problems of bringing a considerable number of additional pylon lines into large cities, and across heavily industrialised areas, weighted heavily in the balance in favour of a few lines of much greater power transfer capacity. The electrical operation of more lines is more difficult than that of a few lines of higher capacity. Very large future power stations, including those where nuclear energy may be transformed into electrical energy, could more easily be coupled into a high-power network. British manufacturers of high-voltage plant would have an opportunity to demonstrate to potential customers abroad what they could do in this field. The actual choice of voltage was almost an obvious one: a small increase, from 132 kV to say 164 kV, would not have justified the

enormous expense. The next internationally agreed standard level was 275/300 kV, and this was chosen in preference to the possible 380/400 kV level owing to the problems likely to be encountered in operating high voltage outdoor plant in the British climate, particularly in areas where atmospheric pollution is prevalent.

Some electrical engineers—even within BEA—would argue that one entirely different aspect of Britain's future power problems was insufficiently explored in connection with the supergrid: district heating. Engineers have not yet solved the basic problems of using coal for power generation for the thermal efficiency of coal-fired stations cannot exceed about 40 per cent even in the most favourable circumstances. Indeed the supergrid assumes an average thermal efficiency of no more than 27 per cent during the next 15 years.

In face of the wastage each year of millions of tons of coal, some modification of the supergrid proposals to utilise a certain amount of district heating has been advocated. Part of the new power station programme might have been devoted to combined power and district heating stations, and their lowered efficiency (for they would use smaller generating sets) would be offset by the coal saved by the distribution of heat. Such a programme would involve the transport of coal instead of electrical energy, since a district heating station must burn the coal within a few miles of the point where the heat is used. It would have meant the establishment of a number of large district heating stations near the centres where industrial heat is needed, and where large residential areas are being expanded,

all the new houses being equipped with hot water pipes from the mains. This would change the whole picture of the transmission of energy in Great Britain; short, heavy capacity "balancing" feeders between large stations, instead of the long-distance bulk transmission lines in the new supergrid, might have been the result.

There are strong arguments against such projects, chief among them the capital cost required for district heating and its dubious economics in many circumstances. But the supergrid itself is to cost £52 million, a large figure by any other standards than the British Electricity Authority's. Any project that might save a significant proportion of 30 million tons of coal a year has obvious attractions; coal prices are likely to rise rather than to fall in the next decade. But in the end the economic validity of the supergrid is independent of the debated virtues of alternative systems incorporating district heating; it rests instead on the question whether the supergrid will be a cheaper means of power transmission than the extension of the existing grid. The load transfer estimates on which the supergrid is based seem a little shaky, and not even of such a fairly reliable order as the prediction of the increase in the total demand for electricity. The supergrid will work, and it will enhance the benefits arising from any grid scheme. But it was not inescapably forced on the Authority by any promise that it would offer a greatly reduced capital cost compared with the cost of extending the old grid and using it more effectively. The economics of this vast and imaginative new investment are still in doubt.

Business Notes

Cheaper Local Loans

A MODEST concession has been made this week in rates charged by the Public Works Loan Board for new loans to local authorities. As from last Tuesday, loans for periods of less than six years cost 2½ per cent instead of 2¾ per cent, loans for six to fifteen years cost 3½ per cent instead of 3¾ per cent, and those for more than fifteen years cost 4 per cent instead of 4¼ per cent. The City has jumped to the conclusion that these changes flow from the recent reduction in Bank rate, and some people are even regarding them as yet another indication that the authorities are now deliberately pursuing a policy of cheaper money. Both these assumptions, plausible though they may seem at first sight, collapse upon detailed scrutiny.

The PWLB affords long-term finance, so that the rates it charges, if aligned with market rates (as they are always supposed to be), are adjusted to those in the gilt-edged market, and not to the structure of short-term money rates now dominated by Bank rate. That this is no hair-splitting distinction can be clearly seen by a glance at Mr Butler's two previous changes in PWLB charges. His increase of ¼ per cent (to 3¼ per cent) in the longest PWLB rate in November, 1951, though announced simultaneously with the first increase in Bank rate, was made to take account of the big rise that had occurred in gilt-edged yields in the preceding two and a half years (during which time Labour Chancellors had broken the rule that PWLB rates should broadly conform to the market). And his second increase in PWLB rates, though it reflected the further sharp fall caused in the gilt-edged market by the "new" monetary policy, was not associated with any change in Bank rate.

The PWLB rates established then, and retained until this week, became effective on February 9, 1952—when Bank rate still stood at 2½ per cent, and four weeks before it rose to 4 per cent.

Relationship to Rents

THE latest changes were, indeed, overdue before the recent Bank rate change induced a further rise in gilt-edged. The transformation that had occurred in the gilt-edged scene in the preceding fifteen months had left PWLB rates appreciably above the corresponding market yields, especially for the longest loans. Since mid-September these disparities had, of course, widened further, but only marginally. Had they been allowed to remain much longer, Mr Butler might have found it hard to claim that he was still fulfilling the pledge not to use the PWLB rate as an instrument to drive the local authorities to use their new freedom to borrow alternatively in the market; and he might also have been accused of penalising those smaller authorities for which market operations are impracticable—though any such argument would have merited the retort that the less credit-worthy bodies cannot expect to command the same rates as the strongest ones. This consideration has perhaps been in mind in the framing of the new rates, for the changes made are conservative. In the five year and the six to fifteen year categories the new rates are, it is true, a shade below the nearest comparable market yields (for the longest stocks within each bracket), but the margin now is smaller than it was at the time of the last change. For loans over fifteen years, however, the PWLB charge of 4 per cent is still between an ⅛ and ¼ per cent above the redemption yield on long-dated stocks (taking Transport, 1978-88, and Gas, 1990-95, as the basis of comparison), whereas in February, 1952, the 4½ per cent rate was almost exactly at parity with the long-term market. The new differential is a very proper one; for even the strongest of municipal borrowers could not command in the market the same terms as the British Government. Moreover, the fact that the rates have not been brought precisely down to market level has to be set beside the Treasury practice of not following the market yield upwards until the new basis has been long established; no revision was made when the market slumped violently in the early summer of 1952.

In short, this modest cheapening of Government finance for local authorities, which might seem at first glance to be an odd prelude to the promise of some revision of the rent restriction acts, is not really out of harmony with the hope that a little realism may soon be introduced into the pattern of rents. In any case, it remains to be seen how housing finance will be affected by the interest rate concessions. The 1952 review of the housing subsidy specifically took into account the addition caused to new housing costs by the two increases in PWLB charges; and the 1954 review ought logically to take equal account of the small saving that new housing will now enjoy.

United Steel Terms

THE prospectus for the resale to the public of United Steel shares will be advertised on Monday, the lists for the issue are likely to open next Thursday (October

29th) and remain open until Monday, November 9th. A preliminary announcement from the Realisation Agency confirms that the terms will be very close to those adumbrated in *The Economist* last week. The 10,194,000 £1 ordinary shares now held by the Agency will be supplemented by 3,806,000 new shares created by a capitalisation from reserves, and the whole 14 million £1 ordinary shares will be offered at 25s. each. The directors expect to be able to pay a dividend equivalent to 9 per cent on this £14,000,000 capital for the 53 weeks to October 3rd last, which would offer a yield of 7.2 per cent on the issued price. The prospectus on Monday will detail the arrangements whereby priority will be given to applications from former shareholders and the list of gilt-edged stocks that can be tendered for the issue in the same way as cash.

The directors suggest that "maintainable profits" should be of around £6 million a year. Dividends on the £9 million odd of preference shares held by the Agency will absorb just over £250,000 and interest on the £10 million of a new debenture stock (which is to be issued to the Agency to cover an existing loan to the company and to finance the concluding stages of the company's massive development programme) will absorb £475,000; after allowing for a total tax bill of around £2,970,000, which would be payable on the estimated maintainable profit and on the proposed dividends, this would leave net retainable earnings of just under 30 per cent to cover the 9 per cent dividend. Clearly, a dividend that is as well covered as this and a yield that is some 1.6 per cent above the average yield on the blue chips in the *Financial Times* ordinary share index should ensure hearty support for the issue from institutional investors; and, although the diffuse Labour growlings about the terms of any future renationalisation—which seem to amount to a threat that they might buy back the shares compulsorily at the issue price less the excess of dividend payments over interest that would have been paid on a Government stock—may impose a damper on future capital appreciation, even some private investors may regard this as an opportunity that should not be missed. Until the terms of future offers for sale of the preference and debenture stock are known (and until the arrangements for handling United Steel's former holding in John Summers are clarified), the "political arithmetic" of the issue must remain uncertain; but—on present indications and thanks partly to the Bank rate reduction—Conservative propagandists who will want to prove that the state has made a profit on this resale over the original purchase price should have a fairly easy task, and Labour propagandists who will want to prove that the state is making a loss on the operation will have to do some very strange arithmetic indeed. But, no doubt, they are already working furiously over their slide rules in duty bound to try.

Mutual Aid against the Grain?

THE American Government's plans for disposing of some of its surplus farm products by selling them abroad through the Foreign Operations Administration for sterling and other non-dollar currencies are now in an advanced stage. The Foreign Operations Administration (the new

name for the Mutual Security Administration) was empowered last November to use up to \$250 million of aid funds to finance the sale of surplus commodities for local currency to friendly countries. It is now reported that the Administration is ready to sell \$175 million of surplus commodities under this programme, of which \$130 million are destined for Europe. This would still only scrape the surface of America's problem—total farm surpluses are now estimated at \$2,600 million—but the FOA's negotiations with individual countries have been sufficient to arouse rather touchy comments on this side of the Atlantic that a scheme that might lead to the loss of certain dollar receipts by Europe, in order to assuage Mr Eisenhower's agricultural headache, is a new and dangerous definition of mutual aid.

There are two major difficulties. On the one hand the Americans naturally want to be sure that sales of goods under the scheme are genuine additional sales that help to reduce their piled-up surpluses—that they do not simply replace regular transactions for dollars. They are also being told by European and other agriculturalists—with growls about dumping on a saturated market and possible international retaliation—that their sales should not be at the expense of other countries' regular exports. The scheme must, therefore, be confined to those surplus American commodities that do not form part of a general world surplus. The FOA itself has laid great stress on its intention to avoid any diversion from normal channels of trade and to confine sales to goods for which there is clearly scope for increased European or Asian consumption. This must impede sales under the scheme of the great surplus commodities such as grain and (to a less extent) cotton; large sales of tobacco under the scheme might also tend to be at the expense of regular American exports, and increasing emphasis may have to be laid on beef, dairy products, fats and fruit.

★

The possible pitfalls of the scheme for receiving countries are equally serious—and they may indeed make agreement on its operation impossible. The great danger is of course that the FOA's acquisition of sterling or other European currencies may, in effect, lead to a decrease in Europe's net dollar receipts—so that the surplus commodities will turn out to have been paid for in dollars after all. Most of the American suggestions for ways in which the FOA might use its sterling are open to this criticism. Funds used to finance British manufacture of equipment for other Nato countries, for example, would presumably tend to replace the off-shore contracts that would otherwise have been placed in dollars; and the same would be true of funds set aside to meet expenses incidental to the presence of American military personnel in this country. It is easy to see what the extreme American reaction to this sort of grumbling could be: stop paying for these parts of Europeans' defence programmes, and tell them they can have surplus grain as a free gift or not as they please. And it is equally easy to see what the extreme European political reaction, and intimations about what they might do with their grain, could be too. The task of diplomacy now is to devise some formula whereby the FOA's accumulation of local currencies would be used to finance operations wholly additional to its present commitments, or rather to whatever its much reduced future commitments are likely to be.

Third Quarter's Trade

THE final returns of Britain's overseas trade in September estimate exports at £202.2 million (f.o.b.), imports at £269.4 million (c.i.f.) and re-exports at £8 million. The gross visible trade deficit for the month is therefore recalculated at £59.2 million, or about £800,000 less than was suggested by the preliminary returns which were discussed in *The Economist* last week. The details now available show that the fall of nearly 3 per cent in the monthly value of exports in the first nine months of the year was wholly due to a decline in prices; the volume of exports was, if anything, very slightly higher than a year ago. The fall in prices also more than accounted for the fall of nearly 7 per cent in the value of imports in the first nine months of the year; the volume of imports was between 5 and 6 per cent higher in this period—although there was some check to this rise in the third quarter itself (when the volume of imports was nearly 3 per cent below the monthly average in the previous six months). This downturn in the third quarter was caused by a fall of some 14 per cent in imports from the sterling area, mainly owing to a seasonal decline in imports of raw wool and other products. Imports from the non-sterling area actually rose by some 7 per cent in this period, thanks partly to a seasonal rise in arrivals of grain, flour and tobacco.

Exports to the sterling area rose by nearly 3 per cent between the second and third quarters of the year, and were higher than in any other quarter in the last eighteen months. Thanks to the easing of import restrictions, shipments to Australia were more than £3 million a month, or about 20 per cent, larger than in the second quarter. Exports to the non-sterling area fell slightly in the third quarter, although they were still 2 per cent above the average of the first quarter. It may be premature to link the slight decline in non-sterling exports to the increased pulling power of the Australian market; but this is clearly a danger to be watched. Exports of textiles, particularly woollen goods, were £3 million a month higher in the third quarter than in the second, and miscellaneous manufacturers were £2.5 million higher (with shipments of refined petroleum setting a new record). These gains were almost entirely offset by a fall of £5 million a month in shipments of engineering products, notably of machinery and motor cars. The net result of these changes on the pattern of trade was that the trade deficit with the non-sterling world rose to a monthly average of £36.5 million in the first nine months of the year from £33 million in the first six, but was still well below the average of £50.2 million a month for 1952. The deficit with the sterling area declined to an average of £24.3 million a month in the first nine months (compared with £31 million a month in the first six and £12.8 million a month in 1952). In other words, in the first half of this year Britain's balance with the non-sterling area improved while that with the sterling area deteriorated; but now, most disappointingly, the trend seems to be moving the other way again.

Lancashire's Recovery—and After

AT the annual conference of the cotton textile industry last week—held, by Lancashire's choice, in Harrogate in Yorkshire—Sir Raymond Streat, the chairman

of the Cotton Board, addressed an audience that has now almost fully recovered from the painful recession of 1951-52; and warned it against complacency. For the rebound to recovery seems to have caught Lancashire somewhat off its guard. Domestic demand is nearly back to what appears to be its "normal" postwar level. Demand from overseas has recovered more slowly, and is now only about 77 per cent of the 1950-51 average; but the proportion of exports consisting of cloth wholly produced in this country has risen from 80 to 90 per cent, and in the past three years Lancashire has at least maintained (at around 15 per cent) its share of world trade in cotton piece goods. In consequence, total orders now reaching the industry would be sufficient to maintain output at about 90 per cent of the pre-recession level. But—and it was this point that Sir Raymond Streat found disturbing—the shortage of workers in all sections has prevented output from rising to more than 88 per cent of that level; the result is that delivery periods are lengthening.

In the next few months demand from overseas is likely to increase further, now that import restrictions in Australia and other countries are being relaxed. But many foreign textile producers have a pool of labour on which they can draw to increase output, and unless Lancashire can compete on deliveries, to say nothing of prices, the new orders will go abroad; since the long-term trend of world trade in cotton piece goods is downwards, and since Britain cannot expect to enjoy its present degree of protection in Colonial territories for ever, any such inroad into Lancashire's traditional markets should be viewed with concern. In the short term, output may be raised to meet new demands by making further efforts to increase the recruitment of workers, but Sir Raymond warned his audience that there was a limit to the number of workers the industry could hope to attract. "Increased productivity," he concluded, "is more than ever our most critical need."

Unfortunately, the record of productivity is not encouraging. Between 1947 and 1951, output per worker in the spinning section rose by 6.3 per cent gross; but, after allowing for changes in the average counts of yarn produced, Sir Raymond estimated the net increase at only about 3.7 per cent. In the weaving section the gross increase during the same period was about 8.2 per cent; but the net adjustments for changes in the type of production, which defy measurement, would probably be greater than in spinning. Moreover, the record has been uneven. "Many units have increased productivity by much more impressive percentages, whilst others have not achieved any increase at all." Presumably these others belong to the body of opinion in the industry that holds that, when times are bad, schemes of re-equipment and redeployment cannot be afforded, and that when times are good they are unnecessary.

Ministry Eases Copper Squeeze

THE Ministry of Materials has this week done a "Dalton in reverse" to bring down prices in the London copper market. On Tuesday afternoon, before its intervention, spot copper prices had reached £246 5s. a ton—a new peak since private dealings began on August 5th, and (when allowance is made for the difference in the terms

of sale) only about £4 short of the pre-August official selling price of £252 a ton. At this point the Ministry's broker announced that he was offering prompt copper to the market on the standard contract basis; the Ministry had previously sold considerable quantities of specified copper to consumers through the market, but it had not previously sold copper to the market itself. As a result of these offerings, spot copper fell abruptly to close on Thursday at about £237, and three months' fell from £228 a ton to about £223. The Ministry, which holds very large stocks of copper left over from the days when it was the sole British importer, is not attempting to establish any absolute level of prices; but it is naturally anxious that during the transitional period of decontrol the British copper-using industries should not be at a disadvantage in the price of the raw material compared with their foreign competitors. Prices on the Continent have recently been below those on the London market.

The rise in prices in London up to Tuesday last reflected the improvement in demand in Britain and the Continent, the covering of forward sales, and the shortage of prompt supplies from private sources. Prompt copper is also short in the United States, owing partly to the strikes in American and Canadian mines. But the market is still playing Hamlet without the Prince. The agreement that will almost certainly be reached on the sale of Chile's surplus copper to the American stockpile should prepare the way for a resumption of Chilean offers from current production; Chile's traditional customers in the United States do not seem to be in a state to absorb anything like its output of 30,000 to 35,000 tons a month, so that substantial supplies may then come on offer to European consumers. The strikes now current or pending in some Chilean mines may defer this threat, but the large discount for three months' copper on the London market, which has remained at about £15 a ton in recent weeks, suggests that nobody is confident that the deferment will be long.

Slump in Ship Orders

THE flow of orders to British shipyards dwindled to only 350,000 tons gross in the first nine months of this year; indeed, in the third quarter alone the flow almost dried up into a mere 55,000 tons. Total new orders for this year now seem unlikely to reach 500,000 tons, compared with 1,858,000 tons ordered last year and nearly 4,000,000 tons in the boom year of 1951. The industry is in no immediate danger of unemployment. Its order book still stands at the high figure of 5,750,000 tons, compared with the peak of 7,000,000 tons in June, 1952, and its current rate of launching of about 1,250,000 tons a year. Even if the expected improvement in supplies of steel plates next year allows output to be stepped up (towards Britain's estimated full launching capacity of 1,750,000 tons a year, the industry has therefore at least three years' work in hand. But the distant future does not look bright.

Although this year's slump in orders has been world-wide—thanks to lower freight rates and high replacement costs—the industry's most pressing need is to meet the growing competition from foreign yards by reducing costs and delivery periods. Some orders have evidently been lost to the Continent, and some orders for British owners

This designer needs help FROM A METALLURGIST

New designs with higher standards of performance often require improved materials.

It is the job of the metallurgist to see that these materials are available when required.

He and the designer both have the same objective — the project which in a few years' time may be depending on materials not yet commercially developed.

Mond Nickel is working now on such problems in the field of nickel alloys. Now is the time for designers to . . .

have been given to Continental yards. The latest Lloyd's Register returns show that in the third quarter of this year eleven ships totalling 102,000 tons gross were under construction in Holland for British account and two ships totalling 3,600 tons in Germany (which has now jumped into second place behind Britain among the leading ship-building nations). In view of the importance of quoting prompter delivery dates, it is surprising that more steel plate is not being imported into Britain now that supplies are readily available. Prices are higher, but this could surely be offset by the economies of greater productivity.

Burma Imports a Health Service

A NEW fashion in the establishment of a welfare state has been set in the agreement signed in London this week between the Burmese government and a British pharmaceutical company, Evans Medical Supplies Ltd. Burma has plans for a National Health Service—free medicines and all—and the government wants a local pharmaceutical industry to be set up to provide it with drugs, all of which are now being imported (£202,476 of them came from Britain in the first nine months of this year). But since the country is not showing any great haste to compensate the companies nationalised when it assumed independence, it seems unlikely that any of the world's major pharmaceutical producers would be prepared to risk their own capital in Burma at the present time. Under this week's agreement Evans Medical will build and operate a factory outside Rangoon, but all the initial and running capital is to be provided by the Burmese government and paid in advance—out of its sizeable sterling balances in London.

The agreement is to run for seven years, but it is unlikely that the whole scheme will be completed within that period, since it involves training Burmese staff to take over the entire management of the factory. The whole cost of the

venture is likely to run to several millions of pounds, of which more than a million will go on building and equipping the plant and a further portion on Evans Medical's management fee. The project is not an easy one, since pharmaceutical production calls for considerable know-how and immense care at every stage if the products are not to become contaminated. The first stage in Burma is likely to be the dispensing and packing of products imported in bulk from this country (for the purchase of which Evans Medical will be responsible); it will be some time before the new factory can start actual production of drugs. Once the terms that the Burmese government was offering became known, there was considerable competition for the management contract from continental manufacturers. Competition in the industry for new outlets has become acute during the past few years; the end of fighting in Korea may very literally throw a drug on to the market, and import restrictions overseas are being only gradually relaxed. Evans Medical, which does a considerable wholesale business, besides manufacturing drugs, is well placed to carry out an agreement of this kind; but the company's cautious approach to this very novel formula is no doubt well advised.

Treasury Bill Rate Falls

THE Treasury last week reaped an interesting by-product from the success of its bond re-financing operation. The big response to the cash portion of this operation was indirectly responsible for an unusually sharp dip last Friday week in the rate it had to pay on the weekly offering of Treasury bills. At the Treasury bill tenders themselves, the only visible results of the big flow of cash to the Treasury on October 5th were an under-allotment, by £30 million in each week, of the bills offered for tender on October 2nd and 9th, and a cutting of last week's offering to £240 million, the lowest issue for three months. In consequence, the bills issued in the three weeks just ended have fallen £50 million short of the corresponding nominal maturities. The real reduction in the supply of bills in the hands of the banks and the money market has, however, been much larger than this—perhaps about four times as large—because the big cash subscriptions to the new Exchequer Stock issue could not have been financed unless the authorities themselves had been prepared to relieve the resultant stringency in the market by buying up large quantities of bills. These special acquisitions of bills, like those transferred simultaneously by "departments" to finance the internal cash subscriptions, were obviously treated by the Treasury as bills surrendered for immediate cancellation, with the result that the total of outstanding Treasury bills showed an immediate decline of £277 million (in the Exchequer return of October 10th).

This reduction in the bill supply, and especially in the supply of near maturities, has made many banking interests anxious to restore the balance of their portfolios. But at the tender of October 9th, perhaps in consequence of the resultant temporary dislocation of the short loan market, the discount houses refrained from raising their bid—with the result that outside applicants secured a larger share, and the discount market allotment was only 49 per cent of the amount for which it applied, an unusually small proportion

If no part of your accounting or statistical work is yet mechanised, the question of mechanisation must arise sooner or later.
When it does—what method shall you adopt?
The most flexible, the most adaptable, the most versatile of all mechanised accounting equipment is Hollerith. The potentialities of Hollerith Electrical Punched Card accounting range from an installation to carry the whole accountancy burden of a complex organisation to the execution—through a Hollerith Service Bureau—of one single job, or periodically occurring jobs.
It would be to your advantage to investigate Hollerith's potentialities Now.

**"This South African Sherry
is better than ever!"**

Yes, it's remarkable how they manage to keep on shipping finer and finer wine year after year.

How do they do it?

Simply by taking infinite care and not trying to hurry the job. These lovely South African sherrys we are enjoying in this country now are the reward of the infinite patience displayed back through the years by those Wine Farmers at the Cape.

You seem to know a great deal about it!

You remember I went to South Africa last year. I happened to meet a man who took me round the wonderful Wineries there where millions of gallons were being matured for the British market.

How long do they mature them?

The best wines are kept seven years at least before they are shipped. The South African Wine Farmers are determined—in spite of the demands from all over the world—to hold back and let the good stuff mature properly. You see their climate and soil are simply ideal for wine-growing, but it is necessary not only to produce lovely wine but, if you establish a name and reputation, to provide for keeping up the quality over the years.

These South African people certainly keep on improving their wines—especially their sherry. It's a credit to them.

That's what comes of selecting and maturing and waiting and keeping on doing that, and the longer it goes on the better the quality becomes.

I must say this is one of the finest Sherrys I've ever tasted.

Well, keep on drinking the best South African Sherrys and you will find the quality will astonish you."

**SOUTH AFRICAN WINE FARMERS

hat contrasted with 63 per cent in the previous week. Last week, therefore, the discount market attempted to outmanoeuvre its competitors, and raised its bid by 2d. per cent. It did not secure any substantially increased allotment; its proportion rose to 51 per cent. But it did have the effect of reducing the average rate paid by the Treasury on the whole issue to just under 42s. per cent, compared with 42s. 7½d. per cent in the previous week and just under 48s. per cent in the week before the Bank rate reduction. The next few tenders will be closely scrutinised for signs of any abatement of this increased competition.

World Bank Loans for Japan

THE International Bank has caused quite a stir of controversy over its latest activity—the granting of three loans totalling just over \$40 million for the expansion of electric power facilities in Japan. The loans have been made to a government agency, the Japanese Development Bank, which will in turn re-lend the money to three private companies to help finance the construction of three high efficiency thermal electric power stations in central and southern Japan. The loans are guaranteed by the Japanese Government in the usual way, and the interest rate of

5 per cent includes the customary 1 per cent commission charge that the Bank allocates to a special reserve. The controversial feature of the loans is that the principal contractors for the supply of equipment and technicians are two American companies—the Westinghouse Electric International Company and the International General Electric Company—that will participate in the Bank's loan to the extent of over \$6 million. These participations will be repaid between 1956 and 1960, while the rest of the loan is repayable within twenty years.

It has been pointed out, however, that the American companies were granted their supply contracts by the Japanese firms in 1952, whilst the request for a World Bank loan was not made until May of this year. It is therefore maintained that the existence of the World Bank loan could not have influenced the placing of the contract. More than 63 per cent of the Bank's loans in the last year were indeed spent in the United States; but that may be less a sign of any partiality shown by Bank officials than a tribute to the availability of supplies of American capital goods.

Unfreezing German Assets

THE German Federal Government is to make further important relaxations in its restrictions upon the transfer of current earnings on foreign capital. By early next year, profits and dividends earned on direct investments and all other non-contractual credits acquired before July 15, 1931 (the date of the "standstill" agreement), or after September 17th, 1953, will all be freely transferable. Contractual debts have already been dealt with in the London Debts Agreement (that came into force on September 16) and a number of payments have already been made under it. The total of assets on which current earnings have now been freed is some DM 13,000 million. This leaves some DM 7,000 million of non-contractual assets acquired between 1931 and 1953—the "blocked mark" period—as the group of remaining assets on which current earnings are still blocked.

The limitation of the proposed relaxation to earnings on assets acquired outside the "blocked mark" period means that Germany has still not fulfilled its obligations under the OEEC charter to liberalise all current capital transfers—although it has the largest cumulative surplus in the European Payments Union. But it must, in fairness, be admitted that for Germany to resume payment on all its external obligations at one stroke would put an intolerable strain on its economy, resilient though that now is. Annual payments in foreign currency on account of obligations covered by the London Debts Agreement will amount to DM 660 million or so (about £56 million), and within a few years amortisation charges will add another DM 160 million to the annual charge. The recent limited relaxations on the transfer of profits and dividends is expected to cost about DM 250 million. In addition, DM 200 million is required for the German-Israeli reparations agreement. These several arrangements in themselves impose a total annual obligation far in excess of last year's surplus of DM 700 million on the balance of payments. Although this year's surplus is running at a substantially higher level

than this, it would be decidedly dangerous for the German authorities to free the remaining blocked foreign holdings. The DM 7,000 million of restitution claims of German refugees, direct investments financed from blocked mark funds and blocked mark balances themselves, which constitute the rump of blocked foreign assets, would entail an annual transfer charge of around DM 600 million. The problem of un-blocking earnings on these massive holdings is undoubtedly best handled by the German authorities' present piecemeal approach. The prospects for a comprehensive solution will doubtless become clearer in the next few months, when the strain on the economy of the transfers already liberalised can be fully assessed.

Easier Export Finance

THE recent formation of Air Finance Ltd. to help British exporters of aircraft and aero-engines to offer extended credit terms to foreign buyers was "designed to meet a special problem" and the formation in Britain of some special financing organisation for exporters in general, on the lines of the German *Ausfuhrkredit A.G.*, "might not only be superfluous but might also encourage buyers abroad to ask for unnecessarily favourable credit terms." These, broadly and tentatively, are the conclusions that seem to emerge from an admirable little booklet on *Finance for Exports* that has just been published by the private firm of insurance consultants, the Credit Insurance Association Ltd.

The Association recognises flatly that there is an educational, if not an organisational, problem. In consumer goods it is "only during the past few months" that the widespread shortage of money in overseas markets has led to an intensified demand for credit terms. Some British exporters have undoubtedly lost business by their failure to respond to this demand, but the Association ascribes this failure to lack of appreciation of the ample and cheap facilities available for finance through the various forms of commercial bills, especially following the fall in commercial bill rates caused by the recent reduction in Bank rate; an alternative explanation of this failure, of course, is that British manufacturers of consumer goods happen to be enjoying an easy sellers' market at home while they are faced by a bothersome buyers' market abroad.

For exporters of capital goods the Association apparently believes that there was some evidence of an organisational gap up to about April of this year. During the early stages of the return to a world buyers' market, the period for which credit was demanded by overseas importers of capital goods "lengthened first to two years, then to four years, and later to five years." At that time, however, Britain was in the middle of a balance of payments crisis, and the Foreign Exchange Control Committee kept a stern watch over all credits to foreigners for periods longer than six months; while the commercial banks, under the squeeze of a restrictive monetary policy, apparently kept very closely to their traditional rule of requiring to be allowed to call in almost any and every loan upon giving appropriate notice. In the past few months, however, the FECC's regulations have notably eased, while "there have been numerous cases where joint stock banks have discounted bills payable over a period of years." The banks, of

course, will normally only discount the proportion of the face value of bills that is covered by export credit insurance (usually 85 per cent); but some merchant banks have recently tried to meet the manufacturer's desire to receive payment in full on delivery of his goods by, in effect, buying export contracts from him.

With all these avenues open, there is indeed little sign of an "export finance gap." But the booklet hints at a complaint among manufacturers that bankers—befuddled by the alarmingly swift changes in exchange control, Government directives and the credit-worthiness of importing countries—may be ultra-cautious, not so much in the terms that they eventually offer as in their initial assessment of the terms that they are likely to be able to offer; in particular, the dissemination of news about day-to-day changes in the situation—and in the last few months these changes have been very great—may be slow in seeping through to the district and branch banks that "represent almost the sole source of financial guidance for countless business firms."

BBC Goes VHF

THE BBC's announcement of plans to set up 51 new sound broadcasting stations operating on very high frequency wavebands gave no details of the type of modulation they will use. There are two choices open, frequency modulation and amplitude modulation, and BBC engineers are for the former to a man. Growing interference from foreign stations on the over-crowded medium wavebands has made the provision of sound programmes on the very high frequency bands highly desirable—in this case Band II, which was reserved for sound broadcasting on the advice of the Television Advisory Committee. Owners of radio receivers might have to spend between £5 and £15 for adapters to pick up these transmissions, or pay about 10 per cent more for new radio sets. But since the change has to be made, the BBC argues that listeners may just as well be given the additional advantage of frequency modulation, a system of transmission that is generally held to give far better reproduction and greater freedom from interference than amplitude modulation; but its principal virtue in the eyes of the BBC may well be its stronger signal over long distances, a property that will reduce the number of transmitters needed to cover the country.

A number of countries, including the United States, have experimented with FM stations, but they have not proved popular because the problem of interference on the medium wavebands did not exist to anything like the degree that it does in Europe. The only advantage of the FM stations was the reputedly better quality of transmission, but this hardly justified the higher cost of the sets needed to pick up the transmissions. The BBC has been operating an experimental FM transmitter for several months and is highly pleased with the results, but the final word on which type of modulation will be used rests with the Government, acting on the advice of the Television Advisory Committee. Some people in the radio industry are opposed to the introduction of FM in place of AM transmissions, and these have a voice on the Committee. The BBC may, therefore, not win without a struggle its point that very high frequency broadcasting—if it has to come—is better on FM than on AM.

The Economist 1843-1943

This book was originally published to mark the centenary of the first issue of *The Economist*, which appeared on September 2, 1843. Owing to wartime restrictions, the edition had to be a small one, and it went out of print almost at once. It has now been reprinted and the new edition was published on September 2, 1953, the paper's 110th birthday. In addition to chapters dealing with the history of *The Economist* and with the role that it played in its first century of publication, the book contains contributions by a number of distinguished individuals, including the following:

WALTER BAGEHOT
by the late Francis W. Hirst.

The Economist AS A SOURCE FOR THE HISTORIAN
by the late Sir John Clapham

A POLITICAL RETROSPECT
by Sir Llewellyn Woodward

The Economist, 1843-1943 is published by the Oxford University Press. Copies can be obtained through any bookseller.

Price 8s. 6d. net.

**it's a deal quicker
by RAIL**

**Time for your meeting—
back the same day.** Are you taking advantage of the dozens of British Railways speeded-up services for the business man? They cover most big industrial centres. You get there quicker, fresher and arrive before lunch. There's time to do your business and return in comfort after tea. Meals en route and reserved seats, of course. Ask your secretary to get you a leaflet giving full details, from any Railway Station or authorised travel agent. Why not ask her *today*?

Progress in Terylene

DURING the past month, Imperial Chemical Industries has licensed the production of the synthetic fibre "terylene" to companies in France, Germany and Italy. Of the new synthetic fibres developed since nylon, "terylene" appears to have made the most headway. Most of its development troubles, such as the difficulty of making dyes penetrate its almost non-absorbent fibre, have been met at the factory stage, whereas the difficulties of the other synthetics have often not come to light until they faced the actual processing of the fabrics in the mills. And where that has happened it has been correspondingly more difficult for the chemical factories to detect and eventually correct the limitations before the fibres reached the market in quantity. Reports from the United States suggest that some of the more ambitious plans for producing acrylic fibres (these, broadly speaking, are the fibres that can be given a wool-like "feel," as distinct from the more silky texture of nylon or "terylene") have been severely trimmed. In this country, opinion differs sharply about the success of ICI's wool-like fibre "ardil," and there are indications that ICI is having second thoughts.

"Terylene" is not yet in full production. ICI is putting up a full scale plant in two stages; the first section, with an annual capacity of 11 million pounds, should be completed by the end of next year, whilst the second, which will raise total capacity to 22 million a year, is due to come into production by 1956. At present, therefore, only pilot quantities of yarn are reaching the market. In the United States, where du Pont is producing "dacron," a modified version of "terylene," the first unit of a full-scale plant to produce 35 million pounds annually came into operation this spring, and the remaining five units should be working by the end of the year. Neither the British nor the American market, therefore, has yet had really appreciable quantities of this type of fibre, but the manufacturers—including those

on the Continent who have recently taken out licences—are reasonably confident of finding a ready market for quite substantial quantities. The success of this new synthetic, like that of nylon, depends upon its special properties rather than a competitive selling price. Experience in developing synthetic fibres during the past few years suggests that, unless it can offer such special features, a new chemical fibre may find it difficult to compete—either in price or performance—with rayon or the natural fibres. The tempo of the mills has been tuned to the special characteristics of the traditional fibres, and it is apparently not easy, even in the United States, to alter it to meet the less tractable features of the newer chemical products.

SHORTER NOTES

The new futures contract for wheat on the Liverpool grain market contains premiums designed to attract certain qualities to the market. For Canadian Manitoba wheat the premium is 2d. per cental of 100 lb, and for American spring wheat and Australian wheat it is 1d. per cental. In other respects the contract is virtually the same as before the war. The market, which will begin trading in wheat futures on December 1st, is expected to announce the months of delivery next week.

★

Prices of a number of oil products have been reduced during the past two weeks. The price of most types of fuel oil have been reduced by 1/8th of a penny a gallon, and the prices of marine bunkers by amounts ranging from 7s. a ton on all grades marketed by Esso to cuts of between 2s. 6d. a ton and 10s. a ton on bunkers supplied by the Shell Petroleum Company. The price of commercial grade petrol was earlier reduced by 1/4d. a gallon but the prices of the premium grades of petrol, of kerosine and of aviation spirit remain unchanged.

Company Notes

ANGLO-AMERICAN (GOLD MINES). The reports for the September quarter published last week by the Anglo-American Corporation group of gold mines in South Africa injected new life into the Kaffir market, which had been off colour for a long time. The glitter lay not in gold profits (which continued to sag), but in the uranium profits of the Daggafontein mine and in the most cheering report of underground reef development yet to have come out of the Orange Free State (on the new haulage being driven by Western Holdings towards its boundary with Free State Geduld). Daggafontein's uranium profits rose from £120,000 in the June quarter to £228,000 in the September quarter, easily offsetting the drop from £991,873 to £971,683 in its working profits from gold alone. Western Reefs, another company in the group, announced that its uranium plants were brought into commission towards the end of the September quarter,

that operations are in progress on a gradually increasing scale, and that the first profits from this source will be declared in the December quarterly

PROFITS OF ANGLO-AMERICAN GOLD MINES

	Profit, June qtr.	Profit, Sept. qtr.
Brakpan	£67,550	£75,388
Daggafontein	(a) 991,873	(a) 971,683
E. Daggafontein	145,304	147,355

Western Reefs	240,201	233,459

(a) Not inclusive of uranium profits of £120,000 in June quarter and £228,000 in September quarter.

figures. Here again, profits from gold during the past quarter fell from £240,201 to £233,459; but obviously the profits from uranium are likely to offset this.

The striking news from Western Holdings is that a distance of 60 ft was developed last quarter, all of which was

payable, with the exceptionally high average grade of 2.025 inch-dwts; the first quarterly working profit from this mine for the September period was £30,036. There were also more encour-

aging reports from President Brand, where the reef footage sampled increased from 555 to 1,420, and values averaged 1,138 inch-dwts compared with 919 inch-dwts in the previous quarter. Among the operating mines, as the first of the accom-

panying tables shows, there was a serious drop in the profits of the Welkom mine last quarter; the mine encountered an unusually large number of water-bearing fault fissures that required cementation (a trouble that also prevented any development on reef by Free State Geduld during the entire quarter). Apart from Welkom, Daggafontein and Western Reefs, the other operating companies in the group showed a slight increase in profits from gold mining last quarter. The market's reaction to this good news is shown in the second of the accompanying tables; it will be seen that the *Financial Times* index of shares of operating gold mines rose from 84.24 to 85.57 between Thursday of last week and Tuesday of this, while its index of developing gold mines rose from 79.97 to 81.72. But then Dr Malan's somewhat depressing speech in the South African Parliament caused a reaction, to 84.57 and 80.74 respectively, on Wednesday.

THOMAS W. WARD. The activities of Thomas W. Ward stretch over an unusually large field; it is the largest company in the country to be concerned with the collection and supply of scrap iron and steel for steel manufacturers, and it is also engaged in brick-making, quarrying, and the dismantling of ships. Most of these—by no means interdependent—activities were in voracious demand during the peak years of postwar boom; and it is not surprising that 1950-51 and 1951-52 were the best years, both as regards turnover and profits, in the company's long history. It is also not surprising, that the chairman felt it right to warn shareholders a year ago that some recession in profits should be expected in the twelve months to June 30th, 1953.

In the event, however, the recession has been very slight. Indeed the preliminary statement now issued actually shows an increase of over £140,000 in the group's net profit, from £805,471 to

£946,868; these figures are struck, however, after including £148,771 (compared with £35,167 a year ago) of exceptional income and transfers from reserves. When these are excluded, and when allowance is made for a fall of nearly £50,000 in the tax bill, it appears that gross trading profits are down by about £22,000. This very conservative company has therefore felt able to consolidate last year's cash bonus of 5 per cent into the dividend (to make 20 per cent); and to supplement it by a tax free bonus of 2½ per cent, ostensibly to mark the 75th anniversary of the founding of the business. The directors have elected to pay this bonus out of capital profits, but shareholders who hope for its consolidation next year can note with comfort that

	Years ended June 30	1952	1953
Group net profit (a).....		805,471	946,868

Carry forward.....		497,727	471,690

(a) After tax and including exceptional income and transfers from reserves. (b) Also 2½ per cent (nil) tax free bonus from capital profits.

the 20 per cent is covered about five times by net current earnings. While the ordinary dividend absorbs only £115,500 net, this year's allocation to general reserve is £300,000 (against £200,000 last year), and £150,000 is added to the reserve for replacement of fixed assets which has stood at £100,000 since 1948. The announcement of the results made little or no impression on the market price of the £1 shares; at 78s. 9d. they yield about £5 2s. per cent on the basis of a 20 per cent dividend—but optimists can also take the 2½ per cent cash bonus and the ample cover for the dividend into account.

THE ECONOMIST, OCTOBER 24, 1953

LONDON STOCK EXCHANGE

Next Account begins: October 28th.
Next Contango Day: October 28th
Next Settlement Day: November 3rd.

THE cheerful atmosphere pervading markets at the end of last week, aided partly by more dividend increases and partly by some good quarterly Kaffir reports, gave way to a cautious and subdued tone after the week-end. On Monday gilt-edged were nearly all ½ off on the day, and foreign bonds fell sharply. The announcement that the first steel de-vesting operation, of the ordinary shares of United Steel, was imminent failed to act as a stabilising factor for the Funds; but it also did not prevent a few scattered gains among industrial equities, especially in engineering, motors and paper-making issues. Elsewhere in the markets, a further general advance occurred in Kaffirs, led by "uranium" shares and Orange Free State developers, and most dollar securities hardened in sympathy with the firmer tone on Wall Street.

Tuesday was a day of irregular but relatively slight price movements; the majority of gilt-edged prices were unchanged, but the *Financial Times* index of industrial ordinary shares lost 0.2 of a point. It was not until Wednesday, with the settlement out of the way, that a gradually firmer tendency became noticeable. A few of the longer dated and undated gilt-edged stocks put on ½ to 1, thus regaining Monday's losses; and there was a further and more general improvement by Thursday's opening. Foreign bonds, particularly German Potash issues, attracted support, and industrials resumed their upward movement; paper-making issues were especially prominent with Albert E. Reed spurring 8s. 6d. to 95s. on rumours of a free scrip bonus. The *Financial Times* ordinary share index rose on the day from 127.8 to 128.1, its highest for over a fortnight, and a full point above the 127.1 on Wednesday of last week. Kaffirs, however, lost some of their previous gains.

In other sections of the market the week has been relatively uneventful. Leading oil shares have been steady to firm, but base metals have been easier for choice. Tea shares have been quiet, but rubbers have been generally weaker.

* In consequence of official purchases of tender bills in connection with cash subscriptions to the new Exchequer stock, it is impossible to calculate the division between tap and tender bills until all the bills purchased have passed their original maturity date.

THE MONEY MARKET

THE whole of the £230 million of bills on offer were allotted at last week's Treasury bill tender. The market raised its bid by 2d., to £99 9s. 6d. per cent, at this tender; but, as total applications rose by £8.2 million to £367.7 million, its quota rose only from 49 to 51 per cent of its bid. The average rate of discount therefore fell by nearly 8d. to £2 1s. 11.57d. per cent, fully 6s. below that at the last tender before the reduction in Bank rate. At yesterday's tender, the offer was raised to £240 million.

Credit conditions in Lombard Street were easier in the week covered by Wednesday's Bank return. Only moderate special help was necessary on Thursday before the week-end, and on the following two days funds became plentiful and the authorities engaged in some reverse selling. On Monday the position was transformed by the market's lack of maturities (reflecting the heavy sales to the authorities earlier in the month to finance subscriptions to the new Exchequer Stock); considerable special help was necessary. But conditions improved once more in the middle of the week, and on Wednesday market funds were just adequate to meet demand. Following the fall of $\frac{1}{2}$ per cent in the Treasury bill rate last week, buying rates in the market dropped to $2\frac{1}{2}$ per cent for December and $2\frac{1}{8}$ per cent for January maturities.

The Bank return shows a return of £4.5 million of notes from active circulation. But Government securities in the banking department fell by £4.9 million; and, as £6.3 million was released from public accounts, bankers' deposits rose by £7.2 million to £292 million.

BLYVOORUITZICHT GOLD MINING COMPANY, LTD.

(Incorporated in the Union of South Africa)

Extracted from the Annual Report for the Year ended 30th June, 1953.
AUTHORISED CAPITAL £3,300,000
ISSUED CAPITAL (24,000,000 Shares of 2/6 each) £3,000,000

Tonnage milled, 1,219,000.

Working Revenue	£9,322,962	Per ton milled, £7 13 0
Working Expenditure	2,960,476	2 8 7
Working Profit	£6,362,486	£5 4 5
Net Profit from Uranium (subject to adjustment)	21,710	

Total	£6,384,196	
Total Profit for the year	£6,425,631	
Balance unappropriated at 30th June, 1952	1,252,788	
Forfeited Dividends	165	
	£7,678,584	

This amount has been dealt with as follows:-	
Taxation	£2,388,663
Mineral Lease Consideration	530,107
	2,918,770

Dividends declared during the year—No. 14 of 1s. 6d. per share and No. 15 of 1s. 4d. per share	3,400,000
--	-----------

Leaving a balance unappropriated of £1,359,814

The Ore Reserve was re-estimated as at 30th June, 1953, as follows:-

Reel	Available			Shaft and Safety Pillars			Total		
	Tons	Value, Dwt.	Width, In.	Tons	Value, Dwt.	Width, In.	Tons	Value, Dwt.	Width, In.
Carbon Leader	6,515,000	12.3	46.5	1,948,000	12.9	45.6	6,864,000	12.4	46.3

Compared with the previous year the available reserve decreased by 12,000 tons, the value was 0.2 dwt. per ton lower and the stope width 0.1 inch greater. The unavailable tonnage increased by 99,000 tons, the value was 0.3 dwt. per ton higher, and the stope width unchanged. The uranium plant was brought into operation during the last quarter of the year, but due to initial plant difficulties and consequent adjustments, the output was seriously restricted. The Full Report and Accounts may be obtained from the London Secretaries, A. MOIR

"AS has been suggested in *The Economist* before, the time has come when the City and the C.I.C. together should consider whether a much more active boost cannot be granted to issues by 'mutual fund' trusts. These flexible trusts, which fall half-way between the investment trusts with all their discouraging complications and the original and not particularly successful fixed unit trusts, would seem to provide the safest route into venture capital for the savings of the unskilled investor. In these trusts the risks

of investment are spread; the composition of portfolios can be altered; there is no 'gearing' problem, because the investor is in effect himself the owner of the underlying securities, and the price of the units cannot fluctuate more violently than the market value of the portfolio and, after paying a reasonable fee for the skilled management of the trusts' portfolios, the unit-holders receive, in effect, the whole of the trusts' investment income."

The Economist, August 15, 1953.

THE PIONEERS

OF UNIT TRUSTS

Today, as in the past, Municipal and General Securities Co., Ltd., who introduced the first Unit Trust to the British investing public in 1931 and the first flexible trust in 1934, are constantly engaged in developing and improving this medium of invest-

ment. Full details of prices and yields and current portfolios of "M. & G." Unit Trusts, together with any other information about their construction and working and their price and dividend records over the years, may be obtained from the Managers.

COMPANY MEETINGS

JAMES HOWDEN & COMPANY, LIMITED

(Boiler Auxiliary and General Engineers)

GRATIFYING RESULTS

ORDER BOOK WELL MAINTAINED

MR CRAWFORD W. HUME ON INADEQUACY OF STEEL SUPPLIES

The forty-seventh annual general meeting of James Howden & Company, Limited, was held on October 16th, at 195, Scotland Street, Glasgow, Mr Crawford W. Hume, MINA (the chairman), presiding.

The secretary (Mr John D. Young, CA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman, which had been circulated with the report and accounts:

The accounts for the year ended April 30, 1953, are in the usual form apart from some modifications necessary in view of the acquisition and formation of subsidiary and associated companies here and in South Africa and Australia. They show a clear picture of the position at that date and a gratifying profit after taxation for the parent company of £255,180, and for the group as a whole of £316,982.

Provisions have been made for taxation for the year, amounting in the case of the parent company to £451,155. These cover a reserve for income tax on profits for the year due in 1954-55 as well as a provision for profits tax and excess profits levy for the year ended April 30th last.

HEAVY BURDEN OF TAXATION

The present rates of taxation remain very high and are quite out of proportion to the balance of the profits left for extensions and the replacement of machinery and other assets, for the provision of pensions and for the payment of dividends. In the case of expanding businesses such as ours the incidence of the excess profits levy is a particular hardship and it is gratifying to know that it comes to an end next December. It is to be hoped also that circumstances will soon allow substantial economies in the administration of the country to be made, thus producing some alleviation of the heavy burden on industry.

The general reserve account of the parent company has been increased to £910,000 by transfer of £160,000, and that of the group to £965,152 by transfer of £205,152. After making the appropriations shown in the directors' report and providing for the dividend, the balance to be carried forward amounts to £61,801, compared with £56,711 the year before. The carry-forward of the group is £87,954.

NEW ACQUISITION

In addition to the South African company mentioned last year, James Howden & Company Australia Pty., Limited, has been formed in Melbourne, and a majority interest has been acquired in Safanco, Limited, a company in South Africa with a modern plant and facilities for the manufacture of our products as well as their own, which are complementary to ours. Since our interests in this company were acquired about a year ago it has shown satisfactory results and I

believe that each of these developments will contribute to the prosperity of our group.

Our main works have had a busy year although the production was not quite so high as in the previous record year. As was forecast in my remarks last year, considerable delays in obtaining adequate supplies of steel plates impeded production and a shortage of skilled men had a retarding effect. The improved output of steel ingots at home is not likely to affect the plate position to any great extent before the end of 1953 because of the continued deficiency in the productive capacity of the steel plate mills. To overcome this, however, we have taken vigorous steps to supplement our supplies by buying overseas and we have thus been able to augment to some extent the stocks of material. The indications are that from now on the position, although still far from satisfactory, will improve steadily, but the manpower difficulty remains.

WORKS EXTENSION

The extension to our main works which I mentioned last year has made good progress and will shortly be in use. This extension, which will be used mainly for the heavier and more bulky products, will give much needed space and will facilitate the manufacture of the plate work which needs ample space for efficient production.

The developments at our Maclellan Street factory have followed the anticipated course and the output of aircraft components now forms a considerable proportion of the production.

The output from the Craigton factory continues to be good and the support which it provides for the main works in the supply of equipment involving repetition work, and also of other components, is of first-rate importance.

The order book was well maintained during the year and is now slightly greater than it was at the end of the previous year, so that we are in the fortunate position of having in hand sufficient work to maintain full employment of our factories. The proportion of direct or indirect exports still remains about one-third of the total.

IMPORTANCE OF AMPLE POWER SUPPLY

The industries of this country, supplying exports and agricultural goods on which depends our food, supplying armaments on which depends our safety, supplying domestic goods and public services on which depend our comfort and health, are all supported to a greater or less degree by engineering products and services. All these industries and the engineering industry itself are dependent on ample supplies of power, and in this respect we have a long way to go in the United Kingdom as compared with the USA, Sweden and Switzerland, which are all much more power-conscious. In these three countries the annual consumptions of electric power per head of the population in 1951 were respectively 2,820 kw hours, 2,750 kw

hours and 2,480 kw hours. Here it was only 1,430 kw hours. As a nation we have obviously considerable leeway to make up and this company should continue to benefit by the inevitable developments and extensions in the field of power production.

DIRECTORATE

During the year under review Mr Douglas S. Macfarlane has been co-opted to the board. Mr Macfarlane has been in the company's employment for some 20 years and has a wide knowledge of its activities and its relations with its customers, which is of great value. The board would like to take this opportunity of formally welcoming him and commending him to the stockholders.

On your behalf I should like to thank all the administrative and executive staff and all the workpeople for their helpful, friendly and loyal services throughout the year.

The report and accounts were unanimously adopted and the final dividend of 22½ per cent, making 30 per cent for the year, was approved.

The retiring directors, Sir John Craik Henderson, Mr Henry L. Paul and Mr Douglas S. Macfarlane, were re-elected, and the remuneration of the auditors, Messrs William Hart, Junior, and Wilson, CA, having been duly fixed, the proceedings terminated.

ALLEN HARVEY & ROSS, LIMITED

A SUCCESSFUL YEAR

MR G. M. B. PORTMAN'S STATEMENT

The tenth annual general meeting of Allen Harvey & Ross, Limited, will be held on November 11th at the offices of the company, 52, Cornhill, London, E.C.

The following is the statement of the chairman, Mr G. M. B. Portman, which has been circulated with the report and accounts: The company's balance sheet as at September 30, 1953, together with the profit and loss account, is now before you for your consideration and adoption.

