Concrete examples are available in almost every Middle Eastern state. Lebanon, for instance, proclaims its anxiety to attract investment from overseas, but is at the same time engaged in expropriating an urban electricity company without proper compensation. Syria, though less keen on new foreign investment, is joining with Lebanon in squeezing the two foreign oil pipeline companies that enjoy transit rights through their lands for better terms. Saudi Arabia, which sees the Arabian American Oil Company as an

inexhaustible source of benefits, seldom tires of renegotiating recent agreements in quest of better terms. Iraq may yet carry out threats to nationalise a foreign electricity company without compensation for loss of profits. Almost everywhere in the Middle East, Dr Mossadegh's battle with the Anglo-Iranian Oil Company is vested with such an aura of nationalist triumph for Persia that its reverse aspect—the deterrent that it constitutes to further foreign investment—is ignored.

★

General Neguib's Egypt, however, offers an interesting potential exception to the rule. The Egypt of his predecessors was even more apt than its neighbours to throttle foreign enterprise in the name of nationalism, regardless of its need for foreign capital. In 1947 and 1948 it passed anti-foreign company and mining laws that caused many foreign concerns to put a brake on development and some to withdraw from the country altogether. Today, the Neguib government has instituted a new production council and a committee for the investment of foreign capital, and the chairman of the two bodies has publicly remarked that "if we want to understand how to attract capital, we must study what we did that caused it to flee." The new government has revised the mining law, is talking of amendments to the companies law, and has produced a new law on the investment of foreign capital in economic development projects that is meant to protect the investor against the freezing of his assets.

These moves present so sharp a contrast to the blind nationalism of past policy that most Egyptians have not been able to go into reverse overnight, and foreign investors still hang back because they see the survivors among their predecessors handicapped by the acts of officials who have not caught up with the new thinking. But a start has been made.

The underdeveloped countries have their retort to many of the complaints. It was voiced at a panel discussion held at the International Bank in September on the problem of creating in underdeveloped countries a climate conducive to foreign investment. Its spokesman was the Egyptian Minister of Finance, who asked:

You demand transferability for both profits and capital. But are you doing the necessary to enable importing countries to earn your currency or are you, by trade barriers, barring them from earning it in an honest way? You complain of labour legislation. But is it too much for the people in less developed countries to claim the right to a bite of the cake that is produced there?

Naturally, there is a happy mean in such matters. But the chief reason why it is not yet attained in underdeveloped areas, and why the investor with money to place remains shy of commitments there, lies more in the waywardness and xenophobia of the countries that wish to borrow than in the present practices of the west.

Local myopia is often founded on beliefs and preju-

dices that have nothing to do with economics. The Arab, Persian or Egyptian, however keen to attract capital, judges that he can behave as loftily as he likes to the West because he has suffered at its hands and is owed compensation. A second premise is that he is indispensable. These two ideas have been encouraged by western behaviour—by greedy concessionaires of Ottoman days, by leading figures in two world wars who represented the Middle East as "vital to western interests" but failed to establish any impression that Middle Eastern interests also were at stake, by oil companies that paid a royalty of three cents a barrel until they sensed that the Middle East was discovering the better terms secured by Venezuela, by politicians who partitioned Palestine and then—in Arab eyes—acknowledged guilt by paying conscience money towards the upkeep of its refugees.

In recent years the twin premises have been further encouraged. One end-product of such enterprises as Mr Bevin's Middle East Office, President Truman's Point Four, the United Nations' agency for the relief of the Arab refugees, and President Eisenhower's recent grant of \$43 million to Persia, is an enhancement of the conceit that western bounty is due as of right, and that, no matter how often western street names are torn down and American or British offices sacked, the West will turn the other cheek. Normally, the technique for a concern needing capital is to display the security and yield obtained by earlier investors. Underdeveloped countries, in their arrogance, offer no such attractions, and the would-be lender is understandably shy.

★

He is also held back by another big consideration. All categories of private investor—whether individuals, fiduciaries responsible for insurance and trust funds, or corporations whose managements are responsible to stockholders—look, when investing abroad, for one or more of the classic inducements to invest. Of these, one is a large and sure market; the biggest markets being in the west, the investor abroad has tended to put his capital into raw materials that he can market at home, that are really an extension of his home economy and that bring local benefits only as a by-product of his operation. These conditions are not on offer in the Middle East today; it wants the other side of the medal.

An alternative inducement is the financing of part of the enterprise by local participants. In the Middle East, however, the absence of the habit of investment in any project offering a small but regular yield has long been proverbial. Your Egyptian, Persian or Kuweiti wants at least a 30 per cent dividend; mistrusting his neighbour, he also wants it quickly, and completely within his personal control; he therefore puts his savings into land, houses or merchandise. He does not see that his participation would carry weight

with foreign lenders, and is querulous about the dimensions of American aid to Western Europe as opposed to American aid to himself. A wider move than has yet been made to establish joint-stock companies in collaboration with western lenders would vastly increase his country's prospects of capital development.

The American government's idea in launching aid programmes for underdeveloped countries was that public aid would fade away and private investment step in. But what happens in Western Europe is not happening in the Middle East. Nor will it happen quickly. Especially in xenophobic countries, the private investor is not the man to whom to turn for basic requirements such as vast irrigation schemes or networks of communications. As Sir George Schuster pointed out in the discussion at the International Bank already quoted, "the scope for private investment capital, and the things that need to be done to open the way to a fuller flow of private investment capital, are quite different." It is unrealistic to hope for the latter without first providing the basic capital works that will make investment pay, and to finance these recourse must undoubtedly be had to continued foreign public aid. Yet here, at least in the Middle East, is the threat of a vicious circle. The greater the public aid that is proffered from the West, the more lasting the Middle East's belief that the West is under an unredeemed obligation to it.

But compromises are not beyond the bounds of imagination. At a meeting last spring of the Finance Ministers of the Arab League there was some talk of an Arab Development Bank, and some at least of the propounders of the idea envisaged International Bank participation not only in its capital formation but in its management. Here is a germ that, if developed, might produce a new type of mixed International Finance Corporation undertaking major works. Such public bodies offer a double advantage; they are, owing to their strength and spread, more proof than private companies against the risk of expropriation that is at present the main deterrent to individual investors, and they are the essential forerunners of the mixed private companies that are—until underdeveloped territories give birth to a large body of indigenous savers and investors—the best answer to their need for capital.

Until he gets that answer the new private investor will be a scarce commodity there. He may poke his head round the door, but, after colloquy, he will tend to leave in search of the better risks that are to be had in the western lands themselves. The remedy lies in the hands of the "underdeveloped" peoples, but it shows too little sign of being used. Indeed, their rich men, far from setting the example for a local change of investing habits, are prone also to place their private investments in those countries of greater security.

The Economist Diary

The Christmas present for the man who seems to have everything.	A memorandum book, an appointments register, and a complete reference book.	A diary lay-out specially designed to meet the needs of the busy man.
A week's appointments at an opening; a book that lies open flat on the desk.	Facts and figures covering the world always available when required.	All information easily found by means of handy thumb-indexes.
Bound throughout in red leather; title blocked in gold.	Price (U.K. only) 41/- (including postage and purchase tax)	Prices to overseas addresses vary widely; a schedule will be sent on request.

ILLUSTRATED PAMPHLET AVAILABLE FROM
DIARY DEPT., THE ECONOMIST, 22 RYDER ST., LONDON, S.W.1

Notes of the Week

Bewildering the Opposition

NOTHING could have given the new Parliamentary session a better start than Sir Winston Churchill's immaculate speech on Tuesday afternoon. He gave coherence to the Government's programme, put the Opposition on its mettle, and greatly heartened his own followers. Problems had seemed to be multiplying both at home and abroad without any apparent prospect of early solution. The problems remain, and truth to tell, some of the solutions are as distant as ever. But the activity promised in the Queen's Speech, followed quickly by Sir Winston's eloquence, the White Papers on housing and agriculture, and a variety of Bills—including those on the reserve forces and judges' salaries as well as the expected Regency Bill—revealed the Government in a more purposeful mood than some of its followers were prepared to expect.

The Conservative backbenchers are happy, above all, because Mr Macmillan is judged to have produced a housing policy that is saleable in the constituencies. This verdict seemed to be confirmed by Mr Morrison when he rather ponderously condemned as propaganda a "popular" version of the White Paper issued for sale to the general public. For all his constitutional conscience, one doubts whether Mr Morrison would have bothered about the publication if he thought that its arguments could easily be answered. The speed with which the Government followed up the Queen's Speech seemed to take the Opposition by surprise and probably accounts for some inconsistencies in its early reactions. On housing, the promising thesis that the Tories are putting money into the pockets of the landlords was abruptly sabotaged when Mr Bevan claimed that the plan would fail because landlords would not find it profitable to take advantage of the repairs increase. Nor, remembering the recent history of council house rents, will Labour necessarily be grateful either to Mr Bevan or to the authors of "Challenge to Britain" for laying so much emphasis on "municipalisation" as the answer to the repairs problem.

Sir Winston Sadder But Wiser

THE sadness was unmistakable in the passage of the Prime Minister's speech on Tuesday in which he erred once again to his project for a meeting of heads of governments. The "cruel problems" of east and west did not, he admitted, be laid to rest by such personal feelings, which might, indeed, lead to "a still worse

deadlock than exists at present"; and he touched a deep chord in a silent House of Commons when he added:

Time will undoubtedly be needed; more time than some of us here are likely to see:

This was a very different thing from Sir Winston Churchill's brave words in May, when he assured the Commons that "at the worst, participation in the meeting would have established more intimate contacts." The pennant that the new Garter knight then raised on his lance is still gently fluttering, but its now faded colours no longer draw all eyes.

Sadness is in place if Sir Winston, under the pressure of events—or advisers—has lost the bright vision of a great career crowned by a personal victory over the dark powers of war. But relief is also in place. In the past six months the Prime Minister's cloudy concept of top-level talks has itself helped to make the international situation—to use his own words—"more baffling." If it is now to be jettisoned, the sharp edges of the real position will be seen more clearly.

It seems, however, that a new illusion may now arise; to over-simplify can be as misleading as to becloud. The Prime Minister's speech on Tuesday contained a passage in which he declared it reasonable to conclude that

internal prosperity rather than external conquest is not only the deep desire of the Russian peoples, but also the long-term interest of their rulers.

He is undoubtedly right to put into the scales the Soviet peoples' longing for a better life. But his words will strengthen the hold on many minds of the false antithesis, according to which a country such as the Soviet Union must be either openly aggressive or genuinely peace-loving. So great is his influence that these words are already being widely cited as a new gospel of hope. Yet all the bitter experience of eight postwar years has shown that the men in the Kremlin, without firing a single gun, can wreak vast mischief in many parts of the world. There is no necessary contradiction between a policy of "all mischief short of war" and the easing of the Soviet people's burdens. On the contrary, the more hammers and sickles can be thrown into the wheels of the free world's economy, the faster will the relative position of Malenkov's subjects improve.

Moscow Will Not Talk

WAS it malice, or mere coincidence, that brought the new Soviet Note to London a few hours after Sir Winston Churchill had told the House of Commons of his hope for an early and favourable answer to the West's "conciliatory invitation" to a conference at Lugano? There was nothing conciliatory about the reply—if, indeed, it can be termed a reply, for it made no reference either to

Lugano or to the new date (next Monday) set by the western governments after their disappointment over October 15th. Firm omissions seem to be the new Soviet method of dodging the irksome business of actually saying "no."

"No," however, remains the burden of its argument. The Note toils tediously over the same ground that was covered in that of September 28th, grubbing up again every conceivable reason for not holding a conference on Germany and Austria. The brevity and restraint of the western invitation sent to Moscow last month have had no visible effect. The calculated discourtesies, ponderous polemics, and ingenious omissions of the Note suggest that it is primarily intended neither for the governments to whom it is addressed nor for their peoples, but for publication east of the iron curtain.

The impossible conditions which the Soviet Note of September 28th attached to any kind of discussion have now, with a visible effort, been made a little more impossible. Fantastic as it may seem, it now appears that Molotov could not bring himself to sit down to a talk about Germany without a previous assurance that the free world's defences were being dismantled in areas as remote as the Middle East. What would be his reaction—and that of German and world opinion—if the western powers matched this obstruction by refusing to discuss Germany unless Russia abandoned its military bases in such countries as China, Hungary, Poland and Finland? Further invitations from the western side can hardly serve any useful purpose. Moscow does not want to talk; it made that clear in September, and it has now said it again in terms which drag the whole exchange down to rock bottom. There, it seems, it must stick.

Operation Rescue

MR MACMILLAN has hit on an apt title for his new housing policy. Essentially, it is a vigorous and fairly comprehensive attack on the problems presented by old, decaying, and sub-standard houses. No less than four million privately-owned dwellings, representing almost a third of the nation's total stock of houses, are more than 75 years old. While the Government has been busy building 300,000 new houses this year, as many old houses may have deteriorated beyond repair. This paradoxical and futile situation could not be allowed to continue any longer.

The Government's policy for old houses falls naturally into three parts. First and most important is the amendment of the Rent Restriction Acts. Its object is to permit private landlords to charge a sufficient increase in rent to carry out adequate repairs. The method adopted was suggested in 1951 by the Royal Institution of Chartered Surveyors, which pointed out that the statutory deduction allowed in estimating rateable value provided a rough but fair measure of the cost of maintaining and repairing houses in 1939. According to the recent report of the Girdwood Committee, the cost of repairs has more than trebled since 1939; the Government has now therefore decided that an increase in rent equal to twice the amount of the statutory deduction might reasonably be allowed—"reasonably" meaning that the Government thinks that voters can be convinced of its necessity.

The effect is that most controlled houses will become eligible for a rent increase of from £10 to £16 a year, with the proviso that the new rent may not exceed twice the gross rateable value. For many tenants an extra four shillings or six shillings a week is an increase of from 50 to 75 per cent, but this indicates the ridiculously low level of existing rents, not that the burdens on tenants will be heavy. Moreover, the rent increase may be claimed only if a stipulated minimum, equal to six times the statutory deduction if spread over three years or three times this figure if spread over one year, is in fact spent on repairs by the landlord. The tenant is assured of an additional benefit out of his house. He can challenge the landlord's right to raise the rent by an appeal to the courts, and he can at any time withhold the permitted increase in rent (with the consent of the local authority) if the property is not maintained in good repair. These arrangements run the danger of fomenting a good deal of bickering and litigation. And it is difficult to guess how many landlords will think putting up rents worthwhile on these stringent conditions.

Counting the Cost

THE second part of the Government's housing policy, as outlined in the White Paper,* is concerned with houses ripe for demolition. The Government thinks that their number runs into hundreds of thousands. Local authorities are to be asked to draw up programmes of slum clearance for immediate action. At the same time, they will be empowered and encouraged to buy up slum property in advance of demolition, in order to keep it in a tolerable state of temporary repair meanwhile. This is a bold and wise proposal.

The third element in the programme is designed to deal, by a mixture of prods and threats, with all those dilapidated houses (which are certainly numerous) that could be made reasonably satisfactory, but only at a cost which landlords are unwilling to incur. Local authorities will be given stronger and clearer powers to compel landlords to make their properties "fit for human habitation." At the same time, the conditions attached to the payment of improvement grants to private owners will be significantly eased.

The Government's proposals undoubtedly contain elements of both a nice blend of political boldness and of acumen; but their limitations are serious. They subordinate all other considerations to the one important aim of arresting the decay of old houses, and there can be no certainty that they will succeed. There is no real equity as between landlord and tenant, and there is no proper counting of the cost. They will impose considerable new burdens on the public finances, by way of improvement grants and subsidies for slum clearance and for the maintenance of condemned houses by local authorities.

This extra expenditure on old property would be entirely welcome if it were matched by reduced expenditure on new houses. The White Paper recognises that this heavy cost ought to be curtailed, but does not show how it is going to be done. With Mr Macmillan still talking about the need to continue building 300,000 new houses a year, the next

* "Houses. The Next Step." Cmd. 8996. HMSO. 9d.

step in housing involves a considerable extra call on the country's resources, to an end that is worthy enough but ought to rank behind the need for industrial investment.

Lords and Parties

SIR WINSTON CHURCHILL was pointedly silent on Tuesday about the reference in the Queen's Speech to the reform of the House of Lords. He is not the prime mover in this bit of Government policy. But having broached the subject in their last two election manifestos, the Conservatives could scarcely ignore it. Some of the forecasts of early legislation are, however, obviously wide of the mark. During their years in opposition the Conservatives frequently laid down the doctrine that constitutional changes should be made by agreement and not by unilateral party action. At the moment the dictates of doctrine are reinforced by the practical hazards which would face a government with a small majority trying to impose a constitutional reform. Any changes which the Conservatives forced through in this Parliament against Labour opposition would be almost worthless; they might well be used as an excuse for total abolition of the House of Lords when Labour returns to power.

The Government originally hoped to approach the matter through all-party talks; early this year Mr Clement Davies accepted the Prime Minister's invitation to talks, but the Parliamentary Labour Party decided that Mr Attlee should decline. The next move thus remains with the Government, and clearly the phrase in the Queen's Speech—"further consideration"—was not chosen idly. Labour will not easily be brought to the conference table, for many Labour MPs feel that to assist in reforming the Lords would be to forfeit all right to abolish it later. But the Government must persevere and it will now be expected to disclose something of its views before the session ends. The normal way of doing so would be in a White Paper, which would presumably set out some fairly general principles, and on this basis the invitations to all-party talks could be renewed, perhaps with more hope of success. If Labour were to agree, the ensuing discussions would still be lengthy and the prospects for an agreed reform Bill in this Parliament are not bright. That being so, the Government is unlikely to hurry its deliberations and ministers might have been saved some future embarrassment if Sir Winston had made this clear at the outset.

In framing their own ideas for the composition of a reformed second chamber, ministers would no doubt start from the basis of the all-party talks in 1948. All parties then seemed to be agreed that a revised chamber should include a restricted number of hereditary peers and a larger number of life peers and that women should be eligible to sit. To these broad principles the present Government would now presumably add some provision for university representation. It is this prospect that has reconciled many Conservatives to giving up the plan to restore the university seats in the House of Commons. But proposals for the composition of the Lords will be of little avail if the 1948 deadlock on powers cannot be broken. The Conservatives then insisted on a delaying power three months longer than Labour would concede. Many Con-

servatives are by no means ready to swallow the difference, slender though it must seem when set against the fact that unless the House of Lords is reformed by all-party agreement its future must always be in question.

M. Bidault and the EDC

IT is not M. Bidault's habit to move so far ahead of public opinion in France that he risks being cut off. So the spectacle of his full-blooded defence of the European Defence Community before the Council of the Republic last week is doubly reassuring. It shows, first, that the Foreign Minister will act on the assumption that there is life in the treaty yet, and secondly that public feeling is less hostile to it than had been generally asserted. He is to be congratulated on defending so bravely a cause that faint-hearted counsel is doing its best to betray.

He insisted, it is true, that interpretative protocols must be signed, that the Saar problem must be settled with the Germans—if only provisionally—and that Britain must somehow be drawn even closer than it has already come. But these conditions are only difficult, not impossible, to fulfil. To meet Gaullist criticisms that the treaty would violate the constitution and destroy the French Army, M. Bidault was obliged to interpret its provisions very strictly. He might also have pointed out that an instrument which binds Germans strongly enough to satisfy Frenchmen must also bind Frenchmen strongly enough to worry the Gaullists of the right and the Communists of the left. He might have gone on to show how this proposed defence treaty goes to the root of Western Europe's difficulties with the full development of the coal-steel community, further economic integration, and the drafting of a constitution for a political community. Once complete sovereignty in defence is surrendered other steps become relatively easy. On this point Dr Adenauer and Signor de Gasperi have always been firm and clear.

It is a pity that French discussion of these matters still ignores one point that is much cherished by Germans who are genuine Europeans and democrats. It is that the EDC could help to solve a problem that haunts the mind of every German politician and soldier who has learnt the lessons of

the last thirty years; how is the young Republic, still struggling to recapture a decent tradition of parliamentary government, to control the forces and emotions that will be set in motion again by rearmament? If Germans cannot trust themselves to control their generals, is it not to their credit that they should look to Europe to help them do so? That, certainly, is one of the thoughts prominent in Dr Adenauer's mind. This mood in Germany will not last very long if it is not understood outside; but much can be made of it if M. Bidault and Dr Adenauer can set next spring as the date for ratification and Franco-German agreement.

Mysteries in Soviet Germany

STRANGE things are happening in Soviet Germany. Field-Marshal Paulus has allegedly repeated the familiar Molotov jargon in a much-publicised manifesto on the establishment of a united Germany that will live—as proposed in Soviet Notes—on friendly terms with all “democratic peace-loving states.” At the same time, a large-scale hunt for alleged “partisans” has been reported and a new effort has been made to induce the population to denounce enemies of the regime.

Just before the round-up took place, new economic concessions were unexpectedly proclaimed. The prices of some goods sold off the ration by the state shops were cut, although it had previously been declared that this move could be made only if production increased. There is little likelihood that the workers have indeed raised their “norms,” as unrest has continued in the factories ever since the revolt of June 17th. The concession seems to have been made prematurely to pacify the population while the big drive against the opposition was in progress. The same motive may lie behind the use of Field-Marshal Paulus for propaganda purposes.

More baffling than any other move is the sudden announcement that a “gold content” of 0.399902 grams has now been fixed for the eastern D-mark in view of “the constant strengthening of its purchasing power.” This is, on the face of it, sheer nonsense. West Berliners continue to buy about four eastern marks with one western mark, though the Soviet zone currency has hardened slightly since prices were cut. It has quickly been noted that, if the “gold content” of the eastern mark is compared with that of the rouble, the sacred Soviet currency is “worth” less than the satellite mark. This is *lèse majesté* which Herr Grotewohl may have cause to regret.

Power Politics

THE glimpse of future power politics vouchsafed recently by Mr Thomas Murray, a member of the American Atomic Energy Commission, has not attracted outside the United States the attention it deserves. Briefly, he suggests that the nation first able to produce and transmit atomic power for industrial purposes is likely to attract the

allegiance of countries seeking new sources of cheap power just as surely as the nation with most atomic bombs is likely to gather round it weaker nations without them. To put the point in more dramatic form; how would we feel if we knew that we had more atomic bombs than the Russians, but that they were able here and now to export to India, Japan, Burma and China plant for supplying atomic power to industry?

Put in this form, the question throws new light on the importance of deciding wisely what should be the priorities in the use of money and materials available for atomic development. Does the British interest, as seen from the cabinet room and the Foreign Office, lie in priority for military uses or in priority for industrial uses? The question is not easy to answer, especially if it is assumed that bigger and better weapons make peace more likely. Nor is it easy to decide how the effort being made by Britain in atomic development should be regarded as a Commonwealth concern; yet, if Mr Murray is right, the fact that Britain is within sight of transmitting atomic power for industry should be a powerful attraction to wavering members. It is impossible to know in the present conditions of taboo and secrecy whether political considerations such as these are being pondered.

Health Service Resources

ALTHOUGH a net total of something over £400 million is accepted as the maximum that the taxpayer ought to pay for the health service, it is not accepted that this sum, reached so empirically, is distributed in the right proportions among the various branches of the health service. Nor is it accepted that the best value is being obtained for the present expenditure. A conference held last week under the sponsorship of the Institute of Public Administration had these two questions as its main theme. Many people think that the hospitals have obtained too large a share of the total budget. Yet as Mr Farrer-Brown pointed out in the first paper of the conference, the present allocation of resources between the hospitals, the general medical services and the local authority services is broadly the same as existed before the health service and also broadly the same as exists in other similar countries. This does not mean that the allocation is sacrosanct. It is, for instance, certainly arguable that bigger expenditure on the prevention of tuberculosis by local health authorities would save a far larger sum on the expenditure by hospital authorities on sanatoria. But the big share of resources allocated to the hospitals reflects the advance of medical knowledge and increased specialisation, and cannot rapidly be altered. Changes must come about, Mr Farrer-Brown emphasised, by decisions on marginal questions. Although these are not unimportant, they cannot change the main pattern quickly.

Whether value is being obtained for money is much more debatable. Nearly all those who read papers spoke of the economies that would accrue if the health service were unified instead of divided into three separate administrations. In his paper on manpower, Mr Goddard declared that a large part of a nurse's time was wasted on unskilled or administrative work or, in out-patient departments, on

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasco Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos...

COMPRESSED AIR EQUIPMENT

The Hymatic Engineering Co. Limited, Redditch, Worcestershire

doing nothing. Moreover, it is widely believed that a great deal of proper nursing duties, such as the routine taking of temperatures and pulses, could be dispensed with, and much the same could be said of some medical investigations and treatment.

Unfortunately, although the papers were mainly concerned with one aspect or another of the hospital service, they did not discuss fully the question of organisation, although one or two of them touched upon it. Under the present system, those who actually spend the money cannot be called to account for it by the users of the hospital or the taxpayer. Responsibility is divided, and it is no one's interest to see that waste and inefficiency are stamped on. Without some drastic reorganisation of hospital administration, the hospitals will continue to struggle along from year to year, spending large sums and asking for more, and the taxpayer can do nothing but complain and foot the bill.

Kenya's Emptying Kitty

THERE is no secret about the object of the visit to London now being made by Mr Vasey, the member for finance in Kenya's Executive Council. He is hoping to negotiate the loan or grant-in-aid which is now so badly needed to make good the colony's budget deficit. Last week, presenting the estimates for revenue and expenditure for the first six months of 1954, he showed that by the end of June Kenya's revenue balances will have fallen from nearly £9 million to under £5 million in a period of eighteen months. This is the measure of the direct cost of the emergency. Both this year and during the first half of next revenue will probably almost exactly match other expenditure. Kenya's general prosperity has not yet suffered from the emergency as badly as the pessimists foretold, and government revenue is not expected to fall next year. Nevertheless, there will be a deficit of £2 million in 1953 and another of £2 million is forecast for the first half of next year.

There are three ways of stopping this deficit and the consequent danger of inflation. Taxation could be raised; but this might inhibit the agricultural and economic expansion on which the colony's future depends. Social services and other development plans could be drastically cut; but these are essential elements in the political strategy of the campaign against Mau Mau. Or help could be given by this country. If it is not given, there is little hope of bringing to fruition the reconstruction plans outlined by the Governor last month. Mr Lyttelton has no choice but to say, as he has already done, that Britain will stand behind the colony if need can be shown.

Stretching the Intelligence

PEOPLE have grown so accustomed to being harried by intelligence tests, at eleven or at the threshold of the army or of many civilian occupations, that they have come to believe not only in their efficiency—at least for others—

but also in the absolute fixity of each individual's endowment. The bag of intellectual tricks with which the infant is born is his total complement until death. The validity of this concept of intelligence has been questioned fairly often by the experts, but their doubts did not reach the outside world. Now two articles in *The Lancet* of October 24th crystallise the objections to this assumption of a fixed quantity of intelligence. The immutable can now change; it can expand if it is stretched.

The idea that an individual's IQ can grow over time revolutionises some of the current opinions about the measurement of intelligence, particularly about those tests which in measuring intelligence now attempt to predict attainment hereafter. It appears that far from being a fixed quantity, intelligence can vary considerably during a person's life. Tests taken over a period on people of "superior intelligence" and on a group of mental defectives revealed considerable changes in intelligence, and in the case of the intelligent group the tests were made comparatively late in life. Of the mental defectives several blossomed out into quite normal people, particularly when they were removed from an environment which was seriously adverse to their development. Indeed it appears from this series of investigations that during the formative years it is the exception rather than the rule for a person's IQ to remain constant.

This is encouragement indeed, even if it must cause some uncomfortable heart-searchings in those who have been putting their faith in these tests. The new findings do not mean that all intelligence tests should be scrapped; they are, at present, more valid than any other method of assessing a person's intellectual ability. But they are not final.

Dilemmas for Persia

ANYONE who broaches today in Teheran the sore subject of oil is told at once that nothing can be done unless some third party acts: at best, it must make a proposal, at least it must entreat the Persians to make a move. Otherwise national pride is at stake and the government is impotent. The Persians, therefore, face a dilemma. They now know from the State Department's oil consultant, Mr Herbert Hoover, junior, that their oil is a drug upon the market; that Dr Mossadeh halted their best industry at a time when neighbours of Persia were only too well able to take its place; and that, to get it moving on a scale that will give them the revenue they need, they must consent to foreign participation at least in marketing the oil. Yet General Zahedi is caught between a Mullah to his right, thundering that he must not cede an inch to foreigners, and liberals to his left who say that he must earn oil revenue if Tudeh is to be kept at bay.

Most men, caught in such a position, would take a chance in one direction or other; but Persians have been accustomed for so long in international affairs to the role of the wooed that they have forgotten how to play a more active role.

In home affairs General Zahedi and his colleagues face a lesser but similar conundrum. Shall they or shall they not try Dr Mossadeh? To do so gives him a chance to

exercise in the box and before the world his famous histrionic talent; to refrain from a trial suggests that they hold back out of weakness. The most prudent thing to do would be to take a leaf out of Malenkov's book and pop him into the *oubliette* with Beria.

Peking's Bait for Japan

THE barter "trade agreement" recently concluded in Peking by an unofficial group of members of the Japanese Diet is another move in the campaign, sponsored in Japan by both Communists and leading business men, for the loosening of current restrictions on the export of strategic materials to Communist China. The present agreement provides for a substantial quantity of Japanese exports, of which 35 per cent are to be goods now definitely subject to the ban on trade in strategic materials, 25 per cent goods not subject to any restriction, and the remaining 40 per cent in doubtful categories. The agreement being on a barter basis, the Chinese have tacked the supply of materials most desired in Japan, such as coking coal and iron ore, on to the most obstructed section of the proposed Japanese export list in order to step up the pressure for removal of the controls.

There is, of course, no difficulty in the way of exporting consumer goods from Japan to China, but for Peking's determination to give priority to capital goods required for industrialisation, including armaments. In Peking's comment on the trade negotiations it is explained that the Japanese must not think that they can, as in the past, "procure Chinese goods of high economic value for goods of little economic value not needed by China."

Chinese Communist policy in relation to Japan is to use Japanese industry's need of raw materials from China as a lever both for obtaining currently prohibited supplies of capital goods and also for modifying Japan's foreign policy. Tokyo is informed that

if Japan were to sever relations with the Chiang Kai-shek gang, free herself from the onerous position of a satellite of the American aggressors and become a peaceful and independent state, then normal relations could be established between China and Japan.

The present Japanese government is not willing to repudiate its existing treaty commitments for the sake of an uncertain commercial advantage, but there are many on both the left and the right of Japanese politics who listen gladly to the siren voices from Peking.

A Nineteenth-Century Perspective

By taste, talent, and sheer longevity, Lord Samuel is an especially suitable person to survey, in the widest terms and the longest perspective, secular changes in the climate of opinion. In the Hibbert Centenary lecture, now published,* he contrasts the preoccupations of 1853 with those of today. He notes those questions, then actively controversial, which have been settled: slavery, the duty of the state to intervene in the economic process; the authority of science in its own domain; the extent of the suffrage. He assesses, in defiance of all pessimism, the gains that these changes have brought. He isolates the questions unsettled from that time

to this—notably international and inter-racial relations—and the new problems of our own century: in the economic sphere the balance of world population and world subsistence, in the social sphere the divorce of work and leisure and the threat to the family.

Progress, Lord Samuel affirms, has been real, but remains conditional and precarious; one recalls the saying that the most civilised of states is no further from barbarism than the most polished steel is from rust. Continued progress, escape from the threat of decline and catastrophe, depend not on abstract "forces" but on the "perceptions, characters, ideas... action or inaction" of individual men and women, singly or in groups; and therefore, ultimately, on the quality of their philosophy and religion.

Even so brief a summary of an already highly distilled argument shows that Lord Samuel's standpoint is essentially that of the nineteenth century. The individual is an individual, not a bagful of psychological Kilkenny cats; reason is the Logos, not a rationalisation of infantile urges; above all, society is what men make it, not what "historical process" dictates. Lord Samuel does not argue these questions; he either states without argument or leaves his public to infer for themselves. Surely, however, it is here rather than in the overt subject-matter of current political and social debate that the main change is to be found between the nineteenth and the twentieth century outlooks. Whether this change, however deplorable pragmatically, matters so much as the less recondite shortcomings of greed, pusillanimity and sheer dimwitted confusion, of which no

Russia and the West

It seems certain that hostilities have actually commenced at the seat of war—that there has been an affair of outposts—and that the Turkish troops have crossed the Danube in force. . . . All parties must, we think, be desirous of a peaceful solution of the difficulty—the principals first, the seconds scarcely less. Russia must be anxious to back out, if it can be done without humiliation. The mistake she has made must be as obvious to herself as to the world. The whole public opinion of Europe is against her. . . . The Czar has succeeded in doing what scarcely any one else at the moment could have managed so effectually, and which assuredly was about the last thing he wished to do—has united in a cordial and honest understanding the two great nations of the West, the only two from which he can dread any serious check or any permanent control—the two Powers from whose alliance he has everything to fear, from whose misunderstandings he has everything to hope. He must be most desirous to retrace such a step—to undo and escape from such a blunder. But a great Potentate and a proud man may be willing and resolute to persist in error and in wrong, if the way out of it is made too difficult or too humiliating. It is scarcely ever worth while to inflict *shame* upon a powerful foe: it rankles longer than even discomfiture or injury. If, therefore, Russia be as we suppose really desirous to concede what is required in order to settle the dispute, we do not think it unreasonable in her to ask that the appearance of threats or force should be withdrawn in order to enable her to retreat with comparative ease and honour.

The Economist

November 5, 1853

century has a monopoly, is perhaps doubtful. But a survey which ignores it, however well-proportioned, lucid and just, somehow fails to achieve a complete relevance to the current Age of Anxiety.

Better Holidays for Good Europeans

THE raising of the travel allowance from £40 to £50 is very welcome for its own sake, and also because it is part of the Chancellor's policy of making the British "good Europeans." But has Mr Butler been generous enough?

As the average British tourist abroad spends less than £40 in any case, the present concession will cost very little in foreign exchange—a mere £2,000,000 in a full year. Even in 1951, when the travel allowance, until November, was £100, the average tourist still spent only some £40 to £45 including his fare, which means that he only spent about £25 in the countries he visited. Businessmen are responsible for much of Britain's expenditure on travel, and this part of the account is unaffected by changes in the allowance. Thus when it was reduced to £25 at the beginning of 1952, the effect on total travel expenditure was small: it fell from £104 million in 1951 to £82 million in 1952. Nor will the extension of the allowance to cover 18 more countries, including Russia and Eastern Europe, make any appreciable difference to tourist spending. Travel behind the Iron Curtain is still restricted by the difficulty of getting visas—and those who can get the visas are those who, broadly speaking, need no allowance.

If it costs little in foreign exchange to raise the allowance to £50, there would presumably be little increase in tourist spending if the limit were abolished altogether. The cost, such as it is, would be a small price to pay for the greater personal liberty of unrestricted travel. The serious obstacle to removing the controls is that it would permit movements of capital under the guise of tourism. But at least the allowance could be raised to the point where the limit was inoperative for almost everyone but the mover of capital.

Blue-Shirts in Madrid

LAST week about 150,000 blue-shirted Falangists converged on Madrid to celebrate the twentieth anniversary of the founding of their party by José Antonio Primo de Rivera on October 29, 1933. The Falange national congress, of which these birthday celebrations formed the colourful climax, was the first to be held since 1939. But the proceedings and the speeches do not seem to foreshadow any important changes in General Franco's domestic policies to match the altered course in foreign policy represented by his recent agreement with the United States.

In recent years the Falange has deliberately been kept in the background. Its ardent members hoped, therefore, that the congress would herald their return to the seats of power. On the other hand, those who have been advocating more liberal policies hoped that the congress might prove to be the Falange's swan song. Both have been disappointed. Franco reaffirmed the Falange's position as the only authorised political force in Spain; but he did not offer it a greater share of political influence. He has stayed in power largely because of the success with which he has

played off the different contending forces within Spain one against the other. He is not likely to upset the equilibrium now by unduly encouraging any one of them.

Some of the resolutions adopted by the congress—such as demands for "a more just regulation of wages," for swifter agrarian reform, and for more equal distribution of wealth—reflect the interest in social and economic reform that has always characterised some sections of the Falange. They also hit the nail on the head; in spite of some wage increases and a slight drop in the cost of living in recent months, wages in general continue to lag dismally behind the rising cost of living. The Falange's espousal of the workers' grievances, however, will not necessarily win it their support; in the workers' eyes the movement is too closely associated with the Franco regime. In fact the pronouncements of the party and the actions of the government are two entirely different things. But General Franco may well prefer that the Falange rather than his political opponents should be the mouthpiece of popular discontent.

Self-Righteous Herr Doktor

DR ERHARD, confirmed in office as Dr Adenauer's Minister of Economics, gives the tiresome impression that he is trying to teach Britain, the rest of western Europe and the United States that the Germans under his ministrations have become the moral-economic leaders of the OEEC countries. In the process facts are becoming distorted. In a recent very one-sided account of German recovery in export markets, published under his auspices, the essential part played by American aid is not given its due place, while the British are shown quite unfairly as intent on keeping a competitor down whatever the cost. Dr Erhard himself has been proclaiming that the OEEC members must now follow the German example, and have the courage—it seems that no more than courage is needed—to throw exchange controls to the winds. This, he says, is Europe's hour of destiny. The Council of the OEEC received his speech to this effect last week with poor grace.

Fortunately for Germany the heads of the *Bank deutscher Laender* and the Minister of Finance, Dr Schaeffer, realise that something more than courage is needed before any drastic form of convertibility can be risked. Indeed, they are over-cautious in taking the first steps. Germany's large reserves of foreign exchange, and the need to attract back foreign capital, would have justified a less niggardly decision on the transfer of earnings from foreign investment than that recently made by the financial authorities.

Dr Erhard is on stronger ground when he and his supporters in the German industrial world criticise the method of co-ordinating European economies sector-by-sector that the coal-steel community has inaugurated. They demand wholesale integration, with policies co-ordinated in all financial, commercial and social fields, and an all-embracing customs union. Without actually mentioning France, they declare that no one country should any longer be allowed to maintain an artificial rate of exchange at the expense of its neighbours. This excellent advice will be appreciated in the United States, when Dr Erhard goes there shortly; but the fact remains that Germans should not distort the causes of their recovery and should bear in mind that they are, in any case, not the best people in the world to lecture the French or the British.

Letters to the Editor

Milk Marketing

SIR—I was not surprised at the tone of your comment on my address the other day, because you seem to be most unsympathetic to any proposals that farmers should make use of the Agricultural Marketing Acts to improve the marketing of home produced foods. But in your comment on milk you seem to me to have very incomplete understanding of the facts and this is surprising for a journal of your standing.

You refer to the Board's success in manipulating the milk market to get higher prices for producers. If by "manipulation" you mean improving the efficiency of production and marketing, I agree.

In 1933, a time of dire depression, it was vitally necessary, if production of milk was to continue, to raise producers' prices. The Board succeeded in this, although between 1933 and 1939 consumer prices increased no more than the general index of food prices, and during that time the distributors prospered. No independent commission has found that the Board exploited the situation and used its powers unfairly at the expense of the consumer. Most have paid tribute to the value of the Board's work to the industry as a whole. Incidentally, the Board does not insist on fixing retail prices of milk while Government subsidies continue and producer prices are guaranteed.

You query the justification for resur-recting the marketing powers of the Board when producers are protected by the Government price guarantees. In your last paragraph you prophesy that the Board would rather shelter behind Government subsidies than deal with the problems that face the industry. In my remarks I made it abundantly clear that we believe the only ultimate protection to the industry lies in efficient production supported by enterprise in marketing, and we believe that even the guarantee of prices by the Government will not do the industry much good in the long run without these.

In the final paragraph you pick on some important matters which can only be argued at length but not in a short letter. But I cannot let pass the point you make on quality milk, because you must be badly misinformed. The incentive to producers must be adequate otherwise the proportion of TB-free milk would not have been raised from 6 per cent in 1939 to over 50 per cent of the total output in England and Wales in 1953, and the figure is still higher for Scotland.

Similarly although you doubt the ability of the Board to expand the liquid

market, I must point out that in the first six years of our operations we were able to increase liquid demand by 20 per cent.

In the light of our experience and the need of the situation as we see it in the future, this marketing organisation with its record of success and achievement must, I feel sure, have a big part to play under conditions of greater freedom in the milk market. Other suggestions have been made, but they generally involve more rather than less controls. You suggest that the Government should aim higher in milk policy. Does this mean that you favour public ownership, or control by public authority, possibly the continuation of the Ministry of Food, or merely a free for all? Tell us what you suggest, but please get the facts right first.—Yours faithfully,

W. R. TREHANE, Vice Chairman,
Milk Marketing Board
Thames Ditton, Surrey

[To get two facts right first, the Cutforth Commission (1935) was highly critical of the Board's powers and wanted milk prices fixed by an independent authority. The Williams report (1948) said specifically that "it is wrong for control of the industry to be in the hands of sectional interests." Secondly, freedom from tuberculosis is not by itself a full test of the quality of milk; the incentives for quality are still inadequate—for instance, there is no premium for butter-fat content.—EDITOR.]

BBC Goes VHF

SIR—Your article of October 24th makes the claim that FM sound is more efficient than AM sound. To show that this is debatable, it is only necessary to point out that the FM scheme apparently requires more transmitters than are needed to cover the country with AM sound on television service.

There are two further points which should be corrected. It has been reliably estimated that it will cost the customer an additional £7 to £10 for a radio set having a satisfactory built-in VHF circuit. Considering that the average run of radio sets that are sold in large quantities cost between £15 and £20, this represents an increase nearer 50 per cent than 10 per cent on the price.

Secondly, the article states that experimental services have been tried in other parts of the world; it would be nearer the truth to say that for up to fifteen years public services have been running in many countries, including one or two European countries. With one exception, these services have been a complete failure. This failure is due simply to the fact

that the increased price of the receiver makes the service appeal only to a very few.

Finally, if you consult any members of the retail trade, you will find that they would prefer money to be spent on alternative television services—maybe even in colour—rather than on a limited market for expensive, high quality sound broadcasting.—Yours faithfully,
N. A. TWEMLOW
Pye, Ltd., Cambridge

Private School Paradise

SIR—Your Note of October 24th, in stating that Surrey parents' "predilection for paying school fees is no reflection on the local education authority but a mirror of the county's attraction for the middle class," presents a one-sided picture of the situation.

I can speak only from knowledge of schools in this locality, but here it is the case that the primary school teacher-to-pupil ratio runs to worse than 1 to 50. What chance has any but an exceptional child in such circumstances—and, indeed, has a teacher?

Even a clever child might be forgiven for falling by the wayside if an ill-timed absence caused him to miss a vital stage in the curriculum, for there can be little opportunity for that extra individual attention which would enable him to "catch up" again. Add to the above facts parents' awareness that passes for grammar school are, in some cases, as low as 1 in 10 pupils and it becomes apparent that a desire for a private school "gloss" is by no means the only motive in a parent's mind. Surely any parent, seeing his child suffering under such disabilities, will try to make the effort to place him in a private school with an average teacher-to-pupil ratio of 1 to 17.

It is high time that the authorities realised their grave responsibility for shortcomings which will have repercussions for decades to come, and pressed their claims for the priority for education which will enable this lamentable state of affairs to be corrected.—Yours faithfully,
G. JOHNSON
Coulston, Surrey

Services not Servants

SIR—Your amusing article on American household services seems to imply that automatic central heating is a novelty barely known in this country. This is hardly fair to British heating engineers, who have been installing automatic oil fired boilers, in private houses as well as commercial buildings, for over 20 years.

I myself had an oil fired boiler, for central heating and hot water supply, installed in a small Worcestershire farm house in 1933, with all the automatic devices of thermostat and electric clock which your correspondent describes with such enthusiasm.—Yours faithfully,
MICHAEL HOPE
Birmingham

Downward, Christian Soldiers

THE NEMESIS OF POWER: *The German Army in Politics, 1918-45.*
By John W. Wheeler-Bennett.
Macmillan. 829 pages. 50s.

MR WHEELER-BENNETT'S long studies in German subjects are celebrated. For he moves like a connoisseur through the diplomatic and military history of Germany since Emperor William left it, fascinated by events and persons that he fears and dislikes, but finding much to wonder at or admire. He has wormed out the truth about Hindenburg, the wooden titan; recaptured the spirit of Brest-Litovsk as a crisis in Soviet-German relations; summed up the Munich tragedy with great power; and now turns to the Great General Staff. This is the latest of four interlocking books that present an epitome of the history of Germany's thirty years in the wilderness, history partly dug out of documents and letters, partly collected in day to day scrutiny and experience of events.

The book is too long, but the elegant style, the power to recreate people and situations, quickly carry one from the admirable General Groener, who saved the Republic in 1919, to the despicable General von Schleicher, who wrecked it in 1932. And then one must go on 400 pages to the end, to the ghastly picture of old Field-Marshal von Witzleben taking five minutes to die, suspended from the meat-hook that Hitler ordered for his rebellious generals, and to the final and deepest humiliation of the officer corps—the order issued after the plot of July 20, 1944, by General Guderian, in obedience to the Fuehrer who gave him dead men's shoes:

I expect every General Staff Officer immediately to declare himself a convert or adherent to my views and to make an announcement to that effect in public. Anybody unable to do so should apply for his removal from the General Staff.

No chief of a general staff could issue such an order unless he knew that most of its officers had been corrupted by years of compromise with evil, obedience to a crafty tyrant and selfish careerism. The best part of the book is the story of those years. It tells how the Army allowed the blackshirt SS to do its dirty work for it in the horrible purge of Roehm's Brownshirts in June, 1934; how shortly afterwards the officers took the oath of "unconditional obedience" to Hitler, which later so chafed their consciences when they saw the methods of Genghis Khan being copied in Poland and Soviet Russia; how men like Generals Beck and von Fritsch were removed to make way for the lickspittle

Keitel and the temporising von Brauchitsch; how Hitler pushed these superbly trained men into a "technicians' quarantine" where they plotted politics while he planned battles.

As a work of historical art the book has conspicuous faults. Its shape has been determined too much by those matters on which evidence is most plentiful and most interesting. The last third of it is virtually a history of resistance to the Nazis, giving much detail about events that have little to do with the declared theme of the book; for example, the argument about the motives of von Moltke-Kreisau, many of the character sketches (good though they are) and much of the data on peace-feelers and contacts towards Britain. Little or nothing is said about the effect of Nazism on the rank and file of the Army, the relations between Army and SS divisions in the field and at home, the remarkable social and mental effects—to be observed in Germany now—of Hitler's humiliation of the officer class. Mr Wheeler-Bennett likes, it seems, to study his history only at the "highest level."

It looks, indeed, as if he had a number of episodes on which he was eager to write the best and the last word, chose the army in politics as the central theme, and then found that the episodes did not make a well-balanced play. But it really does not matter. The quality and scholarship are there and three of the episodes are superb. Best of all is the study of von Schleicher, wrecking from his office the whole relationship on which Weimar Republic and Army had flourished together, unconsciously smoothing the way for Hitler while convinced that he himself was directing events. Also excellent is "From Stalin-grad to Normandy," where the ramifications of the military and civilian conspiracy against Hitler are traced with notable clarity and a moving charity of mind; and next comes "From Fritsch Crisis to the Outbreak of War," which makes it even harder to decide what Britain and France could have achieved by resisting Hitler in 1938. Incidentally, this book establishes beyond doubt what could have been done had they opposed the return of German troops to the demilitarised Rhineland in 1936.

Mr Wheeler-Bennett's tone is restrained and cool; he sets out fairly the noble and strong elements in these Germans, only to sorrow at their hesitations and to mock at their hypocrisy. His moral judgments come, as they should, as the inevitable climax of

evidence. But one wonders here and there by what standard he is measuring these unhappy men. Their predicament is perhaps one that has not faced a British staff officer since the Irish troubles; it behoves us to be cautious in judgment. What is remarkable is not so much the moral failure of these men as their lack of resolution or independence. There were noble characters among the July conspirators, and many broad minds in the narrow uniforms; but the average mentality to which they had to appeal was that which "thinks with its hand on its trouser seams."

Yet Germans can be proud of the gallant Major General von Tresckow, who said in 1944 under the shadow of the meat-hook: "We have done the right thing. Hitler is not only the arch-enemy of Germany, he is the arch-enemy of the whole world."

Duff Cooper Remembers

OLD MEN FORGET.

By Viscount Norwich.

Rupert Hart-Davis. 399 pages. 21s.

WE are not likely to get a more candid account, or a better written one, of the British Government in the throes of the Munich crisis than in these memoirs of Lord Norwich. As a politician, Mr Duff Cooper (he prefers his commoner's title throughout the book) had a reputation for indiscretion as well as for courage, and he now puts forward many passages from the detailed diaries he kept during the years leading up to his resignation from the Admiralty the day after the Munich settlement was announced.

There is much here to fascinate the historian. The extent to which Chamberlain hugged the power to himself in those fatal days, acting alone or on the advice of a few chosen colleagues, has never been more clearly shown. The Cabinet were told of his decision to visit Berchtesgaden only after the telegram had gone off to Hitler. At the peak of the crisis, when Chamberlain was at Godesberg, and it was decided that the British Government could no longer advise the Czechs not to mobilise, not the full Cabinet but a group consisting of Lord Halifax, Lord Simon, Lord Templewood, Mr Malcolm MacDonald and Lord Inskip, were called together. The First Lord of the Admiralty, worried not only by his responsibility for the Fleet, but by the possibility of having to divert merchant shipping from the Baltic, was reduced to ringing around Ministers' offices to find out what was happening. Even this had no effect. "With some difficulty I got on to the Cabinet Office and spoke to Ismay," writes Duff Cooper. "He told me that he himself had given my message to Tom Inskip, who had immediately got up and gone home to bed." The actual terms of Munich, which brought his resignation, were learnt by Mr Duff Cooper from the newspapers.

The Prime Minister's behaviour owed much, no doubt, to his own character and to his distrust of the resistant wing of his own party; but there was more

to it than an accident of personality. These memoirs provide the clearest evidence that has so far come to light of the degree to which the Cabinet system in its modern form tends to concentrate power in the hands of the Prime Minister and one or two of his most trusted colleagues. The pressure of business means that more and more decisions are reached in Cabinet committees, and the full Cabinet becomes more and more a ratifying body. This development has usually been ascribed to wartime influences, but it was already in full swing in 1938. The dispute between Mr Chamberlain and Mr Eden over policy towards Italy was conducted in the foreign policy committee, and the full Cabinet learnt of it only when the Foreign Secretary's resignation had become inevitable. (Mr Aneurin Bevan may have some interesting comments to make in due course of how this system operated when the Labour Budget of 1951, which led to his resignation, was in preparation.)

Mr Duff Cooper is equally forthright about his struggle, as Ambassador in Algiers and Paris, to get the British and Americans to recognise that General de Gaulle would inevitably be the real power in France after the liberation. Sir Winston Churchill's attitude he ascribes to dislike of the General, but the American view reflected, he suggests, a lingering intention of "going back to Vichy." He adds:

It would be interesting to collect historical instances of harm that has been

done by the reluctance of men to accept readily what they know they will have to accept in the end.

Charles James Fox was one of Mr Duff Cooper's early heroes, and something of his spirit animates these pages. The fustian of politics is interwoven with a gilded thread of the dinner parties and country weekends, of Bucks and Venice and the Riviera. And surely the shade of Fox was looking over Duff Cooper's shoulder when he penned his glowing passage in praise of wine; or when, haunted by fear that Chamberlain would yield even after Poland was invaded, he noted in his diary on September 2, 1939, "we went to the Savoy Grill. I felt I could eat nothing—but dealt very successfully with a cold grouse."

It was probably a mistake for Mr Duff Cooper ever to have left the Foreign Office for politics. He was never an outstanding politician, despite his courageous gesture in 1938. But he was a good ambassador. The parts of his book dealing with his ambassadorship have a surety about them which the rest lacks. His acute powers of observation, his willingness to face unpleasant facts, the clarity of his writing, his sociability, were all assets which fitted him for this role. Had he remained in the diplomatic service he might have exercised a greater influence on events than was ever possible to him in the struggle for power at Westminster.

Somervell on Young on Baldwin

STANLEY BALDWIN. *An Examination of some features of Mr G. M. Young's Biography.* By D. C. Somervell. Faber. 135 pages. 8s. 6d.

IT is not with the literary merits of Mr Young's biography that Mr Somervell is concerned. He is outraged that, dealing with a figure who has become unpopular in retrospect, it leaves out so much of what should have been said in his defence, and he fears lest, since it is an "official" biography, posterity will conclude that there was no more to be said. His chief complaints are two, a general and a specific. The general complaint is that far too much blame is left by Mr Young resting on Baldwin for the wishful thinking, the blind sloth, of a generation which he admittedly epitomised but which he could not have changed. Mr Somervell hardly establishes this thesis. One may think that Mr Young was oddly lukewarm in defence of his client and still believe that the verdict was sound. It is a sufficient defence of the man-in-the-street to say that his attitude is entirely typical of the rest of his generation. But Baldwin was Prime Minister, and the charge against him is that he accepted the state of opinion and did nothing to change it. Mr Somervell brings as little evidence to rebut this as Mr Young did.

With the specific matter, the case is otherwise. This is the charge, to which

Sir Winston Churchill has lent his authority, that in his "appallingly frank" speech of November, 1936, Baldwin confessed to having put his party before his country. Mr Young implied that he thought there was something in this, and even Mr Somervell is rather hesitant about it. But nobody who now reads the whole of the speech of November, 1936, and who remembers the circumstances in which it was made, ought to have the slightest doubt what it was that Baldwin was saying. "We were returned to office," he was saying, "in 1931 on a pledge of economy. To be released from that pledge and to start rearming when Hitler seized power in 1933 would have required a dissolution. But the East Fulham by-election showed that we should have been beaten and a pacifist Labour party would have been put in office, which would have damaged any party without advancing the cause. Clearly the only thing to do was to wait until we could get a mandate for rearmament, as we did in 1935." This is not perhaps particularly noble, but it is perfectly proper. On this count, Baldwin deserves a complete acquittal.

The oddest part of the whole affair is that neither Mr Young nor Mr Somervell puts any weight on the episode of Baldwin's life that most became him: the stubborn stoical self-control with which he kept silent from his retirement to his death.

The Philosophical Revolutionary

WILLIAM GODWIN AND HIS WORLD. By Rosalie Glynn Grylls. Odhams. 256 pages. 21s.

ENGLISH life has its special way of making revered old men out of the most scarifying revolutionary writers. As a bachelor of thirty-seven, William Godwin startled, shocked and inspired the England of 1793 with a work on *Political Justice* that assaulted all political and social conventions; he ended his days forty-three years later as the pensioner of a Whig Government and a much-visited sage. In between he had married twice, had failed hopelessly as a dramatist, a publisher and a father, and his hubris in explaining the fallacies of the marriage contract had brought down on him the supreme penalty of acquiring Shelley as a son-in-law. He was an individualist—even orchestras were condemned as an offence against individual expression. He was also an optimist, men being kept from something near perfection only by temporary impediments. These impediments included all political institutions, which must be dispensed with as men developed frankness of speech and universal benevolence of action. This would come with universal education and the end of work. Like contemporary thinkers on the Continent Godwin imagined that the coming of the machine age would finally solve the problem of work—"machines will be our helots"—and men would have to put in perhaps

CORDON BLEU

A fine liqueur brandy

The choice of a lifetime

In the natural process of trial and error you'll find good reasons why so many men get a lifetime of pleasure from Player's "Medium".

Now available in 2 oz. round airtight tins, as well as the flat pocket tins and 2 oz. pouches.

PLAYER'S MEDIUM NAVY CUT TOBACCO

First Again! AIRCRAFT NOSE-DOCKS in ALUMINIUM

S.M.D. Engineers now build Aluminium Nose Docks to provide cover and facilities for servicing aeroplane engines—eliminating the expense of complete hangars. These "Wing Hangars" are easily transported, and erected; delivery is rapid and, of course, no painting is required. Let us send you details.

ALMIN LTD · FARNHAM ROYAL · BUCKS
FARNHAM COMMON 595

Aluminium Hangars and Nose Docks are built by S.M.D. Engineers Ltd., of Slough, the construction company of the Almin Group.

Gift giving made easier!

MITRE CLUB

THE STATIONERY THAT

Makes writing easier

Available in white and an attractive new shade of blue, in boxes including matching envelopes . . . price 5/6.

FROM ALL REALLY GOOD STATIONERS

Here's the gift of the season—Mitre Club—the new kind of notepaper that does make writing easier! Everyone will be delighted with Mitre Club, with its specially-processed satin-smooth surface that suits every kind of pen. Choose Mitre Club Cabinets in the gay new Christmas wrapping—for a gift that you know will please!

He eats houses!

Wood-boring insects and destructive fungi cause enormous damage. Dry rot alone costs the country over £20,000,000 a year! How vital, therefore, with building materials still in critical supply, that modern structures should be protected, newly felled timber safely stored for future use and period buildings preserved. In all cases Monsanto's wide range of 'penta' chemicals has provided some of the most effective of modern preservatives.

"PENTA", the short name for pentachlorophenol, is the most powerful wood preservative in modern

use. It gives protection against dry rot, powder-post beetles, furniture beetles, long-horned beetles and termites. Penta is easy to apply—to whole timbers by immersion, or by brush to woodwork already in service. It is produced by Monsanto in various forms and is supplied only in bulk to formulators and trade users.

Monsanto General Preservatives for a variety of uses

Monsanto preservatives are also used to protect adhesives, sizes, paints, leather, textiles, paper, rubber latex, inks and creams. Write now for full information.

"Penta" is one of Monsanto's wide range of chemicals and plastics for industry. If you have an industrial problem which chemicals might help you solve—get in touch with Monsanto today!

half an hour a day (an estimate subsequently revised to two hours).

Miss Grylls's book is not a life or a history of Godwin's thought, though both are sketched. Instead she has tried one of the most difficult of literary tasks: to recapture the intellectual climate in which he lived. There are passages in which she brilliantly succeeds and there are many pleasing touches, but the account becomes too often merely a catalogue of Godwin's social acquaintances. She has found interesting new material about some of the minor characters, but here again it is brought in in a way that adds to the discursiveness of her general manner. Moreover, Miss Grylls has a habit of making facile comparisons with the present day. By so doing she is not bringing the early nineteenth century any nearer to her readers.

Still, Miss Glynn Grylls deserves to be read, because Godwin deserves to be remembered—as a personality in his own right and as an influence on later, more practical political thinkers—and more people are now likely to read her than to read him. Without the brilliance of Mr Brailsford in his "Shelley, Godwin and their Circle," but with her own enthusiasm and occasional wit, she has passed in review a gallery of very English intellectuals.

That Unfortunate Movement

THE FRENCH REVOLUTION.

By A. Goodwin.

Hutchinson. 192 pages. 8s. 6d.

"THAT reminds one of the worst excesses of the French Revolution. And I presume you know what that unfortunate movement led to?"

Mr Worthing was too much embarrassed to answer the Old Regime as represented by Lady Bracknell. But the reader of Professor Goodwin's book will at least know what led to the Revolution; for in 180 pages he examines its causes and discusses the course it took. His account of the coming of the revolution is similar to Georges Lefebvre's: it begins with an attempt by "Privilege" and Provincialism to block essential administrative and financial measures belatedly proposed by Louis XVI's Government. The desperate efforts of de Brienne and Lamoignon to avert bankruptcy were frustrated in 1788-89 as M. Laniel's are today: the nobles, the hereditary legal officials, and the champions of provincial autonomy, may be said to have tried to start a counter-revolution, which was intended to anticipate, but actually precipitated, the most dramatic revolution in history.

Up to October, 1789, when a riotous mob insisted on escorting both King and National Assembly from Versailles to Paris, Professor Goodwin's story is as clear as it is necessarily concise; but after that, the general reader who has, in the publishers' words, "made no previous study of the particular subject," is likely to feel bewildered, the victim rather than the student of a revolutionary

movement, carried along by the stream and confused by the cross-currents of events which are not self-explanatory, and which no author could hope to explain in such restricted space.

The reader who knows the story will derive pleasure and profit from this scholarly interpretation of the fall of the monarchy, the war, and the terror; but for the beginner, trying to appreciate the personalities and the deeds of the "men of '93," this analysis of their motives, though informed by the latest research, will hardly be sufficient; he may feel as the disappointed reader of Conrad felt who, having expected an adventure story, complained that it was like listening to people in the next room talking about something happening outside. This is the more irritating when "outside" means bloodthirsty crowds bawling *Ca ira* or the *Marseillaise*, or the angry mutterings of the socialistic "Bras Nus." Nevertheless all that is needed to make this handy and inexpensive book attractively useful to the "unprofessional student" is the addition of a short historical introduction to the years 1787-94.

Potting Parliamentary Procedure

EUROPEAN PARLIAMENTARY PROCEDURE.

By Lord Campion and D. W. S. Lidderdale.

Allen and Unwin. 270 pages. 30s.

THIS book is produced by Allen and Unwin, but we are told that it is published by the Inter-Parliamentary Union. Lord Ruffside has written a foreword. It is a handbook on the parliamentary procedure of twelve European Parliaments (Egypt is in the list) and an attempt has been made, with considerable success, to reduce the information to comparable sections in the chapter devoted to each country. In each chapter the facts are arranged under the following headings: position of members; basic organisation; organisation of time and business; rules of debate; legislation; financial procedure; control of administration; the committee system. Each of these main headings is further subdivided. Thus at a glance the student can learn under Section 1, subsection 4, what are the privileges enjoyed by members in each of these twelve Parliaments. He may learn that in Denmark "A number of free seats in the Royal Theatre at Copenhagen are available to members." Drury Lane kindly copy.

In the Egyptian Parliament—now in cold storage—members' salaries were £468 per annum subject to tax, and attendance was compulsory. This will surprise anyone who believed that an Egyptian MP's life was more profitable and less arduous. Although events in Egypt have made Chapter III of historical rather than topical interest, the book is nevertheless an excellent work of reference for students and others—provided they remember that theory and practice are not always co-incidental.

The chapter on the United Kingdom is a miraculous potting of facts. It is safe to assert that at least half the members of the House of Commons (if it is not breach of privilege to say so) would not obtain 25 marks out of 100 if examined on the contents of these pages. This chapter should be reprinted as a pamphlet and issued to each new member as he obtains his first free railway pass.

Interpreting Asia

THE STATE OF ASIA. *A Contemporary Survey*.

Lawrence K. Rosinger and associates.

Allen and Unwin. 546 pages. 45s.

ASIAN NATIONALISM AND THE WEST.

Edited by William L. Holland.

Macmillan, New York. 450 pages. \$5.

THESE two books are the products of the Institute of Pacific Relations. Between them they provide a comprehensive background to all the developments which have taken place in eastern and southern Asia since the war. Both are the collected contributions of experts, each writing in his own field, and, although most are American, a number are probably as well known on this side of the Atlantic by those who follow Asian affairs as they are on the other. Neither volume is able to carry its account of events right up to the present time; the one edited by Mr Rosinger does not go beyond 1951 and Mr Holland's runs through to about the end of last year. But each book covers the important formative period of change which followed the war, and, while there is some duplication of effort, one is complementary to the other.

The extent to which western ability to interpret events in Asia as well as knowledge of the events themselves has developed during the past few years is suggested by the foreword that Mr Holland, as Vice-Chairman of the institute, has written for Mr Rosinger's book in addition to his own. Writing in 1951, he says that the western world needs to "understand more of what is happening inside Asian countries . . . and not simply to know what is being done to Asia by the outside world." Already in the two-and-a-half years since he wrote those words they have begun to seem out of date. They belong to an era in which interest in Asia was still a good deal narrower than it is today. Today, Asia has become the cockpit of the cold war.

These two books constitute at once a guide for those who do not know Asia well and a source of reference for the expert. Mr Rosinger's book consists of an introductory chapter on the political and psychological state of Asia followed by a series of twelve country studies and a chapter on the Korean crisis. Mr Holland's book is shorter, but deals more exhaustively with the countries of South East Asia proper; it includes a useful section summarising the work and findings of the conference of the Institute of Pacific Relations at Lucknow in October, 1950.

*"Do you think I might have a
little whisky instead: I should prefer
White Horse if you have it."*

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Protection on the Defensive

Washington, D.C.

IT was some time after the President had announced the theoretical existence of his Commission on Foreign Economic Policy before he breathed life into it by choosing its members. The members themselves then had some difficulty in collecting a staff. In consequence, they did not hold any public hearings until ten days ago, though they had been listening to the Administration's case in private for some little while. When the commission was finally ready to give a performance before an audience it was immediately apparent that the members understood their parts and that those who were already well known to the Washington public, the members of Congress, were playing their familiar roles. The Democrats, by and large, were still supporting the kind of policy the President is believed to want and the Republicans were still opposing it.

Much of the interest of the Washington critics was concentrated on the chairman, Mr Clarence Randall, who has not made many appearances in the capital before but who arrived with an impressive reputation. He was understood to be a fairly recent convert to a liberal trade policy, but nobody quite knew how far his ideas went. However, by what may have been a coincidence but, since Mr Randall obviously has an orderly mind, was probably design, he published a book, on the day before his commission made its first public appearance, in which he made his position absolutely clear.

In a short passage on tariffs he pointed out that the anomaly in American attitudes to Europe was very striking:

Using both persuasion and pressure, we have demanded that trade barriers and restrictive practices of all kinds be promptly removed in order that commerce may flow freely among the various countries. . . . Yet we refuse to apply the same principle in the relationships between the United States and the very same countries. Our own tariff barriers have not only not been materially reduced but, on the contrary, in some instances, have actually been increased. Hanging over each European manufacturer who might be willing to try to sell to us even in spite of our tariffs is the threat that if he is too successful he will have to climb a still higher wall which we will thereupon erect. . . . Champions of free enterprise based upon competition, we refuse to practise it in dealing with the very people who we believe most need to adopt it.

It was against this background that Mr Randall called on interested national organisations to give his commission their views. He was obviously looking for solutions, but it he was given instead by most of the witnesses were imitations. With only two exceptions, the individuals who cared represented groups, of varying importance, who

were earnest believers in freer trade. There was unanimous agreement that foreign aid programmes, however necessary they may have been in the years immediately after the war, have reached the point at which they produce more aggravation than co-operation. There was, therefore, almost equally unanimous agreement that the rest of the free world must now be allowed to earn the dollars that have been given to it for the last few years. But nearly everyone became a little fuzzy when asked how to overcome the practical problems that a lowering of trade barriers would inevitably present.

Unfortunately admirable sentiments by themselves were not of much use to Mr Randall. His commission undoubtedly contains a majority who agree with them, thanks to the views of the seven members chosen by the President and those of the Democrats from both Houses of Congress. But, however large the majority, there remain Senator Millikin and Representative Reed, the chairmen of the congressional committees who must sponsor any legislation that arises from the commission's report, and, as long as they are unrepentant protectionists, there is little hope of anything being done. What were needed were some clear-cut suggestions which, even if not immediately acceptable to the diehards, would weaken their arguments and give the other members of the commission weapons to use against them. Only Mr John Coleman, the head of the newly formed Committee for a National Trade Policy, produced such suggestions in full measure, though the representatives of the two big trade union organisations gave considerable help by expressing their confidence that the problems could be solved without their members suffering seriously.

★

Nobody thought that the elimination, either gradual or immediate, of tariffs was a solution for all the economic problems of the free world. But most people would have agreed with Mr Pierson, of the American Council of the International Chamber of Commerce, who put the renunciation of protectionism as a policy by the United States at the top of the list, followed by the encouragement of foreign investment and convertibility of key currencies. And nobody seemed to agree, until Mr Baruch's views were published, with Mr Cola Parker, the Wisconsin paper manufacturer on the commission, that convertibility must come before anything else. But the real struggle in the hearings and, no doubt, the real struggle behind the scenes was over the extent of the dislocation that a steady reduction, however gradual, of tariffs would cause to American industry and over what could, and should, be done to cope with

its effects. It is a measure of how much the situation has changed, even in recent years, that the argument should now be about how to ease the transition to freer trade and that the protectionists should have been driven back to what must surely be their last line of defence.

Mr George Meany, the president of the American Federation of Labour, ridiculed alarmist estimates of the number of American workers who might lose their jobs if they were not protected, but said that his organisation felt that

where adjustments are clearly unavoidable and are in the national interest, they should be accompanied by special measures to assist both the enterprises concerned and the workers affected.

The representative of the Congress of Industrial Organisations was less optimistic, because he believed that the productive efficiency of many plants abroad was now comparable to similar plants in the United States, while wages remained lower, but he did not question the necessity for lowering tariffs. And he thought that one of the commission's main tasks was to

look at the problem of injury to American plants and production and employment from the standpoint of attempting to solve the problems created by imports through means other than increasing duties, tariffs or quotas.

Neither of these two had come prepared to give specific examples of what they would do. Nor had Mr Meyer Kestnbaum, of the Committee for Economic Development, who told Senator Millikin that people had been moved from areas where there was unemployment before and that it could be done again. But Mr John Coleman, who has had plenty of experience of such problems as a member of the Michigan State Economic Development Commission, said that dislocations resulting from tariff reductions should be handled administratively, that it should be government policy to cushion any transition and that it was better to subsidise the readjustment of an industry for a short period than to subsidise the industry itself forever by tariffs. He went on to give Senator Millikin more than one practical example of what had actually been done when industries had died, either because of a change of public taste or because of competition from more favourably placed competitors within the United States—not from foreigners. Mr Coleman's arguments were unanswerable and Mr Millikin was reduced to clouding the issue with verbosity (the Senatorial equivalent of the squid's ink) and to asserting that nothing that had been said was in any way applicable to his own State of Colorado. For the first time Mr Randall's face, which had carried a weary smile through much of the hearings, broke into a broad grin and he must have been sorry, for once, to have to invoke his stern rule that no witness should be allowed more than three-quarters of an hour.

These two days of public hearings have given a glimpse of the area into which the long argument over tariffs and trade is beginning to move. There is little hope that anything positive will be done by the present Congress; indeed, it will be an achievement to hold the line. But it now looks as though it will not be many years before some President has to appoint a commission to study not what the foreign economic policy of the United States should be, but how to prevent individual communities suffering from the effects of a policy already determined.

Southern Solidarity

FROM A CORRESPONDENT IN ALABAMA

IT is just a year since Mr Eisenhower repeated Mr Hoover's feat of splitting the traditionally Democratic South and thus reopened the possibility of creating a two-party system in the states of the old Confederacy. The personal appeal of the President to Southerners has diminished very little in this time. But the election (by a comfortable margin, if a much smaller one than Governor Battle won in 1949) of a feeble Democrat as Governor of Virginia suggests that Southerners make a sharp distinction between the President and his party.

It would have been poetic justice if the progressive Republican, Mr Dalton, had won in Virginia, for last year Senator Byrd, the conservative autocrat of the Democratic machine, helped Mr Eisenhower to carry the state by encouraging Democrats to vote Republican. The danger that the lesson might have been learned too well was great enough to force Mr Byrd to do unaccustomed campaigning for his candidate; a scandal in the Democratic ranks, coupled with the willingness of anti-machine Democrats to show their resentment of Mr Byrd's defection last year by voting Republican themselves this time, seemed to give Mr Dalton an outside chance of success. His failure, in one of the few southern states which sends any Republican representatives to Washington, is a sign that the South is still inhospitable to Republican hopes.

It should be remembered that there are roughly three political groups in the South: the old-line Republicans, who are relatively few, a considerable number of dissident right-wing Democrats, many of whom in recent years have organised as "States' Righters" or "Dixiecrats," and the loyal Democrats who normally constitute the majority. It was a combination of Republicans, Dixiecrats, and "Democrats-for-Eisenhower" who in 1952 enabled Mr Eisenhower to carry four southern states, and secure a large popular vote in the other seven. In the twenty-four years since Mr Hoover won five southern states, no other Republican presidential candidate had carried even one.

Ever since last November, Southerners have wondered whether this time the two-party system would take root in a region which has long suffered the evils of one-party rule. Most of the Democratic leaders are sceptical of Republican prospects. Governor Persons of Alabama said, after the Republican sweep last year: "This was a personal victory for Eisenhower. When some of these ambitious Republicans try to run for state and local offices, they'll find their name ain't Ike!"

★

Conscious of this, the Republicans have been using federal political patronage to develop the dynamic party leadership that has been lacking. Most of the Republican organisations in the past have been tiny and intentionally exclusive, for although they made no contribution to the election of a Republican President, they could count on sharing the rewards when a Republican Administration came to power. Most of them supported Senator Taft in all his efforts to win the Republican nomination.

In the past year efforts have been made to recruit Republicans from the new managerial class in the South, and the plums that Washington has to award in the form of local appointments have been going to newcomers, many

of them from the ranks of the Dixiecrats and the Democrats. But even this, although it has angered the "Old Guard" Republicans, has not appreciably broadened the base of the party's support, for most of the Administration's appointments have gone to the "country club element," who are out of touch with the mass of the voters. Some thought is now being given to the advisability of running candidates under an independent label, to catch the votes of those who still hesitate to vote Republican.

The strength of the Republicans in the South is the President's repeated insistence on states' rights. This term is usually used as a euphemism for less federal intervention to protect the civil liberties of Negroes; conservative southern economic interests and the politicians who reflect their views tend to soft pedal their hopes that it may also mean less federal intervention in the field of welfare. It is doubtful whether a majority of southern voters would welcome the withdrawal of the federal aid to which they have become accustomed.

Southerners are naturally delighted that so far the Administration has not pressed for legislation to protect the interests of minorities, as the Truman Administration did. A serious attempt to force through civil rights legislation at the next session might jeopardise the support that southern Democrats have given the President. Already there is silent resentment at the President's moves to end segregation in the armed forces and in the District of Columbia, and at the appointment of Negroes to positions of authority. These moves have not, it should be noted, been welcomed with much enthusiasm by the southern Negroes, who are voting in increasing numbers.

Some of the sharpest criticism of the President in the South concerns his changing attitude toward the Tennessee Valley Authority. The Democrats regard this vast regional development, which brought electric power, flood control and land rehabilitation to five states, as one of their most brilliant achievements. During his election campaign, Mr Eisenhower, pressed for his views, replied:

If I am elected President, TVA will be operated and maintained at maximum efficiency. I have a keen appreciation of what it has done. . . .

As President, however, he has branded TVA as "an example of creeping socialism." Republicans in Congress have slashed TVA funds and some are even suggesting that the authority's power facilities be taken over by private companies. The threat to the TVA is keenly resented in Tennessee, Kentucky, and the northern parts of Georgia, Alabama, and Mississippi, and has cost the President the support not only of many liberal voters, but also of business elements which are benefiting from cheap TVA power.

President Eisenhower's popularity in the South has suffered most, however, from the continued decline in farm prices. The decline has been especially drastic in the price of beef cattle, which have displaced cotton over a wide area in the South. Nor has it helped for the Treasury to allow interest rates to rise, for farmers, and particularly farmers in a poor region such as the South, are heavy borrowers. Hard times are an unfortunate reminder of what followed Mr Hoover's victory in 1928, and discourage Southerners who still regard the President with affection, as a hero above and beyond the partisan battle, from following him into the Republican party.

American Notes

Republican Reverses

THE President swallowed his words about not intervening in local elections in record time, under pressure from his party, and flew to the other extreme of announcing that he favoured the election of Republicans over Democrats in every case. But all this has achieved is to make the President seem sadly infirm of purpose and make the Republican defeats in Tuesday's scattered elections look like personal reverses, which they were not.

The results in New Jersey are the ones which the Republicans must take most to heart. In Virginia, a sensation would have been created if the Democrat had lost. In New York, the traditional hold of the Democrats upon the city was enhanced by scandals which involved figures in the state Republican organisation and by the choice, as the party's candidate for Mayor, of Mr Wagner, who inherits the assets of the Fair Deal and of his father, the author of labour's Magna Carta, the Wagner Act. The Republican, Mr Riegelman, had so little chance in a three-cornered fight that it is surprising that the President should have been willing to let it appear that he had given way over aid to Israel in response to pleas not to alienate the Jewish vote in New York.

It is the loss of the two contests in New Jersey, which has not elected a Democrat to state office since 1940 and where agricultural discontent was not involved, which suggest that the political tide is running against the Republicans and that the Wisconsin reverse was no mere eddy. The President was forced, one imagines reluctantly, to extend his approval to Mr Troast, the Republican candidate for Governor, although he was one of a number of politicians who had recognised the "invisible government" of a convicted labour racketeer by pleading for his release from jail on parole. But the Democrat, Mr Meyner, succeeded nevertheless in turning a Republican majority of 70,000 in 1949 into a Democratic one of 160,000.

It is the loss of the sixth Congressional district which will be most keenly felt, however, not only because it had not gone Democratic since it was organised, but particularly because it brings the Democrats, with 215 members, almost level with the Republicans' 218 in the House of Representatives. If the Democrats carry the seat at stake in California next week, the President will control the House only by one vote.

The President has brushed aside the defeats as "skirmishes," and it is true that few important offices were involved. But these reverses are warnings that the public will not tolerate even local corruption—a very potent issue in New Jersey—in a party which promised a clean-up of government; and that machine-made candidates will not do. They are also evidence that realistic Republicans are right in insisting that, unless the party can write an impressive legislative record in the next session, the President will lose his already tenuous control of Congress in 1954's elections.

Up Against the Debt Ceiling

THE government's latest \$2 billion bond issue was as successful as had been forecast; it was five times oversubscribed and \$2.2 billion is actually to be allotted. This brings the Treasury up against the \$275 billion ceiling on the national debt. It is not, however, expected that any more new money will be needed this year; the \$10.5 billion that must be found by December 1st will be for refunding purposes only. The Treasury therefore still hopes to avoid actually going through the ceiling before Congress meets in January, the month when in any case the stringency will begin to be relieved by a rising volume of tax receipts. Meanwhile continuous attention will have to be given to such expedients as reducing progress payments to manufacturers with arms contracts, selling off Commodity Credit Corporation loans to commercial banks and, possibly, postponing tax repayments. The latest device for holding down the government's indebtedness has been to stop issuing the savings notes which corporations buy with funds reserved for future tax payments and the Treasury is also expected to use some of its outstanding cash balances to buy, and retire, government securities held by the Federal Reserve banks.

At least the officials who are preoccupied with such stratagems have not also had to worry about the new bond issue, which was put out under very favourable conditions and was immediately at a premium. Its terms, an intermediate one of 7 years and 10 months, fits in with the maturity dates of other government securities, although it is probably not as long as the Treasury, anxious to spread out the government debt still further, would have liked. Its rate, 2½ per cent, when compared with the 2½ per cent which was necessary for a 3½-year issue only two months ago, is evidence of the recent sharp fall in interest rates, which has been just as striking as was the rise earlier in the year. At that time the fear that credit would become dangerously short during the autumn led the Federal Reserve Board to make additional funds available for bank loans. But the seasonal increase in the demand for credit has been much smaller than usual and in consequence commercial banks were very ready to subscribe for this new government issue which was designed to appeal to them. Other subscribers were required to put up a 10 per cent deposit, to discourage speculative "free riders."

Capital Spending in 1954

THE appearance of a new government issue specially intended for bank purchasers is the latest move in the anti-deflationary course that monetary policy has been following for some time. The general easing of credit largely explains why many experts are little perturbed at the failure of the economic indices to show their usual autumn gains. Mortgage money, for instance, has been more readily available recently; this should be reflected before long in better figures for new housing starts. And both private and local government borrowers are finding it less difficult to obtain funds for new capital investment.

Further evidence that expenditures on capital goods will remain at a satisfactorily high level is provided by a special

survey of manufacturers' plans for investing in new plant and equipment in 1954. Carried out by the McGraw-Hill Department of Economics in October, this indicates that manufacturing, mining and utility companies, which together are responsible for over half of the capital outlays by business, are proposing to spend \$17 billion for such purposes, only \$1 billion less than this year. For manufacturing industries alone the planned total is \$11,683 million, compared with \$12,690 million this year; this decrease of only 8 per cent over 1953's record expenditure is reassuringly small and is largely explained by the virtual completion of expansion for defence purposes, especially in steel and aluminium.

Plans for capital spending in 1954 are concentrated in the big companies which have long-term programmes for modernisation and expansion, and particularly in the auto-

mobile and electrical machinery industries, where growing competition is necessitating more efficient output and the development of new products. Demands for both textiles and certain types of chemicals, the industries in which capital expenditures are expected to drop most sharply, have been lagging behind supply. This has also been true to a lesser extent of the petroleum industry, which is nevertheless planning to maintain its outlays almost at this year's level.

It is noticeable that, with the exception of some chemical companies, the firms surveyed have made little change in their plans for capital spending since they were first questioned last February. Since the subsequent numerous, although only minor, signs of a possible recession next year do not seem to have brought about any substantial alteration in these plans, it seems unlikely that they will be changed drastically as a result of the latest indications—the failure of the industrial production index to rise in September and October, the slackening of the rate of increase in consumer credit, the falling-off in overtime worked. But if these trends continue, and particularly if Christmas does not do all it should for lagging retail sales, then next February many of the replies to McGraw-Hill's regular annual survey may be very different.

The World Overseas

Pakistan without a Crown

BY A CORRESPONDENT

THIS week's Constituent Assembly decision to opt for Republican status for Pakistan accords with the expectations of all who have been in regular and recent touch with public opinion in that country. Indeed, the real surprise would have been if the decision had been otherwise; for even those Ministers and officials who are most cordially disposed towards Britain have for some months past warned their friends in this country that there was little likelihood of an indefinite continuance of Dominion status once the business of constitution-making began in earnest. Nor is there any evidence that anybody was willing or anxious to sponsor a continuance of the *status quo* either in the meetings of the Moslem League party, which are held in private, or in the deliberations of the Constituent Assembly which are open to the public and have been fully reported in the newspapers. The Hindu and other minority groups are opposed to some of the new constitutional provisions, but none of them could be expected to feel strongly enough on the subject to come out openly in favour of placing the hitherto somewhat provisional Dominion status of Pakistan on a permanent footing.

Not that there has been any real dissatisfaction amongst the masses of Pakistan with the post-1947 relationship between their country and the Crown or the other elements within the Commonwealth; for the great bulk of public opinion is in no sense qualified to pass judgment upon those delicate constitutional arrangements which make up the sum total of the Commonwealth concept. Its chief interest in the future constitution lies in the division of powers between the Centre and the Provinces, the composition of the legislatures, the apportionment of revenues, linguistic autonomy and the maintenance of the primacy of Islamic ideals within the structure of society and the anonymity of collective life. According to the Quranic revelation Allah is the supreme legislator, and it is enough therefore to be "brethren in the Faith." Thus the regulation of the formal external relationships of an Islamic country such as Pakistan is a matter which inevitably devolves upon a few self-appointed specialists—religious leaders, politicians, publicists, news-paper editors and the like—to whom the man in the street, the factory or the paddy field is happy enough to delegate the final decisions; this, after all, is not very different from the methods employed in more sophisticated democracies.

It is conceivable that had either Mr Jinnah or Mr Liaquat Ali Khan been alive today the decision in favour of a republican form of government would not have been

made. Such was the immense personal prestige of both (likewise their personal understanding of the Commonwealth concept) that probably either could, if he wished, have resolved the issue in whatever way he might have chosen. Not so Kwaja Nazimuddin who was dismissed from the premiership by the Governor-General last April. Despite his many estimable qualities, Kwaja Nazimuddin was much under the influence of the *mullahs*, the chief protagonists of an Islamic and theocratic state. Mohammad Ali, his successor, a cadet of the Dacca Nawab family and junior kinsman of Kwaja Nazimuddin, is a modernist who, whilst not unmindful of the tenets of his religion, has shown himself to be tolerant, progressive and desirous of the material progress of his country. For the present he is cautiously feeling his way amongst the conflicting pressures which exist within the Moslem League party, and his main objective in the constitutional debates has been to secure adoption of a formula which will reconcile the rival claims of the Punjab and East Bengal for representation in the Central Legislature. Thus far he appears to have been successful, though several more rivers may have to be crossed before his plan is completely accepted.

In the circumstances, Pakistan's future status within the Commonwealth, which has occupied a disproportionate place in British speculations about the final form of the new Constitution, has inevitably been the concern mainly of one small sector of public opinion. This small, but important, minority has tended to assess the value of a continuance of the direct connection with the Crown by two tests. Firstly, how, in terms of national independence, does a Pakistan Dominion stand *vis-à-vis* an Indian Republic within the Commonwealth? As Pakistanis see it, full membership in Dominion form brings no advantages that are not equally available to the only Republican member of the Commonwealth, which happens to be India, with whom it is essential that Pakistan should not only be equal in all matters but (what perhaps is even more important) appear to be equal. To those who think in this fashion it is only too clear that the republic reaps any benefits that may be going without subscribing to the full ritual and all the rules of the Commonwealth Club. So runs the argument. Secondly, according to the Pakistani way of thinking, if ever there was a case for Commonwealth mediation it is Kashmir. And Kashmir, in Pakistan's eyes, is almost exactly as it was in the autumn of 1947.

The logic of such simple reasoning is difficult to counter,

for present and prospective advantages count for more in the competitive nationalism of contemporary Asia than old ties and dimming loyalties. That the Islamic Republic of Pakistan will desire to remain within the Commonwealth is almost certain. Its close trade and other ties with Britain are unlikely to be much affected by last Monday's resolution which is primarily intended to show that Pakistanis feel as free as their next door neighbours and as little inhibited by the past. Nonetheless, there will be those in Britain and Pakistan and in other Commonwealth countries who for personal and undefinable reasons will regret last Monday's break with a long and honourable past.

Yemen Sets its Door Ajar

BY A CORRESPONDENT LATELY IN ARABIA

IF a world contest were to be held in the art of keeping strangers at bay, the prize would surely be divided between Tibet and the Yemen. Centuries ago, the latter was the heart of Arabia Felix, the source of the best spices, an important trading centre, and the fabled home of the Queen of Sheba. Its mountains enjoy a relatively plentiful rainfall and, so long as they are terraced and dams are built, it is a land of fertility. But it has lost this greatness. Today, it is a withdrawn, feudal state living under the domination of a ruling family that has the final word in all matters. It is a member both of the United Nations Organisation and the Arab League; it attends their meetings and votes on major issues, but contributes in word only to their affairs; and no important representative of either body has been invited there. It has, as yet, no public opinion, no modern system of education, justice, or public health, and not much chance of power or money for anyone who has not the luck to belong to the ruling clan. Any able plebeian is therefore apt to emigrate, and there are today colonies of émigrés as far afield as Cairo, Singapore, Marseilles and South Shields.

These exiles played some part in an upheaval which in 1948 shook the *ancien régime*, though, in the end, did not overthrow it. Apostles of progress, led by a member of the ruling family, and supported financially and morally by Yemenis abroad, murdered the aged Imam in the interests of reform. The rebels stipulated, for instance, that the treasury should cease to be the private property of the Imam and his family, and that the Imam and his sons should no longer monopolise all government posts and should participate in trade only on an equal basis with the rest of their subjects. After some vicissitudes, the Imam Ahmad, son of the old Imam, came to the throne. He is more aware than was his father of growing pressure from a younger generation that is waking to the ideas that fire the Moslem Brotherhood in Egypt; so is his brother, Prince al-Hasan, who is prime-minister. But custom dies hard and the family as a whole is still jealous of its privileges.

Yet, lately, they have unlocked their fastness to admit a few foreigners. Stirred by fabulous accounts of the profits being made in other parts of the Arabian peninsula, they have opened the door to oil prospectors and asked for a limited amount of help from the UN Technical Assistance Administration. They are difficult people to help because their mistrust of strangers is such that they are loth to let these roam their country. But they already possess two

surveys done by Arabs—one an Egyptian, the other a North African—which gave them some information on the physical resources of the most important parts of the country and, with these to guide them, the ruling family are now open to offers from investors and traders of other nationalities.

Hitherto, the chief export crop has been coffee, but the area devoted to it is now said to be diminishing in favour of *qat*, a plant with narcotic qualities which most Yemenis chew to the detriment of their health, but which must be used at once and does not travel. Hides and skins were also exported in some quantity. Fairly good cereals and excellent fruit are also grown where there is irrigation, but these are mainly locally consumed; much better irrigation would be needed before the land could resume its ancient role as a food-exporter. The Imam is personally interested in the development of a cotton crop in the coastal lowlands. Of minerals, the North African's report already referred to proclaimed the existence of petroleum near the coast, coal near the capital at San'a, and a variety of other minerals and semi-precious stones that were exploited in the past; but it is not yet clear which are present in commercial quantities.

Meanwhile the prime minister and his principal adviser seem to have felt that German prospectors will serve them best. They have not welcomed Egyptian pressure for pride of place; they would rather deal with the West than the Levant. They claim that, over oil, they approached Anglo-American concerns, but were turned down. Last summer, therefore, they granted a nation-wide oil concession to a west German firm, on terms which give themselves a 75 per cent share and the Germans a 25 per cent share in both costs and profits; the contract will be regarded as void if no oil is found within five years, though if prospecting is successful, it will be valid for twenty. Other German firms have taken up a concession for mining salt, and have secured a contract for supplying textile machinery for a Yemeni-German textile firm that will weave the Imam's cotton. German contractors are also building a cement factory and a tannery. One British concern has submitted a report on certain economic developments, including the improvement of breeding and fruit growing, and British and German firms are in treaty with the government over road development.

The most important foreign contribution that is being made towards opening up the country comes, however, from the United Nations. In January, 1951, the Imam asked for its help in establishing a bank and reorganising the country's finances and currency; at present currencies ranging from the Indian rupee to the Maria Theresa thaler and the gold sovereign and louis are all in circulation. A Pole, Mr Z. Siemensky, has been sent to report both on the type of system needed and on what further technical

assistance would be opportune. He has met with two local schools of thought, the more progressive of which urges that the bank shall be "national" and not "state"—that is, shall not be in the hands of the Imam's family. Some other UN technical assistance advisers are expected to help with public health and teachers' training, but will find their work difficult unless they stay for longer than most UN experts reckon to do. For here, if ever there was one, is a land in which a stranger can make no headway at all until he has lived there long enough to gain some grasp of customs and prejudices that will die hard in this far corner of Arabia.

Moscow's Bid for the Trade Unions—II

Colonial Revolutions in the Making

IN Communist practice as laid down by Lenin and Stalin a "correct policy" is not enough. Organisation for applying it is just as important. This is just another way of saying that it is no use drawing up plans for campaigns without a trained officer corps and an army to carry out the tactical moves. But strategy comes before tactics, and to see the World Federation of Trade Unions (WFTU) in its proper place as an army for fomenting revolution it is necessary to outline the Soviet strategic conception for the "colonial and semi-colonial" countries.

In the first place, the Soviet leaders—whether Stalin or Malenkov—regard this as "the era of colonial and semi-colonial liberation movements." In the standard terms, these countries form "the rear of the imperialist camp," or, more materialistically, the source of strategic raw materials and overseas military bases for the West. It is safe to assume that the greatest organisational effort goes into fostering unrest in the most vital strategic spots, even though, owing to local conditions, the Communists may have greater success in other parts. Persia, Iraq, Saudi Arabia, Egypt and the Sudan, are, for example, certainly targets with higher priority than British Guiana. The fact that East Africa was noted in Moscow as a new area of strategic importance to the West gives a prior reason for the sympathetic interest that Soviet propaganda shows towards Mau-Mau, or, as it is called, "the people of Kenya."

In the Leninist-Stalinist view (brought up to date by Mao Tse-tung) the strategy of revolution in countries "exploited by foreign capitalists" as well as the native variety is different from that in countries which have only to free themselves from their local oppressors. Stalin laid down the differences in an analysis of colonial revolutions in 1925, when he pointed out that the dual yoke in the backward countries deepens the "revolutionary crisis." As the revolutionary movement progresses, he said, the local national bourgeoisie splits into two sections—the petty bourgeoisie, which has an interest in helping the revolution, and the big bourgeoisie, which compromises with the foreign imperialists. The revolution would develop, forecast Stalin, as the proletariat joined the local small capitalists, and the national liberation movement linked with the proletarian movement in the Communist world. From this, Stalin deduced that the liberation of colonies cannot be achieved without a successful revolution. The revolution

will not be successful until the big bourgeoisie is isolated, the petty bourgeois masses freed from its influence and the "advanced" working class elements organised in a Communist party. No lasting victory could be achieved unless a real bond were established between the liberation movement and the Soviet Union.

Stalin decreed that the fundamental task of Communists in the colonies is to base their revolutionary work on these deductions. He gave instructions for the colonies that are in varying stages of development. In some, the bourgeoisie had not yet split and it was the immediate task of the Communists to make it do so, drawing the petty bourgeoisie into a united front. The peasants were classed among the small capitalists who must be led by the Communists in order to set up the dictatorship of the proletariat. The "revolutionary intelligentsia" were also to form part of this united front. Another Soviet analysis of this process in Africa has more recently classed the tribal chiefs as an obstacle, and noted with satisfaction that leadership is passing from them to the intelligentsia.

Stalin applied to colonial revolutions familiar warnings against deviations to the left and right—that is, against the Communists, who overrated their strength and underrated the importance of securing an alliance with the petty bourgeoisie, with the result that the Communists became an isolated sect; and the party men who overrated the need for an alliance with anti-imperialist elements of all kinds; this error may lead the Communists, who are in any case always a minority, to lose control.

Mao's Recipe for Success

The victory of Mao in China had a twofold effect on Soviet strategy. It gave the Communist leaders greatly increased confidence; and Mao was able to claim that he had improved on Russian principles for colonial revolutions. The Chinese did not introduce a new strategy or tactics, but they shifted the emphasis on to gaining the support of the peasants and propounded practical steps based on their own success. Mao's two main principles for colonial revolutions were laid down in the inaugural session of the Asian and Australasian section of the WFTU in Peking in November, 1950. These were that liberation will only come by armed force, on the Chinese model, and that the revolutionary army must be based on the support of the peasants, who must be won over by land reform. A rising of the proletariat in the cities is the last stage of the armed campaign, which starts with guerrilla warfare and ends with the establishment of regular armies, fed by deserters from the enemy. The setting up of a base and "People's Government," such as Mao had in Yenan, is regarded as an essential pre-requisite of a successful armed revolution on these lines.

How far Chinese leadership in this vital sphere has been accepted by the Soviet Communist party is not certain. There would seem to be readiness on the Russian side to admit that Mao has a "correct" tactical blueprint for the colonial countries, even though the Soviet Union remains the fount of doctrine and strategy. The executive bureau of the WFTU includes a leader of the Chinese trade unions. One Soviet writer soon after the federation's meeting in Peking at the end of 1950, after admitting the Chinese claim to have worked out the best means for success, stressed that "it is essential to form, when possible and

where possible, powerful people's liberation armies under the leadership of the Communist party. . . . The struggle of the masses must be identified with armed struggle, because the latter is the chief form of struggle in colonial national liberation movements." The national liberation movements, it is laid down, must be linked with Communist campaigns in the metropolitan countries, and can only be successful if the "feudalism" and the bourgeoisie (after the petty-bourgeoisie elements have first been used to strengthen the united front) are finally eliminated.

The role of the WFTU in carrying out these principles is important, as the mere evidence of the Peking conference would suffice to show. It has been growing in recent years. At the federation's council meeting in Berlin in 1951 for the first time a special colonial bureau was formed; the recent White Paper on British Guiana points out that this was done on the suggestion of Dr Chididi Jagan. At the recent Vienna conference, one of the chief items on the agenda was the promotion of WFTU work in the "colonial and semi-colonial" countries in which Latin America is included; and no less than half the delegates came from these areas. An agricultural section had been set up earlier inside the WFTU because the peasants and workers in the under-developed lands have special grievances. These countries are still in the "feudal" stage of capitalism, according to the Marxist definition; and, as voluntary reforms are said to be "impossible," the way is believed to be open for the Communists—always in the minority—to win the peasants and agricultural workers by offers of better labour conditions and land reform. At the same time the intelligentsia is attracted by the offers of opportunities for study at universities in Prague and the Soviet Zone of Germany, while local Communist parties in the metropolitan countries look after colonial students in western capitals.

Call for a United Front

At the WFTU conference in Vienna, a number of statements were made that seem particularly significant in the light of Stalin's and Mao's rules for colonial revolutions. The keynote was the need for a united front, with constant efforts to win the rank-and-file away from unions affiliated to the International Confederation of Free Trade Unions. Action must be taken "against trade union activities which are not in the true interests of the working class," said an Indonesian trade union leader. A representative from British Guiana stated that the People's Progressive Party works "hand-in-hand with the unions" and that "we will fight with as much determination even against odds as the Malayan patriots and the people of Kenya." A Sudanese union leader who is a vice-president of the WFTU declared that the working people of Africa were increasingly realising that protests were not enough. The time had come to fight for liberation, against the ICFTU. "You cannot be for the workers and at the same time against the countries in which the workers control the state," he affirmed. Though the Indonesian leader talked of the use of "all lawful means," and the WFTU will doubtless try to keep on this side of the law, it is not difficult to see that the activities of this new Comintern may well lead in some countries to the battles of "liberation armies" which, according to Soviet-Chinese strategy, must bring colonial revolutions to victory.

(Concluded)

Crisis on Hungary's Farms

IT is now clear that the Hungarian Communists have no intention of back-peddalling in their policy of collectivisation in the countryside. Those peasants who took at its face value Premier Nagy's promise that those who wished could leave the collectives after the harvest of 1953, now know better. If the road out of the collectives has not in theory been barred, it has at any rate been strewn with a series of formidable obstacles. At the same time steps have been taken to make life in the collectives seem more attractive, and to persuade the peasants that it is now, in Mr Nagy's words, "quite pointless" to leave them.

This development does not come as a surprise. Indeed, within a week of Mr Nagy's announcement on July 4th, Mr Rakosi had made it clear that the new Premier had exceeded his brief. This douche of cold water was not, however, sufficient to halt what seems to have been a strong movement among the peasants to leave the collectives straightaway; no doubt they distrusted the government's promises and wanted to get out while the going seemed good. The regime was forced to act vigorously to stop the rot. The Hungarian press was at once full of accounts of how members of collectives who had applied to leave had been "illuminated" by local officials and the police on their "real" interests, had thought better of their decision and withdrawn their application. Elsewhere members of collectives were reported to have "spontaneously" decided that the last thing they wanted to do was to leave their collective. There is little doubt that every form of pressure, as well as open intimidation, was used to keep the peasants in the collectives until the harvest was gathered in; and when that was done, the peasants were given to understand that in order to prevent any damage to the collectives, no one was to leave until the autumn sowing plan had been fulfilled.

Full Rigour of the Law

The blame for the regime's difficulties with the collective farmers is chiefly laid upon the kulaks, who are accused, among other things, of worming their way into the collectives in order to incite the members to disaffection. The machinations of individual kulaks are frequently pilloried in the Hungarian press and due emphasis is placed on the retribution—in the form of severe prison sentences—that has overtaken them. In a leader entitled "Let us Protect our Producers' Co-operatives" on August 7th, *Szabad Nep* gave a plain warning that "with the full rigour of the law it (the state) will hit out against all who incite against the co-operatives."

The regime, however, evidently realises that punitive action is not enough; the collectives must be made to exert a positive attraction on the peasants. It is admitted that many of them have proved a great disappointment and that the bureaucratic and unsystematic planning of agricultural work by local councils and the Ministry of Agriculture (whose numerous supervisors have been nicknamed "brief-case carriers") is thoroughly unsatisfactory. But Communist speakers assume with easy optimism that now that the government has taken things in hand, all will be well so that "to want to leave the cooperative now is neither comprehensible nor wise." And they urge the stronger collectives not only to set an example to their weaker

brethren but to help them with labour, machinery, advice and enlightenment.

It is obvious that the series of financial and other concessions granted to the cooperatives since Mr Nagy's speech, in particular those granting easier credits and bigger state investments to the collectives, should, if duly carried out, make life easier and more rewarding for the collective farmer. But it is highly unlikely that they will help to reconcile him to the system. For one thing many of them—the reductions in compulsory quotas, the cancellation of fines for last year's non-deliveries, the remittance of some debts—represent merely the removal of crushing burdens that should never have been imposed in the first place. For another, the concessions are being used as an additional barrier to keep the peasants within the collectives; those who leave will immediately lose the benefit of all concessions granted to the collectives. They have, moreover, been warned by the Premier that if they repent their decision and ask to rejoin "it will not be possible to ignore the fact that they have shirked the difficulties and troubles and have left the co-operatives disgracefully." As an additional precaution the regime has issued—with the minimum of publicity—a new set of statutory rules for the collectives which, in effect, pile still higher the legal and financial obstacles blocking the path of all who want to regain their independence.

Half-Broken Promises

In his famous speech of July 4th, Mr Nagy also promised much more help for the individual peasants who still farm the greater part of Hungary's arable land. Here again reality has nothing like equalled the promises made. Perhaps the peasants never expected that it would, for there is a good deal of evidence that Mr Nagy's speech only provoked in them an even more uncooperative attitude; probably they took his conciliatory gestures to be a sign of weakness. At any rate in spite of the excellent harvest the compulsory deliveries, which should have been completed by August 20th, are still coming in at a thoroughly unsatisfactory pace. There seems to have been a good deal of trouble with kulaks who insisted on threshing their wheat in the privacy of their own farmsteads instead of taking it to the official threshing machines.

Some concessions, however, have been made to the private peasants, although it is fair to say that they are all a good deal more niggardly than the comparable concessions to the collectives. For instance, in the middle of July all the delivery obligations of the collectives were reduced by 10 per cent. But the private farmers had to wait until August 30th before getting any of their quotas reduced and then only those for maize, potato and sunflower seeds were affected and even these only on condition that the much more important cereals quotas had been fulfilled. Again, whereas the collective farmers got all their unpaid taxes for 1952 cancelled, private farmers only obtained a 50 per cent reduction.

In short, in spite of all that has been said and done by the Communists about agriculture this summer, the position in the Hungarian countryside remains basically unchanged. The regime has shown a lively appreciation of the fact that agricultural production has been at a standstill since 1945; that, in the words of the Minister of Agriculture, "the effect of our lagging agricultural production is being felt in the lives of all our working people"; and that, as Mr Nagy recently told a conference of agricultural experts re-

cently, the "only road" by which Hungarian agriculture could emerge from "its backward state" was increased yields. The regime has even shown that it has some idea of what should be done to improve the situation, but it has only nibbled tentatively and half-heartedly at the fringes of the problem. It is too much the prisoner of its own ideological dogmas and political fears to go to the heart of the matter and make a genuine attempt to recapture the trust and confidence of the peasants.

German Coal for Europe

THE importance of Western Germany's coal production for the rest of Europe needs no stressing. It is Europe's largest and most regular exporter, and it is second only to Great Britain as a producer and consumer of coal. Of the 83 million tons of solid fuel imported by European countries in 1952 nearly 25 million tons, or almost 30 per cent, came from Germany. The trends of coal production and consumption there are therefore of vital concern to the rest of Europe, and especially to its partners in the coal and steel community.

Many of the current views about the European coal market are coloured by the events of the winter of 1951-52, when an acute shortage of coal caused heavy imports from the United States. It is not, however, generally realised that Germany was the major factor in that sudden dearth and that it was the largest single buyer of American coal during that winter. Between the years 1950-51 and 1951-52 deliveries of solid fuel to consumers in Germany rose by 19 million tons (from 111.0 million tons to 130.0 million tons), while in 1951 10 million out of the 25 million tons of coal and in 1952 13 million out of the 20 million tons coming from the United States went to Germany. The following table gives the salient features of changes in German coal consumption:

DELIVERIES OF SOLID FUEL TO CONSUMERS IN WESTERN GERMANY (Million tons)			
	1950-51	1951-52	1952-53
Thermal power stations	31.2	35.2	34.9*
Iron and steel industry	13.2	15.3	17.7
Other industries	29.7	33.2	32.0
Western Berlin	2.3	2.9	3.3
Railways, internal navigation and bunkers	11.8	13.4	12.6
Domestic and miscellaneous	20.7	27.6	27.3
	111.2†	130.4†	130.9†

Note.—* Figures for last three months 1952-1953 are estimates.
† Totals include certain figures for gas-coke for which there is no breakdown of end use.

Thus out of the total increase of 19 million tons, domestic consumption accounted for 7 million tons, electricity for 4 million, and the iron and steel industry and other industries combined for nearly another 5 million. These are very large increases for so short a period.

Fortunately for the stability of the European coal market several of the causes of this sudden increase in the demand for coal are unlikely to recur. Domestic fuel rationing

came to an end in 1951 and considerably upset the balance of consumption. The same relaxation cannot be repeated. It coincided with exceptional increases in industrial output and in the demand for fuel for electricity and transport, which were mainly internal to Germany and a part of its postwar rehabilitation. On these internal changes was superimposed the international upward swing of activity due to the Korean war. Since 1951 the rate of increase in German industrial activity has fallen off. While it seems certain that German industrial output will go on increasing the peculiar postwar conditions cannot recur in peace-time. Increases in industrial output production of the order of 20 per cent a year are possible only in circumstances as abnormal as Germany's collapse and subsequent revival.

It is, therefore, safe to say that the coincidence of circumstances during the winter of 1951/52 was unique. It is, however, necessary to look at the long-term trends of German coal production and consumption in order to assess Germany's contribution to the European coal market. Broadly speaking, the long-term question which faces the market is whether Germany will be able to maintain or increase its coal exports if its own industrial production increases. Is its own industrial and housing development going to absorb all its own coal? Does it regard its exports merely as a residual element after its own needs are satisfied?

Germany's record on coal exports has so far been good. As the table below shows, even the winding up of the Ruhr Authority did not seriously affect its exports. It cushioned its increased imports by buying from America, merely keeping its own exports steady. The effect of this policy is apparent in its net exports, which are shown in the table below, and are the true measure of its exporting power:

IMPORTS AND EXPORTS FROM WESTERN GERMANY
(Million metric tons)

	1948-49	1949-50	1950-51	1951-52	1952-53
Imports.....	4.7	5.4	5.6	13.5	12.4
Exports (including brown coal)	20.4	23.1	25.9	24.7	24.7
Net exports	15.7	17.7	20.3	11.2	12.3

But in the long run the bulk of any increased consumption in Germany must come from its own mines.

While German coal production has been rising steadily, the rate of increase has fallen recently and it has not even now reached the prewar level. This is the case in spite of a labour force in the mines which is 45 per cent higher than it was before the war. Productivity is, therefore, very low and rising but gradually.

Western Germany	1937	1938	1949	1950	1951	1952
Output of hard coal (million tons)....	138	137	103	111	119	123
Manpower (thous.)...	298	321	376	391	402	419
Overall output per manshift (tons)...	1,575	1,500	1,032	1,063	1,102	1,114

While the industry has the necessary skilled staff for future developments, it is short of capital. As and when

labour becomes more scarce even greater efforts than at present will presumably be made to increase productivity. Meanwhile the present annual increase of about 4 million tons a year is more than sufficient to meet the immediate needs of Germany and its neighbours. At the present time the rate of increase of German steel production is slowing down slightly and the European coal trade has diminished by 25 per cent since 1951.

It is, however, necessary to take a longer view of Germany's coal requirements. If its industrial production expands only gradually it should just about absorb its own increasing coal output and be able to import and export coal as now. But Federal Germany has potentialities for a much bigger expansion. In spite of having a population which has increased by over 20 per cent its level of industrial production compared with 1939 has risen only by about the same amount as in other western European countries whose populations are stable. Output per man has, therefore, virtually not changed. In addition its consumption of solid fuels for domestic purposes is relatively low (27 million tons a year compared with 53 million tons a year in the United Kingdom where the population is roughly the same). As housing conditions improve it seems inevitable that domestic requirements will rise. Nor does it seem probable that Germany will neglect the question of productivity or fail to take proper advantage of its additional manpower. Any developments in these directions will mean a considerably increased demand for energy.

Improving Fuel Efficiency

But this increased demand for energy may not mean a proportionate increase in the demand for coal because of increased efficiency. Germany is highly efficient in its utilisation of coal, and uses methods which could usefully be investigated in this country. For example it uses a much higher proportion of its coal (51 per cent in 1951) in secondary forms as gas, briquettes or thermal electricity than most other European countries. It has also encouraged a fundamental change in stoking techniques, so that it can use a much higher proportion of small coal. The coal industry itself runs a highly competent fuel efficiency organisation at Essen to encourage these developments. Changes of these kinds reduce the quantity of coal required per unit of output. At the same time Germany's consumption of fuel and oil per head is very low, and some of the future demands for energy, particularly for transport, may be met from this source.

So long as the progress of industrial activity in Europe remains hesitant there are no serious problems of coal supply. In the future the major difficulty for Western Europe is how to bring enough flexibility into German production to meet changes in demand. The margin for manoeuvre is extremely small and the widespread difficulties which followed the steep increase in German demand in the winter of 1951-52 illustrate the importance of flexibility. It is no longer practical politics to cushion changes in demand by changes in unemployment, as was normal in the years before the war. If industrial activity in Germany should rise steeply in the future there seems little doubt that its coal output will do little to relieve the rest of Europe, unless Germany continues its policy of importing American coal to balance its requirements of coal for export. This depends on dollars.

THE UNITED
STEEL
COMPANIES LTD

United Steel spreads its markets

The United Steel company is by no means tied to the fortunes of a single trade. The company's markets are very widely and evenly spread, because of the diverse nature of the products of the group.

This independence of particular markets provides a good insurance when demand varies between products or between industries. Furthermore, the distribution of the United Steel company's markets shows a sound balance between industries making capital goods and those making consumer goods. The wide range of products is such that customers find it easy and convenient to deal with the United Steel company for all their requirements.

JOSÉ FROM HAVANA

Soon after they were formed, in 1834, Por Larranaga began sending their Havana cigars to England.

José and other descendants of the skilled craftsmen who made those early cigars are now in Jamaica making Larra cigars for Por Larranaga, with the same fine Havana wrapper as their ancestors had used. Thus more than 100 years of experience, tradition and hereditary skill go to create these very fine cigars.

LARRA CIGARS by POR LARRANAGA

GO...

where the sun is hot

where the snow is firm

where living is good

Whether you intend to ski, skate, toboggan or just laze around eating magnificent meals and acquiring a mid-winter tan... GO by French Railways the fast, punctual, comfortable, courteous service that covers all France and connects with many adjoining countries.

THROUGH-SERVICES Winter sports through-services from Calais to the French Alps with sleepers, couchettes or ordinary seats.

the fastest in the World, with many air-conditioned coaches.

85% PUNCTUALITY Latest figures show French expresses improved their already high punctuality record with 85% arrivals absolutely on or ahead of time!

TOURISTS TICKETS offer reductions of 20 or 30% on ordinary fares for return and circular journeys of at least 1,500 or 2,000 km. and on certain conditions of stay in France.

FREE LITERATURE
Write for the colourful 24-pp. "France" booklet, and the Blue (Winter) Leaflet of practical information.

CVS-81

It means faster progress in the clearing of sites for new factories and housing estates, in the building of new roads, in the breaking of new ground for agriculture. It means greater economy for the contractor on every excavating and construction job.

Today, in Britain and in the many countries for which Britain is an *International* source of supply, contractors are taking delivery of the new

Doncaster-built International LTD-6. This is a 40.5 horsepower full-diesel crawler, incorporating the exclusive features and the traditional ruggedness of construction which have kept Internationals in a class of their own.

With its remarkable versatility and its outstanding economy of fuel, and with matched allied equipment, the International LTD-6 certainly means business.

THE BUSINESS WORLD

Power and the Atom

THE government is expected to act quickly on the proposals in the Queen's speech to set up a statutory corporation for atomic energy. A White Paper outlining the new organisation will be issued very soon. Sir Winston Churchill has promised that it will give "a very great deal of information" and will be "quite hard reading." Changes are certainly needed. A new and potentially vast industry is developing out of the science of atomic physics. In the past there has been little time for thought about the way in which this industry should be organised. The atomic energy staff of the Ministry of Supply have been primarily concerned with practical results; they have taken their fences one by one. First they produced fissile materials; then they mounted the explosion at Monte Bello; the results at Monte Bello were consolidated in a second series of tests at Woomera last month; ahead there lies the completion of the world's first atomic power station in Cumberland. By placing so much emphasis on tangible results they have shown that atomic science in Britain does not have to look to the United States for a technical lead. But they have clearly not had time to ponder the effects on technology, on industry, and on the British economy of these remarkable achievements.

The fact that to most people atomic energy is synonymous with horror and destruction suggests that the horizons within which this new atomic industry has so far been developed need to be widened. An elite circle of scientists employed by the Ministry of Supply at its atomic research establishments holds all the keys to knowledge; other scientists in other industries, and the managements to whom they are responsible, are almost wholly ignorant of what is being done. Yet the techniques of atomic physics have potentialities that go

far beyond the design of weapons of immense destructive power; an industrial country that confines its knowledge of atomic physics to those who have to make weapons may enjoy military security, of a kind, but eventually it is likely to run into economic perils of a different kind. The applications of atomic energy in peacetime uses are not the only problems requiring study; the prospect of a new chemical industry based on radiation is already taking shape; and, on a more modest scale, industry is just beginning to learn production techniques employing materials that have been made radio-active in atomic piles.

★

Twelve months ago, after the Monte Bello explosion had crowned with its atomic cloud a six-year quest for the secret of controllable fission, an article in these columns drew attention to the dangers of leaving the Ministry of Supply solely responsible for the development of atomic energy beyond this research stage. Since then, decisions have been taken to build atomic power plants with an output big enough to be piped into the grid. It does not follow, indeed, that a statutory corporation will automatically be free from the defects of the present regime. Certainly it should be able to offer more attractive terms to its scientists than a government department can do, though staffing is not the only problem. But if, after the Ministry of Supply had transferred its atomic plants and staff to the new corporation, the latter were able to behave as a monopoly no longer subject even to occasional Ministerial prodding, there would be no gain at all. Industry would still be working only on the periphery of atomic energy,

ignorant of its fullest potentialities and playing no part in realising them.

The Ministry of Supply, using powers granted by the Atomic Energy Act of 1946, owns and operates six separate stations; a research centre at Harwell where preliminary development is undertaken, including work on atomic power generation; a drawing office at Risley for construction plans; a metal refinery at Springfields for extracting pure uranium from imported crude ore; an elaborate chemical plant at Capenhurst where fissile uranium 235 is separated from non-fissile uranium 238—the starting point for the whole process; a big pile in Cumberland where plutonium is produced from U235; and an armament design establishment at Aldermaston. The quantity of fissile material that can be used for weapons, for power production or for other experiments, is determined by the capacity of the plant in Cumberland, where plutonium fuel (Pu 239) is produced atom by atom from the interaction of a small charge of U235 with a larger charge of U238. This plant is being expanded, and the atomic power plant that is being built on the site will be run at temperatures high enough to produce plutonium as well as to provide power for the grid. A second reactor, working much faster on the “breeder” principle, awaits a decision on its site. The new corporation would presumably take over all these plants and assume responsibility for all their functions, apart, perhaps, from the design and production of atomic weapons. But that exception—if it should be made—would be concerned with the use of fissile material in only one of its several applications.

★

The White Paper will be expected to reveal the Government's plans for financing the corporation and for the ownership of power plants (the economics of which form a separate study in themselves), together with the first appointments to the corporation. The members will have posts of great responsibility, for while the main directions in which the new corporation has to expand are clear, the way in which this expansion is put in hand will be crucial. Considerations of national security will require continuing Government control over its policy; as a case in point, fissile material is likely to be so scarce that its allocation between weapons and other uses will be a matter for Cabinet decision for many years to come. But the corporation will have to decide whether to remain a closed corporation or whether to invite and encourage the co-operation of industry in the most challenging technological revolution that man has ever known. How much of the design of new plants will be done by the corporation's own staff, and how much will be contracted out to industry? At what stages can industry be brought in as a partner in developments that it is now forbidden to watch as a spectator? In practice, the new corporation is likely to enjoy something less than the degree of autonomy of a nationalised industry. But the corporation should be able to strike its own balance

between the present self-sufficient organisation that it will take over from the Ministry of Supply and the American system, under which the Atomic Energy Commission owns plants and directs policy, but employs a number of companies, big and small, to design, build and run those plants as government agents working for a management fee.

★

Past experience suggests that atomic scientists, with a few notable exceptions, have shown a positive disinclination to use resources outside their own official establishments. While the work done by Harwell has been conspicuously successful, its success has rested heavily on the personal abilities of a few men. This appears to have served admirably in fundamental research, where development often proceeds logically from one step to the next, but an expanding industry would have to depend on the many, not on the few. The time is near, if it is not indeed here, for introducing an element of competition in design, such as exists today in the aircraft industry. The corporation should not start on the assumption that it can for all time rely exclusively on its own design teams. If industry is to co-operate effectively, it must first be given opportunities to learn; it must be encouraged and not admitted only under pressure.

These principles deserve emphasis, for although the idea of co-operating with industry is more acceptable than it was a year ago, in most cases “co-operation” is not intended to mean more than the designing of turbines and generators to produce power from heat tapped from an atomic pile. Sir Charles Hinton, head of the Harwell production department, said in New York last weekend that he and his colleagues expected in the future to design and develop power reactors which could be handed over to industry “after satisfactory pilot operating experience.” This does not suggest that industry will be given much opportunity to do original work. The idea of using the resources of industry to design the piles themselves, or to co-operate in any other operations close to the atom is too often brushed aside as unthinkable—either because “security” must not be breached or because some scientists have peculiar notions about “profits.” But unless the corporation is to grow to such monstrous size and power that it can run all the industries to which atomic development may give birth, private companies must be called in or opportunities will be lost. Immense problems of capital investment, security, and management will remain. But it is inconceivable that British technology can ultimately flourish if its leading industries continue to be excluded from knowledge of atomic science and its applications. The setting up of a new corporation will be a critical point in the development of atomic energy. Its implications, in particular, for the generation of atomic power will be further considered next week.

Free Market in Cotton

THIS week the Government announced that it will end public trading in raw cotton and the provision of facilities, backed by public funds, whereby spinners can cover themselves against the risk of fluctuations in cotton prices. It intends to wind up the Raw Cotton Commission—the public agency which now supplies cotton to about half Lancashire's spinning mills, and provides cover both to its customers and to spinners that import privately—after the current importing season ends on August 31st next year. The Liverpool Cotton Exchange will be allowed to reopen and resume its traditional rôle of providing cover facilities through the operation of a futures market. A necessary condition of these changes is the removal of the restrictions on imports of dollar cotton; this is expected to take effect from September 1, 1954. The market hopes to begin trading in futures in April or May, with October as the first delivery month. The Government's decision will complete the postwar restoration of Britain's important commodity markets and restore almost the last of the major commodities to the open market.

Its action is the logical outcome of the developments of the last eighteen months. On the recommendation of the first Hopkins Committee, the Government allowed spinners to choose in the 1952-53 season whether to continue buying from the Commission or to buy privately. After this decision, the Commission, established by the Labour Government's Cotton (Centralised Buying) Act of 1947, was no longer the sole importer of raw cotton. But all spinners, whether they bought from the Commission or from shippers, could still cover their cotton under the Commission's cover scheme. Last May the second Hopkins report suggested that the dual buying system should continue for a further year, but argued strongly that the provision out of public funds of cover for private trade risks was inherently undesirable, and that private cover facilities should be urgently considered.

The conclusion was not as unequivocal as it sounds. By the trade union members of the Hopkins Committee and, as it subsequently transpired, by the Labour Party, it was interpreted to mean that the Commission's cover should not be available to spinners who bought their cotton elsewhere. But the Government accepted it in the realistic sense that no spinner should enjoy public cover. The conclusion is unassailable. Insurance against risk of fluctuations in commodity prices is a function of private business, not of government. Moreover, given the size of the Commission's operations, it cannot itself hedge the risks that it accepts, and it is therefore fully exposed as a principal to the possibility of loss. From its discussions with representatives of the cotton trade on methods of providing private cover the

Government rightly concluded that the most practical way was to reopen the Liverpool market.

These discussions also indicated that although some small spinners still favoured the continuation of the Commission, Lancashire as a whole was now prepared for a complete return to the private buying of raw cotton. This is also desirable in principle, for reasons no less cogent than those in the case of public cover. And it is pertinent to recall that in the year ended August 31, 1952, the Commission's trading risks involved it—or rather the taxpayer—in a loss of some £27 million. It is thus logical that the Government should have decided to wind up the trading and cover activities of the Commission at the same time.

★

This particular transfer of responsibilities to private hands, however, raises more than the usual crop of difficulties, partly because raw cotton has been largely a government responsibility since 1939. One difficulty is the transfer to the Liverpool market of the hedges now placed with the Commission, which may cover as much as one-quarter of Britain's annual consumption, or roughly 400,000 bales. Such commitments may well strain the risk-bearing capacity of the market at first and it will be in spinners' own interests to arrange such transfers in steps, as opportunity offers, and not to wait until the last moment. The smaller spinners, who may be tempted to hang on to the Commission's cover scheme to the end, should remember that the longer they delay, the higher may be the premium that they have to pay for their hedge.

Most spinners will have to learn, or re-learn, the somewhat complex and delicate operation of trading in futures, and will have to accept the responsibility of active participation in the market. It is perhaps not yet generally realised in Lancashire that the success of the market will depend in large measure on the support it receives from the spinners themselves. They will have the opportunity of exercising a greater influence on the market than before the war. Then it was the merchants who were well supplied with capital and the spinners who lacked capital—a position that is in many ways now reversed. To attract more capital to the market, the Liverpool Cotton Association has broadened its terms of membership to permit the entry of private limited liability companies as full trading members. Such companies can be financed to the extent of 49 per cent of their capital from abroad; in practice, the foreign capital may be chiefly American. There is no reason to suppose that the banks will not be able to provide finance for Liverpool as readily as

they have provided it for other commodity markets.

The hedge offered by Liverpool will almost certainly be a contract confined to American-grown cotton and based on Middling 15/16 in. staple. The market authorities are not in favour of a broad contract, against which non-American cottons could be tendered, for they argue that this would weaken the effectiveness of the hedge. A strong contract is obviously needed, and it is doubtless true that if a number of cottons were to be included, buyers would be reluctant to deal in the futures because they would not know what type of cotton they might actually receive. American cotton has been chosen because it is the most widely used of all cottons, and therefore the major influence on world cotton prices. American cotton prices are also rather less subject to arbitrary government action than are some other growths. The contract will not, therefore, offer as full a hedge for Colonial and other cottons as for American, though it should give a greater degree of protection than a mixed contract would offer.

★

If spinners consider that in practice the American futures contract is an inadequate hedging medium for non-dollar cotton, they are likely to protect themselves by using more American cotton. This would increase the dollar cost of reopening the market, and it might also mean that Lancashire's consumption of Colonial cotton, which the Government is naturally anxious to encourage, would suffer with that of other growths. The initial cost of opening the market should not be significant, as long as prices of non-dollar cottons remain competitive with, or cheaper than, American cotton. The main risk, however, is that, if a dollar famine should develop, non-dollar cotton might command a premium over dollar cotton, as it did a few years ago. Such a dollar shortage would not miss this country; how long, in those circumstances, could Lancashire be allowed to buy more heavily in the United States? In the market's first year at least, this is a risk which has to be accepted. When the market got into its stride it is conceivable that it might, if necessary, operate not too unsatisfactorily under a quota system for American imports, provided that such imports were not greatly reduced. This problem of maintaining the fullest freedom that was possible at a time of dollar scarcity or crisis would have to be faced in Britain's other commodity markets as well. One must hope that it will be long deferred.

The market will in any event have to operate under exchange control arrangements similar to those that will apply to the futures markets in grains. Members will be free to do business with any part of the world, provided that dollar cotton is paid for in dollars, unless it is for consumption in Britain. Foreign operators holding a maturing futures contract will not be able to take delivery abroad of dollar cotton paid for in sterling. Arbitrage operations will be allowed, but

the market will have to make returns to the Bank of England, and to enforce remedial action if an unwarrantable speculative position is being built up.

The opening of the market will take place when stocks of raw cotton are likely to be low. The Commission will obviously run down its stocks, and the merchants have so far been unwilling to build up a spot stock. This appears to be due partly to a fear, which does not seem justified, that the Commission might sell some of its cotton at cut prices, and partly to an understandable reluctance to accept the risks and expense of going into stock when the returns for doing so are bound to be small. The disposal of the Commission's stocks should present no great difficulty.

The merchants will eventually maintain—as they certainly should, if the Liverpool market is to provide a comprehensive service—spot stocks of cotton. But they will not be tempted into holding stocks, given their postwar resources and the costs of carrying cotton, unless spinners are prepared to pay for the charges and risks involved. In present circumstances, spinners may well find these charges distinctly high, and they may prefer to rely on direct shipment contracts for the bulk of their supplies, as the contracting-out spinners have done. Most contracting-out spinners have found that they needed a stock equal to some 15 weeks' consumption, compared with roughly five weeks' stock carried by contracting-in spinners. The carrying of this extra stock represents a substantial addition to working costs. This probably explains why it is mainly the smaller spinning firms that have remained with the Commission. The Commission is obliged to hold a large and varied spot stock, and as a public authority it has been able to charge appreciably less for this service than a private merchant could. In effect it has subsidised from public funds a part of spinners' stock holding costs.

The big spinning combines are well able to finance their own stocks, and they are also less dependent on access to a spot stock because they can usually switch supplies between mills to tide over a particular shortage. Vertical firms are also less dependent on a spot stock because they can plan their future requirements more accurately. It is the smaller firms that will feel the change, and their difficulties in financing additional stocks may encourage their integration with larger organisations, horizontal and/or vertical. From the broad economic point of view this is probably a desirable development, though the Government can hardly expect to be thanked for it.

The return to full private trading and private cover in cotton will not be easy. It will be made even more difficult if the Labour Party indulges in threats to restore the Commission completely when it returns to power. If the market takes some time to provide adequate cover in today's changed circumstances, that will not justify a demand for reviving public cover or public trading. It must be given a fair chance to meet the challenge of meeting Lancashire's needs.

Business Notes

Hé Torro

THE bulls came surging into the stock markets this week, lured by the glittering cape of higher dividends and profits, and blithely indifferent, in the headlong rush, to their exposure to the lurking matador. His thrust, which pinked rather than killed, was duly delivered on Thursday morning, after Tube Investments had announced that its profits had suffered a severe setback and that its equity dividend was to remain at 15 per cent. Before this blow brought the advance in prices to a halt, investors, including the institutions, had been buying equities eagerly. Just before the week-end the *Financial Times* ordinary share index, at 130.5, topped for the first time the point at which it stood before the slide in markets that followed the launching of the "new" monetary policy in November, 1951. By the close on Wednesday it had climbed another full point, to 131.5, or about 9 points below the all-time peak attained during the boom in equities in the early summer of 1951 (and also in 1947). This latest phase in the bull market dated from the reduction of Bank rate in mid-September, but the bulls did not make their first tentative charges until a sustained burst of activity in Wall Street had wiped out almost all the losses of the early autumn, when the talk of an American recession was at its loudest. Then, towards the end of last week, the suggestions previously made—in these columns and elsewhere—that profits would soon turn upwards again, carrying dividends with them, seemed to be confirmed by a crop of cheering profit and dividend announcements; and this confirmation became the signal for a strong and general forward rush.

★

For a few days, the fact that most gilt-edged stocks could be tendered at fixed prices for the United Steel equity stock kept the gilt-edged market beyond the zone of this bursting optimism. But the fever proved infectious, and the market soon realised that the effect of this curious arrangement for the steel issue was to fix a floor rather than a ceiling for the stocks concerned—and that in any case the steel issue, large though it is by equity market standards, was a small tail for the big dog of the gilt-edged market. On Wednesday, when the market envisaged—not very accurately, as it proved—a good performance from the gold and dollar figures, gilt-edged became the centre of attraction, and prices broke away from their moorings. In the week to Thursday's close War Loan had risen from 83½ to 84½ and old Consols from 63½ to 64½. Having at first taken the threat of an American recession very seriously, the markets now seem to be taking it a little too lightly.

Tube Investments Misses the Bus

THE steady flow of higher dividends was suddenly interrupted on Wednesday afternoon by the announcement from Tube Investments that its gross profits had slumped by £3,184,336 to £5,872,259 in the year to July 31st last, and that its equity dividend was to remain unchanged at 15 per cent. This announcement came as a shock to those bulls (including some institutions) that had been cheerfully buying the company's £1 ordinary stock units before the week-end. It also caught the rest of the market off balance, for it had been basking in sunny announcements from Albert E. Reed and Harrisons and Crosfield (as well as from Fisons, Wall Paper Manufacturers and Crompton Parkinson, whose increased profits are discussed in Company Notes on pages 448 and 449). The market's immediate reaction on Thursday morning was to mark down Tube Investments' £1 ordinary stock units from 69s. 3d. to 64s. (and even at this price, they offer the limited yield of 4½ per cent). The ripple from this disturbance was sufficient to bring the steady advance in equity prices to a halt.

Tube Investments, despite its large stake in export markets, was one of the companies that did not suffer from the recession in 1951-52. Its profits in that year were still outstandingly high, though they included a windfall gain of about £1 million from an appreciation in stock values. In these circumstances, it may have been optimistic for speculators to expect another sharp increase in profits, but until the full report is published it must remain a mystery why the group has shown such a sharp fall instead of approximate stability. Until that report arrives stockholders must find what consolation they can in the fact that taxation charges have fallen sharply (from £5,879,675 to £3,415,171) so that the fall in net profits has been confined to £668,798—from £3,388,970 to £2,720,172. Indeed, once the latest tax adjustment is taken into account, the sum available for distribution has risen from £3,388,970 to £3,754,130, providing a very comfortable cover to the £569,038 paid out in equity dividends. But investors have a lesson to learn from this experience. There are grounds for hoping for a stream of profit increases in the near future from companies that had experienced a recession last year, and that have since recovered from it; but any boom based on this, in view of current uncertainties in America, can only be tentative—and must certainly be selective.

Britain against Convertibility

THE speeches delivered by Mr Butler and Mr Maudling to the OEEC meeting in Paris last week deserve a welcome in present conditions of trading uncertainty. But

they do not deserve to escape scot-free from ironic reminiscence. It is, after all, less than eleven months since the Commonwealth conference hatched its famous "plan" for sterling, which—if it meant anything at all—called for a progressive surge towards convertibility (that is, towards allowing soft currency countries to turn into dollars any sterling that they earned), even though that might mean a disappointingly scratchy advance towards liberalisation (that is, towards allowing foreign countries to earn more sterling by exports to Britain). It is less than nine months since a French Finance Minister thundered back Europe's reply that "convertibility, implying a maintenance or intensification of existing import restrictions, is not wanted"; and thereby sent Whitehall into a huff for weeks. Yet last week, while German and Dutch delegates were preaching the cause of convertibility (admittedly, with liberalisation too), Mr Maudling was declaring that, "in the British view, trade and finance should advance hand in hand and liberalisation should not be subordinated to convertibility"; and it was at least partly on British insistence that the final OEEC communique declared that it was only after bearing in mind "that progress by member countries towards convertibility should not be achieved at the expense of the continued liberalisation of intra-European trade and payments" that the Managing Board of EPU should draw up a report (before March 31st next) on "the methods which might be adopted for an orderly transition . . . from the present form of EPU to a wider system of trade, payments and credits."

It would be captious to criticise this turn-round in British policy. The fairest judgment seems to be that a year ago Britain and the Commonwealth put convertibility first, and tried hopefully to insert liberalisation second; now, apparently, they put liberalisation first and convertibility nowhere (except in conditional perorations about the rather distant future). Europe's reaction to the original "plan"; America's slow (and by no means sure) response to the proposals contained in it, and the fear that the American downturn might make easier markets in Europe essential to each country's full employment policy—all these make modifications of the original "plan" very sensible. But it would be an act of decency towards the dead, between now and next March at any rate, to leave the word convertibility out of the politicians' perorations as completely as it is now out of their programme.

Future of EPU

No details are yet available of the imports that Britain will free from quantitative restrictions before the end of this year, in order to increase its liberalisation percentage from 58 to 75 per cent; there is little doubt, however, that some of them will coincide with the goods on which higher duties can be levied under the newly acquired Gatt waiver. Mr Butler made it clear in Paris that Britain has opposed the suggestion of the Secretary General of OEEC, M. Marjolin, that there should be complete liberalisation of intra-European trade for a trial period. Instead, he threw his weight behind the resolution, which was eventually passed, that escape clauses in the liberalisation code should be tightened and that members should, in effect, be

"nagged" unremittingly about any unnecessary restrictions that they maintain. The main immediate sufferer from this nagging, of course, will be France. It has agreed to increase its liberalisation percentage from 8 to 20 per cent, but has been told to report back to OEEC by March 1st next to outline the steps that it proposes to take to advance towards the obligatory target of 75 per cent. Surprisingly little seems to have been said in Paris, however, about one of the main inconsistencies of the whole OEEC formula—namely the artificial way in which these liberalisation percentages are worked out. They are percentages of each country's imports in the base year 1949, but with the reservation that imports on government account do not count as imports at all; the result of this formula is that some of the countries of Southern Europe boast of very high liberalisation percentages, although they still maintain a total ban on imports of some of the most important manufactured goods entering into international trade.

Mr Butler also successfully opposed proposals from the German and Dutch delegates that EPU should be "hardened," by increasing the proportion of each country's monthly surplus or deficit that must be settled in gold. The Ministerial Council is to meet again before April of next year to discuss any new advances that might be possible towards further liberalisation or towards widening the very restricted area of multilateral payments that EPU now embraces. On present indications, however, EPU is likely to be extended in very much the same form as at present for the year to June, 1955, except that some member countries may claim the right to give shorter notice of withdrawal than is now allowed.

Disquiet over Dollars

It would be a mistake to draw much comfort from the fact the gold and dollar reserves rose by \$34 million in October, compared with increases of only \$17 million in September and \$13 million in August. Last month's receipts included \$13 million of defence aid from America and \$6 million of gold from the European Payments Union. The "residual" surplus, which for the most part reflects the sterling area's direct current balance with North America, therefore amounted to \$15 million this October, compared with \$50 million in October, 1952. The normal seasonal pattern should be for the sterling area's balance with the United States to swing into comfortable surplus in the period from October to April, when American buying of certain staple Commonwealth commodities reaches its peak. It is inevitable that some connection should be drawn between last month's mildly disappointing results and the fact that the provisional estimate for the American index of industrial production in October (like the revised estimate for September) is a full 4 per cent below the springtime peak. If America's "adjustment" should now gather pace, it may be that the effect of its reduced purchases on the sterling area's balance will be disguised by favourable seasonal influences. This might be important, for speculators are less likely to be aroused by a fall in the usual winter surplus than they would be by an increase in the usual summer deficit; and British Government spokesmen are unlikely to go out of their way to explain this intricacy to them.

Unfortunately, however, there are signs that it may be difficult to maintain a dollar surplus this winter at all. The sterling area's balance with Western Europe in October is provisionally estimated at a deficit of £10.8 million, compared with a surplus of £4.3 million in September (when there was a special debt payment of £8.7 million to Britain from France). Half of the October deficit will have to be settled by a transfer of some \$15 million of gold to EPU in the middle of this month; this compares with the receipt of no less than \$96 million of gold from EPU in November, 1952, when special receipts from the com-

modity arbitrage scheme were at their height. No official explanation has been vouchsafed of this surprising and unseasonal deficit with EPU; none of the recent liberalisation decisions, of course, has yet begun to take effect. One possible explanation is that although Britain's own terms of trade have improved notably this year, the sterling area's terms of trade have probably deteriorated; and there is a danger that the fall in commodity prices may show up disturbingly in the winter season when those commodities are sold.

Postscript on the Loan

At first glance, the clearing banks' statement for October—the first since the Government's refinancing operation—seems to suggest that the cash portion of that operation may not have been quite so resounding a success as has been universally assumed. The total investment portfolios of the clearing banks rose during the five weeks to October 21st by only £101 million, a figure that is not easy to square with the guess that about £200 million of the £341 million of total cash subscriptions for the new Exchequer stock came from the banking system as a whole (including the

non-clearing institutions) and that the "departments" took up roughly £100 million. It seems probable, however, that the clearing bank figures to some extent understate the banks' participation. The operation as a whole, and especially the popularity of the new 1957 Serial Funding Stock (which was not offered for cash subscription) set in motion some complicated switching transactions in the market, and it seems likely that part of the resultant demand for the 1953 stock for exchange into the 1957 was satisfied by the banks, who may also have been sellers of other stocks, too.

But, in either case, the ultimate counterpart of such sales was probably provided by the authorities themselves, perhaps in the form of purchases of the 1952-54 War Bonds that mature next March. Hence, although "genuine" cash subscriptions for the Exchequer Stock may have been larger than the bank statements imply, it remains true that the authorities did not immediately secure a fully corresponding net inflow of cash. And it seems equally clear that the initial share of the authorities in the new stock must have been rather larger than the first impressions implied. The success of the operation, however, has to be judged as a whole, and it seems evident that the conditions created in the gilt-edged market must have provided the authorities with steadily improving opportunities for the release of other stocks. For these reasons, notwithstanding the unexpected appearance of the banking figures, it is too soon to revise significantly the first judgment about the success of the Treasury's tactics. Meanwhile, although bank investment portfolios have expanded only moderately, they necessarily reach a new high level, at £2,238 million; and, more striking still, their ratio to deposits has leapt from 33.8 to 35.1 per cent—which, with the exception of one month early this year—appears to be the biggest proportion ever attained.

Record Bank Deposits

AN even more unexpected feature of the bank statements is the smallness of the decline in the portfolios of Treasury bills—for the supply of bills was known to have been sharply reduced early last month by official purchases designed to ease the pressure of loan subscriptions upon the market. The banks' portfolios dropped in the five weeks by only £35 million, and since there has been little change in the banks' other liquid assets, the liquidity ratio has dropped by only 0.8 per cent, and still stands at the high level of 36.6 per cent. Last year, when the funding operation was virtually enjoined upon the banks, the ratio was reduced from 38.0 to 34.4 per cent.

The narrowness of this movement in liquid assets is, of course, partly a consequence of the moderateness of the net increase in bank investment portfolios. But to a large extent—to the extent, in fact, of the difference of roughly £70 million between these two movements—it is evidently a reflection of new borrowings from the banking system by the central government for its current needs. The Exchequer was in fact in deficit on its domestic finances during the period to approximately this extent, after allowing for receipts from tax certificates and for the presumed "departmental" share in the call on the Gas Loan—without, however, taking credit for any genuine non-bank sub-

scriptions to the new loan. But in the corresponding (four-week) period last year, when the domestic deficit was approximately the same, the Government's apparent demands on the banking system were very small—despite the substantial surplus that had then to be financed on the external balance of payments. The upshot is a rise in net bank deposits by £61 million, to the new peak of £6,156 million, in contrast with a rise of only £15 million last year. This last disparity, however, may not be significant; con-

ceivably, it has been mainly caused by distortions arising from the difference between the dates of the Exchequer and banking returns and by the fact that the latest period was one of five weeks.

Meanwhile, demands for bank advances for the private sector of the economy seem to be rising again. For the second month running, the decline in total bank advances has been substantially less than the amount of the relevant call on the Gas Loan (which presumably was promptly applied by the Gas Council in repayment of its own bank indebtedness). But, thanks to the Gas repayments, the ratio of total advances to gross deposits has declined again, to 26.0 per cent.

Agreement on the Film Levy

ALMOST at the last stroke of the clock, the branch organisations of the Cinematograph Exhibitors' Association voted in favour of the draft agreement for a "voluntary" film levy already approved by the industry's three other associations; and thereby averted the statutory levy that the Board of Trade had promised to introduce if the industry could not settle its differences by October 31st. In a few days' time the industry will present the Board of Trade with two documents, one containing the new levy agreement, and the second solemnly warning the President that the agreement will not solve the industry's problems. The industry's associations have resorted to

this face-saving gesture because the President had told them that he would not accept an agreement that contained any reservations.

The new "voluntary" levy will not come into operation until next June, when the present Eady agreement expires. The present (downward) trend of cinema attendances suggests that it may yield about £2.3 million a year, which will be paid into a fund to help film production. Neither the producers nor the exhibitors like the agreement. The producers had asked originally for £3 million a year; and the exhibitors complain that a formula that takes account only of the number of seats sold and that disregards rising costs and falling gross receipts obliges them to pay out a higher percentage of net revenue than in the palmy, pre-television days when cinemas were full. The widespread complaint that the levy is eating away a large slice of exhibitors' net profits has now broadened into a complaint that many exhibitors are making no net profits at all.

Both sides of the industry are hoping for a further cut in entertainment tax in April, and each would rather have drawn up the levy agreement when it knew what the budget contained, instead of five months before it. Both sides will vehemently oppose any suggestion that more than a nominal portion of any reduction in tax should be passed on to cinema patrons, but there are the makings of a first-class row about how the rest of the cut (if it comes) should be divided between the production fund and the exhibitors' pockets. The film producers will certainly expect a share big enough to raise the fund to their original figure of £3 million, while the exhibitors are relying on pocketing a big enough share of any tax reduction to put their cinemas back on a profitable basis. The idea that a reduction in seat prices might be a better way of filling the cinemas again has not, apparently, entered into the industry's calculations.

Skeletons in the Tax Cupboard

IN the memorandum* on death duties that it has submitted to the Chancellor of the Exchequer, the Federation of British Industries has rattled some of the most irritating skeletons in the Inland Revenue's cupboard. It is a major and legitimate source of business complaint that the law relating to the valuation of business assets for probate purposes is so riddled with anomalies and uncertainties that not even the Solomons of Somerset House find it easy to interpret it. When the owner (or part-owner) of a small business dies, there is often a dreary battle between the executors, who opt for the most lenient, and the Estate Duty Office, which chooses the strictest, interpretation of that law; sometimes a reasonable compromise is reached only after years of haggling, when the executors threaten to appeal to the High Court. While this haggling goes on, production is likely to be retarded; for it is a mistake to assume that business efficiency is wonderfully concentrated when the business itself is sitting on the executioner's block. In order to reduce these delays, the FBI suggests that appeals on the valuation of an estate should be submitted to an independent tribunal, leaving

BUSINESS MEN
IN CANADA
TO ASK...
how many **HOURS**
are you away?

DISTANCES between some thriving commercial cities in Canada are greater than across the Atlantic to Britain. No wonder the Canadian business man plans his trips on a basis of flying hours! Canada's vast wealth in minerals, oil and wheat builds the nation-wide demand for more goods. There's a warm welcome in Canada for British business men — especially when they come by Canada's own Air Line. Remember, personal contact pays dividends.

AIR FREIGHT: Ask TCA about fast delivery of goods across the Atlantic to anywhere in Canada.

Book with your Travel Agent via TCA's Trans-Atlantic Tourist Service. TCA links you with all Canada and major U.S. cities.

Air Lines

There is a power barrier even in Mecca. A barrier between darkness and light—between old-fashioned power methods and modern power with all its benefits. But the city of Mecca will soon stand also as a symbol of the progress in temporal matters—in industry and agricultural reform. For once again, *power* is bursting through the barrier. The Brush Electrical Engineering Co. Ltd., a member of THE BRUSH GROUP, is carrying out the electrification of Mecca. Power is being supplied for lighting and for industry—from a power station situated outside the walls of Mecca and fifteen sub-stations in the city itself.

BRUSH through the Power Barrier

Wherever *power* is exported—throughout the world—The Brush Group is helping to extend the frontiers of progress, bringing the plant and the experience that burst through the power barrier.

the High Court to settle any appeals on a point of law. The continuity of a business, which represents an important part of the goodwill of any family concern, is also threatened when the state demands a lump sum in cash for the payment of duty. To make it easier for a private company to convert its non-liquid assets into cash for this purpose, the FBI suggests that the Inland Revenue should allow the duty to be paid off in instalments.

The FBI also tilts its lance at the provisions of the 1940 Finance Act that seriously weakened the over-riding principle that the probate value of an estate should be the price that it would fetch if sold in the open market. Broadly speaking, the result of these provisions is that when an individual is deemed to have "controlled" a private company at any time within five years of his death, his holdings may be valued for probate not upon their open market value (based on yield considerations) but on the proportion they represent of the net assets of the company. The FBI suggests that this method of valuation should be regarded as exceptional; that assets in these cases should usually not be valued on a "break-up" basis but on the basis of what they would fetch if the business was sold as a going concern; and that "control" over a business should be deemed to exist only when control has been deliberately exercised.

The FBI also urges that, when a *bona fide* reorganisation of a private company is planned, the Estate Duty Office should exercise discretion in implementing the provision under which a company is liable for estate duty on any benefits that one of its members received on transferring property to that company at any time within five years of his death. In making this and its other recommendations the FBI does not pretend to be doing anything more than nibble round the problem; the heart of its case rests in its downright assertion that death duties as a whole are too high.

Reviving Uniscan

AN almost unnoticed, or at any rate singularly unpublicised, meeting of the four partners of Uniscan—the United Kingdom, Sweden, Norway and Denmark—took place in Stockholm towards the end of October. In retrospect, it seems to have achieved at least one resounding success. For when Mr Butler announced the increase in Britain's basic travel allowance from £40 to £50 a year, along with his other liberalisation measures, in Paris last week, he also restored one of the distinguishing marks of Uniscan, namely the virtual removal of all restrictions on the expenditure of British tourists visiting Scandinavia. Uniscan, in its original conception in 1950, was an agreement for the mutual exchange of certain privileges between the four countries. The privileges extended by Britain in 1950 were the lifting of the tourist allowance for Scandinavia to £200 (or more if a case for it was made out), permission for Scandinavian countries to repatriate sterling capital and to borrow in the London market, and certain privileges about royalty payments.

The most important of these discriminatory favours sank without trace during Britain's balance of payments crisis in 1951. The tourist allowance for Scandinavia was reduced to the low common denominator for non-sterling and

non-dollar countries as a whole; it was £40 up to last week. The Scandinavians also lost their right to repatriate capital from Britain; for close inspection showed that some of the "Scandinavian blocked sterling" that went through the gap was not of Scandinavian origin at all. Uniscan thus became little more than a friendly debating club. The agenda for the October meeting suggested that it was going to remain so. The delegates were reputed to have come together to discuss such subjects as convertibility, liberalisation of trade, Britain's tariff intentions, *Gatt et hoc genus omne*. But it now looks as if they must also have discussed some topics a little less general than that.

Oscar for Accounts

IN deciding to make one or more awards each year to public companies "in relation to the form and contents of their reports and accounts," *The Accountant* has borrowed a very worthwhile idea from across the Atlantic. In the United States similar "Oscars" have been remarkably successful in encouraging companies to present more facts and figures in their reports than is strictly necessary by law and to present these facts in an intelligible and attractive way. In this country, too, many of the giants of industry have taken an increasing pride in issuing reports that can stand up to comparison with those published on the other side of the Atlantic. But there are still too many laggards. It is still possible, for instance, to read a British company report from cover to cover without discovering what products the company manufactures; while charts and tables showing the company's turnover in domestic and export markets, its outstanding orders and so forth are still the exception rather than the rule. When the intricate accounting details required by the 1948 Act are left unexplained it is no wonder that these reports are quickly thrown into the waste paper basket. Only too frequently a British stockholder remains unconscious—as certainly is not the case in the United States—of his status in a company. Although *The Accountant* has kept the conditions of the competition in general terms, it is presumably such facts as these that it will bear in mind when deciding which are good company reports; its initiative prompts a wild temptation to offer a booby prize for bad ones.

No Buffer for Rubber

THE always doubtful prospect of an international buffer stock, which might stabilise the price of natural rubber, is now dead. That is the clear implication of the communique issued this week by the management committee of the International Rubber Study Group after three weeks spent in discussions in London. The committee found that no real change had taken place in the views of the participating countries, on the desirability of a buffer stock agreement, since they last met in Copenhagen in May. The United States, the largest consuming country, and some other consuming countries are as opposed to it as

ever, whilst the main producing countries still favour it. The natural rubber growers are going through a hard time—the price has fallen in the last six months by 6d. to 16d. a lb., at which it is unprofitable to many growers—and if their appeal is unsuccessful now, there is no reason to expect that it will be any more acceptable in the future. The committee recognised that the apparent surplus of natural rubber this year should be nearer to 170,000 tons than its estimate of 193,000 tons last May, and that the true surplus would be considerably less after making allowance for additions to strategic and consumers' stocks. It solemnly agreed that the natural rubber industry is in a serious state, and recorded the suggestions of certain members of measures that might be taken to relieve it.

These are not, for once, aimed solely at the United States, although the more practicable of them do concern that country. It was suggested once again that the American government should raise the price of GR-S synthetic rubber, and also that it should re-examine its methods of rotating the strategic stock. The rotation policy is certainly partly to blame for the depressed state of the market. The sale to manufacturers, for delivery up to six months ahead, of low-grade rubber from the strategic stock has widened the discount in the market on those grades, and helped to pull down the price of high-grade rubber too. It was also suggested that the American government should revoke a directive regarding the level at which the mandatory consumption of GR-S might be reimposed. This directive calls for a minimum consumption of 450,000 tons a year, although the minimum prescribed by American law is 200,000 tons. The present rate of consumption of GR-S is still well above 450,000 tons, but if it should fall towards this figure, American manufacturers might curtail their usage of natural rubber to avoid the possible imposition of controls on their consumption of synthetic.

Cheaper Petrol

THE oil companies have made their second cut in a month in the price of commercial grade petrol and diesel fuel for road vehicles. Early in October, prices were cut by ½d. and ¼d. a gallon respectively, bringing commercial petrol down from 4s. 2½d. to 4s. 2d. a gallon compared with 4s. 5½d. for typical premium grades. This week, prices were again reduced by the same amount so that commercial petrol, now costing 4s. 1½d. a gallon, becomes 4d. a gallon cheaper than most premium grades and 5d. cheaper than the top grade of petrol marketed by Esso.

Next week's issue of
The Economist
will include the annual
survey of
International Banking

The intermediate Esso grade, which falls between commercial petrol and the premium grade marketed by most of the other oil companies, has also been reduced in price by ½d. a gallon, bringing it to 4s. 4d.

That there should have been two reductions within so short a time suggests that the oil companies are slightly apprehensive about the market's willingness to absorb the quantities of commercial grade petrol that the refineries are producing. The quantities of premium petrol that can be produced from a given volume of crude oil are determined by the capacity of the cracking plant at the refineries, and especially of the catalytic crackers. The ordinary motorist, who seems to be taking about two-thirds of his requirements in premium grades, is no longer sensitive to minor price adjustments of this kind, especially at some cost in performance. But commercial users may be more sensitive in their choice between commercial grades and the premium petrols that they have been buying fairly freely. In the first half of the year, it is calculated, about 14 per cent of the million odd tons of petrol they bought consisted of premium grades, and the recent reduction of ½d. a gallon does not seem to have tempted them to use more commercial petrol. Perhaps this week's further cut may be more successful. Many of the light commercial vehicles have passenger car engines adjusted to use petrol in the region of 85 octane. Esso's decision to cut the price of the company's intermediate grade (which was not altered in October) suggests increasing competition in this section of the market. The market for petrol is showing a degree of inelasticity that the oil industry had not expected; users of all kinds want, and are prepared so far to pay for, the best.