SATISFACTORY RUNNING MARGINS

Your company has experienced a successful year undisturbed, until almost the close, by any changes in money rates or the policy of the authorities, and so there have been earned satisfactory running margins on the bills and short dated bonds carried by the company against a supply of call money evenly maintained. Sufficient profit has been earned to add substantially to the inner reserves of the company and to increase the carried forward balance on profit and loss account in addition to an appropriation of £25,000 to general reserve.

The recent reduction in bank rate and the adoption by the Bank of England, after many years of a rigid structure of rates, of a policy of more freedom and flexibility seem to forecast for the time being a tendency towards narrower margins; however there may be a prospect of healthy opportunities for competitive activities once again. It seems evident that rates in future will be changing far more frequently in accordance with events than has been the way in the City of London for nearly a generation.

Of the investments held on September 30th the maximum life was 2½ years and the average one year and 10 months.

INTAKE OF TREASURY BILLS

The company's intake of Treasury bills over the year rose by 9.4 per cent from £305 million to £334½ million, but the purchases of commercial bills decreased from £44 million to £25½ million, that is, by 42 per cent. Such a rapid decline common to the whole market had started during the previous year and continued until March, 1953, but the pace of the decline slackened during the latter six months. Although there are today, since the reduction of rates in September, some hopeful signs of a revival of the use of the acceptance credit system, the present overall cost of this traditional method of finance is still high in relation to its alternatives. However, there should now be grounds for discount companies to hope that during the gradual process of evolving the convertibility of sterling the "Bill on London" will regain its universal use.

We welcome our relations with several recently opened overseas banks in London; their establishment indicates a renewal of world confidence in sterling and in the City of London.

CAPITALISATION OF RESERVE

Your directors recommend the capitalisation of £50,000 hitherto shown in the share premium reserve in order to "tidy up" the balance sheet and to bring the issued capital up to the round £1 million; at the same stage it would seem to be convenient to increase the authorised capital to an amount greater than is at present needed against possible future requirements and fresh circumstances.

The directors also recommend that in future the company's year shall close on April 5th, a more suitable date than September 30th. Your directors desire to express, on your behalf, gratitude for the energetic and loyal work of the company's staff.

LEWIS BERGER & SONS

IMPROVING OUTLOOK

The seventy-fourth annual general meeting of Lewis Berger & Sons Limited, was held on August 11th, in London, Mr Thomas Lilley, chairman of the company, presiding.

The following is an extract from his statement, which was circulated:

Berger paints were first made in London in 1760 and now Lewis Berger & Sons Limited, is the holding company of a group of 37 companies operating 20 factories. The group thus covers the Commonwealth territories, France, Eire, and the international scope of its activities is extended by technical and selling links with manufacturers on the Continent of Europe and with the Sherwin-Williams Company in the Americas.

I explained in my review last year that particular restricting conditions which applied early in 1952 had continued into the year ended March 31, 1953. Events proved that these conditions seriously affected the group's paint trading during the majority of the year and it was not until the final months that a material improvement was evidenced.

The group profit after taxation reflects the difficult trading conditions of the year ended March 31, 1953, and amount to £212,152 compared with £420,010 for the preceding year.

As compensation for the reduction in the ordinary dividend declared this year out of trading profits, the directors propose a distribution of 5 per cent on the ordinary stock to be made out of capital profits. The opening months of this financial year have provided encouraging results.

The report was adopted.

RANSOME & MARIES
BEARING COMPANY,
LIMITED

BETTER TURNOVER

The thirty-seventh annual general meeting of this company was held on October 16th at Newark, Mr E. W. Senior (the chairman) presiding.

The following is an extract from his circulated remarks on the year ended June 30, 1953:

Recognising that trading conditions in world markets became more difficult during the year, not only for us but for our customers, wage increases granted in the engineering industry were not passed on. Consequently in spite of a better turnover made possible by increased productivity the trading profits of the group were £57,287 lower, at £1,018,371.

In the current year, just over £500,000 has been spent on plant and in consequence the amount provided for depreciation has been substantially increased to £257,151.

After taxation and other charges, the net profit of the group is £332,430, of which £301,928 is transferred to the appropriation account of the holding company.

DIVIDEND AND BONUS

The directors recommend that the amount available for appropriation should be dealt with by making the same final distribution as last year, viz., a dividend of 12½ per cent and a bonus of 5 per cent, absorbing £96,250 and by carrying £100,000 to general reserve, £10,000 to special pension fund trustees, £3,000 directors' remuneration under Article 93, and increasing the carry forward by £53,303 to £261,836.

The consolidated balance sheet shows a surplus of liquid assets of £2,686,357, and whilst cash and tax reserve certificates are reduced, there has been an increase of £296,153 in fixed assets, and in stocks and debtors £431,175. The factory at Annfield Plain started production towards the end of the year, and will, it is hoped, build up to full output during the current year.

There is no doubt that from the outbreak of the Korean War, industry was endeavouring to ensure its future supplies by building up stocks, possibly overscheduling requirements, and placing long-term orders. During the year under review the tendency has been reversed, with a resulting lower order book, but a much more realistic position.

THE OUTLOOK

Forecasting the future is always difficult and the present time is no exception; our interests are intimately associated with those of the engineering industry where activity continues on a relatively high level, although profit margins tend to become smaller. Export business, with its many restrictions and increasing competition, remains difficult, but, despite that, we had a small increase in the past year. Practically every country is striving to increase its exports. Management through better equipment and organisation, such as your company has carried out over the past years, is playing its part, but any increase in wages without at least a corresponding increase in productivity will make it impossible to obtain the full benefit of these efforts to increase our export trade. All our factories continue to be fully employed and your board is confident that the policy it has adopted of steady expansion and re-equipment is in the best interests of shareholders, customers and workpeople.

The report and accounts were adopted.

POWELL DUFFRYN
LIMITED

CHAIRMAN'S STATEMENT

The annual accounts to March 31, 1953, were presented at the Annual General Meeting, held on October 21st. The following is an extract of the statement of the Chairman, Sir Herbert Merrett:

Expansion of activities and many changes have occurred since our properties were nationalised. We have not been entirely successful in everything we have attempted but, engaged as we are in many businesses in all parts of the world, we must be satisfied if on balance we make progress and satisfactory profits.

In an attempt to hasten proceedings under the Coal Industry Nationalisation Act, I have been in constant touch with the Coal Board regarding an investigation of the many items of our claims which are outstanding, and I am pleased to inform you that several of these have been settled.

Owing to unavoidable delays in completion of the refinery at Coryton, we have received no income from our substantial investment in Vacuum Oil Company Limited during the year under review. Neither can we expect any revenue from this source in the current year. I do, however, look to this investment producing a steady income in future years. In the words of our partners, Socony-Vacuum Oil Company, Inc., of New York, who rank amongst the largest oil refiners in the world, Coryton is a thoroughly sound venture, well conceived and planned, with every promise of satisfactorily rewarding its owners.

By mutual consent of all parties concerned, including the Government of Southern Rhodesia, we transferred our interests in the Wankie Colliery Company Limited, and in Powell Duffryn (Rhodesia) Limited, to the Anglo American Corporation of South Africa Limited, the total consideration being the allocation of ordinary shares in Rhodesian Anglo American Limited, of a market value of approximately £750,000. The outcome should be a substantial increase in the value of our investment in the Rhodesias and a much higher current income.

Stephenson Clarke Limited, together with its subsidiaries, and more particularly Associated Coal and Wharf Companies Limited, has again earned a satisfactory revenue.

The business of Cory Brothers and Company Limited continues to thrive despite the fact that because of the wide area of its activities, it meets the full blast of overseas financial upheaval and instability. The Oil Bunkering and Storage Department is doing well and further progress has been made in the Timber Department through our Swedish company.

Cambrian Wagon and Engineering Company Limited has in hand a contract for steel mineral wagons which will keep the Wagon Shop in full employment for the next five years.

Powell Duffryn Technical Services Limited calls for no capital investment other than working capital, and its earnings so far have been satisfactory. Its employment is widespread and varied, and negotiations for the use of its services in new fields continue with interesting possibilities.

The results of the Group as a whole justify a repetition of the same dividend as has been paid in previous years. While the dividend now proposed encroaches slightly on the carry forward of the Parent Company, the carry forward in the consolidated accounts is actually increased.

The report and accounts were adopted.

BRITISH OVERSEAS
STORES LIMITED

The thirty-second annual general meeting of this company was held on October 16th in London, Mr R. J. Blackadder, MC, CA (the chairman), presiding.

The following is an extract from his circulated statement for the year ended March 31, 1953:

The accounts now before you show a substantial falling off in profit compared with that of last year, but you will recall that when I last addressed you I pointed out that we had experienced boom conditions throughout the greater part of the year and that we could not hope to repeat the figures in the year under review.

The period covered by the accounts has been one of considerable difficulty. Last year I drew attention to the severe restrictions on imports imposed by the Governments of Australia and New Zealand. These restrictions operated throughout the year with the result that the activities of our subsidiaries in London and New Zealand were drastically curtailed. In Jamaica also trade was seriously affected by the fall in prices.

The cumulative effect of the restriction on

imports and falling prices is reflected in the accounts now before you, but, in spite of this setback, we have sufficient confidence in the future to justify the maintenance of the dividend at 10 per cent, the same rate that has been paid for a number of years.

You will expect me to be in a position to give some forecast of the probable results for the year. Under conditions prevailing I am satisfied that the results for 1953-54 may be expected to show an improvement.

The report and accounts were adopted.

KUALA MUDA RUBBER
ESTATES, LIMITED

A SATISFACTORY RESULT

The twenty-eighth annual general meeting of this company was held on October 16th in London, Mr L. I. Simpson, ACA, chairman, presiding.

The following are extracts from his circulated statement for the year ended March 31, 1953:

The profit for the year, before providing for taxation, amounted to £103,694, as compared with £211,397 for the previous year, a

result which I feel may be considered satisfactory in view of the substantial fall in the price of rubber.

I informed you in my remarks last year that we had, in conjunction with two other Malayan companies, decided to plant up rubber in Nigeria. This decision has now resulted in the formation of the Oban (Nigeria) Rubber Estates, Limited, a company with a capital of £800,000, in which we and the other two Malayan companies are associated with the Nigerian Eastern Regional Production Development Board.

We have again turned out almost the whole of our output in the form of concentrated latex under the trade name of Lacentex, a large quantity of which was sold to America. The market has at times been difficult, but the fall in the price of rubber has greatly increased the sale of foam rubber. In addition, our latex has become well known and we have established a considerable goodwill.

The present price of our commodity makes it very difficult for many companies to cover all their outgoings, but I am glad to say that owing to the goodwill which we have built up the premium we obtain for our latex enables us to make ends meet and show a profit at today's price.

The report was adopted.

Marketing Abroad

If you are seeking new markets abroad or want to know more about your present ones, the quarterly reports by The Economist Intelligence Unit will help you. These reports give concise and up-to-date analyses of economic and business conditions and prospects in other countries, and they contain a wealth of information of value to the exporter and investor. Each report is prefaced by a summary of the main facts and conclusions, and contains a comprehensive statistical appendix supplemented by maps and diagrams.

This service of reports was started by the Unit last year. From the outset the demand was large and came from many parts of the world, and in response to requests from subscribers the list of countries included in the service has been extended. Fifty reports are now published every quarter on a total of seventy territories.

THE ANNUAL SUBSCRIPTION to these reports is £10 per country or group of countries; single copies may be obtained for £3. Discounts up to 30 per cent. are available on subscriptions to reports on more than five countries.

Descriptive leaflets and a specimen copy of the reports may be obtained from:

The Progress of Design

MOTORISTS may sometimes wonder whether the treasure and talent devoted by the manufacturers to design and development yield a commensurate dividend to the purchaser. As a given model develops over the years, it is often apparent that the addition of features called for by the sales organisation results in a steady increase in weight; all that the back-room boys do, by technical improvement to enhance performance, or by manufacturing improvements to reduce cost, is then jeopardised by features of questionable value to the customer. But there are occasions when new models show a decisive advance on the old. To set the new Ford Prefect and Anglia, the new Standard Eight and the Armstrong Siddeley Sapphire against their respective predecessors demonstrates the solid advantage for the motorist that results from the industry's unending development work.

In the Standard Eight, the significant difference compared with its prewar namesake is the reduction of almost 2 cwt, say one-eighth, in weight, a reduction which should give about the same proportionate reduction in the manufacturing cost. The new Standard has a smaller engine, of more efficient character and turning at a higher speed, but still giving significantly less power. The vehicle gives very slightly more passenger accommodation; covered luggage accommodation is greater, but has to be reached by lowering the back seats, instead of through an outside lid. In total, the customer is given practically the same amount of the things he wants when he buys a motor car, at a real cost which should be seven-eighths of that of the 1938 Standard Eight.

The progress shown from the Siddeley Special of 1934 to the current Armstrong Siddeley Sapphire is of a different order. The Siddeley Special in its day could not have been called the most distinguished of automobiles. The cylinder block and crankcase were expensively cast in aluminium alloy, yet the total weight of the car was surprisingly great; and the performance, having regard to the size and cost of the engine, was by no means remarkable. The new Sapphire, on the other hand, is far ahead of the average of today, as the Siddeley Special lagged behind its contemporaries. The capacity of the Sapphire's engine is 30 per cent less and its weight probably 25 per cent less than that of the Siddeley Special. The total weight of the Sapphire is almost a quarter less, and it is a substantially roomier car than its predecessor. The Sapphire gives an improvement in performance which is by no means exaggerated by the difference in the figures shown in the table; on the open road it will cruise at 75 mph with greater ease, and with more feeling of a margin in hand, than its predecessor at 55 mph. Thus the customer is offered a much roomier motor car (though a more compact one) with a much better performance, much more comfortably achieved, at a real cost which is probably under rather than over 75 per cent of that of its predecessor.

Comparison of the new Prefect (the four-door version of the new Ford models) and of the new Anglia (a two-door and rather less soignée version of the same basic car) shows an advance over the former Prefect which is scarcely less sensational, and probably more significant, because vastly greater manufacturing potentialities are at Ford's disposal.

The passenger accommodation is slightly greater than in the old Prefect, and the luggage accommodation a good deal more generous. There is a reduction of fully one-eighth in the total weight of the new Anglia and of over 10 per cent in the new Prefect. Both models have the same engine of the same dimensions as in the old Prefect; but it has been substantially redesigned to give a marked improvement in performance; and the new Anglia offers a prospective saving in fuel of perhaps 10 per cent to those drivers who do not require the highest performance of which the car is capable.

These almost identical twins from Dagenham are so important in their potential sales appeal that they justify close analysis. The common body dimensions afford slightly more room all round. None of the more essential amenities has been omitted; indeed, the Prefect, and in some respects the Anglia also, is certainly better equipped than its predecessor. Since it must have been in the body rather than in the working parts that weight has been saved in the two cars, the designers must be credited with a remarkable achievement. The engine is a side-valve unit of 63½ mm bore and 92½ mm stroke like its predecessor. It shows a close resemblance to the engine of the German Ford of the same capacity—the Taunus—which develops a little more power. The bore/stroke ratio is, for these days, unusually low; and the retention of side valves may seem a little old fashioned. On this, the views of Mr. E. S. Macpherson, now the technical head of the parent Ford Company, given in a paper last year, are interesting; he has said that "Ford does not consider the L-head engine (that is, the side-valve engine) obsolete, and will not con-

sider it so for several years. But looking to the future, and considering the fuels that probably will be available eight or ten years from now, it is likely that the overhead valve engine will give far better performance than the L-head type."

Despite the changes in its design, the new engine, with the same dimensions and valve disposition as before, can probably be manufactured on the same machine tools as the old, at the cost of a moderate investment only in ancillary equipment. It seems reasonable to deduce that the present engine will enable the old machine tools to work out the remainder of their lives; and that in due course it may be superseded—with the prospect of substantial savings in cost using modern machine tools. Its successor might well have overhead valves; and a bore/stroke ratio rather closer to the 1.08 of the Zephyr and Consul engines than the .69 of this engine. No doubt the Ford Company will wait to assess exactly the sales appeal of the new Prefect and Anglia—and above all the components of that sales appeal—before deciding how to exploit the advances that modern technique makes possible. The choice is likely to be between an engine of similar capacity, with overhead valves and a small reduction in weight and cost—which could be expected to give an enhanced performance rather out of scale with these two cars—or a smaller engine, with a greater saving of weight and cost and no more than the already ample performance.

As they stand, these new Ford models should prove to have great sales appeal and, indeed, to offer severe competition with the Volkswagen, with which comparison is inevitable. The estimate of a maximum speed of 70

mph for the Anglia and a mile or two less for the Prefect is based on a comparison of engine power and thrust with the Ford Consul, which has a maximum speed of 72 mph. The Anglia will, on the figures, have greater power in hand than the Consul at 50-60 mph, and may even equal the Consul's maximum. It will certainly be a good deal faster than the Volkswagen, with 8-10 mph better maximum, and appreciably better top-gear acceleration—all this at the cost of slightly higher fuel consumption, and perhaps a slightly shorter life between major overhauls or engine replacement. The accommodation offered will compare not unfavourably with the Volkswagen, and with a water-cooled engine against the Volkswagen's air-cooled engine, the reduction of noise and greater refinement of running should

PROFILE OF FORD'S NEW ANGLIA AND NEW PREFECT

These are the same basic cars, the Anglia having two doors.

certainly be noticeable. The weight of the Volkswagen is between that of the Anglia (14½ cwt) and the Prefect (15 cwt); the manufacturing cost of the Volkswagen—which in certain details shows that economy of man-hours was not a paramount consideration in its design—might, in parallel conditions, be above rather than below that of either of the Fords.

The Volkswagen was, of course, designed nearly twenty years before these cars; and it was intended primarily for its home market rather than as a competitor in world markets. It is, indeed, in several major respects an unorthodox design—in its suspension, in the rear location of its engine, and its use of an air-cooled horizontally opposed engine. The unorthodoxy of its suspension seems to have yielded neither gain nor loss; the rear location to have paid a useful dividend; air cooling to have saved weight, at a sacrifice of refinement which must be counted a disadvantage; and the opposed position of the cylinders (which, with water cooling, would have been uneconomic) to have paid. But a further unorthodoxy is the restriction of effective engine speed by the limitation of engine power in the upper range of speeds, which must be attributed to the limited breathing of the small inlet manifold. Maximum output of 26 bhp, therefore, is given at 3,300 rpm, whereas the Ford engine, of less than 4 per cent greater displacement, and with cheaper valve mechanism, gives 36 bhp at 4,400 rpm. In other words, the Volkswagen disposes of power which might have been given by an engine with conventional breathing having 25 per cent less displacement, and probably 20 per cent less weight and cost. It is hard to believe that the saving in maintenance—due to the easier life enjoyed by the engine—alone justifies these disadvantages.

A designer may be led to exaggerate one particular aspect of design or to go far outside the conventionally accepted limits of design; but he does so at his peril when

his competitors are as astute as he is and backed with similar resources. He may succeed in showing that accepted standards do not deserve the respect they enjoy; or he may discover a new optimum, neither much better nor much worse than those generally accepted, though in a field so well worked over as that of engine speeds this is as probable as the discovery of another peak to match Everest. But he is also quite as likely to incur failure, or to discover that the advantages which his more fortunate innovations provide may be nullified or reduced. So it seems to be with the design of the Volkswagen. A competitor had two opportunities to better it. He could get better performance by allowing the engine to breathe more freely, getting more power from a similar capacity and weight at some expense of engine life. Secondly, he could, with water cooling, obtain greater refinement for a modest penalty of weight and cost. Ford have taken advantage of both openings. They have, furthermore, saved the weight penalty—no doubt partly by indefatigable testing of each component until the last superfluous ounce is eliminated.

In 1946 the British motor industry rejected the opportunity to take over the Volkswagen plant and designs. The design, they declared, was already more than twelve years old, and as soon as British design offices got into their post-war stride, they would do better than the Volkswagen. It has taken long to redeem that pledge; if the new Fords prove to have done so, the gratification at their achievement will not be lessened because some of the medals have to go to Detroit.

The new Ford Popular announced on Monday is the old Ford 8, with the old Ford 10 engine installed, and slightly de-frilled. This engine is, as far as outside dimensions go, practically interchangeable with the 8 hp 933 cc Ford 8 or Anglia engine; and the larger engine was for some years substituted in the export version of the Ford Anglia. As a technical product, this is not a car to get excited about; it is just a thoroughly serviceable small car—not of serviceability expressed as a *chef d'oeuvre* of engineering genius such as the 2 cv Citroen, but nevertheless with much work in it—comparable with a humdrum housemaid "a long time in her last place" of which Bernard Shaw said the world had greater need than of geniuses. But the price of £275 or 40½d. per lb is certainly remarkable and gives the model market leadership at the bottom of the price scale.

It is a little difficult to see exactly how this product is fitted in to the manufacturing policy at Dagenham as interpreted above. But undoubtedly this has been contrived and on a thoroughly economic basis. With the new Ford Zodiac to add glamour at the top end of the price scale, the Ford Company now has a range of products to cover the requirements of practically all motorists (outside "the fancy") that most other manufacturers on this side of the Atlantic will regard with admiration and envy.

For many of the figures of technical performance in the tables of this survey, acknowledgment is made to *The Motor* in whose invaluable road tests they were established. The profile drawings of the cars illustrating these articles also owe much to *The Motor's* original work.

It all started with one cylinder

1903 — First Vauxhall Ever Offered for Sale.
Single cylinder, 4" x 4½", horizontal stroke.
Tiller steering. No reverse

1908 — Reliability 45 Years Ago! In the RAC and Scottish Reliability Trials this 20 hp Vauxhall became the world's first car to complete 2,000 miles without one involuntary stop

Startled citizens were still stroking their chins over the horseless carriage, and saying it would never replace the horse, when the first Vauxhall pattered on to the road. What a wildly daring departure for a respectable firm of marine engineers! And what a long way Vauxhalls have travelled in the fifty years since!

Before long Vauxhalls were beating all comers for reliability and speed. In 1908 a 20 hp Vauxhall won the 2,000 Mile RAC Trial coupled with the Scottish Reliability Trials. In 1911 four 16 hp world's records were broken. In 1912 a new 20 hp world's record of 97.15 mph over 50 miles was set up. In 1913 the fabulous 30/98 Vauxhall, the sports car of sports cars was introduced. In the 1914 war the Vauxhall 25 was the No. 1 staff car. It took King George V as near the front line as a car could go.

Between the wars, Vauxhall set new conceptions of motoring value by marrying economy and performance. The Cadet, the "Light Six", the 10 hp made motorists of pedestrians in tens of thousands.

Today Vauxhall lead the way with the new Wyvern and Velox, so big and handsome, so powerful, inexpensive and economical, that the designer of that first single-cylinder tiller-steered marvel might well gasp at the revolution he began.

The 6 cyl. Velox illustrated below costs £535 plus £224.0.10 P.T. The 4 cyl. Wyvern costs £495 plus £207.7.6 P.T. Full particulars from your local Vauxhall Dealer or Vauxhall Motors Limited, Luton, Beds.

1910 — First 20 hp Car to Beat 100 mph was this Vauxhall which, at Brooklands, flashed over the flying half-mile at 100.08 mph

1920 — The Fabulous Vauxhall 30/98 — "One of the greatest British high performance cars of all time", winner of innumerable trophies. And still winning today in vintage car events

And Today — The six cylinder, spacious, comfortable, reliable Vauxhall Velox, an 80 mph high performance car — which combines economy with luxury

THE NEW ANGLIA

£360

PLUS P.T. £151.2.6

THE NEW PREFECT

£395

PLUS P.T. £165.14.2

The first light cars in the '5-Star' class

BEAUTIFUL APPEARANCE

Such grace and elegance in those beautifully flowing lines . . . and practical design too—more room inside and exceptionally large luggage space.

ROOMINESS AND COMFORT

Plenty—yes plenty—of room for four big people. A car that you can hold your head up in! And for added comfort, all seating is within the wheelbase.

PERFORMANCE

The engine gives new standards of power and performance. Minimum of gear changing necessary. Really 'big car' performance—due to the excellent power to weight ratio.

ROAD HOLDING

New independent front-wheel suspension—similar to the Consul and Zephyr 6—for easy riding and safe cornering.

SAFETY

All-steel welded integral body construction. Wide angle windscreen and rear window for full vision. Hydraulically operated brakes and clutch for ease of control and therefore safety.

ECONOMY

Ideally balanced power to weight ratio ensures low petrol consumption, reduced engine wear and remarkably economical running costs.

More room and style—at less per mile

Ford '5-Star' motoring

THE BEST AT LOWEST COST

THERE IS A FORD DEALER AT YOUR SERVICE IN YOUR TOWN

Five Million in Five Years?

BEFORE the war there were just over 2 million cars in use in this country. Twelve months ago there were just over 2½ million, and the latest figure is 2.625,000 cars in May. Some hold that this postwar expansion is largely a reflection of the increased number of cars used mainly or entirely for business purposes and that the only people nowadays who can afford to run cars purely for private purposes must be surtax payers. But the facts surely disprove such ideas. A large and increasing number of people of modest incomes own cars which they use purely for pleasure; with a reduction in the cost of motoring and an increase in the general standard of living, the number of private motorists will certainly expand too.

What the motor industry has to estimate, or to guess, is the prospective increase in the number of car owners of the most modest means. The greater part of any increase in the number of private motor car owners during, say, the next five years must be of new owners who become able to afford a car through a reduction in the cost of motoring or through an increase in incomes—both at the margins where, at present, motoring cannot be afforded. The first point of study is the cost of motoring at the margin. The cheapest motoring today is probably to be had by buying a three- or four-year-old car of the smallest size and running it for six or seven years—when its value will be so small as to be negligible. The figures suggest that there must have been some people with marginal means who were able to afford to become motorists for the first time in 1952. The costs that they may have incurred in the middle of 1952, and the cost of the cheapest motoring, as it may be projected for 1959, will largely determine the pace of expansion of popular motoring in the next five years.

Early in 1952, popular cars of 1948 vintage were about 10 per cent above the list price of the same model new. The list price of the cheapest new car, the old Ford Anglia, was £515 including purchase tax. The marginal motorist last year might have been lucky enough to buy a postwar Anglia for £550. Given a prospective life of seven or eight years, postwar depreciation could hardly be less than £75 a year. Tax would cost £10 a year and insurance, say, £12 a year. If he bought 100 gallons of petrol a year, he could hope to do 4,000 miles; at 4s. 6d. a gallon this would cost £22 10s. Replacement of tyres might cost £5 a year; and other costs, if he were very frugal, might be kept down to £15 a year. All told, this marginal motorist would have to allow a total budget of £140 a year.

Any calculation of the prospective costs of motoring for the marginal motorist in 1959 is bound to involve a gen-

erous share of guesswork and a range of assumptions for which the only respectable claim is some degree of plausibility. The next stage of the argument, therefore, enters a field not of fact, but perhaps not wholly of fancy. The lightest saloon car on the British market is the Standard 8, weighing 13½ cwt, and retailing at £339 (plus purchase tax) or 54.3d. per lb. The cheapest car is the new Ford Popular—a new name but a not unfamiliar car—which weighs 14.6 cwt, and retails at £275 or 40½d. per lb. The first hopeful assumption is that some British manufacturer will in the next year or two surpass the technical economy of such vehicles as the Renault 4 c.v. of 12 cwt, or even the Citroën 2 c.v., by developing a vehicle of 10½ cwt, retailing, as the Ford Popular retails, at 40d. per lb. This would give a price just below £200. The second hopeful assumption is that the present purchase tax of 50 per cent on cars is replaced by a general sales tax of 15 per cent, which would raise the retail price, including tax, to £225. If by the

arrival of the sixties the second-hand market had attained its prewar pattern, when a four-year-old car sold at 40 per cent of its list price, a marginal motorist would be able to buy such a car for £90; if he ran it for six years, depreciation would cost him £15 a year.

Moving into an area of even rosier optimism, let us now assume that governments become so intelligent that they no longer overtax motorists, and content themselves with £10 licence duty and petrol tax at 1s. a gallon. Petrol for 4,000 miles—if his much lighter car does 50 miles to the gallon—will require 80 gallons, costing £12 at 3s. per gallon. Allowing £12 for insurance, £4 a year for tyres, and £12 for other

costs, the projected total budget by the end of this decade would come to £65 a year, less than half the 1952 minimum of £140. The number of people who could afford to become motorists at £65 a year would be enormous; the cost would be no more than many a working-class family now spends on cigarettes.

From this plainly hopeful projection of future costs, a series of guesses at the potential number of motorists can be developed. A report on the ownership of cars (and other goods) in May, 1952, by Mr R. F. F. Dawson, published in the Bulletin of the Oxford Institute of Statistics last May, shows how car owners were distributed among different income groups. This distribution appears in column 4 of the table overleaf. In columns 6 and 8 respectively are set down the proportions in each of the income groups which by 1959 might be expected to become car owners on two assessments—optimistic and most optimistic. These are frankly guesses—not inherently impossible, perhaps, but

Before the war, the number of cars in use (in the third quarter of the year) increased two and a half times in twelve years. The figures are at three-year intervals, together with the average annual rate of increase.

	Cars in use	Average annual increase per cent
Prewar	800,100	18.4
1927	1,075,100	10.4
1930	1,226,500	4.4
1933	1,675,100	10.9
1936	2,073,400	7.4

Registrations since the war are divided between cars taxed on horse-power (that is, cars first registered up to 1946) and those taxed on cubic capacity since 1946. In the thirteen years since the outbreak of war the number in use has risen by a quarter.

	Cars Registered on H.P.	Cubic Capacity	Total	Increase over previous year per cent
Postwar	1,752,100	208,400	1,960,500	...
1948	1,789,500	341,300	2,130,800	8.7
1949	1,790,700	467,200	2,257,900	6.0
1950	1,782,900	597,500	2,380,400	5.4
1951	1,766,800	741,300	2,508,100	5.4

not capable of carrying too much weight. And the projected total numbers of cars on these two bases shown in columns 7 and 9 have a similar ranging quality that cannot be tested very far by cold statistical logic. The calculation

How Many Cars in 1959?

Income Group	Number of Incomes		Car Owners in each group 1952		Guesses for 1959			
	Per cent of total	000's	Per cent of group	000's	Optimistic		Most Optimistic	
					Per cent of group	000's	Per cent of group	000's
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
Under £200	24	5,280	1	50	2	110	3	160
£200 - £400	35	7,700	4	310	7	540	19	770
£400 - £600	26	5,720	10	570	20	1,140	30	1,720
£600 - £1,000	11	2,420	19	460	40	970	50	1,210
£1,000-£2,000	3	660	44	290	75	500	80	530
Over £2,000	1	220	76	160	80	180	85	190
Total	100	22,000	...	1,840	...	3,440	...	4,530
Add cars owned by businesses, etc.				560	...	840	...	1,000
Grand total				2,400	...	4,280	...	5,530

tions assume that the size and distribution of incomes are the same in 1959 as in 1952—one assumption, at least, that should have the merit of being conservative. The guesses in columns 7 and 9 do not presuppose, of course, that all the new motorists will each own a four-year-old car of minimum size and greatest economy; the considerations that apply to that limiting case of motoring at the margin will also apply, *mutatis mutandis*, to the costs of motoring on less frugal standards, and must be expected to stimulate demand for all cars throughout the entire range of incomes.

On these guesses it is possible at least to visualise the possible total ownership of cars in 1959 at between 4½ and 5½ million. To deduce from such figures how many cars

are likely to be sold in the home market involves a further series of assumptions about the rate at which cars are scrapped. Reliable statistics on the expectation of life of motor cars are unfortunately lacking in this country; there are American figures of the ages of the cars under registration at July 1st each year, from which some sort of mortality statistics can be drawn up, and these may not be wholly irrelevant to conditions here.

Postwar figures suggest that during the first five or six years of life, about 1 per cent of each age group of cars perishes in every year; the rate of mortality increases thereafter, and subsequent survivals, for any given age group, seem to run as follows:—

	After						
	11 years	12 years	13 years	14 years	15 years	16 years	17 years
Survivals, per cent.	84	78	70	59	45	31	20

From this trend, the demise of the 1,700,000 of prewar cars (out of the two million in 1939) still registered in September, 1952, might proceed roughly on this pattern:—

1954	..	150,000	1957	..	300,000
1955	..	200,000	1958	..	350,000
1956	..	250,000			

leaving a gallant band of 450,000 moving into their third decade of life in 1959.

By then, the mortality of cars registered in the period 1946-52 should be considerable. The table opposite sets out the number of cars registered for the first time in each of those years and the number which it seems reasonable to assume will perish between 1952 and 1959. It suggests

V Engines

AN engine designer's problem is set by limits of space, fuel economy, performance and accessibility. He must then design a unit producing the requisite power at the lowest cost of material and labour. In normal conditions of large output, labour and material costs will not vary greatly between one engine and another of similar weight; it is weight that remains the decisive factor. Reduced to its essentials, the problem then becomes a matter of enclosing the requisite combustion space in its double skin of cylinder wall and water jacket, and the crankshaft in its stiffer single skin, using the minimum weight of metal.

One school of designers hold that if there are to be more than six cylinders, and perhaps if there are to be more than four cylinders, the most economic answer is the "V" engine, with cylinders of rather fat, stocky proportions. Much of the engine development work in the American automobile industry is now concentrated on V engines. The diagram—reproduced from a paper read to the Society of American Engineers

by Mr Matthews and Mr Turlay of the Buick company—shows the saving in length and height which can be achieved. The saving in weight is 170 lb, or over 20 per cent. The saving in height is welcomed by the body stylist, whose dictates, according to these authorities, "are one of the most important, if not the most important factor, in determining the future trend of engine design."

REDESIGN OF BUICK ENGINE

1953 V-8
1952 SERIES 70

ing the future trend of engine design." The increased width, particularly with an overhead valve engine, for long a characteristic of the Buick and almost universal in modern engines, can just, but only just, be accommodated. The saving in weight means a saving in cost in the engine itself, and a consequent saving in weight and cost throughout the rest of the vehicle. It seems possible that V-8 engines may, in the next two or three years, become almost universal in American cars; if so, the change will call for heavy investment in production plant which will commit the industry to V engines for fifteen or twenty years.

For engines of four or six cylinders—which British sizes of vehicles demand—a V arrangement would give comparable savings in weight and size; but it would also involve more expensive crankshafts, heavier flywheels and unbalance in running. General Motors, however, have acquired a patent for an arrangement to give a V-6 engine the balance it lacks; and at least one British manufacturer is said to have an experimental vehicle on the road with such an engine. It is possible that for a car of the utmost economy, a V-4 engine might be the best solution.

INTERNATIONAL MOTOR SHOW, EARLS COURT (OCT. 21—OCT. 31)

-you can depend on it!

that by 1959, there may survive, perhaps, 450,000 pre-war cars; and of the 997,300 cars of vintage 1946-1952, say, 850,000, making 1,300,000 in all. If, then, the car population in 1959 were taken at a potential $4\frac{1}{2}$ million, there would be a market in this country over the next six years for $3\frac{1}{2}$ million new cars; if the more optimistic figure

Year	New registrations	Assumed rate of loss by 1959	Losses by 1959
1946	000's 121.7	per cent 20	000's 24.3
1947	147.8	18	26.5
1948	112.7	16	18.0
1949	154.7	14	21.6
1950	134.4	12	16.2
1951	138.4	10	13.8
1952	187.6	8	15.0
Total	997.3	...	135.4

of $5\frac{1}{2}$ million were taken, the total market would be for $4\frac{1}{2}$ million. The two lines of guesswork set limits for a potential home market of half a million to three-quarters of a million cars a year. Production of passenger cars for the twelve months to July last was 525,000; and exports for the same period were 286,000. If sales in the home market for the next few years were to reach half a million a year—or, on an even more buoyant basis, three-quarters of a million—the prospects for car exports should also be excellent. Such a volume of home sales ought to make possible a level of

Disc Brakes

ALMOST every production car and truck is braked by shoes pressing outwards on drums. Sometimes the pressure of the foot is augmented by power drawn from the engine; and sometimes by a self-wrapping arrangement by which the brake drum, when the shoe presses against it, draws the shoe round with it and increases the pressure.

EXPANDING BRAKE

Internal expanding brakes in their various forms are neither expensive nor heavy, and will ordinarily do what is required. But with repeated use in a short space of time they generate much heat and if the rubbing surfaces become very hot, braking efficiency falls sharply. Modern styling keeps the cooling stream of air from the brakes; and with fiercer

DISC BRAKE

driving and higher speeds, a braking system less prone to "fade" becomes increasingly desirable.

The answer is the disc brake. Instead of carrying a brake drum, the wheel carries a solid disc. The expanding brake shoes give place to friction pads mounted on either side of the disc; these pads can be moved under hydraulic pressure so that they pinch the disc and so arrest the rotation of the wheel. The disc, uncovered except for the small area of

the brake friction pads themselves, gives up heat much more readily.

In the 24-hour race at Le Mans, the Jaguar Company, which in conjunction with Dunlop has led the technical development of disc brakes, fitted them to their cars. The effect, in allowing the drivers to postpone the moment of braking for a corner, was dramatic. Time after time, a Jaguar approaching a corner could pass another car applying its brakes, and still have time itself to brake for the corner.

Disc brakes are demonstrably more efficient than expanding brakes for hard driving or in mountainous country; given time for development, they may become cheaper than expanding brakes.

Holding the American Market

IS it worth making a special effort to secure sales of British cars in the dollar markets? The easy cynical answer is that the American car industry will react sharply if the volume of British sales becomes uncomfortably high or if a period of stiffer competition lies in store for the American car market. The practical answer from past experience is rather different. In 1938, the number of British cars exported to the United States was 99. Who would have predicted then that in 1953 the total export of automotive products to the USA and Canada would have earned \$100 million? Yet that figure, or something very close to it, is likely to be achieved. This represents a considerable and a growing success. The following table shows the numbers of British and European cars registered in the USA in the last five years by seventeen makers; these firms sold all but 2,000 of the foreign cars registered in the United States in these years:—

FOREIGN CARS REGISTERED IN THE UNITED STATES

	1948	1949	1950	1951	1952	Total
M.G.	682	857	1,576	3,790	7,449	14,354
Austin	8,610	3,642	5,452	3,800	4,804	26,308

Bentley	4	8	18	12	27	69
Daimler	0	0	5	19	11	35
Total British	13,577	10,713	14,341	19,323	27,571	85,525
Volkswagen	...	2	157	390	601	1,150
Renault	860	1,402	1,551	777	374	4,964
Porsche	...	...	...	...	141	141
	14,437	12,117	16,049	20,490	28,687	91,780

For the first six months of 1953, the registrations of the five leading makes show an increase of 18 per cent over the corresponding period of 1952; Jaguar indeed heads the list with a 61 per cent increase, followed by Ford with 27 per cent and Hillman and MG with 23½ per cent; the new registrations of Austin cars show a decrease of 23 per cent.

From these figures a general pattern emerges. Five years or so ago, the American buyer found it difficult to get delivery of a new car; Austin, and at a later stage Ford, showed commendable energy in seeking dollar sales. With the disappearance of the sellers' market, demand has waned for the ordinary English saloon cars. Ford, with the Zephyr and Consul—much more attractive vehicles than they could offer in the earlier years—and with the American Ford distribution organisation to help them, have none the less improved their position; and so have Hillman, with the sales appeal of the Minx; but Austin have continued to

experience a declining trend in sales. On the other hand the sales of open sports cars—almost entirely the Jaguar and the MG—have shown remarkable growth.

★

In the closed car field, the demand for standard English saloon cars, exemplified by the sales of Austin, Hillman and Ford, is perhaps not likely to expand very rapidly. The principal attractions to the American owner are the distinction of something different, economical running, and easy parking. But the market may be narrowed if other American makers follow the Hudson company in offering smaller cars. At the lower end of the scale, in size and economy, the failure of the Renault—a really small car of remarkable properties—to achieve larger American sales suggests that expectation should not be pitched too high; but special considerations of costs or marketing policy may have kept the sales of that car below those that might have been expected, given its low natural cost.

Three of the British big six, Austin, Hillman and Ford, have achieved substantial sales in the American market. The new small Standard and Ford models may well add to the volume. The remaining one of the Big Six, Vauxhall, may perhaps revise its future attitude to the American market. If a new policy at Luton included, in due course, a small Vauxhall, this might well be sold in quantities in the United States; and General Motors' high command might be glad to find out for themselves, at negligible cost, the answer to the multi-million dollar question: Is there a really large potential market for a small car in the USA?

Style with Speed

Jaguar, alone of English manufacturers, has succeeded in selling in serious quantities a closed car of a type which the British connoisseur would consider really interesting. But in this field there may be latent possibilities. It is reported that substantial orders have been booked (a rate of 3,500 a year has been quoted) for the Porsche car—a small saloon car of high performance and distinguished appearance, powered by an enlarged version of the Volkswagen engine. The Porsche is disfigured by a noise level (almost inseparable from an air cooled engine) much higher than that of American cars; and it may be that after a year or two its sales will not be maintained. It seems that a market might be developed for an English closed car with an appropriate combination of size, performance and distinction of appearance which has hitherto been missed. The sales of the Jaguar saloon, of similar size to the general run of American cars, show that there are buyers prepared to pay a small premium for the distinction of a non-American car plus a small measure of superiority in appearance and performance. It may be that the 4 cylinder version of the Jaguar and other British engines in the 1½ to 2½ litre range will in due course show what can be done.

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasco Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos...

attainable with given power. In subsequent racing this year, Aston Martins have on more than one case defeated Jaguars, once because the peculiar character of the circuit showed that the disc brake has limitations, and once through gear-box trouble. These failures have no relevance to what the fiercest private driver could do to his car on public roads; but the Aston Martin may well be able to exploit its success in the USA, though at a higher price and in smaller quantities than the Jaguar can accomplish.

★

There are, however, two possibilities of serious competition with the Jaguar XK120. The American factories are all eyeing with interest the market for high speed open cars, and at least one model has appeared which must be taken seriously—the Corvette, made by General Motors. Current production is scheduled at only 50 a month, at a selling price of \$3,250. For next year, a production programme of 1,000 a month has been announced, and this could reduce the selling price, it is thought, to \$2,600. This new car has a kerb weight of 26 cwt and an open body of reinforced plastic construction which is reported to be of impressive appear-

ance. It is powered by the Chevrolet six cylinder engine which in standard form develops 108 bhp. In the Corvette, it is to be fitted with three carburettors, and with other modifications these may increase the output to 150 bhp. The acceleration at moderate speeds should be equal to that of any European sports car, and the maximum speed is likely to be more than 110 mph.

The other potential threat is from Mercedes. In 1952 the Mercedes team won handsomely at Le Mans; but the factory eschewed racing in 1953, no doubt to the mortification of Jaguars, who would almost certainly have had their revenge. Mercedes are expected, however, to return to racing in 1954; and success at Le Mans might lead to the subsequent marketing in the United States of a sports car of a performance and price which could challenge the Jaguar XK120—and also to an even better, more salable, large Mercedes saloon.

Sporting Juniors

Logically enough, British manufacturers are opening the country between the two paths blazed by Jaguar and MG with an intermediate range of open cars in size of engine

Diesel Engines for Cars

A PETROL engine sucks into the cylinder a mixture of air and fuel, compresses it in the ratio of between 6 and 8 to 1, and ignites it with a spark. A diesel (or compression-ignition) engine sucks in air and compresses it to about 16 to 1; a tiny dose of fuel is then pumped in against the pressure and is ignited by the high temperature generated by the high compression.

The attractions of compression-ignition, or diesel, engines for cars are the saving in fuel consumption—roughly speaking, a doubling in miles per gallon, and perhaps a lower price per gallon—the elimination of electrical ignition and lower maintenance costs. Against these must be set: (1) Greater weight—since the diesel

engine runs at lower speed, it needs bigger cylinders to give a required power output, and the higher pressures call for a stiffer and heavier construction. (2) Greater roughness at idling speed. (3) Greater cost of accurately made equipment to measure out a tiny dose of fuel and pump it into the cylinder against high pressure. (4) Narrower range of usable engine speeds. (5) Greater difficulty in starting at very low temperatures.

If produced in the same quantities as automobile petrol engines, the extra cost of a diesel engine would probably be equivalent to the cost of the fuel pump and injector which, in such quantities, might be brought as low as £10-£15; the saving in fuel might

balance this in, say, two years running.

For the small car of utmost economy, two technical difficulties arise with the diesel engine. The doses of fuel to be metered out for each explosion with a four-cylinder engine may be as small as one half-millionth of a gallon—and it is not easy to do this accurately and cheaply. It is also difficult to build a diesel engine with a stroke shorter than about three inches, for with manufacturing tolerances and the play which develops with wear, there is danger of the crown of the piston hitting the head of the cylinder. But experiments with diesel engines in London taxicabs and in other light vehicles may show how far the application of diesels to private cars is practicable.

COMPARISON OF TYPICAL 4 CYLINDER DIESEL AND PETROL ENGINES

LEATHER UPHOLSTERY

MAKES A GOOD CAR
A BETTER INVESTMENT

Real leather is unique for its lasting comfort and luxurious appearance. So, even if this refinement involves a little extra cost, you will be prouder of your car and, when the time comes to re-sell, your good judgment will be more than rewarded.

and vehicle, in performance and in price. The two outstanding examples are the Austin Healey and the 2-litre Triumph. The former is a model developed by the Healey Motor Car Company, a small British concern that has links with the Nash Kelvinator Corporation—the largest independent American car manufacturer outside the big three, GM, Chrysler and Ford. Based on the engine used in Austin Healey, the Austin Healey has passenger accommodation more luxurious than the MG Midget, more luggage accommodation, and a modern appearance, all for a kerb weight of 18½ cwt—little more than that of the Midget and with twice the MG's engine capacity. The performance is outstandingly good, with a maximum speed of about 110 m.p.h. When the Healey Company unveiled the car at last year's Motor Show the price was announced at £850. Since then the Austin Company has undertaken responsibility for its production and, in spite of the addition of overdrive (which probably adds £50 to the retail price), the British price has been reduced by £100. A programme of 200 units a week has been rumoured; on such an output, and with the energy of Mr Lord and the British Motor Corporation organisation behind it, its sales in the United States might well outpace those of any British car, particularly if the Nash dealer organisation were concerned in its marketing.

With a rather smaller engine (the Standard engine as used in the Vanguard and in the Ferguson tractor, which is produced in quantities which should ensure really low costs) the Triumph 2-litre is priced in this country nearly £200 below the Austin-Healey. No road tests have been pub-

lished, but officially reported performances of prototypes (presumably not entirely standard) have shown speeds of more than 120 m.p.h. The production cars should have excellent acceleration and a top speed of about 100 m.p.h., and, given an effective dealer organisation, prospective sales in the American market should be impressive. The Sunbeam Alpine cannot hope to offer a performance comparable with either of these two cars. The 2½-litre engine now gives 80 bhp; but since the car's kerb weight is over 26 cwt—some 7 cwt more than the Austin Healey with its 90 bhp engine—its success must rest not so directly on its performance as on the sales appeal of its graceful lines and on the aggressive marketing ability that the Rootes organisation has always shown.

★

The MG Midget continues its highly successful sales, but a successor can hardly be indefinitely delayed. The Austin Healey and the Triumph will have a top speed of 30 per cent above that of the current Midget to set against their higher selling prices. Those who have bought, new and secondhand, the 20,000 Midgets must include a high proportion of the "fancy" of the current generation. The BMC can hardly fail to take advantage of the legend handed on to the succeeding generation, and of the strong dealer and service organisations that have been established, particularly in the Eastern and Pacific Coast States. The owner of a sports car can overlook being left at the lights

Engines: Front or Back?

THE most successful Continental economy cars have their engines next to the axle they drive; the Renault with its vertical water-cooled 4-cylinder engine, the Volkswagen with an air-cooled flat four engine, both at the rear, and the Citroën with an air-cooled

flat twin in front driving the front axle. The location of the engine next to the axle it drives saves the weight and cost of a propeller shaft and the tunnel that houses it. Comparison of the rear engine 750 c.c. Renault with the orthodox 803 c.c. Standard eight reveals very

similar body space—the Renault a little wider and the Standard a little roomier fore and aft. But the Renault saves an inch in overall height and 1½ in in wheelbase; and 10 per cent in total weight. The lighter vehicle gets an almost identical performance with a slightly smaller engine and a 3-speed gear-box against four-speeds for the Standard, but it offers no greater economy. This fact suggests that the Standard engine—designed five years later—shows a full measure of progress for that space of time.

Comparison of the Volkswagen and the Morris Minor does not give such close resemblance; but the Morris Minor has 1 cwt more of weight, to be paid for initially and in running costs. The Morris Minor owner need resort less to the gear-box to attain a given performance; the Volkswagen, with its lightly stressed engine, will show its quality on exacting terrain or under hard driving.

SAYNER LANE, LEEDS, 10 Telephone: Leeds 29466-7-8

by a standard saloon car, and on the open road he is not likely to be passed very often by a saloon car driven by a paterfamilias, even though the latter has a 20 m.p.h. advantage in maximum speed. But he is not likely to be allowed to forget a similar indignity inflicted on him by one of his own generation in a car as airy as his own. The performance to be required may well call for an engine bigger than the current 1½-litre MG; the BMC, already represented in the over 2-litre field with the Austin Healey, might well choose a 1½-litre size, perhaps using a hotted up version of the new 1½-litre BMC engine embodied in the newly announced MG Magnette saloon. If a new MG achieved a weight similar to that of the new Jowett sports car of 14 cwt, the difference in its performance compared with the Austin Healey and Triumph should be made good by its lower price.

★

The new Jowett Jupiter R4, unveiled on Wednesday, is a brilliant design. In terms of mechanical design, the low weight achieved is remarkable, as a comparison with the other figures in the table shows. But in addition, the new technique developed for the construction of the body in a plastic fibre seems most promising, and may well be a most apt reaction to the particular difficulties in which the Jowett Company finds itself. The car should have a performance

comparable with the new Triumph Sports, and is reported to have excellent road behaviour. If, when it is in production, market arrangements can be made which are worthy of the technical quality of the product, its sales in the USA might be substantial.

A British-built open car which will be smaller than any of these and can hardly rival them in performance—but which may still earn more dollars than any—is the Nash NK1. This will embody the Austin engine used in the A40 and will be built in the Austin works at Longbridge to designs by the Nash Kelvinator Corporation, who will market it. Production is expected next year or possibly even earlier. It is a tribute to the British industry that, after various European engines had been considered (which must have included the Fiat 1100 c.c. and the 1400 c.c.), Nash Kelvinator selected the Austin engine and decided on production at Longbridge.

The opening of this article suggested a total of \$100 million of automobile sales in the North American market. The range of cars here discussed from the point of view of their saleability in the USA should do more than maintain their proportion of that total—to which should be added the sales of cars in Canada, mostly of standard saloon cars. In neither market has the British commercial vehicle, for all its success in certain other markets where it has competed very successfully with North American products, achieved substantial and enduring sales.

Terms for Trade-Ins

A REVIEW of the second-hand car market in these columns in March, 1952, showed that almost all popular-priced cars built since the war were then selling above the list prices (including purchase tax) of new cars; two-year-old cars of the lower price range were commanding a premium of about 50 per cent and five-year-old cars a premium of about 10 per cent. In the medium price range two-year-old cars were about 7 per cent and five-year-old cars about 37 per cent below list price. It was clear that the prewar pattern would one day reassert itself—that is, year-old cars selling at about 75 per cent of the list price, with a reduction of about 20 per cent of the diminishing values in each subsequent year.

A second article last March showed that second-hand car prices declined sharply in the following year, but in the last six months demand for both new and second-hand cars strengthened. Despite the fact that new registrations totalled 133,732 for the first six months of this year, against 80,871 in the first half of 1952, prices of second-hand cars have been distinctly firm.

A few months ago there were very few models which could not be obtained either "off the peg" or after a wait no longer than would have been customary before the war for a car which was selling well. Today, a longer wait may be necessary for delivery of any of the more popular models, or even for expensive cars, such as the Jaguar Mark VII, which are selling well; and the public is ready to pay up to the list price for year-old cars of the more popular models in first-class condition.

In the United States, until recently, the rate of depreciation of used car prices was rather higher than the prewar average of about 2 per cent per month; but American prices of used cars have also become firmer and are now roughly in line with prewar experience.

The present state of the second-hand car market is shown in the graph. It is divided into three groups—cars with a list price below £800, between £800 and £1,200, and above £1,200. The second-hand prices refer to cars basically the same as those still current. Thus a one-year-old car listed

TREND OF SECOND-HAND CAR PRICES

below £800 still fetches almost the full list price, and about three-quarters of its list price when it is four years old. The steepest fall in second-hand values applies to cars listed above £1,200, which cannot be sold for half their list price at four years old. But all second-hand values are still well above prewar levels.