Insurance at the Door

INDUSTRIAL life assurance—that is to say, life assurance in which premiums are payable at intervals of less than two months and are collected at the door—has changed greatly in character since the war. The life offices are also trying to change its name, to the much more appropriate one of Home Service life assurance. There are still no less than 100 million industrial policies in force, and industrial life funds have risen from £410 million at the end of 1937 to £919 million at the end of 1952. The latest report of the Industrial Insurance Commissioner, the first full report to be issued since the war, shows, however, that business is much less buoyant in this branch than in the ordinary branch, where staff pension schemes have added so much grist to the mill. Only 6.1 million new industrial policies, with a total of £267.6 million new sums assured, were sold in 1952; this was £12.8 million higher than in 1951, but it was £19.2 million less than in the peak year 1947—and it compares with no less than 11.1 million new policies sold in 1937 (when £219.9 million of new industrial sums were assured). The doubling of the average size of new policies (to about £45) has thus done little more than make up for the decline in the number of new policies sold; it should be noted, however, that new industrial life policies are now usually endowment assurances or whole life policies with periodical endowment payments, while before the war they were preponderantly whole life contracts (to pay for funeral expenses). This represents a very significant change in the working man's insurance habits.

TELEGRAMS: Nonfermet London CABLES: MANston House 4521 (10 lines) TELEPHONE: Branches at BIRMINGHAM, MANCHESTER and GLASGOW

About three-quarters of all industrial life assurance is transacted by 14 industrial assurance companies, with the Prudential and the Pearl accounting for 49 per cent of the whole. The other quarter is shared among 115 "collecting societies," which are registered friendly societies; the Liverpool Victoria and the Royal Liver together dominate this field, with £139.7 million of the collecting societies' total of £172.5 million of industrial life funds. At the end of 1952 the collecting societies held 33.4 per cent of their assets in British Government securities, 17.0 per cent in British Municipal securities, 19.6 per cent in mortgages, and the remainder in property and miscellaneous assets (with an average yield of 3.8 per cent in the year). The average yield on the industrial assurance funds of the companies, however, was 4.5 per cent, but their assets are not usually listed separately from those held against liabilities under other classes of insurance. The percentage of premiums absorbed in expenses (mainly staff costs) continued to creep up in 1952, to 30.8 per cent for the companies and 38.9 per cent for the societies; but it was still below the 1937 expense ratios of 31.5 per cent and 39.7 per cent respectively. Fortunately, there was a fall in 1952 in the proportion of industrial assurances forfeited without the grant of free policies or the payment of surrender values (because of the discontinuance of premiums soon after purchase of the policy); but this proportion, at 18.3 per cent for the companies and 23.4 per cent for the societies (compared with an average of 21.9 per cent for the companies and 23.3 per cent for the societies in the three preceding years) was still distressingly high.

Rayon's Recovery at Home

THERE is no longer any question about the genuineness of the rayon industry's recovery from last year's slump; in September the combined output of continuous filament and staple yarn reached 36.2 million lb, barely a million lb short of the peak output of 37.1 million lb attained in July. This recovery has, however, been wholly attributable to the remarkable buoyancy of the home market. In the first nine months of this year the value of the industry's exports was slightly less than £33 million, or only a little above the slump figure of £31 million for the corresponding period last year; in the first nine months of 1951, the industry had achieved an export total of £48 million. This disappointing performance in export markets formed an important theme in the speech made this week by Sir William Palmer, chairman of the Rayon Federation, at its annual general meeting. He attributed it to import restrictions in Australia and South Africa, two of the best markets in 1951; to the high level of stocks that had been built up by foreign customers, stocks have been slow to run down and even more slowly replaced; and to foreign, including local, competition. The development of local industries, protected by tariffs, is something that the British manufacturer naturally cannot counter; and these protective tariffs are almost invariably outside the authority of Gatt, so that exporting countries can claim no redress. Talks that Sir William has had with Australian representatives have made it clear to him that the Australians intend to spare no effort to build up a local rayon industry.

The recovery at home is, in Sir William's view, due to re-stocking by traders all down the distribution line, just as last year's slump was due to the deliberate running down

of stocks. He does not believe that actual consumption has altered very greatly over the period. Fabrics made from spun rayon have recently come back into favour and they, with filament yarn, provide the only two bright spots on the industry's export record. Owing, however, to the industry's and the Board of Trade's system of classifying all synthetic textiles as "rayon," it is impossible to do more than guess how high a proportion of the rising production consists of yarn such as nylon, "terylene" and "ardil." They probably account together for about 1.5 to 2 million lb a month, but the proportion is bound to rise as the new plants come into production, while it is quite impossible to form any opinion of their export performance. The present method of classification is clearly becoming an anachronism.

Problems in Tungsten

HARDLY a week goes by now without another reduction in the Ministry of Materials' prices for tungsten ores, the mineral that is used in the manufacture of high speed steel and other cutting tools. In the last seven weeks prices have fallen by over £3 (per unit of 22.4 lb). The latest reduction, which promptly followed the decline on the world market, is by 25s.—to 245s. a unit for wolframite and 230s. for scheelite. The market had soared from about 100s. a unit before Korea to 700s. a unit when the crest of the boom was reached in May, 1951; it has been dropping steadily ever since. The recent collapse appears to have been touched off by renewed selling pressure from producers and merchants in the Far East. The prolonged weakness of prices is the natural reaction to the heavy over-buying by the United States and other western countries during the early period of the Korean war, when supplies from China, then the main producer of tungsten, were cut off and an acute shortage was feared. Production in other countries, however, was expanded so successfully that the market has long been saturated with supplies.

During the period of panic buying the Ministry of Materials felt obliged to try to ensure that British industry would not go short, and it burned its fingers badly in doing so. It concluded long-term contracts at high prices with overseas producers, as the only means of inducing them to expand production, and it also bought heavily on the open market. But the estimate of Britain's requirements proved to be far too high. The Ministry was left not only with stocks much larger than it could hope to dispose of in a reasonable time, but also with purchase contracts that still have several years to run. The market value of the official stocks has probably now been halved by the fall in prices. Three courses seem open to the Ministry. It can continue as the sole supplier of tungsten, to ensure that domestic demand is wholly met from official stocks. Or it can return the trade to private hands but itself enter the market as a seller — which might depress prices further. Or it can partially decontrol the trade and make consumers buy from the Ministry a certain proportion of their requirements. The last two courses would simply prolong the sale of its stocks. The first might minimise the already substantial loss of public funds. The new Minister of Materials, Lord Woolton, who has a proper partiality for private trading, may well take the second course and not weep overmuch about writing off his losses.

Conserving Manganese

THE supply of manganese "continues to cause some concern in Western Europe." This was the conclusion of a recent report by OEEC on "Manganese in the Iron and Steel Industry—Use, Recovery and Supplies." As Russia and China were large suppliers of manganese before the war—and have since had to be replaced by India, North, West and South Africa—the conclusion is hardly surprising. The gross amount of manganese used per ton of steel in the United Kingdom is higher than in any other West European country, and hence the OEEC's "concern" for supplies is particularly important to this country. Manganese is used to remove oxygen and sulphur from iron and steel, and to increase toughness and welding properties. British consumption is high because domestic iron ores are low in manganese, and domestic coke has a high sulphur content. Moreover, the quality of many British steels calls for a higher manganese content than foreign steels.

The report described the methods used for recovering and conserving manganese in America and Europe, in the light of replies by member countries to questionnaires that OEEC had sent out. But it did not discuss how far these conservation measures could be applied to British practice. The technical indications are that none of them is markedly applicable to the British industry in its present physical form. Only by greatly increasing the proportion of steel made in Britain by the converter process (at present some 7 per cent) would the prospects be substantially improved. There has been no sign of any such intention in the iron and steel industry's postwar development plans, although there are hopes of some savings through sulphur reduction by increased sintering of ore and coke fines as new plants come into operation. But it still seems likely that Britain will have to continue to import nearly half a million tons

of manganese ore each year. The authors of the British industry's development plans probably consider that capital investment might be better employed in mining and railway equipment in the countries of supply than in complex and debatable re-equipment of Britain's iron and steel industry. How far the difficulties in the supply of manganese are due to inadequacies of plant in the mines and the transport undertakings abroad was not discussed in the OEEC's report. It might well repay study.

Ivory Prices Firmer

THERE was good competition for nearly all the three tons of elephant tusks offered at the quarterly ivory auctions in London last week. The offering was smaller than the average of five to six tons, and met a ready demand from the home trade, Continental and other overseas buyers. Prices of medium grades, including bangle and ball sizes, were up to 20 per cent higher than at the previous sales, and sound tusks were steady at about their previous levels. Bangles realised between £77 and £83 a cwt for oversize grades, and the heaviest soft Mozambique sound tusks realised about £120 a cwt.

Supplies of good quality ivory in London have been rather short since the war, owing partly to the restrictions on the killing of elephants in some African countries and partly because the main consumers now purchase more ivory direct. Demand, however, has suffered from the competition of plastics, particularly in billiard and snooker balls, most of which are now made from this material. Ball sizes of scrivelloe tusks, which come from the female elephant, have consequently lost their former premium and now fetch some £80 a cwt. Sound tusks suitable for the manufacture of piano keys are also meeting strong competition from the plastic material.

the spring of this year, when—to quote the directors' report—a "boom" replaced months of "quiet trading." Since the end of the financial year (June 30th) sales have shown a further improvement, thanks "probably to restocking by distributors

who (had) allowed stocks to run down." Despite the quiet trading conditions in the first nine months of the financial year gross profits rose quite sharply, from £2,523,713 to £3,142,794. This advance, which must have owed something to an expansion in margins, was not accompanied by as heavy an increase in taxation as might have been expected, so that the group's net profits

rose by £330,515 to £1,211,597. This increase has enabled the directors to make generous appropriations to reserves as well as to raise the deferred ordinary dividend from 12½ to 15 per cent.

The consolidated balance sheet shows further symptoms of a return to health, including a fall in working capital commitments and a consequent reinforcement of liquid reserves. Stocks have fallen in book value from £7,936,377 to £5,549,787; while the group's cash balances have mounted from £527,548 to £2,047,904, its bank overdraft has to all intents and purposes been liquidated (falling from £1,104,444 to £121,518). This reinforcement of reserves, together with the increase in profits and the rosier prospect for the immediate future, make the new dividend (which is covered no less than six times by net earnings) look a little niggardly.

★

CROMPTON PARKINSON.

The preliminary statement issued by Crompton Parkinson for the year to June 30th last is even more cheering than—though it falls into a different category from—the reports issued by Fisons and the Wall Paper group. Manufacturers of electrical capital goods continued to thrive while the industries producing consumer goods experienced a slump in trade in 1951-52. The story here, therefore, is of progress from strength to strength and not from sickness to health. The group's total income before tax has again risen sharply, from £1,690,937 to £2,058,871; and, as the provision for taxation is not very much higher than it was in 1951-52, the group's net profits have risen from £397,934 to £662,713. In the directors' view these "much improved results of the past year's operations justify a substan-

tial increase in the amount distributed to the stockholders." And a most substantial increase it has proved to be, for the total equity dividend has been raised from 11½ to 20 per cent.

There is one note of caution. Part of the new dividend is described as a "special cash bonus" of 7½ per cent; the directors explain that they "still find merit in distributing profits to the stockholders partly in the form of a special cash bonus which can be varied from year to year as the fortunes of the company vary and intend to use it for that purpose in the future." In many ways these excellent results from Crompton Parkinson are rather surprising. Most investors had assumed that, the biggest increases in profits this autumn

would be supported by those companies that had suffered most severely in the recession of 1951-52. On balance (as the disappointing results from Tube Investments, discussed in a business note on an earlier page, show) this still seems the wisest view; but behind and beyond it, of course, lies the knotty problem of sifting out those securities that might also suffer most severely in the (still hypothetical) recession of 1954-55.

LONDON STOCK EXCHANGE

Next Account begins: November 11th.
Next Contango Day: November 11th.
Next Settlement Day: November 17th.

ALL the signs of a bull market were in evidence in Throgmorton Street this week until dealings began on Thursday. Until then equities had been very strong and gilt-edged stocks seemed to have broken away from the moorings established by the opening of the United Steel subscription lists (through which investors can exchange gilts into the company's new equities). Aided by the Prime Minister's eloquent cheerfulness in the House of Commons and a surprisingly optimistic reading of the rise in the gold and dollar reserves, gilt-edged were especially strong in mid-week; in the week to the close on Wednesday War Loan rose from 83½ to 84½ (including a gain of ½ on Wednesday itself) and old Consols from 63½ to 64 (including a gain of ½ on Wednesday). Even when the demand for equities died away in dealings on Thursday, gilt-edged continued to advance, and War Loan put on another ¼ of a point. In the foreign market, too, turnover expanded appreciably, with German and Japanese bonds making handsome gains; by Wednesday's close the 1930 Japanese loan had risen in a week from 160½ to 169½ and the German Young loan from 92½ to 96.

Just before the week-end buying of blue chips had carried the *Financial Times* index of industrial ordinary shares up to 130.5, the highest point since monetary discipline was revived in November, 1951. Demand for a wide range of industrial securities was stimulated by a stream of more cheerful reports from Wall Street and by a crop of good dividend announcements at home. But the boom was halted on Thursday when the preliminary report from Tube Investments came as a shock.

Among oil shares, only Trinidad Leaseholds shared to the full in this exuberance; the rest were rather dampened by the news that Anglo-Iranian's interim dividend was to be left unchanged. Although copper shares staged a slight rally, commodity shares remained dull; and in the Kaffir market, where little business was reported, prices slipped back.

£1 ordinary stock at 42s. 3d. yields £5 18s. per cent, which they should reflect the recovery in trade and production that has taken place since that date seems to be getting into full swing. The preliminary statement issued by Fisons, the fertiliser manufacturers, for the year to June 30th last falls into this new category.

The group's trading profits have jumped from £2,240,341 to £3,103,116 and, although this has inevitably been followed by a heavier bill for EPL and other forms of taxation, its net profits have risen from £643,660 to £701,429. There are

some special factors to account for this recovery. In 1951-52 the demand for fertilisers had been damped by the backwash from the heavy stockpiling that took place just before the removal of the fertiliser subsidy, and falling prices had forced the group to write £300,000 off stocks. The directors also state that new productive capacity has contributed substantially to the increase in profits in 1952-53; the fact that this has apparently been used to the full is a sign of strong demand. An increase in Fisons' equity dividend, in line with the group's recovery, was foreshadowed last June when the interim dividend was raised from 3 to 4 per cent; this promise of better things to come has now been handsomely confirmed by the directors' decision to raise the final dividend from 7 to 8½ per cent, bringing the total annual payment up from 10 to 12½ per cent.

★

WALL PAPER MANUFACTURERS. The full report of Wall Paper Manufacturers tells the same story of recovery from recession as that sketched out in the preliminary statement from Fisons. In this industry, apparently, the recovery did not really get under way until

* In consequence of official purchases of tender bills in connection with cash subscriptions to the new Exchequer stock, it is impossible to calculate the division between tap and tender bills until all the bills purchased have passed their original maturity date.

THE MONEY MARKET

CREDIT conditions tightened considerably in Lombard Street in the week covered by Wednesday's Bank return, and the authorities made special purchases of bills on each day except Wednesday itself. Only small official purchases, made both directly from the market and indirectly through the banks, were needed on Thursday before the week-end; but on the next two days this special assistance was on a larger scale and all took the indirect route. The absence of maturities caused by the fall of August Bank Holiday three months earlier necessitated considerable purchases from the banks by the special buyer on Monday, and on Tuesday he was only slightly less active. But conditions eased notably on Wednesday, and there was even some reverse selling by the authorities.

At last week's tender for Treasury bills, the market maintained its bid at £99 9s. 6d. per cent for the £240 million of bills on offer; but as total applications rose by nearly £33 million, the average rate of discount fell to £2 1s. 11.37d. per cent and the proportion of the market's application to be allotted from 55 to 45 per cent. The offer at yesterday's tender was reduced to £220 million.

The Bank return shows a seasonal outflow of notes of £7.3 million; the autumn low point for the active circulation, at £1,531 million in the third week of October, was £88 million higher than a year ago. The security portfolio in the banking department increased by £12½ million last week as a result of the authorities' purchases; but public accounts rose by £11.1 million and bankers' deposits therefore fell by £6.3 million.

HOME SERVICE INSURANCE pays £200,000 daily in death and endowment benefits

Issued by the
Industrial Life Offices

THE LONDON OMNIBUS

A vehicle of information

During the 1880's this horse-drawn Omnibus could be seen transporting the public between Hammersmith and Charing Cross.

Many years even before that, another London Omnibus was started by The London Assurance, an "omnibus" collection of all kinds of insurance policies for all kinds of people. Here are a few of them.

LIFE AND LIMB

Both may be insured by our Personal Accidents Policy. The less hazardous your occupation, the less you pay for this policy's varied and valuable benefits.

GLASS BREAKS

We have been aware of this for some time—notably since we instituted our Plate Glass Policy, the popularity of which leads us to suspect that others are also aware of it.

THREE-SCORE YEARS AND—WHAT?

In life's later years much comfort may be found in an Annuity. To those interested, we are happy to say that our Annuity Rates now are better than ever.

P.S.

If you would know more about any of the policies outlined here, if we can provide information about any other policies or about insurance problems generally—pray make what use of us you wish. Our address is 1, King William Street, Department U.6 London, E.C.4.

THE LONDON ASSURANCE

"Very good people to deal with"

Incorporated by Royal Charter
A.D. 1720

Responsible advice ON INVESTMENT

AS AN EXECUTOR

AS A TRUSTEE

AS A SOLICITOR

AS AN ACCOUNTANT

Professional men, business men, even private individuals are often asked for advice on the safe investment of substantial sums of money, whether arising from a will, a maturing policy, the sale of property or other sources.

The investments offered by the Co-operative Permanent provide an ideal answer to such problems. Money so invested enjoys the security assured by a large financial institution with interests throughout the country. Moreover, capital is free from fluctuation. Interest at 2½% is paid with unfailing regularity and income tax is paid by the Society making the return equivalent to more than 4½% where there is liability to income tax at 9/- in the £. Invested money is always at call on short notice and can be realised without loss or expense.

Full details of the complete financial service made available by the Society will be forwarded on request.

COMPANY MEETINGS

FERRANTI, LIMITED

CONTINUED EXPANSION

The forty-eighth annual general meeting of Ferranti, Limited, was held on November 5th at Kern House, Kingsway, London, W.C.2, Sir Vincent de Ferranti, MC, MIEE (chairman and managing director), presiding.

The following are extracts from his statement, circulated with the report and accounts for the year to June 30, 1953:

The accounts show continued expansion in the activities of the company and its subsidiaries and further extension of our manufacturing capacity.

Net current assets amount to £1,973,724. The increase in debtors of £545,107 is the result of the increased turnover. Stocks at £4,190,175 compare with £4,223,102 a year ago, and creditors are down by £93,725. Provision for taxation, including future taxation, amounts to £1,747,898 this year, as compared with £1,581,094 at June 30, 1952. Bank overdrafts have increased by £743,229.

On the other side of the balance sheet the excess profits tax postwar refund suspense account has been reduced by £200,000, which, with £800,000 drawn from general reserve account, has been capitalised in the form of £500,000 of 5½ per cent Third Preference stock and £500,000 of additional Ordinary stock, so that the issued capital now stands at £2,500,000. The balance of £19,235 on the excess profits tax postwar refund suspense account has been transferred to general reserve account.

PROFIT AND LOSS ACCOUNT

The consolidated profit for the year, including dividends on investments, amounts to £1,284,033, as compared with £1,320,164 for the year ended June 30, 1952. After provision for tax (including £150,000 for excess profits levy) on all profits earned to date, the net profit is £436,248, against £529,208 a year ago. During the year we received a dividend of \$50,000 from our Canadian subsidiary company, of which £11,002, the net proceeds, after tax, have been carried to our appropriation account.

We have transferred £300,000 to general reserve account and a dividend on the Ordinary stock of 6 per cent is recommended.

The output of the group, which is employing over 10,000 people, is 26 per cent above that of last year. The input and output have been in balance, leaving an unchanged value of unexecuted orders of £16 million. Armament output has increased by 40 per cent, compared with an increase of 10 per cent in civil work, the latter being adversely affected by the reduced demand for meters, particularly from abroad.

The Canadian company, while maintaining its turnover, has, in the latter part of the year, experienced some difficulty in obtaining satisfactory prices for some of its principal products, resulting in a moderate reduction in profits, which, after payment of a dividend amounting to \$50,000, have been retained in its own funds. A building has been completed for the manufacture of apparatus for the Royal Canadian Air Force, and the first instruments have been made and delivered. The American company has made a loss which it has carried forward.

POWER TRANSFORMERS

We have continued to expand our output of power transformers, and this was 25 per cent higher by value than the corresponding figure for 1951-52. Among the orders received is another important one from the dollar market, for six 230-kv transformers for the McNary dam, in the USA. The extensions authorised to the buildings of the Avenue works at Hollinwood are now finished, and we are deriving the benefit from the consequent redistribution of manufacturing facilities.

Important deliveries made recently include two 100-MVA transformers for the British Electricity Authority at Leeds, two further 230-kv units in addition to those already supplied to Finland, one unit for 301 kv and two for 275 kv for the Aluminum Company of Canada. We have also delivered three large impulse generators, and the manufacture of a 1 million volt DC cable-testing equipment for Norway is now complete.

IMPROVED DEMAND FOR METERS

The fall in sales input of electricity meters towards the latter end of the last financial year has been reflected in a considerable drop in output for the current year. The demand for meters remained depressed during the year, both from home and export markets. Since the end of the financial year there has been an improvement in both these markets. Measures continue to be taken for lowering production costs by the provision of special-purpose machinery.

The current year has seen a fall in the output of our foundry. This reflects the position elsewhere in the industry where the market has become more competitive. Floor space has been added to our Moston factory for the manufacture of electrical gyroscopes and fire control equipment for the Ministry of Supply and the Admiralty, and we have participated in offshore procurement orders for Nato.

The demand for indicating instruments and allied equipment is well maintained and shows a slight increase. Work continues on our electronic digital computers, and we have received another important order, this time from the Royal Dutch Shell Group, for a computer for their Amsterdam laboratories.

TELEVISION SETS

There has been a considerable increase in our sales of television sets, which are competitive both in design and price. The output of cathode ray tubes and valves showed an increase over the previous year and our development over a wide field of vacuum devices is expanding at a considerable rate.

The removal of the ban imposed on the British Electricity Authority prohibiting promotional publicity on the use of electricity in the home should improve the demand for electric fires and water heaters. Satisfactory progress continues to be made on the important work of development of guided weapons.

The output of our Edinburgh factory has increased appreciably during the past year. In order that production can be stepped up further, however, we have taken over a factory at Dundee, and this will be in operation by the end of 1953.

The report and accounts were adopted.

AMALGAMATED ANTHRACITE COLLIERIES, LIMITED

QUESTION OF REORGANISATION

The twenty-ninth annual general meeting of this company was held on October 29th in London, Mr John Waddell, the chairman, presiding.

The following is an extract from his circulated statement for the year ended December 31, 1952:

Within the last month or so we have practically reached agreement with the Coal Board on all outstanding values and the final position is likely to be a more or less permanent balance due by the parent company to the British Anthracite Company, Limited, of some £500,000 to £600,000.

Our operating subsidiary, the British Anthracite Company, Limited, has again had, considering all the difficulties, a very successful year. The trading profit comes out at some £563,000 compared with £602,000.

FUTURE DIVIDENDS

We have, as I see it, three courses open to us as regards dividends, but they depend on the attitude of both classes of stockholders. These three courses are as follows:

We can leave the capital deficit standing in the balance sheet *ad infinitum* and distribute whatever profits are available. This means the preference stockholders have an annual non-cumulative participation of a further 4 per cent on their capital, at which stage the ordinary stockholders receive 1½ per cent on their capital.

The second alternative is the direct opposite of this, whereby the equity stockholders might feel that their proportion of any such distribution would be so small that it would be better to have nothing distributed but to use all available profits ploughed back to make good their capital deficit.

There is some justification for such a policy because it would conserve entirely for the benefit of the ordinary stockholders what would have been paid out in participation to the preference stockholders together with the distributed profits tax relating thereto, as well as any ordinary dividends contemplated.

POSSIBLE COMPROMISE

The third alternative is a compromise whereby the capital might be brought more in line with the value of the assets, which would be a good feature, and where, by a rearrangement of the rights between the participating stock and the equity stock, it might enable both parties to receive some extra dividend at an early date. Thus, the preference stockholders would actually collect some of their participation which otherwise might be blocked, and the ordinary stockholders might collect in cash some of the profits which otherwise they would have to plough back into the business for an indefinite period.

I hope the foregoing has clearly set out the issue between the preference and equity stockholders, and in view of the possible conflict of interests I would say that your board feel that a reorganisation scheme under the third alternative above is the most desirable course to follow.

If it appears to be the general wish of our members that such a reorganisation scheme should be considered your board will undertake to place one before the members within three months.

At the meeting, in response to an enquiry from the chairman, stockholders unanimously voted in favour of the suggestion to reorganise the capital of the company.

The report was adopted.

NEEPSEND STEEL & TOOL CORPORATION LIMITED

SIR STUART C. GOODWIN'S
STATEMENT

The thirty-third annual general meeting of this company was held on November 3rd at Sheffield, Sir Stuart C. Goodwin, JP, chairman, presiding.

The following is an extract from his circulated statement:

The parent company's reserves and surplus are now £392,190, as compared with £336,226 last year. Current assets total £1,638,457, against current liabilities and provisions £1,326,453, giving an excess of current assets of over £312,000, which places the company in a satisfactory position.

The consolidated reserves and surplus amount in total to £2,524,640, in comparison with last year's figure of £2,187,881, which is an increase of over £330,000. Current assets of the whole group amount to £2,871,117, against current liabilities and provisions of £576,331, showing an assets excess of £2,294,786. The Neepsend group of companies is in a very sound financial position.

The trading profits for the year before taxation have amounted to £920,266, as against a figure of £1,135,250 in the previous year. After providing for transfer to general reserve and for proposed dividends and bonus, the carry forward is £1,238,699, against £1,014,979 brought forward.

The dividend and bonus declared on the ordinary stock of the company represents a distribution of just over 4 per cent, free of tax, on the capital employed in the Neepsend group of companies.

The report was adopted.

CRYSTALATE LIMITED

MR J. LESSER'S SPEECH

The annual general meeting of Crystalate Limited was held on October 27th in London.

Mr J. Lesser (chairman and managing director), in the course of his speech, said: For the eighteen months to March 31, 1953, the accounts of Crystalate Limited show a profit, before taxation, of £38,930, as compared with £29,828. After all taxation has been provided for, the result is a profit of £16,104, as compared with £13,750.

The consolidated accounts show a profit, before taxation, of £119,144, of which taxation absorbs £62,362, leaving £56,782 net. The previous accounts showed a profit of £70,208 before taxation and after taxation a profit of £40,161. The financial position of the group continues to be strong.

As I told you at our last annual general meeting, the compression moulding sections of the industry were experiencing a recession in trade. This recession affected both Ebonestos Industries Limited and Crystalate Limited. These conditions have persisted into the current year. However, within the last month or so there have been some signs of a revival of demand, which we all hope will persist. Mica Products Limited maintained its progress and this improvement has continued. This, coupled with the orders on hand, would permit our looking forward to a reasonably good result in this section of your company's enterprises. The British Homophone Company, Limited, to date is maintaining its trading profit.

A general summing up of trading for the current year to date would be that the group as a whole is, at the present moment, working on the profitable side. The report was adopted.

ANGLO-CEYLON & GENERAL ESTATES COMPANY, LIMITED

LARGER PROFIT

The sixty-seventh annual general meeting of this company was held on November 4th, in London, Mr Francis W. Douse, chairman and managing director, presiding.

The following are extracts from his circulated statement:

In my statement last year, I reported the sale of Holmwood Estate. In consequence, it was only to be expected that the crop of tea in Ceylon for the past season would be less than for the previous year. This was estimated at 5,339,000 lb, but unfortunately adverse climatic conditions were largely the cause of only 5,210,617 lb being harvested—an average yield of 661 lb per acre, as compared with 700 lb per acre in 1951-52, and 651 lb per acre in 1950-51.

The average price realised was 35.28d. per lb, as against 33.30d. per lb last year. De-rating of tea came into force in October, 1952, and, as I predicted, resulted in slightly improved prices for quality teas. The cost of production was kept down to approximately the same as last year by stringent economies in various directions.

During the past year, the Government has tightened up the regulations regarding recruitment of personnel from overseas, with a view to speeding up the process of Ceylonisation. This has been very noticeable in regard to recruits for the planting community, and has led to some considerable concern as to the future prospects of the existing non-Ceylonese personnel serving on estates, who feel that should the process be further intensified, prospects for planters, other than probably for senior men, will be uncertain.

Despite the present regulations, I cannot think that the Government will adopt any extreme measures to reduce non-Ceylonese personnel until such time as the country has sufficient properly trained young Ceylonese who wish to take up planting as a career, so important is the prosperity of the tea industry to Ceylon.

MAURITIUS SUGAR CROP

It had been expected that for 1952-53 the Island would harvest another record crop of sugar, but in fact the total tonnage was less than for the previous year, being 468,000 tons as against 483,000 tons. This was due to the sucrose content of the canes being generally lower owing to weather conditions. This company's crop, however, including that of Mon Tresor and Mon Desert Limited, was slightly higher at 55,650 tons compared with 55,100 tons. The net price realised was approximately £32 15s. per ton against £30 10s. last year, but again most of the increase was absorbed by higher wages and enhanced cost of supplies.

The profit and loss account shows that the trading profit of the company and its subsidiaries amounted to £876,539 as compared with £840,539 for the year ended March 31, 1952. The trading profit for the year is satisfactory and although below that of the all-time record of 1951 is in excess of the previous record in 1950. The directors now have pleasure in recommending that a final dividend of 20 per cent be paid, making 30 per cent for the year on £1 million of ordinary stock capital.

After making allowance for amounts payable in dividends and crediting the balance brought forward from the previous year of £123,422, there remains £142,170 at credit of profit and loss account.

The report was adopted.

NAHUMS HOLDINGS LIMITED

INCREASED LEVEL OF ACTIVITY

The fourth annual general meeting of Nahums Holdings Limited will be held on November 26th in Manchester.

The following is an extract from the statement by the chairman and managing director, Mr Daniel R. Nahum, which will be presented to the shareholders of the meeting.

I have pleasure in informing you that your group's trading loss of £16,063 for the year ended June 30, 1952, has this year been converted into a profit of £45,873. The net profit after taxation, appropriate to Nahums Holdings Limited, amounted to £30,724, the comparative loss for 1951/52 being £77,366. Group revenue reserves have been strengthened to the extent of an additional £22,580 this year. With a view to conserving the Group's resources the directors have decided, despite the relatively favourable results, not to recommend the payment of an ordinary dividend for the year ended June 30, 1953.

The past year, following immediately on successive periods of boom and slump, was one of readjustment in the textile industry. The process of liquidation of stocks, accumulated by the trade during the recession, resulted in a gradual return to a more normal level of demand. Simultaneously, an increased measure of confidence was restored. Our own experience followed this trend, and during the closing months of our year both the volume of sales and the level of activity in our mills increased considerably.

Furthermore, I am happy to state that both the volume and value of the Group's turnover for the first four months of the current financial year are in excess of last year's comparative figures. The current sales order book position is also substantially stronger than it was at this time last year.

SUCCESS OF NEW RANGES

I indicated to you in my last report that our cloth departments would concentrate on producing new lines, which would be original, attractive and of excellent value. Our new ranges have, in fact, been very well received by our customers both at home and overseas, and the trade continues to show much interest in our current productions. Yarn sales in the home trade and abroad are encouraging and appear likely to achieve the targets that we have set for the current year.

Despite the indications of improvement in our business and in the trade in general, I do not wish to be over sanguine, and would strike a note of warning because of the intrinsic hazards of the textile business as a whole. For example, the return to seasonal buying does, of course, extend our resources fully at certain periods of the year. In addition, delivery dates quoted by suppliers and processing times have also been lengthened, with a consequent increase in the element of risk involved, accompanied by a decrease in the rate of turnaround of capital employed. Margins also tend to diminish as a result of increasing competition. Moreover, one should not overlook the difficulty of estimating the stability of purchasing power at home, together with the well-known problems of the export trade and the contraction of overseas markets.

However, your company is taking advantage of the improved conditions in the trade and a more satisfactory result for the current financial year can be hoped for, provided that there is no serious set-back or further recession in the industry.

ANGLO-ECUADORIAN OILFIELDS, LIMITED

RECORD OIL PRODUCTION

The thirty-fifth annual general meeting of the Anglo-Ecuadorian Oilfields, Limited, was held on November 3rd in London, the Rt Hon Lord Forbes, chairman of the company, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to March 31, 1953:

Crude oil production for the year was 298,476 tons, compared with 269,130 tons for the previous year, being an increase of 29,346 tons. This establishes a record for the field. The previous highest production was 281,663 tons in the year 1939-40.

The improvement in production was entirely due to oil from shallow wells; in fact, deep production showed a decline of 7,539 tons compared with the previous year. The footage drilled continued to show improvement, the total for the year amounting to 159,851 ft, compared with 147,810 ft last year.

Efforts to find a new deep oil pool continued to meet with no success.

REFINING AND MARKETING

Your refinery has been operating for over two years at its full capacity of just over 200,000 tons per annum. Owing to the rapid and continued expansion of the Ecuadorian market in refined petroleum products, we are unable to produce the full gasoline requirements of the Republic, and in order to prevent a shortage of supplies we imported the necessary quantity of gasoline to make up the deficit. This operation, because of the low level of Government-controlled prices for refined products, was effected at considerable financial loss to your company. Your board is giving serious consideration to this matter of refined products in view of the continuing increase in demand throughout the whole country; this is well illustrated by the following figures:

	1950-51	1951-52	1952-53
Gallons			
Gasoline	25,719,438	26,059,604	32,571,567
Kerosene	4,647,118	5,128,843	5,346,224
Diesel oil	9,245,831	9,955,329	11,732,180
Residue	20,859,179	24,783,269	21,387,216

In 1952-53 residue production failed to meet requirements and the three largest consumers, the railway, the cement company and the electric light company, were forced to import between them 2,126,673 gallons.

The Government of Ecuador has not authorised any increases in the sales prices of refined products since 1948, despite the fact that there has been a continuous increase since that year in both materials and labour costs. Your board hopes that the Government of Ecuador will soon take steps to rectify this anomalous state of affairs, cognising that it is not only in the best interests of your company but also of the nation, that Ecuador should have a flourishing petroleum industry.

CANADA

As we announced in the press on February 20, 1953, your company has, in partnership with other British oil companies, made a small investment of £16,369 in the Province of Alberta, Canada.

In the profit and loss account due provision has been made for income tax and excess profits levy. The resultant net profit for the year amounts to £188,846, and adding to this figure the sum of £145,489 brought forward from the previous year, a total of £334,335 remains to be allocated. Your board

recommend that this amount be dealt with by the payment of a dividend at the rate of 10 per cent (less income tax), the allocation of £104,377 to general reserve, £5,945 to investment reserve and carrying forward the sum of £141,513.

The report and accounts were adopted.

HOSCOTE RUBBER ESTATES, LIMITED

MR H. B. EGMONT HAKE'S
STATEMENT

The twenty-first annual general meeting of Hoscote Rubber Estates, Limited, will be held on November 25th in London.

The following are extracts from the address of the chairman, Mr H. B. Egmont Hake, circulated with the report and accounts:

Our trading profit before taxation was £60,864, against £83,392 for the previous year. After taxation the figures are £35,277 for the year under review against £38,996 previously. To this year's profit, however, has been added on account of war damage grants a further sum amounting, after provision for taxation thereon, to £11,115. You will note that we have appropriated £10,249 to development reserve, bringing that reserve up to £75,000, and £21,566 to the reserve for replacement of planted areas, which after covering the actual cost of replanting during the year (£11,566) increases that reserve to £50,000. If our recommendation for a 12½ per cent dividend is approved, the carry forward will be £18,328, which shows an increase of £2,546 over the amount brought in.

If you will turn to the balance sheet you will see that a sum equivalent to the company's issued capital, £175,000, together with the development reserve, £75,000, has been invested in the fixed assets, all but £5,000 still unspent. This means that the reserve for replacement of planted areas, £50,000, and the general reserve, £30,000, are represented by the surplus of current assets over the combined total of current liabilities and estimated future taxation; this surplus amounts to £103,326, which equals approximately £20 per planted acre, and is considered adequate, for the time being, for the purpose of working capital and bringing our immature areas into bearing.

The proportion which our immature areas bear to the total planted acreage is 10.3 per cent, which is on the low side and indicates that replanting/new planting should be accelerated in the interests of our future earning power. It is low because it has been the board's policy, while considerably strengthening the replacement reserve out of the profits while prices were high, to go slow with actual replanting/new planting during that period, while wages were high. With the more recent fall in costs it will be the board's policy to improve the ratio to which I have referred.

The crop was practically the same as for the previous year, and it still remains, as I have said on previous occasions, below what we expect to get when the districts in which our estates lie return to normal. The general improvement in Malaya cannot yet be said to have lessened appreciably the fear of terrorism among our labourers, but recently the military and police have made a determined attempt at last to clean up hostile elements around our Pertang properties, and it is our hope that an improvement will become apparent from now on.

I mentioned to you last year that the drive for cheaper production was under way, and in fact our estate cost of production, including special grades manufactured, shows a

decline of 2d. per pound, and the all-in cost (including a fall of 1½d. in export duty, which fell with the price) was reduced by 5d. per pound, which accounts for the not unsatisfactory level of profit in a year in which the sale price of our product fell by 8½d. per pound.

PURNELL & SONS LIMITED (Printers and Bookbinders)

The nineteenth ordinary general meeting of Purnell & Sons Limited was held on October 30th at the Charing Cross Hotel, Strand, London, W.C.2, Mr W. Harvey (chairman and managing director) presiding.

The secretary (Mr Bertram Clarke, ASAA) read the notice convening the meeting and the report of the auditors.

The following is the address by the chairman which had been circulated with the report and accounts:

I have pleasure in submitting to you the accounts of your company for the year to December 31, 1952. The delay in presenting the accounts has arisen from two factors: the time taken to obtain the consignment balances from our overseas agents, and the desire of your directors to be satisfied that the taxation reserve was adequate. In regard to the reserve for taxation we have not yet arrived at the final settlement with the Revenue, but for those years in which agreement has been reached the reserve has been more than adequate.

You will remember that at the last annual general meeting I pointed out that there had been a recession in some branches of the printing trade during the first six months, but at the same time I indicated that the conditions had improved, and this continued to be so to the end of the year.

TRADING RESULTS

The profit of the group for the year before providing for taxation shows a decrease of £83,077, the comparative figures being:

1952	£358,861
1951	£441,938

The net profit, however, shows an increase of £15,073 due to the lower rate of taxation.

You will notice from the balance sheet that during the year we have added to our fixed assets after depreciation a sum of approximately £90,000.

Your directors deemed it advisable to construct a new factory and install the latest plant in order to widen the fields of our activities by entering the packaging business. The new factory is now nearly complete and most of the plant installed and we have every reason to believe that in future years this will add to the profit of the company.

In regard to the trading of the past nine months I am pleased to report that all branches of the group have been working to capacity and that the profits are slightly larger than those of the first nine months of 1952, and if no unforeseen circumstances arise between now and the end of the year I anticipate that the year's trading will be satisfactory.

I wish to pay a tribute to my colleagues on the board, all of whom give their full time to the company, and to express my thanks to the staff and workpeople for their services during the year under review.

The report and accounts were adopted and the final dividend of 25 per cent, less tax, making 40 per cent, less tax, for the year, was approved.

The retiring director, Mr S. V. Wilshire, was re-elected and the other formal business having been duly transacted, the proceedings terminated.

WILLIAM DOXFORD AND SONS, LIMITED

INCREASED TRADING PROFIT

DR E. P. ANDREA'S SPEECH

The sixty-first annual general meeting of William Doxford and Sons, Limited, was held on October 30th, in London.

Dr E. P. Andreae (the chairman), in the course of his speech, said:

The trading profit at £777,339 compares with £601,744 for the previous year. After charging £450,000 for taxation on the profits of the year, and crediting £27,000 income tax over-provided in previous years, the net profit amounts to £354,339, compared with £253,744—an increase of approximately £100,000.

We are again recommending the capitalisation of £50,000 of undivided profits.

Those of you who have been following the fortunes of this company will have long since realised that the issued capital bore little relation to the capital employed in the business. Only five years ago the issued ordinary capital was £500,000 out of an authorised ordinary capital of £750,000. Your directors then decided on a policy of capitalising the sum of £50,000 each year, by the issue of 50,000 fully paid ordinary shares. Whilst in some measure these capitalisations have reduced the disparity between the issued share capital and capital actually employed, they have not fully dealt with the problem. If at this meeting you approve of the capitalisation of £50,000 of undivided profits in respect of the year under review, the issued ordinary capital of the company will amount to £750,000. Your directors are proposing to double this capital in one operation by a further issue early next year of 750,000 shares in the proportion of one for one. For convenience, it will also be proposed that all the ordinary shares shall be converted into stock.

In accordance with the resolution set out in full in the notice convening this meeting, you will be asked to agree that the authorised share capital be increased by the creation of a further 1,250,000 ordinary shares of £1 each.

This, of course, is a preliminary step necessary to the actual issue of 750,000 new shares just mentioned, which will be the subject of an extraordinary general meeting to be convened for January 18th next year. You will note that following the proposed increase in the authorised ordinary share capital, there will remain unissued £500,000 nominal capital after the one for one issue has been approved and made.

I must emphasise that when the necessary resolutions giving effect to our proposals are passed, no further issues of shares, either for cash or by way of capitalisation, are at present contemplated, neither am I indicating any increase in the total amount of dividend distribution following the increase in the issued capital, other than that attributable to the one for fourteen share issue now before you.

WORKS FULLY OCCUPIED

During the year our works were again fully occupied, although the output was limited by the restricted availability of steel. Whilst the steel position has slightly improved recently, we are, in fact, still receiving much less steel than we need to take full and proper advantage of our new installations. I see little likelihood of any material increase in the amount of steel available for shipbuilding for some considerable time to come.

The number of ships which have been

built powered by Doxford engines now approaches 850 and, as there are well over 250 engines still building or on order, the day is not far off when the 1,000th Doxford engined ship will be in commission.

As is generally known, the inquiry for new ships is now very limited and, whilst this may be due in some degree to the long deliveries quoted, there is no doubt that the ever-increasing cost of new ships has reached a point where it has become almost impossible for shipowners to reconcile these high initial costs with the great drop in freights. Whilst, therefore, your company still has about three years' work on its books, the outlook beyond that is impossible to foresee. There are bound to be periodical setbacks in any industry, but our faith in the ultimate prospects of your company is evidenced by our determination to carry on with the major developments already planned.

INDUSTRIAL FINANCE AND INVESTMENT CORPORATION, LIMITED

IMPROVING MARKETS

MR J. N. BUCHANAN'S STATEMENT

The twenty-eighth annual general meeting of The Industrial Finance and Investment Corporation, Limited, will be held on December 11th at 82 King William Street, London, E.C.

The following is the statement of the chairman, Mr J. N. Buchanan, DSO, MC, which has been circulated with the report and accounts for the year ended June 30, 1953:

The first half of the year covered by these accounts was one of reduced activity. The company's business, however, improved during the second half. Owing to the uncertainty of the outlook at the beginning of the year, an unusually high proportion of the company's funds was kept in cash or short-dated investments. Partly as a result of this, there has been a slight fall—about 3½ per cent—in our investment income, of which I gave warning in my last statement.

You will see in the profit and loss account that no charge has been made for profits tax. A large part of the company's revenue is in the form of franked investment income, which does not attract tax. In addition, we still have some relief available as a result of the change made in 1950 in the basis of valuing our investments and also of the depreciation of investments suffered last year.

CONTINENTAL HOLDINGS

The recovery of moneys invested in Germany before the war is continuing. This year's total is the highest achieved so far and your directors recommend a bonus of 2 per cent, less income tax, on this account. In order to enlighten shareholders who had acquired their shares in the last few years, I should perhaps emphasise two points. Firstly, all continental investments were entirely written off in 1940. Secondly, the resultant losses had been allowed for in computing our earlier liability for taxation; consequently, recoveries subsequently made will be subject to taxation.

The time factor governing these recoveries is difficult to assess with any degree of accuracy, more particularly in cases where we endeavour to reach agreement for capital repayments in blocked Deutsche marks rather than fund such loans on a long-term basis. If and when some measure of success attends our efforts, as this year, it is the intention of your board that shareholders shall derive benefit in some form.

As lately announced in the Press, your company has taken a participation in Private Enterprises Investment Company, Limited. Your board are of opinion that the field in which this concern will be operating will offer opportunities of useful collaboration.

The opening months of the company's current year have witnessed a satisfactory improvement in markets, with consequential effect on the investment portfolio, whilst on the financial side a number of promising propositions are in course of examination.

Once again our sincere thanks are due to the Managing Director and all the staff for the satisfactory results of the past year, and in your name I wish to record our appreciation of their fruitful work.

MERLIMAU PEGOH, LIMITED

PRICE FALL AFFECTS PROFITS

The forty-fourth annual general meeting of Merlimau Pegoh, Limited, was held on November 4th in London, Mr J. L. Milne, chairman, presiding.

The following is an extract from his circulated statement:

Although the parent company's crop was slightly higher and its costs somewhat lower in the year ended March 31, 1953, than in the previous twelve months, the profit, before taxation, was down from £268,473 to £76,237. This was due to lower prices ruling for rubber, which affected our sale proceeds and also to reduced dividends from our subsidiary companies.

The extent of the fall in the price of our product will be appreciated if I tell you that whereas the average spot London price for No. 1 R.S.S. for the year was about 2s. 1d. per lb., it was around 3s. 8d. per lb. for the previous year.

After deducting from the above-mentioned profit of £76,237 the amount required for loan stock interest, £11,128, and taxation, £29,339, there was a balance of profit of £35,770. Out of this a dividend of 5 per cent was paid on October 10, 1953. After making transfers and adjustments there is a debit balance for the year of £15,469, which reduces the carry forward from £41,137 to £25,668.

The lower price ruling for rubber naturally also affected the results of our subsidiary companies and, as will be seen from the consolidated accounts, the profit, before taxation, of the whole group was reduced from £419,031 to £107,271.

The report was adopted.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

A JEKYLL in HIDE!

Another brilliant idea from the famous Bury leather craftsmen—and the Unicorn Document Case is born . . . to lead a double life!

1. See it first, slim & a folio case for carrying under the arm, packing in a suitcase or slipping in a desk drawer. A light spring holds the handle flat.

2. Then unzip all round and load it with 3,000 (yes, three thousand!) sheets of paper in its three roomy compartments (it makes a fourth when closed).

3. Now 4" thick, it is as capacious as a big briefcase, and can be carried by the strong leather handle.

Size 17" x 11", the Unicorn Document Case is beautifully stitched and hand-finished by skilled leather craftsmen and sold direct to you at work-bench prices. Model F.X.8 in golden tan, brown or black polished hide £4.18.0 (U.S.A. \$14.50). Model F.X.9, in golden tan or Autumn tan pigskin £7.10.0 (U.S.A. \$22.00). Either model can be fitted with a lock at an extra cost of 5/- (\$0.75). Post free and tax free in U.K., carriage and insurance free to U.S.A. (20% Customs duty payable in U.S.A.).

UNICORN LEATHER CO. LTD.

Obtainable at our Showroom 39, Burlington Arcade, Piccadilly, W.1, or by post, with money-back guarantee of satisfaction from our work-shops at WOODHILL WORKS (Dept. ET 16), BURY, LANCs.

An artist's impression of a battery of Clearing double-action presses in one of the vast press shops at Cowley, Oxford.

"The largest press shops in Europe, with over 350 power presses working with pressures up to 1000 tons... a factory area at Cowley alone more than half the size of Hyde Park... Here, indeed, with its 12,000 and more workers, is one of Britain's greatest industrial enterprises."

cars in the making

FROM THESE IMMENSE presses come bodywork and pressings for many of the most famous names in the British motor-car industry, including Austin, Daimler, Hillman, Humber, Jaguar, Lanchester, Morris, Morris Commercial, M.G., Riley, Rover, Singer, Wolseley.

Pressed Steel Company Limited are the largest car body manufacturers in Britain and pioneers in this country both of pressed steel

bodywork and unitary construction in quantity. The unequalled service of the Company to the British motor-car industry is founded on engineering and production facilities second to none, an organisation without parallel in Britain, and unsurpassed technical experience.

In its continued — and continual — expansion this service will, also, not be denied to manufacturers yet to achieve world renown.

ask the typist

Of all the tests a typewriter undergoes the typist's test is the final and most important one. On its result depends the assessment of the typewriter's value. To pass it, the typewriter must produce work of a very high standard, quickly, quietly and easily; the touch must be light; the carriage movement firm and precise; every one of the 2,400 parts working faultlessly.

Careful planning and precision engineering ensure that every Imperial typewriter is, above all else, a typist's typewriter. As a result, Imperial typewriters have been passing the typist's test all over the world for more than fifty years.

Conserving the Featherbed

THE Government has decided to end all food rationing by the middle of next year, and with it to end (except for a few commodities) state trading in foodstuffs. This, however, is merely the occasion of the White Paper on "Decontrol of Food and Marketing of Agricultural Produce" (Cmd 8949), which is a more important document than its cumbersome title and its brevity suggest. Its implications cover the whole field of government policy for food and agriculture. Mr R. A. Butler, in what is perhaps a pardonable exaggeration, describes it as dealing with "the most difficult problem in modern times." It is concerned with how to secure choice and plenty for consumers while providing stability for producers.

The White Paper itself does not provide a full or even a consistent solution for this central problem. Its object is to show how the Government guarantee to agricultural producers will be honoured in the changed circumstances of a free market. That there should be some guarantee is not in dispute. For reasons that are a mixture of strategy and economics, the country requires a larger output of food from British farmers than could be expected without Government support; and they need to be protected against wide fluctuations in prices. The guarantee to agriculture cannot, however, be unconditional, nor is there one sacrosanct way of administering it. It now needs to be given in a form in which the consumer can also resume his traditional freedom of choice and the taxpayer can be told the extent of his obligations toward British agriculture. This changed situation is the starting point of the Government proposals. Unfortunately, in Monday's debate, the Opposition insisted in viewing these proposals exclusively in terms of their impact on the "confidence" of producers. Mr Tom Williams painted a ludicrous spectre of the countryside reduced once more to a condition of poverty and despair; and if a free market is incompatible with the pledges to agriculture, he contended that the former must be sacrificed to the latter.

In fact the Government proposals must be judged as what they are: an attempt to strike a balance between the divergent interests of producers, consumers, and taxpayers. In the crucial field of livestock marketing, an ingenious attempt has been made to reap the benefits of a free market in a way that overcomes the vehement objections of the farmers' unions. The prewar system of livestock markets will be restored, although an inquiry is promised into its "unsatisfactory" features. At the same time producers will get the benefit of two separate types of price guarantee. The Government will fix a "standard" price for each grade of fatstock, and any divergence over the year between this price and the average price actually realised will be made good and distributed between producers according to the volume of their sales. This arrangement, similar to the deficiency payments scheme for cereals, ensures that meat producers as a whole will get an adequate level of returns; but it does not (they claim) give sufficient help to the farmer who gets a particularly low price when

he takes his beast to market. He is therefore to get the further protection of a guaranteed minimum price which will underwrite each individual transaction.

The results of this elaborate system cannot easily be forecast. To some extent it will persuade farmers to study consumer taste as reflected in the market; but unless the guaranteed individual price, which will be varied seasonally, is set very low during the peak period of home killings, they will have too little inducement to increase their supplies at other times of the year. In this case the cost to the Exchequer of honouring both guarantees, which are separate and cumulative, may be very large. Producers will get the carrots of a free market while the sticks are diverted on to the backs of the taxpayers.

But the livestock scheme is at least the outcome of original thinking. It is the Government's only attempt. For other commodities it puts its trust in the hoary recipe of producers' marketing boards. The boards for milk, potatoes, and bacon pigs that existed before the war will be restored to power. In addition, new producers' boards may be established for eggs and even, perhaps, as "a long-term solution," for the marketing of livestock.

Ministers have offered no justification for this grave and far-reaching decision. Apparently none is thought necessary, since the Conservative party is committed to the principle of producers' boards and the Opposition, in its pursuit of the rural vote, is halfhearted or less in its objections; but if politicians do not care, it is all the more important for others to look at the consequences.

★

Before the war the boards used their statutory monopoly to manipulate the market to get maximum returns for producers. Whatever justification there was for their activities then derived from the depressed condition of agriculture. Even so, the system was condemned as wrong in principle by successive committees of inquiry. It certainly is not right now that the extenuating circumstances have wholly disappeared. The boards will now be handling commodities carrying a Government price guarantee in some form or other. The Government is strangely reticent in explaining how a producers' board can be made custodian for the taxpayers' money. This is the riddle which the Lucas Committee pronounced insoluble, but the Government simply says that "adequate safeguards" will be provided; and that these will include, initially at least, Ministerial review of all price determinations made by the boards.

The main test of this policy is milk, which accounts for 30 per cent of the net output of agriculture. The market for liquid milk is already glutted despite subsidies which amounted to £83 million in the last financial year. If producers are to go on getting their present guaranteed prices for milk, a large sub-

sidy must also continue. It is hard to understand how the Chancellor can accept this prospect. He pointed out in the debate that if prices are fixed in advance while the amount sold is unlimited, there is no ceiling to the Exchequer's liability. He regarded this situation as intolerable for livestock; how does it differ in the case of milk? Possibly the Government means to attach a quantitative limit to its price guarantee for milk; it may even intend to change over from guaranteeing fixed prices to some alternative formula which will limit its liability. But if it does screw up enough courage to do either of these things, the first result would be to bring the monopoly powers of the board into full play. As before the war it would doubtless restrict supplies to the liquid market in order to keep up prices; and the consumer at least would be no better off.

It is equally hard to believe that producers' boards will be any more successful than before the war in improving the efficiency of marketing and distribution. The need for some public regulation to cut down the costs of distribution was exhaustively demonstrated by the Lucas and Williams Committees, but it is not even mentioned in the Government proposals. The suggestion has been made that the boards should be widened to include representatives of distributors and consumers, but this partial syndicalism is in no way the equivalent of an impartial board of control.

In its anxiety to meet the claims of both farmers and traders, the Government has reckoned too little the cost of its proposals to the nation as a whole. All these subsidies on food with the exception of the welfare schemes, must from now on be regarded as primarily producer subsidies. They represent in effect the extra cost of homegrown as opposed to imported food. Although no figure can yet be given, the cost of supporting British agriculture under the new dispensation may easily approach £200 million a year. It may be higher.

This payment, large as it is, may yet be a reasonable price to pay for the insurance that a large domestic output of food provides. But before this conclusion is reached, the reasons for it ought to be more clearly understood and debated; and if these large subsidies are in fact to be paid, then the search for greater efficiency in both the production and marketing of foodstuffs ought to be relentless and the machinery to ensure that it takes place ought to be foolproof. There can be no case at all for devolving this responsibility on to producers' monopolies, whose interest in effective action, while enjoying a full Government guarantee, is much less than that of taxpayers or consumers; and if the guarantee to farmers is to be curtailed or modified (as in practice it may be, whatever the Government's present intentions), the interests of the marketing boards will run directly counter to those of the rest of the community. In their present shape, the Government's proposals may well bring higher consumer prices and restriction of imports as well as a heavy load of taxation. This is too high a price to pay for the farmers' vote.

An Idea for Bermuda

SIR WINSTON CHURCHILL is, after all, getting a little of his own way. Having failed to bring the Big Four together, and having received no response to the suggestion that he and Malenkov might together make a *tour de rideau*, he has at least succeeded in getting President Eisenhower and the French Prime Minister to take part in a conference next month in Bermuda. There, at the highest level but not without expert assistance, they can exchange views on the breakdown of hopes that were raised after Stalin's death by the Russians, inflated and dramatised by public opinion and the Prime Minister himself, and then deflated in the cold prose of the last Soviet Note. Sir Winston, faint yet pursuing, will talk with an American President who is bored but polite, and with a Prime Minister who is willing but powerless until it is known who France's next President will be. What, then, will they talk about?

The chief item must clearly be Germany. The door seems closed to a four-power peace treaty with a united country; it is therefore for consideration whether there can be a three-power settlement with a divided country. At first sight the difficulties are not obvious. After all, the allies are in occupation of the Federal Republic; their relations with the Germans are very fair; and Dr Adenauer has just received a resounding vote of confidence in his policy of co-operation with the West. Why, then, should peacemaking be difficult, especially with the Russians standing aside? The brief answer is that to make peace with the Federal Republic on the terms already drafted is possible only if the treaty for a European Defence Community is ratified, notably by France. That treaty is so interwoven with the Bonn Conventions by which the allied occupation would be brought to an end, that the one instrument has no formal validity without the other. Together—but only together—they provide the essentials of a peace treaty. The Germans accept the obligation to contribute to defence in return for virtual independence in all things but defence; the French and their allies approve Germany's rearmament in return for its undertaking to accept dependence in defence.

That, on paper, is the situation as it has been for nearly two years. If it has changed in fact, it is because the hesitation of Germany's neighbours to create the defence community (EDC) has given Dr Adenauer's government every opportunity to behave as if the occupation were already a thing of the past. Hopes that the Russians would treat on German unity, fears of German resurgence, suspicions of the sacrifices demanded of governments in a European community—these things have created delays that have worked to the German advantage. If the EDC is now rejected, then Dr Adenauer will be able to stand out for far

better terms in a new settlement than he dared hope for two years ago. A settlement that is tied to the EDC means a new start with the Germans in harness; a settlement without EDC means a new start with the Germans outside the shafts of the western alliance, expecting to be coaxed and bribed into a leading position in the team.

The Bermuda conference cannot, therefore, avoid the heated and complex arguments for and against EDC and the alternatives to it. Nor can it evade the fact that M. Laniel can give no assurance that France will accept the treaty before next spring. But this is all old stuff; and if progress is to be made by the three statesmen there will have to be some fresh thinking about their next objectives.

★

There are three main questions to be asked which, if they are frankly and honestly examined, point clearly to a British—and perhaps an American—initiative. First, there is the question whether there is, in present circumstances, an acceptable alternative to the European Defence Community. Secondly, there is the question about what happens if the French reject the treaty setting up the community. Lastly, there is the question whether the British can do more to help.

Some maintain that there is a simple and excellent answer to the first question: it is that Germany should come into the Atlantic treaty organisation as a full member. The argument is attractively presented: the mighty Atlantic community would contain a rearmed and impatient Germany far better than could the small European community; Germany would be one among five major powers, instead of sitting as an overpowering partner *tête-à-tête* with a resentful and self-pitying France. In fact, the proposal to "rearm Germany within the framework of Nato" means simply rearming Germany—nothing more. It means that the Federal Republic would have its own defence ministry, its own general staff, its own ministry of supply and defence industries, and its own defence budget. That is a very long way from the integration of EDC. Any illusions about the freedom of a German government in Nato to move its own troops, to make its own threats, and to thrust its own territorial claims on its associates must have been dispersed by the behaviour of the Italian government in the last two months. To give Germany the freedom of Nato may be a good way of frightening the Russians, but it is no way to reassure the French or, indeed, the Germans themselves; for as Dr Adenauer himself would put it, they are not confident that the young republic could control alone the forces that would be set loose by a straightforward revival of the *Wehrmacht* and the arsenals of the Ruhr.

In fairness this, perhaps, should be added. If the United States and Britain and Canada should decide to make of Nato a much tighter and stronger association—a real Atlantic defence community—then it could be argued that it could safely contain a rearmed Germany. But for that to be possible there would be needed time to think, a change in the British attitude, and above all a change in the American disposition—discussed this week by our Washington Correspondent—to expect other nations to give up their sovereignty while the United States guards jealously every scrap of its own. It is not inconceivable that such a change might one day come; but it would need an effort of imagination and leadership even greater than that which created Nato in 1948. Otherwise, what are to be the Atlantic, as distinct from the European, controls on German rearmament?

Suppose France rejects the treaty—what happens then? Dr Adenauer clearly cannot and will not wait another year to learn on what other terms his government's independence will be granted. It would be a sad climax to Allied policy to see him demanding with threats what they had been offering with inducements only two years ago. He could argue that he had committed himself to their European policy, fought and won an election on it, only to be faced with its rejection by the very government that had first proposed it. In such a ludicrous predicament France could count on very little sympathy from either Britain or the United States. Moreover, it is most likely that a French government which had failed to get the EDC treaty accepted would veto the admission of Germany into Nato.

What, then, could be done? It is sometimes suggested that an old-fashioned Anglo-American-German agreement on German rearmament would be possible. It probably would; but to attempt it would be the signal for the collapse of the whole movement to integrate Western Europe—and the death of the only positive political idea that presents itself to European youth. Another suggestion is that the whole idea of German rearmament should be abandoned. That would please the Russians, but would it now be acceptable to the Germans? Quite apart from the indignity of expecting Mr Dulles and Mr Eden to demand that the Germans should not do what they had previously been so stoutly urged to do, there is the fact that Dr Adenauer's government is in an excellent position to say Yes or No about how and when rearmament is to begin.

Yet, powerful as the arguments for the defence community remain, it is clearly in danger; not only from those in the member nations who oppose it from motives of sectional interest, but also from those who do not want to be remembered as supporters of a cause they believe already lost. If the British Government

are convinced, as the United States government clearly still is, that the creation of EDC is a vital objective of policy, then they must ask themselves whether there is anything they can now do to tip the balance of opinion in its favour. And here a very special responsibility lies on Sir Winston Churchill personally, both because he has pressed for this conference and because Europe remembers how he once advocated a European army.

★

It appears that the balance in France might be tipped by a British undertaking to keep a minimum number of troops on the Continent, in the closest association with the defence community, and to move them only in agreement with the six members of EDC. There exists already an undertaking from the United States, as well as from Britain, that forces will be kept in West Germany and Berlin as long as is necessary. What, therefore, is asked for from Britain is a promise not to reduce those forces without the consent of France, Germany and its associates. Is that really an impossible pledge for a Conservative government to give and for a Labour government to honour? Would it hurt Britain as much as opponents say it would? From the strategic point of view the argument in its favour is, perhaps, stronger than it has been seen to be in the past. The central area covered by EDC—northern France, the Low Countries and northern Germany—are now virtually part of the Fighter Command area of these islands. The airfields, dumps, pipe-lines and radar installations that exist there, largely at allied expense, for the use of the RAF, are evidence of an inescapable fact. The decision to stand ready on the Continent in peacetime has been taken; indeed, the War Office would be baffled if it suddenly had to accommodate at home the four active divisions now in Germany.

Only in a dire emergency outside Europe or in a situation demanding the most drastic cuts in defence expenditure would it be desirable to reduce those forces; and it is difficult to believe that Britain's allies would refuse agreement to a reduction if its necessity were apparent beyond dispute. What then stands in the way of such a concession—it would have to be the final concession—to French fears of what Germany might become and do in the EDC? If Sir Winston could at Bermuda offer some such pledge, if only for a limited period, then it would be fair to ask that M. Laniel and M. Bidault—or a future French Prime Minister and Foreign Minister—should stake their government's fate on a demand for the ratification of the EDC treaty. But it is important that the British should offer a sacrifice without being asked; and it is even more important that President Eisenhower should go to the limit of his power and discretion in assuring the Europeans that his conception of the American role among them has not changed since he ceased to be their Supreme Commander.

Britain and Japan

THERE can no longer be any doubt that Japan is on the way to re-emergence in world affairs, not merely as the strongest industrial power in Asia after the Soviet Union but also as a considerable military power. After a period of indecision and tentative bargaining with Washington it is now going ahead with plans for building up an army of substantial size, for which the United States will provide a large quantity of equipment. The Americans want Japan to be capable of self-defence; for they are unwilling to keep ground forces stationed there longer than is necessary, partly because it would immobilize a large number of troops in a distant country in case of a major war, and partly because of the stimulus given to anti-American agitation by the continued presence of what were formerly forces of occupation.

The new developments are primarily a matter of negotiation between Tokyo and Washington. But the prospect of Japanese revival is one that cannot be entirely without interest also to Britain and the Commonwealth. The view is sometimes held that the affairs of Japan are now beyond the horizon of British concern and are best regarded as a sphere of American policy and responsibility with which Britain should have nothing to do beyond a minimum of normal diplomatic relations. This attitude of detachment and indifference does not, however, correspond to the facts of international relations. Britain is not isolated from Japan in another world, but is involved over a wide range of export markets in a commercial competition which is likely to become more intense. Britain cannot avoid having relations with Japan, and if they are not good, they will be bad. Unfortunately, a series of recent events has given ground for believing that possibilities of improving them have been neglected.

The British attempt to keep Japan out of Gatt (which in any case failed) has been the most obvious example of antagonism arising out of trade rivalry. Such a policy might be regarded by the Japanese as a move in defence of British economic interests without the implication of any national antipathy, if there were in other fields convincing manifestations of good will. But it has been just at those diplomatic and ceremonial levels where so much can be done at so little cost that brick-dropping seems to have become chronic. The good effect of the visit of the Crown Prince to this country was marred by the incident at Newcastle and the hostile attitude of a section of the Press, which were widely reported in Japan; even so, the harm done could have been counteracted by a little officially arranged publicity of the right kind. But the film of the Coronation sent to Japan caused cinema audiences there to besiege box-offices, demanding their money back, because it provided no glimpse of the heir to the Japanese throne who had travelled half way round the world to be present at the ceremony as the guest of

Queen Elizabeth. Similarly, the opportunity afforded by the appointment of a British Ambassador after the conclusion of the San Francisco peace treaty was spoilt by the knowledge that he had originally been nominated to China, and that Tokyo had been used as a dump for an envoy rejected by Peking. These may seem trivial matters, but they are inevitably taken to heart by a proud people which is trying to find its way back into the comity of nations.

★

The British people has grounds in recent experience for being wary and suspicious with regard to Japan, and there is good cause for alarm among British manufacturers at the prospect of a renewal of intensive Japanese commercial competition in world markets. But this country has not maintained its immediate post-war attitude of dislike and distrust towards Germany, though there were comparable reasons for such a state of mind, and it is most undesirable that war-time feelings should be permitted to influence British policy towards Japan at a time when it is being rearmed as a part of the defensive structure of the free world. The security arrangements recently concluded do not simply make Japan an ally of America; they bring it into a scheme of Pacific defence, which also includes the Philippines and Anzus, and is a partial equivalent of the Nato system on the other side of the Soviet bloc.

Whether one recognizes it or not, the Japanese are indirectly becoming an allied power, and the only real alternative to their being such is that they should pass into the Asian Communist orbit. Certainly it will not help the political leaders of Japan to keep their country on the side of the free world if they are cold-shouldered by the nation which ranks second in importance among the western powers. On the other hand, if there were to be closer and more friendly relations, it might have a highly significant effect in confirming Japan in its present course of political development. For various reasons its relations with the United States give rise to tensions that are not without danger for the future. Japan remains dependent to a high degree on American economic support, and this dependence enables the American Government to bring strong pressure to bear on Tokyo whenever it wants to influence its policy. But even though such pressures may be hard to resist, they evoke strong nationalist resentments and provide favourable opportunities for agitations promoted from Moscow and Peking. The present government may agree on a programme of rearmament and conform its foreign policy to American requirements, but this is a course which cannot be followed indefinitely if the most active political elements in the country, especially of the younger generation, are persuaded that Japan has become a satellite, or even a "colony," of America.

and that its new armed forces are intended for use only as mercenaries. What is above all needed in contemporary Japan is the sense of participation as an equal and respected member in a community of nations transcending the special, and inevitably dependent, relation with the United States.

There should, of course, be no question of Britain competing with the Americans for influence in Japan or trying to undermine their position there. It is ultimately to the American interest that Japanese policy should not depend simply on Washington's capacity to offer inducements or threaten sanctions, but should be reinforced by a deeper awareness of belonging to a world-wide association of free nations with which Japan's future is bound up. No country can do more than Britain to strengthen these ties. Many Japanese still look back with pleasure to the days of the Anglo-Japanese alliance as the most successful period of their modern history; British institutions are more congenial, Britain's national problems more comparable and Britain's experience more applicable from a Japanese angle of view than those of the United States. There is no reason why the contacts of the two island countries should not be greatly extended if there were a will for closer relations. If the two peoples become accustomed to think of each other only in terms of rivals for

markets, the disputes that will arise must become more exasperated by lingering feelings of distrust and antipathy. But if political relations are as sound as diplomacy can make them, conciliation is possible.

So long as Mr Yoshida and his colleagues feel that nothing of importance can be decided or discussed save by visits to or from the former American occupier, so long will there remain a problem of face—a problem only too familiar to the British in Asia. Here Britain can help, especially by recognising that it can have no effective policy in the Far East, especially towards Communist China, unless it gets itself in a position where its advice is sought and heeded by the Japanese. They have to find and fill a new role in Asia, which might easily become a fierce and lonely one if they are simply ignored from the centre of the Commonwealth. It might, for example, be found useful to associate them with the Colombo Plan, so that their economy might be linked with a great international enterprise reflecting the new co-operation between the white man and those who seek his help. Japan, as its internal political struggles show, is at the cross roads of sympathies and aspirations; men of goodwill are trying to take the right turning. If they receive no encouragement from Britain and its associates, they might quickly turn back to the sullen vindictiveness of the disinherited.

The Charabanc and the Law

THERE used to be something of vulgarity about the idea of joy-riding in numbers of more than two or three at a time. A flavour of paper hats and football rattles, of beer and fish and chips, clings still about the good old un-English word "chara." But now the charabancs have all turned into coaches, and along with the change of name has come a change of status. Coach parties today may not be stylish, but they are eminently respectable. Delegates to serious international conferences are refreshed for their labours by coach trips to local beauty spots; Eatanswill Conservative Association packs itself with dignity into hired buses to visit a town where one of the party's leaders is making a speech. And no one who saw the West End in the weeks after the Coronation, when many thousands of coaches converged on the processional route from all over England, can doubt that, whether called charabanc, coach or Road Cruiser, the bus is an accepted means of recreation for a great variety of people.

But if the charabanc has turned respectable in the eyes of the public, much that it is used for lies on the fringe between legality and illegality created by the confused state of the licensing regulations. There are three ways of putting a bus on the road. One is to obtain a licence to run a regular passenger service over a stated route at stated intervals for stated fares. Another is to obtain a licence to run excursions or tours to certain destinations, on which any member of the public

can book a seat. The third way of running a bus needs no licences (except those concerning the fitness of vehicle and driver) and amounts to chartering the bus and its driver to some privately organised party of people to take them to a place of their own choosing. These legal distinctions are more historical than truly functional, and lead to some curious anomalies.

The first two ways of operating buses—regular local and long distance passenger services and public excursions—are controlled very closely indeed by the eleven area licensing authorities. Every journey and every price has to be approved in advance. The system has outgrown some of the crudely restrictionist character of its early days. For local passenger services, at least, it now serves one obvious public interest. A company is not allowed to run stage services to take the cream of the traffic at busy times and places; licences are made conditional upon adequate services being provided in off-peak hours and to outlying districts.

The close control of long-distance services and advertised pleasure excursions, however, has no such justification. It remains a system conserving established interests against new arrivals in the field, to the consumers' disadvantage. Such competition as exists between rival operators takes place less on the road than on the table of the licensing authority, where every application to vary an existing licence or to obtain a new one is subject to appeal by other operators whose

interests might be affected; they can appeal on the grounds that the service it intends to provide is already given by themselves. Licences to do tour and excursion work are not, on the whole, so strongly contested as those for stage carriages. But even here the more popular classes of business, the semi-local excursions, are most closely guarded.

Each licensing authority consists of a Ministry chairman and a couple of local councillors. The basic principles on which their decisions are founded, and the pattern of service that results from their activities, are not easy to see. "In the interests of economy" their annual reports to the Minister are not published, except in summary form; "387 valid appeals [against their decisions in 1951-52] were lodged . . . of these 63 were against the refusal of licences, 109 against the grant of licences. . . ." It would surely be in the public interest to know what these were all about.

★

Work on private hire is the free market within an industry which in every other respect is exceptionally tightly regulated. A free market that, subject only to the road safety tests, anyone can enter with one second-hand bus. A free market in which "haggling" over price really takes place. Small wonder that there have been repeated attempts to regulate this section of the industry too. Groups of operators in many towns have tried at one time or another to form local price agreements for private hire work, but always some operator sees a chance of a quick profit and breaks away from the ring, or else a rival from a nearby town quotes a lower price and steals all the business—for a coach service is mobility itself, and it makes short work of local pockets of monopoly.

There is, besides, an inherent instability in the cost of private hire work that makes any fixed average artificial. A theatre party, for example, might approach two companies for quotations for a five-hour evening job. If the first is a company owning a large fleet of buses, engaged on long-distance express services and popular excursions, this particular contract might mean keeping a bus unnecessarily idle all day and then paying the driver overtime; the other may be a one-man business, glad to utilise the vehicle on that date. The two quotations may then differ considerably, and they could just as easily be reversed if the big company happened to be expecting many of its vehicles to be idle that day. Cost are not uniform, or even uniformly calculated. For the large companies, firmly entrenched in licensed operations, private hire is an irregular sideline, priced at something very near to marginal costs that may vary greatly for each particular contract. For the small man, struggling to get a toe-hold on this free first rung of the industry's ladder, prices must cover average cost in the long run, but overheads in an efficient small business of this kind can be cut to the bone. So the "price war" in private hire has plenty of scope.

An interesting position arises in London, where the

London Transport Executive, unlike municipal services in other cities, has permission to engage in private hire work within its own area, and does so, since the end of petrol rationing, on an increasingly large scale. Its week-end pool of idle vehicles is, of course, enormous; it can put something like 400 buses out to private hire on a summer Sunday without inconvenience, at very moderate costs.

The line of distinction between the open market in private hire and the controlled market in excursion and long-distance express services is like a frontier between rationed and unrationed communities, and it constitutes a continual challenge to the "have-nots" to break the law. For the small man building up a business on private hire, the difference between hiring out one's coach to a party organised by someone else, and doing a little to encourage that organisation oneself, is easily blurred. It is an open secret that in many small towns where no licensed bus service runs to London, for example, or to Blackpool for the illuminations, operators do in fact run effective regular services to these places under the thin disguise that their passengers on each trip constitute a private party hiring the coach for its own purposes. The several hundred annual prosecutions for "using a vehicle as a stage vehicle or express carriage without a road service licence" probably consist largely of such cases.

Such evasion of a law which at best commands little respect is helped rather than hindered by a considerable vagueness in the law itself. Among the conditions governing private hire is one stipulating that the journey must be for a "special occasion," and although the Act of 1934 attempted to clear up earlier controversies about what constituted a "special occasion," subsequent High Court judgments have reopened the question and left matters in a position where nine-tenths of honest private hire work may be technically on the wrong side of the law. Does the hiring of a coach for a special occasion mean an occasion "special" to the party or to the destination? If a Sunday School outing is planned to take children to the seaside, is their "annual treat" a sufficiently special occasion, or must they choose a day when a statue is being unveiled on the promenade? If a visit to a ballet which is performing for a week is a special occasion, can the same be said of a visit to a pantomime which runs for three months? It is in such nonsensical terms that the legality of private hire contracts can be challenged and this in an industry where it is already a firm habit to try to stop the other fellow putting his bus on the road.

The whole problem of regulating road passenger transport is at present one of the subjects being reviewed by a departmental committee—the Thesiger Committee. It is understood that the committee's wide terms of reference will enable it to reconsider the unsatisfactory nature of the licensing laws. These laws have nothing to do with nationalisation; they are a legacy from the monopoly-minded thirties, and they constitute an unreasonable handicap to genuine private enterprise.

Notes of the Week

The Regency

THE Regency Bill attracted only sporadic controversy, strictly confined to the backbenches, on its second reading in the House of Commons. But there has been a variety of private discussion, and it was in tacit recognition of this that Sir David Maxwell-Fyfe gave a more detailed explanation—defence would not be too strong a word—than would normally be expected. The decision to provide that the Duke of Edinburgh should be Regent in the event of the Queen's death before her son is 18 became known in the summer at an unfortunate moment, when there had been a good deal of public gossip about Princess Margaret's alleged matrimonial intentions. Inevitably this was linked with the proposed alteration; and one personal issue having been raised, it has since been recalled that the Duke of Edinburgh is a member of the Mountbatten family, and that his uncle, who was responsible for much of his upbringing, had been involved in political decisions of a controversial nature.

The Government's careful public statement of the case for the change is understandable only against the background of this discussion. No good is done, however, by private controversy when the leaders of all three parties are agreed that present circumstances (including the wishes of Princess Margaret as well as of the Queen) justify the setting-aside of the Act of 1937, which was intended to make permanent provision for a regency and so to avert just the sort of discussion that has now arisen. Sir David seemed on weak ground when he argued that the then Government, only 16 years ago, could not have foreseen the possibility of a Queen with a young heir. But he was able to parade several precedents for the change, and finally he was able to assure those suspicious of the departure from the hereditary principle that the change will be "a limited exception" to the Act of 1937. It might have been possible to observe the principle as far as the regency itself is concerned while providing that the father of a young monarch, not the next adult person in the line to the throne, should act as guardian. But, as Sir David seemed to imply, such a division of the functions of regent

and guardian might not be the most helpful environment for a young king in his formative years.

The other main proposal of the Bill, whereby the Queen Mother becomes one of the Councillors of State, is plainly welcome to all, although some thought is rightly being given to Mr Gordon Walker's submission that Britain should fall in line with other Commonwealth countries and appoint a governor-general to act in the Sovereign's absence.

Labour Scratches the Surface

THE Government has emerged almost unscathed from the first Parliamentary tests of the new session. At the beginning of the debate on the Address, Ministers seemed vulnerable at four points—foreign policy, rents, agriculture and food prices. By the end they had cleared their lines in each sector. The announcement of a new date for the postponed Bermuda conference pleased those who had been urging Sir Winston Churchill to regain the diplomatic initiative; the housing White Paper set out a rents policy that steers a clever course between economic need and political expediency. The Opposition duly tabled censorious amendments to the Address on agriculture and food prices, but both were defeated not only in the division lobbies but also in debate.

Neither on agriculture nor on food prices is the Government's position in fact strong; but the Opposition chose merely to scratch the surface. It could not bear to jettison a single catchphrase in the interests of establishing a coherent and logical policy. This enabled the Government simply to counter-attack on Labour's own record. When the Opposition sought to outbid the Conservatives as the farmers' friend, the Government could recall Labour's opposition to prewar legislation beginning with the 1932 Wheat Act. On food prices, the Government could make parallel points laced with pertinent, and unanswered, questions about Labour's attitude to rationing and subsidies. Labour's only positive proposal—that social security benefits should be tied to the cost of living—had been condemned in 1946 by Mr Griffiths, then Minister of National Insurance.

Labour's debating failure was the more surprising because it coincided with fresh evidence that the party's internal stresses are for the moment stabilised. The twelve members of the retiring "Shadow Cabinet" have all been re-elected, and if Mr Bevan's position has improved, so has that of Sir Frank Soskice. Indeed, so anxious is the party to preserve the *status quo* that it even rejected, if only by one vote, the considerable claims of Mr Harold Wilson to a place on the front bench. It is a pity that internal stability should not be reflected in a more forceful challenge to the Government.

Red Square Without Stalin

LAST week's celebrations in Moscow of the thirty-sixth anniversary of the October Revolution provided little new evidence about the balance of power in the Kremlin. Normally the speech delivered by an important personality on the eve of the celebrations is the highlight of the Soviet political year. But the nine months that have passed since Stalin's death were so packed with events that Marshal Voroshilov's speech came as an anti-climax. He broke no new ground, but merely echoed former assurances that the improvement of the consumer's lot is now the regime's primary task. On economic topics the speech added nothing to the recent pronouncements of Malenkov, Khrushchev and Mikoyan. On foreign policy it was simply a rehash of the latest Soviet Note, which is summarised on p. 502.

The personality of the man chosen to take the rostrum on such an important occasion gives the impression of a compromise. If contending groups were seeking a non-committal spokesman they could have made no better choice. Klim Voroshilov is an impressive figurehead, one of the last survivors of the Bolshevik old guard. Nominally he holds a high office, since as chairman of the Presidium of the Supreme Soviet he is the equivalent of president in a western country. But in the Soviet Union presidents have little say in policy-making, and Voroshilov, at the age of 72, cannot be viewed as a serious rival by any contenders for power. He has the additional advantage of being a military figure without too close links with the younger fighting generals. His military laurels were won during the civil war as Stalin's companion at Tsarytsyn. His prestige was tarnished during the war with Finland, when he was generally held responsible for Soviet reverses. Hence, after the German invasion he had to leave the stage and the limelight to younger men, although he was never dropped from the highest ranks of the Stalinist hierarchy.

During the parade held last week in Red Square the striking feature was the brevity of the military display. While civilians marched on as usual for hours, troops paraded for only twenty minutes. This may have been meant as a sign of the Soviet Union's peaceful intentions and of its deep preoccupation with domestic economic problems. Lest this should be taken as a sign of weakness, the Minister of Defence, Marshal N. A. Bulganin—who also took the salute—mentioned in a short address that the autumn manoeuvres of the Soviet armed forces gave a convincing proof of their military preparedness.

Bloodshed in Trieste

THE disturbances in Trieste last week have confirmed many British people in their support for the Yugoslavs; and those who believe that the balance of justice tips towards the Italian case have been thoroughly disgusted. Fascist hooliganism, sheltering behind student exuberance, and talk of British "colonialism" are a reminder of those cruel and reactionary influences that Signor De Gasperi worked so hard to oust from Italian political life. Mr

Kardelj has been made to sound like a sucking dove, and anyone who recalls what Italians did to Yugoslavs during the war now gets spontaneous applause. It is a sad falling away in Anglo-Italian relations, although those who have worked to improve them must persist in the effort to understand Italian feelings and Signor Pella's difficulties with the unruly parties of the Right.

Trouble was to be expected on November 4, which is a national holiday on which Italians celebrate the end of the first war and their original occupation of Trieste. In the light of the tensions built up during recent weeks, six dead and 77 wounded seems to have been a relatively low price to pay for preventing the city from being controlled by a mob. There is a case for reviewing in private the handling of the situation, but none for a formal inquiry: the facts given by General Winterton make that much clear.

Sir Winston Churchill pointed out very properly in his Mansion House speech that Britain has nothing to gain at all from staying in Trieste and doing such dirty work, and that it shares with the United States a vital interest in a peaceful solution of the problem there. Orderly demonstrations would have won sympathy everywhere, for reasonable people understand the Italian feeling that Marshal Tito has slowed down the departure of General Winterton's troops by his threats to use force. There should be no going back on the principle of the allied decisions already taken. Both in Rome and Belgrade the tone of official comment has become slightly more conciliatory and encourages the hope that a way out of an intolerable situation can be found by negotiation. Even when that has been done, Marshal Tito and Signor Pella should find a common interest in seeing that relations between their two countries are not wrecked by nationalist Fascists and nationalist Communists. In their methods and aims the two are not very far apart.

As India Sees Panmunjom

THE twists and turns of the day-to-day news from "Indian village" at Panmunjom suggest that two significant changes have taken place since work on the prisoners of war began. The behaviour of the hard-pressed Indian custodian force, under the direction of General Thimayya, the chairman of the neutral nations repatriation commission, has won much praise for its tact and impartiality, as well as for its determination to carry out a most invidious task in spite of every kind of external pressure. As a result, there is now considerably better feeling between the Indians on the spot and the American officers of the United Nations command.

This improvement has not, however, occurred to anything like the same extent in India itself. Each nation, whether in Asia or the western world, must solve for itself the problem of its own relationships with the people of another continent. But none is more important than those between India and the United States, and, unfortunately, one of the main impressions left among many Indians, even those of moderate views, by the contact of their own troops with the complex irritations of Korea is that the Americans have lost the power of being impartial. Having just fought one of the most cruel wars in history, the Americans deserve considerable sympathy. Indeed, one

Since it was largely through Sir Roy Welensky's influence that direct African representation on the legislative council was accepted by the Europeans, it is hard to see why he is jibbing now at a proposal that would still leave the total number of African representatives—including the two Europeans nominated to represent African interests—at only a half of the elected Europeans. Presumably the answer lies in the elections to the first Federal Parliament that will shortly take place. Sir Roy evidently hopes that by showing himself an opponent of African aspirations he will draw votes away from the Confederates, who appear to have gained a lot of support by expressing extreme racist views. These are dangerous tactics that may well recoil on his own head. He should remember that the success of the new federation depends much more upon dispelling the Africans' fears than upon winning over a handful of white voters.

The Sudan Elections

THE words 'Misr' (Egypt) and 'Brittania' were bandied about and there was much brandishing of fists and sticks, which, however, did not seem to denote ill-humour. This single sentence from the report of *The Times* special correspondent who is covering the present Sudan election sums up one important aspect of the scene. The election is supposed to produce a Chamber that will tide the country over three years of "self-government," as a step towards a more important vote on "self-determination," and therefore to produce only a temporary and ephemeral result. In fact, as the quotation shows, the first vote has come to be a decision little short of a vote about self-determination. As the parties have shaped, the voter this month is called on to plump either for a link with Egypt (of a nature which none of its advocates has dared to specify) or for complete independence (labelled by its adversaries as "the wish of Britain").

The quotation illustrates, also, how primitive are large parts of an electorate that is suddenly called upon to make, in a way altogether novel to it, a choice that has nothing to do with the day to day problems of its life, such as the finding of food or the placating of ancestors. The press of the world is full of stories of a puzzled and volatile electorate. Raconteurs remind one another that in 1906, when rural Persia, then at a somewhat similar stage of remoteness from the centre of government, first elected a Majlis, many voters thought that a constitution was something to eat; in some districts of the Sudan it has been difficult to explain that it is otherwise. But goodwill is in the air; the Sudanese are a solid people and their better leaders are urging them to prove their mettle by steering clear of all alien influences. As the non-party leader of their Orthodox Khatmia sect proclaimed to them this week:

Elections are the real test of a people. Public opinion throughout the world is now watching what we are doing. Let us show we are a nation whose religion and morals serve as safeguards against slipping and temptation.

Maybe thousands of tribal voters will fall woefully short of grasping this conception; maybe the regime they will experience as the result of their vote will not come near

the Sanders-of-the-River standards to which they have been accustomed by their British administrators. But, before deploring the whole scene, it is pertinent to ask what other course was possible in a world situation that necessitated the agreement and co-operation of Egypt?

French Budgetary Labours

LAST week M. Faure, the Finance Minister, laid a draft budget for 1954 before the French National Assembly and urged the deputies to vote its provisions quickly, before the end of the year. There is little hope of the Assembly's following M. Faure's advice and the deputies are expected to resort to the old parliamentary trick of claiming cuts in revenue without any corresponding reduction in expenditure. After all the recent talk of the need for a French "new deal," however, the draft, even in its present form, is not impressive. True, for the first time since the war the upward trend of public expenditure is arrested and estimated total expenditure is brought down to Frs. 3,732,000 million. But this is due exclusively to a cut in defence expenditure—down to Frs. 1,110,000 million—facilitated by a windfall of American dollars for Indo-China. Estimated civilian expenditure is still rising and the over-all deficit should reach Frs. 650,000 million in 1954.

The "budgetary" deficit should be less than half that amount, but this is merely the result of a change in the method of accounting. Part of the burden of investment is removed from the budget proper to "treasury charges." Since total investment is to be maintained at the present level, and even stepped up, no shifting from above to below the line will bring important benefits until the investing propensity of French savers has been greatly increased. In Paris, fears have been expressed that this is but a first step towards a cut in total investment—a move which would be particularly dangerous at this stage, when a new "Monnet Plan" is being drawn up and agriculture is in great need of modernisation. The government denies such intentions and claims that, on the contrary, reduced taxation of investment will encourage the flow of capital. This should be brought about by fiscal reform and a draft has already been laid before the Assembly. Yet this draft is only a shadow of the original scheme truncated at the governmental stage; it will now be mutilated by an Assembly that knows M. Laniel's days as caretaker are numbered.

Cleaner Food

THE Food and Drugs Amendment Bill is the Government's answer to the general anxiety about the great increase in food poisoning that has taken place since catering establishments and pre-cooked food began to play such a large part in the nation's eating. It gives the Minister of Food and the Secretary of State for Scotland much wider and more flexible powers than they have had hitherto to prevent the sale and manufacture of food that is

Radio Circuits in Aspic

—but instead of a jelly, a hard plastic resin, proof against extremes of temperature and humidity, preserving the circuit—however delicate—under all conditions. This is typical of the technical advances made possible by the products of Bakelite Limited—just one side-line from the continuous main stream of development that goes on day after day. The polyester resins used for 'potted' circuits, in association with glass fibre, also make plastic boat hulls and have already been used experimentally for car bodies. The story of plastics is already a long one, but new pages are being written every day—by the organisation whose pioneering efforts were mainly responsible for the general adoption of these wonderful man-made materials.

THE CASE OF THE SATISFIED SALESMEN

Marmite, in its handy wide-topped jar, is now a familiar sight in grocers' shops—and in kitchens—up and down the country. The Marmite salesmen mightn't have done such a fine job without efficient backing from headquarters...

Customers could never complain of a bottleneck (nor could the head office!)

AT THE WAR'S END, the Marmite Food Extract Co. Ltd. were faced with a problem—and an opportunity. For years, supplies of Marmite had been far below demand. Raw materials were short, and most of the output went to the Armed Services. Then the situation changed. It was time for aggressive selling. The sales-force was ready; new

Seen operating a Burroughs Typewriter Accounting Machine in the offices of the Marmite Food Extract Co. Ltd. is Miss Doris Miller. This is one of the fast and versatile machines that are helping to keep the salesmen (and their customers) satisfied.

territories could be opened up; new demand could be created and satisfied.

But, in support of this sales campaign, could the office departments cope with the great volume of figuring work involved? To plan its production in advance, the company realized that it must have detailed statistics on the selling operation—sales analyses by travellers, by areas, and by class of outlet, would have to be prepared day by day.

Some years earlier the company had used Burroughs machines to cut six weeks off the time needed to make up the books at the year's end. Now, with this new problem, Burroughs were consulted again. After investigation, Burroughs specialists recommended the installation of Burroughs Typewriter Accounting Machines on which complete records of sales, purchases, and other data could be classified in many different ways.

Result: So smoothly and quickly do these Burroughs machines serve the

company's offices that a fact-and-figure picture of the whole sales operation is always on hand. Details of sales in any kind of shop in any county can be produced at a moment's notice—a great help to the company in planning production and distribution in advance.

What about you? If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service guarantees its efficiency in operation.

Call Burroughs today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities round the world.

CALL IN Burroughs

injurious to health. It also increases the penalties for breaches of the regulations.

The most important section concerns food hygiene. This gives the Ministers power, as they think fit and as they specify by order, to lay down, for all kinds of premises where food is sold, standards governing construction, equipment, cleanliness, the manufacture of equipment and the use of materials. They may forbid the use of an ingredient not merely because it is immediately harmful, but because there is reason to think—as there might be, say, of agene in bread—that it is harmful in the long run. The Act of 1938 did lay down broad standards of hygiene for places where food was sold, but these were mainly concerned with ensuring that washing facilities were suitably near and drains suitably remote. The Bill lays down no general standard for all establishments, but would enable the Ministers to prescribe separate ones for different kinds of premises. They could even, if they wished, lay down standards for street barrows. The duty of enforcing the regulations will be left with local authorities. With such an extension of the premises to be inspected they will certainly need a far larger inspectorate.

Another important power contained in the Bill is the power to order that various kinds of food establishment, as the Ministers choose to designate them, should be registered with the local authorities. Under the Act of 1938 only the manufacturers of sausages, ice-cream and preserved foods had to be registered; while dairies, milk bars and so on were dealt with under a separate order of 1950. Under the Bill, registration can be refused to an unsuitable applicant or revoked if the regulations are thought to have been broken. Although there will be a right of appeal, this extension of administrative discretion into yet another field will have to be carefully watched. If the new powers are used only for the sake of cleaner food, they are welcome; but they may be open to arbitrary abuse.

Kultur Politik

THE Government is at present considering the future of the British Council, which last year cost the nation just over £2,500,000. The council's report for 1952-53, published last week, accordingly takes care to make out a strong case against the critics who think that all the money disbursed from Davies Street is being thrown away, as well as against those who instinctively oppose government propaganda at home and abroad.

The council has for some years been fighting a rearguard action against increased costs and reduced grants. Big reductions were certainly desirable, but they cannot go on indefinitely. There comes a point at which less money means more waste, because the operation is on too small a scale to be effective. Probably there is now no middle way of worthwhile economising. Either the council should be scrapped or many of its activities should be preserved from further cuts. This year expenditure has been held steady while a committee under the chairmanship of Lord Drogheda examined information policy in general; its recommendations are now awaiting Cabinet discussion. Meanwhile, with a few minor exceptions, such as the withdrawal from Persia and China and the setting up of

an office in Japan, a certain rigidity has necessarily overtaken the council's activities.

The major difficulty about cultural propaganda is that its results, if any, take so long to show; any quick change of emphasis from one part of the world to another inevitably wastes the results of much previous work. But if the British Council is to be justified, as it should be, by its contribution to the cold war it is hard to see why the little money that is available should be spread thinly all over the world, chiefly in order to keep up appearances. If the council can win more friends for Britain in those areas where loyalties are still undecided the effort will be well worth the cost; it might, indeed, be worth more money, if that were obtained by sacrificing the council's less important work elsewhere, notably in Europe.

Ireland's Persisting Inflation

THE latest report of the Central Bank of Ireland records a notable improvement in the trading position of the Republic. The deficit in the balance of payments on current account was reduced from £62 million in 1951 to £9 million in 1952. Net invisible income is said to have remained unchanged. The recovery came from a fall in imports, which were exceptionally heavy in 1951, and, more markedly, from a substantial increase in the volume of exports. This increase was mainly in agricultural products and in manufactures with a high agricultural content. The report adds that the deficit in the balance of payments for 1953 may not be any greater than in 1952. This suggestion, writes our Dublin correspondent, seems well-founded, since cattle prices have been maintained by the favourable weather of recent weeks. Current savings are estimated to have been £30 million in 1952 whereas there was a small dissaving in 1951; and there are signs that savings have continued at a comparable level in 1953.

These signs of improvement, especially in the volume of exports, are thoroughly welcome. But, as the bank adds, they are largely offset by the results of state policy in other fields. It argues that the signs of inflation are still present:

GOLD AND DOLLAR RESERVES US DOLLARS [MILLION]

the indices of wholesale prices, the cost of living, minimum agricultural wages and industrial earnings have all increased. The expenditure of the state and of local authorities continues to rise and budgetary deficits are being financed by borrowing. Moreover, the capital market has been almost monopolised by public borrowing, much of which is for purposes that may be socially commendable but cannot be expected to increase output or to provide permanent employment. The bank's comments conclude with a warning that the republic is using its foreign assets on objects of domestic expenditure which will not provide any net addition to real wealth or increase national income. A continuation of this process will weaken the capacity of the country to maintain its population at a higher standard of living than is justified by the present level and nature of output.

These observations of the central bank may induce both sides in the *Dail* to examine the truth of the assumptions that are freely made about the proper aim and scale of domestic expenditure. There is no doubt that investment is necessary, above all in agriculture which remains the prior, indeed almost the only, exporting industry. State investment has, however, become entangled with making good arrears in housing, electricity supply and the like. Capital and labour have thus been attracted to the cities and into forms of activity that cannot create exports but swell the demand for imports. A great deal of employment has therefore become directly dependent on transient projects that are financed out of public funds. It seems as if the *vis medicatrix naturae* is at work in agriculture, which although deprived of state investment is free from direct taxation; but its effects elsewhere are offset by the devotion of politicians to a concept of domestic investment that carries implications they do not clearly understand.

Poland Falls in Line

THE new economic policy launched in Moscow has by now become a blueprint for all the satellites. Poland, the latest to adapt itself, has finally fitted into the new pattern. This was proclaimed at a meeting of the Central Committee of the ruling United Workers (Communist) Party which was held at the end of last month. Reports of the proceedings reveal that it was then decided to convene a Party congress for next January, after an interval of four years. In the theses prepared for this congress and in Bierut's report to the Central Committee great pains were taken to echo faithfully the remedies prescribed recently in the Soviet Union. Some passages sound as if they were literally taken out of Malenkov's or Khrushchev's speeches. Satellite planners remind one of medical students carefully copying the actions and even the mannerisms of their professor. The attitude, however, is not as grotesque as might appear. Throughout the Soviet bloc the diagnosis is everywhere the same: a bottleneck pace of industrialisation has led to the neglect of agriculture and consumer goods' industries, and something must now be done to restore the balance.

Poland enjoys one advantage in this shift towards a milder policy. The collectivisation drive was never very ruthless, and even now collective farms account for scarcely more

than 6 per cent of total agricultural land. But in other respects Poland, too, is in need of a potent medicine. While industrial production has apparently more than doubled since 1949, agricultural output has risen by only 9 per cent. Output of light industry is not sufficient to satisfy the demand of urban consumers and to attract supplies from the countryside. To remedy this situation it has been decided to cut the rate of investment, and its share in the national income should fall in the next two years from one quarter to one fifth. A greater proportion of this investment should be channelled into agriculture and light industry.

Will these economic changes be followed by a reshuffle in the leadership? For the new line smacks of the "Gomulka deviation." Gomulka, the former general secretary of the party, was disgraced and arrested but never brought into the dock; but he is unlikely now to be rehabilitated. Whether the forthcoming congress will do more than revise the statutes and elect new leading bodies of the party remains to be seen.

Adenauer and Ollenhauer

IT is an encouraging sign that Dr Adenauer should have had recently a long conversation with the Social Democrat leader, Herr Ollenhauer. In Herr Schumacher's day such meetings were less easily and less often arranged, but his successor shows little sign—especially since the sharp lesson of the election—that he wishes to revive the passionate partisanship of that time. Indeed, neither nationalism nor Marxism have real appeal for the West German voter now, whatever might be the case in less prosperous circumstances.

If the victorious Chancellor and a reasonable Opposition leader could now sow the seeds of a bi-partisan approach to the basic objectives of German foreign policy, much good might later result. Again and again people in Europe are heard saying, "Yes, Adenauer is a good enough European and a reasonable, if hard, bargainer. But who comes afterwards?" If future German pledges of co-operation with Western Europe and the Atlantic alliance, and mor-

especially German assurances that frontiers will not be changed by force, were known to command the loyalty of both the principal parties in the Bundestag, confidence in their value would quickly grow. It is not for the foreign observer to judge who should take the initiative in this respect; but there seems to be substance in the Social-Democrats' complaint that they are not met half way by the Chancellor and his colleagues.

Any such development would not settle doubts about the attitude of the raucous parties of the Right that have helped to win Hamburg for the government coalition, and that have been generously treated in the Chancellor's cabinet-making. But it is possible—one can say no more—that the trend in West German politics, given a continuation of peace and prosperity, is towards a two-party system. If it were come to anything, then the risk of a German political party adopting a nationalist—what the Russians would call a *revanchiste*—platform would be reduced. Party politicians in Bonn are, perhaps, not aware how closely fair and foul signs are watched for from abroad.

Spain and Nato

IS the Spanish Civil War at last losing its sting? The recent agreement on bases between Washington and Madrid has caused far less of an outcry in Europe than might have been expected; indeed, it looks as though those who angrily denounced a few years ago any idea of admitting Spain to the Atlantic alliance are now prepared to turn a blind eye on a deal with one Atlantic partner in which they have no part, but which has much the same effect as taking Spain into Nato. The attitude has practical advantages, even if it is not free of hypocrisy; and it betokens a change in mood.

Franco has been a dictator with a difference. The difference is that the Civil War, from which he emerged victorious if not exactly glorious, had stirred European emotions more violently than anything that happened between the wars. So there was no scurry to recognise and forget as there was to be later for Mao; and while other authorities like Salazar and Perón were tolerated, this feeling was not allowed to extend to Spain. If the mood is now different, two causes in particular may be discerned. The first is time, time during which Europe has been in its turn convulsed, while in Spain little has changed. The second has been the admission to grace of the left-wing dictator Tito. Those keenest on keeping Spain ostracised have found their arguments turning brittle; *mutatis facile mutandis* they sound inappropriate at Brione; but it is difficult to snipe at Franco without grazing Tito. Moreover, the Left has been able to vent on the United States much spleen that would otherwise have assailed Franco.

At this point one of two things—or even both—may happen. It may become the fashion to whitewash Franco and all his ways; for this there is nothing at all to be said. Alternatively, the time may have come, certainly among younger people, for a sober appraisal of the history of Spain between the wars. This would still not be easy; but, until it has been done, Spain will remain one of those dangerous subjects which cannot be approached without strong prejudice.

The Right to Uproar

ONE does not want to be stuffy about Guy Fawkes Night. Like the ancient Saturnalia and the institution of Lords of Misrule, it offers a salutary safety valve for natural animal spirits normally constrained by the oppressive social decencies; and those citizens whose own animal spirits have regrettably ceased, with the passage of years, to need such a safety valve may reasonably substitute an annual exercise of tolerance towards thunderflashes, rough music, and irregular traffic blocks. But enough is enough, and last week's near-riot by the students of London University was more than enough. They had, it is true, a grievance—the last-minute cancellation by Authority of celebrations, the plans for which had been properly submitted and duly approved—and Authority may well have been infuriatingly maladroit. Maladroitness on the part of Authority, however, does not confer a right to uproar. It is not an umbrella excuse for idiotic displays of mass hooliganism. No doubt it all seemed wonderful at the time; few sensations, after all, are more exhilarating than those of mob unity. In the chilly retrospect of the morning, at Bow Street and elsewhere, its manifestations take on the less attractive appearance of a quite unfunny juvenile delinquency.

Wage Claims

It is with sincere regret and deep disappointment that we have witnessed the proceedings of the operatives in the manufacturing districts during the last few weeks or months. . . . One fact, indeed, showed a decided and most significant advance upon the follies and crimes of former times. At the commencement of the strike notice was given by the committee of the turn-outs that the funds of that body would not be employed in the defence of artisans guilty of acts of violence or disturbance. . . . With this single exception, the conduct of the operatives has presented no features on which we can dwell with satisfaction. We do not, of course, blame them for taking advantage of prosperous trade and a relieved labour market to demand an advance of wages. On the contrary, there can be no doubt that they were entitled to such an advance, that profits could afford it, and that they were quite right to ask it. So much was conceded on all hands: many masters volunteered an advance; nearly all gave it, to a greater or less amount, on the first application. Whether the rise of 10 per cent, which is now the matter in dispute, be or be not too much—whether the scarcity of hands justifies it—whether the state of the goods, yarn and coal market can bear it—are questions on which we can pronounce no judgment. . . . But there can be no doubt, we think . . . that the men are decidedly wrong—decidedly blameable and foolish—in two points. . . . In the first place, they are at issue in most cases on the merest fraction of a coin. . . . Secondly—and this is by far the worst feature of the case—on this occasion, as on all previous ones, the operatives have not managed their own business, but have submitted to the dictation of irresponsible self-elected leaders. In place of settling their own affairs with their own employers . . . they have preferred acting in combination and acting through a body which had no concern in the matter, and which their employers could not recognise.

The Economist

November 12, 1853

Letters to the Editor

Economics of the Super Grid

SIR—The faint damns with which you praise "this vast and imaginative investment," in your issue of October 24th, are ventured against a single aspect of its purpose; but the first and most distinct function of the Super Grid is to provide interconnection capacity for the pooling of generating plant. Detailed studies have made it clear that a substantial increase in this capacity is necessary to keep the overall costs of generation and transmission to a minimum; indeed, they show that without such interconnection the cost of the additional generating plant which would have to be installed, to give the same security, would be several times the cost of the interconnection system.

The second function of the new system to which so much of your article is devoted—the provision of bulk transmission to reduce transport costs of coal—comes into quite a different category. The long-term estimates depend on a host of factors, including the future costs of coal, transport charges and plant; the location of new generating stations, the thermal efficiency and the incidence of demand. No one could be dogmatic on the movement of these factors and their relative interplay over the next 20 years. Although the BEA experts took the most probable trend as a working hypothesis for the long-term picture, this played little part in the practical design of the system to meet requirements in 1960. In fact, the additional capacity now being provided for bulk transmission is relatively small, and the range of error in the estimates is hardly likely to shake the foundation of the scheme even if the towers "are reaching 130 feet high"!

Although, like you, some of our American critics paid scant heed to the interconnection function and directed most of their comment to bulk transmission, it is not without significance that recent references in the American press have pointed out the economic merits of electrical transmission for transferring large blocks of energy.

Another American comment—the improvement of power factor—is a debatable subject. Your statement of the BEA case, otherwise admirable, is sadly marred by confusion with load factor. On the value of a high-load factor there can be no two opinions.

And so to your last portentous dictum—"the economics... are still in doubt." Is any large-scale enterprise entirely free from risk? If absolute security against economic uncertainty is to be an essential prerequisite of progressive development, whether in private or national affairs,

then let British industry put up its shutters without more ado. Let us forget all about the second Elizabethan age and return to the rustic peace of an agrarian society where neither electrical engineers nor economists shall disturb our bucolic slumbers.

What should the BEA do? Turn a blind eye to posterity and continue to patch and bolster year by year the 132kV system designed 25 years ago—or look ahead and take the plunge, perhaps just one jump ahead of other progressive nations of the world?—Yours faithfully,

D. P. SAYERS

British Electricity Authority,
London, S.E.1

[This welcome contribution to the debate on the Super Grid enables us to apologise for an editorial blind spot in the original article, as a result of which "power factor" and "load factor" were briefly but thoroughly confused.—EDITOR.]

Liberty and Lunacy

SIR—The article in your issue of October 31st contains three points which may be worthy of further consideration.

1. The statement that "The first Act dealing with mental defect was not passed until 1913" is not wholly accurate. There was a permissive Idiots Act in 1886, and mental defectives were specifically included in the scope of the Lunacy Acts of 1845 and 1890. Thus treatment for mental defectives did exist before 1913, though it was not until that date that a workable definition of mental defect was evolved.

2. You state that "there is no provision for voluntary admission to an institution for mental defectives." This is true; but it would seem that a mental defective is by definition unable to express volition in this matter.

3. Any extension of the voluntary status of mental patients is generally to be welcomed. Quite apart from considerations of humanity, it separates the concept of mental treatment from that of compulsory detention and loss of civil liberties; but the figures do not tell the whole story. In a recent survey carried out at this university, it was found that of the voluntary patients discharged from a particular hospital in the first quarter of this year, over half had received treatment in a mental hospital more than once; 11 per cent had been in hospital for less than 14 days, and had left before receiving treatment, most of them against medical advice; and 18 per cent had again entered a mental hospital by August, in most cases staying again only a few days. This problem of the "ins and outs," who by exercising their statu-

tory right to discharge at 72 hours' notice place a great strain on the limited medical and clerical resources of mental hospitals, is one which may well occupy the attention of the projected Royal Commission.—Yours faithfully,

KATHLEEN JONES
University of Manchester

[Miss Jones's second point needs qualifying. Mental defectives sometimes develop a mental illness. Many of them, if over the age of 16, are accepted as voluntary patients in mental hospitals, and are therefore regarded as able to express volition. Children under 16 can be accepted as voluntary patients in hospitals on their parents' application, but not in institutions for defectives.—EDITOR.]

★

SIR—May I be allowed to make some comments to supplement your article in your issue of October 31st?

1. It is far too easy for people to be "certified" in present circumstances. In accordance with Section 14 (as amended by the National Health Service Act, 1946) and Section 16 of the Lunacy Act, this significant procedure, which involves deprivation of both liberty and property and carries also the stigma which you stress, can be put through by a single doctor after only a few hours' observation of a patient.

2. There appears, as you say, to be insufficient awareness of the relatives' right of discharge under Section 72 of the Act. Mental hospital authorities do nothing to encourage this awareness.

3. There is no effective authority to whom a certified person (certainly one certified under the above procedure) can represent his case either at the time of certification or subsequently. The justice who countersigns the certificate allows his signature, in the circumstances of today, to become a mere formality. The same can be said of the Board of Control who have tended to become just another government department with a natural tendency to support authority. The certified person thus suffers a total loss of civic rights of all kinds.

4. With the ease of certification that has already been described, it is obvious that there is a danger of the "voluntary patient" system becoming a mere façade used for the sake of improving the look of the hospital returns. To be a voluntary patient has, in fact, little significance when, at any time between the time of giving notice to leave and actually leaving, a person can be certified so easily.

You indicate in your article the helpfulness of a preliminary period of observation in a general hospital as a method of avoiding the unfortunate position I have outlined in my first paragraph. Other steps would be stricter control over the notification to relatives of their rights of discharge, and a more simply worded notice explaining these rights to replace the present formal and semi-unintelligible one. Voluntary patients, too, need the assurance that their status is a real one.—Yours faithfully,

DONALD MCL. JOHNSON
Sutton, Surrey

Hats and accessories from Herbert Johnson (Bond St.) Ltd.

At some time in a man's life comes the full appreciation of hand tailoring, allied to superfine and exclusive cloths. In all parts of the world where important people meet, you will find Chester Barrie outercoats and suits, hand cut from cloth specially woven in Britain, hand sewn and hand pressed. Available in 170 sizes for men who seek perfection.

"We know all about the huge Commonwealth development schemes—but you can't reach the people in charge of them."

But you can, of course. And your advertising agent, if he knows his way about the Dominions and Colonies, will tell you how. He will tell you that through the medium of NEW COMMONWEALTH more than 400 British firms have made themselves well known to the men who are planning and executing these great Commonwealth schemes.

Take his advice. By advertising in the one journal they all read, you can reach the people in charge—not only in one territory but in every part of the fast-growing, friendly Commonwealth market. To back up an established representation, to pave the way for personal pioneering, there is nothing so effective as NEW COMMONWEALTH advertising.

NEW COMMONWEALTH is the business man's fortnightly review of Commonwealth affairs. By reading it you keep in touch with important developments in every Commonwealth country. By advertising in it you ensure that all important buyers and distributors throughout the Commonwealth keep in touch with you.

Specimen copy on request.

Paper keeps your presents safe

Christmas without parcels? As unbelievable as parcels without paper. Yet each Christmas thousands of parcels disintegrate before they arrive simply because they have been so poorly wrapped. Please help the Post Office; by all means use gaily patterned paper to decorate your presents but be sure to give them a good strong outer wrapping of tough brown kraft paper as well.

TO SHOPKEEPERS we would say—

good customers are entitled to insist on well wrapped goods; so when you are ordering wrappings and bags ask your suppliers for Reed's Aylesford Kraft and Sulphite papers.

"Short of War"

THE WORLD CRISIS AND AMERICAN FOREIGN POLICY: *The Undeclared War 1940-1941.*

By William L. Langer and S. Everett Gleason.

New York: Harper Bros. London: The Royal Institute of International Affairs. 963 pages. 60s.

WHEN the first part of this study appeared a year and a half ago it was widely acclaimed as a masterly exercise in the writing of recent diplomatic history. The second volume will in no respect disappoint the readers of the first. In nearly a thousand pages its authors record with a serene, but by no means excessive, amplitude the sequence of events that separates the destroyer-bases deal from Pearl Harbour. If for these fifteen months they require almost 200 more pages than they devoted to the two years 1939-1940 no one who recalls the more extensive landscape of those bitter months will grudge the authors the extra canvas on which to paint it. This is the period that sees the war extended to the Volga and the Euphrates, which witnesses the ding-dong battle for the Middle East, the overrunning of the Balkans, the anxious intriguing at Vichy and Madrid, the long wrestling match of the North Atlantic. On the other side of the world the mounting ambitions of Japan strain at the last frail limitations that American diplomacy can provide. Through it all runs what these authors well describe as the "anxiety, perplexity and vacillation" of an American public opinion that has abandoned neutrality but cannot nerve itself to embrace belligerency.

To narrate this is virtually to write world history for the period covered, and that, in fact, is what the authors have done. This is a world diplomatic history, as seen from Washington and, in particular, from the windows of the State Department, for this volume like its predecessor has, for the core of its source material, the reports of American ambassadors overseas and the internal memoranda of the department. Two deficiencies, however, which this treatment left in Volume I have largely been made good in Volume II. Thanks to the Hopkins papers we can here follow much more clearly the President's curiously charted course—even if we cannot always understand it. Furthermore the determinant role of public opinion is much better presented in this volume than in the last. Even now perhaps it is not the authors' forte—there is rather too much uncritical quot-

ing of public opinion polls and still a much too cursory analysis of Congress—but at least it is prominently in the picture, a *causa causans* that the reader must recognise even when he cannot fully understand.

Although based on original sources this volume cannot be expected, in fields that have been so thoroughly ploughed, to come up with many new revelations. What it does continually offer to the attentive reader is something rarer—clarification. Thus Professor Langer's relation of United States policy towards Vichy, while it may not always persuade (since there are value judgments involved beyond those which he appears to appreciate) at least makes it seem consistent and comprehensible. There is a masterly account of the inception and development of Anglo-American military and naval strategy, which shows how from the beginning, contrary to what might so reasonably have been imagined, the "Atlantic Firsters" had their way, but also how the seeds of later disagreements over cross-Channel invasion versus Mediterranean "diversions" had been planted as early as January, 1941. Again, in the pages that describe the early differences of emphasis over the handling of Russia there is much that is depressingly pertinent in 1953; equally significant of then and now is the dissent which will rise to most British readers' lips when they read on page 819 the authors' implied endorsement of the Hearst-McCormick criticism of Lend-Lease aid to the Russians in 1941.

It would be misleading, however, to stress the disagreements recorded here or the critical judgments expressed. If this narrative is anything it is a triumphant vindication of Anglo-American co-operation in an extraordinarily difficult and delicate period, and if the authors are occasionally critical of Britain they far more often carry their generosity beyond the mere limits of justice. It is for American shortcomings (e.g., the campaign promises of 1940) that their harshest strictures are reserved, and when at last the hesitations of the Undeclared War are resolved in the thunderclaps of Pearl Harbour they conclude that it was not only the swift disaster of that attack which explains "the sobriety and even the grimness" of America's warring.

The steadfastness and value of all those warring peoples who were presently to become the United Nations had afforded the American democracy a unique opportunity, by democratic processes, to appraise and at long last to respond to the appeal for leadership in the struggle.

Mountain Hero

THE ASCENT OF EVEREST.

By John Hunt.

Hodder and Stoughton. 300 pages. 25s.

IT has often been observed that mountains and deserts have one thing at least in common—they appear to impose on those who write about them an English style excellent beyond the norm. This is probably putting the cart before the horse. Thousands of bad writers have written about both. Writers about the deserts have not all been Doughties, Lawrences and Starks, or about mountains Stephens, Youngs or Shiptons. But there is a grandeur about both subjects which causes us to reject immediately the writers unworthy of them.

But this is not the whole truth. In the past only wealthy educated gentlemen were able to write about such subjects at all—and other wealthy educated gentlemen were probably their only readers; and whether their books sold or not was a matter of indifference to them provided they were praised in the circles they respected. Certainly it was then unnecessary to produce a book of 100,000 words or so in a month and get it published in another three. "The Ascent of Everest" is such an excellent production that one cannot help wondering at the efficiency of both author and publisher; but one also cannot help lamenting that the book was thus prematurely born. We shall never read the masterpiece which a writer of Sir John Hunt's unexpected ability might have produced had he taken a year or more in the writing of it. But the needs of this generation of impecunious young adventurers demanded that their hard-pressed and unselfish leader should cash in on the nine days' wonder of the mob. And it must be supposed that Hunt has got to get back to his job—he will probably be very glad to get back to it.

But how wonderfully, within the limits he has imposed upon himself, he has done. It would be fulsome to suggest that he commands the imaginative and balanced style of Shipton or the quiet humour of Tilman or the poetic prose of Winthrop Young—to name only three of the living writers who have done so much to charm the leisure of the fire-side mountaineer. But the connoisseur of mountain literature will find himself fascinated by the steady upward path from the soldierly, efficient, somewhat pedestrian beginnings to the lyrical end of the story and the sudden descent into the utility of the appendices. He can watch the theme gripping the author, insisting on the style most suited to itself. There is no attempt to impose himself upon the reader. The hero of the book is Everest, not Hunt.

"The Ascent of Everest" is a classic foreordained by its theme. No later book can ever take its place. But perhaps one day emotion, remembered in a tranquillity greater than that which is now allowed to the leader, may evoke from another of the band of adventurers a more personal portrait of Everest and of the men who climbed her.

History Out of Scale

THE THIRTEENTH CENTURY, 1216-1307.

By Sir Maurice Powicke.
Oxford University Press. 829 pages. 30s.

IT is nineteen years since the first volumes of the Oxford History of England appeared. From the start, Professor Powicke was announced as the author of the volume on the reigns of Henry III and Edward I, and in the intervening years he has made himself still more the pre-eminent authority on this period than he was then. Even so long a wait is worth while, one has said to oneself in the intervening years, to get the gap so well filled as Sir Maurice will fill it.

But unfortunately the present book does not fill the gap in the series; it is written on an entirely different scale, one might almost say on a different plane, from the other volumes. The Oxford Histories are intended to be written, without any sacrifice of scholarship, for the general, or at least the non-specialist reader, and their particular feature has hitherto been that, in addition to the main political narrative, they take account of the development of literature and the arts and of the organisation of society. Sir Maurice Powicke, as he admits in his preface, has departed from the formula. Although his book is by more than 80 pages the longest of the series, it contains very little indeed that cannot be fitted within the political framework. This means that a long book is almost entirely taken up with the political and administrative narrative of ninety years—admittedly a very important century, but a very long time ago. To carry a story of such detail and of such unfamiliarity requires a prose style of great clarity and smoothness. Sir Maurice can write with great force, but his chapters do not have that obvious architecture that is needed if the reader is at all times to follow what the author is writing about. There is too much allusion, too many comparisons that involve skipping backwards and forwards over the years—in a word, there is too much erudition. The general reader is likely to find the book much more difficult—and therefore much less valuable for the particular purpose for which it was intended—than the other Oxford Histories.

To say that the book does not fit into its place in the series may be to say that it is the more valuable as a piece of original scholarship. The present reviewer must confess that his specialist knowledge of the period is too small to permit of more than a provisional judgment of that. Sir Maurice's own masterly study of the earlier of the two reigns, "King Henry III and the Lord Edward," is only six years old and the earlier chapters of the present book are clearly based upon it. But nearly two-thirds of this book is given to Edward I (that is, to thirty-five of the ninety years) and these chapters have something of the original authority for the son's reign that the earlier book had for the father's.

Here again, however, it is a pity that the attempt was made to force so much original scholarship within the framework of a series not intended for it. For the chapters on Edward I, long and detailed though they are, are still compressed in comparison with the scale on which Sir Maurice was writing in "King Henry III." Not only does one have the feeling of a quart in a pint pot, the quality of the brew is stronger than the customer ordered.

Nothing that has been written here is intended to detract from the massive qualities of Sir Maurice Powicke's scholarship, or from his achievement in replacing so much of what has hitherto been conjecture by ascertained fact. But it does seem to have been a mistake for his work to have been done in this form. It would have been better for Sir Maurice to have written another pair of scholarly volumes on the reign of Edward I to stand alongside his "Henry III," and for somebody else, less ambitiously but perhaps more effectively, to have filled the gap in the Oxford Histories.

Aristocratic Asses

THE REASON WHY.

By Cecil Woodham-Smith.
Constable. 293 pages. 15s.

"WE call Lucan the cautious ass and Cardigan the dangerous ass," wrote an aggrieved officer serving under them in the Crimea. It was the Earl of Lucan whose interpretation of an ambiguous order launched the Light Brigade on its fatal charge and it was his brother-in-law, the Earl of Cardigan, who executed the order, leading the cavalry as though on one of the parades he loved so well. Mrs Cecil Woodham-Smith approaches the story of the disastrous charge through the careers of the cautious ass and the dangerous ass.

Both men owed their commands to the system of purchasing commissions, which made the higher ranks of the army the virtual preserve of the aristocracy. Lord Lucan, who bought his cavalry regiment for £25,000, owned wide acres in Ireland. He there vainly attempted to revive his own manorial court and when reorganising his estates, chose the moment of the potato famine to evict his tenants wholesale. He retired from the army on half-pay to devote himself to these occupations, and his obsolete words of command proved totally incomprehensible when he was given a division on the outbreak of the Crimean War. To one of his officers it seemed "as if one of the cavalry commanders of the Thirty Years' War had risen from the grave to take command." Lord Cardigan, a dished Tory, reigned in splendour in Northamptonshire. His tyranny over his officers and savage treatment of his men made him the best-hated officer in the army and a frequent embarrassment to the government. He delighted in spending large sums on the uniform of his regiment and when it sailed for the Crimea, *The Times* commented that the "tightness of their cherry-coloured pants" was more suitable to female

THE ECONOMIST, NOVEMBER 14, 1953

hussars in a ballet than to the needs of modern war. Both men epitomised the insensitive arrogance of the aristocracy in its extreme form and their unconcealed hatred for each other contributed much to the endless friction that divided and distracted the command in the Crimea.

Mrs Woodham-Smith has written an absorbing book which sparkles with satiric touches. Her narrative of the campaign is spirited, lucid and fair. Her biographical approach has not led her to find "the reason why" in terms of personalities alone. "Above all," she concludes, "the disaster was the fruit of the system under which the British Army was commanded." She brings out very clearly the dead weight of Wellington's prestige and influence. He lent his authority to defend the system of purchase, and it was his intervention that saved Cardigan from dismissal in 1841. Lord Raglan, Commander-in-Chief in the Crimean War, had served as Wellington's secretary for thirty-three years, and could not free himself from the habit of referring to the enemy as the French. "You and I," his second-in-command said, "are accustomed, when in any great difficulty, to ask ourselves how the Great Duke would have acted in similar circumstances." Mrs Woodham-Smith's book is not only a highly entertaining study of arrogant eccentricity and mental rigidity but also a valuable study of the army before it finally fell to the assaults of the reformers.

Dissecting Communist Rule

ANATOMY OF A SATELLITE.

By Dana Adams Schmidt.
Secker and Warburg. 512 pages. 30s.

OF all the countries that have been forced into the Soviet bloc, Czechoslovakia is, by history, tradition and outlook, most akin to the western democracies. The story, therefore, of what Communist rule now means to its people is of particular interest to the West. Mr Schmidt, who was correspondent for the *New York Times* in Prague from April, 1949, until he was forced to leave in a hurry just over a year later, has made an admirably thorough job of this survey. He discusses the impact of Communist rule on industrial worker, peasant and housewife. He analyses the apparatus of the police state. He describes in impressive detail the "sovietisation" of all intellectual and cultural life.

Perhaps the least satisfactory chapters are those dealing with industry and agriculture; here the analysis of trends and developments tends to be obscured by a too liberal scattering of percentages. Mr Schmidt prefaces his survey of Communist Czechoslovakia by a brief but vivid account of his own experiences in Prague and by a broad survey of Czechoslovak history from the ninth century saints, Cyril and Methodius, to the twentieth century Communist boss, Gottwald. He gives a very fair and

THE ECONOMIST, NOVEMBER 14, 1953

comprehensive record of the events leading up to the Communist coup and of the fateful days from February 20 to 25, 1948.

When this book was finished Slansky was still in prison awaiting trial. Mr Schmidt is able to make out a good case for his belief that the fall of Slansky was basically the result of an experiment in controlled Titoism—in other words, that Gottwald, in collusion with Moscow, tried to allay the mounting popular discontent and passive resistance by throwing to the wolves all those Communist leaders most closely connected with Moscow. (That this gave Gottwald a chance of getting rid of a hated and dangerous rival was of course an added attraction.) Gottwald is now dead as well as Slansky; and his effort to retrieve the situation was clearly a failure. The passive resistance in the factory and on the farm, and the creeping demoralisation within the Party, are almost certainly greater now than at the time of Slansky's arrest. In Mr Schmidt's view there is encouraging evidence that the Czech nation will survive a Communist dictatorship just as it has already survived Nazi occupation and the religious fanaticism of the Hapsburgs.

The State of Geography

GEOGRAPHY IN THE TWENTIETH CENTURY.

Edited by Griffith Taylor.
Methuen. 661 pages. 35s.

THIS collection of papers by various authors is intended to review the present state of geography and its evolution, especially since 1900. In its first edition, which appeared in 1951, the book was rather roughly handled by some reviewers, who felt that the intention "to study the growth, fields, techniques, aims and trends of geography" was realised only in part, and who objected particularly to the five chapters in which the editor put forward his own rather controversial views. It was also suggested that a work with such comprehensive aims might well have found room for such major branches of the subject as cartography, historical geography, economic geography and regional geography.

It is interesting to see from the second edition how far these criticisms were accepted. The balance of the book is certainly improved by its two new papers. Mr W. W. Williams gives an authoritative brief account of the present state of cartography, especially of the various national surveys, while Mr F. Walker provides a glimpse of the exciting uses of air photographs in geographical studies. The publisher also says that minor errors in the original papers have been eliminated. Unfortunately, a comparison of the lists of such errors provided by reviewers of the original edition with the present volume proves this claim to be greatly exaggerated. As might be expected, the editor, in his preface to the new edition, stands firmly by his own distinctive ideas on racial and political geography, and on

the question of physical determinism in geography. Nobody will deny the interest of Professor Taylor's ideas, but it may be questioned whether, highly controversial as many of them are, they provide a true guide to the inquirer from outside the subject who wishes to understand the progress of geography in the first half of the twentieth century. This should not, however, conceal the value of most of the papers contributed to this book, which makes it well worth reading, and worth buying at a price that is reasonable for these times.

Germany and Its Satellites

THE SECRET FRONT.

By Wilhelm Hoettl.
Weidenfeld and Nicolson. 235 pages. 21s.

FOR seven years Wilhelm Hoettl was a member of the notorious SS Security Service, the *Sicherheitsdienst*, and his book tells an unusual story.

For the greater part of the time, Herr Hoettl served in Branch VI, the SD's intelligence service in central and south-eastern Europe. In 1944 he became its acting head, and the chapters that deal with Yugoslavia, Hungary and Italy are written from first-hand knowledge. In Yugoslavia Herr Hoettl recounts the history of the Germans' dealings not only with Pavelic, Nedic, and Mihailovic, but with Tito as well, a surprising if inconclusive episode. In Rome, Bucharest and Budapest, he records the last miserable months of the satellite regimes. All these chapters shed new light on the complicated politics of 1941-44 as they were seen from the German side of the fence.

The chapters dealing with the inner history of the Nazi regime in Germany are much less interesting. Herr Hoettl confirms the now generally accepted view of Himmler and throws into relief the far more intelligent Heydrich, one of the ablest and most evil figures of the Third Reich. But his view extends no further than the leadership of the SS. Hitler, Goebbels, Goering are little more than names, while Martin Bormann, Himmler's most dangerous rival in the last year of the war, is barely mentioned.

In his final chapter, however, Herr Hoettl succeeds in providing something that is too often missing from accounts of the Second World War. By collecting what little is known about the subsequent fate of the survivors of the Third Reich and its satellite regimes he gives a vivid reminder of the links between the events of today and what is, after all, only the day before yesterday.

The difficulty in judging such a book, of course, is to know how far the author is reliable. Where he was not himself a spectator of the events he describes, he rarely takes the trouble to name the sources of his information. Like others who have become fascinated by intelligence work, he is careless of the value of evidence. His book undoubtedly adds to the material for the political history of the Second World War, but the reader would be unwise to accept it without looking first for corroboration.

The book is most valuable for the light it throws on the human and political realities which underlie the process by which Congress enacts a major statute, and by which it is then modified in day-to-day operation. 45s. net

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Back to Containment

Washington, D.C.

THE latest Russian note in the correspondence that began when the three Foreign Ministers met in July is presumed in Washington to be also the last in the series. Its very length, completeness and clarity suggest that it is intended to dispose, once and for all, of the possibility of holding any kind of important conference until the western powers have made such concessions as cannot, under present circumstances, be made. To an extent, therefore, the conditions demanded on each, but particularly on the Communist, side have made negotiations impossible for the present, and for the foreseeable future.

It is pointless to argue now whether the Soviet leaders might have been more flexible had they been brought to the conference table quickly after Stalin's death or had there been no riots in East Berlin to expose their nakedness. They are at present as inflexible as their predecessors ever were, if the view taken in Washington of their note is correct. And, although American policy-makers have for months discounted the chance of lessening tension by agreement, this proof that they were right is likely to have a profound effect on their outlook because American policy itself has, even if subconsciously, been based on a little wishful thinking. That cannot go on any longer and the time has come to get back to a sober and steadfast policy that can stand up for a number of years.

The argument that has been going on about the possibility of using a few men and a piece of atomic artillery to take the place of the old infantry division is likely, therefore, to assume even greater importance in the new circumstances. The advocates of the new weapons are behaving rather like those dieticians who proclaim that it will shortly be possible to provide all the vitamins and calories necessary for a balanced diet in two or three pills to be taken night and morning. Mr Dulles, on the other hand, is the family physician who points out that some bulk food—a little roughage, at least—is needed to keep the digestive system functioning properly. As the man responsible for foreign policy, he realises that the American armed forces must be seen as well as heard if they are to play an effective part in the alliance and to support his programmes. In the American view, the Soviet leaders have clearly decided that, as things are, no further advances can be made in Europe and that the present situation cannot be improved at the conference table. Therefore, they will accept the *status quo* and await a weakening of western

resolution. In the East, it seems, they think they can exploit their present advantage for some time to come. So it falls to the United States, as the leader of the western coalition, to ensure that the position is held in the West and stabilised in the East. There may be some irony in the spectacle of Mr Dulles, who once preached liberation, having to fight, presumably with the generals and admirals at his side, for enough strength to continue a programme of containment. But that is likely to be the goal of American policy for the next few years.

Even before the Russian note reached Washington there were signs that the hatches were being battened down. The speech on colonialism made in California by Mr Henry Byroade, the Assistant Secretary of State for Near Eastern, South Asian and African Affairs, was an example. Mr Byroade began with the assumption, in the first paragraph, that "our principal concern is the threat of Soviet aggression" and proceeded logically to the conclusion that "we cannot ignore the legitimate economic interests which European nations possess in certain dependent territories" because the European nations "will probably represent, for many years to come, the major source of free world defensive power outside our own." The suggestion that "there is such a thing as premature independence" has never been made openly before, though the idea has been implicit in many American actions, particularly in the United Nations, in the last few years.

There is, indeed, a danger of American opinion, both official and unofficial, swinging too far and becoming too impatient on this subject as it has on others that are considered to be subsidiary to the main problem. There has probably been too little comprehension of the attitudes of India, Pakistan and Ceylon—which have been so similar to those of the United States during its early years—just as there has been too little understanding of the depth of the suspicions that divide France and Germany or Italy and Yugoslavia.

Mr Byroade spoke, more in sorrow than in bitterness, perhaps, of the paradox in the fact that the upsurge for national self-determination among the dependent peoples has come at the moment when western nations are coming to recognise that self-sufficiency is a myth. But he has only to listen to some of the voices in Congress to realise

that the "myth" is still very much alive among those who, as the President suggested last week, may want to go back to 1892 and who are determined to pass Senator Bricker's constitutional amendment, which is designed to save the Senate from the danger of ever nodding momentarily in its own defence of self-sufficiency. In his recent book Mr Clarence Randall, the chairman of the President's Commission on Foreign Economic Policy, said, when discussing the American attitude to such projects as the European Defence Community and the Schuman Plan, that

if by our pressures we had any part whatsoever in causing other nations to surrender sovereignty, we have done an immoral thing, for the very obvious reason that we would not surrender sovereignty ourselves.

★

It seems possible that the lines between East and West are to be stabilised, at Russian insistence, for some time to come; and the development of the North Atlantic alliance has made containment an actual policy rather than a goal to be attained. But military alliances need continual refreshing or they tend to disintegrate. And the Russians have one great advantage over the West—they can count on the subservience of the countries behind the Iron Curtain. It is a perpetual source of irritation to many of the more vocal members of Congress that the allies of the United States have not also become, thanks to various aid programmes, equally subservient "voluntary satellites."

These men, and others throughout the country who echo their sentiments, continually impede the State Department in its attempts to pick its way carefully through the minefields of foreign affairs. But the department itself is often inclined to take a too simplified view of some international problems. It shows, for instance, a tendency to believe that, once the Trieste issue is settled, Italy and Yugoslavia will be able to concentrate wholeheartedly on the defence of southern Europe and that the ratification of the European Defence Community and the solution of the Saar problem will produce Franco-German solidarity in the face of the common enemy. The State Department cannot really understand, just as it cannot understand the neutralism of the new nations in the East, how any country can permit itself to be sidetracked at this moment by comparative irrelevancies.

The American policy of the future must, therefore, if it is to be as successful in keeping the western alliance together in boredom as it was in building it in crisis, be founded on patience and a recognition of the difficulties, to which lip-service is always paid in public utterances, of maintaining a common policy among democracies. And somehow the Secretary of State will have to persuade Congress—and particularly the members of his own party in Congress—to accept a joint stand and even, perhaps, some day to surrender a little sovereignty in the cause. It is therefore unfortunate that the results of the recent elections should, apparently, have strengthened the hand of the Congressional reactionaries who run the committees with an iron hand and want none of the policies to which President Eisenhower and Mr Dulles are committed. Even in a country where party discipline does not exist, an almost mathematically exact balance in both Houses of Congress discourages a firm, stable and undramatic policy. And that is the policy needed by the United States today.

American Notes

Brownell's Bombshell

THE announcement of the Attorney General, Mr Brownell, that, according to evidence in his department's files, Mr Truman in his first year of office promoted a "Russian spy" over the protests of the Federal Bureau of Investigation has provided an even bigger sensation than the Alger Hiss case. Mr Truman himself has been subpoenaed to appear before the Un-American Activities Committee of the House of Representatives; so have Mr Justice Clark, once Mr Truman's Attorney-General, and Mr Byrnes, once Mr Truman's Secretary of State and now his most spiteful enemy. However, the Committee may have second thoughts now that the President has said that he himself would not have issued a subpoena. Furthermore, Mr Truman may refuse to answer questions which it can be argued infringe the constitutional separation of powers, and Mr Byrnes is standing on his dignity as Governor of South Carolina and insisting that the Committee come to him.

Much more may become known, nevertheless, while *The Economist* is in the press. The President, at his most stormy press conference, has already been forced to admit that, although he was consulted, he left it entirely to Mr Brownell to decide in what way so grave a charge should be made public. It seems to turn, however, on two questions: did Mr Truman receive the FBI reports on Harry Dexter White before he appointed him American executive director on the International Monetary Fund, and did the reports contain substantial proof of Mr White's disloyalty? Mr Byrnes tells a circumstantial story of the President and other prominent officials receiving the second and fuller report just as the Senate was acting on Mr White's confirmation in February, 1946, and of the President deciding not to take the embarrassing step of terminating the appointment of a man who had already spent twelve years in the government service. Mr White served another year and then resigned, with a rather fulsome message of thanks from Mr Truman. It was not until 1948 that Miss Elizabeth Bentley's allegations that he had supplied her with secret information became public and began to be taken seriously, although the FBI heard her story in 1945. Mr Whittaker Chambers's evidence also came just before Mr White's death.

Mr Brownell, whom the Democrats would dearly love to question, has not revealed what was in the early FBI reports and may never do so, on the ground that it would imperil sources of information. But a grand jury, which saw the reports in 1947, found insufficient evidence for an indictment.

★

Whatever the facts are—and it is unfortunate that so many of the men who could have thrown light on them are dead—it can only be deplored that the President allowed Mr Brownell to make party capital out of so serious a charge before holding a judicial inquiry. The Administration

itself has not hitherto used Senator McCarthy's methods of blasting reputations without a fair trial. There may be other causes for regret. The partisan handling of the case may well alienate the Democratic votes the President will need next year if his programme of legislation is enacted. And the charge that the White House "overruled" the FBI in 1946 (though an agency whose mission has at all times been restricted to the provision of facts and does not extend to the making of recommendations can hardly be said to have been overruled) may well have the effect of encouraging Congressional committees to press their own loyalty investigations, rather than relinquish them to the Administration, as the President would prefer.

Silver Lining in the West

MR BROWNELL'S spy story is being given credit for the ray of Californian sunshine that has penetrated the post-election clouds which enveloped Republican party headquarters last week. The Republican victory in the 24th district, a suburb of Los Angeles, with no farm and little labour vote, has ensured the party of a majority of at least three when the House of Representatives meets again. This is a bare margin, but better than the majority of one which had been feared last week. Yet the unexpected triumph of Mr Lipscomb, in a contest in which two rival candidates represented each party, was not so much a defeat for his Democratic, as for his Republican, opponent. Nominally, there are more Democrats than Republicans in the district, but it has formed the habit of returning a Republican. This time, however, Mr Lipscomb had to compete with another supposedly good Republican, Mr Collier, and it was forecast that a split Republican vote would present the seat to the official Democrat, young Mr Arnold; the strength of the other Democratic candidate was known to be negligible. In fact, Mr Collier's strength also turned out to be negligible and Mr Lipscomb won by 42,800 votes to Mr Arnold's 34,545.

Mr Lipscomb himself fought on a straight pro-Eisenhower platform, while Mr Collier seems to have been certain of only one thing, that he was standing against the party machine. While his vagueness may in part explain his failure, it has not necessarily been proved, as the Republican left-wing may argue, that the voters want pro-Eisenhower liberals in Congress and that the disaster in New Jersey might have been avoided if the Republican candidates had been less conservative. It could perhaps be argued more validly that Mr Lipscomb's victory proves that last week's poor showing might have been avoided if candidates in New Jersey had followed Representative Reed and Senator McCarthy and had attacked high taxes and Communism with more vigour. For Mr Lipscomb had the help of such famous Republican die-hards as Senator Dirksen of Illinois, and in the State Legislature his record has been much more conservative than that of Mr Collier.

In fact Mr Collier was regarded as the candidate of the liberal Warren-Knowland faction in the Californian Republican party, while Mr Lipscomb had the support not only of Vice-President Nixon but also of the party machine and of the new Governor, Mr Knight. It is difficult, as in all Congressional by-elections, to assess the national significance

of this week's result in California. Its local significance is that it confirms the conservatives in control of the Californian branch of the Republican party, something which had already been made virtually certain when Governor Warren resigned to go to the Supreme Court.

Employment on the Turn?

THE Administration is keeping its eye upon the nation's 63 million jobs, although on the surface, at least, the figures make cheerful enough reading. Unemployment reached a new peacetime low of 1,160,000 in October, while the number at work was only a fraction under last autumn's level. What is causing some concern is that factory employment, although half a million higher than it was last year, has fallen by 60,000 this autumn instead of rising by the 200,000 or so which has come to be regarded as customary. Claims for unemployment benefits, which usually drop as the factories begin to hum after the summer, have risen instead.

Overtime, too, is dwindling: average hours worked in September were lower than they have been since the recession year of 1949, although the Labour Day holiday may exaggerate the steepness of the decline. The average weekly pay-packet has fallen from nearly \$72 in March to \$70.49, something which helps to explain why personal incomes receded by \$1 billion a year in September from the August rate of \$287 billion a year, and why retail sales, already wilted by the prolonged warm weather, have failed to recuperate.

Unemployment might be higher if the temporarily laid-off worker were included, and if almost 2 million women, elderly men and young workers had not withdrawn from a

Trade follows this flag

In every corner of the world, wherever trade is possible, the flag of The National City Bank of New York symbolizes the march of commerce.

The National City Bank provides the means of making trade easier, safer, and more profitable. In a world of complex and changing regulations it offers business men an invaluable service: up-to-the-minute knowledge of trading conditions in all parts of the world.

The National City Bank provides this service through its network of 57 branches in 19 countries, and through its banking correspondents in every commercially important city in the world. The London branches of the bank offer, as well, an intimate knowledge of trade with the dollar countries.

A visit to The National City Bank of New York will always ensure the speedy and successful transaction of your business.

labour market in which employers are beginning to be able to pick and choose, at least where unskilled workers are concerned. But the storm-signals—if that is what they are—are still very faint. Nevertheless the Administration has thought it worthwhile to announce a special tax-amortisation bonus for firms with defence contracts who build new plants in one of the areas with a labour surplus. Mr Wilson, who used to put such emphasis on saving the taxpayer's money, has denied with heat that defence spending is likely to decline very rapidly after it reaches its peak in December.

Pressure, moreover, is being put on the seven economic study groups to have their recession remedies ready before Christmas; the President wants to be able to ask Congress for whatever legislation may be necessary to enable him to act quickly in his message in January. Mr Burns, the chairman of the Council of Economic Advisers, is already considering the virtues of a large public works programme, easier credit for home-building, an extension of unemployment insurance, and various tax changes as means of strengthening the ability of businessmen to ward off a recession. All have the attraction that they need not involve much federal spending for the Republicans hope, though in this they may be disappointed, to induce the states to shoulder part of the cost of the public works that may be needed.

The Right to Know

THE steel manufacturers should welcome President Eisenhower's new executive order on the safeguarding of official information, for it abolishes the lowest category for classified documents—"restricted"—and leaves only three—"confidential," "secret" and "top secret." Confidential papers must be kept in a steel container while wooden desks were safe enough for restricted documents. Until the restricted files can be sorted out (there are said to be twelve miles of shelves of papers from the last war still to be dealt with), they may have to go into confidential steel cases, in spite of the official warning against unnecessary upgrading—provided of course funds are available to buy the cases. There is also a suspicion that the abolition of the restricted classification may merely mean that in future more documents will be made confidential, rather than that more will be released. And newspaper men will not apparently be allowed access to confidential papers as they often were to restricted ones, for background information.

But in spite of these possible drawbacks the press, which was consulted in advance about the new order, considers it a great improvement over the comprehensive one hastily imposed by President Truman after the Korean outbreak. This was more concerned with keeping information from the enemy than with making it possible for Americans to know what their government was doing. Under it all government agencies, including the Battle Monuments Commission and the Committee on Purchases of Blind-Made Articles, had power to classify documents. Now this power has been removed entirely from 28 agencies and is given only to the heads of 17 others. Only in especially sensitive offices, such as the State and Defence Departments, is authority to classify more widely distributed. In addition, provision is

made for appeal to a presidential assistant by anyone who thinks information is being withheld unjustifiably.

But just as the dangers of Mr Truman's order were potential rather than actual, so are the benefits of Mr Eisenhower's. There is no point in eliminating the obstacles which prevent the press telling the people what they ought to know if officials are unwilling to talk to reporters. In this the Eisenhower Administration has left much to be desired. It is true that since he returned from his holiday the President has been holding press conferences regularly, but there are members of his Cabinet who seem to pride themselves on treating newspapermen with suspicion, and others who are accused of giving stories only to a select group of their friends. And when government officials do talk they show a tendency to contradict themselves; for example, not long ago atomic energy spokesmen seemed unable to agree on the extent of Russian atomic developments. More recently, when the Secretary of Defence implied that American troops would be withdrawn from Europe, the Secretary of State had to deny this immediately, and there has been a similar confusion over the question of making atomic weapons available in Spain. Now the President has taken steps to see that in future such statements will be co-ordinated between departments and officials.

Benson's Straight Furrow

ANY motorist in the United States today can see the influence of the Department of Agriculture's Soil Conservation Service on the hillsides where the furrows follow the contour of the land instead of being ploughed in straight channels down which the rain washes away the topsoil. The service, which is an outstanding example of successful local co-operation between government officials and individual farmers, is also responsible for suggesting suitable crops and fertilisers and for reforestation and flood control. Started in the dust-bowl days of the nineteen-thirties, this autumn's drought has shown that the need for it is by no means over, even though by now many of its experiments have become normal farming practices. But to the Secretary of Agriculture, Mr Benson, the service offered an excellent opportunity for practising the Republican principles of economy, efficiency and decentralisation of government. He decided to close the seven regional soil conservation offices, and leave the work to existing state agencies, under general direction from Washington, as part of a complete reorganisation of the Department of Agriculture.

Congress authorised this reorganisation several months ago, before Mr Benson became the scapegoat for the farmer's troubles. Now, however, the Republicans who want to drive him out of office and the Democrats who want to drive the Administration out of office are together trying to force him to abandon the section of the scheme that affects the soil conservation service. They have been flooded with letters, condemning the change, organised by the National Association of Soil Conservation Districts; these districts cover nearly 90 per cent of the country's farm land and over one million farmers co-operate in conservation policies, but the association is probably speaking mainly for officials who fear the loss of their jobs. It is also said to be inspired by antipathy for the Farm Bureau Federation and suspicion

of its influence with Mr Benson. His thinking on such matters as lower farm price supports is similar to that of the federation, which works closely in some states with the agricultural educational and advisory services. Admirable as many of them are, these services are thought to lack the technical experience needed for the soil conservation responsibility which, Mr Benson's opponents insist, he intends to give them. He denies that this is his plan, or that he wants to weaken soil conservation. He also denies that the reorganisation scheme means the dismissal of many of the government's already inadequate staff of soil experts or the abandonment of regional co-operation on such questions as watershed development.

There is no doubt that Mr Benson's proposal has been misunderstood and misrepresented. But there is a genuine background of concern at the possible disruption of a practical service that has been widely admired. Nor is Mr Benson helped by the fact that a scheme similar to his was first proposed when Mr Henry Wallace was Secretary of Agriculture. However, Mr Benson, who never conserves himself, refused to make any concession to the political lay of the land and ploughed straight into his reorganisation before Congress could stop him. In thus courageously implementing his scheme, he had the full support of President Eisenhower.

New Lines in Trains

EARLY this month the last steam engine on a regularly scheduled run pulled out of Washington station. From now on the capital will be served by diesel engines only and elsewhere the "dieselisation" of the railways is nearing completion. This means that the railway companies are having to think of new ways of cutting down costs, and the diesel manufacturers of new markets in which to sell their products. By the end of the year it is expected that 75 per cent of freight trains and 90 per cent of passenger trains will have abandoned steam, and already the General Motors Corporation has cut its output of diesel engines from seven and a half units a day to four. It is not very surprising, therefore, to learn that the company's overseas department is planning a major sales drive next year, nor that the American Locomotive Company, whose diesel production has gone down from four units a day to three, has been exhibiting a "world" model, lower and lighter than its standard engine for the United States and with a flexible wheel base that can be adjusted for use on lines with different gauges.

The profits statements of the railway companies for the first half of this year are cheerful enough. Operating revenue is up by 4 per cent over the corresponding period last year, while operating costs have increased by only one half of one per cent. Dividends are greater by 9 per cent. The attack on costs must go on, if the high level of traffic which alone makes the investment in diesels economical is to be maintained. Goods yards are being laid out afresh, with all traffic directed from a central point by remote control. The time taken to move freight through Chicago, for instance, has been reduced by a half. Labour time is being saved on maintenance, either by new machines, like the compressed air spike driver for laying rails, or by cutting out travel in work trains to and from the part of the

permanent way being repaired. Instead special dormitory and restaurant trucks are left at the places of work.

In the United States, as with every other railway system, it is not the passenger trains that make the money. The main lines lost \$643 million on their passenger traffic last year, though this was lower than the highest deficit recorded—\$680 million in 1951. Strenuous efforts are being made to economise, particularly in the design of rolling stock. The Chesapeake and Ohio Railway and the New York Central Railroad have just launched a joint research project to find a new light-weight coach. One such type of coach, made by an American firm, is already in use in Spain. It is short, has a low centre of gravity, and has only two wheels, at the rear end—the front end being supported by the carriage ahead. There are also new facilities to tempt the passengers to travel by train. At one station he can now order his ticket by telephone and collect it from a "drive in" office in his suburb, without having to get out of his car.

Psychological Information

THE functions of the new overseas information agency, created by consolidating the information services of the State Department with those of the mutual security and Point Four programmes, have now been set out in a directive from the National Security Council and in a letter from Mr Streibert, the radio and advertising executive who was chosen to head the agency. They reflect, almost word for word, the views of the Jackson Committee, which last July took a strong stand, in theory at least, against the illusion, fostered during the Republican campaign, that psychological warfare had a role to play independent of official policies and actions. According to Mr Streibert, emphasis will be placed upon "objective, factual news reporting and appropriate comment," and he promises that the new approach will be more "hard-hitting" than the previous "diffuse" programmes.

In part this is the consequence of having less money to spend; Congress appropriated only \$75 million for this year, compared with \$96 million last year. On the other hand, it hardly seems that the facts will be allowed to speak entirely by themselves. The new agency will stress fewer, but more vital, themes, and try to "get a message across convincingly." That message, as laid down by the Jackson Committee and the National Security Council, is that the objectives and policies of the United States are in harmony with the legitimate aspirations of other nations. Mr Streibert adds that "we must explain those goals in ways that will cause other peoples to join with us in achieving them."

Where this might be difficult, as in the case of Trieste or, conceivably, of South Korea, Mr Streibert will have the benefit of State Department guidance, but he will not be required to accept its day-to-day direction. He is responsible only to the National Security Council. Mr Streibert will have more independence, if less money, than his predecessors. It remains to be seen whether Congress has finally become reconciled to the need for an information service and is ready to give the new scheme a fair trial by calling off its investigators.

The World Overseas

Death of a Desert King

BY A CORRESPONDENT

KING IBN SAUD is dead, and his eldest son, now King Saud Ibn Abdul Aziz, has immediately been proclaimed ruler of his father's domains. When an old friend dies, and Ibn Saud can be counted as a very old friend of Britain, memory at once leaps back to typical incidents in his long career. One such took place immediately after the first world war. Sir Percy Cox, then High Commissioner in Iraq, had asked Ibn Saud, then Sultan of Nejd, to meet him and discuss a disputed frontier. He came, splendid in traditional dress; he met Iraq's representative, equally splendid in frock coat and brown boots. "As everyone knows," began the latter, "the historic frontiers of Iraq stop just short of Riyadh." Sir Percy, impassive in the chair, called on Ibn Saud to speak: "As everyone knows," the latter began, "the historic frontiers of Nejd stop just short of Aleppo." Both contestants were thus in a position to protest, and Ibn Saud even to weep, when the inscrutable west fixed a compromise and a neutral zone. But, as so often in the Arab world, common sense triumphed once the fuss had been made; both parties have since observed the arrangement.

What sort of a man was Ibn Saud? Brave, of course; a giant both in physique and in heart, and though the former failed him in his declining years, the latter never did; a match for opponents in debate, humorous, but sensitive and capable of deep feeling.

Such Britons as knew him before the First World War may be pardoned if their estimate of him differs from that of many Americans who came to know him only after oil was discovered in the Hasa in the 'thirties. To several Americans, Ibn Saud represented Arab nationalism *par excellence*; and it was partly in this belief, fostered, perhaps, by the numerous Syrians whom he attracted to his service, and to whom, whatever their worth, he was unfailingly loyal, that haste was made in the United States to attend to his private whims, or to the whims of his unspaced family. To Britons, on the other hand, Ibn Saud appeared to be the last of the truly great Arab feudal chiefs, a man who believed primarily in Islam and in personal sovereignty, not one who paid overmuch heed to doctrinaire plans for Arab unity or to the lessening of individual sovereignties for the sake of a greater entity.