BRITISH EUROPEAN AIRWAYS invite applications for a post in their recently formed Organisation and Methods Branch. The person selected will be responsible for the investigation and development of office methods and accounting and other paper work systems. Applicants should have a University Degree, preferably in Engineering, Science, or Mathematics, or a professional qualification in Engineering or Accountancy; some years' experience in a position of responsibility; and recent experience of methods study. A knowledge of office machines and equipment, including punched card equipment, is also desirable. Salary within the scale £875-£1,175 per annum. Pensions scheme.—Applications, giving full details of age, qualifications, experience and when available, to the Chief Personnel Officer, B.E.A., Keyline House, Ruislip, Middlesex. Closing date November 15, 1953. Persons who answered a similar advertisement in July last should not re-apply.

TUTOR required by Foreign Office (German Section) for Wilton Park Steyning, Sussex. Must be able to conduct small discussion groups in German. Qualifications: British university graduates in one of the social sciences with good background knowledge of institutions and history of Great Britain and Germany. Preference given to specialists in industrial relations. Salary £685 by seven increments to £870. Point of entry according to qualifications. Write, giving date of birth, education, full details of qualifications and experience of posts held (including dates), to Appointments Officer, Ministry of Labour and National Service, 1-6 Tavistock Square, W.C.1, quoting E.C.930, by November 7, 1953. No original testimonials should be sent. Only candidates selected for interview will be advised.

ASLIB (formerly known as Association of Special Libraries and Information Bureaux) proposes to appoint an Assistant Director with particular responsibility for research into documentation methods, costs, etc. Experience in a special library, information department or organisation and methods department is essential and a university training is desirable. Salary on a scale £700 x £30 would be an additional qualification. Some administrative experience to £1,000 per annum, plus superannuation similar to F.S.S.U. An exceptional candidate would start high on this scale.—Applications should be submitted as soon as possible to the Director, Aslib, 4 Palace Gate, London, W.8.

AN expanding Company requires the services of a woman graduate to undertake field and office control of a National Retailer Panel. A knowledge of statistics would be an advantage, as the work entails maintaining a panel at full strength, checking field work, organising office routine and the appreciation of findings in collaboration with the staff Statistician. Salary not less than £625 per annum and the benefits of a non-contributory pension scheme.—Box 366.

ACTUARY: An exceptional opportunity occurs for a qualified Actuary anxious to make a career in Consulting work. Age limit 35 years, but younger man preferred. Although the post offered is, in the first instance, on the staff, the right man, who will also possess the necessary personality and ability to mix, will be offered an early partnership, probably in about 18 months or less. Full details of career to date should be given, including initial remuneration required. All applications will be treated as strictly confidential, should be marked "Actuary," and sent to Duncan C. Fraser and Co., 18 Hackins Hey, Liverpool, 2.

ADVERTISER, late 30s, seeks appointment as Senior Marketing Executive in progressive company of national standing. Wide experience with front rank companies in Home and Export, Advtg., Mktg., Sales Prom. and Production problems. Languages.—Box 368.

YOUNG ACTUARY, experienced security analysis, brokers' reviews and circulars, requires post with substantial firm of stockbrokers, or institution. Salary £1,500 p.a.—Box 364.

LADY, recently returned from America, with wide contacts in Newspaper world, Hotel, Catering, Tourism, energetic and resourceful, has limited company, no liabilities. Invaluable to someone requiring enterprising assistant to help work up business, particularly where American contacts useful.—Box 363.

LADY, early 30s, Australian born, American citizen, 12 years' business experience, including U.S.A., seeks lucrative and responsible position as confidential secretary or administrative assistant. Drives car. Willing to travel.—Box 363.

SOLICITOR (39), 21 years in charge legal department large commercial firm West Africa, seeks commercial or legal appointment in London.—Box 359.

TWO NEW PELICAN BOOKS.—"The Chemical Industry" by T. I. Williams (2s.) and "Balance Carried Forward" by R. R. Coomber (2s. 6d.).—Full list of titles available from Penguin Books Ltd., Harmondsworth, Middlesex.

SALES EXECUTIVE post wanted by young graduate (26) who, with three years' experience in market research and the preparation of market appreciations behind him, now wishes to change over to a more practical commercial job. A business dealing with the mass market, where this experience would be of most value, is preferred.—Box 358.

F. TREMAYNE, Deputy Secretary, 8 Waterloo Place, Pall Mall, London, S.W.1. October 21, 1953.

DEPARTMENT OF SCIENTIFIC AND INDUSTRIAL RESEARCH require one Principal Scientific Officer (minimum age 31 years) and one Scientific Officer (minimum age 21 years), unestablished posts, in Headquarters Office for work on economic problems associated with application of scientific research and development to industrial processes; 1st or 2nd class Hons. degree in Economics required; for P.S.O. 1st or 2nd class Hons. degree in Science with economics or operational research experience acceptable. Appointment for three years only. Inclusive remuneration (45 hour week within range, P.S.O. (men) £1,161-£1,559; S.O. (men) £475-£877; rather less for women.

Write, giving date of birth, education, full details of qualifications and experience of posts held (including dates), to Appointments Officer, Ministry of Labour and National Service, 1-6, Tavistock Square, W.C.1, quoting E.D.858/859, by November 7, 1953.

No original testimonials should be sent. Only candidates selected for interview will be advised.

CHARTERED ACCOUNTANT with several years' service as H.M. Inspector of Taxes seeks an opportunity of joining a large Industrial Group, to initiate or assume charge of existing Taxation Department for control and supervision of the global tax liabilities of the Group.—Box 365.

PRODUCTION EXECUTIVE required by progressive Glasgow Company. The position is an executive one involving control of a department mass-producing specialised food lines. A Chemistry or Engineering Degree, though not essential, will be regarded as an asset. Commencing salary £1,250 a year, plus expenses. Full particulars of age, qualifications and experience will be treated with the strictest confidence.—Box 361.

MANAGEMENT Consultants are required by the Wallace Attwood Company. Applicants between the ages of 30 and 45 must possess a University degree or technical equivalent in engineering and have held responsible executive positions. A thorough practical and current knowledge of the organisation and routines of industrial concerns is essential. Substantial salary and excellent prospects available.—Replies in confidence to Chantrey House, Eccleston St. S.W.1.

EXECUTIVE required for senior position in London Office of expanding virile export organisation. Exceptional opportunity for man with ability to match ambition. Experience in selling office machines and sales or export administration essential. Must be prepared some travelling overseas. Age 28-38. Initial salary not less than £850. Consideration only to those stating fully age, education, languages, posts held, present salary. All applications will be answered and treated in strictest confidence.—Box 357.

ECONOMIST WANTED, able to write briefs for business man *ad hoc* following subjects: Commonwealth Trade, GATT, Joint Stock Banking. Remunerative fees paid or would employ part-time if preferred. State age and experience.—Box 362.

ACTUARIAL CLERK required for position offering experience in all types of actuarial work in Life Assurance and Permanent Sickness and Accident Insurance. Applicants should be working for Parts 1 or 2 of the Institute Examinations.—Write to the Manager, and Actuary, Medical Sickness Society, Limited, 7, Cavendish Square, London, W.1.

ADVERTISING MANAGER wanted with thorough appreciation of advertising and promotional programmes. Write, giving background details to Box 367.

MANUFACTURERS and others interested in developing Italian markets invited contact gentleman (English) with high-level connections. Only propositions with large or medium-sized potential considered. References required and given.—Box 360.

I WANT to become a Surtax payer (in due course). I have an Honours Degree in Economics, a sound, practical knowledge of all aspects of Export, selling experience at home and abroad, a knowledge of French and German and a liking for sales promotion and advertising. Age 33.—Reply to Box 355.

PERSON, age 25-35, with literary flair for writing articles, and who has engineering background, required by large company for work connected with internal publicity. Must be able to liaise, bright ideas and think up material for articles on production, methods, time study, foremanship and general management.—Box 352.

ENGINEERING HONOURS GRADUATE (Cambridge), aged 50, retiring from administrative service abroad, seeks occupation in scientific or operational research. Somewhat obsolete technically but could relieve scientists of administrative routine. Satisfied with small salary to supplement pension.—Box 350.

SIR WINSTON CHURCHILL'S WAR MEMOIRS

The Sixth and Final Volume

IN the context of 1953 this last volume of Sir Winston Churchill's War Memoirs is the most enthralling. It is an account not so much of the series of great victories that ended the War as the story of the personal negotiations between Churchill, Stalin and Roosevelt, and later Truman, about the shaping of the post-war world.

In American eyes, at least, the word Yalta has become synonymous with Munich. Sir Winston now tells what really was agreed there and in what manner the Russians voided their pledges.

Equally absorbing is his account of how the Western armies failed to carry out the occupation of Berlin, Vienna and Prague, all of which would have had a profound effect upon the present situation. How, too, America's feeling that British "ambition" after the war must be curbed led to fatal divergence between American and British dealings with Russia.

The whole volume is summed up in Sir Winston's words "How the Great Democracies triumphed, and so were able to resume the follies which had so nearly cost them their life".

That is why he has named it—

Politicians and Trustees

NEXT Tuesday the Government will enter its third Parliamentary session with the specifically party measures in its legislative programme at last disposed of: steel and road transport are being returned to private ownership. Appropriately, the last days of the old session have been largely occupied with the industries where public ownership continues. There have been debates on the annual reports of the nationalised undertakings—transport, the fuel and power industries, and the air corporations.

These debates were to have been, in the theory of 1945, the grand inquests which showed that whole industries were run not for private greed nor for bureaucratic empire-building, but for the public good. It was by this means that the very concept of the public corporation, accountable to Parliament for its custodianship of the people's railways or power stations, was to be justified. In practice, the debates have become, in the eyes of politicians and public, an accepted means of filling in the overhanging ends of sessions whose real business has been completed months before. That timing is a fair enough reflection of the value of the debates as they have been. Some members talk objectively and well about minor issues; some members take up local grievances or ride particular hobby horses; most members see the debate as one more stage in the attack and defence of established party doctrines.

Until 1951, all this was hardly avoidable. The Minister who moved that the House should take note of some corporation's report was defending his own creation; he had to defend it the more extensively and dogmatically because he knew so well that its performance had disappointed him and everyone else. Similarly, an Opposition scenting blood was disposed to attack wholesale the Minister, his creature and its doings, and the whole principle of public ownership. The reversal of roles two years ago, with the creators of the nationalised industries become the Opposition, has so far made disappointingly little difference. The debates have continued to be used only to a secondary extent as trustees' meetings at which the policy and performance of the public corporations are seriously and fairly examined; to a much greater extent they have remained an occasion on which the partisans of private and public enterprise—armed with whatever useful ammunition might be selected from the most recent annual reports—have refought old battles and reiterated old warcries.

If this went on much longer, it would be time to despair of ever subjecting nationalised industry to the broad public control without which it loses all relation to the theory of democratic socialism. Fortunately, there is no reason why this failure should go on. It could be excused while the Bills denationalising steel and road transport were before Parliament and the general issue of public versus private ownership was thus kept in the forefront of politics. For the rest of this Parliament, both sides can surely feel that they will bring themselves no electoral benefit by rehashing stale controversies.

Signs of this realisation may, indeed, be detected in the contrasting tone and content of the recent debates. Inevitably, the dust of battle hung quite thickly over last week's transport debate; the Transport Commission's report had complained that plans for integration which were just maturing had been impeded by the denationalisation of road haulage. Labour therefore had an obvious and legitimate opportunity to renew, in effect, the debate on denationalisation; and the Government spokesmen were consequently defending a salient in a party line, though the tone of their speeches was nevertheless commendably objective.

This week's debate on fuel and power showed, by contrast, a new and more promising stage in the development of Parliamentary criticism of the nationalised industries. Here there is no salient but a recognised frontier that no one proposes to move. Such matters as absenteeism, output per man-shift, and redundancy in obsolete pits would once have been debated in the ringing tones of class warfare; this week they were discussed in a manner so objective and sympathetic that it would not always have been easy, without looking, to credit each speech to the proper side of the House. In terms of party politics, if not of economics, the administration of the coal mines is at last on a fairly even keel, and both parties can concentrate on the objectives of coal policy and the merits and demerits of the means the Coal Board is using. That still provides plenty of scope for differences on party lines. The Conservative bias will always be, presumably, towards running the nationalised industries as much as possible like other businesses—not always a very helpful criterion. Labour, on the other hand, will no doubt remain too disposed to identify national ownership with highly centralised management, as well as to elevate wider and vaguer notions of social benefit above the corporation's financial obligation to pay its way.

★

But these are differences of emphasis. The politicians have moved far from the days of absolute opposition between Labour members determined to hold the structure set up in 1946 sacrosanct in every detail and, on the other side, Conservatives who would admit nothing but evil in the Coal Board, though they did not propose denationalisation. The Minister of Fuel's account of the latest moves towards improving the structure of the coal industry was confused, and it would be rash to assume at this stage that much good is going to be done. But at least the possibility of managerial changes, without doctrinal controversy or automatic trade union hostility, is no longer ruled out. This week's debate showed that at last a nationalised industry does not have to be treated as either a golden cow or a red rag. That is an important gain.

It rests not only on a more objective and less partisan spirit in Parliament. Occasional wide-ranging debates, based in most cases on annual reports for a year and

more ago, will never in themselves make the corporations in any real sense accountable to the public. The main responsibility of acting as trustee of the public interest must always lie with the Minister. For the men who carried out nationalisation that was extraordinarily difficult. Inevitably, they were less watchdogs on behalf of the public than counsel for the defence, or even mere public relations officers. Conservative ministers, if they had given too much scope to their party's instinctive hostility to nationalisation, might have moved too far towards the opposite role of counsel for the prosecution. That temptation and its attendant dangers have fortunately been avoided. The proper relationship between a minister and a public board is something quite novel and it is still far from being clearly defined. But after two years of Conservative responsibility it is possible to feel that some compromise is being evolved, and to hope that the next Labour ministers will not feel themselves driven back to the role of partisan champions.

Such hopes depend on the fact of nationalisation in the public utilities being genuinely and plainly an accomplished fact. Threats of denationalisation and renationalisation, the atmosphere of frontier raids and suspected territorial ambitions, must be dissipated. An important step to this end could be taken from the Government side. It is, after all, the Conservatives who have most recently moved the frontier between public and private ownership; one further move, for cotton buying, is rightly in prospect. It would surely be appropriate to make an entirely forthright declaration that this is the end of the process: for all other industries, the concern of the Conservatives is now to make nationalisation work and to save industry from further upheavals of ownership. Frontbench policy in this respect is not, indeed, in any serious doubt. But its blunt reaffirmation should be effective in stopping the partisan sniping against the public corporations that is still conducted from the backbenches and from Tory meetings in the country.

The response from the Labour side could hardly be one that would remove the nationalised industries entirely from the scope of party controversy. Their experience will continue to be watched in the hope of obtaining arguments either for or against further nationalisation. But that need not prevent both parties from now looking at the corporations much less as politicians and much more as trustees, concerned about the proper running of public property by methods that are broadly agreed. It is only in this spirit that the task will be well done; and those who now bear political responsibility for the public corporations have an equal interest in their efficiency with those who created them.

Freer Trade in Europe

THE session of the Organisation for European Economic Co-operation which has been meeting in Paris this week is likely to prove a crucial one and of far greater importance to the trade and prosperity of the free European countries than has generally been recognised. One of the few successful international ventures in the economic field since the end of the war has been the programme of European trade "liberalisation" carried out by the OEEC. The title is immodest—or else it is a reflection of the lowered ambitions of a world grown cynical—since nothing more has been in question than the removal of quotas and other quantitative restrictions to trade among the members of OEEC. A country can be 100 per cent "liberalised" and still have a mountainous tariff wall round its market. But tariff duties, bad as they may be, are nothing like as final an obstruction to trade as a system of quotas.

Up to the middle of 1951, the achievement of liberalisation was considerable. There were few members of OEEC which had not attained the target of liberalising 75 per cent of their private trade, and many had gone considerably further. The reappearance, two years ago, of large deficits in the balances of payments of several European countries, however, led to a period of backsliding. The largest debtors, and therefore the worst backsliders, unfortunately, were OEEC's most important members, France and the United Kingdom. The percentage of "liberalised" imports into the United Kingdom fell to 44, and in France to zero. These moves by two such large trading countries might well have led to a general desertion by all the others. Fortunately, that has not happened, and some countries have even continued the process of relaxation. But there are now signs that this state of affairs will not last much longer. Either the defaulters will give some earnest of their intention to come back into line, or else the other European countries will move away from liberalisation. Countries like Italy and Belgium, which have liberalised more than 90 per cent of their imports, now threaten to beat a retreat unless they receive greater reciprocity. Some have begun to experience difficulties in their own balances of payments, which they are inclined to blame at least in part on the French and British restrictions. European trade has clearly reached a branching of the ways. Unless new momentum can be put behind the trade programme of OEEC, the present partners will, one by one, straggle off, each of them seeking to attain security and stability by restrictionism and isolation.

The choice between the alternatives really rests with the British Government. It is true that France is as much a defaulter from liberalisation as Britain—indeed, far more so. But France is still paralysed by the incompetence of its domestic financial policies. In spite of the

total suspension of liberalised imports, France has now accumulated a deficit with the European Payments Union of over \$850 million and each month brings a further addition to the total. Exports are maintained at their current level only with the aid of special subsidies. France, in short, is operating an economy built on a permanent deficit, an achievement made possible only by the continued and massive receipt of American aid. It is quite apparent that, until such time as the internal political situation in France, now frozen by the impending Presidential election, permits that devaluation of the franc which has clearly become imperative, any suggestion for an increase of French imports is academic in the extreme. The delegates to OEEC do not expect more from their French colleague than a gesture for the present and a promise for the future.

★

From Britain much more was expected. The British economy has recovered, as Ministers have been proclaiming to their domestic audiences. If the emergency which was cited as the reason for the suspension of liberalisation two years ago has passed away, cannot the restrictions now be removed? At the moment, 58 per cent of the United Kingdom's imports on private account are "liberalised," and, though this is better than the 44 per cent of a year ago, it is still a long way below the minimum of 75 per cent to which the members of OEEC are pledged in principle. The statement of Britain's intentions that the Chancellor of the Exchequer made on Thursday was therefore awaited with some anxiety. To European eyes, British policy has seemed in recent months to be turning away from the Continent rather than towards it. The episode of the convertibility plan—or, more accurately, the clumsy way in which it was handled—gave birth to this suspicion; the attacks made at the Conservative Conference on Gatt, coinciding with a British request to be released from some of its obligations, served as confirmation. It was thought that the somewhat less buoyant state of the British balance of payments in the last few months would be taken as an excuse for a timid approach. Reports had been current that the British Government intended to increase its percentage of liberalisation only to some 65 per cent. This would have been regarded as better than nothing, but hardly as enough to rekindle some fire of enthusiasm beneath the programme of developing European trade.

Mr Butler's announcement that the target was to be, not 65 per cent, but 75 per cent (including an increase in the travel allowance from £40 to £50), will therefore have come as a welcome surprise to the delegates in Paris. This is a bold step, and though Europeans would

argue that there was a moral obligation on Britain to do something of the sort, it is only fair to point out that there was no shadow of a legal obligation under the principles of the liberalisation programme. Britain's accumulated debit balance with the EPU is still as large as \$200 million, and though the recent monthly settlements have not added to this figure, they have not greatly reduced it. It is being done as a deliberate encouragement to the movement towards freer trade in Europe. Unquestionably, however, it is also in Britain's own interest, since few things could be more harmful to the British export trade than a general movement among the members of OEEC towards a reimposition of quotas on their imports. The possibility of a general economic recession spreading from the other side of the Atlantic, which might have been pleaded as an excuse for timidity, is really another justification of boldness. Those whose memories reach back to 1930 and 1931 will recall what a commonplace it was in those days to deplore the vicious downward spiral of mutual restrictions imposed by the European countries. If such a process starts, it becomes compulsory for each country to join in, just as the coolest-headed man caught in a theatre fire will join in the rush for the doors if it once starts. The only protection against a *sauve qui peut* is a prior mutual obligation to maintain the volume both of imports and of exports among an important group of trading nations.

Mr Butler can reasonably hope that his speech on Thursday will have contributed to a reinvigoration of the movement towards freer trade in Europe. But what is being attempted in Paris this week is really no more than a rescue operation, an effort to get back to the position that was first reached two years ago. Much more will be required before European trade is liberalised in fact as well as in name. There are three main hurdles to be surmounted.

The first is the chronic economic anaemia of France.

Malenkov Looks for a Line

AT one moment last spring it seemed that the death of Stalin had set off a new revolution, full of dramatic possibilities. Lately, however, there has been a sense of anti-climax in the Soviet scene, as if the second act of a play were being performed with no idea of what would happen in the third. When Malenkov took over, there was no upheaval, only smothered convulsions, their most dramatic symptom being the liquidation of the powerful Beria faction. Yet, when Sir Winston Churchill made his famous speech of May 11th there seemed much to justify his reference to the change of attitude, and, we all hope, of mind, which has taken place in the Soviet domain, and particularly in the Kremlin, since the death of Stalin.

He added a warning against action that might impede "any spontaneous and healthy evolution which may be

To cure that is, of course, a task for the French themselves; but it would be a false courtesy to refrain from warning them that their neighbours will not indefinitely abet them in living beyond their means.

The second task is to see whether the principles of liberalisation cannot be extended to agricultural products, which have hitherto been almost untouched by the programme. The importance of this lies not only in the fact that several European countries—Denmark chief among them—are largely dependent on agricultural exports and have hitherto received less than their fair share of the benefits of liberalisation. It also lies at the root of the philosophy which inspires all movements towards freer trade, the first and greatest of whose benefits ought to be a lower cost of living for the people.

Thirdly, means will have to be further sought for preventing those sudden crises in a nation's balance of payments which at present have to be admitted as a valid reason for escaping from the obligations of liberalisation. This brings the argument back to currency, since the proximate reason for these crises clearly lies in the fact that there is, in the world's present arrangements, no automatic corrective mechanism, such as the old gold standard used to provide, constantly at work to prevent deficits or surpluses from cumulating until they reach crisis proportions. If there is to be a crisis-proof system of international trade, it will have to include some such "thermostatic" control. And if the nations are not prepared to move back to the gold standard and submit their domestic policies once more to its disciplines, they will have to move in the direction of much more flexible exchange rates. By one means or another such massive maladjustment as that which now afflicts France, or from which Britain suffered in 1949 and again in 1951, will have to be corrected in their early stage if international trade is not to limp from one restrictionist crisis to another.

taking place inside Russia." How do the prophecy and the exhortation look now, six months later?

Sir Winston's carefully qualified words reflected the almost universal reaction in the West to the news of successive gestures made by Malenkov and his colleagues not only to the outside world but also, in the form of amnesties and propaganda about civil rights and justice for racial minorities, to their own Soviet subjects and to the satellite countries. The Kremlin seemed to be turning, slowly but perceptibly, on to a more liberal bearing than Stalin had ever permitted. But since the fall of Beria the news from Moscow has changed. The flow of gestures has dried up; nationalist tendencies among Soviet minority peoples have been repressed again, and there is no more talk of civil rights. Are we back to Stalinism—but without Stalin?

It may be easier to answer these questions after next week's celebration of the anniversary of the Bolshevik revolution. Up to now, there is little solid evidence to go on. Except for the almost unprecedented volume of economic information, the news from Moscow remains curt and cryptic. It leaves unanswered all the really big questions. Biggest of these, and the hardest to answer, is the question about the internal situation on which present Soviet foreign policy is founded. This enigma may be broken down into more precisely formulated questions. What is Malenkov's personal position now? Could he speak for the Soviet Union in a conference with the British Prime Minister? Why is it that the new Soviet government seems much more vigorous in its economic policy than in the handling of its political affairs?

An aid to analysis, to be used only with due caution, may be found if Malenkov's position is related to that of a prime minister in a country, such as France, which lacks a stable parliamentary majority. Malenkov has no need to count heads in the Supreme Soviet when that docile body is convened; but his first concern must be to ensure for himself, inside and outside the Kremlin, the backing of a majority among the rival groups in the struggle for power that Stalin's death unleashed. This is no mere business of playing off against one another the army and the security police, the peasants and the urban proletariat. The Beria crisis revealed that the rivalries reach to the topmost pinnacles of power and penetrate the inmost sanctuaries of the Communist party itself. To remain on the throne for which Stalin anointed him, Malenkov has to win over or browbeat enough of his restive court to enable him to proceed ruthlessly against pretenders.

In this he has shown great skill. Although surrounded now by men like Khrushchev, Bulganin and Zhukov, whose hands have been strengthened—and their ambitions doubtless whetted—by the elimination of Stalin and Beria and the decline of rival stars, Malenkov has steered a course which, while involving some abrupt changes of direction, has assured a majority at all critical moments. But it seems not to be always the same majority. He may, for example, have downed Beria by branding him as a rash liberaliser, thus gaining the support of the Stalinist diehards; he may now be conciliating Beria's surviving supporters by adopting some of the purged man's policies—but in so doing he must again arouse the suspicions of the diehards. In these circumstances not even the most skilful of middle courses can be steered indefinitely.

Similar difficulties confront Malenkov and Molotov outside the Soviet frontiers. Mao Tse-tung has now made Peking a second Moscow (or fourth Rome); his price is higher than in Stalin's time, and he demands not only political support but also an almost limitless amount of economic aid. The European satellites, too,

are clamouring at least for the easing of the economic burdens laid on them by Moscow. Malenkov, from his uneasy throne, cannot silence these clamours as easily as Stalin did. How long will it be before these concessions to China and the satellites collide with the demands of the new programme of economic concessions to the masses at home?

It is precisely over these domestic economic concessions—again enlarged by Mikoyan, the trade minister, only this week—that the most interesting questions arise. Malenkov seems to have failed to muster a majority behind any new political programme, either at home or abroad; but his government has plunged boldly into a new economic policy in which, for the first time, the Soviet consumer has been given a place of consideration. This is a gamble that must disturb many of the Soviet leaders. The marshals may see in it a threat to a decade of massive military budgets; the diehards can hardly surrender without qualms the absolute priority hitherto given to heavy industry. How have the groups that blocked the "Beria" policy of liberalisation and of civil rights been persuaded to accept these concessions to consumer and peasant?

The agreement that has been reached here would seem to be an agreement under pressure from below. The long suppressed demand of the Soviet masses for better living conditions has forced itself to the surface. Stalin's death evidently encouraged their hopes; the talk of civil liberties earlier this year emboldened them

Education and Sanitation

Sanitary evils and strikes [according to Mr Cobden] are both owing to the want of intelligence amongst the people, after Parliament and the Executive Government have taken education into their consideration and adopted sundry measures with regard to it, off and on, for half a century past. Very soon after 1800 Joseph Lancaster began to draw attention to the subject; George III gave him some support; and ever since the question of education has more or less continually occupied the attention of the public and of Parliament. . . . The result of our vast appliances to promote education and intelligence are complete and conspicuous failures. Is it not time, therefore, to express doubt whether our system be adapted to the end proposed? . . . By inculcating observation, it might be supposed to sharpen the faculties, and so prepare men to learn and to profit by the events of the material world. But the general system of education for the multitude scarcely does this. It may almost be doubted whether it be not even positively injurious in this respect. It teaches them directly to disregard the world about them, and fixes their attention on something very different. At least our common school education does not teach that observation of external objects, and that exercise of the senses, which enables people to find out and obey the laws of health, and the laws which govern the production and distribution of wealth. We do not so much need new appliances to inculcate intelligence as to overhaul the old institutions long ago established for this purpose, and adapt them to modern times.

The Economist

October 29, 1853

to express themselves; Beria himself, according to his accusers, led the peasants to expect exactly the kind of concessions that are now being granted to them. The lid once lifted, it was obvious that it could not be screwed down as tightly as before without risk of explosion. So, while civil rights vanished from the propaganda curriculum, even the diehards felt they must accept Malenkov's proposal for an economic new deal for the common man. Agreement on a move in this direction does not, however, imply agreement on its scale. The diehards and soldiers might be expected to argue that Malenkov's new economic policy would be wise and safe only if it accompanied a move towards a genuine relaxation of international tensions, a relaxation real enough to permit a fair measure of disarmament and a slowing down of the race for industrial equality with the West.

Yet no such move is taking place. The gestures made during Malenkov's first hundred days of power have all but petered out. If the iciness of Stalin's international policies showed signs of breaking up in the

spring, winter is now setting in again. There may be no return to a hard frost; for those in Moscow who sponsored the wooing gestures earlier this year can point to the substantial results they obtained at small cost. But the results were not quite good enough; the East German rising in June and Dr Adenauer's electoral victory showed the limitations of the policy. On present form, the West can now expect nothing more than frigid flirtation—a selective courtship of the frailer of the western allies; and even that does not seem to be based on firm and agreed intentions in Moscow.

All the evidence to date suggests, indeed, that the much-advertised "collective leadership" in the Kremlin has still to agree on a comprehensive policy. Malenkov the manager is being permitted to put the Soviet economic house in order; but that is all. In the international sphere, Soviet tactics have become pragmatic, almost Fabian; there is a clear intention to avoid engagement with the adversary, to stay away from any conference table at which firm decisions would have to be taken—in one word, to stall.

Liberty and Lunacy

IT would be tempting to regard the new Royal Commission on the lunacy laws as the outcome of a case that has recently received much publicity; that of the fourteen-year-old girl under "care and protection" who was sent to a mental hospital. Perhaps the timing of the announcement had something to do with this case. But periodic Royal Commissions are proper to a field in which medical knowledge and public opinion can change rapidly. The time had come for a reconsideration of the laws, especially in view of the changes brought about by the national health service.

The new Royal Commission is to consider the law and administrative machinery relating both to mental illness and to mental deficiency. The distinction between the two, though clear enough in most cases, is sometimes blurred, and it may be a patient's age when he first seeks treatment that determines whether he is regarded as mentally ill or defective. Legally, however, the distinction is sharp. The legislation on mental illness has developed from the Lunacy Act of 1890. The first Act dealing with mental defect was not passed until 1913.

Yet the two sets of laws are inspired by the same principle. Their purpose is to protect the public from damage to life and property that might be inflicted by the insane and defectives; to ensure humane care and treatment for them; to protect their own property and to preserve as far as possible their civil rights. By the Act of 1890, the interests of certified patients, detained under a magistrate's order, were put under the protection of the Board of Control, and their property

rights were safeguarded by the Court of Protection and the Lord Chancellor and his officers.

These arrangements for protecting certified patients have stood the test of time and work well in practice. But they do not overcome the stigma of certification, with all that it implies of enforced detention. Perhaps this stigma might be less pronounced if there were a more general awareness of relatives' rights under section 72 of the Lunacy Act. The nearest relative can, at any time, order the discharge of a certified patient even against the advice of the hospital. The superintendent has power to issue a "barring certificate" only if he considers the patient dangerous or unfit to be at large, and this power is used very rarely.

Thus, even certified patients can leave a mental hospital if their relatives wish it. Nevertheless, certification imposes a sharp legal distinction—similar to the distinction, also carrying a stigma, that used to be imposed under the poor law on those entering institutions. People would always be reluctant to seek treatment if they had to be singled out in this way; and after 1890 reform was concentrated on enabling them to enter and leave mental hospitals of their own free will, without having to submit to the special legal process of certification. The culmination of these efforts was the Mental Treatment Act of 1930. Since then people have been able to apply for admission as voluntary patients by signing a form. On the same form, they undertake to give three days' notice of their intention if they wish to leave; but there is no power to bring them back when they simply walk out.

Voluntary admission to a mental hospital has proved great help to those suffering from the less serious—and more transient—forms of mental disorder. It has also done more than anything else to remove the stigma associated with mental hospitals and to improve their atmosphere. Freedom from restraint, varied occupations, clubs, canteens, shops and open—that is, unlocked—wards are now ordinary features of mental hospitals and would have been introduced in any case; but they appeared more quickly with the arrival of large numbers of voluntary patients, and all but the most disturbed of the certified patients share their benefits.

Over the whole of England and Wales 60 per cent of new cases admitted to mental hospitals—as distinct from the chronic cases who form the bulk of their population—are now voluntary patients; in some hospitals the proportion is as high as 90 per cent. But a few people object to signing a form of any sort. Since 1948, the Maudsley Hospital has been able to take such cases without any formality at all—without even informing the Board of Control—and early this year the same facility was introduced experimentally in certain hospitals in one of the metropolitan regions.

Voluntary patients have to be capable of showing their willingness to enter hospital. There are some patients, however, who are too ill to express their willingness or unwillingness. If they are likely to benefit from treatment, they can avoid being certified by being admitted to hospital "temporarily" and can be kept in hospital on this basis for as long as a year. This provision of the Mental Treatment Act has proved useful in, for instance, the temporary insanity that sometimes follows childbirth; and presumably the Royal Commission will consider whether it should be widened.

In London and a few other places, another device for avoiding certification is the observation ward of a general hospital. The official who has inherited the mental illness functions of the old poor law relieving officer—the "duly authorised officer"—can send urgent cases for observation lasting for up to seventeen days. In London last year, only 35 per cent of the patients admitted to observation wards had subsequently to be certified. Twenty-five per cent became voluntary patients in mental hospitals, and most of the remainder did not have to be admitted to a mental hospital at all. It is, therefore, unfortunate that since 1948 so many observation wards have been diverted to other uses. Because of the shortage of observation beds more people than need be have to be admitted direct to a mental hospital, and if they refuse to come as voluntary patients they may have to be certified.

One of the major questions facing the Royal Commission is whether certification could sometimes be avoided for mental defectives as it can be for the mentally ill. At present, a local health authority has

the duty of "ascertaining" the mental defectives in its area; ascertainment is based on social incompetence, on the defective's inability to look after himself or to be taught to do so. But anyone thus deemed a defective is not necessarily certified. Certification, by a magistrate's order, follows, as a rule, only if the defective's condition is bad enough to make his removal to an institution, or to the care of a guardian, desirable in his own interests. Once moved to more favourable surroundings and given skilled training, a defective is often able to live a fairly normal life and can be released on licence, and perhaps subsequently discharged from the order certifying him.

★

There is thus no provision for voluntary admission to an institution for mental defectives. Nor is there any provision allowing the relatives to discharge a mental defective from an institution against the superintendent's advice. Champions of civil liberties see in this an infringement of individual rights, and a strong case can certainly be made out for a parent's right to have a mentally defective child at home. On the other hand, poor home care is the usual reason for removing a defective to an institution, and it is the defective child who is most likely to be exploited and cruelly treated or neglected. To strike a fair balance between civil liberties, the protection of the public and the provision of care and treatment is much more difficult in cases of mental deficiency than of mental illness, partly because mental defect is a permanent disability and partly because parents' rights do not always coincide with the best interests of their defective children.

The Royal Commission will probably be mainly concerned with this issue of detention versus civil liberty. It will presumably also consider such matters as whether the divorce laws affect the release of mental hospital patients on trial, which interrupts the period of continuous institutional care laid down as grounds for divorce. It may also, according to the Prime Minister, consider the special problem of old people—one that is so urgent that it ought not to wait for the deliberations of a Royal Commission. Before 1948, the senile could be admitted for care to the general hospitals of local authorities or to the sick wards of their institutions, and certification was avoided. This sort of accommodation is now denied them, and they may have to be certified for no other reason than that mental hospitals can then be compelled to take them in. There are, it is true, a few hospitals where senile people over 70 who have never been in a mental hospital before can be admitted without certification. But there are not nearly enough of them. The provision of accommodation is outside the commission's terms of reference. But if it is able to suggest ways of relaxing the law so that the certification of old people is avoided more easily, it will do much towards solving a problem that will get ever bigger as the population ages.

Notes of the Week

Trieste in the Commons

THE first Labour speaker in Wednesday's debate on Trieste in the House of Commons, Mr Noel Baker, began his attack on the Government on the wrong foot. "They had made Trieste," he said, "a deadly weakness at the heart of Europe." That is surely not true. The weakness has been there for years but in recent months, as Mr Eden emphasised, it has been getting worse. To the Opposition's charge that a unilateral decision had been unwisely taken in favour of Italy and against Yugoslavia, Mr Nutting, the Under-Secretary for Foreign Affairs, made a most telling retort. It was not, he said, for the Opposition "who recommended that the whole of the territory should go to Italy" in 1948 to cavil at the present desire to implement the Three Power Declaration in respect of Zone A. The natural attraction of Marshal Tito's liberalised regime for Labour supporters should not blind them either to recent history or to the logic in the Italian case.

The Government, it is true, went wrong on October 8th in the manner and timing of the Anglo-American declaration. Yet Mr Eden's insistence that the proposed withdrawal of troops "will lead to a final solution" and Mr Nutting's replies to subsequent questions did not make clear the fact that both Signor Pella and Marshal Tito had been told that Italian claims on Zone B would not receive any further active support. If that assurance had been given publicly instead of privately it would have been a bitter pill for Rome, but it might have helped to avoid some of the present tension. If, in addition, the decision to withdraw had been announced less precipitately Marshal Tito would have had more time to consider his reaction to it.

Whatever the arguments about method, however, and about how far the present crisis is due to American pressure in favour of a "solution," two points of importance emerge from the House of Commons debate. The first is that the origins of this latest decision go back to Mr Eden's visit to Belgrade a year ago; from his conversations at that time he "concluded that a settlement along the zonal boundaries, although by no means ideal, was the only practicable one in all the circumstances." The second is that, if this was the Government's view after quiet reflection, then their recent decision to act on it now should not be reversed. Every effort should be made to bring about the proposed conference between the western powers and Italy and Yugoslavia, and there should meanwhile be a pause before anything else is done. But the ultimate aim must remain the withdrawal of troops from Zone A. To get agreement it may yet be necessary to set a date for the departure of the last units and so reduce the elements of bluff that may persist in the Italian and Yugoslav attitudes.

Mr Bevan's Decline

MR BEVAN's second attempt to oust Mr Morrison from the deputy leadership of the Parliamentary Labour Party has proved no more successful than the first. Last year Mr Morrison won by 194 votes to 82; this year by 181 to 76. So slight a reduction in Mr Morrison's very comfortable majority cannot give the challenger any consolation. Mr Morrison's loss of 13 votes almost certainly reflects some revulsion against his challenge to Mr Arthur Greenwood for the treasurership of the party. His last-minute withdrawal from that contest irritated some of his sponsors without appeasing those who criticised his nomination. Although Mr Greenwood's subsequent handling of the Margate conference reinforced the argument that he should retire from the National Executive, Mr Morrison was nevertheless expected to lose some votes in this week's ballot, and the small defection does not shake his position.

★

For Mr Bevan the result is doubly distressing. Not only has he lost six votes since last year—and a challenger can ill afford any decline, however slight—but the figures justify the warnings of some of his friends who regretted his decision to stand. Instead of his vote benefiting from the Morrison-Greenwood affair, Mr Bevan has merely alienated a few Labour MPs who supported him last year. The main argument for his opposing Mr Morrison this time rested on the belief that he would thereby consolidate his claim to the third position in the party. Yet this was by no means certain, even if his vote had been maintained. In the last year Mr Gaitskell has made considerable strides within the party, and his is a challenge Mr Bevan cannot ignore. Against Mr Morrison, Mr Bevan must always have time on his side; but if Mr Gaitskell emerges as a real force Mr Bevan will for the first time lose the advantage of age. Both men, of course, have plenty of time to jockey for position; but if a decline in Mr Morrison's standing were merely to be balanced by a rise in Mr Gaitskell's, other things being equal, Mr Bevan's last state would be worse than his first.

Not that the leadership of the party seems likely to be on offer yet awhile. There is no sign of Mr Attlee retiring and the hierarchies of political parties commonly change with the speed of a glacier. In recent weeks rumours of major changes within the Cabinet have continued; several Ministers, both old and young, are undoubtedly overdue for replacement. The only certain move, however, is the departure of Lord Cherwell. His resignation will deprive the Prime Minister of a treasured confidant and the Opposition of a favourite target, but in itself it is of little political moment.

Implications of Guiana

IF there was any chance of the situation in Guiana becoming a serious party issue in this country, it disappeared with the debate in the House of Commons last week, and the Lords, when they in turn debated the subject on Wednesday, naturally did not reopen the party battle. The responsible leaders of both parties are agreed in condemning the behaviour of the dismissed Guianese ministers, and the only difference of substance is over tactics. The Opposition continued to maintain that the Governor should at least have tried to set things right by using his reserved powers. But the Government had the better of the argument; reserved powers, however formidable on paper, were never designed for a situation such as developed in Guiana.

But if the measure of agreement in this country is welcome, the colony itself does not seem to be any happier. When the constitution was suspended the men who made this step necessary remained at liberty. That was a wise initial policy, but it certainly produced an anomalous situation. The leaders of the People's Progressive party took their chance to foster protest strikes on the sugar plantations. They have had enough success for the Governor last week to use his emergency powers to put five of them under preventive arrest for an indefinite period. This seems to be a necessity, though regrettable, but has anyone yet begun to consider how to keep the leaders of the discredited party out of power when progress towards constitutional liberty begins again?

The Government has rightly made it clear that its measures in Guiana carry no wider implications. For this reason, Dr Nkrumah's cleaning of his own house on the Gold Coast is doubly welcome. He has suspended two prominent members of his party on the grounds that they were engaged in pro-Communist activity. This action should both encourage colonial people everywhere to put more faith in the British Government's intentions and that Government itself to look favourably on the proposals that Dr Nkrumah put forward so courteously yet firmly for further constitutional advance on the Gold Coast. Mr Lyttelton has already said that he finds the broad principles acceptable.

Mikoyan—at Your Service

MALENKOV's plan for improving the consumer's lot is now taking a more concrete shape. He himself first gave the broad outlines and asserted that a "sharp rise" in the output of consumer goods is now both possible and necessary. The party secretary, Nikita Khrushchev, sketched a programme of incentives to get the necessary foodstuffs and raw materials. Now, Anastasi Mikoyan, deputy premier and minister of home trade, has filled many gaps by his speech on the need to improve distribution and step up supplies. Mikoyan has been the Soviet supreme salesman for many years and he again used some tricks of his trade, emphasising, for example, the notable rise in champagne consumption. He has also revealed many interesting figures of the planned production of Soviet light

industry, in which the emphasis is shifting towards the provision of comforts and semi-luxuries. Some of the targets sound very impressive by Soviet standards: by 1955 industry should produce annually 500,000 vacuum cleaners and 330,000 refrigerators; in 1956 it should supply 4.4 million wireless sets, 1 million television sets and 23 million clocks and watches.

These figures cannot be simply compared with western output. Whereas American or British sellers deal with a fairly saturated market, Mikoyan may expect a salesman's paradise. Nevertheless, such large quantities will put a great strain on Soviet industry. Much is being made of the fact that defence industries are to play a part in this drive, although it is well known that arms factories have always produced consumer goods as by-products. On the other hand, if the output of light industry is really to be stepped up above original plans, it will compete for scarce resources with heavy industry and defence.

This makes one wonder whether the Soviet leaders, without a change in the international situation, will be able to persist in these first steps "to catch up with the West" in the field of consumption. Mikoyan counters such doubts in an interesting passage, candid about the past and hopeful for the future:

Many sceptics, particularly among ill-wishers, will ask what we have found to astonish the world. Obviously we do not intend for the moment to astonish anybody by our output of washing machines, vacuum cleaners and refrigerators. We have only just organised it. Yet, the speed at which we are going to make up arrears may well astonish many a sceptic.

It will not be possible to check this prophecy, like Malenkov's earlier pledges, until two or three years have passed.

A Decade after Stalingrad

FIELD-MARSHAL PAULUS, commander of the German 6th Army at Stalingrad, has now been allowed to leave the Soviet Union and return to Eastern Germany. There is no reason to doubt this announcement from Soviet

UK WAGES AND PRICES.
INDEX NUMBERS JUNE 1947=100

sources, as the Russians have just allowed several thousand German prisoners to return, many of them SS officers and men. They have been permitted to go to the west if they wish, though most of them are bitterly anti-Russian and some have not recovered from worship of Hitler. It seems improbable that the Soviet authorities would be harder on Field-Marshal Paulus, who was so useful to them as founder of the Free Germany Committee in Russia during the war. If they keep him in the Soviet Zone, it may be assumed that they wish to prevent his being questioned by western intelligence officers, or that he still has a role to play in the Soviet German army.

★

Soviet policy towards the German prisoners and the East German forces has changed since Malenkov succeeded Stalin. Previously the repeated efforts of Germans, including Pastor Niemöller, to secure the release of the remaining prisoners met with no response. The thousands of high-ranking officers who had been sent to labour camps for 25 years in 1949, when the establishment of the Bonn government sealed the division of Germany, seemed likely to stay there unless plans for West German rearmament were abandoned. At the same time, it appeared certain that the Soviet Zone army, known as the "barrack-based police," would be openly proclaimed as the new national defence force at this year's celebration of Napoleon's defeat at Leipzig.

Malenkov appears to have realised that this policy hindered Communist appeals for German unity and helped advocates of the European army. In May, when concessions were first offered to the East Germans, the decision was taken to free some of the German prisoners in Russia, and mention of the People's Army dropped out of public speeches. The revolt of June 17th, though it evidently brought a great deal of uncertainty and some changes in Soviet policy in Germany, did not alter this decision. Many of the prisoners have returned, and, at the Leipzig anniversary this month, speakers extolled Russo-German comradeship-in-arms without proclaiming the People's Army. This probably means no more than that Malenkov follows better advice on psychological warfare than Stalin did. There is no reason to assume that Field-Marshal Paulus will not continue to work for re-establishment of a Russo-German alliance. This would, after all, be in keeping with the tradition of Stein's Prussia and Bismarck, not to mention the Reichswehr under General von Seeckt.

The Elysée Stakes

FOR the next six weeks even optimists need not expect any bold moves from the French government and parliament. Politicians will avoid sticking their necks out lest they spoil their own or their party's chances at the forthcoming presidential election. Already much lobbying is going on among more than 900 parliamentarians from both Chambers, who will gather in Versailles on December 17th to elect M. Auriol's successor. It is strange that so much is being made of the presidency, which has never

played in France the role it plays in the United States, and the powers of which were further limited by the postwar constitution. But the short and feeble lives of the governments of the Fourth Republic have strengthened the position of a man who can be certain of seven years in office. The safe seat in the Elysée has become a glittering prize.

Many candidates have entered the race and many more, still protesting at this stage, will probably be cajoled to the starting gate. M. Laniel, the right-wing independent prime minister; M. Bidault, the Christian Democratic (MRP) foreign secretary; and the Radical, M. Yvon Delbos, are currently tipped in Paris as the best bets for the first round. Another Radical, M. Queuille, is given a good chance in the second ballot. Should no absolute majority crystallise even then, such public figures as M. Herriot might appear on the stage. In only three previous presidential elections was the second ballot needed. It is feared, however, that more time may be needed to fill the seat left vacant by M. Auriol. French political alignments are very unstable and there is no clear division between Left and Right. Those, for example, who could strike a bargain on economic issues may well be divided on religious questions. To complicate matters even more, the attitude towards EDC—cutting across almost all party allegiances—has become a vital electoral issue.

Here may be an opportunity for the disciplined ranks of Communist electors. At last week's plenary meeting of the Party's Central Committee its secretary, M. Duclos, asserted that the Communists "are ready, in all the acts of parliamentary life, to contribute . . . to the defeat of promoters and defenders of a European army." Did his hints of co-operation imply that the Communist delegates will no longer stick to their own candidate throughout, but throw their votes after a time into the balance in favour of an anti-German successor to M. Auriol?

The Last Ration Book

THE Minister of Food's announcement on Wednesday that control of oils, fats and milk products will end in 1954 was not quite the last nail in the coffin of food rationing. No announcement has yet been made about bacon, but as it is already embarrassingly plentiful new ration books will hardly be issued for that. The date for the end of rationing is now likely to be the second week of May, when the present books expire—unless it withers away earlier. Condensed and dried milk will be largely handed back to the trade by the early spring, and the last control is to be dismantled by the autumn.

The two obstacles to abolishing the rationing of fats have seemed to be, first, the dollar cost of buying the extra supplies needed, and secondly, the expected rise in the price of butter. Both these difficulties have partly melted away. The Minister once said that the extra fats needed would cost £22 million, of which some £10 to £12 million would be in dollars. But the trade now estimates that the cost will not be more than £12 to £15 million, probably all of it in sterling—as a result, it is claimed, of skilful private buying. As for the butter price, the pessimists in the trade do not think that they will be able to sell butter at more

than about 4d. over the present price of 3s. 4d. per lb.; and even the most optimistic do not reckon on more than about 4s. 6d. A better quality margarine will then be on the market at perhaps 1s. 8d. or 1s. 10d., and experience in other countries where they eat margarine does not suggest that butter can hold its own at much more than double the price.

At such a low price British production of butter would be quite uneconomic. It will only add to the difficulty of freeing milk products—a problem far more intractable than that of decontrolling fats. People are drinking rather less milk than they did last year and still less than the year before. The surplus goes to the manufacturers of condensed and dried milk, whose products are bought, and stored, by the Ministry. But what will happen when the trade has to find its own market? The Government may have almost to give milk to the manufacturers if they are to sell so much to the public. The same applies to the manufacturers of butter and cheese. If the Government accepts the farmers' interpretations of its obligations, it is committed to a subsidy without limit and without end.

Milk Marketing

THE farmers' representatives are keeping up their pressure on the Government. This week it has been the turn of the vice-chairman of the Milk Marketing Board, Mr W. R. Trehane, to urge that the board should without further delay be given back its prewar powers over the production and distribution of milk. Unlike the other producers' boards, the Milk Marketing Board has continued in operation since 1940, but as agent for the Ministry of Food acting under its orders. It is therefore ready, as well as anxious, to resume its old role as soon as the Ministry stands down.

Before the war the board was uniquely successful in manipulating the milk market so as to get higher prices for producers. Its great powers and the use made of them, particularly in the fixing of minimum retail prices, were condemned then by successive committees of inquiry. It is hard to see what possible justification exists for resurrecting these powers when milk producers enjoy the protection of a government price guarantee.

The producers' case is that this guarantee may soon be adjusted so as to assure them of no more than a minimum return. They therefore want additional protection, and they claim that the Minister's authority, under the Marketing Act of 1940, to appoint a few members to the board and to override its decisions constitutes an adequate protection against abuse. They also point out, quite rightly, that action is needed quickly to improve the efficiency of milk production and to expand further the market for liquid milk.

But what action would the board take? Probably it would rely, as in the past, on educational work among both producers and consumers. Such work, however useful, is hardly adequate in a situation in which milk producers are insulated completely from the market. Small producers get an unjustified bonus; producers in remote areas (where transport costs are high) get almost the same price as those who are near their market; and few get an adequate incentive to improve the quality of their milk. Would a producers' board deal with such anachronisms? It would be far more likely to shelter behind a government subsidy; and in the field of distribution it would probably lead, as

the Williams report argued in 1948, to the creation of a rival distributors' monopoly. At the best, the Minister's powers of control would stop flagrant abuse. Government policy for milk should surely aim higher than a stalemate of that kind.

Clearing the Slums

IF Mr. Macmillan needs more evidence to justify a switch in housing policy, he will find it in this week's proceedings of the National Housing and Town Planning Council. The council is conducting an enquiry to which 605 of the 1,468 housing authorities in England and Wales have so far responded. They estimate that of the 5,500,000 houses in their areas over 20 per cent are seriously substandard. Of the substandard houses, 431,000 are thought to be not worth repairing, while 681,000 would justify the outlay if tackled now. By contrast, the slum clearance schemes that these authorities plan to start during the next five years will deal with only 63,000 houses. At this rate it would take several generations to eliminate the slums.

These figures have at least to be doubled to convey a rough picture of the national situation. They add force to Mr Macmillan's known intention to speed up greatly the rate of slum clearance. The two types of unfit houses—those which could be repaired and those which could not—will have to be tackled along different lines. Since the replacement of a million or so houses must on any basis take a considerable time, some even of the condemned houses should be made more habitable in the meantime by temporary repairs. This is a task for local authorities rather than private landlords, and Birmingham has shown the way by the advance acquisition of most of its unfit houses. Other authorities should be urged and assisted to follow this example.

Those substandard houses that could be properly repaired present a different problem. The council believes that the grants for improving old houses under the 1949 Housing Act, of which relatively little use has been made, are subject to too many conditions. This may be so, but the grants themselves, which cover up to 50 per cent of the cost of improvements, are quite generous enough. The real need is to amend the Rent Restriction Acts in order to give landlords an adequate incentive to execute repairs as well as to make improvements. The latest report of the Girdwood Committee, published this week, shows that it costs more than three times as much as it did before the war to keep houses in proper condition. The essential step is to stop hoping that this will be done on prewar rents; otherwise the list of houses that must be demolished will soon be much longer.

How to Build Faster

MOST housebuilders are slow, but some are much slower than others. A survey of productivity carried out by the Building Research Station and published* this week shows that 3-bedroomed council houses completed between

* "Productivity in House Building." HMSO. 1s. 9d.

January, 1949, and March, 1951, took an average of 2,705 man hours to build. Productivity is said to have improved since then, but it is still nearly 20 per cent lower than it was before the war. The average of 2,705 man hours, moreover, conceals far worse figures. On one contract included in this survey it was 4,645 man hours per house. This was more than three times the lowest figure.

An analysis of the circumstances producing these widely differing results gives valuable clues about the means of raising productivity. It was found, first, that specialisation pays. Where plastering, plumbing and painting were sub-contracted, the man hours expended were 15 to 20 per cent less than where the contractor employed his own men. Secondly, incentive schemes have a marked effect. Where men were set a target and given a bonus on reaching it, they took 15 to 20 per cent fewer hours over the job. Thirdly, the contractor's experience and personal supervision were important in small contracts. On the other hand, productivity, at least in bricklaying, increased with the size of the contract, especially if incentive payments replaced the personal supervision.

Much of this was known before—notably through the Girdwood Committee's reports on the cost of housebuilding—and some of the advice is hard to follow. It is not easy, for example, to issue large contracts when so many authorities are short of large sites. But other lessons of the survey are too obvious to be ignored. Incentive schemes are still operated on only about half the contracts for council houses, and only about a quarter use the "target bonus" that is shown to give such good results.

Italian or Nato Divisions?

Now that the hubbub and the hate around the North Adriatic have subsided a little it is, perhaps, possible to make heard one or two questions of some importance to the Atlantic alliance. It is said that crack Italian divisions were moved to cover the frontier with Yugoslavia and Zone A, presumably leaving other positions, agreed with Nato commanders as part of the European defence plan. The immediate and local question is whether Nato's agreement was asked before this movement was ordered. The more general question is whether any Nato government can move formations allocated to the Supreme Commander whenever it wishes, and whether Lord Ismay has been able to persuade his political masters to give any thought to this point of constitutional importance?

In their present mood the Italians will probably deem the question impertinent. Who would think of denying Italy's right to defend itself in its own way with its own troops? And who ever admitted that Nato had any claim to dispose of Italy's crack formations? One can imagine Communists and Fascists combining in the Chamber to roar out such questions. But these are precisely the rights that the European Defence Community would have, and it is on such rights that its ability to control the troops of France, Germany and other members would depend.

The problem can be put in other ways. Suppose, at a time of tension, that the American Sixth Fleet and part of the British Mediterranean Fleet moved under Nato

orders to the North Sea without previous consultation with the Italian cabinet; or suppose that a government in Nato took action involving the risk of war without considering the effect on Italy, one can imagine what would be thought and said in Rome. Here, in miniature, is the problem that might be presented to the western allies by a German government which believed that it could, in the last resort, use German divisions as it wished, against or without the advice of its allies. If Nato lets this incident pass without discussion or comment, member governments will have missed another opportunity to assert its authority and to make people believe that the European Defence Community could and would restrain an impatient Germany.

In Praise of Umpires

THE United Nations Mixed Armistice Commission which supervises the uneasy frontier in Palestine came well out of the debates in the Security Council this week. The major deduction to be drawn from the report of its truce supervisor, General Bennike, is that his small staff, though it lacks the strength to stop frontier incidents, is able to prevent them from bursting into war. Those who do this unspectacular and sometimes dangerous job deserve the thanks not only of many ordinarily peace-loving folk living near the frontier, but of the world in general.

General Bennike had been summoned to New York to report on two incidents—the Israel attack on Qibya and the flouting by Israelis of his order to stop digging a diversionary channel on the upper Jordan, at Lake Huleh. He placed the first in the two-way pattern of frontier violations that was described in last week's issue of *The Economist*. His evidence supports the view that Israeli offences are greater in scale than Arab, though less numerous. He deduced for a number of reasons that the force of two hundred and fifty to three hundred well-armed men that attacked Qibya was military. Amongst these he cited their competent use of 81 mm. mortars and other standard weapons of the Israel army, their expert use of military techniques, and the fact that a raid of such size and so equipped could not have escaped the notice of the Israel troops guarding the district through which it came.

On the mid-day train to Paris

She is cutting up a salad for the children's lunch—but in her thoughts she is leaving Victoria en route for Paris and the autumn collections. As a matter of fact, there is a connection; her table is surfaced with WARERITE Plastics—the material used by British Railways in standard compartments, toilets, dining and sleeping cars. For making brighter living and lighter work in home, factory, office and school there is nothing to touch WARERITE. It is widely fitted to new furniture and can be used to resurface old furniture to make brighter homes everywhere. The growing popularity of WARERITE is just one of the many successes of the Bakelite organisation, whose pioneering efforts have been mainly responsible for making plastics a part of daily life.

Please write for booklet describing BAKELITE products.

PROGRESS IN ELECTRONICS

ONE of the earliest electronic devices to strike the popular imagination was the photo-electric cell or "electric eye". The public became familiar with it as a gadget for mysteriously opening doors or sounding burglar alarms.

The modern emissive photocell continues to perform these tasks, but in addition it is employed in a wide variety of control and measuring equipments, which are already indispensable to industry.

The cell contains a photo-sensitive cathode which emits electrons when light radiations fall upon it. This emission, or current, corresponds in strength to variations in the light intensity, even when minute, and when the current is amplified it can be used to

operate measuring, indicating or control instruments. With suitable photo-cathode materials and, if necessary, with the aid of filters, these photocells can also be made sensitive to colour.

Among the many applications of photocells are high-speed counting, batching and sorting of mass-produced articles; inspecting for variations in size or colour; control of temperature, smoke, liquid, position, printing register, or photographic exposure; safety devices in machines and furnaces; and sound-heads in modern cinema projection equipment.

Mullard photocells are used extensively for all these purposes, and research is constantly opening up new fields of application.

THE ZEPHYR ZODIAC—new luxury version of the famous model that won the 1953 Monte Carlo Rally. The Zephyr Zodiac is for connoisseurs of motoring; it is a leader amongst cars of today, built to deserve the instant admiration it will always command.

LISBON RALLY 1953 Mrs. N. Mitchell won Coupe des Dames for Gt. Britain driving a ZEPHYR-6

Meantime the Jordan government and Major-General Glubb, who commands its Arab Legion, are being accused by Jordanians of failing to protect them, and are having to withstand public pressure to carry out retaliatory raids.

Regarding Lake Huleh, the Security Council learned that General Bennike's order has now been obeyed, though the pressure which brought about the change in Israeli behaviour was not the force of his authority but a screw applied by the United States government. This withheld certain financial aid to Israel pending compliance with his injunction; it is now resuming the normal flow of its gifts.

All told, the events of the week point to two conclusions of importance. They afford yet another proof that nothing short of unchallengeable pressure from outside settles any issue in Palestine; they also suggest that if a Mixed Armistice Commission can, in so inflammatory an atmosphere, do the creditable work that this one has so far done, it surely offers a precedent for similar bodies on other frontiers—tomorrow, perhaps, at Trieste or in Korea and, later, also in Germany.

Prisoners' Base in Korea

PREMATURE jubilation has been caused by the latest turn of events in the Korean prisoner camps. Three things have happened. Out of nine hundred Chinese subjected to "explanations," only a handful chose to return to Communist rule. Then the North Koreans who were next on the list to enter the explainers' tents staged a sit-down strike. At this, the Communist explainers flatly refused to go on working through the Chinese prisoners while the North Koreans were pacified, and thus brought the explanations to a halt. The first of these three events is certainly satisfactory, for it shows that the United Nations Command was justified in refusing to hand all prisoners over unconditionally; in the past few days, Peking's propagandists have tied themselves into ludicrous knots in their efforts to explain why the Chinese prisoners chose to return to the compounds where, according to the Communist press, their life is one of torture. But it is shortsighted to rejoice over the threatened paralysis of the whole process of "explanations," tedious and bizarre though it is. Only for Mr Rhee—and perhaps for Chiang Kai-shek—is there any real cause for joy.

From the United Nations' viewpoint, the most satisfactory outcome would be for all prisoners to present themselves for "explanations" and make their choice freely. It is now clear, even to the Communists, that only a fraction of them will opt for Peking and Pyongyang, and that, if all are given an individual choice, a great moral victory will accrue to the United Nations. The new obstructive tactics of the explainers—ably supported as regards walking out, by the Poles and Czechs, whose "neutral" badges are now irredeemably tarnished—no doubt reflect their fear of this. If the prisoners refuse to come out of their compounds, the Communist press can say that this is due to terrorism by "agents," that is to say, by anti-Communists among the prisoners; but if they come out and declare their choice, the whole façade of propaganda must collapse.

The best the Communists can now hope for, therefore, is deadlock. This they may well achieve, for common humanity prevents the Indian guards from storming the

compounds just as it forbids the United Nations to accept a further extension of the prisoners' long captivity. Once again, it seems, the futile obduracy that marks the Korean character will defeat the very nations that have bled for Korea's sake.

Strike Futility

THE strike of oil tanker drivers in London did not survive the highly successful distribution of oil and petrol by troops. The 3,000 strikers had to watch their jobs taken over by twice as many servicemen. Petrol flowed again so that even private cars were back on the road. Only a handful of workers in other industries came out in support of a strike that was not backed by the union.

It seems probable that this fact, more than any reasoned argument, caused the collapse of the strike. But reasoned argument certainly played a part, and in this the oil companies' role seems to have been more important than that of the union. It would not be fair to say, as some critics have done, that the union did not keep its members informed of its negotiations with the employers over the very matters that caused the strike. Apart from the usual communications from headquarters to the branches, there was a mass meeting the day before the strike, at which union leaders explained what was being done. But all this seems to have made less impression than a letter sent by Shell-Mex and BP Ltd. to all its workers who were on strike. A public statement from the company also explained how little ground there was for the strikers' fears. Any "mates" who were removed from their purely ornamental position beside the lorry drivers would be found other work within the companies. The drivers who would lose their old jobs when the smaller loads were distributed through agents could take work with the agents, at not less than the union rate; if they preferred they could be found other work with the companies, and in any case they could return to the companies at the end of a year. As for the trouble over non-union labour, the companies refused to operate a closed shop, but they did recommend their workers to join the Transport and General Workers' Union.

It is extraordinary that arrangements so conciliatory should have led to a strike. Was it because so few men attended the union meetings at which these matters were discussed? Was it because the men did not take in the jargon from which trade union speakers are by no means exempt? What part did deliberate agitators play? The strikers returned to work on the condition that negotiations began at once. If this was not pure face-saving, the disturbing implication is that they still do not understand that the strike caused great expense and inconvenience for no purpose at all.

The Artist's Patron

THE Arts Council is sometimes accused of exercising too great a domination over the arts in Britain. An artist's prospects are poor, it is claimed, if he cannot win the approval of a small cabal in St. James's Square.

The council in effect sets out to answer this charge in its annual report, published last week. As private patrons become scarcer every year, both in numbers and in the extent of their support, collective patronage must take their place if the arts are to survive. In Britain there is comparatively little danger that this will lead to an *art officiel* such as usually emerges when the task is entrusted to a Ministry of Fine Arts. The new patrons are many and diverse, ranging from firms and local authorities to voluntary bodies like the Contemporary Art Society and the National Art Collections Fund. In distributing state aid the Arts Council has only an indirect influence on artistic policy, at least in music and drama. It decides which orchestras and theatres it will help, but does not tell them what to play or whom to employ. Its role here is comparable to that of the University Grants Committee, which distributes funds without interfering with the universities' autonomy. With a few exceptions the council has ceased to provide plays and concerts itself, as it used to do in its early days. But it does still mount its own exhibitions of pictures, and it is in this field that its policy has been criticised.

In answer, the Arts Council can point to an impressive list of exhibitions of great variety and excellence. The report points out that its art panel is "exceptionally large in number and diverse in its preferences," and that it rings the changes by asking different individuals to select for different exhibitions. It is perhaps inevitable that a few council members should exercise more influence than the rest, and that they should in consequence have a power in the world of art that extends far beyond the council projects with which they are immediately concerned. But an alternative is hard to see, and there is no doubt that both artists and lovers of art would be worse off without the council's work.

Sterility on Strasbourg

THE House of Commons is seldom as sterile as it showed itself in last week's debate on the Council of Europe. The council itself had provided red meat for discussion in the form of the comprehensive resolution on general policy which it adopted at the end of September by 76 votes to 7. Moreover, several members of Parliament complained last week that it was rare for them to have an opportunity of discussing the Council's affairs. Yet, when this precious opportunity came their way, a thin House was entertained for the most part by familiar pipers repeating traditional airs.

Members disputed which of their parties had been the true founder of the Council of Europe (it seemed tacitly agreed that no Continental could make any such claim); whether the council had been given too much to do, or too little; whether it had done great things, or nothing at all; whether the Committee of Ministers, or the Assembly, was to blame for everything that went wrong; and whether the council was already dying—in which context members eagerly disputed which of the (British) parties was the murderer. As to this last question, nothing was said to efface the impression that successive British Governments have been feeding the struggling flame at Strasbourg with damp wood.

However, Mr Robens, perhaps moved by the approach of the Fifth of November, tossed in some bangers apparently left over from the display he had previously staged at Strasbourg itself. There, his set piece had been a proposal to defer the European Defence Community for five years in the hope that it need never be formed. But last week he assured the Commons that he had been "most active in doing all I could to help EDC." He went on to argue that EDC, as envisaged at present, must hasten the death of the already moribund Council of Europe, but that both the council and British leadership in Europe could be saved if Britain entered the coal-steel community and linked itself more closely with the European army, perhaps to the extent of a token contribution of forces. Mr Robens declared himself to be representing the Opposition; but something in his manner apparently made the House hesitate to take at its face value so startling a change in party policy.

Indo-China and the French Union

RECENT events in Indo-China have had at least one encouraging result in Paris: they appear to have led to a slight shift in thinking about the nature of the French Union. The assumption that leadership and the control of foreign policy must remain indefinitely in French hands is beginning to yield ground to something like the concept of the Commonwealth—untranslatable though the word is. This shift has been given impetus by the negotiations between Paris and the three Associated States, designed to implement the French declaration of last July that they would be given complete independence "within the French Union."

In the case of Laos and Cambodia agreement has been reached after many ups and downs on the terms of fresh treaties, which appear to go further in conciliating local nationalist opinion than anything previously envisaged in France's relations with other members of the Union. In the case of Vietnam, by far the largest of the three states and the one where the main fighting has been, no agreement has been reached. The Vietnamese National Congress caused something of a sensation ten days ago by refusing, in so many words, to appoint delegates for any further negotiations unless Paris changed its traditional view of the meaning of the French Union. The matter has since been turned over to Bao Dai personally and there it rests for the moment.

This new and direct clash between the attitude of the French and that of their allies in Indo-China, the anti-Communist nationalists, is playing its part in both crystallising and sobering public opinion in France. While the Vietnamese action shocked people into asking themselves once again what France is really fighting for, the debate in the Assembly this week has spread understanding of the practical obstacles to withdrawal, however ardently and unanimously it is now coming to be desired. If France's western allies are to help effectively in sustaining what to them is a vital struggle against Communism in Indo-China, they must understand the rather different moods and motives now dominant in Paris. On the whole, the developments of the past two weeks may be regarded as a move in the least unfavourable direction.

Letters to the Editor

Film Agreement as Before

SIR—An article that appears in *The Economist* of October 3, 1953, refers to dollars the film companies have been able to transfer ("wriggle") through "the twenty-six different loopholes that they have discovered in the original agreement." But these are not loopholes at all. The twenty-six uses are the agreed purposes, laid down in the original agreement, for which sterling that cannot be transferred may be used. They give rise to no transfer of dollars whatever so far as Great Britain is concerned, wriggled or straight.

Later, the article says that the companies' "frozen balances must be accumulating at the rate of about \$20 million a year." In fact, there is no accumulation whatever. All sterling that cannot be remitted in dollars under the Agreement is and must be consumed as sterling, via the twenty-six uses provided for that purpose. In fact, the agreement is built up on the principle that all untransferable funds will be consumed as sterling to avoid any possibility of accumulation. But should untransferable sterling accumulate briefly, it would not constitute a dollar obligation, hence could not be said to accumulate at the rate of so many dollars a year.—Yours faithfully,

F. W. ALLPORT

Adriatic Solomon

SIR—Your article of October 17th does not mention the third and unconsidered claimant to Trieste—Austria. Neither of the two claimants, Italy and Yugoslavia, is in need of Trieste. But the port is the natural outlet to the Adriatic and Mediterranean of the Austro-Hungarian-Croat hinterland. The cutting off of Austria and Hungary from Trieste was one of the major economic disasters of the 1919 Treaties. Moreover, there is a large Austrian population, and the modern city and port is largely the creation of Habsburg rule in the nineteenth century. The granting of that strip of territory, formally part of Italy from 1920-45, and of Austria prior to that time, and now included in Yugoslavia, to the present Austrian State would enable that unfortunate country and the Danubian hinterland to the north and the north-east to regain its feet. Such a new frontier should run from north of Fiume along the former Italian frontier and at a point of latitude parallel with Ljubljana go north to include the Gorizia-Klagenfurt railway.

Such a sacrifice on the part of Italy would make not only for world peace but for a pact of friendship between her and Austria. To Yugoslavia the loss of such territory cannot be said to affect her, for her ownership has been of too short a duration, and she has never possessed either the town or port of Trieste. The final factor which has been forgotten is that the Austrians themselves are bound to recuperate sooner or later from the disasters and injustices of both 1919 and 1945 and with the help of the Croat-Slovene population of Yugoslavia put an end to the absurd situation.—Yours faithfully,

London, N.W.3

A. R. U. ENFIELD

Commonwealth Confers

SIR—In your issue of October 3rd, page 46, you question the necessity for the Commonwealth Finance Ministers' journey to Sydney in January. As you acknowledge that occasional meetings whose timing is not prompted by *ad hoc* necessity are desirable, presumably the doubt is about the choice of place for the meeting. It would certainly be undesirable to establish any precedent that conferences should be held in each overseas capital in turn. But an occasional meeting in one of these should serve to emphasise (to countries both inside and outside the Commonwealth) that the independent countries of the Commonwealth share in these deliberations as political equals.

There are sound economic reasons why Australia should be chosen as the first overseas venue for a Finance Ministers' Conference. Apart from the fact that the size of Australia's total trade is second only to that of the United Kingdom among sterling countries, the volatility of the Australian balance of payments over the past three years has shown how economic events in Australia are among the most potent factors influencing both the level of the central reserves and also the extent to which the resources of the sterling countries are diverted from the task of closing the gap in the area's balance of payments with the rest of the world. Moreover, the vulnerability of Australia to any American recession, to the development of synthetics and to adverse climatic conditions means that Australia is as exposed as any sterling country to the sort of problems that will have to be faced in the coming years. The holding of such a conference on Australian soil might well help to bring home to Australian opinion the extent to which the strength of sterling may well depend upon the policies of Aus-

tralian governments. And, at the same time, surely nothing but good can come from giving the policymakers of other sterling countries the opportunity to learn something at first hand of Australia's problems and of her capacity to contribute to solving those of the whole sterling area.

At any rate, there is no reason to believe that there is little the sterling countries can consult about until American policy crystallises. Their common problems are constantly changing in point of detail, and there must surely be plenty of room to improve their plans to meet probable future contingencies—such as an American recession.—Yours faithfully,

J. O. N. PERKINS

Australian National University,
Canberra

Australia's Incentive Budget

SIR—Mr Newton, in his letter to you published on October 17th, is certainly right in claiming that the Australian government did more than "practically nothing" in trying to curb Australia's recent inflation. But he is also certainly wrong in claiming, as he does implicitly, that what the government did was, in the immortal phrase of Sellars and Yeatman, "a good thing."

It is true, of course, that the wool-tax provided in the 1950-51 budget siphoned off some 20 per cent from the incomes of wool-growers as a prepayment of tax. This additional revenue was then used to balance that budget. In other words, something of the order of £A200 million was transferred from the section of the community which would have, above any other, saved a large proportion of their suddenly and phenomenally increased incomes, to the government, which spent every penny of it. Mr Newton is quite right—this is by no means "practically nothing." But it is exactly the *wrong* thing.

In economic terms, it is fatuous to style such a tax as disinflationary. In political terms, it is equal nonsense to claim that it was "courageous." Never in a thousand years would the wool-growers vote for anyone not a member of the Treasurer's own Country Party. Mr Newton would then, no doubt, assert that the wool-growers showed their annoyance with Sir Arthur Fadden by voting against a proposal for a reserve price. But surely the wool-growers have also voted against every *other* such scheme ever put to them. Mr Newton is right, but for the wrong reasons.—Yours faithfully,

ROGER G. OPIE

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Republican Harvest

Washington, D.C.

ACROSS the whole of the continental United States a dry hot summer has merged into Indian summer and almost trespassed upon the span of winter without any perceptible break. Week after week of cloudless, rainless Mediterranean skies have created not only a tinderbox of the nation's woods and forests, but also the materials for political and economic bonfires which needed only a spark to set them alight.

Many parts of the country have this year experienced the worst drought since the disastrous summer of 1936. And, like 1936, this year has been only the culmination of four dry years which have destroyed vast acreages of pasture in Texas and the south-west, according to the cyclical pattern by which Providence at regular intervals chastens "God's own country." The difference between 1936 and 1953, however, is that the distress of the cattle ranchers and farmers takes place, not against a background of general depression and "equal misery," but in an economy in which industry and commerce are, if nervous, still flourishing.

The United States is a country which is used to the constant recurrence of the plagues of Egypt: flood, fire and drought on a large scale. What is unbearable to the American farmer, and accounts for much of the abuse which has been heaped upon one of the best Secretaries of Agriculture in recent years, Mr Ezra Benson, is that the eccentricities of nature should, as it were, be aided and abetted by economic forces from which the rest of the community is so far immune.

Net farm income in the United States has been declining for the past two years. In 1951 it was \$16 billion; for this year it is estimated at \$12.5 billion. No other section of the community has suffered so sharp a loss. This decline is not due to any reduction in the domestic demand for foodstuffs or textile fibres, which has been rising steadily

for the past two years. It arises from the conjunction of two forces, neither of which could have been effectively controlled by the Republicans in the period since they have been in office.

The first has been the steady fall in the inflated and quite unnatural demand for American agricultural exports which the world shortages of the postwar period created—a fall which would have been apparent four years ago but for the sudden upsurge in demand created by the Korean war. In 1952 the value of American agricultural exports was \$3.4 billion, or \$600 million lower than it had been the previous year. This has put heavy pressure on prices. Despite the government's support machinery, through

which the prices of six principal crops are supported at 90 per cent of parity—a formula which relates the price a farmer gets for his crops to his costs in order to arrive at a theoretical fair return—in the first nine months of 1953 agricultural prices have been 10 per cent lower than they were last year.

The other factor has been the increase in the volume of marketing, particularly of livestock, which is a direct result of the drought. Farmers and ranchers unable to fatten their stock or to spread their sales over a period of months have been jamming the stockyards of Chicago and Kansas City, with unhappy effects upon the prices they receive. Last week the smouldering fire of resentment among the farmers and politicians with agricultural constituents broke into flame. The victory of a Democrat in a district of Wisconsin, where none had ever been elected before, had already shown that in one area at least the support of the farmers, which had been a major factor in the Republican victory, had been shaken by fears that the Administration is planning, when the present price support machinery expires next year, to expose them to the rigours of the market place.

These fears were increased by the President's speech in

Kansas City two days after the by-election. Mr Eisenhower spoke of advisory commissions, of conversations between the Department of Agriculture and farm groups, of Congressional hearings "at the grass roots," of studies and recommendations, in short of the mechanics by which a farm policy might be devised, with no hint of what that policy would be. The farmers remembered the President's famous speech at Kasson, Minnesota, during last year's election campaign, in which he had said that to farmers "a fair, full share of the national income should be not merely 90 per cent of parity (the existing law) but 100 per cent of parity"; and in which he had promised "a positive, aggressive, farmer-run programme." Comparing promise with performance, they began to wonder whether their support for Mr Eisenhower had been in their best interests.

The politicians were quick to catch this sense of alarm. Last week Senator Milton Young, Republican, of North Dakota, demanded the resignation of Mr Benson and Senator Russell of Georgia and several other Democrats, not to be outdone, swelled the chorus. Last Friday a "caravan" of furious cattlemen, reminiscent of the "bonus marchers" of the depression, began to converge on Washington. And finally last Sunday, October 25th, the Gallup poll of public opinion disproved the comfortable contention of the White House that none of this furore affected the President's personal popularity, by showing that support for him throughout the country had dropped by 10 per cent, largely as a result of disillusionment among farm and independent voters.

★

To the Republican politicians Mr Benson is obviously the Administration's greatest liability. In principle he may be right to criticise a price support system that results in the piling up of commodity surpluses which the rest of the world cannot afford to buy or no longer needs; and to argue that the farmer, as much as the industrialist, should adjust his plans to the requirements of a changing world market. But the politicians fear he is pursuing Republican principles at the risk of losing the Republicans next year's Congressional elections, and precipitating the kind of "green revolution" in 1956 which defeated Mr Dewey in 1948. Next year eight Republican Senators are up for election in states where the agricultural community accounts for half or more of the voting population. Ten Republican Representatives are up for re-election in predominantly agricultural districts which were won by majorities of 5 per cent or less last year. The defeat of these eighteen would be more than enough to ensure Democratic control of Congress in 1955 and 1956.

It seems equally certain that President Eisenhower is not going to bow before the storm which is at present breaking over Mr Benson's head. The very violence of the attack against Mr Benson would make it virtually impossible for any President to dismiss him at this moment, let alone one as loyal to his staff as Mr Eisenhower. However, the President now seems to realise that something more than promises of a sound future policy must be forthcoming, particularly to make good the ravages of the drought.

The probability is that the Republicans will eventually emerge with a farm programme more "socialist" than any a Democratic Administration would dare to recommend, although Mr Benson and the President have so far resisted the pressure to extend support to cattle prices. The danger is that the faults of recent American agricul-

tural policy will be visited upon the rest of the free world. There will be a standing temptation to the next Congress to remove one of the causes of the fall in agricultural prices by stimulating exports through a conversion of the foreign aid programme into a dumping programme. Economy is necessary; so are high farm price supports (in which, during the twelve months to June, 1953, the government invested \$2.8 billion, nearly three times the amount tied up in the previous twelve months). Consequently, it seems a very simple remedy to make all grants of foreign economic assistance conditional upon the purchase of surplus commodities, thus killing two birds with one stone, whatever the effect on the health of world trade.

Services Not Servants

FROM A SPECIAL CORRESPONDENT

AMERICANS have become almost unbearably ingenious in devising ways of serving each other. The main reason, of course, is the high cost of individual, particularly domestic, service. Another is the rigours and vagaries of the climate and still another the perpetual movement from class to class. The services provided, some of which are already beginning to cross the Atlantic, are most successful when they can solve problems in more than one of these areas.

The winters make central heating absolutely necessary and the shortage of staff has forced it to look after itself. Electric power and natural gas need little servicing, but oil, which is for reasons of cost the most usual fuel, has to be delivered. The tank which holds it is therefore outside the building and the spout into which the oil is poured can be reached without access to the premises. The tank is filled and a slip of paper pushed through the letter box. This is usually stamped with a record of how many gallons the lorry contained before and after delivery. Nobody need be at home when this happens. The firms that sell heating oil keep a temperature chart so that they can tell when each customer needs more oil. There is also a gauge on the house tank, but this is seldom looked at except in spells of extreme or sudden cold.

Inside the house, the boiler operates automatically, the temperature being controlled by a thermostat in a draught-free place. This can be adjusted at will and one type includes an electric clock by which it can be set at different temperatures for night and day. A house can be shut up for weeks in winter without risk of burst pipes. Most of the big oil companies also offer a service guarantee for an annual fee and will send a plumber day or night; they clean the boiler during the summer and replace minor parts without cost. They even send out reminders asking for the boiler to be turned on for an hour or two to make sure all is well before the cold weather sets in. This only entails turning up the thermostat for a few minutes—about the only time in the year when such an effort is necessary.

The heat of American summers has made the use of ice essential and the ownership of a refrigerator universal. Ice can be bought from an icelhouse at all hours, even in the depths of the country, by putting a coin in a slot which opens a trap door from which either a large block of ice or a bag of ice-cubes clatters out. Wine merchants and grocers

keep stocks of beer on ice and soft drink manufacturers have dotted the country with their special refrigerators which dispense an iced bottle of their wares at the drop of a coin. Air conditioning is widely used and individual "room coolers" can be hired by the month. The climate is very friendly to moths, so storage companies provide a service of trunks which are hired by the year. These have little holes in their sides and are fumigated as soon as they reach the warehouse and then stored in a cool place. They are delivered to the house in spring and autumn for the exchange of clothing and blankets.

The shortage of domestic help has always encouraged cafeteria and counter eating and the sale of packaged cooked food ready to take home. But now eating habits have apparently been considerably affected by television. Some restaurants, in order not to lose customers to the new medium, are now providing packaged "Television" meals. Others are offering home delivery, within a limited area, at 25 per cent less than menu prices. Catering firms are prosperous, as only the rich can afford to keep enough servants to give big parties.

Coin-in-the-slot machines now provide not only hot and iced drinks from the same machine, but also hot and cold sandwiches. Railway stations have machines that dispense toys, toothpaste, razor blades, combs and handkerchiefs, and enterprising drug stores can now have a machine that provides a whiff of oxygen at a cost of 25 cents to cure a hangover or add to the general sense of well-being.

★

Although large commercial laundries exist and even sheets can be washed in the machines found in many homes and the basements of blocks of flats, people who live alone and work all day often find it easier to hire their household linen by the week. A supply of clean linen is delivered and their dirty linen removed while they are out by "bonded drivers"—drivers who are insured against dishonesty. Also hired by the week, rather than washed at home, are nappies. One of the first duties after confirmation of pregnancy is calling up one of these firms and booking their services from the expected date. Some firms sell the customer the nappies and guarantee the return of the same ones each time. Deliveries are made once or twice a week depending on the district and charges vary from \$1.40 a week for the use of 20 to \$3.00 for 170. A metal container is provided with waterproof internal bags and these bags can often be seen waiting to be collected from front doorsteps.

Mothers of young babies are also tempted by various firms who prepare formulas according to the doctor's prescription. Some of these specialise in sour milk formulas, while others pack all the child's food for a journey. The food for the infant is delivered, including bottles, sterilised water and orange juice, in a refrigerated container which can be returned and credited.

Gardeners find that most nurseries will plant and guarantee the trees they sell for a year for an additional cost of about 20 per cent. They will also sod or sow a lawn on the same principle or contract to spray a garden at the necessary intervals. As there are innumerable pests, fungi and plant diseases in the United States, this service is fairly widely used, especially in towns, or where the amount of equipment needed for small areas would be too costly.

The upward movement from class to class has given birth, not only to the prosperous lecturer and his even more

prosperous agent, but also to the charm schools, to education for "leadership" and services for public speakers. For those with such ambitions there is a service of "Speech Sparkers," with helpful suggestions on fifty different topics varying from "The American Way of Life," and "Capitalism (Free Enterprise)" to "God and Man" and "Worry."

So, while the ambitious housewife is busy attending a class or a lecture in order to help or push her husband up the next rung of the social and economic ladder, and he is desperately learning how to behave when he gets there, the personal services are making a nice profit out of washing the nappies, heating or cooling the house or cooking the food. It sounds like "All this and heaven too." But there are still no heated towel rails in those shiny bathrooms.

American Notes

Firepower for Manpower?

MR JOHN FOSTER DULLES has allayed some of the alarm caused in Europe when the Secretary of Defence suggested that new atomic weapons, such as the cannon recently sent to Germany, might soon lessen the need to keep American soldiers overseas. The dispersal of the Joint Chiefs of Staff to the four corners of the earth bears out the belief that no radical changes are contemplated in the military budget for the year which begins in next July and which must be submitted to Congress in January. But there is fairly general agreement that before the next budget is drawn up the Joint Chiefs and the National Security Council will consider whether defence costs can safely be brought down by the substitution of atomic firepower and foreign troops for American manpower and conventional weapons.

The National Planning Association has just challenged the Administration's assumption that defence must be cheaper; it declares that the American economy can take even larger defence spending in its stride if necessary. But the Administration is anxious to redeem its campaign pledges of lower spending and convinced that the burden of defending the free world must be lightened if the American taxpayer is to be asked—as it believes he must—to carry it for years to come. The Joint Chiefs evidently believe that there are only two ways of making real economies: by bringing home some of the American divisions overseas, which are at the very least three times as expensive to maintain as those of any other nation, and by putting more reliance on atomic weapons. In terms of firepower they are infinitely cheaper than the conventional ones which are being manufactured side by side with them, and there would be an additional, and very welcome, saving in manpower.

No withdrawal of American troops is contemplated until German and Japanese divisions are ready to take their places, and even then, according to the "plate-glass window" theory, a thin, indeed transparent, cover of

American troops would remain to ensure that any aggression involved the United States at once. The proposal that all foreign aid should be lodged in the Defence Department, which is a permanent agency and well fortified against Congressional attacks, is another sign that both military and "budgetary" aid are likely to be put on a long-term and flexible basis, and that no return to isolation is being prepared.

It will be up to the Joint Chiefs to decide whether the moment has come when it is safe for America to put all its military eggs in one atomic basket; judging from General Ridgway's reference to "gambling with untested weapons," it may not be an easy decision to reach, even if the administration is faithful to its pledge that no attempt will be made to buy security at bargain rates. But before the decision can be made, the President and the National Security Council will have to wrestle with some knotty problems. The Joint Chiefs will want to know whether there is any likelihood of all atomic weapons being outlawed—something which might, in the future, leave America defenceless; and whether, in any new Korea, the Administration would continue the policy of forgoing the use of atomic devices in order to localise the conflict.

Above the Battle

MR EISENHOWER'S statement that he would not take an active part in next year's Congressional elections has shocked many hard-pressed Republican candidates who hoped to return to Washington on the coat-tails of their popular President. There is some dispute about how effectively a President can intervene in local elections when he is not running himself, but no question that it will be hard to reconcile the politicians to the spectacle of his sitting firmly on his coat-tails when their need is so great. Mr Hall, the anguished chairman of the Republican National Committee, has already sought a promise that the President will at least make some general speeches from Washington, but this is hardly enough to reassure anxious candidates.

The President's view that his office is above partisan politics is in accord with a tendency which several commentators have noticed: that he prefers to reign, with an active leader in Congress, rather than govern himself. It is a radically different view of the Presidency from that which sent Mr Truman and Mr Roosevelt out into the highways and byways to secure Congresses which would support their policies. It may prove, as the critics contend, too lofty and impractical for the President to sustain, even if, as they suspect, it means he does not intend to run for a second term.

But those very critics, it is interesting to remember, criticised the President even more bitterly during the campaign, for the support his political advisers persuaded him to give to such candidates as Senator Jenner and Senator McCarthy. This was justified as a compromise necessary to secure a Republican Congress. But in practice the President has found that the very candidates he swallowed his principles to assist have put the worst obstacles in his way. Mr Roosevelt relied on the corrupt city machines, but they did not try to dictate his policies.

Only a few days before the President spoke, the *Washington Post* took him to task for dissipating his enormous

strength by trying to reconcile the diverse elements within his own party rather than formulating a broad programme which would appeal to moderates within both parties. The President was making exactly this point when he argued that his responsibility was to develop a programme for all the people that was enlightened and progressive; this would provide an "umbrella" under which like-minded members of his own party might shelter. The real criticism of the President must be that he has been slow and indecisive in working out such a programme, not that he is politically naive.

Atomic Power Plans

IT is no coincidence that the Atomic Energy Commission should have disclosed its plan to build a full-scale atomic electricity plant just as the flow of atomic weapons has reached a level which seems to require revision of military strategy. The absolute priority given to the development of weapons can now be modified; and Mr Murray, the commissioner who made the announcement, showed that the commission is very anxious lest the lead in developing the peaceful potentialities of atomic energy should pass to the Soviet Union. The new plant will be built by the Westinghouse Electric Corporation, the government paying the cost, which is put at "tens of millions of dollars"—probably about \$30 million. It will be erected near one of the commission's gaseous diffusion plants and will produce at least 60,000 kilowatts of electricity when it comes into operation in three or four years time.

The Westinghouse Corporation was chosen as the chief contractor because it is familiar with the reactor which is to be used in this first of a series of electricity plants. The reactor is the one which was developed for the aircraft carrier whose building has been postponed. Admiral Rickover, an enthusiast for atomic power, has been put in charge. It was Admiral Rickover who risked his promotion in his fight with the Navy, to build the first atomic-powered submarine, the *Nautilus*, which is to be launched in January.

The new plant will concentrate on producing power, and will produce plutonium only incidentally. In this it is significantly different from the rival scheme sketched out to the press with apparent haste, a few days earlier, by the General Electric Company. General Electric, which is the largest operator of reactors for the commission, proposed that it should build, with government money, a plant in the power-hungry north-west which would rely for part of its income on the sale of plutonium for weapons to the commission. The commission's decision that it will not encourage such dual-purpose plants, since the supply of plutonium is already adequate for present military needs, eliminates the main means by which private industry had hoped to make atomic electricity plants self-supporting. The government monopoly of atomic energy thus must go on. But it is hoped that eventually private industry will shoulder much of the job of providing atomic power and in the meantime its help will be sought in bringing down the cost, which at the first plant will be at least twice that of power produced by conventional means. Congress, however, will first have to bring to an end the monopoly of information which the commission now shares with only a few private firms.

Petrol Overflows

PETROL price wars have been flaring up at service stations in many parts of the country since July, to the delight of motorists, but the hostilities have not yet been carried back to the refining centres. The higher prices for all refined products that were established in June are still holding; only one major refiner has reduced posted prices, and then the reduction, for cargo quantities of regular and lower grade petrol, was only one of $\frac{1}{8}$ to $\frac{1}{2}$ cent a gallon. While some other refiners and distributors have unofficially reduced prices, in general the industry hopes that it can escape price reductions with the colder weather, which shifts the emphasis in refining from petrol to fuel oil and should reduce the brimming stocks of motor fuel.

There has been no lag in the demand for petrol and other refined products; indeed, demand for the first eight months of this year was 6 per cent higher than that for the same time in 1952. However, last year stocks were lowered by a strike; this year, they were raised by an unusually mild winter which left the industry with large supplies of heating oils.

This was an added incentive to concentrate on the more profitable motor fuel. During the summer almost half of each barrel of crude oil was taken for petrol. Consequently, instead of falling, as they usually do in the summer when most Americans take to the road, petrol stocks remained dangerously high. Both crude and refined production have been cut, but only as the demand for petrol has started its seasonal decline, and stocks may well press upon production next spring when the shift back to higher petrol output takes place.

Behind all the over-supply at the refinery level lies an over-supply of crude petroleum, and the smaller companies with no foreign sources of supply have been pressing for import quotas. This campaign, and the concern over the effects on the world market if Iranian production is resumed, were two additional notes of gloom that depressed the celebrations this month of "Oil Progress Week." Because the demand for heating oils rises as the mercury falls, dreams of a white Christmas—preferably well below freezing—provided the only cheer.

Panama's Grievances

DR MILTON EISENHOWER, the brother of the President, had not long returned from his good-will tour of Latin America before the first head of a state to visit Washington since the inauguration, President Remon of Panama, called at the White House to ask for a concrete expression of good neighbourliness. Mr Remon did not come in vain. Within a week of his arrival he stated that he had secured approval for two important changes in the treaty with Panama which controls the perpetual lease of the Canal Zone.

The concessions Mr Remon has secured concern wage discrimination in the Canal Zone in favour of US nationals, and the competition of US commissary shops in the zone with merchants in Panama; Mr Remon said President Eisenhower had agreed in principle with Panama's objections to these practices. By a fortunate coincidence, Mr Remon found support for his complaints in a report on the management of the canal that has just been sent to Congress by the General Accounting Office. This report criticises the construction in the canal of service plants such as milk and ice cream factories when such enterprises are already in existence in the Republic of Panama. The GAO also attacked the military control of the canal and the duplication of such facilities as hospitals by the army and the zonal government, and recommended that an impartial study of the problems be made.

The main question that Mr Remon brought with him has not been resolved, however; it is the demand for an increase in the annual rent paid for the zone, which is now \$430,000 and has not been changed since 1936. Panama would like at least a million dollars a year. The additional \$570,000 may be regarded in Washington as a remarkably low investment in the friendship, not only of Panama but also of all of Latin America, which is watching the negotiations with interest. Still another Panamanian request, for more economic aid, might be indirectly answered by a proposed \$26,500,000 scheme for modernising the canal so that present delays in two-way traffic during repair of the locks can be avoided. However, the criticisms of the GAO may lead Congress to give priority to overhauling the administration rather than the locks.

SHORTER NOTES

Correction.—In the Shorter Notes last week the figure for US economic assistance in the fiscal year ending June 30th was given as \$6 billion; it should have been \$2.7 billion.

★

Filter tip cigarettes, whose sales have risen by over 50 per cent each year since 1950, will soon be produced by three of the major tobacco companies in competition with their other brands. Although sales of filter cigarettes account for less than 2 per cent of total cigarette sales, the rapid growth of the market may entice even more of the big companies into this field, particularly in view of the premium price they command.

future imperfect

Wild animals depend for their food on what they can find.

It is a hand-to-mouth existence. Man, having evolved the idea of agriculture, sows to reap. He cozens nature, making her amenable, to produce his food *when and where he wants it*.

He asks only health and strength to work his fields, peace to enjoy the fruits of his labour and a stable economy to ensure that he can sell and buy and exchange.

The main product of the Fisons business has for a hundred years

been chemical fertilizers, to enrich the soils of farms and gardens.

But they make chemicals for medicine and industry too.

Fisons contribute to Britain's harvests, health and wealth.

FISONS LIMITED • HARVEST HOUSE,
FELIXSTOWE • SUFFOLK

..... Fertilizers • Heavy Chemicals

Fisons are also among the largest manufacturers in Great Britain of pharmaceuticals, medicinal food preparations and fine chemicals for industry. Many of Fisons products in these fields are household names.

The World Overseas

Moscow's Bid for the Trade Unions—I

The New Comintern

THE World Federation of Trade Unions (WFTU) has its roots far back in the turbulent mid-nineteenth century, when Dr Karl Marx was laying down his famous fallacies about the inevitable course of history. The use of "mass organisations," manipulated by men behind the scenes, is as old as Marxism. In 1920, the Bolshevik party set up the Red Trade Union International (the "Profin-tern"), which had a rival in the Socialist International Trade Union Congress formed in Amsterdam. All these attempts to unite the workers of the world failed. The Red International was dissolved in 1934 and the Socialist organisation succumbed during the second world war.

At the back of the original Marxist efforts to unite the workers of the world lay several misconceptions that have, in part, been abandoned by the Soviet rulers. The first was that the revolution would start in the most highly industrialised countries; the second was that the workers had in fact nothing to lose but their chains, and the third was that the capitalists and imperialists would never allow, still less offer, reforms. Since the victory of the Bolsheviks in backward Russia, the Soviet rulers modified the first principle, though they still regard it as essential that the proletarians shall—under the Communist party—form the controlling element in revolutionary movements. The Soviet Communist party has also brought Marx up-to-date by recognising the chances for unrest that exist in "colonial and semi-colonial" territories, which are now a main field for the WFTU's activities. As regards reforms voluntarily accorded by capitalists, the Soviet leaders are in a dilemma. Though it is presumably impossible for them completely to overlook the facts of life under capitalism, they nevertheless remain prisoners of Marxist doctrine. They must fight the forces of reform in the WFTU and elsewhere while denying that they exist.

The reformist policy of the British has always been the most potent of these anti-Marxist forces, but it has been greatly reinforced since the last war by another—American financial aid. Marshall aid undermined the basic Marxist tenet that wars bring revolutions, while American military aid threatens to do the same for the dictum that armaments production inevitably lowers the workers' standard of living. It was obvious that the Communists would aim from 1948 onwards to use the WFTU to wreck the European Recovery Programme—a task which even the great strikes in France did not achieve. It was also to be expected that the WFTU's French general secretary, Louis Saillant, should make the

greatest effort at the recent Vienna congress of the organisation to prove with statistics that the doctrine is correct and that every country receiving American aid suffers a lowering of its standard of living. The WFTU, according to *Pravda* has been helping an inevitable revolt of the workers which has been manifested in an increasing number of strikes.

It might seem that the WFTU is nothing particularly new and will fail like its predecessors. Saillant was perhaps merely boasting when he proclaimed that "in this magnificent new struggle, the international working class is securing new means of action and is raising the level of its class consciousness." A glance back at the WFTU's career, however, shows that it is, indeed, more formidable than any of its forerunners.

In 1945, the Soviet party leaders evidently saw a new chance of ousting the hated International Labour Organisation, which had been set up by the League of Nations. They aimed to establish an international that would be affiliated to the United Nations and would use the struggle for labour rights to further Soviet foreign policy. The chance was unparalleled because Soviet prestige was at its height and the idea of co-operation with Communists was popular. In fact, both the cautious British TUC and the American Congress of Industrial Organisations agreed to form the WFTU with the Russians in 1945. Under Soviet auspices, the "democratic" mass organisations for women and youth were set up at the same time.

It very soon proved impossible for the free union leaders to work with the men who represented the sham unions of the Soviet bloc, and were working to prevent economic recovery in the West. After stormy sessions, the British and Americans left the WFTU in January, 1949. But no rival organisation was set up until November of that year, when the International Confederation of Free Trade Unions (ICFTU) was established.

In Europe, one big success was achieved against the WFTU, which may be offset against Communist control of the big French and Italian confederations. This was in Germany, and was largely due to the British. To secure the revived German unions was always a major objective of Moscow's strategy. But owing to the insistence of British Military Government that the new unions should be formed on the British pattern from the bottom upwards, on the basis of free elections, the Communists were frustrated in the West. The WFTU was, therefore, only able

to secure the affiliation of the East German union, and Saillant's personal appeal to the West German body to send delegates to the recent Vienna congress failed. This is only natural, as the WFTU has denounced the June 17th strike of the Soviet Zone workers. One of its main tasks for the future remains, however, to split the West German federation in order to organise a revolutionary general strike to overthrow Dr Adenauer's government.

Soviet domination of the WFTU naturally became more obvious after the departure of Sir Vincent Tewson and the Americans, and this has doubtless hampered its efforts to split the free unions in Europe. The executive bureau included from the outset representatives of the Soviet bloc, led by Kuznetsov, head of the Soviet unions. But now the Chinese are there, too, and Kuznetsov has been replaced by a more famous figure, Shvernik, who was moved by Malenkov from the position of titular Head of State to take over leadership in the Soviet trade union world. When the importance of the WFTU is taken into account, this re-shuffle does not appear to be so much of a demotion for Shvernik as it seemed at first sight.

For all and Sundry

In one important way the split with the British and Americans may have actually helped the WFTU. It left the Communists free to organise according to their own well-tried technique. The WFTU quickly turned into a new Comintern, with the difference that it worked without a Communist label, and opened its arms to all and sundry. It was always more important than the Cominform, which was a limited European organisation formed for the express purpose of keeping first the French and Italian, and then the Yugoslav parties in line with Moscow. For years past, the WFTU has been a main support of Soviet foreign policy. It was given the task of ensuring that strikes turned under Communist direction into political demonstrations in support of the Soviet "peace" campaign. Since Malenkov came to power, it has taken up his slogans about the need for a peaceful solution of all outstanding differences between the powers. As Saillant said in July, 1951, at a meeting of the executive, there must be a close link between the struggle for better conditions and peace "since by fighting against the immediate consequences of a war economy the working people are making the implementation of armament plans difficult." For this purpose, special WFTU "action weeks" have been organised, and Soviet commentators have claimed that

the WFTU has become one of the strongest fighting units in the struggle for peace. In company with other mass organisations, WFTU branches are the chief inspirers of the struggle against US occupation, the revival of the Hitlerite Wehrmacht, for national unity and independence. The fact that the EDC has not yet been ratified is also due to the efforts of the militant WFTU.

As soon as the WFTU was free of the British, it started organising individual craft internationals in those strategic branches of industry which could, if they wished, paralyse a country at the moment of mobilisation. Internationals were formed, among others, for miners (whose headquarters were turned out of Belgium in 1951), air, sea and land transport, dockers, fishermen, post and radio, and (with an eye on the colonies) agricultural workers. These bodies are intended to take advantage of local conditions in their industries.

The Vienna congress marked the culmination of an

intense drive based partly on new tactics, to split the free unions. Early this year, instructions went out to secure representatives from branches of unions that were not affiliated to the WFTU, and even from individual factories. Money was not spared. Millions of leaflets were distributed in many languages, and funds were collected to pay the fares of any one who asked to go to Vienna. In Britain, the results were poor though in WFTU speeches claims are often made to support among dockers and from the ranks of the Electrical Trades Union, the Foundrymen's Union, and a few other bodies. In all less than 800 representatives and observers turned up in Vienna, including the contingent from the Communist bloc. In Europe the strength of WFTU continues to rest in the great French and Italian unions. But they alone make the WFTU a formidable organisation even without taking into account the whole "colonial and semi-colonial" world which is under attack in ways that will be examined here in a second article.

(To be concluded)

Johnston Over Jordan

MR ERIC JOHNSTON, the president of the Motion Picture Association, who is special adviser to President Eisenhower on schemes for international development, and who is now in the Middle East, has left the Arab States for Israel without having mustered any support for the blueprint he has under his arm. This is a T.V.A. for the Jordan valley. He carries a theoretically admirable document called the "Unified Development of the Water Resources of the Jordan Valley Region," but the Arab states have dubbed it "useless" because its execution entails co-operation with Israel. He is now encountering the Jewish reaction which is that Israel, though theoretically in favour of cooperation, wants only the kind that will allow it to pursue its plan to pipe half of the upper Jordan water across the Galilean hills and into the coastal plain. Mr Johnston's blueprint precludes this project.

Thus his scheme cannot expect to find favour as a whole, but it possesses one very great merit which no one—Jew, Arab or United Nations member—can afford to ignore. The plan it propounds is to be executed in stages and

its first stage, which is or could be entirely inside the Kingdom of Jordan, would go some way towards settling Arab refugees. This stage entails the digging of a canal from the Yarmuk river down the east bank of the Jordan—the area known as the *ghor*—which would irrigate the five to eight mile-wide plateau between the foot of the escarpment and the river.

Chance for a Pathfinder

At present, this eastern *ghor* carries about 35,000 people on land irrigated by trickles from the side valleys, and by pumping water up from the bed of the river. If the canal which is the first stage of the unified plan were built, it would at full flow irrigate 307,000 further dunums (4 dunums = 1 acre), and this additional land, at 5 dunums per person, would enable the area to carry three times as many people as it does now. So full a flow would entail building a dam on the Yarmuk, one end of which would be in Israel, but a lesser volume of water could be obtained, or a smaller canal be filled, by a pumping system entirely within the Kingdom of the Jordan. Plans for a smaller *ghor* canal (of a size to irrigate around 40,000 dunums) have been available for the last five years but have constantly been set aside and forgotten because bigger and better ideas were on the way. They could now serve as a pilot scheme for the larger project.

Here is the chance for a pathfinder through the human, political and legal problems that have hitherto baulked refugee settlement in the valley. The refugees would not be the only beneficiaries; others would be the Jordan government, which is groaning under its burden of homeless people, and the foreign subscribers to the United Nations refugee organisation that pays the refugees their dole. So far, American love of big plans, and consequent scorn for small beginnings, has prevented the adoption of any scheme for the eastern *ghor* alone. Simultaneously, the Arab states have for political reasons always been prone to turn down any scheme leading to refugee settlement, regardless of the relief it would bring to the economic plight of the poorest of their number, which is the Kingdom of the Jordan. It would be the gravest pity if this American *penchant* added to these Arab emotions, were to encourage the UN once more to shelve the practicable part of a scheme that is, for the present, impracticable as a whole.

China's Winter of Discontent?

FROM A CORRESPONDENT IN HONGKONG

THE Chinese Communist government celebrated its fourth anniversary at the beginning of this month with the usual fanfare and rejoicing. In fact, however, the Korean truce is about the only development that can give cause for pride and satisfaction in a year of crippling natural disasters and dulled dreams.

There may have been a measure of relief, rather than satisfaction, at the conclusion of the agreement with the Soviet Union whereby the latter undertakes to render direct aid in certain specific construction enterprises. But the new arrangement which is evidently a poor substitute for the grandiose ideas that obtained a year ago, emphasises the roles of patron and protégé. It is, moreover, the latest

in a series of buffetings from Russia, from the death of Stalin and the fall of Beria to the emphasis on the consumer instead of heavy defence industries, on collective as distinct from individual leadership and, finally, on the incentive policy for the peasant. China, struggling on the steep way up, is embarrassed to meet Russia on the way down.

China has suffered from every conceivable form of natural disaster, and conditions are as bad as they were in the climactic of the Communist conquest in 1949. Disasters have been of the double kind not infrequent in particular parts of the land but seldom in modern times over so wide an expanse of the country. Where there was drought, floods followed, together with a late winter, pests and other troubles. In many areas real famine occurred earlier this year. In provinces like Kwangtung and other parts of East and South China, where drought had struck in the summer after the spring floods, typhoons brought renewed floods, though hitherto in less serious measure.