He understood personal rivalries; it was part of his hard-formed make-up, and he did not take easily to the subduing of old hatreds just to please academic dreamers. When Faisal the First of Iraq died in 1933, Ibn Saud, who

a little earlier had met the Iraqi King on HMS *Lupin* in the Persian Gulf, and had there shown all his traditional courtesy and hospitality to the scion of a family which he had ejected from the Hejaz, said: "So the wily serpent is dead at last." But if his hatreds were durable, so were his loyalties. Britain was, next to Arabia, his oldest love. His belief in Britain, if severely tested at times, notably by events in Palestine, never really wavered; during the Second World War, particularly in the black year when but for Greece and the Arab Legion Britain seemed bereft of allies, his faith in the *Inglesi* remained steady. Neutral he was, but his neutrality was not of the cold kind whereby hopes are entertained of profiting from both sides. He ardently wanted the Allies to win, and on the attainment of victory he thanked his God with a sonorous "Alhamdulillah!" Hyperbole, so unbecoming in English, is suitable in Arabic and in that tongue it can be said that after his God, he believed in the British Government.

Between Minaret and Pipeline

It is early to speculate on the chances of Saudi Arabia's enduring in its present shape and temper. Riches came swiftly to Ibn Saud, through oil, and after fifty years of comparative poverty which were made tolerable only by the revenues accruing from the Pilgrimage to the Holy Places of Islam and by subventions from the British Government. That these riches from oil revenues tended to corrupt the hitherto tough fibre of Ibn Saud's subjects is indisputable. The old austere moral law in Saudi Arabia has sadly weakened, nor is there, as yet, any moral sanction to take its place. Drunkenness, once unheard of, has latterly been rife. Luxury accommodation for Ibn Saud's relatives has overleaped itself almost annually, and the contrast between certain of the Princes' palaces and the comparatively wretched existence of millions of Nejdians and Hijazis, largely untouched by the oil wealth, is far greater than that between Park Lane and the East End of London.

Of these dangers, the new King, Saud, is well aware. Already he has tried to revivify the faith of his ancestors, and when a royal edict is issued that the foreman of a gang of labourers shall lead the party in daily prayers, it is a sign, not only that King Saud has read the slippery tendencies of the oil-rich times, but also that it will be obeyed. If it is demonstrably true that as Saudi Arabia has prospered materially, so it has declined spiritually, it

is not necessarily true that the decline cannot be arrested. Of all Ibn Saud's sons, King Saud is the man most likely to effect such an arrest, to preach and practise the virtues of faith and spare living, so to husband the country's resources that millions as yet unaffected by the oil wealth shall prosper through whatever development is possible in other ways. He has perhaps not so clever a wit as certain of his brothers, but he stands a chance, through his integrity, of reducing Saudi Arabia's feverish and sometimes ill-considered growth to a steady, broadly based increase in solidity and in prestige. It will not be an easy task.

Much will depend upon the new King's advisers. But if he can check the flow to his capital of such Arabs as have not fared well in their own countries, and who come to this desert kingdom for wealth that was altogether out of their reach in their native lands, he will, at least, have made a right beginning. He will have demonstrated that there is in the Nejd way of life a fund of commonsense that was first exemplified, in this century, by his father.

Europe in Perspective

FROM OUR SPECIAL CORRESPONDENT

IT is common knowledge that the student of Western Europe's economic statistics and the traveller through its towns and villages have differing views of what has been achieved there. The former sees heavy clouds threatening the economic outlook; the latter thinks of what the liberated countries looked like eight years ago, and draws comfort and strength from the massive achievements of this era. It would be foolish to be complacent—to rest 'insecurely on the laurels of rehabilitation and reconstruction; but it would be equally stupid to dismiss, or under-rate, the remarkable, and now complete, recovery of Western Europe from the wreck of Hitler's war. There is always a danger that men with short memories and boundless illusions will fall victim to the seductive propaganda of the Communists, whose own people are permitted the luxury neither of a past nor of a future. Yet if free Europe's achievements of the past eight years are seen in their proper perspective, they more than match anything on the other side of the iron curtain. And the relative costs in human suffering are disproportionate.

What has been done in Western Europe? In wellnigh every sector of economic activity prewar levels have by 1953 been surpassed. Take industrial production: the combined index of the eighteen OEEC countries (Spain is a sector apart) averaged 115 in the first half of 1953 (base 1950) compared with 82 in 1938—an increase of 40 per cent. Recovery has naturally been unequal; but it is not surprising that the most rapid strides have been made in the heavy industry sector, since this has been a period of sustained investment. In the aggregate an average of more than 28 per cent of the gross national product in OEEC countries has been set aside for investment since the war, compared with less than 22 per cent in 1938. Such an effort must of necessity strain the resources—human and material—of these countries and, as even the Russians have discovered, must temporarily depress living standards until such time as the investments bear fruit. Generally speaking, Western Europe has now finished this phase of rebuilding, re-

equipment and heavy investment. In every country there is evidence not only of rebuilt roads, bridges, buildings, but also of new factories, modern machines, the latest type of blast furnaces, rolling mills and new mines equipped with the latest mechanical equipment. Not only have the great ports like Antwerp, Rotterdam and Amsterdam been restored to full working efficiency, but new extensions are now being brought into operation. In short, the basis of a considerable industrial revival has now been laid.

In agricultural production, too, though the record of recovery is less impressive than in the industrial sector, prewar outputs have on the average been exceeded by more than 20 per cent. That no more has been achieved is due not only to the inherent difficulty of extending the area under cultivation in this densely populated area, but also because it still pays Europe to concentrate on its role of a supplier of industrial goods. Yet it is surely a fact of no little importance that free Europe, despite the emphasis on industrial investment, is now better able to supply its own food requirements than before the war.

While the long pull of recovery since 1946 has put a break on living standards it is a mistake to think that no progress has been made. Indeed, in many ways the people of Western Europe are better off, for a minor social revolution has gone on side by side with the industrial and agricultural renovation. In every country a fundamentally new attitude to social problems now prevails. For instance, large, and in some cases major, redistributions of income and wealth have been carried out as part of a conscious policy. Expanded systems of social security have been introduced. And there is pretty general agreement everywhere on the need to keep unemployment as low as possible.

Defence *versus* Investment

Statistically speaking, the people of Western Europe now enjoy on the average substantially the same food supply in terms of calorific, protein, and fat intake as they did before the war. On the other hand, while the total population of the OEEC countries has increased by more than 30 million since 1938, and the total labour force by perhaps 25 million, the percentage of unemployed is now considerably lower than before the war.

American aid in its many forms—Marshall aid, military aid, offshore procurement, technical assistance—has been a big factor in putting Europe back on its feet. And even now a flow of dollars remains necessary. In this sense Europe's performance has been disappointing, but it is only fair to point out that new and unexpected burdens have had to be shouldered. For instance, the international tension and the artificial division of Europe has forced most of these countries to accept heavy defence budgets, while at the same time they have been cut off from traditional markets and sources in the East. Had the defence programme coincided with a period of slack demand and unused resources it would have been easier to bear; but in the existing circumstances, military priorities can be met only by displacing other competing demands, including exports. Thus, even though Europe's performance is suspect, if the acid test of the balance of payments is applied, there are many reasons for softening the judgment.

To many people recovery in Europe has been disappointing because in general it still retains its former institutional framework. That is, it is still a collection of sovereign independent states each with its own currency system, tariffs,

ELECTRICITY for more prosperity

THE FIRST TASK OF BRITISH ELECTRICITY — the restoration of the pre-war reliability of supply — has progressed substantially towards fulfilment.

Today, all consumers — industrial, commercial, agricultural and domestic — are using more electricity. Even so the power stations are not producing their full output except for short periods once or twice a day.

A vast potential electricity supply is available for more electric cooking and water heating, as well as for industry, agriculture, and other purposes. Increased use of electricity in different ways helps to develop a balanced load on the power stations and makes for increased prosperity, cheaper goods, and a higher standard of living.

THE NEW RECRUIT...

ANOTHER SUPER-TANKER glides down the slipway—one of thirteen 32,000-ton giants ordered by the British Tanker Company, shipping organisation of Anglo-Iranian Oil Company.

With a carrying capacity far greater than any other ships ever built on the Clyde, these ships are joining one of the largest privately-owned fleets in the world. The British Tanker Company owns some hundred and fifty tankers totalling nearly two million deadweight tons and has more than twenty other tankers on order or under construction.

To keep this great and growing fleet manned, the Company operates its own training scheme for navigating and engineering apprentices. These new recruits receive their training in the most practical way—on board tankers carrying Anglo-Iranian oil to refineries in seven countries and marine bunkering stations in four continents.

quotas and national economic policy. Certainly it falls far short of the idealistic conceptions that held sway shortly after the war. Only in such small beginnings as the Schuman community and Benelux has any positive progress towards an integrated economy been made. Yet it would be a cruel judgment to write off the many other real advances. There is, for example, a much greater degree of international consultation through such organisations as the OEEC and the European Payments Union (EPU). It is unprecedented in European history that sovereign independent states should be willing to submit the facts of their national economy to critical examination by other countries. True, Europe is still not a single market, nor is there a common economic policy or fully convertible currencies; but there is at least a much greater degree of mutual understanding and broad agreement than hitherto.

Trieste Through Yugoslav Eyes

BY A CORRESPONDENT

WHEN the Yugoslavs look at the Trieste problem, there are three considerations uppermost in their minds. The first is the ethnic composition of the three areas under dispute—Zones A and B and the city of Trieste. The second is Yugoslavia's rights as a victorious ally in the last world war and as a signatory of the peace treaty that made certain specific arrangements about the territory. The third is the way in which the western powers have now made two attempts to impose a solution of a problem which should have been dealt with either by all the signatories of the Italian peace treaty or by agreement between Italy and Yugoslavia.

Leaving aside the city of Trieste, both zones have a predominantly Slav population. According to Yugoslav figures, in 1945 Zone A contained 15,000 Slavs and 5,000 Italians, of whom 4,000 live in the town of Milje; while Zone B contains 38,000 Slavs, 25,000 Italians and 2,000 undeclared persons. In the city of Trieste itself, only about 40,000 to 50,000 out of a population of about 300,000 are Slav. The rest are Italian-speaking and mainly of Italian race, although some are of Slav or Austrian origin. If the city of Trieste is regarded as a separate issue, as the Yugoslavs think it should be, it is clear that they have the advantage on ethnic grounds in both zones. But they regard any attempt to eliminate minority difficulties by an exchange of populations as impracticable; for while the Italians of Zone B are town-dwellers who could possibly move their goods and chattels, the Slavs of Zone A are peasant land-owners who could not move their farms, farmhouses and stock.

The Yugoslavs claim that both Trieste and the surrounding territory, which before 1918 belonged to the Austro-Hungarian Empire, were wrongfully given to Italy by the Treaty of Neuilly at the end of the first World War. Italy's administration of these territories in the period between the two wars was, they say, one of brutal and deliberate denationalisation of the Slavs. The Yugoslavs cannot forget this and believe that it should not be ignored in any settlement today. They claim that 80,000 Italians were brought into the area between 1919 and 1945 to increase the numbers of Italian voters; this does not

include the thousands of Slovenes and Croats who were forced to change their names, to be educated in Italian and to give up all their Slav affiliations.

In the last war the territory of Trieste was used by the Italians, fighting in alliance with Nazi Germany, as a base for the invasion and occupation of Yugoslavia. The Yugoslav fear that the same sort of thing could happen again is aggravated by Italian extremists who still publicly lay claim to coastal areas of Yugoslavia. And when the western powers attempt to deal with the problem first, in 1948 by promising the whole of the free territory to Italy and then last month by awarding it Zone A and Trieste city, the Yugoslavs feel that an ex-enemy is being rewarded at the expense of an ex-ally.

Marshal Tito has made two suggestions for dealing with the town of Trieste, first that it should be internationalised, and, more recently, that it should be handed over to Italian civil administration but not to Italian military control. Both these proposals emphasise the Yugoslav wish that the town should be treated as a separate problem. They feel that the port is much more important to them than to the Italians. The latter—as recent figures show—have little need of a port in this part of the Adriatic; it is too far away from the main stream of Italian commerce and, in any case, Italian shipping in this area can always use the port of Venice. But Yugoslavia does need a port at the northern corner of the Adriatic both for supplies to Slovenia and Croatia and for the shipment of goods to the small ports further south along its Adriatic coast. From a strategic point of view the Yugoslavs feel that Trieste would be more usefully employed supplying their north-west army and more easily defensible by it than by Italian forces.

Signor Pella's Price?

Jugoslavs remain unimpressed by the argument that Signor Pella's democratic government must be bolstered up by a favourable Trieste settlement lest it be destroyed by right-wing extremists. They know also that Britain wants Italy to join the European Defence Community and think that Trieste may be Pella's price for doing so. They feel, however, that to give Italy a favourable award on Trieste for this reason is nothing short of blackmail and they still hope that this will not be allowed to succeed. Since the break with Russia in 1948 Yugoslavia has moved very much to the west and a growing friendship with Britain was thought to have been cemented by Marshal Tito's highly successful visit to this country in June. Some measure of the bitter disappointment with present British policy can be seen from the unusually sharp and emotional character of Tito's recent speeches. And there is no doubt that in his present policy he has the whole country firmly behind him. It is equally certain that the demonstrations in Belgrade were a spontaneous manifestation of a general feeling. Jugoslavs feel that if the present award is pushed through in spite of their justifiable claims they will be forced back to the position they were in after 1948, without friends either in the west or the east. Yugoslav leaders affirm—and they are doubtless sincere—that there is no question of them going over to the Soviet Union. But they feel that the present situation has given grist to the Cominform mill both among their own people and outside, and they fear that unless a more reasonable and to them less blatantly pro-Italian solution is found, their blossoming friendship with the west will be irreparably harmed.

Caesar's Wife at Uno

FROM OUR UNITED NATIONS CORRESPONDENT

THE best battles at the United Nations are sometimes hidden behind the mildest phrases. Thus, the Fifth Committee of the Assembly, working its way down a schedule of such modest gems as financial reports and accounts, budget estimates, and reports of the Negotiating Committee for Extra-Budgetary Funds, has been slowly but surely approaching two very portentous items: the Secretary-General's report on personnel policy, and the paying of indemnities to dismissed officials under the recent rulings of the Administrative Tribunal. Both items could prove explosive.

The Secretary-General's report arises out of two resolutions passed by the last Assembly, one requesting him to submit a further report on personnel policy, the other asking him for recommendations as to further action. It will be remembered that the whole personnel problem arose in 1952. At that time a Senate investigating committee and a grand jury were baying on the trail of Americans suspected of subversion, and the implication was plain that if the United Nations did not cleanse its own house of them, Congress and the Department of Justice would do it. Even before Mr Lie's resignation from the post of Secretary-General was accepted, the new American delegation head, Mr Henry Cabot Lodge, added his own dramatic touch to an unhappy situation by bringing to the glass house some 1,500 civil service forms and asking that they be filled in by American employees, complete with finger prints, within 24 hours.

Looking for a Foolproof Formula

This was the situation that Mr Hammarskjöld inherited, and it speaks well for him that staff morale has so largely recovered from the shocks of those days. Meanwhile the FBI has presumably been investigating every one of the Americans employed in the "big glass house." Thus far those investigations have not been concluded, but apparently the process has had a quieting effect. Presumably Mr Hammarskjöld has in turn been trying to convince American officials that he meant what he said (and what the Charter says) when he talked, in many speeches, about "the exclusively international character of the responsibilities of the Secretary-General and his staff," and the obligation of every member nation "not to seek to influence them in the discharge of their responsibilities."

Certainly he has firmer ground to stand on than had Mr Lie, for the legal attitude of the United States was laid down in an executive order last June which in substance recognised the right of the Secretary-General to govern his own staff. If, as one assumes, he has been firmly but quietly upholding the much-debated independence of the international civil service, it is probable that in the light of the June order the Secretariat and the State Department each knows where the other stands, and cannot be shaken from that mutually respected position. At any rate, the element of ambiguity which baffled Mr Lie has now been removed.

The invitation to submit recommendations for the future touched a different angle of the problem. In the one case Mr Hammarskjöld found himself having to assert his right to hire and fire against the American desire to weed out

THE ECONOMIST, NOVEMBER 14, 1953

Americans who fell foul of present attitudes toward those suspected of Communist sympathies. In the other, he faced the necessity of finding a basis for firing which would save the Secretariat from unfounded suspicion.

Now that his report is out, the basis for this tightening and strengthening has been revealed, at least in part. There are obvious discrepancies between the description of the ideal international civil servant as laid down by the Charter and that set forth in the staff regulations. In the removal of these discrepancies may lie the possibility of an important and fruitful reform. For example, Article 101 of the Charter says that "The paramount consideration in the employment of the staff and in the determination of the conditions of service shall be the necessity of securing the highest standards of efficiency, competence and integrity." On the other hand, the staff regulations say that men may be removed from their jobs at Uno only for unsatisfactory service or serious misconduct.

Obviously these two sets of qualifications, the one in the Charter, the other in the staff regulations, are by no means equivalent. Men may be totally lacking in integrity, and yet be technically guilty of neither unsatisfactory service nor serious misconduct. They may be so lacking in judgment that no foreign office would employ them, yet under present regulations the United Nations could not dismiss them without the risk of having to pay an indemnity for wrongful discharge.

Nothing but the Vote

What the Secretary-General seeks is the uncontested right to apply, under the staff regulations, the standards of the Charter, and to make them stick. If he had that, he would be reasonably secure against any national attempts to apply national standards to international civil servants. He also needs some legitimate way of persuading these civil servants that they should not engage in the political activities of any single nation. On this point the staff regulations say merely that a staff member must undertake "no activity reflecting on his status as an international civil servant," but no definition of such an activity has been provided, and political activity by itself does not rank as serious misconduct. A staff member may be most un-neutral in his expressions and his activities, he may even be known to be conniving with the delegation of his country; but under present regulations none of this is reason for dismissal.

This is not a new quandary for international organisations. Sir Eric Drummond, Secretary-General of the League of Nations, faced it there and recognised that an international civil servant should, by definition, be expected to cede some of the political interest attaching to his own nation which his fellow citizens enjoyed. It was never proposed that he give up his right to vote, but it was recognised that he should not be an active member of a national political party, nor take even an active amateur part in political activities.

A man less versed in parliamentary affairs, and less aware of the obligations of his office, than Mr Hammarskjöld might have asked for tighter control over his staff without weighing the possibilities of tyranny implicit in such a request. It looks as though he expects to pay for the grant of greater power by the acceptance of some Assembly check on his use of it. If, for example, a disgruntled national could persuade his delegation to raise in the Assembly a question as to the principle on which the

THE ECONOMIST, NOVEMBER 14, 1953

Secretary-General was acting in dismissing him, this would provide a parliamentary check in the British—or the Swedish—manner. It might make trouble for him; it is potentially a dangerous weapon to put into the hands of nations not yet accustomed to international disciplines. But it would be a *quid pro quo* for needed powers.

The Secretariat as now organised is built on the American plan, with a Secretary-General who has executive powers that must be used according to rules, and a staff bound by a precise set of regulations which govern hiring, firing, wages, complaints, obligations and so on. The framework is rigid, the rules are precise. Most of the time it works, but occasional clashes create spasms of bitterness. What is proposed would loosen the rigidity of the framework, give the Secretary-General more power, but at the same time make him subject to political check and balance. It is the grafting of something European on to an American stem.

Revolt in Atjeh

FROM A CORRESPONDENT IN INDONESIA

DURING the past five weeks the situation in Atjeh, the most northerly district of Sumatra, has reverted to a suppressed calm. Order has been restored and, while the possibility of further outbreaks remains, the central government has done something to pacify local opinion by making a number of administrative changes. The Achinese, the people of Atjeh, however, have never willingly accepted outside interference in their affairs and the root causes of their hostility to Djakarta have not been removed. They are a fierce, bigoted, strongly Moslem and altogether more positive race than the Javanese. Their struggle against occupation by the Dutch and the seething discontent which broke into the open from time to time after the original occupation constituted a minor epic.

At the end of the second world war Atjeh joined in the independence movement and was a part of the "original" republican territory. However, once Indonesian independence was a reality it soon became clear that the views of the Achinese on liberty were by no means the same as those held by the former Djocja government, which had moved itself to Djakarta and rapidly stifled the infant federation in favour of a unitary state. Soon Achinese grievances were centred on what was felt to be three offences against their pride and independence. The first was the presence of non-Achinese government officials, largely Javanese, most of whom did not speak the language of Atjeh and had no appreciation of the territory's needs. The second was the tactlessness of these alien officials and their ignorance of local customs, coupled with neglect from the capital. The third was the continuation by the central government of the Dutch system of security in the outer islands according to which Moslem troops looked after Christian areas and Christian troops after Moslem areas. Only the participation of the Masjumi in the early cabinets and the personal influence of respected Moslem leaders such as Natsir, who took the trouble to go to Atjeh and speak plainly, maintained the peace.

For several years, therefore, an embryo separatist movement endured in Atjeh nurtured by discontent, by mis-

handling from the centre and, to a lesser extent, by the natural Achinese propensity for having a fight with anybody non-Achinese. The long cabinet crisis of 1953, ending with the formation of the Ali Sastroamidjojo government, helped to bring matters to a head. The new government gave every sign of being strongly influenced by the Communists and was firmly opposed by the main Achinese political organisation. As a result respected Moslem leaders disappeared from positions of authority. Moreover, the general security situation took a turn for the worse, partly as a result of a rising of Moslem tempers in rural districts, partly because the gangs were encouraged by the weak government.

All these factors brought to the surface an uprising which had been stirring in a rather sporadic manner for several years. On September 20th armed groups attacked the main towns in Atjeh, particularly along the east coast, broke up the railway line and cut communications. Attacks on Langsa, Lho Seumawe, Bireun and other eastern centres continued for a week. Families of non-Achinese government officials were evacuated by sea to Medan. Today it is mainly in the east that the army has restored some measure of security in the towns and along the railway between Langsa and the

capital, Kotaradja. Between the other towns and in the interior the army has less control.

Government pronouncements on the rising have not inspired confidence that the real facts are being admitted. Radio Indonesia ignored the whole affair and came in for a great deal of criticism in the press as a result. The official communiqués exuded an optimism that no one shares, least of all the army commander on the spot.

Atjeh is yet another fragment of the progressive disintegration of Indonesia's unitary state. Separatist movements with armed backing now exist in the Moluccas, in South Celebes, in West Java (where Darul Islam is as strong as ever) and now in Atjeh. The capture of couriers bearing documents of the Darul Islam organisation show that the groups of dissidents are trying to keep in contact with one another and, presumably, to co-ordinate their activities. It would be a gross exaggeration at present to think of these widely spread movements as being really co-ordinated or controlled by any "master-mind." But the elements of co-ordination now exist and cannot fail to embarrass the government—already very weak—which is called upon to deal with revolts in territories as far apart as are Britain and Turkey. Nor can it be encouraging to the Djakarta

government to know that there are yet other districts which look with satisfaction on the failure of the central authority to put down separatist and federalist movements.

As it becomes increasingly clear that the use of limited force in such impenetrable country solves virtually nothing the federalist idea is bound to have more and more appeal. As a unitary state Indonesia is burdened with a series of revolts which its troops can scarcely subdue and its economy cannot stand. One must hope that the bitter events of the last four years have not so alienated the races of the outer islands as to make federalism impracticable. Hope springs from the fact that despite these events the ideal of an Indonesian nation still remains.

The Soviet Note

[The Soviet Note of November 5th to the western powers has been the subject of so much comment that its actual content has been in some cases overlooked. Below is a summary of its main points and argument.]

THE Note begins by complaining that the previous western Notes of October 18th and September 2nd avoided the principal questions put forward by the Soviet Union in its previous efforts to resolve international problems; and asserts that meetings of the three western foreign ministers, like the recent meeting in London, cannot but limit initiative and lessen the possibilities of agreement.

The Soviet Note then recalls that its previous Note of September 28th had proposed a meeting of the foreign ministers of the United States, Britain, France, the Soviet Union and the Chinese People's Republic. The Soviet Government had made this proposal in the belief that favourable conditions now existed for such a meeting, especially since the armistice in Korea had been signed. Efforts to secure an easing of tension had been made all the more necessary by the growing armaments race—which now included hydrogen and atomic weapons—by the formation of military groupings of some states against other states, and by the growing network of military bases set up by certain states on the territory of other states. The western powers had contended that disarmament was being considered by the UN General Assembly; this was not a well-founded objection, since the UN's discussion of disarmament had run into serious difficulties and had completely failed to halt the armaments race.

A full settlement of the Korean problem based on national unification and a stable peace is most important for a lessening of international tension. If the western powers are really anxious to secure this they cannot fail to take into account the legitimate demands of the Korean-Chinese side for the representation of certain interested neutral states at the proposed conference on Korea.

The easing of international tension also depends to a great extent on the admission of the Chinese People's Republic to the United Nations "and its participation in the decision of the fundamental questions relating to the maintenance of peace. . . ." Peking's participation in international consultations cannot be limited to the Korean conference since Korea is connected with the settlement of other important problems. It is also necessary to recognise that acts of aggression against the Chinese People's Republic, which have been provoked by certain powers, are impermissible.

From all the above it follows that a five-power conference of foreign ministers is urgently necessary. But the western powers have put forward a number of conditions for the holding of this conference; if they continue to insist on these conditions it will show that they do not really want to ease international tension. The western powers have pointed out that all five powers could be represented at the Korean political conference. But their refusal to accept neutrals at it makes Soviet participation impossible; moreover, this conference could not discuss "the general question of lessening of international tension."

The Soviet Note then goes on to enumerate the evidence which in its view strongly suggests that there is a serious danger of renewed aggression by the Bonn Government "which expresses the aspirations of aggressive circles of West German monopolists and Hitlerite military leadership." These circles are exerting continuous pressure to get the EDC Treaty and the Bonn agreements brought into force. If they succeed, the remilitarisation of West Germany will go ahead, and every effort will be made to drag West Germany's treaty partners into a war for the accomplishment of the "West German revanchists'" criminal aims.

The Note points out that the Anglo-Soviet Treaty of 1942 and the Franco-Soviet Treaty of 1944 still exist and states that the Soviet Government is ready not only not to weaken its obligations under these, but also to consider "new possibilities for ensuring security in Europe." The Soviet Government believes that European security can only be assured by the joint efforts of the four powers to observe the principles and aims of the Potsdam Agreement on Germany. It also believes that until an all-German Government is formed it is impossible to hold truly free all-German elections.

American Bases

The Note then goes on to state that it is impossible to separate the German problem from that caused by "the ever-widening network of United States military bases on the territories of certain European states." Since these are mostly being created in regions bordering the Soviet Union and the "people's democracies" it is clear that they are intended for aggressive purposes. The recent agreements on American bases in Greece and Spain are specially mentioned; the Note also refers to open pressure being put on other states, particularly Iran, to make their territory available for bases. The Note concludes that there is a growing threat to the security of the Soviet Union and that the solution of the German problem "is inextricably bound up with the decision of the question of the liquidation of these military bases."

The Soviet Note then asks for a clarification of the western powers' attitude towards the ratification of the EDC and the Bonn agreements, because if they intend to put these agreements into force this would "make impossible the restoration of Germany as a unified state" and would render any four-power discussions of the German problem "pointless."

Finally the Soviet Note proposes: (1) a five-power meeting of foreign ministers "to examine measures for the reduction of tension in international relations"; and (2) a four-power conference to consider the German problem "including all the questions advanced during the course of the preparations for the conference." The Note repeats the former Soviet proposal that the Austrian treaty should be discussed through normal diplomatic channels.

**more
power

*Much more work
completed per hour!*

That's what "3 in 1 posting" means

OPERATORS have just one pair of hands. However heavy the accounting load, they can work only as fast as the machines they use will let them. Adding staff or machines may help—but not in keeping office costs down.

The economical answer is to provide an operator with an accounting machine that gives the greatest output for the least manual effort—whatever job is being done.

The Burroughs M800 achieves this in two ways. First, because it enables three or more related items in a routine to be prepared *simultaneously*. Secondly, because it reduces posting, totalling and proving to one single, continuous operation.

Ask Burroughs to demonstrate how this machine will improve your complete accounting system—giving better results faster.

Call Burroughs today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

For expert advice on business figuring

CALL IN  Burroughs

MANAGEMENT. Many questions of importance to a business are posed, and answers suggested, in the Burroughs booklet "Ways to Save Time in an Office." Write for it today, to Burroughs at the above address.

... on general accounts. Below is a normal flow-chart for Payroll. On this work, the Burroughs M800 prepares Earnings Record Card, Payroll, and Payslip, in one operation. Similar reductions in effort apply to Sales or Purchase Accounts, Receipt or Cheque writing, Stores Accounts, etc.

No less than 18 work-saving features make this Burroughs Typewriter-Accounting Machine faster in operation, and the records more fully informative. Debit and credit balances or totals are printed and designated automatically. Amounts can be subtracted from any register or the cross-footer separately or simultaneously.

THE BUSINESS WORLD

Franchise for Atomic Energy

THERE is a pleasing elegance of style about the Government's White Paper on atomic energy which suggests that it was not drafted in haste; and its silence on several important points must be taken to mean that many aspects of policy have yet to be agreed. Briefly, the White Paper sets out to describe the kind of organisation to which the Government has decided to entrust the development of atomic energy, without going into too much detail about how it will do its work. It is to be "a non-departmental organisation with the necessary executive power, within the framework of an approved policy and under a financial ceiling, to settle day-to-day problems." The Government's proposals follow the suggestions of Lord Waverley's committee which was appointed last March to work out a scheme for transferring the control of atomic energy from the Ministry of Supply to some new organisation. For reasons of security, only a summary of the report's main recommendations has been made public; the suppressed portion may contain some of the "hard reading" to which the Prime Minister referred last week, for the White Paper itself is not dismayingly difficult.

The Minister responsible to Parliament for the new organisation will be the Lord President of the Council, at present Lord Salisbury. He will also be chairman of a Ministerial committee representing the departments interested in the development of atomic energy. The transfer of responsibility for atomic energy from the Ministry of Supply to the Lord President will take place on January 1, 1954; but new legislation to amend the Atomic Energy Act of 1946, and possibly the Radioactive Substances Act of 1948 also, will be needed before the corporation can come into being. The White Paper endorses the suggestion that the control of atomic policy will remain a matter for top government decision for many years, and the new

corporation will not enjoy a degree of autonomy comparable with the relative independence of the nationalised industries. The corporation will be managed by a chairman who will also be the managing director; the appointment of Sir Edwin Plowden to this post can be welcomed without reservation. The high reputation that he has earned, among Ministers of both parties and among permanent civil servants, as adviser on economic policy should not be allowed to obscure the fact that he rose during the war to be Chief Executive of the Ministry of Aircraft Production. The problems that will confront the Atomic Energy Corporation have a family likeness to those of MAP: to draw the proper line between projects that must be kept in Government hands and those that can be entrusted to outside enterprise; to master the technique of the development contract; to keep the supply of raw materials in phase with productive capacity; and to strike the right balance between speed and soundly based progress. There will be four whole-time directors responsible respectively for engineering and production, for weapons, for research, and for administration and finance. The three atomic knights, Sir Christopher Hinton, Sir William Penney and Sir John Cockcroft, who already carry out the first three functions under the Ministry of Supply, present themselves as obvious candidates. In addition, there will be two part-time directors without special technical functions—the number might with advantage be raised to three—to act as counter-weights to the scientists.

The corporation's expenditure is to be met by an annual vote by Parliament to the responsible Ministry. For the first time, therefore, some idea of the scale of investment in this new industry will emerge. Hitherto, expenditure on atomic development has been concealed in the vast depths of the Ministry of Supply's research

THE ELEMENTS OF ATOMIC FISSION

CHAIN REACTOR

BREEDER REACTOR

and development vote; it was possible for the Labour Government, during six years of office, quietly to spend £100 million on atomic energy without Parliament or the country being any the wiser and no doubt the Conservative Government has been spending on a similar scale. Lord Waverley's committee recommended that the corporation's estimates and spending policy should be approved in advance, and that the Comptroller and Auditor General should audit its accounts; but once the estimates had been approved, the corporation should be given "freedom to conduct its affairs, including the execution of large capital projects, in a business-like way" which involved giving it "rather more flexibility and discretion in respect of capital expenditure than is usual with Government departments."

These recommendations go as far as they reasonably could to give the corporation freedom from day-to-day Treasury interference in its financial arrangements without flouting the accepted accounting procedures for a body dependent upon an annual Parliamentary grant. The corporation cannot be a wholly independent industry; but it can be run more like an industry than like a Government department, and a permanent, non-scientific and non-political head will secure that full-time attention to its affairs that could never be guaranteed while it was one division of a large Ministry. Whether its work will be impeded by the requirement that it must work on an annual budget, surrendering unspent balances at the end of each year, remains to be seen. It is certainly impossible to budget on an accurate yearly basis for a capital investment programme spread over a number of years, and to expect the new corporation to do so hardly seems calculated to aid it to conduct its affairs "in a business-like way."

★

The White Paper is wholly concerned with the relations between the corporation and the Government and with the need to combine government control of policy with freedom to operate atomic energy on business, not departmental, lines. It throws no light on the prospective relations between the corporation and industry; nor does it examine the crucial question whether private capital may eventually be allowed to participate in atomic development. It ranges into a future when the exploitation of nuclear energy may come to be regarded as "the most important step taken by man in the mastery of nature since the discovery of fire"—to which a cynic might reply that it did not take a public corporation to rub two sticks together. A reference in the White Paper to the need for closer contact and co-operation with industry, including the nationalised industries, is open to several interpretations. It might mean that the corporation would control research and development and co-opt industry for what might be called the non-atomic extensions of its work. Or it might mean that industry would on occasions act as the corporation's agent, working for a development

contract or a management fee with capital provided out of the corporation's annual grant. Finally, it could mean that opportunities might arise for investing private capital in research and development, and ultimately that industry might own atomic reactors and produce fissile materials independently of the corporation.

★

The meaning of "co-operation" has no doubt still to be decided. But it cannot be postponed indefinitely, for the first atomic power plant is already under construction in Cumberland. The sketch opposite shows what it will look like; it will work on the "simple" chain reaction principle, illustrated in the diagram. A second plant working on the more complex and more economic "breeder" principle (difficult to illustrate in a two-dimensional diagram) which produces fissile fuel from non-fissile materials is also to be built experimentally. The British Electricity Authority have a number of engineers working in Cumberland with the Ministry of Supply; the layout of the Cumberland plant suggests that BEA could either buy electricity from the plant, or buy steam from the atomic reactors to use in its own turbogenerators.

The part that the electricity authorities can play at this stage is likely to be small. If the experimental power plant in Cumberland proves successful, it would not follow that an atomic power programme should immediately be put in hand. The purpose of the Cumberland plant is twofold: to produce plutonium, of which extra supplies are badly needed; and to obtain operating experience of atomic reactors harnessed to generate power. The total supply of energy from this station to the grid is expected to be about 40,000 kW, which is well under half the output of an average coal-fired station. Sir Christopher Hinton has estimated that, without making any allowance for the value of the plutonium produced in the reactor, the price of the electricity should be in excess of the cost of generation at a conventional power station—which is about one halfpenny a unit—but this can only be a conditional estimate at this stage.

Since the cost of coal to the power stations has been rising steadily, scientists take a more sanguine view of the prospects for atomic power generation than they did a year or so ago. The argument is also gaining ground that a shortage of coal will compel Britain to turn to atomic power for marginal supplies of electricity, regardless of cost. But the high cost of coal can at least be partly offset by improving the efficiency of power generation and distribution, as BEA is doing. To assume that lack of coal will make atomic power inevitable is one sure way of creating a coal shortage. And to encourage the development of atomic power without reference to economic costs is not the right way of embarking on this great enterprise.

Whether the generation of electricity from atomic power can become economic until "breeder" reactors have been developed is a matter for conjecture. These

plants, which create fissile fuel out of normally non-fissile materials at a faster rate than they are used up, are in the early stage of development, and more will need to be learned about them before they can be safely run. Until then, electricity produced from atomic power will be a by-product of plutonium production, and its "cost" will be a matter of bargaining between the Government, as buyer of the fissile material, the corporation, which owns the reactors, and the electricity authorities.

★

In the United States, the Atomic Energy Commission provided information for a number of companies, usually working in a partnership consisting of a chemical company and a public utility company, to draw up their own projects for privately owned reactors producing heat and plutonium. Estimates of the probable capital cost per kW ranged from \$350. to \$480 for typical projects. On the basis of these studies, at least one American company, Monsanto Chemicals, has become

convinced that a reactor could be designed which would not only produce electricity for as little as one third of a cent per unit (taken over a life of 10 years), but could also reduce the cost of plutonium by about \$6,000 a pound. The company's spokesmen have been pressing the Atomic Energy Commission for permission to go ahead with a privately financed project and although the Commission is showing considerable diffidence, the value of giving industry access to the information that makes possible the evolution of projects of this kind through a process of competitive emulation can hardly be doubted.

To leave the development of atomic power in this country to discussions between the corporation and the nationalised fuel industries may not, eventually, be the best way to progress. Scientists expect the capital costs of atomic power plants to fall after operating experience has been gained. Need the Exchequer carry the whole cost of these developments if private industry is prepared to assume part of the burden? These are points that deserve consideration before the new Bill is presented to Parliament.

Business Notes

Spotlight on Gilts

THE spotlight in a generally unexcited stock market has this week switched on **ACTOR**. The equity markets, given the ~~excitement~~ of recent weeks, took a little time to get their breath back after the shock of the Tube Investments announcement of ten days ago. But it is a measure of the speculative optimism that pervades the House nowadays that this disappointment—and one or two others this week—provoked only a modest setback in the industrial market generally, on profit-taking, and that the rise was actually resumed on the last day of an account. The ordinary share index of the *Financial Times*, which slipped from the peak of 131.5 reached ten days ago to 130.1 by Monday last, had climbed back to 131.1 by the close on Wednesday, the first day of the new account.

Meanwhile, the course of gilt-edged has been strongly upwards from the moment when prices broke away from the moorings supposedly established by the fixing of prices at which gilt-edged stocks could be tendered for United Steel stock. The breakaway, as noted in these columns last week, began four business days before the lists for that issue—the outcome of which is discussed below—closed on Monday last. In the six working days to last Wednesday the gains in gilt-edged stocks have ranged up to 1½, with the 3 per cent long-dated Gas Stock in the lead and War

Loan following a little behind it (with a gain of 1½ points, to 85½ gross). The suddenness and pace of this advance have to be appraised, however, in the light of the fact that market prices were virtually stabilised for the first six days after the announcement of the steel tender prices on the morning of October 27th, during which period the equity market was booming. And since both sections of the market seem to be influenced, somewhat paradoxically at this juncture, by the same spirit of rather unreasoning optimism, this sudden spurt in gilt-edged may to some extent be regarded as a natural adjustment in a spectrum of yields that had been temporarily—and most arbitrarily—distorted by the steel arrangements. But that particular distortion should surely have been smoothed out by now; over the whole period since the close on October 26th, the industrial index has risen on balance by 3.4 points (from 127.7), while rises in the long-term sector of the gilt-edged market have ranged up to just over two full points (2½ in 3 per cent Gas Stock, 1990-95).

Redemption yields on the dated stocks have in several instances been narrowed by fully 3/32 per cent, while the irredeemables, in which speculation over-reached itself after the reduction of Bank rate, have enjoyed a narrowing by about 1/16 per cent. Redemption yields in the dated group are now well below the lowest point reached in September (and substantially below the yield basis ruling on the eve of the first rise in Bank rate, two years ago) whereas the flat yields on Old Consols (£3 17s. 5d. per

cent) and on War Loan (£4 1s. 7d.) are only roughly restored to the levels of their September boomlet—and likewise are only just below their levels of November 7, 1951. These comparisons deserve a particularly close scrutiny by those of the market's optimists who are still watching the Bank rate notice-board week by week. There is not, of course, any directly consistent or "normal" relationship between short money rates and yields on long-term stocks; but, if the scope for variation in this relationship could be left out of account, it would appear that gilt-edged prices now discount a reduction of Bank rate not merely to the 3 per cent level that a diminishing band of optimists predict for the early future, but actually to the level at which it stood—inert and almost forgotten—before Mr Butler brought it into service over two years ago.

United Steel Success

THROUGHOUT the week, the market has been indulging in enjoyable guesswork about the success of the United Steel Companies offer. The only official information issued by the Realisation Agency after the lists closed last Monday afternoon, stated that "a large number of applications" had been received; they were being examined, and the basis of acceptance would be announced "as soon as possible," but the volume of applications was such that the posting of letters of acceptance was not expected until this weekend. During the week, estimates of a double subscription for the 14 million shares on offer—which would have indicated a very satisfactory response—have been set aside by suggestions of a three-fold subscription, with an attractive opening premium to follow.

On this rising tide of enthusiasm, aided by a favourable wind from the gilt-edged and industrial markets, the United Steel offer has sailed home with outstanding success. Given in addition the technical complications of the issue—with preferential consideration for former shareholders and the elaborate arrangements for tendering a number of specified Government stocks in payment for United Steel shares—a delay of some days in working out the basis of acceptance and issuing the letters can be understood. It remains to be seen, when dealings open (presumably on Monday) how extensive the "staggering" of the issue has been. A sizeable premium—and there has been increasing expectation of a shilling or two rather than a few pence—might bring out a considerable volume of selling. But one effect of an over-subscription on this scale will no doubt be to leave the institutions with allotments of United Steel shares more in keeping, in some cases, with their ideas of a conveniently sized holding and the readier to participate in future issues. Perhaps the best measure of success for this first offer of steel shares will be the maintenance of a modest premium after the "stags" have drunk their fill; certainly the United Steel offer allowed sufficient time and opportunity for any investor who wished to obtain a holding to do so. The expectation of a continuing high demand for these shares—as distinct from a steady investment interest—could for this reason be easily exaggerated, particularly with other steel issues to follow. Whether, with only five shopping weeks to Christmas, the second offer can be squeezed in is now becoming doubtful.

Ban on the Bids?

THOSE who put their trust in take-over rumours have been dining out this week. On Tuesday they surged into Savoy Hotel shares, which rose 5s. 3d. to 50s. 6d.; but came out the next day following a denial from the directors (which sent the shares down by 2s. to 48s. 6d.) and went off instead to the Ritz (sending the shares up from 20s. to 25s. 7½d.). They came out of Criterion Restaurants (shares down by 1s. to 7s. 6d. on Wednesday) after the news that Mr Forte had withdrawn his offer of 9s. for each share, but were still looking round hopefully for certain breweries, stores, land agencies and docks. While all this was going on, the whole question of the propriety of these bids boiled up again in the press. The flame was lit by a letter to *The Times* at the end of last week from Lord Hacking, who came very close to suggesting that any operation that led to any change of control over any company left sober managements "exposed to adventurers and speculators"; this plea for security of tenure for existing directors was promptly taken up by the left wing press, which, excited by anything called an attack on speculation, thought it saw something progressively pink in a proposal that was really blue. Lord Hacking's attack on the bids was backed up in a much more moderate form in another letter to *The Times* by Mr Lionel Fraser at the beginning of this week; but it has since been very ably countered by three further letters to that newspaper, including an exceptionally cogent contribution from the new Lord Linlithgow.

There is not one problem here, but four. The first is that some take-over rumours have been false, and a few may have been deliberately cultivated by speculators who wish to unload their existing holdings of the shares concerned at a profit; if so, they can only unload these shares onto other speculators who are foolish enough to believe their tall stories, and there is no real reason why legislation should be enacted to protect one species of fly-by-night from another. The second problem is that some genuine business interests that are willing to buy up existing companies—if necessarily at a price above current market values—have not unnaturally tried first to buy more of their shares that are on offer at current market values. In the process they have resorted to quite legitimate subterfuges (by buying through different brokers and in the names of different nominees) in order to avoid turning the market against themselves. Once again, it seems a strange doctrine that legislation should (or indeed could) be introduced to prevent people who are willing to buy shares at a high price from buying some of them first at a low price, if anybody is willing to sell.

Speculation or Stagnation

THE third, and much more vital, problem is that much existing property and equipment is being wastefully used in the least profitable forms of venture under the control of inefficient boards of directors; in consequence the shares of these companies stand at a price far below the real value of their underlying assets. It would be a major national tragedy if any steps were taken to make it more

difficult for abler interests to buy control of these companies and divert their resources into more productive and profitable fields. The fourth problem, however, is that some share values stand below their underlying assets values not because those assets are being unprofitably employed but because the existing directors are following conservative dividend policies. It would be unfortunate for the country if fly-by-nights gained control of these companies and then adopted a distribution policy that was more generous than the long term interests of the company demanded, or if their activities should cause existing directors to defend their jobs by doing the same thing. Such manoeuvres, however, can only lead to a gain in capital values for the speculators if some investors can be found to buy shares at a price that is inflated above their true long term worth by generous short term distribution policies. Current taxation policies (especially the misleading system of depreciation allowances) may encourage investors to make this mistake, just as the moral muddles of "patriotic" dividend limitation encourage directors to make the opposite one. But it is much better to allow the brute forces of the market to teach both some investors and some directors the error of their ways than to run any risk of freezing the pattern of industrial control. That way lies industrial stagnation.

Aquarium for the City's Zoo

ON Monday morning next, for the first time in its hundred and fifty years existence upon its present site, the London Stock Exchange will be on view to the general public during business hours. The long-awaited, and long-debated, visitors' gallery will then be opened to the public, and will thereafter be available to anyone—without charge and without prior application—on all normal business days between 10.30 a.m. and 3 p.m. Completed early last week, only six months after a referendum had sanctioned the project, it has since been visited by members and their friends and by the press; and the consensus of opinion, even among members who had formerly questioned the wisdom of this breach in the traditional closed door, seems to have been one of almost unqualified approval. The view from the gallery, which has been skilfully positioned to command as much as possible of the trading floor, gives an excellent impression of the Stock Exchange at work. In the interests of public safety—and possibly also of the dignity of the House—the viewing front of the gallery is screened with plate glass. Any high jinks in the markets will be seen rather than heard, and would-be eavesdroppers upon members' anecdotes will go unrewarded; they will do better in their clubs. But this sensible device has already inspired an apt christening of the addition to the City's zoo; to members, with their worm's-eye view from the floor (or should it be bull's-eye?) the gallery is the Stock Exchange "aquarium." The public should not deduce that only queer fish need attend; there is much to be learnt, and much of interest to see, from a visit to this new City viewpoint, and it is to be hoped that it will steadily grow in popularity.

It is to be hoped, too, that the Stock Exchange itself will regard this move as only the beginning of the fruitfully promising policy of the open door. The attraction of the

gallery, with its invitation to the public to explore the supposed "mysteries" of the temple of finance, should give an unparalleled opportunity to explain the real purpose of the stock market in the life of the community. A tastefully designed ante-room with wall-charts does indeed try to tell a little of the story. When and if space permits, this particular effort ought to be extended; and it may be desirable, too, for the senior "waiters," who will normally guide the visiting public, to be supported by more widely knowledgeable officials—or from a roster of members themselves. But an excellent start has been made. It is not every Stock Exchange chairman who is privileged to see the fruits of his work enshrined in the authentic marble of the House; Sir John Braithwaite can enjoy this privilege in the knowledge that it carries with it a general acclaim of his efforts.

Warning the Optimists

THE debate on the Queen's Speech was a political rather than an economic occasion. The Chancellor of the Exchequer spoke twice—on Friday in the disappointingly general debate on the economic situation and on Monday in the debate on an opposition amendment that implied that the Government was plotting to allow agricultural prices to fall too low; on Wednesday, when the debate was on an opposition amendment that declared that the Government had allowed food prices to rise too high, both sides found it more consistent to put up a different team of speakers. The flood of economic statistics that gushed over these three debates—on the trend of the price and production indices, on past and prospective receipts of American aid, on the terms of trade and performance in export markets—added nothing to the store of knowledge; all the statistics had been published before, although most speakers showed great ingenuity in the choice of base dates—in order to show that their own side had been very able and the other side very lucky.

The most significant feature of Mr Butler's speech on Friday was his response to Mr Gaitskell's criticism that too much of this year's increase in production has gone towards consumption and too little towards investment. The Chancellor stated flatly that if increased consumption threatened inflation or interference with exports, then he would "be quite firm in dealing with it"; but he honestly did "not think that that state has been reached." He declared that investment was now "creeping up," but had had to be stimulated by an increase in both production and consumption; he would "watch developments in the three with a view to seeing that we get the proper investment we have now authorised in our industrial structure—investment and modernisation." This emphasis on watchfulness—together with the news that a large supplementary estimate will have to be presented for the Ministry of Food (because of the Cuban sugar purchase and losses on cereals)—led the Chancellor to warn "those who speculate about the budget" that he thought "they would be wrong to take too hopeful a view."

When he turned to external affairs, the Chancellor implied that the main topic to be discussed at next January's Commonwealth conference at Sydney would be the oppor-

Marconi Television for Canada

Equipment supplied includes:

- Marconi Image Orthicon Cameras
- 5 kW vision transmitters
- 3 kW sound transmitters
- High-gain aerial systems
- Associated monitoring and control equipment

Marconi's are supplying the transmitting, Studio and 'O.B.' equipment for the new Canadian Broadcasting Corporation television station at Vancouver.

Marconi's have already equipped the studios at Montreal and Toronto and supplied the Transmitters for Ottawa.

Marconi Television equipment has been supplied to the United Nations Headquarters, Venezuela, Thailand and is on order for Italy.

Marconi high or medium power transmitters, and high power aerials are installed in every one of the B.B.C.'s television transmitter stations.

A temptation to be resisted

'I see and approve better things, but I follow worse.' Many intelligent men and women who approve the worthiness, the humane tradition, of the Manchester Guardian, themselves read a 'popular' newspaper.

The temptation to read some brisk and breezy newspaper, more interested in millions than in millenniums, is a natural one. But those who change to the Manchester Guardian—and their number is growing—soon come to prefer it above all others.

There is a warmth about the Manchester Guardian which delights the new reader. By avoiding the two extremes, gutter or pulpit, the Manchester Guardian has endeared itself to many generations of decent people. If you will turn to the Manchester Guardian, you will soon know that it is a turn for the better.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

tunity for overseas investment; about convertibility he said only that the necessary pre-conditions "are not yet fulfilled," and he was strangely defensive about the recent liberalisation of imports from Europe (without it, he believed, OEEC and EPU "would not have held together"). When questioned about the dangers of American recession, Mr Butler frankly wriggled. He said that he had had the opportunity of going to America and having a look for himself, as well as of hearing what other people thought of the prospect; but it was not for him "to comment upon the economic affairs of another nation." Meanwhile "without knowing what may arise, the forward outlook is not exactly set fair, but is settled from the point of view of the balance of payments." It was not clear whether the description "settled" was meant to be a meteorological metaphor or to imply a sorrowful belief in pre-destination.

More Money for the Airlines

THE borrowing powers of the two air corporations are being increased to meet their capital investment programmes. A bill to raise the borrowing limit of British Overseas Airways Corporation from £60 million to £80 million, and that of British European Airways from £20 million to £35 million, received its second reading on Wednesday. Introducing it, the Minister of Transport said that the two corporations expected to spend a total of £77 million, mostly on new aircraft, during the next four years. BOAC has so far borrowed £40 million, and further capital expenditure contemplated amounts to £63 million. BEA has borrowed £16 million to date and expects to spend a further £14 million. The bill is expected to meet requirements until 1960.

These limits provide little or no margin for any additions to their programmes that the corporations may decide to undertake. One open question is whether BOAC will decide to make a firm bid for the three Princess flying boats now offered for sale—and, if so, whether it would be at the expense of cancelling orders for other aircraft. Since the Ministry of Supply suggested that suitable engines could be found for the three completed or partially completed Princesses, both BOAC and an independent operator, Aquila Airways, have shown interest in buying them—at bargain prices and under certain conditions. Aquila's bid is subject to the company's being given a licence to fly the Princesses on certain long range routes already operated by BOAC, which would involve a reversal of present government policy by which BOAC has exclusive rights on all passenger routes already developed, apart perhaps from cut-price "colonial coach" flights.

There may be some purpose in developing routes that can be operated by seaplanes, and the Princess is the only seaplane of size on the market. But BOAC's results for the first half of the financial year raise the question whether it would be justified in undertaking the additional expense of developing seaplane services. Its profit, after meeting all charges, for the peak months April to September was only £123,000, or 1.6 per cent smaller than in the same period of 1952. Such earnings are unlikely to be sufficient to cover the leaner period of the winter months when traffic

is at its lowest. It attributed these disappointing results to the influx—and subsequent exit—of coronation visitors. With aircraft flying fully laden one way, but partly empty the other, the corporation's average load factor fell from 65.9 per cent of capacity offered for sale in the first half of 1952-53 to 64 per cent. As BEA's figures for 1952-53 had shown, busy traffic alone does not guarantee a satisfactory profit; balanced loads are no less important for financial success.

Tobacco Comes First

TOBACCO is the first of the surplus American commodities to be sold to Britain for sterling under Section 550 of the Mutual Security Act. The sale of \$20 million worth has now been confirmed in London, bringing Britain's total purchases from the 1953-54 American tobacco crop up to \$80 million; previously the Treasury had cut its allocation for purchases from this crop to the equivalent of only about eight months' normal requirements (thus spending some \$60 million against about \$85 million in 1952-53), and had intended the shortfall to be made good from stocks. The new purchase, therefore, meets the requirements of Section 550 in that it will not displace America's normal sales of tobacco to Britain, nor those of other "friendly countries." Nor could there have been any difficulty in ensuring that prices were "consistent with maximum world prices of like commodities of similar quality." The American tobacco auctions will be over soon, and this evidently explains why the sale was not held up until agreement had been reached on the other commodities under discussion.

The total value of commodities coming to Britain under Section 550 may be between \$40 and \$70 million, according to a recent Treasury communique. It seems likely that only tobacco and foodstuffs will be involved. Presumably cotton is being excluded because sales of it could be represented by Brazil and other countries that grow American-type cotton as unfair dumping, and grains appear to have been ruled out for the same reason. American beef should be eligible—if agreement can be reached on price—and lard would certainly be welcome, not least because it would assist derationing; but American butter may run into difficulties because it has a higher moisture content than is allowed by British law, and because the price the Americans would be likely to ask might be much higher than Britain pays Dominion producers. The Treasury communique revealed that one of the main obstacles to agreement—the argument about the use to which the United States would put the sterling received from these sales—had been cleared.

International Banking Survey

Page 527

The money will simply be handed back to Britain and written off against the defence programme in the same way as the sterling counterpart funds to ordinary defence aid. If so, the transaction should be regarded as a free gift of tobacco; but it still differs from ordinary aid transactions, which are free gifts of dollars from Britain to use—within certain broad limits—as it pleases.

Funds for Films

THE Government's bill to extend the life of the National Film Finance Corporation has a sting in its tail. Since it was set up in 1949, the Corporation has lent a total of £8 million to the film industry to finance production; of this, it has received back only £2 million. Expenditure in film-making is concentrated into a few hectic months whereas the receipts from a completed film come in over the years, so rapid repayments were not expected. Nevertheless, the chances that the Corporation might recover a significant proportion of this money have become so unlikely that the Government has made provision in the new bill for the Corporation to accept shares or debentures in any borrowing company in lieu of repayment. Whether in these circumstances the Corporation will qualify for representation on the board of the borrowing company will probably depend on the relative size of the amount in question.

The bill provides for the Corporation to borrow up to £6 million from the Board of Trade to make loans during the three years from March, 1954, which it can supplement, up to £2 million, by borrowing from non-Government sources. The Corporation's accounts to last March show that during each of the past two years it has assisted the production of more than 75 films, lending for this purpose between £1.2 million and £1.5 million annually. The Corporation's report concluded that "if present trends continue, repayments during the coming year should keep pace with advances." The provisions of the new bill for the take-over of shares, which will be used only when repayment would seriously disrupt the working of the company, may apply more to the Corporation's older bad debts than to its future commitments. The biggest of these is a £3 million loan to British Lion as working capital. None of this has been repaid, and the Corporation reported that up to the end of March it has not been possible "for a programme of repayment to be prepared."

Financing Aircraft Exports

AIR FINANCE, LTD., the new institution for the finance of aircraft exports, whose formation by three leading London merchant bankers, in conjunction with the Finance Corporation for Industry, was recorded in *The Economist* of September 12th, has now given some details of the methods by which it proposes to do business. The company will not hold itself out as open for direct and separate negotiations with prospective overseas purchasers of British

aircraft, but, contrary to the first expectations, will in all cases deal with the exporter. This seems to be a sound principle, for there is no intention that aircraft exports shall be sold on credit unless it is clear that credit terms are necessary to enable the sale to take place; nor are the company's facilities intended to displace other and more normal forms of finance—and, in particular, the finance that the aircraft manufacturer may be able to provide himself. These conditions could not be satisfactorily met unless the company's negotiations were conducted in all cases with or through the manufacturer, but the announcement makes it plain that overseas operators—the prospective purchasers—may usefully address preliminary enquiries to the company if they think fit.

When the terms of credit have been agreed between the three parties and the finance has been arranged, it is clear, however, that the purchaser will become the primary debtor to the company—and, indeed, will be the sole debtor to the extent of the portion of the liability that is covered by a guarantee of the British Export Credits Guarantee Department. Such guarantees will normally be required for all foreign orders, and will be arranged by the company. The procedure will be for the seller to draw a series of bills on the buyer for varying dates for the amount of the credit plus the commitment commission charged by the company and the commission payable to the ECGD; the bills drawn for the portion of the total that is covered by the ECGD guarantee will be specifically without recourse to the drawer, but on the remaining portion, not so covered, the drawer will remain at risk in the event of default by the purchaser. The bills will be discounted and retained in portfolio by Air Finance, Ltd., and the proceeds will be paid to the manufacturer to make up, with instalments paid to him in cash by the buyer, the full value of his order. The company will ordinarily expect manufacturers to induce their customers to pay approximately 60 per cent of the order on or before delivery, so that the credit will extend to only 40 per cent. It is also intended that the credit period shall not usually exceed three years. These are conservative terms; but it is to be hoped that the technical quality of British aircraft will ensure that Britain can command any worthwhile business without the need for any more liberal facilities. The balance of payments is certainly in no state to support facile long lending even for the purpose of pushing aircraft into overseas markets.

Advance in Commodities

AFTER nearly six months of approximate stability, commodity prices as a whole are beginning to show signs of advance. As the accompanying chart shows, *The Economist* commodity price indicator has risen in the last four weeks from 90.5 to 92.1 (1952=100). Most commodities have contributed to this improvement. Prices of raw jute and cocoa have led the field. All the base metals have risen in price, though they are now a shade below their best levels of recent weeks. Copra and cotton have risen slightly, and even rubber has bobbed up by a farthing or two. Prices of wool and coffee have remained firm at a high level, but sugar has continued to sag and wheat prices have been mixed: Chicago futures have risen by some 5 cents a bushel

to \$1.99, but Canadian Northern Manitoba Wheat has dropped by about eight cents to \$1.90. Though commodity prices in general withstood the seasonal decline of activity in the summer, the present modest advance can be regarded as a somewhat belated response to autumn revival. It has

no doubt been helped by the belief that the prospect of an American recession seems less imminent than it appeared to be a few months ago. But all apprehension will have to be swept aside before prices can advance very far.

Seasonal Rebound in Exports

BRITISH exports staged a welcome rebound in October from the low level of the previous two months and imports showed only a moderate increase. The provisional trade figures put the estimated value of exports at £227.7 million (f.o.b.), compared with £202.2 million for Sep-

(£ million—monthly average or calendar month)

	Imports c.i.f.	Exports f.o.b.	Re-exports f.o.b.	Visible deficit
1952 Year	290.1	215.1	12.0	63.0
1953 1st quarter....	272.4	208.5	10.0	53.9
2nd "	291.7	210.0	8.0	73.7
3rd "	274.8	211.6	8.5	54.8
October*	279.9	227.7	9.3	42.9

* Provisional figures.

tember and a monthly average of £211.6 million for the third quarter. Re-exports also rose sharply to £9.3 million, compared with £8 million in September and a third quarter average of £8.5 million. To a large extent, the recovery

in exports last month must reflect the seasonal expansion of trade and industrial output. On an average working day basis, total exports rose to £8.8 million in October from £8.1 million in the previous month and £8.3 million in August, but they were still slightly below the average of £9 million for July, which also had 27 working days.

The rise in imports was probably wholly seasonal. At £279.9 million (c.i.f.) in October, imports were £10.5 million higher than in September, but only £5.1 million above the average for the third quarter as a whole. The October figures include £5 million for the Canadian-built Sabre jet fighters and parts presented to Britain as a gift early this year. Similar imports in the third quarter amounted to £8 million a month. The recovery in exports and the much smaller rise in imports reduced the gross visible trade deficit by £16.3 million to £42.9 million in October. This was well below the monthly average in each of the previous three quarters, and only £1.4 million above the low average of the fourth quarter of 1952.

Exports to the United States in October, at £13.6 million, were slightly below the level of the previous month, but they remained commendably close to the peak averages of £13.9 million a month in the first and second quarters of the year. Exports to Canada rose by £1.7 million to £13.3 million compared with the peak of £15.7 million reached in the second quarter and the third quarter average of £12.8 million.

SHORTER NOTES

The members of the trade mission to the Middle East have now been appointed and the mission will leave in a few days' time under the leadership of Sir Edward Benthall.

★

Coal output last week was the highest for some months; moreover the total of 4,657,000 tons was 83,000 tons higher than in the same week last year. With one exception, weekly output during the past two months has been running consistently below last year's levels. Cumulative output for the first 44 weeks of the year has reached 188.2 million tons, some 2½ million tons behind last year's output for the same period.

★

The International Bank has made its fourth public issue in the Swiss market. The issue, which has been handled by a syndicate of leading Swiss banks, offers 3½ per cent on fifteen-year bonds, and is designed to raise Swiss francs 50 million (just over £4 million).

★

October broke all previous steel output records. Crude steel production for that month achieved an equivalent annual rate of 18,462,000 tons, and there is every likelihood that the industry's output will reach 17½ million tons for the full year. Ten months' output has virtually achieved that annual figure, and production in November should show a further increase sufficient to cover the seasonal fall in December with some margin to spare.

PARKINSON & COWAN INDUSTRIAL PRODUCTS

THE Parkinson and Cowan Group is well known for its production of domestic appliances, meters and instruments. It also produces a large volume of industrial equipment. In particular, Parkinson and Cowan Gas Meters operates a rapidly developing business in industrial heating apparatus, notably in infra red drying equipment. The growth of these activities makes it necessary to establish a new Division of the Group to foster them. This Division will be known as

PARKINSON & COWAN INDUSTRIAL PRODUCTS

and will operate from

Cottage Lane Works, City Road, London, E.C.1

Could more accounting work be done ... with fewer machines?

Sensimatic Control* means limitless adaptability in one machine

BUSINESS NEVER STANDS STILL, and sometimes, accounting routines are not flexible enough to cope with heavy new commitments. But this doesn't mean that the office need get in arrears with its work, nor that a variety of different accounting machines must be installed.

There is one machine—the Burroughs Sensimatic—which can be switched in a flash to any kind of accounting operation. A single control-unit directs the Sensimatic through any *four* posting operations—and there is no limit to the number of *different* units you can use.

What does this mean? Simply, that a small business needs only one of these versatile machines to handle *all* its accounting jobs; that a large organization, as the need arises (perhaps, for the "peak-period" preparation of payroll), can switch every one of its accounting machines to one kind of work.

LOW INITIAL COST

The value of a limitlessly adaptable business tool like the Sensimatic is incalculable—but even its initial cost is far below that of any comparable machine. You owe it to your business to see it demonstrated in relation to your particular figuring problem. Call Burroughs today.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

THE BURROUGHS SENSIMATIC

Is now produced in 5 versions giving as many registers, or combinations of registers, as you may need.

*THE MEANING OF SENSIMATIC CONTROL

This sense-plate (the Sensimatic Control unit) guides the machine automatically through every mathematical function and carriage-movement of a complete routine. Every unit—there is no limit to the number you can use—controls any four different accounting operations in any combination.

For expert advice on business figuring

Company Notes

BRITISH MOTOR. The preliminary reports just issued by four of the leading motor manufacturers in this country—British Motor, Standard Motor, Rootes Motors and Rover—all relate to very much the same period, the year to last July and August. They all show that profits have been more or less maintained and that equity dividends have been left unchanged. In some ways, this is disappointing, for, as the accompanying table shows, total British output of cars and taxis increased by over 16 per cent in this period, as steel became easier to obtain. But output of tractors and commercial vehicles fell, and all the companies

	PRODUCTION AND EXPORTS	
	Years to July 31, 1952	1953
<i>Cars and taxis:—</i>		
Production	450,992	524,264
Exports	363,823	286,455
<i>Commercial vehicles:—</i>		
Production	247,490	237,039
Exports	140,714	108,266
<i>Tractors:—</i>		
Production	130,433	109,412
Exports	115,672	92,018

became increasingly dependent upon the home market; in fact exports of cars and taxis in the year to July 31 last represented only about 55 per cent of total output, compared with about 81 per cent in 1951-52. It seems clear from these figures that the motor companies' profit margins were dwindling. To some extent this narrowing of profit margins reflected a deliberate decision by some of the manufacturers to cut prices as competition increased (or rather, as some would say, returned); but it may also have reflected yet another rise in operating costs.

The biggest of the four companies, British Motor (which was born from the merger of Austin and Morris Motors at the end of February, 1952) fared rather worse than the others. In the year to July 31 last it earned a trading profit

of £14,299,644, compared with an annual rate of some £17.4 million in the first four months of its existence. This "decline" in profits, however, was probably almost wholly accounted for by the labour stoppage at Austin's Longbridge factory at the beginning of this year. The company has, therefore, declared the expected equity dividend of 10½ per cent for the full year (paid on a capital of £24,131,799, as increased by the four for one scrip issue of shares last December); this compares with the 17½ per cent paid for the four months to July 31, 1952, on a capital of £4,826,360—and means that the annual rate of dividend has been effectively, though fractionally, raised from 10 2/5 per cent to 10½ per cent. The new dividend was forecast by the directors last August when they made their successful offer for the shares of Fisher and Ludlow, the motor body manufacturers. That acquisition, following the acquisition of Briggs Motor Bodies by Ford Motor, may be an even more significant pointer to the future competitive struggle within the industry than the reinforcement of reserves that British Motor, like its rivals, has been very careful to ensure.

STANDARD MOTOR. While British Motor's profits have apparently fallen, the trading profits of Standard Motor rose from £3,041,443 to £3,121,858 in the year to August 31st. Yet its 5s. ordinary shares, at the current price of 6s., offer a yield of a full 10 per cent, compared with a yield of 7½ per cent offered on British Motor shares and of only just over 4 per cent offered by the equity of Ford Motor (in which a dividend increase is expected). The market is warily cognisant that Standard Motor's net earnings still provide only a very lean cover on the maintained ordinary dividend of 12 per cent;

this dividend absorbs £338,415, or nearly twice the sum that the company has ploughed back into the business.

The preliminary report, indeed, furnishes no evidence why investors should radically alter the valuation they have placed on these shares. After allowing for an increase of some £93,000 in depreciation provisions, the increase in net profits from £530,631 to £644,330 appears to have been wholly due to a fall of £105,000 in the tax bill. Moreover, the company, with its considerable interest in the production of Ferguson tractors, is perhaps more dependent than most of its rivals upon a rather volatile export market; and some fears have been expressed that it may ultimately be adversely affected by British Motor's acquisition of Fisher and Ludlow. With these doubts in mind the equity may remain rather friendless until the company's new venture—the production of a baby car—has proved itself.

ROOTES MOTORS. At the other end of the pole from Standard Motor, the maintained ordinary dividend of 32½ per cent announced by Rootes Motors absorbs only £178,750 out of a net profit of £1,069,262, and the company's 4s. ordinary shares are as high as 21s.6d. to yield only 6.2 per cent. With such an impressive cover upon the dividend, shareholders have perhaps little need to worry about the slight drop in the group's gross profits (from £3,425,697 to £3,307,335) and in net profits (from £1,098,148 to £1,069,262) in the year to July 31st. Humber, the manufacturing division of the group, has also announced a fractional decline in gross profits from £1,620,160 to £1,604,149. Although Rootes—unlike Ford, British Motor and Standard—does not intend to add a baby car to its range, it has already announced its intention to spend about £5 million on expanding production. This suggests that the policy of conservation of resources and low dividend payments may have to be continued; and those

PRODUCTION OF FUEL AND POWER ⁽¹⁾

PRIMARY PRODUCTION ⁽²⁾

EXTERNAL TRADE ⁽³⁾

EXCHANGE RESERVES AND PRICES ⁽⁴⁾

(1) Petroleum production in Canada in 1938 and 1951 includes natural gasoline. Annual figures of electricity production in Australia are for 12 months ended June 30th of year stated and for New Zealand 12 months beginning April 1st; monthly figures for New Zealand represent about 87 per cent of total generation. (2) Copper production is smelter; tin is primary metal. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b. (4) Exports are f.o.b. (5) Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st and for Australia and Pakistan 12 months ended June 30th. (6) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100- for S. Africa relates to Europeans only. (7) Average of second quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended November 7th there was an "above-line" surplus (after allowing for sinking Funds) of £14,890,000 compared with surplus of £8,351,000 in the previous week. The surplus of £32,541,000 in the corresponding period last year, bringing the cumulative deficit to £305,077,000 (£320,386,000 in 1952-53). Net expenditure "below-line" absorbed £939,000, bringing the total cumulative deficit to £580,535,000 (£665,751,000 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the new Exchequer stock, it is impossible to calculate the division between tap and tender bills until all the bills purchased have passed their original maturity date.

THE MONEY MARKET

At last week's Treasury bill tender the market maintained its bid at £99 98. 6d. per cent for the £220 million of bills on offer; total applications for this reduced offer rose from the already high total of £385.9 million to £392.5 million, and the market's allotment fell to the quite exceptionally low level of 34 per cent. This allotment, following upon the other low allotments in recent weeks, has seriously depleted the market's bill portfolios. Under the increased weight of outside competition the average rate of discount on all bills fell by just over rd. last week to £2 1s. 10.62d. At yesterday's tender the offer was increased to £230 million.

It has been a quiet week in Lombard Street. Before the week-end most houses were fairly comfortably placed for funds, and special assistance was needed only on Thursday. On Monday credit was more generally short, and small official help—given indirectly through the banks—was necessary; Tuesday saw an improvement, but on Wednesday the authorities again made special purchases, this time directly from the market.

The Bank return shows a further seasonal outflow of £5.3 million of notes. The increase of £13 million in government securities in the banking department was more than offset by a decline in other securities; but as public deposits (including the counterpart fund account) fell by £18.8 million and other accounts rose by only £5.2 million, bankers' deposits rose by £5.7 million despite the note efflux.

COMPANY MEETINGS

FISONS LIMITED

LARGER SALES AND TRADING PROFIT

CRIPPLING EFFECT OF TAXATION

MR F. G. C. FISON'S REVIEW

The sixtieth annual general meeting of Fisons Limited will be held on December 7th at Harvest House, Felixstowe, Suffolk.

The following is the Review of the Chairman, Mr F. G. C. Fison, circulated with the accounts for the year ended June 30, 1953:

Directors: Mr D. J. Bird, who has been a Director of the Company for 24 years, has been appointed a Vice-Chairman, and Mr G. V. K. Burton, one of our younger executives, has been elected to a seat on the Board.

THE ACCOUNTS

Sales for the year were £26,441,000 against £21,975,000 in the previous year. These figures include the sales of Fisons Chemicals Limited (£3,442,000). It is interesting to note that the official estimate of the cost to the farmer of fertilizers bought in the United Kingdom for these two years is:

1951-52	£54,689,000
1952-53	£63,290,000

The consolidated trading profit of the Group was £2,413,485 compared with £1,602,958 for the previous year. The additional productive capacity created by our capital expenditure during recent years became more fully employed and contributed considerably to the increased profits earned.

I referred last year to the serious effect upon industry of the present burden of taxation and to its crippling effect upon development in the chemical industry. This year we have had to provide for taxation no less than £1,650,303, compared with £808,885 last year. Included in this figure is an estimate of £316,000 for Excess Profits Levy against a provision of only £3,000 last year. The Excess Profits Levy continues in operation until December 31, 1953, so that for the year in which we are now trading half our profits will be subject to this tax.

Our cash resources at June 30th, as shown in the Consolidated Balance Sheet, were £3,592,000. The greater part of this was invested in short-dated Government Stock some of which has since been converted into cash to finance our stocks of raw materials for next season's trade.

FERTILIZERS

Last year I told you that we were planning for a considerable expansion in sales for the year 1952-53. Our forecast proved to be correct. The total sales of fertilizers in the British Isles recovered from the depressed figure of 1951-52 as is shown by the following table:

1949-50	4,316,000 tons
1950-51	4,023,000 tons
1951-52	2,740,000 tons
1952-53	4,020,000 tons (estimated).

The sales for 1951-52 proved to be con-

siderably lower than the estimate made by the Government at the time of the issue of our report last year. However, the figures for that year are of little real value as a guide to consumption because of the stock piling which took place in previous years before the removal of the old subsidy.

During the past year the new subsidy operated for the whole period and no doubt was a contributory factor to increased consumption. We well maintained our share of the total trade of the country and our triple superphosphate and high-grade compound fertilizers based upon triple superphosphate were in great demand.

As in the previous year, a substantial contribution to our profits came from our interests in Corby Basic Slag Limited and Nitrogen Fertilizers Limited. Our horticultural trade also showed a very satisfactory expansion in sales and profits.

I have no reason to think that the demand for fertilizers during the year in which we are now trading will be less than in the past year. Indeed, on the assumption that the marketing plans for agricultural products are settled in a satisfactory manner, and given favourable weather in the spring planting season, my view is that there may well be a further increase in consumption of fertilizers, and we are making plans accordingly.

FERTILIZER FACTORIES

We have continued to maintain our factories in good working order. That we were able to meet the exceptional demand in the spring of this year reflected great credit upon our Production Department, which successfully planned to make record deliveries. In order to relieve the heavy burden on our producing units, resulting from the farmer's inclination to take the bulk of his deliveries at the last moment before the spring sowing season, we have introduced a new price structure which shows considerable advantages to our customers if they order early. There is every indication that this policy is having the desired effect, and this should lead to more orderly deliveries in the spring.

Our Immingham factory operated very satisfactorily, although not at full output due to sulphur restriction. The technical improvements which I mentioned last year have borne fruit

and pursuance of this policy has, therefore, added a needless burden, small in some cases but large in others, to the costs of industry. In its larger aspect, Government policy in regard to sulphuric acid capacity, the chief point of which was to increase modern pyrites burning capacity, thus reducing excessive dependence on sulphur, was entirely correct in my view.

The capacity having been laid down, however, the country should have been enabled to take advantage of the most favourable situation as regards either of the principal raw materials; that is to say, when sulphur was available and cheap as in the past year, emphasis should have been placed on that material, whereas if sulphur becomes scarce and dear, then emphasis should be placed on pyrites. The complicated and restrictive scheme which has been forced on the industry as a result of the mistaken Government policy, does not allow us, or other major users, to take the maximum advantage of the world market situation as regards sulphur and pyrites. I very much hope that this policy will be reconsidered in the near future, and a more realistic, commercial, and liberal attitude adopted.

GOVERNMENT AGRICULTURAL POLICY

Towards the latter part of the year which I am reviewing, some uncertainty developed in the mind of the farming community in regard to Government agricultural policy. This was due to a number of factors, not the least important of which was the situation in the United States where substantial surpluses of farm produce were built up and farm income showed declines for the first time in a considerable number of years. This signalled the temporary, as I believe, end of a period of world shortages of the principal agricultural products. The Government in this country, on the other hand, wish to take advantage of favourable trading conditions in world markets, and to introduce more flexibility into agricultural marketing in this country. In spite of assurances, the farming community has become seriously unsettled, and undoubtedly fears that there may be some return to the "cheap food policy" of the inter-war years. I do not think that these uncertainties are justified, but the fact that they exist is in itself important and liable to affect the individual farmer's policy, and in consequence his purchase of fertilizers.

It would be most unfortunate, both for the country as a whole and for the individual farmer, if he were to follow his natural inclination, and to reduce his investment in fertilizers as part of a general policy of retrenchment. On the majority of farms in this country, the usage per acre of fertilizer is substantially below optimum, and there is virtually unanimous agreement amongst agricultural scientists on this point. What is not so obvious to the farmer is that fertilizers reduce the cost of producing many crops. It would, therefore, be more logical for many farmers to increase their usage of fertilizers. The Government, of course, is well aware of the value of fertilizers to the farmers and the national economy, and has encouraged their use by substantial subsidies. I do not think, as I suggested in my review last year, that this is the most effective method as changes in Government policy in this respect have an extremely unsettling effect, however temporary, on the farmer and the fertilizer industry.

I think the sphere in which the Government's initiative would be the best exercised, would be in a substantial increase of expenditure to educate the farmer where necessary in the value of fertilizers. Such education if carried out intensively is very expensive, and to further increase our own expenditure in this direction would inevitably lead to increase in selling prices, which would be

liable to criticism and misinterpretation. It is the natural reaction of the customer in the face of heavy advertising to conclude that he is paying more for the product than is necessary. This is in many cases a mistaken view, as advertising enables markets to be enlarged with a consequent reduction in costs. The view exists, however, and sets certain limits to the activities of commercial enterprise.

As I have indicated above, I do not think the Government will seek to evade its responsibilities under the Agricultural Act of 1947, but the formulation of plans to implement the policy requires good will and a broad outlook on both sides. More important still, in my view, is that the national organisations representing the farmers should carry public opinion with them, for no Government, whatever its complexion other than a Totalitarian Government, can in the long run pursue a policy which has not the support of the mass of the people.

ASSOCIATED FERTILIZER COMPANIES

Our associated companies in Canada, South Africa and Rhodesia have again had successful years.

In Canada conditions were particularly difficult owing to the collapse of the potato market, but our sales were slightly in excess of those in the previous year though our profits were a little down.

In South Africa the demand for granular fertilizers is increasing and we are erecting a new plant to produce granular fertilizers in the Cape Province, which is planned to come into production early in 1954.

In Rhodesia the fertilizer trade is largely dependent on the tobacco industry. Sales of tobacco for the past year have been a record and, given favourable weather conditions, it is anticipated that production during the coming season will be stepped up from 105 million lb to 125 million lb thus ensuring an increased demand for fertilizers. We have cordial relations with the Rhodesian Tobacco Research Board which has recently published its recommendations as to the type and quantities of fertilizers that should be used to increase the yield of tobacco per acre.

NORTH EAST YORKSHIRE POTASH

The exploratory work carried out by Imperial Chemical Industries Limited and ourselves in North East Yorkshire has proved the presence of extensive deposits of potassium salts. Methods of working these deposits are under consideration with a view to making the potash available for British agriculture.

FISONS CHEMICALS LIMITED

In previous reports I have referred to the intensive task of re-organising which we have been carrying out in certain constituent companies of this group, and it is therefore disappointing to record that a deterioration in market conditions has prevented us from reaping the full reward of this work. The largest Company in the group, however, returned substantially improved results, and Bengers Limited, although showing decreased profits, do so largely as a result of a falling off in demand for certain raw materials supplied to the pharmaceutical industry. The demand in the previous year had been exceptional and the very competitive conditions both in home and export markets, resulted in a substantially reduced off-take by the pharmaceutical industry in this country. On their own ethical medical products, this Company also showed satisfactory progress. Continuing the trend of last year, a very severe decline was again

registered in our sales of pharmaceutical fine chemicals for the reasons already mentioned. Our interests in this field depend largely on direct export as well as on the supply of raw materials to manufacturing houses, who in their turn export finished products. The most intense competition has prevailed in export markets, and we have therefore experienced a decline both in turnover on this side of the business and in profitability. In my view some rationalisation of this industry is now overdue.

The publication of the classified list of products for the use of doctors has led to a considerable upheaval in that part of the pharmaceutical industry selling products for prescription by the medical profession. Comparatively few of the group's products have been affected, unlike a number of other companies where virtually the whole of the catalogues have been placed in unfavourable classifications. At the same time the efforts to reduce the cost of prescribing which have led to this and other measures, cannot but affect us, and we, in common with other manufacturers, must strive to reduce costs to the minimum. I am afraid that it is only too likely that the results of the Government's efforts in this direction will be to reduce the willingness of manufacturers to invest large sums in research and development, and the marketing of new products, and this country consequently may fall still further behind the United States in this direction.

We have spent considerable time and energy formulating a policy to deal with great changes which have recently occurred on many sides of the business of this Group, and while I cannot forecast any reduction in competition, rather the contrary, I believe that our strenuous efforts and constant improvements in organisation and efficiency will enable us to fare better than many of our competitors.

RESEARCH

During the year plans have been prepared for a major extension of the research activities of the Company. A farm of some 400 acres has been purchased at Levington, six miles from head office. Here will be carried out field trials of new fertilizers and other agricultural chemicals. The farm will be equipped with all facilities for the testing of new fertilizers, and of the best methods of using them.

Levington, however, will be more than an agricultural testing station. Plans are in hand for the erection on the farm of a comprehensive block of Research Laboratories, mainly devoted to fertilizer technology, but capable of pioneer work in any aspect of chemical and biological research necessary to keep your company in the forefront of progress. I should, perhaps, give you an assurance that there will be no unnecessary duplication of the work going on at any of the Government Research Stations. Steps have been taken to make our plans known to the Agricultural Research Council and to ensure that good relations will be maintained with Experimental Units operated by the Ministry of Agriculture.

The research work of the station will be closely linked with our Advisory Services, and Dr R. Stewart, the Director of the Station, will also be the head of the Advisory Services. In this way our research and development will be kept intimately related with the needs of the agricultural community.

The farm at Levington was chosen after careful consideration of the large number of factors which are relevant to the setting up of a comprehensive Research Station on modern lines. But some of the field experiments will need to be checked on other soils with different climatic and drainage conditions. The work at Levington will therefore be reinforced by a subsidiary station in the

West Country and by the organisation of special tests, where necessary, on various farms throughout the country. The full scheme will, of course, take some years to complete.

STAFF

We continue to have the benefit of most efficient staffs in our offices and factories. I have already referred to the fact that our relations with the Trades Unions remain cordial. My colleagues and I would like to express again our great appreciation of the services rendered to the Company by all those working for it, both at home and abroad.

THE ALUMINIUM CASTINGS COMPANY

DIVERSITY OF ACTIVITY

The forty-seventh annual general meeting of The Aluminium Castings Company, Limited, was held on November 6th at Glasgow, Mr R. K. Calder, chairman and joint managing director, presiding.

The following is an extract from his circulated statement:

The trading result for the year now under review was disappointing, and there is little consolation to be derived from the fact that other manufacturers engaged in the electrical appliance industry suffered a like experience. The diversity of activity within the group proved a useful buffer, however, and in the circumstances I feel that the outcome for the year is reasonably satisfactory.

When I made my statement to you last year I indicated that there were then distinct signs of improvement. I was unable to foresee, however, that within a few weeks' time there would be initiated a national agitation for the abolition of purchase tax. The effects of the agitation, which started in the autumn of 1952 and was fanned by powerful organs of the daily press, touched off a "buyers' strike," which lasted some six months and resulted in a most drastic—in other circumstances it might well have been a catastrophic—decline in demand for electrical appliances. As a result our output in that field declined by some £750,000, a very substantial proportion of the group's total activity.

In spite of this and owing to increased output in other directions, trading profit fell by no more than some £67,000, being £147,501 as against £214,769.

At Burnley we suffered a slump—I use the word advisedly—in the sale of washing machines, particularly in the last six months of the year, offset partly by the growing level of output on the jet engine programme.

Your board is satisfied that the jet engine work being undertaken is no longer a mere temporary rearmament effort but is a well-established addition to the activities of your Burnley company. So much so that special arrangements, including the provision of further factory space, will now be required to cope with the healthier order position prevailing in the washing machine market and the heavy forward orders on the jet engine programme.

Aluminium Bronze Company failed by only some 10 per cent to hold the record output achieved in 1951-52, but rising costs cut severely into profit margins.

Atkinson's Agricultural Appliances, Limited, fully justified the hopes which I expressed last year, and output advanced by some 75 per cent, the bulk of which arose in the last few months of the year, when output was more than doubled. In the current year this in-

creased rate of output has been more than maintained.

Scottish Aluminium Ware, Limited, failed to hold the improvement recorded in 1951-52.

The plating and metal finishing division of the group—represented by the Verichrome Companies at Walsall and Larkhall and Makmoroom Limited—all suffered setbacks common to that trade, and output fell by some 30 per cent, with the result that small losses emerged over the division as a whole. Conditions in the current year show a reasonable degree of improvement.

The parent company's foundry at Greenock had a poor year due to a marked decline in the demand for sand castings, a situation which has continued into the current year.

Last year I ventured a cautious prophecy which was nullified within a month or so as a result of the almost overnight collapse in the public demand for electrical appliances. This year I might feel tempted to repeat the prophecy, but I will content myself by recording that to date the current year shows an expansion in output of almost one-third, with an even better showing in earnings.

Your directors are at present negotiating for the acquisition of a further business, but I regret I am not yet in a position to make a statement.

The report and accounts were adopted.

At subsequent extraordinary general meetings resolutions increasing the authorised share capital were approved.

HAROLD WESLEY LIMITED

(Manufacturers of Paper Products)

SATISFACTORY RESULTS

The seventh annual ordinary general meeting of Harold Wesley Limited was held on November 5th in London, Mr Percy Day-Winter (chairman and managing director) presiding.

The following is an extract from his circulated statement for the year ended June 30, 1953:

During the period under review, in common with other paper converters, we experienced certain difficulties, due to further falls in paper prices coupled with a falling of trade generally. The loss of sales, however, was compensated by additional business in connection with the Coronation. Stock losses at the end of the year and losses incurred during the year due to fall in price of raw materials have been taken in the profit and loss account. The stock depreciation reserve of £20,000 has been retained intact once again.

The paper situation has undergone some change since my report of a year ago and the tendency is for prices to remain stable and in consequence a more even flow of orders is resulting.

A pleasing feature of sales has been the increase in our export business, in particular to the United States and Canada.

Your company's subsidiary, Wesley & Clark Engineering Company, Limited, is working fully and produced approximately the same profit as the previous year. They have a reasonably well-filled order book for the current year.

The factories of your company are fully employed and a considerable amount of overtime and double-shift work is in operation.

The report was adopted and a final dividend of 14 per cent, making 23 per cent for the year, was approved.

HARMONY GOLD MINING COMPANY, LIMITED

(Inc. in the Union of South Africa)

MR P. H. ANDERSON ON DEVELOPMENT PROGRESS

At the third annual general meeting of shareholders, held in Johannesburg, on November 6th, Mr P. H. Anderson, the chairman, in the course of his remarks, said: Development continues to indicate good mining conditions and up to the end of October the total development footage accomplished since these operations started in February was 14,550 ft. 5,866 ft. had been advanced on the Basal Reef horizon, and of this 5,640 ft. had been sampled, 5,330 ft. or 94.5 per cent proving payable, averaging 15.33 dwt. over a channel width of 43 inches, equal to 659 inch dwt.

The main haulage on 6 level to connect the ventilation shaft with No. 3 shaft was holed five days ago on November 1st. Consequently the various restrictions applying to a single entry mine have been removed and, though the scale of operations can be only slightly increased due to the limited hoisting capacity of the ventilation shaft, underground conditions will be considerably improved. 16 Winze, which is being sunk also to connect the shafts, had 2,840 ft. to go at the end of October and is not expected to hole until about September, 1954.

In the ventilation shaft area good progress continues to be made with the development of the initial stoping area. 6 level drive has now been stopped temporarily while work is concentrated on footwall haulages and on 15, 16 and 17 raises. These three raises are spaced about 800 ft. apart and are being put up to 2 level, a distance of 1,750 ft. up dip to the east of 6 level. If progress continues to be made according to plan it is expected that by the time the mine is scheduled to go to production in July, 1954, a block of ore 1,750 ft. by 1,600 ft. will have been opened up in this area, and a fair proportion of the 10,500 ft. of face in the three raises will have been prepared for stoping. Development rock is being hoisted and dumped on a stock pile at the ventilation shaft and this ore together with that from mining operations will be transported to the reduction plant by road pending the commissioning of No. 3 shaft.

No. 3 shaft has progressed satisfactorily and at the end of October had reached a depth of 5,247 ft., leaving 130 feet to be sunk to its final depth. The ore and waste boxes and portions of the ore and waste pass systems are nearing completion, and most of the stations and a temporary pump chamber required for the initial stages of operations have been completed. Equipping should commence in January and the shaft is expected to be ready for operation as the main hoisting shaft shortly after production commences.

REDUCTION PLANT

Construction of the first 45,000 ton unit of the reduction plant is well advanced, although there have been one or two minor delays in erection. This unit is scheduled to start operating in July, 1954, and a second unit of a similar size a year later. No decisions have yet been taken regarding the possible further extension of the reduction plant or when the sinking of the proposed second hoisting shaft will commence.

A suitable site for this shaft has been located by the drilling of borehole L.R.9 which has also yielded encouraging reef values. The results of the second deflection of the borehole were published yesterday

and these, taken in conjunction with the results of the original borehole and the first deflection (which was drilled from just above the Basal Reef) gave the following averages: the two intersections of the Leader Reef at a borehole depth of 4,978 ft. averaged 0.9 dwt. over 56 inches, equal to 50 inch dwt. The three intersections of the Basal Reef at a borehole depth of 5,028 ft. averaged 18.34 dwt. over 71 inches, equal to 1,302 inch dwt. In addition, interesting values were obtained on the "A" Reef horizon at a depth of 4,555 ft. In the original borehole this reef assayed 5.3 dwt. over 88 inches equal to 466 inch dwt., and in the second deflection 4.2 dwt. over 84 inches, equal to 353 inch dwt. As all the other boreholes on the Harmony property have given unpayable results on this horizon it would appear that the pay zone located by borehole L.R.9 is of limited extent. It should, however, be possible to test the potentialities of this payable zone at some time in the future as the proposed No. 2 shaft is likely to intersect it.

URANIUM PRODUCTION

The construction of the uranium plant to handle the residues from the first two units of the gold reduction plant is making fairly steady progress but it will probably not be commissioned until two or three months after the gold plant has commenced operations. Shareholders will have noticed from the recently issued prospectus that uranium production, although it is only a by-product of gold production, is expected to yield considerable additional profits to the company. Values have been encouraging and it is estimated in the light of ore disclosures to date that the profits, after allowing for loan redemption and interest, earned from the uranium plant during the period of the agreement with the Minister of Mines will be of the order of one-third of the working profits from gold mining.

The report and accounts were adopted.

EAST ASIATIC RUBBER ESTATES

MR H. T. KARSTEN'S ADDRESS

The thirtieth annual general meeting of East Asiatic Rubber Estates, Limited, was held on November 11th in London.

Mr H. T. Karsten, the chairman, presided, and in the course of his speech said:

In spite of the severe drop in the average sale price of our crop, the net result, after taxation, of the year's working is only £50,000 down at £91,703 and the board proposes a dividend of 10 per cent for the past year.

During the year 471½ acres were replanted, making a total of 1,839 acres as at March 31st last, and the board have authorised the replanting of a further 544 acres during the current year. As it takes about seven years to bring replanted areas to maturity, the cost during the coming years will be quite substantial and the board have therefore decided not to undertake any new replanting during the next financial year. The board realises, however, that we shall have to resume our programme in order to get our estates replanted with first-class material as early as possible, and for this reason we propose to place some £40,000 to general reserve, leaving £58,489 to be carried forward.

The crop estimate for the current year has been put at 3,300,000 lb.

I am afraid I can give you little encouragement about the market for our product for the near future. There does not appear much chance of any real improvement to a higher price level. Our endeavours must be to improve our estates and the work on our estates so that we can reduce our cost of production, and I can assure you that your board has this very much in mind.

The report was adopted.

KOLAR GOLD MINING COMPANIES

(Mysore, Champion Reef, Ooregum, Nundydroog)

At the annual general meetings of the above-named companies, held at Oorgaum, Mysore State, on October 29, 1953, at which the results for the year ended December 31, 1952, were considered, Mr J. K. Lindsay, in the chair, referred to the accounts of the companies. The following dividends have been paid: Mysore 5 per cent, Champion Reef 6 per cent, Ooregum nil, Nundydroog 5½ per cent.

Since the close of the year under review, the market values of the United Kingdom Government securities held by the companies have improved and on October 15, 1953, were: Mysore £152,635, Champion Reef £120,824, Ooregum £81,595, Nundydroog £135,750.

At the Mysore and Nundydroog meetings, Mr Lindsay recalled the remarks of the chairman last year regarding the intention to put these companies into voluntary liquidation as soon as it became possible to do so without jeopardising the position of the respective KGF Companies. It is expected it will be possible for the Mysore KGF Company to dispense with the support of the holding company in the early part of next year provided no unforeseen circumstances arise in the meantime. Until the assessments have been settled it will not be possible to distribute all the assets. On the Mysore Company going into liquidation, however, it may be possible to distribute to stockholders the shares in the KGF Company and thus avoid the Indian super tax which the holding company pays on the dividends received from the KGF Company.

The financial position of the Nundydroog KGF Company is not yet good enough to dispense with the support of the holding company especially in view of the capital expenditure which will be necessary for the proper development of the West Reefs. For this reason and because of delay in the settlement of the income tax assessments, the directors regret they are not yet in a position to recommend that the Nundydroog Company should be put into liquidation in the immediate future. Such a recommendation will be made as soon as practicable.

As was explained in the circular dated July 28, 1953, to the stockholders of the Champion Reef Company, the intended liquidation of the company will have to remain in abeyance for some time as its support will be required by the KGF Company to assist in financing the purchase of the Ooregum Mine.

At the Ooregum meeting Mr Lindsay said that to the great regret of all concerned the mine was closed on July 9th after over sixty years' successful operation. It is not possible at this stage to estimate the return which shareholders may expect on their shares when the company is liquidated.

The intention is to put the Ooregum KGF Company into liquidation as soon as the clean-up and dismantling of the mill have been completed.

As shareholders have been informed, the liquidation of the Ooregum Holding Company will follow that of the KGF Company.

The reports and accounts of the four companies were adopted.

GOLD COAST GOVERNMENT

VACANCY FOR POST OF MANAGING DIRECTOR TEMA DEVELOPMENT CORPORATION

Applications are invited for the above post. The Corporation, established by Gold Coast Ordinance No. 35 of 1952, has been set up to create a town at Tema, near Accra, for a population of 50,000 to 80,000 to serve the major new port under construction there. The Ordinance is based on United Kingdom New Towns legislation and the duties of the Managing Director include responsibility for certain statutory obligations laid upon the Corporation such as the production of a Master Plan, the preparation of annual accounts for audit and of an annual report.

The Managing Director is a member of the Corporation and shares with it the responsibility for policy. In addition, as its Chief Executive Officer he is responsible for the organisation to carry policy into effect. He will co-ordinate the work of the various branches of the organisation, administrative and legal, engineering, health, accounts, architects and town planning and estate management. It will be his duty to co-ordinate the Corporation's work with that of the Harbour Authority responsible for developing the port. Applicants should be not less than 35 years of age, and should have held positions of comparable responsibility in major development projects. Preference will be given to candidates with previous New Town experience. Previous employment overseas, preferably in West Africa, is almost essential.

Terms of Service: Appointment will be on contract/gratuity terms for a five-year period. Salary will be from £2,600 to £3,500 consolidated per annum, according to the qualifications of the candidate. A gratuity at the rate of £50 for each completed three months of satisfactory service will be payable on final termination of the contract. Free passages on first appointment and on leave will be provided for the officer and his wife once each way during each tour of service. Length of tour 12-15 months. Successful candidate will be required to travel by air. Free air passages will also be provided for a maximum of 3 children under 13 years of age once a tour. Vacation leave with pay; seven days for each month of service. Free medical and dental attention provided for officer and family. Furnished quarters available at low rental. Income tax at local rates. Kit allowance on first appointment £30. United Kingdom candidates should apply in writing to the Commissioner for the Gold Coast, Melbourne House, Aldwych, London, W.C.2, giving brief details of their age, qualifications and experience not later than December 19, 1953. Persons who applied previously and who were not informed that an appointment could not be offered should merely advise that they are still interested.

THE Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Sciences, you may wish to sell (*periodicals excluded*).

ACCOMMODATION available for conferences and schools at Halls of Residence during the Easter vacation and the months of August and September, 1954. Further particulars from the Registrar, University College, Hull.

FOR SALE.—The Economist: April, 1914—April, 1952 (2 missing 1919). Investor's Chronicle: 1913-1952.—Box 377.

SENIOR Technical Executive required for important industrial company. Experience of non-ferrous metals essential and proved ability to co-ordinate production and research departments. Knowledge of yellow metals an advantage.—Box 382.

INTERNATIONAL BANKING SURVEY

This series of articles, surveying salient trends in international banking and in monetary policies overseas, is complementary to the similar survey of banking in Britain and the British Commonwealth published on June 20th last. In these two half-yearly features, THE ECONOMIST continues the tradition of its ANNUAL BANKING SUPPLEMENT, which has been published for many years.

Softening the Sound Dollar

WHATEVER else happens to the American economy, the Eisenhower Administration has decided—after some old-fashioned mutterings to the contrary—that it shall not crucify mankind upon the cross of the sound dollar. It has, very wisely, devolved more power and responsibility on the Federal Reserve in the fight against economic disorder; and it has voiced no objections now that the “Fed” has chosen to turn its sentries in a new direction—on guard against deflation. The change of front, in response to a change in threats, has taken place as swiftly as any sensible liberal could ask for. It has also taken place against a very difficult political background.

To understand that background, it should be recognised that the Federal Reserve’s uneasiness about the former Government’s monetary policy was contingent rather than current. The “Fed” was reasonably happy about the way current monetary policy was working out, at any rate after the famous “accord” of March, 1951; but, in view of its previous experience, it was not unnaturally afraid that complications might arise if ever renewed inflation should make a switch from a neutral to an aggressively tight monetary policy desirable. If a new shock effect ever had to be imparted and active steps had to be taken to drive Government borrowing rates up—well, the pessimists argued, the Truman Treasury still included many people who would wax very cross about that.

Inevitably, this minor and hypothetical cause for concern about the Truman Administration’s monetary policy was magnified into something quite different during the election campaign. President Eisenhower’s economic henchmen—or rather their speech-writers—fought that election on a promise not merely to resist further inflation but to roll back the inflation that they alleged was currently in progress. This so-called “sound money” doctrine was even more frightening than the Truman Government’s suspected lingering predilection for a “flabby money” policy; for it should have been evident that America was not caught up in any menacing inflationary spiral at the time of the election, on any of the three criteria by which an excess of demand over supply can be measured. Stocks were not being drawn down; they were rising rather alarmingly. America, admittedly, was beginning to lose gold; but to pretend that it was in balance of payments difficulties was merely comic. And

consumer prices had risen by little more than 1 per cent on the year, while wholesale prices had fallen sharply.

On balance, although a watch still had to be kept both ways, there seemed to be more danger of the emergence of a lack of demand than of a surplus of it; and this danger was intensified when Marshal Stalin, inconvenient to the last, died on March 6th. From then on the danger was clear. As the standard bearers of the sound dollar charged dour-faced out of the smoke of their victorious battle there stood, at the tip of Mr Randolph Burgess’s leading lance, not the dragon, nor even a windmill, but the fair maid prosperity herself. It was a very embarrassing position for a knight to be in, if he was to retreat without looking silly.

It is greatly to Mr Burgess’s credit that he did retreat, or rather that he allowed himself to be hustled unprotestingly back from the battle. For three frightening months, from March through May, it did not look as if he would allow this. This was the period when the Treasury bill rate, which had gone over 2 per cent for the first time during the usual winter squeeze at the end of 1952, not only kept above 2 per cent but climbed up to the peak rate of 2.42 per cent (at the first June tender). This was also the period of that much misunderstood operation, the floating of the long term 3½ per cent Government bond.

The muddled apprehension that was aroused in economic circles by this operation was due, once again, to the blatant over-simplifications of Republican oratory. “Over three quarters of the debt,” declared Mr Burgess in a speech at a bankers’ convention, “matures within five years or is maturable at the option of the holder of the debt. That is unsound financing.” It would have been more accurate to say that it was rather inconvenient financing in the special circumstances of the American political and economic scene. There were two reasons for this. First, the short term structure of the debt allowed the commercial banks to hold a large portfolio of one or two year maturities which they could liquidate without serious loss even if the Federal Reserve resorted to a policy of credit tightening; in other words, funding issues were desirable to make the commercial banks worried—if the need to inject worry should arise—about their liquidity. Secondly, the “Fed” had found that frequent re-

funding operations led to recurrent trouble between it and the Treasury. Experience had shown that it was only when the Treasury had no large early maturities to handle that it was willing to leave monetary policy in the unfettered control of the "Fed"; and the more completely American monetary policy is left in the hands of the "Fed", the better for the whole free world.

It was for this reason that the "Fed" welcomed the relatively small—\$1 billion—issue of a 30-year $3\frac{1}{2}$ per cent bond in the spring, the first long-term Government issue since the war years. The issue received ample subscriptions from the insurance companies and pensions funds at whom it was principally aimed; it also, however, attracted subscriptions from some speculators who wrongly assumed that the authorities would wish to support the new bond at a premium, found out their mistake too late and then realised the security at a loss. But the temporary difficulties into which the bond market was plunged by this manoeuvre had no serious deflationary consequences; and both this issue and the (very successful) tactic of offering investors the choice between a one and a three-and-a-half year maturity for a short-term refunding operation in September should be regarded as sensible steps that were designed to make a tighter monetary policy more effective, if—with the emphasis on the if—the need for such a policy should arise. The impression that these operations had no more than this purely precautionary objective was strengthened when Mr Burgess suggested to the banks last June that they might find it wise to lengthen the average maturity of their bond portfolios. There was, of course, an element of inconsistency in this speech, which implied that the Treasury was going to indulge in what Mr Burgess considered to be sound financing but that the bankers ought to indulge in what they had been taught to regard as unsound financing; but it was a sensible inconsistency, of the sort that Mr Burgess's style of oratory is peculiarly well fitted to propagate without a blush.

The real cause for concern about American monetary policy throughout the spring and early summer lay, therefore, not in these refunding operations but in the course of the "Fed's" day-to-day operations. In January, after the usual end-year squeeze had brought the commercial banks to the discount counter (discounts, in American

terminology and in the chart below, mean borrowing from the Federal Reserve), the "Fed" raised its official rediscount rate from $1\frac{1}{4}$ to 2 per cent. This move, again, could be defended as a mere precaution; the real question was whether the "Fed," by standing aside from market operations, was going to make this more burdensome discount rate effective. Up to May, as the chart shows, it was very effective. All through the period when the Treasury was in seasonal budget surplus the "Fed" refrained from purchases of Government securities, and the Treasury bill rate crept up to its June peak of 2.42 per cent, compared with about $1\frac{1}{4}$ per cent a year before. This trend set in just at the time when it became clear that the Administration was going to follow a tight enough taxation policy to try to bring down the overall budget deficit from \$9.4 billion in 1952-53 to (according to the current estimate) \$3.8 billion in 1953-54. If the new fiscal year, to June 30, 1954, was going to see a budgetary turn-round of this order, plus higher interest rates, plus cooler war, plus the automatic "corrective" factors that many people professed to see in the American economy, then it was obviously likely to be less inflationary than 1952-53—and, as the outside world saw it, 1952-53 had not been inflationary at all. A very great deal depended, therefore, on whether the "Fed" would continue its restrictive policy when seasonal pressure reasserted itself on the money market after the turn of the fiscal year (when the Treasury's accounts would swing into seasonal deficit and when demand for commercial loans from the banks would show a seasonal rise).

This worry went out with the spring. Already, in late May, there were some signs that the "Fed" was coming back into the market; by June it was back there in real earnest and pumped out some \$1,000 million in new security purchases in the course of a few weeks. Then, on June 25th, it announced a relaxation in member bank reserve requirements that released another \$1,000 million of cash.

The transformation to a policy of easy money was thus complete. It is true that the "Fed's" purchases of securities have not been heavy since this transformation, but this has been because seasonal demands upon the money market have been much lower than usual. The Treasury has been borrowing less, partly because of its approach to budgetary balance and partly because the unfortunate Con-

gressional decision to maintain the ceiling on the national debt has forced the Treasury to run down its cash balances rather than resort to borrowing operations. Moreover, the seasonal expansion in commercial bank loans since the mid-summer low point has been only between a half and two-thirds as much as last year—a sign partly of the decline in stock-building (which has prompted some people in this country to allege that the "recession" has, at least to some extent, already begun), but partly also of the fact that a change in the system of anticipatory tax payments has led some businesses to switch their peak borrowing from the autumn to the spring. But the general

assumption that the "Fed" now stands ready to pump in any money that is demanded has done much to steady nerves, in Wall Street as well as in banking circles. Up to June there was real reason to fear that the mild deflationary spiral into which America already seemed to be toppling was going to be aggravated by orders to the

"Fed" to conduct a bizarre game of musical chairs, with money being made scarcer and scarcer as borrowers (and thus openings for new employment) became fewer and fewer; now the "Fed" has put out as many chairs as there are players—and, if it is not putting out new chairs every day, that is because no new players are coming forward.

The question remains: although it can now be assumed that the "Fed" will not do anything to intensify any incipient deflation, can it also be assumed that it will be able to do anything to alleviate it? So far, the effect on interest rates has been diverse. The Treasury bill rate, aided by the reduction in short term rates in Britain and elsewhere, has of course fallen notably; it was down to $1\frac{1}{4}$ per cent at the end of last month, fully $\frac{1}{2}$ per cent lower than a year before. Since the end of September the rate offered on prime commercial paper has fallen in three successive stages from $2\frac{3}{4}$ to $2\frac{1}{4}$ per cent. The Federal Reserve's rediscount rate and commercial bank loan rates have not so far been lowered; but the banks undoubtedly feel much freer to make loans to sound borrowers than they did six months ago.

The new easing of rates and of screening requirements does not, of course, mean that many businesses will wish to borrow if they fear that production may be unprofitable—nor does it mean that the banks will necessarily be willing to lend to the few that might like to try. But there is some confidence that lower interest rates might help to revive housing expenditure (in fact, the figures for mortgage loans—though not yet for housing starts—suggest they may already be doing so). Moreover, the fact that America's dearer money policy after March, 1951, proved much more effective than even its strongest advocates had forecast has led some people to hope that monetary policy might prove no less surprisingly effective now that it is operating with arms reversed. At worst, the world is being given a chance to see.

Europe's Flexible Money

THE revival of monetary policy as an economic regulator in Western Europe has become more firmly consolidated in the past twelve months—although the pressures it has been called upon to regulate have abruptly changed. Last year Europe was still fighting against inflation and external deficit; this year the disinflation and the marked improvement in its external balance of payments have permitted a general easing of monetary discipline and an appreciable reduction in money rates. If the keynote of an orthodox monetary policy is the use of monetary weapons as the primary means of adjusting national economies to changes, in either direction, in economic circumstances, then orthodoxy has now won a remarkably complete victory in all but a few of the countries of Western Europe.

The shortness of the period during which this revival of monetary policy has taken place makes this achievement the more notable. Before the outbreak of the Korean war, as an article in last year's International Banking Survey pointed out, there had been a marked dichotomy in European countries' attitudes to the use of monetary policy. Three important countries only—Germany, Italy and Belgium—had attacked their inflations with the classical weapon of

the interest rate; the rest—and in particular Britain, France, Holland and the Scandinavian countries—had kept their Bank rates pegged at low and often ineffective levels, and had relied instead upon budgetary and physical controls in their efforts to counter inflation. In consequence, the flexible manipulation of short-term interest rates was confined to the first group of countries; and inevitably—as Table I shows—there were wide variations in levels of rates of the leading central banks of the whole area.

The differences between the monetary attitudes of the two groups were far less marked, however, in long-term rates; the British Government by 1947 and Sweden two years later had learnt that the degree of government support needed to maintain permanently low yields in the gilt-edged market necessarily involved a quite disastrous inflation of the supply of money. The only two European countries whose long-term rates have been maintained consistently low are Norway and Switzerland; and in Switzerland the exceptionally low yields are a quite undesired natural result of the glut of investible funds that have accumulated since the war.

The change in the pattern of official discount rates that developed in the post-Korean inflation is plain to see. The

central banks in the "orthodox" group naturally raised their rates first; but, speaking very broadly, it can be said that most of the countries of the whole area were at last moving their rates in the same direction at roughly the same time. Table I does not, moreover, tell the whole story; Denmark and Austria must be added to the list of converts to the practice of flexible adjustment of money rates; and Sweden, whilst maintaining its rigid government-dominated interest rate structure, also raised its Bank rate in December, 1950 (from 2½ to 3 per cent). Except for the special case of

*To end—October.

Switzerland, the only western European country that left its discount rate unchanged during the inflation that followed the Korean war was Norway.

Hardly less striking than this measure of synchronisation of rate movements has been the narrowing of the divergence between the level of rates. At the beginning of 1950 every one of the six countries included in the table maintained a different Bank rate; today, the rates of the three leading countries—Britain, France and Germany—coincide (at 3½ per cent) and the spread between the rates of all six countries has been reduced to 1½ per cent. From 1951 onwards the changes in rates begin to assume a definite general pattern, where previously they had reflected only uncoordinated individual trends. That is the measure of Europe's return to orthodoxy.

There have, it is true, still been considerable divergences—in both magnitude and timing of changes—in the pattern of European discount rates; but these differences, far from belying the switch to orthodoxy, have been a quite natural result of it. The countries that entered the period of Korean boom with tight monetary controls, and those others that then unsheathed the monetary weapon most quickly, were naturally also those whose balances of payments and domestic economies recovered soonest. Consequently, it was Belgium, the Netherlands and Germany that led the way in the general relaxation of central bank discipline; and Britain and France, the former cheap money countries, whose internal and external positions did not permit a relaxation until later. Italy, which has maintained

its Bank rate at 4 per cent since April, 1950, is the exception to this pattern; but the Italian balance of payments has deteriorated since the end of 1951—and this deterioration, the Italians claim with some justice, was largely caused by the incidence of the import restrictions imposed two years ago by Britain and France.

Indeed, the most striking feature of Europe's monetary experience in the past two years has perhaps been the recognition of the intimate and essential connection between monetary policy and the balance of payments. The Bank rate has again become the signal of confidence—or of warning. It has been used for its classic purpose of allowing more play in the economy when the external balance permits, and of enforcing stringency when the balance tilts the other way. It is becoming again an important psychological instrument, as well as one for levering market rates upwards or downwards. In Germany, for example, when the official discount rate was reduced to 3½ per cent last June, the Bank Deutscher Laender stated that the reduction was called for as a gesture of confidence in the internal and external position.

The remarkable recovery of Western Germany and the Netherlands and the relationship of this movement to the dear money policies pursued by those countries are now familiar. More recently, there have been a number of less widely recognised examples of the close connection between monetary policy and the external balance. It is surely significant, for example, that the one west European country (apart from Italy) whose balance of payments deficit has widened appreciably in the past year is Norway—also the one country to maintain its cheap money pattern undisturbed. Norway, it is true, did suffer from a deterioration in its terms of trade last year while most countries benefited from an improvement; but the deterioration was much smaller than that experienced by Austria—which, after a sharp bout of dear money in 1952, turned its chronic deficit into actual surplus early this year.

Orthodoxy has not always been an easy policy to implement; and it is not surprising that some countries have fallen down on the task. Most of the weaknesses in the implementation of monetary policy by European countries can be traced to one of two broad defects: lack of the necessary technical institutions, or an irresponsiveness of market rates to central bank influence in consequence of excessive liquidity in the particular market. The most common technical deficiency has been the lack of an effective link between the money market and the wider capital market, so that impulses imparted to short-term rates are not necessarily reflected in long-term rates. Where these conditions obtain, the central bank's influence tends to be limited to the short-term market—unless it is prepared to intervene directly in the capital market on a Daltonian scale. In Belgium, for example, despite a continuous decline in both the official and market discount rates in the past two years, rates on long-term government bonds have declined only fractionally from their high level—to the intense frustration of the Belgian authorities who wanted to borrow cheaply. In Italy, falling money market rates have now for some time proceeded side by side with rising yields on long-term bonds.

In Germany, the fiscal and other restraints upon the organised capital market limit the effectiveness of the central bank's discount rate still further. The fact that a large proportion of investment finance is provided by the banks under medium and long-term commitments or by industry

Perhaps you
didn't know that
BASLE

held its first Trade Fair in 1471, where products of mediaeval handicraft were displayed to admiring visitors from France and Germany. This was the forerunner of the great trade fairs of modern times.

But everybody
knows

that Basle is famous for its chemical and pharmaceutical products, its industry manufacturing ribbons for the fashion trade and heavy metal goods. It is also a centre of international banking and insurance. Needless to say, the Basle Branch of the Union Bank of Switzerland, plays an important part in the financial life of this prosperous city. Its vast experience is, at all times, at your disposal.

itself means that the response to a change in market rates is not immediately felt in the investment field. The Bank Deutscher Laender is certainly taking its responsibilities as the fount of German monetary policy very seriously, but some inroad into the German tradition of financing investment through channels other than the public capital market may be necessary before it can exercise effective control; in particular, the Bank might find it harder to counter an economic crisis in Germany—if ever the trade cycle turned really sour—than some Germans tend to assume. In France too, as the accompanying tables show, the long-term market has been relatively irresponsive to the movements in the official discount rate; but in this case the deficiency is not institutional but very real. It is investors' lack of confidence in the country's position that maintains the yield on long-term government bonds at a high level.

★

The effectiveness of European central banks' discount rates has probably been impeded still more by the excessive liquidity of banks and money markets. The liquidity of the market becomes "excessive" when it is so great as to remove from the banks and other financial houses concerned the threat that they might have to resort to the central bank for re-discount; in those circumstances, unless the central bank can dry up the surplus credit (or unless it can influence the banks by less orthodox means, as in some instances) the level of its rate can exert only a psychological influence on the pattern of market rates, and even that influence may steadily weaken. The main cause of excessive liquidity in Europe in the past few years has been not the lack of outlets into "risk assets," but the expansion of the banks' liquid assets in response to the increasing short-term borrowings of the government. In France and in some other countries such borrowings have been primarily caused by large deficits on the domestic budget; but in Germany and the Netherlands, in particular, the government's demands have arisen from the need to finance a substantial surplus on the external balance of payments. In Germany, the result has been that, as mentioned above, the bank rate has lost contact with market rates.

The margin of ineffectiveness of bank rate has been particularly marked in Holland; the rate for three months Treasury bills has now been forced down to around $\frac{1}{2}$ per cent, although Bank rate has remained at the $2\frac{1}{2}$ per cent to which it was reduced last April. Nearly all money rates in Amsterdam have indeed been falling since the first of three reductions in Bank rate occurred at the beginning of 1952—a movement diametrically opposite to that in the London and most other money markets. But this pattern, in particular the low rate on Treasury bills, has been partly the result of the Netherlands Bank's deliberate policy of greatly limiting its sales—and it is the sole institution that now sells Treasury bills. The object has been to convert most of the floating debt into five-year Treasury notes, and to force the banks to keep their liquid assets in the form of central bank cash balances.

Most European countries have been afflicted with the problem of excessive liquidity; and few have been able to face the prospect of making a frontal attack by reducing the demands of the Government on the banking system. Consequently, the monetary authorities have introduced measures that sterilise but do not eradicate the surplus

credit. The most common expedient has been to fix minimum liquidity ratios, requiring a certain percentage of deposits to be held in the form of liquid assets (cash, balances with the central bank, call money, Treasury and sometimes commercial paper); the regulations may further lay down that a minimum of this liquid reserve must be held in a certain form—either in government securities as a whole, or in one particular type of security or bill. In some instances there are additional provisions that require minimum absolute holdings of liquid assets in relation to holdings at some date in the past ("historical cover"). Quantitative credit controls of such types as these have become especially popular in Continental countries since their swing towards monetary orthodoxy, though the measures themselves have sometimes been used simply as a means of avoiding the full rigours of orthodoxy, as formerly understood.

Indeed, in some cases, they are really only an alternative to the so-called "qualitative" controls imposed by directive. Immediately after the war, France and Holland gave particular attention to direct qualitative controls upon bank lendings; but in 1948 France supplemented (and to a large degree replaced) its complicated selective controls by a compulsory ratio scheme, and at the beginning of 1951 Holland replaced its system of detailed qualitative regulation by one of thorough-going reserve ratios. Italy, Belgium and Germany have also supplemented bank rate action by variations in legal reserve ratios, whilst Sweden has, with scant success, lately attempted to use a (semi-voluntary) reserve ratio scheme to supplement its selective credit controls. Britain, in fact, remains the only major European country that has left the pattern of bank liquidity to be judged by the normal criteria of commercial bankers—and this autumn it also became the only one to regulate liquidity by the strictly orthodox device of funding issues offered for voluntary subscription on the market (as distinct from the semi-compulsory fundings of the two previous years).

In the special circumstances created by the heavy government borrowings, however, it may be conceded that even the unorthodox use of these newer types of so-called quantitative controls—which at least are less unorthodox than the detailed "selective" controls—have served a

useful purpose. In countries such as Belgium, Holland, Germany, and Italy they have prevented the unduly large base of liquidity (existing mainly in the periods when the surplus on the external balance of payments has been large) from becoming the source of an excessive credit expansion; and in that way they compare favourably with the qualitative mechanisms used, with only dubious success,

in the effort to check the expansive effects of excessive liquidity—including the qualitative system upon which Britain put its sole reliance before November, 1951.

One major objection to systems of this sort is, however, the tendency of the authorities to use them not primarily for their "classic" (American) function of sterilising deposits but rather as a weapon with which to bludgeon the banks into taking government paper on terms that the Government could not command otherwise. This object is achieved even by a system that does not specify that government securities shall form a certain proportion of the minimum ratio—since considerations of earning capacity prevent the banks from keeping too large a part of their assets in the other main liquid asset, cash. Germany has indeed used its minimum reserve ratios

wholeheartedly for the classic, rather than the "Treasury", purpose—so much so that it has made them into an additional weapon of flexibility and varied them up or down with the discount rate. But the other European countries have used quantitative credit restrictions quite unashamedly for the Treasury purpose—at first largely to force the banks to retain the mass of floating paper issued during the war. On the whole it is safe to say that whilst it is the existence of the reserve ratios that has enabled central bank monetary policy to have any influence at all in most European countries, the effective operation of a flexible and free policy demands an orthodox approach to the problem of liquidity—that is to say, an approach through the market and not by directive. Slowly, perhaps too slowly, Europe seems to be learning this.

Banking in Latin America

BY A CORRESPONDENT

IN spite of differences quite as great as those between the different states of Europe, the twenty republics of Latin America share certain economic and political features that impose some pattern of uniformity on their monetary and banking experiences. Most of them are desperately dependent on the export of a handful of primary commodities, so that they often run huge export surpluses (and import raging inflation) in times of boom, and then relapse into equally huge balance of payments deficits in times of even moderate recession. Many of them have a long history of political disturbance, and Ministries of Finance are not usually bold enough or their civil services skilled enough to control the effects of external disequilibria by fiscal policies; the political courage needed to impose disinflation is a scarce attribute in an area where an unpopular politician is still liable to be hung from a lamp-post in a public square. The result is, of course, that when a recession eats into exporters' incomes and drains away foreign exchange, these countries often inherit cost structures that have been grossly inflated during the previous boom; and, at the first sign of trouble, they tend to resort swiftly to exchange depreciation (usually on the basis of multiple rates), to rigid import licensing, to discriminatory regulations about overseas profit remittances, and even to bald-faced default on debts. Finally, in almost all these countries economic development (all too often regarded as synonymous with uneconomic industrialisation) is an article of faith.

The economic experiences of these countries in the last three years have depended largely on how fiercely the post-Korean boom and subsequent readjustment have affected the different commodities in which each is principally interested; and the immediate prospect before each of them may largely depend on how those commodities might be differentially affected by any American recession. It also depends on how far any shock administered by fluctuating commodity prices may be countered by financial and monetary policy. The several republics display an unusual diversity of types of central banking institutions; it is therefore of interest to examine how these central banks—and Latin America's rather more uniform commercial banking systems—have stood up to the strains of recent years.

Among the first central banking constitutions in Latin

America were those drafted by the American economist, Professor Kemmerer, in the 1920s. Professor Kemmerer was responsible for the constitutions that were adopted in the west coast states from Colombia to Chile (and also for that in Bolivia). He laid down that the main weapon on which these banks should rely was variation of the discount rate, while acting as lender of last resort either to the commercial banks or (quite frequently) direct to the general public. He believed that central bank lending to the government should be rigidly restricted, and that open market operations should not be allowed at all. In addition, Professor Kemmerer enjoined these central banks to follow the orthodox rule that currency circulation and bank deposits should be strictly related in fixed ratios to gold and foreign exchange reserves.

By consecrating the orthodox rules of the gold standard, these Kemmerer constitutions actually tended to intensify the violence of cyclical fluctuations. In economies such as those of Latin America, the boom tends to be associated with an export surplus and the slump with an import surplus. Reserves therefore increase in the boom; if proportionate currency expansion on the basis of these reserves is encouraged, the fires of inflation are stoked high. This is what has, in fact, happened in successive booms; but as political pressures have generally made disinflation in the downswing impossible, the Kemmerer countries have been as ready as any others to resort to undesirable forms of exchange control and multiple exchange rates in times of trouble. During the wartime and postwar inflation, they also resorted to selective credit controls and introduced powers to allow the central bank to operate in the open market. The Kemmerer system is therefore dead; and it has not left a very happy legacy behind it.

The failure of the Kemmerer experiments led Dr Robert Triffin and an able group of economists at the Federal Reserve Bank of New York to propound a new system, which was brought into effect in the 1940s, in the constitutions of the central banks of Paraguay, Guatemala, Cuba and the Dominican Republic. The object of these constitutions is to curtail credit expansion at the height of the export boom, by devices that are particularly designed for the special circumstances of the various countries. For

Yours faithfully

FAITHFUL service to the needs of agriculture, commerce, industry and the people of Britain is the objective of the Bank, in which all the advantages of intimate local knowledge of people and affairs are used to the benefit of customers and prospective customers. Local Boards of Directors in important centres in association with resident District General Managers have, for many years, contributed much to the successful achievement of this objective in providing a distinctive banking service for everybody.

Enquiries will be welcomed and will meet with immediate and courteous attention at the local District Office or through any branch.

ple, exporters may be induced to accept part of their currency receipts in stabilisation certificates instead of cash during boom years, discriminatory reserve requirements against all deposits) may be forced on the mercantile banks, and the central bank may be enjoined to keep a watch on the level of the gold reserve in relation to the price of imports and increases in (instead of the low level of) the internal money supply. This counter-factual policy, which leads the central bank to advocate a policy of disinflation in times of export surplus but allows of reflation in bad years, is the exact reverse of the orthodox rule.

To some extent, at any rate, the experiments seem to have worked. There has been a fairly high degree of monetary stability in three of the four Triffin countries in the last few years; the exception has been Paraguay, which had a raging inflation, with a ninefold price rise between 1948 and 1952. But Guatemala, Cuba and the Dominican Republic have enjoyed relatively stable prices and relatively constant export surpluses—partly, however, because their staple exports such as sugar and coffee have been less affected by the post-Korean see-saw in most other primary commodities. Among the other countries that have enjoyed relative stability have been Argentina and Costa Rica, which have also been free from very violent fluctuations in their export markets. The central bank constitutions in these two countries were inspired by the Chilean economist, Dr Max. There are no special requirements for these central banks; Dr Max has chosen to have placed his main reliance for adjustment on the economies on the flexible exchange rates, for he was in sympathy with the views of the "commodity currency" school. As there has been no unusual flexibility in exchange policy in Nicaragua and Costa Rica, it may be a fair comment that Dr Max's ideas appear to have succeeded because stable export markets have made it unnecessary to put them into effect.

Of the remaining countries, Mexico can boast of a central bank that is one of the most up to date and powerful in Latin America. It is particularly closely related to the United States Federal Reserve system, and has a full authority, including powers of selective credit rationing, of obliging the commercial banks' reserve requirements, and of opening market operations both in securities and gold. Argentina also has a central bank of great power. This was once a highly orthodox organisation, for it was established on the advice of Sir Otto Niemeyer in the 1930s. Sir Otto's system differed from Professor Kemmerer's in that it allowed open market operations from the start; in Argentina, unlike most of the other republics, such powers were used, and were usefully employed. In 1946, however, the Perón regime introduced drastic changes; in addition to nationalising the central bank, it passed legislation whereby commercial banks in Argentina were to receive deposits from private individuals only as agents for the central bank, and whereby they could make loans to their private customers only from their own funds (that is, from their own capital and reserves). This legislation, while it was politically inspired, was supposed to have some disciplinary effect—in stopping the banks from "creating deposits"; but it did not prevent a steady expansion of the money supply, and a price and wage inflation which continued through the early months of this year. This inflation was the inevitable consequence of the Argentine Government's

attempt to foster industries in which Argentina is at a comparative disadvantage at the expense of agriculture, in which it has great comparative advantages; it was also fostered by an attempt to peg government bond rates at 3½ per cent for long term and 1½ per cent for short term maturities—ridiculously low rates for a country with a long history of inflation. Recently, the position in Argentina has been reversed; late in 1952, the trade balance shifted into surplus, and subsequently prices and urban wages have fallen. This has been partly due to a wise damping down of the industrialisation policy; but it remains to be seen whether the reversal may not itself be reversed in time.

The other major South American country, Brazil, has no true central bank at all, in spite of frequent discussions of proposals to create one. However, the Bank of Brazil is a state owned bank, which acts as the government's banker and carries out discounting operations, as well as transacting ordinary commercial banking business; it also performs the duties of exchange control, which are of crucial importance in most South American countries, and which are generally entrusted either to the central bank or to some institution that is closely related to it. It is a moot point whether the lack of an ordinary central banking mechanism has had much to do with Brazil's sorry record of inflation and payments difficulties in recent years; even if there had been an established way of damping down credit inflation, there would not necessarily have been the will to accomplish it. It should be noted, however, that Brazil seems at last to have attained some stability of prices since the early months of this year, and that wages have been stable since early in 1952; the foreign trade position has also recovered from the excesses of 1951-52, although it would be optimistic to suppose that this recovery will necessarily last.

★

Ordinary commercial banking in Latin America has two roots—the foreign banks and the local institutions. Among the foreign banks, British institutions (especially, of course, the Bank of London and South America) have always played a predominant role. German, Spanish, Italian and French interests have also taken an active part, while in recent decades Canadian banks have become important and United States banks have become very important indeed. From the earliest days of the international banks in this part of the world, overstrained governments have tried to impose discriminatory legislation against them. This has led to a rash of locally registered subsidiaries; and many of the banks that are now purely locally owned and controlled had origins as international banks, although others were purely local in origin. The strong British influence seems to have been reflected in the tendency to fairly widespread branch banking systems (although the local banks do not usually cross national boundaries). A common activity, and frequent weakness, of the local banks has been to make long term loans, often in connection with the important domestic industry—or sport—of real estate speculation.

In some countries, especially Costa Rica and Argentina, substantial parts or the whole of the commercial banking system have been nationalised. Usually, however, the commercial banks are still privately owned, although in Brazil and some other countries they have to compete with government owned central banks or quasi-central banks that carry out ordinary commercial banking operations. Another very common way in which Latin American governments

have entered the field of ordinary banking has been through the establishment of mortgage and agrarian banks; these institutions are usually state-owned and operated, often in response to the influence of political pressure groups. In recent years there has also been a large crop of new state-owned development banks. These have been established to make long-term loans for economic development; nobody seems very clear about where they are to get their funds from, although they angle for capital from abroad.

It would be a mistake for foreign traders and businessmen to throw up their hands in disgust about trading and financial developments in Latin America, despite the disappointments and discrimination that they have had to suffer in recent years. These essentially volatile economies would have very difficult problems ahead of them, in a

world in which the trade cycle has not yet been conquered, even if they had the right economic institutions for their particular stage of development and the right political atmosphere and the necessary administrative expertise to make those institutions work. The first step towards sanity must probably be to devolve powers of economic control away from weak governments towards strong central banks, which may have to be of a rather novel kind; in some republics, at any rate, steps of this kind now seem to be under way. The major danger is, perhaps, that a serious recession in the prices of primary commodities might come before sufficient of these experiments have been started, and while others are too immature to take the strain. For central bankers may not like to run the risk of being strung up on lamp-posts either.

Revival in the Exchange Market

THE past year has been a period of re-expansion and rehabilitation in London's foreign exchange market. The process of rehabilitation, of course, really dates from December 17, 1951. Until that date only the Bank of England, acting for the Exchange Equalisation Account, had bought and sold foreign exchange as a principal; the commercial banks had been mere agents, buying at fixed rates from the Bank of England and selling to it, also at fixed rates, the specified foreign currencies they obtained from their clients. There was therefore a sudden rising from the dead when the Bank of England announced, in December, 1951, that the authorised banks would again be allowed to negotiate transactions for approved purposes at or within the official upper and lower limits for seven specified currencies, together with three "unspecified" ones.* The firms of foreign exchange brokers, whose business had vanished overnight with the coming of exchange control in 1939—and whose organisation had been largely dispersed and its personnel absorbed into the vast new exchange control department of the Bank of England—had to be swiftly reconstituted. And the foreign exchange departments of the commercial banks themselves had to be refurbished, dealers discovered or re-trained, the dust-sheets taken off the old paraphernalia of dealing boards, direct lines and calculating machines.

In the form in which it entered the year 1953, however, this revived foreign exchange market was still essentially bilateral. There was freedom for arbitrage between United States and Canadian dollars, but, apart from this, the banks in London had still to restrict their operations to bilateral dealings. When dealing with Brussels they could do so only in sterling against Belgian francs, with Zurich in sterling against Swiss francs, and so on. The first real break through this curtain of bilateralism was made on May 18th last, when arrangements were made for the resumption of arbitrage transactions on a spot basis between authorised banks in the United Kingdom, Belgium, Denmark, France, the Netherlands, Sweden, Switzerland and Western Germany, in the currencies of any of these countries.

* The seven specified currencies at that time were the US and Canadian dollars, the French, Swiss and Belgian francs, the Dutch guilder and the Portuguese escudo; the three unspecified currencies concerned were the three Scandinavian crowns.

These arrangements involved no change in the permitted methods of settlement by importers and exporters. The necessary forms had still to be filled in, permission had to be obtained to secure foreign exchange; and any specified currencies obtained as the proceeds of exports or in any other manner had still to be sold through an authorised bank. But a breach had been made through the principle of bilateralism, and the scope for effective competition by British banks in international foreign exchange dealings was immensely increased. At first this freedom for arbitrage was restricted to cash transactions; but from October 5th it was extended to transactions in forward exchange, provided the forward operations were limited to positions up to three months. This was an example of the authorities' policy of giving the market only a little rope to begin with, and then giving it more later when they saw that neither the letter nor the spirit of prevailing exchange control regulations was being garrotted thereby.

The results have been heartening. The volume of business transacted in the London market shows that dealers have rapidly reacquired their former skill. Some foreign exchange departments, notably those of the merchant banks and acceptance houses, had never completely lost touch with this type of business, and they rapidly adjusted themselves to the opportunities for increased activity that the relaxations offered. The rest sprang back to life with remarkable vigour. Moreover, one handicap to the re-emergence of London as the principal foreign exchange dealing centre in Europe, the fact that British authorised banks are not allowed to deal in the many types of free sterling, has been losing importance in the last two years. As the accompanying table shows, the discounts on the two main types of unofficial sterling ("transferable" and "switch") have now narrowed to a point at which it cannot be profitable for many people to use them.

The volume of business transacted by the London foreign exchange market has also benefited from the gradual transition from state trading to free markets in the handling of imports into this country. At one time, just after the war, some four-fifths of Britain's imports were bought by Government departments; and even as late as 1950 the proportion was as high as 50 per cent. As a result of relaxations already made—or, in the case of cotton, in immediate prospect—the equivalent percentage now is very low indeed.

Government departments occasionally purchased through the market the dollars and other currencies they needed for import payments; but, generally, they obtained them directly from the Exchange Equalisation Account. The progressive reopening of free commodity markets has therefore brought much new business back to the market, and has tended to offset the fall in business that has resulted from the fall in raw material prices.

The reopening of the commodity markets has also brought some changes in the system of exchange control. Until this year most of the reopened commodity markets were those dealing primarily in sterling commodities, such as rubber, tea, tin and wool; the scope for exchange losses from the operation of these markets was very small. This potential danger became greater when copper and grains were returned to free markets this year. In the copper market, no special precautions have been taken to guard against it; the exchange control arrangements for dealings in this commodity conform exactly to those made when tin, lead and zinc were freed. Participants are allowed to make purchases of copper in any part of the world, to hold stocks where they wish and to sell in any part of the world without prior consent from the exchange control. The only check kept on these transactions is a *post facto* inspection by the Bank of England of monthly returns submitted by the authorised participants in the market.

The exchange control arrangements for the grain market, however, lay down that grain of American or Canadian origin (and any other grain that has been purchased for dollars) may not be sold to an overseas buyer except against payment in dollars. In other words, British merchants are free to buy grain for domestic consumption where they wish; but there are controls over re-exports, to ensure that no net dollar loss is incurred as a result of arbitrage transactions. It will be recalled that when commodity arbitrage between the dollar and EPU areas was re-established for a

short time in August, 1952, there was an immediate rush by European countries to buy dollar grain for sterling. That form of convertibility has not been risked again.

Another testimony to the resurrection of the foreign exchange market in London is that the volume of compensations now handled monthly by the European Payments Union has fallen to a small fraction of what it was a year ago. Instead of being operated by substantial book entries

TABLE III—THE STRENGTHENING OF STERLING

Sterling Rates in New York (dollars)	End-1951	Mid-1952	End-1952	Mid-1953	Nov. 9, 1953
Official rate	2.78½	2.78½	2.81	2.81½	2.81½
Transferable sterling..	2.39½	2.66	2.72½	2.70½	2.74½
Discount (per cent) ..	14	4.5	3	3.9	2.4
Security sterling	2.35	2.47	2.63	2.65½	2.70½
Discount (per cent) ..	15.5	11.5	6.5	5.5	3.9

once a month the compensation of intra-European payments is now done day by day—indeed, hour by hour—as a result of the arbitrage deals that are now permissible between the eight most important countries of the EPU group. In this arbitrage business London now takes the undisputed lead; it handles the bulk of the transactions. The settlement of final balances is still, of course, done through the EPU, either in gold or in the credit provided under the EPU quotas. If ever the limited area of multilateral trade and payments that is embraced within EPU and the sterling area should expand—and an approach to something nearer genuine sterling convertibility be made—the London foreign exchange market should be well equipped to take up the challenge and its responsibilities. Its one real disappointment in 1953 has been that convertibility seems to be as far away at the end of the year as it was at the beginning of it.

The Decline in "Free" Gold

THE past year has seen some interesting developments in the international market for "free" gold—that is, gold dealt in at prices above the levels determined by the exchange parities of currencies as agreed with the International Monetary Fund. The dominant element in the history of this market has been the persistent fall in the free market price, which has crumbled steadily from \$37.50 a year ago to \$35.35, and now, therefore, is only a shade above the dollar parity price of \$35 a fine ounce. This decline has been the result of a persistent offering of newly mined gold in the free market and of a considerable contraction in the demand for premium gold. This sagging of demand has been primarily due to the easing of international tension, particularly in the Far East, but it also reflects the waning of hopes of an increase in the American official price of gold—hopes upon which a considerable bull speculation in gold had been built up.

Meanwhile, during this phase in which the premium on "free" gold has been running off, dealers in the London bullion market have been given a little—disappointingly little—scope for participating in the "free" dealings. London firms of bullion brokers have been granted permis-

sion to act as agents for the sale against US dollars of newly mined gold from the British Commonwealth to buyers outside the sterling area. This was a gradual development, which began with permission given to London houses to handle Rhodesian gold for sale against dollars outside the scheduled territories. It was then extended to Australian and West African gold. This agency business does not yet extend to South African gold, although in effect certain London houses, through subsidiaries established in South Africa, have handled much of the South African gold that has been sold in the premium markets, in processed or fabricated form.

Within the last few weeks the South African authorities have decided that, in view of the tiny premium now commanded by gold sold on the free markets, they must jettison the restrictions that, in deference to the wishes of the IMF, they had imposed upon all South African sales of gold in the free market. They no longer insist that such gold must be sold in processed form. The sales are still limited to 40 per cent of the supply of South African gold, but the gold can now be sold in the form of fine bars. It should be only a matter of time before the London market is

given the same facilities for handling South African newly mined gold as it already enjoys for newly mined gold from other Commonwealth countries.

The free gold market divides itself naturally into three broad areas—the Far East, the Middle East and Europe. In the Far East the most important dealing centres are Macao and Bangkok. During the past year the latter centre has gained considerably at the expense of the former. Trade in Macao is still hampered by the fact that all import licences are issued to one fabulous operator, whose virtual monopoly of the business has made this small Portuguese enclave on the mainland of China a decidedly expensive centre in which to deal, and one in which the expenses have not been sufficiently reduced to leave scope for profit now that the premium is so small. Siam has for some time past been a considerable hoarding centre for gold, and it has recently also become a transit centre independent of Macao.

The capacity of the Far Eastern market to absorb gold has been greatly reduced. Communist discipline, combined with the virtual disappearance of the wealthy merchanting classes, has achieved what a few years ago would have seemed unattainable—the virtual suppression of the hoarding demand for gold in China. The famines and agricultural destitution of the past year have even brought a certain amount of metal out of hoard. The market in Hongkong has continued to play some part in the Far East gold traffic; the customs and exchange controls that were supposed to restrict this have been to some extent circumvented, and have themselves been relaxed recently. Gold can now be sent to Hongkong on a "through" bill of lading. Bullion dealers, however, find that there are some inconveniences in this procedure, as the authorities in Hongkong may question the bona fides of a "through" bill if the gold in question remains in the colony for more than a very short period. The Hongkong authorities are also prepared to grant import and export licences for gold, but in their export licences they maintain a "black list" of destinations which at present includes Macao, the most important of the Far Eastern centres to which gold might be sent through Hongkong. It is now possible to obtain a gold export licence from the United Kingdom for Macao—but then to find that the transaction is interrupted in Hongkong because re-export from there to Macao is still prohibited. These anomalies in the gold market and the contradictions between British and Hongkong practices are probably temporary phenomena; the considerable advance that is being made towards a genuine freeing of the international gold market has not proceeded uniformly, or in any coordinated way, in the several centres.

The next main geographical grouping of the international gold market is the Middle East. The main centre of distribution for this group is Beirut. This market is fed by gold from Europe, and it supplies the Middle East countries, including Arabia; these countries in turn smuggle gold to the forbidden shores of India. The Middle East market has, however, the solid basis of a genuine continuing demand for gold for currency purposes. In Arabia and the contiguous sheikdoms, including that of Kuwait, gold coin still circulates and provides a means of payment as well as the recognised measure of value. The booming prosperity of these rich oil regions creates a steady demand for gold in all its forms—coins, bars and ornaments. The dhows of the Persian Gulf and the Arabian coast carry much of the smuggled gold to India. This traffic has

diminished considerably during the past year. One reason for this diminution is technical; the authorities in Kuwait and other Middle East centres have during the past year placed more rigorous controls on dealings in rupee notes, and this fact has considerably hampered the traffic in gold with India—since rupee notes necessarily constitute the main means of payment for the smuggled gold. The other and more fundamental reason for the diminution in this traffic has been the declining demand in India itself. The money surpluses that formerly went into gold hoards are no longer mounting up as they did in the years of postwar inflation; and this tightening of money has been reflected in a drop in the rupee gold price this year from 85 to around 81 rupees per tola (from \$47½ to \$45½ per ounce).

★

The European market has recently become only a shadow of its former self. France, which until a few months ago was the principal Western "sink" for gold, now appears to be saturated with the metal. The speculators who had bought in the confident anticipation of a rise in the official dollar price for gold have recently lost heart and have been liquidating at a substantial loss. Confidence in the franc has not revived, but there is a limit beyond which the French peasants and other men of wealth cannot go in immobilising their savings in the form of gold. The main buyer of free gold in France recently has indeed been the Bank of France itself; the bank has conducted a highly profitable trade by buying bar gold, while selling Napoleons and Louis coins to the French public.

Most of the gold reaching the Paris market comes through Switzerland, a country where transit traffic is wholly free from control. Geneva is the obvious transit centre and the imports into France, though illegal, can now be effected with such facility and have to overcome such perfunctory checks that they hardly deserve the name of smuggling at all, though that is what they are. Zurich is the main dealing centre. It has shared with Amsterdam the task of redistributing the increased offers of Soviet gold that have appeared on the market during the past year. The shortage of sterling in the hands of Communist countries has been reflected in the offers of platinum, silver and gold by these countries. The sales of gold have so far been modest, but in prevailing market conditions they have none the less been a significant marginal factor that has helped to press the free market price down to an extremely narrow margin over the official parity. Though the gold is of Russian origin, the bars do not usually bear the hammer and sickle brand of the Moscow mint. Before offering on this market they are remelted or, in market jargon, "put through the laundry" to remove their red taint.

The European market has not been noticeably affected by the ambitions of Tangier. The market there has failed to live up to the expectations that were held out when plans were made a few years ago for Tangier banks to use the complete exchange freedom enjoyed in that city to issue gold certificates through which free market dealings might be made without the need to ship bullion. Neither the financial standing of the city nor the prospects for its political stability have made it possible for Tangier to encroach on the free market to any considerable extent. In any case, the complaint of the gold dealers today is not about lack of markets but about lack of business.

FROM THESE IMMENSE presses come bodywork and pressings for many of the most famous names in the British motor-car industry, including Austin, Daimler, Hillman, Humber, Jaguar, Lanchester, Morris, Morris Commercial, M.G., Riley, Rover, Singer, Wolseley.

Pressed Steel Company Limited are the largest car body manufacturers in Britain and pioneers in this country both of pressed steel

bodywork and unitary construction in quantity. The unequalled service of the Company to the British motor-car industry is founded on engineering and production facilities second to none, an organisation without parallel in Britain, and unsurpassed technical experience.

In its continued — and continual — expansion this service will, also, not be denied to manufacturers yet to achieve world renown.

PRESSED STEEL COMPANY LIMITED

FACTORIES: COWLEY, OXFORD. THEATR, BERKSHIRE. LINWOOD, SCOTLAND

HEAD OFFICE: COWLEY.

LONDON OFFICE: SCEPTRE HOUSE, 169 REGENT STREET, W.1.

Manufacturers also of Prestcold Refrigerators, Steel Railway Wagons, Agricultural Implements and Pressings of all types.

CHRISTMAS NUMBER

...with a Difference

Once again *IDEAL HOME* Magazine brings to its readers that "something extra": that forethought, that added care in planning and production that makes it so outstandingly the leading magazine in its field.

Designed by experts to win you glowing tributes from your guests, its special supplement—"For the Hostess"—is only one fine feature of a Christmas Number that really helps your Christmas. Reserve your copy now!

156 SUPERB PAGES

Including a bound-in 8-PAGE CHRISTMAS EXTRA—(Meals, Drinks and Style)—"FOR THE HOSTESS"

Other Contents Include—Home and Family Gifts: Christmas Party Fare: Wines and Liqueurs: Ideas for Interiors: All-Year Comfort: Clever Cupboards: Making Your Own Music: Garden Gifts: Cottage Conversion, and TV for Fringe Areas.

Magazine

ON SALE NOVEMBER 25 — TWO SHILLINGS

Your after shave perfection

PRESENT a vigorous complexion to a world that judges on face values. Use Imperial Leather After Shave Lotion and enjoy feeling

clean shaved as you have never enjoyed it before.

Imperial Leather toilet luxuries also include Shaving Sticks, After Shave Talc, solid and liquid Brilliantines and the famous Imperial Leather toilet soap. From all good shops.

Cussons IMPERIAL LEATHER
Toilet Luxuries

Craven-

tobacco

to

live for

IN TIMES OF STRAIN and trouble a Craven smoker turns to his tobacco for comfort and solace. And slowly, but surely, the mellow and cool burning CRAVEN casts its richly comforting spell to make life easier and brighter. "It is" said Sir James Barrie in 'My Lady Nicotine' "a tobacco to live for." Every Craven man knows how right he was.

Try CRAVEN

Obtainable in 3 fragrant, slow burning, deeply satisfying blends.

Craven Mixture 4/7 oz.

Craven Empire de luxe Mixture 4/3 oz.

Craven Empire Curly Cut 4/4 oz.

Last week
the Directors of Accles & Pollock
gave us a bit of a start
moving along the corridors at a rattling pace we found them

holding a skeleton
tubular steel car chassis six gallons of petrol
and a brand new sales chart. Close behind them was a racing
car manufacturer well in front
of modern trends

he is using tubes to lose weight at the
same time increasing strength
thus cornering nicely
all the grand prizes
as the idea
spreads motorists generally
will benefit from better
cars and Accles & Pollock
sales curve will go off
in top gear

Accles & Pollock Ltd. • Oldbury • Birmingham • A T Company • Makers and manipulators of seamless tubes, in stainless and other steels.

Harmony of line

Mechanical perfection expressed in a form of measured beauty.

Is your product
regularly advertised to
this market of
6,750,000
men, women and
children?

DAILY HERALD families represent a market of 6,750,000 men, women and children whose total income exceeds £1,000,000,000 a year. These are the people who are today one-third better off than pre-war (despite the increased cost of living) and who for the most part have two or more wage-earners per family each week.

Add to these facts that in 53% of DAILY HERALD homes no other national daily newspaper is taken and it is clear that advertising in the DAILY HERALD is a must in any national sales campaign.

Copies of QUANTUPLICATION—a media planner's guide to the better use of the DAILY HERALD—and copies of the first four of a new series of Commodity Reports on "The Buying Habits and Purchasing Power of DAILY HERALD Readers"—Boot and Shoe Cleaners, Pet Foods, Footwear, Buying by Mail—will be sent on application. Other reports in this series will deal with Outerwear, Holidays, Bicycles and Accessories, Razor Blades, Shaving Soaps and Dentifrice.

Conscription Continued

THE House of Commons has shown this week that, despite all the Bevanite disputes, defence policy remains in essentials a subject of all-party agreement. In the debates on Monday and Tuesday conscription for the armed forces was discussed both with unusual thoroughness and with much good sense on both sides. This was an accurate reflection of public opinion. Most young men dislike being conscripted, and their parents generally dislike it more. During two years' service much time is inevitably wasted on activities that do nothing to make the conscripts good reserve soldiers for the future, and some feelings of resentment cannot be avoided. Conscription imposes a heavy burden on individuals and on the whole economy of the country, and everyone must feel it to be unfair that there should be a two-year period of service here when most western countries consider eighteen months an adequate contribution to their common security. Nevertheless, public opinion is acquiescent; the necessity of the present conscription arrangements is accepted in good faith if not with complete understanding.

It is this that makes the issue on which the parties divided on Monday not only narrow but also artificial. The Opposition's defeated motion suggested that the time had come when the present two-year period of service should require annual renewal by Parliament, instead of remaining in force automatically for another five years unless Parliament moves to change it. The Government's case on this point is sound. Everyone hopes that the burden of conscription can be lightened, but the realistic presumption, as far ahead as can be confidently foreseen, is that in fact it cannot be. The legislation should surely reflect this public mood. The period of conscription can be ended or shortened easily enough if circumstances change; but in the meantime it would be artificial to treat conscription as an open question requiring a new Parliamentary decision every year. That would create an appearance of uncertainty about British military policy which fortunately has no real basis.

There is also a more particular criticism of the Opposition's defeated proposal. In fact what is suggested was a formal change in procedure, but with the phrase "the time has come" it would have been taken abroad to imply something more substantial; it might have suggested that a definite relaxation in Britain's defensive measures had become more likely. This would be a bad time for such an idea to get about. Nothing that has happened recently in international politics would justify a relaxation. If postwar British Governments of both parties have hitherto been right to provide for a settled conscription policy, running for more than a year at a time, this is emphatically not the moment to appear to make it all more doubtful.

But if this is an overwhelming case against the formal change proposed by the Opposition, it does not mean that all discussion of changes in conscription is superfluous, premature or harmful. On the contrary, there is much that needs up-to-date discussion and it

would be a pity if the Opposition's well-meaning concentration on an artificial point obscured the need. The need arises from the circumstances in which public opinion has come to accept that conscription is the only way for Britain to be secure. That acceptance arises from an historical process, not from any reasoned argument that could be consistently applied throughout the past eight years. At first, it seemed fair that men who had just missed the war should be called up in order that others might be demobilised more quickly. Then a public grown accustomed to the idea of a citizen's army accepted conscription as the natural way of dealing with the commitments of occupation left over from the war. And when this patience might have been exhausted, the dangers of the cold war reconciled people to the continuing need both for military training and, particularly after the Communist aggression in Korea, for the stationing of large forces overseas.

★

In these circumstances the politicians have continually been saved from the necessity of justifying conscription to their constituents *de novo* in each particular set of circumstances. And, one suspects, the military advisers have thereby been saved from the necessity of justifying themselves to their political masters. To a remarkable extent, particularly for a country involved in great economic difficulties, the Services have been allowed to act, in the demands they have made on the nation's manpower, as judges in their own cause. The results, so far, may well have been good rather than bad. If political discussion had been more concerned since the war to probe into the real problems of defence policy, there would inevitably have been at first much fumbling and misunderstanding (as, indeed, there was in the Bevanite controversy); probably the country is at present the better for having left much to the military experts.

The difficulty is that such a situation is unstable. Sooner or later, in a democracy, politics asserts itself; and if the assertion is uninformed, it is liable to be badly timed. The changes in military needs that are obvious to the layman are not necessarily those that in reality call for the sharpest changes in defence policy. At the moment, for example, there is a possibility that a considerable number of troops will soon be withdrawn from the Suez canal base and some from Korea. There is no necessary and direct connection between such a reduction in commitments and the possibility of cutting the period of conscription. But it is very tempting for the politician to exaggerate the connection, and the more tempting because he is aware that new weapons may have far more revolutionary effects on strategy. Here again, the connection is less simple and direct than the layman is disposed to think; but he must hope, and indeed insist, that the enormous industrial cost of new weapons and equipment should be offset

by some saving in direct service manpower. Meanwhile, the military situation has certainly changed in the sense that Nato planning is no longer based on a "critical date," by which the greatest possible strength was to have been built up. Now the strategists' concern is with alertness over a long period. This change produced last year the Prime Minister's talk about a new pattern of defence, but its implications for manpower policy have remained mysterious.

The danger about all these uncertainties is that they may boil up on some trivial occasion and produce a demand to cut commitments for defence in a way and at a time that would do quite disproportionate harm. The danger will, of course, be the greater if a period of sharper economic stringency again comes into prospect. The temptation then, as last year, would be to make cuts that do not immediately affect the forces' strength—cuts in research and development expenditure and in production of the more experimental weapons—while leaving manpower policy unchanged. That would probably be mistaken; but it might also be unavoidable, if there had been no prior examination of how to make an orderly reduction in the forces' manpower without either suddenly shelving overseas commitments or wastefully throwing training programmes into chaos.

Thoughts of this kind would be misrepresented, not expressed, by making conscription dependent on annual renewal by Parliament. The presumption in the public mind is and should be that conscription will have to go on. But there is none the less a valuable element in the Opposition's attitude. It is important to have a continuing review, by people other than the military experts, of how conscription is working, of exactly what purpose in general defence policy it serves, and of how the scope and period of service could best be changed to meet various hypothetical changes in international affairs and in military circumstances. The object of such a review should be to increase public understanding of defence policy, to prepare the ground so that the political decisions—when they are needed, as sooner or later they must be—rest on a better basis of knowledge and are more easily intelligible to the public and to other countries.