These grievous misfortunes have happened in a year of mounting discontent. For two years the bourgeoisie, private industry and private enterprise were the target of a constant stream of hostile word and deed. This year it has been the turn of the state industries, the bureaucracy, and the state commercial bodies to be the targets of incessant criticism. The Communists insist on criticism and self-criticism as a matter of routine. But it is quite obvious from the volume and range of criticism, and from the facts and figures of exact incidents cited, that an unprepared, untrained, and inexperienced host of young officials have made a great mess of almost the whole production and distributive system of the country. The great Five Year Plan had to be pruned, and pruned again and yet again.

Progress with the Railways

It is very doubtful whether any such thing as a national plan now exists, though regional construction in the North-east and in Shensi and Shansi provinces and municipal construction in many of the leading cities has been going on vigorously on a scale that would have created a sensation in the slothful and unconstructive days of Kuomintang rule. The railways linking up Chengtu with Lanchow, and Lanchow with the cities of Sinkiang and ultimately with the Turksib line have been steadily progressing in the teeth of immense topographical and engineering difficulties. The Huai River conservancy works have held, though many sceptics doubted the quality of the work and imagined collapse and possible disaster; and the vast project still goes on. The still uncompleted Kwanting Reservoir, the biggest in China, recommended by the Chihli Rivers Commission headed by a former British conservancy engineer-in-chief in India a quarter-century ago, has stood up to one of the biggest torrents the Yungtingho has registered in modern times; it has thus saved Tientsin and the great northern plain from the flooding to which this destructive, silt-laden river used to subject the vast farms of the Hopei railway triangle. This great dam is in the hills west of Peking, and it is a boon to the whole farming populace.

But the chorus of dissonance began over the Plan. From the various regions and from the Ministries in Peking came all the rainbow-drafts, a perfervid and soaring ambition could put on paper. The volume was preposterous and impossible, and from Peking came cries of anguish. Then

came the first sharp warnings in the spring of frowning skies, and in a month or two the word famine was in frequent use on official lips. A million tons of grain had to be shifted from the State reserves to ameliorate the catastrophe.

Up to this time the Vanguardists had held the centre of the stage which they had seized in the spring of 1950, when they absorbed the spirit, if not the word, of the common programme and its promise of mild gradualism. In these months they had socialised two-thirds of the nation's economic activity and almost all its finance. But about the beginning of this year there was a turn both in popular feeling and in Party outlook. The war in Korea had enabled the activists to do many things they would have been unable to do otherwise, and the Vanguardist leaders were still boasting that the war had been "a great dynamic power which drove forward our national construction programmes in all respects." They were confident, they said, that victory could be won on both fronts—war abroad and revolution at home. But the people were already murmuring; confusion reigned over the Five Year Plan; merchants and industrialists feared construction levies instead of war levies, and they had little left; taxation was already severe, and in the countryside there was trouble, fear and anger.

The Vanguardists therefore were waved off into the wings and other names gained prominence. Successive congresses of national bodies were held, without the usual oratory of the Vanguardist Mayor of Peking, Peng Chen. Chen Yun and Po I-po, who had led the socialising drive, fell into silence, and the latter was dismissed from his post as finance minister.

"Five-Too-Many Evils"

The "tiger-hunting" activists of the Youth League were warned off the bourgeoisie and the individual peasant alike. Criticism has even been allowed to invade the domain of the all-powerful head of the North-east government, Kao Kang, the first of the Vanguardists. Instead of the five crimes of the bourgeoisie the "five-too-many evils" of the bureaucracy and the State enterprises have been assailed—too many tasks, too many meetings, too many documents and forms, too many organisations, and too many concurrent posts for the official cadres.

Scarcely a state enterprise has not been under fire, for absenteeism, labour indiscipline, and shocking mismanagement; there have been complaints of wilful neglect of freight by the railways, of wanton waste and adventurism in the handling of precious timber supplies, and of every other kind of evil. The heaviest blow was administered by Li Fu-chun—who popped up as Chen Yun popped down—in his report as Vice-Director of Economic and Financial Affairs to the Youth League Congress in Peking. "Even political conditions internally," he admitted, "are too immature for a Five Year Plan." They had not consolidated the alliance between the peasantry and the workers as yet, and this must be "the starting point in all planning and policy." The revolution, in fact, has not only failed to make ground among the farmers—it has lost what it gained by the strenuous work of the activists.

The Chinese are approaching what is certain to be a winter of discontent—and worse, for famine is feared since the late crops cannot possibly make up now for the heavy losses in the earlier months. The effects are bound to be acute not only on the livelihood of the people and on their expendable income but on the general standard of

economic activity, the government's finances, and the construction plans.

The alternatives before the ruling group are to relax still further the Socialistic measures of the Vanguardists and reassure the bourgeois industrialists—in other words continue to mark time—or to surrender the field to the activists again. The dilemma is all the more acute because in so many ways the Soviet Union is moving in a different direction from the still infant Chinese revolution.

The Attack Against the Polish Church

IT is clear that the recent trial of the Polish bishop, Kaczmarek, and the removal of the Polish Primate, Cardinal Wyszyński, are part of a determined effort by the Communist régime to break the Polish Episcopate. Its object, of course, is to destroy the prestige and influence—intolerable to the Communists—of the Catholic Church in Poland. But the régime's chances of an easy victory are not good. The bishops have gone as far as they decently could to meet the Communists' wishes. It appears that it is the régime not the church that has consistently flouted the church-state agreement of 1950. Many Catholic schools have been liquidated and all forms of religious teaching are being systematically stifled. The censorship of the Catholic press and publications has become increasingly severe and unscrupulous. Political pressure on the lower clergy and attempts to divide them from the hierarchy have been stepped up—but with little success. Interference by the state in church affairs, especially in the appointment and removal of priests and bishops, has become more and more widespread. The bishops themselves are increasingly subject to open attack and intimidation; at least eight of them have been either arrested or removed from their dioceses. Faced with all this accumulated evidence of Communist hostility it seems that the bishops, contrary to earlier reports, are inclined to dig in their toes. Only eight bishops were present at the meeting at which the episcopal letter condemning the Cardinal was drawn up, and none of them actually signed the letter.

Vatican and Oder-Neisse

It is, indeed, doubtful whether the Communists are seriously interested in a *modus vivendi* with the Church; it looks as if they are only interested in discrediting it. One of their major and constantly reiterated complaints against the Church is that no permanent ecclesiastical administration has been set up in the Western Territories; and from this they argue that the bishops and the Vatican are really in favour of handing these lands back to Germany. This is an excellent stick with which to beat the Church since every Pole, whatever his political beliefs, wants to hang on to the Western Territories. But the latest evidence suggests that it is a complete distortion of the facts.

The Vatican, it is true, will not appoint permanent bishops in the Western Territories; its reason is that the Oder-Neisse frontier has never been the subject of a permanent political settlement between the great powers (only between Poland and East Germany) and that it cannot anticipate the terms of this settlement. But the Polish

Church has done everything it can to set up a flourishing ecclesiastical organisation in the Western Territories. Its efforts could have been successful, if they had not been deliberately sabotaged by the government. The régime has disrupted the work of many of the Polish priests sent into the recovered lands by forcing them to leave their new parishes. The decree of February 9, 1953, which, among other things, allows the state to remove priests without any reason given, has been used to the greatest effect in the Western Territories. Moreover, the government has also done its best to perpetuate the temporary nature of the four new administrative units set up by the Church at Wrocław, Opole, Gorzów and Olsztyn. For when Cardinal Wyszyński obtained permission from the Pope to appoint four titular bishops in these new dioceses, the government refused to allow them to take office. Thus it has frustrated the Church's efforts to stabilise its organisation in the Western Territories at all levels on a basis that was to all intents and purposes permanent, while at the same time heaping continuous abuse on the Church authorities for their failure to do this very thing.

These facts were contained in a letter addressed by the Polish Episcopate to Bierut last May in protest against the Communists' treatment of the Church. The letter was suppressed by the government, but an authentic text has recently reached the West. It demonstrates to what lengths the Communists are prepared to go to undermine the faith of the Polish people in the Catholic Church.

Worried Journalists in the Americas

FROM A CORRESPONDENT IN MEXICO

THROUGHOUT the Americas, the past year has seen dangerous backsliding from the ideals of a free press and liberty of expression. A list of new offences against free expression was recently put together by the Inter-American Press Association at its ninth annual meeting in Mexico City. Despite the temptation, especially strong among Latins, to indulge exclusively in self-praise when others are listening, the editors and publishers in the association squared boldly up to the trouble. It was a strange sort of meeting, as such things go nowadays, because the usual ringing phrases were soon abandoned in favour of realism.

The association is composed of journalists, editors and publishers, and it is strictly non-political. As a result it is a more useful body than committees of the United Nations or the Pan-American Union, such as the abortive UN committees that set out to write a treaty on press freedom and wound up with what was virtually a code of subservience. It is different because it has a clear idea about what constitutes freedom of information. It bars from membership any publications judged to be Fascist or Communist, or the tools of totalitarian governments. Since its members know what they mean by these things, they have not bogged down in futile discussion of qualifications that would be open to misinterpretation anyway.

At Mexico City the association reviewed, country by country, the situation of the press in the two continents. Ten of the 21 American republics were judged guilty, not so much for failing to live up to general standards, but for

specific measures that impeded honest publishing. They were: Argentina, Bolivia, Brazil, Colombia, Cuba, the Dominican Republic, Nicaragua, Paraguay, Peru and Venezuela.

Argentina and Cuba received the most bitter criticism. In a heartily applauded speech, the association's president, Mr John S. Knight, owner of the *Chicago Daily News* and other papers, criticised his own government for its apparently pleased response to General Perón's recent blandishments. He deplored Dr Milton Eisenhower's visit to Argentina and argued that any rapprochement between the two countries at the moment "can only spread further disillusionment and pessimism among the other South American countries."

Almost as refreshing as the frank listing of infringements of press freedom was the association's avoidance of sweeping pledges that it would, or could, soon put all right. In fact, it was admitted that its greatest efforts had produced comparatively small results. Nevertheless, there were some victories to report. In Ecuador, in April, President Velasco Ibarra had closed down two newspapers, *La Nación* and *La Hora*, and jailed their editors for criticising his government. But after a campaign by other local publishers and the association, they were released and the papers resumed publication in August. Again, the combined efforts of a Brazilian newspaper owner, who spent two days in jail for his pains, and of the association had forced the Brazilian government to stop putting pressure on the country's independent press through unfair competition by an officially supported group of newspapers.

Compared to the new pressures imposed by governments on the press, the relief that had been secured was relatively small, but the association could justly claim that it did even a little more than the cold records show to keep a bad situation from being worse. Its mere existence may remind persecuted publishers that they are not fighting their battles entirely alone; and angry governments may consider the unfavourable publicity that they will earn their countries before they decide to padlock newspapers or jail editors.

There was no attempt at Mexico City to analyse the reasons for the "ominous trend" toward increasing government attempts to dominate the press. It was simply pointed out that, more and more, governments are insisting that anything short of adulation is subversion. Some of the new press laws were very similar, the association was told, to those of Fascist Italy.

Portugal's Trade

BY A CORRESPONDENT RECENTLY IN PORTUGAL

THE journey from Madrid to Lisbon is one of contrasts. Crossing the frontier, one leaves the barren landscape of Extremadura and enters a country of small, well-kept fields and neat whitewashed houses. Two hours later the first sight of Lisbon is of the great new housing estate of Encarnação, and from there into the city the impression is of enormous building activity. Lisbon is growing rapidly, partly because of genuine prosperity, but partly, too, because current trends are centralising Portuguese life and the Portuguese economy in the capital and developing it at the expense of the rest of the country.

Portugal has had two recent periods of outstanding

economic success. One was during the war, when both sides were competing for its favour and its minerals; the second was the Korean boom, when the United States stockpiled cork and wolfram prices were high. The balance of payments showed a surplus on visible account in 1946 and again for a time in 1950-51, though in between there had been a sharp crisis. Marshall Aid was first accepted in 1949-50, and by the end of 1950 the metropolitan and overseas territories together had become a creditor in EPU to the point where exports had to be restricted, export earnings had to be blocked, imports were liberalised, and the escudo was treated as though in some respects it was a hard currency. Then a deterioration set in, and today there is a deficit with every part of the world except Eastern Europe. In the first half of 1953, exports from Portugal to countries other than its overseas territories covered only 56 per cent of imports; imports were some 800 million escudos (£10 million) less than in the corresponding months of 1952, but exports were down by almost exactly the same proportion.

The half dozen commodities which form the bulk of the export trade—cork, sardines, timber, wines and wolfram—are highly sensitive to market variations, and several of them to weather conditions as well; the drought which has persisted for the last eighteen months is one of the causes of the present troubles. Imports are affected, too, for though agriculture is fairly efficient (it could be more so if the system of land inheritance did not lead to excessive fragmentation of holdings) wheat is imported from the United States and Canada and even potatoes from Great Britain; this year it was hoped that wheat imports would not be needed, but the final results of the harvest are less satisfactory than the estimates.

Sales of Cork to Russia

Cork and its products form nearly 30 per cent of exports (by value), but the trade has become curiously unbalanced. Exports boomed in 1950 and 1951, when the American market was taking the raw material for storing as well as the manufactures which it is cheaper to import than to make in the United States. Prices rose rapidly to a peak early in 1952, and have since fallen; but while the average export price of manufactures is now down to about 80 per cent of 1948 levels, unmanufactured cork has stayed near the 200 per cent level—largely because growers, accustomed to a seller's market, prefer to leave it to accumulate on the trees rather than accept a lower price. Manufacturers who own their cork forests can make the best of both worlds, but those who buy from private growers have seen their margins cut to the point of disaster. The Soviet Union has, incidentally, become the third largest customer for unmanufactured cork (next to the USA and Britain); this accounts for Portugal's trading surplus with Eastern Europe.

Sardines are a fickle fish, plentiful in some years and elusive in others; moreover tinned sardines have suffered almost every time a European country has had to tighten its import restrictions. The chief buyers are Italy, Germany and the United States. Exports have increased in volume each year since 1949, though still not to prewar levels; but prices have fallen steadily for three seasons, and the trade has some of the marks of depression. Nor are the prospects good, for the experts believe that the shoals are deserting Portuguese waters.

Britain dominates the timber market, and pit-props account for three quarters of the value of Portuguese exports. Sales in 1952 reached the 1938 level for the first time since the war, but will probably be lower this year. The wine trade also looks towards Britain, but is at present undergoing a severe contraction. The last of the main exports is wolfram, which is mined in the northern provinces and sold chiefly to the United States. In 1952, when Portugal was still the third biggest producer in the world, exports at 4,495 tons were 80 per cent above the prewar level and the price was sixteen times as high. But in the first half of 1953 exports were down to 1,464 tons and still falling, and the price was declining rapidly. The loss of this trade is serious for the whole Portuguese economy. It is particularly serious for the northern part of the country, which is also suffering from the port wine slump, and northerners complain that the authorities in distant Lisbon pay all too little attention to their plight.

On the import side, machinery from America and Europe and cotton from the African territories (one must not call them colonies now) head the list. The government's programme of industrialisation is ambitious—

PRINCIPAL EXPORTS* OF PORTUGAL (BY VALUE)
1937 and 1953 (January to June)

	1937		1953 (Jan. to June)	
	'000 escudos	% of total	'000 escudos	% of total
Cork & cork products	219,952	18.1	574,120	28.9

Total exports	1,216,267	...	1,982,909	...

* Excluding exports to Portuguese overseas territories.

perhaps too ambitious, since it also involves enormous expenditure on hydro-electric development. In the manufacturing industries already developed, of which cotton spinning and weaving are the largest, costs tend to be high; wages are below the levels of north-western Europe, but it is difficult to get high productivity out of a largely illiterate labour force, and redeployment is a slow process when workers have to be taught to read before they can follow new instructions. The quality of the textiles is, however, quite good, and there is an export trade with the overseas territories and North Africa; last year a consignment of grey cloth was even sent to Manchester. Larger exports might be possible if only the Portuguese public (or the weavers; it is hard to say which is responsible) did not prefer narrow widths of fabric which cannot be sold abroad.

Yet despite the deterioration since 1951, the general picture of the Portuguese economy is not discouraging—particularly not to anyone who knew the country twenty years ago. Dr Salazar has had his share of luck. But he and his colleagues have turned it to good account, and whatever criticisms may be levelled against them they have created a stability which would once have seemed unthinkable.

How many SHEETS IN YOUR HOUSE?

You have a washing machine? A refrigerator? An electric cooker? Then you have more sheets in your house than you know. Steel sheets. For these make the machine and the cooker; make them to last; make them smooth and easy to clean.

When you ride in a bus you are surrounded by steel sheet. Oil drums are made of it. It goes into the home and to markets overseas. And all of it is made to exacting standards of dimension, gauge and quality. Only the continuous rolling process can produce sheet steel that meets those standards. Britain now has three continuous wide strip mills in Wales (at Ebbw Vale, Shotton and Port Talbot), for 200 years the home of the sheet trade. No other country except the U.S.A. has more than two such mills.

STEEL is at your service

THE BRITISH IRON AND STEEL FEDERATION S.59

Hat from Herbert Johnson (bond St.) Ltd.

Styled comfort is ever present in Chester Barrie leisure wear. These two-piece suits are handmade throughout from Britain's most exclusive and specially loomed 'limited edition' cloths. 50 styles and 170 sizes ensure perfect fitting. Combining ease and distinction, they are found in every part of the world where men of taste seek outdoor pleasure.

Two-piece suits from £22
Three-piece suits from £25
Sports coats from 15 guineas
Slacks from £6:10:0
Top-coats from £22
Overcoats from £25

THE BUSINESS WORLD

Steel and the Public

WHEN the lists opened on Thursday morning for the offer of United Steel Companies ordinary shares, the general feeling in the market was that the issue would "go." It will not be for want of skill in preparing the offer or of quality in the shares themselves if this is not so. It is simpler to say "denationalise" than to do it, but it is of the highest importance, once denationalisation has been ordered (and in the case of steel most rightly ordered) to spare no effort to make the first major share issue a success. It has to be followed—if the first phase of denationalisation is to succeed—by a series of share offers on behalf of steel companies comparable in size and in quality with United Steel Companies itself. The prospects for this first issue involve in their turn the outlook for a whole programme of issues stretching over many months—and even when that is successfully out of the way, it will still be only a beginning towards the "return to private ownership" of the companies owned by the Iron and Steel Holding and Realisation Agency.

The fourteen million £1 ordinary shares of United Steel are being offered at 25s., which can be paid either in cash or by the tendering of certain gilt-edged securities at prices which the Bank of England have published. Preferential consideration is to be given to applications from shareholders who were on the register on February 14, 1951 (the eve of vesting date, by which time there were large institutional holdings of steel shares, bought as a cheap way into the gilt-edged market). The complications of tendering gilt-edged stocks and the offer of preferential consideration for former shareholders are no doubt largely responsible for the fact that the lists remain open for ten working days. It seems quite clear from the time-table adopted for the United Steel issue that not more than one other steel issue can make its bow before Christmas. The

period of risk, for an issue of this size and complexity, cannot be called agreeably short.

It is a risk that falls primarily on the shoulders of a consortium of eight leading finance houses who have agreed to procure applications for the whole issue on firm underwriting terms; and it is no secret that the success of the issue leans heavily on the support that institutional investors have been encouraged to provide for it. The offer for sale is none the worse for that fact, and the demonstration that co-operation in the City of London can match the burdens and intricacies of this issue and its successors is worthy of all proper praise. But it is not only the political critics of denationalisation who would draw some distinctions between "private ownership" and "institutional ownership" of the leading companies in the steel industry. The great unknown is whether the private investor will be prepared to come in as an appreciable applicant for United Steel.

He is so constantly reminded of the political risks of doing so that it may be more realistic to accept the threat of renationalisation for what it is worth—and in the end it might not be worth very much—and concentrate attention on what it is that the private investor will buy when he puts down 25s. for a United Steel ordinary share. He will get, first and foremost, an equity in a diversified and highly efficient group ranging over a large area of the steel industry—a group that last year produced more than a fifth of the iron ore and more than an eighth of the pig iron and ingot steel turned out in this country. Its technical skill in smelting lean home ores is unsurpassed; its advances in blast furnace and steel smelting practice have been important; it is one of the biggest producers of special steels in the country; and since the war it has spent £38 million on capital development, mostly from its

internal resources. Thirteen months ago, the group's net tangible assets were little short of £30 million, of which just over £5 million was matched by preference capital, leaving say £25 million of net assets to be attributed to slightly more than £10 million of ordinary capital. There have been changes in capital structure to march with the new issue—in particular a new class of 5½ per cent. redeemable preference shares (of which 2,500,000 have been allotted to the Agency on the capitalisation of reserves and 1,500,000 subscribed at par by the Agency for cash) and the raising of the ordinary capital to a round £14 million (by the same capitalisation of reserves). But taking a short cut through these complications, it is clear that 25s. a share does not overstate the asset value of United Steel.

That, however, is not a determining fact. To the investor, the prospects of earnings and dividends are the paramount consideration. Here the prospectus employs broad brush strokes. Profits for the 53-week period to October 3, 1953, will be of the order of £9 million, after charging depreciation but before interest. But this profit was "exceptionally high," and the directors prefer to take £6 million as a reasonable datum for dividend policy; this would cover the 9 per cent. dividend that the directors suggest by earnings equivalent (on a full distribution and with allowance for profits tax) to nearly 25 per cent. This calculation deducts the interest on £10 million of 4½ per cent. debenture stock 1968-78 that the Agency is subscribing at 98, whereas the benefit of this new money is included in the round figure of £6 million profit after depreciation.

The estimate seems cautious, but it is right that it should be so. Steel output in this country is running as high as ever, but across the whole world there are

signs of greater competition for markets. The export premiums which no doubt added their quota to the "exceptionally high" profits of United Steel in the latest year had run off before it ended. There have also been important changes in the cost of imported steel-making materials as international competition for iron ore, scrap and tonnage has become less frantic. But it is never possible to work out the cross-cut effect of these various factors on the profit earning prospects of a single steel producer. The Iron and Steel Act charges the Iron and Steel Board to promote "the efficient, economic and adequate supply under competitive conditions of iron and steel products" and it is no simple matter to translate "competitive conditions" into terms that square with the working of the "industry fund" in which United Steel and the majority of steel producers have co-operated. A year ago the industry fund (burdened admittedly by exceptionally high import of steel-making materials) seems to have redistributed across the whole steel industry a sum as large as the industry's entire net profits which was made up of the extra costs of imported raw materials.

The offer for sale brings the existence of the industry fund to the investor's notice and leaves it to be inferred that the levies may in future be lower. But it does not tell him how United Steel Companies fared on balance from the operation of the various levies imposed by the fund. As a large producer of steel from home ore, its costs must have been increased in order to equalise the costs of other producers who depended on "expensive" imported ore or scrap; but it does not follow that other sections of the undertaking did not gain from the fund. This pooling of costs is a matter of concern to the investor. He is rightly told—though in general terms—that it goes on. But he is

not taken any distance at all towards a closer appreciation of "competitive conditions" in the supply of steel, or of the Board's possible ideas about maximum prices in the future. This last point is of particular importance because—to employ a sweeping summary—prices of crude steel have been kept too low and prices of finished steel have been too high. The satisfactory financing of major schemes for increasing crude steel capacity could in future involve changes in the orders of profitability that have almost become traditional in the steel industry.

The ordinary applicant need not concern himself too closely with these questions at this stage—for he may be permitted the reflection that, while the industry is busy, one good steel share is likely to be very much the same thing as another good steel share. He now has to decide whether a prospective yield of 7.2 per cent on a 9 per cent dividend—a generous 1½ per cent more than the current return on blue chips—is enough to discount political and economic risks. It is at any rate a margin that is a good deal more reasonable than the margin suggested by some spokesmen in the steel industry six months ago. But realism is not necessarily an attraction in itself. The yield recognises the risks, but it may not discount them at more than the due rate that they deserve. Some investors, too, may ponder the industry's financial commitments for expansion schemes during the next five years and conclude that steel shares are not likely to include any big "growth" element during that period.

Yet, in just over a week's time, it may still be discovered that those responsible for the United Steel offer have achieved a *tour de force*, hitting a price and terms that give nothing lavish away, but are sufficient to attract a significant volume of genuine private applications and to hold a firm opening price. That would be the best outcome, for a variety of reasons. The real test of success is the acceptance of risk investment in steel by the private investor. He may be buttressed

by the institutions and the pension funds, but these have not the resources—nor have they any right, given their fiduciary responsibilities—to take up unlimited slabs of steel shares. Again, it may prove to be one of the paradoxes of this first steel issue, and of good hope for its successors, that whereas a big opening premium would be too great a temptation for many applicants to resist, a firm price at par or a little better might be accepted as the condition of an orderly market.

* Excluding interest shortly due. † Originally Iron and Steel Stock.

But there may well have to be second thoughts on some technical aspects of the issue. A ten-day issue may be unavoidable if former shareholders are to be allowed to apply on pink forms. But if the arrangements for tendering gilt-edged stocks are to be repeated, it will inevitably follow that, at intervals stretching out over the next twelve months, the gilt-edged market will be solidly frozen for periods of up to a fortnight—as in effect it is frozen at present. This is a heavy price to pay for assisting the successful issue of steel shares, and it calls for the most careful reconsideration.

Bare Balance

THE new White Paper on the balance of payments (Cmd. 8976) confirms that the deterioration in Britain's external surplus in the first half of this year was not as alarming as some pessimists had at first suggested; although it should be added that it was also not as innocuous as some official explainers have since tried to make it appear. The drop in the surplus (exclusive of defence aid) from £93 million in the second half of 1952 to £26 million in the first half of 1953 was much more than accounted for by an increase of £135 million in imports, of which £108 million went on increased purchases of food and feeding stuffs. This increase was £114 million greater than the rather disappointing increase of only £21 million in exports; in consequence Britain's visible deficit widened by £114

million to £140 million, but its surplus on invisibles (aided by lower outlays on interest payments and travel) rose by £47 million to £166 million.

The most cheering feature of the new statistics, however, is that, despite the drop of £67 million in the total surplus, Britain's balance with the dollar area improved by £62 million and its balance with Western Europe improved by £6 million between these two latest half years. The deterioration occurred wholly with soft currency countries—that is, with the overseas sterling area (by £34 million) and with the residual group "other non-sterling countries" (by £101 million). More than half of the deterioration with these "other non-sterling countries" and, therefore, nearly five-sixths of the deterioration as a whole, occurred with the

Britain's Balance of Payments 1946-1953

dubious debtors of southern Latin America. There is not much to complain about if these figures mean mainly that Britain has been devoting to domestic re-stocking the money that it had previously used for unintentional long-term loans to Brazil.

The record of Cmd 8766, in short, is of an approach to better regional balance; and it is in that light that its story—both of the long haul since 1946 (the paper sets down revised figures for the whole postwar period) and the latest chapter in it—deserves to be read. The principal features are illustrated in the accompanying charts. It will be seen from the first chart that Britain's deficit with the dollar area declined from £510 million in 1946 to £282 million in 1952; it had been much lower (at only £80 million) in 1950, but that was because Britain had run down its stocks of dollar commodities in that year—an act of improvidence that was directly responsible for the large deficit of £426 million in 1951. The improvement of £228 million between 1947 and 1952 was wholly due to an increase of no less than £281 million (or 216 per cent) in dollar exports; in these five years dollar imports increased by £29 million (or only 5 per cent despite a rise of 8½ per cent in American export prices), but the dollar balance on invisibles deteriorated by £24 million—thanks wholly to the interest payment of £39 million that is now made at the end of each December on the postwar American loans. The latest chapter in the story is that Britain's direct dollar balance improved again, from a deficit of £83 million to a deficit of £21 million, between the second half of 1952 and the first half of 1953; but this was almost wholly explained by an improvement of £60 million in invisibles, of which £39 million was due to the fact that the most recent half year did not include a December 31st. Britain's achievements in bringing its direct dollar deficit under control in the last six years of boom have been great; but it would be a mistake to suppose that the achievements in the latest half year have shown a marked acceleration of this favourable trend.

With the OEEC countries Britain achieved a surplus of £40 million in the first half of this year—much the same as the annual rate of surplus in 1946 and 1948, before Germany's recovery began; but the improvement of £6 million between the second half of 1952 and the first half of 1953 was again wholly due to an improvement of £16 million in invisibles, for which a seasonal cut in British travel expenditure (by £5 million) was partly responsible. Moreover, this surplus has been achieved behind a barrier of rigid restrictions on imports from Europe; the easings promised by Mr. Butler on Thursday may make it difficult for Britain to maintain any surplus with Western Europe at all.

With the residual group "other non-sterling countries"—which includes a wide range of countries in southern South America, Asia and behind the Iron Curtain—Britain ran a deficit of £31 million in the first half of 1953, compared with a quite abnormal surplus of £70 million in the second half of 1952. Exports to these countries fell by £30 million between the two

half years, while exports to all countries outside the group rose by £51 million; by contrast, imports from this area, almost wholly of food and raw materials, rose by £46 million. The "deterioration" in this sector is mainly a sign that import restrictions in these countries have gone up as their war-accumulated sterling balances have come down (from £844 million at the end of 1946 to £371 million in the middle of 1953); it is not a development that is to be regretted from this country's point of view—except that it is disappointing that British exports to the Middle East (to which a Board of Trade mission is now being sent) have not increased more substantially in line with the oil boom.

There remains Britain's surplus with the overseas sterling area, which had been running at the exorbitant annual rate of between £250 and £310 million in 1948-51—and was up to a still more exorbitant £293 million (that is, an annual rate of £586 million) in the first six months of 1952. In the first six months of 1953 this surplus was down to £38 million; exports to this area were £160 million lower than a year before and imports from it (especially of food and raw materials) were £85 million higher. By dint of this economy in imports from—and expansion in exports to—Britain, the overseas sterling area at long last returned to surplus (of £132 million) in its own total balance of payments; since its cumulative deficit—and thus its cumulative strain on Britain—in the period 1947-52 was some £873 million (thanks wholly to the profligacy of the overseas dominions) there must be heartfelt thanks for this belated relief.

The overseas sterling area's total surplus of £132 million in the first half of this year combined with Britain's total surplus of £26 million to give the sterling area as a whole a surplus of £158 million. Part of this surplus was paid for by new drafts on the sterling balances of non-sterling countries (reduced by £38 million to £716 million), and another part had to be devoted to debt repayments to EPU and elsewhere; but the strain imposed by these obligations was more than offset by the receipt of £55 million of American aid, and the gold and dollar reserves increased by £186 million. This was a reasonable rate of gain for a half year in which worldwide inflation had gone off the boil. Three years ago, in 1950, the sterling area proved that it could keep healthy in high summer. Now, in the year to June 30, 1953, it has shown that it can stand up to a cool summer. It remains to be seen how successfully it might weather a hard winter—or even an inclement fall.

Business Notes

Britain Gets the Waiver

BRITAIN has received permission from Gatt to raise tariffs on foreign products, while still allowing them duty-free entry from the Commonwealth. Last Saturday, the final day of Gatt's session at Geneva, this controversial "waiver" was granted by twenty-six votes to nil; although seven countries, including France, the Netherlands, Denmark and Italy, abstained—after fighting a continuous defensive action against the British initiative. Britain's new freedom, however, is rigidly restricted. In the first place, it will apply only to goods that Commonwealth countries have been able to send in duty-free since January, 1939. Secondly, Britain must show that any new preferences created thereby will not cause a diversion of its imports from foreign to Commonwealth sources. Thirdly—and most important—Britain must consult with exporting countries before increasing the tariffs concerned; and these exporting countries will have the right to refer the matter to arbitration if they consider themselves threatened by unduly harsh treatment.

It was no doubt these restrictions that the President of the Board of Trade had in mind when he said in Parliament this week that "the procedures agreed to in Geneva fall somewhat short of what we should have liked to obtain to meet our difficulties in full." These difficulties flow from the Government's pledge to give increased tariff protection to British horticulture, to replace the thoroughly undesirable form of protection that is at present provided for it by import quotas and seasonal embargoes. The machinery for securing the tariff increases has already been set in motion, and the British Government has notified to Gatt the items on which it wishes to increase tariffs; the contracting parties now have thirty days in which to lodge complaints and appeal to arbitration. Although the list has not been published, it is understood that Britain originally hoped to raise tariffs on some 40 items—mainly vegetables, fruit and flowers.

Reviewing Gatt

MEANWHILE the year ahead promises to be the most critical in Gatt's short history. It was unanimously agreed at Geneva that a special session of the contracting parties should be called on or after October 15, 1954, in order to examine "to what extent it would be desirable to amend or supplement the existing provisions of Gatt and what changes should be made in the arrangements for its administration in order that Gatt may contribute more effectively towards the attainment of its

objectives." An invitation has been sent to the contracting parties to submit proposals for such reform not later than July 1st next.

Britain would be wise to tread very cautiously in this matter. The debates at Geneva showed that the vast majority of foreign countries are in favour not only of maintaining some such organisation as Gatt but of giving it a more permanent form than it at present possesses; indeed some countries pleaded—probably unwisely—for an extension of Gatt into something nearer the full charter of the International Trade Organisation, with polite but unenforceable platitudes about the need for maintaining full employment succouring under-developed territories, and so on. It is quite obvious, however, that the results of this fundamental review of Gatt must in the main be determined by the nature of the Clarence Randall Report on America's foreign economic policy, and by the Congressional reaction to whatever that Commission recommends. It is probable that no clear appreciation of those Congressional reactions will be apparent by October 15th next year; and, for this reason, it would be wise to keep the timetable for the review of Gatt as well as the target date for presentation of Britain's proposals as flexible as possible. So far, Britain has quite clearly gained more from Gatt (through the reductions negotiated in the American and other tariffs) than it has lost from it. It may be that, as Britain moves further along the road towards restricting imports by tariffs rather than by illiberal licensing provisions, the restrictions on Imperial Preference and the rest will begin to hurt—instead of, as at the moment, merely being said to hurt. Everything will then depend on whether the door to further lowering of the American tariff looks like being gradually opened or summarily shut.

Boomlet in Bank Shares

FOR the second time this year a member of that select and staid group of institutions, the "Big Five" banks, has set hearts beating faster in the bank share market—by breaking the assumption that the dividends of the big banks never change. The trail was blazed by the National Provincial Bank, which last January raised its final payment by 1 per cent, and last July its 1953 interim by a like amount, implying an increase of 2 per cent (to 17 per cent) for the full year, the first changes since 1932. Now comes Barclays, with a capital reorganisation scheme that will effectively raise its equity payment by 2 per cent beyond the 14 per cent that has been paid since 1920. This has had shattering effects upon the old assumption, for this bank has the longest tradition of dividend stabilisation of

all the clearing banks; it was the only one of them that did not reduce its dividend during the crisis of 1930-32.

It is small wonder that buyers have this week been eagerly seeking the shares of the other big banks—and, indeed, of the discount companies, too. Though the recent reduction of Bank rate has squeezed the banks' profit margins—since rates paid on deposit accounts have fallen by less than those earned on advances, and the yield from other assets is also falling—it is well known that up to that moment the banks' earnings experience this year had been unusually favourable.

* On basis of 16 per cent dividend.

The optimists should be warned, however, that early this year the chairman of at least one of the big banks (the Midland) seemed to be committing himself to the view that bank shares ought to be regarded as virtually "fixed-interest" securities. As the accompanying table shows, the yields on the ordinary shares of the three biggest banks apart from the National Provincial and Barclays (Lloyds, the Midland and the Westminster) are now only between 2s. 6d. and 4s. per cent above the yield on old Consols, compared with a general margin of between 14s. 6d. and 16s. 3d. per cent on each of these shares before the increase in the National Provincial's dividend last January. This may be an intelligent anticipation of dividend increases to come; but, if so, the prospect may only be for one more fling before another twenty years of refrigeration.

The Barclays Scheme

THE effective increase in Barclays' dividend is being brought about by a capital reorganisation that is designed to kill two more birds with the same stone. It is designed to simplify the capital structure, and also to put more of the bank's total capital resources in the shop window—thereby raising the ratio of paid-up capital to deposit liabilities, a ratio that in all the banks has been much reduced by the inflation of the past fifteen years. Except for £667,050 of "C" stock held by the staff, Barclays' paid-up capital (unlike the other Big Five banks, all fully paid) comprises £11,761,811 of "B" stock and £3,340,356 of "A" stock, both ranking *pari passu* up to a 10 per cent dividend but with the dividend on the "A" stock restricted to that amount. The board now proposes to merge the two stocks, and asks stockholders to approve a removal of the dividend limitation now suffered by the "A" stock. To equate the 14 per cent now paid on the "B" to the 10 per cent that is obviously intended to become the new basic payment on the merged stock would require a splitting of

five "B" units into seven merged units; but the board proposes to split into eight units, thereby achieving the effective increase in the "B" dividend to 16 per cent, and regards this as "compensation" to the "B" stockholders for agreeing (if they do agree) to share their equity with the "A" stockholders.

This is an unexpected proposal to come from one of the big banks, which are always scrupulously fair in all their dealings—and, at first glance, this proposal looks less than fair. It is not clear why it was necessary, for Barclays is not the only bank with limited-dividend capital. Apart from their desire to simplify the capital, the directors seem to have been influenced by a historical consideration—that the "A" and "B" stocks both stemmed from a splitting of a single stock in 1913. That is scarcely a relevant consideration; but if it has the effect of persuading them that they ought not to increase the dividend on the "B" stock unless they give "A" stockholders the right to share in any further increase, the "B" stockholders may be persuaded that these proposals are acceptable in practice, however dubious in principle. Most stockholders, indeed, are likely to be content to let the future take care of itself—and be thankful for the present increase that many of them probably did not expect.

Time Limit for the Film Levy

IF the film industry cannot produce an agreed scheme for a voluntary levy by Saturday, the Board of Trade will "seek statutory powers" to impose a levy upon the industry. This ultimatum was given to the industry on October 6th. Since then three out of the four major associations in the industry had agreed to a scheme that would have given the film producers £2.3 million from box-office receipts—not too painfully short of the £3 million for which they originally asked. When agreement seemed within reach, the council of the fourth body, the Cinematograph Exhibitors' Association, refused to ratify the plan. The exhibitors are not convinced that a voluntary levy on the present lines is the best way of assisting British film production. Unless the Chancellor of the Exchequer, who already contributes a proportion of entertainment tax receipts to the fund for aiding the producers, will underwrite the proposals, the exhibitors believe that the industry will simply commit itself to raising an amount of money without knowing where it is to come from.

The level of cinema attendance during the second quarter of the year, lends some support to their view that future income may be uncertain. Attendances, at 323.5 million, were 1.5 per cent lower than in the first quarter, and gross box-office takings, at £27.4 million, were down by the same proportion. But exhibitors can hardly hope that the Chancellor will make any promises at this stage about future levels of entertainment tax, which mops up nearly 34 per cent of gross takings, a proportion that all sections of the industry—unanimous at least in this—consider to be much too high. In an attempt to get a last-minute agreement, the exhibitors' association have recirculated the draft proposals for final decision by their 24 branches. It seems that they may reverse the Council's rejection of the scheme, which was somewhat absent-mindedly voted by a majority of three.

Footings the Gas Bill

ONCE again the nationalised gas industry has fulfilled its statutory obligation to "break even" taking one year with another—although only in terms of conventional accounting practice. In the year to March 31st last, eleven of the twelve Area Gas Boards (Scotland alone was in the red) contributed something to the industry's combined surplus of £2,272,631, which compared with £1,440,916 in 1951-52. This surplus appears in the accounts after a contribution of £500,000 to the Central Guarantee Fund (which now totals £1,620,603); and after providing £2,538,000 for taxation, £12,097,246 for interest charges and £14,430,628 for depreciation. Depreciation provisions, however, are calculated only on the basis of historical costs; if the pre-vesting assets were depreciated on the basis of present-day replacement costs, the conventional surplus of just over £2 million would be turned into a deficit of between £16 million and £18 million. To cover this deficit, the price of gas would have to be raised by the politically horrific amount of 2d. a therm.

The industry at the moment is increasing prices only when costs rise too. Even so it seems to be meeting consumer resistance. In the last financial year the volume of gas sales rose by only 0.4 per cent—from 2,513 to 2,524 million therms—but, thanks to increases in selling prices, the value of sales rose from £147.6 million to £164 million. This increase was very nearly offset by a rise in costs (including depreciation) from £135.3 million to £148.1 million; and recent increases in wages and in coal and transport charges will add another £12.8 million a year to this bill.

In the face of this rise in costs, the boards are trying to fight a delaying action by closing down uneconomic plants and by searching for economies in production. But these economies depend, in turn, on the installation of new equipment; and the industry now intends to spend between £40 million and £45 million annually on capital account in the next five years. In consequence, the proceeds of the recent issue of gas stock will have been absorbed by the end of this year; thereafter the industry will have to turn again to temporary aid from the banks, and by the end of 1954 it may well have to rejoin the queue in the capital market. Inevitably, this raises the question of whether the favourable borrowing terms accorded to all these nationalised industries is not leading to an exorbitant pre-emption of the nation's scarce supply of investible funds. But one part of the investment programme, at least, can be unreservedly welcomed. The projected expenditure of £1 million in the next five years on a search for natural gas in this country—initially in south-east Yorkshire and Lincolnshire—is very small beer in the industry's total development plans; but, if natural gas was found in worthwhile quantities, it would turn out to be an investment paying a very high rate of dividend.

Timber and Monopoly

THE timber trade has provided the Monopoly Commission with its most straightforward case to date. The Commission's investigation* into the arrangements governing the trade in imported timber has led to their outright condemnation as being contrary to the public

* Report on the Supply of Imported Timber. HMSO. 4s. 6d.

interest. The Commission has recommended, without reservation, that these arrangements should be brought to an end. It finds that trade in imported timber is based on a system of "approved lists" of agents of the foreign sellers and of British importers, neither of whom will sell to or buy from traders not on the list; the Commission decides that there is no feature of the trade that justifies this closed shop.

The timber trade told the Commission that the existence of the "approved list" gave importers "sufficient confidence in their market to run the risks entailed in holding stocks and providing the (wholesaling) services which their customers expect." It has also been said that if any merchant or timber user wished to import on his own account, his lack of experience and his presumed readiness to pay a premium for special types or cuts of timber would force up prices generally. The Timber Trade Federation told the Commission that anyone who wanted to import timber was always admitted to the list provided that the existing members were satisfied about his standing and ability to maintain a certain minimum turnover, but the standard they require is known only to themselves.

The Commission did not accept these arguments. Several big timber users, especially among the furniture and packing case industries, said that they would find it cheaper to cover their substantial timber requirements by direct imports, and not through "approved list" importers as they must do at present. Several other intending importers complained that they had been refused admission to the lists. While there was no evidence of lack of competition among "approved list" importers, the Commission believed that timber prices might fall rather than rise, if the system were abolished. There seems in any case no reason why timber users and other merchants should be prevented from burning their fingers—as the trade asserts would happen—by importing direct, and no justification, in the Commission's view, for preventing a timber dealer from widening the scope of his business by doing a little importing (too little to justify his admission to the lists) on his own behalf. In short, the Commission condemned the undertaking given by traders to deal only with each other; this undertaking "should be abrogated and should not be replaced by any other arrangements or undertakings having similar effects." It is difficult to quarrel with this conclusion.

Markets Overseas

If you are seeking new markets abroad or want to know more about your present ones, the quarterly reports by The Economist Intelligence Unit will help you. These reports give concise and up-to-date analyses of economic and business conditions and prospects in other countries, and they contain a wealth of information of value to the exporter and investor. Each report is prefaced by a summary of the main facts and conclusions, and contains a comprehensive statistical appendix supplemented by maps and diagrams.

This service of reports was started by the Unit last year. From the outset the demand was large and came from many parts of the world, and in response to requests from subscribers the list of countries included in the service has been extended. Fifty reports are now published every quarter on a total of seventy territories.

Descriptive leaflets and a specimen copy of the reports may be obtained from

First time in 23 years a new daily paper!

Know all the news—some of it in no other newspaper—and understand it.

Know what is going on behind the scenes.

Know the people who are influencing your life—from high politics and high finance to your television entertainment.

The Recorder is new in approach, new in conception.

It is not afraid to state the facts.

If you are a business man The Recorder is your best daily newspaper.

If you are a woman—there is something specially for you in The Recorder.

If you are a man or woman wanting your news interesting and accurate, trustworthy and true, then The Recorder is your daily newspaper.

Autumn Smiles on Coal

SINCE the build-up of stocks has been quicker than one could dare to hope three months ago, the coal winter now opens with about 19 million tons of coal in hand—not far short of last year's figure. For this relief, a mild autumn deserves a good deal of the thanks, for the losses of output due to the Coronation and the second week's holiday for the miners have not been made good; the Minister of Fuel and Power put the loss at about $5\frac{1}{2}$ million tons, of which $3\frac{1}{2}$ million tons has been made up. This is a valuable achievement, but even the two biggest producing months of the year are hardly likely to provide the extra quarter million tons a week that would be required to equal the 1952 output figures.

The verdict must be that the winter prospect is better than it might have been, but that the margin in hand is not excessive for an active and a cold winter. There is no ground for complacency on this or on many other aspects of the coal problem to which the Minister referred last Monday. Doubtless it was not his intention to suggest any ground for extravagant praise when he disclosed that the Coal Board's investment expenditure in 1954 would reach £58 million—exceeding for the first time the "planned" rate. Even if the plan were all-sufficient, there would still remain a formidable burden of arrears to be overtaken. Nor is the move towards effective decentralisation with the mining area as the proper unit of management so dramatically new as it seemed to emerge from the Minister's speech; Mr Aubrey Jones pointed out from his own backbenches that something of the sort had been heard five years ago. Perhaps the keynote of the debate was simply that there was nothing very new to report in coal—still the shortages and the imports, still the concern for development and new capital, and still the search for the secret of effective and understanding management. No one is to be reproached for the fact that matters stand very much where they did. But perhaps the sympathetic eye can perceive promises of advance; and even the sternest critic has no ground for saying that coal's intractable problems could have been solved by now.

The Government's Gilt-Edged

THE annual—but infuriatingly slight—clue to departmental holdings of gilt-edged was insinuated into circulation this week in a footnote to the National Debt Return (Cmd 8975). The return reveals that what it chooses to call Government "departments" (its definition includes only the National Debt Commissioners and a dribble of others) held £3,557 million of the national debt at the end of last March, or £171 million less than a year before. Although total internal floating debt increased by £103 million to £4,714 million in the year, the "departments" holdings of floating debt fell by £24 million to £321 million; and although the total of "other internal national debt" increased by £54 million to £19,175 million (thanks wholly to an increase of £169 million, to £13,940 million, in the

nominal value of British Government securities quoted on the London Stock Exchange), the "departments'" holdings of non-floating debt fell by £147 million to £3,236 million. This total of £3,236 million is likely to have included all the £1,311 million of Terminable Annuities in issue (against about £1,353 million a year before); but the implication is that the "departments'" holdings of marketable British Government securities may have fallen by about £100 million, to about £1,925 million, during the year.

Although the total holdings of the National Debt Commissioners have now ceased to rise substantially (thanks to the fact that the national insurance fund is heading towards a deficit), it is believed that their total portfolio is now fairly stable at around £4,500 million; this total includes some loans to local authorities by the savings banks and other entities, and also large holdings of government-guaranteed stocks (especially those issued by the nationalised industries). Almost certainly, the bulk of the "departments'" apparent sales of marketable British Government securities last year will have been accounted for by a switch into such government-guaranteed stocks; thanks to the large issues by the nationalised industries, the nominal value of government-guaranteed stock quoted on the London Stock Exchange rose by £281 million in the year to last March, and it would not be surprising if the National Debt Commissioners took up about a third of this.

The official figures exclude (excusably, from the point of view of the market analyst) the holdings of the Public Trustee, the Charity Commission and similar trustee bodies; but, less excusably, they also exclude the holdings of the Bank of England and the Exchange Equalisation Account. The Bank of England held just over £1,875 million of government securities at the beginning of last April; guesses at the sterling holdings of the EEA are bound to be hazardous, but perhaps between £100 and £300 million may be of the right order of magnitude. If so—and if the additional assumptions can be made that official holdings of tender Treasury bills were small but that all holdings of tap Treasury bills and of Ways and Means advances came within the portfolios of the Bank, the EEA or the "departments" (as officially defined)—then a very rough estimate can be made of the total of marketable gilt-edged in the government's *masse de manœuvre*; the estimate comes out at around £3,000 million, or about 18 per cent of the £16,800 million nominal of marketable gilt-edged (both government and government-guaranteed stocks) that were quoted on the Stock Exchange at the end of last March.

Off-Shore Orders

By June 30th last—the end of the American financial year—the American authorities had placed orders for \$2,225 million worth of military equipment in European factories under the off-shore procurement scheme. The biggest order was for \$868 million of ammunition, of which \$100 million has been placed in Britain; it is estimated that about 20 per cent. of the ammunition produced in the Royal Ordnance Factories at the present time is being financed in this way. In France, three new ammunition plants are being built to meet off-shore orders; in Portugal the ammunition factories are taking on roughly 1,000 extra men and some are beginning to make artillery ammunition for the first time since 1936. These ammunition contracts are also helping many of the less industrialised countries of Nato to build up their arms potential; orders have been placed in Greece (for \$34 million), Turkey, Portugal, Spain and Norway as well as in Britain and France.

The second biggest item is aircraft, but here the orders have had to be concentrated in the few countries with established aircraft industries. The lion's share of the total aircraft orders of \$442 million is divided as follows: \$153 million to British factories for Hunters and Sea Hawks, \$86.5 million to France for Mystère IVs, \$45 million to Holland for Hunters and spare parts for Curtiss Wright engines, and \$42 million to Italy for Sabres to be assembled by Fiat and for spares for other American aircraft. Contracts for ships amount to \$254 million; these include mine-sweepers and patrol boats, some of which are being built in this country. France has received \$79 million of ship-building orders, and these account for one third of the tonnage under construction in French yards. Holland has contracts for mine-sweepers and submarine chasers amounting to \$28 million, and Italy is building landing craft. Other naval contracts have been placed in Portugal and in Denmark, where they have led to a revival of the Danish wood shipbuilding industry. The balance of the off-shore procurement programme is made up of \$139 million for radar and electronics (divided between Britain, France and Italy) and \$523 million for vehicles, vehicle repairs (this in Italy) and odd engineering orders. A substantial item among the vehicles is an order for \$100 million worth of Centurion tanks placed in Britain; this is said to account for half of Britain's current production of these tanks.

Distributing the Dollars

THE great majority of these off-shore orders were placed in the financial year to June 30th last, although some were placed in the financial year before that. The crop of orders for the current financial year—the size of which is still uncertain—will not really begin to be reaped in full earnest until January or February next. In any case, since the Americans do not pay for the goods until delivery, the dollars receipts from orders already placed will trickle rather than flood into European exchequers; probably they will be spread over three or four years. Some ammunition and some of the smaller items are being or have been

delivered, and so have a number of the Centurions ordered from Britain. But it will be difficult for the aircraft factories to complete their orders by the dead-line of June, 1955, originally laid down by Congress; the ingenuity of the contract drafters has been exercised to the full to overcome this problem.

The distribution of the orders between different countries (set down in the accompanying table) confirms the suspicion that the purchasing officials have been torn between the irreconcilable objectives of providing dollar support to unstable European economies and getting the

best possible equipment at the lowest price, and there have also been complaints that the companies and governments concerned have been left unnecessarily in the dark about American intentions. But these quibbles should not obscure the facts that most of these contracts are bringing the free world more defensive power per dollar than if they had been placed in high cost American factories, that all of them are helping Europe in its dollar difficulties and that their combined contribution to the building up of Europe's arms potential is substantial.

Slump in Free Gold

THE downward drift in the free market price for gold has recently gathered momentum and has carried the quotation below \$36 per ounce, or less than \$1 an ounce above the official price; this is the lowest figure yet recorded in the postwar premium market. Many influences have contributed to the decline. Hoarding demand from the Far East has dropped sharply since the Korean armistice. The agricultural areas of France, the traditional Western "sink" for the metal, seem unable to mobilise the cash needed to maintain their purchases at the high levels of 1951 and 1952. Hopes of an increase in the official price of gold have completely evaporated for the time being, and speculators who had been holding gold in anticipation of such an increase have been losing patience and closing their bull accounts. In addition, the supplies of gold reaching the free market have been supplemented in recent months by "hammer and sickle" bars offered through most of the Continental markets. These offers of Soviet gold, accompanied by similar sales of platinum and silver, testify to the prevailing shortage of sterling in the Soviet bloc—a shortage partly explained by the new policy of feeding the Russian consumer with imported butter and other consumer goods. The sales of Soviet gold have not been substantial, but they have pro-

vided the marginal factor that, in present conditions, has virtually killed the premium market.

The narrowing of this premium has caused an important adjustment in the arrangements for the sale of South Africa's newly mined gold in the free market. Until now the South African authorities have made some pretence of obeisance to the rules of the International Monetary Fund, by decreeing that South African gold sold in the premium market should be in processed form—plates, wire, strips, ornaments and so forth. The gesture deceived nobody, but some trouble—and a cost of about 35 cents per ounce—was involved in remelting the "ornaments" exported from South Africa back into the bars required by the free gold market. This cost and trouble could easily be afforded when the premium was several dollars over the official price, but it has become intolerable now that the premium has narrowed to about 85 cents. South Africa has therefore announced that from this week its sales will take the form of bars of the customary fineness. These sales must still be made against payment in US dollars; and, for the time being, they will still be restricted to 40 per cent of the newly mined gold produced in the Union. This development, which may of course drive the free market price still lower, weakens one of the few remaining arguments for preventing free dealings in premium gold in the London bullion market. There would be some irony about granting freedom now that freedom is no longer profitable. But irony is preferable to hypocrisy; and, unfortunately, hypocrisy and the IMF's strictures on free markets have become inextricably mixed.

Cars and Dealers

At the beginning of the year, the British Motor Trade Association invited car dealers to say whether they were in favour of bringing back the prewar control of trade-in allowances for used cars. Dealers are heartily sick of controls, having only recently got rid of covenant and declaration forms, and the proposal did not get much support. But it appears to have been shelved rather than abandoned. When this week the president of the Motor Agents' Association (the official retailers' body) said that the trade was against any form of control on used car allowances he was careful to add the qualifying words "at present."

It would be rash to assume that the motor trade has finally set its face against all forms of control. Its present mood must owe something to the fact that the spectre of falling secondhand prices which was looming large at the beginning of the year, has receded. During the summer new cars did not come to the home market as rapidly as was expected, and in consequence good used cars became scarce and their prices hardened. A chart published on page 307 of *The Economist* last week showed that a year-old car that cost less than £800 when new (including tax) would fetch something close to its original list price on the second-hand market. But this state of affairs cannot continue for ever. Secondhand prices now face their normal winter decline and are not likely to revive again until the spring. How low they fall depends on the supply of new cars. One or two individual models among the "popular" cars still

have impressive waiting lists, but some of the cheaper cars can be delivered within a reasonably short period.

The justification for control over trade-in allowances before the war was that a dealer, anxious to sell a new car for which he had already paid, was sometimes obliged to offer an uneconomically high trade-in allowance on the buyer's old car. Some dealers undoubtedly put themselves out of business in this way, but there is little parallel between trading conditions in the car market in the thirties and today. A dealer who offered a higher allowance than the figure laid down in a confidential publication known as the National Used Car Price Book was threatened, if discovered, with a fine, and in the last resort with stop-listing that would cut him off from any future supply of new cars. It is not surprising that dealers have not so far shown any enthusiasm for reviving the system which was in any case as much a device to prevent undercutting from firms with low overheads as a move to prevent uneconomic competition. In view of present public attitudes towards restrictive practices of this kind, the motor trade may yet hesitate before it reconsiders price control again next spring, after rejecting it as recently as last summer.

Storm Round the Weather Ships

THE American Government's sudden decision to shut down the five weather stations that it maintains in the western and mid-Atlantic could have serious consequences for trans-Atlantic air traffic. For the past seven years, ten weather stations have been maintained in the Atlantic under an agreement drawn up by the International Civil Aviation Organisation (a United Nations body) in 1946; five of them are the responsibility of the United States, and of the balance two are maintained by Britain, two by Norway, and one by France and Holland jointly. The stations are operated by weather ships, using radio sonde methods to take readings of weather conditions in the upper atmosphere at heights of 100,000 ft. Ships and aircraft crossing the Atlantic also report on the weather conditions that they meet, but the weather ships have been the only source of information about high-altitude conditions where weather is born. If the five American stations now taking such readings are withdrawn, the upper air across half the Atlantic will become uncharted territory.

It is said that the decision has been taken on grounds of economy, and indeed the American side of the service has been more expensive than the rest. The five American stations require fourteen ships in commission at a cost of \$1 million each a year. The other countries maintain two ships per station, and the four maintained by Britain cost together £250,000 a year. The American administration has told ICAO that "the benefits derived by the United States are no longer commensurate with the cost" of keeping the ships. They are, admittedly, of little value to the internal weather bureaux in the United States, whereas forecasters of European weather derive certain benefits from them. But all trans-Atlantic airlines need the information that the weather ships provide, and jet airline services need it most of all. BOAC's projected North Atlantic Comet service would be hard hit if there were no high-altitude reporting across half the route.

When weather services were discussed by ICAO this

summer, the American delegates apparently had no inkling of what was in their Government's mind. It is difficult to believe that the only course open to the Administration is to withdraw completely from a vital international service and at such short notice. The closing down of the American stations is expected to start immediately and to be completed by the end of the American financial year in June, when the international agreement on the service itself also expires. American airlines would then be able to use what remains of the weather service—that is, full coverage of the Eastern Atlantic and what partial coverage can be improvised further west—while their government contributed nothing towards its upkeep.

Standstill for Export Subsidies?

EUROPEAN export subsidies have become unpopular with European exporters themselves. The Federation of British Industries and its sister organisations in twelve other west European countries (working through their joint organisation, the Council of European Industrial Federations) have unanimously advocated that their governments should impose a standstill on any further increase in "artificial incentives to exporters"; and they have suggested that during this period of truce OEEC officials should attempt a definition (and, if possible, a dismantlement) of practices that are considered to be objectionable by all members.

The known views of leading European industrialists and of the OEEC have obviously played some part in the liberalisations that have taken place on this front this year—in particular, the long-awaited abolition by Holland of its dollar retention scheme in the middle of this month. But the OEEC will not have an easy task. France, whose exchange retention scheme and substantial tax-rebates for exporters make it easily the worst European offender, claims that its large balance of payments deficit and its close links under the Schuman plan with low-taxation countries such as Germany give it a special position. The French also maintain that rigid limitation of any agreement to direct governmental incentive schemes would leave intact the most irritating of its competitors' practices—notably the German Government's alleged subsidisation of long-term export credits and Britain's much attacked (and now virtually vanished) dual pricing of coal and steel for home and export markets. If Europe is to whittle down export subsidies, it will first have to define what they are.

The New Gallery

THE gallery in the London Stock Exchange will be opened to the public on Monday, November 16th. Those members of the House who feared that the public will come to stare—and go away to criticise—only when excitement runs high in the market, and when malicious talk about "speculative excesses" is in the air, were finally defeated in the referendum a few months ago; and the Council is now able to take this useful initial step towards selling the idea of investment to the public at large. The "waiters" who will be stationed in the new gallery are much more likely to be plagued with curious than with critical questions. Who is in

that group under the dome? Where is the "jungle"? What is a "blue button"? Only rarely, one suspects, will the question be: what is the purpose of all this? But when that question comes, the Stock Exchange should have its answer ready. The answer should never be that the market has a right to exist because it brings some benefit to widows and orphans; it should always be that the market has got to exist if Britain's scarce supply of investible funds is to be directed towards those industries that can make most productive use of them. The Stock Exchange is a necessary, not a charitable institution; and it is as such that it needs to be explained to the public.

Coffee and the Cruzeiro

THE Brazilian coffee market has taken in its stride the devaluation of the cruzeiro earlier this month. Such is the demand for Brazilian coffee that "export" prices, in terms of foreign exchange, have almost regained their levels prior to devaluation. In effect, therefore, growers have been able to pass on to foreign consumers nearly all of the increase in domestic prices. To compensate growers for the damage to plantations during the recent frosts, and perhaps also for strictly political reasons, the government's new regulations raised the exchange rate for exports of coffee from 18.36 to 23.36 cruzeiros to the dollar. The immediate result was a sharp rise in the cruzeiro price of coffee, and a somewhat smaller fall in the export price, extra prime falling by some 27s. to about 451s. a cwt f.o.b. Santos.

European buyers at once came into the market for large quantities, American buyers followed a few days later, and prices soon recovered to about 476s. a cwt for extra prime. The buying spree has now died away, but the tone of the market appears to be fairly firm. It is in fact difficult to foresee any radical weakness developing in view of the tightness of supplies. The latest estimates of the 1954-55 crop in Brazil vary considerably, but it will probably be much the same as the previous crop, at about 16.5 million bags (of 132 lb). The effect of the frost damage on the flowering of the trees has been rather less than was feared, but the probable crop is far below the 20 million bags or more that were originally in prospect for 1954-55.

New Ideas in Tankers

THE recently launched 18,000-tons deadweight oil tanker *Helix* being built for the Anglo-Saxon Petroleum Company, is the first of the new class of 51 "general purpose" tankers being built for the Shell group in shipyards in three different countries. The design is of particular interest, for the ship is being used as a floating testbed for a number of new ideas in tanker design developed in Anglo-Saxon's research and development section. They include the slightly bizarre idea of a lift running down the ship's side that is intended to replace the normal gangway as a means of getting ashore. Tankers rise and fall considerably as their cargoes are loaded and discharged, and this movement, coupled with the tide, may make it impossible to keep a gangway at a reasonable angle and can involve accidents to crew for which compensation can be expensive. The lift is expected to cure these troubles, as well as to prevent the

entry of rats. If it proves successful it will be fitted to the other ships of the class.

Other new ideas under trial in the *Helix* include several intended to reduce the risk of explosion. Special equipment allows soundings to be taken in the cargo tanks without opening them up, and the whole of the accommodation for the ship's company can be kept slightly above atmospheric pressure, so preventing the entry of gases that might be inflammable. One result of these measures is that the crew are able to smoke with a freedom hitherto unknown in tanker operation, and this and other amenities (among them the provision of a swimming pool) may well have their effect in encouraging good crews to remain. The satisfactory manning of tankers is not always easy for they spend the absolute minimum of time in port, and the outward end of voyages will often be in the Persian Gulf, where amenities are few. Shell now operates a fleet of 6½ million tons deadweight, a fifth of the world's tanker tonnage. Apart from the high proportion on charter, the group owns 2½ million tons and has a further 1½ million tons under construction. A new company, Shell Tankers Ltd., wholly owned by Anglo-Saxon, has now been formed to operate this growing fleet.

Copper Dividends Shackled

THE "Rho-Anglo" group of Rhodesian copper producers has followed the example recently set by the Rhodesian Selection Trust group in keeping a tight rein on equity payments in spite of an impressive leap in profits. For the year to June 30th last its principal operating subsidiary, Rhokana, has left its dividend unchanged, at 225 per cent of its unrealistically small nominal capital. The parent

Company Notes

DEBENHAMS. In the last year capital profit of £50,954 made from the shares in the shops and stores group, to sale of investments. Unfortunately, the company's preliminary statement is presented in such a complicated way that shareholders will have difficulty in assessing what cover is provided on this new dividend by net earnings. In the report, the consolidated net profit after all charges except taxation is shown to have risen by £275,712 to £3,426,801. The provision for British taxation is then shown as £2,133,947, compared with £1,981,304 in 1951-52; on this reckoning, the group's net profits, as usually defined, have risen by only £123,069 to £1,292,854 (covering the new dividend about twice). Yet elsewhere in the report the directors state that "the balance on the consolidated profit and loss account carried forward to next year and attributable to members of the holding company is £4,242,172," or £231,973 higher than in 1951-52. Which-ever figure is used, the cover on the dividend, for a company whose capital is very highly geared, is not so ample that it can make the yield of 6 per cent unduly

attractive. But this yield is assessed on the basis of a 50 per cent dividend, and at the current price of 33s. 3d. It ignores the (possibly exceptional) 2½ per cent capital distribution, and some speculators may be looking for capital distributions, from a revaluation of the group's many properties, still to come.

ELECTRIC AND MUSICAL INDUSTRIES. It is a very mournful HMV record that the directors of Electrical and Musical Industries have had to put on the turntable for the year to June 30th last. The group's trading profits (excluding those earned by foreign subsidiaries) have slumped from £1,542,877 to £660,039; its net income has fallen from £402,365 to £279,983; and its equity dividend has had to be cut from 12 to 8 per cent. Indeed, a detailed study of the preliminary report reveals an even gloomier picture. Trading profits are shown in the accounts before charging operating expenses; once the increase in these costs is entered into the reckoning, the group's income before tax is shown to have collapsed from £1,166,865 to £446,921. The group's final net income after tax is reported as £279,983, but this includes a credit of

company, Rhodesian Anglo American, which has a controlling interest in Rhokana as well as substantial investments in Mufulira and Nchanga, has also left its dividend rate unchanged, at 62½ per cent. This payment, which takes £3,996,875 from profits, does however put a little more into the pockets of shareholders than a year ago, for the interim and final dividends are declared on a slightly larger capital than was in issue in 1951-52.

Rhokana's dividend has been left unchanged in spite of the fact that its gross income has increased from £11,476,457 to £12,610,811 and its net income from £7,860,922 to £8,391,027; the dividend will take £5,625,004 of this. The gross profits accruing to Rhodesian Anglo American rose even more spectacularly, from £19,490,411 to £25,265,928, although the net income attributable to it advanced only from £6,176,235 to £6,715,417. Clearly, in making their decisions, the directors of the copper companies had to be curbed by anxieties about future prices and profits. But some investors had hoped that a curb would not be synonymous with a shackle.

SHORTER NOTES

The British Productivity Council is to set up a National Industrial Fuel Efficiency Service which will gradually take over the work on fuel efficiency that is now being done by the Ministry of Fuel and Power. It will be financed by the three nationalised fuel industries together with any voluntary contributions from other industries and revenue from fees.

★

The Bank of Belgium has reduced its Bank rate from 3 to 2½ per cent. This is the fourth reduction in the Belgian Bank rate since July, 1952, when the rate stood at 3½ per cent.

★

£220,000 written back from reserves; effectively, therefore, the latest dividend, which absorbs £166,045, seems to have been paid from this exceptional credit. Moreover, since the net profits earned by foreign subsidiaries fell from £450,805 to £359,002, and since the dividends that they paid to the parent company fell from £139,814 to £93,758, the group has fared

almost as badly abroad as it has in this country and in the Commonwealth.

These results, to say the least, suggest a certain lack of dynamism by the management in meeting the growing competition of the company's rivals in almost every branch of the electronic industry. Definitive judgment, however, should be deferred until publication of the full report. In the meanwhile, shareholders will note ruefully that "Emmies" 10s. ordinary shares have come down from this year's "high" of 15s. 3d. to 13s., to yield 6 3/8 per cent on the new dividend of 8 per cent, while the 5s. ordinary shares of Decca Record (EMI's most obvious rival) have risen from this year's "low" of 17s. 6d. to 33s. 3d. to offer the forward looking yield of 4 9/8 per cent.

HAWTHORN LESLIE. In deciding to raise the ordinary dividend from

15 to 18 per cent the directors of Hawthorn Leslie have presumably been cheered by the knowledge that the company's order book is still bulging, and comforted by the thought that the company's long-standing association with the Navy may protect it from the threat of idle capacity that may confront so many shipbuilding yards once orders now on hand have been completed. For, on the face of it, the company's report for the year to June 30th last does not convey the impression of buoyant net profits and greater liquidity that usually accompanies such an increase in equity payments. It is true that gross profits have jumped from £783,543 to £1,005,534; but because of a much heavier charge for taxation—due in part to a bigger provision for EPL—its net profits have risen by only £3,359, to £275,866. Moreover, with so many orders on hand, the inevitable increase in investment in stocks and work in progress (from

10s. ordinary stock at 22s. 6d. yields 8 per cent.

£796,558 to £1,246,725) has led to a marked decline in liquid balances. There are occasions when an explanation why a dividend has been increased can be just as important to shareholders as an explanation why a dividend has been reduced. Despite the ample cover for the new dividend, this welcome surprise seems to be one of them.

LONDON STOCK EXCHANGE

Next Account begins: November 11th.
Next Contango Day: November 11th.
Next Settlement Day: November 3rd.

THE unsettled condition of the markets at the end of last week gave place to a firmer tone on Monday when it became known that the strike of petrol delivery workers was petering out. Dealings in gilt-edged were restricted by the fact that the lists for the United Steel issue (for which a wide range of gilt-edged can be tendered) will remain open until November 9th; but the undertone was quietly firm—and remained so throughout the week.

The *Financial Times* index of industrial ordinary shares, which had dropped on Friday from 128.0 to 127.2, had picked up $\frac{1}{2}$ a point to 127.7 by Monday's close. British American Tobaccos jumped 2s. on hopes of a dividend increase, but newspapers declined on profit-taking and there were also declines in store shares. Further rises occurred in bank shares following the capital reorganisation scheme announced by Barclays last week, and there was also a general marking up of discount companies' shares. On Tuesday, the last day of the old account, there was some further clearing up of speculative positions in store shares, but the *Financial Times* index remained unchanged at 127.7. Dealings were still quiet when the new account opened on Wednesday (bargains marked amounted to only 9,001 compared with Tuesday's 9,342), but buying orders predominated. Led by such "blue chips" as Dunlops, Unilevers and Turner and Newall, prices went generally higher, particularly in tobaccos, textiles and engineering shares; and the industrial share index rose from 127.7 back to 128.1, the same level as on the previous Wednesday. At Thursday's opening the undertone still seemed to be firm.

In other sections of the market oils went ahead at the start of the new account, and Kaffirs recovered after drooping on Monday and Tuesday. Rhodesian coppers were easier on Thursday following the announcement of the Rhokana and Rhokana dividends. Teas were in fair demand during the week; but rubbers were lower where changed, following the cut in the dividend of United Sua Betong.

* In consequence of official purchases of tender bills in connection with cash subscriptions to the new Exchequer stock, it is impossible to calculate the division between tap and tender bills until all the bills purchased have passed their original maturity date.

THE MONEY MARKET

CREDIT was adequate, or more than adequate, in Lombard Street on each of the first four days covered by Wednesday's Bank return; even on Wednesday itself the stringency was limited and official help—given indirectly through the banks—was needed by only one or two houses. Buying rates for December and January maturities were maintained at $2\frac{1}{2}$ per cent and $2\frac{1}{4}$ per cent respectively throughout the week.

Despite these easy credit conditions, there was little change in the pattern of rates at last week's Treasury bill tender. The market maintained its bid for the £240 million of bills on offer at £99 9s. 6d. per cent; but, as total applications fell by over £14 million to £353.2 million, its "quota" rose from 51 to 55 per cent. The offering at yesterday's tender remained at £240 million; it is still impossible to calculate the relationship between new bills and matching maturities because of the large official holdings acquired at the time of the recent issue of Exchequer stock.

The Bank return shows an outflow of £1.5 million of notes into active circulation. Government securities held in the banking department fell by as much as £16.2 million; but accretions to discounts and advances and "other securities" limited the reduction in the total security portfolio to just over £2 million. There was also a small net transfer to "other accounts," so that bankers' deposits fell by £4.7 million.

EXPORT QUESTIONS NEED EXPERT ANSWERS

*Can we tender
for tractors in
Latin America?*

WHETHER you are exporting tractors or transformers, electrical gear or jet engines the markets of Latin America pose special questions about currency, import regulations and exchange control. As the only British Bank with branches throughout Latin America, we are particularly well equipped to answer these questions promptly and accurately, and to advise and assist you in many other ways.

Our *Fortnightly Review*, a digest of reports sent in from our 56 branches in South and Central America, is an invaluable summary of economic information for all who trade in these markets. We shall be glad to send you a specimen copy on application to:—

ON INVESTMENT

as an executor . . .

the principal objective is to ensure safety, a good steady return and the ability to realise on capital without loss should occasion arise.

as an accountant . . .

the problem usually revolves round the safe disposal of surplus funds or reserves: the ability to realise quickly and without loss when required is equally essential.

as a solicitor . . .

a variety of problems may arise — money realised by sale of property, the settlement of estates, the investment of legacies — but in all cases safety for capital plus regular interest and accessibility of money without loss are the main objectives.

COMPANY MEETINGS

TRINIDAD PETROLEUM DEVELOPMENT COMPANY

A SUCCESSFUL YEAR

MR KENNETH A. E. MOORE'S REVIEW

The annual general meeting of Trinidad Petroleum Development Company, Limited, was held on October 29th at the Abercorn Rooms, Bishopsgate, London, E.C.

Mr Kenneth A. E. Moore, FCA, the chairman, who presided, said:

It has been said, with considerable truth, that every balance sheet suffers from the defect that, by its very nature, it can be no more than a snapshot of the position of a business at a certain date—a "still" of a moving object, since, in reality, every business is on the move, either uphill or downhill.

Thus, a balance sheet lacks perspective unless considered against the background of the accounts of earlier years, in the light of the story behind the figures and some reasonable assessment of its prospects in the years that lie ahead.

It will be my object today to give you a fair and balanced view of our affairs by reference, among other things, to these broader considerations—a sort of 3-dimensional picture.

THE YEAR'S RESULTS

But, first of all, let us look at the results of the past year:

The production of crude oil was 3,424,409 barrels—the highest figure for twelve years. Its sale produced a profit of £716,515 after charging all outgoings except taxation. These outgoings included over £750,000 spent on oil wells and development account, which broadly represents the cost of the 44 wells drilled during the year, and over £300,000 for depreciation of plant, machinery, casing in wells, etc.

Of the profit of £716,515 taxation absorbs £425,172, leaving £291,343, of which £205,694 is absorbed by the dividends paid or proposed, and £85,649 is left in the business mainly in the form of an addition of £75,000 to general reserves.

The capital employed is £3,148,604, as shown by the balance sheet.

This has been built up as follows:

Cash subscribed by the public for ordinary stock in 1937	500,000
For preference shares in 1940 and 1949	725,600
	1,225,600
Ordinary stock held by British Controlled Oilfields since 1937	500,000
	1,725,600
Undistributed profits ploughed in over the life of the company	875,879
Reserve for future taxation and contingencies	547,125
	£3,148,604
This is represented by fixed assets—plant and buildings properties, etc., at the written-down value of	2,402,050
Plus net current assets	746,554
	£3,148,604

In the light of the satisfactory outcome of the year's working and of the reasonably sound financial position, your directors have felt able to recommend an increase in the final dividend, making the total distribution for the year up to 18½ per cent, free of tax, on the ordinary stock. The increase in dividend would not have been feasible but for the more favourable terms of the new long-term oil-sale contract entered into with UBOT as from July 1, 1952.

HISTORICAL REVIEW

And now, to give these figures perspective, let us turn back the pages of history. You may not know it, but your company owes its origin to a famous British firm of contractors who were commissioned, many years ago, to build railways in Mexico. In the course of this work they accidentally discovered the Mexican oilfields, and, no doubt, became the richer as the result of it. A few years later it was represented to them that there was oil to be found in Trinidad, so they sent a team there to prospect and explore.

The early results were encouraging, but baffling, owing to the confused and distorted geological conditions met with in Trinidad. They persevered, however, for a number of years and in 1918 founded the Trinidad Petroleum Development Company, Limited, to carry their venture a stage further.

In all they spent and lost a million pounds more or less in the unsuccessful attempt to establish production on a commercial basis. By 1924, after many disappointments, they had come to the conclusion that the game was not worth the candle and sold their shares in TPD for the proverbial song—the purchaser was British Controlled Oilfields.

Thereafter, TPD, owned and financed for the time being by BCO, continued the struggle to reach profitable commercial production, but, although a measure of success was achieved, it was not until about 1935 or later that there seemed to be real hope of turning the corner.

By that time BCO was not prepared to risk further money in Trinidad and, accordingly, a scheme was prepared under which the capital of TPD was to be reorganised and TPD, so to speak, to become an independent public company. The reorganised capital was to consist of one million ordinary shares of £1 each, of which BCO was to retain 500,000 shares and the remaining 500,000 were to be offered to the public for cash at par by public prospectus.

It was at this stage that Lord Rothes, Mr Jacks, and I were approached on the matter and were invited to join the board of the reorganised company, with myself as its chairman, the other directors to be Sir Goronwy Owen, with Mr Tweed and Mr Dalley as joint-managing directors.

To cut a long story short, the prospectus was duly issued in January, 1937, and was oversubscribed. In it production was estimated at 1,500,000 barrels and profits at £90,000. The company then had oil rights over some 24,000 acres on the mainland of Trinidad.

TURNING POINT IN COMPANY'S AFFAIRS

This was the turning point in the company's affairs and, since then, it has been conspicuously successful—the new money provided by the public, the new effort and the new management, put the company very much on its feet and, indeed, in the 16 years ended July 31, 1953, production has averaged 3,006,514 barrels per annum and profits £421,360 per annum. The comparative figures for the year just passed, you will remember, were production 3,424,409 barrels and profits £716,515, and today we hold oil rights over some 74,000 acres on the mainland of Trinidad.

In the meantime, as the developments were so considerable, extra capital was required and this was found wholly by the public in the form of 700,000 preference shares of £1 each issued at a premium.

PROGRESS IN TRINIDAD

In Trinidad, as our affairs have developed and prospered, we have built roads, workshops and power stations, houses in model villages and camps, and have provided sanitation, drainage and water, gas and electricity supplies, and many amenities, such as clubs, playing fields, etc. We have also provided a medical clinic and medical services for our employees and their families, and, in the areas in which we operate, have almost stamped out the scourge of malaria and greatly reduced the incidence of other tropical diseases.

Finally, we have provided technical and other educational facilities, giving opportunities to local boys, including scholarships to British universities.

We have provided a great deal of useful employment, have looked after our employees and their families and have enjoyed excellent relations with them and with their union. In short, we have done a thoroughly good job for the community of Trinidad and I am delighted too that, in the process, our shareholders have had a good return on the savings which they had the courage to entrust to what is, after all, a hazardous enterprise. The capital value of their investment has also greatly increased.

As oil companies go we are, of course, very small fry, and Trinidad is not a large island, but there is the advantage that, in such a case, the benefits of our enterprise are there for all to see, and I make no apology for drawing attention to them.

The larger oil companies, I need hardly say, bring similar, but correspondingly greater benefits wherever they operate successfully in the four corners of the earth, often in hitherto undeveloped territory. It is strange that their great contribution to the welfare of the local communities and to mankind in general so often passes unrecognised and unappreciated.

THE FUTURE

But, to return to our domestic affairs, and to look ahead a little, the fact that during the last sixteen years we have taken nearly 50 million barrels of oil out of the ground means that our search for oil has to go on

over wider areas and ever deeper. In the curious and mainly hitherto geological formation in Trinidad this involves persistent and intensive drilling year after year, both in proved and unproved areas, and we are fortunate in that we still have a large area—more than half the total—as yet untested by the drill. This is a laborious and expensive, but nevertheless inescapable task if production is to be maintained and further reserves are to be discovered.

You will remember that during the war we were required, in the national interest, to confine our drilling to more or less proved areas so as to get the maximum of oil for the minimum of steel and equipment. As a result, after reaching a peak production of 3,660,255 barrels in 1941, production began to tail off and since 1948, when we were able to get new and heavier equipment, we have had to devote a significant part of our efforts to making good this falling off by reaching out to new ground or going deeper. Hence the heavy expenditure in recent years on what we call exploratory and semi-exploratory drilling to distinguish it from bread-and-butter drilling. This has enabled us to increase production from a postwar low of 2,662,170 barrels to nearly 3.5 million barrels. It has brought no spectacular success, but it has increased our knowledge of potential reserves and has yielded vital geological information.

During the past year the total expenditure on drilling was £774,000, exclusive of the cost of casing. Rather more than one-third was on exploratory and semi-exploratory wells, principally in the Moruga area. As the result of information gained in the course of drilling in this area and of seismic surveys recently completed there, our geologists have high hopes that the Moruga district will provide important additions to our reserves. In the meantime we are getting modest production from certain of the wells already drilled in this area.

MARINE AREAS

You will remember that, on a previous occasion, I mentioned that the Government of Trinidad and Tobago had indicated its intention of granting marine oil mining licences to this and to certain other oil companies. The grant in our case covers some 350 square miles situated off the south and west coasts of Trinidad.

Negotiations have been proceeding for some time past with Trinidad Northern Areas, Limited, with the object of arriving at a mutually attractive scheme for the proving and development of these areas.

The partners in Trinidad Northern Areas, Limited, are the Darcy Exploration Company, Limited, the United British Oilfields of Trinidad, Limited, and Trinidad Leaseholds, Limited.

These negotiations have now reached the stage of agreement in principle and are on the basis that the initial exploratory drilling will be carried out by TNA. This entails, I need hardly say, specialised experience in marine drilling which TNA is in a position to contribute, together with the extremely expensive plant and marine equipment necessary for such operations.

In consideration TNA will receive a share in any oil produced and TPD will be relieved of the risk and heavy cost of the initial proving operations.

The broad plan has, I know, the blessing of the Government of Trinidad and Tobago and it is, I venture to think, a happy solution of a formidable problem.

It will, I need hardly say, be two or three years at least before we shall know the outcome of the initial exploratory stage.

CHAIRMAN'S VISIT

I went out to Trinidad early this year with our managing director, Commander Lavington, and inspected all phases of the companies' activities and also had conversations with the Governor and leading Government officials. I have paid a number of such visits to the field since I became your chairman 16 years ago, and on each occasion I have noted with pleasure the progress made in all directions. My reactions on this occasion were no exception.

We owe a great debt to Commander Lavington, who was general manager in Trinidad throughout the period from 1937-46, in which this company was nursed from a rather rickety childhood to robust manhood. He was the man on the spot who set the standards of integrity, work, and loyalty in the formative years in which decisive progress was achieved. When he came back to London soon after the war to become managing director, he was a difficult man to follow in Trinidad, but his successor, Mr Bennett, who took his place as general manager, has made an excellent job of it and a most notable contribution, not only to the affairs of this

company, but also as a member of the Legislative Council of the Government of Trinidad and Tobago. Our warmest thanks are due to him and to his able and enthusiastic staff and to all who work for us in Trinidad. Their achievements in the realms of geology, field engineering, and drilling and operational technique have made a significant contribution to the success achieved in recent years.

From all that I have said, you will appreciate that our affairs are in good order and that there is useful work to be done for many years to come. The results of those labours will depend, among other things, upon continued good management, reasonable success in the unending search for oil, and stable government in Trinidad. They will be affected for better or for worse by fluctuations in the price of oil and in the dollar/sterling exchange, since our oil is sold in terms of United States dollars and by reference to Gulf Coast export prices. Some of these factors are within our own control and some are on the lap of the gods.

The report and accounts were adopted.

NATIONAL CANNING COMPANY, LIMITED

A YEAR OF CHANGING CONDITIONS

INCREASE OF CAPITAL APPROVED

MR W. V. SMEDLEY ON RETURN OF COMPETITIVE TRADING

The twenty-second annual general meeting of the National Canning Company, Limited, was held on October 27th, at St. Ermin's Hotel, Caxton Street, London, S.W.1, Mr W. V. Smedley (chairman and joint managing director) presiding.

The secretary (Mr F. G. Pickett) read the notice convening the meeting, and a representative of the auditors, Messrs Price, Waterhouse and Company, read their report.

The following is the address by the chairman which had been circulated with the report and accounts for the year ended May 31, 1953: Ladies and gentlemen,—In January of this year the founder and chairman of the company, my father, Mr S. W. Smedley, retired from the board and also gave up his directorships of the various operating companies.

The growth of this organisation since the group commenced business in 1925 with one small factory is ample evidence of his immense drive, knowledge and experience. Only those who have worked in close contact with him, as I have since the firm started, can fully appreciate the great energy and singlemindedness he has brought to the task. I am glad to be able to tell you that, at the unanimous invitation of the board, he has consented to act as advisor to the group.

Upon my appointment as chairman, my brother, Mr G. P. Smedley, became joint managing director with me.

TRADING CONDITIONS

The year under review, ended May 31st last, has been one of many changes for the company. As you are aware we have been expecting conditions to become more difficult for some time past. In point of fact, my father in his last annual address said, *inter alia*, "Ever since the end of World War II in 1945 I have been looking for signs of

recession in our business, but I am bound to admit that so far, since that date, we have gone from strength to strength."

About last Christmas the long-expected recession became clearly apparent and there was a marked changeover from a sellers' to a buyers' market in certain of the lines we pack. Before the war there was usually a difficult selling period in the early months of the calendar year. We met this problem in various ways. Firstly, by a considerable increase in our sales force, secondly, by increased advertising, and, finally, by price reductions on certain lines.

THE ACCOUNTS

As a result of the change in market conditions the profit on trading, as shown in the consolidated profit and loss account, after charging depreciation, directors' remuneration, the auditors' remuneration and expenses, declined from £1,149,492 to £789,261. In my opinion, in all the circumstances this result is satisfactory. The return to a more competitive market clearly affected the outcome and will, indeed, continue to do so, but I have no doubt, however, of our ability to meet the challenge of changing conditions successfully.

Two other items in the consolidated profit and loss account call for comment. First, the figure of £75,201 in respect of adjustments of taxation on profits of prior years. This is accounted for to a substantial extent by an over-provision for excess profits levy and the reduction in the standard rate of income tax. Secondly, the transfer of £20,000 to a pensions reserve—in a large business such as ours the building up of a reserve of this nature is necessary.

In the consolidated balance sheet you will see that stocks in hand show an increase from £678,573 to £998,739, that is, £320,000. These stocks consist not only of processed

goods, but also of a number of items such as empty cans, jars, cartons, labels, etc., and are conservatively valued. Hitherto we have always made a practice of keeping processed stocks at as low a level as possible and, while at May 31st last we held decidedly more stocks of processed goods than we normally like to do, I am glad to be able to tell you that the position is righting itself and that there is no reason to believe that we shall be carrying excessive stocks of any kind at May 31, 1954.

EXPANSION OF PRODUCTION

During the past year, as mentioned in the chairman's statement at our last meeting, we added to our frozen food plants by building a factory at Spalding. This plant has operated most successfully during the current season. Since the year ended we have purchased a small fruit and vegetable merchandising business in Scotland which will be a help in our general operations there.

Since the war ended in 1945 we have expended approximately £940,000 on capital account, modernising and increasing our productive capacity, and we are constantly installing, and we shall continue to add in the near future and at an increased rate, new plant and machinery as it becomes available, in order to speed up our processes and increase our packs.

During the current canning season we have varied the nature of our pack considerably, reducing certain lines which met with consumer resistance and increasing other packs more to the public liking.

If we are to accept the view, as seems likely, that profit margins will be narrowed in future, we must seek methods of processing a larger pack at reduced cost. We have ample funds for this purpose and you may be sure that, where needed, they will be used to the best advantage.

BOARD'S PROPOSALS

You will see from the accompanying notices that two proposals will be put before you at special meetings which will follow the annual general meeting. One, that the annual remuneration of the directors of the National Canning Company, Limited, shall be increased as follows: the chairman from £200 to £1,000 and for each of the directors from £50 to £500.

The other resolution contains proposals to capitalise part of the reserves of the company. Subject to your approval, when this capitalisation has taken place the free reserves of the group will stand at £2,522,231.

I would like to express appreciation for the help of my fellow directors and, in particular, to those upon whom the main burdens of the reorganisation, to which I have referred, have fallen, as well as to the managers and staff who have cheerfully dealt with the new problems and difficulties that the year has brought, with great goodwill and energy.

The report and accounts were adopted and the dividend of 25 per cent was approved.

The retiring director, Mr G. W. Osborne, was re-elected and the remuneration of the auditors, Messrs Price Waterhouse and Co., was fixed.

At the subsequent extraordinary general meeting resolutions were passed increasing the authorised capital to £950,000 by the creation of 200,000 additional ordinary shares of £1 each and capitalising £257,125 of reserves by the payment up in full at par of 257,125 ordinary shares of £1 each to be issued in the proportion of one new share for every two held. The proposed alteration to the articles of association was also sanctioned.

BERALT TIN & WOLFRAM

MR F. GATES ON THE OUTLOOK

The twenty-fifth annual general meeting of Beral Tin & Wolfram, Limited, was held on October 29, 1953, at Winchester House, London, E.C.

Mr F. Gates, chairman of the company, presided, and, in the course of his speech, said: It is a great pleasure to present to you accounts which record the result of another successful year's operations. The market price of wolfram, our principal product, which during the previous financial year ranged between 560s. and 485s. per unit, fell steadily during the year under review from the latter price to 330s., so that a substantial fall in profits as compared with the previous year was inevitable. This fall would have been considerably greater but for the fact that more than one-half of the year's production was covered by long-term contracts at prices appreciably higher than the average market price for the year.

As from October 1, 1953, only 40 tons of wolfram concentrates per month, less than a quarter of the total production, remains covered by a fixed-price contract and the average selling price will, therefore, in the absence of unexpected developments, approximate more closely to the market price current from time to time. As you will be aware, this has fallen further since the end of the financial year to 260s. per unit.

The future course of the wolfram price is subject to so many uncertain factors that I would not venture to forecast it, but I can at least assure you that the high quality of the company's wolfram concentrates, which has been more than maintained, is recognised both in this country and the United States.

IMPROVEMENT OF PLANT AND EQUIPMENT

The company's prosperity during recent years has offered an opportunity to modernise and improve plant and equipment which has not been missed. You will notice an expenditure during the year under review on fixed assets (including work in progress) of over £80,000. This represents mainly the cost of extending the old Panasqueira Mill and making minor additions to the River Mill, erecting the new canteen at Barroca Grande and improvements in housing for workmen and staff.

The capital commitments of £40,000 referred to in a note on the balance sheet relate for the most part to plans now well advanced for converting the River Mill from d.c. to a.c. electric power, which will result in greater efficiency and reduced costs, and for the installation of two English Electric diesel generating sets. These two sets, one of which is already installed, together with the Belliss and Morcom diesel engine available at Barroca Grande to drive one of the compressors there, will provide sufficient stand-by power for full maintenance of the company's production even if, through prolonged drought or other cause, the "grid" power were entirely cut off.

HEAVY TAX BURDEN

I come now to the subject of taxation. Out of a gross profit of nearly 2½ million pounds, almost two million pounds has to be provided for taxation in Portugal and the United Kingdom, the exact figures representing total tax of over 16s. 3d. in the pound, a rate which no company, least of all a company working a wasting asset, could support indefinitely.

You will probably have seen reports that the Portuguese export tax on wolfram con-

centrates has recently been modified. It was originally levied at a fixed rate equivalent to £500 per ton, irrespective of the wolfram price, which represented roughly one quarter of the value of wolfram at the time the tax was imposed.

The tax is now calculated on a sliding scale formula based on the price at which the wolfram concentrates are sold and on this new basis, with a selling price of 300s. per unit and the present rate of exchange, works out at about £350 per ton, which, although substantially lower than the former tax, represents a larger fraction, about one-third, of the value of the wolfram.

You will, I am sure, agree with me that Portugal has every right to share in the company's prosperity, but an export tax on this scale imposes on the company an unduly heavy burden and one which would become very difficult to support with lower wolfram prices.

The company's taxation position is aggravated by the fact that the Portuguese export tax is ineligible for unilateral tax relief in the United Kingdom. The company is thus entirely deprived of a UK tax relief which was expressly designed—and increased to 100 per cent in this year's Finance Act—with the purpose of assisting British companies operating overseas. It is to be hoped that the Royal Commission on the Taxation of Profits and Income, to which representations have been made on this aspect of tax relief, may recommend measures to remedy this gross injustice.

ORE RESERVES

It is interesting to note that the reopening of the Panasqueira Mill has made it possible to treat ore from the upper part of the mine, work on which had been left in abeyance when that mill was closed until sufficient ground had been opened up on No. 1 Level. Ore from this source, which is of quite good grade, has made a useful contribution to production, but the bulk of output has come from the ground between Main Adit and No. 1 Level, which continues to open up satisfactorily.

Although we have drawn heavily during recent years on the ore reserves so far made available, I do not feel it necessary at present to sound any note of warning on this aspect of our operations. It is true that we have extracted almost all of the ore above Main Adit, including the old Panasqueira area, but we are assured of ample reserves for the next few years in the block, 200 feet deep, between Main Adit and No. 1 Level. Furthermore, work between that level and No. 2 Level, 325 feet lower, is giving promising indications of the continuity of veins to that depth. Much more remains to be done, however, before I can speak with any certainty of the quantity or the grade of the ore in this lower block.

Work has continued in the Vale da Ermida and a quantity of ore from that section has been tested in the Panasqueira Mill. These tests confirm the belief that tin and wolfram values persist over an extensive block of ground running into millions of tons, but have made it clear that these values are not high enough to permit of profitable working by our normal mining methods. We are not without hope, however, that some method of low-cost bulk mining and subsequent treatment of the ore may eventually be devised to meet the special problems presented by the nature of the ground in this area.

The report and accounts were adopted.

RONEO LIMITED

REASONS FOR REDUCED TRADING PROFIT

CONSTANT WATCHWORDS—COMPETITION AND COSTS

EFFORTS FOR FURTHER IMPROVEMENT IN EFFICIENCY

NEW EXPORT RECORDS ACHIEVED

SIR GREVILLE S. MAGINNESS REVIEWS ECONOMIC TRENDS

The forty-sixth annual general meeting of Roneo Limited was held on October 27th at the Holborn Restaurant, London.

Sir Greville S. Maginness, KBE, chairman of the company, who presided, said:

Ladies and gentlemen,—The directors' report and accounts for the year ended June 30, 1953, have been in your hands for the requisite period and I assume that you agree to take them as read. (Agreed.)

As on previous occasions, I propose to draw attention to items in the consolidated accounts which I consider will be of interest to stockholders.

PROFIT AND LOSS ACCOUNT

The profit on trading shows a decrease from £806,986 to £550,226 and the net profit for the year—after providing for taxation, depreciation and amounts written off, is £189,681, as against £213,524 for the corresponding period in the previous year. The relatively small reduction in the net profit is largely due to the incidence of taxation. In appropriating this net profit your board consider it prudent to supplement the general and plant replacement reserves to the extent of £80,000 and £40,000 respectively, bringing these items in the balance sheet to a figure of £400,000 each. The preference dividends on the 6 per cent and 10 per cent stocks have already been paid, in addition to an interim dividend of 5 per cent, less tax, on the ordinary stock. It is now proposed to maintain the dividend on the latter by a final payment of 12½ per cent, making a total of 17½ per cent, less tax, for the year. After payment of these dividends the amount to be carried forward to next year will be £294,530, compared with £275,925 brought in from the previous year.

BALANCE SHEET

The net liquid assets as at June 30th last amounted to £1,862,363, whilst the revenue reserves—including the carry forward on profit and loss account, but excluding taxation—amount to £1,124,530.

The only other item in the balance sheet which might call for comment on my part is that relating to stocks. These have received the unremitting attention of your board in order to ensure that their movement is in line with existing trading conditions. I can assure you that they are, as usual, valued on a conservative basis. The decrease in the stock mainly accounts for the increase in the cash holdings of your company.

TRADING

In my address last year I referred to the recession in demand which took place in March, 1952, and I informed stockholders that they must not expect the record sales of that year to be repeated during the year covered by the present accounts. I went on to say that profits were certain to be lower, although not sufficient to prevent the pay-

ment of a satisfactory dividend on their investment.

Both these forecasts have proved to have been correct. The fall in trading profit is due to reduced sales, higher costs of wages and materials without any increases in our selling prices. Whilst our sales during the first quarter of this financial year do not compare unfavourably with those realised during the corresponding period last year, our trading results for the current year depend much more upon the future course of competition and costs—those two "c"s which must be our constant watchword. I shall refer to this question later in my remarks. To meet these conditions so far as lies in their power the board will continue to spare no effort to still further improve the manufacturing and selling efficiency of your business. The ploughing back of profits in past years and the consequent strengthening of the liquid resources will stand the company in good stead in the pursuit of these aims.

MACHINES AND SUPPLIES

I am pleased to be able to inform you that there is still nothing in the duplicator field which will compete with the efficiency and economy of the single cylinder fully automatic inking system on the Roneo 500 which is thoroughly appreciated by the discerning purchaser.

Last year I referred to our exclusive electronic stencil. You will be pleased to learn that a prototype of a machine to produce electronic stencils for use on the larger policy model Duplicator has now been developed and approved thus extending the application and use of this outstanding achievement over a wider field.

STEEL EQUIPMENT

On May 6th last the Government relinquished control of the supply of steel sheets. This has enabled us to resume the manufacture of those lines of steel equipment which our clients both at home and abroad have had to do without during the past 13 years. I refer particularly to lockers, shelving and cupboards. It will take time to recover our lost markets especially in the export field where our competitors have established themselves, but we shall spare no effort to take full advantage of the wider opportunities now once more available to us.

The continued growth of the supply of banking equipment both in this country and abroad is encouraging. An increasingly large number of banks who recognise the advantages of equipping their establishments with the most modern steel equipment are accepting the offer of Roneo Service freely placed at their disposal to survey their needs of both standard and special lines.

EXPORTS

It is with much pleasure that I am able to report a further albeit small increase in our

export sales during a very difficult year, and we have once more attained record figures both in volume and value in this section of our business. These results are all the more gratifying on account of the difficulties which still persist by way of prohibitions, controls, currency restrictions and growing local manufacture in many parts of the world. I wish to refer particularly to our sales in dollar markets, which show an increase of approximately 20 per cent compared with the previous year. It has been no easy task to achieve this improvement, but these encouraging results will inspire us to make still greater endeavours to establish ourselves in these markets on a firm basis.

NATIONAL SITUATION

In considering the results of the past year and the prospects for the immediate future of our own company, I think it is useful briefly to pass in review the main events and trends in our national economic situation because the essential condition for the prosperity of every company in this country is that our national economy should be on a sound and healthy basis.

When we met at this time last year we were emerging from perhaps the most critical of the successive crises through which this country has passed since the war. It was at that time by no means certain that the temporary check to the loss of our gold and dollar reserves which occurred during the summer of 1952 would be converted into a definite upward trend.

However, the past twelve months have seen a consolidation of our position, and while at September 30, 1952, the amount of these reserves stood at only £602 million, they have mounted steadily though slowly to the figure of £888 million as at September 30th this year. We must, of course, feel satisfaction that such a recovery has occurred, but when we consider the nature of the measures, involving as they did very substantial reductions in imports by this country and by other members of the sterling area, which played so great a part in achieving this result, it must be recognised that the result itself is modest enough.

Between June 30, 1951, and March 31, 1952, our gold and dollar reserves fell from £1,381 million to £607 million; that is at an average rate of £86 million per month over a period of nine months. In the year from September, 1952, to September, 1953, the increase in these reserves has been at the rate of some £24 million per month. During that time we have received from the United States Aid totalling £122 million, or some £10 million per month. Thus, leaving aside the receipts from United States Aid, the increase in the gold and dollar reserves which has been actually earned by ourselves and the other sterling area countries during this past year has been at the rate of about £14 million per month, or less than one sixth of the monthly loss in the period June 30, 1951, to March 31, 1952.

We have also to recognise that circumstances have been particularly favourable to us in this period. As between August, 1952, and August, 1953, the average price of our imports fell by 10 per cent, while the average price of our exports fell by only 3 per cent, so that the terms of trade turned in our favour by about 7 per cent and this was itself one of the major contributory factors in the building up of the gold and dollar reserves.

It would, however, be imprudent for us to expect that trend in the terms of trade to continue indefinitely, and it may well be that these favourable influences have nearly spent their momentum and that the trend itself may be reversed.

GOLD AND DOLLAR RESERVES

I have referred at previous annual general meetings to the dependence of this country on its ability to import from abroad the essential supplies of food for its people and of the raw materials for its manufacturing industry, and I think it is a sobering thought to reflect that at their present level our gold and dollar reserves which have to support the trade of the whole sterling area—of which this country's own trade is only about one-half—are sufficient to meet the cost of this country's imports for about three months, whereas before the 1939-45 war they were sufficient to meet this country's imports for eight months.

During the past year the Government has, in consultation with the Governments of the other countries of the Commonwealth, formulated plans to put an end to the recurrent balance of payment difficulties which we have experienced since the war, and has made it clear that if the long-term measures envisaged by it to strengthen the position of the sterling area are to be successfully undertaken and our other external commitments met, it will be necessary for this country to increase the volume of its own exports to a level 20 per cent above that of 1951. This may not convey much to some people, but it means no less than double our prewar volume of exports. Expressed in these terms, the magnitude of the task ahead of us will be better understood, and we must never forget that our customers overseas are not prepared to pay more or to accept longer deliveries for our goods when they can obtain similar products elsewhere on more favourable terms.

In recent years I have drawn attention to the accelerating growth of competition in our overseas markets and, whilst a few years ago many firms did not feel the impact of that competition, reports from all sides now speak of increasing difficulties not merely in expanding overseas markets but in retaining our position in markets in which we had thought we were established. In this situation we must make every effort to keep down our manufacturing costs, but firms face in this matter the greatest difficulty because so many elements of cost over which they have no direct control are constantly mounting.

It is perfectly true that increased efficiency in industry can itself make a substantial contribution to reducing costs. This is not solely a matter of installing more efficient machinery, but is also a matter of making the best and fullest use of our existing resources. In this matter a considerable responsibility rests upon industrial management and there is much that can be done by improved methods and more efficient planning of production. Nevertheless, to my mind it is essential that everyone engaged in industry today, at whatever level he works, should challenge himself as to whether there are ways in which he can improve his own individual efficiency and increase his contribution to the solution of our national problems. Much has been said in the last

few years about improving efficiency and increasing productivity, but I am sure that we have not yet succeeded in bringing this home as a matter of personal responsibility to the people of this country.

GROWING DIFFICULTIES

Too often in recent years a temporary improvement in our economic situation has produced a sense of complacency and a slackening of effort. There appears to me, however, to be nothing in our present situation which justifies any such feeling. In whatever direction one looks—whether it be to export prospects, to the urgent problem of fuel supplies or to the present trends of internal costs and prices—there are indications of growing difficulties for British industry, and I think it would be foolish to delude ourselves with the idea that we have yet made any serious impression on the major problem with which we have been faced ever since the war of adjusting ourselves to the realities of our present position in the world. I am convinced that it is well within our capacity to re-establish our national prosperity, but I think that the first essential step in doing this is to bring home to everyone a full realisation of the magnitude of the effort which is necessary.

In conclusion, I again wish to convey on behalf of the board sincere thanks to all employees, both at home and abroad, who by their loyal co-operation have made their valuable contribution to the results achieved during the past difficult year.

The report and accounts were unanimously adopted.

FOISTER, CLAY & WARD, LIMITED

RECORD PRODUCTION

The twenty-seventh annual general meeting of Foister, Clay & Ward, Limited, was held on October 29th in London, Mr A. Clarke Vincent, FSAA, the chairman, presiding.

The following is an extract from his circulated statement:

Net consolidated trading profits amounted to £411,701. Taxation absorbs £252,835. Your directors recommend a final dividend of 9 per cent, making 15 per cent, less tax, for the year.

The improvement which I foreshadowed in my last report was continued throughout the remainder of the past year, though not entirely without some setbacks, notable among which was a scarcity of nylon yarn.

Production and turnover for the year reached an all time record and is continuing to increase. We have installed a new research laboratory to improve the quality of our products and to maintain high standards.

The major part of our capital expenditure was at Mansfield. We were able to obtain machines and increase the output of "LOR" stockings.

We have developed new lines, including fashioned knitwear, and have set up new departments for woven fabrics, particularly at Middlesbrough.

Our spinning mill at Keighley, and all our factories at Leicester, Mansfield, Derby, Kegworth, and Middlesbrough are working to full capacity. This production is all sold for many months ahead and, although profit margins are less than they were two-three years ago, I am reasonably confident, given stable prices of our raw materials, and barring any unforeseen calamity, that the current year will be at least equal to the one now presented to you.

The report and accounts were adopted.

WATNEY COMBE REID AND COMPANY

EXPANSION OUTSIDE LONDON

The annual general meeting of Watney Combe Reid and Company, Limited, was held on October 23rd at the Windsor Castle Restaurant, Victoria, S.W., Mr S. H. Combe, MC, chairman, presiding.

The following are extracts from his circulated statement for the year to June 30, 1953:

Although your company managed to hold their own in regard to trade generally, the London area again proved disappointing. You will remember that my remarks last year when looking to the future were, in certain quarters, thought to be too pessimistic. I was then unable to foresee in the near future an upward trend taking place in Southern England and was doubtful whether the position had been reached where no further decline was likely. I regret to say that that forecast has been only too correct.

DEMAND FOR BOTTLED BEERS

Expectations based on the Coronation festivities and the consequential influx of visitors to London were certainly not fulfilled and since then the weather has not contributed to the seasonal trade upswing of a normal summer. The trend in London towards bottled beers still continues, but is more than offset by the decreased demand for draught beers. As yet we do not seem to have reached the time when we can say that the outlook for the beer trade in London is, set fair. I am, however, glad to be able to report a further increase in our export trade and further extensions of our trade outside the London area. A satisfactory aspect has been the keen demand, particularly in the West Country and the Midlands, for Watney's brown ale which is now available to a much larger section of the public than heretofore.

We were able to agree terms for the acquisition of the Ordinary Stock of Tamplin & Son's Brewery, Brighton, Limited. By this purchase we have acquired some 400 public houses situated wholly in the county of Sussex, where we were indifferently represented before, especially in the Brighton, Hove and Worthing area. From a trading point of view, the board consider that the purchase offers valuable potentialities.

The parent company and its subsidiaries have been successful in obtaining several new sites for licensed houses on new housing estates.

Time and money will be needed to expand the market for Coca-Cola. I would, therefore, repeat my last year's warning to those optimists who visualise a great benefit to Watney's profits in the near future.