A Royal Commission, which has been suggested for this purpose, would be too cumbersome and cautious. What is needed is a less formal, and in a sense a more politically minded, committee of inquiry. It should be charged in the first place to report specifically on the present operation of the call-up, but it could usefully be kept in being afterwards for wider enquiries. It might be an independent committee appointed by the Minister of Defence, but a select committee of the House of Commons would probably be more appropriate. Its appointment would not in any way imply that the public or the present Government is anxious to escape from Britain's commitments in western security; it would be the means of giving a proper point to the serious thought and public explanation that this week's debates have shown to be required.

Middle Eastern Alternatives

BECAUSE differences between Britain and Egypt over the future of the Canal Zone have been narrowed to a couple of crucial points, it would be wise to assume that a settlement is to be expected in a matter of weeks. Indeed, there is reason to believe that calculations in London may not be keeping up with events in Cairo. Our correspondent (in an article on page 591) reports that the Egyptian negotiators have suddenly become content to pause and let things ride; the reason for this is an improvement in their internal position, and another is the growing feeling that if they wait until 1956 and then exercise their right under the treaty of 1936 to appeal to the United Nations against the unwanted presence of foreign troops, they are sure to get a heavy vote against any British claim to stay. Simultaneously, in London, a posse of Tory back benchers and retired public servants is denouncing the impending agreement in advance, and without full knowledge of its content, as another British surrender in the Middle East—a Tory Abadan, as it were. The emotional debate provoked by such a prospect ignores not only the new state of mind in Egypt, but the fact that two distinct but related matters are involved. First, there is the question of what is a mutually acceptable Anglo-Egyptian arrangement about the base and the conditions in which British troops will be withdrawn; secondly, there is the question of what is a suitable and practicable policy for the Middle East as a whole.

It is often overlooked that the strategic and political setting of the Middle East defence problem has been changing. The traditional British fear of Russian expansion southward towards India and the Persian Gulf remains, reinforced by the revelation during the last war of what happens when North Africa and the eastern Mediterranean are under enemy threat; but the means for the protection of the Middle East bridge between Africa and Asia have altered. The United States, after generations of labelling Britain's technique of restraining Russia as "imperialistic," has suddenly seen the joint of the policy. Turkey, lying directly in the Russian path, is protected by and linked with the Atlantic alliance for the defence of Western Europe. Greece and Turkey have been given by the United States both a guarantee of protection and much military and economic aid. And American policy in the Arab states has been much more active and realistic in the last two years. Britain remains the great power with the principal military responsibility in the Middle East and it is, generally speaking, the wish of Commonwealth governments that it should remain so with their support. The line of communication is as important as it ever was, but no partisan of the policy any longer expects or desires that Britain should play the protective role on its own.

Indeed, any British Government that attempts to re-think its Middle Eastern policy finds itself from the outset taking into account the differing attitudes of half a dozen or more governments, even apart from the Middle Eastern states themselves. There is that of the United States, interested in defence against the Soviet Union, in security for oil supplies and in the safety of Israel. There is that of France, concerned with the growing links between the Arab League and North African nationalism. There is that of Pakistan, with its inclination to an Islamic grouping of states; and that of India which is suspicious of Pakistan's intentions and their effect on its own defence.

How different is this state of affairs from that which was familiar to British statesmen of the past. It was the old rivalry with France that first brought British forces to the eastern Mediterranean. But they stayed there all through the nineteenth century on guard against Russia. For a hundred years it was a main tenet of British policy to maintain, with the help of the powers, the integrity of the Ottoman Empire as a buffer; further east Persia filled a similar role. These policies were not devised out of love for the Turks and Persians, but simply to check Czarist imperialism. The discovery of oil and the immense development of the fields in the last half-century merely provided a most potent reinforcing argument for what was already traditional British policy. A new *raison d'être* was given to that policy just as the means for enforcing it by British power alone began to wane.

★

There was, then, a time when Britain could go it alone because it could call simultaneously on a powerful Mediterranean fleet and on the Indian army. To maintain a similar monopoly of power in the Middle East today would require large and widespread military establishments, money to spare, and the will to make and execute policy singlehanded. Those factors have all diminished. The relative strength in war of Britain compared with that of the Middle East states themselves is as great as it has ever been—perhaps greater; but the threat of force (as Abadan showed) is apt to be derided as something outmoded and damaging to the government that uses it. The maintenance of British interests in the Middle East by anything like the old methods has become very difficult. Instead of dominating the area, the British are in it in force without dominating it. That, as the troubles in the Canal Zone have shown from time to time, may be worse than being out of the area altogether. It is no longer possible to stand alone.

There have been inconclusive plans and attempts to get round this difficulty. The idea of a Middle East Defence Organisation linked to Nato quickly faded away. In January, 1952, Sir Winston Churchill suggested in an address to Congress the despatch of a small token American force to the Canal Zone as a sign that Britain was there to defend an international interest. Nothing has come of that suggestion, but the idea behind it was certainly right. The key to the Middle East's security unquestionably now lies in Washington. Until very recently, it is true, British and American aims and methods in that area were more apt to frustrate than to supplement one another. In American eyes British policy was tainted with colonialism, and in British eyes American policy was foolishly sentimental. Neither charge could be proved, but both were kept alive by the fact, or the suspicion, of commercial rivalry. But the process of education—on both sides—which began with President Truman's guarantee to Greece and Turkey was sharply accelerated by the successive exposures of the extent to which British power had been weakened. Moreover, one of Dr Mossadeh's undoubted achievements was to demonstrate to everybody that western businessmen in the Middle East had more to gain than to lose by sticking together. Now, especially, since Mr Dulles's visit to the Middle East earlier this year, the essential identity of British and American interests has become clearer.

★

There is, therefore, some chance of an Anglo-American policy for the Middle East, and it is important that nothing should be done to frustrate that chance, whether by stubborn action or by rash words. But what is the policy to be? The policy of dominating the area and insisting on a privileged position is no longer possible for Britain alone; is it possible for Britain and the United States together? It would require determination to the point of military toughness; it would run into serious moral opposition even in the Anglo-Saxon world; it would be resented and opposed in a Middle East which is far more capable than it used to be of turning resentment into practical retaliation; it would put Britain and America in the dock at the United Nations; and it would cost a great deal of money. In short, it is an unattractive policy.

A modified form of this policy would be to stay as partners instead of prefects. This has been tried and has in some cases failed: the Treaty of Portsmouth with Iraq and the Middle East Defence Organisation are its tumbled monuments. The hard fact is that what the Middle East, generally speaking, wants of the West—apart from oil revenues and aid in development—is its absence. Yet it is important to realise that the Middle East is unlike India. The material losses suffered by Britain in withdrawing from India have been offset by gains of a different kind; but in the Middle East states where the withdrawal has been partial there

have been no gains at all. Partnership with foreign powers is still not acceptable to most of the states concerned, largely because their governments have not acquired the kind of confidence and experience that enabled India to treat the Great Powers in an adult manner. Until that feeling has grown, a working political and economic partnership between local and foreign governments is unlikely to develop.

The real alternative to going it alone is therefore not to alter the terms on which Britain stays, but to get out on the best terms possible, to recognise that bases in unfriendly countries can be a serious liability, and to hope that the accomplished fact of withdrawal will create the possibility of new relationships later. This is as unattractive as the tough policy. Nor is it *a priori* much more likely to succeed. It involves trusting inefficient and wayward Middle Eastern states to keep the Soviet influence at bay (with the help of American and British money) without blackmailing the oil companies or hopelessly squandering the oil revenues. It means also running all the risks of open war between the Arabs and the Jews.

★

What then remains to suggest? An alliance of Middle Eastern states on the lines of the Balkan Pact would have some virtues—but minor ones. A treaty between Turkey, Persia and Pakistan, for example, might have some effect in Moscow, for it would associate soft and unguaranteed Persia with a member of Nato and a member of the British Commonwealth. And it might encourage that local self-confidence the absence of which has been a barrier to acceptance of even so modest a venture as the Middle East Defence Organisation. But it is not at present practical politics, and even if it were, from the western point of view it would be a long-term gamble, justifiable only on the assumption that there is plenty of time before it would be tried in the fires of a real world crisis.

One thing is certain in this complex and baffling problem. The choice between the policy of toughness and the policy of withdrawal has to be made in principle, whatever local variations from it may prove possible—for example, in Jordan or, in the American case, in Saudi Arabia. Compromise in principle is not possible because a bit of one policy damns the whole of the other. Any possibility of reaping political rewards by withdrawal is jeopardised by the slightest tendency to revert to an assertive temper; and the difficulties of standing firm for the defence of vital interests are immeasurably increased by any hint of weakness or withdrawal. Of the two unpleasant alternatives, which is it that Washington and London, after mature consideration, have decided to go for? Until the public has been given some glimmering of the answer to that question, it will be quite impossible to form a reasonable judgment on the terms of any agreement with General Neguib that the Government may present to Parliament.

Television's Medium Wave

THE Government's White Paper on Television Policy (Cmd. 9005), which appeared last Friday, is primarily a political document. The task that confronted the Postmaster-General was not that of devising a framework for television that he believed to be ideal, but of producing a scheme that fulfilled the Government's promise to a group of its backbenchers to introduce some element of competition into television while offending as little as possible the influential and vociferous element within the Conservative party that is perfectly content with things as they are. It is only in this way that some of the White Paper's oddities can be explained. "As television" it says "has great and increasing power in influencing men's minds, the Government believes that its control should not remain in the hands of a single authority, however excellent it may be." An admirable sentiment, but surely as true—or virtually as true—of broadcasting to the ear as to the eye. Why then is sound broadcasting not mentioned? The answer is one of politics, not of logic. It is not that the Government thinks there is any distinction of principle, but because its commitment (which has turned out to be a rather awkward one) happened to refer to the one and not to the other. Or again, though a new broadcasting organisation is to be set up, no change whatever is to be made in the present position of the BBC or even in its plans for future expansion (unless the abandonment of the shadowy prospect of a second BBC television programme be so regarded). Here too, the reason is not that a set of arrangements designed for monopoly is thought to be equally perfect for the changed circumstances of partial competition, but that it will be hard enough to get the proposal for a second corporation through both Houses of Parliament without the task being complicated by a positive dismemberment of the BBC.

It is these conflicting pressures that explain why so much elaboration of structure is proposed for a minor part of the smaller half of what is in total not a very large industry—why there is so much steam hammer for so little nut. The BBC is encouraged to go ahead with its plans for providing television for 90 per cent of the population of the country. But in addition there is to be a new competitive system with a two-tier organisation. A second public corporation is to be set up and, with capital provided by the Treasury, is to construct and operate additional television transmitters. For the present only three are contemplated, in London, Birmingham and Manchester, and will therefore cover considerably less than the whole of England and none of Scotland, Wales or Northern Ireland. This corporation will not itself provide any programmes, but will hire out its facilities to "privately financed companies who would provide programmes and draw revenue from advertisements." The corporation will be responsible for laying down the standards that are to be observed

by the programme companies and for seeing that they are observed.

The White Paper does not make it clear how many programme companies are contemplated. Some sentences seem to assume a number; others hardly make sense unless there is to be only one for each station. This is more than a detail; it is fundamental to the scheme. The Government insists that its proposals do not amount to "sponsoring," and that the responsibility for what goes out on the air will not rest on the advertiser. For this to be true, it is essential for one company to be responsible for engineering a proper balance in the whole output of each station. But if it is possible for any organisation calling itself a programme company to buy an hour here and an hour there, nobody will have any positive responsibility for the programmes as a whole, as distinct from the necessarily negative powers of censorship exercised by the public corporation owning the transmitters. There is all the difference in the world between the balanced competition of two or more bodies each claiming to be judged on its output as a whole and the atomised competition of the American radio, in which every item competes with every other item. One of the first points to be elucidated is how many programme companies there are to be. If there is to be more than one for each transmitter, then the result will merely be "sponsoring" by another name.

★

However many programme companies there may be, it is plain that the only source of revenue for the whole structure will be the sums that advertisers can be induced to offer for the privilege of catching the public eye and ear for a few minutes out of every hour. This is unfortunate, for several different reasons. First, it will inevitably give the programmes a much more money-catching character than will be acceptable even to many of those who most ardently want to see some alternative to the BBC. The White Paper makes the familiar point that "there is a vast difference between accepting advertisements and sponsoring," and goes on to argue that both the press and the cinema accept advertisements without surrendering to the advertisers control over their editorial columns or the films they show. But neither the press nor the cinema is entirely dependent on advertising revenue; nor is each advertisement nearly so closely tied up with a particular editorial item or a particular film as a television "commercial" is likely to be with the programme to which it is attached. The experience of the press suggests that broadcasting could draw some of its revenue from advertising without danger, but only provided that it had other sources of income as well—and it would probably be wise to prescribe that the other sources (which in practice could

only mean licence revenue) should always be the larger part of the whole.

The dangers of depending entirely on advertisement revenue are increased by the strong probability that the new television stations will have a hard struggle to make ends meet. The "representative advertising bodies" consulted by the Government appear to be confident that the new service will pay for itself, and, in particular, that the precautions to be taken against sponsoring will not dam the flow. But it is a very expensive matter to provide good television programmes. The new stations will cover only part of the country (though admittedly the most densely populated parts). And none of the existing television sets will receive the new programmes without modification. To the outside observer it would seem very doubtful whether, in these circumstances, there will be enough advertisers who will find it worth while to pay the heavy fees that will have to be charged if the overheads are to be covered and the initial borrowings from the Treasury repaid. Yet if the whole scheme is threatened with failure because of the shortage of revenue, the efforts to please the advertisers will be redoubled, and it will become very difficult for the guardian corporation to take a firm line in upholding the standards it has set.

★

The third objection to complete dependence on advertising is perhaps, in the long run, the most serious of all. It will serve to confirm the public in the belief, which it has already far too easily accepted, that there are only two possible, and mutually exclusive, ways of organising broadcasting: either there must be a monopoly financed wholly by licence fees or, if there is to be competition, it inevitably brings total commercialism with it. And if it should happen that the advertising service never has enough money to provide good programmes—still more if it eventually expires—then

even those who see the dangers of monopoly will conclude that there is no escape from it.

Yet it is perfectly possible to devise a middle course—a medium wave—which would provide competition without commercialism. Let there be two or three public corporations, each constituted exactly as the BBC is now, and let them all share in the licence revenue (which might well be increased, since the present radio-and-television licence costs only about as much as four cigarettes a week per household). Then let each corporation, if it chooses to do so, take advertising revenue up to, say, one quarter or one third of its total income. Perhaps the possibility of a compromise scheme along these lines is just beginning to come over the horizon. The motion that Lord Halifax and his friends have put down in the House of Lords recognises "the desirability of an alternative television programme"—which is a very considerable advance for this school of thought—and if they attempted to argue that even the smallest admixture of advertising would corrupt, they might be invited to remember that the BBC already enjoys a large revenue from advertisements in its publications.

This, it must be hoped, is the way in which the public debate will develop. The internal defects of the Government's proposals are so great that they cry aloud for amendment. Any attempt to change them in the right direction—to make a greater inroad on monopoly but with a smaller dependence on advertising—should be supported. But outright rejection would be a great pity. For this White Paper has one overriding virtue which, when the tale is complete, may be found to outweigh all its absurdities. It keeps the question open; it keeps the discussion alive. The very defects of the scheme proposed make it certain that the Government and the public will soon have to think again, and go on thinking, about the right framework for broadcasting in a democracy. From that nothing but good can result.

The Sinews of Tito

TOMORROW nearly 10½ million Yugoslavs go to the polls in circumstances, highly favourable to their present rulers. Indeed, it will be surprising if a virtually unanimous vote is not recorded for Marshal Tito and his policies. His recent moves in more liberal directions have been popular among all but the diehard Communists who are still to be found in positions of influence, and his determined reaction to the allied declaration of October 8th on Trieste will have rallied national feeling as nothing else could. By next week the Marshal should be able to point proudly to the firmness of the political ground on which he stands, and his representatives should be able to go into negotiation on Trieste somewhat more confidently than those of the harassed Signor Pella. That is not to say

that there are no pitfalls around his feet; in the economy that has been so closely linked with the West there are weaknesses that are less well known than the more apparent political success of the Yugoslav state.

More than once in recent weeks Marshal Tito has tried to maintain that his country's attitude towards the Trieste problem could not be influenced or modified either by the western economic aid it has already received or by its prospects of getting more. Yugoslavia has known before what it is to be completely isolated; it could happen, he said on one occasion, that "we shall again stand alone." Such statements are gestures of defiance to those who, in the Yugoslavs' view, have let them down so badly over Trieste. If, as is probable, they are based on a belief that the Yugoslav economy

is now in good working order, they are also an unintentional tribute to the ability of the western capitalist powers to help—in the short space of four years—a struggling socialist economy on to its feet without impairing its political independence. Even when full allowance has been made for the ability of the Yugoslav people to accept hard work and short commons, the western powers can still feel gratified as this unsolicited testimonial. (Soviet satellites, please note.)

That the Yugoslavs should now proclaim their ability to "go it alone" if necessary was only to be expected; in the emotional atmosphere created by the Trieste crisis it would be odd if they did not. The question is, how far is the wish the father to the thought? Is the patient really strong enough to stand on his own feet without any ill-effects? Those who have made an important contribution towards building up his strength will be the first to be disappointed if an impartial examination discloses that he is still only convalescent. It would be a poor return for the millions of dollars in grants, loans and credits from the free world that have been pumped into Yugoslavia during the last three to four years if its economy were not well on the way towards becoming a working proposition—if it could not exploit its own resources effectively, build up and maintain its own defences, provide its own people with an adequate standard of living, and begin to pay its own way.

★

There is no doubt that today Yugoslav industry has recovered from wartime devastations and reached a stage of development that many people would have thought impossible a few years ago. Marshal Tito's advisers have realised that they must cut their coat according to their cloth. Most of the key projects to which they accordingly reduced their hopelessly ambitious five-year plan three years ago, are now either completed or nearing completion. They are designed principally to tap the country's rich natural resources which have been neglected so long—to develop electric power, coal-mining, and the mining and processing of iron ore, copper, bauxite, and the other metals and minerals found under Yugoslavia's soil. Existing industries have been modernised, new ones developed. The production of electric power, which before the war was negligible, has now increased to such an extent that there is more than enough even for Yugoslavia's greatly swollen requirements.

Coal production is now almost twice what it was before the war. The steel industry using home-produced iron ore, pig iron and coke, has made great strides forward; crude steel production has nearly doubled compared with pre-war. The lead mines of Trepca and the copper mines at Bor—both well-known foreign concessions before the war—have been modernised. Bauxite production will shortly be sufficient to produce 15,000 tons of aluminium a year; before the war less than 2,000 tons were produced.

The beginning made in the manufacture of machine tools has received warm praise from foreign observers, and the Yugoslavs reckon that their light industries can now supply the modest demand for consumer goods.

Thus, in spite of the gaps that still remain in their industrial development (of which the chief is, perhaps, poor communications) and the problems still to be solved, the Yugoslavs have reason to be pleased with the progress they have already made. It has, moreover, been accompanied by a small but steady increase in living standards. They could probably now—at a pinch—do without any more western aid; in any case, this will begin to taper off quite rapidly. But they can ill afford to do without western technical skill and know-how. And they can hardly hope to make further progress unless they can maintain and develop their trade relations with the outside world. This means in practice the non-Communist world, because even if Marshal Tito resumes trade relations with eastern

Europe—as he may well do eventually—the satellites are unlikely to prove satisfactory trade partners. Over the last four years Yugoslavia's indebtedness has reached a total of over \$400 million. Yugoslavia's creditors will not be willing indefinitely to cover its trade deficit; and although on the whole its need for imports of industrial equipment is steadily diminishing, purchases of certain industrial raw materials, such as cotton and wool, will always make heavy inroads into its foreign exchange.

Yugoslavia's best chance of reaching economic viability and wiping out its trade deficit lies in a rapid expansion of its agricultural exports. Agriculture, in fact, is both the trump card and the losing card of the economy. It is the trump card, because in a normal year Yugoslavia can grow enough to feed its own population of 17 million and have enough left over for export. It is the losing card because in a year of drought—and in the last four years there have been two bad droughts—the Yugoslavs may be reduced to starvation level unless they can get outside help. But the Yugoslavs, like Communists everywhere, have until

quite recently been loth to recognise the importance of agriculture; all their care, attention and resources have been lavished on industrial expansion, and now in the countryside there is a great deal of lee-way to be made up. Mechanisation has made only very limited progress; and there is a wide and gaping need for every kind of stock and equipment.

The 10-year plan for agriculture, which is designed to remedy this neglect and is now under discussion, will, even with the help of western tripartite aid, prove a heavy strain on Yugoslav resources; about 640,000 million dinars are to be invested in agriculture over the next ten years (compared with the 116,000 million invested in industry over the last five years). But the plan does not outstrip the need. It is essential both to step up agricultural exports, and to take what steps are possible by stockpiling and by irrigation measures to cushion the effect of years of drought.

Investment in agriculture is also essential from a political and social point of view. The Yugoslav Communists have had the sense to recognize that, on the whole, collectivisation does not work. They have had the courage to cut their losses and allow those who wished to leave the collectives and return to private farming. This step has gone a good way towards

restoring the Yugoslav peasants' confidence in their present rulers; but it must also have caused a good deal of dislocation. If Marshal Tito is both to press home the advantage he has gained with the peasants and obviate the effects of the dislocation caused by the disbanding of the collectives, every effort must be made to pump tractors, seeds, fertilisers and all the rest into the countryside.

On the whole, therefore, it can be fairly said that the Yugoslavs, as a result of their own hard work and a generous helping hand from the non-Communist world, are now better able to stand on their own feet than at any time since the war. But they have some way to go yet before achieving a viable economy. Under the most favourable circumstances they cannot expect to see any rapid increase in their comparatively low standards of living; the profits of industrial expansion must be ploughed back into industry and agriculture; the consumers cannot for some time hope to get a much larger share of the national cake. If they are now to consolidate their gains and move forward economically, they will need good harvests, expanding trade relations and a minimum of alarms and excursions in the international field. That is not quite the same thing as an ability to stand alone.

Notes of the Week

Demonstration Strike

THE wage dispute in the engineering industry has now reached the stage at which the Communists can take full advantage of the diffuse nature of the Confederation of Shipbuilding and Engineering Unions. Their demand for a one-day token strike was endorsed by the policy-making national committee of the Amalgamated Engineering Union and accepted on Thursday by the whole confederation. It will be on December 2nd. This is an excellent example of the few influencing the many. The AEU, if it wishes to press the matter, can usually control the confederation, just as the confederation can usually determine the wages of about twice as many workers as belong to its 39 affiliated unions. And the policies of the AEU, these last few weeks, have been determined by the handful of Communists on its national committee.

The result, in this case, may not be serious, but it will have been the work—the planned and calculated work—of the British Communist party. It is interesting to note that Communist parties abroad have also been calling one-day strikes. It is difficult, however, to see what a one-day strike by the confederation is expected to achieve. Leaders

of the non-Communist unions in the engineering industry have made plain their doubts about the wisdom of the whole enterprise, mainly because they feel that a one-day strike will give employers an excuse to discharge unwanted workers. They might also reflect on the uselessness from any point of view of stopping an industry for a day. A one-day strike would, of course, interrupt continuous processes, but in the main it would not amount to anything much more serious than adding a second Sunday to the week in which it is called.

The ultimate danger, from the unions' point of view, is that once the strike has been called they are committed to an attitude of intransigence and wrath which they may feel bound to sustain. Even if every factory in all the land is idle for a day the unions will have done nothing more than prove the extent of their own ferocity. Unless the employers are impressed, and it is most unlikely that they will be, the unions will have to think of some fiercer punishment, if only to maintain their own prestige. Yet the willingness of men to take a day off in fact proves nothing about their determination to press for more pay by a prolonged strike. And each time the unions have to show their anger and their strength their members suffer, along with the nation.

Molotov's Second Thoughts

IT seems to have been quickly realised in the Kremlin that its latest Note to the western governments was felt as a cold douche by the very people in Europe that it is trying to mobilise for a campaign against the European Defence Community. The man who gave the shock was asked to soothe the patient; so last week Vyacheslav Molotov took the exceptional step of inviting newspapermen, including foreign correspondents, to a press conference at the *Minindyel*, Moscow's foreign office. The gesture was novel, but the words behind it were unchanged. Molotov's fifty-minute talk was less clumsy and more flexible than the Note but it showed no departure from its content. If his purpose is to attract western, and especially French, public opinion the second thoughts have failed to remove the bad impression made by the first.

Prospects of a conference of the powers were probably shattered when Dr Adenauer's electoral triumph strengthened western determination to go ahead with the integration of Germany in Europe and caused the collapse of Soviet hopes of a following in the Federal Republic. Perhaps neither side has now anything to offer the other in a bargain. But that is not to say that Soviet policy has resigned itself to accepting German rearmament. It is launching the Communist legions in the West into the strangest alliances for an attack on the European Defence Community. Why Molotov should not also have accepted the invitation to Lugano and directed this campaign from there is still not clear. It can hardly be that Mao Tse-tung has insisted that China's claims to make a fifth with the Big Four should first be recognised. By ignoring a good chance of talking, the Kremlin has disappointed all those who saw in four-power negotiations an alternative to rearming the Germans.

When asked by a foreign journalist whether he favoured

a meeting at the highest level (Eisenhower, Malenkov, Churchill) Molotov avoided the question. Two days previously a Tass communiqué denied rumours that Malenkov had been asked by the British Foreign Office whether he would be willing to attend such a meeting. The Soviet line seems to be that such reports are being circulated as excuses for the Bermuda Conference. It is impossible to avoid the conclusion that the Soviet leaders are not, for the moment, interested in negotiations about European matters. Mr Dulles goes further and says that the initiative now lies with the West. That may be; but he would do well not to encourage the idea that new and startling moves are to take place. There is much to be said for a period of diplomatic calm, in which public opinion is not swung every three months from hopefulness to apprehension and back again.

France Before Bermuda

FOR the French Premier and Foreign Minister all is not plain sailing on the route to Bermuda. As *The Economist* goes to press MM. Laniel and Bidault are facing in the National Assembly the first full scale debate on foreign policy that the French lower chamber has had in the last twenty months. With the conference in mind, the debate has turned into a preliminary trial of strength between the opponents and partisans of EDC, who are expected to start their real contest at the beginning of 1954. Whatever its outcome, this preparatory exercise will at least make it possible to appraise the balance of parliamentary forces and thus add substance to French declarations at Bermuda. The French delegates are, in fact, facing their Anglo-Saxon colleagues with the obvious handicap of being known to be merely caretakers. The presidential election—incidentally both M. Laniel and M. Bidault are candidates for the Elysée—renders the resignation of the present government inevitable early next month. This gives added importance to the Assembly's present mood on foreign affairs.

The partisans of EDC, encouraged by M. Bidault's recent declaration of thoroughgoing support, have thus a good opportunity to counter-attack. Up to now the opponents have been more vociferous. The Communists have trumpeted their offer of "national front" to anyone who is against German rearmament. As a curtain-raiser to the debate General de Gaulle held a press conference, in which he reiterated his bitter dislike of EDC and of the projects of political community. The parliamentary troops loyal to the General are really the main cause of M. Laniel's headache. While there are EDC supporters outside the governmental coalition, particularly among the Socialists, the Gaullists sitting in the government do all they can to frustrate the project. Their tactic is, therefore, to insist on the presentation of a purely governmental motion, and thus place before M. Laniel the alternative of producing an innocuous motion or being left by their resignation with the barest of majorities.

Whatever steps M. Laniel takes to get out of this predicament, the debate will serve as a thermometer to be consulted by France's partners in Bermuda. Reports that Sir Winston Churchill and Mr Dulles will present M. Bidault with an ultimatum have been promptly denied; it is hoped, on the contrary, that they have thought of ways of convincing his countrymen that the defence community is safe for France.

The Weapon of Secrecy

By now it is almost a tradition that debates on disarmament in the United Nations Assembly should be sterile. Year after year, the Soviet delegation produces new and often ingeniously worded formulae which capture the world's attention and sometimes even raise its hopes; but hopes die when it is seen that each new slogan is only a smog-mask behind which Mr Vyshinsky's face remains regrettably the same. Last week, Mr Vyshinsky did not even bother to beam. Instead, he made the disarmament debate an occasion for lambasting the West on every conceivable issue from Korea to Germany; he seemed almost to be going out of his way to slam any doors that might have been left ajar by Molotov in the last Note from Moscow. If this was saddening, it was hardly surprising, for the end of the post-Stalin honeymoon had been clearly marked long before the Assembly began this year's discussion of a familiar theme.

The basic differences which divide the Soviet group from the majority of nations on the issue of disarmament seem likely, therefore, to remain as unbridgeable as before. The essence of these differences is that the majority group—which is by no means limited to the western powers—insists that any disarmament plan must be watertight; while the Russians, with equal insistence, call for an act of extraordinary faith. The various proposals they have put forward at various times have one thing in common: there would be no census of armed strength before disarmament began, and very little means of verifying progress after it had started. This amounts to asking the rest of the world to open its mouth and shut its eyes, in the hope of finding a sweet on its tongue; and it is not surprising that peoples who have in the past found themselves swallowing unexpected pills should be a little wary of the offer. It may well be asked why the Russians themselves feel able to take such a risk. The answer is, of course, that the armed strength of the free nations is largely an open book to them, while their own is shrouded in darkness. Secrecy is itself one of Moscow's secret weapons, and it is unlikely to be thrown away.

Fifth Wheel Misplaced

THE addition of a fifth minister at the Foreign Office has received less attention than it deserves. The official explanation, that Mr Eden needs more help in the House of Commons, is a considerable over-simplification of the problem that the change is designed to meet. The Foreign Office's representation in the House of Commons must certainly be strong enough to leave Mr Eden free to go abroad while Mr Selwyn Lloyd is at the United Nations, but this is not the only point at which there is strain and finding a solution is not just a question of arithmetic.

It is generally agreed that under present conditions no Foreign Secretary can give adequate, personal attention to all four main aspects of his work—contact with foreign statesmen, study of reports, answering for his department in Parliament, and actual formation of policy. Too often

the routine of the first three items leaves little time for the fourth and most important. Merely to give the Foreign Secretary a large number of aides is, however, of little use if there is no corresponding delegation of authority. If Mr Eden is to feel real relief from his quartet of assistants, he must be prepared to leave with them some of his personal responsibility for taking decisions. How this should be done is open to argument. The American system of giving junior ministers geographical responsibilities could be followed, or Lord Reading, the new Minister of State, Foreign Office, could be in effect (as his title implies) a resident Deputy Foreign Secretary, acting as a sieve and leaving for Mr Eden's decision only those issues on which the Minister of State and the Foreign Office experts are either uncertain or divided.

But if the latter course is followed, then the fact that the new resident Minister of State is in the House of Lords is open to objection. He will be handicapped in his work by lack of direct contact with the House of Commons while, in the absence of Mr Eden and Mr Lloyd, only the two young Under Secretaries will be left to deal with the Commons. What Mr Eden needs in the House is a minister of Cabinet rank permanently on hand and able, by his seniority, to speak with the same authority as, for example, did Mr Gaitskell when he was Minister of State for Economic Affairs during the last months of Sir Stafford Cripps's Chancellorship. The new Foreign Office arrangement would be far more effective, therefore, if the resident Minister of State were in the Commons, leaving one Under Secretary in the Lords. To say this is not to imply personal criticism of the appointment of Mr Dodds-Parker as the new Under Secretary. But the arrangement of the posts does not look satisfactory.

Rents and Subsidies

THE Government has now introduced its Bill to lessen the destructive effects of rent restriction, and it is up to the local authorities to tackle their related part of the housing problem. Local authority houses are not subject to rent control but there are extravagant and anomalous methods of fixing their rents that equally require alteration. The report* of the committee which has been examining these methods therefore comes at a timely moment.

The original and proper purpose of the housing subsidies was to bring the rents of council houses within the means of their occupants. The tendency, however, has been to tie the subsidy to the house rather than to the needs of its tenant, so that the rents of similar houses vary widely according to the date of their construction and the prevailing scale of subsidisation. This is an indefensibly wasteful use of public money. Under postwar policy, council tenants have been drawn from a broad range of occupations and income groups. It is well known that many of them could afford to pay a higher rent, while their subsidy is paid for in part by families much worse housed than themselves.

Some authorities have introduced a rent surcharge on

* "Transfers, Exchanges and Rents." Report of the Housing Management Sub-Committee of the Central Housing Advisory Committee. HMSO. 1s. 9d.

tenants whose income exceeds a stated maximum, usually £500. Others have graded their housing estates into distinct rent categories, with subsidisation varying all the way from nothing to well above the normal subsidy. A common practice is to treat prewar houses as a pool of cheap accommodation available to meet the needs of poorer applicants. But these devices are at best blunt instruments for relating the subsidies to their proper purpose. More promising are the differential rent schemes, under which a basic rent is first fixed for each dwelling according to its size, location, and amenities, but the actual rent is then varied within a considerable range according to the tenant's means, on the assumption that about one-eighth of his income should be available for rent. This type of scheme also makes possible much more flexibility in the letting of dwellings and in the exchange of tenants. The most interesting of the committee's findings is that opposition to differential rent schemes has always faded quickly after their introduction. Local authorities have power to pool their subsidies and rationalise their rents, and they can no longer make fear of unpopularity an excuse for shirking the task.

Industrial Evacuation

MORE than 300,000 Londoners will during the next twenty years shift their homes to towns some thirty to eighty miles away. Such, at least, are the present schemes of the London County Council. But the programme cannot succeed without an equivalent dispersal of industry; and as the clerk to the council, Sir Howard Roberts, pointed out this week at a conference of the Town and Country Planning Association, the dispersal is not yet in prospect. The towns scheduled for expansion may well attract new industry; but unless it is drawn specifically from London, and is not replaced, the policy will have failed. In that case the basic problems of the capital—the overcrowding of dwellings, the traffic congestion, the pollution of the air, and the vulnerability to air attack—will be in no way alleviated.

The Government's present scheme is that firms moving to the "reception" towns shall notify the Ministry of Labour of the workers they require; and the Ministry shall relay this information to the housing authorities in London, who will select from their waiting lists people who both possess suitable skills and are willing to move to the required town. Sir Howard argued that this machinery is too devious and limited to be successful. The London housing authorities, who must help finance the dwellings built in the reception areas, want to be assured that the result really will be to lighten their housing load—otherwise they will simply assist towns like Swindon to prosper at their expense. At present they have no such assurance; for if a firm does leave London for Swindon, there is nothing to stop another firm from occupying its vacated premises.

The basic problem cannot be solved at all by tinkering with housing lists and allocations. It cannot be fully solved by tightening planning controls over industrial location in London or by redirecting the policies of the Board of Trade—although these things would certainly help. The cost of acquiring sufficient industrial sites in London to

make possible the present dispersal policy is estimated by Sir Howard at over £50 million. This is too much for the pocket of any local authority. The social and strategic gains—not to mention a large saving in the housing subsidies, because houses can be substituted for flats—may well justify this expenditure; but it is for the Government to decide whether dispersal is worthwhile in the national interest—and, if it is, to meet the cost.

America, India and Pakistan

MR DULLES has now denied the reports that negotiations have been going on for a military pact between the United States and Pakistan. This denial, however, has not averted an increase of tension in the relations between India and Pakistan owing to Mr Nehru's strong expression of disapproval on principle of the hypothetical pact, coupled with his intemperate attack on the new Pakistan constitution as "a medieval conception totally opposed to democracy." Although Mr Nehru at his press conference admitted that it was "open to Pakistan to have military bases and even foreign troops on her soil," he said that this would have "far-reaching consequences on the whole structure of things in South Asia" and that India would have to "watch developments with the greatest care."

Whether it would be desirable to bring Pakistan into any security system for the defence of the Middle East is a question for serious consideration, taking into account both the strategic and political aspects of the matter. The argument for trying to do so is that aid could best be given in an emergency to Persia and Iraq from a point somewhere near the mouth of the Indus, and that a friendly Pakistan might be better than an unfriendly Egypt as a base for Middle East defence. On the other hand, the motives which might induce Pakistan to join in such a defensive system would almost certainly not be confined to the possibility of a Soviet advance towards the Persian Gulf; though it would definitely be in Pakistan's interest to prevent such a Soviet expansion. It is only too likely that Karachi would also have in mind the strengthening of Pakistan's position in relation to India, especially on the Kashmir issue, which would assume a new importance in a Middle East strategic conception inclusive of Pakistan.

The whole prospect is so complicated that only two things are perfectly clear. The first is that the setting up of bases is a matter on which the United States and Pakistan would be wise to consult Britain and India. The second is that India, because it adopts a neutralist attitude in public on world issues, is not therefore entitled to exercise a veto on Pakistan's defence policy, which cannot simply ignore the Middle East.

More Liberalism in Kenya

THE elected European members in Kenya's legislative council chose a good moment for their comprehensive statement last week on constitutional and economic policy. At first, the Mau Mau outbreak did much to destroy the hopes of a better atmosphere between African and European that had previously been appearing in Kenya. More recently, however, there have been signs that the long drawn-out emergency was persuading men of all races to question some accepted tenets and to try to make a fresh start. While there is little strictly new about the Europeans' proposals, they are a constructive and welcome gesture. Particularly encouraging is the hint, given by Mr Blundell when commending the statement, that the discussions between the races on constitutional reform—postponed indefinitely by the Mau Mau outbreak—may, after all, come about.

Understandably, Mr Blundell concentrated on convincing the settlers that a liberal approach did not involve jettisoning their interests; and his speech was more remarkable for what it rejected than for what it proposed. He dismissed out of hand any suggestion of immediate self-government not only because Britain is doing so much to help in the emergency, but on the interesting theory (which politicians in Northern Rhodesia would do well to study) that a sense of unity between the various races in a colony is a necessary condition of self-government. He was equally emphatically against partition. The only possibility was gradually to allow the Africans and Asians a share in Kenya's politics.

Fine words, of course, do not go far. Africans have listened to enough already. The polite generalities already show signs of degenerating into the familiar haggle over percentages and numerical representation and the right atmosphere is unlikely to develop unless the Kenya government is soon able to announce the bold policy of agricultural and social development that everybody wants but nobody is able to pay for. Much depends on what the Finance Member, Mr Vasey, has achieved by his fund-raising visit to London.

Masking the Fog

THE first widespread fog of the year coincided with the bringing of anti-fog masks into the "free" health service. It also coincided with London County Council's consideration of a report which is to be the basis of the

council's evidence to the Beaver Committee on Air Pollution. The report recommends, among other things, Government action to ensure ample supplies of smokeless fuel at competitive prices; the establishment of smokeless zones by order; fog warnings; and more extensive cleaning of coal. These recommendations, however impracticable some of them may appear for the present, have at least the merit of tackling the menace of fog at its source.

The wearing of fog masks is quite a different matter. If fogs like that of last December were a frequent occurrence, and if masks were an effective safeguard, they could be considered a useful piece of preventive medicine. (But how much more useful and how much more preventive if people were urged to wear them at work on the onset of the common cold.) In fact, fog like last year's, with its trail of death and disease, is becoming as rare as a Cockney born within the sound of Bow Bells. Tuesday's fog, though it made Westminster at midday as black as midnight and considerably dislocated traffic over a wide area of the country as a whole, was not pea-soupy enough to persuade Londoners to breathe through a piece of gauze.

Why, then, has the Ministry of Health announced with such a blare of publicity that fog masks are prescribable under the health service? It is true that they are subject to the shilling charge—which, surprisingly enough, will barely meet half the cost of even the cheaper variety. It is also true that they will be prescribable only to certain patients in certain areas—but this is the sort of regulation that provokes endless argument and irritates rather than helps the doctor responsible for prescribing. Ever since he took office, Mr Macleod, like his predecessors, has been concerned with cutting down the cost of prescriptions, which have become the most uncontrollable part of the health service bill. By encouraging people to ask for something more—and something whose value is admittedly non-proven—he may well undo much of the good that his exhortations to economise have hitherto produced.

Living in London

FEWER by a million than in 1931, the 3,347,982 residents recorded in the county of London in the 1951 census have fared better for housing than people elsewhere. The full county report now published shows that although at least 70,000 dwellings were destroyed during the war, new building and conversions have given London a balance of about 70,000 more houses or flats in 1951 than twenty years earlier. At the same time, the number of households has fallen—though, since their average size has decreased, not as quickly as the number of people. The result is that many more households than in 1931 have a house or flat entirely to themselves; the proportion who share—nearly a half—remains, however, much higher than in the rest of the country.

This improvement may well seem paradoxical to the queue of desperate home-seekers in London. But the extra pressure on housing springs from higher incomes, which give people the opportunity and the urge to house themselves more spaciouly, while at the same time rent restriction and subsidies have encouraged undue waste of space. In London households are smaller than elsewhere and one

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasec Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos...

* Based on the one per cent sample report.

rooms ; people elsewhere 1.33 rooms. Standards, of course, vary from borough to borough, but are much more uniform than they used to be. Paddington has the blackest areas with 5.2 per cent of its residents living at a density of more than 2 persons per room. But this is very different from the position twenty years ago, when seven boroughs had over 20 per cent of their population living in such crowded conditions.

A Mission to Moscow

THE Foreign Secretary usually prefers a quiet life. But in replying to a question in the House of Commons on November 6th about the proposed trade mission to Moscow, Mr Eden fairly startled the doves of peace. He roundly condemned the organising body, the British Council for the Promotion of International Trade, as "a Communist front organisation . . . mainly concerned with the dissemination of Communist propaganda." It is well known that the Council arose out of the ashes of the hand-picked Moscow Economic Conference of 1952: that it distributes spiteful anti-American propaganda and spends much energy in attacking the West on the export of strategic goods ; that through some of its members it has associations with the Communist party and its discredited offshoot, the World Peace Movement ; and that its efforts

have been exclusively directed to promoting trade with iron curtain countries, in spite of its "international" title.

One may ask, Why this sudden urge to charge off to Moscow ? Anglo-Russian trade in non-strategic goods is developing quite satisfactorily within the official trade agreement ; a Soviet trade delegation permanently resides in Highgate ; and there is no objection on the British side (as Mr Eden explained) to a two-way exchange of business visits between the two countries. In contrast to the Peking trip, also organised by the Council, there is no commercial reason for the proposed group visit. Indeed, it might be asked whether the Russians are very keen to receive self-invited guests. Members of both parties in the House of Commons have recently displayed curious naivete about East-West trade. For example, there have been questions about the Consultative Group Co-ordinating Committee (COCOM), which sits in Paris to co-ordinate the policy of 15 nations on the export of strategic goods to Communist countries. This organisation has existed since November, 1949, and is purely advisory, yet suddenly some members have discovered in it a sinister intrusion on sovereign rights. In fact, the existence of COCOM provides the clearest refutation of the argument that the strategic controls are imposed on the free world by the Americans. Agreement is reached multilaterally between 15 equal partners, and even then has no more force than recommendations to governments. Is it seriously contended that people should make money by increasing the military potential of the Soviet bloc ?

Discords Among Hungarian Communists

THE Hungarian Communists' central committee has recently met to sort out its ideas on the new programme introduced by Mr Nagy last July. Four months is too short a time in which to make any but the most provisional judgments ; but it is clear that there are to be no second thoughts. The emphasis on improving the workers' standard of living is to be continued ; the improvement so far achieved is "far from satisfactory." For the next two or three years an increase of agricultural yields is to be regarded as the key objective. Next year, investments in heavy industry are to be "tangibly reduced"—although *Szabad Nep*, the party newspaper, has since been careful to deny that heavy industry is to be relegated to a position of secondary importance. The Hungarian planners are obviously in for a difficult time.

It is also clear that the programme did not get off to a good start. The impression was created, whether intentionally or not, that it represented a new and radical departure from the old policies. This encouraged the enemies of the regime, especially in the countryside. What is more important, it also bewildered and confused the party members and in some cases, on the central committee's admission, provoked their open opposition. It looks as if some lively arguments have been going on inside the party. There are those who believe that some modifications, but not too many, are necessary to put Hungary's house in order ; and there are others who maintain that any slowing-down of industrialisation is a "retrogressive step" and that any wavering from the old line can only make things worse.

It is possible that when Rakosi speaks with satisfaction of the "previously unknown spirit of bold and severe criticism and self-criticism" that has recently manifested itself, he is really trying to put a good face on things and convince the rank-and-file that, whatever the appearances, they are not witnessing a serious split in the party.

What is more certain is that Rakosi is now anxious to play down the novelty of the new measures. He insists that these, contrary to the mistaken belief of some comrades, do not represent a new economic policy. Hungary began its NEP years ago; the new programme is merely designed to remedy the mistakes that have been made in carrying it out. (But almost in the next breath he talks of carrying it out as a "serious change" and a "turning-point" in the building of socialism.) Whether Rakosi is still strong enough to make his views prevail is uncertain. As yet he is the strongest man in the party; but the emphasis on collective leadership must cramp his old style. A clear directive from Moscow is probably the answer to the Hungarian Communists' discords.

A Low Poll in Portugal

THE fact that 28 opposition candidates stood in the recent general election in Portugal implies no change in the character of the Salazar regime. In theory any candidates except Communists could have presented themselves in 1949, 1945 or earlier. In practice some were nominated on each occasion, but they withdrew before polling day because, with the administrative dice loaded against them, they did not think it worth while to press their attack. This year the same complaints were voiced: no voters' lists were made available, and the poll and the count were to be conducted by government officials with no outside check; but in Lisbon, Oporto and Aveiro the electors actually had their first chance for twenty-five years to vote against the government if they wished.

Over 43,000 of them did so, while 215,000 voted for Dr Salazar's National Union. The opposition has taken heart from the low poll of 62 per cent, compared with the 90 per cent claimed by the government in 1949. None of the anti-government candidates was elected; but the fact of an alternative choice seems to have encouraged abstention by many who were unwilling to risk the possible consequences of a hostile vote. Elsewhere in the country there were only government lists, and Dr Salazar's party goes back for another four years with all 120 seats in the Chamber.

The real popularity of the regime is hard to gauge, either from these figures or from other indications. The twenty-eight candidates were not so much fundamentally opposed to Dr Salazar, as critical of some points of policy and—more important—of some of his associates. Quite clearly the system is not democratic in any accepted sense. But Portugal's experience of so-called democracy thirty years ago was hardly a success, and most Portuguese are grateful for the stability and the economic progress the regime has given them; mild but efficient dictatorship can be better than chaos in a democratic setting. Dr Salazar may yet feel able to introduce more genuinely liberal forms. He is 64, and the question of who or what is to follow him will have to be settled some day.

Depostalising Telegrams

THAT unbeautiful word "postalisation" has long served as economists' shorthand for any system of fixing prices that lumps high-cost and low-cost services together at a single flat rate, with swings paying for roundabouts; the postal services, with their flat 2½d. on letters from SW1 to SW3 or from Land's End to John o'Groats, provide the outstanding and outstandingly successful example of such a system. Its original justification was economic; the expenses of sorting and delivery, which do not depend on distance, account for much more of the total costs than the actual expenses of carriage. Its secondary justification is social. The flat rate unifies, discrimination by distance separates; the flat rate helps the country-dweller, who is on average poorer than the city-dweller.

Both these elements emerged in last week's debate by the House of Commons on the Post Office and Telegraph (Money) Bill, when the ailing telegraph service got a major share of attention. Its losses—£4,600,000 last year—cannot be reduced by attracting more custom; it is staff costs per telegram, not the maintenance of idle overheads, that are the trouble. From the economic point of view, the obvious answer is to raise rates steeply, accepting with gratitude the consequent cut in traffic. But the economic argument does not stand alone. Access to rapid communication is, in modern society, like access to the protection of the law: something on which everyone feels entitled to count. Not everyone has, or is ever likely to have, a telephone; and between the members of the telephoneless majority the telegraph remains the one means of emergency communication. As such it has claims to be regarded as a social service whose expenses should be covered, if need be, by the community at large. As a commercial enterprise serving the ordinary conveniences of business, the press, and the betting fraternity it has no such claim. Present anomalies may be reduced by a reshuffling and raising of rates, but the dual status of the service makes it certain that some deficit will remain and have to be made good from somewhere.

But should that "somewhere" be the budgets of the other, self-supporting Post Office services? Should the telegraph deficit be a threat to the 2½d. letter rate or a cause of high telephone charges? A measure of de-postalisation, not geographical but financial, a separation of the telegraphic roundabouts from the profitable swings of the postal and telephone service, might be the proper solution.

Justices' Clerks

SUPERFICIALLY, the recent controversy about justices' clerks has the air of a storm in a teacup. Should the clerk stay in the courtroom when the magistrates retire? Should he join them only when called for, or as a matter of course? Should he return to the courtroom before them, or with them?—these questions resemble those that must have troubled many of the courts of minor German Grand Dukes in the eighteenth century. But the arguments

have a serious origin. It is important today—and the emphasis comes quite as much from the activities of Ministries as from those of magistrates' courts—that justice should manifestly appear to be done, as well as in fact be done, if the resulting decisions are to be accepted without mental reservations by the people they adversely affect.

The Lord Chief Justice, with the concurrence of the Lord Chancellor, has now made a statement in the High Court that should clarify, once and for all, the position of the justices' clerk *vis-à-vis* the magistrates themselves. The clerk is the technical adviser to the magistrates. He is not an official who should take part in their decisions on questions of fact, on whether the accused is innocent or guilty. He is there to advise on law, procedure and practice, and both he and the magistrates should take care that he seems to do no more than that.

This proper relationship between justices and clerk is probably the most difficult of all the obstacles to the gradual refurbishing of the magistrates' courts, a process that has been going on, gradually but on the whole successfully, since the end of the war. The day was when, in some courts, neither the clerk nor the magistrates troubled to conceal the fact that he was the one man in court—with the possible addition of the police superintendent—who knew what it was all about. That kind of clerk was as harmful to the practice of justice as his converse, the chairman of the bench whose word was, in his district, quite literally the law. It would be pleasant to think that the domineering clerk has gone for ever, but, if he still exists, Lord Goddard's statement is a large nail in his coffin.

A Medical Birthday

TWO years ago, the College of General Practitioners was only an idea—an idea that had been incubating for over a hundred years. Last weekend it had its first annual general meeting and elected its first president and council. Faculties of the college are being set up in the different hospital regions; applications for membership have come from general practitioners in many other countries; and in Canada, a separate college, modelled on the English one, is being founded next year.

Doubts about the wisdom of launching the college were based on two main grounds: either the college's work would overlap with that of existing institutions or it would find itself with nothing substantial to do and initial enthusiasm would soon evaporate. From its first report neither fear seems justified. Those responsible for starting the college have wisely maintained for it a strictly academic status, and its work is at present directed along three main lines: the education of medical students, the post-graduate education of general practitioners, and research. Although the great majority of medical students eventually take up general practice, many of them complete their medical training without having spoken to a general practitioner, much less having been initiated by one into his craft. The college is therefore closely pursuing with the medical schools a project that would not only introduce lectures by general practitioners into the medical curriculum, but enable students to spend some time accompanying selected general practitioners in their day's work.

In research, the college has already made some progress. It is initiating a research project into the value or otherwise of the sulphonamide drugs in the early stages of measles, a piece of research that only general practitioners can do because only they see large numbers of cases in the early stages. The college also hopes to collect information from doctors' records that when analysed will show the relative prevalence of the different diseases. It has also set up an epidemic observation unit, which by spotting, from individual doctors' reports, the onset of an epidemic of, say, poliomyelitis or influenza, could obviously be of great value to all the authorities concerned. Co-operation in simple research of this sort has also an imponderable value for general practitioners themselves. By providing a fresh stimulus and interest in their work, it should effectively counteract an overdose of routine doctoring and certification.

★

Correction.—"Proud Borrower and Shy Investor." In *The Economist* of November 7, 1953, it was stated (p. 403) that oil companies in the Persian Gulf had in early days paid a royalty of 3 cents a barrel; the figure should be 3½ rupees a ton (8 pence a barrel).

A Just and Necessary War

We have as yet no intelligence from the seat of war which is at once decisive and thoroughly authenticated. All the accounts which have hitherto reached us represent the Turks as successful on nearly every point. . . . Events seem now to be confirming what we some months ago had the confidence to predict. It is too soon yet to speak with any certainty of the final issue even of the first campaign; but at present it really seems highly probable that the result of the war in which the guilty ambition of Russia has involved herself may be to burst a hollow bubble and dissipate a vast delusion—to betray to Europe that her strength has rather been that of the bully than of the giant . . . and that her past successes have been owing more to the skill with which she has played upon the fears of her antagonists than to her actual superiority of force. . . . We return once more to our perpetual note of warning. Whatever be the successes of the Turks, and whatever willingness Russia may manifest to come to terms and get out of her foolish and wicked scrape, do not let us . . . lose sight of the great object. . . . Let our statesmen and those of Middle and Western Europe look the whole question in the face, and see if they cannot devise some securities against a periodical recurrence of the embarrassment of today. . . . They have to ascertain that there exists—and, failing its existence, to create—a Power, or Powers, in the South-East of Europe which shall be a competent, ample, self-acting barrier against Muscovite aggression—which shall guarantee us against the necessity of perpetual interposition—and shall deprive Russia of the desire by proving to her the hopelessness of further extension in that direction. . . . Three mighty issues are at stake upon our firmness and our foresight: the possession of Constantinople—the stability of our Indian Empire—and the continuance and spread of free and civilised institutions in Europe. Greater issues are seldom tried. Nobler motives are seldom held out before a noble nation.

Letters to the Editor

Liberty and Lunacy

SIR—In fairness to the various authorities whose duty it is to carry out the provisions of the Lunacy Act, a reply should be made to some of the points made by Dr Johnson in your issue of November 14th.

1. If certification is made too difficult some patients for whom early treatment means a chance of recovery and rehabilitation will never be treated. "Easy" certification should not be regarded as synonymous with wrongful certification. In my experience the duly authorised officers, the doctors and the justices do not treat their duties as formalities. Even if these people were negligent in a particular case, the hospital superintendent's report to the Board of Control, which has to be sent within a week of admission, would result in the patient's discharge.

2. It is wrong to suggest that none of the authorities to whom the certified patient can represent his case will help him. It is not uncommon for the Board of Control to question a certificate or for one of the other authorities to request a special report. Apart from this aspect, the shortage of accommodation in mental hospitals is such that the medical authorities are constantly searching for people to discharge or send on trial.

3. It is the aim of the mental hospital staffs with which I am acquainted to make the voluntary patient's status real, and they go to great pains to do so. Of 550 voluntary patients admitted to one hospital in 1952 none was certified on the premises; only 10 were judged to be too unfit to return home and these were sent to an observation ward.

In my experience there is no evidence at all for the existence of the abuses described by Dr Johnson.—Yours faithfully,
D. M. LEIBERMAN
Croydon

Brazil Agreement at Last

SIR—The Anglo-Brazilian agreement to which you refer in *The Economist* of October 10th has been severely criticised by British businessmen in Brazil. After making due allowance for the many difficulties which hampered the negotiations in Rio de Janeiro, it is thought that an arrangement more acceptable to the individual British creditor might well have resulted. It is still hoped that HM Government will formulate some plan to finance in London the total amount involved, or that part of it not already guaranteed by the Export Credits department, in such a way that individual creditors will receive their outstanding accounts immediately

and thus provide them with the capital they require to resume their normal trading. A strong recommendation in favour of such government relief has been made by the Sao Paulo British Chamber of Commerce.

Trading with Brazil in the postwar years has become, perhaps unfortunately, somewhat reliant on inter-government negotiations, with the result that less heed has been paid to the dictates of common commercial prudence. Hence, many experienced British exporters to this market now find themselves much more deeply involved than they might have been if they had not been lulled into false security by the hope that Brazil's sterling payments position would be brought up to date by government assistance.

A most unsatisfactory feature of the agreement is its failure to provide adequate scope for resumption of UK exports to Brazil on anything like the scale of 1950-52, when imports from Britain exceeded an average value of £50 million per annum. It is difficult to see how Brazil will be able to pay for more than about £4 million of UK general exports during 1954. Assuming that Brazil will be able to ship £35 million of exportable products to UK next year (a figure arrived at by experts during recent negotiations in Rio de Janeiro and which serves as the basis for the present agreement), if we deduct the £15 million for British oil which we are to supply yearly, the £6 million for instalments on commercial debts and approximately £10 million for debt servicing and other Brazilian government priority calls, the remaining £4 million is all that is left for payments to UK in current trading account. A most dismal outlook!

Sterling oil shipments to Brazil crept into Anglo-Brazilian trade at a time when Brazil was pressing for payment of her then substantial accumulated sterling balances in London. Those sterling credit balances have long disappeared, and with them the original reason for the concession of oil for sterling. Until Brazil succeeds in developing her own oil fields, she has pressing need for more oil than she can comfortably pay for with dollars. This need might well have been converted into a powerful lever for HM Government to negotiate a more advantageous agreement which would not sacrifice the interests of UK exporters. By all means let us help Brazil. Let us continue to sell her oil for sterling; but only after due provision has first been made to find the sterling required for general trading.

The recent agreement seems to have given this facility at the expense of

our long-established trade with a market which provides an outlet for not unimportant quantities of British machinery and other manufactured goods in which labour costs constitute a high percentage of total price.—Yours faithfully,
J. A. CHAPMAN
Sao Paulo

Nyasaland: Storm in a Teacup?

SIR—With reference to your article in the issue of October 24th, I should like, as a resident of Nyasaland and the unfortunate owner of 2,000 acres of freehold land in the Shire Highlands (so inaptly called the White Highlands by your correspondent), to correct a few of his more misleading and inaccurate statements.

First of all, most of the so-called "land-hungry" Africans of the Cholo district are far less indigenous to the country than are the white settlers. A very high percentage of these Africans have come over the border from Portuguese East Africa, where there is plenty of land and, in the last few decades, have "squatted" on European estates in many parts of the Southern Province of Nyasaland. Owing to the native system of shifting cultivation, they have consumed the land at an alarming rate and the white farmer who, like myself, in good faith invested money in freehold land (at that time unoccupied by Africans), finds himself faced with the ruin of his land by invaders (in my own case 250 of them). So when your article mentions harsh sentences on Africans for damaging fruit trees, it is guilty of serious distortion of the facts. It is also these detribalised Africans from over the border who have been the chief participants in the recent disaffections.

The article states that "nobody works very hard" and that "the country is poor and undeveloped." It can be truthfully said that without the effort of the white man, who in many cases has worked extremely hard, the population of 2,500,000 Africans would certainly experience famine and starvation. Those of us who are making efforts to develop the country are constantly hampered by our own kith and kin outside whereas if Nyasaland is to be developed for the good of all and especially the African, the farmer, on whose work success depends, must be supported by a competent administration and spared ill-informed criticism.

The farmer's point of view is never fairly represented in the English press and he rightly resents the newspaperman's action in accepting the statements of African Congress leaders and completely ignoring the settlers' views. How many Englishmen at home would be prepared to watch gypsies steal the fruit from their orchards without complaining to the police? If irresponsible people continue to encourage such hooliganism it is no wonder that the African should lose faith in the white man.—Yours faithfully,
JOHN WARD

Books & Publications

Bond of Commonwealth

DOCUMENTS AND SPEECHES ON
BRITISH COMMONWEALTH
AFFAIRS, 1931-1952, VOLUMES I
AND II.

Edited by Nicholas Mansergh.

Royal Institute of International Affairs.
(Oxford University Press.) 1,308 pages. 84s.

TWO fat volumes of documents would not normally call for trumpets (except, perhaps, in academic places which loathe bugling anyway), particularly documents about the Commonwealth. The very idea of commonwealth has still to be sold to the mass of its citizens, while to foreign sceptics it appears as an increasingly nebulous association of nations who consult together only in order to agree to differ and act independently.

The professors of Chatham House have done much in recent years to sweep away this sort of ignorance and cynicism and to give the rapidly changing Commonwealth something of a rationale—in itself no mean feat. But Chatham House never struck a shrewder blow for the Commonwealth ideal than by publishing these volumes. For out of this quarry of material it is possible for the first time to make independent judgments of the potentiality of the Commonwealth as a force in the postwar world.

Here, admirably arranged, are selections from most of the major documents and speeches on Commonwealth affairs from the Statute of Westminster to the proclamation of Elizabeth II. Professor Mansergh has provided a synopsis of the different viewpoints of each member nation for every major turning point, including the Abdication, Munich, the outbreak of war, the direction of the war, the secession of Burma and Ireland, the devaluation of the pound sterling, and the admission of the Republic of India. It is possible indeed to follow the constitutional progress of India in some detail from the Round Table Conference of 1930-31 onwards. And there are also important sections on the Commonwealth in relation to the North Atlantic Community, the Pacific, Asia, Western European Union and the United Nations which will commend the work to all students of international affairs. The selection is as comprehensive as it could conceivably be, although, of course, only public documents could be given. The secrets remain locked away in government files.

What conclusions, then, does this mass of material point towards? Mr Mansergh's own verdict on the

Commonwealth in the prewar years has already been delivered in his "Problems of External Policy, 1931-1939": his interpretation of wartime co-operation and postwar change within the Commonwealth is reserved for a forthcoming volume. But it would seem that, as the condition of world politics since 1938 has become more and more depressing, the condition of Commonwealth unity has brightened considerably. The isolationism in the dominions and their morbid preoccupation with the status of independence, which so obstructed their co-operation with the United Kingdom in the 'thirties, have gone. Paradoxically, the experience gained from the responsibility of running their own foreign policies has impressed the value and need of Commonwealth membership upon its statesmen more effectively than anything else could have done. On this point, at least, Dr. Malan and Pandit Nehru agree. "We join the Commonwealth," Mr. Nehru explained, "obviously because we think it is beneficial to us and to certain causes in the world that we wish to advance," because it is an association with "a touch of healing" in a wicked world. At the same time, Dr. Malan was explaining to his Parliament that the Commonwealth, as a shield against Russian aggression, needed India. "The decision," he observed, "... to allow India to remain a member of the Commonwealth... will make the world realise that the Commonwealth is still a power in world affairs." With the accession of the three Asiatic member nations, the Commonwealth has undoubtedly become the great bridge between East and West.

As Mr Mansergh says, these volumes form a commentary upon Lord Balfour's dictum: "a common interest in loyalty, in freedom, in ideals—that is the bond of [Commonwealth]. If that is not enough nothing else is enough." There would seem every hope that it is.

The Female of the Species

SEXUAL BEHAVIOUR IN THE
HUMAN FEMALE.
By Alfred C. Kinsey, Wardell B. Pomeroy,
Clyde E. Martin and Paul H. Gebhard.
W. B. Saunders. 842 pages. 50s.

BEFORE the researches of Dr Kinsey and his colleagues were published, reports on sexual behaviour tended to be dismissed as biased. For the most part they were derived from highly selected cases—patients, criminals, parties to a divorce suit—and their conclusions were

not necessarily valid for ordinary people. Dr Kinsey's work has aroused wide interest precisely because it is based on the reported behaviour of average people, who cannot be regarded as ill, eccentric or in any way unusual. Few critics have questioned his sincerity, and few have asserted that he does not accurately report and summarise what he has been told. The main criticism has been directed towards his methods of obtaining case histories.

For this reason the first hundred pages of this second "Kinsey Report" are of particular interest. Here he explains why he and his colleagues rejected as unsuitable the sampling techniques used in market research and in public opinion polls; why they rejected unsolicited histories from volunteers; and why they did not employ a questionnaire. Such methods, they point out, would have produced a refusal rate high enough to invalidate the sample or have elicited replies mainly from a particular type of individual—the too willing volunteer. They therefore approached individuals only as members of distinct social groups, first winning the co-operation of a group and then obtaining histories from as high a proportion as possible of its individual members.

The social groups chosen ranged from a church congregation to the staff of a prison, from a woman's club to a class of high school students. The report is based on 5,940 histories steadily amassed

COLLINS

10s. 6d.

In this way between 1938 and 1950, and Dr Kinsey and his colleagues tested the reliability of their information by retaking some histories years later, and by checking a wife's history against that of her husband. Even so, they continually criticise their own methods. Well-educated people and those in higher occupations are, they admit, grossly over-represented in the sample. For this reason no attempt has been made in this report, as was done in the earlier volume concerned with the male, to calculate figures of various forms of sexual activity for the United States population as a whole. But despite its imperfections Dr Kinsey's method has produced more valid and valuable results than could have been achieved by other, more orthodox, techniques.

The layout of the book is broadly similar to that of the authors' earlier volume, but there are useful comparisons at the end of each section between the findings reported for males and females, and the book concludes with an extended treatment of the same topic. If one of the conclusions to be drawn from the first report was the huge variation that exists among individual males both in the frequency and in the type of sexual behaviour, this is reinforced in the present volume. Variability in females is reported to be even greater than in males, although the average frequency of several types of sexual behaviour is less.

However much some people may disapprove of this kind of research, Dr Kinsey's books will probably exert a moulding influence on informed opinion perhaps as important as that of the works of Freud. Although completely different in approach and method both arrive at the same essentially determinist conclusion: people have within them such powerful instinctive urges that they are able to choose their course of action to a much smaller extent than any individual would like to admit. Whether one accepts this or not, it is at least plain that the actual sexual behaviour of individuals is very remote from what is demanded by convention, custom and law in Anglo-Saxon society—just how remote few people will have realised before the publication of this honest, courageous and painstaking inquiry.

Eternal Travellers

IN SARA'S TENTS.

By Walter Starkie.

John Murray. 348 pages. 25s.

ALL people that lead a persecuted, embattled or otherwise exclusive life have a word for the rest of the world. For some, it is "infidels" or "gentiles"; for gypsies, the word is *busnó* or *gorgio*. During the centuries since the Original Band of gypsies entered Europe in 1417, the *busné* (which is the plural) have been in two minds about the gypsies. Either their reaction is near to fear, and they banish or burn, or else—if milder mannered

than Henri Quatre or Hitler—drag their children past the caravan telling nightmare tales of stolen babies stained beyond recognition with walnut juice; or else they have developed a passionate interest in this race of eternal travellers—indeed are spellbound by them. There is no middle emotion.

Artists of all nationalities have proclaimed their allegiance to the second group, among them Liszt, Glinka and Falla, Borrow and Lorca. During the nineteen-thirties, Walter Starkie joined their ranks by writing books on his excursions among gypsies in Spain, southern France, Hungary and Rumania, but chiefly in Spain because it is in the melancholy scenery of Andalusia that the Gypsy, like the Jew and the Arab before him, found the mental and artistic climate most akin to the talents he brought from Asia, his original home. They were vagabond books, good but wild. This book is different, though, happily, not altogether so. Its author was born in the shadow of Trinity College, Dublin, and is a Litt.D. in his own right. The strain in him that he attributes to his lunar demon ("sly, dreamy and always tempting one to slip away on secret errands") is therefore crossed with a strain of pure scholarship, and the two together produce a splendid survey of the gypsy contribution to European life and art, both in the past and now.

The book is arranged as two journeys, one an excursion in time and the other spaced along the western Mediterranean shore. In both, Doctor Starkie's link with the gypsy world is his fiddle. With it, he can resurrect in phantom form the rites which sixteenth century witches performed in a remote Spanish cave; or win a place as leader of the orchestra at the High Mass for gypsies that is yearly celebrated in May at the shrine of their patron saint, Sara the Egyptian, at Les Saintes Maries in Provence; or call up the *duende* or demon that transforms a gypsy singer, dancer or bullfighter from a halting performer into a great artist. Gypsies are not originators; except in the field of reading palms they are, as the book emphasises throughout, always reproducers and embellishers of the art forms of the peoples they meet on their way. Europe has them to thank, therefore, for preserving tunes, rituals and even customs that would otherwise have been lost.

Nowadays, people who once roamed free are caught up in the web of customs, passports and permits to camp that entraps the modern traveller. Moving with the times, they have—if rich enough, and many of them are so—exchanged their horse-drawn carts and gabled caravans for motor trailers complete with dunlopillo mattresses and cocktail bars. Yet these luxurious lounges still contain their higgledy-piggledy of eiderdowns and children, clothing, pots and pans, while, just outside them, bicycle tricksters are practising, performing dogs barking and unschooled children quarrelling over a

monkey or a spanner till their parents join in. There is still room, at least in the Old World, for nonconformity and eccentricity, vitality, spontaneity and disregard of the rules, and Dr Starkie is agreeable proof that there is room for it in *busnó* as well as gypsy.

Agricultural Perspectives

SOCIETY AND THE LAND.

By R. Trow-Smith.

Cresset Press. 252 pages. 18s.

THE millennial story of British farming falls, in Mr Trow-Smith's compact and shapely book, into four main periods: the family-subsistence period of the Saxon pioneers; the period in which land was desired above all as "a source of dignity"; the period of profit-seeking; and the contemporary period in which agriculture returns, full circle, to its proper role as "the means of national subsistence." It is a fascinating story, not merely in itself—Mr Trow-Smith writes exceedingly well, and has a gift for the illuminating quotation of sources—but also for its bearing on the wider contemporary world, in which other peoples face problems suddenly seen, in the light of his narrative, as identical with those of Britain's past.

Agricultural change emerges as part of that often agonising process of reshaping national economic patterns which imposes itself, as the only alternative to sheer famine, on a population growing faster than the resources which existing techniques can yield. It is the tragedy of today's "backward areas" that necessary change has lagged critically far behind population growth; it was the tragedy of a Britain whose essential problem was identical with theirs that necessary change was imposed blindly and ruthlessly by the strong on the weak. Mr Trow-Smith's lively awareness both of essential economic morphology and of social implications and values provides the mainspring of his book. The tension between them, however, has as its personal counterpart a certain confusion. Although tart with the agricultural mystics, he remains in his own makeup a mystic honestly at odds with an economic historian. When, distinguishing agriculture from all other human activities, he calls the land "the great catalyst," or says that Britain has followed "strange industrial gods which have brought her near to bankruptcy," it is the mystic that speaks. The economic historian is quite capable of seeing that bankruptcy results not from specialising in industry but from falling down on the industrial specialist's job; and that the decline of farm output is, economically speaking, no more necessarily to be judged an evil for Great Britain than it is for the Metropolitan Area of London—whose soil, after all, is no less a "great catalyst" than that of Norfolk.

Privilege and protection for British agriculture can be justified as insurance

WORKERS IN THE TEAM

Number 4 in a series

Barnabas Siankombo, a member of the Tonga tribe, was born at Simwambwa, in Northern Rhodesia, twenty-one years ago.

Now, he drives a big diesel tractor and scraper which can excavate and carry hundreds of tons of earth in a day.

For nearly four years Barnabas has been with the same team, helping to build the first modern all-weather road linking the capitals of Northern and Southern Rhodesia. He has learned to handle the powerful machines efficiently—and that is no easy matter in virgin mountain country. On the hottest, dustiest day he goes cheerfully on with the

job, for he is happy and proud and feels that his work is worth while. It is more important than he knows, for the road he is helping to build is part of a great scheme that will mean much to Central Africa.

"A good type and a good worker", his supervisors say. They are as glad to have him as he is to be there. It is because this mutual spirit prevails that, whatever the hardships and difficulties, the job gets done.

JOSÉ FROM HAVANA

Soon after they were formed, in 1834, Por Larranaga began sending their Havana cigars to England. José and other descendants of the skilled craftsmen who made those early cigars are now in Jamaica making Larra cigars for Por Larranaga, with the same fine Havana wrapper as their ancestors had used. Thus more than 100 years of experience, tradition and hereditary skill go to create these very fine cigars.

LARRA CIGARS by POR LARRANAGA

Dreams Come True

SIX YEARS AGO, the site of I.C.I.'s Wilton works was virgin green. It now presents a vista of pencil-slim chimneys and silver towers set in a network of broad, grass-verged roadways, while at night, the plants take on the appearance of a castle of fairy lights. Wilton is the result of a long-term plan to group together I.C.I.'s new factories according to a logical pattern. Interdependent plants, though operated by different manufacturing divisions, are being built close together on one site, to save transport and materials handling and to enable common services such as steam, electricity and compressed air to be supplied on a large scale from central generating stations. Ten plants are already operating, taking their electricity from a power-house that could supply all the needs of a town of 50,000 inhabitants. Many of the processes operating or scheduled to operate within the works are the realisation of recent I.C.I. advances in research. Important new materials, ranging from the tough, flexible plastic, polythene, to Britain's newest synthetic fibre, 'Terylene', are coming into large-scale production.

I.C.I. has already expended nearly £25,000,000 in developing Wilton. About £20,000,000 will be spent in the course of the next few years. To the chemical engineer Wilton, together with its sister plant at Billingham across the river, represents the largest and most modern centre of chemical industry in the world. To the ordinary Tees-sider, who remembers how unemployment ravaged the district before the war, the great project now spreading over Wilton's 2,000 acres is an earnest of new stability in the industrial situation on Tees-side and of greater security for this and future generations in a young and vigorous industry.

against a greater secular change in the terms of trade than the private investor in farming can take into account in a free market economy, or as the way to safeguard the country against starvation in war. Exactly analogous arguments are used, by primary producing nations, for privilege and protection to industry. In the last resort, Mr Trow-Smith's case is the case for political despair, for permanent acquiescence in the mutual frustration, and the potentialities for mutual destruction, of the sovereign nation state. In the last resort he may, accordingly, be perfectly right. But nothing is gained by resting essentially political arguments on an implicit neo-Physiocracy.

Homespun Law

THE MACHINERY OF JUSTICE IN ENGLAND.

By R. M. Jackson.

Cambridge University Press. 372 pages. 30s.

THIS book is more valuable in its second edition than in its first. The author has continued to think, to feel and to grow, and so to change his mind. These are not reactions usual in the case of a book on this subject; they are provoked here because this is not a book wholly about law. Its title is accurate. The book sets out to describe the machinery of justice in this country (which accounts for its length). It succeeds in relating the machinery of our justice to the people of this country, their history, habits and traditions, to their deep-seated belief in what at first looks like a paradox, that the true test for any social machine is to be found in what results it produces, and yet that, given the drive, it is possible to produce almost any kind of result from almost any given piece of social machinery.

Dr Jackson is well equipped to make this kind of survey. He is now Reader in Public Law and Administration at Cambridge, but he was trained as a solicitor, which means that he learnt the details of the machine first and only later investigated its background of theory and history, both from books and from the commissions and inquiries with which he has served. So, while in the thirties he was an iconoclast, hoping to see a Minister of Justice ruthless enough to shape everything with blueprint exactness, now he can write:

The fact that some suggested reform has not been taken up by either the Lord Chancellor or the Home Secretary does not show that a sound project has fallen between two stools, for who can say that a Minister of Justice would have been more receptive.

It is a good and valuable book, but not perfect, and its excellence provokes one to wonder why it has not gone beyond the last camp below the summit. Probably the reason is that Dr Jackson is not a born writer. He is not wholly conscious of the reader. His paragraphs

are far too long. The subject is compressed, like pemmican. The section on special tribunals is only 42 pages long (that subject alone should be the topic of Dr Jackson's next book). The reader is bludgeoned and stunned. It is like being under the falls at Niagara; there is no surcease, and the essence of the art of maintaining interest is that there should be some variation in the tension. Despite that, it is not an easy book to put down; it is so full of common sense.

Text and Reference Books

THE ECONOMIC DEVELOPMENT OF CEYLON. 829 pages. 60s.

THE ECONOMIC DEVELOPMENT OF NICARAGUA. 424 pages. 40s.

SURINAM: RECOMMENDATIONS FOR A TEN YEAR DEVELOPMENT PROGRAM. 271 pages. 40s.

Johns Hopkins, Baltimore (London: Geoffrey Cumberlege).

The International Bank for Reconstruction and Development has organised missions to report on the economic development of various under-developed countries at the request of their governments. Reports by missions to Ceylon, Nicaragua and Surinam, presented in 1952, have now been published in book form in this country.

The reports follow a standard pattern; a detailed survey was made of existing conditions and on it were based recommendations for planning future development. The programme for Surinam was drawn up for ten years, those for the other countries for five years. The surveys provide useful sources of statistical information and some criticism of existing development projects.

Spy Stories

Washington, DC

ON the morning of Friday, November 6th, the Depart-
ment of Justice circulated the texts of two speeches
to be made that day at Chicago—one at 10.30 in the
morning and the other at a dinner—by the Attorney-
General. Neither contained any startling news and Wash-
ington was just settling in for a quiet week-end when it
was announced that still a third text was ready—that of a
speech which would be delivered shortly to a luncheon of
the Executive Club. Mr Brownell was, it seemed, being
even more garrulous than the average Cabinet officer on
tour. It was this third text—entitled, with a humour rare
in Washington these days, “Ethics in Government”—
which included the statement that

Harry Dexter White was known to be a Communist spy
by the very people who appointed him to the most sensi-
tive and important post he ever held in government service.

A few minutes later Mr James Hagerty, the President's
press secretary, emerged from his office to tell the White
House correspondents that “the President told the
Attorney-General that it was his duty to report to the
American people.” At once every Congressional committee
that considered it might have a jurisdictional claim to the
case started to issue subpoenas to all and sundry and began
to announce when Mr Truman, Governor Byrnes, and Mr
Justice Clark would appear. Those who, to use the
immortal phrase of the counsel of one committee, “got
into the act” too late, had to be content with General
Vaughan and Mr T. Lamar Caudle. It was suggested by
the same phrase-maker that it would make a “more juicy
hearing” if the interested committees were to hold joint
sessions. As the days went by, and the reporters were
unable to get at Mr Brownell, the demand for evidence
became steadily more insistent.

When the President held a press conference on Novem-
ber 11th, therefore, he found 175 people waiting for him,
most of them in a hostile mood. When the questioning
began, it soon became clear that, in spite of the announce-
ment that he had given permission for Mr Brownell's
speech, the President was, in fact, bewildered by the way
the situation had developed, unhappy at the idea of Mr
Truman being subpoenaed by a Congressional committee
and indignant at suggestions that his predecessor would
“knowingly have appointed a Communist spy to high
office.”

The conference, however, established some important
points. The President, for one thing, did not wholly sup-

port his press secretary's statement, but said only that he
had told Mr Brownell to make his own decision and that,
if he felt it was his duty to make the facts public, he must
do so on a purely factual basis. It also became apparent,
as was confirmed later, that Mr Eisenhower had not read
the controversial speech either before, or after, delivery.
He denied that an ex-President's loyalty had been impugned
on the grounds that Mr Brownell had never told him that
Mr Truman saw the Federal Bureau of Investigation reports.

The Attorney-General had evidently been something less
than perfectly explicit when he obtained General Eisen-
hower's permission to make his accusations. He apparently
failed to tell the President that they would be made, not
before a grand jury or a Congressional committee, but in a
political atmosphere before a partisan group. And he did
not mention the fact that Mr Truman would be personally
inculped. The press conference, therefore, to the relief
of everyone, established the fact that the President was
not involved in Mr Brownell's performance, but it did
leave many people with an uncomfortable impression that
Mr Eisenhower remained unaware of the significance of
what had been happening. This impression was strength-
ened when he was overheard to say an hour or two later
that “that Brownell can sure stir things up!”

★

There has been plenty of speculation over precisely what
it was that “that Brownell” was trying to stir up. It was
certainly not only the voters in the 24th Congressional
District of California. There is some evidence to suggest
that Mr Brownell's speech was primarily the attempt of one
faction in the party to steal the thunder of another faction.
It is not at all certain that President Eisenhower will be
a candidate in 1956, and some of his possible successors
are beginning to jockey for position. One effect of Senator
Taft's death is to put Governor Dewey, his mortal enemy,
back among the runners, and Mr Dewey's supporters
are said to consider that Mr McCarthy, or someone from
his stable, is the chief danger. What more natural then
that Mr Brownell, who managed both of Mr Dewey's cam-
paigns, should decide to go to one of the Senator's finan-
cial strongholds and try to outdo him at his own game?
And what better case with which to outdo him than that
of Harry White?

It may never be possible to prove conclusively whether
or not White was, as Mr Brownell said, “a Russian spy.”
And, though few people who have studied the case closely

in the last few years would be prepared to wager any considerable sum on his innocence, that is irrelevant to the present accusation. What matters now is whether he was known to be a spy in the winter of 1945-6 (18 months before a grand jury found there was not enough evidence to indict him) by those who, at that time, appointed him to the International Monetary Fund. One man who could tell the whole story, and whose word would be taken, not only by the President, whose great friend he was, but by the country at large, was Mr Vinson, who in 1945 was Secretary of the Treasury and Mr White's chief. It is a thousand pities that Mr Brownell did not come across the papers in this case until after Mr Vinson's death.

Unfortunately for his defence, Mr Truman chose in his broadcast to make a political answer to a political attack and not to wait for the testimony of Mr Brownell and Mr Hoover, the head of the FBI. Unfortunately for Mr Eisenhower, Mr Brownell, when presenting a large volume of evidence, little of which was new to anyone in Washington, tried to justify his original charges instead of consolidating his retreat on to an accusation merely of laxity which, of course, there was.

It may turn out to be unfortunate for the United States that it was considered necessary to draw Mr Hoover into a political controversy. Mr Hoover testified to meetings with Mr Vinson and Mr Clark, then the Attorney-General, who conveyed Mr Truman's wish that Mr White should be kept under surveillance. From his statement, however, the newspapers were able to extract such headlines as "FBI did not agree" to retaining Harry White in the government service, without drawing attention to such qualifying phrases as "that would not be within my purview." If no one else considered the implications of allowing the head of the FBI to be injected into politics, the Attorney-General should have done so. But the events of the past fortnight have not testified to Mr Brownell's sense of responsibility.

American Notes

Courtesy Call on Canada

THE links between Canada and the United States have developed into something stronger than those between mere good neighbours; the personal, social and economic connections between the two countries are by now so inextricably interwoven that they form a family relationship. But recently the family has not been a very happy one, largely because the United States, suffering from various minor economic pains, has been trying to get some relief more tangible than sympathy out of Canada. Restrictions on imports of cheese and dried milk, made necessary by the overproduction which has been encouraged on American dairy farms by high government price supports, were

followed by threats of restrictions on imports of oats, fish and certain non-ferrous metals. Of course, such restrictions affect countries other than Canada, as do the many other barriers against increased exports to the United States. But Canada is particularly anxious that these barriers should be lowered, or at least not be raised, because more than half its foreign trade is with the United States. And Canada alone was affected by what seemed like a gratuitous piece of bureaucracy when last month the Civil Aeronautics Board in Washington applied its regulations in such a way as to prevent at the last moment the opening of a Canadian air service between Montreal and Mexico City.

However, last week, before leaving on his courtesy call on the Canadian people, President Eisenhower took steps to see that in future such arguments should be kept in the family instead of becoming matters of public protest. He agreed to the setting up of a joint economic affairs board, where questions of trade policy will be discussed and, it is hoped, solved. The board will be on a higher level than the existing joint defence board, for its members on both sides will be from the Cabinet. But settlement will often depend on Congress and on Parliament, and what they will do can never be guaranteed, at least as far as Congress is concerned. However, on the long-standing cause of Canadian disgruntlement, the United States' refusal to co-operate in the St Lawrence Seaway, there is a good chance that the Senate may at last act at its next session. In the meantime, as the result of prodding from the President, almost the last obstacle has been removed from the hydro-electric side of the project, which is to be the joint enterprise of the Province of Ontario and the State of New York.

All these sources of family friction lose their importance when seen in the light of the inescapable bond that binds Canada and the United States together—their joint responsibility for the defence of the North American continent, which President Eisenhower emphasised so strongly in his speech to Parliament at Ottawa. As he pointed out, security plans "must now take into account the Soviet ability to employ atomic attack on North America." There can be little doubt that by far the most important, as well as the most concrete, consequences of his visit will come out of his private discussion with the Canadian Cabinet which resulted, in the words of the communique, in "complete agreement on the vital importance of effective methods for joint defence."

Humphrey's Choice

THE Secretary of the Treasury, Mr Humphrey, has now confirmed what Administration spokesmen have been hinting for several months; that all expectation of balancing the budget in the year which begins next July has been abandoned. This is the first budget for which the Republicans will be wholly responsible, and it was hoped, after the \$6.5 million cut from Mr Truman's estimates had brought the deficit expected this year to below \$4 billion, that Republican pledges of solvency might be redeemed next year. Mr Humphrey now concedes that if government spending is not drastically reduced to compensate for the \$5 billion tax reduction in December there will be a deficit next year of from \$8 to \$9 billion. The possible choices, as

Mr Humphrey told the Economic Club of Detroit (no doubt in the hope that Congressmen were listening) are only four: to accept a deficit of this magnitude, to cut government spending, to raise taxes, or to accept a combination of all three.

Mr Humphrey evidently prefers a little of all three distasteful expedients, each one directly contrary to Republican promises. Spending, by which is really meant military spending, for this accounts for 70 per cent of the total, can hardly be cut by \$9 billion or even by \$5 billion in the face of the Soviet hydrogen explosion and the intransigence of the Soviet leaders; even if it safely could, the reduction might transform the present economic decline into a real recession. The Department of Commerce now puts the decline in the gross national product between the second and third quarters of 1953, on a seasonally adjusted annual basis, at \$2 billion greater than the earlier estimates of the Council of Economic Advisers; reductions in buying for inventory were almost wholly responsible.

Even Mr Humphrey's estimate of a \$9 billion deficit may be too low. It is based on the assumption that Congress will extend the high corporate and excise tax rates due to disappear next April. But the closer Congress comes to the elections the more anxious it will be to give the taxpayers evidences of goodwill. It already seems certain to repeal the rise in the social security tax scheduled for January because it would more than wipe out the December reliefs for taxpayers earning less than \$4,000 a year. The Administration can hardly count on retaining all of the \$3 billion in revenue due to disappear in April. What really would knock all Mr Humphrey's calculations into a cocked hat, including the modest \$15 billion rise in the debt limit which Congress will be asked to pass early in the session so that the voters will have time to forget about it, would be a recession. It has been calculated that one of only 1949 dimensions would cost the federal government \$14 billion in corporate and individual taxes, which provide four-fifths of its revenue. But under those circumstances, balancing the budget might not seem so attractive even to Mr Humphrey as it does now—or at least as it did during the election a year ago.

Sitting on the Tariff Fence

THE only section of President Eisenhower's speech to the Canadian Parliament that was not received with enthusiasm was that in which, while recognising the need for a high level of international trade, he reaffirmed his intention of sitting on the tariff fence until the Randall Commission on Foreign Economic Policy had made its report; he added that it would never do to risk any sudden dislocation of the American economy. Two days later the Administration's lack of decision on trade policy was demonstrated further when the Secretary of Commerce, never an enthusiast for lowering tariffs, called for fair competition in foreign trade, provided that the standard of living of the American worker was protected.

Some Canadians are beginning to feel that the important thing is not which side of the tariff fence the United States finally comes down on, but that it should make up its mind quickly. That uncertainty about future trade regulations

is one of the chief deterrents to foreign exporters thinking of entering the American market is clear from the reports from the national affiliates of the International Chamber of Commerce which the United States Council of that body has collected for presentation to the Randall Commission. The other complaints in these reports—about high rates of duty on specific products, complex customs procedures, and so on—have all also been frequently expressed, but it is valuable that the commission should have this opportunity of hearing directly from foreign businessmen, since at its meeting in Paris it had time only for American officials and representatives of international organisations.

Mr Randall at least is well aware of the desirability of speed in making his recommendations, but since there is little chance that they will be unanimous, there is less that a trade policy will be agreed in Washington next year. The most that can be hoped for is another extension of the Trade Agreements Act. That means more uncertainty, not only in general but particularly for the individual foreign businessmen whose products compete with those of American industries which appeal to the Tariff Commission, under the present legislation, for relief on the grounds that they need additional protection.

Before an increased duty can be imposed, the President has the final word; he has just spoken it, very encouragingly, in the case of the briar pipes which first came to his desk last February. The difficulties of the domestic industry arise, in his opinion, from the decline in pipe smoking, not from imported pipes, and a higher tariff would therefore be of no help. Other imported products which are in more or less danger from pending decisions are oats, lead, zinc, chinaware, both common and safety pins and, once again, watch movements. Few of these are of great importance in the American economy, while one of the most hopeful signs on the tariff horizon recently has been the stress which leading American industrialists have been putting on the need for reducing their country's trade barriers. Even the conservative National Association of Manufacturers is beginning to think in these terms. It is therefore disappointing to find a firm of the size and international ramifications of the Monsanto Chemical Company resigning from the association because it believes the NAM's "present stand on free trade is detrimental to the chemical industry."

FOREIGN TRADE in the UNITED STATES
MILLION DOLLARS

Dewey's Homework

Governor Dewey is cleaning house in New York—with an energy which revives memories of the aggressive racket-busting prosecuting attorney he once was before he went to Albany and began to fix his eyes on Washington. Mr Dewey's national influence and his claim to be considered as a possible presidential candidate are based on his control of New York State's Republican organisation and his ability to carry the state, with its 96 electoral votes, the biggest block in the country. Swift action is needed if both are not to be endangered by scandals. The Republican defeat in New Jersey, on the issue of corruption, and the Democratic revival in New York City have underlined the risk to Mr Dewey's political future whether it lies in state or national affairs.

Tammany, the disreputable Democratic machine in New York City, won this year, under the banner of a New Dealer, Mr Wagner, whose decision to retain the services of Mr Robert Moses as Park Commissioner and to make Dr Luther Gulick "city administrator"—a new post which in effect means city manager—shows that he means to give more than lip service to reform. With the liberal wing of the party in charge, the Democrats may put up a formidable bid for the state governorship next year with the magic name of Mr Franklin Roosevelt, Jr.

A special meeting of the State Legislature is being held this week, at Mr Dewey's demand, to oust the Senate majority leader and the state's acting Lieutenant Governor, Mr Wicks. The governor considers Mr Wicks fell below the proper ethical standard for public servants and brought odium upon his party by his visits to an influential labour leader and racketeer serving a sentence for extortion, Mr Joseph Fay. Mr Wicks's candid explanation that Mr Fay, even in prison, was the head of an "invisible government" has shocked instead of satisfying the public. Mr Wicks, however, is determined not to be made a scapegoat; and his popularity with his colleagues, and his apparent ability to frustrate changes in electoral districts through which the Republicans hope to entrench themselves in the legis-

lature against a possible Democratic sweep next year, may strain Mr Dewey's control of the party.

The other shocker is the revelation that leading state Republican politicians, including the bosses of Nassau and Westchester, have had substantial financial interests in the lucrative harness racing tracks, which now rival the flat racing tracks as an attraction to spectators, gamblers, and racketeers. Mr Sprague, of Nassau, a close friend of Mr Dewey, has now resigned as Republican National Committeeman, though the Governor protested that this was unnecessary. Mr Bleakley, of Westchester, has resigned his job as counsel to the tracks. Nearly half a billion dollars will be spent on an investigation of the harness racing business, in an effort to show that the party, which has made so much of Democratic misdeeds, will apply the same high standards to its own members. But, for Mr Dewey, it may be a case of locking the barn door after the horse has been stolen.

Back Door to Taft-Hartley

IN a message to the convention of the Congress of Industrial Organisations the President has renewed his promise to ask Congress in January for amendments of the Taft-Hartley labour law which will make it "absolutely fair to labouring men . . . to management and to the public at large." But even if it were possible, in theory, to please everyone, most trade unionists doubt whether any frontal assault on the Act, to make it more acceptable to labour, will succeed in the present Congress. The inability of the CIO and the American Federation of Labour, because they are pinched in different places, to agree on what remedies are the most urgent, strengthens the hand of businessmen who oppose any "weakening" amendments.

In fact, the Act seems likely to become more, rather than less, restrictive, now that the Republicans control the National Labour Relations Board, which administers it. The loose drafting of the law has left the board with a great deal of discretion. Re-interpretation is already under way, even though Mr Mitchell, the new Secretary of Labour, who needs to win the confidence of labour, is proving as hard to please as Mr Durkin, his predecessor, in the matter of finding a candidate for the fifth place on the board. Two of the present members of the board, a Democrat and an independent Republican, were appointed by Mr Truman; the chairman, Mr Farmer, and Mr Philip Rodgers are Eisenhower appointees.

Supporters of the Act have always argued that it never had a fair trial because the old board was out of sympathy with its aims. The new members, consequently, are determined to review all their predecessors' decisions. Their first step will be to reduce the number of cases they must handle and confine them to those which substantially affect inter-state commerce. The old board, in a single year, accepted 14,000 cases, nearly 1,500 of which concerned firms with fewer than twenty employees. In the future, local cases, where possible, will be left to the states.

Trade unions whose officers have been indicted for falsely swearing that they were not Communists will not be able to request the board's services in determining the proper bargaining agent for a plant or industry until their officers

are cleared. The "free speech" for employers which the Taft-Hartley Act set out to protect will certainly be interpreted more generously by the new board than by the old. One of the most critical changes, in view of the division in the trade union movement, concerns the ease with which craft unions have been able to split off from the big unions which represent a whole plant or industry. This seems democratic and has pleased the AFL, which is largely built on a craft structure, but employers and the CIO seem to have convinced the board that, in the interests of stability, such "craft-severance" should be discouraged.

When's a Sport not a Sport ?

THE Supreme Court's answer to the riddle is: "When Congress declares it to be a business." That is in effect the meaning of last week's ruling which upheld Mr Justice Holmes's famous decision in 1922 that "the business of providing public baseball games for profit between clubs of professional baseball players" was a sport, and therefore not subject to the anti-trust laws, even though it entered into inter-state commerce in various ways. This time the Court held that if, as the prosecution charged, conditions had changed drastically in the last thirty years, then the anti-trust laws should be applied to baseball by specific legislation, not by court action.

This is a clear warning to the owners of baseball clubs that, if they do not watch out, Congress will get them—although previous attempts to induce Congress to regulate professional baseball have had no success. However, the Baseball Commissioner, Mr Frick, will find this warning from the Supreme Court a useful backing for his attempts to clean up and reinvigorate the game. The fact that the cases went to the Supreme Court at all showed that baseball is taking a new lease on life. For to the baseball clubs Mr Holmes's decision always seemed too good to be true and they dared not risk it being upset; as a result, whenever they were challenged they settled out of court, an expensive method that they can no longer afford.

The cases at issue on this occasion concerned the "reserve clause" which ties baseball players to a club for the duration of their professional life. It is possible that the Supreme Court might have decided differently if the argument had been over restrictions on broadcasts of baseball games. The development of broadcasting since Mr Holmes's day was one of the reasons given by Mr Justice Burton for dissenting from the Supreme Court's majority decision. Here, however, the first conclusive test may come over professional football, for a few days later a federal judge in Philadelphia answered the riddle differently, by deciding that football ceased to be a sport when it went on the air, and thus became subject to the anti-trust laws. He ruled that the National Football League had the right to forbid televising of a match within an area of 75 miles from where the game was being played, but no farther. He argued that since the league depended on gate receipts for its existence it was reasonable to prevent people who could go to a game in person from seeing it at home without paying. But to prevent those farther away from seeing it would be an unreasonable restraint of trade within the meaning of the Sherman Anti-Trust Act.

Lifebelt for Shipbuilders

THE Navy has come to the rescue of the nation's private shipbuilders with an order for 165 ships. This is the biggest postwar naval building programme, and it will go to the private yards under competitive bidding. The plum is the contract for the Navy's third super-carrier, which is expected to cost about \$210 million. It will have to be built on the east coast; there are no facilities for doing so on the Pacific. The recent practice of the Navy has been to reserve much of its work for its own yards, despite the protests of the industry. What has made the Navy change its mind is the prospect that by 1955 the private shipyards will be completely idle, and their skilled labour and engineers dispersed. This happened, to the nation's cost, before the last war. At present no new orders are being placed for non-military vessels, and almost all the work on hand will be completed by the end of 1954. Even reconversion jobs are going to less costly foreign yards.

The naval order is only a stop-gap while the Administration and Congress think out a long-term shipbuilding programme to keep the yards busy and replace the ageing merchant marine. There is no new money in this year's budget for shipbuilding subsidies and the Administration has no intention of embarking on costly construction programmes such as those the Truman Administration undertook if the shipping industry can be induced to do the job. It has taken many months for government shipping officials to sell the first three Mariners—fast cargo vessels which the government began to build in 1950—to a private shipping line, even though they were offered at much below cost. To dispose of the rest, rather than lay them up now that they are no longer urgently needed to transport military cargo to Korea, the Maritime Administration is considering offering to use part of the purchase price to convert them to the buyers' taste. One of the difficulties about government aid is that the services tend to insist on the inclusion of special defence features which would make the ships easy to convert in wartime, but which the private lines do not want. But the Maritime Administration is moving slowly. Its predecessor ran into such heavy weather with Congress and the Comptroller General over extravagant shipping subsidies that it will wait until Congress reassembles and gives a go-ahead signal.

SHORTER NOTE

The Army has become entangled, on moral and economic grounds, with two very different groups—the Women's Christian Temperance Union and the retail liquor dealers—because of its recent ruling which permits the sale to men over 21 of spirits and beer, either by the drink or the bottle, at clubs and messes of officers and non-commissioned officers. The new regulation, which the Navy adopted in 1934, is designed to do away with the evils of prohibition by providing liquor in wholesome surroundings where supervision can ensure moderation. Temperance advocates, however, warn of a "storm of protest" from mothers, and liquor dealers are incensed by an extension of government competition with private enterprise. A Gallup poll shows that public opinion on the subject is almost equally divided with a slight majority disapproving of the sale of liquor at military posts.

Today's da Vinci needs TOMORROW'S ALLOYS

In Leonardo da Vinci's 450 year-old notebooks can be found sketch designs for flying machines, dredgers, machine tools and many other ingenious mechanisms. Many of da Vinci's most advanced designs were not put to the practical test in his lifetime because materials then were not good enough. Today the designer can turn to the metallurgist for help. Together they can look ahead to projects which in a few years time may depend on materials not yet commercially developed. Mond Nickel is working *now* on such problems in the field of nickel alloys. Now is the time for designers to . . .

"Acqua alle corde!" The Obelisk in the Piazza di San Pietro in Rome was erected in 1586 with the help of 800 workmen and 140 horses. This detail from Carlo Fontana's engraving gives some idea of the splendid grandeur of the operation. It was a close thing, so the story goes. The architect had not allowed for the enormous strain on the ropes and their consequent stretching. But, though silence was imposed under pain of death, one of the workmen—a sailor from San Remo—shouted at the critical moment:

"Acqua alle corde!" And the water on the ropes, tautening them, saved the day. These days the builder works with far more manageable materials. Some of the most versatile are made by the Building Boards Division of the Bowater Organisation. Made from compressed wood fibre, these boards are used, among a thousand other uses, as insulating materials in ceilings, as partitions in houses, as panelling in railway coaches or in ships... all over the world they are essential to the architect and builder of today.

Too Quiet Flows the Nile

FROM OUR CORRESPONDENT IN CAIRO

TWICE recently President Neguib has remarked to me that "with patience the Canal Zone question can be settled." His demeanour matched his words as he benignly expounded, once again, how much both Britain and Egypt stood to gain by a settlement that dissipated the rancour of recent history in Egypt. "I can remember my time on the frontier near Sollum," he said. "The British officers used to invite us over to their mess and we were all good friends together. It can be like that again."

Other officers of the Council of the Revolution equally speak without urgency. Colonel Gamal Abdel Nasser, the Deputy Prime Minister, remains adamant that Egypt has gone as far as it can or will go; but he is tranquil about the situation and has found time to go sailing in the Red Sea and to Saudi Arabia on a mission of condolence and compliment. To questions by newspapermen about the state of Anglo-Egyptian talks, the answer is usually a simple "nothing new." This patient mood developed shortly after the meeting of October 21st failed to produce the desired agreement, and it contrasts strongly with earlier impatience. It can be, and no doubt partly is, a pose, a calculated no-response to Britain's silence. But it is more than this. The Egyptian leaders are now apt to say they would like to forget about the whole matter and get on with their pressing domestic problems. When gossiping, almost idly, like this about the Canal Zone question, one may be apt to miss the significant fact that the Egyptian leaders are no longer insisting that their domestic situation and their economic recovery cannot make any real progress until a settlement with the British is reached.

When there is any notable change in the temper of Anglo-Egyptian relations it is always wise to look for the explanation first in the domestic situation of Egypt. Just as the Wafd were pushed headlong into abrogation of the treaty by their own misgovernment, so the present government's patience is largely the fruit of Abdel Gelil el-Emary's wise husbandry at the Ministry of Finance. He has gone far towards redressing the balance of payments; he has about £18 million in the convertible sterling account with a right to release of a further £10 million, plus £5 million more if required, on January 1st next; and he has steered the cotton market through its worst crisis in a decade. Farmers are getting about 60 per cent more for their cotton than they were a year ago. Price inflation has been arrested.

To ask whether the regime could for long survive without

a settlement with Britain is much less pertinent than it was only a few months ago. During the first eight months of this year there were periodic waves of discontent which encouraged opponents to hope for the regime's collapse. Each wave was mildly repressed. Now the Revolutionary Tribunal is punishing past offenders with vigour and speed, in a way that sometimes offends the western observer. The Council feels, however, that the mass of the Egyptians worry little about judicial niceties and see in the tribunal a proof of strength and staying-power in the regime. They feel that the vigorous punishment of offenders from the royalist past will have a more lasting effect than past mildness. In this they are probably right, for the economic background to popular discontent on which the older politicians based their hopes of the regime's collapse, has been modified very much in favour of the present leaders.

In these circumstances one may expect their patience regarding the Canal Zone question to continue. The British Government is meanwhile silent because it feels that, having presented the broad lines of agreement on October 21st and found them unacceptable in some respects to the Egyptians, it is for the latter to propose improvements. But the Egyptian government believes it can safely afford to wait—that the nearer one gets to the terminal date of the 1956 treaty, the more factors are on its side. Diplomatic jargon has been strained to the limit to describe the current state of affairs. One can only say that there has not been a breakdown in the talks because neither side desires one. In actual fact, both sides have not moved from the positions taken up on two points, reactivation and uniforms.

Egypt agrees that British troops should automatically re-enter the base if a state which is signatory to the Arab Collective Security Pact is attacked, and that it would be necessary to revive the base if a serious attack was developing towards the frontiers of the Arab states. It therefore suggests "immediate consultations" in the event of Turkey or Persia being attacked. The British, seeking a wider formula, presented a clause which virtually left it to the United Nations to decide when British troops would re-enter the base, but the Egyptian negotiators rejected this, despite the fact that the idea had originally come from one of them. Now the Egyptian side is adamant against the United Nations formula because, they say, Britain and the United States could determine what the decision of the United Nations would be. They fear that the United States would use the clause to secure reactivation of the base for, say, an anti-Communist

crusade in Indo-China. The British side is, nevertheless, sticking to the United Nations formula.

The uniforms issue is almost foolish. The British do not intend that their technicians should always wear uniforms and agree they would seldom do so. The Egyptians, while insisting that they are engaging technicians, not soldiers, agree that there might be occasions, such as the Alamein ceremony, when they might wear uniforms. But the British will not accept a clause specifying that they will not wear uniforms and the Egyptians refuse a clause which specifies the right to do so.

It should be added that the informal talks which produced a wide field of agreement on essentials did not produce complete formulation of the agreed points and there may well be other difficulties.

From First to Second Monnet Plan

THE first phase of the "Monnet Plan" to modernise and equip French industry has ended, and to mark its completion the *Commissariat Général* has just issued a report summing up its achievements. The report reviews clearly and precisely what has happened since 1947, when the project was first launched, both to the six basic industries with which the plan was primarily concerned and also to the French economy generally. But what gives this year's report more than routine interest is its frank self-criticism, the readiness of the authors to display the lacunæ in the first plan which time has revealed. In doing so, they also foreshadow part of the nature and the content of the second plan, not yet published but expected in the New Year. The second instalment, the authors suggest, will in many ways differ radically from the first.

The initial Monnet Plan focused its attention on modernising and stimulating production in some half-dozen basic industries, in the hope that this impetus would shake the French economy out of its prewar lethargy. How striking is the contrast between French and British conceptions of "planning" is indicated by the fact that the Commissariat has always been independent of parliamentary control and virtually of government control. Its effectiveness, therefore, has been due very largely to the skill and energy with which M. Monnet and his successor M. Hirsch have cajoled sluggish politicians into providing state funds and into guiding private investment, where possible, through constructive channels.

During the first five years there was every sign that the efforts of the Commissariat, coupled with large injections of Marshall aid, were meeting with a remarkable degree of success. Between 1946 and 1952 France's industrial production increased more rapidly than that of its European neighbours, with the exception of Holland and Germany; by 1952 it was 45 per cent greater than in 1938 and 16 per cent above the peak prewar year of 1929. This progress was reflected in five of the six basic sectors singled out by the Monnet Plan. As Table I shows, the targets set in the early years of the plan were very nearly reached by the coal, electricity and steel industries, and were more than fulfilled by the oil and cement industries. The only real failure was in tractor production which achieved a mere 63 per cent of its aim.

Apart from these five basic industries, however, the picture remains far from satisfactory. The fact that by mid-1952 total industrial production had begun to slacken and the trade balance to deteriorate makes it clear that modernisation of the six chosen sectors of industry by itself is not sufficient to rejuvenate the French economy.

The most obvious weakness is in agriculture which, the report notes, employs one-third of the occupied population yet produces only one-fifth of the national product. Yields are barely half those obtained by most of France's neighbours, and it is a net importer of food. There has been scarcely any advance in agricultural research and education; indeed, in many parts of the country such activities are practically unknown. Mechanisation is slight and facilities for credit poor.

Second claimants for special attention in the next plan are the consumer industries. The setback to French production that took place in the second half of 1952 was concentrated almost entirely on those industries directly concerned

TABLE I—DEVELOPMENT OF KEY RESOURCES

Resources	1929	1938	1946	1951	1952	Targets set for 1952-53	Percentages in 1952	
							Of increase as compared with 1946	Of fulfilment of targets for 1952-53
Coal (mil. tons)	55.0	47.6	49.3	55.0	57.4	60.0	+ 16.5	96
Electricity (bil. kWh)	15.6	20.8	23.0	38.3	40.8	43.0	+ 77	95
Oil (mil. tons) (ref'd crude)	...	7.0	2.8	18.4	21.5	18.7	+ 668	115
Steel (mil. tons)	9.7	6.2	4.4	9.8	10.9	12.5	+ 148	87
Cement (mil. tons)	6.2	3.6	3.4	8.1	8.6	8.5	+ 153	101
Tractors (thou)	1.0	1.7	1.9	16.0	25.3	40.0	+ 1,230	63

with the production of consumer goods, particularly textiles and footwear. The truth is that these industries have long lagged behind in postwar recovery; while other branches of industry had recaptured and even surpassed their 1938 level of production by 1947, in the case of consumer goods industries this point was delayed until 1950.

From a study of the report the outsider might well suspect that there has been a serious and continuing structural unbalance in the French economy created by the tendency to devote an unduly large proportion of the nation's resources to the production of food and capital equipment. It is reflected in the fact that the average family devotes some 60 per cent of its income to the purchase of food and only 40 per cent to buying the products of all other consumer industries. In short, the neglect of agricultural productivity and the neglect of the consumer industries are two facets of the same problem; in this sense the backwardness of French agriculture is responsible for the fragility of the consuming industries.

Still a third black spot is housing. In the seven years since the Liberation and up to the end of 1952, a grand total of 207,000 new dwellings were built in the whole of France—less than the current annual rate of housebuilding in Britain. In addition to its obvious depressive effects on French morale, such a rate of building completely immobilises large sections of the working population. The report recommends that an annual rate of construction of 240,000 dwellings should be put at the head of the priorities in the next plan.

Unfortunately the second plan is not likely to escape the limitations which handicapped the initial plan—a continuous hand-to-mouth struggle for funds and a climate of commercial opinion which greatly prefers security to risk bearing.

Table II shows that by the end of 1952 public funds had contributed about half the financial resources required under the plan. In recent years the relative share from this source has declined and indeed would almost have disappeared in 1951, when American "counterpart funds" no longer became available for this purpose, had their place not been taken in part by increasing Treasury loans. But loans of this kind will always be an undependable support as long as French political and economic conditions remain unstable. The decline in public funds available for modernisation was especially marked in 1953—admittedly a "transitional" year bridging the two plans—when they sank by over 20 per cent.

Perhaps the most encouraging feature of the table is the comparatively high contribution made by self-finance. In coming years this contribution will have to be even greater, but whether this can be achieved by a technologically

TABLE II—FINANCING OF INVESTMENT
(In billions of current francs)

	1947	1948	1949	1950	1951	1952	Total	
							In current francs	In francs 1952
Self-finance and market loans	93.0	97.9	177.4	246.1	403.7	395.8	1,413.9	1,974.7
Public funds	11.8	195.7	320.8	374.4	313.6	374.5	1,590.8	2,247.4
Other funds (e.g., bank credits, etc.)	72.1	62.1	77.6	49.5	83.0	163.0	507.3	778.5
TOTAL	176.9	355.7	575.8	670.0	800.0	933.4	3,512.0	5,000.6

stagnant complex of agricultural and consumer goods industries is highly uncertain. The government is said to be pinning its hopes on encouraging re-investment through the discriminatory taxation of profits as part of its programme for fiscal reform to be debated soon by the Assembly. At the moment the portents are not good. There have been suggestions that the government wishes to rely on self-finance and on loans raised in the open market as the main sources of investment and that it intends to support the plan substantially with state funds only when it becomes demonstrably clear that other methods have failed. The danger is that it will postpone action for too long, which may well mean yet another year of "transition" in the life of the Monnet Plan and a tragic loss of momentum.

In the eyes of the Commissariat, however, there is a second incubus which at this stage is just as serious as a shortage of funds. This is what the report calls the "rigidity" of the French economy. France's essential trouble, it says, is psychological and social.

The attitude of ordinary individuals, of the professions, the banks and the public authorities is to give priority to security and to the maintenance of what status they have managed to achieve—a state of mind which has contributed to a kind of sclerosis of the whole nation that can only prevent any response . . . to the need for new industrial techniques and the pressure for higher living standards. . . . Investments will have an essential part to play; but they must be accompanied by reforms that will eliminate all that is paralysing and sterilising the economic apparatus.

. . . The first plan brought the country face to face with the alternative: modernise or decay. The second plan will have fulfilled its purpose if it leads the French nation to grasp the opportunity for a better future and to put this goal ahead of clinging for protection to the mediocre *status quo*.

The European Political Community—I

FROM OUR SPECIAL CORRESPONDENT

ON November 26th the Foreign Ministers of Belgium, France, Germany, Italy, Luxemburg and the Netherlands are to meet at The Hague. They will deal with the most important medium-range question confronting the six: the form of their permanent constitutional association. The European Political Community is not, of course, so urgently on the agenda as the European Defence Community which, with the Coal and Steel Community, is eventually to be integrated into it. But confidence or suspicion at The Hague may well influence the French National Assembly when EDC comes up for ratification early in 1954. These days the Foreign Ministers of Little Europe are engaged in a never-ending diplomatic conference on the coal-steel pool and on the European army. Germany and France, still far from solving the Saar problem, are struggling to elaborate a European institutional design in which this and other difficulties may assume a new form. The forward movement of the European idea seems sometimes to depend on a kind of mental leap-frog, of which M. Jean Monnet is the acknowledged virtuoso. If the ministers can make a bold showing with the EPC, the planetary momentum of integration will perhaps be regained.

A second article will deal with the differing national conceptions of the European Political Community, which became painfully evident at last month's conference in Rome when the ministers' deputies tried unsuccessfully to establish an area of agreement for The Hague. Especially obscure has been the hypothetical European status of France, which has somehow to be at the same time a colonial and protecting power in Africa and probably senior partner of the associated states of Indo China. The constitutional impediments to a real federation of six states with such divergent relationships with the outside world are clearly enormous. The question therefore arises: is the EPC an embryonic federation or confederation? If not, what is it?

Article 38 of the Treaty for a Defence Community, signed by the Foreign Ministers of the Six, of the USA and of Great Britain, in Bonn in May, 1952, envisaged the creation of a political community, with institutions of a federal or confederal type including a legislature and senate. Last winter a constitutional committee under the chairmanship of Herr von Brentano, parliamentary leader of the CDU, worked out a draft treaty embodying the statute of the European Community which has been the basis of all this year's discussions. The *rapporteur* was a Belgian professor, M. Dehousse, who, with Herr Hallstein, Dr Adenauer's Secretary of State for Foreign Affairs, may

be regarded as the leading jurists in the enterprise. In his commentary on the draft M. Dehousse observes:

In any form of association between states, whether confederal, federal or merely community, there are two elements to be represented in the common parliament: firstly the individual citizens, all of us who are within the association; and secondly, the states to which we continue to belong, as nationals of certain specific countries.

This remark seems to indicate the general spirit of the treaty. The drafters have in reality not opted for a federation or confederation but, it is vital to note, for a community. The individual citizens, to which M. Dehousse refers, are represented in a first chamber, called the Peoples' Chamber. To this house "the peoples united in the Community" send deputies "who may not accept any mandate as to the way in which they shall cast their votes." (Article 12.) The deputies are to be elected by universal suffrage under a quota system whereby each national territory returns the following number of representatives:

Germany and Italy: 63 each.

France: 70 (including an allotment of 7 for those *territoires d'outre mer* which already return deputies to the *Assemblée Nationale*).

Belgium and the Netherlands: 30 each.

Luxemburg: 12.

The gist of this scheme of representation is that, e.g., French deputies to the Community's Lower House will be elected by Frenchmen in France, but will not receive political instruction from electors or parties. The Community will have to create its own parties.

Powers of the President

The Senate is to represent the national states. Senators shall be elected by the national parliaments in the following proportion:

Germany, France and Italy: 21 each

Belgium and the Netherlands: 10 each

Luxemburg: 4

This means that in neither House has representation been based on purely demographic considerations, but on a "qualified" system. At the time of writing the ministers are not yet agreed whether national representation in the Senate should be weighted or equal. Neither deputies nor senators, it is worth noting, need be national parliamentarians.

The third (and most controversial) organ of the EPC is the European Executive Council. The Senate, so the draft proposes, shall elect by majority vote a President, who in turn will appoint an unspecified number of other members of the Council. Neither he nor they can be members of a national government, nor exercise any other paid function. The Council must at the outset receive the vote of confidence of the two houses of parliament and it must resign when no confidence is voted. The Senate's method of showing disapproval is simply to elect another President; the Peoples' Chamber's is to pass an adverse vote by a three-fifths majority of its members. If there is an adverse vote of less than three-fifths the President has the interesting right either to resign or to declare the Peoples' Chamber dissolved.

Besides Parliament and the Executive Council, the Community (as the defence and the coal/steel communities) has a Council of National Ministers. Its role is to "harmonise the action of the European Executive Council with that of

the governments of member states" (Article 35). The draft treaty therefore provides a kind of dual executive: the Executive Council is totally supranational and responsible only to the parliament of the Community; the Council of National Ministers is "intergovernmental," and, although of course sympathetic to the policies and procedure of the supranational organs, will in practice limit the Council's executive power. This duality does not, however, extend to the Parliament in spite of the national-representative character of the Senate. The Senate "shall be composed of senators representing the people of each state" (Article 11), but the senators do not on that account represent the member states themselves.

This abstract and fragmentary sketch of the EPC (no mention has been made of the Court, of the Economic and Social Council or of the proposed links with the Council of Europe) remains quite in the air until it is related to the matter of powers and competence. The immediate practical significance of the political community would lie in its assumption of the functions of the coal and steel, and the defence communities. The leading notion of the drafters (as of all the governments of the Six) was to provide a political hat to cover the two autonomous supranational agencies. Thus the two "specialised" assemblies will be replaced by the parliament of the Community; similarly with the two special councils of ministers. Conversely the ECSC and EDC Court will become the Court of the Community. After a period of adaptation the coal/steel High Authority and the EDC Board of Commissioners will hand over their powers and competence to the European Executive Council (EEC). These bodies will then continue to exist but merely as administrative departments of the Council. It is the EEC that will subsequently appoint the members of these military and industrial authorities, on proposals from national governments.

Strong Master or Gentle Custodian

Up to this point the draft treaty does no more than effect a legal transfer of the existing powers of the specialised agencies (the defence community being assumed already to exist, which as yet it does not) to a single political authority (EEC). This authority would thenceforth exercise its "limited functions but real powers" as a kind of cabinet responsible to a supranational two-chamber parliament in an ill-defined association with the Council of National Ministers. This is not all that the Council of Ministers would do. For just as the supranational parliament, composed in large part of national deputies, would form European pressure-groups in national parliaments; so, it is presumed, the Council of Ministers would act as a conductor of influence from the Community to the governments of the member states. This view of the supranational organs, however, puts in question the whole federal theory of the association and illustrates the intellectual dilemma of the scheme's proponents. For the Community theory, already embodied in the coal/steel pool, is not so much a new kind of state as a novel administrative technique, which depends for its success less on the positive transfer of powers to this or that body as the withdrawal of major economic veto-rights from the national governments. Thus the High Authority at Luxemburg is a regulator and arbiter rather than an executive in the ordinary governmental sense of the term.

Debates on the political community have, however,

Pig Iron!

WHY PIG IRON? Because molten iron from the blast furnaces was run out into sandmoulds. And a series of these moulds suggested a nursing litter of pigs. The main channel was called the sow!

The modern pig-casting machine is an endless chain of moulds, moving continuously. Above it, a ladle car teems in molten iron. "Teems" is a Gaelic word originally used on the famous Black Band in Scotland. On this ironstone field, which is now worked out, the modern blast furnace was first developed.

Blast furnaces built since the war have increased production from 7,761,000 tons in 1946 to the rate of 11,102,000 tons per year. Nowadays pig iron usually goes in a molten state straight to the steel furnace: saving fuel, speeding up the whole process of steel-making.

STEEL is at your service

Nothing left to chance...

CAP AXIALITY

Correct distribution of light with Royal "Ediswan" Lamps is ensured because perfect alignment between the cap and the glass envelope is achieved during assembly.

The incorporation of a "register" accurately moulded into the glass during manufacture of the lamp makes correct fitting of the cap automatic.

This is but one example of the intricate operations in the manufacture of Royal "Ediswan" Lamps, calling for the highest degree of technical skill and the utmost care and precision. Nothing is left to chance—only the finest materials are used and there is strict control at each stage of manufacture.

"Arrivederci, PAL"

ROME IS OUR GATEWAY . . . to the East. Twice weekly, the eastbound skyliners of Philippine Air Lines take flight from London. First stop Madrid. From Rome, these Douglas DC-6 and DC-6B aircraft fly by long stages: to BEIRUT · KARACHI · CALCUTTA · BANGKOK · MANILA. From MANILA to HONG KONG, TAIPEI AND TOKYO; and over the Pacific, via HONOLULU, to CALIFORNIA. Linking at every touch-down with the great international networks.

Who flies with PAL? Mostly, experienced travellers who value the advantages of 'flying the long hops' and of being in the hands of people who understand the East and its ways—not to mention the comfort of a luxurious sleeping-berth . . .

Going East? See your travel agent, and fly with PAL, who know the East best.

20, PALL MALL · LONDON · S.W.1
Tel: W1itchell 3371

The Direct Automatic Navigator watch is the official time-piece of Philippine Air Lines.

seemed curiously to ignore the analogy between the High Authority and the European Executive Council and to concentrate on the old-fashioned idea of a federal executive. Thus on the one hand the "minimalists" (represented by France) have insisted on the strict limitation of the power of the EEC which they fear as a sort of presidential cabinet, responsible, if it is responsible to anyone, only to a supranational parliament of *fumistes*. On the other the "maximalists" (the Netherlands and Germany) have warmly welcomed the EEC as a strong-arm managerial cabinet which would sort everybody and everything out in no time. In some quarters this centralist conception had spread even to foreign affairs, so that Herr Hallstein at Rome felt himself able to speak of "a European cabinet" with respect to international diplomacy. This ambitious view of affairs does not yet commend itself to France which is worried, among other things, about the use to which a European Army might one day be put. There must evidently be a fundamental cleavage between those who want the EPC because they want from it a strong supranational executive *alias* a tough European government and those who want it merely to act as gentle custodian of the coal/steel pool and EDC.

(To be concluded)

Italy Looks Eastwards for Trade

FROM OUR ROME CORRESPONDENT

UNDER pressure from its sagging exports to the West and its mounting European Payments Union (EPU) deficit Italy has responded with alacrity to trade feelers from various Iron Curtain countries. But, as many other western European countries have discovered, the practical working out of East-West trade agreements is never so straightforward or so promising as it seems at first sight.

After months of laborious negotiations the Italo-Russian trade agreement has at last matured. The previous agreement expired at the end of 1952, but, although the Italians had suggested its extension as long ago as last November, negotiations did not get started until the following May. Progress was slow owing to difficulties about Soviet standards and prices, and because Moscow permitted its delegation only limited authority. But the real reason why the Russians dragged their feet was because Italy, in contrast to France, did not offer the same succulent political plum. The Franco-Soviet trade agreement, described in *The Economist* of July 25, 1953, went through quickly and smoothly.

While the Italo-Soviet negotiations dragged on, the volume of trade between the two countries—especially Soviet exports—fell sharply. By the end of March, 1953, Italy had accumulated a surplus of 4½ billion lire. Seven months later it had risen to 6½ billion lire, and resort had to be made to the Italian Credit Union for 600 million lire of this total. The Soviet Union's exports declined from 11,910 million lire to 3,021 million lire in the corresponding period. Italian exports on the other hand fell proportionately less, from 6,829 million lire to 4,800 million lire.

The new agreement is not sensational. It covers a period of 12 months during which the most substantial Soviet export will be 100,000 tons of hard grain. This is a valu-

able import to Italy as it is needed for pasta making. Wheat from America is unsuitable for this purpose and, besides Italy's own variable production, the only other source of supply is Turkey. On this occasion the Italians were less interested in Soviet grain, because of a bumper harvest and increased supplies from Turkey. And furthermore Soviet prices are consistently higher than the world level.

Among the wide variety of exports from the Soviet Union envisaged in the agreement are substantial quantities of naphtha, anthracite, non-Italian type essential oils, tobacco, turpentine, shell fish, crude oil, manganese, asbestos, chrome, paraffin, sawn wood, silk waste and bristles (from China?). The net has been spread fairly wide, which is an indication that the East is no longer in a position to supply the food and raw materials on the scale to which the West was accustomed before the war. The list also includes certain minerals normally regarded as strategic like manganese and chrome, which have showed up in many recent Soviet trade agreements.

The Italians for their part have been able to dispose of 10,000 tons of oranges and a similar quantity of lemons. Other items include 1,000 tons of almonds, a large quantity of essential oils, tartaric acid, borax and boracic acid, rayon, artificial fibre and textile materials. Licences will not be needed for any of these items, but they will be required for the sale of textile machinery, food-making machinery and other light industry machines included in the list. The Italians will also send steel ropes, copper cables, sisal, rope, tobacco, films and a number of other miscellaneous products. The Russians will also place orders in Italy for three cargo boats of 5,000 tons, three fishing boats and 15 tugs. In addition they will buy four floating cranes, ten harbour cranes and 25 generating sets.

Russians Buy Consumer Goods

In spite of reports that Italy was being pressed to supply strategic goods it is apparent that the items included, though in some cases close to the margin, are all technically non-strategic. It is interesting, furthermore, that the Russians are showing an increased interest in consumption goods. The agreement, as might be expected, has been greeted with jubilation in the Communist press, but has been passed over in silence by the official press. There is evidence, however, that business quarters are, to say the least, relieved that the Soviet market has not disappeared altogether.

The Italians, like the French and the English, are intensely interested in cutting in on the Chinese market. As a result of private initiative, trade with the Chinese Communists was resumed last November, and by June this year had reached a total of £1 million in each direction. An unofficial mission, with the blessing of the government, has recently concluded a global compensation deal for the exchange of £5 million of goods, in each direction. Italy will supply textiles, pharmaceutical products, machinery and ships in return for oilseeds, silk waste and egg products. One of the reasons behind this deal is Italy's desire to conserve its diminishing sterling by cutting out imports through Hongkong. But the Italians fear they are too late in the field in which the French and the British have staked previous claims. Furthermore they are handicapped by the fact that Communist China is not a transferable account country and thus the Italian surplus with China has to be

offset in some way by imports from that country. It is the old story of China's limited ability to pay.

Though in official circles there is a tendency to play down the ability of increased East-West trade to alleviate Italy's economic difficulties, the Prime Minister, Signor Pella, has made it clear that Italy will seek outlets on either side of the iron curtain. In addition to this agreement with China and the Soviet Union, a new official trade agreement has been made with Bulgaria in which the Bulgarians will sell cereals, oilseeds, poultry, eggs, chrome and tobacco, in return for machinery, textiles and chemicals.

But the experience of Italy seems to be the same as a number of other western European countries that have recently responded to Communist trade offers. They have found that the Communists are now more willing to buy consumer goods; that they are not any longer so desperately keen to get strategic goods; and that they are prepared themselves to offer a wide range of products, including materials ordinarily considered strategic. All this seems to point rightly enough to a more hopeful outlook for East-West trade. But new difficulties are arising. For example iron curtain countries do not seem able to offer the quantities and the kinds of goods the West now needs. In consequence offers from them now cover a wide miscellany of goods. On the other hand some of the old hindrances remain. The Communists still appear unwilling to align their prices on world prices, and, as the recent agreement between France and the Soviet Union shows, they are still anxious to make as much political capital out of trade as possible.

Mr Ben Gurion's Example

BY OUR MIDDLE EAST CORRESPONDENT

MR BEN GURION, Prime Minister of Israel, has puzzled even his most intimate friends by his decision to withdraw from politics and to take up residence in a remote agricultural settlement that lives a communal life. Is he ill, they ask? His answer is no; though 67 years of age, he is in fine physical fettle; his only trouble is "mental fatigue." Busy Israeli minds are therefore full of conjecture as to his "real motive" for withdrawal and for upsetting a somewhat precarious coalition. Can it be that his urge to write has transcended all sense of other duty and that he must get his story of the nation's birth onto paper while still vigorous? This is one of the explanations on offer, because, once before, he dropped all public business and withdrew to a lakeside in order to put history right by means of a series of anonymous open letters (they were signed with a thinly veiled pseudonym) in answer to an adversary. Another theory that is being bandied about is that he is exercised at young Israel's way of life, and wants to point the younger generation the way to the harder living and pioneering spirit that now characterise only the outlying settlements.

He has taken a decision that few public men take, and as busy minds mill over his motive for taking it, they miss a simple and plausible explanation. It is that no one is indispensable, that the modern overload of interviews, and telephone interruptions, and piled in-trays in which every dossier is flagged "urgent," can reduce even the best mind to a state of incapacity for thought, and that here—at last—

is a statesman with the strength to weigh his duty to the world's reservoir of intellect against the drawbacks of quitting the treadmill.

Michael Roberts in his book on the world's resources which he called *The Estate of Man* pointed out in a chapter headed "How much will our nerves stand" that while we are careful about preventing the manual occupational diseases—silicosis, painters' colic and the like—"we do nothing about the more serious hazards of propinquity. . . . Our mental health is a vital part of our personal capital yet . . . we are constantly frittering it away on mere resistance to our surroundings." Anyone who has been to Israel will know that these words ring specially true. Money worries are, as is well known, a prime cause of mental strain and any statesman in Israel suffers continuously from these on a national scale, as well as from all the worries that arise out of making a new nation from elements very mixed both as to origin and as to their attitude to the Jewish faith. Added to these there are the noise, the hurry and the habit of sleeping short nights that beset a nation that has not yet made up its mind whether to live daily life to a European or to an Oriental timetable, and at present keeps the longest hours of both. Again, not only are the cities highly congested; they are also inhabited by a people that cannot let well alone; cannot trust a fellow member of the party to explain its point; cannot credit a listener with the intelligence to grasp that point at first making. Your correspondent finds a fortnight's work in Israel far more exhausting than a similar stretch in, say, Washington, because of the intellectual pounding which the cream of Israeli politicians and economists give to a ready listener.

Recharging the Intellect

In any country, the prime minister of a coalition government is inevitably a prime victim of this strain. Yet how few such men retain, while actually subject to the strain, the capacity to regard themselves as dispensable. It can be just as important to recharge one's intellect, or indeed to forestall the occupational diseases of statesmanship—the duodenal ulcer, the coronary thrombosis and the even graver diseases of the mind that stem from overwork—as to sit, below par, in a chair of office.

For Mr Ben Gurion has not retired. He retains his seat in the Knesset and intends to occupy it. He is merely giving his mind a rest in fallow. It is true that his party is placed in a difficulty without him. Despite his personal unpopularity with some of its partners, he is a seer built on the pattern of one or two of the prophets, and therefore a figure of the dimensions necessary to provide a link with party-political adversaries. No one can fill the whole of his role, and this is hard on Mapai. Owing to Israel's strained position on the international front his decision will not cause a general election; but it necessitates a complete reshuffle of the cabinet. It is likely to leave Mapai at the disadvantage that it will not be able to continue to hold both the premiership and the Ministry of Finance—to confront it with the problem either of advancing Mr Eshkol, the present finance minister, to be premier and ceding the Treasury to the General Zionists, or else of waiving its claim to supply the premier. Naturally, to some party members, Mr Ben Gurion has played a sorry trick by placing them in this dilemma, but to outsiders his decision appears otherwise. To all statesmen suffering from "mental fatigue" he has surely set an important example.

THE UNITED
STEEL
COMPANIES LTD

Advancement by research

The United Steel company's programme of research stands in high repute, not only within the steel industry but in the wider field of scientific and industrial development. Each producing unit of the company has its own extensive research facilities for individual problems. Co-ordinated work of a more fundamental nature is undertaken for the whole organisation by the Research and Development Department at the newly-opened Swinden Laboratories. Here over 180 research workers with a great diversity of scientific skills and practical experience pursue development research on raw materials, plant and processes, as well as upon products and their applications. This team has been responsible for work (such as that on principles of furnace design) which is already paying dividends in increased outputs and reduced costs; many notable new products, applications and techniques are being made available to the steel-consuming industries.

"A very smoothly run business,"

beamed the Chairman to the Secretary. 'Helped by the correct office equipment,' said the Secretary, wearing his pride well. 'Powers-Samas have supplied trays, racks, cupboards and the like for their punched-card accounting system...' "Tantamount to tidiness," said the Chairman, 'and the complete range of desks, chairs, filing cabinets - everything for comfort and neatness.' "Excellent for efficiency," said the Chairman, "Powers-Samas are a long way from great-grandfather's ledgers and trestle tables. Wonderful firm."

There is a range of Powers-Samas accounting
machines and equipment for every business

POWERS-SAMAS

•Powers-Samas Accounting Machines (Sales) Limited,
Powers-Samas House, Holborn Bars, London, E.C.1.

Here's dictation with a difference . . .

... the Dictaphone **TIME-MASTER**
with its revolutionary plastic Dictabelt!

See for yourself the amazing Dictaphone Time-Master—the neatest, most compact, most time-saving dictating machine ever! This superb machine was only made possible by Dictaphone's invention of the revolutionary Dictabelt.

Hear for yourself what a difference these amazing little plastic belts make. Just slip in a Dictabelt and speak your notes and letters—your every word or whisper will be recorded crystal-clear. Each Dictabelt takes 15 minutes' flaw-

less dictation, and there's no risk that your recording will be spoilt or damaged!

***Prove for yourself** how utterly simple the Time-Master is to operate. A few days' free trial or a demonstration at your local Dictaphone office, will convince you how revolutionary it is in design and efficiency! Full particulars at your local Dictaphone office.

Immediate delivery. Dictaphone can now offer you immediate delivery. Order your Time-Master now.

You'll find that the Time-Master faithfully records your every word! No time wasted, because controls are automatic.

Secretary transcribes easily, accurately using feather-light "Magic Ear." Controls are simple and recording is of constant quality.

THE BUSINESS WORLD

Lorries for Sale

ANYONE who wants to start, or restart, in the road haulage business can now get from the Transport Commission the first list of "transport units" to be put on offer. From that list, he will discover that transport unit number 66/255, consisting of three vehicles, awaits his attention at Paradise Row, Bethnal Green. Or, picking another lot at random, at Sturton-by-Stow, Lincolnshire, there is a rather different kind of transport unit for sale, consisting of five vehicles and also leasehold office, workshop, garage and parking facilities. In all, this first list includes 398 transport units, comprising 3,154 vehicles, and for each unit separate tenders are invited.

The Transport Act passed early in the summer was founded in part on the principle—or perhaps the supposition—that the small man and the small operating unit were particularly appropriate and efficient in road haulage. "Notwithstanding that their resources permit them to do so only if their operations are on a small scale," people who want to go into the road haulage business are to be afforded a "reasonable opportunity" to do so. This first list is addressed to the small man; two further lists will be issued a month and two months hence, the three together containing 10,000 vehicles, of which 2,000 will be offered in small lots of up to four vehicles, without buildings, and no unit will include more than fifty vehicles. After these 10,000 vehicles have been sold, there will still remain about 20,000 vehicles for disposal, and then the bigger operators will have their turn.

But the small man's turn comes first. He may think that the process of buying back what he once had marches him through a lawyer's paradise. Denationalisation is simple to say, but less simple to do. The Act enjoins the Commission to sell its lorries by methods approved by the Road Haulage Disposal Board; the Board has to approve the Commission's acceptance of

any tender, and it may not do so unless it is satisfied that the price is "a reasonable one," not only for the property, but also for the accompanying free grant, for a five-year period, of an "A" licence without restriction to a 25-mile operating radius. The attractions of an unlimited operating franchise are limited to a single year, for after the end of 1954 the 25-mile restriction is to be removed altogether. But a five-year licence will be a valuable right, not only for new entrants to the industry or old members returning to it, but also to existing operators working under permits who want to increase their fleets, and to traders who have hitherto operated their own fleets under "C" licences and may now be disposed to enter the haulage business for hire or reward. To obtain such a right, without having to run the gauntlet of the licensing authorities under the Road and Rail Traffic Act of 1933, is an asset of substance which merits its price, even allowing for the prospect that licences will be granted more liberally in future than in the past.

This, however, is only one of many matters on which the small man will have to keep a clear head. First, he must go through the list to find the unit or units in which he may be interested. Secondly, he must obtain a form of tender from the Commission for each unit that he thinks might appeal to him. This form sets out in great detail the specification of the vehicles and property comprising the transport unit, and the legal rights and obligations that go with them. The properties can be inspected by appointment; the Act says that there must be no avoidable disturbance of the transport system while the Commission's trucks are being sold, and therefore weekend viewing is likely to be the rule. Finally, he must make up his mind about the price that he will bid, and ensure that his tender is in the hands of the Transport Commission by December 21, 1953 (for units without buildings) and

by January 11, 1954 (for units with buildings). If his bid is successful, he will have to deposit 15 per cent of the price he has tendered within ten days of the Commission's acceptance; the remainder he will have to find within a period of a few weeks. By this time, he will be mopping his brow; but if he has successfully jumped all these hurdles and come to terms with a hire purchase or finance company he will, once again, be the political *beau idéal* of road haulage—the small man in his shirt-sleeves, hard working, and indeed often very efficient in providing road transport in small volume.

The chairman of the disposal board, Sir Malcolm Trustram Eve, said this week that the board had "some good evidence" of the wishes of the smaller operators; this suggests that about one-third of the vehicles for sale might be taken by small operators. But the board is now trying to find out who may be interested in the remaining 20,000 vehicles that it has to sell. And it is doing this by a simple method of market research—by asking those who may be interested to say how many vehicles they want, of what kind, and where, and whether with premises. This smacks of improvisation, but it is not necessarily so. There are several ways of selling vehicles under the Act, and the bringing together of buyers and seller need in no way be stereotyped.

But the disposal of the Commission's fleet—32,500 vehicles, after allowing for the 3,500 vehicles that they will be keeping under the Act—will be a formidable task. At a fairly early stage it will be the big man, not the small man, who has to be attracted. There would be nothing new in this fact. The Road Haulage Executive took over thirteen undertakings with over 7,000 vehicles between them; it also took over 3,305 undertakings with over 27,000 vehicles between them. One-fortieth of the number of undertakings it acquired had more than one-third of the total number of vehicles; and over one-quarter of all its vehicles came from undertakings with more than 100 vehicles, though these were a mere one per cent of the whole. The "liner" undertakings in road haulage were already well established long before 1947, and they were growing, under the umbrella of a restrictive licensing system; the "tramps" were numerous and apparently independent, but their success frequently rested on clearing-house organisations, and sub-contract work for the bigger operators. Of the 20,000 vehicles or so that will remain after the small men have been given their opportunity, perhaps 12,000 will be general haulage vehicles engaged on trunk traffics, and about 8,000 will be for special traffics. It would be foolish to break up the trunk lines into small pieces, after private and public ownership have amply demonstrated the advantages of large scale regular long-distance services. Among the special vehicles, there should be opportunities for hiving off some large undertakings—in contract hire vehicles, for example, and certain parcels and smalls services. It all turns on what is meant by "a reasonable price."

This process of disposal is beginning at the end of a year in which, by all the signs, British Road Services

should have made a distinctly satisfactory profit for the first time. How far it will be able to continue to make a satisfactory profit on the fleet—still a considerable fleet—that it will retain, is less certain, for it will have large competitors free to carry without restriction of distance. Moreover, all road hauliers, including the new entrants to the industry, must try to assess the force of the new criteria that the licensing authorities are to have in mind in considering applications for new licences. For the first time, the charges made by existing operators may be compared with the charges proposed by an applicant; secondly, objectors must prove the substance of their objections to new applications for licences; and thirdly, the licensing authority is to put the interests of the transport user before those of the transport operator. All this promises that the grant of new licences ought to be much easier than in the past, for hitherto the 1933 Act has been interpreted and administered in a highly restrictive way; if so, the areas of private monopoly, by benefit of operating licences, ought to be greatly reduced.

★

In the further distance, there lie the problems of rail and road competition. The railways will eventually have maximum charges, with the promise of much more effective freedom to vary those charges, both upwards in their general level, and downward in ordinary commercial practice, than they have hitherto enjoyed. Long distance road haulage will be regulated by licence, presumably more freely obtainable than hitherto, but it will not be subject to any regulation of charges except to the extent that charges may be taken into account in the granting of licences. This situation could lead to a degree of competition between rail and road that would be sharply different from what has been taken as axiomatic for a quarter of a century. It was the plight of the railways that led to the Act of 1933; but the remedies did little more than set up licensed road haulage monopolies. The "Square Deal" was an attempt to solve the problem by a cartel; and nationalisation brought a further attempt to solve it through common public ownership, with new restrictions to bolster it up. Now, at least, a little competitive light seems to have been let in, and it must be given a chance to show whether it will work. If the bidders for road haulage are frightened of it, they do not deserve the benefits of denationalisation. If the railways are so obsessed with their century-old obligation of regular public service that they seek to impose it on other forms of competing transport, protecting themselves and their competitors in the process, the public can abandon hope of greater efficiency and lower costs. In transport, as in most things, the issue is not a plain choice between competition on the one side, and monopoly and cartel on the other side. But the Act puts at least a little more weight on the competitive end of the see-saw than it has felt for a quarter of a century. The new entrants into the road haulage industry should not, if they are wise, rush to the other end of the plank.

Jute: A Test Case

WITHOUT many people realising it, the Government has run into an awkward dilemma in its progress towards freedom in commodities; this has reached a stage where further advance would conflict with the most questionable principles of the Conservative party instead of merely with the crude ideologies of the Opposition. Only three small swings of the axe are now needed to free the country altogether from state trading in imported raw materials. By the end of this year the only materials still under Lord Woolton's control will be sulphuric acid materials, tungsten, and—most important—raw jute and jute goods. Of these, tungsten is kept under departmental control because the Government bought too much of it when prices were high, and is frightened of the political odium that would be involved in selling it on a free market at a heavy loss. Sulphuric acid materials (which are discussed in a Business Note on page 613) and jute are kept under Government control in order to protect home producers from more economic producers abroad. It is time that public attention was drawn to the plight of these last three slaves; and among them jute provides most scope for a detailed case study.

The removal of all restrictions on internal consumption of jute in September, 1952, formally recognised that the original *raison d'être* of the Jute Control had disappeared. Yet the control has run merrily on because the Government wants to protect the jute manufacturing industry in Dundee against competition from cheap Indian jute goods and because it is frightened that a switch to protection by way of tariffs would worry the Empire free traders, who are too short-sighted to understand the much more flagrant form of protection against Empire jute goods that at present exists.

The story is all the stranger because the element of protection in the work of the Jute Control arose fortuitously from the wartime system of supply and distribution. It involves two main features: first, the centralised purchase of imported goods; and, secondly, the equalisation of prices of home-produced and imported goods. This second feature first saw the light as a simple administrative device to make the two products freely interchangeable during wartime conditions of irregular supply. But, like all other essential features of the control, it has been maintained ever since. The control is still the sole importer of raw jute and of jute goods (apart from very small quantities of special goods that can be privately imported under licence). It is not

a bulk buyer in the usual sense, but is simply in the market from day to day. Some 60 per cent of Britain's requirements of jute goods are met from Dundee, and the control only imports what is needed after Dundee has produced all that it can.

Although the control does not trade in home-produced goods, the prices of these are controlled (in relation to raw jute prices) by a series of agreements with the industry. In theory the trade's permitted margins are maxima; in practice they are not undercut. Imported goods are normally much cheaper than Dundee-made goods, and the control sells them at Dundee prices. The current market price of Indian hessian, for example, is about 85s. 6d. per 100 yards for 10 oz/40 in. cloth, delivered Dundee, compared with 110s. for similar home-produced cloth. The control therefore makes a handsome profit from its sales of imported goods, and pays this over to the Exchequer; the only exception to this norm of high profits—profits made in part at the expense of inflating the packaging costs of British exporters—is in heavy Indian-type sacking, which is not made in Dundee.

Under the present system there is thus no direct price competition within the home industry, nor is there competition between Dundee and the Indian industry. The absence of competition within the domestic industry obviously cannot be defended. Continued protection against competition from cheap Indian goods might be described as an inescapable expedient—because without it there would be desperate and localised unemployment in Dundee—but obviously it should not be protection in its present form.

★

What form, then, should protection take? This question was studied by the working party on jute appointed by the Labour Government in 1946 "to report as to the steps which should be taken in the national interest to strengthen the industry and render it more stable and more capable of meeting competition in the home and foreign markets." The working party's report, issued in 1948, put the conversion cost of 10 oz/40 in. hessian cloth in India at about £28 a ton, compared with nearly £48 a ton in Dundee. The estimate of Indian costs was based on incomplete information because the Indian industry would not co-operate, but the working party was satisfied that there was a gap between British and Indian costs—mainly attributable to lower Indian wages—that

no amount of re-equipment and reorganisation in Dundee could bridge. (The industry has in fact spent over £5 million on new equipment since the war.) The working party, therefore, concluded that there was no prospect of a healthy home jute industry without protection against Indian imports; and it recommended that so long as it was the policy of the Government to protect industry in this country, Dundee should be assisted.

Four possible methods of protection were suggested, but the report recognised—as the Government must be only too painfully aware—that all four were fraught with difficulties. One proposal was to limit the volume of imports by quotas to individual importers. This would mean that consumers who obtained a share of the cheaper imported goods would benefit at the expense of those that did not. A second proposal was to limit Indian imports to certain weights and types of goods. This would be open to the same objection, because consumers requiring cloth in the weights permitted to be imported would have an advantage over those requiring goods that could only be obtained in Dundee; moreover such a limitation would probably gradually lose its effect, because consumers would be sensible enough to try to adjust their requirements to the types of goods that could be imported from India.

A third proposal was to limit the volume of imports by centralised purchase, which might include, for

administrative simplicity, the purchase of raw jute. In effect, this would merely continue the present system. All three proposals would also conflict, as the present system does, with Britain's obligations under the General Agreement on Tariffs and Trade. It is a cardinal principle of Gatt that quantitative import restrictions should only be used as a means of protecting the balance of payments. Within the foreseeable future Britain is unlikely to have a balance of payments problem with India.

★

There remained, therefore, only the expedient of a tariff on Indian goods; the working party thought it would have to be of the order of 20 per cent. One argument that is often advanced against this is that an ordinary tariff would be an inefficient method of protection, because the raw jute market in Pakistan and the market in jute goods in Calcutta are both subject to arbitrary influences and do not necessarily move in step with one another; a tariff on jute goods, it is said, would therefore inevitably be too high at one period and too low at another for Dundee's needs. The fundamental difficulty is that the Government fears to face the political approbium at home and abroad of imposing a tariff on a Commonwealth article that has long enjoyed the right of duty-free entry into Britain under the Ottawa Agreements. The trade agreements with both India and Pakistan, which intends to become an exporter of jute goods, would have to be revised, and the Import Duties Act and the Ottawa Agreements Act of 1932 would have to be amended. Moreover, India has knuckled under, tacitly at least, to the present method of protection; if another form of protection—even a more liberal form—was substituted for the present one, then the sleeping dog would be set barking.

This is the dilemma. For anybody who believes in the virtues of the market place—as the Government says it does—the solution must be clear. If protection has to be given to the jute industry, it should fulfil four conditions. Indian imports should not be limited by direct quantitative restrictions. The industry at Dundee should have a permanent incentive to reduce costs and prices. The burden upon consumers should be as small as possible. And the fact that a subsidy is being accorded should be brought out into the open. The present system offends against each of these principles. What seems to be required is a tariff that could be readily adjusted, by an appointed body, to changes in the Indian and Pakistan markets. The aim should be to give the home industry protection only at the margin, and if that margin can be progressively squeezed—as more economic industries are attracted to Dundee—then so much the better. Nobody wants to see the cruellest rigours of unemployment settle again in Dundee; but the Government should realise that protection for this hard case should take a more straightforward form.

Business Notes

Safety at 75 Per Cent?

THE details of "operation liberalisation" confirm the impression that Britain could have made more impressive headway in the removal of import restrictions from Europe—and thus gained additional kudos in OEEC—at little extra cost. As the Chancellor of the Exchequer announced in Paris late last month, the object of the new operation is to raise the percentage of private British imports from Europe that will be freed from import restrictions from 58 to 75 per cent, the minimum standard set by OEEC for countries not in serious balance of payments difficulties. The details now announced reveal that the biggest increase in liberalisation percentages is to be in imports of raw materials, from 55 to 80 per cent, thanks mainly to the removal of restrictions on the use of softwood; it is only fair to point out, however, that the liberalisation of 80 per cent of private imports means much more in this field than it did in 1948, because so many more raw materials have been returned to private trade. In foodstuffs the latest increase in the liberalisation percentage is from 58 to 72 per cent; the canned meats and other foodstuffs that were put on global quotas during the emergency import cuts of late 1951 and early 1952 have now been returned to open general licence—not a very important step as imports of them have long been sufficient for requirements. In manufactured goods the increase is from 65 to 72 per cent; the newly liberalised list includes the usual trivia such as bodkins, bird cages, thimbles, fly swatters, nut crackers and cocktail sticks, in which the Treasury apparently solemnly considered that Britain's balance of payments was extremely vulnerable before.

In all, the new measures of liberalisation are expected to add about £17 million to Britain's annual import bill, and the increase from £40 to £50 in the tourist allowance should not cost much more than £2 million. There has also been an increase of £2 million (to £13 million) in the import quota for paper and board during the first half of 1954, and a small increase of £160,000 in the quotas for certain other restricted goods. The countries that may benefit most are the Scandinavian countries, which are Britain's principal suppliers of paper, board and softwood, and to which British tourists can now take any reasonable amount of foreign exchange. The imports from OEEC countries that are still subject to licences are an odd assortment. An important group of them, horticultural products, are now restricted mainly to protect the domestic industry, and the quotas for these will be withdrawn when Britain puts up the tariffs on them (and thus takes advantage of the recent waiver granted by GATT). Could not Britain take that opportunity to move towards 100 per cent liberalisation—with the possible (though still doubtful) exceptions of wood pulp and paper and board?

Investigating Share Dealings

TWO parallel investigations—though of differing natures—have been set in train in the stock markets during the past week. The Board of Trade is to investigate the dealings that lifted the £1 ordinary shares of the Savoy Hotel up to a high point of 50s. 6d. last week (they dropped to 45s. 3d., partly because of the directors' denial that any bid for the shares was in the offing and partly because of the news of the investigation itself). And secondly, a sub-committee of the London Stock Exchange has been asked to inquire into the dealings that have caused even more violent fluctuations in the £1 shares of Slaters and Bodega, where negotiations for an offer by Berkeley Property and Investment had been opened but have now been broken off.

The Board of Trade's investigation into dealings in the Savoy shares has been made in response to a request by over 200 shareholders, owning over one tenth of the company's issued capital; this unusual request—the first of its kind, in fact, to relate to shares quoted in the stock markets—thus had the full backing required by the Companies Act. In making this investigation for the express purpose "of determining the true persons who are or have been financially interested in or able to control or materially to influence the policy of the company, with particular reference to stock in which dealings have taken place on or after August 4, 1953," Mr. J. B. Lindon, QC, the inspector appointed by the Board of Trade, will be able to penetrate the veil of nominee shareholdings. The sub-committee of the Stock Exchange that has been asked to inquire into dealings in the shares of Slaters and Bodega will not have this facility of ripping away any nominee's disguise (unless that nominee is a member of the Stock Exchange).

To the layman, at any rate, the purpose of the provisions for a Board of Trade investigation enshrined in the Companies Act appeared to be to give some protection to minority shareholders against a powerful controlling interest; they did not seem to be primarily designed to protect an entrenched power from an outside threat to its ease of mind. But publicity can do no harm in these cases—provided always that that publicity is not misread as building up a case for special regulations to stifle share dealings that lead to a more economic distribution of real resources. The investigations proceed; but nobody, and certainly not the free market, is on trial.

Steel in the Markets

THE 14 million £1 ordinary shares of United Steel emerged from their very successful flotation this week on an equities market that was by no means robust

The Economist Diary A reference book for the desk

For the man who seems to have everything he could want, The Economist Diary is the ideal present. The appointments and memoranda section is designed to meet the needs of the busy man and in addition there are 72 pages of facts and figures, which together form a complete reference book.

The reference material covers a wide range of subjects, including elections, national income, banking, taxation, crime, manpower, commodities, and a special section giving the basic facts on 47 principal countries in the world.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 41/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of The Economist Diary are given in an illustrated pamphlet available from:

Diary Department, The Economist,
22 Ryder Street, St. James's, London, S.W.1

—but they held steadily to a 3d. or 3½d. premium throughout the first three days of dealing. At the opening on Monday, when it is estimated that between two and three million shares changed hands, there were inevitably some early fluctuations (the highest premium entered on the official list on that day was 6d. and the lowest 1½d.); but the whole operation has proved that even a queasy market can have a remarkably good digestion. The queasiness elsewhere, which was partly due to the antics of the engineering unions and partly merely a reaction from earlier exuberance, brought the *Financial Times* index of industrial ordinary shares down from 131.3 at the end of last week (0.4 points below the year's high in early November) to 130.1 by Wednesday's close; in the same period longer-dated Government stocks lost between ½ and ¾.