PROFIT AND DIVIDEND

Trading profit at £1,579,943 compares with the figure of £1,542,879. The net profit, after providing for taxation and all the necessary provisions and expenses, is £45,548 larger, at £647,299 than last year's figure. The slight increase in profits is almost entirely due to savings that we have been able to effect.

The report was adopted and resolutions for appropriations to reserve, for the conversion of 175,900 deferred ordinary shares, issued in part payment for the Tamplin Brewery Ordinary Stock, into Deferred Ordinary Stock, and for the payment of a final dividend of 10 per cent and a bonus of 2 per cent, making 17 per cent for the year, on the company's Deferred Ordinary Stock, were approved.

CARRIER ENGINEERING COMPANY

POSITION OF FINANCIAL STRENGTH

MR S. L. GROOM ON TREND OF CURRENT TRADING

The annual general meeting of the Carrier Engineering Company Limited was held on October 29th.

Mr S. L. Groom (chairman and managing director) presided, and in the course of his speech said:

When I addressed you last year I referred to the fact that in spite of a tentative contraction of capital expenditure our accounts for that year showed a better result than in 1951. The accounts we are considering today show a modest improvement over 1952, but it is proper to draw attention to the fact that the tendency which was apparent in 1952 has developed and has become pronounced in 1953.

The figures with which I am about to deal will no doubt be regarded as satisfactory. The gross trading profit at £383,000 and the net trading figure at £347,000 are slightly more than last year. Our net income after taxation is £165,783 and is some £27,000 more than the corresponding figure in 1952.

The income tax assessment for the fiscal year to April 5, 1955, is upon the profits shown by these accounts and provision for this amounts to £167,400.

AMPLE DEPRECIATION PROVISION

You will observe that we have followed our usual practice in making ample provision for the depreciation of our fixed assets and the effect of this policy is clearly shown in our balance sheet. Here you will observe that the cost of patents and goodwill has been written down to the nominal figure of £1 and, of course, the substantial sums we have expended in protecting our name and equipment have been written off throughout the years.

The book value of our freehold and leasehold properties is shown at £63,274. One of our leasehold properties was itself valued in 1950 at nearly £90,000, and there is no reason to believe that this value has diminished since that time.

Factory and works fixtures, fittings, designs, patterns and loose tools also appear at the nominal figure of £1.

The figure of stock is nearly £52,000 less than in 1952. The fall in the general level of prices and a marked improvement in the supply position has encouraged us to use up a substantial portion of our stocks.

Our current liabilities, including provision for the dividend we are recommending, amount to £349,300, and the surplus of current assets over current liabilities is over one million one hundred thousand pounds.

TREND OF CURRENT TRADING

I feel that I should now say more about present trends and their effect on your business. There has, as I anticipated, been a pronounced reduction in the allocation of capital expenditure throughout industry, and this is bound to have repercussions on businesses such as ours, which specialise in the design of what I may term "purpose-made" equipment, and although the volume of work completed during the first four months of this current year is only slightly less than our average for the last financial year, our order book for future delivery compares less favourably.

The engineering service we render results in an increase in the tempo and uniformity

of production, and for this reason progressive managements will no doubt give high priority to the installation of equipment which achieves these objects.

We are further encouraged by this month's "Bulletin for Industry," issued by the Treasury and first mentioned in the daily press on October 14th, to anticipate that the situation will improve, but we cannot be certain that we can regain this inevitable loss of productive time during our current year's trading.

The success of a contracting business such as ours depends to a great extent upon liquid financial resources and the hitherto generally accepted policy of dividend restriction has helped to provide additional working capital which has been of the greatest value to your business. The amount we are proposing to carry forward, although large, is not excessive having regard to the nature and scope of our present and contemplated activities, but it will most certainly be used to maintain our ordinary dividend should such a course be necessary.

I was mindful of this possibility last year, when I emphasised our exceptionally strong and liquid financial position.

TRIBUTE TO EXECUTIVES AND STAFF

I take great pleasure in paying tribute on your behalf to my colleagues on the board for their untiring and energetic support and to the company's employees who have given their unstinted co-operation to ensure the efficient and progressive conduct of your business.

The directors' report and accounts were adopted and the dividends approved.

THE OLYMPIC PORTLAND CEMENT

DELIVERIES IN BULK

The forty-second annual ordinary general meeting of The Olympic Portland Cement Company, Limited, was held on October 28th, in London.

The Hon Gerald H. G. Williamson (the chairman) said that adverse factors had had their effect and the excellent profits of 1951-52 had not been maintained during the year under review. Trading profits before depreciation and depletion had fallen from £236,404 in 1951-52 to £152,722 in the present year, but it should be remembered that 1951-52 had been a record year. Net profits at £39,038 showed a decrease of £44,423, after charging £28,137 for depreciation and depletion, £72,148 for adjusted British taxation and management expenses.

As more and more buyers were calling for barge delivery in bulk which they were not properly equipped to handle efficiently, their managers in Seattle had requested authority to proceed with the installation of bulk loading facilities as a first priority and that authority had been granted in December last. The installation was completed early in September of this year.

Their Canadian subsidiary, Beac Quarries, Limited, had had its most successful year, the net profit of \$27,572 being the highest ever made, although it was in part due to some extraordinary revenue from the sale of timber.

So far as prospects for the current year were concerned, deliveries of cement were running some 17 per cent lower than a year ago, but they were hopeful that with the new bulk loading facilities now in operation they would be able to make up some leeway by obtaining a larger share of the cement market.

The report and accounts were adopted.

DALGETY & COMPANY

ANOTHER SUCCESSFUL YEAR

The annual general meeting of Dalgety & Company, Limited, will be held on December 17th in London.

The following is an extract from the review of the year 1953 by the chairman (Mr D. Abel Smith):

From the directors' report and accounts for the year ended June 30th last you will see that the company has enjoyed another successful year's trading.

I mentioned last year that our land department staffs had carried out a valuation of our fixed assets, which had revealed a substantial appreciation over balance sheet figures, and we have since brought part of this appreciation, £2,600,000, into the books, so that the balance sheet now shows net assets somewhat nearer their real worth.

Where justified, we have continued to replace outside agents by our own staff officers. With changing conditions in Australia and New Zealand, it is becoming evident that an organisation with wide representation, such as this company, can offer a service to the pastoralist and farmer that is second to none, and in consequence we have little doubt that our direct country representation will continue to grow, within the limits imposed by our capacity to provide staff and premises.

The company now has direct representation at 233 centres overseas, as follows:

	Australia	N.Z.	East Africa	Tot.
Branches	11	7	7	25
Sub-branches	94	35	—	129
Agencies	24	54	1	79
	129	96	8	233

PROFIT AND DIVIDEND

The profit for the year, after providing for all expenses and taxation (other than profits tax on distributions), amounts to £490,635, as compared with £484,505 for the previous year. Apart from 1951, this year's results are a record for the company.

From the appropriation account you will see that the directors have utilised £42,492 in meeting the expenses of the new share issue, and have allocated £150,000 to contingencies reserve and £25,000 to supplementary pensions reserve. We are recommending a final dividend of 6½ per cent on the "A" ordinary shares, which, with the interim dividend of 2½ per cent paid in May, represents 8½ per cent for the year.

OUTLOOK

Trading conditions are, on the whole satisfactory and, with greater freedom generally, there may be fresh opportunities for expansion from time to time, though they are certain to be of a highly competitive nature. I mentioned last year that the heavy rise in expenses, to a great extent outside our control, was a worrying feature in a business so much dependent upon making small margins on large turnovers.

I am glad to say that so far the rise in expenses has generally been covered by additional earnings, and a special watch is being kept upon opportunities, where they exist, of ensuring that this remains the case. With the steps taken last year to increase the share capital, sufficient funds are available for a reasonably progressive policy, and your board believes that the programme arranged is providing about right for present circumstances without any wasteful accumulation of funds which may not be needed for some years.

TRAWLERS GRIMSBY, LIMITED

A SATISFACTORY RESULT

The annual general meeting of Trawlers Grimsby, Limited, will be held on November 18th, in London.

The following is an extract from the circulated statement of the chairman, Mr J. Carl Ross:

The total of our trading profits is £243,563, inclusive of profits applicable to prior years of £20,178. This is a decrease of £34,452 on the year to March, 1952, after due allowance has been made for income of a non-recurring nature in both years. This result is considered to be satisfactory under the difficult trading conditions ruling throughout the period.

The net profit of the group is £44,673 (£53,603) from which profits attributable to outside shareholders amounting to £434 is deducted, and there is added "Provisions no longer required" £5,474, making the total net profit attributable to Trawlers Grimsby, Limited, £49,713, compared with £58,884 last year. It is proposed to pay a final dividend on the issued ordinary stock of 10 per cent, absorbing £10,344, making 15 per cent less tax, for the year.

Owing to the great disparity between the issued ordinary stock and the capital employed, it is proposed, subject to the usual formalities, to capitalise £94,035 of the general reserve by the scrip issue of £1 worth of ordinary stock for each £2 worth held.

FISHERMEN'S DANGEROUS CALLING

Our fleet remains approximately the same, but it is with much regret that I have to report the loss of one of our North Sea trawlers—the s.t. Riviere, with the irreplaceable loss of nine of her crew. This is one of the hazards of fishing which is unfortunately continually being brought home to us.

Fishing conditions continue to be difficult, but it is pleasing to report that there is an improvement in the unit catch per day on the North Sea grounds. While this might under normal conditions warrant building new vessels for the North Sea, the continual rise in the cost of new tonnage is getting beyond all reasonable proportions, and at the present time it is quite impossible to earn sufficient to cover interest charges and replacement costs on such vessels. This question of costs is always foremost in our minds when we hear of the necessity of the housewife having cheaper fish.

ICELANDIC DISPUTE

Much publicity has been given recently to the import of Icelandic fish. Iceland cannot produce fish at a lower cost per stone than the British trawler fleet, so that if there is some special reason for the lowering of prices because of Iceland wishing to break into the British market again there must inevitably be a rise later for purely economic reasons. The Icelandic fishing industry cannot survive at prices below those at present ruling.

It is perhaps of interest once again to state that the present ban on Icelandic-caught fish arises purely because of the arbitrary manner in which that country has fixed a fishing limit seawards to the exclusion of our own fishermen who have been fishing in those waters for over 50 years. All sections of the industry would welcome a more reasonable attitude on the part of the Icelandic authorities so as to expedite an early and equitable settlement. Meanwhile, the exclusion of Icelandic-bought fish from this

country has not increased the price of fish; in fact, the average price of distant-water fish has been less almost every month since the dispute started.

For the six months to September 30, 1953, our trading results are approximately the same as during the same period last year. It is most difficult to make a forecast for the year to March, 1954, but it is felt that your company, with its wide field of activities, will continue to make further progress.

BENNIS COMBUSTION, LIMITED

FURTHER PROGRESS

The eighteenth annual general meeting of Bennis Combustion, Limited, was held on October 23rd at Manchester, Sir Herbert G. Williams, Bart, MP, the chairman, presiding.

The following is an extract from his circulated statement:

I am pleased to report another year of successful effort and of progress. Turnover has been substantially higher and the net profit of the group for the year amounted to £63,920, as compared with £30,545 in the previous year. Your directors feel justified in recommending a small increase in the final ordinary dividend to 7½ per cent, making 12½ per cent for the year.

Whilst all departments of our business have been fully employed throughout the year, both our subsidiaries have substantially contributed to the increased turnover and to the results obtained. One of these companies, Saxon Engineering Company, Limited, has completed during the year a large contract obtained in 1949 for a complete coke screening, conveying, cleaning and storage plant for the West Midlands Gas Board, with very satisfactory and encouraging results, whilst both subsidiaries have had an individual record turnover in 1952-53 and a year of progress.

Your company's wide and extensive experience as manufacturers of all types of machines for the burning of all grades of coal fuels is being more readily sought by steam users. In the mechanical handling department, our turnover for all types of coal and ash handling plants is steadily increasing.

The report and accounts were adopted.

NORTH KALGURLI (1912)

INCREASED ORE RESERVES

The annual general meeting of North Kalgurli (1912) Limited was held on October 28th in London.

Mr C. T. Ley (the chairman) said that profit for the period before taxation was £10,416 greater at £106,005. Taxes, however, at £60,526 against £48,802 also showed an increase of £11,724. With the amount brought forward, less the interim dividend, there was a surplus of £80,990 out of which they were recommending the payment of a final dividend of 7½d. per share, less tax, on the increased capital.

Ore treated had been some 13,578 tons less than the previous year, although their quota at both plants had been fully filled, with some increase in grade amounting in ounces to 1,447. Their total ore reserves were estimated at 2,234,415 tons of an average grade of 5.57 dwts, against 2,183,162 tons of an average grade of 5.62 dwts. That was an increase of 51,250 tons which, if it had been sent for treatment, would have represented a further 4,000 tons each period.

Developments had been rather restricted during the first six months of the year, but

with the completion of the Shaft a total of 9,806 ft for the year had finally been reached. A run of 106 ft assaying 15.6 dwts per ton over a width of 7 ft was mentioned in the North Kalgurli Section on No. 10 Level. In the Kalgurli Section on the important No. 5 Level, a drive 264 ft in length, with an average width of 5 ft, had given values of from 3.2 to 10.5 dwts per ton. Recent reports mentioned also in this section an advance of 86 ft averaging 7.1 dwts per ton on the No. 17 Level.

The report and accounts were adopted.

STRATFORD-ON-AVON PRODUCE CANNERS

A SATISFACTORY RESULT

INCREASED RANGE OF PRODUCTS

The twenty-first ordinary general meeting of Stratford-on-Avon Produce Canners, Limited, was held on October 26th at the Welcombe Hotel, Stratford-on-Avon, Colonel N. C. Joseph, chairman of the company, presiding.

The secretary (Mr G. E. Smith) read the notice convening the meeting and the report of the auditors.

The following is the statement by the directors, circulated with the report and accounts for the year to May 31, 1953:

Your directors have to report the trading profit for the year amounts to £81,593, compared with £95,080 last year. The profit and loss account shows the net profits amount to £35,484, compared with £42,280 for the previous year, and the directors recommend that this shall be dealt with as set out in the company's appropriation account. You will observe that after provision for dividends, the balance to be carried forward has been increased by the sum of £21,346 to £136,754, an amount which is considerably in excess of the company's issued ordinary share capital.

INCREASING POPULARITY

As anticipated in last year's report, trading conditions have changed considerably, competitive times are with us again, but the high quality and increasing popularity of your company's products, combined with its conservative policy, have shown what, in your directors' opinion, is a satisfactory result. The range of products has continued to increase and your directors look forward to the future with every confidence.

In accordance with the articles of association, Mr G. E. Smith and Mrs D. Edkins retire from the board and, being eligible, offer themselves for re-election. We take this opportunity of thanking our employees for their continued loyal services during the year. The auditors, Messrs James, Stanley and Company, have intimated their willingness to continue in office.

The report and accounts were adopted; the proposed final dividend of 14 per cent, making 20 per cent for the year, and a bonus of 5 per cent, both less tax, were approved, and the retiring directors were re-elected.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

AUTUMN BOOKS 1953

Selling Books

A CRISIS in the book trade has become so proverbial that anyone who mentions it will be accused of crying "Wolf." But certainly the economics of general publishing and bookselling have changed rapidly in the past few years. The most significant of these changes are the price increases forced on publishers by increasing production costs; the demand for increased discounts which booksellers have insisted on, and in some measure obtained; the new distribution of incomes, which, if it has not lowered total demand, has altered the structure of it; and the return of competitive entertainment, the lack of which greatly aided the wartime and immediate postwar bookselling boom.

Rising distribution costs have been as notable in recent years as increasing costs of production, and it has been increasingly difficult for the bookseller to keep pace with his overheads. This year, a report entitled "The Results of Bookselling, 1948-1952" (known as the Balleny report) was presented to the annual conference of the Booksellers' Association of Great Britain and Ireland. The report analyses the accounts of a sample of seventeen firms of booksellers over three financial years, and was conceived as a means of bringing home to publishing houses "the seriousness of the position before a general decline in bookselling makes itself evident."

The Balleny report is primarily concerned with the sale of new books; but only twelve firms could present accounts for new books alone. The remaining five firms included secondhand books and stationery in their figures. The following figures are taken from the averages of the firms dealing in new books only.

The average rate of gross profit of these twelve firms, expressed as a percentage of turnover, increased slightly in the three years from 21.48 per cent to 21.88 per cent and then to 22.21 per cent. Meanwhile, however, after deduction of overheads (and interest on capital employed) the average net profit was 0.83 per cent, 0.04 per cent, and 0.45 per cent respectively. It should be noted that, according to the 1950 Census of Retail Distribution, only 4½ per cent of booksellers have an annual turnover of £25,000 or more, and over 80 per cent have a turnover of £10,000 or less.

The rise in the rate of gross profit can be attributed to the improved terms and conditions of supply that were granted by a number of general publishers during the period

in question. The small increase in booksellers' net profit in the last year considered, however, is shown to be almost entirely due to reductions in the wage bill. Total overhead expenses over the period averaged 19.49 per cent, 20.62 per cent, and 20.55 per cent of turnover, and within these figures wages and salaries, including management remuneration, accounted for 12.85 per cent, 13.24 per cent, and 12.84 per cent. The minimum wage in bookselling (which is so low that, at any rate in London, few capable assistants can be paid the bare minimum) has been increasing, and will increase again shortly. One can only assume that booksellers have been forced to meet the rising costs of distribution either by dismissing some of their staff or by not replacing those who leave.

This reduction in staff is serious, for many of the complaints voiced against the book trade's service are directed against lack of interest, or lack of knowledge, on the part of the sales staff. Booksellers are not blind to the fact that much of the goodwill of their custom, and hence much of their trade, depend upon the knowledge displayed to the customer and the service given to him. But booksellers are equally wide awake, it would appear, to the fact that it is becoming economically impossible to employ a knowledgeable staff and to provide a high cost service. It is with this dilemma largely in mind that the Balleny report states:

In the circumstances of today it is hard to see what remedy may be found for the plight of new booksellers other than an improvement in the publishers' terms and conditions of supply.

Publishers have already, in most cases, cut the margins fine. They have granted some improvement where possible, but they say that the only real answer is to sell more books. Increased margins for the trade can only mean, in the case of the majority of books, that the price must rise, and the public is manifestly unwilling to pay higher prices. The total of publishers' turnover has been steadily rising, but so has the percentage of their turnover accounted for by exports. The total turnover of retail booksellers in this country is not known, but the figures given for the firms considered in the Balleny report show a decline in the average turnover. Stocks must have been piling up in the trade, for even the more successful booksellers have found their stock turning over fewer times during the year.

Compared with pre-war prices, the price of new books

THE FEDERAL RESERVE SYSTEM

1945-1949

By J. S. Fforde 35s. net

This book is an historical examination of central banking in the U.S.A. during the late nineteen-forties. It was written by an English observer who was fortunate in being able to supplement documentary research with personal contacts in America.

THE PRICE OF FUEL

By I. M. D. Little 12s. 6d. net

A reform of prices and tariffs constitutes the main part of the national fuel policy proposed here, a policy which is urgently needed if crises are to be avoided in the future, and if Britain is ever again to achieve the large coal exports of pre-war years.

THE FUTURE OF STERLING

By A. C. L. Day

Probable price 12s. 6d. net

The international position of sterling, both within the Sterling Area and outside, is a matter of the greatest importance for the future of the British economy. This book considers the origins of the present position of sterling as an international currency and on this basis suggests possible lines for future development.

THE REBIRTH OF AUSTRIA

By Richard Hiscocks 18s. net

In this book the author describes the re-creation of the Austrian Republic after its absorption by Nazi Germany in 1938 and gives an account of the revival of its political, economic, and cultural life from 1945 until the spring of 1953.

OXFORD
UNIVERSITY PRESS

is not high. But it is true also that they are expensive—in relation to the other ways now open to people to occupy their leisure time. People now want cheaper books if possible, and certainly not more expensive ones. Like any other mass-produced article, the price of a new book is greatly affected by the size of the printing and by its chances of being readily and speedily sold in large quantities. Publishers are unanimous in their dislike of the single copy order, which is costly, and will therefore only supply it at short discount to the bookseller. But one of the bookseller's important functions has been to accept orders for single copies of books which he has not got in stock, and this service has recently been proving increasingly costly. Postage and carriage charges (which he frequently has to bear) have risen, and the labour cost of research that an inquiry may involve may be considerable.

Another dilemma is that more and more books are published, and the bookseller is consequently under pressure to stock fewer copies of more titles, whereas to make his business profitable he should be stocking and selling more copies of fewer titles. The only thing he can do is to endeavour to equate his stock to his expected demand, and trust that he can keep single copy orders of cheap books to a minimum.

The bookseller will welcome cheap books if he can buy and sell them in quantity, and as long as they can be relied on to sell themselves to a great extent. Mass merchandising of any cheap article can come only at the expense of personal attention and

knowledgeable salesmanship. If the public wants cheap books, there is no reason why it should not have them, provided that customers remember that if they want special service it will have to be sought and paid for, which will make many purchases more difficult. If the economic climate encourages only best sellers, the distributive mechanism must change.

Good, cheap books, mostly in paper covers, have come to stay in the United States. They are on the increase here. Collins recently introduced a series of cheap, well produced reprints. The Publishers' Guild is producing paper covered editions of a number of new cheap books for simultaneous publication with the cloth-bound editions. Any book that is assured of a large reading public can be produced and marketed cheaply. If cheap marketing becomes general, however, the old standards of service will have to go to some extent, and the less popular, but possibly more important books may suffer.

In the very different economic conditions of America, much the same thing is happening. An American recently spoke of rising prices, falling profits, the growth of book clubs and the increase in paper-backed publishing. The heavily stocked, "old-fashioned" bookseller is already a rarity. But the American's conclusion is perhaps significant of the difference between the two sides of the Atlantic. If the "old-fashioned" trade disappears, after a time someone will come up with a wonderful new idea. "He'll invent a bookstore."

The Broth of a Girl

MIND YOU, I'VE SAID NOTHING.
By Honor Tracy.
Methuen. 176 pages. 12s. 6d.

ONE wonders sometimes why the Irish should rouse such violent emotions in those who write about them. Few visitors have ever been able to preserve a sense of proportion. The Irish, it seems, are either a noble-spirited race who trail the last enchantments of a better world (pre-Reformation, pre-Industrial Revolution, pre-1914, pre-United States—according to choice but always pre-something or other) or they are a dishonest, drunken and lazy tribe whose only standards of civilisation are derived from an unhappily incomplete conquest. However one chooses, it seems that the Irish are rarely dull. Thus writers about them are rarely dull either.

Miss Tracy is not. Her aim, according to the blurb (which is very well written), is to share "much pleasure and some pain and well-nigh endless amusement" with her readers. She has succeeded—provided that her readers can keep up with her. The narrative starts sedately but so quickens up that one has to re-read many paragraphs in order to be sure, or a little less uncertain, of who is codding whom: the true test of any book on Ireland.

If the sponsors of "tourism" in

Ireland had any sense they would distribute this book free. It is not only that Ireland preserves its own four freedoms (to talk, to drink, from work and from the company of gallant allies). It is not only that Ireland preserves "a magnificent dottiness"; that is not unique—there used to be happy Sunday mornings of indecision whether Miss Tracy should be read before or after Mr George Schwartz. It is rather that neither language nor the conventions of life, according to Miss Tracy, mean quite the same thing in Ireland as they do anywhere else. And this is what the tourist propagandists should plug; it is the unanswerable Irish riposte to Italian sunshine, Alpine snows and the Changing of the Guard.

But they won't; because, being state-aided, they can't approve of the half of what Miss Tracy says. She whirls a shillelagh (only visitors have them) which she brings down with a thwack right, left and centre, but mainly right. No vanity is left unscoured except the really sacred ones about golfers and race-horses. Nothing quite like her has been seen in Ireland since Biddy Moriarty and if Donnybrook Fair is ever revived she must have the cracking of the first skull. This is a darlin' book about grand playboys by the broth of a playgirl and it will be borrowed all over Dublin.

Edited by C. E. M. Joad.

Odhams. 279 pages. 16s.

THIS "anthology and symposium" contains extracts from Shaw's pamphlets, essays, lectures, prefaces, and correspondence, with a few passages from the plays; essays by Mr Kingsley Martin, Mr Leonard Woolf, and Mr S. K. Ratcliffe; and memorial lectures by Mr Benn Levy, Mr Hugh Dalton, and the late Professor Joad, who also provides an introduction. Like a composite King Canute in reverse, the distinguished contributors try to stem the ebbing tide of Shaw's reputation; but it will probably go on ebbing in spite of them. Shaw the dramatist, the entertainer, continues to be richly appreciated; but Shaw the prophet, the social reformer—the Shaw with which this book is concerned—is as dead in public esteem as his fellow-progressive, Mrs Bloomer. Unbelievably but unmistakably, there is something frowsty about him.

Is this merely because he outlived himself, turning into a silly old gentleman who wrote silly letters in praise of dictators, uttered silly complaints about the equalitarian taxes which he himself had advocated, and made a surpassingly silly will? Partly, no doubt; and partly, more creditably, because he succeeded so enormously in changing the climate of thought of three successive generations that, being all Shavians now, we feel little of that impact of fresh truth which is an essential element of stimulus. We take our liberation—the liberation of which Professor Joad writes so feelingly—for granted. But that is not all. Shaw was not merely a liberator in general, he was specifically a Socialist, and over all the wit and wisdom and fire of his advocacy—even while one recognises

Human Cyclone

LORD NORTHCLIFFE.

By A. P. Ryan.

Collins. 158 pages. 7s. 6d.

IN including Northcliffe in their "Brief Lives" series, the publishers made an interesting choice, and in Mr Ryan they selected an excellent biographer. The portrait of Northcliffe is on the whole faithful (except for the challengeable statement that Northcliffe was never a countryman) and will be recognisable by his surviving contemporaries, friends and foes. For posterity it is a balanced and objective record of the man and his works. Mr Ryan adds little to what is already known of the human cyclone who on the one hand revolutionised the "popular" press, and on the other saved *The Times* from extinction; but he confirms Northcliffe's niche in history as one of the most perplexing social portents of his time—perplexing, for even to Mr Ryan it has not been given to assess with finality the consequences of that revolution and the quality of its influence.

However, Mr Ryan shows us a Northcliffe who, through the medium of the printed word, brought to the million the

that a great deal more Socialism, a great deal more solidarity, a great deal more collective action and responsibility, were just what Britain needed in the days of the early Fabians—there falls today a de-oxygenated breath of Morecambe and Margate, a shadow of bureaucratic dreariness, a back-projection of forms in quintuplicate, a dust of groundnut husks. How much collectivism, how much private enterprise, how much equality, how much private incentive, are now questions of less and more, to be rationally weighed and discussed; but from Socialism as a creed, an inspiration, a palladium, the glory has obviously departed. The magnificent good sense that Shaw talked or wrote on social questions—and of which this book contains some lively samples—is commonplace today; the nonsense—and there are some wonderful samples of nonsense too—is nakedly revealed. Neither transformation helps a prophet's fame.

And yet it is impossible to believe that the tide will not turn, that Shaw will be remembered as an entertainer only. Cant and pomposity, humbug and flabbiness, the hollow phrase and the *idée reçue*, the mean admiration of mean things, are recurrent and perennial evils. They can attach themselves to other institutions than those of Victorian England. Future generations will learn from Shaw not that those institutions needed changing (which they will know from other sources), nor that collectivism is superior to private enterprise (which they will debate on other evidence) nor that the true end of man is to co-operate with the Life Force (which will probably remain unprovable), but that these recurrent and perennial evils are blessedly vulnerable; and they will give GBS that honour which is due to the great emancipators of the human spirit and will.

The Last of Lhasa

SEVEN YEARS IN TIBET.

By Heinrich Harrer.
Hart-Davis. 288 pages. 16s.

SOME books, like some mountains, are lonely, unrivalled peaks, and this is one of them. Nobody before Herr Harrer had ever done what he did, and nobody will ever do it after him. Thus, his modest and unaffected narrative—admirably translated by Richard Graves—provides not only an account of travel and endurance in remote places, but also an intimate portrait of a society that will never be quite the same again. It is, at one and the same time, an excellent yarn, a romantic vision, and an important political and historical document.

Heinrich Harrer, an Austrian mountaineer, was 27 when he was caught in Karachi by the war, together with other members of the 1939 German expedition to Nanga Parbat. The authorities in India were rash enough to intern these alpinists at Dehra Dun, so close to the Himalayas that their thoughts turned instinctively to the idea of escape into neutral Tibet and perhaps of even reaching Japanese-held China or Burma. They studied Tibetan, and copied maps of possible routes; and in April, 1944, after several unsuccessful attempts at escape, seven of them walked out of the camp disguised as Indian workmen. After eighteen days of night marching they reached the top of the 17,000-foot pass that marked the Tibetan frontier. It was then that Herr Harrer's seven years of experienced fantasy began.

Tibet, as Peter Fleming points out in his introduction to this book, is by tradition most unanxious to admit visitors. Local officials turned Herr Harrer and his companions back, turned them aside, made them halt in remote villages while they consulted higher authority, and consistently forbade them to make for Lhasa. Nevertheless, after twenty months, Harrer and one companion, Aufschnaiter, reached the forbidden capital. They had to make a weary trek through the desolate passes and plateaux to the north-west; and they arrived exhausted, ragged and penniless, having lost even their invaluable yak.

They were, however, human curiosities; and they quickly became the rage of polite Lhasa society. Herr Harrer, who by now spoke good if somewhat rustic Tibetan, tutored young noblemen, built dykes and was appointed a state official. Then, after being commissioned by the Dalai Lama to film public ceremonies, he became the boy ruler's confidant and close friend. He came to see Tibetan society from above, as he had earlier seen it from below. Fascinated both by the country and by his extraordinary position, he intended to remain in Lhasa; but in 1950 the Chinese Communist invasion—on which he sheds some interesting sidelights—drove him to take the southward road with his royal master, and eventually to cross the passes again into India. He brought with him the remarkable photographs that adorn his book, and a vivid account of life in the city that is now, under Communist rule, more truly sealed off from the world than ever before.

Men's Men

CLUBLAND HEROES.

By Richard Usborne.
Constable. 217 pages. 15s.

A REAL shock was inflicted on at least one reviewer by this delicious study of the light fiction of John Buchan, Dornford Yates and "Sapper"; and a warning must be hastily passed on to readers who may be in like case. The vintage years for these books were the twenties and early thirties, and very many of their very many readers must still be in happy ignorance of the existence of much later works. Happy ignorance, because, even if there is a certain logic in the fact that after "Sapper's" death in 1937 the Bulldog Drummond saga was carried on by an author who had originally served as model for the character itself, it is downright distressing to learn that in Buchan's last novels Sandy Arbuthnot, thinly disguised as Lord Clanroyden, was a sedate adviser to Neville Chamberlain's government, and Archie Roylance an intellectual MP attending conferences at Geneva. And Yates's addicts will be shocked to hear that Boy Pleydell is now divorced from Adèle and married to none other than his little grey-eyed cousin Jill.

Nor are these the only changes. Things have got steadily worse for Dornford Yates's characters. White Ladies has been taken over by the Government, and the Pleydells have decided that the Pyrenees must henceforth be their front line. Things have got steadily better for Buchan's Hannay, Blenkiron, Lamancha, Arbuthnot and Roylance, but they are now all terribly tired; and they have got like that not by being chased across the moors by villains in the good old-fashioned way, but by mere hard work in committee. Drummond should be grateful that "Sapper" left him in full possession not only of his much raided Brook Street flat, but also of his fighting fitness.

West End clubs were the common factor in the lives of Buchan's conscientious public servants, Yates's country gentleman and "Sapper's" ex-service buccaners. Drummond's gang used their club most (its name varies from book to book, but it is in the south-west corner of St James's Square) Hannay had four clubs. The Pleydells and Jonah Mansell belonged to Brooks's. Mr Usborne records the painful fact that Boodle's and the Travellers each at one time admitted to membership a villain of the darkest dye.

However, he cannot be challenged when he points out that today the heroes of thrillers are less likely to be London clubmen; many of them, one might add, are positively unclubbable. A chapter in fictional society has closed. Mr Usborne seems to regret this closing as much as any of us. Class-conscious, insular, and mildly racist as they were, the clubmen compare well with the masochists and bedfellows who have so largely taken their place in popular fiction; their young readers were more likely to make fighter pilots than juvenile delinquents. Perhaps they deserve that epitaph.

Family Histories

THE ONSLOW FAMILY, 1528-1874.

By C. E. Vulliamy.
Chapman and Hall. 277 pages. 21s.

THE BRUDENELLS OF DEENE.

By Joan Wake.
Cassell. 516 pages. 21s.

HISTORIES of landed families, long regarded as the harmless products of snobbery or at best agreeable footnotes to national history, now enjoy a new importance. Historians are leaving the Public Record Office for the family muniment rooms. For in seeking to explain national politics in terms of social structure they have been led to attribute a decisive role to the landed gentry, and to frame hypotheses which can only be tested by the study of a sufficient number of case histories. Professor Neale for the sixteenth century and Sir Lewis Namier for the eighteenth have shown how parliamentary history can be rewritten from such case histories. For the seventeenth century the importance of the gentry is agreed, though the nature of their role is disputed. On one interpretation the Great Rebellion registered the political triumph of the rising gentry, whose strict attention to estate management had allowed them to prosper at the expense of a debt-ridden aristocracy and an impoverished Crown. Against this it has been argued that the Great Rebellion was the work above all of the declining gentry who, excluded from the prizes of office and patronage, subsisted on the meagre profits of land and adopted one or other of the ideologies of dissent, Puritanism or Catholicism.

Histories of families which can throw light on their changing fortunes, the sources of their wealth and power, the weight and nature of their local influence and their shifts of political allegiance are thus of particular value. Both the Onslows of Surrey and the Brudenells of Northamptonshire afford rich material. The fortunes of the Onslows were founded in the sixteenth century by Richard Onslow, who acquired lucrative legal offices and a Surrey heiress, and inaugurated the tradition of the Speakership in the family. Prudent business sense, careful fostering of political interest in Surrey and a succession of marriages with heiresses carried the Onslows successfully through the Civil War into the eighteenth-century security of a peerage and a Palladian house. Unfortunately, Mr Vulliamy, though he has had access to the family papers, has chosen to concentrate on those of the Onslows who "by virtue of rank, oddity or achievement were conspicuous"; is bored by those who were "much concerned with commercial enterprise and with methods of raising money"; and has set his characters against a tawdry and impressionistic backcloth of the social and political scene. His tone is by turns arch and arrogant, and in his quotations from the family papers he gives particular prominence to the spicy and the trivial.

Miss Wake, unlike Mr Vulliamy, has written the history of a family and has brought to it skill and scholarship en-

livened by a warm interest in personalities. The Brudenells, like the Onslows, owed their start to a lawyer and were well established in the Midlands by the end of the fourteenth century. Elizabeth's reign saw both the building of the great house at Deene and also the infection of the family with Catholic sympathies. Marriage into the neighbouring Tresham family of Gunpowder plot fame fixed the Brudenells as recusants for over a century. But, though burdened by debts, recusancy fines and outlay on a peerage bought from Charles I, the Brudenells' carefully managed resources carried them through to the Restoration and the reward of the earldom of Cardigan. Thereafter the family followed a duller and a safer course.

Miss Wake devotes the last third of her book to the seventh Earl of Cardigan, arrogant and obstinate, tried by his peers for duelling, execrated for years by radicals and reformers as an outrageous martinet in the army, but finally enjoying heroic status as the leader of the Charge of the Light Brigade.

Yet scholarly and enjoyable as Miss Wake's book is, she has made the personalities rather than the fortunes of the family her main theme; and it is to be regretted that she has not given us more than a few tantalising glimpses of the economic foundations and policies which served the Brudenells so well.

Marsupial Masterpiece

COORINNA.

By Erle Wilson.
Andre Deutsch. 160 pages. 8s. 6d.

THIS compact novel tells the story of a male marsupial wolf from birth to death; man appears, but only as a foil to "Coorinna"; even his mate plays a secondary part. The scene is laid in the Tasmanian uplands, lovely, wild, not yet wholly tamed.

Great novels about animals are few. Without wallowing either in superlatives or in a catalogue, one may fairly rank "Coorinna" with Jack London's "White Fang" and Henry Williamson's "Tarka the Otter" and above "The Red Deer" and "Bambi." It is better written than all but "Tarka" and more exciting than all but "White Fang"; and it is free from the sentimentality of "Bambi." Although C. G. D. Roberts wrote several short stories as good in their kind, he wrote nothing with the scope and sweep and substance of "Coorinna." Moreover, its author does not, like Rudyard Kipling, mix his animals with anthropomorphic fantasy.

Mr Erle Wilson combines two gifts seldom found in effective combination: a superb gift of narrative, taut and vivid and compelling; and a poet's apparently effortless skill in description. The fact that the setting will, to the majority of readers, seem strange and almost exotic, should not blind them to the immeasurably more important fact that here is a virtually timeless masterpiece, vehicled in language of rare power and beauty.

BRITAIN'S ECONOMIC PROBLEM

C. A. R. CROSLAND

LONGMANS

The Elizabethan Stage

THE GLOBE RESTORED: A Study of the Elizabethan Theatre.

By C. Walter Hodges.

Ernest Benn. 199 pages. 50s.

IN Elizabethan public playhouses the performance took place on a large platform, surrounded on three sides by an audience standing at ground level or sitting in raised galleries, and backed on the fourth side by a green-room or tiring-house from which the actors emerged through doors or curtains. The only well-authenticated contemporary sketch of a playhouse shows this and nothing else. In the printed plays, however, we frequently find the dramatist requiring that action take place "above" or "within," or that it be "discovered" by the drawing back of curtains. It has therefore long been conjectured that the portion of the tiring-house contiguous with the platform or outer stage took the form of a curtained alcove or inner stage, and that the corresponding section of the gallery immediately above was in fact an upper stage in regular use as a playing space.

Two factors have influenced the building up of this conjectural picture. The first is a more or less legitimate inference from what is known of those inn-yards in which the theatrical companies performed during the formative period in Elizabethan acting convention; for these galleried yards would have required no more than planks, trestles and a curtain to achieve outer, inner and upper stages. The second factor is a disposition to conceive the modern theatre as evolved from the Elizabethan, and therefore to seek in the Swan or the Globe some structural feature in which our own peep-show type of stage may have originated.

Mr Hodges, a co-designer of the Mermaid Theatre and a draughtsman of distinction, has written a well-informed and judicious essay; illustrated his argument with a series of brilliant and almost dangerously persuasive drawings designed to trace the development of the playhouse from its primitive form; and added for good measure an admirably chosen collection of some sixty plates, reproducing from contemporary sources a large body of pictorial evidence on Renaissance staging at large. It is an invaluable book, and the better for not attempting to be a decisive one. Mr Hodges accepts the existence of the inner stage, at least in some of the theatres, but finds it unnecessary to suppose that any important phase of action was sustained behind its curtain line.

This is a temperate conclusion, and a more thorough-going scepticism will stress one consideration of which Mr Hodges makes little. There is abundant evidence that what we have come to call the upper stage was commonly known as "the lords' room" and reserved for the wealthiest and most exalted section of the audience. The so-called de Witt sketch of the Swan, already mentioned, is innocent of any suggestion of an inner stage, and it shows the gallery above the

tiring-house quite clearly as occupied by spectators—whether lords or commons—and not by actors.

There seems, indeed, to be little plausibility in the suggestion that the most important members of the audience were accommodated in a gallery regularly used for playing, and commanding no view whatever of actions or discoveries "within." And Mr Hodges, by supposing at least the occasional use of a pavilion-like knock-up well forward of the line of the tiring-house, only makes this aspect of the matter more perplexed; the second of his reconstructions, indeed, actually shows somebody peering out of a "lords' room" so situated as to admit virtually no view of the outer stage itself. If—as Dr Leslie Hotson has recently argued—Shakespeare's theatre was always an arena, and if at the Globe the most expensive seats were situated directly above the "scene" or back-drop, it is still no doubt possible to conceive an "above" adjoining the "lords' room" and comfortably visible from it. But "within" presents a pretty problem. Speculation upon it is easy, but certainty will come only from further research.

Pieces of Hate

THURBER COUNTRY.

By James Thurber.

Hamish Hamilton. 238 pages. 12s. 6d.

PUBLISHERS sometimes cheat short story readers by serving a réchauffé dish garnished with a few fresh tit-bits. There is nothing unfair about this collection. None of the stories has appeared in book form before, and only those who see the *New Yorker* regularly are likely to recognise any of them.

The collection consists of twenty-five stories, extracts from correspondence files, bits of advice, reminiscences, pieces of hate, allegories, extravagances and knock-out blows to other people's pretensions. It has fewer drawings than usual. Dogs are scarce but the War between Men and Women still goes on. If a practical joker marries "a tapioca brain" and has to take strong measures to rid himself of her, the lady has a retort. Using one of Mr Thurber's inventions in a word-making game she can call him a "cussgravy"—a husband, he says, who complains of his wife's cooking in the presence of guests. Thurber's satire is always kindly and his strictures just. He does not attack the weak or the unhappy, and never goes too close to the bone as Dorothy Parker sometimes does. Perhaps one could wish that he would leave alone the vein of family reminiscence opened up by Clarence Day and overworked by others since he died. Surely the spate of eccentric aunts must soon subside.

The one thing a reviewer cannot say about this book is that it is a perfect Christmas present. No Thurber reader who buys it will be able to give it away.

University Library

Thomas Arnold

DR ARNOLD OF RUGBY

By Norman Wymer.

Robert Hale. 200 pages. 21s.

IT is difficult to agree with the opinion of the publishers that this slender monograph "will assuredly be the definitive biography" of a man whom some have regarded as the greatest Englishman of the nineteenth century. True, a new biography was long overdue; since Stanley's "Life and Correspondence of Thomas Arnold" appeared in 1844, the results of Arnold's work have become apparent not only in the public schools, but in the whole field of secondary education, and it is time that a solid and comprehensive assessment of their importance was made. But Mr Wymer does not make it; nor, to judge by the brevity of his final chapter on Arnold's influence, does he wish to enter deeply into the matter. We have a brief list of Arnold-trained headmasters (inevitably inadequate, since Frederick Temple's brood receive no mention); we have the suggestion that the character of Forster's Education Act may have been influenced by Forster's marriage to Arnold's daughter; we have a description of those aims and methods of Arnold which have been so widely copied and miscopied. But of the national importance of what Arnold accomplished during his headmastership, when, as Hawkins had prophesied, he "changed the face of Education" in England, Mr Wymer has nothing new to say; and of the effect of Arnold's vigorous views on the relations of church and state, which profoundly influenced, among others, William Temple, nearly a century later, he has virtually nothing to say at all.

The book, to be sure, does contain some new material, from which the author attempts to picture Arnold the human being who has for so long been hidden—as perhaps to a large extent he was to his contemporaries—under the cloak of the "great stern prophet." Prophet he may have been, and unbending in the Christian principles which underlay all his work; but he appears in a different light in Mr Wymer's description of his morning round with a hair brush to beat his family out of bed, of his love of the country, of his humour, and of his very human pleasure in looking forward to retirement in the Lake District on an adequate income which his own care and thrift had assured. It is interesting, too, to have some account of Arnold's early life and family background. Though relatively unimportant, much of this new material might be entertaining if it were clothed in even tolerably accurate or attractive English. Unfortunately it is not, and purists will find themselves perpetually irritated. The best things in the book are undoubtedly the charming sketches by Jane Arnold.

A great man demands a great biography, and Mr Wymer's work is not of that calibre. The "definitive biography" of Thomas Arnold has yet to be written.

HOLLIS & CARTER**Minute-Hand and Hour-Hand****HUMANITIES.**

By Desmond MacCarthy.

MacGibbon and Kee. 222 pages. 15s.

AFTER "Memories," "Humanities"; another miscellany of criticism literary and dramatic, of reminiscence, of political comment, and, delightfully but tantalisingly, of fiction. The whole volume, indeed, is as tantalising as were its predecessors. That essay, for instance, on "Shelley as a Religious Poet," prompted by Mr Herbert Read's retort to Mr T. S. Eliot's "The Use of Poetry and the Use of Criticism"; why did Sir Desmond never write a "Use of Poetry and Use of Criticism" himself? Why should that quite extraordinary power of sympathy and discrimination, subjectively complete understanding and objectively sure judgment, have been displayed merely in occasional pieces however excellent, book reviews and dramatic criticisms however penetrating? If "the long single book" as Lord David Cecil says in his Preface, "was not the right unit for Desmond MacCarthy's talent," what was it about that talent which proscribed a more highly organised unity than that of the spirit informing these collections? Not even those who know MacCarthy best seem to have the answer.

The unity of spirit is real enough. MacCarthy's sensibility was not one of those suspended lutes resounding, beautifully but passively, at a touch. It

was allied to a vigorous, masculine, and essentially moral power to place and evaluate the writers, playwrights, politicians and personalities on whom it was brought to bear. If MacCarthy was never censorious, if he felt, in the closing words of his essay on Vernon Lee, "an uneasy distrust and possibly downright contempt for that glowing and dangerous emotion—moral indignation," he could still be severe; witness the comment on Arnold Bennett's use of his unrivalled popular prestige as a critic. And a less explicit severity—towards obtuseness, silliness, insincerity, the dull eye of scorn—appears between the lines of many of his most light-hearted and kindly papers, delimiting the frontiers of that "ruthless charity" (in Lord David Cecil's words) which he appreciated in Tchekov and recognisably shared with him.

It is perhaps merely greedy to wish that MacCarthy had chosen a different and more capacious vehicle for his gifts. "The sensibility of your own generation," he writes in a typical comment on Professor Elton's "English Muse," "is only the tick of a minute-hand. If you set up to read the clock, you must watch the hour-hand as well." Though MacCarthy recorded, for choice, minutes and seconds, he never lost sight of that hour-hand. With the triumphant truth of perfect time-keeping, the parts add up to the whole.

Candid Correspondence

A BLESSED GIRL: *Memoirs of a Victorian Girlhood Chronicled in an Exchange of Letters, 1887-1896.*

By Lady Emily Lutyens.

Hart-Davis. 340 pages. 21s.

LADY EMILY LUTYENS is the daughter of that Earl of Lytton who was successively Viceroy of India and Ambassador in Paris. At the age of thirteen she started to write almost daily to a family friend, the Reverend Whitwell Elwin, nicknamed "The Rev," who was fifty-eight years her senior. Emily Lytton poured out to him all her troubles, anxieties, fears and her thoughts on religion. He called her his "Blessed Girl"; hence the title of this book.

These letters of an adolescent girl are remarkable for their clear-sighted and savage candour. One has read many polite books of family letters where everyone appears to have been so very nice, or whose defects are only hinted at. Lady Emily tells us how bored she was when her father read aloud his long narrative poems in the evening, and of her occasional strong disagreements with her brothers and sisters.

With her mother she is nearly always at odds. Poor Lady Lytton—money was scarce, and she lived much in the past, regretting the days when she was Vicereine and Ambassadors. These vain regrets for lost importance filled her daughter with impatience. The reader cannot help feeling sorry for any mother who was forced to live with a girl as angular and as highly intelligent as Lady Emily.

"The Rev's" letters were remarkable for good sense and good counsel. He encouraged his young correspondent to enjoy meeting people, reminding her that unless she conquered her shyness she would never meet any man whom she would care to marry. She agreed with this while pouring scorn on society. Cousins she especially disliked. Next to them she hated the smart intellectual society of the day, with its highly sophisticated pencil and paper games which reduced her to helpless misery.

Her friendship triumphantly survived an incident which could have strained it to breaking point. She fell in love with Wilfred Blunt, father of Judith Blunt, her greatest friend. He was handsome, wore Arab dress and bred Arab horses at Crabbet Park. She soon realised that his intentions were dishonourable; but his charm for her was potent, and for three years she was in love with him, repelling with difficulty his ardent advances. She concealed nothing from "The Rev," who, with a complete lack of Victorian prudery but with a sobering realism, showed her the ruin and disgrace as well as the moral decline she would undergo if she yielded to Wilfred Blunt's seductions.

This correspondence has real value and it shows that December can teach April many useful lessons. It gives no clear picture of the life of the period, but it tells vividly of the emotions of the human heart. It should be read by all those who value unusual honesty and unconventional writing.

Learning to Fly**A HISTORY OF FLYING.**

By C. H. Gibbs-Smith.

Batsford. 304 pages. 21s.

THE history of flying is older than the aeroplane; it stretches back over centuries and its origins are lost in legend. Kites were being used by the Chinese in 1000 BC, and an enterprising Chinese contemporary of Leonardo went up in smoke riding a kite powered by 47 rockets lit by 47 coolies. The curious history of the pre-aeroplane age, with its bird-drawn chariots, its kites and tower-jumpers, flapping-wing machines and balloons, occupies the greater part of Mr Gibbs-Smith's book, and it does not need any knowledge of aerodynamics or engineering to find it immensely enjoyable.

A nagging conviction has pursued philosophers and scientists through every generation that men could travel as easily in the air as on the water, if the formula could only be discovered. A great deal of energy was wasted in attempting to reproduce bird flight without understanding that the feathers on the wing tip operate in the same way as an air screw, a fact not known until high-speed photography showed it to be so. From Daedalus onwards, men have tried and failed to fly with movable wings, but in the 1670s a Jesuit priest put forward the first rational proposal for an airship, a dual-purpose sailing or flying vessel to be raised into the air by four 20-foot diameter copper spheres evacuated to make them lighter than the surrounding atmosphere. Provision was made for ballasting the ship, and for letting air gradually into the spheres to control its descent. The inventor saw clearly the military possibilities: "Houses, fortresses and cities could thus be

destroyed (by iron weights or fire balls), with the certainty that the airship would come to no harm as the missiles could be thrown from a great height." Just over a hundred years later, in 1783, the first gas balloon went up; and, a century and a half after that, aerial bombing techniques were reaching a high degree of perfection. After the balloons came the air-ships, the gliders, and eventually, in 1903, true powered flight.

After such centuries of endeavour, what follows reads as something of an anticlimax. Mr Gibbs-Smith has chosen to compress development since the end of the first world war into a single chapter, with the result that much of it becomes unintelligible to the ordinary reader. Having browsed through the intricacies of ballooning (or autostation) and primitive helicopter design, with a side-glance at seventeenth-century science fiction, he is jet-propelled through the last thirty years and is hard put to it to do more than grasp the sequence that has led from the Wright brothers' precarious contraption on skids to the Comet and the guided missile. If events in the last few years are too fresh to make history, Mr Gibbs-Smith succeeds, for all his gentle humour at their expense, in showing that his early pioneers have handed down a long and immensely courageous tradition to today's airmen.

At the back of the book is a table of notable dates, beginning with the death of King Bladud of Britain while attempting to fly in 852 BC and ending with the establishment of a new altitude record of 63,668 feet this summer by a Canberra bomber. This is itself invaluable—and the illustrations of early contraptions are charming.

Tremors Under the Ice-Cap**CHANGING GREENLAND.**

By Geoffrey Williamson.

Sidgwick and Jackson. 280 pages. 18s.

COPENHAGEN humorists have sometimes thought fit to describe Greenland as Denmark's white elephant. That, indeed, has for centuries been a more accurate label than the misleading name given to Greenland—if tradition is reliable—by Eric the Red as part of his tenth-century scheme to encourage his fellow Icelanders to settle the then empty land. An Arctic island as large as western Europe, almost wholly covered by the dead and desolate ice-cap, and even today supporting a permanent population of only 22,000, Greenland has seemed to many Danes an unnecessary incubus. The original Viking settlements foundered after four centuries of struggle against the elements. It is uncertain whether their final extinction was caused by pestilence or by Eskimos driving down from the north, but for three hundred years Greenland sank back into oblivion. Then, in 1721, Hans Egede, a pastor inspired by extraordinary missionary zeal, led the first party of settlers from whom modern Greenland may be said to stem.

Today, although the settlements are

still lonely specks in the vast solitudes, and the eastern coasts still largely shut off from the world by the drifting ice, Greenland is developing faster than ever before. Cryolite and coal mining, shrimp canning, and even sheep farming in the south have become established activities. Nature itself has worked a quiet revolution. In the nineteen-twenties the seals on which Greenland's whole economy had been based began to vanish northwards; mercifully, their place was taken by cod and other fish, and the Greenlanders were successfully guided by their Danish mentors into a new way of life in which the motorboat played a greater part than the kayak. Since 1939, moreover, the new airfields built by the Americans have begun to transform one of the remotest corners of the world into a staging post which may have an important place in the future development of civil as well as military aviation. Mr Williamson's book is a welcome and up-to-the-minute introduction to Greenland old and new. Although he gives some of his information in rather uncritical and undigested gobbets, he has brought together all the essential facts about the country and its explorers, the people and their economy.

**THE
REASON
WHY**

by Cecil Woodham-Smith

Taking her title "The Reason Why" from a line of Tennyson's celebrated verses on the Light Brigade Charge, Mrs. Woodham-Smith has unearthed an extraordinary story from a mass of unpublished family papers, letters and diaries. The Charge of the Light Brigade is familiar to everyone; but why and how the famous "blunder" arose has remained obscure.