In all, the Realisation Agency had received 52,000 applications, for about 40 million shares, when the lists for the issue closed on November 9th; since a consortium of issuing houses had agreed to put in, or procure from other institutions, enough applications to cover all the 14 million shares on offer, this suggests that outside applications from the public amounted to about 26 million shares (involving some £32½ million in cash and securities at the issue price of 25s. each). About 8,500 of the pre-nationalisation holders wanted their shares back again, and they applied for 8½ million shares. In accordance with the agency's promise of preferential treatment, they received allotment up to and including 10,000 shares in full; but larger applications from them were accepted to the extent of only about 23 per cent (subject to this minimum allotment). The agency fulfilled its second promise, to give preferential consideration to applications for small numbers of shares, by according allotment in full for all applications up to and including 200 shares; acceptance of larger applications was made to the extent of about 11 per cent, subject to this minimum allotment. Government stocks were accepted by the agency in exchange for approximately 3 million shares; the other 11 million shares went to cash subscribers.

The agency must be delighted at this result. The issue has been much more widely spread than most analysts had originally expected. The institutions have got less than they had anticipated, and indeed less than some of them want; they have been buyers in the market this week, but not heavy enough buyers to allow the stags to make a "killing." And United Steel shares now stand in the market with some appearance of stability at around 25s. 3d., to offer a yield that is still over 7 per cent. Since the outlook for steel does not look like the sort that breeds long-term growth stocks, however; even those who do not set too much store by the Labour party's imprecations may feel that they are sufficiently valued at that price. Some six other major steel issues are waiting in the wings to follow a trail that has been so successfully blazed. Although all are of high standing, they are not necessarily all of quite the same calibre as United Steel; the recipe for success in these issues will presumably be the mixture as before, but with minor variations.

Green Light for Cotton

THE Government had an easy time in the debate on the second reading of the Bill to wind up the Raw Cotton Commission, the public agency that now supplies cotton

to about half Lancashire's mills and provides cover facilities both to spinners that buy from it and to those that buy privately. The difficulties and risks that will attend the complete reversion to private buying after next August, and the provision of private cover by a reopened Liverpool futures market are real enough (they were discussed in *The Economist* of November 7th), and the Opposition made much of them—but of a few that are less real. Though it roundly condemned the Bill as sacrificing Lancashire's true interests to speculators and politics, its arguments did not weaken the force of the Government's proposals. The Opposition was unable to suggest a satisfactory alternative, and it did not threaten to restore the Commission in full when it returned to power.

What the Labour Party—which was not impressed by the news that the Commission had lost another £25 million this year—would like to see, according to Mr Harold Wilson, is that the Commission should continue to provide cotton and cover to those spinners that wished to buy from it. This would remove none of the objections to the existing system. The contracting-in spinners would still be subsidised from the public funds that would be at risk on the Commission's stocks and its cover scheme. A dual cover system, part-Commission and part-Liverpool, would be completely unsatisfactory, and the Liverpool market would almost certainly refuse to attempt it.

Preparing for Christmas

THE official statistics for wholesale trade and retail stocks in September show that shopkeepers were getting ready for a busy winter and Christmas season—although the figures for retail sales themselves suggest that the persistently mild weather might already be doing something to disturb the persisting buoyancy of home trade. The average level of retail stocks was 8 per cent higher than a year before; a 25 per cent rise in stocks of women's outdoor clothes and a 28 per cent rise in stocks of children's clothes are signs that delivery of new winter stock must have been nearly completed by the end of September. Wholesale stocks were 10 per cent higher than a year before. The index of wholesale sales, mainly reflecting a rise in deliveries of textiles to the retailers, jumped from 78 to 135 per cent of the 1950 average between August and September (between the same months of 1952 the rise was less marked, from 67 to 118).

The total value of retail sales in September (excluding food) was 3 per cent higher than the year before, but this was due to larger sales of furniture, hardware and electrical goods, and (rather surprisingly), of jewellery and miscellaneous items. In winter clothing, where sales might have been expected to show a seasonal improvement, they either showed no change or else were lower than in September, 1952. Sales of men's and boys' clothes were 2 per cent lower, sales of women's outerwear 1 per cent lower, and sales of children's clothes showed no change. Apart from sales of women's underwear, which were 9 per cent higher in value, the trend seems to have been away from textiles towards durable goods—a strange state of affairs at this season of the year, and one that the Board of Trade attributes to the fine September weather. One sector where the

MARKET INFORMATION SERVICES LIMITED

MARKET RESEARCH & PLANNING

Market Information Services Limited undertakes market research by means of sample surveys of every sort on any required scale. Its field of operation covers habits and characteristics, and public opinion. It has a fully qualified technical staff, its own force of field investigators, and the punched-card tabulating equipment and calculating machinery necessary for this type of work. It specialises in devising and applying new techniques for the solution of difficult problems.

MARKET INFORMATION SERVICES LTD.

24, BROOK'S MEWS, LONDON, W.1. GROSVENOR 2211

Insulation applied by the Darlington Insulation Co., Ltd.

Look up your fuel costs!

Take a look at last year's fuel costs and you will quickly realise the value of heat saving. Darlington 85% Magnesia Insulation is easy to apply to existing plant without structural alteration or interruption of production, and can reduce heat losses by as much as 90% which will be good value for the modest capital outlay involved. Our technical department will supply full information and a free insulation analysis of any industrial or marine installation.

boom is still in full flush is in the sweet shops. Sales of sweets were 27 per cent higher than in September, 1952; since last February the orgy in sweets has been running 35 per cent above consumption in 1952, and this when food sales as a whole are only 8 per cent higher, and when a proportion of even this modest increase has been due to higher prices. Sales of bakery products (16 per cent down in September) and of fish and poultry (5 per cent down) suggests where the money for sweets is being found.

Freedom for Softwood

THE removal of the last control on softwood, the licensing of consumption, has not come at a very propitious time, but the timber trade is not disposed to quibble about that. The overseas market has been firmer since the log auctions opened in Scandinavia early last month, and prices have risen by some £5 to an average of about £70 a standard, f.o.b. The freeing of consumption in Britain will tempt the Scandinavian shippers, who supply over half of Britain's requirements, to raise prices further, but there is no good reason why they should be successful. Stocks in Britain are high—at over 565,000 standards they are equal to nearly six months' consumption—and larger supplies of softwood from Russia should help to stabilise the market. There is a Russian representative in London at the moment; he is being very cagey about the quantity his Government is prepared to offer, but it is expected to be about 250,000 standards, nearly twice as much as Russia will have shipped to Britain this year.

Meanwhile, it will be interesting to see how the official estimates of the increase in consumption that would follow decontrol will be borne out. The official forecast was that consumption would rise by about 110,000 standards (or roughly 10 per cent) in the first year of freedom, by 80,000 in the second, and by 40,000 in the third—a total of 230,000 standards in three years. This would bring Britain's annual consumption to about 1.5 million standards, compared with the prewar average of about 2.3 million. Many former uses for softwood have probably been lost for good, but some of the substitution of other materials during the years of restriction has been flagrantly wasteful. A larger expenditure of foreign exchange will be a price worth paying for getting rid of the distortions that this substitution has caused.

Whitehall in the Box

ANYONE with a dilettante appetite for odd facts about weak spots in Whitehall's handling of matters of finance can always depend upon the bulky yearly record of the labours of the Public Accounts Committee for diverting bedside reading—by the easy method of random choice. For the serious investigator, of course, these verbatim reports of evidence before the Committee present a formidable, if often rewarding, task; but only the few

are likely to find it worth while this year—for there is no parallel this time to the substantial and revealing tale of the National Debt Commissioners that enlivened last year's proceedings. That, at least, is the impression given by the easy approach. But even that route discloses many intriguing by-ways.

There is, for example, the curious story of the Milk Marketing Board, a statutory board of producers the net assets of which belong to the producers, and to which the Ministry of Food paid an annual management fee of £600,000 for its job of distributing the Ministry's milk (bought from the producers) to the value of some £150 million and of collecting the sums due from wholesalers and retailers. But in addition the Ministry paid the Board a percentage fee to guarantee it against bad debts, a fee that started at 4s. 3d. a £100 back in "the mists of time of 1942" and was reduced to 1s. 6d. during the three years to 1952. Even in the three years at this reduced rate, the Board received a total of £265,000—yet the bad debts it shouldered on the Ministry's behalf came to a mere £7,000. Over the whole period its losses were £12,000, its receipts £1,087,000; and this surplus, subject to depredations by the tax-gatherer, belongs irrevocably to the Board. After criticism by the PAC, the Ministry has at last abandoned this largesse, but it has substituted a plan that the Committee still dislikes. The Ministry now shoulders any bad debts itself, but pays the Board 15 per cent on the amount by which they fall short of £100,000. The Committee may be unrealistic in complaining that the Board should need no incentive to do its "duty" in minimising bad debts; but the Ministry is equally unrealistic in measuring the worth of the plan by the saving it offers compared with the previous scheme. The payment still looks liberal.

The Miller's Tale

OR, again, also within the sphere of Food, there is the account of how the Ministry unwittingly and gratuitously provided a milling concern with huge amounts of working capital over a period of years. The miller, like others in the trade before the recent decontrol, in effect traded as agent for the Ministry and was due to pay over to it any excess of trading surplus beyond an agreed remuneration based (at first) upon his prewar profits. This particular miller, whose special product commanded a high price, had at the outset a capital of £39,000 and bank loans of £28,000, and its agreed remuneration was fixed at £8,000 a year, progressively raised to £36,000 as its turnover and trading surplus increased (though its paid-up capital did not). But although this revision was made, the Ministry apparently did not discover until years after each relevant date that a large part of each surplus due to be paid over was constantly in the hands of the company. The company's accounts seem to have been sent to the Ministry up to five years in arrear, with no accounts sent in the period 1946-49, and it was disclosed thereafter that the debt to the Ministry during this period was at times over £400,000. The outstanding debt at accounting dates averaged £220,000 over thirteen years. This expanding business, which began with one rented mill, bought three further mills and resold one of them during this period.

The lapses of Government departments—often, still, the legacy of frenzied pressure, new tasks and untrained staffs during the war—are not the only ones that are spotlighted in these PAC records. There is this year the first light upon the "probe" into banking accounts to spot the evaders of tax on deposit interest. By last February the Inland Revenue was expecting returns from the banks of interest paid on 1¼ million accounts—600,000 from the Post Office, 400,000 from the Trustee Savings banks and 250,000 from the joint stock banks. It had already received 500,000 returns and had settled 100,000 tax cases—with a tax collection of £4 million, generally from cases that did not suggest any "really culpable negligence." The Savings Bank returns, which comprised the bulk of those reviewed at that date, suggested that one in every four depositors had omitted to declare their interest for tax.

The Convertible Rouble

THERE is more than a touch of propaganda in one of the tokens of friendship that Soviet Russia has recently given to Finland. The Russians have promised Finland that its substantial rouble balances will be convertible. It would be a triumph indeed if the rouble could claim convertibility well before the pound sterling. The offer, however, is decided circumscribed. It provides for convertibility only of these particular roubles, and into West European currencies. This concession is an echo of the earlier suggestions made from Moscow that Finland might clear its rouble balances by means of triangular or multi-lateral trade with Western Europe. At an earlier stage in this project, the authorities in London were asked if the United Kingdom would accept roubles in payment for exports to Finland; but this obvious try-on provided little basis for serious discussion. The latest offer is more realistic. Russia's recent sales of precious metals, which have played an important part in forcing the free price for gold actually down to the dollar parity price, suggest that it is making some effort to build up its London balances. And, provided that it secures the necessary sterling, there will be every facility for it to repay its clearing debt to Finland by transferring sterling to that country. Both countries are in the transferable sterling account group, so that there would be no objection from London to such a transaction. If it takes place it would be extremely interesting to know what rate of exchange will apply to the conversion. Finland would have good reason to resent the use of the official rate of exchange between the rouble and sterling in such a transaction.

Two Australian Issues

AUSTRALIA is an active customer in the London capital market this month. On Thursday of last week details were announced of a new Australian Government loan at 4 per cent, maturing in 1966-68, offered at 99½. The loan is essentially a conversion operation, and is offered in

exchange for the £10.8 million of 3½ per cent stock that matures at the beginning of February. Cash applications, the lists for which opened and closed on Wednesday, are being accepted to the extent that the conversion offer is not taken up. The terms appear to be sufficient to encourage an improvement upon the meagre response to the issue made in mid-1952. The redemption yield at the issue price is £4 1s. (to latest date), or almost 2s. above the redemption yields on the Commonwealth 3½ per cent 1961-66 and 4½ per cent 1960-62 stocks. The margin of the yield on the new stock over yields on British Government stocks of comparable life conforms broadly with the existing pattern.

The news of the Australian Government issue was followed on Monday by the announcement of a "rights" issue by the London-registered Australia and New Zealand Bank, the merger institution formed in 1951 by the fusion of the Bank of Australasia and the Union Bank. Shareholders are offered 1,700,000 £1 "B" shares, in the proportion of one-in-five, at 26s., compared with a market price of 34s. 3d. on the eve of the announcement. The new (fully-paid) shares will be identical with the old except that they are not subject to reserve liability; the old shares are of £2, with £1 paid-up. The effect of the operation will be to augment the bank's capital resources by roughly £2.2 million, and to raise its paid-up capital to £10.2 million. In the year to September 30th last the net profits of the bank rose from £A701,608 to £A749,865; the dividend was maintained at 10 per cent. The issue is in line with recent moves by other Australian banks to bring their capital more into conformity with their expanded activities; the Commercial Bank of Australia and the Bank of New South Wales have both made capital issues during the past year.

Cycles on Show

THE annual cycle and motor cycle show that opened in London last week-end is designed for the public more than for the trade. The motor industry might learn a great deal from this display about the judicious use of chrome and colour, combined here in remarkably happy effect. About two-thirds of bicycle production still goes to export. Total export sales last year amounted to 2.8 million (valued at £24 million) out of a total production of about 3.6 million; the biggest markets were Malaya, British West Africa and the United States in that order. This year production has been cut back to an annual rate of about 3 million; import restrictions are expected to cut exports for the year to about 2 million, and the home market is less buoyant than it has been. But a breakdown of exports for the first three quarters of the year shows the United States as the leading export market (276,000 bicycles valued at £2.5 million) followed by British West Africa (177,000) and Malaya (100,000). In 1953 as a whole, the industry expects to sell about 350,000 bicycles to the United States; if so, exports to this market will have doubled in twelve months—a remarkable achievement in a country where so many working men have their own cars.

Current production of motor cycles is probably running slightly above last year's total of 153,000, of which about 65,000 (against last year's 70,000, valued at £8

million) are likely to be exported. Sweden is the biggest market, followed by Australia and the United States; to the industry's great relief the American Tariff Board has recently refused to give further tariff protection to producers there. Both the cycle and motor-cycle industries are adept at building to widely varying overseas requirements; a significant feature of the bicycle exhibits was the number of apparently old-fashioned upstanding designs produced for colonial markets. Many makers are also selling models with rear wheels and frames reinforced for use with small auxiliary motors. Last year the industry cut its prices in order to revive flagging home demand; with the worst of the slump behind it (or so producers hope), no further cuts have been thought necessary this year. The retail price for a standard bicycle therefore ranges from £12 to £20 (with tax) and children's models are not much cheaper. The motor-cycles as shown start at £66 (with tax) but go on into rarefied ranges above. Profit margins are clearly lower than in 1951, but if competition grew fiercer it is difficult to believe that prices could not again be cut.

Profits Tax in the Balance Sheet

PROFITS tax is a Gordian knot of complications, as any investor who has tried to calculate percentage earnings on equity capital will admit. But the problems that profits tax raises are far more important than mere difficulties in arithmetic. When profits tax is assessed, all profits liable for it are charged at the full rate of the tax (at the moment 22½ per cent), but then this charge is reduced by a non-distribution relief (at the moment 20 per cent) on the amount of profits not distributed. In assessing the tax the Commissioners of Inland Revenue define distributions to shareholders in such a way as to include not only distributions from current earnings, but also to include distributions of profits that have been earned in the past and then have been held for a time in reserves, and indeed the distribution of capital surpluses too. Hence the reserves shown in a balance sheet are not wholly what they appear, for if they were to be distributed to shareholders they would in most cases attract the payment of non-distribution relief that the company had already received. The question whether some reference should be made in a balance sheet pointing out this possible liability for profits tax has been debated by accountants for some time and now the Institute of Chartered Accountants has made an authoritative pronouncement on this subject in two pamphlets, one of which codifies accounting practice for the accountants' reports that have to accompany company prospectuses and the other containing a detailed and highly technical discussion of the treatment of profits tax in accounts.*

The Commissioners of Inland Revenue can claw back any of these accumulated reliefs only if in an accounting period the "amounts distributed" exceed the profits (as defined for profits tax purposes) accruing in that period. This provision would be of little significance were it not for the fact that the Commissioners' definition of "amounts distributed" range far beyond distributions out of cur-

* Recommendations on Accounting Principles (Number XVI) and Notes on the Treatment of Profits Tax in Accounts.

rently earned revenue and capital profits to embrace distributions out of reserves built up in the past from ploughed back revenue or distributions out of accumulated capital profits; and in some exceptional cases this definition is stretched to cover a reduction in capital and even a capitalisation of reserves as well. How, then, should an accountant tackle the problem of showing shareholders that accumulated reserves, if they were to be distributed, would attract an additional charge for profits tax?

Finding the Core

IF he wishes to set a figure to this liability, there seem to be two courses of action open to him. Either he can show the total sum of non-distribution reliefs that have been accumulated (although, even here, he would have to make it clear that these sums have not actually been ploughed back into reserves); or else he can make an intricate calculation of the total amount that would be paid out in profits tax if all the company's reserves were distributed. But both systems can be misleading. The publication of the accumulated sums of non-distribution relief fixes only the upper limit of the profits tax that may be levied, and with any distribution (even one of the whole of reserves) the levy would usually fall well short of this amount. The second method may be less illogical, but any reference to the distribution of all reserves to shareholders immediately conveys the impression of liquidation and is thus hardly an appropriate basis for calculation in a balance sheet that is drawn up on the assumption that the business is a going concern; furthermore, such a calculation would be forced to ignore the element of capital profits (which would themselves attract a further charge for profits tax) that could arise when a company is liquidated.

After pondering these and kindred problems in great detail the Institute comes to the conclusion that—except perhaps when the liquidation of a company is planned—accountants should merely draw shareholders' attention to the problem without specifying any precise figure for the tax liability. It suggests that a note might be included in the balance sheet stating, for example:

The company has been given profits tax non-distribution relief and accordingly a profits tax charge would normally be incurred in the event of a distribution to shareholders out of reserves, including the balance on profit and loss account.

After such a long-drawn-out argument the Institute risks comparison with Ibsen's Peer Gynt, who, after laboriously peeling an onion layer by layer, discovered that it had no core.

BOAC and the Comet III

BRITISH Overseas Airways Corporation signed its first order for five Comet IIIs this week, bringing the corporation's projected Comet fleet up to 25. BOAC has had an option on ten of these aircraft from their inception, and has taken some time to reach a final decision on

"Don't argue.
Get cracking!"

The air was electric with tension.

Someone had contradicted the boss. Someone had flouted the great Panjandrum. He had asked to see one of the new Sumlock electric calculating machines, and someone had said that Sumlock didn't make electric machines. Oh, the folly of it—even the air was electric.

MORAL. Don't argue with the boss, particularly when he's in the right.

Apply now for demonstration of our electric calculating machines to

Basic chemical ingredients are as vital to the world's textile industries as flour and salt are to the cook in the making of ravioli. One of these basic chemicals is the range of Hydrosulphite, essential for the dyeing of super-fast colours. The large independent company of Brotherton, established in 1878, is now one of the world's chief manufacturers of these basic chemicals.

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds, 1.
Also at Manchester, Glasgow, Wakefield, Birmingham and Birkenhead.

LEATHER UPHOLSTERY

MAKES A GOOD CAR
A BETTER INVESTMENT

Real leather is unique for its lasting comfort and luxurious appearance. So, even if this refinement involves a little extra cost, you will be prouder of your car and, when the time comes to re-sell, your good judgment will be more than rewarded.

Invoicing...

- ★ done more quickly and to a regular time schedule
- ★ done with less labour and less disturbance of routine
- ★ done with an irreducible minimum of error

the very job for

Invoicing may be only one process in accounting, but it is, after all, the bread-winner. Hollerith takes the whole of accountancy in its stride—but Invoicing is an admirable starting point for an enquiry. It costs nothing to find out what Hollerith might save you.

How soon will
they get to your market?

The younger generation move fast. They're always looking ahead. That's why they are so vital to you and your business. Right now they may not all be rich enough to buy your products, but they are planning for the future and if you give them the ambition to own them, sales are assured when they have got on enough to shop in your market.

By approaching the problems of our time realistically and presenting the news in a vital up-to-the-minute style, the Daily Mirror appeals outstandingly to the vigorous 'keen to get on' younger generation. In fact, the majority of the 4½ million people who buy the Daily Mirror every day are young people. People with long buying years ahead of them.

With the biggest daily sale on earth, the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. Daily Mirror readers are young readers. Your customers today—next month—next year.

the purchase of a design that has aroused considerable discussion. Delivery will begin in 1956, provided that the aircraft makes its first flight next year as scheduled. At the same time, the de Havilland Company expects to start delivering the three Comet IIIs ordered last year by Pan American—assuming that the argument about American recognition of a British certificate of airworthiness has been resolved by that date. BOAC earlier agreed to waive its option on a certain number of Comets IIIs in order to give Pan-American quick delivery. The third order signed for Comet IIIs is for two aircraft for Air India; but other orders are under negotiation and clearly BOAC could not indefinitely postpone a decision on Comet IIIs. The Comet III, with its effective range of 2,500 miles, including provisions for diversions, has still to prove its worth in North Atlantic transport, and to show whether its high speed is seriously qualified by the need for an intermediate stop. But it is the only modern long-range transport that will be on the market by that date. The turbo-prop Britannia, which some engineers expect to oust the pure jet transport from civil operation, is still unproved, and no airline would be justified, at this stage, in basing its whole long-range fleet on the Britannia.

Japan Searches for Sterling

JAPAN'S shortage of sterling is becoming more and more acute. When it first felt the pinch this spring, it thought it was a purely seasonal phenomenon; and it made arrangements to eke out its sterling balances by some £30 million of dollar swaps (spot purchases of sterling against dollars, balanced by forward sales of sterling against dollars in the London market). But when these contracts matured in August, the pinch was still there; and the swap operations were renewed—in fact the amounts involved were increased. Between now and the end of the year they will fall due once more, and Japan will again have to search for sterling. Either it will have to try to get the swap operations renewed or find other ways of borrowing sterling in London; or else, if Britain objects, it will have to sell dollars to the Bank of England against sterling or buy sterling for yen from the International Monetary Fund. It seems likely that it may seek a combination of these devices.

Meanwhile, one swap contract amounting to £1 million has already fallen due and has been settled out of Japanese working balances in London. After this transfer was made, the foreign exchange director of the Ministry of Finance in Tokyo announced that Japan had applied to purchase sterling from the International Monetary Fund. Recent comment from his office has suggested that Japan is determined to beat about every possible bush in order to avoid having to sell some of its precious but adequate dollar reserves outright in order to restore its sterling balances. These and the related commercial problems are due to be discussed in London soon between representatives of the Japanese and British Governments. The principal object of these negotiations is to renew the Anglo-Japanese payments agreement that expires at the end of the year and under which Japan has the right

(codified in an exchange of letters between the two central banks) to transfer sterling to any other transferable account country; but it is certain that Japan will emphasise that its principal problem today is not that of paying out but of receiving sterling. Although shrill complaints about sweated labour die hard, Japan's export prices are not fully competitive in the sterling area today; the cheapest textiles now on offer in West African markets are not of Japanese, but of Southern European, origin. The balance of payments between Japan and the sterling area makes it more than ever difficult to understand Britain's churlish attitude towards the inclusion of Japan in Gatt and the attempts that it is still making to discriminate against Japanese imports into colonial territories.

Shelter for Sulphur

THE import of crude sulphur and sulphur-bearing pyrites may well be the next candidate for restoration to private trade. The acute world shortage of sulphur ended many months ago and supply and demand throughout the world have been approximately in balance for most of this year. Britain is still not importing as much sulphur as formerly, but the expansion of sulphuric acid production from pyrites and from spent oxides, together with economies in the use of acid itself, have offset the fall in the production of acid from elemental sulphur. Production of acid in the first eight months of this year averaged 151,000 tons a month, which slightly exceeds the peak of 150,000 tons a month in 1950. Stocks of crude sulphur have been run down in recent months, but they are still well above the average monthly level of 1950. The Ministry of Materials removed controls on the use of sulphur—except for its principal use in the production of acid—last February, and price controls were withdrawn in July. But it appears that the return of private trading in sulphur and pyrites, when it comes, will not be accompanied by complete freedom to import sulphur.

In a statement last February the Ministry of Materials explained that the control of sulphur for the production of acid was being retained so that sulphur should be used only to the extent that acid made from other materials fell short of total needs. This was necessary to ensure the full operation of the plants using pyrites and anhydrite which were coming into use, in order to lessen industry's dependence on imported sulphur and to conserve supplies. Imports of sulphur, the Ministry added, would therefore continue to be restricted. The chickens hatched during the sulphur panic of 1951, for which government policy at the time cannot escape a large part of the blame, seem to be coming home to roost. The cost of producing 100 per cent acid from domestic anhydrite, assuming a reasonable price for the cement clinker produced as a by-product, is now estimated at £8 2s. a ton, and for plants using pyrites the cost is £9 2s. a ton. These figures compare with £7 2s. a ton for plants using American sulphur. So the high-cost plants are evidently to be protected against competition from the cheaper sulphur-burning plants.

The Ministry stated that there could be no assurance that there would not be another serious shortage of sulphur

within a few years. This view is not necessarily any more accurate than former official views about sulphur—which proved to be hopelessly wrong. Supplies of American low-cost sulphur are indeed declining, but higher prices have already stimulated considerable programmes of development and exploration, and have created new sources of sulphur recovered from oil refining.

Agreement on Tin?

THE United Nations conference on tin has opened in Geneva in more favourable circumstances than the 1950 meeting, when the leader of the United States delegation promptly declared his government's opposition to an international tin agreement, on the ground that it was unnecessary. Events showed that he was right. Panic buying set off by the Korean war sent the price of tin soaring from £600 a ton in June, 1950, to a peak of £1,615 a ton eight months later and the threatened surplus melted away. The price remained high even after the boom collapsed, and only since May this year has it dropped back to about £600 a ton. Although mining costs have risen in the last three years, world production has not so far been affected by the fall

in price; the closing of some small high-cost mines has been offset by increased output from others. World consumption this year has been maintained at an annual rate of about 130,000 tons, and the surplus of tin, now put at 30,000 tons for 1953, is still being taken off the market by American strategic purchases from Indonesia and certain other producers. The largest of these contracts, however, are now due for renewal for a further year, and in future they will be based on market prices, and no longer on fixed prices well above market levels. If the United States were to decide to re-sell such tin on the open market, the surplus would become a reality.

The work of the Geneva conference has been smoothed by the progress made at the Tin Study Group's working party in Brussels last June, but it will still not be easy to reach agreement either on the need for a regulation scheme, or on the way that exports should be controlled under such a scheme; the operation and financing of a buffer stock and the fixing of floor and ceiling prices are thorny topics. It does not follow, however, that because the same group of consuming countries represented at Geneva turned down a regulation scheme for natural rubber last month that they will necessarily do the same for tin. But the last word on the proposals will not be known until the United States has completed its review of foreign economic policy next year. The United States delegate has made it clear that he is in no position, at this stage, to commit his government to any specific course of action.

Company Notes

TUBE INVESTMENTS. The full report of Tube Investments had been eagerly awaited; it was the preliminary report of this company, which showed that trading profits had fallen from £10,574,315 to £7,458,583 in the year to July 31st last and that the equity dividend was to be left unchanged at 15 per cent, that caused a sharp set-back in the market two weeks ago. The publication of the full report has now allowed the £1 ordinary stock units to settle down at around 63s., compared with the recent "high" of over 71s.; but even at this price they offer a yield of only 4½ per cent. Thanks to a tax adjustment of £1,033,958 (arising partly from an over-provision for tax in 1951-52 and partly from a settlement of EPT), the amount available for distribution actually increased last year from £3,388,970 to £3,754,130; the dividend, which takes only £569,038 of this, is therefore well-covered. But the yield must obviously make the stock unattractive to short-term investors, although there seems a prospect of a rise in profits—but not necessarily in dividends—in the current year.

The chairman, Mr Ivan Stedeford, has couched his statement to shareholders in very cautious terms. He points out that after allowing for depreciation and the element of inventory gains in the profits for 1951-52 the true fall in the group's earnings last year was from £8,056,595 to

£5,872,259, or by 27 per cent; but he then adds that this decline arose from a fall of only 4 per cent in turnover (although the group's direct exports fell by £2 million to £18 million). In other words, the group has been more or less holding its own in extremely competitive markets, but at the expense of a sharp reduction in profit margins. There is no hint in Mr Stedeford's statement that these margins

will widen rapidly again; the most that the directors feel able to say in their report is that "by the end of the year general conditions showed signs of improvement

and of trade settling down on a more even keel." There are, however, some other reasons for expecting a recovery this year. First, the substantial loss made by the group's aluminium division in 1952-53 is unlikely to be repeated. Secondly, the profits of divisions manufacturing capital goods (particularly engineering products) are still rising. Thirdly, the group is steadily widening the circle of its interests. It has recently purchased the Round Oak Steel Works for about £5,800,000; the directors believe that this should ultimately enable them to secure sufficient tube steel to meet the group's expanding requirements. This and similar purchases, together with a programme of capital development that cost the group about £3 million in 1952-53 (and that should on present indications, cost it at least another £3½ million in the current year), make continual calls upon the group's financial resources. Investors must therefore expect the emphasis to be placed—as it was in the latest financial year—upon the ploughing back of profits rather than upon a generous dividend policy. This should be a long term growth stock, but on short-term considerations it still looks too high.

FISONS. The full report of Fisons shows that the increases in trading profits (from £2,309,974 to £3,203,257) and in the ordinary dividend (from 10 to 12½ per cent) for the year to June 30th last were firmly based on an increase in the total value of sales from £21,975,000 to £26,441,000. By using new productive capacity to the full, the group secured

a large share of the total increase of sales of fertilisers in this country, from 2,740,000 tons to just over 4,000,000 tons. The chairman, Mr F. G. C. Fison, is confident that the demand for fertilisers in the current year should not be less than it was in 1952-53; in fact, the group is making its plans on the assumption that demand will increase further.

The prices of the group's principal raw materials (with the exception of sulphuric acid) dropped last year. This is reflected

£1 ordinary stock at 41s. 9d. yields £6 per cent.

in the fall in the book value of the group's stocks (from £4,968,080 to £4,319,326) and—at one remove—in the expansion of its liquid resources from £859,487 to £3,591,247. This is an ample balance to cover immediate stock commitments, and at the current price of 41s. 9d. the company's £1 ordinary stock units still look healthy.

TRINIDAD LEASEHOLDS. The steady rise in the 5s. ordinary stock units of Trinidad Leaseholds in recent weeks put on another 6d., to 34s., after the publication of the company's preliminary statement for the year to June 30 last. The increase in the tax free ordinary dividend from 16½ per cent to

20 per cent was more or less in accordance with anticipations; but the bulls' appetite has been whetted by the hope that the proposed 100 per cent scrip issue may presage other increases to come. As the new dividend, which absorbs £327,890, is amply covered by net profits of the order of £1¼ million, this hope is not necessarily without foundation.

Unfortunately, the company's preliminary profits statement is cast in an unnecessarily complicated and confused form. The only fact that emerges with any clarity from it is that the consolidated net profit has fallen from £1,889,952 to £1,774,652. No figure is published for the group's gross earnings and shareholders are left to draw their own implications (which on the face of it cannot be particularly satisfying) from the statement that British taxation charged in arriving at net profits has fallen from £4,047,780 to £2,903,443. Until the full accounts are published investors might be unwise to chase too furiously after the hare of the scrip issue, especially as the 5s. ordinary shares (at the current price of 34s.) offer the not particularly generous yield of just over 5½ per cent.

INTERNATIONAL NICKEL.

—The recent reduction from \$2.60 to \$2.35 a share in the distribution on the no par value common stock of International Nickel seems to have been due to a rise in operating costs. The group's customary report for the nine months' trading to September 30th shows that sales rose again in this period, from \$229 million to \$255 million; but operating costs rose from \$139 million to \$166 million, so that the group's consolidated net earnings fell from \$45.7 million to \$41.3 million. As a result, earnings on each common share were \$2.72 in these nine months, compared with \$3.03 in the corresponding period of 1952. The underground mining of nickel, which has been forced on the company by the exhaustion of surface ores, is obviously proving a costly business.

LONDON STOCK EXCHANGE

Next Account begins: November 25th.
Next Contango Day: November 25th.
Next Settlement Day: December 1st.

ALTHOUGH more bargains—11,406 of them—were marked on Monday of this week than at any time since May, 1951, the stock markets had a patchy appearance this week. The huge turnover on Monday was due, of course, to dealings in the new United Steel equity; the premium on it started at 3d.-6d., settled down quickly at 3d., and has since stayed there. But other sections of the market have been disturbed by the proposal to call a token strike in the engineering industry. Gilt-edged stocks, which had remained firm before the week-end, began to waver in the face of a certain amount of routine selling at the beginning of this week. Their prices slipped back a little on Tuesday, but then staged a slight rally on Wednesday. As a result of these conflicting movements old Consols rose from 64½ to 65½ in the week to Wednesday's close, but 3½ per cent War Loan fell from 85½ to 85½; some of the other long dated stocks showed slight losses on the week, notably Transport (1978-88) which fell from 86½ to 85½. In the foreign market Japanese dollar loans remained in demand while German Potash loans advanced quite briskly; the weakest section of this market was that dealing in Greek loans.

In the industrial market, prices remained steady throughout dealings on Monday, with chain store shares being particularly lively after the announcement of the increase in Marks and Spencer's interim dividend. On Tuesday, however, the threatened strike in the engineering industry led to widespread, though small, losses throughout the market. The only group to move strongly against this ebbing tide were brewery shares, to which buyers had been attracted by a good crop of dividends and preliminary results. Oil shares remained quiet, but rubbers attracted scattered support. Kaffirs showed some improvement, while Rhodesian copper shares gained a little ground on the hope that uranium may be developed in the copper belt.

(1) Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and in Western Germany on July-December, 1948=100. (2) Index numbers of unit value which compare the current value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (3) Notes only for France and Austria. (4) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only.

Financial Statistics

EXCHEQUER RETURNS

For the week ended November 14th there was an "above-line" deficit (after allowing for Sinking Funds) of £17,269,000 compared with a surplus of £14,890,000 in the previous week and a deficit of £10,208,000 in the corresponding period last year, bringing the cumulative deficit to £322,346,000 (£330,594 in 1952-53). Net expenditure "below-line" absorbed £736,000, bringing the total cumulative deficit to £598,530 (£673,834 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the new Exchequer stock, it is impossible to calculate the division between tap and tender bills until all the bills purchased have passed their original maturity date.

THE MONEY MARKET

LOMBARD Street has had a comfortable week. Only on Thursday before the week-end was there any shortage of funds, and the authorities promptly relieved this by moderate special purchases of bills both from the market and the banks. In the rest of the week covered by the latest Bank return large governmental disbursements, including the repayment on Saturday of about £40 million on the unconverted portion of the maturing Serial Funding Stock, made credit abundant—so much so that the authorities indulged in "reverse selling" of oils on Friday and Saturday before the week-end, and again on Wednesday of this week.

At last week's tender for Treasury bills, the market maintained its bid at £99 9s. 6d. per cent for the fifth week in succession; but as applications for the increased offer of £230 million of bills fell by nearly £20 million, to £372.9 million, the market's allotment rose from 34 to 46 per cent of its bid, and the average rate of discount rose by over 1/4d. to £2 1s. 11.48d. per cent.

The Bank return shows only a fractional outflow of notes into active circulation, but the outflow in the two previous weeks had been considerably larger than is normal so early in the Christmas season. Government securities in the banking department rose by £2.2 million, but this was more than accounted for by an intake of securities to match an increase of £5.6 million in the Treasury special account. As "other securities" rose by £2.3 million and "other accounts" fell by £4.4 million, bankers' deposits rose by £2.1 million, to £288.8 million.

WE'RE INVITING INVESTMENTS and this is why!

More houses are going up. More purchasers are asking building societies for advances to pay for them.

So far in 1953 this Society has agreed to lend over £5,000,000 for the purchase of more than 3,000 houses newly built or in course of erection.

Money saved and invested with the Society is thus being used to good purpose.

Still more savings can be used. The interest offered is 2½% with income tax paid by the Society—equal to more than 4½% where the investor is liable for tax at the full standard rate.

Time for Eastern trade

Ten-fifteen in Singapore and the city office of the Chartered Bank is already a hive of business activity. The Bank's branches in Japan began work an hour and a half ago but seven hours must elapse before the London, Manchester and Liverpool offices will be open for business; but wherever merchants and manufacturers are engaged in the Eastern trade the services of the Bank will be available to them at one point or another of its far flung branch system.

GOVERNMENT OF THE COMMONWEALTH OF AUSTRALIA CONVERSION LOAN

Offer of Conversion to Holders of

£10,796,065 Commonwealth of Australia
3½ per Cent. Registered Stock, 1951-1954,
into

GOVERNMENT OF THE COMMONWEALTH OF AUSTRALIA 4 PER CENT. REGISTERED STOCK, 1966-1968,

at the rate of £99 : 10s. per cent.

Interest payable 1st February and 1st August.

Six months' Interest will be paid on 1st August, 1954.

The Government of the Commonwealth of Australia will comply with the requirements of the Colonial Stock Act, 1900, in order that Trustees may invest in the Stock, subject to the provisions set forth in the Trusts Act, 1925.

Commonwealth Bank of Australia is authorised by the Government of the Commonwealth of Australia to offer to holders of £10,796,065 Commonwealth of Australia 3½ per cent. Registered Stock, 1951-1954, maturing 1st February, 1954, Conversion of their holdings, in whole or in part, into an equal nominal amount of Government of the Commonwealth of Australia 4 per cent. Registered Stock, 1966-1968, on the terms set forth in the full prospectus.

Principal of the new Loan will be repaid in London at par on 1st February, 1968, the Government of the Commonwealth of Australia having the option to redeem the Stock at par, in whole or in part, on or after 1st February, 1966, on giving three months' notice by public advertisement.

Holders who convert will receive on 1st February, 1954, a cash payment of 10s. per cent. representing the difference between the issue price of the new Stock and the redemption price of the old Loan. They will also receive the usual six months' interest payable on that date.

Six months' interest on the new Stock will be paid on 1st August, 1954.

Holders accepting the offer of conversion must lodge their acceptances on the appropriate forms accompanied by the relative Stock Certificates, at COMMONWEALTH BANK OF AUSTRALIA, Stock Department, 8, Old Jewry, London, E.C.2. These forms have been posted to the Stockholders or, in the case of joint accounts, to the Stockholder first named in such accounts.

Any Commonwealth of Australia 3½ per cent. Registered Stock, 1951-1954, not converted will be paid off at par on 1st February, 1954, together with the six months' interest then due.

The Stock now offered will be registered and transferable in any amount by deed, at COMMONWEALTH BANK OF AUSTRALIA, Stock Department, 8, Old Jewry, London, E.C.2. Stamp duty on all transfers will be paid by the Government of the Commonwealth of Australia.

Commonwealth of Australia Stocks issued and payable in London and the interest thereon, the property of persons not domiciled in Australia, are not, and will not be, subject to any taxes, duties or levies in Australia.

All Commonwealth Loans, all Loans issued by the several States and now taken over by the Commonwealth and all Loans guaranteed by the Commonwealth, carry a Sinking Fund in accordance with the provisions of the National Debt Sinking Fund Act, 1923-1934, and the Financial Agreement Acts.

The revenues of the Commonwealth of Australia alone are liable in respect of this Stock and the Interest thereon, and the Consolidated Fund of the United Kingdom and the Commissioners of Her Majesty's Treasury are not directly or indirectly liable or responsible for the payment of the Stock or of the Interest thereon, or for any matter relating thereto. —40 and 41 Vict., cap. 59, sec. 19.

A commission of 5s. per £100 Stock will be paid to Bankers and Stock-brokers on allotments made in respect of conversion acceptances bearing their stamp.

Full Prospectuses, with Statistical Statement relating to the Commonwealth of Australia, may be obtained from Commonwealth Bank of Australia, Stock Department, 8, Old Jewry, London, E.C.2; from Messrs. R. Nivison & Co., 25, Austin Friars, London, E.C.2; and at the Offices of the Government of the Commonwealth of Australia, Australia House, Strand, London, W.C.2.

Commonwealth Bank of Australia,

8, OLD JEWRY, LONDON, E.C.2.

16th November, 1953.

The List for Conversions will be closed at 3 p.m. on Wednesday, 25th November, 1953.

COMPANY MEETINGS

THOS. W. WARD, LIMITED

75 YEARS' PROGRESS MARKED BY £33 MILLION RECORD TURNOVER

MR GEORGE WOOD ON TRENDS AND PROSPECTS

The Fiftieth Ordinary General Meeting of Thos. W. Ward, Limited, was held on November 20th at Sheffield. Mr George Wood, CBE (chairman of the company), presided, and in the course of his report said:

This great and unforgettable Coronation Year of 1953 also marks two notable events in the history of the business and your company, namely, the seventy-fifth anniversary of the founding of the business by Thomas William Ward in 1878 and the holding of the fiftieth annual general meeting of the company. I feel it indeed to be a year of three-fold celebration.

Space does not permit, neither does the occasion call for, personal and nostalgic recollections of the intervening years; but I, together with the president, the deputy-chairman and other colleagues on the board, have lived intimately with the affairs of your company throughout the past fifty years; we have seen it through times of prosperity and adversity, have experienced great worries and great happiness, and at times results from strenuous endeavours and hard work have appeared to follow very slowly indeed. You will therefore appreciate how proud and honoured I feel to be the chairman of your company in this anniversary celebration year, and to have the pleasant duty of bringing before you such a record of achievement.

In so doing I would like to pay my tribute to our founder and first chairman, Thomas William Ward, who by his courage and sagacity laid the foundations of the Ward Group of Companies in those far-off days in 1878—when Disraeli was Prime Minister, income tax was threepence in the £ and the national annual output of steel was approximately two million tons compared with the output of the present day of 18 million tons per annum.

I would also like to acknowledge the work of Mr Joseph Ward who succeeded his brother and was chairman until 1941, and particularly my immediate predecessor Mr Ashley Ward under whose wise and skilful guidance as chairman from 1941 to 1950 the group expanded and consolidated its position.

Your board feels that such a year of three-fold celebration should be marked by a special bonus to the members of the company together with some suitable gift to the employees, and I will refer more fully to our proposals in this respect at a later stage in my review.

GROUP PROFITS

Last year I drew attention to the similarity of the results with those shown for 1951 and I am again pleased to comment on the relative stability of the results for 1953 compared with the two preceding years, particularly so as during the year under review there has been a noticeable swing in certain directions towards more normal and competitive market conditions with a consequent reduction in profit margins; a factor which I forecast in my review last year.

The profits before taxation after crediting exceptional income of £148,771 are £1,974,210 comparing with £1,882,035 in 1952 and £1,886,950 in 1951. The charge for United Kingdom and Foreign Taxation requires £1,027,342, leaving profits after

taxation of £946,868 and after adjusting for the amounts already dealt with by subsidiaries in their own accounts, we are left with a net profit available for allocation and appropriation in the accounts of the parent company of £590,835 compared with £574,955, an increase of £15,880.

I will deal with the various factors that have influenced the year's results in my analysis of the trading aspects and experiences during the year.

It is no doubt a trite saying that "records are made to be broken," but it is very gratifying to report that, despite more competitive trading conditions, we have achieved the new record turnover figure of £33 million, which exceeds by £4 million last year's record of £29 million. Of this total turnover the parent company's figure of £22½ million shows an increase of £3 million, and the combined turnover of subsidiary companies of £10½ million shows an increase of £1 million compared with the previous year. The turnover for the current three months subsequent to the date of these accounts is rather less than for the corresponding period last year.

EMPLOYEES

Mr C. F. Bishop, who has been with the company for fifty-seven years, of which he has been a member of the board for seventeen years, decided for health reasons to retire from the board at June 30, 1953. He is, however, remaining with us in an advisory capacity, and we all hope he will benefit from the lessening of his duties and completely recover in health.

In each succeeding year it is my pleasure to tender sincere thanks to all employees in our group of companies for their good work, and I am especially pleased in this anniversary year to congratulate them on the way they have again played their part. In the parent company alone we have twenty employees, including directors, who have completed fifty years or more service, and 325 employees, including directors, with at least twenty-five years' service. There is an old Chinese proverb which I feel is apposite to the effect that "if you are planning for one year, plant grain, if you are planning for ten years, plant trees, but if you are planning for 100 years, plant men." The strength of the present-day position of your group has been largely attained by the policy of attracting and retaining the right type of men and the maintenance and consolidation of this position in the future years depends upon the continuance of such a policy.

TRADING ASPECTS

As I stated above, the parent company's turnover has again shown a satisfactory increase and our principal trading departments with slight exceptions have had a good year although they have felt increasingly the weight of competition and have experienced some contraction in profits. Those sections of the business concerned with the collection and supply of scrap iron and steel and related raw materials have again handled large tonnages. This follows the normal anticipated pattern, for over the past 75 years these important sections of the business have been carefully developed and expanded so that today they are unrivalled in the vital

services they perform in supplying one of the nation's most important basic industries. For those lacking practical acquaintance with an organisation performing such a service I would mention that the recovery and supply of scrap metals on the vast scale of your company's operations is a highly specialised business calling for wide expert knowledge both of materials and markets and of consumers' specialised needs. It requires a network of branch works and shipbreaking yards conveniently sited and adequately equipped with efficient machinery for the stocking, handling, processing and manipulation of the various metals.

As the largest suppliers of scrap iron and steel to the consuming industries we are proud of the fact that during the past year we have again played so vital a part in the recovery and supply of substantial quantities. I mentioned a year ago that quantities available were at that time considerably below requirements but during the present year supplies have improved considerably. Pig iron deliveries have also improved, so that the steelworks are in the happier position of having sufficient raw materials to meet their immediate requirements and even to put a little into stock. Normal home supplies of scrap need to be implemented from outside sources and shipbreaking has contributed in some measure to this need. As anticipated, the output of new ships from the shipbuilding yards has released a number of old and obsolete ships for demolition, and consequently there has been a fairly regular flow of vessels into our shipbreaking yards, with the result that this section has had a satisfactory year.

The strategic value of scrap is such, however, that the steelworks must build up still larger reserves. We cannot, therefore, relax our drive, but must vigorously pursue our efforts for the full recovery of this important material.

I have given precedence in these remarks to the operations of those sections of the business concerned with the recovery and supply of scrap metals because steel is so vital to the prosperity of this country and in recognition of the fact that it was one of the principal activities on which the business was originally founded. This does not indicate, however, that the other sections of the business are considered of secondary importance. On the contrary, they supply a large proportion of the turnover, and we look to them to contribute on a considerable scale to the common pool of profit.

These sections supply a wide range of goods and services to industry, and include sizeable manufacturing and engineering interests. Although the manufacturing interests of the group are mainly carried on by subsidiary companies, there is an appreciable element of manufacturing directly performed by the parent company, such as the construction of railway sidings, the fabrication and erection of structural steelwork, the production of bolts and nuts and light forgings, machine tools and other similar equipment. In our modern and well-equipped engineering shops we also undertake the reconditioning and repair of all types of heavy and light machinery and plant for industrial and contracting purposes.

It is paradoxical that the improvement in

ASK THE MAN FROM THE

PRUDENTIAL

FAMILY MAN. Under forty-five. Comfortably off. Very little life assurance. Seems to be spending most of his income. Neighbour's serious illness last year made him concerned about his own future. Wants good provision for family. Also needs capital when he retires.

The Prudential Heritage Endowment is a life assurance plan just suited to his needs.

steel deliveries should have introduced somewhat more difficult trading conditions into certain of our engineering sections, but the better steel position has generally enabled the back-log of orders in the engineering trade to be reduced and delivery dates are now better than at any time since the war. Furthermore some of the large capital development schemes of the postwar years are nearing completion, so that general trade is reverting more to normality and business is becoming highly competitive. This evidences the return to a more stable economy and should be regarded as beneficial to the general conduct of industry. Competition creates lower margins but ultimately expands trade and efficiency. The process of transition, however, creates special problems for management, and I cannot over-emphasise the initiative and tenacity shown by all departmental controllers in dealing with the changing situation. We can only keep in the forefront of the business in which we are engaged through the medium of an efficient service backed by the full resources of our large scale organisation.

I commented last year on the unsatisfactory position of the contract as it then stood with the Saudi Arabian Government for the building of a road from Jeddah to Medina and promised that everything would be done to finalise our obligations at the earliest possible moment. I am pleased to inform you that negotiations have enabled us to reach a settlement with the Saudi Arabian Government. Our obligations with the exception of matters of a minor nature, are therefore at an end, the plant and equipment has been disposed of and the further loss incurred since the last financial year has been written off in the accounts under review.

SUBSIDIARY COMPANIES

The combined trading results of our subsidiaries again show an increase of some £125,000 compared with the previous year. A magnificent achievement. These companies carry names which have become synonymous with outstanding workmanship, quality and service in the particular spheres in which they are engaged. Although younger in the time of their association with the Ward group in certain cases they can claim even a longer separate existence than the parent company.

It is my usual practice to refrain from singling out individuals for commendation for the very good reason that it would be impracticable in the short space of this review to bring to your notice by name all those directors and officials who so worthily contribute their all out efforts, year in and year out towards the success of the group. I feel, however, that I may be allowed to relax this practice for once on such a notable occasion in the company's history and I would like to pay tribute to certain of my colleagues who carry between them the responsibilities of chairmanship of several of the major subsidiary companies in addition to their responsibilities with the parent company. I would mention our deputy chairman, Mr F. R. Stagg under whose guidance the fortunes of several of our largest subsidiaries have prospered so well and in so doing I would like to congratulate the Ketton Portland Cement Company, Limited, of which he is Chairman, in the celebration of its 25th anniversary. Long may it continue to prosper. In addition I would like to acknowledge the leadership of our joint managing directors, Mr Harold W. Secker and Mr Joseph Walton who so ably fulfil the role of Chairman to several other of our important subsidiaries.

In making such acknowledgements I would like it to be felt that my remarks include all those directors of the Parent Company who are also engaged on the boards of subsidiary companies, together with the resident directors and officials of

the companies concerned and I would like to thank them for the loyalty and whole hearted support which they give to their respective Chairmen.

OVERSEAS TRADE

We have several subsidiary companies registered in other countries: France, Sweden, Belgium, India and Australia, whilst the parent company also has an important overseas trade department. There are many difficulties in export business, not least the restrictions on import licences in some of the most important markets, but the main difficulty is still a financial one, viz.: the inability of many countries to find the necessary currency to pay for the goods required. Owing to its financial strength your company is in a stronger position than some others to meet this difficulty but at the same time we find it necessary to act with very great care. Export trade is vital to this country and we are exploring all avenues to promote and foster such trade through our group but great obstacles will remain until a more balanced state of international finance is reached. I am pleased to record, however, that the French Company had a turnover of approximately £1 million which, despite the fact that profit margins are relatively small, can be considered very satisfactory. I am also very satisfied with the manner in which we are gradually but firmly consolidating our position in the Scandinavian countries through the efficient organisation of the Swedish Company. Our newly acquired Australian Company has suffered materially from the effect of the import and credit restrictions but we consider this recession to be only of a relatively temporary nature. As evidence of our confidence in the potentialities of the Australian Company we acquired in June last an old-established business of general engineers, specialising in boilers, tanks, steam raising equipment, etc. This acquisition has been merged in our existing Australian Company.

PENSION SCHEME

The first five years following the inception of the Pension Scheme ended on October 15, 1953, and the actuaries will shortly be making their quinquennial revaluation so I think it is opportune to give you a short review of the scheme's scope and progress. It covers the whole of the permanent male staff employees over 21 years of age who contribute on the basis of 5 per cent of salary with a like contribution from the company. The pensionable age is 65 when the employee qualifies for a pension for life on retirement with a minimum period of five years or the right to opt for a lesser pension and widow's annuity. The amount of pension is calculated on the number of years pensionable service with a maximum pension of one half the average salary during the five years immediately preceding retirement. These benefits are flanked by a non-contributory group life insurance scheme under which dependents of the members of the pension scheme receive a lump sum payment if the member dies before pensionable age. The scheme is working remarkably well, the funds have been well invested and the accumulated fund at the present time is £600,000. We know that all employees are very appreciative of the benefits which it provides and we regard it with justifiable pride.

REVIEW OF THE BALANCE SHEET POSITION

From the consolidated balance sheet it will be seen that the total of share capital and reserves relating to your company's interests is £6,607,895, showing an increase of £622,006 compared with the position a year ago. The main movements reflected by

this cover increases in the Excess of Current Assets over Current Liabilities of £694,915 and £69,457 in Fixed Assets; against which future income tax shows an increase of £64,959 and interests of minority shareholders £77,772. The liquid resources of the group are adequate and show the satisfactory position of Current Liabilities being slightly more than doubly covered by Current Assets.

The balance sheet of the Parent Company shows a similar satisfactory position and although bank balances show a reduction mainly because of the considerable increase in debtors, the cash balances and short term loans totalling £462,604 are ample for requirements.

Although some small relief from income tax was given in the last budget and the unfortunate excess profits levy will terminate on December 31st next, the burden of taxation on industry is still far too heavy. By reason of the good standards of profit we had established in 1947 and 1948 we have fortunately escaped the inroads of the excess profits levy, but you will see from the group accounts that no less a sum than £1,023,933 has had to be provided out of profits to meet the demands of income tax and profits tax. In particular I feel that it would be a step in the right direction if wear and tear rates were increased and brought into line with general industrial experience of depreciation. More encouragement should be given to manufacturers to modernise both buildings and equipment and if we are to meet the highly competitive conditions of world trade we shall have to have a more enlightened fiscal system.

APPROPRIATION OF PROFITS

Before dealing with the profit available as shown earlier in this report, I would like to comment on the fact that we have set aside the amount of £25,000 for distribution amongst employees to mark the anniversary celebrations. This is in addition to the normal bonus which employees receive based on the results of the year's working, but we know that this step will fully accord with the wishes of the shareholders. From the profit available for allocation and appropriation of £590,835 we have decided to transfer £150,000 to the reserve for replacement of fixed assets. With the ever increasing costs of replacements we consider this a prudent course to follow. This leaves a balance on the year of £440,835 added to which we have the balance brought forward from last year of £497,727, giving a total of £938,562. Dividends already paid on preference and employees shares together with an interim dividend of 5 per cent per annum on the ordinary shares total £71,731.

Your board recommend the payment of a final dividend on the ordinary shares of 15 per cent less tax, making a total of 20 per cent less tax for the year, and with the participating rights on employees shares this will require £95,141. In addition to mark this special year in the company's history it is recommended that a bonus of 2½ per cent not subject to income tax be paid out of capital profits.

We propose a transfer to general reserve of £300,000 bringing the total of that reserve up to £1,700,000 which will leave the carry forward on profit and loss account of £471,690 compared with £497,727 brought in.

An analysis of results shows that after meeting all charges including taxation the net profit available is only equivalent to 2½ per cent of the turnover. Your board is conscious of the fact that the more highly competitive trading conditions which are developing will probably result in a reduction of the already small profit margins on which we have been operating, and consider that the recommendations made are most likely to promote and consolidate the interests of the

shareholders and the future business of the company.

FUTURE PROSPECTS

I cannot forecast that group profits will be maintained at the high levels ruling over the past three years, indeed the indications from our normal everyday business are that there will be some falling away from such exceptional levels, but one can never forecast the opportunities for special transactions which may arise and for which your company is so well organised and equipped to turn to advantage.

In general terms a reduction in profits is referred to as a recession but I prefer to regard the phase on which we are now entering as a period of adjustment. In my concluding remarks last year I urged the need for a restoration of stability of value to our currency and I consider that the steps taken so far by the Government are gradually promoting that stability and confidence. The process of adjustment to more normal and healthier trading conditions may result in reduced profit margins but I am confident that they will be representative of greater value.

I can say that we face the future with confidence but there is an urgent and increasing need for higher productivity if we are to meet the keen competition of other nations. I support the warning given by other industrial leaders—if we are to improve or even maintain our standard of living we must make an all out effort for greater production.

Finally, may I express a personal hope for the future. The next landmark in the history of this business will be the celebration of its centenary in 25 years' time. May it then be in an even stronger position than it is today with its personal ties and traditions unbroken, and providing then the means of livelihood to many thousands of people under peaceful and prosperous conditions.

The report and accounts were adopted and the dividends recommended declared. The retiring directors were re-elected and auditors reappointed.

WANKIE COLLIERY COMPANY

MR T. COULTER'S STATEMENT

The thirtieth annual general meeting of shareholders in Wankie Colliery Company, Limited, will be held in Bulawayo on Monday, December 14th.

The following are extracts from a statement by the chairman, Mr T. Coulter, dated October 23, 1953, circulated with the annual report and accounts for the year ended August 31, 1953:

MANAGEMENT.—Since the annual general meeting last December, important changes have taken place in the management of the company. Last April the Anglo-American Corporation of South Africa, Limited, Group acquired a substantial interest in the company, and the board of directors was reconstituted. Anglo-American Corporation of South Africa, Limited, were appointed consulting engineers to the company, and the technical control of the colliery is now under the direction of the coal department of that corporation.

ACCOUNTS

Profits earned during the year ended August 31, 1953, amounted to £465,016, compared with £245,198 earned in the previous year.

Provision for taxation absorbed £125,000, leaving a balance of £340,016, which amount, together with the balance of unappropriated profits at August 31, 1952, made available for appropriation a total amount of £560,098.

Dividends Nos. 58 and 59, each of 5 per cent, amounted to £330,938, and a sum of £100,000 was transferred to general reserve.

Certain preliminary expenses incurred in connection with the increase in capital totalling £13,115 were written off, and the balance of unappropriated profits, amounting to £116,045, was carried to the balance sheet.

Capital expenditure on fixed assets during the year, less sales, amounted to £1,265,384, and after making allowance for amortisation of coal mining rights and depreciation, the balance sheet shows fixed assets at August 31, 1953, at £4,988,969.

Current assets at £1,039,151, as against current liabilities of £1,659,996, indicated a shortfall of £620,845. This shortfall was due to the heavy capital expenditure to which I have referred, and was financed by temporary overdraft facilities which have since been liquidated from the proceeds of the recent new issue.

SALES

The following is a summary of sales of coal and coke over the years ended August 31, 1951 to 1953, inclusive:

	1951	1952	1953
Coal	2,283,949	2,543,978	2,781,023
Coke	101,622	113,371	147,751
Coke breeze	8,238	10,062	11,070

Plans have been made to bring about a substantial increase in productive capacity, and it is expected that there will be a progressive improvement commencing from about April, 1954.

FUTURE MINING POLICY

Careful studies of the future demands for coal in the Federated Territories have indicated that the company would have to provide for an increase in output to a figure of 5 million tons per year by the end of 1956.

The consulting engineers have recommended, and your board have adopted a mining policy which comprises briefly:

(1) The introduction of machine mining at Nos. 1 and 2 Collieries as soon as possible and the adoption of a production technique similar to that used in most of the Transvaal collieries.

(2) The opening and equipping of No. 3 Colliery, situated about six miles from No. 1 Colliery, for the production of about 2,250,000 sales tons of coal per annum.

(3) The completion of a large variety of capital items on the surface, all of which are necessary adjuncts to the programme of expansion.

Work on the opening and equipping of No. 3 Colliery has already commenced, and good progress has been made in providing the essential preliminary services, such as electric power supplies, branch railway connection, water supplies and roads.

The incline belt conveyor shaft, through which coal will be brought to the surface at No. 3 Colliery, is expected to reach the coal seam before the end of the present year, and production of development coal should commence on a small scale early in 1954.

The expansion programme, with all its ancillary requirements, is estimated by the consulting engineers to cost approximately £5,300,000, distributed over the next three years.

EASTWOODS LIMITED

STEADY PROGRESS MAINTAINED

The thirty-third annual general meeting of Eastwoods Limited was held in London on November 19th.

Mr G. W. A. Miller, FCIS, chairman and managing director, in the course of his speech said: The consolidated balance sheet shows that fixed assets increased from £1,975,000 to £2,244,000 after full provision for depreciation and amortisation. Actually the increase amounted to £473,000, which exceeds the expenditure of any earlier year on capital development. In addition, you will see there are forward capital commitments estimated at £525,000.

Current assets are down from £1,877,000 to £1,819,000, mainly due to a considerable reduction in paper sack stocks carried at the Cement Works, and the tremendous demand for our bricks and cement is reflected in the lower figure of manufactured goods on hand. Total assets amounting to £4,063,000 are higher by £211,000.

On the liabilities side, last year's taxes and similar essential provisions this year exceed £460,000. The very large increase in the amount for taxation charged in the consolidated profit and loss account strikes heavily into what the accountants call "net availability," but Excess Profits Levy is, of course, effective for only part of the current financial year, after which it goes altogether. In industry we are unanimous that this was a thoroughly bad tax, which we are glad to be rid of.

Even after these heavy appropriations we bring down an available total of £315,000, compared with £261,000, which enables us to transfer £50,000 to general reserve as before and to increase the final dividend to 12½ per cent on the ordinary stock, making a total of 17½ per cent, and thus also to increase the amount carried forward from £127,000 to £163,000.

TOWN PLANNING

I have told you in the past how necessary it is for mineral extractive industries to be backed by adequate reserves of raw materials.

With the deepest sense of sincerity and responsibility, I repeat that unless we can engender a more realistic approach to mineral planning, certain sections of our industries are in danger of being plotted for extinction.

At Eastwoods we have had faith to resuscitate this industry in an atmosphere of obstruction and uncertainty which has to be experienced to be believed.

Throughout the building industry as a whole, the steady progress forecast last year has been maintained, and there is every reason to think it will be continued during 1954.

Our production is on an all out basis. New tools, new plants, new properties will take a little time before we can get more output than we are already giving. I can only say without doubt that the works and all those things which go to the equipping of a group of this size, are in better shape than ever before. The energy and zeal displayed by all our workpeople and staffs has been engendered by the loyalty and unswerving co-operation afforded to me by my colleagues and by all the members of the team.

The resolution approving the report and accounts was carried unanimously.

At a subsequent extraordinary general meeting resolutions were passed to increase the ordinary share capital and to apply £500,000 of the share premium account in payment of unissued ordinary shares, such shares to be allotted to ordinary stockholders in the proportion of one £1 bonus share for every £2 stock already held.

TUBE INVESTMENTS LIMITED

GROWING OPERATIONAL STRENGTH

A RETURN TO REALISTIC PROFITS AND PRICES

MR IVAN STEDEFORD ON COMMONWEALTH'S ECONOMIC FUTURE

A return to realistic prices and profits, and further increases in the company's operational strength, were reported by Mr Ivan Stedeford, chairman of Tube Investments Limited, in his annual statement circulated with the accounts to shareholders. The annual meeting will be held in Birmingham on December 9th.

Mr Stedeford said that his warning a year ago, that prices and profits were likely to undergo a severe shake-up before industry became conditioned to a world buyers' market, had been borne out by events, and during the year under review both had returned to a more realistic environment. Profits totalled £6,199,131 compared with £9,291,834 in the previous year. This last figure included £1 million exceptional profits from an appreciation in the value of steel stocks. If this sum and income from other sources were excluded, the real trading profits for 1952/53, after depreciation, were £5,872,259 against £8,056,595, a reduction of £2,184,336.

It was significant that this fall in profits of 27 per cent related to a reduction in sales turnover of only 4 per cent; a fact which, in itself, told the convincing story of the return to sterner trading conditions he had forecast. In plain terms, it meant that in spite of some recession in the world demand for certain types of products TI manufactured, and, therefore, an intensified competition for what trade there was, the company had practically maintained its sales turnover, although to do this it had to pay a price. TI had, in fact, emerged from the lush days of the Korea boom stripped to battle order, and had met the fierce challenge of a keen world buyers' market; the year's earnings offered a fair reflection of these rigorous conditions, and the fact that they were still substantial, notwithstanding all these circumstances, might be a source of some satisfaction.

USE OF RESERVES

The accounts, taken with their notes, had been presented in a self-explanatory form, but attention was invited to a few aspects of the financial position. The profits of £6,199,131 were struck after providing £1,586,324 for depreciation, which, as in previous years, was nearly double the amount allowed for income tax purposes. The reduction in profits was not reflected in the net available balance. Because of necessary tax adjustments, this, at £2,984,311, was £477,335 more than was shown last year. The board proposed that £2,150,000 of this balance be transferred to General Reserve and development reserve of £750,000 and the dividend stabilisation reserve of £700,000 making the general revenue reserve £10 million.

The prudent financial policy which stockholders had permitted the board to follow over the years had greatly added to the competitive power of the group to the benefit of all concerned. Throughout the last seven years, TI had been spending money on new capital equipment for the modernisation of the company's factories, just as fast as this could be obtained, and this form of expenditure was continuing at much the same rate. The employment of the liquid resources in these ways in so short a time, and on such a scale, whilst impressively building up TI's operational strength, had reduced substantially the available funds; these were

adequate at present for the company's requirements, and the question of additional capital, therefore, was not under consideration. If this position should change, there would be no delay in dealing with it.

DEVELOPMENT PROJECTS

Recent additions to TI's operational strength included the acquisition of Round Oak Steel Works, Limited, at a cost of £5,800,000. This was a good sum to pay, but it was a good company—well founded, well manned, well equipped with modern plant, and conveniently situated. Apart from its existing business, which would be developed, the company would help to safeguard TI's supplies of special tube steels. For some time, these had been barely enough to keep the mills working at more than two-thirds capacity. TI would now share the advantages enjoyed by larger competitors at home and overseas by having a more or less integrated steel and tube plant. It would also make it possible for tube steel to be included in the company's technical researches. The plans would take a year or two before TI reaped the full benefits.

Another acquisition, costing just over £1 million, was W. H. A. Robertson & Company, Limited, of Bedford, a company with a world reputation, which specialised in the design and manufacture of rolling mills, tube-making plant, wire-drawing machinery and heavy to light machinery and engineering components. With the resources of TI to support them, there would now be no financial limit to the size or value of contracts Robertson's could handle at one time; the value of the association in this respect had already been amply demonstrated. The company's entry into the TI family would in no material way affect the trading autonomy it had always enjoyed. Other TI projects nearing completion were the big aluminium rolling mills in South Wales, which had already enabled the aluminium division to offer certain products at lower prices; and the £2,500,000 plant for fabricating special quality-bearing tubes, for which a big demand existed.

EXPORTS AT £18 MILLION

Direct exports totalled over £18 million, a reduction of nearly £2 million from the previous year's record. The financial difficulties which beset so many countries, the overstocking of markets against previous shortages, and the hope of price reductions, had been disturbing factors in an unsettled world market, and they had led to a growing ferocity in competition to secure what trade there was. It was to be expected that foreign competitors would make headway in some of their traditional markets which TI had served immediately after the war. This they had done, but, by and large, TI had not been losing ground to them and, if it could be helped, the company did not intend to. It had, however, been found necessary to sell certain components at uneconomic prices to meet the challenge of German subsidised exports. The sterling area again provided the most important export market. Prices fell steadily in Europe, with a general expectation that the Schumann Plan and increasing steel supplies would lead to still further price re-

ductions. Shipments to the dollar markets continued on a very satisfactory scale.

A sharp recession in the British and European aluminium industries turned the aluminium division's previous year's profit to a substantial loss. There had, however, been an encouraging increase in exports, and the full savings in costs expected from the new rolling mills promised a fair share of future trade in this competitive market. Price reductions of virgin aluminium in July on the resumption of private buying were welcomed, but he believed that further far-sighted and statesmanlike decisions on the part of the Canadian producers were necessary if the full demand for wrought aluminium in this country were to be stimulated.

Overseas economic difficulties, and consequent market restrictions, had led to a halt in the cycle division's meteoric rate of expanding output, when, in addition to big home sales, over 1½ million cycles were exported in one year. In 1949, he had suggested that the industry's production capacity had probably outstripped long-term demands, and TI had taken the warning to heart. By improving processes, TI companies had absorbed rising costs and produced more and better bicycles without greatly extended premises, and were thus able to retrench with the least embarrassment on the return of more difficult conditions. Much more than half of Britain's cycle exports to the US had come from TI in recent months. Without being complacent, he was confident that the cycle division was well-placed to gain full advantage of the opportunities in the world market open to it.

RECORD ENGINEERING RESULTS

The general and engineering divisions had achieved record results. This spoke for the growing demand for capital goods and TI's capacity to share in satisfying it. This significant trend, coupled with the group's own considerable requirements of new plant and equipment, had led TI into the specialised light machine tool and mechanical handling equipment industries through the purchase of Brookes (Oldbury), Limited, and New Conveyor Company, Limited, last year. These acquisitions had been further justified by a year's results. The acquisition of W. H. A. Robertson and Company was another step in this direction which would so extend the range of TI engineering equipment manufacture that the group would touch upon world industrialisation at many new points.

The steel tube division had recorded another satisfactory year's trading. There had been a sudden falling off in demand for certain categories of tubes, particularly electrically welded tubes, which caused TI to abandon a project for increasing capacity at a works in South Wales, but for some—especially those used in the manufacture of capital goods—the demand mostly remained firm or increased. Order books generally had been reduced during the year to levels which, for the first time for over a decade, should serve to energise the sales departments. The already enormous range of TI tubes continued to grow in step with industry's changing and exacting requirements. The electrical division, benefiting by a welcome change in the heart of the authorities towards the domestic use of electricity,

had made headway, improving sales and income for the year, and had introduced a number of new products, but a long road had to be trodden before the electrical appliances industry would fully recover from the privations imposed upon it for so long.

PROGRESS OVERSEAS

It had been evident that the general hardening of trading conditions was not confined to this country, and, for TI's associated and subsidiary companies overseas, the period had been one of consolidation and development rather than expansion. Good progress on all fronts could be reported. The value of these overseas enterprises continued to grow in an atmosphere of mutual trust and goodwill, which was so essential to the development of the group's international trade. The potential importance of Central Africa was reflected in the formation of a small company, TI (Central Africa) (Private), Limited, which would be developed as opportunity commended.

COMMONWEALTH AT CROSS-ROADS

Commenting on the emergence of a number of powerful economic groups of countries, the purpose of which, naturally enough, was the advancement of their own interests, Mr Stedeford said that wholehearted supporters of the Commonwealth took pride in its great contribution to human progress and world stability, but there was an inclination to think mainly in terms of moral leadership and to overlook its deficiencies in the economic field. From the practical point of view, apart from some fine ties of sentiment, which meant as little or as much as any member cared to decide, and Imperial Preference, already the subject of erosive attack from all sides, each member could depend upon little more than his own strength to withstand the pressure of economic events. This had for long been an uneasy position, but, in face of the rapidly changing pattern of world economic forces, it had surely become a vulnerable one.

There might be conflicting views on what, if anything, should be done about it, but the blunt fact remained that the Commonwealth would ultimately lose much of its moral influence if it did not gather economic power. If all-round, long-term benefits could be won by some more definite relationship, then surely it behoved members to examine the circumstances and consider what form the new relationship might take.

THE FUTURE

One did not forget the jealously guarded sovereignty of member countries, but what could be done by, and the best advantage of, the Western European countries, with their conflicting interests, should not be beyond the good fellowship of the Commonwealth community, if, likewise, a worthwhile gain for all could be achieved.

Was there an economic future for the Commonwealth as a community, and should we strive towards it? Prudence prompted that we should at least find out, and it would surely be well if we made some haste in doing so. There were alternatives, of course, for every member, and these would have to be considered in the cold light of self-interest, for in the ultimate this was necessarily the test for any association. But we all stood to lose before the economic groups confronting us, if, for want of seeking it, we allowed a great opportunity to go begging.

Concluding, Mr Stedeford said that we were passing into a tough new age when a company had to be fit to survive. TI had been saving and spending well to condition itself for these circumstances, and he was encouraged by the knowledge that the TI companies were in fine shape to meet them.

HORLICKS LIMITED

RESULTS NOT UNSATISFACTORY

The annual general meeting of Horlicks Limited was held on November 20th at Slough, the Rt Hon Richard Kidston Law, PC, MP, presiding in the absence of the chairman.

The following is an extract from the statement by the chairman (Mr O. P. Horlick) for the year ended March 31, 1953:

The year's results have been by no means unsatisfactory. I cannot yet say, however, that the difficulties of our overseas subsidiaries have been overcome and in the United States particularly, further losses seem inevitable.

The trading profit of the group amounts to £607,575 and compares with £659,138 for the previous year. Net profit before taxation amounts to £431,154 against £527,222 and after provision of £226,865 for all taxation at home and overseas, assessed and assessable, against £332,265 last year, there remains a net profit of £204,289, which compares with £194,957 a year ago.

The directors recommend a final dividend of 16½ per cent, bringing the total distribution for the year up to the usual rate of 30 per cent.

Our position in the home market is being well maintained, the milk situation has become somewhat easier and packing material costs are declining a little. Milk, wheat and barley prices and freight rates increased during the period under review. Our new products, Air-wick and Nulacin, have made useful contributions to the year's results and plans for the introduction and marketing of additional products are well advanced.

Our overseas markets remain a source of great strength, but the economic factors, which in the home market have tended to reduce consumer purchasing power, are increasingly evident in overseas markets.

Australia's valuable role as a substantial supplier of our eastern markets is now growing in importance with the completion of the new factory.

EXPANSION OF ACTIVITIES

Turning to a much happier picture, I referred last year to the steady expansion of our activities in the West of England, and since then not only has the throughput of the West Somerset Bacon Company, Limited extended considerably but also our branded "Somerset" sausages are finding favour with an increasingly large public.

Activity in our dairying interests has also broadened in that we have now arranged to treat and bottle milk for a large proportion of the milk retailers in an area stretching from Minehead to Weston-super-Mare.

Our cattle breeding centre continues to serve an increasing number of farmers in Somerset and with the recent advance in technical methods of artificial insemination, it is hoped to extend this activity among cattle breeders in many parts of the world.

Last year I referred to our hope that we should be able to add further products to our range by development in Somerset and the first steps in this direction have now been taken by Horlicks Farms and Dairies Limited through their acquisition of the controlling interest in Thatchers Food Products Limited, a company which specialises in the manufacture of such aids to the housewife as bottled garden mint and parsley.

Through our investments in the United States and Australia, we have been able considerably to expand and consolidate our Far Eastern markets.

The report was unanimously adopted.

FAIREY AVIATION COMPANY, LIMITED

NEW DEVELOPMENTS

The twenty-fifth annual general meeting of the Fairey Aviation Company, Limited, was held on November 12th in London.

Sir Richard Fairey, MBE, HonFRAeS, chairman and managing director, in the course of his speech said: Our increased profits for the year are more than wiped out by additional provision for taxation, which this year amounts to no less than £641,654. This is literally an outrageous proportion of our earnings and I do not know how long industry as a whole can be expected to stand these exactions. Since the war, for every £1 that we have paid in dividends we have paid £5 in taxation.

We have endeavoured to cover the field of new development in a way that should stand us in good stead not only while free nations are rearming, but also when rearmament comes to an end and orders for military types will fall away. We were pioneers and we are now established in the field of guided weapons. We are building up a strong organisation with a view to having a definite share of this business in the future.

We have designed the Rotodyne, which is of 40-50 seating capacity, with many alternative uses, both civil and military. Inquiries manifest a world-wide interest.

Our production facilities are in full swing. The super-priority "Gannet" has emerged from the tooling stage and is now coming off the production lines. From this aeroplane we are entitled to expect much.

The report was adopted.

THE BORNEO COMPANY, LIMITED

A SATISFACTORY RESULT

MR C. R. AKERS' REVIEW

The one hundred and sixtieth Ordinary General Meeting of The Borneo Company, Limited, was held on November 18th in London.

Mr C. R. Akers (the chairman), in the course of his circulated speech, said:

Although the accounts for the year to March 31, 1953, as was to be expected, and as I warned you would be the case, do not show profits up to the record profits of last year, still they do show results which we consider in the circumstances satisfactory. The net trading profit of the parent company fell from £925,995 to £438,185 and the group profits before taxation from £1,828,692 to £1,222,961. After deducting taxation the profits of the parent company were reduced to £187,852, compared with £331,459 last year.

As stated in the directors' report, our Rejang timber business has caused us a great deal of anxiety. Prior to the last war the concession was worked for Hardwoods, but operations were brought to an end before we had established regular markets for the several species of timber which were not familiar to the trade. After the war there was a strong demand for the so-called Softwoods of our forest areas, and we concentrated on extracting and selling Meranti and Kapur logs, but we have had many problems to contend with.

We have over the last few months reorganised our staff both in the forests, in the saw mill and in Sibul, with effective control,

and we hope that the resultant reduction in costs of extraction will enable us to realise profits. But it is too early yet to say whether these hopes will be realised. Our saw mill has been rebuilt and re-equipped and is now passing through its teething troubles. The re-establishment of the saw mill has been opportune as the trend of the markets now is to require increasing quantities of sawn timber. We have resumed the extraction of Hardwoods on a small scale, and the prospects of finding satisfactory outlets for our production appear promising.

PROBLEM OF FINANCE

The difficulties of finance which I mentioned last year are still with us. We have not yet come to the end of the expenditure which is necessary to maintain our organisation, and, particularly in Borneo, to establish ourselves where the trade has developed or is expanding.

Our subsidiaries, particularly the Borneo Motors, Limited, group and Orchard Motor Company, Limited, have the same constant demands for finance for garages, showrooms, workshops and offices for the necessary development of their businesses. This in turn requires more money to be tied up in stocks. Substantial profits have been made in the last few years, a large part of which have had to be ploughed back into the businesses; in spite of this they still have periods of considerable financial stringency.

It is impossible at present to foretell how the economic factors in the territories in which we operate are going to affect our business.

The report was adopted and the ordinary dividend of 15 per cent was approved.

ALLIED BAKERIES LIMITED PRIVATE INDUSTRY'S CONTRIBUTION TO NATIONAL ECONOMY

At the eighteenth annual general meeting of Allied Bakeries Limited held on November 17th, in London, the chairman, Mr Garfield Weston said, in the course of his speech:

The policy of modernisation of our plants financed entirely out of revenue has absorbed very heavy capital expenditure since the end of the war and has enabled us to hold down production costs in face of the rising trend of costs experienced in recent years. Our overseas interests have made excellent progress and their contribution is having an increasing effect on our total earnings. Our turnover for the year has increased by 20 per cent. There is no need to emphasise the importance of this increase in sales, and its influence on our earnings position.

With the return of freedom of supply more competitive trading has emerged but we are well equipped to play our full part and welcome this new challenge to our efficiency.

The results we have before us today are a new record in the history of our organisation. The net profit figure comes out at £4,679,000 and is £1,012,000 higher than last year and taxation provided at £2,880,000

is greater by £790,000 than the charge last year, and absorbed over 75 per cent of the increased earnings. The total of revenue reserves and surplus amounting to £4,343,000 is more than three times the issued ordinary capital and the surplus of current assets over current liabilities is £2,812,000, an improvement during the year of over £2 million. Over the years the total sum provided to write down intangible assets is £5,854,000.

PROPOSED BONUS ISSUE

Your directors have decided to apply for permission to a bonus issue of one new ordinary share for each ordinary share issued. It is proposed that the new ordinary shares should be non-voting but should rank in all other respects *pari passu* with the existing ordinary shares.

We must recognise the trend of somewhat more difficult days ahead but it is our constant endeavour to lessen the effects of a decreasing consumer demand—competition from the greater availability of other foodstuffs has in my opinion been the main cause, and to some extent to the housewife doing more baking at home.

I am proud of the contribution our group of companies has made to the Exchequer, and this year for every £1 paid to our equity shareholders over £12 has been paid to the Government and this I think will be acknowledged by every thinking person as proof that private industry is contributing its full share to the national economy.

The report and accounts were adopted.

KUMASI COLLEGE OF TECHNOLOGY

Applications are invited for the following posts in the Department of Commerce:—

- (1) SENIOR LECTURER in ACCOUNTANCY and
to take accountancy up to final professional level and to cover between them costing, executorship law and accounts, auditing and taxation. Qualifications: degree in commerce, membership of professional body, professional and/or teaching experience.
- (2) LECTURER (Grade A or B) in ACCOUNTANCY and
to take courses up to final level of examinations of Chartered Institute of Secretaries and Corporation of Qualified Secretaries. Commerce graduate with secretarial qualifications preferred.
- (3) LECTURER (Grade A or B) in SECRETARIAL PRACTICE, LAW and ACCOUNTS.

Salaries for pensionable appointments: Senior Lecturer £1,266-£1,780 p.a. Lecturer (Grade A) £798-£1,450 p.a. Lecturer (Grade B) £798-£1,150 p.a.

including overseas pay and temporary c.o.l.a. of approximately 15 per cent of basic salaries (£850-£1,200, £540-£1,000 and £540-£780 respectively). Temporary appointments would carry slightly higher salaries. Grading for lecturers and point of entry into scale according to qualifications and experience. Partly furnished houses provided, rent according to basic salary. Free first class passages once each way for each tour of service, for persons appointed, their wives and up to three children under 13. Income tax at Gold Coast rates. Generous home leave on full salary.

Write for further information to Secretary, Advisory Committee on Colonial Colleges, 1 Gordon Square, London, W.C.1. Closing date for applications (6 copies) December 7, 1953.

STATISTICAL OFFICER.—Mars, Limited, the well-known confectionery manufacturing company, is expanding its Statistical Department and, accordingly, invites applications for the above specialist appointment. The successful candidate will be directly responsible to the Chief Statistician; his duties will involve: (a) the statistical design of enquiries, particularly those relating to consumer and marketing problems; and (b) the development of statistical control systems applied to manufacturing operations. Applicants, under 30 years of age, must have a First-Class Honours degree, with special Statistics and Mathematics, and at least two years' experience in an industrial or research appointment, requiring the practical use of advanced statistical method. Acquaintance with electronic computers would be advantageous. The Company is less concerned about initial salary than securing the right man, but has a four-figure level in mind, plus non-contributory pension, life assurance and other benefits. Applications, which will be treated in confidence, should give a concise account of education and experience, and be addressed to the Personnel Officer at Dundas Road, Slough, Bucks.

ARE you getting the most from your investments? Sound independent advice on them can be obtained from Ernest H. Eve, head of the Evening Standard Investment Advice Bureau. Write for his free advice to 6 Throgmorton Street, London, E.C.2, and enclose stamped, addressed envelope.

LIFE ASSURANCE COMPANY in Mauritius requires assistant to General Manager. Age 35 or under. Experience of Life Office work and Insurance Company pension schemes essential. Good salary and allowances, free house and passages. Contributory pension and widows' and orphans' scheme. Further particulars from W. H. Clough, Empire House, St. Martin's le Grand, London, E.C.1.

NOTICES

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(UNIVERSITY OF LONDON.)

Applications are invited for two posts of Research Assistant, one in Economics and one in Agricultural Economics. Candidates should have a good degree in Economics and/or in Agriculture, and aptitude for statistical work. Initial salary £325-£450 per annum, according to qualifications and experience.

Applications should be received by the Secretary, Economics Research Division, London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2, not later than December 5, 1953.

NATIONAL INSTITUTE OF ECONOMIC AND SOCIAL RESEARCH

Applications are invited for the post of Research Associate, Grade II, at the Institute to work as a member of a team on an inquiry just starting into Trends in Business Organisation and Collective Regulation of Trade in the U.K. The following qualifications are essential: a good honours degree in economics; research and drafting experience; general knowledge of the structure of British industry. Knowledge of or experience in particular industries would be an advantage. The salary range for Research Associate, Grade II, is £600-£950, together with F.S.S.U. provision; a family allowance scheme is in operation. The appointment will be for two years with possible renewal for a third.—Applications, in writing and marked "Confidential," with a full statement of qualifications and experience and the names and addresses of not less than two referees, should be made by December 5th to the Secretary, N.I.E.S.R., 2 Dean Trench Street, Smith Square, Westminster, S.W.1.

EXECUTIVE ENGINEER required in London to manage energetic department of inspectors and others concerned in heavy engineering construction. A graduate mechanical engineer between 35-45 years of age is preferred, but graduates in industrial administration with an engineering background will not be excluded. Proved management ability and mature outlook, however, is essential. The post carries a salary of not less than £1,500 per annum, and in addition the company provide sickness, pension and life assurance benefits.—Applications, giving essential details, to Box 378.

SENIOR Technical Executive required for important industrial company. Experience of non-ferrous metals essential and proved ability to co-ordinate production and research departments. Knowledge of yellow metals an advantage.—Box 382.

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable December 15, 1953, to shareholders of record at the close of business November 19, 1953.

Toronto, By Order of the Board,
November 13, 1953. C. H. WINDELER, Secretary.

EUCLIDS - Gluttons for Punishment!

This gigantic 28-ton rock—one of many hauled from a quarry near Aden—represented almost double the rated capacity of the 15-ton EUCLID standard Rear-Dump Wagons, yet the fleet of 46 EUCLIDS stood up to this punishment under trying conditions of temperature and gradients up to 1 in 3½... proving once again the outstanding superiority of EUCLIDS.

This remarkable achievement was accomplished by EUCLIDS operated by George Wimpey & Co., Ltd., in conjunction with the Middle East Bechtel Corporation during the construction of an important new oil refinery for the Anglo-Iranian Oil Co., Ltd., at Aden.

EUCLIDS are available for sterling. Place your order now—all orders executed in strict rotation.

A complete After-Sales Service for all EUCLID equipment is provided by the distributors

Brilliant New Novel of Suspense

BY

VICTOR CANNING

JOHN BULL is proud of its steadily growing reputation as a magazine of frankly good reading: proud, too, of the very large number of discriminating readers who buy it regularly.

Since the war, this intelligent magazine has featured with increasing frequency the work of distinguished writers; its editorial policy has concentrated upon bringing to its readers really good books. In doing so, it has time and again chosen stories which, when later produced in book-form, have proved to be best-sellers. Nigel Balchin, Pearl Buck, James Ramsay Ullman, C. S. Forester,

Howard Clewes, Mazo de la Roche, J. B. Priestley, Agatha Christie, Stuart Cloete, H. E. Bates, and Paul Brickhill are only a handful of the top-class authors whose work has been published in JOHN BULL.

And now JOHN BULL is pleased to announce its purchase of Serialization Rights to Victor Canning's great new novel, *The Man from the Turkish Slave*. Set against the colourful background of South America, with a fast, exciting plot and all of Mr. Canning's convincing characterization, this story is yet another certain best-seller brought to you—before book publication!—by JOHN BULL.

Electricity Supply— Present and Future

"A well established characteristic of electricity supply in Great Britain is that the demand for electricity doubles about every 10 years. Over the past half-century this trend has persisted in spite of war and peace, slump and boom, and there are reasons for the expectation that it will continue in the future. It is against this background of progressive expansion that the policy and progress of electricity supply development in the post-war period must be examined. The past five years have run true to form. The total consumption of electricity is now about 50 per cent. higher than it was in 1947-48; it is also two and a half times greater than immediately before the war—15 years ago."

From an article by the Rt. Hon. Lord Citrine, Chairman, British Electricity Authority, in 'The Times Survey of Electricity Supply in Great Britain.'

This special supplement by *The Times* on electricity supply in Great Britain will review past and present achievements and examine future needs; and will consider the problems involved to-day in finance, engineering, transmission, and efficiency both in production and consumption.

There will be authoritative articles on the application of electricity to particular industries, including railways; views of the electrical industry by the heads of two leading companies; contributions on the need for coal conservation, emergency operation, the problem of smoke, the super-grid and the cross-Channel cable project, North of Scotland hydro-electric developments, pumped storage, generating equipment progress; and an article, by Sir John Cockcroft, F.R.S., on the prospects of nuclear power stations.

'ENGLISH ELECTRIC'

The 'heart' of many big stores is never seen by the customers. It is the power generating plant, used in some cases to supplement the mains electricity supply during peak hours, and in others to maintain a supply completely independent of the public service. Famous stores throughout the country have private power houses equipped with diesel-electric generators made by 'ENGLISH ELECTRIC'.

bringing you

'ENGLISH ELECTRIC' generating plants not only help to provide customers with the amenities of the big store — lifts, escalators, catering, lighting and heating — they also help to relieve the enormous demand on the public electricity supply. In this, as in so many other ways, 'ENGLISH ELECTRIC' puts the power of electricity at the service of millions.

To Meet the President

THERE was a curiously hysterical note in Mr Vyshinsky's attack on the Bermuda conference last week. Moscow, of course, detests all forms of what Mr Molotov terms "collusion" between the democratic powers, although it still seems unable to avoid driving them into one another's arms. But is there, in this case, something more? Do the Soviet rulers really fear that the quiet weekend at the Mid-Ocean Club will upset their plans in some unexpectedly sensational way?

It is difficult to see why they should. Indeed, until a very short time ago the Kremlin might have been expected to welcome the idea of a pull-devil-pull-baker contest between the heads of the western governments. A Bermuda meeting at which Sir Winston Churchill was trying to sell President Eisenhower a ticket to Moscow, while the latter talked tough about EDC to M. Laniel, who in turn reminded Sir Winston of his godfatherly responsibilities towards the European army plan, would surely have been a pleasing sight to Russian eyes. Happily, there are now sufficient grounds for hoping that the talks will not take that shape. The Prime Minister has finally acknowledged the grave dangers that lurk in his vision of a top-level meeting with Mr Malenkov; M. Laniel demonstrated, in this week's debate in Paris, that French indecision could no longer be laid at his door; and British association with EDC appears to be crystallising into a more generally satisfactory form.

The omens are now better, therefore—if it can be assumed that the French governmental crisis does not prevent the Bermuda meeting from taking place at all. But what shape will these discussions without agenda in fact take? Clearly it will be for Sir Winston Churchill, as both host and convener, to set the ball rolling. If, in spite of everything, he begins by rolling it in the direction of a Malenkov meeting, it is bound to stick almost at once; for it is now plain for all but the wilfully blind to see that the last thing the Soviet leader wants is to find himself closeted with Sir Winston. Indeed, even the smog released by Mr Molotov at his celebrated press conference and eagerly inhaled by some open-mouthed individuals in the West cannot conceal his reluctance to confer on any level at present.

The reasons for that reluctance have now been widely recognised. Moscow has nothing to offer in negotiations; and it feels that it has nothing to lose by indefinitely freezing existing positions in Germany and elsewhere. The Soviet leaders' attitude may also be influenced by a domestic factor. The monolithic discipline they impose alike on their subjects and their satellites depends in part on the constant evocation of supposed threats from the outside world; Malenkov's concessions to the Russian consumer at the expense of the iron framework of heavy industry and defence must make these external threats seem less imminent to many of his subjects. If they once sensed a genuine relaxation of tension, it might be impossible to maintain discipline of the severity that the Kremlin finds necessary. Soviet

policy will probably, for some time to come, aim at keeping the political temperature steadily in the middle ranges, well away from either boiling point or zero, but with a tendency to be uncomfortably warm.

It is here, surely, that the first task for Bermuda is to be found. The western statesmen have to review the events of this eventful year, and thence to estimate the temperature at which they must operate in 1954 and perhaps for a year or two after that. Clearly, the free world dare not relax to a greater degree than does the Communist bloc; equally clearly, it cannot afford to waste its strength on unnecessary efforts. It must not be expected that three heads of governments, each of whom has pressing preoccupations of many other kinds, can in a few days of bilingual talk find detailed agreement on all the international problems that confront them. They must confine themselves to the broadest essentials. But breadth is not to be confused with inexactness. Taking a temperature is an exact business, calling for a nice degree of judgment, not for dramatic decisiveness or moral fervour. For this reason, the Bermuda meeting will prove most satisfactory if it results not in any resounding sensation but in a glow of quiet understanding.

Whatever the Bermuda thermometer records will be impatiently awaited by the planners of the North Atlantic Treaty Organisation, for the regular annual meeting of the Atlantic Council, at which sights are set for the coming year, is almost due. But Bermuda, though it may throw out the careful calculations of the Nato planners, may offer them some compensation: it may speed up the exchange of information between allies about the new weapons which have in past years represented an unknown quantity in the annual Nato equations.

★

But in addition to these primarily technical issues, there is a major political problem in the European sphere confronting the statesmen at Bermuda. This is the European Defence Community project, which, for reasons that have been sufficiently described in these columns, remains the only satisfactory formula for the common defence of Europe. Before MM. Laniel and Bidault spoke in this week's parliamentary debate in Paris, it might well have been expected that the Bermuda meeting would be largely devoted to an Anglo-American demand for French ratification of EDC. Now, however, the French prime minister has defined his position, and it would be both unseemly and futile for Sir Winston Churchill and Mr Eisenhower to apply personal pressure to him in this way. France's allies should not seek to dictate to the French premier, whose difficulties they must perceive and whose honesty of purpose they must applaud, the substance of the French decision on EDC. But they have a right to insist that it be taken, one way or the other, at the earliest practicable date.

M. Laniel, in turn, is entitled to demand the immediate clarification of the American and British posi-

tions. In the Paris debate on Tuesday he expressed his expectation that the terms of Britain's close association with EDC would now be rapidly and satisfactorily settled. At Bermuda, Sir Winston Churchill will have not only the opportunity but the duty of completing his assurance on that score. But what of the United States? There has never been any question of Congress agreeing to an association with EDC as close as that contemplated by Britain. On the other hand, American leaders have, on various occasions since the change of administration, used terms implying a commitment not to reduce their effective military strength in Europe, which is the heart of the matter. Something more specific may now be forthcoming, and, as in the case of the British commitment, a prompt and spontaneous American offer would be very much better than a grudging concession to importunity.

★

As between Europe and Asia, the obvious difference in the picture over which the three statesmen will brood at Bermuda is that in Asia Communist representatives are actually seated at the other side of a table. Admittedly Mr Dean's table at Panmunjom is a very small one, something between an occasional table and a mere camp stool, and it may yet fail to grow into a full-size conference table of whatever shape. Its reason for existence is that a shooting war has only lately been stopped in Asia, and much remains to be tidied up. The tidying may get no further than it has done in Europe since 1945. Up to now, the Chinese have shown small enthusiasm for a real conference; indeed, why should they, when by stalling tactics they can hope to widen what they take to be major rifts in the unity of the United Nations? The issue of Indian participation was handed to them on a plate as a result of allied short sight and misunderstanding, and it is hardly surprising that in such circumstances they should have decided to invest in obstinacy. Even now, after three months of procrastination, they may still look to the UN Assembly to prod Mr Dean in the back for them.

But it may not be long now before the Chinese judge that they have exploited this situation to the point of diminishing returns. When the moment for real negotiation arrives, it is essential that the free nations should find themselves agreed on the outlines of a Far Eastern policy. For, although there can be no yielding on the principle that Korea must be stabilised before the wider affairs of the Far East become the subject of negotiation, any Korean conference worth its name must eventually broaden out into a wider discussion.

There is an element of fantasy in the manner in which these broader Far Eastern issues are generally discussed in the West. It must be acknowledged as a triumph for the Communist technique of obsessive propaganda that nearly all such discussions take as their starting point not the conditions that are essential to the security of the free world, but the numerous

demands of Communist China. To bring out the irony of this situation, a parallel may be suggested. Suppose that the League of Nations had successfully driven back Mussolini's invasion of Ethiopia, and thus for the first time asserted both the principle and the practice of collective resistance to aggression; but that a formidable fascist army remained poised in Eritrea, and an unrepentant Duce was still bragging of his military exploits to cheering crowds in Rome. Would the allies then, while still compelled to keep their joint forces in the field in Africa, have agreed to approach a general settlement by way of Mussolini's claims on Nice and Corsica and to liquidate instantly every kind of economic sanctions? It may pardonably be doubted—even if the Emperor of Ethiopia had outraged liberal opinion in the West by talking as much intransigent nonsense as Mr Syngman Rhee.

Yet today Peking, having just celebrated with much rattling of sabres the anniversary of the Chinese invasion of Korea, blandly puts forward as its price for a dubious Korean settlement a set of demands ranging from admission to the councils of the Great Powers to the surrender of Formosa; and the western governments are widely criticised for their reluctance to accept such an agenda. Indeed, Mr Eisenhower may arrive at Bermuda next week expecting not only to be taken by the hand and drawn deeper into Europe, but also to be proffered a velvet glove for use in handling China. Yet what the three statesmen ought really to discuss in the Far Eastern sphere is not China's interests, but those of the free world. These interests embrace the halting of the Communist onslaught in Indo-China; the prevention of a second aggression in

Korea; and assurances against attacks on Siam, Malaya, India and Japan. No security is likely to be obtained under any of these heads while Peking remains in its present braggart mood and counts on disunity in the UN ranks to bring all its aims to fruition in time. Only by hard bargaining by a united group of allies can any satisfaction be obtained; and if that bargaining is to succeed the free nations must play their cards, some of which are strong, with coolness and deliberation.

A policy of this nature would in no way imply a surrender to the views of the many extremists in America. The gulf between those views and those of Mr Eisenhower's Administration has already been made clear—particularly in Mr Dulles's recent reminder that the Administration had never committed itself to permanently resisting the seating of Peking representatives in the United Nations. There is no reason for Britain to abandon its standing thesis that Communist China should be admitted to a normal international status once it has purged its contempt; in the long run, American opinion can be expected to align itself with British in this respect. But in present circumstances, while Mr Dean at Panmunjom is meeting Chinese abuse with restraint and patience, while the Indians in the "explanation" tents are discovering how justified was the American insistence that prisoners of war should choose their fate freely, while Peking continues openly to encourage the Communist generals in Indo-China, and the latter spurn French suggestions of a settlement, the one outstanding need is for firmness; and it is for Britain in particular to demonstrate that in the Far East it stands shoulder to shoulder with America and France.

Recession Small or Large?

IT now looks unlikely that the economic tide will turn before Christmas. The prophets of a recession in the autumn have once again been proved wrong. This does not mean that the British outlook is exactly set fair. The Chancellor of the Exchequer last week told industry that exports are increasing only slowly; indeed, he suggested that in many important fields British exporters have been losing ground to their competitors for the past two years. In itself, this is old knowledge: it is one of the reasons why the mood of business has become so much more cautious since 1951. But it must be read in conjunction with the Chancellor's belief that increasing consumption in the home market does not at present threaten to distract industry from selling abroad—or, in other words, that his budget of last April was not too lenient. The indifferent showing of exports does not mean, on this official view, that the economy is veering off course in the direction of inflation. On the other hand, fears that it is about to veer in the opposite direction, towards deflation, have

slackened somewhat of late; they do not fit either with the buoyancy of the Stock Exchange or with the present facts of consumer spending and investment outlay. There are differences of emphasis about where the future dangers may lie, but there is wide agreement, among both planners and businessmen, that the economy is on a pretty steady course at the moment.

To try to forecast the economic weather ahead is to turn to the United States, where there are three questions to be asked, which are not often distinguished as clearly as they should be. First, will economic activity decline during, say, the next six or twelve months? Secondly, if it does, what will the recession be like—how sudden and how big? Thirdly, what will be the nature of its effects on the rest of the world?

On the first, he is a brave prophet who at present has any confident answer. Ever since 1945, almost everyone has under-estimated the expansive force of the American economy. Occasionally, it is true, economists have succumbed to the enthusiasm of the moment and

become falsely convinced that production would stay on the up and up; this happened, most notably, in 1951. But at most times, and whenever there was any real measure of immediate uncertainty, informed opinion has turned out to have been too gloomy; industrial activity six months later has been higher than most people had thought it would be.

★

The recent past is no exception. The level of American industrial production this last summer was higher than the general prediction at the beginning of the year; and it looks like remaining higher at the end of the year. What looked, not many weeks ago, like the onset of a real recession, now has more the appearance of one more "rolling readjustment"; slack in some industries is being largely taken up by continuing expansion elsewhere and unemployment remains low. This also, however, may be only a momentary impression and the bearish symptoms may reappear. But since the seasonally high period of Christmas trade is immediately ahead, a dramatic turn for the worse before January would now be surprising.

The forecasts of a recession are thus put off once again. The common belief is now that the recession will come in 1954 and its likely magnitude is commonly expressed in America as a 5 to 10 per cent drop in industrial production below this year's level—which would only bring it back to the level of 1951-52. Even such moderate predictions have in the past turned out to be too pessimistic, but it would still be very foolish to dismiss the expert opinion. The chances are that it will not go on being wrong for ever. If the American economy has proved itself extraordinarily resistant to the trade cycle for eight peacetime years, that is still a short time and they have been years with many other abnormal features.

There is in this no evidence that the trade cycle has been conquered once and for all. On the contrary, it remains as true as ever that the American economy is by its sheer exuberant nature peculiarly exposed to instability. That is the cost of great technological vigour, which is liable to make industrial investment go in bursts, and of a high standard of living, which makes so much consumer expenditure postponable. Continuous high activity in such an economy cannot have a continuous source; it depends on the constant succession of one expansive force after another. The increased stability that the United States has demonstrated since the war is the equivalent of good tactics in a military operation: the economy has responded smoothly to shifts from one expansive force to another—from the strong postwar replacement demand for consumer goods to a high level of construction and industrial investment and then to heavy defence spending. What is at issue now is not this tactical ability but the general strategy. The main reason for fearing a recession next year is the difficulty of seeing what large new expansive force will be at work.

Mr Colin Clark, writing recently in the *Manchester Guardian* with all the certainty of revealed truth, has created a stir by asserting not only that there will be a recession early next year, but that by the middle of the year it will have gone too far to be arrested by any measures that one can put within the bounds of political probability. Very few people indeed will share Mr Clark's confidence in the mathematical argument on which his conclusion rests. Indeed, he himself admits that the theory does not altogether fit the facts of the Great Depression. Even in 1929-30, economic activity did not slump as rapidly as his equations would have led Mr Clark to suppose, and the forces of resistance to a slump are surely stronger now than they were then. But if in this respect his predictions seem exaggerated as well as over-confident, there is none the less a point of first importance in Mr Clark's analysis, a point that does not depend at all on his particular, mechanistic formulæ. When a real recession does start in the United States, it may well move faster and go further than most Americans are now supposing.

★

The fashion of economic thought in this matter has changed very recently. In the early postwar years, it was usual to think of full employment as a narrow ridge. On either side were steep precipices; if the economy were moved just a few steps off its existing course, it would plunge out of control into an abyss either of galloping inflation or of disastrous deflation. People feared that if the total of demand was reduced by a little, the cumulative natural forces of the economy would immediately take command and produce a big drop. In fact, the United States in 1949 and Britain in 1952 proved resistant to small declines in demand. Full employment is not a ridge but a plateau. The modern economy has quite a considerable room for manoeuvre, round about the point of maximum activity, without getting itself into an uncontrollable deflationary spiral.

To realise this has been, in the conditions of recent years, the largest part of economic wisdom. But it is not the sum of wisdom. There is a danger now that economic thinking has swung too far in the new direction. Is it right to assume that the plateau stretches on indefinitely, that production can fall by perhaps 5 or 10 per cent and the decline still come to an easy and even a natural halt? The contrary analysis is familiar enough. When some firms have met a fall in demand or an expected fall in prices by running down stocks, other firms experience a fall in demand and run down their stocks; when some firms have scaled down their expectations of future business, and cut their investment programmes, other firms find that they have been too hopeful and cut their investment programmes. And so on. These cumulative forces of contraction are known to every first-year student of Keynesian economics, and it would be a pity

if sophisticated economic analysts forgot them. It is true, of course, that the modern economy has powerful "built-in stabilisers" that resist the contraction—tax payments decline sharply with marginal cuts in profits, state expenditure on social security benefits rises automatically. But the efficacy of these stabilisers has so far been tested only against very mild contracting forces. The cyclist can correct for little wobbles and keep his balance; but if he is pushed beyond a certain point, he will still over-balance.

This is not a prescription of hopelessness. The "automatic" counter-forces are not the only thing to keep the bicycle upright. There is also deliberate Government action. The present Administration and Congress of the United States are certainly alive to the danger and full of the best intentions. But would their actions be big enough and quick enough to counter what might be the rapidly cumulating forces of recession? The clumsiness of the American political system makes it impossible to be sure and not too easy to be hopeful.

The argument is not, most emphatically, that the United States is facing another Great Depression; it is not even that a tiny recession, on the 1949 scale, is likely. The point is solely and simply that if, by some mischance, the prophets of a recession are for once right, they may be wrong about its size. If the decline

Dragon's Teeth by the Nile

THE Egyptian government is puzzling its friends, and giving its enemies cause for glee, by its behaviour over the Sudan elections. It has identified itself with a single party in the Sudan—the National Unionist Party that is ready to acknowledge some link of an unspecified kind with Egypt—and it is trying to influence the simple minds of Sudanese electors to favour that party. Its method is to call all other parties the unwitting and foolish tools of British imperialism. The effect of this vehement campaign is to sharpen acerbity between the Sudanese parties, which are not really at odds, since all agree in wanting to do the daily job of running their internal affairs without reference to Cairo or anywhere else. For the sake of quite temporary electoral benefits, Egypt is therefore sowing two kinds of trouble for itself in the future. First, it is increasing the danger of discontent between Government and Opposition in the Sudan, which could create on its southern frontier not the stable and peaceful neighbour it needs but a centre of disturbance. Secondly and graver still, it is antagonising a large section of the more educated members of the Sudanese nation. These men are beginning to hate the too-ready assumption of Egyptians that the Sudan is their business and that they are entitled to behave there as if they were at home.

Those who know the Sudan only from the press

may be 5 or 10 per cent, why not 15 or even 20 per cent? It would be folly to prepare for one and not the other. There are those who would say that the difference is, for this country, academic; a very slight recession would in any event be quite enough to plunge the sterling area into another crisis. That may be true, but it does not make the size of the recession unimportant. In a slight American recession the things for the British Government to worry about would be the balance of payments and the dollar reserve; it would be quite compatible, as it was in 1949, with continuing full employment and even inflation within this country. But if the recession were swift and went further, it could hardly fail to infect Britain's domestic economy with deflation; in a mood of nervousness, investment projects would probably be held back, consumers might reduce spending, and unemployment would then be by no means confined to the export trades. The measures needed would be very different from those appropriate to full employment.

This article makes no forecasts. Its argument is that there are three possibilities to be prepared for: no recession at all; a small recession such as the American forecasters expect; and also a medium-sized slump. Nothing will be more important for Whitehall in 1954 than to watch carefully and to be sure that plans are ready for prompt action in all three situations.

reports on the first week or two of the present elections might think this second risk a small one. They have been regaled with stories of bewildered fuzzy-wuzzies wandering in and out of booths asking which way to vote, and may have come to regard the whole country as primitive. But it is now the turn of the more sophisticated areas to vote; they contain communities accustomed to running town and rural district councils, with majorities of elected members, who have a good idea of their duties and of their responsibility to electors. No one can doubt this who has seen one of them at work. Ignorance is by no means universal in the Sudan, and many of its more progressive elements are alarmed and shocked at Egypt's tactics.

Egyptian thinking about these elections has gone through several phases. It was General Neguib's government that first proposed the machinery for them: the neutral electoral commission that has been seeing fair play is working in precisely the way that Egypt suggested. Then Cairo began to fear that the influence of the Sudan's remaining British officials—40 in the Defence Force, 8 in the police and, at today's date, some 130 in the Administration—would influence the vote and help the parties that favour independence for the Sudan. In August, therefore, Major Saleh Salem was sent south to propose, instead of elections, a gentleman's agreement whereby an all-party group

should run the country for the three years of self-government that are to precede self-determination. On discovering that this idea found no favour with the Sudanese, the Egyptians dropped it and started to use the pressure tactics that Mr Eden described to Parliament on November 13: they sent their Under-Secretary for Sudan affairs and the head of the staff section of their Ministry of Propaganda to Khartoum; they increased the financial contributions that they have always made to the orthodox Islamic institutions in Egypt and they sent numbers of Egyptians of Sudanese origin on leave to the Sudan. The full force of Cairo radio is also devoted to the campaign.

People well acquainted with the non-Arab and non-Moslem south believe that this propaganda has made some headway there; it may affect southern representation in Parliament, and, since the Moslem parties could turn out to be fairly evenly divided between the National Unionists (mainly *Khatmia* or orthodox), and the two Independence parties (mainly *Ansar* or unorthodox), a balance could lie in southern hands. But it is difficult to believe that any such momentary capture of allegiance could permanently operate in Egypt's favour. Southerners may be so bemused by their electoral experiences as to do incalculable things now; but they are unlikely to forget for any length of time their inherited fear of the Arabs, who are connected in their minds with the slave trade and the oppression of the nineteenth century. The latest Egyptian step is a protest to the electoral Commission about undue British influence and unfair proceedings at the poll in Kassala and Equatoria provinces. The commission, through its Indian chairman, Mr Sukumar Sen, who is extremely experienced in electoral matters, has replied that the facts "do not warrant your conclusion" of interference.

It is difficult to understand all this Egyptian activity except as an effort to secure a parliament which will,

during the transitional period preceding self-determination, do its utmost to eliminate everything British from the Sudan. As matters stand at present, the possibility that the policy will produce an outright union of the Sudan with Egypt is extremely remote. The National Unionist list of candidates is a collection, not of supporters of Cairo, but of antagonists of the *Ansar* and its leader el Mahdi. For example, Mirghani Hamza, the National Unionist politician who might be prime minister if the orthodox *Khatmia* emerges in strength from the polls, favours an independent Sudan which will merely co-ordinate defence, foreign policy and certain commercial matters with Egypt. All thinking Sudanese want a separate civil service, and most want a separate currency. The real question for the Egyptians is the degree of co-operation to be secured from the Sudan of the future, whatever party is in power. For they need this co-operation on vital matters such as sharing the Nile waters and defence arrangements. With such requirements, they would have been wiser to be less partisan.

In a world full of young democracies and peoples feeling their way towards new patterns of self-government, interference—even from a would-be good neighbour—has some wider repercussions. Egypt has been perpetrating acts which it would not for a moment tolerate within its own frontiers, even from fellow-Arabs claiming "brotherhood"; its behaviour might well be described in some quarters as imperialist. Maybe the spectacle it has offered the world will have one good result: it will suggest that use of the ballot box is a good thing only when people have enough education to use it as it is meant to be used. Probably the Sudanese will emerge unscathed from the strange battering to which their minds are being subjected, and will arrange their affairs as they think fit. But the outcome would have been happier for all had there been no intervention from Egypt.

Modes and Morals

ONE of the fruits of distributing education and incomes is both brightly coloured and juicy: the women's magazines have become a very flourishing crop. There are about fifty of them, nearly all with circulations comparing very favourably with prewar sales and still rising. At a time when some general periodicals have been in difficulties and two or three have gone out of business, the women's magazines have gone from strength to strength.

Women's magazine reading increased during the war, when there was little else to buy, and when, for the first time, many married women had their own money as distinct from an allowance from their husbands. Circulations were held down by the paper shortage, but nearly all have since risen, in spite of price increases. By now women no doubt feel that to cut down on their

magazine reading would be a false economy. Apart from getting free knitting patterns, which would cost 7d or 9d each in the shops, they are shown how to lay out their money, how to make do and mend; and they get plenty of reading matter without a trip to the library and the cost of a subscription.

Two magazines—*Woman* and *Woman's Own*—each have a circulation of over 2 million and a readership, according to the Hulton survey, of over 5 million, and both have gained over a million readers in the last four years. Their success formula seems to be a gay and dashing presentation and good, gripping fiction. But presentation is not everything. There is nothing to catch the eye, for instance, in the appearance of *Woman's Weekly*, which, with its circulation of 1,800,000, is the only paper to present any kind of challenge to *Woman*

and *Woman's Own*. It looks frumpish beside most of its competitors, and owes its success to less obvious causes: its fiction—almost a week's reading in tiny type; its knitting patterns—three or four for three-pence; its sincerity, as "woman to woman"; and the dependability of its instructions. Women, it seems, develop a strong loyalty to their favourite writers. They come to rely on one paper and one contributor for advice about children; on another contributor—perhaps in another paper—for fashion; on another for cookery,

and another for medical advice. Following their favourite contributors leads many women to buy more than one magazine. Advice and instructions that are absolutely dependable go far to build up a good circulation, and a single mistake in a knitting pattern can undo the work of years.

This loyalty to certain papers and certain contributors explains why the big magazine companies find it worth while to run several women's papers in competition

with one another. Amalgamated Press, which owns over a dozen, built up its long list of magazines under the control of Northcliffe, whose policy it was to probe everywhere to find new markets. Some of the firm's papers are almost direct competitors with each other. They have stories, short and serial; articles on fashion, beauty, the home; interviews with personages, or more probably with their wives; the inevitable piece about the royal family; and the perennial advice about how to get your man, how to keep your man, or how to get your man back.

This, indeed, is the content of more or less all the women's magazines. Broadly speaking they can be divided into three groups: the cheaply produced ones with the largest share of true love; the ones that are bright with colour gravure and ideas; and the glossy ones gleaming with photographs of fashion and furnishing. The common formula can be applied with different emphasis and at different levels, and competition is keenest between those papers that mix the ingredients in roughly the same way. *Woman* and *Woman's Own* are an obvious pair, with a wide appeal that is particularly powerful with the younger woman. *Home Chat* and *Home Notes* are homely in a simple way, while *Housewife* and *Good Housekeeping* are rather more ambitious. *Vogue* and *Harper's Bazaar* compete for the fashion-conscious, with *Vanity Fair*—started since the war—as a younger sister to *Harper's*. Yet it is not easy to classify the women's papers according to the income groups or social classes they cater for. Many of them find their way into all kinds of home. The Hulton Readership Survey showed, for instance, that *Woman's Own* and *Woman*, having in recent years altered their characters to cater for the middle classes in their appeal, are now widely read (as distinct from bought) by women of all income groups from the middle classes downwards. Even *Vogue*, which, apart from a concession to those with "more taste than money," is written as if for the fashionable world alone, seems to be read by over a million women in all. Equally, the domestic magazines are not read exclusively by housewives. *The Lady* still finds more purchasers among a species that seemed to be nearly extinct—perhaps because of its fame as a carrier of small personal advertisements; and at the other end of the scale there are papers plainly written with the factory girl in mind.

In catering for their readers' mental capacities, the editors of the women's magazines have this in common; none attempts to raise matters of politics, and they hardly touch on current affairs at all. In the more serious magazines for middle-class housewives there may be articles about education and other social questions, but these are treated only as readers' personal problems and "human stories." Even in the glossiest papers the current affairs are all in the realms of the theatre, art and literature. True, *Vogue* has a section called "People Are Talking About . . .," which will include some allusion to current politics, but this does no more than warn the reader what to expect at cocktail parties, lest a blank expression spoil the effect of the

new ensemble. As far as the feminists are concerned the women's papers are a dead loss, for they assume that a woman's interests are just *Kinder, Küche, Kleider*—and cosmetics. It might be argued that in a subtle way these papers are an asset to the Right in politics. Their emphasis on stability and security in the family, their idolisation of royalty, the snob appeal that a few of them so successfully exploit, hardly go with revolutionary fervour. But of course a girl can have dreams of Dior without a thought for Sir Winston, and politically the influence of the women's periodicals can fairly be reckoned as negligible.

Economically, on the other hand, their influence is great. Their power as an advertising medium is obvious, though the proportion of revenue derived from advertisements varies too much to make generalisation possible, and so, too, do advertisement rates. Articles and photographs sell furniture and kitchen equipment. Their importance to the textile and clothing industries in publicising each new season's mode can hardly be overestimated, for they make it plain that last year's dress, although in perfect condition, simply will not do. In addition to this indirect help to certain industries,

Joint Consultation

SIR—Some fifteen years ago I was involved in a strike of four months' duration and I suffered so much in pocket and in mind, that I directed my attention to the feelings by which the factory workers of Lancashire were actuated. The result of my study and investigation resulted in a plan which I have invariably adopted from that time to the present with perfect success. . . . Allow me to observe that I am at the head of a firm working 150,000 spindles, and that our works have not been stopped for one week for ten years. . . . In each of our works I selected two of the steadiest and most intelligent of the workmen, as a medium of communication with the hands and the firm, stating to them our willingness at all times to receive any communication from the hands through them. I stated at the same time how keenly I felt the insane proceedings of many of the workers in paying at least 5 per cent of their earnings to clubs, with a view to obtain correction of grievances and equality of wages, when, by a judicious application to their employers, all causes of complaint might be removed without the interference of strangers, who invariably become dictators, and thus instead of obtaining redress often widen the breach. . . . By having a sort of tribunal to resort to, conducted on rational principles, we have been, with only two exceptions (and those have been of a very trivial nature), free from the injurious influence of paid dictators, and our hands have had the full benefit of their own industry. Now you will see, Sir, that the above plan presents many advantages. One is, there can be no angry contentions going on without a speedy adjustment. Another is, that any person employed knows that any reasonable requirement will be laid before the employers, and receive due consideration. I am convinced that as the working classes become better informed, there will be fewer strikes; and as there are in every mill some few who read, think, and reason, the best preventive of strikes is to employ the intelligent in governing the ignorant.—Yours, most respectfully, A COTTON SPINNER.

The Economist

November 26, 1853

individual firms get free publicity. Ready-made clothes are sketched or photographed, and the reader is told where to buy them; knitting patterns must specify the kind of wool to be used; new hair styles are duly attributed to their creators. Above all, the cosmetics industry depends on the women's papers. It has developed with them in the last sixty years and grew rapidly between the wars, when so many of the existing journals were started. How else could women learn the absolute necessity of a nightly ritual of cleansing creams and nourishing creams, hormone creams and vitamin creams? (It is a solemn thought that but for the women's papers the nation would get some ten minutes' extra sleep every night).

★

From a social point of view, too, the women's papers are a power in the land. They are to a great extent doing the job of a welfare worker, with their advice on health and babies and their rough way with old wives' tales. The Mothers' Union itself could not more strongly uphold sexual morality and the sanctity of the family than they do, both in the letter columns and in the fiction. The letters are for the most part so silly that they are sometimes suspected of being concocted by some joker in the office; but they are genuine, and the editorial staffs treat them seriously in notably sensible replies. The fiction varies greatly. In *Harper's Bazaar*, for instance, it is sophisticated. In the more prosperous papers it is often contributed by best-selling novelists—writing, however, within the conventions of the medium. For the cheaper papers it can be bought by the yard from a London agency—much of it American fiction which has been, as it were, “dubbed” to change its setting to this country. All but the most sophisticated fiction conforms to certain rules. Virtue always triumphs, the bad girl is routed, the heroine (who is usually a nurse or a secretary—never, even in the cheapest publications, a factory girl) marries her boss. But she always marries for love.

The moral code evident in both fiction and advice seems to rest on the assumption that it provides the best way to get, or keep, your man. Whether this is the deliberate and sincere conviction of those who run the women's papers, or whether it expresses a belief that morality sells best is debatable. The latter conflicts with the assumption made in film posters and in cheap novels; and it would seem, from the Hulton Survey, that women have quite a taste for “cheesecake.” But they also have an ideal of romantic love and they look to their own papers to provide it. It is arguable that all this fiction fosters a false romanticism that makes marriage more difficult. But against that must be set the fact that the counsels of these periodicals are making marriage smoother, homes brighter, food better and clothes smarter. At a time when so much is heard about the wickedness of the Press, even Mr Randolph Churchill would surely agree that the women's magazines, at least, are on the side of the angels.

Notes of the Week

Revolt in the Lords

THE revolt of the Lords opposed to the Government's scheme for competitive television gathered less support, in face of the Whips, than many people had expected. The Government won easily in the division on Thursday evening. But no one will regret that the first debate on the Government's White Paper took place in the House of Lords. Men of the calibre of Lord Samuel and the Archbishop of Canterbury are clearly better placed to offer a constructive judgment now that the party lines have been all too clearly drawn in the Commons.

But the trend of the debate is at least as important as the result of the voting. The Government has to do more than merely defeat its critics in the division lobbies; it also has to win the argument on the floor of the House. Lord Salisbury, in replying to the debate, rightly said that it had failed to produce any strong body of opinion behind one clear alternative. The Government can claim this negative success but it counts for little when set against the remarkably wide range of criticism levelled against the White Paper. It is, after all, these specific proposals which are under public scrutiny and the debate in the Lords has revealed little support for them. A good many peers are backing the Government only on general principle and have substantial reservations on matters of detail. This is undoubtedly true of Government supporters in the House of Commons as well, and Ministers would do well to fulfil their promises to keep open minds and consider some fairly extensive changes.

★

None of the peers who criticised the Government managed in the compass of a single speech to set out a coherent alternative, but the Government can at least take credit for having conditioned practically all its critics to accepting the need for some alternative to the present BBC service. This was conceded even in Lord Halifax's motion and already the argument has moved to the question of how that alternative should be provided. On this there was no unanimity and the Government can hold that some of the criticism was unfairly negative. Probably the speech to command the greatest assent came from the Archbishop of Canterbury. He argued for an increase in the licence revenue, even to £5, on the welcome grounds that people ought to pay the cost of their amenities. But at the same time he felt that the dangers of advertising were overrated and he proposed that if it would improve television both the BBC and the new corporation should be allowed to earn advertising revenue, both drawing the rest of their funds from the licence pool. Lord Salisbury hinted that the Government will carefully consider the Archbishop's

speech. It should be seized on as the means of escape from what is becoming an uncomfortable position. But the Archbishop's ideas have much more than this political merit; they point the obvious way to a satisfactory solution, round which public opinion could be rallied once it is realised that the future of broadcasting is not a choice simply between monopoly on the one hand and unrestricted sponsoring on the other.

Bigger Subsidies

IT is somewhat ironical that the policy of guarantees for agriculture should run into sharp conflict with the Government's general economic policy just at the time when agricultural policy is being reshaped. It is this conflict that is expressed in the Supplementary Estimate for the Ministry of Food published on Wednesday. That some increase over the Budget estimate would be necessary has been obvious for some time. But the increase of £127 million, which more than doubles the Ministry's net expenditure, far surpasses any reasonable expectation. It is precisely the sort of additional spending that used rightly to shock the Conservatives when they were in opposition.

Of the three main items in the increased expenditure, one (£37 million) is the cost of the additional sugar imports required to increase stocks in order to make derationing possible by meeting the free consumer demand at present prices. The pros and cons of this are matter for separate argument. But the two other big items are largely the embodiment of agricultural policy. Some £57 million is needed to maintain the guaranteed prices for British cereals, and to carry bigger stocks, when world prices are falling. An extra £27 million (making a total of £49 million) is needed for meat and bacon, primarily in order to bridge the gap between what consumers are willing to pay for a lot of pork and what the farmers were promised in order to produce it.

The budgetary significance of this extra expenditure is discussed in Business Notes on page 680. Part, of course, represents an investment in increased stocks and has no immediate inflationary effect; but it is none the less a dangerous commitment, since the stocks may well have to be sold next year at lower prices than the Government has paid for them. And even the effect in the current year appreciably upsets the balance of financial policy. During the period of high world prices it was possible for politicians to shut their eyes to this aspect of the guarantees to agriculture: with falling prices, they expose the Exchequer to commitments that cannot be calculated in advance and are subject to enormous variations. This is precisely the dangerous feature of agricultural policy that the Government's new schemes do nothing whatever to correct.

Parliamentary Troubles

ANY tendency for Ministers to become complacent, and there seems to have been a little, should have been checked by one or two recent events. First, some Labour backbenchers organised a midnight defeat of the Government on a Prayer; then the by-election in Holborn and St Pancras South unmistakably ended in Labour's favour; a Labour backbencher was allowed to delay Government business by an old-fashioned filibuster; and on Tuesday Conservative backbenchers mutinied against Sir Winston Churchill's refusal to increase the pensions of a few elderly officers. None of these events is important in itself, but they all come as a timely reminder to a government that has perhaps been taking its parliamentary position too much for granted. The cascade of Bills and White Papers with which the session opened was impressive, but it scarcely justified the welter of mutual admiration that followed. Ministers seem to have been somewhat blind not only to the movements of their opponents but to the feelings of their own supporters. Only this can explain why, on top of known backbench doubts about the negotiations with Egypt and about television, Ministers aroused fresh hostility over a minor pensions issue on which their supporters had for months shown strong feeling.

Holborn and St Pancras South is a peculiar constituency, with a large floating population, but both sides chose to treat the by-election as of major importance and Labour is entitled to satisfaction for having increased its majority despite a substantial drop in the total poll. Labour's share of the poll was nearly two per cent higher than at the general election; and if most of this could be balanced against the decline in the Liberal vote, the fact remains that the Conservatives suffered from a little more than apathy. Nothing can be gathered from the other two recent by-elections, in safe Conservative seats—in one Labour's share of the poll rose by 2 per cent, in the other it fell by 1½ per cent; the next piece of evidence on the state of public opinion will be provided by the by-election in

Paddington North. But Labour feels that it is leading in this autumnal "little election" and its front bench may be encouraged to new militancy.

The Government's two parliamentary rebuffs, however, were both administered from the Labour back benches. Mr Harold Lever's 2½-hour filibuster was a considerable personal achievement in an assembly which does not allow "tedious repetition," and the backbench trap which drew the Government to defeat on a Prayer was laid with forethought. But a Government Whips office with such a wealth of military experience should surely have been capable of mustering the 100 members needed to stop Mr Lever and should have detected the nocturnal manœuvres on the Prayer.

France Stands Divided

THE dramatic foreign affairs debate in the National Assembly has dispelled illusions that it will be an easy task to muster in France a coherent majority to support ratification of the EDC treaty and agree simultaneously on social policy at home. With its sudden twists and turns, with suspense maintained to the very last moment, the debate had all the ingredients of a thriller. Last week the opponents of the defence community started the parliamentary attack. The defenders rallied to their positions only to see M. Bidault's speech interrupted by his sudden collapse. The few days' break that followed provided little help towards finding a solution. When the debate was resumed the Prime Minister, M. Laniel, made a major declaration of policy, in which he repeated the government's pledge to support the defence community, provided certain conditions were fulfilled. But the main obstacle still remained: to agree on a motion for the vote. The Socialists and the Gaullists have stuck to their guns and, at the moment of writing, the prospects look dim. M. Laniel has threatened to resign if defeated and once again there is a risk of a French crisis wrecking a Bermuda conference. This very risk, however, may tilt the balance in favour of a compromise.

Yet even if MM. Laniel and Bidault carry their motion and get their diplomatic passports for Bermuda, this dress rehearsal has shown that the real battle for ratification next year will be furious. Many deputies expressed their misgivings about the projected status of the French Union in the Community. Many share M. Mendès-France's view—though not all would vote for him—that France cannot enter it in its present state and with the burden of Indo-China. Above all, the government's own acceptance of EDC is not unqualified. It attaches three pre-conditions to French ratification: the signing of additional protocols, an acceptable settlement of the Saar question with Germany and the conclusion of agreements with Great Britain. The prospects for an agreement over the Saar are infinitesimal if France maintains its present terms. On the other hand the debate has shown how many French deputies look to Britain to keep the balance of the new Europe. Without his revelations on contemplated closer links with Britain, M. Laniel's task would have been still more formidable. The fate of EDC in France still depends in a large measure not only on British policy but on the manner in which it is presented.

A Snook from the Ruhr

IN Western Germany decartelisation is a thing of the past; recartelisation is now the order of the day. A bombshell has been thrown by the German steelowners among the three Occupation Powers—if one can still call them that. The first challenge came from Professor Schenck, a steel expert, who told a recent meeting of the steel technicians' association that the trusts must be recreated. The Ruhr, he said, had been penalised by the way in which rationally grouped concerns had been split by the Allied Law 27.

It seems that the Ruhr steel companies intend to reconstitute the trusts to a limited extent, both vertically and horizontally. They demand that German steel companies shall again own all the coking coal they require, as well as subsidiary manufacturing plants. They also insist that works producing the same kind of product, whether crude steel or rolled products, must be amalgamated. It is not proposed to reconstitute the whole of the giant *Vereinigte Stahlwerke*, which owned 50 per cent of the Ruhr steel and 25 per cent of its coal, since that conglomeration was seen to be inefficient. But concentration on a smaller scale is demanded on the grounds that it will facilitate modernisation and thus lower production costs.

Meanwhile a counter-shock has been administered to the steel owners. They have been reminded by Dr. Etzel, chief German representative on the High Authority of the coal-steel community, of an awkward fact that they had so far ignored: that the High Authority's charter gives it the legal right to say Yes or No to such amalgamations. Indeed, some provisions of the coal-steel Treaty were designed expressly to ensure that the spirit of Law 27 would be carried out when the occupation authorities had withdrawn. Had this very issue not been clarified during negotiations, the French would never have signed the Treaty. They insisted that the German steel industry should not be allowed to recover its stranglehold over coal supplies and prices, and that economic power should never again be so heavily concentrated in hands that had so misused it in the past. Only under persistent American pressure did Dr. Adenauer agree to the present phrasing of the Treaty.

Under the Treaty, would-be associations of firms will be permitted only where it can be proved that they will lead to an increase in output and will not create a concentration of power sufficient to determine prices and shelter the parties concerned from competition in the single market. The High Authority's handling of this German challenge will be a major test of the principles underlying Europe's experiments with communities.

End of a Cartel?

AFTER some delay the High Authority of the coal-steel community has ordered the dissolution of the export cartel formed last spring by its steel producers. At the

time it held its hand, partly because it was heavily engaged with the first moves in setting up the common market, and partly because the export prices fixed by the cartel were almost identical with those prevailing in the common market. A mixture of reasons has led to this recent action. On public relations grounds alone the High Authority could not afford to appear associated with an institution smacking so strongly of the bad old days of restrictive monopolies. The general disapproval, moreover, was underlined by specific protests against the cartel from the American Government, which doubtless objected to it on ideological grounds. Finally, recent decisions by the cartel have brought its export prices slightly below those charged within the community, and accusations of dumping were sooner or later inevitable.

The powers of the Authority to intervene lie in a clause in the original Treaty, accepted by all signatories, which said that it could fix minimum or maximum export prices

if such action can be effectively supervised and appears necessary, either because of dangers to the enterprises on account of the situation of the market or to . . . further the development of international trade and see that equitable limits are observed in prices charged on external markets.

In short, if there is a need to fix export prices the High Authority will do the fixing, although in consultation with the industries concerned. The crucial question is whether,

The Economist Diary

A reference book for the desk

For the man who seems to have everything he could want, *The Economist Diary* is the ideal present. The appointments and memoranda section is designed to meet the needs of the busy man and in addition there are 72 pages of facts and figures, which together form a complete reference book.

The reference material covers a wide range of subjects, including elections, national income, banking, taxation, crime, manpower, commodities, and a special section giving the basic facts on 47 principal countries in the world.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 41/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of *The Economist Diary* are given in an illustrated pamphlet available from:

Diary Department, *The Economist*,
22 Ryder Street, St. James's, London, S.W.1

indeed, such action "can be effectively supervised." Buyers outside the community who benefit from evasions are unlikely to provide the Authority with information; and there is no certainty that either heavy fines or the odium of being arraigned before the Court of the community will effectively prevent such practices.

The Lagos Affair

LAST week, there arrived in London two angry Nigerian ministers belonging to Mr Awolowo's Action Group. Their visit should shake any complacency about the chances of agreement being reached on Nigeria's new constitution. Thanks largely to the efforts of the Secretary of State and the Colonial Office, a surprising amount of unanimity was achieved at the conference held in London in August. But it was clear when the delegates went home that Lagos would be a stumbling block to a final acceptance of the new proposals.

The status of Lagos—the capital of the federation—was the one major point on which the conference failed to agree. Mr Lyttelton, as chairman, was therefore asked to arbitrate, and the delegates undertook to accept his decision whatever it might be. He decided to separate the town from the Western Region in which it stands and give it an autonomous status with direct representation in the central House of Representatives. There were many reasons for this decision—among them the fact that Lagos is Nigeria's commercial capital as well as the political capital and also the port that handles most of the Northern Region's trade. The northerners had already made considerable concessions at the conference and it was hoped that the Action Group, which represents the Yorubas of the Western Region, would abide by its undertaking to accept the award. But over the last three months opposition to the award has grown in the Western Region and the Action Group has threatened that the region will secede rather than give up the capital, of which 70 per cent of the population are Yorubas.

So far as Mr Lyttelton is concerned, Mr Awolowo has been told, in far too hectoring terms, that the issue is now closed unless the Nigerian parties themselves agree to a compromise. This is unlikely; the northerners in particular are tied to the award, both because they distrust the West and because they have a sense of loyalty to British rule. Moreover, with the dispute with the Northern Rhodesian settlers on his hands, Mr Lyttelton may well consider it would be a dangerous precedent to give way to whatever pressure group shouts loudest and fiercest.

On the other hand, Nigeria's constitution cannot be expected to work if the whole of one region is seething with discontent and threats. The constitutional conference will be meeting again in January to consider the financial side of federation; and the distribution of the revenues from Lagos is bound to provoke a storm. Unless another attempt is made either then or earlier to get a compromise over the town's political status, an agreed constitution is unlikely to see the light of day.

Competition in Livestock

THE National Farmers' Union means to establish as quickly as possible a producers' board for the marketing of fatstock. Under the Government scheme, this board will have no compulsory powers. It will have to compete with the livestock auctions that will be reopened next year. The union hopes that its board will demonstrate the superiority of marketing on a dead weight and grade basis, so that eventually it will be given monopoly powers. Initially, the board will be restricted by the shortage of large slaughterhouses with adequate cooling capacity; but the union clearly intends to devote its energies and funds to a rapid expansion of the board's activities. It does not mean to be beaten in the critical test of its claims to marketing by producers.

The public has everything to gain from this competition between the auction system and the producers' board, so long as no special favours are shown to either party. The NFU, however, is demanding that all pigs and not just, as at present planned, all bacon pigs, should come under the sole jurisdiction of the board. This would be an unwarranted extension of a producers' monopoly that ought not to be established at all. The Government's scheme for pigs is admittedly unsatisfactory; but its danger is much more that it will stop consumers from getting enough Danish bacon than that it will impoverish home producers.

Now that the farmers have, somewhat ungraciously, agreed to give the Government scheme for livestock a try, the main concern is how much this scheme is going to cost the taxpayer. The Chancellor's recent remarks suggest that it may be more than the existing large meat subsidies. Yet the world supply of beef, in particular, seems likely to remain inadequate indefinitely, and home demand should be buoyant when rationing ends. If in these circumstances British farmers cannot produce beef without so large a subsidy, it is a black outlook for the efficiency of British agriculture.

The Flat Shibboleth

AT last week's conference of the Town and Country Planning Association another assault was made on the common belief that near the middles of cities it is more economic to build flats than houses, because of the high cost of the land. If 40 flats instead of 20 houses

are put on an acre of land costing £10,000, there is a saving of £250 per dwelling in site costs; but this saving is far outweighed by the fact that a four-roomed flat costs up to £1,000 more to build than a house of equivalent size. Even on very expensive sites the building of flats by local authorities is thus highly uneconomic; it is made possible only by a public subsidy which is two and a half to three times as large as the standard subsidy for a house.

Mr F. J. Osborn contended that these subsidy scales are so arranged

that they give most encouragement to just the sort of dwellings people want least, and just the sort that cost most, in just the places that are naturally most disadvantageous.

This statement seems to overlook the fact that a high density of housing is at present unavoidable in central areas; and it really has to be paid for by an extra subsidy. Mr Osborn is right to urge that the flat subsidy ought not to be so large as actually to encourage local authorities to build upwards rather than outwards. A public subsidy equal to £2 a week for a London flat is altogether excessive. It is three times the whole rent of the average worker's dwelling. On this basis the LCC finds it more "profitable" to build flats than houses; and these high subsidies very likely inflate the cost of site acquisition as well.

The subsidy structure should certainly be overhauled; but in London at any rate expensive flats will continue to be built. This adds force to Mr Osborn's point that every local authority dwelling built in a new or expanded town instead of in central London saves over £1,000 of public money. Savings of this sort are only one of many considerations relevant to the policy of dispersing population from London; but they do strengthen the case for dispersal and they do underline the economic frivolity of some of the objections to it. Farmers near Swindon have recently opposed that town's plan to accommodate surplus population from London; yet one farm of 250 acres can provide homes for 1,000 London families and save £1 million in housing subsidies. Is any farm that valuable?

Soviet Import Policy

RECENT reports from the Soviet Union have indicated a new interest in western consumer goods; but British businessmen as yet have not felt any change in its import policy. Indeed, it might be argued on the basis of Moscow's official data that, as only one per cent of Soviet consumption is to be met by imports from outside the Soviet bloc, the effect would be only marginal. However, a shift to new lines of imports would be an important development not only in commerce but also in politics. It may eventually be possible to persuade the Russian consumer (and the Soviet government) of the intrinsic quality of some of Britain's specialised exports.

It is now fairly certain that the new regime, under the influence of Mikoyan, the Trade Minister, has accommodated its policy to the need for western consumer goods, at least during the interim period while the necessary switching from heavy to light industry is made. This might last until 1956. It is also known that the long-suffering Russian consumer is showing through the Press increased irritability about the quality of clothing and

durable consumer goods. Household gadgets, too, are much in demand. This type of demand has not appeared in Soviet imports from the West; and it may well be that the Kremlin is still unwilling to permit its public the luxury of comparing the quality of home-produced with that of imported goods. So far the only noticeable change in Soviet imports from the West has been the purchase of such "consumption goods" as butter, salted herrings, and meat. And this development might be explained by purely transient needs, such as the need to make life pleasanter in Eastern Germany. It so happens that the new import policy coincides with a phase when, for a number of reasons, Soviet export earnings are low. This, no doubt, is one reason for the recent sales of Soviet gold on the free markets, and the disposal of a quantity of silver in London.

It is still too early to get excited about the prospects of Soviet purchases of consumer goods. What the new policy means is still largely a matter of conjecture and, as recent events have shown, sudden and unexpected shifts of power in the Kremlin can cause radical alterations of the plan. The UN Economic Commission for Europe (ECE) has, however, made up its mind that the apparent changes in the policy of the Soviet Union and of other countries within its orbit are to be taken at their face value. In its latest quarterly report it is stated optimistically that "the changes in domestic policies in eastern Europe . . . may eventually lead to some recovery" of East-West trade.

Tito's Democracy

IN the campaign that preceded the elections in Yugoslavia this week Marshal Tito and his associates have shown themselves not insensitive to western criticism that a one-party democracy, which allows no proper opposition, is not a democracy at all. In stoutly rebutting this criticism they have sometimes betrayed some rather confused thinking—*qui s'excuse s'accuse*. This is not surprising since they are simultaneously pursuing two contradictory purposes. On the one hand, they would like to demonstrate that their rule really rests on a broad basis of public support; on the other hand they are determined not to weaken their own position by giving scope to their opponents and critics.

650

Thus the Yugoslav leaders could argue that their form of democracy is more truly democratic than that practised in the West because in the "vital stage of pre-election activity" the elector really has some say in the choice of the man who is to represent him; he does not have to choose, as in the western democracies, between several candidates all probably equally unknown to him and equally uncongenial. But at the same time the Yugoslav Communists could also impress on electors that they should name as candidates only those who are "boundlessly devoted to the cause of socialism"; in other words, they could choose whom they liked provided he had the right ideas. But although the procedure governing the choice of candidates was strongly weighted in favour of the government bloc, the Socialist Alliance, the elections compared very favourably with those carried out today in eastern Europe and in Yugoslavia itself in 1945 and 1950. According to the reports of western correspondents, the voter was not dragooned into going to the polls; when there he was genuinely free to make up his own mind; a real attempt was made—not always successfully—to preserve the secrecy of the ballot; and in a few isolated cases independent candidates have in fact been elected.

Marshal Tito, has said that western parliamentary democracy does not suit Yugoslavia in its present stage of development; that it would be like making new cars and then putting oxen in front to pull them. This happens to be a convenient doctrine from his point of view though unflattering to the voters. If one could be sure that Titovian democracy was really only a stage in progress towards something better, and that it did not involve the oppression of individuals, there would certainly be much to be said for it.

A Committee for the Best Club

THE British MP, who must spend so much time on the job, has to work in conditions that are probably more cramped than those of any other legislator. Last summer a Select Committee was set up under the bustling Mr Stokes to review the whole question of accommodation and amenities in the House of Commons. A first interim report, dealing solely with accommodation, has now been published; it contains some practical proposals for giving MPs more space, either for work or for refreshment. A desk for every member remains a somewhat distant goal, but some of the more obvious anachronisms should be rectified. The Select Committee will now turn its attention to amenities and to the methods of appointing the staff of the House of Commons. The fourth item in its original terms of reference—to consider the desirability of appointing a sessional committee—has been overtaken by a proposal in this first report to set up a permanent "House" Committee.

On the long view this is by far the most important of the committee's recommendations, since it involves the whole question of who shall control the legislative building. The House of Commons is part of the Palace of Westminster, a royal palace of which the chief functionary is the Lord Great Chamberlain, a hereditary office. The present incumbent's view of his priorities was explained to the

committee with disarming frankness: "My first duty is to the Sovereign, who appoints me. My next duty is to look after the Palace of Westminster. After that, I consider it my duty to do all I can for the members of both Houses of Parliament." The Lord Great Chamberlain is not the sole authority—for money he must look to the Ministry of Works—but it seems that MPs, and peers too for that matter, are no more than sub-tenants in their own legislature. In his evidence to the committee the Lord Great Chamberlain archly foreshadowed "a few little surprises at your end." Welcome though these may prove to be, it would surely be more appropriate for MPs to arrange their own accommodation rather than to be the recipients of avuncular "surprises."

The select committee proposes that the new "House" Committee should not confine its attentions to accommodation but should "exercise wider functions." That there would be "constitutional and other difficulties" is recognised, and this is perhaps a fair hint, pending the committee's later reports, that it envisages some change in the Lord Great Chamberlain's powers. By the time it has finished its work this select committee, together with the similar body now investigating MPs' pay and allowances, should go some way towards giving the British legislator conditions of work nearer to those in less busy legislatures elsewhere.

Industry's Disabled

MONDAY'S debate on the Industrial Diseases Bill was an occasion for back-slapping on both sides of the House, with each party trying to claim the credit for the measure. Like all extensions of the social insurance scheme, it was virtually non-controversial among politicians, and the only criticism was that it was not generous enough.

In 1951 the Labour Government introduced, and the Conservative Government carried through, the Pneumoconiosis and Byssinosis Benefit Bill. This measure enables compensation to be paid in certain cases to people totally incapacitated by these two diseases or, if they have died, to their dependants. Workers acquiring the diseases since 1948 are covered by the industrial injuries scheme, and many of those who became disabled before that year obtained workmen's compensation. But there remained some—no one knew how many—who contracted pneumoconiosis before it became a prescribed disease under the Workmen's Compensation Acts or failed to satisfy all the conditions—in particular, because the time limit laid down by the Acts had expired before the disease became manifest. The 1951 Act removed many cases of hardship, but it was still deficient in two respects: it did not provide any compensation for those partially disabled by the two diseases named in it; nor did it cover other cases of prescribed diseases, such as mule spinners' cancer, which may also be slow to develop.

The new Bill fills both these gaps. Benefit will be payable at the rate of £1 a week to the partially disabled, with unemployability supplement and dependants' allowances where appropriate; and the Minister of National Insurance is taking power to apply the provisions of the new measure and the 1951 Act to some other workmen's

Getting down to the facts of

In which countries do the LIFE INTERNATIONAL EDITIONS circulate? Who reads them, who advertises in them?

What could you expect your own advertisements in LIFE INTERNATIONAL to achieve? What are the other advantages of an advertising campaign in LIFE INTERNATIONAL over and above the coverage of the world's most important markets outside North America?

Answers to these and many other questions are contained in an interesting booklet for internationally-minded advertisers called 'The Facts of LIFE INTERNATIONAL'. The Advertisement Director will be pleased to send you a copy.

International Editions

LIFE IN ENGLISH — average net paid circulation 250,000 — 300,000 copies in English, circulating in 120 countries outside North America.

LIFE EN ESPAÑOL — average net paid circulation 200,000 — 250,000 copies in Spanish, circulating in Central and South America.

These are the INTERNATIONAL EDITIONS of LIFE MAGAZINE, with a combined circulation of over 500,000 copies every fortnight.

TIME & LIFE BUILDING, NEW BOND STREET, LONDON, W1

Striking success of new plastic!

Of interest to the electrical and light engineering industries is a new plastic to provide that extra impact strength for special jobs. LUSTREX 'M.I.' is the latest form of Monsanto's versatile polystyrene LUSTREX*. Its chemical properties are substantially the same as for general purpose Lustrex, but the stretch, deflection at break and the impact strength are 2 to 3 times greater! LUSTREX is one of the most economical of plastics. It is light yet strong and its strength actually increases as temperatures drop — one reason why you find it used in the fittings and components of so many refrigerators! But that's not all. Lustrex has excellent insulating characteristics... is resistant to acids and alkalis... does not shrink or become brittle... is specially manufactured for injection moulding. Lustrex is supplied in a wide range of standard colours and, in addition, can easily be produced in any shade you wish.

Lustrex is one of Monsanto's wide range of chemicals and plastics for industry. If you have an industrial problem which chemicals might help you solve — get in touch with Monsanto today!

(*Registered Trade Mark)

These are only a few of the reasons why Lustrex has proved such a success in the electrical and engineering industries!

If there is scope for plastics in *your* industry, write now for full information on Lustrex.

MONSANTO CHEMICALS FOR EVERY INDUSTRY

compensation diseases. Many of the partially disabled who will be entitled to benefit will presumably be found among the coalminers of South Wales, who, until this July, were drawing extended unemployment benefit. The cost of providing for these men will thus be transferred from general taxation to the industrial injuries fund. This is of little significance in itself, but Mr Enoch Powell was right to remind the House that since 1948 there have been five measures which have placed additional charges on a fund whose eventual liabilities are still completely unknown.

Far Eastern Triangle

THE North Korean premier, Kim Il-sung, signed this week in Peking an agreement for economic and cultural co-operation between the two countries. China has agreed to cancel all the debts incurred by North Korea during hostilities. Other details are to be worked out by experts, but—according to Hongkong reports—China has already agreed to offer the Koreans as a free gift the equivalent of £114 million, which is to be used over the next three years for the rehabilitation of the country. This is the second important promise of aid that North Korea has received since the cease-fire. In August Malenkov pledged Soviet help to the tune of 1,000 million roubles, i.e. nearly £90 million at the official rate of exchange. Kim Il-sung then travelled to Moscow on a thanksgiving mission.

His visit, coming as it did at the time of the North Korean purges of unreliable Communists, was interpreted then as a Soviet attempt to buy supremacy in a war-ravaged country. It should not be concluded, however, that Mao Tse-tung is now trying to outbid Malenkov. The nominal amount offered, at the official rate of exchange, has little meaning, for what will matter is the actual flow of goods. More important, also, is the fact that China itself is receiving Soviet aid. It was disclosed not long ago that the Russians had finally agreed to increase their assistance and take charge of 141 "great projects" of

Chinese industrialisation. Mao can hardly be expected to afford bidding tricks with borrowed roubles.

Indeed, Soviet economic aid is now probably the key to relations with China in this triangle as elsewhere. After the victory of the Chinese revolution, the Kremlin found itself in the unaccustomed position of having to bargain with a partner. True, this partner is dependent on Soviet support, yet it is too powerful to be bullied into acquiescence. Common interests probably vied from the first with mutual suspicions. The Korean war undoubtedly helped to cement the interests, but the end of shooting may have revived the suspicions. Since Stalin's death Mao's hand has clearly been strengthened. Previously the Russians were most reluctant to send investment goods to China, but now they are apparently willing to contribute a greater share to its Five Year Plan. Mao's future policy must largely depend on his satisfaction with the size and terms of Soviet aid. Kim Il-sung's trip to Peking therefore should be seen as completing the Communist triangle rather than revealing breaches in the Soviet Far Eastern system.

Ceylon Looks for Loans

THE recent visit to London of Ceylon's Finance Minister, Sir Oliver Goontellike, appears to have yielded only meagre results. It seems that he has received no more than an assurance of cooperation from the British authorities in a forthcoming sterling loan operation in the London market, which it is estimated will total £24.4 million. The recent government to government loan of £10 million to Pakistan might have encouraged Ceylon to expect similar treatment. It must have been an additional disappointment to find that the British authorities would not even guarantee the proposed loan.

The Ceylonese should ask themselves whether their economic policies merit any special favours from the British. During 1952 and the first half of the current year the state of the balance of payments was allowed to get out of hand, and as a result external assets were nearly halved. While the Ceylon Government can plead that it was at the mercy of the terms of trade once world commodity prices broke, it did not, until the last budget in July, take any positive steps to put its house in order. But despite the welcome show of firmness in the budget some anomalies remain. For instance, though some cabinet ministers have spoken of the desirability of having foreign investment, all manner of hindrances still exist. Of these the policy of Ceylonisation of trade, though now accepted in principle by foreign firms, causes resentment when over-zealously applied. Again, the reserving to Ceylonese firms of foreign trade with Japan, China, Yugoslavia and Germany creates a bad impression. Furthermore, non-resident companies are taxed at a rate of six per cent more than local firms, and this, though it is a law of longstanding, remains a deterrent to the foreign investor. As a result of all these difficulties foreign capital has tended to move out of Ceylon in recent years. Some positive incentive is needed if it is to be attracted back.

Ceylon's problem of raising finance to pay for its development programme is not made any easier by its disinclination to take American aid; and at the present moment the

International Bank is still considering an application for a loan. It is only natural, therefore, that an approach to the London market should be made up. Although it is fourteen years since the Ceylon Government last borrowed here, its reputation as a borrower is still good. By comparison with the other potential borrowers from the same geographical area it has an enviable record of peace and stable government. But would-be borrowers ought to realise that their economic policies at home must affect their credit-rating abroad.

Moving Pictures

THE Lords had one of their most decorous debates on Tuesday, when the National Art Collections Bill passed its second reading. The Bill has two main purposes: to make the Tate Gallery independent of the National Gallery and to make possible a wider distribution of paintings on loan. The Tate Gallery has no separate statutory existence; all its works of art belong in law to the National Gallery. The present Bill gives it full autonomy and some attempt has been made to define the spheres of the two galleries. The National Gallery should house paintings of established merit of all periods, and the Tate British paintings and modern pictures generally (in fact it also contains modern sculpture). Provision is made for the transfer, by agreement between the two boards of trustees, of paintings from one gallery to the other. If there is no agreement, however, the question will be settled by an arbitration committee under an independent chairman appointed by the Treasury. The Tate Gallery is often caught in controversy—over its attempts to remove the credited masterpieces of the Chantry bequest and even, recently, over its buying policy; so there may well be a need for arbitration. The wording of the Bill would suggest that if a painting is of established merit or by a significant artist, it should be transferred to the National Gallery. On this theory the Tate Gallery's collection of French impressionists would seem ripe for transfer, but there are likely to be objections to that.

UK WAGES AND PRICES
INDEX NUMBERS JUNE 1947=100

The Bill would also enable the two galleries to lend paintings from their collections to galleries at home and abroad, to British embassies and to Government Houses in the colonies. A Bill to make this possible was defeated by the Lords in 1930, but in 1935 they compromised on British pictures only. One or two speakers in Tuesday's debate remained unhappy about the new concession. They feared damage to the pictures; it had been so convenient to refuse the requests of foreign galleries for, say, Italian masterpieces on the ground that there was no power to make loans. The hard fact has to be faced, however, that foreigners are getting restive about lending their paintings to Britain and having their own requests refused. And perhaps the power to lend, and the power—with Treasury permission—to sell, may somewhat clear the stack of pictures that have been demoted to the cellars of both National and Tate Galleries.

The Aping Hoax

THE man in the street would be more than human if he did not greet with a certain unholy and derisive joy the news that the Piltdown skull—or, more exactly, that fragment which gave the Piltdown skull its special claim to scientific importance—has turned out to be an ingenious fake. The cocksureness of experts (and especially the cocksureness of those who popularise their often tentative findings) rouses the worst instincts of the Philistine, who is accordingly overjoyed when someone successfully pulls the expert's leg. Where the origins of the human race are concerned, moreover, this instinctive delight in saying "Yah!" is, in some quarters at least, reinforced by a wistful fundamentalism. How wonderful it would be if all that evidence, "from scarped cliff and quarried stone," which makes it so awkward to maintain a position on the side of the angels, could be similarly discredited; how edifying to find that an accepted datum, as it were a revered relic of the distasteful evolutionary creed, is in fact a practical joke.

One does not, of course, disprove the existence of Vermeer by pointing to the works of Van Meegeren—a consideration which has brought solace, before now, to other custodians of imperfectly authentic relics. But the real significance of the *Eoanthropos Dawsoni* affair is other than this; for it exemplifies yet once again the genuine morality of science. However awkward a discovery may be, whatever painful recasting of familiar and useful hypotheses it may demand, however many faces it may cause to redden, however much of a handle it may give to irrationalists, the facts that it reveals are sacred and not to be suppressed. If new means of investigation—such as the fluoroscope which was not available to the original investigators of the Piltdown skull—throw a new and destructive light on the evidence, their results are to be publicly and promptly acknowledged; and as each new means of investigation is, in fact, developed, all evidence is properly to be scrutinised afresh. The Piltdown hoax is, indeed, a warning to all who are inclined to forget that science is a matter of suspended judgment and working hypothesis, not of dogma. But its exposure is, more positively, a resounding testimonial to the effectiveness of scientific method and the honesty of the scientific mind.

Letters to the Editor

A Mission to Moscow

SIR—In the passage in your issue of November 21st under the above title: (1) you say that the British Council for the Promotion of International Trade "has associations with the Communist party and its discredited offshoot, the World Peace Movement." Such vague insinuations, which I know personally to be entirely without substance, do not seem worthy of you. (2) The propaganda you refer to is presumably a sheet composed of excerpts from such papers as the *Manchester Guardian*, the *Financial Times*, the *New York Times*, *Le Monde*, etc., selected with a view to showing the advantages of an expansion of East-West trade. These you describe as "spiteful." (3) The British group that attended the Moscow Conference in April, 1952, was not "hand-picked." Invitations were very widespread and the selection of the group depended simply on who did or did not accept. For instance several members of the staff of *The Economist* were invited. (4) You refer to "the official trade agreement." In fact there is at present no trade agreement between the United Kingdom and the Soviet Union. (5) A visit of British business men to Moscow has been proposed because both the business men concerned and the trade organisations of the Soviet Union consider that such a visit at the present time would be helpful in promoting trade. The organisation of business between a private enterprise and a planned economy presents certain technical problems which the method of group visits seems to be a useful contribution to solving, as indeed, you appear to agree, was shown by the recent group visit to Peking.—Yours faithfully, JOAN ROBINSON

[(1) After carefully checking the facts, we have no doubt whatever that the B.C.P.I.T. has associations with the Communist Party. (2) We do not think that any impartial person who reads the propaganda put out by the Council, with its careful dredging up of every scrap of anti-American dirt that can be found, would question our use of the word "spiteful." (3) The British group that attended the 1952 conference was hand-picked in the sense that conditions were laid down for the conduct of the conference which many of the invited were unable to accept. (4) The long-term trade agreement between the United Kingdom and the Soviet Union, which was signed in Moscow in December, 1947 (TS 34-1948) is still in force. Furthermore, a number of commodity agreements have been signed from time to time in recent years. (5) is a matter of opinion; we see no reason to change our view that a private visit to Moscow will serve no useful purpose.—EDITOR.]

Jute: A Test Case

SIR—Two points in the article published in your issue of November 21st call for comment. In so far as the present method of protecting Dundee jute manufactures raises the packaging costs of British exports it is bad in itself, and particularly bad at the present moment when those exports are facing fierce price competition. But in any examination of the cost of exports there are many items that require to be looked into before we come to packaging. Secondly, it is difficult to follow why there should be "desperate and localised unemployment in Dundee" if the present dubious method of protection were withdrawn. The Dundee industry's problem is shortage of labour. Two days before your article appeared it was announced that in order to attract women to work as spinners and weavers a Dundee jute firm had decided to ask mothers to bring young school children with them to work. The firm promised to "give the children breakfast, see them delivered to school, collect them, give them tea and have them ready for taking home by their mothers at 5.30 p.m." And so to bed.

The long-term task for the industry in Dundee—as it is for the industry in India and its young competitor in Pakistan—is to make jute goods cheap enough to withstand the competition of the numerous small local manufacturing units which have grown up in Europe, Asia and Africa since the war and to meet the challenge of substitutes, particularly paper. This will not be achieved by creating artificially sheltered conditions, either in Dundee or in Calcutta.—Yours faithfully, GEOFFREY TYSON

Post-Emergency Regulations

SIR—The Note in your issue of November 14th errs in more than one respect.

It speaks of 97 Regulations surviving under the Supplies and Services Act and another 22 under the Emergency Laws Act; whereas there will be only 97 surviving under both together.

It quotes the White Paper's admission that "much remains to be done," but suppresses the information in the next sentence but one that, "The current session's programme includes several Bills designed to replace emergency powers." Might it not have been helpful to note that the Food and Drugs Amendment Bill alone revokes (except so far as they extend to Northern Ireland) the whole of the Defence (Sale

of Food) Regulations, 1943—a code containing as many as nine of the surviving 97 Regulations. In this connection, you might have a careful look at some of the repeals provided for under other new Bills already published, e.g., the Housing Repairs and Rents Bill, the Currency and Bank Notes Bill, the Inventions and Designs (Crown Use) Bill and the Licensing (Seamen's Canteens) Bill. You might be pleasantly surprised.—Yours faithfully, P. GOLDMAN

London, N.W.11

The Worth of a Judge

SIR—A Note in your issue of November 14th develops the theme that "the Government is not playing fair with the judges." If the Government were not prepared to give the judges an increase in taxable emoluments producing, after tax, roughly the same amount of additional spending power as would have accrued from the original proposal to increase salaries by £1,000 a year tax-free, then it would have been possible and just to give some compensation for the reduction by way of an increase in the rates of pension, which are left unaltered. They provide for Judges of the Court of Appeal and the High Court pensions of £3,500 a year.

A pensionary increase of the order of £500 to £1,000 a year would seem reasonable in the light of the high rate of income tax and sur-tax that it would attract and of the fall in the purchasing power of money since the pensions were fixed at the present rates. Moreover, an increase might act as an inducement to retire when with advancing years the strain of service on the Bench may become excessive.—Yours faithfully, PUBLICUS

Banking in Latin America

SIR—There would seem to be an error in your correspondent's description of banking arrangements in Argentina published in your recent International Banking Survey on November 14th. As you mention, the relevant legislation "nationalised" deposits, which henceforth were to be received by the commercial banks merely as agents of the central bank and it was thereby made impossible to augment loanable resources as a result of an increase in bank deposits. But it has not been true that "they could make loans to their private customers only from their own funds (that is, their own capital and reserves)," since they were at the same time granted rediscounting facilities at the central bank and could thus "monetise" their holdings of securities acquired against their own loans and employ these funds for further and proportionately increased lending. There was, however, no necessary relationship between the re-discount facilities afforded to a particular bank and any increase in deposits received by that bank as agent of the central bank.—Yours faithfully, J. S. G. WILSON

Getting Things Done

POWER AND INFLUENCE

By Lord Beveridge.

Hodder and Stoughton. 448 pages. 30s.

THIS is a most important historical document. It is the story of a crusade, conducted by the procedures of minute and memorandum, committee and commission, and through administrative and academic hierarchies. As such, it is an illuminating study of the physiology of Government; of the way things get done; of what works and what does not work; of the relation between Power and Influence, between the ability to give to other men orders enforced by sanctions (legal or economic) and the ability to change their actions by persuasion.

It is also, of course, a straight historical narrative, a mine of fresh information on the genesis of social security and innumerable other events of the last half-century. Only in a very limited sense is it an autobiography. It begins with the young William Beveridge leaving Oxford and making a false start in the law; settles down to its main theme as, in 1903, he joins the staff of Toynbee Hall and finds his vocation; and virtually ends in 1945, when the author of the Beveridge Report found himself unprecedentedly cut off from the seats of power and the reality of influence. There is no prologue and only the briefest of epilogues; there is never—unless between the lines—a recognisable self-portrait. Lady Beveridge has in course of preparation a book entitled "Beveridge and His Plan" to which readers of the present volume are, from time to time, referred. Such a biographical division of labour may have its advantages, but "Power and Influence" is, in the meantime, the loser. For personality is supremely relevant to Lord Beveridge's theme. One may win power by accident and wield it by brute force; influence can only be won, and must continuously be wielded, by personal impact.

Some of the abilities and character traits which gave Lord Beveridge influence stand out clearly enough. Integrity is there: the intellectual integrity which would never fudge an answer; the personal integrity which would never seek a personal gain. These things inspire the trust which influence requires. Sheer brainpower is there: the intellectual ability to grasp and order masses of factual evidence; the practical ability to frame the articulations of a working administrative machine; the gift of clear statement. So is the devoted and indefatigable capacity for hard

work. There is, also, the knack of knowing which, among a tangle of wires, it will pay to pull, and just when to pull them. But the process by which these gifts were developed or acquired is never discussed; nor does Lord Beveridge ask himself why they occasionally, and at last decisively, let him down. A brief and bitter quotation from Tacitus rounds off the story of the Beveridge Report. The bitterness is understandable, but does an imputation of "envy or fear" credibly fit the human personality of Sir Winston Churchill? The paradoxical fact is that Lord Beveridge, champion and exponent of democratic and persuasive processes, is not interested in personality as such. The characters of his narrative are faceless, colourless, two-dimensional—one is tempted to say one-dimensional, as are lines of force or the wires that one pulls.

Here, perhaps, is a clue to the element of frustration in this story of splendid achievement. Leadership, Lord Beveridge has said, is the ability "to make common men do uncommon things." It is a significantly ambiguous definition. For leadership, thus defined, may be no more than the breaking up of complex tasks into simple processes needing no special gifts for their accomplishment; that is the job—difficult, exacting, enormously important—alike of the production engineer and of the practical administrator. But leadership can also be something quite different, a communication of purpose, a contagion of greatness; and for that, individuals must be seen as something other than lines of force. In the first sense Lord Beveridge is a leader second to none. His closing chapters show what happened when, pardonably enough, he came to believe that he had powers of leadership in the second sense also. The reader of his narrative, fascinated by tracing the sequence of events, following his guidance through the back premises of government, remains in the end baffled, meditating the qualities and limitations of the rational progressive, on tides in the affairs of men, and—just possibly—on hubris and nemesis.

Sheer Hulk

THE GREAT IRON SHIP.

By James Dugan.

Hamish Hamilton. 224 pages. 16s.

THE stuffy will say that this is no way to write economic history. "Here for the first time," barks the jacket, "is the full and incredible saga of the *Great Eastern*—the mighty vessel built over a century ago which dwarfs

all but the largest of today's ocean liners . . . the ship that killed her designer, drowned her first captain"—and so through a list of fantastic achievements and disasters to end in shame as a floating circus. This smacks of Hollywood rather than the University, hot air rather than cold fact. But for once the blurb tells the truth. Mr Dugan has written an extraordinary book that fills out the legend of the *Great Eastern* into a cinematic account of the birth, life and death of an extraordinary ship.

She was a ship conceived far ahead of her time by the genius of Brunel—"a technological explosion" set off by the Great Exhibition; 692 feet long and 120 feet wide and not outbuilt for half a century; intended to carry more passengers than the *Queen Mary* and driven by a bigger screw; woefully underpowered even with engines capable of producing 11,000 horsepower; and brilliantly designed with a double hull and without ribs. To this conception, Brunel attracted £600,000 of solid Victorian risk capital, and held out the expectation of a 40 per cent annual return. It was the first instalment in a long history of raising the wind, bankruptcies and ruinous losses. John Scott Russell, ironfounder and shipbuilder at the Isle of Dogs, ruined himself in building the ship; Brunel exhausted all his fantastic energies in launching the monster sideways into the Thames—it took him four months—and was killed by the news of an explosion on the *Great Eastern's* maiden voyage.

Disaster, loss and death attended the leviathan throughout her life until towards the end of the century she was broken up, a hopeless, huge drab. There was much that was ignoble in her history, and the brash enterprise that produced the ship would have stood no chance today; Brunel and Daniel Gooch were not easily defeated, but they would certainly have found the Companies Act too much for them. They also missed many chances—failing to see the easy money that could be earned in carrying emigrants to America and in bringing cotton from the South through the Union blockade in the Civil War. The *Great Eastern* taught many expensive lessons about the size, power and management of ships which other ship-owners quietly absorbed gratis. When she was a demonstrable failure in the passenger trade, she found an historical vocation in laying the Atlantic cable and the all-red telegraph to India. And she finished as a floating fair ground and advertisement hoarding in the Mersey, yielding the only profit of her career to the shipbreakers who bought her.

There are stories galore here, and Mr Dugan tells them all with gusto, applying his brisk journalism to the solid products of research. It is the life story of a brassy, oversized lady, and such extraverts are often no better than they ought to be. But she fought for birth, and fought mishap after mishap for survival—the vulgar, madly adventurous and yet, as it now seems, good-natured great aunt of the British passenger fleet.

higher mileage

is a REALITY!

Avon made certain of it long before the first Avon H.M. tyre was sold . . . Higher mileage was assured with a tougher rubber compound and a spectacular advance in tread design which permitted extra depth and thickness. Thousands of motorists have now proved higher mileage to be an absolute fact. It must mean a great saving to your pocket too!

Write now for an illustrated folder "The Story behind the Greatest Development in Car Tyre Construction", sent free on request to The Avon India Rubber Co. Ltd., Melksham, Wilts.

AVON
H.M.

HIGHER MILEAGE
Avon's thicker and deeper tread gives many thousands of extra miles.

GREATER GRIP
The wider Avon tread gives more road contact, extra bite.

BETTER BRAKING
Centre traction bars and multiple slots give extra stopping power.

DRY FLY SHERRY—the best appetizer—makes a most acceptable Christmas gift and provides a gracious welcome to your guests. Order early from your Wine Merchant to avoid disappointment.

The Quality Cigarette

[3P 119]

There are electric lights on in this tank. BTH pre-test their lamps so that they can stand up to jolting like this, and worse.

THE SAME RESEARCH and manufacturing resources which produced the first jet engine of Whittle design and the electrical power system of the Comet are also behind Mazda lamps.

For half a century BTH has maintained its reputation for leadership in lighting. During that time many of its developments have become standard throughout the world.

Here are three examples from literally hundreds of recent achievements in the field of lighting.

CRUELTY TO LAMPS

28 tons of tank smashing its way through all obstacles. One 75 mm. gun, two 7.92 mm. guns. A 600 horse power engine driving massive wheels and huge steel tracks. Such is the Cromwell tank. What sort of lamps could possibly stand up to service in such a vehicle?

BTH found the answer. For they have a remarkable machine, believed to be the only one of its kind. It tests lamps for use in tanks by simulating engine vibrations and the shock of driving over the roughest ground. Constant sledge hammer blows simulate the effect of gunfire. Each lamp to be tested is shaken as a terrier shakes a rat.

This is but one example of the constant research which ensures that Mazda lamps stay brighter longer.

'DAYLIGHT' ROUND THE CLOCK

Blackout was one of the most insidious and dangerous enemies in the early days of the war. Long hours under artificial lighting menaced the health of factory workers and threatened production. The problem was urgent.

Methods of improving the traditional and familiar forms of artificial lighting were sought—but BTH lighting engineers insisted that something new was called for.

Already a lot of work on the development of fluorescent lighting had been done in the BTH Research Laboratories. Now was the time to put theory into practice. 'Daylight' lamps were made and installed in a particularly trying section of the Works.

The rest is history. Mazda fluorescent lamps and lighting fittings went into factories all over the country. Health and morale improved. A grave threat to wartime production was averted.

A NEW COMPLEXION ON IT

Mercury Vapour lamps were first introduced twenty years ago by BTH Research, and have made a major contribution to safe and economical street lighting.

But they were not flattering. Indeed, there were jokes in *Punch* about their effect on peoples' colouring.

Again, BTH Research found the answer. Mazda Mercury Vapour lamps are now made with a new phosphor coating on the inside: this preserves both the efficiency of the lamp and the colour of what it shines on.

Soon you will be able to stand under one of them and look your lady in the face!

Case History of Freud

SIGMUND FREUD: LIFE AND WORK: Vol. I: *The Young Freud*.

By Ernest Jones.

The Hogarth Press. 454 pages. 27s. 6d.

THIS is a sober, year by year account of Freud's early life, in which the detail of events is from time to time interrupted by a speculative interpretation in the traditional psychoanalytic vein. Only vaguely behind it all can one discern the massive proportions of a mind which has had more influence than any other upon contemporary psychological thought. The trouble is that biography is an art, revealing the structure of a personality by all sorts of emphases and exclusions. A case history is something quite different: it is a flat laborious chronicle; and even a case history with marginal notes, like the present volume, is no more than the raw material out of which a biography might be made.

This does not mean that Dr Jones has done something that was not worth doing. Reliable material about Freud's life has been difficult to discover, and past controversies have left their distortions and legends behind. Now the facts are available, and all must admire the devotion and industry that have brought this about.

The present volume is concerned with only the first half of Freud's life, from his birth in 1856 to the turn of the century. What may well impress the reader coming to it from a study of Freud's later writings is the amount of work in neurology and allied fields that preceded the development of psychoanalysis. This organic approach was never superseded and shows itself again and again throughout Freud's writings. It is a great misfortune that so many of his followers have failed to give it due weight. For instance, as late as 1925 Freud said:

From a clinical standpoint the (actual) neurosis must necessarily be put alongside the intoxications and such disorders as Graves' disease. These are conditions arising from an excess or a relative lack of certain highly active substances, whether produced inside the body or introduced into it from the outside—in short they are disturbances of the chemistry of the body, toxic conditions. If someone were to succeed in isolating and demonstrating the hypothetical substance concerned in neuroses, he would have no need to concern himself with opposition from the medical profession. For the present, however, no such avenue of approach to the problem is open.

There is a world of difference between this view of psychoanalysis as provisional and temporary and the rather authoritarian attitude adopted by some of Freud's disciples. Speaking of himself Freud says:

I am not really a man of science, not an observer, not an experimenter, and not a thinker. I am nothing but by temperament a Conquistador—an adventurer, if you want to translate the word—with the curiosity, the boldness and the tenacity which belongs to that type of being.

The social scientist may not find much to interest him in this book, but it

might nevertheless be good for him to read it, and to realise that the social and the natural sciences are not really so far apart as they sometimes seem today.

One complaint seems justified. One has grown used in psychiatric literature to a certain clumsiness and abstractedness that betray the Central European origin of many of our distinguished psychiatrists. Dr Jones has no such excuse, yet he sometimes falls into this style. But it would be unkind, when so much of solid value is presented, to stress unduly the defects in its presentation.

Too Many Documents

IMPERIAL CONSTITUTIONAL DOCUMENTS 1765-1952.

By Frederick Madden.

Basil Blackwell. 91 pages. 8s. 6d.

THIS little book is the fifth or sixth collection of documents illustrating imperial and commonwealth history to be published in the last few months. It is the slightest and narrowest of them all. As Dr Madden says in his preface, his selection makes no claim to originality; the themes he illustrates—the attempted reform of the first Empire between 1765 and 1766, the institutional development of colonial responsible government and dominion status, and the position of the crown in parliament in the dependent Empire—are all three well enough documented already. His sole purpose apparently is to serve the convenience of Oxford students in the Modern History faculty which has prescribed these particular sources for study; and to supplement Mr Berriedale Keith's "Select Speeches and Documents on British Colonial Policy 1763-1917" and his "Speeches and Documents on the British Dominions 1918-1931." Mr Madden has carried out a parochial task conscientiously.

Out of this deluge of Imperial documents of mainly constitutional significance, a mere reviewer may well ask what some of our imperial historians think they are doing. Documents are essential no doubt. Editing is tiresome and exacting work and we are thankful to those who do it. And, of course, the wartime gap in published documentation has to be filled. But the empire-commonwealth consists in something more substantial, one hopes, than constitutional relationships. Investment, trade, migration and power are the stuff of national expansion and the law books and speeches are mere commentaries upon them. If we must have more documents let them be about the commercial and political substance. There is something more also to historical scholarship than collecting data. Sufficient stock-piles of facts and sources have been assembled already to overwhelm the conventional framework of interpretation; and it is to be feared that these materials will lie about as rubble until imperial historians raise a stronger, broader structure of ideas about the historical process of European expansion.

Figures and Charts

ECONOMIC TRENDS. No. 1. November, 1953.

Central Statistical Office.

HMSO. 25 pages. 2s.

THIS new monthly publication is designed to make life easier for all who want to keep up to date with the British economy. From the rather indigestible mass of statistics presented in the *Monthly Digest*, the government statisticians have selected what they consider to be the key indicators, making just over a hundred series. These are illustrated in a gallery of neat charts while at the same time the actual figures are also given. The booklet is half-charts, half-tables.

Statistics are still judged by the general public as being able to prove anything. This new publication may help to allay some of the suspicion. In design it is attractive; employment, production, consumption of raw materials, trade, finance and prices—their movements can be followed easily in these simple pictures. Only here and there will there be a wistful glance to the booklet's American counterpart. The British economist has still to make do without any official up-to-date estimates of the gross national product. Much less, too, is known about stock changes. But these are deficiencies in the actual statistics not in the simple presentation of existing material which is the object of this publication. In this respect it succeeds admirably.

The Logic of British and American Industry

P. SARGANT FLORENCE

"In form, this is a much enlarged revision of Professor Sargent Florence's classic *Logic of Industrial Organisation*. The revision has added much more elaborate documentation to a textbook almost alone in class and approach. This book is more than a textbook; it is an original work of economics that a businessman may be able to read with advantage and without exasperation."

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Changing Patterns in Credit

FROM A CORRESPONDENT IN NEW YORK CITY

RISING prices (and of course declining yields) in the government bond market seem to be depriving the Democrats of one of their chief complaints against the Eisenhower Administration. This is that higher interest rates on Treasury issues were a reward to the bankers, who are presumably now back in the temple from which the New Deal drove them. But since early June, when prices of Treasury securities reached their low points, the $3\frac{1}{2}$ per cent 30-year bonds, which were issued in April as the first step in the programme of lengthening the maturities of the debt, have advanced from just under 99 to a fraction above 104. The 91-day Treasury bills, sold in early June at prices to yield a rate of 2.4 per cent, have since sold as low as 1.2 per cent and are still well below 1.5 per cent.

Last week the Treasury, which had paid $2\frac{7}{8}$ per cent for $3\frac{1}{2}$ -year money in September, found it easy to obtain 5-year money at $2\frac{1}{2}$ per cent. Finally, after selling three successive one-year certificate issues at $2\frac{3}{8}$ per cent (in June, August and September), Mr. Humphrey, the Secretary of the Treasury, has now had no difficulty in putting out similar paper at only $1\frac{7}{8}$ per cent. Indeed—and this may be even more significant—the certificates are selling at a premium.

These developments have spiked the guns of the Democrats, who have also lost their only potent allies in the business world, the builders and mortgage brokers. The latter had, until recently, been complaining bitterly that there were no funds available for mortgage lending (by which they meant funds at government-aided low rates). Their complaints, which the Democrats were delighted to echo, have now died away completely; two weeks ago an annual convention of mortgage brokers showed every satisfaction with the demand for their paper from insurance companies and savings banks. These institutions have apparently begun to resume the practice of entering into forward com-

mitments to accept mortgages on houses still to be built.

There is little doubt that the tapering off, or modest decline, in business activity has played a large part in strengthening the bond markets. This is not so much because of any significant reduction in the demand for funds being made upon the capital market—for there is none as yet—as because of the expectation of a reduction to come. The Federal Reserve system has also helped by keeping the banks, and thus at least the short-term money market, in an easy position. Spokesmen for the central bank have explained that at a time when the economy is going through a period of adjustment, if not mild recession, the monetary authorities must make sure that any error

of judgment is on the side of too much ease rather than too much tightness.

This attitude has reinforced the confidence of investors in both shares and bonds; since the middle of September the Dow-Jones average of industrial shares has risen about 20 points, while the Treasury $3\frac{1}{2}$ s, due in 1978-83, have gone up $3\frac{1}{2}$ points. As one shrewd observer of the markets has pointed out in a letter to his customers: "This is pretty fast going for either index." He notes that the confidence of investors

appears to rest mainly upon the idea that the Administration is afraid of deflation, and is doing and will do everything possible to start up a new round of inflation. But, he goes on,

the bond market reaction is that these efforts will not be successful at any time soon, so that we must look forward to a considerable period of steadily falling interest rates. The stock market, on the other hand, seems to say that these efforts really will be immensely and quickly successful, so that prices and profits will again move sharply upward. Both cannot be right at the same time.

There is certainly still some reason to doubt whether the Administration or the central bank, or both, are committed

to a policy of easy money, deliberate budget deficits, and the other stimulants for a faltering economy. Both the Budget Director and the Secretary of the Treasury are still stressing the need for new taxes to balance the budget for 1954-55. As for the Federal Reserve system, it is true that it did purchase government securities in the open market all through September—thus giving the banks reserves at a time when interest rates were falling rapidly—but it ceased its purchases for at least three weeks in October, and apparently allowed the "slack" to be taken up by normal seasonal factors.

The job of forecasting the nature and extent of these seasonal changes seems to be exceedingly difficult this year, and this may account for some of the central bank's indecisiveness. During the latter half of a year there is, of course, a seasonal expansion in the demand for bank credit, reflecting crop harvestings and movements, holiday shopping, and so on. In the last six months of 1952 bank credit rose by almost \$5 billion. Three-fifths of the increase occurred between July and October. For the same four months this year, the rise is barely half this \$3 billion. Even the present lower prices for crops, the slackening off in business activity, and a more cautious inventory policy do not seem to justify so large a drop in the need for bank credit.

★

Some bankers are therefore looking back to the spring months, when the seasonal decline was smaller than usual, for the explanation. They say that the Mills plan for accelerating the payment of corporate income and profits taxes has tended to even out the seasonal changes in the demand for credit. Corporations this year paid 80 per cent of their taxes in the first half of the year; next year they will pay 90 per cent, leaving only 10 per cent to be paid in the last six months of 1954.

The Federal Reserve Bank of New York suggests, in the November issue of its *Monthly Review*, that some of the borrowing in the spring months might have been caused by a desire on the part of some businessmen to obtain credit, even if they did not need it at once; they feared it would be scarcer and more expensive later in the year. The bank also notes that some crop financing may not have gone to the banks, but, because of low prices, may have found its way directly to the Commodity Credit Corporation, which carries out the government's farm price support policy. If this is what has happened, it may be that bank credit will yet be used, for the CCC has already sold \$360 million of "participation certificates" in these crop loans to the banks and it has announced it hopes to sell another \$600 million or so by the end of the year.

Other kinds of bank loans are also failing to show increases comparable with those of last year. Property loans have risen only half as much as they did last year, for example, while consumer loans at banks have not expanded at all. In 1952 they rose by more than \$400 million. Sales finance companies, which borrowed some money from the banks last year, have repaid more than \$200 million since the middle of this year.

The purchases by the Federal Reserve system of some \$500 million of government securities since early July are much smaller than the amounts it bought in the comparable months of last year. But with the demand for bank credit lower, they have helped to produce an easy money market. As a matter of fact, the credit extended by the central

bank since the middle of the year has not even offset the losses of reserves sustained by the banks because of an outflow of gold and a rise in the circulating currency. In short, it remains to be proved that the central bank has embarked upon a policy of really making money easy, however probable it may be that it is determined money shall not become tight. But perhaps the securities markets are saying that this is a distinction without a difference.

Rural Recession

FROM A CORRESPONDENT IN CHICAGO

WHILE the fall in farm incomes, resulting mainly from the fall in farm prices, and the high cost of preventing them from falling still farther are a major political problem in Washington, the secondary economic consequences of this decline do not seem to be causing as much concern there as perhaps they should. This may be because the economic analysts have become accustomed to a decline that has been going on for nearly two years and take more interest in studying more recent storm signals. But in the middle west the manufacturers and salesmen of farm machinery, fertilisers, building materials, electrical appliances and other products are certainly feeling the effects of the downward trend in agricultural income.

These have been accentuated by the continuous rise in the cost of things the farmer buys. This year the actual purchasing power of American farmers will be smaller than at any time since 1941, according to the estimates of the Department of Agriculture, and it is not surprising that farmers are holding on to their dollars harder than at any time since then. The president of the Allis-Chalmers Manufacturing Company, a leading producer of tractors and farm implements, has said:

All business is going to be slow until farmers begin buying again. The country cannot have a high level of general prosperity without a prosperous agriculture.

History supports this statement—depression on the farm was the forerunner of the great depression of the nineteen-thirties—and so do statistics. Even though the number of people living on farms has been declining while the total population has been increasing, there are still 25 million Americans on farms. Even though agriculture's contribution to the national income has not risen proportionately with the growth in that income, last year nearly \$19 billion of a total national income of \$266 billion came from agriculture, compared with just over \$8 billion of a total of \$86 billion in 1929.

The farm machinery industry has probably been harder hit than has any other by the drop in spending by farmers. The International Harvester Company, the world's largest maker of farm equipment, experienced a decline of 8 per cent in sales of tractors and implements during the nine months that ended on July 31st. Smaller manufacturers have suffered even more. The Minneapolis-Moline Company estimates that its farm equipment business in the year that ended on October 31st was off by 18 per cent from the preceding year. The total value of retail sales of all kinds of farm machinery in 1953 will probably fall to about \$1.6 billion, a 16 per cent decline from 1952.

The heavy sales of farm machinery after the end of the war are partly to blame for the slow demand for these

Tax Tug-of-War

ABOUT the middle of December leading Congressional Republicans will go to the White House to hammer out a legislative programme which the President hopes will whistle through next year's abbreviated session. Most Republican realists agree that the party dare not face the mid-term elections without a more substantial record of achievement. But on one of the most awkward problems, that of spending and taxes in the year which begins next July, the Administration itself may have trouble in reaching a united front. Mr Humphrey, the Secretary of the Treasury, is said to be determined, if he cannot have a balanced conventional budget, that he will have a balanced cash budget, that is, one which balances when the \$4 billion or so income of government trust funds is included in the general revenue. That would mean a book-keeping deficit no larger than that predicted for the present year, although some tax reductions are due to go into effect on January 1st.

To achieve this, Mr Humphrey is said to have fixed his sights on a cut in spending of about \$6 billion, most of which would have to come out of security spending on defence, foreign aid, and atomic energy. Together they account for \$50 billion of this year's estimated expenditure of \$72 billion. Mr Wilson, the Secretary of Defence, has already promised a reduction of \$2 billion, but he is digging in his toes against deeper cuts which might endanger the national security. The brunt of any new economies may therefore fall on foreign aid.

The proposed reduction of \$6 billion in expenditure, of which the press got wind, and which Congressional Republicans would probably be delighted to approve in election year, would be more than enough to compensate for the tax reduction which takes place on January 1st. This is estimated to cost \$5 billion in a full year—assuming the same level of incomes—but only \$3.6 billion in 1954-55. But a wider margin is needed to cover the cost of reforms in the Internal Revenue Code. These are being studied by the Treasury and the Joint Congressional Committee on Internal Revenue Taxation; the cost is put at from \$1.5 billion to \$2 billion, even though the Treasury feels it must go slow in relieving certain burdens which it is convinced, in principle, are stifling business expansion. Among the proposed changes are a start toward eliminating double

of evidence connecting him with Communist espionage activities, the limelight was turned away from Mr McCarthy's current investigations of espionage in the Army Signal Corps and at plants belonging to the General Electric Company. Instead attention was concentrated on Senator Jenner's rival Internal Security Subcommittee, which the Administration favours because its methods are more restrained and conventional than those of Mr McCarthy's committee.

Senator McCarthy's reaction was so violent that it would seem impossible for the President to ignore it, were it not for the fact that he has often in the past managed to overlook the Senator's insubordination. This time, however, Mr Eisenhower is obviously uncomfortable at the political and moral turn the White case has taken. He has said that he hopes the chairman of the Republican National Committee is wrong in thinking that Communism in government is still going to be a live issue when the 1954 elections come around. And this week the President denounced "character assassination" and defended the right of Americans to meet their accusers face to face.

The President must be concerned, as are Mr Dulles and Senator Wiley, at the damage being done to American prestige abroad by allegations of Communism at home. More definite injury to American foreign relations was threatened when Mr Brownell quoted a secret letter from Canada to the Jenner committee and when that committee demanded that the Canadian government should allow Mr Gouzenko, the former Russian embassy clerk, to testify before it. The Canadian government, after refusing once, has now agreed that Mr Gouzenko may be questioned, provided that the evidence is not published without its permission. This condition does not appeal to Senator Jenner, who is trying to track down Communist spies whom he believes are still at work in the United States.

Whatever the President may hope, Mr Jenner certainly intends to keep the Communist issue alive for most, if not all, of next year and so does Mr Brownell. For he has forecast that there will be a number of spy trials if Congress removes the prohibition on the use of evidence obtained by tapping telephone wires; supposedly the indictment not only of White but of other, still living, suspects was impossible because the conclusive evidence was obtained by this method. Another piece of legislation which Mr Brownell wants and which also raises the whole question of constitutional liberties is that granting immunity from prosecution to witnesses who confess to Communism or espionage before Congressional committees.

In such an atmosphere the prospects of the President's legislative programme in the next session of Congress are poor. For the breaches in the Republican party will be widened rather than narrowed and the Democrats will not now feel inclined to support an Administration that has launched an unprecedented personal attack on their former leader. Their present leader, Mr Stevenson, has just warned President Eisenhower that, if he continues to allow his lieutenants to divert his "great crusade" into McCarthyist channels, then he will lose the support of the American people. For, says Mr Stevenson, "we are not frightened, frustrated brutes" but "calm and confident, united by the vast majesty of freedom" and therein lies the opportunity of the Democratic party.

sales pick up. Steel mills find that farmers have trimmed their purchases of fencing. One of the country's largest suppliers of wire for this purpose says that sales of this product last summer were 25 per cent below a year ago.

Other industries that sell to both farmers and city people are being hurt by the letdown in rural spending. The world's two largest mail order houses, Sears, Roebuck and Company and Montgomery Ward and Company, reported that October sales showed the sharpest decline of any month since early 1952. Both obtain a substantial amount of business from farmers. Of the two, Montgomery Ward leans most heavily on the rural market for its sales: Sears' October sales were 7.8 per cent below a year ago, while Ward's were down by 15.5 per cent. Farmers are buying furniture and electric appliances sparingly and less money is being spent on farm houses, barns and other buildings. Non-residential construction hit a record \$875 million in 1951. It slipped by \$15 million in 1952, and a West Coast lumber company that sells to farm areas says that there will be another drop of \$15 million or more in 1953. When a farmer wants to economise he cuts back on farm improvements in a hurry.

As yet the reduction in spending has not had much effect on the standard of living of farmers, a standard which has risen most strikingly in the last ten years. The countryside is generously sprinkled with such signs of affluence as television antennae and freshly painted buildings. Business firms, which sell food and clothing to farmers report that their sales are comparing favourably with last year. For instance, the Independent Grocers' Alliance, an association of 5,300 food stores, 60 per cent of which are in rural areas, says its sales are running 18 per cent ahead of last year. But to achieve this, farmers have been forced to dip into some of the savings put away during the lush war and postwar period. The Department of Agriculture figures that farmers will be about \$800 million, or 5.1 per cent, deeper in debt next January than they were at the outset of 1953. Farmers, in fact, are living off their fat at present; since most of them have plenty of it, there is little to worry about as far as they are concerned. But, from the point of view of the national economy as a whole, it is to be hoped that those who claim they can see the end of the farm recession are right.

American Notes

McCarthy Declares War

SENATOR MCCARTHY used the occasion, offered to him by the wireless and television networks in order that he might reply to Mr Truman's defence against the White charges, to declare war on the Eisenhower Administration which had dared to trespass on the Senator's territory in making those charges. When the Attorney-General, Mr Brownell, accused Mr Truman of having appointed Harry Dexter White to the International Monetary Fund in spite

products now. Farmers are so well supplied with relatively new machinery that they can postpone purchases. These figures tell the story: of the tractors now on farms, 69 per cent are postwar models; the same is true of 61 per cent of the combines, 77 per cent of the maize pickers and 86 per cent of the automatic hay balers. With fewer dollars to spend, farmers have more incentive to make do with their present machines. A farm equipment dealer in a small southern Illinois town tells about a farmer who recently bought \$100 worth of parts to repair a combine: "Last year, he wouldn't have put that much in an old machine; he'd have bought a new one."

The slowdown in sales of farm equipment affects many other parts of the economy. Firms that supply the industry with such products as steel, castings and tyres are getting fewer orders and retail trade is suffering in cities where employment in agricultural equipment factories has fallen off. This month a survey by the Farm Equipment-United Electrical Workers' Union showed that farm

machinery plants in the midwest had laid off nearly 47,000 employees during the last six months.

The \$1 billion-a-year fertiliser industry is another that is feeling the pinch in farmers' spending. Sales of commercial fertiliser climbed to an alltime peak in the year that ended on June 30th last, but since then demand has slipped. One of the country's largest producers of fertiliser experienced a 20 per cent decline in sales in the four months to October 31st compared with the similar period in 1952; the entire industry has probably shown a drop of comparable proportions. Because of this slackening in sales, one large fertiliser company plans to cut its expenditure on advertising next year by \$250,000. Out in Carlsbad, New Mexico, where much of the potash used in the United States is mined, there are such big stocks above ground that one producer has "mothballed" his pile of this fertiliser by coating it with plastic to keep it in good condition until

taxation of dividends; an easier depreciation policy to encourage capital investment, concessions to working mothers, and more liberal deductions for medical expenses. In addition, Congress may refuse to extend or wholly replace the taxes which expire in April.

CIO Without Fireworks

THE convention of the Congress of Industrial Organizations gave a more cordial reception to the maiden speech of the new Secretary of Labour, Mr Mitchell, than the American Federation of Labour gave to Mr Nixon, the Vice-President, when he appeared before it bearing an olive branch two months ago. But the delegates, by voting unanimously for repeal of the Taft-Hartley labour law, rejected Mr Mitchell's advice to be "realistic" and concentrate on eliminating the law's anti-labour features, even though he tried to sweeten the dose by endorsing an increase in the minimum wage. The CIO simply does not believe that this Republican Congress will improve the Taft-Hartley Act.

What the CIO leaders consider to be more urgent is the correction of the slump which they suspect is under way and which they think is being accelerated by the "big-business" bias of the Administration. A nine-point programme to raise purchasing power was urged upon Washington. Declining business activity makes it unlikely that 1954 will be a year of widespread wage increases and the emphasis put upon the guaranteed annual wage as the organisation's next major objective was more for propaganda purposes than anything else. The automobile workers, the CIO's pace-makers, may be glad that they cannot be expected to break new ground until 1955, when their contracts expire.

The chief business of the convention was to ratify the no-raiding agreement which the AFL has already accepted. This is being welcomed as a great step towards healing the 18-year-old breach in the labour movement, but always with the proviso that Mr Beck, the head of the AFL lorry drivers, and the unions' most aggressive empire-builder, can be persuaded to respect the red light. The agreement comes into force on January 1st, for two years, and provides for a committee with an impartial chairman to adjudicate disputes. But it applies only to trade unions who sign it, and the lorry drivers will not even debate doing so until February.

The CIO convention passed off without any of the fireworks which, a year ago, seemed likely to blow the organisation apart. Mr Reuther, the president and the head of the automobile workers, the largest of the CIO unions, was re-elected unanimously, and Mr McDonald of the steelworkers, his chief rival, contented himself with a series of pin-pricks: for example, his publicity-attracting tour of steel plants, hand-in-hand with Mr Fairless, the chairman of the US Steel Corporation, was deliberately timed for the second day of the convention. Mr McDonald is said to be playing for bigger game than anything the CIO has to offer: a vice-presidency in a trade-union movement which would be 15 million strong if the continuing talks between the CIO and the much bigger AFL eventually bear fruit.

Metal Troubles

THE plans hatched out by the Democratic Administration three years ago, when metal prices were forced up by the Korean outbreak, have come home to roost on a Republican Administration at a time when supplies of metals are outstripping demand. As a result the complicated mechanism of loans, long-term contracts and other devices to stimulate the output of metals, both at home and abroad, which then seemed to be an essential safeguard against shortages that might endanger American military expansion, now look, to American mining interests at least, like a government plot against their solvency.

Lead and zinc producers have undoubtedly suffered severely recently, although in this instance the blame falls not on government policy but on their own high costs. Their case, now being considered by the Tariff Commission, to which it was referred by Congress, is that prices of lead and zinc have been almost halved in the last eighteen months, while imports of both have been running far above normal. The situation is now improving, but meanwhile American stocks have accumulated, a number of mines have closed down and there is unemployment in the mountain mining areas.

The governors of these western states protested early this month that the mining industry was being choked by the government's "dumping" on the domestic market of metals it had purchased abroad at premium prices to encourage production there, and that as a result American mines would no longer be able to meet the country's needs in time of war. Senator Malone of Nevada, who is investigating the policies governing the stockpiling of strategic materials, carries the argument farther and demands that the needs of the stockpile should be met, whatever the cost, from domestic sources—or at least from the western hemisphere—in order that the United States may be safely independent of uncertain overseas suppliers.

All this is obviously building up into a many-headed controversy which will threaten Administration policy from all sides when Congress meets again. The mountain states must be comforted, or they may vote for the Democrats next autumn, but America's allies must not be offended, or their economies hurt, by the breaking of long-term contracts. Subsidies for domestic mines would run counter to attempts to cut government expenditure, while higher tariffs, which are being demanded particularly loudly by lead and zinc producers, would make nonsense of attempts to substitute foreign trade for foreign aid. Finally, it is only eighteen months since Mr Paley's Raw Materials Commission reported that, however plentiful supplies of metals might be at the moment, the long-term outlook was one of scarcity, which could be met only by the development of overseas sources of supply. Next month an expert conference on Resources for the Future, sponsored by the Ford Foundation, will make plans for bringing home to the public the implications of the Paley report. Meanwhile President Eisenhower has set up a special Cabinet committee to work out a policy, if possible before Congress works out one on its own, which will both assure the ration of enough minerals to see it through "the uncertain years ahead" and protect the domestic mining industry by some means "consistent with our other national and international policies."

PROGRESS IN ELECTRONICS

THE rapid growth of air traffic throughout the world and the introduction of high speed aircraft flying at great heights have multiplied the problems of the meteorologist. The methods of forecasting weather conditions which were adequate ten years ago cannot provide the detailed and accurate data which are required to-day.

A new technique for weather forecasting has, however, now been developed. By employing an equipment known as the Radar Sonde, the complex conditions in the upper atmosphere can be accurately measured and recorded.

A small balloon carries a miniature radio and meteorological station up to a height of 100,000 ft. and is borne by the wind to distances exceeding 100 miles. Throughout its flight the balloon is continuously interrogated by a powerful radar transmitter, and the answers are transmitted back by return.

As the information is received at the ground station it is decoded, computed and recorded to give a detailed picture of wind speed and direction, and of temperature, pressure and humidity.

The Radar Sonde has been designed and built by the Mullard Research Laboratories in co-operation with the Ministry of Supply and the Meteorological Office.

BUT no one ever disputes the dependence of Britain's Industries on the vast Commonwealth market.

Great opportunities abound in every country and colony of the Commonwealth; each is exploiting its natural resources to the full and using every means to expand its economy.

Britain can supply the equipment, the scientific and technical knowledge necessary for these schemes provided the people in charge of them know what we have to offer.

The easiest and most economical way of telling them is through the advertisement pages of NEW COMMONWEALTH. Every fortnight NEW COMMONWEALTH circulates among the executives and managements responsible for the huge projects which are invigorating the Commonwealth.

They read its news and outspoken articles for information and search its advertisement pages for new methods and equipment. Why not let their eyes light on your advertisement?

NEW COMMONWEALTH

is the business man's fortnightly review of Commonwealth affairs. By reading it you keep in touch with important developments in every Commonwealth country. By advertising in it you ensure that all important buyers and distributors throughout the Commonwealth keep in touch with you.

Specimen copy on request.

NEW COMMONWEALTH, 33, Tothill Street, London S.W.1.

Telephone: Whitehall 9233.

Neither Mendès nor Pinay?

FROM A CORRESPONDENT IN PARIS

WITHIN two months, M. Laniel will have to hand his cabinet's resignation to President Vincent Auriol's successor, who may or may not be M. Laniel himself. Already this cabinet is little more than a *mort vivant*. Who is to be the heir? The title of a book recently printed in France suggests the alternative: *Mendès ou Pinay?* But the problem is not only a choice between two or more political leaders. For some time there has been a search for fresh political alignments either in Parliament or in the country. Can and will this search lead to coalitions more stable than the present one, and even, as M. Bertrand de Jouvenel recently suggested in the *Manchester Guardian*, to a two-coalition grouping, which would bring advantages roughly comparable to those of the British system?

M. de Jouvenel also suggested that M. Pinay and M. Mendès-France could be the poles and, indeed, the best leaders of the two prospective coalitions. Certainly M. Mendès-France would be as brilliant a premier as any French intellectual could wish. During the last ministerial crisis, he appeared as one of the men who could best swing the political pendulum back to the left at some later stage, by rallying a centre-left coalition without the help of the Communists. He mustered not only the whole Socialist vote, and nearly all his Radical friends, but also, in spite of their leaders, a good deal of the rank-and-file in the Catholic MRP and M. Plevin's UDSR, together with a number of Gaullists and right-wing Independents and Peasants. However, he failed by 13 votes to get the constitutional majority of 314, and it is commonly assumed that a number of Radicals voted for his investiture only as a polite gesture, because they knew that he would not win.

One of the main reasons for M. Mendès-France's failure was his well-known desire for negotiations in Indo-China. The recent evolution of parliamentary opinion on Indo-China might well be an asset to him next time he asks for investiture. His strict economy plans would again get him a number of right-wing votes but they might cause difficulties with the left-wing supporters of his full employment programme. There is in fact an internal contradiction in his plans, at least from the parliamentary angle, and it is doubtful whether a new run would lead him much further than the last one. This may be the reason for his extreme reserve in recent debates. Moreover, although he stated, in his investiture speech, that he would ask for a confidence vote on the EDC, he has been accused by several promoters

of European integration of not being "European" enough.

On this point, M. Guy Mollet offers better guarantees. His scheme for a "social and democratic front," which is still rather vague, appears as an answer both to the Communist campaign for "unity of action" and to the centre-right policy of the Pinay, Mayer and Laniel cabinets. It is also, to a certain extent, an alternative to a grouping around M. Mendès-France although it would necessarily include a great number of those who voted for him in June. The main difference is that its foreign platform would be definitely "European" and would not involve a change in the Atlantic policy of France. Talks are said to be in progress between M. Mollet, M. Plevin and a number of Catholic MRP or Radical deputies, as well as leaders of the non-Communist trade unions. There have been rumours of a coming agreement on the question of subsidies to Catholic schools, the big stumbling-block in the way of a *rapprochement* between the Catholic MRP and the Socialists.

But even if the proposed front could unite all the Socialists, the Catholic MRP and the UDSR, it would lack a number of Radical votes and therefore need the support of some Gaullists or right-wing independents, reluctant to join a coalition either too "European" or too "pink." To sum up, it seems that the idea of a *regroupement social* has actually caught on with the French public and parliamentary opinion. A large part of the Catholic MRP and the UDSR are as unhappy in the present coalition as they were in M. Pinay's cabinet. They are looking to the left. But the "social and democratic front" scheme does not seem to be quite ripe. Its extension to the right is hindered by disagreement both on home and foreign policy and towards the left by the massive Communist block. The Communists themselves have now altered their tactics. While continuing to woo the Socialist rank and file for "unity of action," they concentrate on promoting a "national front" against EDC. But such an unholy alliance patched up for an immediate negative purpose has no chance of survival.

M. Pinay, who recently sent a manifesto to all deputies except the Socialists and the Communists, leads the counter attack to the challenge from the left. His renewed but limited economic liberalism and his determination to fight all forms of inflation appeal especially to the French middle class and petty bourgeoisie. His followers claim he is the most popular politician in France today. Even if this were true in the *pays réel*, the Palais Bourbon does not seem ready

to draw the political conclusion. M. Pinay's letter was not unanimously welcomed even among right-wing independents. A recent meeting did not bridge the gap which for both personal and political reasons separates him from M. Laniel. Moreover, even if M. Pinay could rally around him the bulk of the Independents and the Radicals, he would still need, for a workable majority, either the Catholic MRP or the Gaullist vote, or at least part of both. When he came out in favour of the EDC last March, he made a step towards the former. But he was very vague on European integration in his recent letter and can no longer be described as the obvious leader for a pro-EDC coalition. Will this give him a better chance to gain the support of the Gaullists? It would not be easy to overcome their intense dislike of the man who more than anybody caused their present dislocation. Apart from the dissident Gaullists (ARS) most of the rest would probably vote against him.

But if the centre-right coalition is not about to cluster around M. Pinay, has it any chance of surviving M. Laniel's premiership? Probably not in its present form. As the EDC ratification debate comes nearer and is more and more the crucial issue in French politics, it seems also more difficult to keep the bulk of the orthodox Gaullist group (URAS) together with political parties ready to ratify the European army treaty. Once the URAS has left, the governmental coalition would provide no more than a narrow and unstable majority.

On the whole, the obstacles against bipolarity in French political alignments at present seem bigger than the chances for polarization. The main reason is the EDC issue, which divides more or less all political parties (apart from the Communists, and maybe the URAS Gaullists) in a way which does not coincide with the divisions caused by domestic affairs. If no new device is found to shelve the issue once more, the French political crisis will rapidly come to a climax with an unstable coalition, cutting across party frontiers. What the lasting effects of this crisis will be, nobody would dare to forecast. Only two things can be said. First, if constitutional revision finally abolishes the present obligation of a new Premier to obtain an absolute majority for his investiture, governmental coalitions should become easier to build up and less heterogeneous. Secondly, it is unusual for a French legislature to end with the same governmental combination as marked its beginnings. This rule would seem to give the best chance, at a later stage, to a centre-left grouping. But both M. Mendès-France and M. Pinay may still have to bide their time, perhaps until after a general election.

India, Pakistan and America

FROM OUR CORRESPONDENT IN BOMBAY

IN India Pakistan's decision to become a Republic hardly raised an editorial; there was much more comment when Ceylon decided to drop the Union Jack. What Indians noticed was that the Republic is to be Islamic; to them this is the final proof, if any was needed, that Pakistan has no intention of giving to its Hindus the equality India has given its Muslims.

The reasons for the lack of comment are twofold. Pakistan's action was in no sense a surprise. It had been long expected, talked about, discounted; and to Indians

it appeared the only course Pakistan could take consistent with its self-respect. As the comment on the Coronation showed, Indians have a very real understanding of the part the royal family plays in English life, of the very deep bond between the British and their Queen. But they consider that the rarity of royal visits, and the difference of race and religion makes any such close bond impossible in Asia. The Commonwealth for them resides in shared ideals, not shared allegiance; in common discussions, not common loyalty. They have no doubt that the Pakistanis feel as they do. Had Pakistan kept the Crown, therefore, they would have felt that it could only be with the ulterior motive of buying British support in its quarrels with India, an interpretation which is greatly strengthened in Indian minds by the comment of some British papers, widely reprinted here, that had the British not truckled to India, Pakistan would never have become a Republic.

Indeed, as Mr Nehru's recent press conference again showed, India's main preoccupation is with the possibility that Pakistan's distaste for India may be sufficiently deep to make the Pakistani Government willing to sacrifice its sovereignty by giving the United States bases in return for the fuller arming of Pakistan. Despite Senator Knowland, no Indian believes that Pakistan is any more eager to be involved in the cold war, or any less anxious to be neutral, than India itself. Nor does any Indian believe that Pakistan's desire for arms is in order to defend itself against Russia and China. As Mr Nehru said, Indians recognise that Pakistan and America are independent sovereign countries which can do as they like. They do not like the prospect of American bases so near, bringing the cold war to their own sub-continent. But if that were all, it would in due course be accepted. The real objection is to the arming of Pakistan.

Cold War in Kashmir

From India's point of view Pakistan is the only country with which it still has open unsettled issues of the gravest importance; the only country whose leaders have regularly and publicly threatened India with war; the only country whose soldiers are still engaged with India in an undeclared war that has never become a peace, but only a cease-fire. Because restraint has been shown and the cease-fire has not been broken and because people have been hypnotised by happenings in Korea, the static war in Kashmir has been transferred in people's minds from the cease-fire line to Uno and the stillborn reports of distinguished experts; and there is a tendency to think only abstractly of the 100,000 odd men on India's side who are actually engaged in Kashmir. But they are as real to Indian hearts as the American troops in Korea are to their parents'.

Indians felt that the Pakistani threats of war did not matter so long as India was the stronger. But were, for example, America to supply Pakistan with jet bombers, every Indian would calculate not the number of hours they would take to reach the Urals, but the number of minutes they would take to get to Delhi or Bombay. Were Pakistan's armed forces to be equipped to fight a really modern war, therefore, every Indian would feel that to equal Pakistan's forces must be the Government of India's first priority. Every educated Indian remembers how it was the better equipment and better horse of India's Muslim invader which gave him his victories.

The options before India would, indeed, all be unpleasant.

The Five Year Plan would inevitably have to be sacrificed to rearmament. The Left has always said that the Americans were intriguing for Pakistani bases, and that aid (in this case the million tons of American wheat to Pakistan) is always tied up with strings. Were their prophecies to be fulfilled, not only could Mr Nehru accept no more American aid, but their thesis that he is never really neutral, but always at the least pro-British, might receive much wider acceptance. Indo-American relations, already tense, can only become tenser; much may be said that will be unfortunate, and make acceptance of help as well as willingness to help difficult, even in the absence of Communist nagging. And any Uno—in Indian eyes the same as American—suggestion over Kashmir will be taken with increased diffidence, making any possible solution still more remote. And if the Commonwealth still left India relatively unarmed to face a fully-armed Pakistan on its border, many an Indian of unimpeachable conservatism might feel that the time had come, neutrality or no neutrality, for India to look for strength elsewhere.

Financing German Exports

FROM OUR SPECIAL CORRESPONDENT

A REMARKABLE contract was recently signed between the Federal German government, in conjunction with three big heavy industrial concerns, and a Greek mission for the delivery of DM 200 million worth of equipment and services on credit up to eight years. The Greeks, who had been unsuccessful in London, found the Germans ready to accept the risks of financing a large part of their four-year development plan. Krupp will provide the equipment and technical aid for exploiting nickel deposits, while other schemes will be carried out by other firms.

On the face of it, this contract seems to prove the truth of the constant reports about German firms' ability to offer longer credit terms. It seems to contradict the perennial complaint of German heavy industry about shortage of capital. And it raises the question why the German government should rush in where the British Treasury fears to tread.

The Greek deal is, in fact, an interesting example of the latest phase of German foreign trade policy. In the first place, it is evident on closer inspection that there lay behind it the same boldness as led the Minister of Economics, Dr Erhard, to abolish rationing in 1948. No clear idea of how the Germans can finance the manufacture and delivery of the equipment seems to have been thought out. Instead, there comes first an act of willpower and courage; then the bankers and finance directors must somehow do the rest, and their difficulties are great. The DM 200 million credit will not be granted to Greece by the German Federal state, and the firms themselves cannot or will not undertake more than a part of the financing themselves. The Export Credit Company, which is the only existing body for financing medium and long-term exports, is limited to credits of four years, though this is usually extended to five years by the exporters taking over one year's financing themselves. A loan, it may be thought, could be issued by the Export Credit Company acting for the German state for the eight years period of the Greek transaction. But technical difficulties stand in the way: for one thing, the Export Credit Company has too small a capital to raise a loan of any magnitude, and the

yield would have to be very high and the interest tax-free if public subscriptions were to be forthcoming. The market for new issues is still very small, and is dominated by the tax-free loans of the government and *Laender*. Even the best-known industrial concerns have to pay nine or ten per cent for the money they borrow. However the Greek contract may be finally financed—and the Germans can be trusted to find a way—the German state will take over the risk through the Hermes credit insurance company. German exporters, eager though they are to secure permanent markets in under-developed countries, demand and secure in varying degrees a guarantee of their risks, including the chance that customers will not be allowed to transfer payments.

The credit to Greece has one precedent in Germany. The Bonn government was induced to grant Yugoslavia a credit a few years ago, when the western powers were anxious to prevent the collapse of Tito. But that concession was not entirely a matter of German free-will, in contrast to the aid for Greece. The Greek deal therefore represents a new phase in German policy. The other significant development in this new phase was the treaty with Brazil signed a few months ago. This was the prototype of the Bonn Government's coming network of treaties with underdeveloped countries which are in debt to Germany. It forms a framework for economic collaboration, and provides for German capital to be exported for setting up joint, or purely German, enterprises in Brazil. In practice, it may be noted, only small and medium-sized German firms have managed to establish satisfactory relations with the Brazilian authorities, while the big concerns have run into local obstacles. They have yet to learn how to get on to the right terms with Latins or, for that matter, Greeks.

Deadlock with the World Bank

The contract with the Greeks does not, it seems, provide for Krupp and the other German firms to take over shareholding in the enterprises that they are to develop, though the Greek planners are said to be urging that part payment should be taken in shares. In this way it differs from the treaty with Brazil. On the other hand, the deal is typical of German policy in another respect. It will certainly be accompanied by a demand for the return of German assets in Greece. For a long time past countries—notably Spain and the governments in Latin America—which want to secure further German supplies of capital equipment, in spite of having already run into debt, have been pressed to relinquish German assets, and some have given way. It is not hard to see a further whittling away of the "Safe-haven" agreement for the confiscation of German assets which the Allies concluded after the war, in order to break Germany's economic-political power overseas.

The state of German negotiations with the World Bank is as revealing a pointer to present German trade policy as the Greek agreement. A deadlock has been reached, after long investigations and discussions had led to two modest proposals from the Bank. One of these was for a \$20 million loan to industries that export a large proportion of their products, and the second was for a \$10 million loan for the partly dismantled Thyssen steelworks.

The Bank's terms have proved unacceptable to the Germans. Only a few firms have gone so far as to submit projects requiring American loans, and only one of them proposes to buy any dollar equipment with the proceeds. In every case, German manufacturers declare that they can

AND THE ANSWER?

A BRICK!

provide all, or nearly all, the necessary equipment for their projects without going to America for it. The only exception is the plant required by the Thyssen works, which German industry cannot supply at once; but it is only a matter of months before this situation is changed. The other objection to the World Bank's terms comes from the Bonn Government, which considers that the guarantees required conflict with the London debt agreement, and are too stringent for an industrial country that has proved its creditworthiness.

The Germans want, in short, local currency loans from the Bank on less rigid terms, and they are waiting to see what the Bank decides to do about it. The Bank, it is considered, should adapt itself to make exceptions for Germany as it has already done for Italy and Belgium. In both these cases the Bank modified its rules because bigger dollar earnings were expected if local currency loans were granted. In general, it is felt that Germany will gain more advantages from the Bank's loans to under-developed countries than from direct financing of German exporting industries. The Bank has already started to grant loans including a mark *tranche*, and it is on further deals of this kind that German hopes rest at the moment.

The *Bank deutscher Länder* in any event disapproves of German firms involving the country in further dollar indebtedness. It has reminded too eager firms not to enter into commitments with American or other financiers without prior approval of the central bank. And a further warning has been issued to the effect that Germans may find themselves liable to pay commission to some of the foreigners who are now offering to negotiate loans, even if the transaction is eventually concluded with different parties. In the view of most well-informed Germans, there is still little chance that American investors will prefer Germany, with its political risks, to the home market which still offers good yields. Even the steel industry does not expect American capital to reach it through the steel-coal community, though Ruhr coal companies will benefit from M. Monnet's trip to the United States. German industrialists, eager to extend interests overseas, still regard the maintenance of their power to plough back profits, and the development of the internal capital market as the most vital tasks for the future.

The European Political Community—II

FROM OUR SPECIAL CORRESPONDENT

DURING the last war the world's statesmen (except, of course, Stalin) were agreed that France, when peace came, should be the smallest of the Great Powers and not the greatest of the small powers. In fact, the France of 1944 was only a small European power with a very large overseas empire tacked on to it. None the less, until the Soviet military threat induced the United States to revive industrial Germany the French could act as one of the Big Three occupying powers. In 1953 Federal Germany is the most powerful continental country. That this would be so French diplomatists already knew in 1950. Hence the "integration policy" of M. Schuman and others, which was most unpalatable to French conservatives out

of office, who wished to stand by the constitution of 1946 and by the imperial and military tradition. A position has now been reached in which the French right, left and centre must seek a constitutional compromise between the unitary and indivisible Republic (which includes such places as Algeria, Senegal and Madagascar) and the European Community.

The current debate in the *Assemblée Nationale* shows how hard it is to combine the France of Schuman, Monnet and Mollet with the France of de Gaulle, Laniel and Juin. The choice is most hazardous. To drop the European *idée-force* would be unthinkable; but how is it to be reconciled with the integrity of a French Union tied to the *métropole* by administrative links and a common currency? To refuse a German defence contribution is impossible now, when the Germans have been made capable of producing 12 divisions and a tactical air-force within, at the most, two years; but how may France, with its eastern and African commitments, match this performance?

Article 1 of the draft statute of the European Community runs:

The present Treaty sets up a European Community of a supra-national character. The Community is founded upon a union of peoples and states, upon respect for their personality and upon equal rights and duties for all. It shall be indissoluble.

The Indissoluble Union

In his report* to the Strasbourg Consultative Assembly (April, 1953) M. Bohy, while admitting that the statute is *sui generis*, insists nevertheless on the presence of vital federal elements in it: the clear general statement of Article I; the provision of a People's Chamber "without which the whole structure would be little different from that of the innumerable intergovernmental experiments and failures which have preceded it." M. Bohy refers to a speech made by M. Paul Reynaud at the Hague Congress of the European Movement in 1949, when the former French Prime Minister said:

We believe it is we who have kept our feet on the ground, for we ask for a European Assembly which will be truly European because it will be elected by direct European universal suffrage to deal with matters of European concern. We believe we must tap a new source of sovereignty by appealing to a European sovereignty. . . . And we believe that only thus, by striking the imagination of our peoples, shall we succeed in solving the problem. . . . Do not fear the peoples, only appeal to them.

This declaration of confidence in the general will of the European population is in utter contrast with the present attitude of French conservatives to the right of M. Bidault. M. Schuman is reported to have said in 1950: "France will bring Africa as her dowry to Europe." The saying may be apocryphal, but it touches the weak spot in the French compromise plan to lead a double life, part national and part European. The *territoires d'outre-mer*, and especially the African ones, are jealously guarded by the colonial service and all those who have developed them; but they are also dear to those who run France's economy, for as a preferential market Africa is essential to the whole

* cf. Documents of the Consultative Assembly relating to the European Community. Council of Europe, Strasbourg, 1953. H.M. Stationery Office. pp. 5-53.

French protectionist system. This system would collapse overnight once it were penetrated by European, and especially German, competition. It proved possible to exclude North African minerals and the North African market from the coal/steel pool even though Algeria was part of metropolitan France. No organ of the ECSC has the power to revise this escape clause.

But it is not at all the same with the European Political Community. M. Senghor, Senegalese deputy at the Palais Bourbon, has successfully insisted that the African territories should be represented in the European Parliament. This means that French conservatives are faced with the possibility of a line-up of their own African deputies with a large majority of Europeans, demanding that Africa should be developed by the capital and business initiative of nationals not of France alone but of all the six member countries. But the French colonial administrator has not the slightest wish to take his orders from the President of the European Executive Council. In particular he fears that non-French Europeans will push their goods in Algeria and Black Africa without assuming their share of the financial burden of administrative overheads such as roads, schools and hospitals.

A European Market?

The real bones of contention in the EPC are Articles 82 to 84 of the draft, which deal with the progressive establishment of the European common market. It is laid down that

The Community shall foster the co-ordination of the policy of the Member States in monetary, credit and financial matters. . . . Nationals of Member States who have completed their service in the European Defence forces shall have freedom of movement within the Community and freedom to choose their domicile in the territory of any member state. . . .

No establishment of the common market may begin for one year after the entry into force of the political community. After that, however, very definite things will happen. For the next five years any economic measure drawn up by the Executive, agreed *unanimously* by the Council of Ministers, and approved by the parliament must be enforced by the governments of the member states. During this period a dissenting national government could use the veto but would become most unpopular if it did so repeatedly. After five years, however, the concurrence of the Council of National Ministers need not be unanimous, but only by majority. It is this automatic transfer of power from the nations to "Europe" that is at present quite unacceptable to France, which adheres to M. Bidault's "*communauté d'états souverains*." For the French the Executive must be merely a supranational board and the European parliament the body that will prevent the board from being too technocratic.

There is no chance whatever that the government of the Netherlands will accept the French conception. The Dutch never liked the European Army but are now prepared to accept it *faute de mieux*. But they see no reason to provide new organs simply and solely to control the EDC's Board of Commissioners, preferring the semi-supranational, semi-intergovernmental approach which is the present procedure of the coal/steel community and the model for the EDC. Moreover, the more grandiose and pseudo-federalist the political superstructure, the less real, in the Dutch view, will democratic control of the pools

actually be. On the other hand the Dutch government subscribes as a low tariff country to the plan for a genuine European union with automatic transfer of powers.

Neither the Germans nor the Italians have supported the Dutch in their "all or nothing" position. But this, it seems, is only for diplomatic reasons. Germany has certainly everything to gain from full union, but something very important—namely its full sovereignty—from the first degrees of it. Hence its desire not to frighten France out of the EDC. Italy, already granted a certain temporary protection for its high-cost steel industry, has everything to gain from a European system which permits it to export its principal commodity, labour. Belgium and Luxembourg have, in negotiations on integration, usually been content to follow the Italo-German line. Belgium is afraid only for its high-cost coal mines (which the coal/steel treaty protects for a time), and Luxembourg only for its agriculture, which, as in the Benelux convention, will probably be excluded from the European common market.

Pools Without a Roof

Granted the deadlock between Holland and France over the automaticity of the EPC's economic clauses, it seems unlikely that any agreement will quickly be reached on the European Political Community. For a number of years there may have to be two pools with no "roof." This will not necessarily mean that the European movement will come to a stop. Industrial and military integration are in the nature of a revolution by the élite occasioned by the iron necessity of defending western Europe against both Soviet and German aggression. European union is certainly the ideal of youth, but it is still rather an escapist and negative idea among the masses. It is argued that a direct election to a European parliament would be of immense educative value and further the cause of union. It can, however, be objected that the Six, having plunged into two pools, will not recover their breath for a while: that what is required is time to discover what the boards and the Council of Ministers can do by themselves. Before the fact, it is argued alternatively that they have too much power and must be further controlled or that they have too little and must be strongly supported in both cases by European political organs. It will surely be time for the people to intervene when the two existing communities have shown what they can and cannot do.

In the meantime it is extremely hard for France to opt outright for a European Community which must live at the German tempo, when it still believes itself to possess the chance, however faint, of re-establishing itself as a world power during the next two or three decades. The trouble is that the draught of foreign competition which is needed to loosen up France's protectionist economy (the main cause of its weakness in general) is likely to be too drastic if Germany is the blower. Those in charge of French fortunes therefore prefer a safety-first system of integration which risks stagnation but not economic *Grossdeutschland* from Hamburg to Bayonne. The test of French diplomacy will be its success in keeping Germany looking western without allowing too much German penetration of France and French Africa. But it can only be said that the French parliamentarian has shown very little talent in the role of Mediterranean seductress of the invading Nordic entrepreneur.

THE BUSINESS WORLD

Kaffirs Lose Their Premium

THE recent disappearance of the premium that "free" gold had long commanded over the official dollar price of \$35 a fine ounce marks a milestone in the history of the international bullion market and of the metal itself. Inevitably, it is also an event of considerable significance for the gold mining industry. This premium was the product of three sets of forces—the fear of war, the fear of inflation and the expectation or hope of an increase in the official monetary price of gold. The first two of these influences showed themselves in a persistent hoarding demand for gold, while the third led to a considerable volume of speculative purchases. The premium reached its peak in the early weeks of 1951, when the price of "free" gold rose in continental markets from \$40 to \$44 per ounce. Events in Korea, fears of an extension of hostilities and the resulting hoarding of gold were the prime causes of this steep rise in the premium. Another was the fact that the substantial outflow of gold sustained by the United States during the latter part of 1950—as the counterpart of its stockpiling purchases of strategic raw materials—had stimulated expectations and hopes that the official American attitude towards the dollar parity price of gold might change. This in turn led to a considerable anticipatory buying of gold by dealers in the free markets.

From that peak, however, the free market price has steadily declined. It had fallen to \$39 by the end of 1951 and to \$37.50 by the end of 1952. The downward trend has continued this year, until on November 18th the spread of selling and buying prices in the free market ranged for the first time below the official quotation of \$35. It now stands evenly balanced on either side of that figure, at \$34.90 to \$35.10 per fine ounce. There remain, however, certain markets where gold is still quoted at an appreciable premium; in India, for

example, the current rupee quotation is equivalent to about \$45 per fine ounce. But the premium still quoted in such centres does not reflect the working of a free market; it results from official, though not wholly effective, prohibition of the import of the metal. Wherever gold is dealt in freely, no seller can obtain as good a price as the official parity. The collapse of the premium became inevitable from the moment when, in September, 1951, the International Monetary Fund abandoned its hopeless battle against sales of gold by member countries at premium prices and left it to each member country to decide for itself how to reconcile its IMF obligations with its gold selling policy. This latitude permitted by the IMF led to an immediate and substantial expansion in the volume of newly mined gold offered on the free market. Informed estimates suggest that the free market in 1952 absorbed nearly half of the gold produced in that year.

A considerable diminution in the hoarding demand for gold went hand in hand with this increasing supply. The mainland of China, formerly the great Far Eastern "sink" for the metal, has been dragooned by the Communist regime into closing its frontiers against anything resembling an organised inflow of gold. Some smuggling still occurs, but the penalties for it, as for hoarding, are such as to deter all but the most hardened enthusiasts. The end of hostilities in Korea has also quietened the hoarding demand not only in the Far East but also in Europe, notably in France, a country whose absorption of gold has in recent years outmatched that of any other. The evaporation of hopes of a higher official price for gold has also played a considerable part in the disappearance of the premium. If for no other reason than that 1933 devaluation of the dollar was the work of a Democratic Administration, it may be assumed that the Republican Administration will have

nothing whatever to do with suggestions for any repetition of such a move—unless and until, perhaps, it becomes convinced of its advantages as a domestic deflationary device. Much has been said in recent weeks of the part played by sales of Soviet gold in weakening the free market price. It is true that in the past month some 600,000 ounces of Russian gold—worth roughly £7½ million—have been offered for sale through the Continental free markets. These sales may have been the marginal factor responsible for the final disappearance of the premium; but they can have done no more than hasten by a few weeks an event that was inevitable in any case.

There seems to be little likelihood of any early reappearance of the premium—in the absence, of course, of any sudden worsening of the international situation or an unexpected sympathetic turn in the attitude of the United States to the question of raising the currency price of gold. One of the reasons for expecting the free price to remain at around the official parity is that the main gold producers are large potential sellers in the free market. South Africa has already taken steps to allow its producers to sell their gold in the free market in the form of fine bars, thus avoiding the expensive artifice by which the bulk of the gold sold by South Africa in the free market was offered in processed form or in simple ornaments that could, without much difficulty, be reconverted into the original form of bars. During the past week some South African gold has actually been sold in the international market at a price below the official parity: but this apparent anomaly is explained by the fact that the effective parity for South African and other producers is not the theoretical currency parity price of \$35 an ounce as such but the net return from gold sold to the monetary authorities of the world at that price or its equivalent. When South African gold is sold through the Federal Reserve Bank of New York to the United States Treasury, the net price received by the seller, after allowing for insurance, freight and handling charges, is \$34.77. It is not surprising, therefore, that some South African gold should have been sold in the free market this week at \$34.85.

The disappearance of the premium is a matter of considerable importance to goldmining profits. Between July, 1949, when South Africa began selling gold on the free market, and the recent disappearance of the premium, the gold producers have received about £15½ million from the premium on the 16 million ounces or so of gold that has been thus sold. In 1951 the additional revenue from premium sales amounted to £6,693,000, compared with total working profits of £44,157,000. In 1952 the aggregate working profits fell to £38,746,000, and over half this decline was due to a fall in the additional revenue from premium gold sales to £3,699,000. At first sight, therefore, it seems paradoxical that the sizeable boomlet in the Kaffir

market should have coincided with this particular episode in the chequered fortunes of the mines. This market activity, however, does not reflect hopes of any early expansion of the working profits derived from gold operations. As Table I shows, working profits from gold are being squeezed inexorably between rising costs on the one hand and the fixed gold price on the other:—

TABLE I—GOLD PRODUCTION, COSTS AND PROFITS OF SOUTH AFRICAN MINES

	Output in fine ounces	Costs per ton	Profits per ton
		£ s. d.	s. d.
1938.....	12,161,375	19 3	11 9
1950.....	11,663,570	1 9 7	17 4
1951.....	11,497,905	1 11 9	15 2
1952.....	11,299,986	1 14 2	12 11
1953 (9 months).....	8,526,591	1 16 2	12 0

There appears to be no early hope of escape from this tightening squeeze on working profits from gold, especially now that the contribution made by sales in the free market has run dry. But from this dull prospect for gold, the market speculators look to the glitter of uranium, formerly a minor by-product of the South African goldmining industry—if, indeed, it was produced at all. The uranium boomlet is certainly not all glitter; but its foundation of fact cannot be precisely assessed even in terms of current or immediately foreseeable output, quite apart from the uncertainties of the future. Under the Atomic Energy Act of 1948, which governs the production of uranium in South Africa, any disclosure of information about ore reserves, annual output or the price paid for uranium is forbidden. Some highly important facts are, however, known about the uranium programme in South Africa. Twenty-three mines have been allowed by the South African Government to announce that they are among the uranium producers. Their names, together with the years in which actual production is due to begin or has already begun, are set out below:—

*-Already producing.

It has been found that in most of these South African mines the production of uranium can best be undertaken by the recovery of uranium oxide from the residual

slimes after the gold content has been removed by the normal treatment. Thus the cost of mining and crushing the ore is borne by gold, and the production of uranium becomes a self-contained and subsequent operation. The capital expenditure involved in the erection of the plants to produce uranium has been advanced by the British and the United States governments in the form of loans to the mining companies. The recently published report of the Committee of Public Accounts revealed that by last April the British Government, acting through the Ministry of Supply, had made loans amounting to £1,400,000 to certain South African companies for the purpose of capital development in the production of uranium.

★

The uranium produced in South Africa is sold under long-term contracts to the governments of the United States and the United Kingdom. These contracts cover a period of ten years from the time at which each mine comes to the production stage. No information about prices is available—except that it is calculated on a “cost plus” basis. Included in the cost of production is an amount sufficient to cover the redemption of the capital cost of the plants plus interest over the ten-year period of production. Thus at the end of a decade the uranium plants will have been paid for and will become the property of the companies concerned. According to figures published in *Optima* by the Secretary for Mines and the Deputy-Chairman of the Atomic Energy Board, Mr V. H. Osborn, the total capital expenditure by the gold mining companies that have agreed to erect plants for extracting uranium is expected to be about £40 million, while the revenue to be obtained from the sale of uranium when all these plants are in operation should be about £30 million a year. From this revenue must be deducted the working costs of operating the plants as well as the amounts required to redeem the capital cost and to pay interest on the loans over the ten-year period. The balance remaining after deducting these items represents profit; for the purpose of income tax in South Africa, these profits are treated on the same basis as profits from gold. According to Mr Osborn “the prices are so arranged as to provide the mines with a satisfactory margin of profit.” That assertion seems to be confirmed by the uranium profits already revealed by the two mines—West Rand Consolidated and Daggafontein—that were first off the mark in the race for uranium output. For the September quarter of this year they showed together uranium profits of £415,000, representing almost exactly one quarter of their total working profits of £1,656,000. At this stage, the two mines in question were presumably doing little more than run in their plants. It would be unwise, however, to regard these figures as a guide to the prospects even of the companies concerned; and they afford little evidence of how other producers may fare.

In any case, it should not be assumed that the return

from uranium will necessarily raise total profits correspondingly. The reefs richest in uranium content may prove to be also those that are relatively poor in gold content; in that case, the profits from uranium production will be partly offset by some decline in gold profits, through a general downgrading of the ore mined. This is already happening in West Rand Consolidated, where the grade of ore has fallen from 3.2 to 2.7 dwts per ton over the past year. The principal uranium beneficiaries will be the low grade mines, notably Randfontein, which is promised not only a substantial increase in working profits but a considerable extension of life.

The benefits of uranium production will be localised, and the prospects must in any case be viewed cautiously. There is complete uncertainty about the terms on which the present ten year contracts with the United States and United Kingdom Governments will be renewed, since the next decade may bring to light much cheaper sources of this material than those provided by the deep gold bearing reefs of the Transvaal and the Orange Free State. It might, indeed, witness the discovery of altogether new types of fissile materials. Uranium is too young and unstable a basis on which to build confident hopes of a new lease of life for the South African gold mining industry.

★

For the time being it would be wiser to continue to assess the prospects for that industry in terms of gold alone. Viewed in that light, the outlook is not very promising. A great deal of capital has still to be mobilised to bring the new Orange Free State mines to full production. This week has provided another example of the difficulties that are being experienced—and will continue to be experienced—in securing the necessary capital; the considerable finance needed by Freddie's North and Freddie's South has had to be found, not by direct issues of capital by these companies but by the issue of fresh capital by the parent company, Johannesburg Consolidated Investment. The best that can be claimed for gold shares is that they provide a reasonable hedge against deflation and economic depression. For those who are convinced that these horrors are on the way, gold shares offer a double attraction: first, the fact that production costs will, in those circumstances, tend to fall; and, secondly, the likelihood that the United States may look much more sympathetically towards the device of dollar devaluation if and when it finds itself in the depths of depression. It is the paradox of the gold mining industry that it tends to be twice cursed in a world boom but twice blessed in a world slump. In inflation it gets all the kicks of rising costs while abhorrence is felt at any suggestion that inflation should be further stimulated by bringing the price of gold into line with other commodity prices. In deflation and slump, as happened from 1931 onwards, it gets the benefit of lower costs, while upon that there is superimposed the unearned increment of devaluation. It may happen again.

Car Shares and Competition

THE easy canter of a racehorse down to the starting gate gives very little idea of its form. In their latest financial years, mostly to July 31st, the motor companies seem to have enjoyed just such a pipe-opener. From the figures recently published by British Motor Corporation, Rootes Motors, Rover and Standard Motor, therefore, investors would certainly find it difficult to name the winner in the competitive struggle that confronts the motor industry; but they ought to be able to pick out the bad starters. Outwardly, at least, these accounts tell much the same story. All the companies' factories have been working closer to full capacity than they were a year ago; profits have hardly altered; and ordinary dividends are little changed.

This placid surface, however, conceals a number of cross-currents. It is not immediately apparent from these accounts that while the total production of the industry has been rising, manufacturers have become increasingly dependent upon the home market. In the year to July 31st, total British production of cars and taxis increased by 16 per cent but exports fell by 12½ per cent. At the same time, production of tractors and commercial vehicles (both rather more directly affected by overseas demands) fell by 16 per cent and 4 per cent respectively, in line with a 25 per cent reduction in their combined exports. Little is known of the stake of the individual companies in these markets. Of the four companies that have just issued their reports, British Motor alone has published details of its sales, showing that while the number of vehicles produced by Morris Motors rose from 128,925 to

139,146 vehicles the Austin factory at Longbridge (where production was thrown out of gear by the three months' strike in the spring) turned out 139,694 vehicles, compared with 147,833 vehicles in the year before. In other reports shareholders are vaguely told of "record sales" and "record output" and even in the BMC report Mr Lord states not very precisely that "at the present time production in all factories is running at a new high level." They will have noticed, too, that Standard Motor has dropped its former practice of showing its turnover figures.

Marked stability in profits for a year of rising sales clearly argues smaller profit margins. For most of the companies, a lower profit margin has been a deliberate choice in preparation for tougher competition ahead, long after waiting lists and covenants have been forgotten. A full and steady flow of raw materials to the motor factories, together with the immediate fact of a high demand in a liberated market, has lifted production close to full capacity; unit costs of production must have been reduced, and commitments in stocks and work in progress could be safely lightened. It cannot be altogether accidental that Standard Motor (which was the first in the postwar field with the "Vanguard") is the only company of the four to report a marked increase in the book value of its stocks—from £4.8 million to £6.5 million—and, as a customary corollary, a decline in liquid resources. The other companies, notably British Motor whose "stocks and tools" have been reduced in book values from £31.6 million to £29 million, have kept a much tighter rein on their working capital commitments than this.

* Including cash balances, tax reserve certificates and quoted investments.

Reduced selling prices are but one of the moves that the motor companies have made against the day when competition among themselves and with foreign companies will grow fiercer. That competition is already taking a fighting form in the new models displayed at the Motor Show; and in the battle between BMC, Ford and Standard for the "baby" car market. Many of the companies have still to tackle the technical and financial problems in developing new designs; cars that have become almost staple lines over the years, with minor modifications in body panels and trim to freshen them up, will not always serve to satisfy an increasingly critical motoring public. The increases in fixed capital investment and the substantial increases in outstanding capital commitments that recent accounts reveal represent the first instalment of the cost of redesigning and re-equipment.

But a new strategic disposition of forces in the motor industry is becoming visible. In retrospect, one sees the first evidence of this deployment in the merger of Austin and Morris into the British Motor Corporation. This year has brought two more moves, this time towards vertical integration. Ford Motor arranged the complete absorption of Briggs Motor Bodies into its organisation and British Motor Corporation bought the ordinary shares of Fisher and Ludlow, both leading motor body manufacturers. It would be a little melodramatic to regard these moves as the gambits in an exclusive struggle between the Ford and British Motor concerns. But equally it is only sensible to recognise the fighting spirit of these two giants as something in a class apart from the admittedly considerable attack that some of the mere heavyweights in the industry could mount.

In any assessment of the financial prospects of individual motor companies, therefore, the investor must satisfy himself on a number of questions. There seems, on the evidence of the success of Ford and Vauxhall, to be great advantage in the maximum standardisation of power units and body pressings. Other companies have gone some of the way along the same road. British Motor, with its more loosely knit organisation, presumably offers opportunities in this direction beyond anything that has been attempted since the merger, if "Austin" and "Morris" can be turned into more complementary and less directly competitive marks than

they now are. The standardised power unit appears too frequently—in the policies of Ford, Vauxhall and Standard, for example—to be disregarded when the investor is looking for the keys of success. If Ford can produce five distinctly different cars, using only two basic engine units and three basic body pressings, they will set a hot pace for any other competitor who wants to cover as much as possible of the total market at the lowest production costs. There are some companies that will have to react sharply to such competition and to forget the cosy market conditions that they have enjoyed since the war.

The assumption is usually made, without benefit of proof, that in the home market, at least, the industry will continue in its high state of prosperity. Indeed, the alarming prospect of five million cars on the roads by the 'sixties recently suggested in these columns has a foundation somewhat more solid than mere fancy. Taxation policy will indeed be crucial. But whatever happens, competition of a more trenchant character than the motor industry has experienced for years is now beginning; profits are likely to be harder to earn and more likely to be ploughed back than paid out if they are increased.

One of the best tests, at this stage, that an investor can apply is to compare the measure of cover for the ordinary dividends of different companies that is afforded by their distributable earnings. Table II shows that the market itself puts a great deal of faith in this particular test, for the dividend yields on motor shares closely correspond with the companies' net earnings record. In the case of Ford Motor (whose financial year does not end until December) an increase in the ordinary dividend has obviously been discounted to an extent approaching 12½ per cent on the reorganised capital, compared with an equivalent 7½ per cent for 1952. The comparatively low yield on the shares of Rootes Motors, technically one of the more conservative groups, reflects a generous margin of earnings for the 32½ per cent dividend and to some extent also the limited market which these shares command.

Discouraged, perhaps, by low yields on the more promising shares and distrustful perhaps of the high yields shown by some of the others, the investor may be tempted to look around to see if there are attractions

TABLE II—MOTOR SHARE DIVIDENDS AND YIELDS

Ordinary Stock	Financial year-end	Earnings		Dividends		Market price		Yield	
		£ '000s	Per cent	£ '000s	Per cent	End-Nov., 1952	Nov. 25, 1953	End-Nov., 1952	Nov. 21, 1953

* Adjusted to give effect to share bonus issues. (a) On a 7½ per cent dividend, the yield would be 4.35 per cent, on a 10 per cent dividend 5.80 per cent, on a 12½ per cent dividend 7.25 per cent.

elsewhere in the industry. The latest results of Rover, however, demonstrate that the moderate-sized companies have fared no better than the giants; and some of them are likely to fare worse in a struggle for markets. If he turns to the fringes of the industry, he finds that the increase in the Joseph Lucas equity dividend from 9 1/6 to 10 5/6 per cent was backed by a comparatively moderate advance in trading profits from £7.6 million to £8.2 million; and he may feel that the shares might look more tempting if the yield were rather higher than 4.6 per cent and if the directors had not taken the unusual line of announcing their intention in future of declaring a single dividend.

Business Notes

Budget Shock

IT is easy to see, now, why Mr Butler recently took good care to give warning that an important supplementary estimate was impending from the Ministry of Food, and also to emphasise that current Exchequer returns might seem to present the budget prospects in too favourable a light. The additional sum sought by that Ministry for the current fiscal year proves to be no less than £126.8 million, so that its total cash requirement for the year is now put at well over twice the £109.7 million originally estimated. This should give a salutary jolt to complacency about the trend of Exchequer finances—even though the true additional strain from the provision for food and agriculture is not so alarming as a bald comparison of these figures might suggest. This moderately consoling qualification arises from the fact that the estimates requiring Parliamentary sanction relate simply to the estimated need for cash, and make no distinction between current and capital expenditure. In fact, a substantial part of the additional sum now sought is needed because some of the Ministry's stocks have not fallen so fast as had been expected and other stocks have been substantially increased.

This capital portion cannot be precisely estimated, but a broad idea of its size can be deduced from the fact that £72 million of the supplementary estimate represents an increase in the bill for subsidies; a large part of the remaining £55 million reflects actual or prospective additions to stocks—notably, the purchases of Cuban and Commonwealth sugar to permit derationing, and unexpectedly heavy purchases of domestic grain. But even the addition for subsidies includes a portion that, if not "capital," is at least a non-recurring charge. Additional sums paid in subsidy on food that will be consumed this year (e.g., the national loaf, as distinct from the new white bread) are indeed current expenditure; but sums paid in

This is, indeed, a difficult field for the investor. But when investors are reconsidering their portfolios of motor shares, they might have in mind a few guiding principles relevant to conditions of keener competition. Shares in the smaller companies or on which current dividends are not handsomely covered by earnings require to be considered with a good deal of circumspection. There need be fewer doubts about the equities of the two public giants of the industry, but if the benefits of a high degree of standardisation in production policy are what they seem, the odds would appear to favour the old stager in preference to the two horses that still have to be made to gallop in tandem.

subsidy to farmers this year on produce that the Ministry retains in stock will reduce its subsidy bill in future. On this basis of reckoning, probably not more than half the £126.8 million represents true additional strain.

The Bill for Subsidies

FOR the same reason, it is impossible to deduce from the figures the true annual rate at which the food subsidies are running now. The original target for the year's bill was £221½ million (of which £185.8 million was to be accounted through the Food Ministry), compared with £331 million actually spent in 1952-53 and with a rate of £410 million before the cuts announced in Mr Butler's 1952 budget. This actual expenditure on subsidies in 1952-53 was reckoned to represent an annual rate of £250 million by the end of that year. Now the actual bill for 1953-54 is put at £293.6 million (£253.8 million of it through the Ministry of Food), and the equivalent true annual rate is officially stated to be much lower than this; but it is hard to say how well it will compare with the target of £250 million set up twenty months ago.

From the budgetary aspect, there is one further point that needs to be made. The Ministry's additional requirement, even if fully spent this year, will not cause a fully corresponding deterioration from the position shown by the Exchequer's "overall" account now, because £41 million of the sum in question has already been spent—under the "below-line" head of issues to the Civil Contingencies Fund. Including that expenditure, the "overall" deficit up to last Saturday was £630 million, compared with £722 million at the similar date last year. The budget estimate of the "overall" deficit for the full year was £440 million, or only fractionally more than the actual deficit for 1952-53.

Convertibility in High German

A LITTLE cynicism—but not too much—seems to be the right attitude to adopt towards last week's outburst by the German Minister of Economics, who told a gathering of economists at Godesberg that "the whole system of the European Payments Union is doomed to failure" because it is nothing more than "a system under which these countries that have put their house in order are forced to subsidise countries that have neglected to do so." Professor Erhard was speaking on the eve of a visit to Washington, with a plan in his pocket for a gradual advance towards what he chooses to call convertibility for the D-Mark. By convertibility he means that Germans should be allowed to buy more dollar goods with their D-Marks, not simply (indeed not mainly) that foreigners should be allowed to do so. A central feature of this plan is that intra-European trade surpluses and deficits should be settled by more payments in gold and by less injections of EPU credit. Since the natural regional pattern of Germany's balance of payments is for it to run a surplus with Western Europe, this would mean that Germany would tend to have more gold to spend; and it is a peculiar virtue of Professor Erhard's oratory that he manages to make himself sound very liberal when he says that Germany would use this gold to buy more dollar goods. Any statesman can be forgiven for hankering after a "convertibility plan" of this sort. The British Government could no doubt enjoy itself with a bonfire of some of its most irritating restrictions on dollar imports, if Britain's principal export markets all agreed to 100 per cent liberalisation and 100 per cent payments in gold; the only trouble is that those markets have not got the gold to pay over.

The fact remains, however, that the EPU system is now saddling Germany and some other European creditors with a burden of unrequited exports that is almost as grave as that which the sterling area system imposed on Britain during the peak periods of inflation and import excesses in Australia and other overseas dominions. To rectify this, Germany would like to see gold payments play a larger part in the settlement of EPU clearings after June 30th next; and it is very angry that the majority of members of OEEC expressed themselves against early action at last month's meeting at Paris. The managing board of EPU is now believed to be studying proposals whereby the EPU clearings might very gradually be settled in larger tranches of hard currency, and whereby debtors would not automatically receive credit but might have to ask for consent to stand-by credits within EPU, on the analogy of the stand-by credits granted by the International Monetary Fund. While this was going on, the proposals adumbrate, EPU creditors would gradually whittle down their discrimination against dollar imports; EPU debtors would be told that they must not protect themselves by new import controls, but should resort to currency depreciation and sterner internal disinflation (probably with the "advice" of OEEC missions); and eventually EPU might itself be merged into an enlarged IMF. In its later stages, therefore, this "plan" coincides very closely with the original British "plan" of last December; and it is along this road that all EPU countries express some intentions of travelling hopefully. But that does not mean that they are going to arrive.

The Savoy and Mr Clore

THE latest salvo in the battle of the bids has successfully blasted its way on to the front pages of the national dailies. The directors of the Savoy Hotel have issued a circular explaining why two hundred members of the hotel's staff, who are also stockholders, have set in motion the machinery of a Board of Trade inquiry into dealings in the company's shares. The directors report that the spurt in the company's shares from a 1953 low of 26s. 6d. to last Monday's high of 51s. (immediately replaced by 53s. after the issue of the circular) followed indications that "a big buyer (who was unidentified) had appeared in the market and was willing to buy anything up to £50,000 or more, at a price nearly always just ahead of the ruling market price." Shortly afterwards Mr Charles Clore, who has become the *eminence grise* of recent property deals, approached one of the directors of the Savoy and indicated that he would like a seat on the board; the "proposal was that the directors, most of whom spend their full time managing the business, for which they have been trained, should remain as directors, but with Mr Clore in financial control." The directors found this quite unacceptable, for they presumed that Mr Clore's objective would be "to dispose of [the company's] freehold property and lease it back again." "In the case of the Savoy," they declare, "such a procedure would bring ruin to the company, as the rents which would be payable at the Savoy and Claridge's and at the Berkeley, on a present-day basis, would be so high that the company could not survive." This seems to be tantamount to saying that the current return on these properties, in the use to which they are now put and as at present managed, does not give an economic yield on the capital values at which a free market would assess them.

In a speech at Bradford last week-end, Sir John Braithwaite, the chairman of the Stock Exchange, delivered a carefully-balanced judgment on all these take-over bids. "It is not a crime," he said, "to make a take-over bid, or to buy shares on the Stock Exchange with the object of acquiring control, and it is not a crime to use the names of nominees for that purpose"; but "what has been regrettable about some recent cases has been the premature leakage of information," and "what would be criminal would be the deliberate putting about of false rumours of take-over bids for personal profit. No case, happily, has so far been substantiated." Many people will also feel that there are dangers in a situation where the best-known and richest bidders have the power, in today's narrow markets, of ensuring a temporary rise in almost any share that they buy and with which they associate their names; and that one of these dangers is that they may bludgeon their way on to the board of companies that they could gut as well as on to those of companies that could be improved by managerial disturbance. The circular from the Savoy, like all good briefs, is well-calculated to stir these proper, if fearful, emotions. It notes that Mr Clore made his original approach to a director on a racecourse in France; it details the names and addresses of the nominees and solicitors concerned in the case, in phraseology that smacks of a detective's dossier; and it reports that Mr Clore intimated that "he thought it would be much better if the directors hitched their star with him," for otherwise "they would in time find they were

no longer 'in the saddle.' It may not always be wrong to judge these cases by reference to the emotions as well as to the reason; but no judgment, least of all an emotional one, should be passed until Mr Clore has exercised his right of reply.

Uncompetitive Exports

THE ostensible function of the National Production Advisory Council on Industry is to enable representatives of employers' organisations, the trade unions and the nationalised industries to advise the Government on industrial conditions and production. It sometimes even fulfils that function, for example all parties in it have recently been pressing upon the Government the need to help industry by devoting more resources to improvement of the roads. More often, however, the meetings of the Council provide a forum for Ministerial exhortations to industry, sometimes of a rather flatulent kind. Mr Butler's criticisms at last week's meeting derived importance because they were much more specific than usual. They were concentrated on one complaint. The Chancellor is disturbed that Britain has been steadily losing ground in many important non-sterling export markets in the last two years because British exporters are very loth to cut prices as competition increases. If a need arises to foster sales—and it very soon may arise in an acute form—the immediate reaction of American exporters is to cut prices to clear stocks. The immediate reaction of British exporters is to write letters to the press, which imply that anybody who has cut prices below hypothetical costs has done something rather shoddy. The recent loss to Germany of a contract for about £11 or £12 million of locomotives for India, where prices (not delivery dates or credit terms) were the deciding factor, has aroused this controversy in an acute form.

The current issue of the Treasury's "Bulletin for Industry" fills in the background to Mr Butler's forebodings, with some uncomfortably hard facts. Between 1950 and 1952 the volume of world exports rose by 7 per cent, but the volume of British exports fell by 5 per cent; in the first half of 1953 this trend was continued, for the volume of British exports stood still at the 1952 average while America, Germany and Japan all increased their exports by 5 or 6 per cent. In 1950 Britain's share of the exports of manufactures from the ten leading trading countries was 26 per cent; by 1952 it was down to 22 per cent, with exports of machinery, cars and rayon especially hard hit. There are some special factors that help to explain this fall: among them, the industrial resurgence of two of Britain's principal competitors in Germany and Japan, the exceptional impact of rearmament on Britain's exporting industries, and the concentration of much of the fall in world demand for manufactures in Britain's traditional markets of the sterling Commonwealth. But none of these—not even defence—is an ephemeral factor; in a later speech at Manchester this week the Chancellor again emphasised that "we should not anticipate in the near future any magic lightening of the load." It is becoming increasingly obvious that without the fortunate turn in the terms of trade Britain's balance of payments would now be looking very sick indeed.

October's Example

THE full trade returns for October, published this week, cast more light on the stickiness of engineering exports in the face of this foreign competition. October is nearly always a good month for exporters in general, partly because Christmas demand comes to the ports some weeks before it comes to the shops. Total exports last month are now estimated at £227.6 million, about £16 million (or nearly 8 per cent) above the third quarter's average. But, within these totals, exports of engineering products rose by only 3½ per cent to £84 million, and are thus still £3 million below their monthly average in 1952. Shipments of vehicles and machinery each rose by £1 million above the third quarter's average, but both were £1 million below the monthly average of the second quarter (and £600,000 and £2 million, respectively, below the average for 1952). Exports of "other manufactures" rose to £49 million in October, a full 9 per cent above the third quarter's average; there was a fall of £500,000 in exports of refined petroleum, but exports of chemicals increased by nearly £1 million, those of arms and ammunition by some £1,500,000, and shipments of footwear and plastics were also notably higher. Textiles continued their recovery; total textile exports reached £35 million in October, some 6 per cent above the third quarter's average. Exports of metals rose even more sharply, to £26 million or 13 per cent above the third quarter's average; this was mainly due to larger shipments of iron and steel.

Recorded imports in October were £5 million higher than the third quarter's average of £275 million, but they were distorted by the recording as "imports" of the aircraft and parts recently received as a gift from Canada. When allowance is made for these gifts, the October figure for imports is reduced to £275 million and the third quarter's average

THE TREND OF BRITISH EXPORTS
(£ million—monthly averages or calendar month)

	1952	1953			
		First qtr.	Second qtr.	Third qtr.	Oct.
Food, drink and tobacco	13	12	12	13	14
Raw materials and articles mainly unmanufactured . . .	9	10	10	9	10
Articles wholly or mainly manufactured :—					
Metals	23	24	23	23	26
Engineering products	87	83	86	81	84
Textiles	32	31	30	33	35
Other manufactures	44	41	43	45	49
Total Utd. Kingdom exports	215	208	210	212	228

to £268 million, compared with the monthly averages of £282 million in the first half of 1953 and of £290 million in 1952. Trade with the sterling area in October showed an increase of 9 per cent in British exports and of 4 per cent in British imports above the third quarter's average; exports to the non-sterling countries also increased by 6 per cent, but imports from them stood still.

An outstanding development . . .

Illustrations by courtesy of Shell

Hydrogen sulphide is extracted from the gaseous fractions produced in the catalytic cracking unit at Stanlow Refinery and converted in Claus kilns to elemental sulphur of 99.9% purity. The kilns produce sulphur at the rate of over 10,000 tons per year and at a recovery efficiency exceeding 98%. Peter Spence & Sons Ltd., as suppliers of the catalyst, are proud to be associated with this successful Shell project.

SECURICOR

PROTECTS YOUR PROPERTY

. . . and your business

Our Service can be used in either of two ways:—

TELECONTACT. For a small charge you can reinforce your permanent night staff by arranging for our TELECONTACT service which gives your staff the protection of an hourly contact by telephone. Should no call be received at our Headquarters, Scotland Yard is at once advised.

Or better still:

TRAINED GUARDS. You can call on us to post on your premises for the protection of your goods and plant one or more trained, uniformed, fidelity-bonded guards in constant touch by telephone with their headquarters. In 1951 losses from fire in the United Kingdom and Eire alone amounted to £23,000,000 apart from any consequential losses. The nightly losses from burglary reach a staggering figure.

Prevention is better than cure. Securicor service has become a household word in industry. For full particulars of our service please write or telephone to

Between privation and plenty, between misery and freedom, stands the power barrier. THE BRUSH GROUP bursts through this barrier with all the great resources of modern skill to give the world those vital raw materials which bring life and hope to its peoples. At this very moment Shell are drilling for oil at a depth of nearly two miles beneath the bed of a lake in Venezuela, using a diesel-electric drilling barge—a floating power station, the first of its kind ever built in Britain.

THE BRUSH GROUP is proud to share in this exciting venture. For the main power plant consists of four 12-cylinder diesel engines made by Mirrlees, Bickerton & Day Ltd., a member of the Group.

BRUSH through the Power Barrier

On land, on water (and now even under the water), THE BRUSH GROUP is bursting through the power barrier—exporting the power which assists the march to *true* civilization.

Atomic Exchanges

THE American Government's offer to Britain of a barter deal on atomic information is generally taken as a sign that American scientists believe their British counterparts have some information worth the exchange. At this stage, neither side knows whether this is in fact true. During many recent months of discreet discussion, representatives of both countries have attempted to discover the extent of progress made by the other, without revealing their own hand. British scientists have come home from these sessions with an impression, but no proof, that they may in certain fields be ahead of the Americans, and the Americans have learnt enough about British developments to suggest that both parties should now put at least part of their hand on the table. The British reply has made it clear that this country expects the cards to be of reasonably high value.

The next step is for the American Government to prepare a list of the headings on which information might be exchanged. When this list has been studied in London, the British scientists will then decide whether they consider these headings provide a useful basis for negotiation and what they would be prepared to offer in return. The matter is one for keen horse-trading. American regulations that prohibit the release of atomic information to other countries relate only to weapons, and given some latitude in interpretation, it might be possible to exchange information on pure research, on industrial developments and (as has already been done to a limited extent) on the effects of atomic weapons, without introducing amending legislation into Congress. A pooling of data on such aspects of the work would go some of the way towards reducing the very expensive duplication of effort that has taken place in Britain, the United States and Canada as a result of the American policy of strict atomic secrecy. But the rapid development of atomic weapons in both countries is beginning to indicate that nothing short of full exchange can provide a really satisfactory and economical working arrangement between the three countries.

Rejuvenating the BIF

THE Government's proposed face-lifting operation on the British Industries Fair will hardly prevent that institution from showing its age, but it may make it easier for the old lady to move with the times. The London section of the fair, which deals largely with light industry, is organised by the Board of Trade, while the engineering section at Castle Bromwich is run by the Birmingham Chamber of Commerce. From next year, the management of the London section will be taken over by a "non-profit-making company" on the lines suggested by Sir Ernest Goodale's committee. The committee noted that the Birmingham sections regularly showed a profit and concluded that the London sections might do the same if placed under a management not continually changing as civil servants were promoted. But the fair dates back to the days when exports were a sideline for many British industries rather

than a necessity for the country's survival. An exhibition representing all industries, with the hotch-potch of exhibits that both buyers and sellers find so irritating today, suited the foreign agent who used to come once a year to arrange for the delivery of a variety of lines from a variety of industries.

The growth of British export business has outmoded this method of trading. The foreign agent with a large general warehouse has been widely replaced by the specialist, and the amount of business done with foreign buyers is usually big enough to justify the holding of special trade exhibitions. It is these exhibitions that have drained the vitality from the BIF. The Birmingham section has the common theme of engineering products to hold it together. But the market-square atmosphere that was such a noticeable feature of the London sections, with their odd jumble of food and printing machines, textiles and boats and jewellery and chemicals, is considered inappropriate today by companies that have been prominent exhibitors in the past. They prefer the more selective atmosphere of the trade exhibition, or the even more *recherché* one of a private show. Yet for small companies, and small industries, the BIF is the one opportunity to attract foreign, or sometimes even home custom. Not every industry has its trade show, and there is not always space for every company that may want to exhibit. But if the new body is to keep the London section of the BIF alive, some big exhibitors will have to be attracted. Without their support, it would be difficult for the fair to survive.

Aid for Natural Rubber?

THE United States Government has responded quickly to the International Rubber Study Group's suggestions of action that it might take to relieve the depressed price of natural rubber. These suggestions, which were discussed in *The Economist* of November 7th, were that the United States should raise the price of synthetic rubber, re-examine its policy for rotating the strategic stock of natural rubber, and revoke a directive which stated that the compulsory use of synthetic might be reimposed at a minimum level of 450,000 tons a year for GR-S and of 60,000 tons for special purpose rubber. In law, the minimum requirements are only 200,000 tons and 22,000 tons. The directive has now been withdrawn, and the General Services Administration, which buys natural rubber for the American stockpile, has called a meeting of its rubber industry advisory committee, representing the rubber trade and the manufacturers of rubber products, to consider how best to rotate its stock. The withdrawal of the directive is a gesture—and conceivably a helpful one. But too much should not be made of it, since the actual consumption of GR-S synthetic is still running at about 550,000 tons a year, well above both the level limit of 200,000 tons and the possible raising of the minimum to 450,000 tons; but the existence of the directive was something of a bogey to the natural rubber producers, who felt that the time could come when American manufacturers might restrict their consumption of natural rubber to avoid the possibility of enforced usage of synthetic.

More tangible help may come from the meeting of the

GSA and its advisory committee in the first week of December. The agency has been selling about 10,000 tons a month of low grade rubber from the stockpile, for delivery up to six months ahead. American manufacturers have thus been able to obtain virtually all their requirements of low-grade rubber without coming to the market. This has widened the discount on those grades in the market, and has probably helped to depress the price of the high grade rubber that the agency buys to replace its low grade stocks. The GSA is evidently considering the suspension of rotation for a time, and then resuming it on a smaller scale; the present rate of rotation certainly appears to be unnecessarily high. The agency's announcement did not mention the oft-repeated pleas for a higher price of synthetic rubber; in any case, this is not within its province. But such a step appears no more likely now than it ever did.

New Ways with Dividends

THIS week the directors of Unilever have set a precedent that could hardly be of general application, and the directors of Joseph Lucas have set a thoroughly bad one, in the manner of their dividend announcements. With their announcement that the interim ordinary dividend of Unilever Limited is to be raised from 5 to 6 per cent and that of Unilever NV from $4\frac{1}{2}$ to $5\frac{1}{4}$ per cent, the directors of Unilever have told shareholders what they can expect to get when the full dividend for the calendar year 1953 is declared late next spring. They expect to raise the final dividend of Unilever Limited from $8\frac{1}{2}$ to $9\frac{3}{4}$ per cent (thus increasing the full year's payment from $13\frac{1}{2}$ to $15\frac{1}{4}$ per cent) and that of Unilever NV from $7\frac{1}{2}$ to $8\frac{3}{4}$ per cent (increasing the full year's payment from 12 to 14 per cent). These increases have been announced, the directors state, with full "regard to the financial results of the year to date" and to the fact that "increases in interim dividends may cause conjecture as to the amount of the final dividend." It is true that "conjecture" about the Unilever payments has been especially widespread since the Dutch dividend limitation law was annulled in September, and the group's financial year has only six weeks to run. Evidently, the Unilever boards are in a position to take a conclusive decision on their dividend policy. But their case may be exceptional; many boards would be reluctant to commit themselves so far in advance or to forgo the opportunity, some time after the end of their financial year, to frame their dividend policy in terms of immediate prospects as well as past results.

The directors of Joseph Lucas have taken quite a different course. After announcing an increase in the full year's dividend from $9\frac{1}{6}$ to $10\frac{5}{6}$ per cent, they have declared that they "do not propose to recommend an interim dividend in the forthcoming year, but to include in the dividend at the end of the year the sum which would otherwise have been declared as an interim dividend." This decision has not been taken out of a deliberate desire for obscurantism, but its effects are wholly regrettable. Investors have bought the shares of Joseph Lucas in the belief that they can expect dividend cheques—and thus some indication of the current profitability of their company—at least twice a year. It may be administratively

convenient, and even yield a small saving, to take away this privilege; but administrative convenience should never be an excuse for making life more difficult for shareholders.

Cheaper Commonwealth Sugar

THE annual talks between the Ministry of Food and representatives of Commonwealth producers have fixed the "negotiated" or support price of sugar sold under the Commonwealth sugar agreement in 1954 at £41 a ton, a reduction of £1 6s. 8d. on this year's price. Britain undertakes to buy 1,568,000 tons of sugar a year at the support price and New Zealand has a similar obligation to buy 75,000 tons. The agreement, which provides an assured market in Britain at a fixed price for the bulk of Commonwealth exports, has been extended for a further year to the end of 1961. The reduction in price reflects a fall in the prices of sugar bags and other materials, and is the first reduction since the agreement became effective in 1950, when the price was £30 10s. a ton. The Commonwealth countries are largely high-cost producers, and the new price, which is equivalent to roughly 42s. a cwt. c.i.f. United Kingdom, compares with a current price in the free market of about 29s. a cwt. c.i.f. The free price, which was appreciably higher than the support price during the inflation of the market in 1950 and 1951, is now severely depressed, but it may rise slightly next year if the International Sugar Agreement comes into force and succeeds in stabilising the market.

The Commonwealth's exportable surplus in excess of the 1,640,000 tons that are sold at the support price, finds a market in Canada or Britain at the free price, plus the preference of 3s. 9d. a cwt. In 1954, this excess is likely to be about 550,000 tons, of which some 400,000 tons or more will go to Canada. Britain's obligations to Commonwealth producers, and similar obligations to home producers of beet sugar, are the two principal difficulties that are holding up the complete freeing of the sugar trade and the re-opening of the London market. Some means have to be found whereby Commonwealth and domestic sugar would be fully taken up at the respective support prices, despite the competition from cheaper sugars bought in the free market. Discussions on this problem are now being held between the Ministry and the trade. One proposal is that the prices of all sugars for domestic consumption should be "weighted" according to their share of the market, to produce an equalised price to the refiners.

Saving by Lottery

LORD PIERCY and his associates in the Industrial and Commercial Finance Corporation have long been in the first rank of those to advocate new methods of attracting savings into risk investment, now that those savings can no longer be garnered from the tax-ravaged rich but must come from "an aggregate of small surpluses, spread over a very large number of individuals." In an address to the Manchester Institute of Bankers last week, Lord Piercy sponsored

CLEAN COAL

The growing use of mechanical coal cutters and the working of thinner and poorer seams inevitably increase the amount of dirt in the coal that reaches the pithead. Efficient coal cleaning is more than ever essential to prevent trouble at power stations, coke ovens, gasworks and other coal-consuming plants, and to avoid burdening transport systems with millions of tons of rubbish. Simon-Carves have been building coal washeries for half a century. Plants by Simon-Carves are today responsible for nearly half the coal mechanically cleaned in Britain, and post-war plants built abroad have earned handsome amounts of foreign currency.

A warning to the new reader

DURING the last few months, some 10,000 readers have changed to the Manchester Guardian. This is agreeable to us, and encouraging. But are we in danger of becoming a 'successful' newspaper, with all the failings that this word implies?

We hope not, and we think not. These new readers must take us as they find us. They are intelligent people. They will hardly expect the Manchester Guardian to dance to their tune, or to tremble lest occasionally a point of view conflicts with theirs. The Manchester Guardian is an outspoken newspaper, which takes its mission seriously (although never solemnly!)

A newspaper is an important influence in the life of the regular reader. Let that newspaper, then, be the best that, in this fallible world, fallible men can produce. The Manchester Guardian can make no higher claim than that it does its best to respect the truth, the English language, and the reader. You may find that this is exactly what you want.

*If you have any difficulty in getting your Manchester Guardian regularly, please write to:
The Manchester Guardian, Manchester.*

a new idea—or rather revived a very old one—namely, the sale by the state of lottery tickets. He believed that if savings are to be attracted away from the vast sums that are spent on drink, tobacco, entertainment and betting in this country, an appeal must be addressed to the “speculative” instinct instead of relying on hopeful homilies about thrift. For this reason he suggested that the unit trust movement and the “penny equity” scheme (advocated by his associate Mr J. B. Kinross) are too conservative to make a real impact on the working classes in this country. Their interest might, however, be attracted by a lottery. It could be run by the state or a public corporation; and the unlucky contributors need not all lose their money but could be compensated with long term and low interest bonds or life insurance cover, while the winners would get a few glittering prizes.

Lotteries, of course, are common in Europe; they may have helped to make good some of the shortcomings of creaking systems of taxation, but they have not exactly proved a magic wand in restoring the financial solvency of France and its neighbours. They are reported to have been very successful in Soviet Russia, but sales of anything—even of pups—are customarily successful in that country, where government salesmanship is a blunt but effective art. Again, both English and Irish lottery tickets figured prominently in the London stock exchange lists during the eighteenth and early nineteenth century. The Victorian middle classes, though they discovered moral reasons for condemning lottery tickets, withdrew their support from them mainly because more profitable outlets for their savings opened up with the industrial revolution. There must also be a grave doubt whether the state is an appropriate instrument to collect risk savings, and it certainly is not the right instrument to distribute them; it might fulfil the function of collection more simply by the nationalisation—or by more milking of the funds—of football pools. In the end, any system of this sort would probably add something to the wealth of this country. But it is more debatable whether it would add anything to the country's welfare; certainly the churches and the football pools (for very different reasons) will maintain loudly that it would not.

Films and Funds

MR HAROLD LEVER last week not only talked out the Government's bill to extend the life of the National Film Finance Corporation for another three years; he also said a few sensible things about this and other methods of financial assistance to film production that deserve to be rescued from the verbiage of his filibuster. Mr Lever could not see why, if the film industry—or rather one section of the industry—must receive special financial assistance from the Government, other “artistic and useful” industries that are being squeezed out by taxation should not be similarly helped. Purchase tax has hit some other small industries exceedingly hard, yet they get no concessions. Moreover, Mr Lever disliked the prospect that the Corporation might continue to lend money to companies already in debt. At the beginning of the ill-fated debate, the President of the Board of Trade said that the £6 million now on loan to the industry had come to represent the film producers' working capital, and that they relied upon the Corporation to provide it. But £3 million of that total has been lent to one com-

pany, British Lion, and left with it. While the Corporation is generally being repaid at about the same rate as it is making its fresh loans of working capital, British Lion is unlikely to be able to repay that £3 million in the foreseeable future: the company's accounts for the year ending March 31st, disclose a net loss of £150,330, or slightly more than its net loss a year earlier, when allowance is made for an anticipated loss of about £200,000 on films produced.

The film industry was no whit disturbed by these criticisms, and took the completion of the debate this week, when only Mr Lever dissented from the second reading of the extension bill, as a matter of course. Producers and exhibitors, having reached a peace under duress over the renewal of the levy scheme, are now airing their separate proposals for future reductions of Entertainments Duty. While the exhibitors' accountants are working out schemes based on a reduction in the amount of tax per seat, the producers have decided that the Chancellor of the Exchequer should introduce a tax rebate scheme. Both sides speak as if a reduction in tax is a certainty, and that the only matter in doubt is the extent of the reduction; they scout discussion on the awkward topic of passing on some portion of the reduction to the patrons themselves. The Chancellor may have other views.

Scottish Bank Dividends

THE movement among the banks to thaw out their long frozen rates of dividend seems to be gathering momentum. Two of the Scottish banks have recently raised their dividends, while a third Scottish bank has now proposed a change in its capital that may be intended as a prelude to an increase in its dividend in future. And this week, too, the recent proposals by Barclays Bank for capital reorganisation (with which an increase in dividend was associated) were approved by class meetings of stockholders. The latest Scottish proposal comes from the National Bank of Scotland, an affiliate of Lloyds Bank, whose £1,100,000 of Consolidated capital stock is at present in £500 units, with only £110 paid-up. The directors will shortly propose a draft of £150,000 upon revenue reserves for the purpose of increasing the paid-up proportion to 25 per cent (so raising the total paid-up capital, including £400,000 of “A” stock, to £1,650,000) and splitting the stock into the more marketable form of £1 units, 5s. paid. Meanwhile, the dividend is being maintained at 16 per cent for the year to October 31st last. The two Scottish banks that have already raised their dividends are both independent institutions—the Royal, whose dividend is now 18 per cent, instead of 17 per cent, and the Commercial, which is paying 16 per cent instead of 15 per cent.

All three banks have announced moderate increases in profits for 1952-53—the Royal from £596,000 to £621,000, the Commercial from £380,000 to £394,000, and the National from £287,000 to £306,000. An intriguing feature of the balance sheets of the two latter banks (the Royal's balance sheet is not yet available) is that both show a perceptible increase in advances over the twelve months. Advances of the London clearing banks have still been declining—but chiefly under the impact of heavy repayments by the nationalised utility industries out of the proceeds of capital issues.

“This South African Sherry is better than ever!”

Yes, it's remarkable how they manage to keep on shipping finer and finer wine year after year.

How do they do it?

Simply by taking infinite care and not trying to hurry the job. These lovely South African sherrys we are enjoying in this country now are the reward of the infinite patience displayed back through the years by those Wine Farmers at the Cape.

You seem to know a great deal about it!

You remember I went to South Africa last year. I happened to meet a man who took me round the wonderful Wineries there where millions of gallons were being matured for the British market.

How long do they mature them?

The best wines are kept seven years at least before they are shipped. The South African Wine Farmers are determined—in spite of the demands from all over the world—to hold back and let the good stuff mature properly. You see their climate and soil are simply ideal for wine-growing, but it is necessary not only to produce lovely wine but, if you establish a name and reputation, to provide for keeping up the quality over the years.

These South African people certainly keep on improving their wines—especially their sherry. It's a credit to them.

That's what comes of selecting and maturing and waiting and keeping on doing that, and the longer it goes on the better the quality becomes.

I must say this is one of the finest Sherrys I've ever tasted.

Well, keep on drinking the best South African Sherrys and you will find the quality will astonish you.”

Remploy Works its Passage

NO simple criterion can be devised by which to judge the performance of Remploy, Ltd., the company formed in 1945 to provide work for seriously disabled people who cannot work in ordinary industry. Industry as a whole has to reserve 3 per cent of its jobs for the less handicapped people in the Ministry of Labour's "Category One"; Remploy employs 6,000 of the 14,000 in "Category Two," hopes eventually to find work for some 4,000 more, and counts the remainder too difficult to reach with employment, except at prohibitive cost. In eight years, the company has thus come some way towards achieving its central purpose; this too, however, not without cost.

In its first seven years it opened for disabled workers some 90 small factories, half of them between 1949 and the end of 1951. This continuous, fragmentary expansion would probably have spelt a continued trading loss even for a company employing able-bodied workers, barring some ravenous new market. Being undertaken simply in order to increase employment of people whose physical efficiency is rated at 26-33 per cent of that of the able-bodied but who receive about 75 per cent of the normal wage rates, it cost Remploy some £4,300,000 more than the company could earn from selling the goods these workers produced. These products are diverse; furniture, surgical boots, cardboard boxes and specialised packages, brushes and brooms, leather-work and some light engineering goods; they have to be chosen with regard not only to demand, scale of operations, and the special labour supply in a given locality, but also to disability.

Of the first seven years' loss, £2,443,000 was incurred in 1951-52; in the year ending March 31st last, with no further expansion in its number of factories, Remploy pulled its loss down slightly to £2,380,400. Its net deficit on trading was some £1,800,000; its turnover was probably about the same sum, so that the total costs were about double the turnover. The company's chairman, Sir Robert Burrows, who characterised the economics of Remploy as "topsy-turvy," was able to compare with its loss the substantial if not easily calculable cost of keeping these people idle; financially, the company thinks, this would be at least £200 a year each. The operations of Remploy cost the taxpayer rather less than £400 a year for each of the 6,000 workers, who get on average just under £300 a year plus some intangible satisfactions that no pension could confer. The company must certainly be encouraged to work its passage towards solvency as well as towards employing all the physically handicapped; but financial results would obviously be an incomplete measure of its effectiveness.

A Dearer Cup of Tea?

TEA blenders' hopes of a further decline in the price of common tea have been dashed by the disappointing trend of production in North India, the largest producer, in the last two months. Prices at the London auctions have fully recovered, with clean common broken pekee

reaching a new peak of 3s. 6½d. a lb, despite the seasonal falling-off in quality. Although the fall of about 20 million lb in output in North India this year has been more than offset by a rise of some 28 million lb in Ceylon and South India, the London trade feels that there will not be quite enough tea available for the remainder of the season. Spot supplies in this country are short, and stocks, which should be rising at this time, are in fact stable and represent little more than two months' consumption. Prices of common tea are expected to remain at about the present high level until supplies from the 1954 North Indian crop begin to reach Mincing Lane in July. The news that crop restriction in North India may be continued in 1954 does not appear to have affected market sentiment. Poor weather, rather than restrictive plucking, has been responsible for the fall in output this year, and the trade is sceptical of the effectiveness of restriction when the outlook for tea prices is so favourable.

The high price of common teas, which are used to cheapen the price of the good quality blends, is expected to lead to an increase of up to 4d. a lb in the average price of packet tea in Britain. As the average price of teas at auction has increased by about 7½d. a lb this year, and packet tea by only 4d. a lb, an advance in prices may be overdue. So far, the pressure of competition seems to have had more influence in restraining an advance than the fear of discouraging consumption.

Building and Materials

THE biennial building exhibition now being held in London faithfully reflects the industry's conservative tastes in materials and methods of construction. This year its stands serve to emphasise the absence of controls on the use of many traditional materials and the revival of competition between materials suppliers. The return of such materials as copper, lead, zinc and steel, side by side with the alternative materials developed during the period when their use was severely restricted, is giving the building industry a freedom of choice that it has not enjoyed for many years, at a time when its own volume of activity is at an inflated level. The physical curbs that still remain on this expansion of building activity are the strictly limited supplies of bricks (or rather, of fletton bricks) and cement; but the greater diversity of other materials available may mean greater flexibility in the style and the techniques used for the buildings themselves. If the building industry does not take these opportunities, it may find the enterprising and ingenious producers of permanent pre-fabricated houses treading too close behind it for comfort.

Output of bricks and cement is no more than adequate for the present rate of building and only builders who have taken the precaution of ordering well in advance can expect regular delivery. Production of cement is running at an annual rate of rather more than 11 million tons, of which 2 million tons are committed for sale abroad. Any gap between production and home demand has to be supplemented by imports of high-cost European cement, which is coming in at a rate that varies from 40 to 60 thousand tons a month. Brick deliveries depend entirely on production at local yards, since it would not be economic to import signifi-

cant quantities. Production is running slightly above estimates at a rate of more than 7,000 million a year—sufficient to meet the government's programme of 300,000 houses and leave a small margin over. But so long as builders are reluctant to use bricks other than flettons (which are usually the cheapest) local brick shortages are bound to persist, since flettons make up only a portion of total production. Capacity for both brick and cement production is expanding, but the building industry and its suppliers already employ one in eight of the working population of the country and it is doubtful whether it is in the best interests of the economy to encourage this further investment in this field.

SHORTER NOTES

A point brought out by Mr. J. W. Platt, chairman of the newly formed Shell Tankers, Ltd., at the launching of the "Hadra" a week ago merits particular consideration. By 1957 tanker tonnage will represent 35 per cent of all merchant shipping throughout the world and 34 per cent of all ships under British registry. The fact that Britain is keeping abreast, however, is due mainly to the activities of the oil companies; British independent owners now have only 10 per cent of the world's independent tanker tonnage. The Shell group has on charter about 4 million deadweight tons, of which 3½ million tons are of non-British registry—"a measure of the opportunities that have been open to British owners in a very sound business."

Company Notes

DEBENHAMS. Immediately after the publication of the full report of Debenhams (for the year to July 31st last), the company's 4s. ordinary stock units were marked down from 36s. 9d. to 34s. 9d. This was not so much a reflection on the company's recent trading—although the full accounts show that the increased dividend of 50 per cent takes as much as £550,000 from net profits of £1,123,509—as a mark of disappointment with the chairman's speech. In his speech, Mr G. M. Wright went out of his way to scotch suggestions that the company was considering a "property deal" and to express his opposition to any drastic scheme to revalue the company's freehold properties. These properties stand in the consolidated balance sheet at a value of only £16.3 million, although they are insured for about £31 million; and some investors have suggested that if they were sold and then leased back to the group, this would give rise to surplus proceeds that could be distributed to shareholders. Mr Wright pointed out that these proposals would merely substitute high rental charges (with the attendant danger of increased rateable values) for "advantageous mortgage terms," and would put the group continually in danger of "heavy uncontrollable expenses." He also believed that the hiving off of the group's properties into a separate company would be of no particular advantage (unless it were an

administrative advantage); it would involve considerable expense and it would not alter in any way the earning power of the group. In other words, the group's

recent action in revaluing the shares held by the parent company in subsidiaries (an action that gave rise to a book surplus of £6½ million) should not be regarded as the first stage in a drastic revaluation of all the group's fixed assets. Mr Wright is, of course, quite correct in pointing out that magical "fiddles" in the group's accounting practices cannot create more money for shareholders out of thin air.

The Agricultural Mortgage Corporation has reduced the rate of interest that it charges on new loans from 5½ to 5 per cent. This is the second reduction this year, as the rate came down from 6 to 5½ per cent last May. The Corporation traditionally adjusts its lending rates in line with changes in the rate at which it can itself borrow on new issues in the capital market.

The member countries of the International Civil Aviation Organisation's weather-ship service in the North Atlantic (Britain, France, Holland and Norway) are to meet in Paris to discuss the effects of the United States' decision to withdraw from the service. American weather ships have been covering the whole of the western and part of the mid-Atlantic areas; the American government hopes to have all 14 of them out of service by the end of June.

Car production during October is provisionally estimated as 53,170 compared with 38,917 in October, 1952. The rate of production was higher than in September, a weekly average of nearly 13,300 compared with 12,860, but because October was the shorter month, the September total of 64,304 cars for the month was the higher. Deliveries to the home market as indicated by the number of new registrations, had reached 180,000 in the first eight months of the year compared with 108,000 during the same period in 1952.

But the book value of the company's assets—as with many other stores—is so absurdly below their real value that shareholders have no means of knowing whether the dividends they receive are a full return on their company's true economic worth. To please the publicists, rather than to placate the "speculators," Mr Wright might be wise to think again.

TRINIDAD LEASEHOLDS.

The full accounts of Trinidad Leaseholds suggest that its proposal to double its ordinary capital by capitalising part of its reserves cannot necessarily be interpreted as a sign that another dividend increase is in prospect. Shareholders may have to be content with the equivalent of the new tax-free ordinary dividend of 20 per cent (which compares with 16½ per cent for 1951-52) for another year at least. Although the group's revenue reserves were as high as £9,883,448 on June 30th last, the chairman emphasises in his statement to shareholders that it is "an absolute necessity" that the group should have "adequate liquid resources available at all times to enable it to maintain and develop efficiently its widespread operations in the face of competition and economic and other uncertainties." Later, in commenting on the rise in the group's cash balances from £2,982,371 to £4,460,823, Mr Vos made this point again; and he added that the group faces heavy liabilities for current and future taxation.

Production in the company's oilfields in Trinidad improved again last year and throughput at its refineries continued to rise, from 26,568,700 to 27,143,500 barrels.

But this increase in output and sales was more than offset by an increase in operating costs and a fall in tanker freight rates. In consequence gross profits fell from

5s. ordinary stock at 30s. 6d. yields £5 7s. per cent.
Tax free.

£7,970,939 to £6,774,493. If the oil share market should enter one of its periodical pauses, the yield of £5 7s. per cent on the company's 5s. ordinary stock, at the current price of 30s. 6d., may not be immediately enticing.

GLAXO LABORATORIES. At their current price of 46s. 3d., the 10s. ordinary stock units in Glaxo Laboratories yield only 3.8 per cent. The new dividend of 17½ per cent (which is 2½ per cent above the effective rate for 1951-52) admittedly absorbs only £153,297 out of net profits of £1,585,025. With this massive cover, there need not be much fear that the dividend for the current year might go down; but neither the company's full accounts nor Sir Harry Jephcott's statement accompanying them suggests that the market is wise to pitch its hopes so obviously on to the assumption that the dividend will continue to go up. In the year to June 30th last, the group's export sales and prices

both fell; import restrictions caused a drastic narrowing of available world markets, and in those that remained competition in the sale of antibiotics was so fierce that substantial quantities of penicillin were "offered at prices little, if anything, above the bare factory production costs." The group is so heavily dependent on overseas trade that it was inevitable that its trading profits should fall sharply. They were down from £4,090,521 to £3,557,769; but, thanks to a reduction of some £638,000 in the provision for taxation, net profits actually rose slightly, from £1,503,278 to £1,585,025.

Since the end of June, Sir Harry reports, there has been some increase in the volume of export sales; but this has only "approximately compensated for the reductions in unit prices," and the group's trading profits so far in the current financial year are neither better nor worse than they were in 1952-53. The group has begun to reshape its export policy by placing the emphasis on the export of bulk products for local processing over-

seas. This reorganisation is probably wise; but it still has to prove itself and it will probably be very expensive. The only wonder left in the wonder drug market is that share prices are still so high.

LONDON STOCK EXCHANGE

Next Account begins December 9th.
Next Contango Day December 9th.
Next Settlement Day December 1st.

AFTER a succession of dull days at the end of the old account, the markets brightened up a little on the first day of the new one. Gilt-edged were still drifting lower at the beginning of this week following another warning from Mr Butler about poor progress in exports; on Monday the selling, though by no means heavy, was sufficient to lead to losses of between ¼ and ½ in the longer-dated stocks. In the next two days prices rallied slightly, but by Wednesday's close old Consols, at 65, and 3½ per cent War Loan, at 85½, were still ¼ and ½ respectively lower than a week before. In the foreign market German Potash bonds came on offer quite freely on the reported details of the debt settlement and on Monday the 7 per cent bonds lost 5½ points to close at 148½; when the new account opened, however, some fresh buying was reported and the 7 per cent bonds rose to 150½. The German and Japanese Government loans moved irregularly at the end of the old account, but turned a little firmer on the first day of the new one.

The heaviest losses in the industrial market were made on Monday, when the *Financial Times* ordinary share index fell by 1.1 points to 128.4. Apart from brewery shares (where recent dividends have been cheering) and colliery issues (which improved on the news of further liquidation distributions), almost all the "blue-chips" were marked down; and at the close United Steel shares were quoted at 3d. discount. This general decline in prices was again apparent on Tuesday (when even brewery shares came under pressure of profit-taking); on Wednesday the tone was firmer but the *Financial Times* index lost another 0.1 of a point to 128.1.

Throughout this period, oil shares remained firm, while rubber and tea shares continued to improve. There was also renewed interest in Kaffirs; the uranium producers, notably Randfontein, were the brightest feature in the whole market.

EXCHEQUER RETURNS

For the week ended November 21st there was an "above-line" deficit (after allowing for Sinking Funds) of £34,254,000 compared with a deficit of £17,269,000 in the previous week and a deficit of £34,583,000 in the corresponding period last year, bringing the cumulative deficit to £356,600,000 (£365,177,000 in 1952-53). There was a net "below-line" receipt of £2,597,000 which brought the total cumulative deficit to £630,197,000 (£722,030,000 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the new Exchequer stock, it is impossible to calculate the division between tap and tender bills until all the bills purchased have passed their original maturity date.

Financial Statistics

THE MONEY MARKET

THERE was never any marked stringency in Lombard Street in the week to Wednesday last, and at times credit was decidedly easy. In patchy conditions on Thursday of last week there was a small net shortage of funds, which was relieved by moderate special purchases from the banks; but in equally patchy conditions on Friday there was a small net surplus, which was absorbed by reverse selling of bills by the authorities to the market. On Saturday and Monday funds were just adequate; but on the next two days the market was flush with maturities and the authorities indulged in reverse selling operations on a considerable scale.

Despite consistently low allotments at recent tenders, the market maintained its bid at £99 9s. 6d. for the unchanged offer of £230 million at last week's Treasury bill tender; as total applications rose slightly to £374.5 million, the market's allotment fell again, from 46 to 43 per cent. The market's portfolio of bills is now clearly at a quite unusually low level. The offer at yesterday's tender was increased by £10 million to £240 million.

The Bank return shows an outflow of £4.4 million of notes; a rise of £6.4 million in Government securities held in the banking department was roughly offset by a fall in "other" securities, and a release of £4.2 million from public accounts allowed bankers' deposits to remain almost unchanged at £288.8 million despite the note efflux.

WE'RE INVITING INVESTMENTS and this is why!

More houses are going up. More purchasers are asking building societies for advances to pay for them.

So far in 1953 this Society has agreed to lend over £5,000,000 for the purchase of more than 3,000 houses newly built or in course of erection.

Money saved and invested with the Society is thus being used to good purpose.

Still more savings can be used. The interest offered is 2½% with income tax paid by the Society—equal to more than 4½% where the investor is liable for tax at the full standard rate.

If you would like particulars please write to the

Correspondents
all over the world

Yours sincerely,

This warm, friendly personal subscription to our letters to friends conveys also a message of truth and honesty. It is strange that these words are not used more often in business. Yet how appropriate they are, especially in such a relationship as must exist when the Bank is appointed as Executor or Trustee.

Hence it is that more and more use is being made of the Bank's services as Executor and Trustee as realisation is growing that the holder of such offices must combine an intimate and personal approach with experience and continuity.

The Manager of any of our branches will be glad to supply information and to hand you a copy of our Executor and Trustee pamphlet.

EXPORT QUESTIONS NEED EXPERT ANSWERS

Will
Latin America
take
Airliners?

WHETHER you are exporting airliners or T.V. equipment, dynamos or omnibuses, the markets of Latin America pose special questions about currency, import regulations and exchange control. As the only British Bank with branches throughout Latin America, we are particularly well equipped to answer these questions promptly and accurately, and to advise and assist you in many other ways.

Our *Fortnightly Review*, a digest of reports sent in from our 56 branches in South and Central America, is an invaluable summary of economic information for all who trade in these markets. We shall be glad to send you a specimen copy on application to:—

BANK OF LONDON & SOUTH AMERICA LIMITED
HEAD OFFICE: 6, 7 AND 8 TOKENHUSE YARD, LONDON, E.C.2
BRADFORD: 19 SUNERIDGE ROAD MANCHESTER: 36 CHARLOTTE STREET

RHODESIAN ANGLO AMERICAN LIMITED

ABRIDGED REPORT OF THE DIRECTORS FOR THE YEAR ENDED
30th JUNE, 1953

FINANCE AND ACCOUNTS.

Capital and Capital Reserve.—The issued capital was increased to £6,425,000 by the issue of £488,391 Stock of which £100,158 was issued for cash to Anglo American Corporation of South Africa Limited at 53/6d. per 10/- unit and £388,233 was issued to that Corporation (and associates) and to Powell Duffryn Limited in exchange for shareholdings. These issues were made at a total premium of £1,929,000 which has been added to Share Premium Account.

Profits.—The Profit for the year to 30th June, 1953, after charging all expenses, was £436,608. Taxation payable (including £370,000 for Profits Tax relating to an earlier period—see below), was estimated at £433,219. Profits unappropriated at 1st July, 1952, were £3,913,449. Making a total available of £4,349,704.

An Interim Dividend of 1/6d. paid on 14th May, 1953, amounted to £945,000. The Directors recommend the payment of a Final Dividend of 4/9d. absorbing £3,051,875. Leaving £293,829.

It should be noted that this year's dividends are payable on an increased capital and that a full year's return was not received on the investments acquired during the year. The amount distributable has also been affected by the exceptional debit for Profits Tax.

Profits Tax.—The Profit and Loss Account has been charged with a provision of £370,000 in respect of United Kingdom Profits Tax for the six months to 31st December, 1950. This liability arises from a series of technical complications which could scarcely have been foreseen, affecting certain income which was, until the receipt recently of a claim by the United Kingdom Revenue Authorities, regarded as exempt from Profits Tax. After very careful consideration it has been decided that no useful purpose would be served by attempting to oppose the claim, which is considered legally well-founded although inequitable in its results.

INVESTMENTS IN SUBSIDIARY COMPANIES. RHOKANA CORPORATION LIMITED.

Capital.—The Company's holding in Rhokana Corporation Limited comprises £1,285,123 Ordinary Stock and £24,777 "A" Stock, representing 52.396% of the total Ordinary and "A" Stock in issue.

The Net Profit for the year after taxation, was £8,391,027 (against £7,490,922, excluding an exceptional profit of £490,000 for the preceding year).

Copper Production.—Total saleable output of Blister and Electrolytic Copper was 74,216 long tons compared with 82,764 long tons in the previous year. Production in all departments was restricted by poor coal deliveries and was twice interrupted by strikes.

Cobalt Production.—Production from the Electrolytic Cobalt Refinery began in August, 1952, but was restricted for most of the year by operating difficulties. These have been largely overcome during recent months and the total production of Cobalt metal for the year was 259 short tons. It is anticipated that further plant modifications now in hand and improved operating technique will give a steady and increased output of Cobalt metal; 1,259 short tons of Cobalt alloy, containing 472 short tons of Cobalt, were produced as against 1,098 short tons of alloy, containing 645 short tons of Cobalt, during the preceding year.

BANCROFT MINES LIMITED.

Since the year end, The British South Africa Company has subscribed for 3,000,000 Bancroft shares and a further 9,500,000 have been subscribed by Rhokana direct. The remaining 2,500,000 shares in Bancroft Mines were offered to Rhokana's stockholders in the proportion of 3 Bancroft shares to every £1 unit of Rhokana stock; and Rhodesian Anglo American Limited thus became entitled to 3,929,700 shares and offered the greater part of these to its stockholders in the ratio of 3 Bancroft shares to ten 10/- units of Rhokana stock. All these shares have now been issued at 6/- per share inclusive of 1/- premium.

Bancroft Mines Limited is now scheduled to come into production early in 1957.

NCHANGA CONSOLIDATED COPPER MINES LIMITED.

Capital.—The Company's holding remains at £1,490,581 Stock, representing 21.294 per cent. of the Stock in issue. The Company's interest directly and indirectly (through Rhokana) in the Nchanga capital is virtually unaltered at 38.922 per cent.

The Net Profit for the year, after taxation, was £8,748,525 (against £5,505,600, excluding an exceptional profit of £750,000 for the preceding year).

Copper Production.—Production of Blister and Electrolytic Copper for the year ended 31st March, 1953, was 93,317 long tons, compared with 68,816 long tons in the previous year.

RHODESIA COPPER REFINERIES LIMITED.

Rhodesian Anglo American Limited has no direct holding in the Company, though it controls it indirectly through Rhokana and Nchanga.

The Net Profit, after taxation, was £31,324 (against £26,578 for the preceding year).

Production.—The production of Electrolytic Copper was 111,576 tons, compared with 102,269 long tons for the previous year.

OTHER INVESTMENTS.

LUBIMBI COAL AREAS LIMITED.—200,000 shares of 5s. each were acquired during the year from Anglo American Corporation of South Africa Limited, and an additional 260,000 shares were subscribed for in cash. The Company was formed in Southern Rhodesia in 1950 to prospect for coal in that territory.

MUFULIRA COPPER MINES LIMITED.—The Company's direct interest was increased by the acquisition of 40,350 shares and now stands at 94,242 £1 shares.

RHODESIAN ALLOYS LIMITED.—The Company's direct interest was increased by the acquisition of 40,350 shares and now stands at 94,242 £1 shares. In Rhodesian Alloys, Limited, a Southern Rhodesian company, the well-known John Brown & Company, Limited, the well-known Rhodesian Alloys has established at Gwelo a plant for the production of aluminium alloys. The Company has also advanced to Rhodesian Alloys.

TANGANYIKA CONCESSIONS LIMITED.—220,000 10s. stock units were acquired during the year.

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY LIMITED.—The Company's holding was increased from £228,171 to £353,176 stock.

WANKIE COLLIERY COMPANY LIMITED.—Towards the end of the Company's financial year arrangements were made for the acquisition from Powell Duffryn of 800,000 10s. shares of the Wankie Colliery Company in exchange for £125,000 Rhodesian Anglo American stock.

REINCORPORATION.

In terms of the Rhokana Group Act, which received Royal Assent on 6th May, 1953, the Company, in common with the other companies of the Rhokana Group, will, as from a date in 1954, not yet selected, cease to be incorporated in the United Kingdom, and the provisions of the Companies Ordinance of Northern Rhodesia, thus finalising the process of removal from the United Kingdom. Thereupon the Principal Register of Members will be maintained in Northern Rhodesia, but Branch Registers established in London and Johannesburg will maintain unchanged the existing facilities for dealing in the Companies' stocks.

COPIES OF THE ANNUAL REPORT AND ACCOUNTS MAY BE OBTAINED FROM THE HEAD OFFICE KITWE, OR FROM THE TRANSFER OFFICE AT 44 MAIN STREET, JOHANNESBURG, AND 11 OLD JEWRY, LONDON, E.C.2.

COMPANY MEETINGS

MITCHELLS & BUTLERS, LIMITED

BOTTLED BEER SALES FURTHER INCREASED

NEFITS FROM POSTWAR PLANNING AND RECONSTRUCTION

The sixty-sixth annual general meeting of the Ordinary Stockholders of Mitchell's & Butlers, Limited, will be held at the White Horse Hotel, Birmingham, on Thursday, December 17, 1953. The following is an extract from the circulated statement of the chairman, Mr Robert H. Butler.

I feel that stockholders should be very satisfied with the results that have been obtained. The increased trading profit of the Group for the year is attributable to two main reasons; reduced cost of materials consumed during the period, and in no small degree to economies which are largely the result of our efforts at Reconstruction, to which I refer later.

The amount brought in as taxation no longer required is, of course, due to the decrease in the standard rate of income tax from 9s. 6d. to 9s. in the £, a very welcome instalment of the heavy burden of taxation which all industry, and in particular the brewing industry, is called upon to bear. These factors together have enabled your Board to recommend placing to reserve £200,000, the same as last year, which is vitally necessary to meet the ever-increasing cost of replacing the fixed assets of the Group, and to create a Repairs Equalisation Reserve.

There has recently been much space devoted in the press to the comparison between present-day and prewar costs of repairs to properties. It has been stated authoritatively that these repairs are now costing in the region of three times that of prewar days. This applies with particular force to your company as we have a large number of properties which it has become increasingly difficult to maintain in the condition to which we were accustomed before the war. In view of this your Board has decided that it is only prudent to create a Reserve for the purpose of equalising the charge in the Accounts under this heading and place to it £100,000 as recommended in the Directors Report.

The improvement in our cash position is to some extent the result of a careful review of our stocks at breweries and managed houses.

Our bottled beers have shown a still further increase, Export Pale Ale and Nourishing Stout leading the way, while draught beer has fallen slightly, resulting in a small decrease in total output during the year. It is a notable fact, however, that our draught beer sales in South Wales have increased appreciably over the previous year. This in the further proof of our position in a free market.

This year shows an increase over last year, the principal increase being that of Scotch Whisky.

TRADING CONDITIONS

From the Company's point of view the trading conditions in the financial year which has just closed were more competitive than in any year since the war. Apart from the increase of consumer goods on the market, the withdrawal of a number of Government controls and restrictions, together with the reduction or removal of a number of Government subsidies, tended to make the public more selective in their spending. In consequence, competition for their custom, be-

tween all trades, showed a marked increase.

In addition Television, which is, of course, a counter attraction to the licensed house, has increased in popularity during the past twelve months, particularly since the Coronation.

In spite of more competitive trading conditions, and the increasing popularity of Television, it is gratifying to note that our trading figures have been satisfactory and we look forward to the future, confident in the knowledge that not only can we maintain, but increase our trade.

It has always been the policy of this Company to give the closest possible attention to the requirements of our customers, realising as we do that the habits and customs of the public are liable to change as between one generation and the next. When the policy of "fewer and better" was being fully developed after the 1914-18 war we were proud to lead this movement. The policy revolutionised the licensed house of the day and proved that the Trade, conscious of its responsibilities, was capable of keeping abreast of the times.

The recent war imposed upon us a great number of changes in our habits and modes of life, some of which have remained, and we feel that whilst the licensed house will continue to form an integral part of the British way of life, its function and character are likely to be subject to changes during the next decade. Such changes will in no way be revolutionary and of necessity they will be gradual, but we feel that if the licensed house is to retain its rightful position as a social centre, the facilities at present provided will have to be increased and improved, particularly with regard to the provision of food and entertainment.

RESEARCH AND RECONSTRUCTION

This year we have commenced to reap the benefit of our postwar planning and reconstruction in the brewery. In spite of the high cost of plant replacements we are keeping our brewery up to the high standard we have always maintained and the new plant and machinery now working are proving more economical to run and saving labour.

Continuing the programme of modernising the machinery and increasing the output of the bottling there has been further installation of new plant and conveyors. One of the most outstanding items of the new plant is a complete new unit with washing, filling, pasteurising and packing machines, the output capacity being the largest of its kind, dealing with 14,500 bottles per hour. The installation of this new machinery is enabling us to deal effectively with this expanding side of our output and to effect important economies.

This year's barley crop proved to be more satisfactory than the bad weather conditions first led us to expect. By selective buying we have acquired the best quality barleys which we know will make the finest malt for our "good honest beer." There has been a fall in the national demand which eased the overall price per quarter and it is expected that the fall in world prices of feeding stuffs will continue this trend.

In continuance of our policy of expansion in South Wales, I am glad to inform you

that we have recently acquired the "Potters Arms," Newport, an up-to-date and centrally situated fully licensed property which is proving a valuable addition to your company's assets.

Last year I referred to the Town and Country Planning Act 1947 and the fact that compensation for acquisition by local and other authorities was made up of the existing use value plus the development value claim, the latter being based on 1947 prices. I am pleased to say that my remarks have been supported by a number of trade associations and professional bodies and I sincerely hope that in fairness to everyone the Government will see their way to delete this reference to 1947 values in their forthcoming legislation.

NEW DEVELOPMENTS

Considerable progress has now been made in the licensing planning of the City of Birmingham, and it is likely that very shortly a scheme for the redistribution of the licences in a large area will be the subject of a submission to the Minister of Housing and Local Government, for his approval.

I feel strongly that now the situation with regard to the building of dwelling-houses has so greatly improved, the needs of the public in regard to the provision of new licensed premises should receive urgent attention. There are in Birmingham and Coventry a number of large housing estates approaching completion, and in order to achieve a balanced development it is essential that licensing facilities should be available.

Similar housing development to that in Birmingham and Coventry is also taking place to a lesser degree in a number of other towns in which we trade. In Redditch, Dudley, Stourbridge, Nottingham, Derby, Leicester County, West Bromwich, Bromsgrove, Aldridge, Bilston, Coleshill, Halesowen, Kidderminster, Leamington, Oldbury, Rugby, Solihull and Worcester we have sites which have been selected with a view to serving new building estates. We know the trade is there and you may rest assured that your company will do all in its power to supply the demands of the public in these areas, at the earliest possible opportunity.

BARCLAYS BANK LIMITED

CAPITAL REORGANISATION APPROVED

Separate meetings of the holders of the "A," "B" and "C" stocks and an extraordinary general meeting of the stockholders of Barclays Bank Limited were held at the head office of the Bank, 54 Lombard Street, London, E.C.3, on November 25th.

Mr A. W. Tuke, chairman of the Bank, presided at each meeting.

Extraordinary resolutions of consent having been approved at the separate class meetings on behalf of the "A," "B" and "C" stockholders, the extraordinary general meeting passed the special resolution for effecting the increase and reorganisation of the capital of the company and the alterations of its Articles of Association which had been circulated to stockholders with the notice of meeting.

The chairman announced that of the proxies lodged for the respective meetings, an overwhelming majority in each case was in favour of the resolution submitted, the proportion of votes directed to be cast in favour varying from 97.7 per cent to 99.8 per cent.

The proceedings terminated with a vote of thanks to the chairman for presiding.

THE NATIONAL BANK OF AUSTRALASIA

(Incorporated in Victoria)

OVERALL IMPROVEMENT IN CONDITIONS

MR H. D. GIDDY ON PROBLEM OF HIGH COSTS

The ordinary general meeting of The National Bank of Australasia Limited, with which is united The Queensland National Bank Limited, was held on November 25th in Melbourne.

Mr H. D. Giddy, the chairman, presided and in the course of his speech said:

The balance sheet totals, at £256,849,373, are £27,842,146 higher than last year as the result of a rise of just over £30 million in deposits. Deposits will always be basic to our progress, and this excellent addition is close to the record annual increases of the inflationary boom years from 1949 to 1951. Advances are £10,332,545 lower than last year, and these movements have improved the bank's liquidity. Liquid assets are £40,135,557 higher, a gain which just about equals the deposit increases and the reduction in advances.

The lift of £661,389 in gross earnings was almost wholly offset by the increase of £609,400 in expenses and taxation provisions, resulting in a small increase of £51,989 in the net profit of £668,954. The directors felt an increase in dividends to be justified, and accordingly the interim dividend in May was raised to a rate of 4 per cent, and this meeting will be asked to approve a final dividend at the same rate, making 8 per cent for the year.

NEW BANKING LEGISLATION

Two Bills were introduced into the Federal House of Representatives on February 19th this year amending the Commonwealth Bank Act and the Banking Act of 1945. The amendments to the Banking Act came into operation on April 29, 1953.

The Government failed to separate completely the central and trading bank functions of the Commonwealth Bank; and compromised by transferring the activities of the general banking division to an entity known as the Commonwealth Trading Bank of Australia, which will commence operations on December 3rd next. In fact, this new organisation will still be subject to the same overall control as formerly.

This compromise offers no real immunity from interference by any future government so minded. Australia, particularly its banking system, still suffers from the failure by many governments over forty years to establish, once and for all, a truly central bank completely independent of competitive commercial banking.

The right of the Commonwealth Bank to call to special account 75 per cent of the increase in a bank's Australian deposits constitutes a severe control over the business activities of the trading banks, and is excessive for overall credit management purposes. However, we welcome repeal of the old retrospective power to call amounts into special account and removal of the huge liabilities that had accrued under the severe provisions of the 1945 Banking Act. We welcome also repeal of the statutory prohibitions under that Act on the investment of surplus funds in government and other securities.

The present banking position has a different complexion from that of a year ago. The fiscal year 1951-52 ended with a balance of payments deficit of £A585 million, and in consequence over the twelve months to

September, 1952, the main trading banks had to meet an outflow of well over £200 million of liquid funds to support industry through that difficult period.

By contrast, the 1952-53 balance of payments showed an extremely valuable surplus of £A171 million, resulting in the main trading banks enjoying an inflow of funds of about £A188 million for the twelve months to September last.

This change for the better in our external position and the enlightened monetary policy of the Federal Government have been primarily responsible for restoring the liquidity of the banking system to a reasonable level.

THE BUSINESS IMPROVEMENT

A material overall improvement in the level of industrial and commercial activity has occurred since I last addressed you. The more liquid state of business generally, following the reduction of excessive stocks, has buttressed business confidence and brought a return of scope for new activity.

The business scene at the moment is one of practically full employment, with its accompaniment of a high market demand. There seems no reason to suspect that these conditions will not continue during 1953-54.

It is of supreme importance that this position should not spill over into one where excessive activity by Governments and private enterprise again force the home market into excess demand and inflationary pressure. A further, and wholly disastrous, upsurge in costs and prices would then be inescapable.

This general improvement in the overall financial position in Australia has not been accompanied, unfortunately, by any parallel achievement in overcoming the problem of high costs. Gains have been made, it is true, and the ominous cost and price trend of two years ago has been substantially halted. But our costs are at a very high level, and there is evidence of a worsening in our overseas competitive position. One thing is certain: our cost levels must not be permitted to rise higher.