HAMISH HAMILTON

Winter Queen

THE LETTERS OF ELIZABETH QUEEN OF BOHEMIA.

Compiled by L. M. Baker. With an introduction by C. V. Wedgwood. *The Bodley Head*. 361 pages. 30s.

THIS collection of the letters of Elizabeth of Bohemia, daughter of James I, supplies a definite want. Both Mrs Everett Green and Miss Carola Oman, in their lives of the queen, drew upon her immense correspondence, but the letters are scattered in the great collection of state papers in the Public Record Office in London and also in foreign and private archives. It was highly desirable that they should be thus collected. With the aid of Miss Wedgwood's introduction and the brief historical summaries of events interleaved at intervals in the correspondence, the ordinary reader, interested in Elizabeth and in general seventeenth century history, can pick his way with adequate understanding. The scholar may well wish that more detailed attribution of each letter to its source could have been supplied; he has to be content with a summary of sources in Appendix III. He may also wish that such a correspondence, ranging over so much of European and English history, should have been edited. To those not familiar with the political scene, many allusions to persons and events will convey little.

But for the general reader the book does much. Here we have Elizabeth herself, gay, indomitable and realist to the end. Her brief reign in Bohemia, her flight to The Hague, widowhood with ten children after 1632, and forty years of exile, living on the cold charity of the United Provinces and scanty pensions from England, could not break her spirit. Her letters make good reading. With her pen she maintained long and deep friendships. Her correspondence with Sir Thomas Roe (why printed Rowe here?) shows not only her affection for "Honest Thom" but the tangled thread of the futile diplomacy of Charles I, negotiations which Elizabeth had little faith in. For herself, having lived much among war as she tells Archbishop Laud, she does not fear to use it. The same realism is evident in her letters to the Parliament of England in the Civil War. At heart she is for the King, but she has shrewd misgivings about letting Rupert and Maurice enter his army. For herself, short of money, and supplies from Charles I failing, she must in sheer necessity write civilly to Parliament for assistance, and take care that her letters contain nothing risky in case of interception. Her letters to Montrose, her hopes for the Restoration show that her sympathies were with the King; the equivocal attitude of her son Charles Louis troubled her.

Her letters show that her greatest affections were for her husband and her daughter Henrietta. With Louise and Edward who became Roman Catholics, she lost sympathy; and Maurice and Frederick Henry she lost by drowning.

Expanding Mind

MY HOST THE WORLD.

By George Santayana.

Cresset Press. 192 pages. 15s.

IT is strongly to be recommended that the Epilogue of this book should be read as a Preface, so that its mature wisdom may provide a talisman against the desultory gossip of the earlier chapters; otherwise exasperation may prove stronger than perseverance. This would be a pity, for in the end we do glimpse that "soul of a Spanish grandee grafted upon the stock of the gentle Emerson," and share the graceful philosophy of an expanding mind capable of absorbing the complementary qualities of varying beliefs.

Autobiography is inevitably egotistical and discursive. The author must impress upon his readers those facets of his personality he believes to be representative, and to this end he indulges his penchant for observation, description, introspection and criticism. Santayana's descriptions are delightful and fulfil his own high standard that the traveller should be "an artist recomposing what he sees so that it may be transmitted as a corrected view of truth." His introspection is ruthless, but not humble. It reveals the melancholy of the *deraciné*, compensated by the deliberate aloofness of spirit of one who resists "human contagion" and grants his fellows the same immunity. It is a little disappointing to find that a spirit so detached from the petty turmoil of life, so proof against worldly triumph and disaster, should harp to the verge of indignity on the rights and wrongs of the decline of his various friendships. He describes himself as "episodical in friendship, Platonising in love" and claims that he cared only for the *numen* in things or persons on whom he bestowed his variable attention. It is odd, therefore, that his probing of private lives often oversteps the bounds of loyalty and discretion, and leaves a cumulative impression of the weaknesses and failings of the people who at one time or another opened their homes to this temporary guest in the busy and animated establishment of the world.

Santayana considers that the contemporary malady lies in a renunciation of the search of self-knowledge, and the acceptance of an arbitrarily imposed anthropomorphic picture of the universe given out for scientific truth. The result is the misrepresentation of the capacities and place of mankind in the scheme of things. A protelariat, he says, is a modern disaster precipitated by industrialism, and the instinct of every member of it should be to win back to a human condition in which a man's true interests may have play. But he views the future with faith. Nature, he avers, will not be diverted from its wider processes at the bid of human rhetoric. All fanaticism burns itself out, and what survives becomes humanised, and

the failure of over-exact hopes and overwhelming ambitions will not prevent spirit from continually turning the passing virtues and sorrows of nature into glimpses of eternal truth.

The Singular Being

BOSWELL ON THE GRAND TOUR.

Germany and Switzerland, 1764.

Edited by Frederick Pottle.

Heinemann. 353 pages. 25s.

IN this fourth volume of Boswell's private papers the young Scottish laird is seen doing the rounds of the German courts. Assuming alike the titles of philosopher and baron he disputes with priests and solicits the friendship of princes. At the end of a year of trying to make a good impression he is astounded at his own virtuosity:

What a singular being do I find myself! Let this journal show what variety my mind is capable of. But am I not well received everywhere? Am I not particularly taken notice of by men of the most distinguished genius? And why? I have neither profound knowledge, strong judgment nor constant gaiety. But I have a noble soul which still shines forth, a certain degree of knowledge, a multiplicity of ideas of all kinds, and original humour and turn of expression, and, I really believe, a remarkable knowledge of human nature.

He does not appeal to the journal in vain. Here he is to be found discussing his favourite topics—melancholia and free will—and picking up hints on how to lord it over the peasants of Auchinleck. He lectures Voltaire on the immortality of the soul (and, when the great man faints, politely waits until he has recovered and then goes on talking) and confides in Rousseau his leanings towards despotism. His one rebuff is at Potsdam: even his appearance on the Prussian parade ground wearing a Scottish bonnet does not secure him an interview with Frederick the Great. All the time he is thinking of new ways of putting off the evil day when he will

have to earn his living at the Bar, and is consciously attempting to mould his character—with enough gravity for an intellectual and enough dissipation for a gentleman.

There are people, Professor Pottle says in his introduction, who cannot abide Boswell. Such people will not be mollified by this volume, but should try instead to keep a journal that records their feelings, aspirations and behaviour with the same degree of candour and self-criticism. Boswell indeed kept the journal as a form of self-discipline, just as he wrote ten lines of appalling doggerel every day, hardened himself by travelling cheaply in the greatest discomfort, and bound himself by solemn oath "neither to talk as an infidel nor to enjoy a woman before seeing Rousseau."

His five interviews with Rousseau form the centre-piece of this volume. But strangely enough Boswell never worked over his notes; so, entertaining as they are, they are not so completely satisfying as the conversations in the *Life of Johnson*.

Professor Pottle is an admirable editor. He combines gaiety and erudition in exactly the right proportions. Above all, the plan of publication adopted by Yale University frees him from having to make the usual compromises between readability and scholarship. In this edition he freely adapts the text, interleaving with the journal interesting extracts from letters and memoranda, and so produces a book instead of a document, secure in the knowledge that his pure scholarship will be magnificently displayed when the research edition of Boswell's papers appears in all its thirty volumes.

Critic as Guide

THE FRENCH THEATRE OF TODAY:

An English View.

By Harold Hobson.

Harrap. 232 pages. 12s. 6d.

MOST modern French plays remain something of a mystery to the English, a queer and tantalising flavour on the tongue, full of unidentified ingredients. Mr Hobson, dramatic critic of the *Sunday Times*, has made a successful attempt to bring them within comprehending distance. It is not often that man can remain so uncompromisingly English and yet understand the French. The English reader will instinctively feel that Mr Hobson's judgments are his own only infinitely better informed; that he knows his way about the complicated society of the French theatre without losing his English sense of values. A Frenchman might find some of his conclusions surprising, but the book does in fact succeed admirably in doing what Mr Hobson intended—that is to give an English view of the French theatre.

And what a fascinating picture it is. The French theatre plays so much more important a part in national life than does the English that it deserves study on this account alone. The chapter dealing with the effects of the German occupation on the French theatre is

especially interesting. Under cover of apparently harmless themes from classical drama, the theatre became a focal point of resistance, which the German censorship was usually too slow-witted to perceive. Through such plays as Claudel's *Soulier de Satin* and Sartre's *Les Mouches* the French public conspired with its playwrights, and the theatre became the spokesman of the anguishes and hopes of the French people. In this grim atmosphere it prepared itself for the ascendancy which was to follow.

Mr Hobson devotes a large portion of his book to Sartre, Montherlant, Salacrou and Anouilh, but he also covers all the principal living French dramatists and the half dozen leading actors and producers. The result is an extraordinarily illuminating and exciting picture of French dramatic life. At the very least the next Sartre or Cocteau performance on the Third Programme will seem infinitely more comprehensible. But the book does more than this. It should stimulate the hesitant and bewildered to hear French plays more intelligently and enjoyably and to taste some of the excitements of French theatrical life. The French theatre is to be taken as the French take it themselves—spiced by wit.

Come, My Beloved

PEARL S. BUCK

For the first time Pearl Buck uses India for the primary scene of her novel. It tells of three men of stubborn will who struggle to express the yearning of mankind towards the highest good. Opening in Bombay, flashing now and then to New York, the book conveys vivid pen pictures of India and the Indian people. 12s 6d

Fantastic State

THE HILL OF DEVI.

By E. M. Forster.

Edward Arnold. 176 pages. 15s.

IN 1912 Mr E. M. Forster spent Christmas with the Maharaja of Dewas (Senior Branch). In 1921 he passed six months as acting private secretary to the Maharaja. On the basis of these two visits and of many years of interest in the Maharaja and correspondence with him he has produced a delightful memoir of one of the more fantastic of the late Indian States. Dewas deserved a book. Where else has a ruling family divided its kingdom between senior and junior branches with such tangled justice that even the streets of the capital were under different administrations for water and lighting? Two headmasters disputed the control of education. Two armies provided prestige and band music for their respective commanders. Mr Forster is not content, however, to record only the farce. For him these visits to Dewas were "The great opportunity of my life." Away from the stultifying influence of British officialdom he felt that his profound anxiety to understand Indians in their natural environment might be satisfied. Amused by the absurdities, exasperated by the inefficiency, he was always brushing these aside in search of the true spirituality which he was convinced lay behind.

Mr Forster has chosen to base his book largely on the letters which he wrote from Dewas during his visits as a young man. These have the advantage of freshness. They reflect the enthusiasm of a generous nature brought into close contact with a land, a people and a ruler whom he loved; but they do not convincingly do more than describe the lighter and picturesque side of Dewas Senior. Unfortunately Mr Forster seems to have had more serious intentions in drawing the character of the Maharaja of Dewas (S.B.). The young ruler is described as "certainly a genius and possibly a saint and he had to be a king." But he does not really emerge from these pages as big enough to fill a star part. Attractive, affectionate, gay and sometimes thoughtful he certainly was, but the letters fail to give any substantial evidence of genius of any kind. What these letters do witness successfully is the affectionate sympathy of one young man for the good qualities and wasted talents of another.

This book is of special interest to all who in the twenties and thirties took "A Passage to India" as their guide through the tortuous ethical problems of India under the British Raj. Mr Forster's letters reflect the same anxieties and convictions which, successfully transmitted through his novel, helped to create in the British public at home a sense of guilt over the conduct and very existence of the Raj. One may wonder now whether Dewas Senior Branch was the best centre for appreciating the work or character of British officials and their wives in India—one thing which particularly recommended the State to the author was that "there was not another

European within a radius of twenty miles." For the Indian side of the picture, however, Dewas was rich in material. Within the limitations imposed by ignorance of the language and inexperience of the country Mr Forster absorbed information and impressions which certainly influenced the later novel. The Maharaja himself had some of the qualities of Dr Ayiz, especially his susceptibility to affection. "It is only for the sake of those that love us that we do things," he writes. The response of Mr Forster's affection is unfailing.

Small Town America

ALWAYS THE YOUNG STRANGERS.

By Carl Sandburg.

Jonathan Cape. 445 pages. 25s.

THIS is both a childhood autobiography of Carl Sandburg, the Grand Old Man of American literature, whose four-volume "Abraham Lincoln: The War Years" is his best known work although his poems will probably have a longer life, and a history of Galesburg, a prairie town in Illinois, from 1878 to 1900.

Sandburg's father, a Swedish immigrant, was a stern, puritanic man whose greatest ambition was to be "a good provider" for his family. He worked ten hours a day for \$35 a month in the blacksmith's shop of the Chicago, Burlington and Quincy railroad, but it never occurred to him to complain. His passive acquiescence is of interest because it explains in part the slow growth of the American labour unions. Carl's mother was a more human and lovable character, and her final "Souvenir," in which she summed up the meaning of her life, is the most beautiful thing in this book.

Most of the pages are filled with small recollections: the wash days and the baking days; the pump which froze during the winter months; the father's brief service as a juror; the long sermons in the Swedish Lutheran church; the Sundays when the Kranses came to lunch. Three points concerning Carl's schooldays are of importance. With one exception all his teachers were women. It has been suggested with considerable force that this explains the strong feminine influence on American men, because in their formative years they naturally accepted the teacher as their guide. Secondly, most of the books which were read in school, such as "The Boys of '76," glorified the pioneer life with its emphasis on adventure and individualism. Today the United States is no longer a pioneer country, but the ideals of that period are still persuasive. Thirdly, the books read out of school, especially the popular paper biographies, emphasised the virtue of success. The Reverend T. DeWitt Talmage was particularly noteworthy because he was said to earn \$75,000 a year.

Carl began work in the best American tradition by sweeping out the rooms of a real estate office in the early morning and delivering newspapers in the evening. His first full-time post, when he

was 14, was as a bootblack in the Union Hotel barber's shop. He held a number of different jobs until at the age of eighteen he decided to become a hobo. For some months he "rode the freight trains," and had some picaresque adventures. Finally he returned to Galesburg in time to enlist for the Spanish-American war. He saw service in Porto Rico, and, although no enemy shots were fired at him, he faced death from disease and poisoned food. After he was mustered out of the army he decided to attend Lombard University in Galesburg on a free scholarship, and it is here that his story ends.

To an English reader part of this book will be dull and some of the pages incomprehensible, but to Americans of Sandburg's generation it will bring back a vivid picture of a period that has gone for ever. The description of the old Auditorium Theatre where Carl saw minstrel shows, *Uncle Tom's Cabin* and *East Lynne*, and the chapter in which he records "kid talk—folk talk" are a fine "small-town" America. The graphics of the "pioneers and olders" are delightful. Particularly useful is the one of the newspaper for Gersh Martin, who "died in 1894 sixty-six years of age, his life given liberty, free speech, printer's ink, and d liquor."

English City

STONES COULD SPEAK.

R. H. Mottram.

Usenum Press. 232 pages. 16s.

THE sentiment expressed in the title of this book is hackneyed enough. The same it was a good idea to tell story of an English city through development and history of its streets. In choosing to write of his native city, Norwich, in this way, Mr Mottram has been able to draw on a great deal of splendid material, and he has the most of it. He begins with the Saxon raiders who sailed up the river from the North Sea first tied down; and he ends with the housing estates which since 1919 have gradually encircled the city. He has combed the local records in order to paint a vivid and imaginative picture of what went on during the intervening centuries—to describe, for instance, the thankless task of the thirteenth century clerks who did their best to preserve and collect the taxes, or to trace the fascinating history of the "Great Hospital" or the varying fortunes of the Assembly House.

Mr Mottram does not omit to place the story in the wider context of the social, economic and political history of the country. But here he is less happy; tenness and superficiality too often pervene. The major drawback to the book, however, is that although there are some pleasant illustrations, there is not a single map or street plan. Since the author frequently discusses in detail the topography and lay-out of the city at different periods, this is a serious staple to enjoyment. And Mr Mottram's prose is too often undisciplined, involved and repetitive.

Before the Prospector

THE WIND AND THE CARIBOU.
By Erik Munsterhjelm.
Allen and Unwin. 234 pages. 12s. 6d.

ITS title is the most pretentious thing about this tale of trapping in the remote north of Saskatchewan. It is a life in which a visit by a couple of other trappers, European or Indian, may be the only social event for months; in which the dogs of a trapper's team are more important to him, and more his companions, than any man. It is a life of perils and hardship, in pawn to an erratic Nature. "Nobody," runs the proverb of the Chipewyan Indians, "knows the way of the wind and the caribou." The migrating herds of caribou may pass through a district year after year, and in the few days they are there the trapper can kill meat for himself and his dogs for months. But in some years the precious days are missing; the caribou may not come that way at all; and the trapper has perhaps portaged his canoe and equipment past scores of miles of rapids only to find himself without a sound basis for winter life in the bush. Mr Munsterhjelm, however, was fortunate in many things, and he is able to make the trapping and hunting of mink and fox, of beaver and bear and wolf, a fascinating story without any falsely dramatic note.

Simplicity, realism and common sense are, indeed, the book's rare qualities. Mr Munsterhjelm writes with a master's flexibility, and conveys the essence of a

scene or a character, a situation or a feeling, with an impressive economy of words. The Precambrian north, with its hard rock and brown muskeg, its rapids and frozen lakes, is an old land, vast and very scornful of man. Mr Munsterhjelm will gladden the few who know its fascination, and will make others understand something of it.

His subject is the country he knew in the thirties, before the prospector had become as important there as the trapper. Now the barren lands and their fringes can be dotted, as Yellowknife and others have shown, with isolated mining towns, tiny islands of modern conveniences. But such development the book resolutely ignores. "A gold-rush that had started further west on the lake . . ." is mentioned merely in passing: but surely it was the rush that in the intervening twenty years built Goldfields, subsidised, and by last winter had left the shell of a mine and the ghost of a deserted town, from which many buildings have been moved over the ice to the centre of the new and greater rush that now dominates the district—uranium. It is a pity that Mr Munsterhjelm offers no old-timer's comment on such changes in the life of the north. It is also a pity that his book contains only one poor map, whose small scale does not conceal the misplacing and mis-spelling of Stony Rapids, the delightful village that is the trappers' centre for Mr Munsterhjelm's territory. Such blemishes are, however, too few to mar an outstanding book.

Magic in Burma

INTO HIDDEN BURMA: AN AUTOBIOGRAPHY.
By Maurice Collis.
Faber. 268 pages. 18s.

AS his numerous devotees know well, Mr Maurice Collis was for many years a conscientious, but never a contented, civil servant in Burma. In this new instalment of his autobiography, the rift between his official function and his private inclination is nowhere more delightfully revealed than in his account of a minor case in his magistrate's court in Rangoon. A Burmese suspected of petty theft met the charge that he had no ostensible means of livelihood with the reply that

he acted as acolyte to the priest-medium of the U-yin-gyi Nat (the Great Garden Deity). As the reader may suppose, this statement, though it caused the prosecuting police officer to smile sardonically, pleased me very much. . . .

The truth was that the then senior magistrate of Rangoon had for a decade been enamoured of the fast disappearing world of "the old Burma, with its nature gods, its magic, and its visionary sense of coming events." This world first closed round the unresisting Mr Collis when he arrived on Ramree island in 1920, to learn how one of his predecessors as deputy commissioner had been pulled under by a sea god. Here, the abbot of Taungyin firmly took his fate in hand with a series of astrological predictions which accurately outlined the course of his official career for over

ten years. Here, too, a visit to neighbouring Cheduba brought Mr Collis his first dramatic experience of the magic of rural Burma in the shape of a scented hill.

Cheduba, with its betel gardens, its tamarinds and toddy palms, and its gentle, hospitable people, remained the Arcadia that Mr Collis remembers for many years; but the Kyaukpyu he loved has been obliterated by war. Strangely, one of the visions that he saw in the Burmese fairyland—and the only one of an occidental character—was a battle fleet in Kyaukpyu harbour. Mr Collis ascribes this vision to his enthusiasm for the idea of a new naval base in those sheltered waters; but when the battle-ships came to Ramree twenty-four years later, it was not to ride at anchor but to pour shells into Japanese fortifications.

This chronicle of sixteen years' service (1918-34) is not by any means the straightforward story of a romantic "pro-Burman" progressively parting company with a less sympathetic official hierarchy. Mr Collis was reluctant to return to Burma at all in 1918; he wanted to write and to live a writer's life in the West, and in later years it was still with reluctance that he ended each period of leave spent in the literary worlds of London, Paris and Dublin. Although he understood the political aspirations of educated Burmese, his heart was not with them but with the ghost-ridden villagers, always looking for a saviour king.

Lyrical Poet

LEOPARDI: A Study in Solitude.
By Iris Origo.
Hamish Hamilton. 305 pages. 21s.

WHILE Byron and Shelley were cantering along the beaches of the Venetian lagoons, a poet and man of letters of their own spiritual and social level, only twenty years old, but close upon attaining his full powers, was crying out for companionship in Recanati, a few score miles down the same Adriatic coast. What rich spiritual exchanges there might have been had the great lyric poet of re-awakening Italy been heard of and sought out by the English geniuses. Yet the meeting might have been no more fruitful than Giacomo Leopardi's inhibited approach to his compatriot Manzoni, when a noisy third party did all the talking. Although Leopardi, just like the English poets, had a tremendous parent problem on his heart (in some ways his relations with his notable father, Count Monaldo Leopardi, resembled those of Shelley with Sir Timothy), he might have been quite unable to find common ground with the two freely roaming and spending milords.

Count Monaldo Leopardi was a nobleman of the old style. His children were expected and compelled to live according to the code fixed for a *figlio di famiglia* until they had won the right to independence by an approved employment or an approved marriage. Being a *figlio di famiglia* meant having all needs (clothing, books, and so on) provided on direct application to the head of the family; never going out of doors unattended by a watchful servant; and never seeing the sight of money. The Leopardi household kept four chaplains to teach the young, and the biggest establishment in the town. Count Monaldo had built himself a fine library in the old style, rich in all classical and approved literature. From the age of fourteen the firstborn, Giacomo, was simply left to browse in this vast field of vellum. At twenty he had become one of the foremost classical scholars of Italy (the great Niebuhr, two or three years later, said the only one of true brilliance): he had also irremediably lost his early robust health and physical prowess, suffering a curvature of the spine which made him the butt of the town as a "hunchback." His major consolation before death in his fortieth year was a highly emotional friendship with a voluble and volatile Neapolitan noble youth, who in old age wrote ungracious memoirs of the association.

Meanwhile Giacomo Leopardi had become not only a great, but, somewhat accidentally, a famous poet. The Marchesa Origo, to whom both England and Italy are mother countries, has now reissued her excellent account of Leopardi's life in a greatly enlarged edition. In it, she embeds much sensitive critical appreciation of the poet, seven or eight of whose stately, simple, hauntingly measured poetical medita-

tions make up (together with Foscolo's few odes and one or two of Manzoni) the great lyrical production of nineteenth century Italy. The world is, in these poems, held up, as it were, in a cool, moonlight, desolate, yet charming stillness. The brief lines "To the Infinite," written from behind a hedge at Recanati, are among the most magical in European literature.

Yet Leopardi's contemporary fame as a poet came, to his father's horror, from the resonance won by some rhetorical verses calling on the Italians to emulate the military glory of their Roman ancestors. 'This was the way to win renown in the incipient Risorgimento. But Giacomo Leopardi seems in fact to have regarded the political stirrings of his times with indifference or distaste, even if not with his father's pious abhorrence.

Cars and Motoring

MOTORING CAVALCADE.
By W. J. Bentley.
Odhams. 144 pages. 16s.

THIS is a pleasant, gossipy book about cars and motoring, and it is not Mr Bentley's fault that it concentrates almost wholly on the early days, for modern cars and their drivers provide him with precious little material. There are too many of them about, and they have too few distinguishing marks to make any one of them stand out as an object of interest. Most of the material has been drawn from memoirs and letters and even contemporary novels. Little of it, therefore, is new; but the book gains rather than loses from allowing these pioneers to speak for themselves. Mr Bentley, who was himself one of the early motorists and has driven many of the cars about which he writes, has recaptured much of the genuine fun that used to go with motoring. To a generation that has known only the crowded roads, the peevish driving manners and the dreadful carnage that make motoring today such a grim business, this does a great deal to explain the previously inexplicable nostalgia of older drivers for a time when cars were notably less reliable than they are today.

What lifts Mr Bentley's book out of the class of run-of-the-mill motoring memoirs is a series of thumbnail histories of the leading manufacturers and their products in Britain, America and Europe. These histories are carried right up to the present time, to the revival of the Spanish Hispano-Suiza interests and the appearance of the Pegaso (shown in Britain for the first time at this year's Motor Show) as inheritor of the Hispano tradition; to the Jeep and automatic transmission; and to the rapid postwar advance of the Jaguar company in Britain. The only regret is that Mr Bentley has not shown so much interest in the structure of these companies and especially their more recent amalgamations as he has in their products.

BATSFORD A HISTORY OF FLYING

C. H. Gibbs-Smith

This exciting and entertaining account of man's struggles for mastery of the air describes the romantic and eccentric inventions, the failures, tragedies and final successes. Particularly attractive are the 161 designs, drawings and photographs. 215.

THE AGE OF INIGO JONES

James Lees-Milne

This important study by the Secretary of the Buildings Committee of the National Trust deals not only with the life and work of our first great classical architect but also with his contemporaries and successors, and forms a comprehensive illustrated record of early English classical architecture. With 92 illustrations. 42s.

THE VICTORIAN MOUNTAINEERS

Ronald Clark

This account of the British mountaineering pioneers—heroic, highly individual and often eccentric—ranges from John Ruskin who explored the subject to Sir Martin Conway who explored mountains throughout the world. The delightful old photographs are a feature of this attractive work. 18s.

Surveyors of Works

THE AGE OF INIGO JONES.

By James Lees-Milne.
Batsford. 242 pages. 42s.

SIR CHRISTOPHER WREN.

By John Summerson.
Collins. 159 pages. 8s. 6d.

"A RARE thing, which see"—so John Aubrey, with his usual succinctness, described the Banqueting House in Whitehall, one of the few buildings designed by Inigo Jones that survive. It is not surprising that the Surveyor of Works to James I and Charles I should have designed so little. As Mr Lees-Milne points out, the Crown had then little funds for spending on public buildings, and Inigo Jones's surveyorship coincided also with a lull in the building both of churches and of great houses for the nobility. The beautifully restored Queen's House at Greenwich, the Queen's Chapel at Marlborough House and part of Wilton House are Jones's best monuments now that the Banqueting House has lost its splendour.

Yet Inigo Jones's influence was far greater than would have been expected from his actual achievements. Mr Lees-Milne describes and documents the buildings of Jones's pupils, followers, and contemporaries, including John Webb, who completed the Queen's House, and George Pratt, who, possibly with the help of the aged Jones, built Coleshill House, whose recent destruction by fire was a national tragedy. The

interesting thing about Jones's followers is that they did not adhere strictly to the Italian style favoured by Jones, but succeeded in imparting something essentially English to their building, which gives such a special flavour to the architecture of the late seventeenth and early eighteenth centuries. The pure Palladianism that Inigo Jones strove for did not come till later.

Between Jones, the founder of the Palladian tradition, and the Palladian movement itself, came Sir Christopher Wren. Mr Summerson's book has little in common, apart from its subject, with Mr Lees-Milne's, which, like other Batsford productions, has beautiful illustrations and is a delight to have and to hold. "Sir Christopher Wren" is written for Collins's series of "Brief Lives." It is consequently concerned with Wren the whole man as much as with Wren the architect. Although at times a little "Third Programme" in manner, his book gives a masterly description of the genius of Wren, which had flowered in so many directions—astronomy, mathematics, anatomy and physiology—before he became Surveyor of Works to Charles II and designed St. Paul's. To quote again from John Aubrey's own, unique, series of "Brief Lives," Wren was "a youth of a prodigious inventive wit." Mr Summerson shows how that "wit" typified the expanding, inquiring experimental intellectual climate of the seventeenth century.

Essays Without Substance

AN ELIZABETHAN GARLAND.

By A. L. Rowse.
Macmillan. 162 pages. 15s.

"THE truth," Mr Rowse remarked in his book, "The England of Elizabeth," "is often neither exciting nor amusing, and to arrive at it one needs endless patience and, above all, an essential justice of mind." And in that remarkably impressive study of Elizabethan society Mr Rowse's excitable imagination and vigorous sympathies were successfully controlled by the qualities of patience and justice. The present volume of essays suggests that patience and justice do not come naturally to Mr Rowse, that he has felt the need to work off his exuberance before returning to the second volume of his study of the Elizabethan age.

The substance of these essays is slight. One group deals with Elizabethan topics. Another group shows Mr Rowse still as the historian but in a more playful mood, collecting gossip about coronations, setting down some notes for a guide book to the royal palaces, and being tempted by the seductive quality of Mrs Hawkes's prose to turn archaeologist. Lastly there is Mr Rowse on the contemporary scene, finding the American people nicer and their political habits nastier than he had expected, reviewing Sir Winston Churchill's third volume and speculating on the prospects of a new Elizabethan age.

Why should Mr Rowse present so

many easy targets to his critics? He can be horribly banal, and he can indulge in the worst schoolboy humour, as in his parenthetical remark on the Long Parliament: "that celebrated body should be called the Long-Faced or the Long-Nosed Parliament." Even his prejudices do not seem to be settled. "Must we always," he asks, "find the weak and the feckless, the foolish and the failed, appealing?" Yet he was much moved by the spectacle of American men "who, in a world where women are so much on top, have something of the appealing qualities of an oppressed class." And are we to look down on or up to the Victorians? Mr Rowse detests, he tells us, their incessant, grinding concern with morals, yet, when he tires of belabouring contemporary writers, he turns with relief and admiration to these same Victorians.

All this is puzzling. Perhaps Mr Rowse remembers Hobbes's apology for his translation of the *Iliad* and the *Odyssey*: "Why did I write it? Because I had nothing else to do. Why publish it? Because I thought it might take off my adversaries from showing their folly upon my more serious writings." For Mr Rowse is engaged upon more serious writings; and now that he has relieved his feelings or, on the more charitable hypothesis, drawn off his adversaries, it is to be hoped that he will again cultivate the patience and justice of mind which his scholarship can show and his exuberance needs.

National Savings Winter Campaign

IN INDUSTRY AND COMMERCE

The Chancellor of the Exchequer writes:—

"I am delighted to send a message in support of the Campaign and to commend in the highest possible terms the work which you are doing. I would appeal to all Employers and Trades Union Leaders to do their utmost to help you, and in this I know I am supported by the Leaders of both sides of Parliament."

The provision of National Savings facilities has the full support of Employers' Federations and Trades Unions—over three million employees are already saving through such facilities offered by 60,000 firms.

Form a National Savings Group for your own staff if you have not one already and help them to save to add to their pension on retirement, to buy a house, to take a holiday or to assist in the further education of their children.

It has been proved over and over again that good savings and high production go hand in hand.

Write for particulars of schemes to

Caution and Conservatism

THE Government has thought of plenty of useful things to do in its third year. The Queen's speech, which on Tuesday opened the new session of Parliament, contained all that had been expected and quite enough to keep the politicians busy. On every one of the proposed subjects, new legislation is in principle welcome, and few of the projects should inflame party passions. These are substantial merits, and it was fitting that the Prime Minister's speech on Tuesday displayed to the full all his talents of statesmanship and of lucidity. The programme is in effect one of wise and mild reforms appropriate to quiet times, and if the times were quiet there would be nothing but approval for it. But the assumption is unrealistic. If there is criticism, it is not that the measures are bad or useless. It is that they do not go far enough to match the pressing needs of times that may be far from quiet for Britain.

There are two proposals requiring separate comment immediately. One concerns the basic division between the parties on nationalisation *versus* private ownership. The Government will continue to undo its predecessor's socialist legislation by abolishing the Raw Cotton Commission. This can hardly encourage the calm and tolerance for which the Prime Minister once again appealed on Tuesday. For a government to undo its predecessor's work should be, as Sir Winston argued, "an exception to the rule"; and this Government has already permitted itself several exceptions. But this is a small one. The nationalisation of cotton importing was never an integral part of Labour policy, and it was, in a sense, accidental that raw cotton buying was handed over to a statutory public corporation and not left, like other materials, to the wartime system of state trading by Government departments—in which event a free market could now have been restored, as for other raw materials, without any reversal of Labour legislation. The Opposition will be arguing about a formal point if it makes a great fuss in this case when other markets have been reopened quietly enough. The Prime Minister wisely balanced his claim to this last "exception" by a welcome assurance that the Conservatives are determined to make a success of nationalisation for the railways and the fuel and power industries, and Labour should be able to moderate partisanship to an equal extent.

The critical test of the Government's skill in political conciliation is the major proposal of the Queen's speech: the new attack on the housing problem. The scheme, summarised on page 406, is of the kind that might typically be expected from a coalition Government. The policy for slum property deserves a warm welcome, but in its immediate effects is essentially sugar on the pill. The crux of the matter lies in the normal houses, due to remain in use for many years, whose rents are controlled at the prewar level. This is a matter that touches the pockets of half the nation's voters; and the problems involved are extraordinarily complex. But grossly uneconomic rents have become such barriers to a soundly based economy that their

removal is urgently necessary. The policy to which the Government has now screwed its courage is not one of trying to sweep away the evils of rent control; it is to moderate them as much as it thinks possible without exposing itself to great unpopularity or to merciless partisan attacks.

★

The evils of rent control ought no longer to need stating. They are of three kinds. First, it is illogical and unfair. Landlords, almost alone, are restricted by law to the prewar gross return on their property; and two tenants may pay appreciably different rents for identical houses. Secondly, the cost of repairs has risen so much, in relation to controlled rents, that it is uneconomic to keep in good condition houses that will continue to be needed for a generation and more to come. Thirdly, the cost of living in a controlled house has become so low, by comparison with other prices and incomes, that people do not trouble to move, or to take in a lodger, when a house has more rooms than they would think worth paying for at the real economic cost. The result is to create an artificial shortage of houses, which the state tries to meet by extensive new building at subsidised rents; it therefore diverts the nation's limited capital resources, so badly needed for productive investment, to a purpose that—whether or not it is socially desirable—is certainly secondary to the country's economic survival through the modernisation and expansion of industry.

The Government's new policy concentrates, naturally enough, on the second of these evils. The necessity of keeping houses in good repair is the thing that tenants can understand well enough. What little is to be done to remove the anomalies of control is incidental. The permitted increases in rents will be very narrowly adjusted even to extra repair costs. There is no provision for financing the great backlog of repair work arising from wartime and postwar neglect, and the right to raise rents at all will be hedged round with strict bureaucratic controls. Indeed, in its anxiety to answer in advance any charge of favouring landlords at the expense of wage-earners, the Government has leaned so far backwards that it has almost fallen flat. The actual increases in rents will vary a good deal, but the overriding limit of twice the gross rateable value put on the new rents—which will not be reached in most cases—means that housing will still remain, relatively to incomes, much cheaper than it was before the war. The distortion of the country's resources by uneconomically low rents will gradually be moderated but it will never, under this scheme, be removed.

This is certainly not a distinctively Conservative scheme. It does not provide the benefits of a free price mechanism in which Conservatives believe. On the contrary, it is a compromise of the kind that many right-wing Labour leaders would consider reasonable if they did not have to answer to their more emotional followers. This does not mean that the Labour party

will let the scheme go without attack, and the Government deserves to be congratulated on going so far as it proposes. By the time rents are actually raised under the scheme, the next general election will hardly be much more than a year away. The risk of political odium, from so moderate a measure, ought not to be great, but even so it is a risk that politicians shrink from too often for this occasion to pass without any praise.

It may well be that a bolder attack and a sharper rise in permitted rents would pay the Conservatives better. If they were going to incur any odium at all, they might as well have allowed rents to rise far enough to have a real chance of solving the housing problem. Whether they ever seriously considered doing this (and doing justice to the landlord into the bargain) is not known. But Mr Macmillan's proposals show that, on this occasion at least, the Conservatives do not feel able to venture far outside the field of inter-party agreement.

★

It is too soon to say whether this tactic of minimum offence is the settled and deliberate policy of the Conservative party. A much more important test of its intentions will be coming later in the session. It is widely believed that the Royal Commission on Income Tax has been asked to submit its report before the budget. Whether that is so or not, it is apparent that the budget of 1954 will be this government's only opportunity to undertake any reform of the present structure of direct taxation. Now if there is anything in the present state of the British economy that every conscientious Tory must want to reform, it is the inhibitions that the present taxes impose on precisely those qualities to which he looks for the economic salvation of the country, the sense of initiative and the freedom for enterprise of the individual citizen and of the private business firm. Unlike Socialists, Conservatives cannot console themselves for any sluggishness or dejection, for any failure of adaptation or growth, that may be shown by an economy deprived of its mainspring by saying that all will be put right by the intervention of the state. They must want a reform, and as sweeping a one as is possible, of direct taxation. But tax reforms will be unpopular. The ordinary man in the street will not perhaps be quite so indignant about "bonuses for profiteers" as he would be about a doubling of his rent; but very nearly. Yet if the Tories believe anything, they must believe that such a reform of taxation, by stimulating the whole economy, would in the end benefit the wage-earners as much as any other section of the public.

It would be wrong to make any assumptions about the budget before it is opened. It may yet be a bold one. But if it were to be watered down to conciliate the opposition, then one conclusion would be plain. It would then be apparent that the division in British politics was not between socialists and non-socialists, between believers in the planned egalitarian society and

believers in individual enterprise and diversity, but between two parties, both of which accept the basic principles of the controlled, over-taxed, anti-individualist bureaucratic state and differ only on the details of their application.

That might be good for politics. As has so often been pointed out, British parliamentary institutions work well only when there is a wide area of agreement between the parties. But as Mr Attlee, with his usual limpidity of phrasing, said on Tuesday, "the economic position of this country is the overall problem," and

Paris on the Red River

LAST week, for the first time for many months, the French Assembly held a full-dress debate on Indo-China. The most significant part of the discussions was the statement in the speech of M. Laniel, the prime minister, of the government's profound conviction that there was no alternative to the present policy in Indo-China. All France is longing to end what is increasingly regarded as a sterile struggle. All France, inspired by motives that spring politically from the Right as well as from the Left, is coming to believe that the position in Europe demands the urgent return of French forces from the Far East. Yet the prime minister won a crucial vote of 317 to 251 in favour of continuing the war.

Why? And for how long can this verdict hold good? Behind the answers to these questions lies the whole range of emotion and logic, cruel loss and inexorable fact which now dominates one of the most critical of all modern problems: can France really be relied upon to go on playing the role in which circumstances have cast it since the war? Both in Europe and in Asia, the other free nations desperately need French assistance. This is the background to all the recent renewal of serious doubt, abroad almost as much as in France itself, about French moral ability to sustain the war in Indo-China, when the national economy is so seriously dislocated; when the perennial political crisis has taken a serious turn for the worse during the summer; and when, above all, the reality of the resurrection of Germany must soon bring to an end, one way or another, the period of procrastination over the European Defence Community (EDC).

M. Laniel was not defeated in the National Assembly, as some had feared that he might be. He won, in the sense that he accepted the successful compromise resolution which called on the government to observe three basic factors in regard to future French policy over Indo-China. It must develop the armies of the three Associated States to the point at which they are able to take over entire military responsibility from the French. It must seek to bring peace by negotiation. And it must ensure that sacrifices are justly shared by all the free nations. This resolution was adopted, however, only because the alternative was recognised to be

it is not likely to be improved if everybody settles down to acceptance of the present state of affairs, with the old mainspring of the economy so nearly broken and with no new one put in its place. If everybody does not think so, one would have supposed that Conservatives do. The public interest is more likely to be served by a clear choice between honestly held and courageously propounded policies than by any attempt to seek harmony at the expense of reality. The Conservatives' proper role is to be real Tories, not caretakers for the next Socialist administration.

not an agreement that would lead to withdrawal, but surrender. For even those who are most passionate in their desire to end the war understand that an attempt to carry out an evacuation in the face of the enemy would almost certainly have two fatal consequences. In Indo-China itself it would probably lead to a colossal physical disaster involving heavy slaughter of French troops and civilians. In terms of world prestige and European politics, France would suffer a setback that would almost certainly offset any increase in its ability to stand up to a German renaissance that might be obtained by the return of the rump of the army from Indo-China. Surrender, in fact, would defeat its own ends. The Red River flows through the heart of Paris.

In spite of the doubts and hesitations which have become so prevalent in the last few months, therefore, France will for the time being continue the struggle in Indo-China. But there should be no misunderstanding—as every recent comment from Paris makes it clear that there has been in the past—of the differences between the way the French regard this evil necessity and the way it is seen by their friends. The resolution adopted by the Assembly was a vote to continue the war; but its nature was essentially defeatist. It presupposed that a serious bid would be made, and sooner rather than later, to negotiate with the Communists in Indo-China on almost any terms. And it drove home with final emphasis the fact that the French are not prepared to engage in the fight against Communism just for its own sake. In the past, Frenchmen have regarded the war in Indo-China as a purely patriotic effort in defence of what were at first regarded as vital French national interests. But now the game no longer seems worth the candle. Victory would merely mean full independence for the Indo-Chinese, and the French cannot help beginning to feel that they have been led into making a heavy sacrifice for a myth and a shadow.

It may seem strange that the logic of this argument is only now having its full effect on the mood of France. It is stranger still that the gap between the primary motives of the French and their allies has not been more fully acknowledged in the past. When countries

ombine together in a common cause their basic reasons for doing so are seldom quite the same. In the case of Indo-China, however, the seven years for which the war has dragged on and the remoteness even now of any possibility of final military victory have combined to widen rather than to narrow this divergence of purpose. And this has happened, perhaps inevitably, at a time when events both in France and in Indo-China have been reaching what may yet prove to be in each case a critical turning point.

Thus, the second question to be asked about last week's vote is: how long will the decision to fight on endure? In Indo-China, the campaigning season is opening slowly. From the Red River delta, General Navarre has done his best to hit at Viet-minh supplies and concentrations. Now being reinforced for the first time for several years with nine additional battalions, drawn in part from Germany, the French forces are in a stronger state to withstand attack but in no position to launch a victorious military offensive. On the other hand, however discomfiting the suspicious attitude of the Vietnamese to the French Union may seem in Paris, the political outlook on the anti-Communist side is possibly healthier as a result than it has ever been.

Against this edifice the Viet-minh are generally expected to launch at any moment their strongest attack so far. There are forecasts of hard pressure on the Red River delta area and a renewed Communist drive into Laos and possibly into Cambodia. The aim of both sides, it appears, may be to reach a position of strength from which to negotiate by next May. But whether or not the Communists are willing to engage in real bargaining, there can hardly fail to be yet another sharp and critical re-examination of the position next summer by the French parliament.

State Farming in Practice

THE theoretical issues of land nationalisation have now been debated for well over a century. A radical approach to the "land question" was the badge of progressive thinking throughout the nineteenth century and was founded on a respectable basis of classical economic theory. This theory, by recognising and defining the element of natural monopoly in the ownership of land, fathered a host of schemes for the confiscation of "surplus" land values which became the pet nostrums of Liberal politicians. The Labour party, when it arrived on the scene, readily assimilated these teachings to its own more rigid doctrines of public ownership; and successive Labour manifestos have included land among the "basic" industries which will eventually be taken over by the state.

Despite its impressive pedigree and its relatively broad appeal, the traditional case for land nationalisation has now lost most of its force even in Labour

When that takes place, France will have passed through a period of several months in which its relations with the Federal German Republic are likely to be the dominant political topic. More is likely to have been said, in the same vein as Sir Winston Churchill's speech at Margate on October 10th, about the alternative ways of rearming Germany if the EDC fails to materialise. Much water will have flowed under the bridges of the Saar. But, short of some unforeseeable change, French policy will continue to rest on the two pivots on which it has lately seemed to turn—in Asia an intense desire for an armistice, and in Europe an intense dislike for any new commitment which the British will not also undertake. For Britain, it is arguable whether further progress in western organisation is more urgent than the need to ensure the holding of the front in South-East Asia. But it is certain that, just as these twin problems are now deeply interlocked in the French mind, they must also be regarded as mutually dependent by France's allies.

Whether rightly or wrongly, there is a growing belief on the Continent that the German is becoming a more urgent problem than the Russian; yet it is no use pressing the French to ratify EDC without regard to the existence of Indo-China. If pressure is to be brought to bear, it must take the form of extra help or guarantees either in Europe or in Asia. It cannot ignore the link between the two. As to what should be done, it still remains true that an Anglo-American guarantee, for instance to keep forces in Europe at least equivalent to those of the Germans, or a wider British commitment to the EDC, would cost little compared with a disaster in Indo-China. For, if the French increasingly doubt the value of their own sacrifices in the Far East, their allies can less and less afford to do so.

thought. This was made clear at the party's Margate conference, where the proposal to include land nationalisation in the next party programme was opposed not only by the late Minister of Agriculture but by the spokesman for the Agricultural Workers' Union, and was heavily defeated. Sir Hartley Shawcross did indeed wake the echoes by entering a plea for the taxation of agricultural land values; but his suggestion has meaning only if it is interpreted in a wholly novel way. Agricultural rents have shrunk, with inflation, to a point where they are clearly and admittedly inadequate for the landlord to carry out his proper economic function. If anyone is to be additionally taxed, it should be those occupiers whose rents are too small to stimulate them to utilise their land fully. In this case, Sir Hartley's proposal has merit; but it is a far cry from the teachings of Ricardo and Herbert Spencer.

This changed situation does not destroy the case for land nationalisation; but the case that now exists is based, paradoxically, on a reversal of traditional views. The problem is not that the landlord waxes fat but that he has grown too thin. It is his poverty not his rapacity that afflicts British agriculture. Since small family farms are still predominant, agriculture remains heavily dependent for its fixed capital on private landlords. Since agriculture was starved of new capital for many years, its requirements now that food production has to be increased are particularly heavy and urgent. Since, finally, private landlords cannot provide adequate capital, the state—it is argued—should assume their responsibilities. The argument is strongly reinforced by the fact that the taxpayer already provides large subsidies for capital improvements on which he gets no returns.

The main exponents of land nationalisation in recent years have thus been agricultural technicians, such as the late Sir Daniel Hall and Dr C. S. Orwin, basing their case on the need to improve farming efficiency. By taking over the land, the state could not only provide much needed capital; it could also reorganise the obsolete layouts of many holdings; it could create larger and more economic units, suitable for the use of modern machinery and management methods; and it could provide more openings for the trained products of agricultural colleges. On the other side of the debate, it is contended that "farming from Whitehall" would clamp down on agriculture an elaborate system of bureaucratic management that would be inefficient, costly, and exasperating.

While the debate has been carried on at this theoretical level, the state has slowly but steadily become the largest rural landlord in Britain. The Forestry Commission owns about 2 million acres, the Crown Commissioners own about 355,000 acres, and the Ministry of Agriculture itself owns 217,000 acres. Other large areas are owned by public and semi-public bodies such as the Ecclesiastical Commissioners. Moreover, these estates, not being liable to death duties, provide opportunities for long-term scientific management which are unfortunately not open to private landlords.

The Ministry of Agriculture's land is managed by the Agricultural Land Commission, a public body specially created for this purpose in 1947. The commission's holdings have originated in a great variety of ways. About 100,000 acres is land originally acquired by the Forestry Commission but more suitable for farming than for forestry. Another 21,000 acres consists of disused airfields. One large estate in Wales, accepted by the Treasury in lieu of death duties, accounts for 38,000 acres. The land that the state has acquired specifically in order to increase food production totals 37,000 acres. Most of this was originally requisitioned during the war by the county

agricultural committees, but some of it has been acquired since under powers given in the Agriculture Act of 1947.

This rag-bag of holdings has presented the commission with difficult problems of management. Most are marginal land, consisting of hill farms, rough wastes, and disused commons. Their fixed equipment was usually in bad condition and in some cases (such as the airfields) was totally lacking. The commission's work therefore cannot be judged by normal criteria. But its experience, recently summarised in its sixth annual report (HMSO, 2s. 6d.), does make possible some tentative conclusions about state farming in those areas where private ownership is least successful.

The commission is unquestionably a good landlord. Its first concern has been to put its properties in good repair and to provide them with adequate fixed equipment. The repairs bill alone has come to over £500 for five-sixths of the farms that have been tackled. Over five years, it has amounted to almost two-thirds of rent income. The commission has now organised nearly all of its land in self-contained units, and about 40 per cent (compared with a negligible proportion when the commission took over) is described as in good order. Much still needs to be done in the rest of the property.

The commission's expenditure has been much heavier than that of private owners managing similar land. Its investment per agricultural acre has been twice or more the national average. This is partly due to the arrears of neglect which had to be made up, but the commission's standards are also high in relation to the poor intrinsic quality of most of its holdings. For instance, though most of its properties are remote, they are probably now better served with piped water than the general run of farms. This is commendable in itself; but it raises the question whether part of this investment ought not to have gone into more productive land where it would without doubt yield a better return.

The commission is not required to pay its way and has generous financial backing from the Treasury. It considers improvements "primarily from the point of view of food production, although due regard is paid to economic factors." More bluntly, it is able to make losses which would cripple completely a private landlord. Over the five years the commission has managed to earn a small surplus on its English properties after meeting all management expenses and allowing for depreciation, but before paying interest on its capital to the Treasury. The Welsh sub-commission has done considerably worse and has a large "above-the-line" deficit. In fact, its rent income has fallen well short of its expenditure on repairs and management alone.

It is clear that state farming on marginal land is

liable to prove expensive for the taxpayer. The commission ingenuously states that "apart from capital," its work does not impose a heavy annual charge on the national revenue. But £200,000, inclusive of accumulated interest, of the capital advanced to it by the Treasury has already been written off as a loss. Moreover, the commission gets the same benefits as private owners do out of the subsidies available for hill farming and marginal land, which it has utilised on a generous scale. This must be set against the commission's success in expanding production. It has improved its properties enormously and regrouped many of them into better economic units. It has, quite rightly, farmed directly only a small minority of holdings which were not suitable for immediate letting. Its vacant holdings have been let to those tenants who are able and willing to farm the land to its full capacity. Rents have been raised considerably in the effort to get an adequate return and to stimulate production.

The commission was intended to give first attention to improving food production, but it is clearly time for broader economic considerations to be taken into account, especially if the ambit of state farming is to widen further. Besides its management functions, the commission has the duty of advising the Government whether it should acquire additional land. It has examined eight problem areas, comprising 110,000 acres, and its reports show that much of this land is in a poor way. The commission, however, has been

cautious in adding to its responsibilities and has recommended that only about 10 per cent of the investigated land should be acquired; the Minister, still more cautious, has so far acquired only one small area.

Public ownership in the form provided by the commission is one of several possible methods of improving marginal land. The basic question is not how the land should be owned but how far the need for more home-grown food justifies investment that cannot yield a full economic return. If such investment is to be on a large scale, there clearly comes a point at which public ownership is better than heavy capital subsidies to private owners. But it is not clear that this point has been reached or ought to be reached. The experiments in state farming should for the present continue on a small rather than a rapidly increasing scale. The results so far suggest that it is in practice neither so good nor so bad as the opposing theorists claim. It does offer advantages in management, particularly in areas where land is at present badly fragmented among many owners. Its danger, in its present form, is that it will lead to a wasteful outlay on odds and ends of land which do not warrant rehabilitation. Since there is plenty of underfarmed and undercapitalised land in Britain, any future state acquisitions should therefore be directed towards, at any rate, the better type of marginal land. That would at least provide a more varied experience on which further nationalisation can proceed cautiously, if at all.

Proud Borrower and Shy Investor

ONCE upon a recent time, a private investor set out from his home in the west to seek good risks in underdeveloped countries. On his first night on a strange shore, he sought his fortune in the bar of the Palm Palace Hotel. Here he fell in, first, with a fine landlord-politician of the place, and later with a fellow countryman in business there.

"Investment here?" said the first. "Our land is crying out for it. You are welcome. We need a dam for our great river and a hydro-electric station beside it, so that we can settle peasants and run factories; we need our marshes drained, some silos and a new port; we need cement, paper, and fertiliser plants; there is no road to the interior, but would you be interested in our minerals?"

"Investment here?" said the second. "Don't touch it. I cannot move for the red tape of ill-run departments; my profits are frozen at will; my right to hire and fire is tampered with, not only by law but also by politicians who press me to sack their opponents. I am up against disregard of undertakings; a long-term operational agreement that I made only last year is already being questioned because someone thinks I ought to be able to afford better terms. Take my advice

and the next plane for countries that offer better security."

This conversation might have taken place anywhere in three or four continents. Both in sovereign states and in dependencies all over the world, would-be borrowers for purposes of "development" see no incompatibility between setting their cap at the new investor and, simultaneously, behaving without consideration to the old. In fact, the talk took place in the Middle East, and, since this is the destination of a large trade mission which is leaving London next week, the examples given in this article are all taken from there. They are given subject to the comment that all can be matched elsewhere.