NEW FOUNDATIONS FOR GOVERNMENT SUPERVISION

Looking back over the past year or so, one must conclude that the overall supervision of the economy by the Federal Government has been wisely applied in the general interests of the community. The recovery which has taken place is indicative of its success. But more important still perhaps is the fact that the methods adopted may be the precursor of a kind of Government supervision which is appropriate to, and will fit in with, the free price market and retention of the profit concept as basic economic criteria.

The Federal Government has made, I feel, a sincere attempt to use weapons of economic oversight which are compatible with the flourishing of free enterprise in a modern society. This may well be in accord with a worldwide trend of the democratic countries. I believe we are witnessing the emergence of the idea that a more delicate touch is essential if Governmental economic supervision and a virile private enterprise are to live together. The report was adopted.

THE BRITISH LINEN BANK

FURTHER SATISFACTORY PROGRESS

LORD AIRLIE'S SPEECH

The annual Court of Proprietors of The British Linen Bank was held on November 24th at the Head Office, Edinburgh, The Earl of Airlie, Governor, presiding.

The following is an extract from Lord Airlie's speech:

Your board of directors are gratified to have been in a position again to present to you an eminently sound balance sheet, showing further satisfactory progress. It is appropriate that so memorable a year from the national standpoint should also be notable in the bank's own story, in that for the first time our total resources are in excess of £100 million.

Record levels have been reached in the figures of several individual items of the balance sheet. Current, deposit, and other accounts at £83,584,000 show the striking increase of £5,382,000 as compared with last year. There is a rise of £808,000 in the note circulation to £10,175,000. Acceptances etc., on account of customers are up by no less than £1,905,000 at £4,949,000, reflecting highly active recourse by our customers to our credit facilities for overseas trade, and including some such engagements on their behalf of a special and perhaps non-recurring character.

On the assets side, cash and other liquid items total £30,247,000—giving a ratio of 32.2 per cent to the combined amounts of deposits and notes. The increase in deposits not having been matched by a like movement in advances, we have made additional investments which bring the book value of our portfolio up to £47,981,000, a rise of £6,312,000. The amount outstanding in advances, £18,671,000, is practically unchanged on the year. Much as we should like to employ a substantially higher proportion of our funds in this way, recent conditions have not favoured this. Indeed, the general trend of the volume of bank lendings seems meantime to be downwards.

PROFIT AND LOSS ACCOUNT

As shown in the report and profit and loss account, the bank's net profit for the year amounted to £250,264—an increase of some £24,500 on the previous year's figure. It is pleasing to see this recovery in our earning capacity, which is still modest in relation to the resources employed in the business. Adding the balance of £181,137 brought forward from last year, the sum available for distribution is £431,401. Of this, £55,000 has already been applied in payment of the usual dividend for the half-year to March 31st last at the rate of 16 per cent per annum, less income tax, and it is now proposed to devote £55,000 in payment of a dividend at a like rate for the second half of the year. Transfers of £54,000 to staff pension fund and £75,000 to contingencies leave the sum to be carried forward at £192,401, an increase of £11,264 on the amount brought in.

The heavy burden of taxation is of great danger to our competitive power as a trading nation, as well as a strong deterrent to individual effort. I would again add my word of warning to the many which have emanated from highly responsible and well-informed quarters on this subject, and I would express the hope that the urgent need for substantial relief will yet be recognised by a bolder resort to every practical means of retrenchment of national expenditure.

The report was adopted.

BLYVOORUITZICHT GOLD MINING COMPANY

MR W. M. FRAMES ON URANIUM PRODUCTION

At the sixteenth annual meeting of shareholders held in Johannesburg on November 17, 1953, Mr W. M. Frames, the chairman, in the course of his remarks, said:

Compared with the previous year's results, the working profit of £6,362,500 from gold mining showed the substantial decrease of nearly £1,333,000, which was due to the reduced tonnage milled, the lower yield, the drop in the premium on sales of gold at enhanced prices and increased working costs. The lower yield conformed with the reduction in value of the ore reserves over the past few years, while the movements in the tonnage milled and unit working costs were due principally to the severe decrease in the average number of non-European underground employees. Under the conditions of the serious labour shortage which is common to the whole gold-mining industry, it was necessary, especially as your mine is in the relatively early stages of its career, to preserve the balance between productive and non-productive work by spreading the limited labour available to the best advantage over the various operations at the mine. Even against this background sufficient ore was developed to maintain the available reserve at very nearly the same tonnage as at the end of the previous year.

Good values were disclosed during the year in reef driving on the 8th level at A1 and A2 sub-incline shafts and in the reef winzes at A3 sub-incline shaft. A large proportion of the development west of No. 2 Shaft was accomplished by raises, and the values were very much in accordance with those exposed in the adjacent drives. The drives being advanced into the western area of the property progressed relatively slowly because of the intersection of water-bearing fissures.

Sinking of the sub-incline shafts was retarded by water control problems and as these may cause further delays additional reef winzes have been started from the present bottom levels of the mine so as to expedite lateral development. Work on the twin haulages south from Nos. 1 and 2 Shafts to the positions of the sub-vertical shafts was continued. It is planned to commence sinking No. 1 sub-vertical shaft first, and for that reason work was concentrated mainly on the haulage south from No. 1 Shaft.

URANIUM PRODUCTION

The uranium plant commenced operations in April but, due to initial plant difficulties and consequent adjustments, output was seriously restricted and the estimated profit for the period amounted to £21,710. Since the close of the year the plant has operated reasonably satisfactorily but not to its full extended capacity, due primarily to difficulties experienced in making up the shortage of current residue slime with additional tonnage from the accumulated slimes dam. However, I am pleased to report that by the end of this year the plant is expected to be in the position to operate at full capacity.

In so far as lease consideration and taxation are concerned, the income from uranium is merged with that from gold and these liabilities are calculated by applying the lease formula and the gold mining taxation formula to the combined revenue, costs and profits from both sources; likewise, the redemption allowance is calculated on the total capital expenditure in respect of gold and uranium.

On several occasions over the past seven years the attention of shareholders has been directed to the fact that the considerable sums expended on capital account have resulted in lower mineral lease consideration and taxation payments, but that the time would arrive when the expenditure would, to a great extent, be redeemed and the liabilities to these payments would then be much heavier. It may not be generally realised that, with the present rate of 27½ per cent per annum allowed for the redemption of capital expenditure, 72.4 per cent of such expenditure is redeemed within four years. The heavy capital expenditure on uranium during the past three financial years has resulted in the total lease consideration and tax liabilities of the company being less by about £900,000 and, although the unappropriated balance has increased by £850,000 during this period, it should be appreciated that the total dividends paid would probably have been less had the company not received the substantial benefit of the redemption allowance in respect of uranium capital expenditure.

It is anticipated that the rate of capital expenditure on the gold mining section of the company's operations will decrease during the next five years and as the uranium plant is practically completed the annual redemption allowance will in future be substantially less with consequent increases in the mineral lease and taxation payments.

NEW AGREEMENT

As you will have seen from the directors' report, a new agreement has been entered into, which supersedes the agreements entered into in 1945 and 1948 between this company and certain other parties, recording the conditions upon which it has been decided to investigate further the possibility of establishing a single ultra-deep mining unit on an area of approximately 4,820 morgen of ground lying to the south of the property of this company and that of West Driefontein Gold Mining Company Limited. In the event of it being agreed to exploit the area and to form a new company for that purpose, this company would be refunded any drilling expenses and would be entitled to a 25 per cent participation in the vendor consideration, which would be applied in subscribing for shares in the new company. This company would also be entitled to a 30 per cent subscription right at par in that company's initial working capital.

In reply to a shareholder who commented on the results so far obtained from the production of uranium when compared with certain other uranium producers, and to his inquiry whether the board of directors was satisfied with the grade obtained and with the extraction of uranium on the company's property, the chairman stated that he was prevented from answering certain aspects of the question owing to the provisions for secrecy imposed by the Atomic Energy Act. He could, however, state that the difficulties which had been experienced in the initial stages of running the plant were, as in the case of all new plant, due to teething troubles, and that in the circumstances the board was satisfied with operations.

The report and accounts were adopted.

ROOTES MOTORS LIMITED

RECORD OUTPUT ACHIEVED

EXPORT EXPANSION—PRIME OBJECTIVE

The annual general meeting of Rootes Motors Limited will be held on December 15th in London.

The products of the Rootes Group are Humber, Hillman and Sunbeam-Talbot cars and Commer and Karrier commercial vehicles.

The following is an extract from the circulated statement of the chairman, Sir William Rootes, KBE:

The consolidated accounts of the company and its subsidiaries in respect of the year ended July 31, 1953, show a profit before taxation of £3,307,335 against £3,425,697. A record output was achieved by our factories in the year under review, largely as a result of a better flow of materials coupled with greater productivity. However, improved specifications of our products without corresponding price increases resulted in lower margins. Taxation again takes its toll; the provision to be made from current profits is £2,198,086, and we have had to provide £411,001 for excess profits levy. The Chancellor has removed, none too soon, this iniquitous tax. The net profits amount to £1,236,498. Your directors have decided to retain in the group £1,003,326, and propose that 32½ per cent should again be paid on the ordinary share capital.

COSTS AND FOREIGN COMPETITION

Fundamentally, we in our industry have changed from a sellers' to a buyers' market. So long as the management, the staff, those on the factory floor and in the field realise this solid fact and act accordingly, we can go forward with confidence. It is our policy not only to hold but to expand our export markets, and this must remain our prime objective if we are to play our part in national survival. We are proud that our industry has done such good trade in the dollar areas. In the period under review our sales to those markets were a record. Much greater efforts, however, must be made to recapture the vast South American markets, traditionally British for many years. I believe that a more vigorous and unrestricted approach to the problems surrounding these markets will yield dividends for British exports.

Foreign competition is with us in great strength, but we have no doubt of our ability to sell in the face of this competition provided the country is cost conscious and, supported as we are by products which have, in recent years, proved their worth throughout the world. In Europe our sales are holding up remarkably well.

The days when industry could be relatively complacent about selling its output at its own price have gone. If we are to hold our position there is but one answer—reduced costs and better value for money.

We in the Rootes Group have always advocated the sale of our products in the markets of the world as being nationally essential. I have also spoken many times, but with less success, on the serious state of roads in the United Kingdom. Surely the Government cannot much longer ignore this problem.

Finally, may I say that I am glad we are beginning again to see a sound competitive home market, but I must add that, so long as our primary effort must be to satisfy export demands, our deliveries to the home market will of necessity fluctuate from time to time.

ROAN ANTELOPE COPPER MINES LIMITED

The following is an abridgment of the Statement, dated October 9, 1953, by the Chairman (Mr R. L. Prain, OBE) circulated to the Members:

The past year may by any criterion be regarded as an historic one for your Company. Not only were production and financial records established, but also there occurred certain events which will have far-reaching effects on the future of the Company and the Rhodesian Copperbelt generally. I refer to the transfer of control of this and associated companies from London to Rhodesia; to the return to free trade in copper after nearly 14 years of UK Government public bulk purchasing; to the Federation of Rhodesia and Nyasaland; and to the negotiations which the copper mining companies have initiated on the subject of the industrial colour bar.

RESULTS FOR THE YEAR

The mine and mill broke all records in hoisting and milling 4,845,600 tons of diluted ore which produced 87,307 long tons blister copper, a new company record.

Production costs per long ton blister copper at Beira worked out at £108 11s. 5d. an increase of about 25 per cent over the previous year. The main causes for the rise were a higher royalty, higher cash bonus (both related to the price of copper), increased African wages and the African strike.

The price received for our product during the year averaged £248 12s. 4d. per long ton at Beira, which is by far the highest price to date. Our profit margin before taxes or reserves was £135 18s. 2d. per ton, and the operating surplus for the year was £12,424,375.

As a result of the transfer of the Company's residence, part of the reserve made in the previous year for United Kingdom income tax becomes liberated and in this way £2,165,000 is taken in as a credit against our remaining tax liability which is substantially for Northern Rhodesia income tax alone. This amounts to £4,565,000 so that after crediting the above-mentioned £2,165,000 the tax debit to the Appropriation Account is £2,400,000.

The sums of £2,750,000 and £3m were transferred to the General Reserve and Replacements Reserve respectively.

After making these reserves, the directors recommend a dividend of 2s. per share, leaving to be carried forward the sum of £53,000.

Mr Prain referred to the mine position, the award of the Arbitrator following the strike of African employees at the end of 1952 and to the fuel position on the Copperbelt. He continued:

POWER

You will be aware from my statement last year that we have been discussing with the Union Minière du Haut-Katanga the possibility of drawing hydro-electric power from sources being developed by them in the Belgian Congo. An agreement was signed with them on September 16, 1953, which provides for a supply of up to 500 million KWH annually in the years 1957/66.

The Copperbelt's power supplies, of which the power to be drawn from the Belgian Congo will form a part, have, as you know, been co-ordinated by the Northern Rhodesia Power Corporation Limited, in which your Company had a 25 per cent shareholding interest, as did the

other three major copper producers in Northern Rhodesia. With the consent of HM Treasury the Corporation transferred its assets on July 20, 1953, to a new company incorporated in Northern Rhodesia and known as the Rhodesia Congo Border Power Corporation Limited, the shares of which are similarly held equally by the four major copper producers. Your Company has an agreement with the new Corporation governing the sale of power by the mine to the Corporation's network and the purchase of power from that network.

I am glad to be able to report that a further source of hydro-electric power should be available to us around the end of the current decade from the project to develop power from the Kafue River at the Gorge a few miles above its confluence with the Zambesi.

The Company's seat of control was moved to Rhodesia on July 1, and the move was carried out with a minimum of dislocation. We are now established in temporary quarters in Lusaka. In view of our emigration, Selection Trust Limited has been appointed London Registrars and Paying Agents as from July 1, 1953. The Anglo Metal Company Limited, of London, continues to act as our Sales Agents.

FEDERATION

This year has seen the birth of the Federation of Rhodesia and Nyasaland. On the broadest political grounds this is a development greatly to be welcomed. Our affairs in future will come partly into the province of the Federal Government and partly into that of the Northern Rhodesia Territorial Government. We hope that we shall be found ready to play our full part in the great political and economic developments that lie ahead of Central Africa.

One of the first-fruits of Federation, with its declared object of partnership, was the move, publicly announced last May, by the copper companies to initiate discussions on the industrial colour bar on the Copperbelt. This problem permits of no easy or quick solution. It is one common to many parts of Africa. Any attempt to solve it is apt to evoke suspicion, alarm, resentment and prejudice. Yet nothing is clearer than that the present situation is untenable both in principle and in practice; nor, unfortunately, is the inevitability of change in this case one which can be contemplated as being likely to take place under conditions of gradualness. To harbour this delusion is to blind oneself deliberately to the lessons of history, and can lead only to the rude awakening which has occurred, often in tragic circumstances, elsewhere in Africa. Once this is recognised I am confident that the action of the companies in attempting to deal with this problem will be seen in its real light, namely, an attempt to do justice to the legitimate aspirations of one section of their employees while at the same time safeguarding the continued industrial and social security of the other section of their employees. The subject is a challenge to the European claim of leadership without domination, and to the liberal principles of British Colonial policy.

On the satisfactory solution of this problem depends, perhaps more than on any other, the continued prosperity of this industry, which in all other respects would appear to be endowed with more than usual advantages and talents. These can be harnessed to the benefit of employees, stockholders, our country of production, and the free world generally, for many years ahead, if wisdom will prevail where at present suspicion reigns; without wisdom, all will suffer.

RHOKANA CORPORATION, LIMITED

EXTREMELY SATISFACTORY RESULTS

The thirty-first annual general meeting of Rhokana Corporation, Limited, will be held on December 16th at Nkana, Northern Rhodesia.

The following is an extract from the statement by the chairman, Sir Ernest Oppenheimer, dated October 28, 1953, circulated with the report and accounts for the year ended June 30, 1953: The past year's results can be considered extremely satisfactory. The operating surplus for the year to June, 1953, was approximately £9,900,000; this is some £500,000 more—on a somewhat smaller sales tonnage—than that earned on a comparable basis in the preceding year, during which abnormal sales resulted in an exceptional profit of £640,000, which was transferred, after taxation, to sales equalisation reserve. Investment income is also higher, by about £600,000, as a result of increased dividends received from Rhokana's large shareholding in Nchanga Consolidated Copper Mines Limited.

The Nchanga company's profit after taxation, for the year to March 31, 1953, showed an increase of approximately £2,500,000 over the comparable figure for the preceding year. Nchanga's scale of operations has shown remarkable expansion in the last few years. The board of that company has recently decided to embark on large-scale open pit mining as an adjunct to underground mining, with a view to securing a better balance in the grade of ore mined in relation to the company's overall ore reserves.

BANCROFT MINES

A major event in the past year has been the formation of Bancroft Mines, Limited, to acquire the Konkola and Kirila Bomwe properties from your corporation. The total estimated cost of bringing the new mine to production is about £12 million, of which £6 million has been raised initially. Your Corporation has subscribed for 9,500,000 of the 20 million shares which have been issued. While the subscription by your corporation of such a high proportion of the Bancroft capital involves the placing to reserve of a large share of profits, the benefits which may be expected to accrue from this investment justify the withholding of funds which might otherwise have been paid out in dividends. It is indeed a matter of considerable satisfaction that your Corporation should have been able to finance such a large stake in Bancroft out of its existing resources whilst simultaneously maintaining its total dividends for the year at the level of those paid for 1951-52. It is now anticipated that it may be possible to bring Bancroft to the production stage during 1957.

The price of copper since the re-opening of the London Metal Exchange has remained steady at satisfactory levels. Contracts have been finalised with consumers for the greater part of the Corporation's anticipated output for the current year and for a substantial part of that output in later years.

The Federation of the two Rhodesias and Nyasaland is now an accomplished fact. We as a Corporation, have played a great part in the past history of Northern Rhodesia and we look forward with complete confidence to the Corporation's future role in the new and greater Rhodesia that is now emerging.

Copies of the annual report and accounts may be obtained from the Head Office, Kitwe, or from the transfer offices at 44, Main Street, Johannesburg and 11, Old Jewry, London, E.C.2.

MUFULIRA COPPER MINES LIMITED

The following is an abridgment of the Statement, dated October 8, 1953, by the Chairman (Mr R. L. Prain, OBE) circulated to the Members:

The past year may by any criterion be regarded as an historic one for your Company. Not only was a financial record established, but also there occurred certain events which will have far-reaching effects on the future of the Company and the Rhodesian Copperbelt generally. I refer to the transfer of control of this and associated companies from London to Rhodesia; to the return to free trade in copper after nearly 14 years of UK Government public bulk purchasing; to the Federation of Rhodesia and Nyasaland; and to the negotiations which the copper mining companies have initiated on the subject of the industrial colour bar.

RESULTS FOR THE YEAR

Production amounted to 76,089 tons of primary copper, of which 50,737 tons were produced in the form of blister copper and 19,212 tons as electrolytic cathodes, the remainder going into operating stocks for the refinery.

FINANCIAL

As a consequence of the decreased production, costs increased by about 27 per cent over the previous year, i.e., from £86 1s. 1d. per ton blister at Beira to an average of £109 8s. 3d. per ton of blister or cathode. Apart from the decreased output, other causes for the rise include the higher royalty based on the higher price received during the year, higher cash bonus and increased African wages.

Sales amounted to 55,486 tons of blister and 17,495 tons of cathodes, the prices received for these products being £245 6s. 1d. and £261 12s. 7d. per ton respectively, in each case expressed f.o.b. Beira. This is, of course, by far the highest price yet received by Mufulira for its products. Our profit margin before taxes or reserves was £135 5s. 1d. per ton, and the operating surplus for the year was £10,535,916.

The main deductions to be made from this profit, before considering the final dividend, come under the heading of taxes, transfer to Replacements Reserve, and appropriations to General Reserve. As far as taxes are concerned, this is an exceptional year. As a result of the transfer of the Company's residence, part of the reserve made in the previous year for United Kingdom income tax becomes liberated and in this way £1,997,000 is taken in as a credit against our remaining tax liability which is substantially for Northern Rhodesia income tax alone. This amounts to £3,842,000 so that after crediting the above mentioned £1,997,000 the tax debit to the Appropriation Account is £1,845,000.

The sums of £2,750,000 and £3m. were transferred to the General Reserve and Replacements Reserve respectively. The former sum is intended to cover the following main items: loan to Rhodesia Congo Border Power Corporation, £750,000; further investment in Chibuluma, £400,000; further contribution towards capital cost of refinery, £500,000. The rest of the transfer is intended to cover miscellaneous items for which cash must be retained in the business.

After making these reserves, the Directors recommend a dividend of 5s. 3d. per share. Together with the interim dividend which was paid before the Company emigrated, this means a distribution of £2,811,000 in respect of the past year; the carry-forward will be £125,000.

The position of the mine remains satisfactory. The ore reserves now stand at 231,730,000 tons, including 25m. for Chambishi and 70m. for Baluba. Development has been maintained satisfactorily.

During the past year the refinery came into operation for the first time. Cathodes were first pulled in November 1952 and by the end of the year the tankhouse was running at its rated capacity of 3,000 tons per month. The extension which will double this capacity is expected to come into operation early in 1956.

CHIBULUMA AND BALUBA

During the year the Chibuluma Company made an announcement regarding the increased cost of equipping the property, the favourable trend of ore sampling and metallurgical testing, and the further arrangements made with the United States Government for the financing of the property. Our investment in Chibuluma is now £1m. We have great confidence in this property and developments to date are all favourable.

I have referred in my two last statements to the possibility that we should begin to develop the Baluba orebody by means of a new company to be called Baluba Mines Limited. I indicated last year that negotiations for the provision of the finance were well advanced and so was the exploration at the property to determine the characteristics of the orebody.

It is with some regret, therefore, that this year I have to announce that your Board had decided not to proceed with the Baluba venture at this time. I will recapitulate briefly the events which led to this decision.

At the time of my last statement the cost of developing Baluba to produce about 100,000 tons of ore per month was estimated at about £9m., and on this basis we had been negotiating with the Export-Import Bank of Washington for credit facilities of \$21m., while the equity to be issued by Baluba would be £1.5m. It was then considered necessary to re-examine the estimates and as a result it was found that the cost would be nearer £13m. We therefore asked the Bank whether they would increase the credit to \$30m., on condition that the equity would also be increased. We also asked for certain guarantees as to price and market. Unfortunately the Bank were unable to agree and the Board decided that the enterprise was too marginal to proceed with at the present time.

In view of Baluba's considerable ore reserves, and an estimated cobalt content of .18 per cent which may well make it the greatest undeveloped source of cobalt in the world, it may be asked why the enterprise should be described as marginal. The reason is that the potential ore production of 100,000 tons per month, equivalent to 24,000 tons of copper per year, is not big enough to justify a capitalisation of £13m. if the bulk of the capital consists of loan capital.

Mr Prain referred to the award of the Arbitrator following the strike of African employees at the end of 1952, and to the power and fuel situation on the Copperbelt. He continued:

EMIGRATION

The Company's seat of control was moved to Rhodesia on July 1st and we are now established in temporary quarters in Lusaka.

In view of our emigration Selection Trust Limited has been appointed London Registrars and Paying Agents as from July 1, 1953. The Anglo Metal Company Limited, of London, continues to act as our Sales Agents.

CONSOLIDATED MAIN REEF MINES AND ESTATE, LIMITED

LABOUR FORCE PROBLEMS

At the fifty-fifth annual meeting of shareholders held in Johannesburg on November 17, 1953, Mr N. W. S. Lewin, the chairman, in the course of his remarks said:

The decrease in the profits earned during the year under review to slightly more than half of those of the previous year was due to the drop in revenue caused in the main by the fall in the tonnage milled resulting from the decline in the non-European labour force. The tonnage milled and consequently the profits during the current financial year are below those of the corresponding period of 1952 and reflect further the difficult labour conditions under which the mine is operating.

LOWER TONNAGE MILLED

The fall in the tonnage milled in addition to decreasing the revenue caused a substantial rise in unit working costs which in turn resulted in an increase in the pay limit. This increase in the pay limit tended to reduce the percentage of payability of the reefs being opened up in the various development areas and caused the exclusion of some 585,000 tons of ore, previously classed as payable, from the ore reserves. In previous annual addresses the chairmen have informed you of the position on each of the five reefs in some detail and have stated that on all but the main reef primary development was no longer taking place. Development on the 66th level main reef was stopped during the year as values were too scattered and the percentage of payability too low to justify further primary development. Throughout the mine, therefore, development is now confined almost entirely to secondary or internal work but, as is mentioned in the manager's report, two drives are being advanced on the Kimberley and Bird reefs into the Crown Mines property with a view to prospecting and tributary sections inaccessible to that mine. Occasionally in the internal development, patches of abnormally rich ore are exposed. It was due to one of these occurrences that the development for the quarter ended September 30th gave such high values.

Shareholders will have noted in the annual report the warning that unless conditions change for the better a further falling off in the scale of operations must be expected over the next few years. Every effort is being made to keep unit costs from rising but it will become more and more difficult to do so in the face of shortage of non-European labour and additional expenditure due directly and indirectly to increased railage and power charges. Quite apart from the labour supply the present and prospective ore reserve position at the mine is such that the tonnages developed are likely, as in the past few years, to fall short of the tonnages mined and a gradual decline in the tonnage milled and therefore in revenue will before long be unavoidable. Plans are now being formulated in order to ensure as far as is practicable a proportionate reduction in overall expenditure as the scale of operations declines.

In reply to a written question from a shareholder, the chairman stated that the position in connection with uranium had been carefully investigated but it appeared to be unlikely that the company would be invited by the Minister of Mines to become a producer of uranium.

The report and accounts were adopted.

KAMUNTING TIN DREDGING

MR JACK ADDINSELL'S STATEMENT

The fortieth annual general meeting of Kamunting Tin Dredging, Limited, was held on November 24th, at 55-61 Moorgate, London, E.C., Mr Jack Addinsell (chairman of the company) presiding.

The following is his statement for the year ended March 31, 1953, which had been circulated with the report and accounts and was taken as read:

The accounts now presented reveal another year's satisfactory trading, and your board is happy to be able to recommend the payment of a final dividend of 27½ per cent, less tax, which with the interim of 12½ per cent already paid makes a total of 40 per cent, less tax—the same as was paid last year.

The sum of £33,000 has been written off dredges, buildings and plant as additional depreciation in order to leave these assets at a figure in the balance sheet which your board considers reasonable in the light of conditions obtaining today. A further sum of £75,000 has been placed to transfer of dredges reserve, bringing the total under this heading to £275,000.

CONCENTRATE PRODUCTION

Production of concentrate during the year amounted to 1,979 tons—a decrease of 503 tons on that of the previous year. This decrease was due mainly to our Pangnga No. 2 dredge having exhausted its payable ground in February, 1952, and to a decline of 76 tons in the output of Pangnga No. 1, the two together showing a decrease of 429 tons.

The payable areas on the Pangnga River leases have now been exhausted and the two dredges are being transferred to our new property at Bangtoe. While it is not possible to form an accurate forecast of the dates on which these dredges will commence production, shareholders can rest assured that everything possible is being done to expedite the work of transfer and reconstruction.

It now appears that the cost of this work will be about £570,000, and it is satisfactory to note that the whole of this will be found from the cash balances accumulated from profits of past years.

Our No. 1 dredge on the Kamunting property has exhausted its payable reserves and ceased operations in April of this year. This is our oldest dredge and has been in commission since 1915. It is a shallow-digging machine, and it is very doubtful if a suitable area can be found for it; meanwhile it is placed on a "care and maintenance" basis.

Shareholders will appreciate that until the two Pangnga dredges commence production from the Bangtoe area we shall be faced with a further decline in production, for, as already mentioned, our Pangnga No. 1 and Kamunting No. 1 dredges, which together produced 557 tons of concentrate during the year under review, are now out of commission.

DRASTIC PRICE FALL

Since the end of the company's financial year the price of tin in Singapore, which on March 31st was equivalent to £921 15s per ton, has fallen drastically, and is now the equivalent of a little over £600 per ton. It will be patent to shareholders that such a decline must have a seriously adverse effect on the profits of all tin-mining companies.

The campaign against the terrorists in Malaya has gone and is going well under the able direction of Sir Gerald Templer, but the most careful precautions must still be

taken in every direction, and our thanks are due to the members of the staff in both Malaya and London for their continued loyal service and support.

The report and accounts were unanimously adopted and a final dividend of 27½ per cent, less tax, making a total of 40 per cent, less tax, for the year, was approved.

The retiring director, Mr W. E. Wallis, was re-elected, and the other formal business having been duly transacted, the proceedings terminated.

THE FINANCIAL NEWS, LIMITED

DIVIDEND MAINTAINED

The fifty-sixth annual general meeting of The Financial News, Limited, was held on November 24th, at Winchester House, Old Broad Street, London, E.C.

Colonel O. E. Crosthwaite-Eyre, MP, deputy chairman, who presided in the absence through indisposition of the chairman of the company, The Rt Hon Viscount Bracken, read his speech as follows:

The consolidated profit before taxation for the year ended June 30, 1953, amounted to £133,283, an increase of £20,747 over the previous financial year. All the newspapers in which we hold shares earned satisfactory profits and having done so well your directors recommend the maintenance of the rate of dividend for the year at 60 per cent by the payment of a final dividend of 35 per cent. After this payment, the carry forward of The Financial News and its subsidiaries is increased by £17,345.

You will see from the consolidated balance sheet that current assets exceed current liabilities by £192,003. As our reserves are obviously considerable, amounting to £471,847 without including reserves for future income tax of subsidiaries, and as it is an understatement to say that the valuation of our assets in the accounts before you is much below their present worth, we hope that in the not too distant future we shall obtain permission to bring our issued capital nearer the true capital employed in the business.

The report and accounts were unanimously adopted.

THE FINANCIAL TIMES LIMITED

SATISFACTORY RESULTS

The twenty-sixth annual general meeting of The Financial Times Limited was held on November 24th at Winchester House, Old Broad Street, London, E.C.

Colonel O. E. Crosthwaite-Eyre, MP, deputy chairman, who presided in the absence through indisposition of the chairman of the company, The Rt Hon Viscount Bracken, read his speech as follows:

As we have already held one meeting this year, I do not propose to take up much of your time today. The need for a second meeting this year comes from the decision to change our accounting date from December 31st to June 30th. The reasons for making this change have been explained in the directors' report. From an administrative point of view the change is altogether desirable and we have been advised that no increase in our income tax liability for 1954/55 will result.

The group profit before taxation for the half year under review was £278,825, against £395,048 for the previous year. We are, therefore, recommending a dividend of 12½ per cent for the six months' period, which

accords with our annual payment of recent years. The profit figures show a substantial increase in the earnings of the group, but it should be remembered that, generally speaking, the first half of the calendar year is more profitable than the second.

We have, I think, no reason for dissatisfaction with the results so far: our printing interests show an increasing profit and the earnings of the *Financial Times* are pleasing.

We should record our gratitude to the editorial and managerial staffs of the *Financial Times* for the energy and judgment they have shown in the fulfilment of their ambition to produce a paper which, I think, both readers and advertisers believe, provides a refreshing blend of all that the intelligent and busy person seeks quickly to know of public, financial and industrial affairs.

The report and accounts were unanimously adopted.

MODDERFONTEIN EAST, LIMITED

MR N. W. S. LEWIN'S SPEECH

At the thirty-seventh annual meeting of shareholders held in Johannesburg on November 18, 1953, Mr N. W. S. Lewin, the chairman, in the course of his remarks, said:

The directors' report and the audited accounts for the year ended June 30, 1953, together with the reports of the consulting engineer and the manager, were circulated to shareholders over a month ago. The position revealed by these reports and by the more recent results published in the press reflects the prevailing difficult conditions of an inadequate labour force and of a mine in an advanced stage of its life.

In the circumstances, the results achieved during the year were as good as could have been expected and, in particular, I should like to draw your attention to the fact that although working profit decreased by 2s. per ton milled, costs increased by only 11d. per ton compared with increases of 2s. 3d. and 2s. 9d. in the previous two years. The decrease in working revenue of 1s. 1d. per ton was due mainly to a further fall in the grade of ore mined and decline in the additional income from sales of gold at enhanced prices.

The overall position at the mine remains, under present conditions, one of a progressive closing of the margin between the pay limit and the value of the ore mined, the figures of working profit per ton milled for October, 1953, being 2s. 5½d. as compared with 4s. 0½d. for the year to June 30th last. The higher grade ore in the eastern and western portions of the mine is virtually worked out and the centre of mining activity is shifting to the large pillars and blocks due east of and close to No. 1 shaft.

DEVELOPMENT

Primary development has virtually ceased in the main body of the mine but is continuing in the Klipfontein corridor area. A limited tonnage of payable ore is, however, still being developed in the former area by stoping. In the northern portion of the Klipfontein corridor No. 11 drive has been stopped on the major fault which will be the northern limit of development in the area. Drives on other levels are being advanced towards this northern limit but the percentage payability and the values continue to be low. In the southern portion of the corridor the SE incline raise and winze were advanced a total of 2,592 feet during the year and have now been connected. A few blocks of payable ore were opened up by development from the raise and driving from the incline is taking place on four levels.

The report and accounts were adopted

COCHRAN AND CO., ANNAN, LIMITED

HEAVY DEMAND FOR PRODUCTS

MR ROBERT ADEANE'S SPEECH

The fifty-first annual general meeting of Cochran and Company, Annan, Limited (Engineers and Boilermakers), was held on November 19th at 117 Old Broad Street, London, E.C.

Mr Robert P. W. Adeane, the chairman, who presided, said:

Gentlemen, it is with great pleasure that your directors are able to lay before you results of another year's successful trading. Good results do not call for long explanations so I will not detain you.

Whilst trading profit at £210,759 is slightly down as against last year—the net, after tax, profit of £76,374 is £8,140 up. This improvement is due to a number of factors, principally the lesser incidence of profits tax and excess profits levy during the year under review.

APPROPRIATION OF PROFITS

The manner in which we have dealt with the balance available after tax and the interim dividends will, I trust, give you satisfaction. The sum of £40,000 has been transferred to general reserve, bringing that reserve up to £210,000—not far short of our paid up capital. The sum of £15,750 has been written off the cost of acquiring patents and patent rights and after providing £13,000 for the final dividend, which you will shortly be asked to approve, £27,373 remains to be carried forward to next year.

If you will turn to the balance sheet—under current assets—you will note that cash and investments taking the latter at market value, amount to £211,822—an improvement in our immediate liquid resources of some £16,000 over last year. Your directors put great store upon maintaining the liquid position of the company so as to cover the eventuality of having to carry more stocks of steel than we are able to get today, and also to enable the company to maintain its efficiency and keep down costs of production by effecting improvements in buildings and layouts, and by purchasing the most up-to-date plant and machinery available without the fear of running the company short of working capital.

PROBLEM OF SHORTENING DELIVERY DATES

Demand for the Cochran boiler, for our Economic boiler and indeed for the whole range of our products, remains at a high level—in fact, from the number of inquiries we receive from all over the world, it might be said to be on the increase. We still have two years' work on hand, but I am glad to say that we are now beginning, as a result of an increased rate of turn-out, to eat into our back-log. The sooner this is greatly reduced and our delivery dates shortened the happier will be both our customers and ourselves. The problem is that the day has passed when customers will wait two or three years for delivery and we are hoping that, within the next year, we will be in a position to offer despatch inside twelve months.

Steel supplies are now better but we still want more than we get. Labour is fully employed in the area and we are still short of men in certain skilled grades.

Last year in my speech I referred to increasing competition and the need for an export drive. That drive has been instituted and is being intensified and should bear fruit in the future.

Mr R. R. Stokes, our managing director, has just returned from Canada. Our export manager is now on an extensive tour in the Near East and one of your directors, Mr R. Lamb, and various senior members of the staff will shortly be covering Africa and the West Indies. These are in addition to our usual routine trips to the Continent and other main areas where we have markets for our goods.

THE NEWBIE WORKS

Being confident in our future, we have pressed ahead with the development in the works at Newbie. The new boilerhouse is completed and in operation. The light plating shop extension has been finished; the block yard and crane gantry is now in use and the stores and dispatch bay extension is in course of construction.

Before concluding you will, no doubt, want me to say something with regard to the current year. To date finished products are leaving the factory at a greater rate than last year, and I have every confidence that once again trading results will be satisfactory.

Our staff and workers have worked well and loyally for the company during the year and I feel sure that you would like me to express the appreciation of shareholders to them for the high standard of their work and productivity during the year.

The chairman concluded by moving the resolution for the adoption of the report and accounts and the payment of a final ordinary dividend of 6½ per cent, free of tax (making 9½ per cent, free of tax, for the year).

The motion was seconded by Mr R. R. Stokes, managing director, and carried unanimously.

HOVIS LIMITED

QUALITY OF PRODUCTS

The fifty-fifth annual general meeting of Hovis Limited was held on November 26th in London, Mr J. F. Merton (the chairman) presiding.

The following is an extract from his circulated statement:

During the year under review the milling industry was still subject to the control of the Ministry of Food and it was not until as recently as August 29th that decontrol became effective. The constant watch we exercise to ensure that our buildings, plant and equipment never fall short of the highest standards of efficiency and the conservation of resources over the years enable us confidently to welcome decontrol of our flour-milling activities.

It must be borne in mind that for fourteen years the importation of wheat was conducted solely by the Government and that throughout that period the machinery of private trading, built up over generations, ceased to function. At present we are having to pay from six to six-and-a-half times the prices at which we were purchasing Canadian, Australian and Argentine wheats in the summer of 1939. Having regard to the large stocks of wheat in America and Canada and the high level of prices, millers naturally do not care to enter into heavy commitments, but, in order to ensure continuity of supply, they will have to hold fairly large stocks at prices in which they have little confidence.

I am pleased to say that the sales of Hovis flour are being maintained at a level greatly in excess of that of prewar days, and this is due in large measure to the consumer public's appreciation of the outstanding qualities of Hovis bread.

The report was adopted.

DOWTY EQUIPMENT LIMITED

FURTHER EXPANSION OF ACTIVITIES

MR G. H. DOWTY'S STATEMENT

The seventeenth annual general meeting of Dowty Equipment Limited was held on November 23rd at Cheltenham, Mr G. H. Dowty, FRAeS (chairman and managing director), presiding.

The following is an extract from his circulated statement:

This year, we have been able to record, once again, an increase in our activities—with rising turnover and profits. Although our Group sales have increased by 60 per cent over last year, our net profit has increased by only 33 per cent—and is equivalent to a meagre 3 per cent on sales. It is disheartening that so much of the financial gain is taken in taxation, leaving so little for future development and maintenance of assets in their full earning capacity.

Criticisms are frequently levelled against company profits, but successful companies make more than a substantial contribution to the country's welfare. Apart from the employment created, out of every £ profit made by our Group, taxation takes nearly 14s.; about 5s. is retained for purchasing capital equipment, developing of new products and for reserves to provide against future contingencies, and only 1s. 6d. goes in dividends to shareholders. Incidentally, in addition to the contribution by way of taxation, our efforts on export sales contribute also to the country's welfare.

Two strong features are our rapidly growing activities in industrial hydraulic equipment and our expanding interests overseas. During the year, additional factories have been opened in Canada, Australia and this country.

Our aircraft business has been affected to some extent by reduction in the aircraft programmes of certain types—but our output of aircraft equipment continues at a new peacetime high level.

A new factory for undertaking the reconditioning of our aircraft products has been opened at Tewkesbury, Gloucestershire, this year.

Development in landing gears and aircraft hydraulic equipment continues to keep this company in the forefront, and it is gratifying to record our contribution in equipment on the record-breaking "Hunter" and "Swift" and the growing utilisation of our products on aircraft of overseas design. Our export business is considerable and this year it represents 20 per cent of our home sales.

The statement then reviews in detail the widespread activities of the company's home and overseas subsidiaries, and continues:

The profit for the Group, before taxation, is £875,983—an increase of £315,972 over the previous year—but taxation at £582,796 requires an additional £246,598.

It is of interest to record that nearly 90 per cent of our increased profit was attributable to our commercial and overseas interests.

Having regard to the increase in the Group's profits for the year under review, it has been decided to recommend the payment of a final dividend of 12 per cent, free of income tax, making 22 per cent for the year—an increase of 2 per cent over last year. The balance on profit and loss account now stands at £807,086 and is regarded as a general reserve, the Group having continued its policy of not setting aside special reserves.

The report was adopted.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY

(Incorporated in the Union of South Africa)

Extract from the speech of the chairman, Mr H. J. Joel, at the annual general meeting held in Johannesburg on November 24, 1953.

The balance sheet shows for the first time, the market value of quoted investments based on Stock Exchange values or directors' valuations and the total valuation, £12,865,851, shows a substantial appreciation as compared with the value adopted for balance sheet purposes, £8,687,229. Both valuations include an amount of £1,969,224 for holdings of shares and loan stock in Freddie's North Lease Area, Limited, and Freddie's South Lease Area, Limited, this valuation being lower than cost. The loans to these two companies at June 30, 1953, amounted to £4,100,000. This figure now stands at £5,150,000. It does seem to us at this stage that these mines will justify the hopes which have led us to invest such a large proportion of the company's funds in them.

The financing of these two mines to their present stage has depleted your company's liquid position to a point which calls for further cash resources. Your directors have decided, therefore, that it is necessary to augment the company's liquid resources by a sum of approximately £2,550,000. A preliminary announcement of a proposed issue of new shares to existing shareholders, in the proportion of one new share for three existing shares at a price of 40s. per share, has already appeared in the press.

The profit for the year was £2,088,239 compared with £1,444,237 last year. Dividend No. 61 of 3s. 6d. per share absorbed £380,187 and the balance of profit carried forward amounted to £311,496.

Although profits may not be maintained at the high level of those for the year to June 30, 1953, I am of the opinion that provided there is no major change in the general conditions affecting the company's varied interests, the present rate of dividend can be maintained on the proposed increased capital.

GOLD MINING INDUSTRY

At the present time two important developments are taking place in the gold mining industry in the Union of South Africa. I refer, firstly, to the fact that in the new goldfields in the Far West Rand, Klerksdorp and the Orange Free State, the preparatory work of many years is now beginning to show cumulative results, and, secondly, to the fact that the production of uranium by the gold mines of the industry has already commenced.

In the Orange Free State, published reports from the developing mines have disclosed values which, in general, have exceeded those which might have been expected from the results previously obtained in boreholes.

Five companies are already in production, and five others have stated in their published reports that they expect to have commenced production by the end of 1954. To October 31, 1953, the operating mines in the Free State had produced 570,591 ounces of gold to the value of £7,205,000.

In so far as the production of uranium is concerned, up to the present fifteen mines in the Transvaal and seven mines in the Orange Free State have announced their acceptance as potential uranium producers. Of these, three have announced the profits which have arisen from the current production of uranium, while a fourth has announced that the initial stages of production have been reached.

PETER BROTHERHOOD LIMITED

SATISFACTORY TRADING

The forty-sixth ordinary general meeting of Peter Brotherhood Limited was held on November 25th in London.

Mr A. M. Neal, JP, ACGI, AMICE (the chairman), in the course of his speech said: You will notice on the assets side of the balance sheet that as a result of the continuance of our policy of modernisation the value of the fixed assets has increased by approximately ten per cent during the year. Under current assets, you will note that the value of stores and work in progress has increased, compared with March 31, 1952, by £382,332.

In view of the tendency of cost of production to increase and in view of the amount of money extracted yearly by the Government in the form of taxation, I think you will agree that a cash balance of £115,199, together with tax reserve certificates to the value of £100,000, is satisfactory. The current liabilities amount to £540,402, against total current assets of £1,609,343, a surplus of current assets over current liabilities of £1,068,941.

The value of our sales for the year shows an increase of twenty-two per cent over last year's figure, while the net trading profit for the year, before provision for taxation, shows an increase of approximately nineteen per cent—£318,446 against £268,022. Of this trading profit of £318,446, the profit and loss account shows that provision for taxation absorbs the large sum of £179,900, against £157,000 in 1952, leaving us with a net profit for the year of £138,546.

DIVIDEND AND ALLOCATIONS

Provision for taxation made previously but now no longer required amounts to £5,326, bringing the total available net profit to £143,872, an increase over the comparable figure last year of £2,850. The question of a dividend has been considered by your board who have decided, in view of the satisfactory results, to recommend the payment of a final dividend of 13 per cent less tax, making with the 5 per cent less tax interim dividend already paid, a total for the year of 18 per cent less tax, on the ordinary capital which you will remember was doubled in March of this year.

We recommend the allocation of the sum of £51,942 to fixed asset replacement, which, with the sum of £98,058 we propose to transfer from excess profits tax postwar refund, will bring the total of this reserve to £400,000. We further recommend the placing of £50,000 to general reserve, bringing the total of this reserve to £150,000, and the addition of the balance of £2,516 to carry forward, increasing this item to £172,146.

As to the future, there is every indication that the trading results for the year ending March, 1954, will be no less satisfactory than those with which we are dealing today. The volume of work on our order book is some 8 per cent less than when I spoke to you last year, but it is sufficient to provide work at the present rate of output for from two to three years.

A fair proportion of the orders at present on our books are contracts for the defence services on which the margin of profit is somewhat narrow, but I see no reason, under all the circumstances, why, in the absence of troubles international or industrial, our shareholders should not look forward to a continuing period of prosperity.

In view of the accounts before you, I feel sure shareholders will agree that the result of the year's trading has been highly satisfactory. The report and accounts were unanimously adopted.

THE PERAK RIVER HYDRO-ELECTRIC POWER COMPANY

CONTINUED STEADY PROGRESS

The twenty-seventh annual general meeting of The Perak River Hydro-Electric Power Company, Limited, was held on November 26th in London, Mr Hugh G. Balfour (the chairman) presiding.

The following is an extract from his circulated statement:

The company has continued to make steady progress during the year, although conditions in Malaya, while improving, are by no means yet restored to normal.

The peak load on the system was 59,000 kW, as compared with 57,000 kW previously. The combined output from our power stations showed a small increase from 367 to 377 million units, although owing to reduced river flow the hydro station at Chenderoh only generated 201 million units, a decrease of 26 million units on the previous year. The steam stations at Malim Nawar and Batu Gajah were therefore more continuously loaded, and in consequence generated 25 per cent more units than during the previous year.

Although slow delivery of materials again somewhat delayed work on the installation of plant at Batu Gajah, to which I referred last year, the new oil-firing equipment and oil storage tank have been installed. The 80,000 lb per hour Babcock and Wilcox boiler should come into service during the current financial year. The other plant, consisting of three small turbo-alternator sets and boilers, with a total installed capacity of 6,000 kW, should also come into operation in the near future.

HIGHER OPERATING EXPENSES

Operating expenses were higher at £596,437, compared with £509,236 previously, the increase being largely due to the increased cost of labour and materials, and the more continuous working of the steam stations.

The operating balance is £788,753, to which has to be added the gross dividend from the subsidiary company, interest less exchange differences, and transfer fees, making a total of £811,817. After providing for London administrative expenses and directors' fees, the balance carried to net revenue account is £796,617. Our usual allocation to depreciation account requires £250,000, and taxation on the profits for the year is estimated at £387,500, so that the balance available for appropriation is £159,117.

The preference share dividend and the allocations to the general and contingency reserves thus total £98,594, leaving £60,523, out of which the directors recommend a dividend of 5 per cent plus a bonus of 1 per cent on the ordinary share capital, which requires £57,750 net. The available surplus on the company's operations for the year is therefore reduced to £2,773 which, with the amount of £103,403 brought in, result in a balance of £106,176 on net revenue account to be carried forward to the current financial year.

With regard to prospects for the current year, monthly returns to date are running at a satisfactory rate, and unless any serious setback occurs in the tin position, or unless general conditions in Malaya deteriorate in a manner which there seems to be no reason to expect at present, our next account should compare not unfavourably with the one now presented to members.

The report was adopted.

THE ANGLO-INDONESIAN PLANTATIONS

FACTORS AFFECTING TRADING

The forty-third annual general meeting of The Anglo-Indonesian Plantations, Limited, was held on November 24th in London, Mr G. C. Denham, CIE, CBE (chairman and managing director) presiding.

The following is an extract from his circulated statement:

We are, unfortunately, still having to contend with innumerable difficulties arising from the instability of Government, the constant changes in connection with taxation and the introduction of a large number of financial regulations which affect, almost from month to month, not only the compilation of our accounts, but the future outlook, which is inherently controlled by the accurate estimate of our costs.

Taking the general position in Java, it can be said that on the whole, despite improvements in certain conditions, we are definitely worse off than we were during the year 1952. The labour position is one of extreme difficulty owing to the never-ceasing demand for increased wages which must, if acceded to by the Government, eventually paralyse the planting industry in Java. There has recently been an award by the Government on an application by the Sarbupri, the union which controls nearly all the workers on the plantations, increasing wages by 50 sen a day and making the Lebaran payment of one month's extra pay a year a gift and not an advance to the workers. To this must be added an extra payment of 30 sen a day to subsidise further the rice purchased by our workers. The Estate Owners' Association in Java has appealed to the Government against the award, pointing out that with such wages it would become impossible to work many estates at a profit, and very few at a profit large enough to provide a reasonable dividend to the stockholders and to allow for ever-necessary capital expenditure. In our own case costs will, on the higher wage scale, be increased by something between Rp 8 million and Rp 10 million (£250,000 and £312,500) a year, with the result that unless there is a most remarkable upward swing in the prices of our products the earning of profits will be an almost impossible task.

NEED FOR REALISTIC POLICY

Indonesia requires a clear and steadfast economic policy which, once established, will enable plantation and other industries to work on an economical and profit-making basis, thus giving encouragement to the expansion of all agricultural industries, which is so vital for the welfare of Indonesia. Until some realistic and attractive policy is put forward by the Government, which mitigates the disabilities under which the plantation industry now works in Indonesia, that industry must inevitably decline and will never be revived by the injection of foreign capital.

We are the owners of what is still a wonderful property and we believe that, given reasonable facilities, there is a prosperous future before us. There will be many difficulties to overcome and probably numerous unpleasant surprises, but with our perseverance and with help from a Government which appreciates our position and the important part we share in the prosperity of Indonesia, a successful future should be assured.

The report was adopted and a final dividend of 2 per cent, making 5 per cent for the year, was approved.

TRINIDAD LEASEHOLDS LIMITED

MR SIMON J. VOS'S REVIEW

The annual general meeting of Trinidad Leaseholds Limited will be held in London on December 17, 1953. The following is extracted from the Chairman's statement circulated with the company's accounts for the year ended June 30, 1953.

Having regard to world conditions in general and the highly competitive state of the oil industry in particular, the results of the group's activities for the year give cause for satisfaction.

Although no extensive new crude oil reservoir was discovered, increased drilling led to extensions of proven territory at some of our oil fields in Trinidad. In consequence, production, potential and oil reserves improved.

Refinery throughput continued to rise, and the catalytic cracking and associated plants operated to capacity in the production of high grade products for the United Kingdom and other markets.

It is with great pleasure that I am able to inform stockholders of the outstanding success that the marketing of Regent Oil Company's premium brand "Regent TT" has had with the motoring public. Its quality is its best advertisement, and the motorist knows now he is buying a motor spirit which will give the very best results.

Once again I have to express our sincere appreciation of the support and co-operation which "Regent" has enjoyed from its ever-growing family of customers, both dealers and commercial consumers.

THE CEMENTATION COMPANY, LIMITED

CONTINUED PROGRESS

The annual general meeting of The Cementation Company, Limited, will be held in London on December 17th.

The following is an extract from the statement of the chairman, Mr A. R. Neelands, MC, circulated with the report and accounts for the year ended March 31, 1953:

The trading profit of £537,958, after writing off £242,509 for depreciation upon fixed assets, shows continued progress. Our satisfaction at the result is clouded by the large proportion of our earnings at home and abroad which has to be set aside for taxation—£394,808.

Those who read of the award of a major shaft sinking contract to a German firm may have wondered about it with some uneasiness. We take no umbrage for it is essential that the country should be supplied with an abundance of coal quickly. When the present pressure for new shafts is relieved to a point where it can be handled by British contractors, we assume that no further contracts will be placed abroad.

Last year we decided against placing further large orders at high cost with delayed delivery, having in mind the amount of plant on order, that plant would shortly start coming back from contracts in hand, and that by the time any plant ordered now was delivered the rush of shaft sinking would probably have abated, and it was unlikely that the extra profit, if any, earned over a comparatively short period would pay for such plant likely to become redundant thereafter. We believe a correct balance was maintained in our orderings between enterprise and caution.

JOHN I. THORNYCROFT & COMPANY

LARGER TRADING SURPLUS

The fifty-second annual general meeting of John I. Thornycroft & Company, Limited, was held on November 25th in London, Sir John E. Thornycroft, KBE, governing director and chairman, presiding.

The following is an extract from his circulated statement for the year to July 31, 1953:

The trading surplus of the group, after provision for depreciation and taxation, is slightly greater than in 1951/1952. From the accounts it will be seen that £511,319 has been brought back into the consolidated profit and loss account, being an over-provision for taxation in respect of previous years. Until agreement could be reached with the Inland Revenue in respect of exceptional depreciation, spreading of profits on long-term contracts, deferred repairs, and other adjustments and of the liability for United Kingdom tax on profits of the Brazilian and Argentine subsidiaries, it was necessary to retain adequate reserves. The position has now been agreed in respect of all these matters up to July 31, 1950, except with regard to the cash provided for Brazilian tax on bonus issues of shares by the Brazilian subsidiary, which is still under discussion.

1953/54: During the current year we do not expect to deliver any great value of ships, probably two tugs and five coastal sweepers, with an oil tanker for the Peruvian Navy and two frigates for HM Navy the following year.

The report was adopted.

Binding Cases

Binding cases for THE ECONOMIST can now be supplied. These cases, made by Messrs.

EASIBIND LTD., are in stiff, dark blue cloth

covers, and are gilt-lettered on the spine; they

provide an extremely effective and firm binding

and will hold 13 issues of the normal edition, with

the quarterly Index, or 26 issues of the air edition

and 2 quarterly Indexes. The year can be

stamped on the spine. The cost per case, post free

throughout the world, is 11/-.

Orders, stating requirements clearly and en-

closing a remittance, should be sent, not to

THE ECONOMIST, but to—

EASIBIND Ltd.

(Dept. E), 84, Newman St., London, W.1.

A binding case can be sent on approval if required.

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS; PATENT EXAMINER AND PATENT OFFICER CLASSES. The Civil Service Commissioners invite applications for permanent and pensionable appointments to be filled by frequent competitive interviews. The Scientific posts are in various Government Departments and cover a wide range of fundamental and applied science. In most of the major fields of scientific research and development, individual vacancies exist at present for candidates who have specialised in biological, physical, chemical, or agricultural science. The Patent Office (Board of Trade), Admiralty and Ministry of Supply.

Candidates must have obtained a university degree with first or second class honours in an appropriate scientific qualification; or engineering) or in Mathematics, or an equivalent attainment. Candidates for Scientific posts, possess high professional attainments. Have had at least three years' post-graduate or other approved experience.

Age Limits: Senior Scientific Officers, between 26 and 31, but specially suitable candidates under 26 may be admitted. For Scientific Officers and Patent Classes, between 21 and 28 during 1953 (up to 31 for permanent members of the Experimental Officer class, competing as Scientific Officers). Inclusive London Salary Scales: Senior Scientific Officers, men, £917-£1,075; women, £786-£949; Scientific Officers, men, £440-£512; women, £440-£507; Patent Examiner and Officers, men, £440-£512; women, £440-£507. Patent Examiner and Officers, men, £440-£512; women, £440-£507. Women's Patent Officer Classes, men, £440-£512; women, £440-£507. Women's Patent Officer Classes, men, £440-£512; women, £440-£507. Women's Patent Officer Classes, men, £440-£512; women, £440-£507.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1. quoting No. S.53/53 for Senior Scientific Officers and S.52/53/S.128/53 for the other posts. Completed application forms to be returned on or before December 31, 1953.

UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA. Headquarters Coonoor, Nilgiris Hills, S. India, with equable healthy climate, invites applications for the post of DEPUTY SECRETARY. The objects of the Association include those of an Employers' Federation as well as those of a Chamber of Commerce, for plantation problems. The gentleman selected will be appointed with a view to his later appointment as Secretary as soon as the Association considers practicable, but within five years from the date of his appointment.

A candidate must not be more than 45 years of age, must have considerable experience in industrial relations and negotiations with trade unions, and should preferably be either a chartered secretary or a member of the Institute of Personnel Management. Legal, or accountancy or statistical training will be a qualification for the appointment. Ability to speak or quickly learn one or more South Indian languages is important, but at present not essential.

The salary proposed for a suitable candidate is Rs.1,600-80-2,000 per month, with dearness allowance of Rs.250 per month for a married man, with 10 per cent contributory provident fund, 10 per cent house allowance, or a furnished rent-free house, a servant allowance of Rs.105 per month and free medical attention, in accordance with the rules of the association for executive staff. In addition, there will be an overseas allowance of 25 per cent of basic pay if the candidate has an overseas domicile. The salary scale will be revised if and when the candidate is appointed as secretary.

Six months' leave, on pay, will be granted at 31 years' service, and return passages (including those of wife and children in India) will be paid by the association.

After allowing for the standard of living, cost of living and taxation in India, candidates from outside India may take it that for this appointment, in terms of expenditure, one rupee is roughly equivalent to one shilling in the UK.

Applications, giving details of the candidate's experience and qualifications, age, family, recreations, and accompanied by not more than three testimonials or names of persons of standing, to whom reference may be made, must be addressed to The Secretary, Upasi, Coonoor, so as to reach him not later than December 31, 1953.

UNIVERSITY OF BIRMINGHAM
FACULTY OF COMMERCE

Applications are invited for a Research post in ECONOMICS. Applicants should be men with a good Honours degree in Economics and preferably a knowledge of Accounting and Statistics. The appointments will be for about 21 months from January, 1954. Salary £500-£550 p.a. Applications, stating academic qualifications, experience and any special research interests, with the names of two referees, should reach the Registrar, The University, Birmingham, 15, not later than December 5.

C. G. BURTON, Secretary.

BBC requires Talks Producer in Home Sound Broadcasting to be concerned with talks and discussions on economics and international finance. He should be able to keep abreast of developments in this field, initiating and planning relevant broadcasts with outside contributors, carrying out preparatory work and production at the microphone. Wide interests and high level of general education up to university level essential, also first-hand knowledge of economics and fiscal matters generally. Legal or journalistic training and experience, competence in writing or editing scripted material and interest in broadcasting as a means of discussing present-day problems would be useful. Appointment on grade with salary £795 rising by 5 annual increments to £1,065 or £1,000 rising to £1,330 per annum, according to qualifications. Applications to Appointments Officer, Broadcasting House, London, W.1, marked "113 Econ." within a week. For acknowledgment please enclose stamped addressed envelope.

PRODUCE OFFICER required by the NIGERIAN GOVERNMENT MARKETING AND EXPORTS for 18 to 24 months in first instance. Salary, etc., according to experience, in scale £807 rising to £1,631 a year. Gratuity of £100 or £150 a year. Outfit allowance £60. Free passages for Officer and wife. Assistance towards the cost of children's passages or grant up to £150 annually for maintenance in United Kingdom. Liberal leave on full salary. Candidates under 40, must have a University Degree in Commerce, Economics or Agriculture, and should possess administrative ability. Experience of inspection and grading of agricultural products an advantage.—Write to the Crown Agents, 4 Millbank, London, S.W.1. State age, name, in block letters, full qualifications and experience and quote M3C/33943/EN.

LIFE ASSURANCE COMPANY in Mauritius requires assistant to General Manager. Age 35 or under. Experience of Life Office work and Insurance Company pension schemes essential. Good salary and allowances, free house and passages. Contributory pension and widows' and orphans' scheme.

Further particulars from W. H. Clough, Empire House, St. Martins le Grand, London, E.C.1.

STATISTICIAN/ECONOMIST with market research experience required to take charge of small market research and statistics department. Salary in accordance with qualifications and experience. —Applications, including outline of experience, should be addressed to Box 385.

COMPANIES ENTERING THE AMERICAN MARKET. Well-established English company with world-wide connections including a subsidiary company in the U.S.A., can offer manufacturing facilities to businesses seeking to produce and market in the United States. These facilities are located near Chicago and comprise factory buildings, building space, steam and power. They are suitable for the manufacture of food, pharmaceutical or plastic products. —Interested companies should write, in confidence, to Box 386.

EXECUTIVE ENGINEER required in London to manage energetic department of inspectors and others concerned in heavy engineering construction. A graduate mechanical engineer between 35-45 years of age is preferred, but graduates in industrial administration with an engineering background will not be excluded. Proved management ability and mature outlook, however, is essential. The post carries a salary of not less than £1,500 per annum, and in addition the company provide sickness, pension and life assurance benefits.—Applications, giving essential details, to Box 378.

MARKET RESEARCH EXECUTIVE required to plan and control consumer surveys at all stages.—Write stating age, qualifications and experience, to the Research Manager, W. S. Crawford Ltd., 233 High Holborn, W.C.1.

EXPERIENCED TEACHER required, January. Interested in individual child. Fully qualified. General subjects, games or art. Burnham Scale.—Principal, Shotton Hall, Harmer Hill, Shrewsbury.

ARE you interested in the Government's plans for introducing competitive television? The Popular Television Association, of 78, Buckingham Gate, London, S.W.1, will gladly send Speakers to address your Society on this vital subject.

ADVERTISER, late 30s, seeks appointment as Senior Marketing Executive in progressive company of national standing. Wide experience with front rank companies in Home and Export Advtg., Mktg., Sales Prom. and Production problems. Languages.—Box 380.

YOUNG MAN, late twenties, considerable experience accountancy, correspondence and office management, driver, seeks progressive position.—Box 384.

JOURNALIST required to syndicate industrial economic financial material to foreign newspapers.—Please apply, giving details of past experience, to Box 383.

ASHRIDGE, Week-end Courses on International Affairs, the Commonwealth, Social Problems, Economics and the Arts. Longer Courses for Industry and Commerce. Prospectus and Programme for 1954 will be sent on request to Secretary, Ashridge, Berkhamsted, Herts. Tel.: Little Gaddesden 3191.

TRAVEL AGENCY, Austria, can offer 150 beds and British representation to British travel agency for summer parties at extremely favourable rates.—Box 388.

COMPANY SECRETARY—Public Company, electrical industry, seeks experienced Secretary, preferably with Accountancy Qualifications. London area. Salary £2,000 per annum.—Write qualifications, experience, age, etc., in confidence, to Box 387.

The profit in farming out

For the smaller firm, the advantages of farming-out research problems are numerous. The most outstanding, perhaps, are these:

The heavy expenses of equipping a laboratory and engaging scientific staff are avoided

The minds brought to the job are fresh and unhampered by the pressure of routine

The techniques employed in other and very different industries—and unfamiliar to the man on the spot—can often be used with striking success

Firms who bring their problems to Sondes Place Research Institute profit greatly from these advantages—and, needless to say, retain absolute professional security and exclusive rights to research results

The work of Sondes Place is discussed in 'Report', the Institute's occasional bulletin. May your name be added to the mailing list?

The business founded by Thos. W. Ward in 1878 has grown from the smallest of small beginnings into a major commercial organisation with links throughout the entire industrial world.

Closely integrated with engineering and the heavier industries, the Ward Group of Companies produces many raw materials, manufactures a wide range of plant and machinery and provides at home, within the Commonwealth and throughout the world an infinite variety of general engineering products and services.

Link by link the chain has grown—purposefully, for service to industry—strengthened and annealed by 75 years' progressive experience.

FOR VALUE AND VARIETY IN WORLD AIR TRAVEL

FLY AUSTRALIAN*

to any of 21 Countries

Warm Australian hospitality, combined with exacting standards of passenger service, makes intercontinental flying with QANTAS a refreshing experience. Qantas air networks link many of the World's major centres of trade and travel—and many minor ones as well. To be specific—21 countries on 60,000 miles of air routes, many of them untraversed by any other airline. For example, the unique 'Wallaby' route (Johannesburg to Sydney) and beyond to the Pacific Islands, Manila, Hong Kong and Tokyo. Your Travel Agent will tell you more—without cost or obligation.

A FORTUNE UP THE CHIMNEY

The amount of wealth that is daily lost up the chimney in the form of heat and raw materials only throws into sharper relief the wisdom of Mr. Therm.

Mr. Therm, by carbonizing coal, saves heat, saves natural resources and saves health. He is not only a prime mover in smoke abatement; he produces, from one ton of coal, 75 therms of gas, half a ton of smokeless coke and a considerable quantity of indispensable by-products. In this way, the Gas Industry is making an enormous contribution to our national well-being.

By no means everybody recognizes the supple feel of good leather... appreciates the skill behind a line of strong, straight, stitches... can even see the small points of finish which betoken masterly skill in leathercraft. Which is just as well, perhaps, because there's a limit to the number of Unicorn briefcases that even the deft hands of the Bury craftsmen can make—at workbench prices—for the people of unusual perception who really appreciate them.

The model illustrated has two interior foolscap compartments and zip-sealed section for overnight things. Capacious exterior zip pocket for newspapers, books, etc. English lever lock and fittings of solid brass. All leather handle. Press studs in the base for slimming. Size 17" x 11½". In golden tan or Autumn tan pigskin at 12 guineas; or in smooth polished hide (golden tan, brown or black) at 9 guineas.

Matching zip folio cases size 16" x 10½" available separately at £4.10.0 and £2.15.0 respectively. Post free and tax free in U.K. (In U.S.A. \$36.25, \$27.25, \$13.50, \$8.25 respectively carriage and insurance free, 20% Customs duty payable in U.S.A.).

Zip Folio Case.

Complete satisfaction guaranteed or purchase price refunded immediately. Obtainable at the Unicorn Showroom, 39, Burlington Arcade, London W.1. or by post from our works:

Out-Manœuvred

BETWEEN Lugano last October and Berlin next January there is a world of difference: that, perhaps, is the best brief comment on the latest Soviet Note, which arrived just in time to provide the *pièce de résistance* for the Bermuda table. Lugano, as proposed by the West and ignored by the Russians, was to have been a fresh start on the specific problems of Germany and Austria. Detailed negotiation was to create confidence between the powers by making possible limited agreement. Berlin, as proposed by the Russians—and presumably to be accepted by the West—seems likely to mark an old-fashioned start on the limitless problems of what the Soviet Note repeatedly calls "reducing international tension everywhere." What is suggested is not only a change of place and method but also a reversal of roles. For when the West was weak the Russians insisted on getting down to brass tacks and avoiding global issues; but now that the West is strong they spurn the brass tacks and point to a vista of broad contention and green cloth. Washington, London and Paris have been out-manœuvred, Note by Note—let there be no mistake about that. And the various pawns advanced in the Churchill gambit have all been taken by the Russians without any obvious gain to the West.

Not everyone, of course, sees it like that. Indeed, the general reaction, in this country at least, has been one of satisfaction, as at a clear advance made towards the objective of a firmly based peace. So indeed it would be, if the Russian willingness to confer had been accompanied by any sign of a willingness to meet the western powers half way on the substance of the matters at issue. But of any such sign the latest Soviet Note is innocent—unless it be one to insist on the presence of Communist China after the meeting opens and not before. It is the purest wishful thinking to suppose that the invitation to Berlin is anything more than a tactical move in support of a main position which is utterly unchanged. The immediate Soviet tactic is to delay, and the strategy is to divide. The hope is that, so long as the Berlin conference is impending or in session, the French National Assembly will stubbornly refuse to ratify the treaties that would simultaneously create the defence community, give independence to Dr Adenauer's Germany and complete the strategic dispositions first laid down when General Eisenhower was Supreme Commander in Europe. This is the objective for the early months of 1954 and if it can be attained, then the further hope of the Kremlin is that the loss of impetus behind western policy, political disagreements, economic depression and the Communists' own skilful wooing of anti-German feeling will disintegrate the Atlantic alliance and leave a divided Germany to make one day what terms it can with Russia.

The evidence of this policy is writ large in the last Soviet Note. Here Moscow is claiming to speak for Europe against America and Germany. Peace, it says, can be achieved by "agreements between all the states of Europe irrespective of their social systems." Such

arrangements "must be based on earlier commitments agreed by the countries concerned" and not on any plan, such as the EDC, that will set Western against Eastern Europe. In other words: Europe is to build its own security system under Soviet patronage; the East European system of treaties directed against German aggression is to be extended westwards; and the basis for such a system lies in the Franco-Soviet Treaty, the Anglo-Soviet Treaty, and the Potsdam agreements. Here is Moscow's counter to Sir Winston's hints of a new system of security guarantees to reassure the Soviet government. It points to the old ones that already exist.

What have these instruments in common and what is their essential characteristic? It is the undertaking to prevent a revival of the German militarism in which, Moscow insists, lies the only danger of war. The West, therefore, faces not only blank opposition to the whole conception of the European Defence Community (designed, among other things, to prevent misuse of military power by Germany) but an alternative plan for curbing German power. And that in turn implies a deal at the expense of Germany between the Russians and such allies as can be lured out of the Atlantic camp. If that is not the letter it is at least the spirit of the Potsdam four-power policy of 1945-7 which was first tried and first failed in Berlin. To judge from recent Soviet Notes, what Molotov is aiming at is no less than a Soviet Monroe doctrine for the whole continent of Europe.

★

The bid to Berlin will have to be accepted. After all the hopes that have been aroused since the death of Stalin, the western governments dare not reject it, even if they all three wished to. But it ought to be perfectly clear to any thinking person that the compulsion to accept it, and to waste weeks and months in Berlin, while all the projects of western policy are either completely held up or at the best limp tentatively forward, is a setback for the West. Every day that the meeting lasts will add to their discomfiture.

Since this is the penalty of being out-manœuvred, it is important to understand how it has happened. The fault does not lie with the professional diplomatists on the western side, but with the state of public opinion and with the failure of the politicians to lead it aright. So much silly nonsense has been talked in America, with so little correction from the President, and Senator McCarthy has been so successful in silencing the voices of moderation and wisdom, that Europe has almost begun to believe the Communist thesis that the Americans are more dangerous than the Russians. British public opinion, always dangerously addicted to sentimental wishfulness, has been positively encouraged by the Prime Minister to believe that there is a quick and easy issue out of all its afflictions if only President Eisenhower would go to Moscow. And in France the deputies have listened all

too eagerly to their ancestral fears of Germany without any politician having both the strength and (until very recent weeks) the courage to make them face facts. The State Department, the Foreign Office and the Quai d'Orsay have all seen the dangers; but each has had to act with a hand tied behind it. The Americans dared not appear "weak"; the British were compelled to press for a meeting which they knew would do no good; and the French could neither advance the policy of European integration they themselves initiated nor propound any coherent alternative. Such are the fruits of democracy when public opinion is left leaderless. The wonder is that the Russians, with neither allies nor public opinion to consult, have had to wait until December to score their first clear diplomatic victory.

★

It would be wrong to strike too tragic a note. It is only a tactical defeat for the West, which can be turned to advantage if its lessons are learned. The precondition is, of course, that it should be recognised as a setback, and even that will not be too easy, so general is the belief in the virtues of talk for its own sake, so little realisation is there of the dangers of delay.

The next requirement is to limit as far as possible the time that is to be wasted. Some time, unfortunately, will have to be conceded—not because there really is any hope of the Russians offering any concessions (why should they when they are doing so nicely?), but because there are so many millions of people who believe there is and who will have to be at least partially de-bamboozled before they will accept a breakdown without blaming Mr Dulles. The dangers of waiting will be the less if the French can be persuaded not to postpone all decision until after the Berlin conference has dragged its long life out. Possibly if a vote on EDC is forced in Paris before the conference has failed it will be adverse. But the position is very nearly reached where even an adverse vote will be preferable to no decision at all.

Perhaps the most important lesson of all to be learnt is that public opinion cannot be left leaderless without danger. If it is left to believe that Molotov has a song in his heart, then the British and French Foreign Ministers will feel bound to give him more than a reasonable amount of time to reveal what it is, whatever Mr Dulles may feel. If, on the other hand, it is pointed out firmly and repeatedly that the Soviet Union has already integrated, subdued and rearmed Eastern Europe and that the Allies ask for nothing more than the integration of the Atlantic half which is divided, thinks for itself and is only half-armed, then some sense of proportion may be restored to public expectation. An eventual compromise between the two conceptions is possible; but only if the Soviet Union is ready to compromise. Of that there is still no sure sign; and without such a sign the proposed journey to Berlin can be regarded only as a retreat.

Pandora's Housing Box

THE House of Commons on Tuesday gave a second reading to the Housing Repairs and Rents Bill. In the two days' debate the Government had an easy task defending its Bill against an Opposition which, while eager to exploit the political passions which any measure concerning rents is bound to produce, could not decide on its line of attack. Mr Bevan's original view that landlords are getting no more than a "mouldy old turnip,"—in other words, an incentive that is quite inadequate to prod them into action—was disputed by those who pretend to see in the Bill a powerful instrument of landlords' extortions. The latter had become the authorised version on the hustings of Holborn and Paddington. Labour has shown no remedy of its own for the problems of rent restriction, short of the extreme and remote step of bringing all controlled property into municipal ownership; and on this issue the fiery orthodoxy of Mr Bevan appeared to be at odds with the cautious doubts of Mr Morrison about the wisdom of municipalising even slum property, which the Bill proposes. Many Labour speakers therefore contented themselves with variations on the familiar theme of the original sin of private landlords.

The real tests of the Government's proposals are twofold. The immediate, short-range test is whether they will enable a more effective use to be made of the nation's large stock of old and decaying dwellings. The broader, long-term test is whether they will clear the ground for a rational solution of the tangled and linked problems of rent control and housing subsidies. The weakness of the debate was that little was said on the wider issue. Neither party seems willing, where housing is concerned, to look more than a year or two ahead.

★

The Government's attempt to stop the decay of rent-controlled houses is certainly on the right lines. It seeks to utilise both private and public enterprise in appropriate cases and to differentiate between those houses which can reasonably be repaired or renovated and those which must be demolished as soon as is practicable. The former will remain the responsibility of private landlords, aided in some cases by public improvement grants; the latter are intended to be acquired and maintained pending demolition by the local authorities. To the extent that private landlords fail to maintain their houses in a fit condition, they will lose them eventually to the municipal pool. This policy should, on paper, do much to refurbish the existing stock of houses, and in so doing it will reduce the present extravagant demands for new houses.

The main doubt is whether the Bill provides the means, either to private landlords or to local authorities,

for making the scheme a success. Mr Macmillan gave some figures which indicate how he hopes the scheme will work. He estimates that of 7½ million rented dwellings in Britain, 5 million or so are still in a reasonably good condition and will be rescued by the Bill from falling into bad repair. Another million or so houses will have to be pulled down as beyond repair; and the most that can be hoped for the remaining million-odd dwellings is that landlords will be induced, by the threat of compulsory acquisition, to make them at least fit for human habitation.

The Minister is thus relying chiefly on the inducements that the scheme provides for private landlords. His estimate of their response seems optimistic. The permitted increase in controlled rents will on the average be barely sufficient (if that) to cover the extra annual cost of repairs, as estimated by the Girdwood Committee. Many of even the "reasonably good" houses have a backlog of repairs which the landlords, in principle quite rightly, have to make good at their own expense before being entitled to put up the rent. The Minister hopes that in such cases the owner will bear the cost, in order to preserve the capital value of his property or, alternatively, that he will be fired to action by the threat of public acquisition. It is doubtful whether this will be enough; and since it seems to be agreed that the proposed increase of rent is, save for exceptional cases, well within the tenant's ability to pay, it might be wiser to give landlords a rather greater financial inducement—subject to proper safeguards.

There are two safeguards in the Bill for securing that rents will not be increased unless repairs are properly executed. Before raising the rent the landlord must demonstrate that he has spent a stipulated minimum on repairs, and the tenant may apply at any time for a certificate of disrepair from the local authority which entitles him to withhold the extra rent. Many Labour speakers regarded these safeguards as inadequate. Mr Bevan argued that the onus ought to be on the landlord in the first place to get a certificate of good repair from the local sanitary inspector. Since local authorities are generally short of staff, this would create delays in getting repairs started—and would thus defeat the Bill's first purpose. Another Labour suggestion is that the landlord's statement of expenditure should be open to challenge before the rent tribunal, but questions of fraudulent mis-statement are properly referred (as the Bill provides) to the ordinary courts. The Bill's safeguards should be adequate provided the local authorities are reasonably alert.

The local authorities have the important but essentially subsidiary task of dealing with dwellings that are beyond redemption by private landlords. In this case the Government clearly is not supplying sufficient

inducement. In some cities the slum clearance programme will take twenty or more years, so that many dwellings need a considerable amount of temporary renovation if they are to be made at all tolerable. The average cost of such renovations in the Birmingham scheme, which the Minister is taking as his model, has been £195 a house, a much larger sum than can be recovered from increases in the rents of such poor property.

The proposed Exchequer grants will cover no more than half the cost of the temporary upkeep of slum property, and they are so constructed that apparently the longer the slums stay up the less the ratepayers will lose. This is not enough to encourage councils to take on a task which, as Mr Morrison was quick to point out, may be politically embarrassing. So far from there being any risk of the Bill's creating the "municipal slum monopoly" which Mr Morrison dislikes—but which represents the only apparent way of tackling an urgent social problem—the Minister will have to reconsider his financial offer (as he has promised to do) if he is to get co-operation from the local authorities in this important phase of his programme. He should also realise the importance of linking slum clearance more

Parliamentary Reform

In the matter of Parliamentary Reform, a Minister is at the present moment peculiarly liable to be led into error. He is more or less so in all projects of legislation involving innovation. Those who desire a change, ask for it, work for it, clamour for it: those who are satisfied with things as they are, remain silent from pure content. The *rémuant* party are active: the conservative party are quiescent. Those who *want*, petition and agitate: those who want nothing (but the status quo), simply do nothing. Those who believe that Ministers agree with them and will act as they would wish, abstain from bothering them: those who are of a different way of thinking, bring to bear upon them every engine of influence and opportunity which they can possibly put in action. So, to a certain extent, it will be in this case. . . . A great change has come over the feelings of the country on the subject of Representative Reform. . . . The wishes, shibboleths, and banners of ten years ago are not those of to-day. The old formulas may still be used, but they have lost their spirit and their meaning. The old creeds are still professed, but people no longer believe in them. The old war cries are still shouted, but they no longer stir the hearts of the people as with the sound of a trumpet. The ballot has still many advocates and many voters; but it has far fewer fanatics and devotees than formerly. The extension of the suffrage is still desired, but we have learned to distinguish between a *lowering* and an *extension*. As for minor points which of old occupied so prominent a place among Radical demands—abolition of property qualification, "manhood" or "complete" suffrage, payment of members, shorter parliaments, etc.—they have all vanished into thin air. A sober senator, with a reputation to lose, would as soon think of wearing a pig-tail as advocating these now. Times are changed, and we have changed with them. The Radical reformers were in the ascendant formerly: the philosophical and conservative reformers are in the ascendant now.

The Economist

December 3, 1853

effectively—and more remuneratively—with the broader tasks of urban redevelopment.

But if the velocity is uncertain, the direction of the Government's measures is right enough. The only other way of improving the condition of old houses—the Labour recipe of wholesale municipalisation—is quite impracticable as an immediate solution, whatever its theoretical merits or demerits. Quite apart from its enormous initial cost (put by Sir David Eccles at £3,000 million), it would throw an impossible administrative and financial load on the local authorities, whose resources will be strained to the utmost if they are to cope properly with unfit dwellings, and they would probably feel bound to subsidise improvements to old houses, in order to give the tenants some parity with the favoured residents of new estates.

★

The eventual goals of Government policy remain obscure. Ministers certainly have not recognised the folly of an extravagant programme of building new houses at public expense. Mr Enoch Powell, in a sensible speech, pointed out that the Opposition's proposals would place the building industry everywhere under subsidised contracts—for repairs, for improvements, and for new construction; and this is the classic prescription for destroying the efficiency of any industry. What he failed to add was that the Government's policy runs the danger of treading the same primrose path. The present Bill provides grants for both private owners and local authorities, grants which may well have to be increased if they are to function effectively. At the same time, the Government is paying out enormous sums to subsidise new construction, and has now pledged itself to maintain the rate of new building at 300,000 houses a year. The new programme is apparently to be superimposed on the old one, instead of partly replacing it.

The nation cannot afford to subsidise both new and old houses on the present vast scale. To do so will not only inflate building costs and deflate (still further) building efficiency. It will also, by swelling the demand for housing, divert more resources into house building than the nation can properly afford, or than it needs to afford in the conditions of a falling birth-rate. On the Macmillan policy, as it has emerged to date, an inflated boom in building will be followed one day by a sudden slump; and the building industry will encounter at last the realities of a subsidised inefficiency. Pandora's box will then stand empty.

The alternative is not municipalisation; it is to stop subsidising, on generous terms, the bulk of new housing. The slum dwellers have a legitimate and pressing claim for public aid, but the general shortage of housing can and should be removed by the joint effect of unsubsidised new construction and a rational recasting of rents. Nothing said in this week's debate makes the present Bill look like more than a first instalment in this process.

At Marxist Mercy

THE United Nations Assembly has now been presented with a documented record of atrocities committed by the Communists during the Korean war. As the fighting has been stopped, and patient efforts are being made to bring the Chinese to some sort of settlement in Korea, voices have inevitably been raised in complaint that this is not the time to lay such unappetising facts before the world. It is true that no Assembly resolution will bring back to life the prisoners of war, the priests and nuns, and the nameless men, women and children who were starved, bludgeoned or cut to death in Communist-held Korea during the long campaign. It is also true that some South Koreans committed atrocities as savage as those now described. Yet there is no reason to suppose that the Peking Government's attitude in negotiation, already one of arrogance and unconcern, will become more intransigent as a result of these revelations.

But these are secondary considerations. The essence of the matter is that the United Nations cannot suppress the record of the suffering of its own soldiers and of those whom it fought to defend. Moreover, Uno did the Communists' specious allegations of germ warfare the honour of taking them seriously, offering investigations—which were refused—and providing a platform for Soviet accusations—which were refuted. It cannot accept demands for silence about crimes the evidence of which is clear and convincing.

The prisoners of war freed by the Communists in the exchanges that ended in September have now come home and told their stories, and the picture that emerges when those stories are pieced together is one unique in the history of modern war between nations. Their gaolers subjected these prisoners to pressures of a kind that certainly neither British nor American soldiers had ever encountered before. For them, the war was by no means over when their captivity began; captivity meant nothing less than a long struggle between prisoner and gaolers for men's minds.

In this struggle, the Communists used almost every conceivable tactic, from extreme brutality to a rather nauseating form of *bonhomie*. They were not consistent. One prisoner might get away with a degree of mental resistance for which another would be ruthlessly punished. But this inconsistency was not intentional; it arose simply from the fact that even in three years the Chinese did not succeed in finally systematising their methods. This fact suffices to explain many of the apparent contradictions between the stories told by individual prisoners. Some were lucky enough to be in minor camps where the local command was too inept to persevere with the prescribed techniques; others felt the full force of the Chinese master plan.

Four main stages may be distinguished. The unfortunate captured in the Communist blitzkriegs of 1950 underwent the worst physical suffering. With few

exceptions, the North Koreans, who in those early months were in charge of the prison camps and staged the notorious forced marches to the north, treated their captives with animal callousness. Those who survived to pass into Chinese hands found, for the most part, that this meant improved physical conditions. But this second stage also introduced them to mental pressures which the North Koreans had not attempted to apply. At first, however, the Chinese made the mistake of handling UN prisoners just as they had handled prisoners taken in their own civil war; but British and American soldiers were not easily affected by forms of indoctrination designed for illiterate peasants.

★

Only gradually were the Chinese able to evolve more ingenious techniques, and this third stage of highly organised mental pressure was never extended to all camps. But the framework for it was provided by very thorough segregation. Officers and sergeants had been segregated from the start, and by degrees junior NCOs and private soldiers who openly displayed mental resistance were also removed to "reactionary" camps and compounds. Prisoners taken in the later stages of the campaign were also sent to join the "reactionaries," for it was clear that their fresh minds and possession of recent news would dispel the clouds of propaganda in which the other camps had been enveloped. The way was thus made clear for small bands of collaborators to set themselves up as "camp leaders" and to carry on the indoctrination.

In its fully developed forms, this indoctrination laid a very severe strain on a man's powers of mental resistance. The main emphasis was not on doctrinaire Communism, but on the virtues of "peaceful" China and the sins of the "imperialists," who had started the Korean war and were now preventing the prisoners from going home. The prisoners were not only cut off from all news from untainted sources; they were also subjected, by loudspeakers, wallsheets, and supplies of the *Daily Worker* from London and New York, to incessant and ingenious presentation of Communist views and Communist-doctored facts—and for three years they had nothing else to read or think about. They were further confused by being made to hear their comrades read out dictated "confessions" and pæans of praise for the Chinese; these statements were often the price a man had to pay to be released from months of solitary confinement in a dark box four or five feet high. Such punishments were inflicted not only for attempts to escape, but for alleged "insincerity" or a "hostile attitude." Cant phrases of this kind dominated the Chinese tactics. Prisoners were given to understand that their mere survival depended on Mao Tse-tung's

"lenient policy." They were "asked" or "urged" to sign petitions or fawning addresses to Mao, and found that to refuse meant punishment. The same hypocrisy marked the refusal of permission for the one surviving chaplain to visit the sick; he was blandly told that prayer could not cure them. But the heights of charlatanry were only reached in the fourth and final phase of the captivity, when the Chinese, foreseeing an early exchange of prisoners, began deliberately to feed them better, and even sent quite healthy men across with the first parties of sick and wounded, in order to create a favourable impression.

That relatively few of the UN prisoners were noticeably influenced by the Communist methods is inspiring evidence of the strength of the human spirit. But it

Mischief and Conspiracy

ONE of the larger criminal trials of the year has been the prosecution of six men and two limited companies for offences arising out of the regulations that governed the sale of decorated pottery. Under the Domestic Pottery (Manufacture and Supply) Order of 1947, decorated pottery was reserved for the export market, and those ordering it from manufacturers and wholesalers were required to declare that the goods were destined for overseas. The men prosecuted were found to have built up and operated for a considerable time a widespread organisation for the diversion of decorated pottery to the domestic market; the total value of the goods they abstracted from the export market, so it was alleged, was some £70,000. Normally (if that word may be used of regulations nominally temporary) the regulations themselves lay down penalties for their breach. These did not. Accordingly, the men were charged with "a conspiracy to effect public mischief." They were found guilty and sentenced, and now the conviction has been confirmed on appeal. The offence of "public mischief" remains, therefore, very much alive.

The words "public mischief" are a sugary coating to a dubious proposition; they are also something of a will of the wisp. It is easy enough to say that it is wrong that men should take advantage of the rules of austerity to their own profit, by providing no more than a minority of fortunate buyers in this country with decorated tea-cups intended to grace the tables of Sydney or San Francisco. They should have laboured instead to fill the Bank of England with dollars. They should be punished, the argument naturally goes on, and if the Board of Trade forgot to lay down a penalty in the regulations themselves, are not the Courts to be congratulated on their decision to step in and take a hand? That is the sugar coating. But if one goes beyond it, the next question is: "What is public mischief?" There is the morass, for to that question there neither is nor can be a clear answer.

must not be thought that this macabre episode can now be forgotten. It is bound to be repeated, perhaps on a larger scale, if another Communist aggression produces another Korea; and if that happens, the technique will doubtless be more advanced. It certainly cannot be countered merely by such amendments to military law regarding the conduct required of prisoners as have lately been proposed by a Select Committee, although these amendments would help a prisoner to understand his responsibilities more clearly. The only effective defence against these mental pressures would be to ensure that, in any future war that takes the form of collective resistance to aggression, each soldier should know clearly what is at stake and what he is fighting for. This, it must be said, was not done in Korea.

In the year 1801, a Mr Higgins was charged with the offence of public mischief because he was alleged to have incited a servant to steal twist to the value of three shillings from his master. When the High Court considered his case on appeal, Mr Justice Lawrence said: "All offences of a public nature, that is, all such acts or attempts as tend to the prejudice of the community, are indictable." In 1905, Mr H. N. Brailsford was charged with the same offence because he was alleged to have conspired with another man to obtain a passport to visit Russia, made out in one name but used by someone else who had blown himself up with a bomb in his hotel in St Petersburg, as it then was. In 1932, a Miss Elizabeth Manley falsely told some officers of the Metropolitan Police that she had been robbed, thus causing them to spend some time in searching for the non-existent assailant. She was bound over on a charge of public mischief and the Court of Criminal Appeal, again, confirmed the sentence.

The last in the series is the pottery case, and in that the Lord Chief Justice, in the course of his judgment, said: "Whether the matter is looked at . . . as a conspiracy by dishonest devices to defeat the clear intentions and purpose of an Act of Parliament or to work to the prejudice of the state, they disclose offences which have long been known to the criminal law of this country." All of which is true enough, but of no assistance at all in defining the offence of "public mischief." May not the offence apply to any set of circumstances of which the executive disapproves, provided it is able to convince the Courts that the state is "prejudiced" by what has been done? The door that opens there leads to a particularly unpleasant swamp.

There is no reason to cry that executive and judiciary are prepared to accommodate each other in the suppression of any course of action that the state finds inconvenient. But punishable activities should, almost

by definition, consist of deliberately intended acts which have previously been forbidden by law, either by the common law from time immemorial, or by the express terms of some statute; and the crime of "public mischief" cannot fall within that definition. When Mr Brailsford, Miss Manley and the gentlemen engaged in distributing decorated pottery within the United Kingdom set out on their various activities, no policeman could have pointed to anything anywhere which said in black and white: "If you do this, you will be guilty of a crime."

It is the pottery case that is the most disturbing. The substance of the charge against the accused was not any form of fraudulent dealing with any individual, seller or buyer. The suppliers were paid; the ultimate purchasers, for whatever reason, were presumably delighted with their flower-ridden tea-dishes. The substance of the crime was the loss of the dollar earnings, the damage inflicted on the community by a weakening of the country's financial strength. That was real enough, but where, logically, does that crime end? It is not necessary to bring out the bogey of the totalitarian state (where, of course, the offence of public mischief is number one on the calendar). There are examples nearer home. The leaders of the engineering and ship-building unions on Wednesday caused their members not to work, many of them in establishments known to be occupied with contracts for overseas buyers. That also is a weakening of the country's financial strength. It is not a crime because it is done in furtherance of a trade dispute, and no one would seriously propose to alter the law on this point. But what exactly is the difference in morals between this case and that of the dealers in decorated pottery? There is a difference, but the concept of "public mischief" is hardly a satisfactory way of giving legal expression to it.

The Courts themselves are not unaware of the dilemma. The Lord Chief Justice drew attention to it in the pottery case. He said that the criminal offence of public mischief might, if extended, "enable judges to declare new offences, which should be the business of the legislature," and it is fair to say that the Court of Criminal Appeal showed a strong desire to draw back from the socially dangerous position that it could foresee. For instance, the Court was clearly of the opinion that the decision that punished Miss Manley for setting the police off on a wild goose chase was bad. That was the kind of action which could be declared a separate offence by Act of Parliament, and, the Lord Chief Justice said, actions by a single individual should only be indictable if they amounted to something that had already been held to be an offence by the common law or was declared to be one by Act of Parliament. On the other hand, the Court defended the conviction in the pottery case by saying that the crime of conspiracy was one already well known.

It is true that the offence of conspiracy has long been

recognised; that is not to say that its definition is much clearer than that of public mischief. A conspiracy to do an act which is itself a crime is easy enough to understand, but under the decided cases an act which is lawful when done by one man can become unlawful if done by two or more in combination. The heyday of this crime was a century ago, for then trade union activity was challenged on this very ground. When trade unions were given their statutory exemption from common law consequences, this particular aspect of criminal conspiracies ceased to have much importance or to receive much public attention. The essence of the crime is the presence of a wrong motive, and that is unsatisfactory because of the uncertainty that must exist in this borderland between dubious motives and unlawful actions.

★

The risk now is that the charge of criminal conspiracy to effect public mischief might once more become fashionable. Suppose, for example, that some future Board of Trade inquiry into share dealings did disclose that a number of gentlemen had spread false rumours about a possible buyer of a company, and by doing so had created a "take-over" boom in the company's shares. The state would have lost nothing by what they did. Could it be that the rather tenuous link between the rumours and the losses of some individual who bought for a rise, and who burnt his fingers in the end, would be strong enough to support a criminal charge? Many would say that, morally, the rumour-monger was at least as reprehensible as the dealer in decorated pottery. The next step is to say: "If that isn't a crime, it ought to be." The fatally easy step, then, is to take the short cut of a charge of "public mischief," instead of considering how the Companies Act (or the rules of the Stock Exchanges) can be strengthened. Laws should punish actions considered to be wrong. They should also be certain in their terms. It is not good enough for the public authorities to say of any activity of which they disapprove: "This must be public mischief," when Parliament is there to debate and decide whether it should be a crime.

It would be an exaggerated reaction to raise a cry that Parliament must take action at once for the liberties of the subject are under immediate threat. But there is a lurking danger. In the pottery case the crime was that the defendants defied official economic policy. Is it utterly impossible that under some future Government a charge of public mischief might not lie against, say, the directors of a company that opposed Government policy as did Tate and Lyle, Ltd., in its "Mr Cube" campaign? So wide a concept inevitably makes such dangers to civil liberties possible. The Lord Chancellors of the postwar period have, fortunately, been men who have not hesitated to appoint committees to enquire into fields of law or procedure where there was perhaps no more than some disquiet. There is a case now for the appointment of a committee of enquiry into the common law crimes of conspiracy and public mischief.

Notes of the Week

The Engineers' Next Step

THE engineers have had their strike and the militant among them are presumably feeling better, though not richer. The strike was quiet and virtually complete, but there is no reason to suppose that the employers are greatly impressed. The loss to the nation will no doubt turn out to have been heavy, but it will be something less than a whole day's engineering production. The piece workers will undoubtedly do their best to make up for it by working harder and recovering as soon as possible the wages they have lost. The time-workers, who include the lower paid members of the general unions, will have no such opportunity—as their leaders have pointed out with some bitterness. The strike has left them poorer by a day's pay and no nearer than they would otherwise have been to the 15 per cent rise in wages that they seek.

At this, the moment of frustration, Mr Tom Williamson, the general secretary of the National Union of General and Municipal Workers, suggested that the time had come to ask the engineers themselves to decide by ballot "the next logical stage in pursuance of the wages claim." Mr Williamson also suggested that they ought to vote either for a strike or else for the reference of the whole dispute to arbitration. He rejected as useless the one-day stoppage, a ban on overtime or a ban on piece work; they would not, he argued with some justice, make any effective contribution to the pressing of the claim.

It remains to be seen whether the Confederation of Ship-building and Engineering Unions, which could so easily be influenced by Communists, will heed Mr Williamson's advice instead. The assembled executives of the 39 unions that comprise the confederation previously rejected arbitration in favour of Wednesday's strike. But now that the strike has happened and has made no difference, it is possible that the confederation itself will realise that there is indeed only one "next logical stage in pursuance of the wages claim." The engineers would almost certainly gain something by referring their dispute to arbitration; another strike or an overtime ban would bring them nothing.

Ruler Deposed

IT was only natural that the House of Commons should have received with shocked surprise the news of the deposition of Mutesa II, the Kabaka of Buganda. There has, it is true, been trouble in this province of Uganda before—for instance, in 1945 and in 1949. But then the British were supporting the Kabaka and his regime, and the Kabaka himself relied upon the Agreement of 1900 with the British—which by his non-co-operation he has now

broken—to counter the demands made upon him by the left wing malcontents in 1949. This makes his present attitude towards the Government all the harder to understand and the shock of his deposition all the greater. Mr Lyttelton's ill-advised but extremely vague after-dinner remark last June about East African federation cannot provide the whole explanation, for reassurances were sent to the Kabaka at least as explicit as those given on earlier occasions, and the Kabaka accepted them. Moreover, there can be little serious doubt that the Kabaka's demand that Buganda should be separated from the rest of Uganda as an independent state would jeopardise the peace and pros-

perity of the Baganda people. As recently as March he had declared jointly with the Governor that Buganda would go forward as a component part of the whole protectorate. Why, then, have relations between him and the Uganda government suddenly turned sour? Is there some personal reason for it which has not yet been told? Or has the affair a wider aspect: is it another symptom of the intense suspicion of Britain that is vitiating good relations with Africans all over the continent?

These real questions make it most unfortunate that the debate in the House of Commons on Wednesday provided a classic example of how not to conduct the business of opposition. Although some of the evidence as to what happened in the Opposition camp is conflicting, it is quite certain that before the debate began a motion of censure on the Government's handling of affairs in Africa was drawn up. Presumably the Opposition banked on Mr Lyttelton's reputation for being the worst parliamentarian

in the Cabinet, but he has a knack of rising to an occasion and this time he did it so effectively as temporarily to stun the Opposition into silence. Over the vacillations which followed on the Opposition's side, it is kinder to draw a veil.

There was really no need for the Opposition to put itself in this embarrassing position. It could have justified a critical motion on colonial affairs in general without committing itself to emotional criticism of the deposition before it had absorbed the facts of the case. Mr James Griffiths's combination of sentiment and political opportunism on colonial matters has served his party ill and has probably killed any chance of making next week's debate on the revived censure motion constructive.

Bermuda, Backbenchers and Egypt

SIR WINSTON CHURCHILL and Mr Eden left for Bermuda unencumbered by any last-minute advice from the House of Commons. On the whole ministers must have been very thankful to have been able to parry the Opposition requests for a debate on foreign affairs before the Bermuda conference. On both sides of the House opinions about the main foreign issues are decidedly fluid and uncertain, and a debate could scarcely have strengthened the Prime Minister's hand and might have caused him some embarrassment. There is at least a hope that the diplomatic situation will be a little clearer by the time Sir Winston gets back from Bermuda, when an early debate will be unavoidable.

Although the requests for a debate were made by Mr Attlee in person, he accepted the Government's refusal with marked docility, and later it became clear that the real driving force came from the Bevanites. Unable to state their views in debate, they tabled a long motion and managed to persuade a few middle-of-the-road men such as Mr Strachey to join them. It was their misfortune that the motion was published on the same evening that the Russians agreed to a meeting of Foreign Ministers, for the gist of the Bevanite message was that the Western Powers had misinterpreted the earlier Russian Note and so were squandering a chance of a meeting. As it is, the Russian agreement to confer gives the Prime Minister a political as well as a diplomatic breathing space. The Labour leaders, already imbued with a healthy respect for Sir Winston's ability to seize the political initiative on foreign affairs, are likely to be more cautious in what they urge the Government to do.

But Sir Winston's political anxieties are far from confined to the Opposition. The outcome of the Sudan elections, confirming all the woeful prophecies of that group of Conservative backbenchers who opposed the Sudan settlement, has sharply stiffened resistance on the Conservative benches to any pact over the Suez base on the lines now under discussion. One protesting memorandum has already passed from the back benches to 10, Downing Street and another may well follow. Sir Winston has assured the 1922 committee that the Government would not give way on the issues of "re-activation" and uniforms for technicians, but he may return from Bermuda to find that even a firm stand on these points would not satisfy some of his supporters. Egyptian behaviour in the Sudan elections has intensified all the latent mistrust on the Conservative benches of any settlement that would depend on Egyptian good faith.

An Eisenhower Pledge?

IF Washington reports of President Eisenhower's intentions towards the European Defence Community are accurate, the British Government may find itself embarrassed by its own attitude to French anxieties. (They can hardly be called demands, for the French Government has not yet asked in London the plain question, "Will you undertake not to reduce your land forces in Europe unless the EDC governments accept your reasons for wishing to do so?") It is said that the American President might give France a personal guarantee that American troops will be kept in Europe at present strength so long as the French have to fight in Indo-China—provided that the EDC Treaty is ratified in the Assembly. If Mr Eisenhower does this, he should kill two birds with one stone: first, the argument that France cannot maintain parity in a defence community with Germany so long as it is fighting overseas; secondly, the rumour started from Washington that the growing production of tactical atomic weapons would make possible an early reduction of American forces in Europe.

He would startle, if not hit, a third bird which is periodically released from Downing Street. This is the perfectly sound argument that Britain should never accept on the Continent a commitment in which the United States does not to some degree share. For here is the President slightly outbidding the British; and it will be interesting to see what the effect in Bermuda on Sir Winston and his advisers will be. If they insist that they cannot pledge the permanent presence of four British divisions in Europe, why cannot they point to the virtual certainty that the air defence of this country will be permanently based on the airfields and warning system of Western Europe? Why cannot there be a clear political commitment where there is such a clear strategic interest? It is a matter in which British policy has been made to appear small-minded and grudging. Yet the situation calls for a political act by this country that will strike the imagination of the perplexed French people. Cannot someone explain this to Sir Winston, vexed though he is with France?

Laniel's Pyrrhic Victory

AFTER his narrow escape in the foreign affairs debate, M. Laniel, the French premier, must be wondering whether the limited mandate he has received is better than no mandate at all. True, the government has survived for a few more weeks, and MM. Laniel and Bidault are in Bermuda. But there they cannot assert that the French Assembly is now pledged to back the treaty for the EDC. They will have, instead, to warn their partners of the great care that must be taken if the plant of Europe is not to be trampled to death in the lobbies of *Palais Bourbon*. The orthodox Gaullists came to the government's rescue at the last moment only because they thought that the myth of solid French support for EDC was sufficiently exploded, and it was not politically worth while to bring down the moribund cabinet at an inopportune moment. Thereupon

the Gaullists, those avowed opponents of "parliamentarism," used the old-fashioned parliamentary trick of dividing their votes.

This makes even more complicated the calculation of parliamentary forces for and against the treaty. The following table, showing the final vote on the government's motion

FINAL VOTE ON GOVERNMENT'S MOTION			
	For	Against	Abstained
Communists	...	100	...
Socialists	...	105	...
Radicals	43	20	11
Christian Democrats (MRP)	83	3	2
URAS*	14	5	60
Peasant and Independent	87	3	9
Total (including others)	275	244	103

*Union des Republicains d'Action Sociale (orthodox Gaullists)

in support of the idea of European union, does not give a complete picture. If the real test came, most Gaullists would vote against, while over two-thirds of the Socialists are in favour of EDC. By opposing the motion they expressed their lack of confidence in the present government rather than opposition to European integration.

If foreign policy could be separated from domestic entanglements, a narrow majority for EDC could probably be mustered in the French Chamber. But the debate has shown above all the gap between the alignments on the home and on the foreign front. In the last twenty months the issue was shirked by merely ignoring foreign affairs; but now it has to be faced. Once the presidential election is over, a new cabinet must be formed, and the majority supporting it should have an agreed and common foreign policy. If no such majority can be found, then the French electors should be called upon to decide.

The Tangle of the Saar

At the end of the inconclusive conference in The Hague last week on the European Political Community, M. Bidault and Dr Adenauer discussed the problem of the Saar territory. A satisfactory agreement on this remains one of the conditions on which the French insist before they will ratify the EDC Treaty. How far the German Chancellor could or would go to meet them is unlikely to be known until he can feel certain that a government in Paris, having been promised satisfaction on the Saar, would then be able to secure the ratification. France's reputation for piling condition on condition is now notorious.

In an article on page 755, a Paris correspondent recalls the typical French views on this matter. To this account should be added a factor which is at once obscure, highly important for Germany, and yet seldom mentioned. German steelworks in the Saar (producing over two million tons a year) have been treated by the French rather as the Russians "settled" the question of key plants in ex-enemy countries of Eastern Europe. Under the inter-allied reparations agreements, the French claim that they could have dismantled large quantities of equipment from these

works; instead, they left them intact and took the value of the equipment in the form of shares. The French Government now holds 60 per cent of the shares in the Völklingen works, the largest in the territory, and 40 per cent of the Röchling and Neunkirchen plants. All steel-works, except those owned by foreigners or Saarlanders, were placed under a French trustee, but no one knows on whose behalf he is acting as regards the former German percentage of holdings.

The future of these French Government holdings remains obscure. The obvious solution, that they should be sold to French steel companies, has been considered; but it would not be easy to find the large sums required. This aspect of the Saar tangle must be examined if Dr Adenauer is to find ways of cutting through it in a way that both French and German opinion will accept.

Cheap Food—

THE Minister of Food did not have much trouble with the Opposition when he explained, on Wednesday, how it was that his department needed another £127 million over and above its original estimate for this financial year. The Labour speakers were as uncertain as ever what line to take.

Some of the extra expenditure arose from the buying in of stocks to make derationing possible. Mr Lloyd George admitted that he had perhaps over-insured in the case of grain, and was left with £5 million worth of stocks that he had expected to be sold by now. But this was a small

little whisky instead: I should prefer
White Horse if you have it."*

MAXIMUM PRICES:— Bottles 35/-, ½-Bottles 18/3, ¼-Bottles 9/6, Miniature Bottles 3/8, as fixed by the Scotch Whisky Association.

matter. More important, some prices had been cut to induce the consumers to buy. Home produced pork had cost an extra £18 million in this way, and bacon £13 million, in spite of the profit on imported supplies. Eggs had cost £3 million more than the estimate, in order to save the consumer from the arrival of the tenpenny egg, about which so many Labour warnings were sounded. An extra £20 million was needed to buy home grown grain now that the guaranteed price was above the world price, and £5 million had gone to the potato growers, because their yield had been 7 per cent higher than the average.

And so on. Labour speakers hardly had the nerve, in the face of these facts, to trot out the only policy they seem to have for food—namely that subsidies should be redoubled to keep the cost of living where it was two years ago. They could only arraign the Minister as a muddler and an incompetent for thinking that it was possible to support the farmer and yet to save money. That is hardly helpful when the Opposition will not push the point to its logical conclusion. In essentials, its policy and the Government's are the same: both are willing to spend more on subsidies—the Government's increases are shown in the chart—in order to keep the consumer tolerably contented, while encouraging and protecting high-cost production on British farms.

—Dear Food

THE Government has this week increased the import duties on a variety of fruit and vegetables. The National Farmers' Union has thus at last gained a substantial measure of the extra protection for British market gardeners and fruit growers that it has been requesting since 1950. It may gain more, since some of the cases submitted to the Board of Trade are still under examination.

The present increases apply to eighteen horticultural products, including tomatoes, cauliflower, new potatoes,

UK TERMS OF TRADE
1951 = 100

peas, carrots, cherries and strawberries. In many cases the seasonal rate of duty, applying when the crop concerned is plentiful, has been at least doubled. For gooseberries the increase is from ½d. to 2d. a lb; for strawberries the former rate of 1½d. a lb in the second half of June and 3d. a lb in July is increased to a uniform rate of 6d. a lb for most of June and July. For tomatoes the rate of duty is doubled and at the same time the period of high protection is extended; for some other crops it is shortened. Such changes have been made possible by the waiver which the other members of the General Agreement on Tariffs and Trade reluctantly permitted, enabling margins of preference to be widened in certain circumstances. In fact, since the crops concerned are insignificant in Commonwealth trade, these higher duties will give no particular satisfaction to the Tories who cherish Imperial Preference. They are a major concession to the agricultural protectionism that is nowadays perhaps even closer to the party's heart.

It is true that imports have hitherto been restricted by quantitative regulations, as well as the relatively low duties, and that therefore on balance the higher duties may not make the British market much more protected than it already was. Indeed, they are in principle a less offensive method of restriction. But at least some tinge of the temporary expedient clung to quotas, whereas with higher duties the Government has firmly committed itself to the policy of dear food in Britain in order that the present number of British market gardeners may go on growing tomatoes uneconomically in hot-houses. Transport costs still give the home producer of fresh fruit and vegetables a considerable measure of natural protection from European competition; if he needs in addition duties like 4d. a lb on such unluxurious foods as tomatoes and cherries, the country is certainly paying dearly to support an uneconomic industry.

Law and Order in Kenya

ON Tuesday, forty-four Kikuyu, who had been sentenced to death for their alleged share in the Lari massacre last March, had their convictions and sentences quashed by the East African Court of Appeal. This proof that British justice still prevails in Kenya is doubly welcome; for the court's judgment was given shortly after the court-martial of Captain Griffiths had brought to light facts that seriously disturbed confidence in British methods of restoring order.

Captain Griffiths was acquitted of the charge of murdering an African. But the accounts of the shooting of wounded Africans and of the competition between battalions in the number of "kills" they could claim have very rightly disgusted public opinion. No one will pretend that the campaign against Mau Mau can be conducted as a police operation against civilians. But, however horrible the terrorists' own acts, they do not excuse the attitude towards suspected Kikuyu shown up at the court-martial. General Erskine's declared determination to put an end to such episodes among British troops will be wholeheartedly supported.

On another occasion, General Erskine said that the cam-

paing against Mau Mau would not be won by bullets alone. His words have now been echoed by Mr Blundell, leader of the Europeans, whose recent policy statement is presumably being discussed by the Governor of Kenya on his latest visit to this country. Constitutional changes cannot be carried out while the emergency still exists—in fact as well as in law. One more trusted and intelligent African leader, a city councillor of Nairobi, has just been murdered, which still further reduces the number capable of taking the greater share in Kenya's government envisaged for Africans by Mr Blundell. But it would be a considerable advance if agreement on constitutional changes can be reached in the meantime, when the emergency is bringing forth new and progressive ideas among the leaders of all races.

Berlin Without Reuter

IF Berlin proves to be the site of the four-power conference, the Foreign Ministers will be meeting in the one place where it seems impossible to maintain the division of Germany indefinitely. In Lugano, and even in Bonn, the *status quo* does not appear too bad to endure; in Berlin, everything points to the need for this isolated capital to have its hinterland restored. This is still true, in spite of the considerable economic improvement that has steadily been achieved since intensive American aid started in 1950.

The Economist Diary A reference book for the desk

For the man who seems to have everything he could want, The Economist Diary is the ideal present. The appointments and memoranda section is designed to meet the needs of the busy man and in addition there are 72 pages of facts and figures, which together form a complete reference book.

The reference material covers a wide range of subjects, including elections, national income, banking, taxation, crime, manpower, commodities, and a special section giving the basic facts on 47 principal countries in the world.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 41/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of The Economist Diary are given in an illustrated pamphlet available from:

Diary Department, The Economist,
22 Ryder Street, St. James's, London, S.W.1

The index of industrial production in the western sector of the city has now risen to 70, taking 1936 as 100, thanks to a big spurt in building. But in Western Germany, the comparable figure is 170; and Berlin, in spite of a decrease in unemployment—all the greater because so many refugees from the Soviet area have been absorbed—still has 200,000 on the dole. If the city is to remain divided, its future depends on many factors, chief among them being the willingness of Congress to vote further funds, the ability of the Federal German government to spend more than the present DM.1,000 million a year in subsidies, and an increase in orders from West German businessmen.

The loss of Berlin's great Lord Mayor, Ernst Reuter, is irreparable. Under him Berlin roused a sense of national pride which offset the resentment or indifference which West Germans tend to feel when they are asked to help the city. It was also an example of co-operation between Conservatives and Socialists. Now it is a cockpit of party politics. The Christian-Democrats govern in a coalition with the Free Democrats, and the Socialists are in opposition under Herr Neumann, an uncompromising politician of the Schumacher school. Immense harm may be done to the western cause in Berlin if the Socialists rouse the workers to make demands that the economy cannot stand, and attack the government in terms that might be used by the Communists. It is a bad sign when the leading Socialist newspaper in Berlin, edited by a brave anti-Communist, declaims that in Bonn "nothing is being done for the victims of the war, but everything for a new army." When the fronts are confused in this way the enemy can, and will, infiltrate.

Next Stage in the Sudan

IN the eyes of Cairo the elections in the Sudan have been a clear victory for Egypt. The National Unionist Party, which Egypt had openly supported, has won 44 out of 92 seats contested. Five more remain to be contested on December 10th, and if the National Unionists win all these, they will have a clear majority in the House of Representatives. Even without these seats they would still stand a good chance of getting a majority, as the various successful independents are having second thoughts about party allegiances. The National Unionists are therefore right in the middle of the stage.

They will now be on trial for a transitional period, for the recent elections were only the first of two bites at the cherry. The issue of union with Egypt or independence will not be finally settled until after fresh elections for a Constituent Assembly at the end of the transitional period in about three years' time. Then the Sudan will be asked to confirm or reverse last month's apparent verdict in favour of union with Egypt. Its answer will depend very much on how the National Unionists acquit themselves in positions of influence and responsibility, and how far their Egyptian supporters remain in the background and manage to conceal the fact that they are interested in the Sudan only for what they can get out of it. If the National Unionists fail to measure up to the opportunities thrust upon them, if the cupboard quality of Egypt's affections becomes too obvious, or if a horde of carpet-baggers descends from the north, the NUP vote might melt away

beyond hope of repurchase. On the other hand, as an article on page 752 shows, the victorious party may prove much less docile than its backers in Cairo anticipate.

There is also the special problem of the Nilotic pagans of the southern provinces, racially and religiously distinct from the Arabised Moslem majority in the north, and culturally backward. There are, in fact, inside the Sudan the main ingredients of a classic colonial problem of a kind which has plagued more experienced politicians than the new men in Khartoum. It will be important but not easy for the dominant north to avoid alienating the southern provinces, which contain more than a quarter of the total population of the country.

Fewer Troops Round Trieste

ALTHOUGH the Trieste dispute is far from settled, this week has seen a slight progress. In a speech last Sunday, Marshal Tito made new proposals about an international conference. He was firm in his rejection of a meeting which would merely assemble in order to hand Zone A over to Italy; but he held out an olive branch by declaring that he would withdraw troops from the zone frontier if Italy made the first move, and by repeating his statement that he no longer claims the city of Trieste itself, since its population is predominantly Italian. This recognition of fact in respect of the city was coupled, however, with the equally firm assertion that the villages in the rest of Zone A are Slovene; and those he said, could in no circumstances go to Italy. If these conditions could be met, he added, he would be glad to represent Yugoslavia in person at a conference.

The offer to withdraw troops met with a quick and favourable response in Rome. Signor Pella asserted that this was what he had originally proposed himself, and he accepted in principle the Yugoslav claim that, since the Italians had been the first to move regular forces up to the frontier, they should make the first move in pulling them back again. This rather unexpected spirit of conciliation should lead to a definite lowering of the temperature in and around Trieste itself. And since the Yugoslav threat to march in was the factor which made the crisis urgent in the first place, these withdrawals at least open the way to the possibility of a peaceful settlement. Every effort should now be made to see that they are in fact carried out. Once they have been, there should be a chance of following up with the preliminary meeting of officials which it has lately been proposed should precede any attempt to call a conference of ministers. The measure of the problem, however, may be gauged by the fact that, in spite of Marshal Tito's olive branch, the leaders in Rome and Belgrade are still too far apart to speak to each other except through third parties.

Delegated Legislation

AT first sight the report of the Select Committee on delegated legislation, published this week, seems comparable with some new models of cars; the bonnet is

altered, a gadget is added here and there, and the basic design of engine and chassis remains as before. The committee was appointed nearly a year ago, held seventeen meetings and received evidence from many distinguished people in Parliament and the Civil Service. The changes it recommends in the present procedure are no more than a slight extension in the time during which a prayer to annul an item of delegated legislation—an Order or other statutory instrument—may be put down, and also in the period available for debate on the prayer, plus a recommendation that the existing Scrutiny Committee of the House should be appointed more promptly at the start of each session. To those who regard the whole apparatus of delegated legislation with deep suspicion these proposals will seem like adding no more than a touch of paint to a particularly repulsive instrument of torture.

That attitude is unhelpful. Broadly speaking, about 70 per cent of all statutory instruments either need an affirmative resolution of Parliament to become effective or may be challenged by any member within 40 days of their creation. In addition, all are considered by the Scrutiny Committee and it is the duty of the committee to draw the attention of the House to any which, again broadly speaking, depart too widely from the general run. In seven years the Scrutiny Committee has examined 6,900 instruments and drawn the attention of the House to 93 of them. The Select Committee believes that the Scrutiny Committee, simply because it exists, has made government departments think more carefully of the rules and conventions to which they should conform.

The Select Committee was concerned to secure a proper balance in all the work that the House, as at present constituted, must undertake, and in those circumstances it is really impossible to say that the committee's recommendations could have gone much further. In Parliament today, the government governs and the members of both Houses comment on the way the government governs. No government could govern without a plentiful use of statutory instruments, and the committee seems to be reasonably satisfied that the opportunities for comment are adequate; they could be increased, the committee would probably say, only at too great a cost to the actual process of government itself. Perhaps there is too much government, but it would be unfair to criticise a Select Committee of the House for not saying that.

Newer Look at Dartmouth

Two things stand out from the Admiralty's announcement last week that Dartmouth cadets are henceforth to be recruited only at the age of 18. The first is that all three services are now in line (apart from the Army's small new scheme at Wellbeck College). Secondly, this has been a victory for the educationists over both the Admiralty and the left-wing politicians. Henceforth the education of a future officer will continue uninterrupted, in a civilian atmosphere, until he is through the sixth form. He will then go to Dartmouth, Cranwell or Sandhurst at about eighteen. Whether his parents will be able to get maintenance allowances to tide over the expensive years between 16 and 18 has not yet been decided. But if the Air Force

thought it necessary to bridge this gap, as was announced a few weeks ago, then it seems highly probable that the Navy will think so too.

The controversies that have raged over Dartmouth since the hey-day of the Labour Government have been complex. It was then considered that entry at the convenient pre-school age of 13, coupled with a special entry at 18, was highly prejudicial to the grammar school child; in an attempt to overcome this unfairness and to get more cadets, the entry at 13 was abolished in 1948 and replaced by entry at 16. This was opposed by the educationists but in fact worked better than its opponents had predicted, even though the proportion of public school entrants still remained embarrassingly large. About 14 per cent of the vacancies remained unfilled, however, despite a lowering of the qualifying standard.

This was rightly regarded as extremely serious; the Navy depends on a small officer cadre. The committee that reviewed the situation most carefully last May produced a compromise proposal for recruitment at all three possible ages—13, 16, and 18—with 60 per cent of the places at 13 reserved for boys from grant-aided schools, because they cannot then compete on equal terms with the prep-school boy. Much though their Lordships would like to "catch 'em young," this 60 per cent cannot have been easy to swallow, while a full-blooded return to recruitment at 13 would have been extremely difficult. It will never be possible to say whether the old scheme produced such good naval officers because of the system or because boys of good quality chose the Navy, but there is no clear reason why recruitment at 18 should fail to instil the same *esprit de corps* and in modern conditions it may well appeal to more promising boys.

Right Way for Wales

THE Government has declined to provide an extra £60 million for developing the Welsh countryside over the next twelve years. This is the substance of the White Paper* published last week in reply to the proposals for rural development put forward some months ago by the Council for Wales and Monmouthshire. Although the council feels that it has been treated with scant courtesy, and claims that some of its arguments have been misinterpreted, the Government has made the right decision.

The council thought it right to spend government money on making the countryside more pleasant and profitable, and it suggested a new development corporation to administer the funds. It was not quite clear from the report whether the suggested £60 million (over twelve years) was to be over and above the funds already provided. The Government's case is that far more than £5 million a year is already being spent on housing, water supplies, drains, roads and agricultural subsidies, and that the local authorities are quite competent to look after their own development plans without a special new authority. The local housing record is already better than that of some comparable English areas (though there is, admittedly, much leeway to make up); and the Government asserts that there is every chance

* Cmd. 9014. 6d.

of more houses being built over the twelve-year period than the council contemplated in its report. Other amenities are also being provided as fast, the White Paper argues, as limitations on capital investment will allow.

The master thought behind the council's request for larger subsidies was, probably, that the local authorities feel themselves too poor to continue to shoulder their present part of the costs. To this the Government replies that the best course is not to provide higher benefits for Wales at the expense of other areas, perhaps equally deserving, elsewhere; it is to increase the revenues of the local councils as the countryside becomes more prosperous. Farming is, and will remain, the basis of the rural economy. The council's way of increasing farm prosperity is, amongst other measures, to provide special loans at low interest rates to hill farmers. But the artificial incentives to farmers of marginal land are already high. It may be that further heavy capital expenditure on Welsh farms is still needed and justified, but the Government has very sensibly decided on a full investigation of the possibilities before promising any financial favours except in the most general terms.

A Bullish Bulletin

IT is difficult for an international organisation such as the Economic Commission for Europe in Geneva, which straddles the conflicting ideologies of East and West, to maintain an entirely unbiased posture. No doubt its bulletins frequently give offence behind the iron curtain; but it is unusual for them to be censured in the West. The latest ECE bulletin for the second quarter of 1953 has, however, been roughly handled in the British press because of a supposed pro-Soviet bias, and because of alleged technical deficiencies.

The ECE secretariat would fail in its duty if it ignored Communist sources of statistics and other data; but it has an equal responsibility to exercise discretion and, where facts are unverifiable, to report them as such. In this bulletin there is a tendency, not previously noticed, to accept as final the ministerial statements and planned targets of Eastern European countries as if they were hard facts. A hideous new phrase—operational plan—has been admitted, as if to suggest that a target has already been seven-eighths reached. Thus, for instance, in a table on page 8 of the bulletin, showing housing construction in Eastern Europe, the heinous sin is committed of adding together actual and "operational" planned figures to give percentage plan fulfilment. A tiny warning footnote is hardly sufficient to prevent the ordinary reader from believing that Rumania had fulfilled its housing plan to the extent of 97 per cent, whereas in fact in the past three years it has averaged only about 62 per cent. Again, there are some unsupported statements, such as the remark that "considerable numbers of farmers" from the Soviet zone of Germany have now returned to their farms, whereas, in fact, no such tendency has been reported.

ECE is quite properly in favour of increasing East-West trade; but where is the solid evidence that Western European countries could "make substantial savings in dollar imports" by raising their trade with the Soviet Union? The example of petroleum given in the report is not

particularly happy, since most of free Europe has already made its dollar-saving dispositions for oil purchases and there is, indeed, a real fear of a glut should Abadan reopen. The price factor as an obstacle to such trade, which the ECE used to emphasise, has now vanished, without explanation. And in irrelevantly coupling with East-West trade the fact of increasing West German competition in certain markets, the authors have drawn on statistics that do not really support their argument. In a table showing the intrusion of Federal Germany in the trade of the Middle East, the figures show that only marginal inroads have been made in Britain's markets in most countries (in Iraq West Germany has actually lost ground since 1952), except in Persia and Egypt, where political factors—not mentioned in the bulletin—are dominant.

Where Sweden Fits In

NEUTRALITY, in the modern world, can be a very different thing from neutralism. This distinction has been made more than once in these columns. The common interest of world peace is served by countries such as Sweden and Switzerland, which not only provide a source of mediation and impartial judgment in international disputes, but also, by steadfastly manning their own ramparts, ease the burden of collective defence that lies on the shoulders of other nations. This is in exact contradiction to the role played by the neutralists, who pretend that this burden does not exist.

But neutrality cannot be practised in a vacuum. It is paradoxical that this should need to be pointed out; but the need has been clearly demonstrated in a newly published panegyric on the virtues and triumphs of Sweden. Sweden, stoutly armed and dedicated to the limited but honest idea of defending its own territory, is an obvious stumbling block to any aggressor and, by the same token, a solid asset to the forces of peace. But, as Swedes themselves are the first to admit, the "alliance-free" policy is successful only

because the western allies not only provide a support against which Sweden can brace itself when pressed by Moscow, but also present no threat to it themselves. It is absurd to discuss the possibility of a Nato attack on Sweden in the same terms as a Soviet attack. Indeed, Sweden's ability to concentrate on defence against attack from the East is partly due to its confidence that it need fear none from the West. It is equally absurd to see Denmark and Norway as living tranquilly under a shield of Swedish strength and sagacity. These two countries explored this idea just five years ago and found it fallacious, with the result that both joined the Atlantic partnership.

The Swedes deserve full credit for their services to peace both as a patient go-between and as a sturdy hedgehog. They may also claim that they were the first to discover that a welfare state is worth costly defence—a discovery not yet made by all Socialists. But modesty and realism make them embarrassed at the idea that a model for Paris, Bonn, Rome and others is to be found in Stockholm.

Beria's Ghost

BERIA'S name has apparently disappeared from the latest volume of the Soviet Encyclopedia. Thus he joins some of the greatest revolutionary leaders on the path towards official oblivion. A new and apocryphal version of his life is written on the well-worn palimpsest. Beria the "beloved leader and Stalin's comrade-in-arms" is no more; he has vanished. Only if his opponents succeed in bringing him into the dock will his name reappear, with the usual terms of abuse attached. But it is one thing to erase a name from the books, another to eradicate a trend from the political life of the country. There are signs that the struggle of which Beria's fall was the climax is not yet over. Important personalities are still being purged throughout the Soviet Union. After Georgia and the Ukraine the turn of Leningrad has come, the former capital, the "commune of the North" and the heart of every past opposition movement.

At a recent meeting of the Leningrad Party committee the entire local leadership was reorganised. V. M. Andrianov, first secretary of the Leningrad committee since 1949, was among those who lost their jobs. Andrianov was an important figure, and not only as the boss of the second Party organisation in the country. At the All-Union Party Congress last year he was elected to the Presidium, which put him among the 25 most important Party personalities in the country. There is no evidence to show a direct link between Beria's fall and Andrianov's eviction, though the name of his successor, F. R. Kozlov, may provide a clue. It was this Kozlov who launched an appeal for "vigilance" in *Komunist* on the eve of the announcement of the "doctors' plot" at the beginning of this year. This active member of the Soviet *vigilantes* may now be getting a reward for his struggle against the Beria deviation. Leningrad has always been a hard nut to crack, and it is not surprising that the general secretary of the All-Union Party, Nikita Khrushchev himself, watched over this purge. One wonders whether all opposition has been crushed here and elsewhere? The Beria heresy may well be hydra-headed even though Beria may no longer exist.

Modern Walpole

MACKENZIE KING: *The Incredible Canadian*.

By Bruce Hutchison.

Longmans. 456 pages. 25s.

IN the spring of 1921 there fell the second centenary of the beginning of Walpole's marathon tenure of the premiership. At that time it seemed most improbable, if not impossible, that anyone in the British Commonwealth would ever equal his record of nearly twenty-one years in that office. Least of all, no one ever suspected that the new leader of the Liberal party in Canada, already in his late forties and with little chance of his political party winning a majority in the next general election, would within the next twenty-seven years exceed Walpole's record. Yet this remarkable feat was in reality only the by-product of what may be termed the politics of Mackenzie King.

Of all the prominent Commonwealth statesmen of the first half of this century, Mr King, if not the most important, was one of the most engaging and intriguing. The mere magnitude of his role in so many political fields assures a welcome for this candid portrait from a journalist's point of view. Journalists have not always proved the most judicious of biographers; their judgment of events and their assessment of character are often uneven. That is inevitable. But the worst kind of biographer is not he who has a point of view, but he who has none; Mr Hutchison has certainly not obtruded his unduly.

Mr Hutchison's main quarry for information has been "many persons who were as close to King as any man could be." Little of the information is new, but the author gives some tantalising, if not sensational, glances into the public and private life of Mr King and many of his associates. However, without more material, it is difficult, if not impossible, to illumine much of the obscurity surrounding his ambiguities and contradictions.

This book has already evoked considerable controversy in Canada; and some of Mr Hutchison's fellow Canadians think his particular illumination of King and his country somewhat curious. Certainly the scope of the volume is wide; and some of the author's generalisations are highly questionable. This is particularly true of his treatment of the 1926 constitutional issue concerning the dissolution of Parliament and of the conscription crisis in 1944—though on the latter Mr Hutchison's postscript contains an important addition. The

treatment of some other subjects, such as the abdication, is quite inadequate. However, the author declares that he is not pretending to present anything like a complete study of King and his era and that the book is solely his own interpretation of both. Accepted as such, it is a lively and vivacious narrative; and, what is more important, it has understanding. Mr Hutchison's remarks on the personal character of King are not very complimentary, but he has high praise for King the politician and statesman. Mr King has emerged from it a much more colourful and complex man than the great majority of people believed him to be.

It is now a commonplace that King was the principal advocate of Dominion autonomy, and that his opposition to common organs and formal imperial unity was for the most part dictated by his desire to strengthen the unity between the French-speaking and English-speaking Canadians. The more detached reader will be interested rather in other questions. Why did this Canadian remain for so long in the first rank of politics? Why was he a man of indecision? What was the extent of his influence and impact on events? Mr Hutchison throws much light on these questions, though the more serious reader will not be completely satisfied with the answers. He must await a more definitive study.

In the meantime this interim biography is welcome: it is highly readable and most of it is sound; moreover, Mr Hutchison's style gives a relish and piquancy to his fascinating narrative. It is higher journalism at its highest.

Eightieth Year

CHURCHILL BY HIS CONTEMPORARIES.

Edited by Charles Eade.

Hutchinson. 528 pages. 25s.

THIS is a good idea which has not quite come off. To portray Sir Winston Churchill's manifold talents by having each of them described and discussed in turn by an expert in a particular field is an original and promising idea. But in practice it has run into difficulties. For one thing Sir Winston has said so much of it so much better himself. The most important field, too, in which his great abilities have found their outlet, that of statesmanship and strategy, requires at the least a volume on its own, and does not lend itself to treatment in a chapter or two, though both Lord Altrincham and Mr

THE ECONOMIST, DECEMBER 5, 1953

A. L. Rowse make points of considerable interest in the sections they contribute.

The more successful parts of the book are those dealing with Churchill as a speaker and a writer. Sir Norman Birkett has contributed an excellent study of the Prime Minister's oratory. Mr Malcolm Muggeridge has a perceptive essay on him as a biographer and historian, in the course of which he describes the volumes of the Second World War as "historic rather than historical, glowing with the making, rather than the writing of history." Professor Bodkin has a characteristically salty commentary on Churchill as an artist. He suggests that the impulse to paint must have been dormant in Churchill from an early age, and found its first expression in the sketches he sent back with his despatches from the South Africa war. This made painting a natural outlet for him when in middle age he sought an avenue of escape from the pressure of events. But Professor Bodkin disagrees with the common — and Churchillian — view that this is an avenue open to all. Sir Winston's call to "Everyman to paint for himself," says Mr Bodkin

must have powerfully stimulated the sale of artists' materials during the past five years; and the number of those whom it has led astray into mis-spent effort must greatly exceed those whom it has led safely into a promised land.

Lord Winterton and Mr Shinwell, from very different points of view, arrive at much the same affectionate though critical view of Sir Winston as a Parliamentarian. Mr George Isaacs has a good chapter—one of the best in the book—on Churchill and the trade unions. And for those who insist that in these days a man is a hero to his valet there are details of his personal and working habits by his ex-secretary and by the detective who guarded him for many years. But not even Sir Alan Herbert has succeeded in getting down on paper Sir Winston's humour. The reason is surely that it is like humour in a play, depending for much of its effect on the timing and the background—on the swift quip which alleviates the tension of some great and passionate issue in the Commons, or the jest which enables him to escape from some tight political corner.

Despite these defects, however, the good parts of this volume render it a task worth undertaking, and make it both saleable and readable. The subject alone guarantees that.

Record of Recovery

THE REBIRTH OF AUSTRIA.

By Richard Hiscocks.

Oxford University Press. 263 pages. 18s.

EVENTS have moved so quickly during the past six months that a postscript is already required to Professor Hiscocks's admirable little book on Austria since the war. Only a few days after it went to press last spring, a new era began in the story of the four-power occupation with the gradual

THE ECONOMIST, DECEMBER 5, 1953

relaxation of Soviet control over Austrian affairs in both the Soviet zone and the Soviet sector of Vienna. Consequently, Russian obstruction, which has hampered Austria's recovery ever since the first post-Nazi Austrian Government was formed in April, 1945, has now become materially less. Mr Hiscocks has devoted a whole chapter to this subject and nothing that he has written about it is in any way invalidated. But there are already a number of new facts to be added to those he has enumerated.

The story of Austria which he has described is an inspiring record of recovery. Starting with a picture of utter chaos, misery and starvation it recounts the various steps and stages through which Austria has passed until now, eight years later, it has become one of the most stable states in Europe. It has a coalition government which really does pull together and which had the same Premier, Dr Figl, throughout practically the whole period with which Mr Hiscocks deals. It has built up a reserve of foreign currency that today exceeds \$50 million. It has a growing export trade in spite of a decline in trade with former customers in eastern Europe. And though Austria still has a formidable unemployment problem, its population is, on the whole, well fed—better fed, unquestionably, than that of any of its eastern and southern neighbours.

The controls imposed by Russia on the movement of goods and people across the frontiers of its zone and its censorship of communications have been lifted since Mr Hiscocks's book was printed. It is no longer necessary, for example, for a "10-kilometre [telephone] call between Feldkirch in the Vorarlberg and Buchs in Switzerland . . . to be routed through Vienna over 500 kilometres away." But the Soviet economic exploitation of Austria continues on the same scale as before, and there is as yet no sign that Russia is ready to end the occupation and restore to Austria the full liberty it promised in the Moscow Declaration of November 1, 1943. Austria's recovery is all the more remarkable in that it has taken place in spite of this exploitation and occupation.

It is, of course, impossible to cover fully every aspect of Austrian recovery in a book of this size, and Mr Hiscocks has said nothing about the relationship between the Federal Austrian Government in Vienna and the various provincial governments. The omission is surprising, since he has dedicated his book to two officials in the province of Upper Austria. As in many countries, the Austrian provinces sometimes tend to be jealous of the capital. It would be difficult, for example, to persuade a majority of the 6 million odd Austrians who live outside Vienna that the Austrian Government is justified in spending no less than £3 million on rebuilding the Vienna Opera House. However, the surprising thing about Mr Hiscocks's book is not that he has left such things out but that he has got so much in. As a general guide to post-war Austria, his book is invaluable.

The Seizure of Power

THE PATTERN OF COMMUNIST REVOLUTION.

By Hugh Seton-Watson.

Methuen. 377 pages. 25s.

IN his introductory chapter Professor Seton-Watson defines the task he has set himself: a comparative historical analysis of Communism as a revolutionary movement. In describing the main attempts, successful and unsuccessful, by Communists to seize power from 1917 until today and ranging from highly industrialised Europe to primitive Africa, he has sought to "indicate the principal social and political conditions that have helped or hindered Communists in their recruitment of supporters and in their onslaught on the state machine. And the title implies that from these descriptions there will emerge a synthesis, a crystallisation of the basic factors common to all Communist attempts to seize power.

If the outcome falls short of the promise the reasons are not far to seek. In the first place, the book (given the author's intention) is top-heavy with familiar and not always relevant detail. An introductory first chapter deals with Europe before 1914, and contains sections on economic and social divisions, political systems, education, religions, nationalities problems, labour movements and the Second International. The following chapters describe the Russian Revolution of 1917, the founding of the Comintern and the abortive central and east European revolutions and uprisings that came with the end of the First World War; and by page 110 the author has also discussed "Communism in Russia, 1921-1928" and "Communism in Europe, 1921-1933." From that point on the geographical scope widens and the dates and names multiply like rabbits. Occasionally the narrative is interrupted by a series of paragraphs which are almost flagged as "causes of victory" or "causes of defeat," and by some surprising generalisations, for instance, that the Popular Front tactic of the 1930s was a failure in Europe.

Even up to page 329 the names and dates (invariably accurate) are being machine-gunned at the reader, and then in his final chapter, Mr Seton-Watson offers his synthesis. He finds that

The political factors that have been decisive for the victory or defeat of Communists have been the resistance or collapse of the State machine and the international balance of power. . . . The collapse of the State machine . . . has been brought about . . . only by the direct or indirect effects of war. . . . The second political factor, the international balance of power, requires little explanation. Communists have succeeded when Soviet military force was available to support them, and have failed when anti-Communist or non-Communist military force was present in overwhelming strength.

In short, the Communists win when they seize and hold state power and they lose when the non-Communists defeat them.

For the generation which at first hand has known politics only since 1939 the

book is an excellent guide to the history of Communist movements throughout the world. To be anything like a complete record of world Communism, however, much more space should have been given to the later integrative and organisational activities of the Comintern and its subsidiaries such as the Pan-Pacific Trade Union Secretariat. Mr Seton-Watson's unwritten book would have sacrificed some of the facts in order to bring out the remarkable consistency which has guided Communist revolutionary activity ever since Lenin—its unshakable determination to destroy capitalism, its insistence that every Communist be a full-time disciplined militant, its definition of every situation as a political one, and its readiness to co-operate with non-Communists should this be the most effective way of destroying them or of safeguarding the Communist Fatherland.

Heritage of Slavery

FAMILY AND COLOUR IN JAMAICA.

By F. M. Henriques.

Eyre and Spottiswoode. 196 pages. 18s.

THE lands of the Caribbean, the southern States of America, and Brazil, are all marked by the heritage of the slave trade and Negro slavery. Their modern characteristic is great poverty, social structures dominated by detailed scales of colour, and apparent instability of domestic groupings. There has been considerable research into these problems

We beg to differ —do YOU?

Unlike most other publications concerned with Current Affairs, KEESING'S has no axe to grind. Being a scholarly compilation of Facts, it is completely objective and unbiased in its selection and presentation of news items.

Just like the weathercock — making no comment and taking no sides—KEESING'S registers events and developments in Politics, Economics, Social Questions dispassionately, from a lofty level.

But KEESING'S is much more than an authentic weekly news summary. Collected in the compact Binding Case, its records form the documentation of our time: comprehensive, yet concise and, above all, designed for permanent reference.

To this end KEESING'S has been fitted with a unique Indexing System which, being cumulative, keeps constant pace with developments and enables you to locate in a matter of seconds every entry in this remarkable diary of world events.

Thus, within twenty years, KEESING'S has become the trusted Reference Tool of those who prefer making up their own minds to rehashing other people's opinions and prejudices on questions of national and international importance.

both in the United States and in the Caribbean, but there has as yet been no satisfactory sociological analysis of a single West Indian island. Most studies in the West Indies themselves have been cultural in their emphasis. Dr Henriques's book on Jamaica therefore stresses the importance of this field of research for elucidating fundamental problems of class and family relations. Ethnographically the book is excellent; it describes the nature of the problems clearly. But the explicit sociological and psychological statements, which are interpolated in the description, somewhat over-simplify the case. The merit of the book resides in its implicit ordering of complex data.

Dr Henriques stresses the general poverty of Jamaica's population, created by successive crises in single-crop economies. A few people at the top, as in the time of the sugar planters' heyday, are extremely wealthy. The descendants of the emancipated slaves, for whom no provision was made at the time of emancipation, live in constant want, moving in search of work and following messianic cults in search of salvation. This poverty and mobility are accompanied by great instability of domestic association. Throughout the region of former slavery the "illegitimacy rate" runs between 50 per cent and 70 per cent of births. Dr Henriques sees that although these classes have Christian monogamy as an ideal, in fact they accept concubinage and "illegitimacy" as normal. No social disapproval attends them. Hence he gives a value to the various forms of domestic association different from that given by preceding studies. These forms are the Christian family with civil marriage as its basis; faithful concubinage, where a couple have lived together for many years; the keeper family, which is a temporary association; and the maternal family, where a number of women, related by descent, live together in the other forms of association with men. He rightly rejects Herskovits's thesis that these associations are African survivals, and shows how they are related to forms of mating under slavery but are maintained by present conditions. Particular domestic groupings may pass in a cycle through all the forms. In the upper, and lighter, classes marriage, with perhaps the keeping of a concubine, becomes normal.

This important analysis is tied into a study of the fine grading of class, dependent on colour, wealth and skill, which has emerged from the mating of whites and negroes. All except the poorest and lowest are striving to move up the scale, and all except the rich and highest are struggling to avoid slipping downwards. This has important effects on the Jamaican temperament and on personal relations. Though there is no "colour bar" the whole society is extremely "colour-conscious." This has the result that the upward mobile man always tries to marry a lighter woman; and there is appearing a class of professional spinsters who

cannot mate at their level or upwards, and will not marry downwards.

The whole structure is now assailed by a constitution which gives political power to blacks; as the practical problems of Jamaica grow more difficult, they become more fascinating.

Malvolio Speaks

UPHILL ALL THE WAY.

By Mary Agnes Hamilton.

Jonathan Cape. 160 pages. 12s. 6d.

IT is not the Malvolio of the cross-gartered yellow stockings, the self-important ass, but the suddenly tragic and dignified figure declaring from his dungeon that he "thinks nobly of the soul," who gives Mrs Hamilton her final chapter-heading. This warm-hearted, intelligent and enormously refreshing autobiography is a manifesto for democracy, an utterance of that "third cheer" which Mr E. M. Forster tolerantly but firmly withheld. She "thinks nobly of the soul" as she has seen it through an active political and professional lifetime; she believes, moreover, that no soul is complete without participation in the life of the social order; she has found that the patient co-operation of men of goodwill in seeking common ground is in fact, and not only in theory, rewarded by solid practical success. For democracy as fact, as a set of social and political institutions, she would, one gathers, agree with Mr Forster in thinking two cheers quite enough. For democracy as aspiration, as vital underlying principle, as the only healthy social relationship of human beings however diverse in nature and gifts, she has that unreserved enthusiasm which he would keep for "Love the Belovéd Republic." The democracy of the textbooks and the democracy of Walt Whitman overlap but do not coincide.

Given a different sort of personality Mrs Hamilton might have drawn different conclusions from the experiences here narrated. She had a happy childhood and adolescence, but thereafter it was "uphill all the way" much in the manner of Sisyphus. Her marriage is a brief, and briefly mentioned, failure; her first political enthusiasm, the Independent Labour Party, leads to disillusionment; she hitches her wagon—until 1931—to Ramsay MacDonald's star, and suffers accordingly; 1931 brings defeat and unemployment; the dismal closing years of the long Armistice overwhelm her with a sense of personal dishonour; she feels her full share of the *Angst* afflicting the exhausted and divided postwar world.

But Mrs Hamilton's capacity for digesting experience and turning it to wisdom, for achieving self-knowledge while preserving sympathy, save her from the common fate of the over-idealistic—at worst cynicism, at best a detached cultivation of a private garden. "Uphill All the Way" is indeed an excellent specific against cynicism, especially that cynicism engendered by the spectacle of equalitarian spite and equalitarian cant.

Independent Asia

ASIA AND WESTERN DOMINANCE.

By K. M. Panikkar.

Allen and Unwin. 530 pages. 30s.

SARDAR PANIKKAR'S book is compulsory reading for anyone who has anything to do with Asia, whether he is diplomat, businessman or plain student. It is not only that it is the first book to cover both the whole area from Karachi to Tokyo and the whole period from Prince Henry the Navigator to the present day; it is also that it is the first book to give the viewpoint of independent Asia. Previous literature has been written either by Europeans or by Asians whose judgment was distorted by their resentment at the colonial or semi-colonial status of their countries. Sardar Panikkar suffers from no complexes.

Sardar Panikkar is a historian of quality. His style is smooth and lucid; his very considerable learning is carried lightly; his choice of facts to illustrate his theses is nearly always judicious. One can quarrel only with his persistent tendency to regard China as always sinned against in its nineteenth century relations with the West. The Opium War was quite as much about diplomatic relations as about opium; the war of 1859-60 was not fought just to protect a pirate; exasperation at foreign interference does not really justify the Boxer murders. Gunboat diplomacy was as much the result of the inefficiency and corruption of Chinese officialdom as of the West's belief in its moral virtue.

That Sardar Panikkar takes this line is, however, in itself significant. That, undoubtedly, is how most Chinese feel, and it is in this reflection of attitudes that Sardar Panikkar is at his most revealing. He is severe with the West about China because he feels that Western behaviour gave the Chinese no real option to Communism; a hundred years of Western, and especially missionary, education left too little faith in Confucianism for Chiang's neo-Confucianism to succeed, while liberalism never got out of the universities. By contrast, his comments on British rule in India are, in general, favourable. He mentions the plunder of Bengal after Plassey; he points out that the victory itself was paid for rather than fought for; he sees no case for the Afghan or Burmese wars; he quotes Kitchener's patronising remarks about the impossibility of having "native officers" in the army. But he recognises the importance of the English language in unifying India, of the British railways, universities and administrative system in providing a basis from which independent India can build up, and of British liberal and democratic ideas in helping to make India Asia's main representative of liberal democracy.

Sardar Panikkar has much to say, too, and all of it illuminating, on such subjects as Russia's relations with China, the role of missionaries, and the Japanese failure to absorb Western humanitarianism. But the book should be read. It cannot all be put in a review.

Letters to the Editor

A Mission to Moscow

SIR—In your issue of November 28th you made a series of comments on a letter from Mrs Joan Robinson. Although I disagree with the general tenor of all your comments on this subject, I will confine myself to one only, namely your statement that "the long-term trade agreement between the United Kingdom and the Soviet Union, which was signed in Moscow in December, 1947, is still in force." This is not correct.

This agreement, which I myself negotiated, covered certain short-term shipments of goods, all of which are now completed except for certain cases where contract negotiations were broken off. The long-term arrangements envisaging further schedules of exchanges of goods never came to anything. The reference to financial arrangements has been taken up by a separate monetary agreement and the shipping clauses fall with the general reference to long-term trade arrangements.

Certainly neither the Board of Trade in this country nor the Soviet Government consider that a long-term trade agreement is in force between the two countries. Moreover, since the phrase "trade agreement" in the text of your article and Mrs. Robinson's reply clearly envisages lists of goods to be bought and sold, there has not been such an inter-governmental agreement in force—apart from specific purchases of particular commodities by Government departments—since the expiry of the short-term arrangements (part A) of the 1947 agreement.—Yours faithfully,
House of Commons HAROLD WILSON

★

SIR,—I was puzzled by the statement in your Note of November 21st that "Anglo-Russian trade in non-strategic goods is developing quite satisfactorily within the official trade agreement." After the ECE conference last April, France and a number of other western countries negotiated agreements for two-way trade with Russia on the basis

of the lists which had been exchanged at Geneva. This country has so far made no response to the Russians officially. The "official trade agreement" to which you refer is not a close analogue to the trade agreements that France, Italy and some other countries have entered into. It is an agreement concerning trade, but not an agreement to trade. It rather takes the form, as Mr Eden said, of not objecting to trade.

The explanation can hardly be that our exports to the Soviet Union are going along satisfactorily. They are, in fact, almost at a standstill. In the first nine months of this year their value was only £1,316,000, the lowest for any peacetime year in the last three decades and less than a quarter of the postwar average.

Our exports to Russia at the moment are, in fact, less than one-thirtieth of our exports to Belgium—and this at a time when the Russians seem likely to increase their sterling holdings rapidly by the sales to this country of grain, timber, manganese ore and other metals as well as silver and gold.

Perhaps that is the explanation of the readiness on the part of a number of manufacturers in need of new export markets to join in a group visit to Moscow, planned on the basis of the indications given by the Russians of their current requirements. Many of our people believe that something more than individual, unco-ordinated sales-

ANNUAL ABSTRACT OF STATISTICS 1953

Prepared by the Central Statistical Office in collaboration with Statistics Divisions of Government Departments, this Annual Abstract of Statistics for the United Kingdom gives annual figures for the years 1943 to 1952 and includes, where possible, comparisons with 1938. It contains over 300 tables covering 32 subjects and is of special and immediate value to industrialists, journalists, and economists, besides being of great interest to the general public.

manship is needed to make the necessary impact on the highly centralised trading organisations of the Eastern bloc. Especially if a commercially disinterested body undertakes the preliminary work of market research, selection of forms and general organisation, the group visit may do a great deal to advance British exports in markets with which we have at present little effective contact.

Incidentally, in the publications of the British Council for the Promotion of International Trade that I have read, I have failed to find anti-American propaganda (even non-spiteful propaganda). Much of it consists of extracts from American newspapers and periodicals of unimpeachable respectability.—Yours faithfully,

Bristol University H. D. DICKINSON

★

SIR—It often happens that one man's fancies are another man's "facts." There are, however, some points in your comment of November 28th on my letter which it should be possible to clear up. (1) On the agreement of 1947 with USSR we seem to be at cross purposes. This is not now an operative trade agreement of the type which, for instance, the UK has with Czechoslovakia, and which France, Sweden and Italy made with the USSR after the last ECE trade meeting specifying quantities and naming commodities. The "short-term arrangements" under the 1947 agreement have long since expired and the "long-term arrangements" which refer to "a balanced programme of shipments between the two countries" seem to have become a dead letter. (2) Your reference to "conditions" laid down for the Moscow conference of 1952 is also misleading. The principal condition was that "the Conference will rule out any discussion of the respective merits of different economic and social systems." Many people, I know, were deterred from coming, not by any "conditions," but by the thought of the smears to which they would be liable to be subjected when they returned.—Yours faithfully, JOAN ROBINSON Cambridge

[Our remark about the course of Anglo-Soviet trade was based on reports reaching us of a number of contracts recently obtained through the ordinary channels from the Russians. An example is that for £10 million of trawlers now sanctioned by the British Government. These orders will of course appear only in future trade returns.

There is no point in quibbling about what is and what is not a trade agreement. Our argument was that the official channels for negotiation set up by Mr Wilson's agreement still exist—including a Soviet Trade Delegation in London—and that better results are likely to flow from using them than from highly publicised private missions with a propaganda flavour. That is still our opinion—and the Soviet Government appears to agree with it. We have the most direct evidence of the conditions that were imposed for the 1952 Conference.—EDITOR.]

Jute: A Test Case

SIR—In fairness to the jute industry I feel that there are certain cardinal points which the article published in your issue of November 21st failed to bring out.

(1) The national importance of having a jute spinning and manufacturing industry in the United Kingdom, which was publicly acknowledged by the President of the Board of Trade in 1948. Without a home spinning and manufacturing industry a large number of consuming industries in the United Kingdom would be unable to get their specialised requirements. The wide diversification of the home industry is obviously not appreciated, and here I would again quote from paragraph 4, page 1, of "The Working Party Report": "It would be unwise in the national interest to allow the consuming industries to become more and more dependent on a single outside source of supply." Subsequent to the publication of "The Working Party Report" the single outside source of supply (India) did in fact let this country down, and for a considerable time only the existence of a healthy and versatile home industry prevented a serious national crisis.

(2) The article seems to imply that the home industry should only be protected until more economic industries can be attracted to Dundee: the word "economic" can be used in almost any context. At the foot of page 71 of "The Working Party Report" there appears a sentence: "It is relevant to mention here that the new industries which are being established in Dundee are all protected by tariffs."

(3) You say that the industry should have a permanent incentive to reduce costs and prices. I would point out that under the present system of cost and profit control exercised by the Government there is a very direct and sharp incentive to every producer to reduce costs, and large sums of money have been expended on modernisation to this end.—Yours faithfully,

W. G. N. WALKER, Chairman,
Jute Industries Limited
Dundee

European Political Community

SIR—In the article in your issue of November 21st, I am not clear what is meant by the statement that "The Community theory . . . is not so much a new kind of state as a novel administrative technique, which depends for its success less on the positive transfer of powers to this or that body as the withdrawal of major economic veto-rights from the national governments."

In my view, your correspondent is not making a positive contribution towards clearing up the issues involved in the European constitutional debate. As he points out more or less clearly at the end of his analysis, the essential

cleavage today is between those who want some definite supranational powers to be granted to a European Government (both to the legislative and the executive branch of it) and those who oppose any transfer of national sovereignty.

There is no new Community theory, and your correspondent's "novel administrative technique" is nothing other than the only possible compromise between the federalist and the anti-federalist groups. Should the EPC eventually become a political reality, either the federalist forces will win the day and the Community will become a going concern or the national forces will prevail and the EPC will surely fall apart like the proverbial house of cards.

If your correspondent believes that "the idea of a federal executive is an old-fashioned one," he should also say with the same clearness and simplicity that he does not believe any supranational government to be possible at all in continental Europe. It would be much better than fumbling about with such subtle and foggy concepts as "novel administrative technique," "gentle custodian," "positive transfer of powers," etc., etc.—Yours faithfully,

RENATO GIORDANO

[Signor Renato Giordano appears to argue that clarity rather than compromise is desirable in politics. Thus he is eager "to clear up the issues involved" and to see that "federalist forces win the day." The first aim, however, of the EPC is to prevent nations and groups from acting in a manner detrimental to the interest of all. This is surely best achieved, in the foreseeable future, by a constitution which is part federal and part intergovernmental. Only when such a system has been tried out will it be possible to say whether a full federation is necessary. To insist on federation now is to create the maximum of resistance; to try the Nato method and the experimental Luxemburg method is more reasonable.—EDITOR.]

Take-over Bids

SIR—The spate of take-over bids appears to be due to the unrealistic state of most balance sheets where fixed assets are shown at prewar cost heavily written down. This state of affairs gives shareholders, and maybe certain directors, a false idea of the real value of the company as an entity and leaves the way open to enterprising speculators to cash in. The idea of an annual balance sheet is surely to let the owners (shareholders) know about the prosperity and current value of their property and should thus be as accurate as is reasonably possible. Last year Imperial Chemical Industries Ltd revalued all its property and produced a very different picture for its shareholders. If other companies were to revalue fixed assets their true value would be brought to light and the speculative bids would largely disappear.—Yours faithfully,

W. A. KINNEAR

Blueprint for Better Neighbours

Washington, D.C.

EVEN before he sent his Vice-President on the Far Eastern circuit, President Eisenhower had despatched his brother, an agricultural expert who is the president of Pennsylvania State College, to mend fences in Latin America. Unlike Mr Nixon, Dr Milton Eisenhower listened, but said very little. Only now, four months after his return, has he revealed in print some of the impressions that were made on him. Besides the published report there was a series of detailed recommendations concerning particular countries, a few of which have already been acted on.

Dr Eisenhower's conclusions will be persuasive evidence in a number of arguments that are still undecided in Washington. For one thing, he comes out strongly on the side of the technical assistance programme. Since the present Administration came into power there have been repeated rumours that this programme, known everywhere as Point Four, would be lost from sight as the result of being included with military and economic aid in the embrace of Mr Stassen's Foreign Operations Administration.

These suspicions were hardly stilled when Mr Stassen dispensed with the services of all the senior officials of the Institute of Inter-American Affairs, which administers technical assistance in Latin America. During his visit Dr Eisenhower was able to see in action several examples of the *servicio* type of project, in which American experts work on the job with their local opposite numbers who, when fully trained, take over completely. As the result of Dr Eisenhower's recommendations Mr Stassen has already increased the funds for this work by 10 per cent to \$23 million.

Secondly, Dr Eisenhower's belief that the outstanding need, as far as Latin America is concerned, is for a stable trade policy, "with the minimum of mechanisms permitting the imposition of increased tariffs or quotas," will add to the cumulative force of evidence to the same effect before the Randall Commission. Then he has given his support to the continuation of the Export-Import Bank or a similar national institution which could make development loans that might not appeal to an international agency. The Treasury has cast a jealous eye on the activities of the Export-Import Bank because its loans are counted as ordinary expenditure for budget purposes, and is insisting that the International Bank, which handles the longer-term

projects, should take over all public development loans.

Lastly, Dr Eisenhower has intervened in the controversy over American stockpiling. There is strong opposition, which was voiced, for example, at the annual National Foreign Trade Convention at New York, to the idea of stockpiling goods for any purpose except strengthening the defences of the United States. While not exactly contradicting this, Dr Eisenhower points to the Paley Commission's report on future deficiencies in American supplies of raw materials, and argues that when world prices are falling the United States can at one and the same time help to shield the economies of the producing countries and make sensible provision for its own future. He does, however, admit that money cannot easily be made available to do this to any great extent, except for purely defence purposes, during the period of rearmament.

★

Both Chile and Bolivia are today in straits on account of the collapse of world prices for copper and tin. In Chile, where the government did not have enough money to buy out the American-owned copper mines, it insisted on controlling their sales and holding out for a price of 36½ cents a pound, when the world price had fallen below 30 cents. The result has been a large stock of unsaleable copper, and at last, after much heartsearching in the Chilean Senate, has come the realisation that the United States can, for the time being at least, do without Chilean copper, just as the cars did not stop all over Britain when Dr Mossadegh switched off the oil. At the end of the intricate negotiations now going on the United States is expected to be able to add the copper to its stockpile at the world price of 30 cents, with an easing of conditions for the American companies thrown in.

The homœopathic argument—that the government concerned, however repugnant to the United States, is alone standing between the country and Communism—was no doubt frequently used during Dr Eisenhower's tour. It was certainly used by General Perón, who declared himself supremely confident that his regime deprived the Argentinian Communists of all their arguments. Dr Eisenhower's visit to Buenos Aires was accompanied by a series of conciliatory gestures, such as the lifting of the ban on American news agencies, and by a declaration, from President Perón,

that all misunderstandings between the United States and Argentina were "totally and absolutely solved."

But it has been President Paz Estenssoro of Bolivia who has had to place the greatest reliance on the homœopathic argument. Although no one has accused him of being a Communist, some of his ministers arouse strong suspicion of being fellow-travellers. After Bolivia nationalised the tin mines, tin prices collapsed and on the world market they are now well below the nationalised company's cost of production. As the country's economy is almost totally dependent on tin and it imports 40 per cent of its food, its plight was genuine enough. The government threatened to resign and, although some people thought that this was the best thing that could happen, the State Department rather reluctantly came round to the view that worse was likely to take its place. Bolivia is therefore being relieved of its tin, its technical assistance grant is being doubled to help expand its food production, and, following a personal appeal from President Paz Estenssoro, President Eisenhower has arranged for \$9 million of direct help, partly made up of surplus foodstuffs.

This action in Bolivia is being contrasted with the much sterner attitude adopted to the left-wing government in Guatemala, which has been engaged in a steady erosion of American interests and has allowed the country to be used as a headquarters for propaganda against the United States. The State Department has decided that, whereas the Bolivian President is trying to hold out against the Communists, the Guatemalan President is not, and it has followed up a very sharp Note by appointing one of its most experienced diplomats to the American Embassy in Guatemala.

★

Despite the obstacles of weak governments, excessive nationalism, a heavy increase in the population and the chronic shortage of properly qualified technicians, there has been an enormous economic expansion in Latin America since the war. Output a head, for instance, has gone up by 2.5 per cent a year, as opposed to 2.1 per cent in the United States. But in his report Dr Eisenhower expresses his firm belief that only the free play of market forces and competitive price mechanisms can save the republics from the kind of unbalanced development that has just, for instance, led Brazil—the country with the greatest potential resources of them all—into a most serious financial crisis. "Private enterprise" has in the past been associated with large foreign monopolies holding a privileged position. There is still an absence of local capital markets in the republics. But the pressing need for foreign investment, combined with the lectures on economics delivered by the International Bank, the Export-Import Bank and visitors like Dr Eisenhower are gradually having their effect in legislation that offers reasonable prospects to the investor.

The Latin Americans, who, as Dr Eisenhower notes, are inclined to overlook the great indirect benefits they reaped from European assistance schemes, may have hoped that a new Administration meant that their turn had come. The Eisenhower charm and the gestures that he has prompted or that his brother may induce Congress to make will probably remove the sting from what was, after all, the main purpose of his mission: to explain that "private capital must be primarily depended upon for helping to develop the great economic potentials of the nations of Latin America."

Assault by Battery

FROM A CORRESPONDENT IN WASHINGTON, D.C.

THE bluest of blue-ribbon scientific juries, a committee of outstanding experts chosen by the National Academy of Sciences, in a verdict delivered last month, found unanimously that the scientific tests of the National Bureau of Standards, the government's research laboratory, were excellent in all respects, and that its long standing conclusions on the worthlessness of a certain nostrum for improving motor-car batteries were entirely correct. In a reasonable world, those findings would have been obvious and superfluous, but certain parts of the congressional and governmental world are not reasonable. And there it was possible for a controversy to arise which cost something like one million dollars in the time of the men engaged in it, which cost an Assistant Secretary of Commerce his job, which cost the Secretary of Commerce his reputation, at least during many months, and which almost cost the nation one of its most gifted scientist-administrators and its most distinguished scientific agency.

All of this grew out of a debate on the utility of a mixture of Glauber's and Epsom salts for prolonging the life and protecting the components of lead storage batteries. Of such stuff have valueless battery additives been concocted for 70 years; the novelty is only that of such stuff was a shattering controversy concocted today. In 1947 a former construction contractor named Mr Jesse M. Ritchie began marketing, from Oakland, California, a mixture of sodium and magnesium sulphate. It was called AD-X2, the AD meaning additive and the X2 intended to connote something frightfully scientific. Like many similar products which have a brief life before their promotion is halted by government action, AD-X2 was a so-called ethical fraud, ethical in the sense that it did little if any harm to an accumulator. Within two or three years the Federal Trade Commission, which is charged with preventing misleading and deceptive advertising, and the Post Office Department, which is responsible for preventing mail frauds, began to interest themselves in Mr Ritchie's elixir. At the same time, his business was suffering because the Bureau of Standards, in the normal course of its work, had published circulars declaring that no battery additives on the market had any merit whatsoever.

Despite Mr Ritchie's representations, the Bureau declined to exempt his product from the general and inclusive condemnation; moreover, in its role as federal testing agency, it began to experiment even more intensively on AD-X2 for the benefit of the Post Office and Federal Trade Commission cases. Mr Ritchie, who was buying his materials for a few cents a pound and selling them at \$3 for the prescribed dose for a sick battery, saw his profitable world coming down about his ears. Up to this point, there was nothing unusual about such a history or in the fact that Mr Ritchie succeeded in interesting some 23 United States Senators in his plight. That his lobbying campaign was unusually successful may be explained by the fact that Mr Ritchie holds a degree as doctor of psychology, earned from a dingy two-room diploma mill in Chicago, called the College of Universal Truth, which was selling its degrees for \$100 or so.

But the story took a very different turn in early 1952 when Mr Ritchie walked into the Senate Committee on Small Business, looking for a shoulder to cry on, and found

Mr Blake O'Connor, a member of the committee's staff, ready to take over the crusade for AD-X2. By that summer the additional and elaborate tests of the Bureau of Standards had reaffirmed the original verdict on the uselessness of the formula and drastic action was necessary. Accordingly Mr O'Connor, at Mr Ritchie's suggestion, engaged for the committee a scientific consultant who had been employed by the additive manufacturer for some months previously; one of this Dr Laidler's glowing reports on the merits of AD-X2 had already become part of Mr Ritchie's promotional literature. Mr Ritchie then brought to Mr

"I Think The Battery Is Dead"

Herblock in the Washington Post

O'Connor's attention another chemistry professor, Dr Harold C. Weber, of the Massachusetts Institute of Technology, who had made some experiments on AD-X2 on his own, with results much to the manufacturer's liking. Mr O'Connor promptly arranged that the MIT should run some independent tests of AD-X2, with Dr Weber to take the lead in the experimentation. When the resulting report avoided firm conclusions, Dr Laidler remedied that deficiency by declaring that the MIT report fully demonstrated the merits of AD-X2.

The matter was still up in the air, however, and the Post Office was still proceeding with the issuance of a fraud order when the new Administration took office last January. The new Secretary of Commerce, Mr Sinclair Weeks, who has jurisdiction over the Bureau of Standards, was conditioned by campaign oratory, a good bit of it his own, about "the mess in Washington," to believe the story Mr Ritchie was waiting to tell him. Its theme was how a small and struggling businessman was being harassed out of existence by an unfair and officious federal bureaucracy. The Assistant Secretary of Commerce, Mr Craig Shaeffer, was even more inclined to listen: a fountain pen manufacturer, Mr Shaeffer had himself been stepped on by the Federal

Trade Commission, which forced him to discontinue advertising his product as "lifetime," because his company exacted a service charge for repairing those of its pens that proved to be less than immortal.

The two Commerce officials quickly persuaded the Post Office Department to suspend the fraud order, and then fired the Director of the Bureau of Standards, Dr Allen V. Astin, a man of great scientific renown. Mr Weeks testified to the Senate Small Business Committee that he had asked for Dr Astin's resignation on the grounds that the Bureau of Standards' tests were not "sufficiently objective, because they discount entirely" the opinion of the market place. Both scientific and public opinion were outraged, recognising Dr Astin's dismissal as a challenge to the scientific method and the scientific integrity of the Bureau of Standards. It was also a challenge to the policy of protecting the consumer against deceptive marketing methods which the federal government had followed for nearly forty years.

The hue and cry obliged Mr Weeks to re-examine the case, which he did through the creation of two scientific committees, one to study the Bureau of Standards as a whole and the second to look into the AD-X2 tests. Dr Astin was retained temporarily, Mr Shaeffer resigned and, after the report of the first committee, which was highly favourable, Dr Astin was persuaded to remain permanently as head of the bureau. The second committee, selected by the National Academy of Sciences, finished its report last month and completely vindicated the bureau in the AD-X2 matter. It also seems to have removed the dangerous challenge to the relationship between science and government. But whether the Administration will return to the principle of *caveat emptor* as its regulatory philosophy, or on the other hand will abide by the protective legislation enacted in Woodrow Wilson's day, will not be clear until the Post Office Department and the Federal Trade Commission decide what they are going to do about Mr Ritchie's catholicon for ailing batteries.

American Notes

Standing Up to McCarthy

SENATOR MCCARTHY'S arrogant attack upon the foreign policies of the Republican Administration has at last provoked a counter-attack. Mr John Foster Dulles, the Secretary of State, who has sometimes been accused of too great a tenderness for Congressional prejudices, had the courage to launch the assault upon the Senator from Wisconsin. In the free time which Senator McCarthy somehow browbeat four wireless networks into giving him, ostensibly to reply to President Truman, he criticised the Administration for not "liquidating the foulest bankruptcy of the Democrats": securing the release of American prisoners of war from "filthy Chinese

dungeons." Senator McCarthy suggested this could be done overnight if only Britain were forced, by a threat to cut off foreign aid, to end its trade with Communist China. "Perfumed notes," he insinuated, were still being used in place of two-fisted action.

It was by this offensive phrase that Mr Dulles identified Senator McCarthy in an admirably phrased statement which had been approved by the President. In it Mr Dulles insisted that the criticism struck at the heart of American foreign policy, whose aim it is to treat other free nations as equals; he denied firmly that, because it was in the interest of the United States to help certain countries, this gave it the right to dictate their policies, and he insisted that he would not squander any of the nation's precious assets of allied friendship by "blustering and domineering methods."

In his press conference the next day the President not only reinforced everything his Secretary of State had said, but also took up the Senator's other challenges, which must have rankled even more at the White House: his arrogant insistence that, whatever "well-meaning persons" said—an obvious slur upon the President—Communism would be a factor in the Congressional elections, and that McCarthyism would be the supreme issue; and his hypocritical assertion that the Administration's decision to retain the services of Mr John Paton Davies meant it was shielding a man who, according to Senator McCarthy, had recruited Communists and espionage agents for key posts in the Central Intelligence Agency.

In his reply the President reiterated his conviction that disloyalty in the government service would be dealt with so effectively that soon it would no longer be a danger, and that a Republican victory next year would depend on whether the party carried out a constructive programme, not on any Communist scare. The President's emphasis on the need to protect the rights of loyal citizens came to the real heart of the case against McCarthyism. They are welcome words from a President whose Attorney-General a few weeks ago seemed bent on "taking McCarthyism away from McCarthy," and a sign that the President and other Republicans realise there can be no compromise with the Senator who is turning his notorious methods against his own party to further ambitions which begin to look as though they were seriously aimed at the White House.

Santa to the Rescue?

THIS year America's shopkeepers are counting on Santa Claus not only to fill their pockets but to empty their shelves. He has to do more than, as usual, break all previous records for Christmas trade; he has to make up for the warm autumn which kept people out of the shops. Retail traders know very well that the man who has not bought a new overcoat before the beginning of December will probably do without it for the rest of the winter. But they hope that he will spend the money thus saved on Christmas presents for his family. Last Sunday would have seen the beginning of a spectacularly tempting display of Christmas advertising in New York if the newspapers had not been shut down by the photo-engraving strike, which is having serious repercussions on retail trade.

It is unfortunate that the unseasonable weather should have affected the clothing trade so seriously, for that was one section of industry which seemed to have completed its "readjustment," after a long period of poor business, and had its stocks, sales and new orders healthily balanced. In the early autumn it was the durable goods trades that were responsible for the failure of business to increase as usual at that time of year, and by November dealers' complaints about excessive stocks had at last persuaded automobile makers to reduce their output substantially.

The effect of this on automobile workers' earnings will be offset to some extent by the increase of two cents an hour which is coming to them as the result of the latest rise in the consumer price index. The rise is the result of increases in rents and service charges which have offset

declines in commodity prices. This means also that the total amount spent on services has gone up faster than have other types of consumption expenditures and explains to some extent the present difficulties of retail traders.

But consumers still have plenty to spend, both from current incomes and from savings, and they will have more next year when reductions in personal income taxes take effect. A special survey recently undertaken by the University of Michigan's Research Centre, which is renowned for the accuracy of its forecasts of consumers' intentions, suggests, rather unexpectedly, that they are as, if not more, ready to buy than at any time in the last two years. This readiness is inspired by present prosperity and stable prices, but it is accompanied by some pessimism about the future, which may make consumers more inclined to have than to spend when it comes to the point.

Waterfront Rivalry

THIS week the concentrated drive to clean up New York's crime-infested port got to the point of getting rid of some of the dirt; but dust must fly and mud be thrown for many more weeks before the New York and New Jersey waterfronts can look attractive to the shipping companies

and foreign traders that use them. Since last Tuesday all men employed on the docks have to be registered and all employers licensed; on that day many longshoremen refused to cross picket lines manned by those whose criminal records had made them ineligible for registration. But the work stoppage was over as soon as the pickets had been called off by the police.

The unregistered dockers were some of the members of the now independent longshoremen's union, which was turned out by the American Federation of Labour last September for its failure to purge itself of criminal elements. To save itself from being further weakened by the registration requirements the union, after an unsuccessful attempt to have them declared illegal, advised its members to try to comply with the regulations. The rival new union, which the AFL set up as a replacement, has also condemned this "regimentation" of longshoremen and has promised to work for repeal. It argues that the regulations will no longer be necessary, once the new union is established and the "mob element" swept off the docks. This argument should appeal to the dockers whom the new union is trying to enlist in as large numbers as possible before a vote is taken on whether it or the old union should be the official bargaining agent in wage negotiations with the employers. To give itself more time to collect members, the new union is trying to postpone the vote as long as possible, by starting various legal arguments before the National Labour Relations Board, which conducts the election. The men are at present working without a contract and are prevented from striking by an injunction under the Taft-Hartley Labour Act. This expires on Christmas Eve; and if, as seems possible, the new union's delaying tactics are still holding up the signature of a contract in New York, then that port may have yet another strike.

Meanwhile the old union has been trying to tidy itself up by casting off its president, Mr Ryan, who had condoned the criminal infiltration of the union and is himself under indictment for misappropriation of union funds. But Mr Ryan's retirement was generously provisioned with an annual pension of \$10,000 and an expression of the union's complete satisfaction with his management of its affairs for the last twenty-five years. It is not surprising that the AFL has condemned this attempt at reform as farcical and has refused even to consider allowing the old union to return to the federation.

Jewel of a Metal

SENATOR MALONE, who has been taking the government to task for buying today's metals abroad when home mines could provide them, has now arraigned it for setting its sights too low on tomorrow's metal, titanium. In this he has had the enthusiastic support of the Air Force, which sees no likelihood, in the near future, of satisfying its appetite for a metal whose lightness and strength, particularly at high temperatures, make it ideal for jet aircraft. Its resistance to many corrosive acids also wins it a high priority for guided missiles. If it were cheaper, the Army and Navy would use titanium to lighten equipment; and beyond lies a range of civilian demand which the Paley Commission estimated might, if the price fell far enough,

rival that for stainless steel. Moreover, the ores from which titanium is extracted are plentiful both in Canada and the United States, so that in time of war it might replace alloying metals which have to be imported.

Consequently, the government's goal of a production of 35,000 tons a year seemed suspiciously small to Mr Malone and alarmingly so to Mr Talbott, the Secretary of the Air Force. In the industry's view, however, it may err on the side of optimism. Over \$100 million of government money has been invested in titanium extraction plants since 1948 (titanium was produced, commercially, for the first time in 1946). Yet production this year is likely to amount to about only 2,500 tons. Contracts have been let for only just under 14,000 tons.

The obstacle is not niggardliness on the part of the government, but the high cost and cumbersomeness of separating this coy metal from its ores by the Kroll process, the method now in use, and the suspicion that the research being energetically carried on for both the government and private firms may uncover new and cheaper methods which will make today's equipment obsolete. If the government were not ready with loans, which can be repaid in metal as well as dollars, and which can be cancelled out if new processes make present ones out of date during the life of a contract, there probably would not be three firms in the field already and others on the horizon. Titanium sheets sell for \$20 a pound, fifty times as much as aluminium sheets. Until such prices can be reduced titanium will remain a jewel of a metal, too dear and too scarce, no matter what Senator Malone says, for almost anything except the most urgent military uses.

SHORTER NOTES

Owners of costly long-playing records are now able to protect them against the damage done by a needle which is wearing out. A blank record, made of very soft material, which is now on the market, turns grey when played with a needle which is approaching the danger point.

★

The Justice Department has deported 536 alien criminals and 42 subversives since the present government took office, and now has deportation cases pending against a further 131 criminals and 142 subversives, the Attorney General's office reports. The office has been helped in expanding and intensifying its programme of deporting undesirable aliens by the terms of the new McCarran immigration act.

★

Between May and October 1,456 federal employees left their jobs for reasons of security. The White House announcement said that 863 were dismissed and the remainder resigned when they discovered that the government was considering detrimental information against them. All but five were holdovers from the Truman Administration. These are the first fruits of the President's determination to keep his own house in order, without Congressional assistance, and of the new security regulations introduced in April. The Post Office has dismissed 166 of its staff on security grounds and the State Department 306 Americans and 178 foreigners employed abroad.

After Sudan's Elections

FROM OUR CORRESPONDENT IN CAIRO

THE severe defeat inflicted on the Umma party in the Sudan general election cannot be explained merely by Egyptian money and propaganda. From the depths of their present despair the Umma would have one believe it can, for otherwise they would have to admit the falseness of that long-standing conceit which identified the Sudan independence movement with the Umma. One cannot speak of evidence in this vast and varied country, but it is possible to point to a lack of evidence that any major interference in the elections occurred. Anglo-Egyptian recriminations have tended to obscure the fact that the Sudan Electoral Commission which Mr Sukumar Sen led through the labyrinthine detail of these elections, has been unable or unwilling to question the results. The commission has never suggested that the results were grossly perverted by Egypt. One must conclude, in these circumstances, that the elections were, in the first place, a rejection of a leadership which, largely by a policy of co-operation with the British administration, the Umma party has appeared to enjoy. The Umma has paid the price of its complacency before and during the elections. It is in part the victim of a growing radicalism which disliked its wealth. It has even suffered for its commonsense, which saw in co-operation with the British administration the simplest method of advancing to self-government and independence. Nationalism of the type engendered by Egypt thought otherwise.

Nor is it possible to avoid the conclusion that the elections are a vote against the British administration. The propaganda of the victorious National Unionist party was a consistent attack on the British administrators and their "tools" the Umma. Those people who entered the elections under the banner of the NUP tacitly accepted that line and, indeed, made one of the principal points in their propaganda a promise that they would expedite the Sudanisation programme. As that programme consists largely of removing British people and replacing them by Sudanese, the candidates were, at the very least, tacitly accepting an anti-British party programme. Sayed Mirghani Hamza, one of the most influential members of the party executive, put his anti-administration policy at the forefront of his plans. Only "practical considerations," he states, will limit the speed and extent of Sudanisation.

The Umma party and the British administrators have gone down together, and they have not gone down fighting; for the party underestimated the opposition against them

and the latter had neither the right nor permission to resist. In the circumstances it would seem wrong now for the Umma to provoke—as some suggest they might—a constitutional breakdown which would justify the interference of the Governor-General. If, taking into account the immense difficulties facing elections in the Sudan, these elections can be considered a reasonable expression of opinion, the future lies with parliament.

But, if the NUP is anti-British administrator, it is not necessarily anti-British nor pro-Egyptian. Even the rump of the Socialist Republican party, which was intended to canalise the independence movement of the Khatmia sect, has a place under the party banner and such men as Mirghani Hamza, who represent the Khatmia sectarian element in the party, are forthright in their statements that the Sudan must have its own parliament, its own government, its own army; that there can be no question of Egyptian domination or supremacy. It is to be, in the case of Egypt, an equal partnership on matters of common interest, such as the Nile water, defence and economics.

What is most interesting about this theory is that the propaganda for unity of the Nile Valley has ignored the fact that the Nile creates potential conflict, not unity. Its waters were divided in Egypt's favour by Englishmen, not by Sudanese, and the orderliness of the country under British administration has ensured the smooth working of an agreement which has become increasingly distasteful to the Sudan, which now needs more water than it is allowed to take from its own river. The Nile, too, has created the cotton fields of both the Sudan and Egypt, which now compete to sell their best cash crops. While the NUP believes, sensibly enough, that the two countries should enjoy good relations, the maintenance of that relationship is going to need more statesmanship than appears in an election campaign. Indeed, from Egypt's point of view, the need for a friendly Sudan hardly justifies the hate which it has created in the defeated but powerful Umma.

What Egypt has gained in these elections is the opportunity for further penetration under a government which is not, as an Umma government would have been, constructed to resist. Its task will be easier because the government will expedite the departure of British officials. Whether Egypt's relations with the Sudan will in the long run prosper thereby remains to be seen. One thing is certain. The Sudan has a difficult time ahead.

Mr Malenkov and the Housewives

ON Stalin's grave his successors promised the Russian public more freedom and better conditions of life. The first pledge did not survive Beria's fall; the second apparently stands as firm as ever. The latest decrees and the speech of the minister of home trade—A. Mikoyan—gave concrete short-term goals. The picture slowly emerges of an emergency three-year plan to improve the consumer's lot. The targets inherited from the Stalinist era are stepped up in varying degrees. For foodstuffs and the staple products of light industry—such as textiles—the increase is relatively modest. Where the additional plan breaks new ground is in its emphasis on durable consumer goods, on the projected mass production of items, which hitherto were known to the broad public only through propaganda. The most interesting of these targets are summarised in the following table.

SOVIET PRODUCTION*
('000 units)

	1940	1950	1954 Plan	1955 Plan	1956 Plan
Watches and clocks ..	2,550	7,200	16,800	22,000†	23,000
Wireless sets	200	1,080	2,860	3,770	4,400
Television sets	...	...	325	760	1,000
Bicycles	270	...	2,510	3,445	3,800
Sewing machines	180	500	1,335	2,615	3,000
Electric irons	...	485	3,550	4,375	...
Vacuum cleaners	...	100†	243	500	...

* Population now about 210 million, of which 80 million urban.
† Of which 7.1 million wristwatches. ‡ 1953.

In all assessments of the east-west power relationship the western superiority in steel and engineering was always partly offset by the large share of American—and the small share of Soviet—capacity devoted to the satisfaction of consumer demand. The new policy inaugurated by the Kremlin must in the long run reduce that discrepancy. Why should Russia's new rulers allow the balance of power to be thus tilted against them? Partly because with the power at their disposal they must feel they can afford certain concessions; chiefly, because they cannot run the risk of throwing both pledges into the dustbin. Great hopes were raised after Stalin's death. Some even thought that a degree of democracy would be reinstalled, first into the party and then into other assemblies. Since these political hopes were shattered, another outlet had to be found for ventilating grievances. Encouraged by the example of Malenkov, Khrushchev and Mikoyan the consumers have begun to voice their complaints. After years of silence the voice of long-suffering millions can now be heard. They have been offered the radio microphone, columns in the press, the assistance of the best *feuilletonists*, and complaints now echo from the Pacific to the western confines of the Ukraine. The soloists, like Mr Mikoyan, can only be properly understood against the background of this complaining choir.

In this consumers' opposition the housewives are front-benchers. Why—asks a Moscow mother—are all children's clothes dull and dark? Here, even these would be welcome

—echoes the voice from Tiflis—here you can scarcely clothe your children at all. Three million children are born every year—argues another—but prams are scarce and their price beyond the average purse. You cannot in certain provinces get even a chamber-pot for your toddler. Women, however, are most vociferous on the subject of time-saving gadgets. Lenin's dictum that only socialism can deliver the woman from her sink slavery is quoted and requested with a vengeance. Yet, the gadgets are there. They are to be found in exhibitions, shows and displays, but the angry housewife is turned away with a regretful: "Not for sale." Toasters, electric irons, washing machines excite women's imagination. Pressure cookers cause special enthusiasm. In one place they appeared a year ago, a few hundred were sold and now they have again disappeared from the counters. Some articles are to be found in one province, while they are unknown in another. Many highly desired objects have to be shunned because of their defects, because of lack of spares and accessories. What use a washing machine from which you cannot pump the water, a vacuum cleaner which with one part broken must remain unused for ever? Tinned goods may be very attractive, but how do you get at them without a tin opener? This catalogue could be continued *ad infinitum*.

A Market for M. Dior?

On the subject of dress and fashion views are divided. Some women demand well-made, but sober and cheap goods; others begin to dream of luxuries and stylish dresses. All, however, agree that at this stage there is little scope for femininity to assert itself. We are told about a naive lady of Talin who thought that stockings were made to be worn and complained bitterly when the foot came off immediately. Even a small improvement in supply carries the feminine fancy away and another provincial lady—this time from Sverdlovsk—dreams of dressmakers, and of *ateliers*, in which customers will be able to watch themselves in mirrors. Finally the privileged women of Moscow clamour for silk dresses, fabrics for evening wear, for soft crêpe de chine, etc. Is M. Dior eyeing the Moscow market?

If the men sing softer in this choir, their complaints also cover a vast range of topics. Here, too, provincials are worse off than the big-town dwellers. A Leningrad worker complains that badly produced blades hurt his face. No matter, provincial skins are harder: in six months a firm palmed-off 20 million defective blades in the provinces. People flock to Moscow for shopping whenever they get the opportunity. They buy not only for themselves, but for the family and friends as well. Glasses are in particular demand. "...All run to opticians—reports a Muscovite—but the two shops cannot satisfy the needs of everybody." A father describes how he proudly acquired in Moscow a big bouncing ball for his daughter, how it shrank into pear shape on the return journey and how at home they had to look at it through a magnifying glass. They saw on the ball the stamp: "first quality."

Leaking fountain-pens, hotels where guests are most unwelcome, dirty restaurants with slovenly waiters come in for a great deal of criticism. A witty Russian denies the truth of the saying that "appetite grows with eating": in Moscow's station buffet, sitting in front of a dirty tablecloth and waiting half an hour for every dish exactly the opposite tends to happen. Men also have their fashion problems. A Russian factory has apparently managed to produce a jacket in which the strongest men look tubercular. The

most ventilated grievance; however, is probably about the lack of the simplest tools for jobs around the house, and the acute shortage of spares for everything.

The newly opened complaints' book is being filled with extraordinary speed and the griefs of the relatively privileged and the under-dogs are to be found side by side. The seamy side of the industrial revolution, camouflaged for decades, is now described by thousands of pens. Yet, too much should not be made of this consumers' rebellion. It is a legalised opposition, tolerated on such a scale because the government probably intends to satisfy some at least of its demands. True, the new course, if followed consistently, is bound in the long run to have important political repercussions. Plentiful wireless sets, for example, will shatter the iron curtain, but will Russia still need a curtain so much in such circumstances? The satisfied consumers may begin clamouring finally for their political rights. Will the dictatorship then agree to "wither away"? All this is in the domain of long-term speculation. One thing seems certain: having embarked its Spartan troops on the road which leads to "Athenian decadence" the new regime can hardly hope for an orderly retreat. But although the new economic policy may be cutting the ground from under the foundations of the dictatorial regime, at first it must strengthen the position of the new rulers.

Nato Prepares for the Annual Review

FROM A CORRESPONDENT IN PARIS

THE third Annual Review of the North Atlantic Treaty Organisation is nearing completion at the Palais de Chaillot, and on December 14th the Foreign, Finance and Defence Ministers of the 14 Nato nations will assemble there in the Atlantic Council to receive this report on the past year's progress and draw up plans for 1954. The past year has been more one of consolidation than of innovation, with emphasis on the building up of support units and the improvement of both the quality and equipment of Nato forces, rather than any marked increase in their size. The high light of the year's achievement is undoubtedly a one hundred per cent increase in support units and considerable improvement in base facilities, training of reserve divisions, air support and cover, supply and transportation—in fact, the general second line facilities on which a modern well-balanced army depends.

The preparation of the Annual Review has gone much more smoothly, rapidly and efficiently than was the case with its two predecessors. Lord Ismay's staff now know their jobs thoroughly and have at their finger-tips such assorted and important data as the correct designation and state of preparedness of all the important national units, together with their locations, commanders, and the amount of training and equipment received. The new method of preparing the Review, instituted a year ago, appears to have worked well. Several delegations think that the questionnaire is still unnecessarily large. It is also suggested that one or two of the member countries have not enough highly trained civil servants to permit them to devote the necessary time to compile all the complicated information now required. In the past each delegation was

able to insert on the questionnaire sent out to all fourteen governments any matter it wished, whether or not it had any real bearing upon the problems under discussion or even whether it was of military or economic value to the alliance. This year the initial questionnaire was drafted by the secretariat. The replies have been shorter and much more to the point and the drawing up of the Review consequently far simpler. The Standing Group will meet here on December 7th, followed by the Chiefs of Staff on December 10th; and on December 11th and 12th there will be a joint session of the Military Committee and the Permanent Council to iron out the last difficult points before the Ministers assemble on December 14th.

To Prune or Not to Prune

It is generally anticipated that the Council will call for a general levelling off of expenditure. The international staff at Nato, taking their lead from London, Washington and Paris, does not appear to be gravely perturbed by this prospect; but the military leaders, who consider that Western Europe is still inadequately armed, will certainly press for at least the same total expenditure as this year. One or two of the smaller powers at present strongly support the military viewpoint. They claim that the only material achievement of Nato so far is infrastructure with its 140 air bases either in construction or completed, and the signals and fuel supplies which complement them. At the moment these members of the permanent council refuse to accept the "levelling off" process which is envisaged in Washington. The Atlantic Council, in their view, must not be allowed to mark time. The same delegates believe that the truce in Korea has not lessened tension between east and west.

The Council is most unlikely to discuss Germany's admission to Nato, as there is a feeling it would be wiser to await the results of the ratification debate on the European Defence Community in the French Assembly. However, the secretariat has already considered possible methods of liaison between the 14 Nato countries and the EDC. The most serious obstacle seems to be that Nato decisions must be unanimous, whereas the EDC treaty calls for a supranational authority which will automatically implement the majority decisions of its six members. Some delegates feel that the only logical solution is the eventual admission of Germany, despite the bitter opposition of France and possibly one or two other countries.

Survey of Civil Defence

The Ministers will not be harassed by the problem of sharing the burden of the infrastructure programme, as they were at the last two meetings. A three-year programme was agreed last April and all that will be necessary under this heading next month will be the task of screening each country's military demands.

Various Nato committees set up as a result of previous Council recommendations are beginning to produce results and proposals will be put before the Council next month on measures to be taken by the committees on food and agriculture, coal and steel, industrial raw materials, transport and by the petroleum planning group, in the long-term task of preparation in case of sudden aggression. In particular the committee on civil defence has produced after 18 months' work and the distribution of nine different questionnaires to member governments, a survey on a

country by country basis. This has stimulated activity in countries where little had previously been accomplished; and the resulting recommendations on standardisation of equipment, warning systems and security measures have created a feeling of confidence that in the event of air raids near a frontier, fire-fighting equipment and medical assistance could easily and rapidly be sent from the adjoining countries.

France's Case on the Saar

FROM A CORRESPONDENT IN PARIS

WHEN they deal with the Saar, French foreign ministers are on safer parliamentary ground than with the European Defence Community. The new Franco-Saar conventions signed in Paris on May 20th were ratified last November by overwhelming majorities in the French National Assembly, the Council of the Republic and the Saarbrücken *Landtag*. In all three Assemblies, only the Communists voted against ratification. Few other home or foreign issues would allow such unanimity in the French Parliament.

Since 1945 a consistent French policy has been administered by M. Grandval in the Saar. It has had two complementary objectives: economic union between the Saar and France, and the political separation of the territory from Germany, to be followed by self-government. There is now a third objective: Europeanisation.

In fact, France's policy toward the Saar since the end of the war has been based mainly on its economic claims. It should be remembered that France's share in reparations was substantially reduced when Britain and the United States agreed to the economic union in 1947-48. Moreover, the economic interdependence of the Saar and Lorraine is so close that the French have been able to produce a confidential Nazi memorandum which emphasises this even more strongly than their own experts. France is the best customer of the Saar coalmines, and the Saar blast furnaces get practically all their iron ore from nearby Lorraine, on which they are much more dependent than on Ruhr coking coal. Moreover, the secondary industries which have sprung up since the war find their best market in France, and it is generally believed that reunion with Germany would wipe them out since they could not stand up to German competition. The Saarlanders' larder can be filled much more easily with French than with German food. The setting up of the European coal and steel pool has increased rather than reduced French insistence on having the Saar coal and steel production added to their own because, if it were restored to Germany, it would make German preponderance in the pool quite overwhelming.

The French are proud of the results achieved since the economic union was put into force in 1946-47. The rise in coal and steel output, combined with practically full employment has always compared favourably with conditions in Western Germany. All the same, a number of Saarlanders—especially the Socialists—complained until last year about the management of the coalmines by a French *Régie*. This was one of the reasons why new Franco-Saar conventions were worked out last spring to replace those signed in 1950. Under the new regime, a public corporation, managed on a full parity basis, is to supersede the *Régie*; it is hoped that the future peace

settlement will allow the Saar to take over complete ownership. The economic and currency union remains, but now French economic laws and regulations will be applicable in the Saar only through Saar *ordonnances*; where Saar interests are principally concerned, the Saarbrücken government will be consulted. Differences are to be settled by a joint commission or a court of arbitration with equal French and Saar representation. The Saar government can claim that, for the first time in their history, Saarlanders are to participate in the management of their own mines.

The Saar representatives in the Paris negotiations strove hard to get French concessions in all fields. The promises they obtained concerning the Warndt coalfield which has traditionally been mined from Lorraine, raised an outcry in Lorraine industrial circles. M. Hoffmann and his colleagues certainly did not behave like French puppets. Do they, on the other hand, behave as true representatives of the Saar people? The working of the Saar parliamentary regime could not perhaps be described as purely

THE STAKE IN THE SAAR

democratic, even though, under the new conventions, M. Grandval will no longer retain his right to veto Saar legislation. The strongest point in the German case on the Saar is that pro-German political parties have been banned. The French and Saar governments reply that the law governing the creation and activities of political parties in the Saar was copied from the Bonn fundamental law: the Saar government can ban all political parties which tend "to threaten the existence of the Saar as based on its constitution" exactly as the Bonn government is entitled to dissolve those political parties which tend "to destroy or to impair the existence of the German Federal Republic." Why, the French say, do the Germans attack in the Saar what they are doing at home? The Saar autonomous State no less than the Federal Republic, must be allowed to protect itself. The French and the Saar ministers claim they have good reason to fear the consequences of inflamed campaigns by German political parties in the

QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

Saar, when they remember the threats and pressure before the 1935 plebiscite or even the German campaign on the Saar border a year ago.

In the general election in November, 1952, 64 per cent of the registered voters supported the political parties which form the present coalition, the Christian People's party and the Socialists. The German political parties had vehemently asked Saarlanders either not to vote or to spoil their ballot papers; 7 per cent abstained and less than 23 per cent spoiled their papers. Even if one maintains that all the latter were meant to be votes for reunion with Germany, it would be rash to assume that all those who abstained did so in obedience to the exhortations from across the border. German newspapers are allowed to circulate in the Saar and the people are not forbidden to listen to German broadcasts. The electors knew what the German political parties wanted them to do. In the French official view, therefore, the result would not have been substantially different, had these parties been allowed to run their own candidates.

A Say For Germany

The Saar political parties which were supported by two-thirds of the electors last year have come out in favour of Europeanisation. The French think, however, that Saarlanders should have their final say only in a referendum, when they have been presented with a draft of a European statute. This draft should be worked out by agreement between France and Germany. After ratification by the Saar population, it should be enforced not as a provisional, but as a final solution: on this the French agree with M. Van der Goes van Naters' report to the Council of Europe last summer. The French welcomed his plan as a good basis for discussion, but they objected to some of the economic clauses. They insist that the Franco-Saar economic union and joint management of the mines could be combined with Europeanisation, provided that suitable changes are introduced into the Franco-Saar conventions: indeed, France and the Saar specifically pledged themselves last May to adapt the conventions to an eventual European statute. But the union should remain in force until it can be merged into a unified European market with a common currency.

Of course, a European statute would further reduce French prerogatives in the Saar and give Germany a say in Saar affairs, although Germany could intervene only through international organisations. The French therefore consider that, in agreeing to Europeanisation, they are making concessions as well as the Germans. They never denied the Germanic character of the Saar: in the Saar University which they have created, about 40 per cent of the professors are of Saar and 20 per cent of German origin. But all French Cabinets and non-Communist political parties have adamantly maintained that the Saar must, like Austria, remain separate from Germany. As M. Van der Goes put it in his report: "The Saar has become for France the very test of German sincerity." This is precisely why French governments have come to intertwine so closely the future of the Saar and the EDC. Only after Germany has agreed to a Europeanised Saar statute could a French government hope to get any form of German rearmament accepted by the French Parliament. For the *Bundestag* this may be hard to swallow. But is it not clear now that any French Prime Minister will face even greater difficulties when he tables the EDC ratification bill?

Finland Fills Some Gaps

THE new non-party Finnish government, headed by Mr Tuomioja, the Governor of the Bank of Finland, seems likely to ride the storm for a little while; but it provides no lasting solution to the problem of mutual hostility between parties, which brought down the minority Agrarian government of Mr Kekkonen early in November. Elections are due next July—many voices are being raised to urge that they be held earlier—and Mr Tuomioja's cabinet of "technicians" won acceptance only as a temporary device to break the party deadlocks. Yet these caretakers may be able to adopt a stricter economic policy than any of the parties could have put through; for Mr Tuomioja's hand is strengthened by the fact that he is, so to speak, a short-term scapegoat, free of political ties and old promises, and personally unaffected by the electioneering manoeuvres that are already beginning.

This financial Fabius has been called on to save the republic after a year troubled by the absence of the discipline previously imposed by the need to deliver reparations to Russia on time. The problem now is whether he can supply a substitute internal discipline. There are some favourable straws in the wind. Drastic cuts in imports have brought Finland a small favourable trading balance in recent months; and although some industries have suffered from these cuts, it must be remembered that if the country is ever to get on an even keel again, the paring down of uneconomic branches of industry must be an essential, if painful, part of the process. The vital forest industry is still losing money on each ton of pulp sold, but less than in the summer, and its activity and sales have slowly increased; and devaluation has been partially achieved, in substance, by a variety of devices.

Mr Tuomioja can also draw somewhat unexpected comfort from the friendly atmosphere in which the new trade agreement with Russia was signed last week. Previously, the idea of a non-party government had been bitterly attacked both by Finnish Communists and by Moscow itself; and the offer of a Soviet loan and other favours made privately to Mr Kekkonen shortly before his fall was generally interpreted as evidence that the Russians were bent on keeping out Mr Tuomioja and his largely right-wing colleagues. Now it seems that they have been accepted with a fairly good grace—although the Finnish Communists are still denouncing them as a "big business" government "bound up with the Atlantic bloc." The Russian change of front is regarded by many Finns as meant to show that Moscow will deal with almost any party except the Social-Democrats, who are still the Communists' mortal foes in Finland.

Malan's Africa Corps

FROM OUR JOHANNESBURG CORRESPONDENT

AS far back as 1935, Mr Erasmus, South Africa's present Minister of Defence, took a deep interest in military matters, even if his knowledge, at that time, was not quite as profound. Thus in the House of Assembly, in that year, Mr Erasmus was loudly objecting to the fact that a number of South African regiments had "English names." He stated

the reason for his objection clearly and emphatically. There were, he said, regiments with such names as Prince Alfred's Own Cape Field Artillery, the Duke of Edinburgh's Own Rifles, and the Cape Town Highlanders. "If," Mr Erasmus pointed out, "we were to take the field against Great Britain, the names of those troops would cause confusion . . . I especially fear our troops with kilts would get mixed up with the Highlanders from Scotland."

Perhaps in 1935 Mr Erasmus was only joking. But, in 1953, he has taken steps which almost suggest that he was in earnest. The process, in fact, began long before this year, as far back as the Malan government's advent to power in 1948, when Major-General Evered Poole, who had been General Smuts's Deputy Chief of the General Staff, was packed off to Berlin to head an obscure military mission. Since then there have been a good many other significant staff changes, and Major-General Poole has now been dispatched to Chile.

Recruiting for South Africa's equivalent of Britain's Territorial Army begins in the schools. The ardour of potential young English-speaking recruits has been considerably damped by Mr Erasmus's decree that English college cadets in Grahamstown shall not be allowed to wear their traditional kilts. Instead, they are compelled to wear peaked caps like those worn by Rommel's Afrika Korps. Other school cadets are thrust into uniforms formerly worn by Mussolini's troops, which Mr Erasmus has apparently bought up in job-lots.

There have been frequent complaints among disgruntled veterans of the second world war about some of Mr Erasmus's military appointments. To take only one example: an Orange Free State regiment formerly commanded by an officer who fought at El Alamein is now commanded by a junior who was a university geology lecturer and who was commissioned only in 1950. The political party to which Mr Erasmus belongs was, of course, opposed to El Alamein being fought at all: one of the Nationalist newspapers openly rejoiced at what seemed at the time to be crushing South African defeats in the Western Desert.

Tinkering and Tailoring

Mr Erasmus's latest plan is to "couple" existing units. Fourteen existing regiments (mainly those with "English names") will become seven. For instance, the first and second battalions of the Transvaal Scottish will be melted down into one. There will be only one commander to two coupled units, but Mr Erasmus has generously promised that "surplus" officers will be retained as "super-numeraries." This compression of existing regiments with long and honourable traditions will no doubt help to minimise confusion (taken in conjunction with the banning of the kilt and the wearing of Rommel caps) if South African forces should ever take the field against Great Britain. But Mr Erasmus apparently feels that some confusion might still remain, so he has decided to rename a number of regiments. Thus, Princess Alice's Own is to become the Pretoria Regiment, and is to be Afrikaans-speaking only: at present, the regiment consists of one English-speaking and one Afrikaans-speaking battalion. During the war, men with names like Johnson and Van Niekerk, Smith and van der Merwe, did in fact fight quite happily side by side, in the same regiment.

Some of the new names which Mr Erasmus has approved for his regiments have caused a certain stir. Thus an East

Rand regiment is to be called after General Kemp, who joined the pro-German rebels in 1914. The Botha Regiment will become the Christian Beyers Regiment; General Botha was the Union's first Prime Minister, while Christian Beyers went into rebellion against the Union Government in 1914 and was subsequently drowned while eluding capture by Botha's loyal forces.

The Middelands Regiment is to become the Gideon Scheepers Regiment. Gideon Scheepers was a Boer War guerilla leader whom the British executed in 1902 at Graaft-Reinet, the headquarters of the Middelands Regiment. When the change of name was announced, all the officers of the Middelands Regiment, including men who regard themselves as being as good Afrikaners as Mr Erasmus, promptly resigned.

It is as a result of these activities that Mr Strauss, the leader of the United Party Opposition, has indignantly described the Minister of Defence as "a glorified military tailor." Mr Erasmus's answer, which appears to have statistical backing, is that by far the greater number of recruits now coming forward are Afrikaners, who wish to be trained in their own language and to join Afrikaner units: the renaming of regiments is, he maintains, an inducement to these Afrikaner recruits. He has not so far dwelt on the severe disinducement to English-speaking recruits provided by his banning of kilts, introduction of the Rommel cap, unexplained demotions, abolition of English-speaking battalions, and renaming of regiments. And the Nationalist newspaper, *Die Transvaler*, is perhaps franker than the Minister; telling "the jingoes" that they will just have to face up to those changes, it declares: "The Defence Force must become Afrikaans."

Unfortunately, the English-speaking South Africans appear to be as confused on this issue as they are on most others. Mr Erasmus's policy could be challenged on a number of grounds. But Brigadier-General G. M. J. Molyneux, the honorary colonel of the Royal Durban Light Infantry, chose to appeal to the Minister on the ground of the need to unite all the whites against the blacks. He said *à propos* of Mr Erasmus's weakening of the Defence Force: "The Native is a thoroughly good chap, but his ideas and ours are not by any means identical, and when these differences come to a head it is especially desirable to have a force which can strike at once and guard threatened localities." The *non sequitur* seems to make about as much sense as Mr Erasmus's former warning about the need for a new Model Army in case South Africa ever fought Great Britain.

Mexican Experiment Goes On

FROM OUR CORRESPONDENT IN MEXICO CITY

AS President Adolfo Ruiz Cortínes's administration nears the end of its first year, Mexicans have noted that the cheery dawn of reform has, as usual, given way to the harsher light of a hard day's work. That, however, is no surprise, and the President's popularity has not diminished even if the wild enthusiasm that greeted his first months in office has become tamer.

The main trouble in Mexico at the moment is that business is bad. The businessmen blame Señor Ruiz Cortínes's administration for this to a certain extent, but they do not suggest any important change in policies. They contend

that current slack buying is due to a sharp contraction in government spending; yet it is generally agreed that the government has no more money to spend and could not really improve the situation by borrowing. The government claims that in the last few months its expenditures have been normal, but a simple look at uncompleted projects in the capital and about the country shows that at least on construction items, one of the main outlays of the last government, the president is going slowly. Undoubtedly the last administration's unpaid bills are a great drain on the government, and new orders are being held up until these have been liquidated.

But government thrift alone is not enough to explain the uneasy situation of business. An important factor is simple reflection of the United States' economic jitters. In fact, any decline in American prosperity is magnified in its effect on Mexico, which relies considerably on surplus American purchasing power and capital. Furthermore, the Mexican economy has been moving through a trough of bad luck. Sustained drought has made necessary large imports of maize and beans, halved cotton exports, and, together with repeated outbreaks of foot-and-mouth disease, ruined cattle exports. The post-Korean drop in prices of minerals cut another big slice off Mexico's foreign earnings, and American tourist traffic has also fallen off.

No Quarter for Inefficiency

Probably more than most Mexicans will admit, the battle of rationalisation has also had a lot to do with the woes of particular segments of the economy. As more foreign capital and Mexican capital with up-to-date ideas is invested, the squeeze on antiquated enterprises becomes more painful. In the textile industry, for example, many factories have been working on 3 and 4-day weeks. Foreign markets have nearly vanished and even the old Central American stronghold is weakening in the face of Japanese competition. Nevertheless, firms that subscribe to the modern capitalistic tenets of reinvestments and reserves are still making good profits. The rest of the industry is demanding a discriminatory minimum wage which would force the efficient factories to pay more than the inefficient. But the government has wisely closed its ear to this plea, reminding the textile producers that they already have the protection of extremely high tariffs.

It is a sign of the state of affairs that, while all businessmen agree—and the statistics show—that current transactions are down, the scale of reaction to the situation runs from grumpy pessimism to warm optimism. The most significant examples of optimism come from large American firms that have decided to move into Mexico during the past few months. Notably, Standard Oil has obtained from Pemex, the national oil monopoly, the concession to distribute aviation fuel throughout Mexico. This is an interesting development, for Standard was one of the companies affected by expropriation in 1938, and has had little love for Mexico or the Mexican oil industry since then. Other American companies are about to enter the luboil market here, apparently confident that, despite the anticipated completion of Mexico's first lubricant plant in 1954, demand will continue to outstrip domestic supply enough to allow competition among several foreign firms.

Although the government has denied any deflationary ambitions, its economic policy has had a deflationary effect. The cost of living was forced down sharply in President Ruiz Cortiñes's first few months in office. It has since been

rising again, but the index is still several points below where it was when he took office. The most important drop has been in food, and the president has been keeping to his promise to give his prime attention to the Mexicans' basic foods, maize and beans.

On the other flank of his programme to push a little purchasing power out among the barefoot populace, he has established a policy of 11 to 15 per cent wage increases. As contracts come up for renewal, industry after industry has granted this rise. There has been considerable pressure during recent weeks for a new national minimum wage of at least 10 pesos (seven shillings) a day and perhaps 12 pesos, instead of the present variable minimum which in no case exceeds 8 pesos.

How much can be done in this direction will depend upon the success of the new taxes. The pressing necessity for revenues precludes as broad a tax reform as the minister of finance, Sr Antonio Carrillo Flores, would like to institute, but the new tax programme will make an effort to stimulate industrial investment and reinvestment and to penalise real estate speculation. Personal income tax remains insignificant but the country simply has not reached the stage of civic responsibility that would make a real income tax possible. Meanwhile export taxes are being reduced and some production taxes suspended, although these, with import duties, are the main sources of government income.

Making Honesty Pay

Neither the prospect of wage increases nor new taxes has upset the business community too much, because the current recession has forced recognition of the fact that the economy cannot expand much further without a better distribution of income. A huge gap exists between Mexico's domestic market and Mexico's population, and no economic programme can hope to succeed in the long run unless it brings the two closer together. Since the government's modest efforts in this direction are now being accompanied by a new tendency of government agencies to pay their bills, some sections of business are even delighted with the way things are going. The railways, for example, are now meeting their obligations promptly for the first time since anyone can remember. There is some resentment that they are cutting capital expenditure, but when they do get ready to make large-scale investments again, they will have far better credit than ever before.

None of this bears a direct relation to Sr Ruiz Cortiñes's honesty programme but it is all a part of what the new American firms coming into Mexico call a "more mature approach" by the government. Consolidation is the main feature of the new policy on the economic front, and behind it lies the realisation that stability and steady development are more important than spectacular public works. As for the honesty programme itself there is reason to believe that corruption has declined a good deal; there have been no reports, public or private, of graft at cabinet level. Since everyone is against sin, businessmen in theory, are pleased with this development but in fact they have not overcome the habit of trying to buy occasional indulgence. In the many cases where honesty has come to mean rigorous application of outmoded laws through fear of reprimand, the affairs of the country really have been slowed down. The problem of administrative streamlining is one to which the president must soon turn if he means to make honesty efficient.

THE COST OF DRYING THINGS

Millions of tons of fuel are used in Britain every year in drying processes, many of which are inefficient and wasteful.

When coal was cheap no one worried unduly, but today the cost of fuel used in drying is a serious expense item which tends to get buried in general overhead without receiving the close control given to economy of raw materials. Furthermore, many drying processes are as ineffective as they are extravagant.

Eight years ago, we started a specialised service to the Metal Goods Industries by providing Gas Infra-Red Tunnels for drying paints and varnishes. Today our techniques have wide application as varied as those employed in fish curing and textiles.

We are ever looking for new drying problems to solve. Nearly every industry has one. Send yours to:

Extended Credits for Exports?

A NEW shrillness has been reached in the past few weeks in the pleas of industrialists and others for special financial facilities to enable them to offer extended terms of payment to prospective customers overseas. The only novelty about this clamour is its intensity. The problem itself was discussed from time to time before the war, and raised its head again almost as soon as the postwar seller's market gave place to a buyer's market. It loomed larger still when reviving German industry began to offer liberal credit facilities as the means of getting a foothold in certain of its lost markets overseas. British manufacturers tend to assume that more difficult export markets entitle them to special aid or new facilities.

Last April the Chancellor himself explained, after inquiries of "those who speak for industry and commerce," that, if there was a problem, it was not one of the adequacy of existing financial facilities but of making those facilities more widely known. After this reassurance, it seemed possible that the clamour would subside—especially when manufacturers discovered that their difficulties in competing in export markets were by no means primarily due to inadequate credit.

But in the early autumn the aircraft industry succeeded in establishing its case for special facilities. Air Finance Ltd, sponsored by three leading firms of merchant bankers, was formed with evident official blessing to provide credits of up to three years for approved export orders for British aircraft. This precedent has touched off a new wave of demands. A project for export finance for small engineering firms has been taken up by another merchant banking house, and the big banks have been canvassed for loan facilities. The chairman of a famous shipbuilding company has affirmed that overseas orders are being lost to foreign

yards through lack of credit facilities, and Mr Butler has agreed to consider how far such facilities are precluded by official regulations. This particular inquiry is apparently restricted to shipping; but in commercial banking circles, and probably in official circles too, much thought is now being given to the problem as a whole.

These signs of activity make it the more important to keep the whole issue in perspective—notably, of course, in relation to the balance of payments. Britain's external account is probably now in only tiny surplus, if any at all. If, therefore, any "working capital" fund put up in additional export credits is not fully offset by a net increase in Britain's total exports, the difference must come out of reserves (or increased overseas borrowings at short-term). But the whole of any surplus that is conceivably within range is already bespoken by Britain's actual and prospective capital commitments—for repayment of debts and participation in the development of the overseas sterling area. Unless the additional exports that might be financed by credit formed part of those overseas development plans, the scope for credit sales must be very limited.

Moreover, the credit sales must promise a net strengthening of the balance of payments in the longer run, if not also in the short. They must not displace or prejudice cash sales, as they easily could do if the relative ease of selling on credit caused manufacturers to be less pushful in difficult markets, or if the rising order-book lengthened the delivery dates. It is often overlooked that the risk of such losses would be less a function of conditions in overseas markets than of those in domestic industry. The greater the "slack" in domestic industry, the less the risk would be, and vice versa. This same consideration is even relevant to another important class of risk: credit sales must

not cause sales for soft currency to displace those for hard currency—yet the pressure for credits will come most strongly from the softest currency areas and the weakest customers. To gain a foothold in a soft market now is of little worth if there is a likelihood either that the market may be softer still in a few years time or that the instalments due may be blocked. And if credits are made available to needy but worthwhile customers, they must not automatically go to those who now pay cash.

★

One of the big dangers of establishing new or special facilities is that they might tempt strong buyers to bargain for what they do not need; and they would certainly increase the risk of a profitless "credit war" with Britain's competitors. There are signs already that international merchant houses are bargaining for buyers by representing to manufacturers that their rivals in another country can outbid them in credit. Many of the rumours of lavish credits offered by Continental firms cannot be substantiated, and many "offers" never become firm contracts. All too often, the alleged need for credit is judged merely against this backcloth of rumour. But very little business, actual or prospective, seems to have been lost to Britain solely because exporters were unable or unwilling to match the credit terms offered by competitors. The unsuccessful manufacturer will not publicly proclaim that difficulties also arose over his prices, qualities or delivery dates.

These many conditions, considered together, suggest that the scope for worthwhile promotion of exports by offering extended credits is probably not very large. Is there reason to suppose that the potential volume of credit business that might pass these searching tests could not be provided by the existing financial mechanism? The general opinion among bankers seems to be that it could be so provided, though the attitudes of individual banks to this type of business differ widely—and, as usual, there are still wider differences between the views of the manufacturers and even the most liberal bankers about what constitutes creditworthy business. Any pleas for consumer goods are beyond the range of serious discussion, which must be entirely focused upon capital goods. And some bankers would draw a distinction between heavy fixed capital equipment and more rapidly wasting capital assets, such as road vehicles, or even locomotives—which raises the paradox that they may look more favourably upon the very types of asset for which the longest credit terms are likely to be sought.

At least one of the big banks seems to be prepared, in principle, to provide liberal facilities to exporters for approved business of this kind, with credits extending up to five years, and even beyond. At the other extreme there is another big bank that apparently stands firm upon the classical principle that a deposit bank should provide only floating finance. But in all cases in which the facilities are available, an absolute condition is that the transaction shall be insured by the Export Credits Guarantee Department (notably against the risk of non-

payment by the buyer or of blocking of remittances by the overseas Government). The most liberal banking view is that, to the extent of the 85 to 90 per cent of the transaction that can be thus covered, the resultant bills are hardly distinguishable from short or medium term British Government bonds—and can therefore be safely taken "without recourse" to the drawer (i.e. the exporter), who is held at risk only on the uncovered 10 to 15 per cent but gets finance even for that portion. This is also the method proposed by Air Finance Ltd., although that company hopes to insist that the buyer shall pay at least 60 per cent in cash by the delivery date, a much larger proportion than some banks might require.

Other bankers do not rate the ECGD guarantee so highly, partly because the policy does not usually cover the risk of rejection of the goods by the buyer; they therefore insist on retaining the right of recourse to their customer. Yet another view is that the scope for business of this kind must remain strictly limited unless the ECGD is prepared to reinforce its guarantee by an undertaking to the banker to take over the transaction itself at any time on demand, even though the insured risk has not materialised. This particular plea is, of course, an attempt to reconcile medium-term lending with the classical principle of British banking.

The whole subject clearly bristles with knotty points of technique. But it appears that the modest volume of creditworthy business that has so far come forward has found a sympathetic response from most of the big banks. And similar business is being done by the merchant banks. The general opinion seems to be, too, that business that looked worth while to the banks concerned has only rarely been frustrated by official regulations.

Most bankers therefore believe that the need for these credits can be adequately met through existing channels—provided that credit terms do not become a widespread custom of international trade in capital goods. This does not mean, however, that an exporter will always find his banker receptive—even where the transaction commands the support of the ECGD. The banker will continue to look to the scale of the customer's commitments in relation to the capital resources and prospects of his business. Though the finance is in effect furnished to the buyer, its basis is the exporter's contract, even where the credit is granted without recourse. But in the less common cases where the would-be exporter is either unable or unwilling to sell on credit, and where the buyer therefore seeks finance direct, official regulations become more constrictive, and the banker may be debarred from lending beyond six months, even if he is willing to do so. It is at this point, which is particularly relevant to the problem of financing overseas purchases of ships, that there may be a "gap" in the facilities. But it is very questionable whether it would be wise to ease the control over foreign lending at this point—or to try to persuade the bankers that they ought to look kindly upon medium-term lending to foreigners direct.

Copper Earns Its Living

THAT over-worked word "boom" has lost the potency it once had upon the Rhodesian copper belt. The latest reports from the interlocking nexus of copper companies, to the end of June, in fact mark the end of a prosperous period since the war—a period in which the persistent rise in copper prices ran well ahead of costs and profit margins widened, taking dividends with them. Now, in addition to the perennial problems of getting enough labour and fuel in Northern Rhodesia, the copper producers are confronted with the economic problems of adjusting their policies to the working of a free market in copper, unprotected by any government contracts or floor prices.

How have the copper producers reacted to this situation? First, the companies—keeping their eye on the possibility that profits may fall and disregarding the highly satisfactory profits that they have recently been making—have not been particularly generous to their shareholders. Their second reaction has been the essentially negative one of refusing to indulge in forecasts. The chairman of the Selection Trust group, Mr R. L. Prain, has skilfully lobbed the ball into the shareholders' court, by declaring that he will "avoid the trap" of attempting any forecast of the financial results under the new circumstances. The trap that Mr Prain has avoided is that of murmuring the word "recession"; this is perhaps too strong a word for the immediate prospect in the copper belt and "slump" would not turn up in its vocabulary unless the American economy took a tumble.

Copper prices and producers' profits would certainly crumble if such a slump came. But for the present, calculations about the price of copper can be based on less gloomy forebodings than these. Even so, the prospect is evidently bearish. World production so far this year has been running well ahead of consumption.

The chart shows that this margin has not provoked any marked reduction in prices. For this, the Chilean Government has largely to be thanked. Having priced its copper out of the world's market early this summer, it has proved itself to be the best friend of other producers by withholding its supplies. Chilean stocks have been built up until they now amount to more than 120,000 short tons. When all the arguments are over, the greater part of this surplus is likely to be absorbed into the American stockpile; if so, the price

of copper is not likely to be unmercifully hit by the sudden dumping of this surplus. But once the Chilean producers clear this stock off their hands, and resume their normal deliveries of about 30,000 short tons a month, the copper market will be squarely faced with the necessity for adjustment. The prospect of

COPPER PRICE TRENDS

ROAN ANTELOPE REVENUE AND COSTS

the eventual resumption of Chilean deliveries argues the prospect of a fall in copper prices.

What, then, are the lines of defence that the Rhodesian copper producers can hold against a fall in price of this order? They would be fortified by the fact that a fall in copper prices would automatically reduce their heavy burden of mineral royalties (paid to the British South Africa Company on a sliding scale arrangement) and bonuses; these royalties account for a high proportion of production costs—for Mufulira the proportion was 29 per cent in the year to June—while bonuses (together with pension and assurance contributions) account for another 12 per cent. Secondly, some of the companies would be protected by the preference that most consumers have for electrolytic copper over blister copper. The companies most likely to benefit from this are Rhokana, Nchanga and Mufulira, whose refinery, having produced just over 19,000 long tons of electrolytic copper in the last financial year, is now running at its rated capacity of 3,000 long tons a month. The Rhodesian producers are obviously eager to take as much advantage of the command that electrolytic copper enjoys in the market, for Mufulira intends to double its electrolytic refining capacity by 1956, while Mr Prain remarks that “it is probable that Roan Antelope” [which, in the past, has relied on the production of very high grade blister copper] “will have to go over to electrolytic refining in the not too distant future.”

Prices, however, are but one side of the profits equation; and the copper companies must be equally

concerned with costs on the other side. The chart of Roan Antelope's revenue and costs shows that since the war the Rhodesian producers have managed quite easily to carry a persistent increase in costs, because the rise in prices has outpaced the rise in costs. But now prices are threatened and they must clearly try to halt the recent rise in costs. The direct way to keep average costs as low as possible is to produce at or near full capacity. To this end, the Rhodesian copper companies have resumed their practice of selling almost all their output forward, at prices ruling at the actual time of delivery. These arrangements are not fully reflected in the latest quarterly reports of Roan and Mufulira, as the resumption of free dealings in copper has caused a delay while the companies established “pipelines” to consumers.

Plans for full capacity working, however, sometimes go awry, as they did last year, when strikes occurred and when the mines were still short of fuel. These two factors reduced Mufulira's output to just over 76,000 long tons, compared with its estimated capacity production of 90,000 long tons. Ultimately, the shortage of fuel should be solved by improvements at Wankie Colliery and on the Rhodesian railways, and also by the Rhodesian and Belgian Congo hydro-electric schemes; but this is looking some way into the future and the copper mines still depend considerably on wood fuel. Eventually, too, there may be a settlement of labour problems in the copper belt (though Central African Federation is not likely to make this problem any less irksome in the immediate future); meanwhile, the copper companies will have to grapple with further

wage demands and to hold the balance, as best they can, between the interests of African and European mine workers. With these difficulties always before them the Rhodesian copper producers will need luck as well as skill if they are to reduce costs.

The fact that profit margins are likely to be slimmer, coupled with the steady rise in the cost of new capital extensions, has forced the copper companies into second thoughts about their development programmes. Such programmes will be pushed ahead for the producing mines and for those developing mines, such as Bancroft and Chibuluma, where a quick return can be expected. But the Selection Trust group has decided not to go ahead

with the development of Baluba Mine—not abandoning it altogether, for the mine has rich cobalt reserves as well as copper. During the next twenty years, the reserves here and elsewhere in Rhodesia and the Katanga province of the Belgian Congo will be heavily drawn upon to satisfy the steadily mounting demand for copper that seems in prospect throughout the world and more particularly in the United States (which now consumes about half of the world's copper and now produces less than one third).

In the very long term, investors in copper shares can expect an expanding equity. But many of them will feel that the long run matters somewhat less than the size of their next dividend cheque. In the case of the dividends from the Selection Trust group these

cheques will be bigger, for taxes on these dividends will be lower now that the group is domiciled in Rhodesia. It does not follow that every British holder of these shares, by the time he has settled with the tax inspector, will be any better off. Nor does it follow that the copper companies will push their dividend rates up, even though they may—as the Selection Trust expressly intends—reduce reserve appropriations. Copper equities always provide a high yield and it is right that they should. Yet after all proper assessment of the prospects in the short and longer term, investors may perhaps accept the market valuation of these shares, despite their rather scaring high yields, without utter dismay. A lot of trouble is at present discounted in their prices.

Business Notes

The New Savoyards

THE emotional barrage that was laid down by the directors of the Savoy Hotel last week seems to have been directed at the wrong person. It was not, after all, Mr Charles Clore who had manoeuvred himself into a position from which he could launch an attack on their peace of mind; he was merely trying to climb on to the back of a tank that was already being driven towards their lines by Mr Harold Samuel. The interim report on these dealings from Mr J. B. Lindon, QC, the Board of Trade investigator, provides for the public (with admirable despatch and clarity) the first full blow-by-blow commentary on one of these battles of the bids.

The nominal issued share capital of Savoy Hotel Ltd. (which owns the Berkeley and Claridges as well as the Savoy) consists of £250,000 of 7 per cent preference stock and £753,699 of issued ordinary stock; on a poll at a general meeting of the company, each £1 stock (whether preference or ordinary) confers the right to one vote. Up to mid-September the directors and staff seem to have held a larger block of the stock than any other single group—at the end of November their holdings amounted to approximately £18,100 of preference stock and £57,380 of ordinary stock. Between September 17th (the day of the Bank rate reduction) and November 26th, however, Mr Samuel's Land Securities Investment Trust, operating through one of its eighteen subsidiaries, and through two nominees, bought £14,000 of preference stock and no less than £186,500 of ordinary stock—thus obtaining almost 20 per cent of the total votes exercisable upon a poll at general meetings of the company (enough, says Mr Lindon, “materially to influence the policy of the company, if not to control it”). These purchases helped to drive the price of the £1 ordinary

stock up from 27s. 9d. on September 16th to 53s. on November 26th.

The spotlight on the Savoy stage thus swings away from Mr Clore towards Mr Samuel's Land Securities Investment Trust. This is a holding company with eighteen subsidiaries (plus three others in liquidation) whose main business is in West End properties. Its last balance sheet to March 31st, showed freeholds at cost of £3,731,000 and leaseholds at cost (less amounts written off) of £6,983,000; but after deducting current and deferred liabilities and provisions (including £7,796,000 of mortgages), net assets available for the equity amounted to £1,799,000. This is probably an understatement of the true values of these assets, for rents receivable in 1952-53 totalled £1,247,861; after deducting ground rents payable, expenses and tax, £108,408 was earned for the equity last year and £66,825 paid out. At the last balance sheet date, the issued ordinary capital was £275,000, but since then £725,000 has been capitalised from reserves in a 29 for 11 scrip issue. The 10s. ordinary shares currently stand in the market at 47s. 6d.; they have made a net gain of 1s. 9d. in the past week. Despite the probable undervaluation of the assets in the balance sheet, it would require a super-Samuel to do a Samuel on Mr Samuel.

Enter Mr Clore

MR CLORE does not seem to have realised what was happening in these dealings at the Savoy until October 16th, when his Princes Investments Limited came into the market and bought £29,000 of the ordinary stock in the course of two and a-half weeks; only £5,000 of this

was bought through a nominee, the rest being bought in the Princes Investments' own name. On November 10th, the day that the request for a Board of Trade inquiry was filed, Mr Clore may have hesitated; at any rate, Princes Investments sold £2,000 of the stock on that day. But Mr Clore's reaction to the indignant circular issued by the directors last week, which said that he wanted a seat on the board and which presumed that he would follow a policy that the directors considered would bring "ruin to the company," was very different. On the two days immediately following that circular, Princes Investments bought no less than £60,000 of the ordinary shares, thus materially contributing to the rise in the £1 shares from 49s. to 54s. 6d. in this period. By the close of business on November 27th Princes Investments therefore held £97,500 of the ordinary stock and thus controlled over 9 per cent of the total voting power in the company—a sizeable, but by no means a dominant, interest.

It seems evident, in fact, that throughout these transactions Mr Clore has been a junior rival of Mr Samuel, albeit a rival who wanted to become a junior partner. Somewhere around November 10th or 11th (apparently, therefore, just after the company had asked for a Board of Trade inquiry), Mr Clore suggested to the accountant who was acting for Mr Samuel that Princes Investments and Land Securities Investments might collaborate to make a bid for control of the Savoy. Mr Samuel considered this proposition (it had the attraction that it would mean that Mr Samuel's group would not have to find so much cash), but eventually decided against it. It is not usual for an entrenched commander to invite a rival into his lines. The company's response to the publication of the report has been to announce that a statement will be issued to stockholders as soon as possible, and that, "meanwhile, reports suggesting sensational changes should be treated with reserve." The response of Mr Samuel and Mr Clore has provided an equal enigma for the markets. At first their response seemed to be mirrored in the wave of buying that lifted the Savoy's £1 ordinary shares to 61s. 9d. at one time on Tuesday; but on Wednesday the shares fell sharply to close at 55s., after touching 51s. 3d. at one point.

Marginal Note on Sears

MEANWHILE, Mr Clore has an entirely different problem on his hands, in turning to good account his purchase earlier this year of a controlling interest in J. Sears and Company. Before he can revamp Sears's assets, Mr Clore has to surmount the hurdle of redemption of £1,737,324 of a 4 per cent mortgage debenture stock, the holders of which would be in a position to impede his operations. A cumulative sinking fund of 1 per cent per annum is in operation on this stock, and can be operated by purchase at or below 103½ or by drawings at 103½; but there is a subsidiary clause that sinking fund payments can be increased for redemption of the stock at the company's discretion by drawings at 105. The company has announced that it will exercise this discretion to the full, by redeeming the entire debenture stock at 105 on February 1st next; apparently no less expensive avenue to redemption has been opened before it. It is raising the cash for this operation

by the sale of a number of shop properties belonging to its subsidiary, Freeman, Hardy and Willis; the company will lease these properties back from the purchasers, who are presumably a group of insurance companies. It is stated that "the balance of the proceeds of the sales will be used to develop and extend the business and interests of the group"; this does not necessarily mean that there will be no cash repayment on the ordinary shares, but expectations of a repayment may be damped by this phraseology and by the fact that there are still nearly £2,800,000 of high-coupon preference shares in issue (just under £500,000 of 12½ per cent preference shares and £2,300,000 of 7 per cent preference shares). It would not be surprising if Mr Clore wished to see some of these paid off too, which presumably would need more cash. A bidder's lot is not necessarily unhappy, but nor is it always easy.

Rise in Advances

AFTER a continuous fall, amounting to £160 million since April, bank advances rose substantially in the four weeks to November 18th. The latest return from the London clearing banks shows an increase in total advances by £22 million, to £1,676 million. This seems to confirm the assumption that credit demands from the private sector of the economy have been tending to rise again for some time past—but until last month this tendency was masked in the aggregate figures by the heavy repayments that have been made by nationalised industries out of the proceeds of this year's issues of stock. There was, in fact, a further call

on the Gas loan in November, so that the advances of all other borrowers presumably rose by substantially more than the £22 million. But as the greater part of that disclosed increase was concentrated upon only two banks, it is reasonable to presume that some special factors were present. The increase in working capital associated with the rising level of production and the revival of private trade in commodities are perhaps the biggest underlying influences making for increased advances, but their force is probably less than the November figures might seem to imply.

Whilst the demands of the private sector are rising, those of the public sector have lately been contracting, with the result that the month's increase in net deposits, at £38 million, is only moderately larger than in the similar period last year. On the customary basis of estimation, the central Government's demands on the banking system amounted in November to no more than £7 million, in contrast with £46 million in the corresponding (five-week) period of last year. This contrast, however, neatly reverses the one presented by the October figures, which leads to the conclusion that the analyses of both sets of figures were distorted by the disparity of periods this year and last. A clear comparison with last year can be obtained by taking the whole nine-week period from mid-September. In that period the net Exchequer deficit (after allowing for net receipts from small savings and tax reserve certificates) was some £6 million larger this year than in 1952—whilst the Government's borrowings from the banking system were some £15 million larger. The residual discrepancy is, therefore, quite small—possibly less than the Government had to find to finance the department's share in the Gas call last month; but, on the other hand, its outlay on the finance of the balance of payments surplus and the redemption of unconverted Serial Funding stock held in private hands must certainly have been less this year than last.

Windfall for the Reserves?

THE sterling area's gold and dollar reserves increased by \$41 million in November. At first sight, this is unexpectedly heartening news. It is true that receipts of American aid were relatively high last month (at \$24 million), but no less than \$15 million had to be paid to the European Payments Union in part settlement of the sterling area's deficit with Western Europe in October. This

means that the residual surplus, which reflects the sterling area's direct balance with North America together with gold receipts from other non-European countries, was as high as \$32 million in the month. It is true that November is a favourable month for sterling area sales of primary commodities; one indication of this is that the residual surplus (excluding commodity arbitrage transactions) was as high as \$70 million in November, 1952, and another is that the sterling area recovered to a surplus of £3.2 million with Western Europe last month (so that some \$4½ million of gold will be received from EPU next week). But last month's residual surplus of \$32 million sits very hearteningly beside the surplus of \$15 million in October and \$4 million in September; and very oddly beside the fact that American industrial production is continuing to decline and that American purchases of sterling area commodities are not exactly buoyant.

The immediate reaction of the analyst must be to search for some special factor that might be included in this residual surplus.

There is one obvious special factor of this sort. It flew into London Airport in the last week of November in three KLM freighters, laden with over £5½ million (about \$15½ million) of Russian gold. There is, of course, no confirmation in London that all or any of this gold (or dollars received from the re-sale of it) reached the vaults of the Bank of England before the end of November. But it will be surprising if the latest rise in the reserves has not at least some snow on its boots.

Reasons for the Red Gold

THE arrival of this Soviet gold in London confirms that Russia is very short of sterling, and that it is now obliged (and perhaps also more willing) to use its gold reserves to cover temporary deficits in its balance of payments. The consignment, which amounted all told to some 17 tons, valued at rather over £5,500,000, flew into London from Moscow via Prague at the very end of November. The Russians have received payment in sterling through one of the leading bullion brokers in the City; the British purchasers of a consignment of gold of this sort can then resell it either direct to the Bank of England or else on the free market against payment in dollars—in either case, of course, the hard currency benefit accrues to the central reserve. Earlier in November the Russians had made a similar sale of about £7,500,000 of gold through the Amsterdam and Zurich markets.

The deficit in the Russian balance of payments that has led to these sales is due far more to the recent decline in traditional Russian exports than to the more popular and picturesque explanation that there had been a sudden boost in Russian imports of consumer goods as part and parcel of Mr Malenkov's policy of pampering the Russian consumer. Britain's switch from Government to private trading in grain and timber, together with the transition from sellers' to buyers' markets in these basic commodities, has caused Russian exports to Britain to fall sharply—from £47,779,000 in the first nine months of 1952 to £26,458,000 in the corresponding months of 1953. It is true that sterling area exports to Russia have also fallen

this year—mainly because of a sharp drop in re-exports of rubber from Britain. Against this, however, the Russians have recently placed some large orders for British textile machinery; they have also been inquiring after electric generators, tankers and some items that will have to be checked off against the list compiled by the international control over strategic exports to Communist countries. In fact, a cynic might suggest that Russia's sudden emergence as a hard currency paying country may not be altogether unconnected with a desire to put more power behind the foot of the unwise people in Britain who would like to kick against the pricks of this control over strategic exports; it may also, of course, be very cunningly designed to give still more strength to the very different (but probably equally unwise) people in America who are opposed to an increase in the dollar price of gold under any circumstances.

Green Light for DSIR

THIS year the Department of Scientific and Industrial Research has about £5 million to spend; next year it is to have an extra £400,000, and will be able to divert to its general work the £250,000-£500,000 it has been spending in grants to universities for research equipment. During the next five years its expenditure will be allowed to increase gradually, to a budget of £6 million or slightly more by 1959. In addition to this increase in current expenditure, it will be allowed to spend perhaps £8 million upon building and capital equipment. During the last two years its recruitment has been at a standstill, but it is now to be allowed to take on an extra 150 non-industrial and 50 industrial staff each year.

It is not easy to compare this expansion with the postwar plan for DSIR that was approved in 1946 but which became an automatic victim for each two-yearly cut in investment and consequent economy campaign in Whitehall up to 1951. When rises in prices are taken into account, the new green light for DSIR may seem a shade paler than the old; but there has in the meantime been some progress in recruitment of staff, and a little in building. Moreover, the department is not disposed to look this horse in the mouth; it has been conceded much of what it hoped for, including freedom to plan its research—and to budget for it, in broad figures—over five-year periods rather than single years. The gentleman's agreement with the Treasury by which, it appears, this will be arranged denotes a considerable relaxation of that department's attitude, perhaps justifying Sir Ian Heilbron's rejoicing over "a revolution in Government procedure." The department's annual budget, of course, will still have to be formally approved by Parliament; but the fact of five-year budgeting, whatever its form, seems to be clearly conceded. The department will be able to complete its mechanical engineering research station at East Kilbride, its new £2 million ship test tank, and new road research station, and provide extra facilities for hydraulics research and research into water pollution, as well as consolidating its facilities for building research. Some increase in grants to the industrial research associations, too, seems likely. The Government deserves some congratulation upon this belated realisation of national self-interest in technological advance.

Engineering on the Turn?

THE most important question posed by the official statistics published last week, which show industrial production at a record level in September and suggest that it may have been yet higher in October, concerns engineering output. The Chancellor of the Exchequer said a fortnight ago that there had been "a slight fall in engineering output," and his monthly Bulletin for Industry had described it as "lower this year than last, though higher than in 1951." But detailed figures for individual industrial groups—the component indices of the official index of production—could hardly then have been available for later than July or possibly August. In August, and again in September, there was a considerable growth in engineering employment—32,000 extra workers in the two months, plus 18,000 more in the vehicle industries. No doubt this in part reflected an influx of youths leaving school; but it was twice as large a rise in employment during the two months as last year and markedly larger than in 1951 (when the figures were not directly comparable). It seems possible, therefore, that the recovery in orders reported by some firms in some engineering industries, may be growing more general; the continued buoyancy of motor production, of course, has some effects beyond its own industry and the direct suppliers of accessories and components, and there seems to have been a considerable increase in activity in the electronics industry and for certain domestic electrical goods.

OFFICIAL INDEX OF INDUSTRIAL PRODUCTION
(1948=100)

	All Industries			Manufacturing		
	1951	1952	1953	1951	1952	1953
January.....	116	117	118	119	120	119
February.....	122	120	122	125	122	123

December.....	113	112	...	115	113	...

* Provisional. † On the basis of data so far received.

The index of total production continues to offer encouragement; some of the slack in industrial capacity is probably being taken up, even if the products are not going into exports. The provisional figure for September, 125 (1948=100), showing the usual seasonal increase over August, is 6 per cent higher than a year before and more than 3 per cent over that for September, 1951. The forecast index for October, 127-128, would be 5 per cent higher than in October, 1952, and 6 per cent higher than in October, 1951. Comparisons with 1951 for recent months, of course, are reminders that the upward postwar trend of

JOSÉ FROM HAVANA

Soon after they were formed, in 1834, Por Larranaga began sending their Havana cigars to England. José and other descendants of the skilled craftsmen who made those early cigars are now in Jamaica making Larra cigars for Por Larranaga, with the same fine Havana wrapper as their ancestors had used. Thus more than 100 years of experience, tradition and hereditary skill go to create these very fine cigars.

LARRA CIGARS by POR LARRANAGA

YOU'LL FOLLOW THE TRACKS

If The BIG Yellow 'CATS'

Many people on the east coast of England have been astounded at the speed with which Caterpillar earthmovers have helped to rebuild the shattered sea defences. One day—perhaps soon—you'll be travelling the new roads which Caterpillar equipment has helped to build. They'll be fine roads, a credit to Britain; the ultra-powerful, fast-working 'Cats' world-recognised nickname for

world-famous machines) will have done an incomparable job, going a long way towards solving the country's transport problems.

THE NEW **ANGLIA**

'5-star' motoring at lowest cost

Like the NEW PREFECT*, the sturdy NEW ANGLIA has more power in proportion to its weight than any other light car saloon.

Because of this, its top gear performance is better—which means:—

LOWER PETROL CONSUMPTION

LESS ENGINE WEAR

AND LOWER RUNNING COSTS

PRICE **£360** PLUS P.T. £151·2·6

* THE ELEGANT FOUR-DOOR PREFECT SALOON, 'FIVE-STAR' LEADER OF THE LIGHT CAR CLASS. £395 PLUS P.T. £165·14·2

Ford *'5-star' motoring*

industrial production had flattened out by the second half of that year. This trend may now have been resumed; global calculations of productivity, for what they are worth, show a marked rise this year over 1952, and a level now passing that of early 1951, the postwar peak.

New Enterprise in Shipbuilding

MODERN shipbuilding technique requires plenty of room to move about in. In this respect the new shipyard formally opened at Newport, Monmouthshire, last week has a considerable advantage of space over yards in traditional shipbuilding areas. It has also the advantage of starting from scratch, so that the whole production process can be laid out to take the best advantage of the latest technical developments, instead of having to graft these as well as possible on to old wood. The Newport yard of the newly formed Atlantic Shipbuilding Co., Ltd., for example, is probably the first in the world to be designed without either a mould loft for marking out plates (a process that occupies much time and space) or an inclined building berth of the conventional type. Plates will be marked for cutting by the photographic projection method, which is coming into increasing use on the Continent but which British shipbuilders have treated with great conservatism. The prefabricated parts of the ships built at Newport will be assembled in shallow dry docks, thus reducing time spent in the open air, the necessity for working at heights and on an inclined plane, and the complications of launching. Assembled hulls will be floated and towed to Newport Docks for fitting out.

More than space and a good technical plan is needed to ensure success for such a venture. There must be plenty of deep water, adequate supplies of steel and other materials, skilled labour and management, useful subcontracting trades in the area, ready supplies of marine engines and components, finance and what is now called "know how" and used to be called skill—and, not least, potential customers. The Atlantic shipyard is not badly placed in most of these respects. Nature has provided a 40-foot tide at the entrance to the River Usk, sufficient to handle bulk carriers of up to 50,000 tons dw, provided the subsoil will take the weight on the dry docks. So far as labour is concerned, the new yard has a nucleus of skilled men with a fair reserve of ship repairing and other workers in the area who can readily be trained in the new techniques. There are steel and aluminium works in the district, although this does not relieve the nation-wide pressure on steel plate supplies; and there are many subcontracting firms, joiners, plumbers, electricians and manufacturers of equipment and auxiliaries, that already serve an important ship repairing area. The provision of marine engines may, at first, be a problem, but foreign suppliers would be only too glad to provide them if British firms do not. Sufficient finance has been made available at least to put into operation the first stage of development, which will enable ships of up to 8,000 tons dw to be built and steel to be worked at the rate of 100 tons a week; and firm orders have been obtained from Canadian owners for two ships of 3,000 tons dw each, which are now under construction.

The second stage, which it is hoped to complete next

year, will provide a much-needed large dry dock and increase the yard's shipbuilding capacity fivefold, and the company believes that suitable export orders are in the offing. Shipbuilding has entered a phase of intense international competition, which may seem hardly the best time to open a new yard, but new and more economical technical methods, coupled with efficient management and ability to absorb the skill that is the tradition of British shipbuilding, might attract to Britain a further share of the contracts for large ships that are likely to be the bread and butter of most shipyards in the future.

Controlling the Fiduciary Issue

THE Second Reading of the Currency and Bank Notes Bill—which represents the Treasury's second attempt to put on a permanent statutory footing the powers to regulate the note issue that have been exercised for the past fourteen years under emergency legislation—took place on Thursday against the background of an increase in the fiduciary issue by £50 million, to £1,625 million. A December increase of £50 million in the note issue to provide for the upsurge of Christmas spending has been necessary for many years. This year's increase comes slightly earlier than usual, although the seasonal expansion of the active note circulation since mid-October has been only £36 million so far this year compared with £38 million in the corresponding period of last year.

The aim of the new Bill is not to put any difficulties in the way of purely seasonal increases of this kind but to restore to Parliament the right to control long-sustained or permanent increases above a basic level. The normal control of the note issue derives from the Currency and Bank Notes Act of early 1939, which followed the principle of ultimate Parliamentary control laid down in 1928 when the demand for elasticity of the note issue was first conceded. Although the Treasury was empowered under those Acts to sanction requests from the Bank for any variation of the fiduciary note issue (i.e. the portion of the total issue not backed by gold) from its basic statutory level, no increase above that level could be continued for more than two years without the sanction of Parliament. But at the outbreak of war, when it was evident that the fiduciary issue would have to be progressively increased, the Defence (Finance) Regulations gave the Treasury wider powers; orders made under these regulations suspended the two-year limit indefinitely. The whole increase in the fiduciary issue from its prewar basic level of £300 million to its present level of £1,625 million has therefore taken place by Treasury direction without any further Parliamentary authority.

Obviously there is need to restore to Parliament at least its prewar right to keep its finger on the currency pulse, but the Treasury's first effort to do this was engulfed in the press of Parliamentary business. The Bill introduced early last year (and discussed in *The Economist* of February 9, 1952) never proceeded beyond its first reading. Now the Treasury is trying again, with a Bill whose only material difference from last year's is that the basic figure for the fiduciary issue has been stepped up to take account of the intervening rise in the circulation—the figure now

proposed is the level of the issue before Wednesday's increase, namely £1,575 million, whereas last year's was £1,400 million. If and when the Bill passes into law, no increase above £1,575 million may remain outstanding for more than two years unless authorised by statutory instrument—so that the power of extension can be annulled by resolution of either House. Within any such two-year period, however, the Treasury may at the request of the Bank alter the fiduciary issue, upwards or downwards, by directions valid for not more than six months, but renewable similarly. Any such direction will be by Treasury Minute, duly laid before Parliament. Like its predecessor, the new Bill also gives the Bank power to call in and demonetise any denominations of its notes, and thus would fill in a small gap in the present legal powers—which do not extend to demonetisation of £1 and 10s. notes.

Financial Discussions in Spate

THIS is the season of flood in trade and financial discussions between the United Kingdom and foreign countries; most of Britain's remaining bilateral agreements cover the calendar year and therefore fall due to be renewed at the end of this month. One of these is the sterling payments agreement with Japan. The Japanese delegates who arrived in London this week, however, have come to discuss far more than the technical machinery for payments; they will also discuss Japan's chronic shortage of sterling (which has not been cured by such temporary measures as the sterling-dollar swaps arranged earlier in the year), the trend of Japan's balance of payments with the sterling area and the discrimination that continues to be applied against Japanese goods in a number of sterling area countries.

This year's round of discussions with Spain has already taken place in Madrid, and has met with some success. In the past the Spaniards have considered sterling as a hard currency and have used the bulk of their sterling earnings for purchases outside the United Kingdom. Some effort was made in the course of the recent negotiations at Madrid to induce the Spaniards to canalise more of their essential imports (such as mercury, pyrites and iron ore) to Britain, and to seek greater alignment between their purchases from Britain and their direct earnings from exports. Spain has also been asked for more favourable treatment of financial remittances to British nationals and businesses; at present these remittances are in arrears by more than £500,000, but a little effort should make good this leeway.

The present series of discussions with Brazil are concerned with the technical application of the recent agreement, by which Brazil has agreed to make gradual repayment of the arrears of some £63 million that it owes exporters in Britain and to the Exports Credit Guarantee Department. The Brazilians have agreed to deposit their initial down-payment and the subsequent annuities with a bank in London. It now remains for the creditors to decide among themselves how and in what order these sums will be allocated. The claims have been registered and various schemes of allocation are being considered. The main issue at stake is whether payment shall be made to creditors in chronological order, in proportional instalments calculated on their total claims, or by some combination of the two.

Transatlantic Cable in Kind

THE British "contribution in kind" to the transatlantic telephone cable project announced this week will include the services of the telegraph ship *Monarch* to lay the cable, plus the manufacture of two-way repeating equipment for the link between Nova Scotia and Newfoundland, and of "a major part" of the submarine cable to be laid. The transatlantic link, from Oban to Newfoundland, will be about 2,000 miles of double cable and the single cable link onward to Canada will be some 300 miles long. The contract for the cable construction in Britain has not as yet been signed. The British producers of this type of cable include Submarine Cables of Greenwich, the cable company owned jointly by Siemens and the Telegraph Construction and Maintenance Company; this is the largest producer in the world, and has recently tooled up a second factory. The total project is to cost £12½ million, and the British contribution (which will give it 41 per cent ownership of the cable, the USA owning 50 per cent and Canada 9 per cent) will be worth £6,250,000, while the plans call for laying to begin in summer 1955 and to be completed by the end of 1956. The annual value of output of submarine cable in this country since the war has been only about a quarter of a million pounds, so that this order may obviously put considerable pressure on capacity.

The new telephone link will supplement the present radio-telephone link that has been in operation since 1927; it is the first telephone cable, as all existing lines carry telegraph circuits only. The twelve circuits on the radio link are overloaded by current demand for Transatlantic conversation; the new cable link is at present designed to carry 35 telephone circuits, 29 to the United States and six to Canada, plus six telegraph circuits to Canada. The British two-way repeating equipment that will be used on the link between Newfoundland and Nova Scotia would have enabled the service to be operated with a single cable link on the mid-Atlantic section, thus saving perhaps 2,000 miles of cable; but American one-way repeaters with a double link are in fact to be used as these have been tested for service in very deep water, while the British repeaters have not.

Bears of Wheat

TRADING in wheat futures was resumed on the Liverpool grain market this week after a lapse of fourteen years. The prevailing view among the trade that wheat prices will fall further in face of the massive world surplus sent prices down by some £2 10s. a ton below current prices for physical wheat. Argentine wheat, which is the basic grade, was quoted at about 23s. per cental of 100 lb, ex-store for May delivery. This is equivalent to about £25 10s. a ton, c.i.f. United Kingdom, compared with a price of £28 5s. a ton for wheat for early shipment. The futures market may not be a reliable pointer at the moment, however. The volume of business has naturally been extremely small, and it is unlikely to increase substantially until the demand for imported wheat in Britain reaches normal proportions.

portions. Millers are still drawing heavily on the domestic crop and on the stocks of imported wheat remaining with the Ministry of Food at the time of decontrol. May was evidently chosen as the first delivery month in the expectation that the Ministry's stocks will by then have been virtually consumed. The resumption of futures trading in coarse grains in Liverpool is still under consideration. The London market will begin to trade in futures in barley and maize on January 4th, and hopes to follow with wheat futures a few months later.

It may be a considerable time before both markets can exert their prewar influence on world wheat prices and again provide an adequate hedge to traders in this country and Europe, but the effort will be well worth while. There is no effective world price for wheat at the present time. The nearest approximations to such a price seem to be the quotations of the Canadian Wheat Board. Soon after the new International Wheat Agreement came into force in August the board brought its price for wheat sold in the free market below the maximum agreement price, and since then the free price and the agreement price have been the same. The United States government has not subsidised exports of wheat to countries outside the agreement, and is finding it difficult to sell much wheat this season at the higher price in the free market. To increase such exports, and no doubt to rid itself of even a small part of its huge stocks, the US Commodity Credit Corporation recently announced that it would offer for sale in competition with other countries limited quantities of government-owned wheat and flour to countries which are not members of the agreement. Presumably this means that the government will subsidise these exports at a rate similar to the current subsidy of about 48 cents a bushel for agreement wheat. So far no offers of this American wheat appear to have reached the trade in London or Liverpool.

Atomic Chemistry

SIR JOHN COCKCROFT, giving the Dalton Lecture in Manchester last week, threw some light on a little known but potentially very important branch of atomic physics, radiation chemistry. It seems probable that milder versions of the processes that bring about atomic fission might eventually offer usable alternatives to some major operations of the chemical industry. Large quantities—atomically speaking—of radioactive substances of various kinds are produced in atomic piles as fission takes place, constituting a form of radioactive "ash" that has to be removed. These waste products, according to Sir John, are a potential source of high-powered radiation.

Many processes in the organic chemical industry consist of moving the atoms and molecules in a compound into different positions. The fast-moving atomic particles emitted by radioactive substances appear in many cases to be able to do this re-arranging just as efficiently as the traditional tools of heat and pressure. What is not certain is whether they can do so more cheaply. If a great deal of radiation is needed to get results, and the value of the chemical is low, the process is not commercially attractive. One such example that Sir John quoted is the pro-

duction of phenol and diphenyl, both of which can be produced, but expensively, by irradiating a solution of benzene in water. But he went on to say that if, as seemed likely, the process could be developed to produce pharmaceuticals—and presumably other types of fine chemicals too—it might have a commercial future. One most attractive application is the use of radiation to polymerise plastics. Polymerisation is the key process in producing many of the newer plastics; if radiation were to be substituted for the standard high-pressure techniques now used, the face of the chemical industry might be changed in the strictly literal sense of a radical alteration in the size, shape and type of the plant used. Apart from this basic change of method Sir John said that some plastics, notably polythene, could be greatly improved by radiation; polythene immediately acquired a far higher melting point and greater creep resistance, which removed two major handicaps to its more extensive use.

Radiation chemistry is still the physicists' toy, though the potentialities it offers constitute perhaps the main motive for the interest of major American chemical companies in entering upon nuclear power production. The programme of research being started at Birmingham University will probably coalesce the existing haphazard findings into a properly defined technique. Meanwhile the potential importance of such developments to the chemical industry underlines the need to give industry access to this data, and to a great deal more connected with atomic physics, at the earliest possible opportunity.

Standard cuts Prices

PRICE changes in the motor industry are usually timed to coincide with the October motor show, but the Standard Motor Company has waited until now, the period when car sales are most difficult, to announce a reduction of nearly £50 in the home price of its Vanguard model. The list price of the Vanguard saloon comes down from

MEDIUM-POWERED CARS

	List price	List price with tax	Cubic capacity of engine
Rover 75	895	1,269	2,103
" 60	820	1,163	1,997
Humber Hawk	695	985	2,267
Wolseley 6-80	670	950	2,215
Morris 6	595	844	2,215
Austin A.70	596	845	2,199
Wolseley 4-44	595	844	1,250
Standard Vanguard	555	787	2,088
Vauxhall Velox	535	759	2,262
Ford Zephyr	523	755	2,262

£590 to £555, a reduction of £35; with the consequent reduction in purchase tax that has been added, this brings the price of the car down from £837 to £787. The Vanguard now becomes more closely competitive with the Ford Zephyr and the Vauxhall Velox, the two models that have so far dominated the medium-power market.

Prices of a number of cars in this class were reduced

in October; the Austin A.70 and the Rootes Humber Hawk both came down by £43 (after tax), while the big Wolseley was reduced by £71. The Rover company went so far as to introduce a cheaper, 4-cylinder version of its standard 6-cylinder saloon, bringing its price down by £106. But neither Ford—which reduced its prices by 10 per cent last year—nor Vauxhall, both with relatively new models in production, have yet found it necessary to apply this stimulus to their home sales this year.

The cut in the Vanguard price, the company explains, has been made possible by lower material prices, improved production methods and—this in a memorandum to the engineering unions—some reduction in unit profits. About 30 per cent of Vanguard production, at present running at 550 a week, goes to the home market. If this is any indication of the kind of reduction that can be achieved now that controls on the industry's use of materials have been lifted, this section of the car market is likely to become just as competitive as the small car field. The table shows that there is now quite a considerable gap between the closely bunched prices of Ford, Standard and Vauxhall, each producing in quantity cars powered by engines of 2½ litres, and those of their next nearest competitors, despite the price cuts that some of those other companies have already made.

Roads in a Rut

NOTHING more positive than the promise of an official statement upon "the road programme" before Christmas emerged from last week's debate in the Commons upon the need for more adequate road development, though Mr Molson, who on behalf of the Minister of Transport accepted Mr Pargiter's motion, encouraged its

"REAL" EXPENDITURE* ON BRITISH ROADS, 1949-53
(Average 1936-39=100)

	Maintenance and minor improvements	Major improvements and new construction
Average:— 1936-39.....	100	100
1949-50.....	66	25
1950-51.....	62	25
1951-52.....	70	17
1952-53.....	73	16
1953-54.....	69	24

* Adjusted to take into account increased costs of road work.

supporters somewhat by this action and by his soft answers. Most of the familiar but not less telling points about the cost in lives and money of the country's outgrown road system were made—the best of arguments, if supported by not the best of statistics. Mr Molson's departmental figures confirming the decline in real resources devoted to the roads both for maintenance and for major improvements, summed up the sad tale. He confirmed that the department's main emphasis in spending extra money—if it does—would be in tackling "the inadequacy of size and

design of our roads" rather than in increasing admittedly insufficient work on maintenance. In estimating the volume of traffic now using British roads, he said that this had increased by some 23 per cent since 1938, but that the traffic of goods vehicles—"the ones that do the damage"—on trunk and Class I roads was up by 88 per cent and still rising steeply.

But the Parliamentary Secretary's sympathetic reception of the motion was tempered by financial caution. Even to complete work on road improvements begun but interrupted, where capital is tied up to no purpose, would cost £20 million, he estimated; while the comprehensive trunk road plan of 1946, pigeonholed ever since the 1947 fuel crisis, would now cost £160 million for new motor roads alone, or in the first year, with the planned maintenance and improvement of other roads, some £80 million. The current central government expenditure on roads is £33 million a year (plus £46 million from local authorities); Mr Molson warned members not to hope for any ambitious steps toward the large programme at present—and once again dismissed any suggestions that a road programme could be financed by means of loans.

Prunes for Sterling

THE humble prune has followed tobacco as the second of the surplus American commodities to be sold to Britain for sterling under section 550 of the Mutual Security Act. A procurement order for the sale of \$5 million worth of Californian prunes has now been authorised in Washington. Negotiations for the sale of other commodities (including lard, meat, cottonseed oil and possibly butter) seem to be proceeding by fits and prematurely announced starts. It is still an open question whether the restrictive clauses of section 550 on the one hand, and the British Government's views on the other, will permit sales under this scheme to reach their full target of \$65 million; and sales to other European countries are reputed to be meeting similar difficulties. The farm lobby in Congress will no doubt be vexed at the slow fruition of its plan to unload surpluses abroad; and if, as has recently been assumed, the arrangements for use of the sterling payments involved ensure that there is no indirect loss of dollars to Britain, there may also be room for a little vexation in this country at the Government's inclination to look gift commodities so very carefully in the mouth.

Meanwhile, fifteen thousand tons of Californian prunes will be greatly welcomed by the British housewife if deplored by the British schoolboy. The shipment is some 2,000 tons larger than Britain's total imports of prunes this year, and amounts to roughly half a pound of prunes per head. Imports from the United States have been a chronic victim of the dollar shortage, and purchases from other countries have not been to the British housewife's taste.

Judgment on the "Princess Victoria"

IN dismissing the appeal of the British Transport Commission against the findings of the court of inquiry into the loss of the "Princess Victoria" ferry ship in January,

More than 20,000 firms already use T.R. equipment the installation and maintenance of which, on a rental basis, is T.R. Service.

MICROPHONES & LOUDSPEAKERS

FOR INSTANTANEOUS STAFF LOCATION .. IN OFFICE BUILDINGS

THE UNITED
STEEL
COMPANIES LTD

Recruitment and training

The United Steel company employs some 30,000 people in its various undertakings. In such an organisation there are many opportunities for those who have the necessary ability and the willingness to assume positions of responsibility. The provision of sufficient men of the right quality to fill senior positions is of vital importance for the future.

The company has been a pioneer in the development of a training policy for all grades of employee from juveniles to managerial staff. This policy has been extended to embrace a long term plan of staff replacement, which relates future requirements for executive staff to present recruitment, and provides comprehensive training for recruits selected by rigorous standards for their potentialities as future executives.

The company thus offers a career in which character, ability and skill will be rewarded by rapid advancement, and has a staffing policy which should ensure that its future management will be in the hands of men competent by training and quality to fill the positions they hold.

the Northern Ireland High Court slightly modified certain of the original findings but held the Commission guilty of default. It however allowed the appeal of Captain Perry, who was manager of the vessel at the time of the disaster but had only succeeded to the post in January, 1952, holding his failure to obtain personal knowledge of earlier damage to the ferry ship "open to grave criticism" but not amounting to default. The High Court held that the Transport Commission, as owner, was not guilty of default in putting the ship into service with inadequate doors and freeing arrangements, but became so by the end of 1951, by which time it should have appreciated that the ship was vulnerable and its seaworthiness open to question in

certain waters. The Court held the commission in default through failure to discharge its common law duty of taking due care to provide a seaworthy ship, not through any breach of statutory duty.

The Transport Commission has since announced that it will not dispute or seek to limit liability under the Merchant Shipping Acts. It has already arranged to modify four of its vessels that had similar stern door or freeing arrangements to the "Princess Victoria." The Minister of Transport, in the House this week, added that the load line rules that govern the provision of freeing arrangements are to be amended, and that methods of search and rescue at sea are also under review.

Company Notes

BREWERY PROFITS. Since the end of October brewery shares have moved irregularly upwards (the Actuaries' Investment Index shows a net gain of over 6 per cent in November), while other leading industrials have made much smaller net gains. Enthusiasm in the brewery share market bubbled most gaily about two weeks ago in response to a crop of rather unexpected dividend increases. As the accompanying table shows, not all the breweries that have recently reported for the year to September 30th last have put up their dividends; and the increases in profits that most of them have announced have been comparatively slight. Nevertheless the brewers' experience in 1952-53 has been in marked contrast to that in 1951-52, when any brewery that was able to announce that it had avoided a fall in profits could be adjudged to have done relatively well.

In part, last year's recovery was a reflection of the fall in the cost of the brewers' raw materials (particularly in the price of barley), although other costs still seem to be rising. In part, it also reflected a slender increase in sales; but this increase was confined almost entirely to the sale of

bottled beers and to the sale of draught beers in the industrial areas of the United Kingdom (particularly the Midlands and North of England). This contrast between recovery in industrial areas, where production and incomes have been rising, and stagnation or decline in the more commercial south, where incomes have probably been more stable, is emphasised again and again in recent directors' reports. Thus the directors of Mitchells and Butlers report that sales of draught beers in South Wales have gone up, although their total sales of draught beers have gone down. Similarly, Strong and Company, which produces in Romsey and relies on a market in the South of England, is one of the few companies to report a fall in trading profits.

Although the increases in profits and in some dividends have usually been accompanied by a reinforcement of the brewers' cash resources (following declines in investments in stocks which in turn reflect the lower price of barley), it would be rash to assume that the boomlet in brewing shares can be kept bubbling for long. With television keeping people away from the public houses and with more consumer

goods competing for the public's spending money, brewers' profits can probably be kept rising on only one of two conditions: one is if real incomes continue to rise (and the increases in production and incomes in the year to this September are probably exceptional) and the other is if sales of bottled beer can offset the declines in draught. According to the extent of their individual cover for dividends, most brewery shares now offer a yield of between 6½ and 7 per cent; at that level, except for the big suppliers of bottled beer, they may not offer enough.

★

TATE AND LYLE. The stock markets took some time to disentangle the implications of the preliminary statement issued by Tate and Lyle—by far the biggest sugar refiners in this country—for the year to September 26th last. Immediately after its publication the company's £1 ordinary stock units were marked down 2s. to 6os., as a sign of uncritical disappointment with the effective increase of only 1 per cent in the dividend despite an expansion of over 17 per cent in trading profits. The dividend of 16 per cent for 1952-53 is 1 per cent larger than the dividend of 20 per cent in 1951-52, because the latter was paid before the nominal value of the ordinary stock units was written up from 15s. to £1 by a capitalisation of reserves. The increase in trading profits was from £3,920,543 to £4,605,143.

The market's adverse snap judgment has since been reversed, and the stock units have recovered to 63s. 3d. Last year's increase in profits was achieved in a year when sugar was still on the ration. Although the company undoubtedly benefited in 1952-53 from the increase in the domestic sugar ration and from the bigger allocations to manufacturers (particularly after the end of sweet rationing), there should be a significant difference in this industry between a bigger ration and no ration at all. The increase in demand that is confidently expected in 1953-54 will probably come from the manufacturers rather than the housewives, but these demands should be sufficient to lead to another increase in net profits. Net profits in 1952-53, at £1,127,746 (compared with £1,038,684 in 1951-52), covered the preference and ordinary dividends (which together absorbed £656,898) rather

* Ind Coope's financial year ends on August 30th. (a) Interim dividend of 5 per cent on £3,000,000 capital and final dividend of 12 per cent on £3,300,000 capital. (b) Interim dividend of 5 per cent on £3,300,000 capital and final dividend of 12 per cent on £3,960,000 capital. (c) Company's shares not quoted until July, 1952. (d) In addition, shareholders received a free issue of a 5½ per cent loan stock in the ratio of £1 of loan stock for every £1 ordinary share.

less than twice. The company has a progressive dividend record to its credit but the fairly good prospect for another dividend increase for 1953-54 has already been discounted; at the current price of 63s. 3d. —the £1 ordinary stock units yield only 4.8 per cent.

★

PRICES TRUST. Only shareholders in United Drapery Stores (which acquired control of Prices Trust last August) will take a specific interest in the full accounts of that company for the year to June 30th last; but for the rest of the market they serve as a useful indication of how the multiple tailors have been faring since the slump in their trade in 1951-52. At first sight they are a singularly depressing indication; the group's trading profits show a further decline, from £370,391 to £161,879, and its equity dividend has been passed. But the trend may not be quite as bad as these figures suggest. During the year the group made substantial price cuts, and reduced the book value of its stock in trade from £4,335,327 to £2,774,444; there was a substantial element of marking down in this reduction, and it largely accounted for the fall in profits. The new chairman of the group, Mr Joseph Collier, believes that these stocks are now "more in line with the normal requirements of the business," and the reduction in the burden of stock finance has enabled the company to wipe out a bank overdraft of £735,267. Moreover, Mr Collier reports that since the end of the financial year in June "there has been an improvement both in sales and profits."

While the group was dragging itself back to health, it also took the wise step of setting an up-to-date valuation on its

freehold and on some of its leasehold properties (though not including leases expiring within the next fifty years). This new valuation gave rise to a net surplus of £3,045,600, which appears as a capital reserve in the consolidated balance sheet; the result is that shareholders in United Drapery Stores can now make a more reasonable assessment of the fairly impressive net worth of their equity in that company. At the moment United Drapery Stores's 5s. ordinary stock units (on the

basis of the latest final dividend of 2½ per cent and the latest interim of 1½ per cent stand at 34s. 4½d., to yield just over 6½ per cent. This yield reflects satisfaction with the recently announced increase in the group's half yearly profits but caution about what the proposed reorganisation of the business of Prices Trust may bring forth. It is a moot point whether it also reflects the danger that next year may see less buoyant clothing sales than in 1953—but then that is a criticism of the prices of clothing and textile shares in general.

THE ECONOMIST, DECEMBER 5, 1953

LONDON STOCK EXCHANGE

Next Account begins: December 9th.
Next Contango Day: December 9th.
Next Settlement Day: December 15th.

AFTER remaining quietly firm before the week-end, the stock markets had a patchy appearance this week; in general, price movements were small but irregular as investors awaited the outcome of Wednesday's 24-hour strike in the engineering industry. Gilt-edged stocks showed few net changes; on Wednesday itself they regained most of the very slight losses reported earlier in the week. Dominion and Colonial Government stocks were also little changed, although the new Australian loan gradually improved until on Wednesday it was quoted for the first time at par. There was little activity in the foreign market, where Japanese and German stocks tended to give way a little through lack of support. The Havana Railway stocks were marked up when it was known that the Cuban government's payment for the purchase of its assets had at last reached London.

In a listless industrial market, prices were inclined to give way at the beginning of the week, but they turned slightly firmer on Wednesday; in the week to Wednesday's close the *Financial Times* ordinary share index lost one tenth of a point to 128.0. The shares of Savoy Hotel were, of course, an exception; they moved very violently—but also very erratically—both before and after the publication of the interim report on the Board of Trade enquiry. Elsewhere, investors were concentrating on companies where dividend increases were expected in the near future. Hawker Siddeley shares were among those marked up for this reason; so were Shell shares in an oil market that was otherwise no more than steady.

Tea shares were in good demand and were marked up throughout almost the whole list; but rubber shares, which had been improving for some time, were marked down on the fall in the price of the commodity. Kaffir shares, which were the brightest feature of the market the week before, also dropped out of favour again and slight losses were scattered throughout the market.

(*) The index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (†) Surveys made twice a year; annual figures relate to October survey. (‡) Figures up to July, 1953, relate to delivery prices and subsequently to ex-warehouse prices of H.C. electrolytic copper.

* In consequence of official purchases of tender bills in connection with cash subscriptions to the new Exchequer stock, it is impossible to calculate the division between tap and tender bills until all the bills purchased have passed their original maturity date.

THE MONEY MARKET

LOMBARD STREET has had another comfortable week. On Thursday before the weekend credit supplies were only just adequate for demands, and on Monday small official help was needed by a few houses; but on the four other days of the week covered by the latest Bank return credit was so plentiful that the authorities sold bills to mop up surplus funds.

The market maintained its bid at £99 9s. 6d. per cent for the seventh week in succession at the Treasury bill tender on November 27th; but as total applications fell by £6 million (to £368.4 million) for an offer that had been stepped up by £10 million (to £240 million) the market's allotment rose from 43 to 50 per cent of its bid. The average rate of discount rose by ½d. to £2 1s. 11.45d. per cent. At yesterday's tender the offer was raised by another £10 million, to £250 million.

The Bank return shows an outflow of £16.7 million of notes; as the fiduciary issue has been raised by £50 million to £1,625 million, the reserve in the banking department now stands at £58.8 million. Early Christmas shopping seems to have been at about the same level as a year ago—the rise in the active circulation since the seasonal low point in mid-October has been £36 million, compared with a rise of £38 million in the equivalent weeks of 1952—but the total active circulation, at £1,566½ million, is £85 million higher than a year ago. Government securities held in the banking department fell by only £23.1 million despite the transfer of £50 million of securities to the issue department, and bankers' deposits rose by £1.4 million despite the note efflux.

COMPANY MEETINGS

THE WALL PAPER MANUFACTURERS, LIMITED

WALLPAPER PROFIT MARGIN

IMPORTANCE OF SUBSIDIARIES' CONTRIBUTION

NECESSITY FOR INDUSTRY TO LINK REWARD WITH EFFORT

MR ALFRED WHITTLE ON TAXATION OUTLOOK

The fifty-fourth annual general meeting of The Wall Paper Manufacturers, Limited, was held on November 25th at the Midland Hotel, Manchester.

Mr Alfred Whittle, FCA, Chairman of the Company, who presided, said:

Ladies and gentlemen,—You may recall that a year ago I drew special attention to the difficult trading conditions we had experienced in our wallpaper mills and that during the year to June, 1952, wallpaper manufacture had proved unprofitable. I am glad to say that during the financial year under review the mills as a whole have operated profitably although the profit margin has been extremely low. One important factor contributing to the profitable trading has been the savings in production costs by the closing of three mills which I reported last year. The remaining mills operated more economically by sharing the production previously carried on by the closed branches.

I now refer to the printed accounts and will deal with the salient features of the consolidated accounts which reflect the position of the Group as at June 30th last.

recommend 5 per cent on the Ordinary Stock (making 10 per cent for the year) and 10 per cent on the Deferred Stock (making 15 per cent for the year). If you approve these recommendations there will be an amount of £632,072 to be carried forward to next year, a decrease of £54,143 on the amount brought in.

CONSOLIDATED BALANCE SHEET

Fixed assets at a book value of £5,291,487 are very considerably below today's values. During the year £494,000 has been added, representing capital expenditure on buildings and plant, and a deduction of £397,000 has been made for depreciation, the net increase on capital account, therefore, being almost £100,000. The next item, £60,642, represents an investment made by the Sanderson Company for all the share capital of a well-established wholesale furnishing fabrics company in Canada.

Current assets stand at £15,651,392. Included in this figure is stock in trade valued at £5,549,787, which takes care of known falls in inventory values at June last. Sundry debtors at £3,050,967 and investments totalling £5,002,734 are substantially the same as the previous year. As regards the investments, 89 per cent are in British Government and Colonial securities, Public boards and corporation stocks purchased at or below par value, all of which have fixed dates of redemption. Almost all of the remaining investments are in British banks and insurance companies. Cash at bankers, £2,047,904, is over £1,500,000 higher than at June, 1952, and, on the other side of the balance sheet the amount owing to bankers is £121,518, a decrease of £982,926, which means an improvement in the cash position of £2,503,282. At this stage it would be as well to mention that the Group's current assets at June last—namely £15,651,392—exceed current liabilities and provisions by £10,618,115.

General reserve now stands at £2,328,717, and renewal and development reserve at £1,185,000, both having been increased by the appropriations out of this year's profit by the Parent Company and subsidiary companies. Your directors do not consider it necessary to increase the existing reserve of £400,000 on investments nor to make any further reserve for stock depreciation.

With regard to the general reserve in the Group balance sheet at £2,328,717, the proportion applicable to the Parent Company is £1,800,000, and I shall towards the end of this meeting ask you to authorise a transfer from the Parent Company's reserve of an amount of £1,125,327, and to apply this sum to the Deferred Share capital account for the purpose of issuing bonus shares to the Deferred stockholders.

Reverting now to the reserves of the Group, you will observe that apart from the specific reserves already mentioned there is an amount of £2,235,098 representing the unappropriated profits of the Parent Company and its subsidiaries, and a further amount of £1,520,334, the reserve for future tax-

tion. All these reserves and unappropriated profits amount to £8,879,892, an increase of over £1 million as compared with June, 1952.

Current liabilities and provisions at a figure of £5,033,277 are lower by £1,663,901, mainly due to decreases in the amount owing to bankers and the liability for current taxation.

I think I have given you sufficient information on the accounts, and will now review other aspects in connection with the Group.

BONUS ISSUE

As already mentioned, an issue to the equity stockholders of 1,125,327 Deferred shares of £1 each to be converted into Deferred Stock is to be proposed at this meeting and, if approved, letters of allotment will be posted on November 30th next. This proposal has the unanimous support of your directors and I commend it to the meeting for approval, as it will bring the share capital of the Company more into line with the capital employed in the business and future dividends on the increased capital will reflect a truer yield on total capital than at present. The authorised capital of the Company requires to be increased to provide for the bonus issue and the opportunity is being taken of increasing the capital to £7,500,000 of which £6,470,629 will be issued and £1,029,371 unissued.

IMPROVED SERVICES TO TRADE AND CONSUMER

The daily problems that arise in the manufacturing of and trading in wallpaper compared with those of the Company's other interests continue to make the major demands on the time and energies of your directors. Last year wallpaper manufacture made no money; the loss has this year been turned into a modest profit. While it is a comfort to your directors that the Company's oldest activity is again able to make a contribution to the year's all over favourable result, it would be wrong to assume that the underlying postwar difficulties have eased. The twin evils faced by our wallpaper mills, the excessive cost of paper and the purchase tax, still remain. There can be no permanent improvement until paper prices are very much lower and purchase tax removed. The improvement last year is due entirely to the closing of three of the 12 wallpaper plants and to concentrating the diminished production on the remaining nine. In fact, the profit earned was from even lower wallpaper sales than in the previous year. To accentuate our difficulties the sales were spread unevenly over the year, with the result that our plants were under-employed for many months until a rush of orders came in the late spring. This pattern of trading makes for uneconomic costs. The Company has always, in working out its trading policy with the distributors, tried to even out the flow of orders, not an easy matter in an industry which is both seasonal and swayed by fashion. Your direc-

itors are giving thought to the possibility of levelling out some of the trading fluctuations by spreading out the work on the preparation of the various new collections—in prewar days our new collections issued annually by each mill served all sections of the home trade and all export markets. Now the home market requires much more attention as between the retail shop trade and the decorators' trade. Export trade is more exacting, and special collections are required for some individual markets.

New collections have recently been issued to both sections of the home trade and to a number of export markets. They have had a favourable reception, and orders received so far have been encouraging in that if the flow of orders continues at the same rate we may hope to equal the best of the postwar years—1949-50. This will, however, still leave much headway to make to reach the prewar volume of trade.

During the year a permanent wallpaper Style and Exhibition Centre has been opened at King's House, Manchester, the Company's head office. There the public can see displayed the decorative materials produced by the group: Wallpaper, paints and furnishing fabrics. The Centre is visited every day by people eager to see the latest trends in decoration and to take advantage of the advisory service available at the Centre.

Crown Wallpaper exhibitions have been held in many towns and all have attracted much attention. The standard of display in the retail shops continues to improve and to reflect the public demand for wallpaper of higher quality.

SUBSIDIARIES AT HOME AND ABROAD

As you may remember from reading your directors' report, certain manufacturing subsidiary companies have sustained a trading loss during the past year. The Straw Pulp Manufacturing Company is one and we are taking steps to put this right. The chief reason for its loss has been the fall in the price of wood pulp, which compelled us to reduce our straw pulp prices below an economic level. We have, since the inception of this company, had valuable assistance by its supply of straw pulp to our paper mills when there were shortages of wood pulp, and it would be difficult to assess the real value your Parent Company gained by having additional paper from the pulp supplied by this subsidiary company. In addition, during that period the Straw Pulp Manufacturing Company itself made good profits. The company still remains a valuable unit and we shall do all we can to help it along. Another subsidiary company which has not earned a profit is Micafine, Limited. This company has made substantial progress in sales both at home and abroad, and is at present fully extended in production. There have been the usual teething troubles expected with new processes, but I am glad to say the powdered mica is of very high quality and in steady demand. The Hollins Brush Company had a very lean time during the first half of the year, but since then and up to the present time the company is extremely busy with a full order book. The loss during the financial year was due to the fall in demand for brushes during the first half of the year and to the writing down of stocks of raw materials.

Turning now to the brighter side of trading by our home subsidiaries, our paper producers, Darwen Paper Mill Company, Limited, and Hollins Mill, have earned excellent profits, although the volume of trade was slightly lower than that of the previous year. James Ferguson and Sons, Limited, manufacturers of "Nestorite" plastics and ebonite, also show a good result in spite of a difficult year. The Sanderson group, distributors of wallpaper, paint, etc., and manufacturers and distributors of the world-famous

Sanderson Fabrics, have made excellent progress. During the year, as already stated, this company purchased a business in Canada with a wide distribution of furnishings. The Parent Company's other distributing units, both wholesale and retail, have also had a very successful year with higher profits and an increasing volume in sales of the products manufactured by the Group.

WALPAMUR

I would now like to say a few words about The Walpamur Company, which is one of the largest paint manufacturers in the country. Although the paint trade has been very difficult during the past year The Walpamur Company has had a very successful year, and has succeeded in improving its sales and its profits. In spite of opposition being offered by competitive materials, Walpamur water paint has retained its pre-eminent position, no doubt due to its consistently high quality and dependability. It has also been gratifying to see our trade in Duradio enamel paint and Walpamur Glossy Finish show so satisfactory an increase. Progress is also being made by Novax, which is a synthetic enamel paint proved outstanding for exterior use, while in the field of emulsion paint Peveril is rapidly gaining a first-class name. In the retail trade we have Marvo oil bound washable distemper, Trojox enamel paint, and Marvosheen emulsion paint. During the year The Walpamur Company acquired a paint factory at Port Elizabeth, in South Africa, and I am confident that through it we shall be able to satisfy the demand for Walpamur products in that Dominion.

I now come to our subsidiary companies in Canada. I am sorry to say that, as foreshadowed last year, the Canadian Wallpaper Manufacturers, Limited, has had an unsatisfactory year and has indeed traded at a loss. During the year we closed down the oldest manufacturing mill and with its output absorbed by our other more modern mills we are hoping to see an improvement, though I would not like you to assume from what I have said that we expect any very noticeable improvement during the current year. The present position is that sales so far are lower than those of last year for the same period. As stated in the directors' report, the Dominion Colour Corporation is making progress in both sales and profit. The Crown Diamond Paint Company, Limited, has had a satisfactory year and our very modern manufacturing unit at Montreal, which compares favourably with the most up-to-date plants, is proving a profitable investment.

RAW MATERIALS AND PLANNING

In recent years one of the most worrying responsibilities your company has had to face has been the buying of raw materials and the fixing of the level at which stocks of raw materials and semi-manufactured and finished goods should be kept. The instability over even short period of time of raw material prices and the quick changes in the supply position from scarcity to adequacy make the long-term planning of production very difficult. Miscalculations can have the most serious effects by either holding up production or throwing up big losses due, not to trading, but to a drop in raw material prices. The variations in the volume of stocks held by businesses as a whole is becoming recognised as a disturbing factor of some importance, meriting study by those interested in business economics.

GROUP'S BIG EXPORT TRADE

Your Company has roots in the export markets going back in some cases over a century. The total export trade runs into a

very substantial figure, cretonnes and wallpaper in roughly equal shares taking first place followed by paints, plastic moulding powders and powdered mica and brushes.

LABOUR CONSIDERATIONS

An increase in wage rates took place in the wallpaper mills during the year. We are now, within ten months, faced with an application for another advance. This annual pressure for wage revisions has become a feature of the industry in postwar days. Placed as we are between persistently high raw material costs and the refusal or inability of the public to pay inflated prices for wallpaper, the raising of wages unaccompanied by a corresponding increase in output can only lead to an increase in manufacturing expenses, and then to a restriction in demand. The wallpaper industry is not one in which production bonus schemes can be easily operated, at least in some departments, because quality and consistency of production are so important. Nevertheless, the very slender margins between costs and selling prices will force us and the interested unions to consider new forms of wage payments and the spread of working hours, which, when adopted, will give the increased output needed before higher wages and lower selling prices can come.

There is, in my mind, no doubt that the key to a higher standard of living lies in the securing of greater output induced by newly thought out wage systems in conjunction possibly with an extended working week for the plant. Although the wage system in operation in our industry is not as much out of tune with current times and conditions as the wage systems in some of the country's industries, it is realised that nevertheless our task is, as is indeed the national task of industry, to link reward with effort. The aim is simple, but goes to the root of much of our social uneasiness; we want a wage system sensitive to and reflecting productivity in the industry. There are forces distorting the wage structure—the shortage of supply of young people, particularly boys, due to the combined effect of the school-leaving age and the call of National Service; the too narrow gap between the wage of the unskilled and of the craftsman; the working out of the place in industry of married women, especially the part-time worker, and now, as was inevitably expected, settling the problem of retaining elderly workers, sensibly recognised as national necessity, without the injury which would be caused to production by younger men feeling themselves robbed of promotion and financial advancement.

All your directors take a strong and personal interest in labour matters and are contributing to the thought and work which is being put into this important side of the business.

TAXATION AND CAPITAL DEVELOPMENT

In my reviews of recent years I have stressed the grave concern that has been felt by industry through the continued high level of taxation and I, therefore, welcome the abolition of the Excess Profits Levy, which has been most unfair in its incidence. Another very welcome move has been the small reduction in the standard rate of income tax and the reintroduction of initial allowances, which will bring immediate relief to that progressive sector of industry which is constantly spending large sums on extensions and capital equipment. I hope the downward trend in taxation will continue, as it must if industry is to maintain and replace its capital equipment, speed progress and increase productivity out of its own savings and those of investors who are willing to risk their savings in British industry. Lower taxation, resulting in increased savings, will give the capital that is needed to modernise

our industries to meet the competition from other countries, many of whose industries are, comparatively speaking, of recent foundation. The policy of the Chancellor of the Exchequer in giving some relief to industry and to the community is encouraging. We must respond to his policy and prove that he is on the right road in creating greater freedom and incentive for everybody. I am confident that British industry will react to lower taxation by applying the savings from taxation relief to the expansion and improvement of plant which will increase the avenues of employment. We realise that the battle for sound currency—for a pound sterling that the whole world will look up to—must inevitably be a long one. We can, therefore, only hope for gradual easing of the weight of taxation. What we most of all need is the feeling that we shall not, as so often happened between 1945 and 1951, suddenly slip right back again through prematurely relaxing our fiscal efforts.

The acceptance, however, by industry of the prospect of taxation relief coming in small doses should not muzzle businessmen in their criticism of bad taxes. Income tax in itself is a good tax moulded and fashioned over nearly a hundred years to the needs of the state and to the capacities of businesses and individuals. What we object to is the high rate of the tax caused by Government expenditure. The Excess Profits Levy and the purchase tax are, on the other hand, very bad taxes; the former has gone and the latter should disappear as quickly as possible.

HANDICAP OF PURCHASE TAX

You will scarcely need me to remind you of the effect purchase tax has had in handicapping the sale of wallpaper and at times we have indeed been led to wonder whether its effects were not likely to cause a permanent reduction in the sales of that article. There are four bad features about this tax. First, the continuance of the tax after its original purpose has disappeared; second, the fact that it falls with discrimination on a limited range of goods; third, the rate of tax is so high that the artificial values caused by it bear no relation to the economics of the industries concerned; fourth, each downward change in the rate of tax leaves traders holding tax-loaded stocks with a loss.

Hard-won economies in manufacture may reduce the cost of a piece of wallpaper by a farthing or a halfpenny. How futile such efforts must seem when the tax ranges from threepence to two shillings or more a piece.

The indifference of the Department to the position of retailers who, on a reduction in the rate of tax, lose an amount which could make serious inroads into their profits, is indefensible.

I realise that the Chancellor of the Exchequer has to face the hard fact that the annual yield is £260 million and with the nation's finances in their present state it is not unfair to assume that were purchase tax to be abolished that sum would have to be raised by other means. Alternatives are a sales tax or the levying of the present tax over a wider range of goods, but I am inclined to think that of recent months public opinion has come round to favour a gradual reduction in the rates of purchase tax over the present range of commodities until the day arrives when it can be abolished altogether.

FUTURE OUTLOOK

There has been a very definite improvement in the country's economic climate during the last months, and the credit for that must largely go to the Chancellor of the Exchequer. For years we have had to become accustomed to budgets which have

imposed an ever-growing weight of taxation on businesses and on individuals with a resulting continual and cumulative crippling of enterprise and initiative. The spirit behind the last budget and the re-emergence of the Bank Rate to play its time-honoured part were particularly welcomed. Another matter that has given us great encouragement has been the acceptance by the Government of the principle that if our export trade is to be maintained and indeed to be developed regard must be paid to the country's industries as a whole.

The improvement in our national affairs promises much healthier trading conditions. The outlook is hopeful even if tempered with occasional fear about our probable dependence upon the state of trade in the USA. As a nation we are rebuilding our financial reserves and with them our economic reputation. While keeping a wary but friendly eye on the USA might we not remember the immense trading nucleus that we have in the Commonwealth? It is in this wider context that eventually we shall, I hope, find the solution of the problem, first of economic survival and then of growth that at times has seemed almost insoluble.

STAFF AND EMPLOYEES

Before I conclude I am sure you would like me to express on your behalf and on behalf of the Board our appreciation of the loyalty and excellent service given during the past year by all the directors and officials of our many subsidiary companies and all our executive officers, staffs, and employees throughout the Group.

The resolutions confirming the Bonus Issue were approved.

The report and accounts were adopted.

W. & J. LAWLEY

The fourteenth annual general meeting of W. & J. Lawley, Limited, was held on December 2nd in Birmingham.

Mr H. J. Gaunt, in the absence of Mr J. W. Gaunt, Senior, presided, and in the course of his speech said:

The net profit for the year before taxation amounts to £60,380, as compared with £62,674 in the previous year. This satisfactory result has been achieved in a year of very uneven trading conditions. During the first half of the year our facilities were fully occupied with an increased turnover, but in the spring of this year we experienced a sharp recession which was not generally expected, but which was common throughout the trade. For some months our foundries and factory were working only four days a week, though I am happy to say that we are now back on full time. At present we are having to meet extremely competitive prices and are having difficulty in holding our profit margins.

From our year's profits the Inland Revenue are taking in taxation £35,200, which includes an amount for Excess Profits Levy. I must again emphasise the heavy burden of taxation being borne by industry. This year the slice of our profits being taken from us is no less than 58 per cent. The net profits, after taxation, amount to £25,180, out of which your directors again recommend a dividend of 40 per cent, less income tax, leaving £14,180 to be ploughed back into the business.

Looking to the immediate future, we anticipate that trading conditions will be far more difficult than in the years immediately following the war, but I feel that we can face future difficulties with quiet confidence.

The report was adopted.

SOUTH WESTERN INDUSTRIAL CORPORATION

SATISFACTORY RESULTS IN A DIFFICULT YEAR

The nineteenth annual general meeting of South Western Industrial Corporation, Limited, was held on December 2nd in London, Sir William Palmer, KBE, CB (the chairman), presiding. The following is an extract from his circulated statement:

The profit of the group, before charging taxation, amounted to £347,303, as compared with £405,845 for the previous year. Taxation absorbs £169,005 and the profit for the year, after providing for taxation, is, therefore, £178,298 as compared with £162,210 for the previous year. These results, which the directors consider satisfactory, having regard to the trade recession which existed during the first few months of the year, have enabled them, after making certain appropriations and provisions, to provide the preference stock dividend for the year and ordinary share dividends, totalling 12½ per cent, and to carry forward £51,262, a figure slightly in excess of that brought forward from 1952.

The companies in the Pottery group which produce ware of the most competitive type have been producing to capacity during the year and at this date have order books which necessitate delivery quotations twelve months ahead. Their profits for the year have been satisfactory and reflect the wisdom of the mass production policy to which the group has devoted special attention.

The metal group as a whole increased its turnover during the year and profit margins, whilst they have been reduced, were not unsatisfactory from the point of view of reasonable earnings on sales. The outlook is generally brighter than it was a year ago.

TRADING CONDITIONS

The recession in trade to which I referred at the last meeting was still operating during the early months of the year under review, but we shared in the improvement that subsequently occurred in most consumer goods industries. This is shown by the fact that the volume of trading over the year was some 4 per cent higher than that of the previous year.

I referred last year to our anxiety about the cash position of the group in view of the heavy liabilities that we had to face. After spending £50,000 on the acquisition of London Aluminium Company, Limited, shares and some £73,000 on the improvement and expansion of our buildings and plant, not only have creditors and accruing expenses been reduced, but, in addition, we have been able to make a reduction in the bank overdraft. I therefore claim that we have made some progress during the year on the task before us, and am glad to say that further progress has been made in the same direction since then. We accordingly face the future with less anxiety than we did a year ago.

Shareholders will appreciate that this does not mean that we are yet entirely satisfied with the organisation and financial position of the group.

Addressing the meeting, the chairman said: Application is being made to the Capital Issues Committee for permission to proceed with a division of the Corporation into Pottery and Metal groups. It is hoped that proposals can be presented to shareholders early in the New Year.

The report was adopted.

SERCK RADIATORS, LIMITED

VERY SATISFACTORY RESULT

The thirty-fourth annual general meeting of Serck Radiators, Limited, was held on November 27th at Birmingham, Mr W. H. Newton, MA, FCA, the chairman, presiding.

The following is an extract from his circulated statement for the period ended August 1, 1953:

The very satisfactory result of trading for the past year is due to increased turnover consequent upon the full enjoyment during the year by the engineering department of the manufacturing space set free by the transfer of the tube department to Bertha Road. The improvement over the previous year is somewhat increased by the non-current costs of reorganisation which were charged in the 1952 accounts.

The tube mill is working well and fulfilling the main purpose for its erection, by ensuring a regular flow of high quality tubes to the engineering department. Notwithstanding a falling off during part of the year of outside orders, in line with the general setback in the non-ferrous trade, the mill has produced a satisfactory profit and is unquestionably a valuable addition to the organisation.

SERVICE BRANCHES

For the first time for many years the aggregate profit of our branches shows a small decrease compared with the results arising from the abnormal conditions of immediate postwar years during which we were employed in overtaking arrears of maintenance of the many old vehicles on the road. The results obtained are still very good and make a handsome contribution towards our total profit for the year. During the year we have erected a new factory at Exeter, where we were not previously represented.

The notable feature in our balance sheet is a considerable improvement in the liquid position. The reduction of over £190,000 in stock is partly the result of lower prices of raw materials, but also reflects the greater flexibility in buying owing to the freer market. The increase in debtors is a natural corollary of increased turnover. The result of these movements, coupled with the effect of the satisfactory profit, has resulted in the elimination of the acceptance credits for £100,000 and bank overdraft £61,000, and in place thereof we had on August 1st a bank balance of £62,000 and Tax Reserve Certificates for £100,000.

LARGER DISTRIBUTION

My board are pleased to be able to recommend the payment of a final dividend of 6d. per unit, the same rate as last year, but payable on the larger capital of £750,000 as increased by the recent capitalisation of reserves. I know that this quite appreciable increase in our total distribution for the year will be acceptable.

The outlook for the immediate future is encouraging; while in various directions competition becomes keener and demands shift from time to time, nevertheless with an alert management we seem to be able to replace a falling off in one particular type of product, by orders for another, and I see no reason why that happy state of affairs should not continue. We are competitive and the quality of our workmanship is of a high standard. As, therefore, we manufacture a wide range of products required in a great number of important industrial activities, we can look forward to the future with every confidence. The report was adopted.

SMITH'S STAMPING WORKS (COVENTRY), LIMITED

LARGER PROFITS

The fifty-eighth annual general meeting of Smith's Stamping Works (Coventry), Limited, was held on November 30th at Birmingham, Mr J. F. Byrne, chairman, presiding.

The following is his circulated statement for the year to August 1, 1953:

The annual accounts of your company and its subsidiary—Smith Clayton Forge, Limited—have now been consolidated and are presented in that form. Marginal figures for the previous financial period have also been consolidated for the purpose of making ready comparison.

The profits for the year before taxation amount to £244,697 compared with £215,817, an increase of £28,880. Taxation, including excess profits levy which amounts to £35,100 as against £16,600, absorbs £174,912 and after adding the over-provision for income tax at 6d in the £, the net profit is £74,087 compared with £87,198, a reduction of £13,111. For the year ended August 5, 1952, the charge for income tax was reduced by tax on initial allowances to the extent of £23,742. The corresponding relief this year is £3,987. Initial allowances were ended in April, 1952, but have been reintroduced as from April, 1953, and will apply to the heavy capital expenditure now being incurred by both companies.

The foregoing figures further clarify the figures which are shown in the printed accounts and particularly the extent to which taxation affects profits. A dividend of 15 per cent, less income tax, is recommended on the £250,000 of ordinary stock as against a dividend of 12½ per cent and a bonus of 2½ per cent paid last year. This leaves £50,303 to add to reserves and unappropriated profits.

The outstanding feature in trading during the period under review has been the complete reversal in conditions from a sellers' to a buyers' market, consequently competition for available business is much keener.

INCREASE OF PRODUCTIVE CAPACITY

I have previously pointed out that your directors foresaw this possibility and in my statement to stockholders at the last annual general meeting you were informed that steps were being taken to maintain and bring up to date, and, wherever necessary, to increase our productive capacity. During the year additional capital expenditure incurred amounts to £182,622 and there are still outstanding commitments, as shown in the accounts, amounting to £212,000. Partly to defray the cost of this expenditure on new plant and buildings, the capital of the company has been increased by £250,000, of which £150,000 has been issued to stockholders.

Your company and its subsidiary are well qualified to meet the severe competition which now exists in our industry and expect to maintain the present expanding production. It may interest stockholders to know that we continue to supply a high proportion of the most highly stressed parts for all makes of British jet engines.

During the period steel supplies have improved and we are now in a position to meet the requirements of our customers, but there is still a good deal to be desired from the steel manufacturers before prewar conditions of service are restored.

It is with great pleasure that I again record the wholehearted support which has been afforded the management of the parent and subsidiary company by the members of the

THE ECONOMIST, DECEMBER 5, 1953

respective staffs and employees. I also desire to express my personal appreciation for the loyal and valuable co-operation of my fellow directors in conducting the affairs of the company.

The report and accounts were adopted.

R. G. SHAW AND COMPANY, LIMITED

The twelfth annual general meeting of this company was held on November 30th, in London, Mr J. L. Milne, chairman and managing director, presiding.

The following is an extract from his statement for the year to June 30, 1953.

We experienced a drop in gross profits, cushioned by a lower current charge for income and profits taxes and the recovery of excess profits levy.

The fall in commodity prices in the countries of the East—in some cases very severe—reduced their buying power and our exports to these countries suffered accordingly; further, lower commodity prices had an adverse effect on our earnings in other directions. However, taking a broad view of our position, we felt justified in paying a dividend of 12½ per cent against 10 per cent last year, but I would not like you to assume that we look forward to any improvement in business during the current year.

Last year the tea plantation industry was in a bad way, but now conditions are much brighter, following a welcome increase in the prices realised for medium and common teas. While current prices allow most tea companies to make a reasonable profit, it will take two or three good years to enable many of them to replace funds depleted following recent losses and meagre profits.

A year ago it was not easy for Rubber Plantation companies to make ends meet at the prevailing price level. Since then their difficulties have increased as the price of the commodity has continued to fall to a greater extent than it has been possible to reduce costs. The report was adopted.

ABERFOYLE PLANTATIONS

DIVIDEND 5 PER CENT

The nineteenth annual general meeting of Aberfoyle Plantations, Limited, was held on November 26th in London, Mr P. J. Burgess (the chairman) presiding.

The following is an extract from his circulated statement:

Aberfoyle in the past year has had to contend with increasing difficulties due to a continuously dropping price for rubber, with costs still running at the inflated figures engendered by the rubber and tin booms in 1950-51. Your directors nevertheless recommend that a dividend of 5 per cent be paid and that £10,000 be transferred to general reserve, leaving £11,623 to be carried forward, as compared with £13,730 brought in from last year.

The Government of Malaya recognises the necessity of replanting, and by means of a levy of 1½d. per lb on rubber from planters who have not replanted a due proportion of their acreage, the Government is subsidising small native holders in replanting their holdings. At the same time, taxation is so severe that owners who wish to replant their estates are crippled financially. In our case we have planted sufficient acreage to obtain exemption from this levy, but we have paid in export duty and income tax £196,000 for the past two years, and have stopped further replanting for the time being.

The Choice for Europe

THE Bermuda communiqué was unexciting, and all the better for that. In a period of apparent stalemate in international affairs, political leaders must always face the temptation to indulge in diversions—to put forward propositions that catch the eye and stir fresh hopes, but ignore the real difficulties of the situation. The writers of the communiqué overcame this temptation. They confined themselves to restating the essentials of western policy, with precision on the points where agreement is complete and with some nice shades of meaninglessness where it is not. Their words by no means reflect the full content of the Bermuda talks; the cross-fertilising of minds in the Mid-Ocean Club will, if it proves successful, yield fruit in various forms and over a considerable period, and it was never to be expected that a full crop would be presented to the world in one basket. Yet a restatement of essentials was itself singularly timely, for the net result of the diplomatic exchanges of the past six months is that Western Europe is now squarely faced with a final and fatal choice.

What has happened is that Moscow has not only shaped its policy for Western Europe, but has also made it clear what that policy is. It is "Europe for the Europeans"—which means that there is no room in Europe for Americans, but does not mean that there is no room for Russians. On the contrary, the Soviet Union categorically declares itself a European power, and lest there should be any doubt about it the last Russian Note contained a reference to the Soviet Union "and the other European countries." Europe stretches from the Atlantic to the Urals, and Moscow is now warning it that its problems will never be solved until all Europeans pull together, instead of one half pulling against the other and calling "outsiders" in to help.

How, in the Russian plan, would a harmonious Europe, purged of Americans, be organised? The heart of the matter, as Molotov can see as clearly as anybody else, is Germany; the European problem is essentially the problem of Germany's frontiers and Germany's relations with its neighbours, of whom France is the most important. A new order for Europe must therefore be made to appeal to large numbers of Frenchmen and Germans. However, it must also be made as attractive as possible to the British, not only because Britain is a closely interested major power, but also because French and Western German policies are strongly affected by the attitude of London. Accordingly, the Soviet government would like to reanimate the existing Franco-Russian and Anglo-Russian treaties and to add a network of pacts linking France, Germany and the satellites. Europe would thus be re-aligned along three main strands—all leading to Moscow's clenched fist. The concept of such a re-alignment cannot be dismissed as mere fantasy; for, although to British eyes it could hardly seem anything but abhorrent, there are a number of inducements that Moscow can dangle in front of both Germans and Frenchmen. Germany, it seems, will be offered a new and better Rapallo: a Russian

treaty of friendship and economic collaboration, guarantees against attack by its neighbours, reunification, greater opportunities for trade with the east, and a national army. Moscow has already proposed the cancellation of reparations payments and postwar debts and the limitation of occupation costs until troops are withdrawn, and Herr Ulbricht has made it clear that the united German government would cancel the London debt agreement concluded last year by the Federal government and stop making restitution payments to Israel. In return for all this, Germany would have to give up the Saar to the west and accept the Oder-Neisse line to the east. Moscow has not yet said so publicly in so many words, but the obedient Herr Ulbricht told Germans a fortnight ago that a democratic and peace-loving united Germany would renounce for all time all territorial claims to west and east, north and south, and the Soviet leaders doubtless hope that there is enough sugar on the pill to make the Germans swallow these territorial disappointments.

★

There is plenty of sugar for France, too. The idea of a Franco-Russian alliance has always had French friends well beyond the Communist ranks. It represents a policy that is now more than half a century old, and when General de Gaulle went to Moscow in 1944 he was, in most Frenchmen's eyes, taking both a reasonable and a traditional step. The fear of Germany which created the original alliance is still notoriously alive; and as long as it persists France will hanker after eastern alliances. This applies to the countries formerly belonging to the Little Entente as well as to the Soviet Union. After the war Paris tried to repair the lines to Warsaw and Prague. The attempt came to nothing, but it might now be renewed with Moscow's blessing; the Warsaw press and radio are urging that Russia, Poland and Czechoslovakia are "France's natural allies." M. Daladier and the Gaullist deputies who are paying a somewhat mysterious visit to Poland may find out some more about this before their return to Paris. Nor is this all that Moscow has to offer. There is the Saar, and there is Indo-China. Russia could undoubtedly offer to use its "good offices" to put an end to the war in Indo-China and thus stop the frightful drain on French funds, manpower, armed strength, morale and prestige.

In the case of Britain, however, the Kremlin's new order starts without the advantage of the superficial attractions which it may have in French and German eyes. If the Soviet Union is part of Europe, then Britain certainly is too; but their tradition in foreign affairs will make the British particularly inclined to ask whether Moscow's "Europe for the Europeans" is not really "Europe for the Russians." It would take a great deal of sugar indeed to disguise the fact that that is just what it is; and so far Moscow has not found anything to entice the British with, apart from some vague commercial propositions and the

exceptional civilities extended by Malenkov to the new Ambassador in Moscow. But British opposition would undoubtedly stiffen opposition on the continent. A special responsibility for clear thinking therefore rests on this country.

★

In the first place it should be absolutely clear that what the Russians are proposing for Europe is not a third position between America and Russia. They are proposing a complete switch, from alliance with the United States to alliance with the Soviet Union. The North Atlantic Treaty is to be scrapped, and treaties with the Soviet Union are to be revived and multiplied to embrace the whole of Europe. Uncle Sam is to be replaced by Big Brother. Secondly, it should be absolutely clear what this association with Big Brother will mean. Herr Ulbricht has told the Germans what will happen. In his speech to the East German parliament on November 25th Herr Ulbricht assured his audience that the "forces of peace and democracy," led by the National Front (i.e., the Communists and their dupes), will prove stronger than the big businessmen and the militarists (in Communist parlance, everybody else).

To anybody conversant with modern political jargon the meaning of statements like this is plain. The Communists intend to have things their own way and have no intention whatever of allowing genuinely free elections in Germany. A united Germany in the new order will be a satellite; perhaps a satellite a little different from, say, Rumania, but this would only be a further acknowledgment that Stalin's way with satellites has failed in important respects and has had to be modified in detail. And if Germany is to become a Russian dependency, it can safely be assumed that the same fate awaits France and the rest of Western Europe, in due course and one by one.

The West can and should take Moscow at its word. The alternatives have been put before Europe; it is for Europe to choose. If Western Europe is now offered a clear choice between alliance with the United States and alliance with—leading to subjugation by—the Soviet Union, then a point has been reached at least as important as the offer of Marshall Aid six and a half years ago. Those who see how and where the choice lies must recognise that to adopt, or persist in, a wait-and-see policy is now insensate. The alternatives have only to be stated for it to become plain that the only counter to Moscow's gambit is to strengthen the Atlantic links and the Atlantic Treaty organisation. At present Nato is doing a purely military job and not much more. Yet the Atlantic partners have frequently claimed that together they constitute something more than an *ad hoc* military alliance; that they are—or can become—a community. It looks as though this claim is now to be put to a severe test, for to many people Moscow's rival claim that the real community is Europe has behind it the force of traditional sentiment and the evidence of schoolroom atlases.

Colonial Bogeyman

LAST week's debate on Buganda and this week's on Guiana have shown the Opposition at its worst. The motion of censure on the Colonial Secretary, threatened last week, has been postponed indefinitely. Ostensibly, the Labour party does not want to jeopardise negotiations between the deputation from Buganda and the Secretary of State. Privately, the Labour leaders must be aware that in both the recent debates the party has succeeded only in making a fool of itself.

This would not matter if domestic politics alone were in question. But, unfortunately, Labour's irresponsibility in colonial affairs is beginning to have a bad effect in the colonies themselves by giving the impression that there is a deep and serious cleavage of opinion on colonial policy in this country. The truth is that there is very little difference in principle between the Labour and Conservative parties. Both are pledged to foster the self-government within the Commonwealth of all the units of the dependent Empire. Both are committed to the economic development of the colonies. Nor is there any disagreement over means. No Conservative could have insisted more strongly on the need for private enterprise to supplement public development schemes than Mr Creech Jones when he was Labour's Colonial Secretary, and it was a Conservative Colonial Secretary who first hinted at development by public corporation. Labour was in power when most of the constitutional changes of recent years were initiated, but the basis had been laid for them by the Coalition Government with a Conservative at the Colonial Office, and they have been continued, with no noticeable change of pace, by the present Government.

There has, in fact, been a remarkable degree of continuity in British colonial policy for well over a decade, due partly to genuine agreement among the parties but perhaps even more to the influence and authority, based on experience and knowledge of the facts, of the Colonial Office and the Colonial Service. For most of this time comment in the House of Commons has not gone beyond the limits of vigilant criticism of details, and colonial debates for most of the Labour Party's term of office were exercises in agreement. It is true that in 1950 and 1951 there was a certain amount of anxiety manifest on the Conservative benches about the pace of constitutional change in the colonies. But there was no attack on the aims or even on the methods of colonial policy. Nor is there any likelihood that the Conservatives, if they had been in office in the immediate postwar years, would have been able to put any effective brakes on the pace of change.

Unfortunately, however, these criticisms happened to coincide with a worsening of race relations in those parts of Africa where there are white settlers, especially in Central Africa, and currency was given to the notion

that the Conservatives, when they came into office, would be considerably more responsive to the white settlers' wishes and considerably less sympathetic to the claims of the black majorities. That there was never any real justification for this belief ought to have been demonstrated by an event in the early months of Mr Lyttelton's period in office, when he confirmed, against the opposition of many of the settlers, a proposal to give the African, Indian and European communities in Tanganyika equal representation in the Legislative Council.

★

Another fact which shows how completely false is the view that there was a sharp change in policy when the Conservatives came in is the absence for nearly a year of any sharp criticism from the Labour benches of Mr Lyttelton's administration. His main preoccupation in that year was the war in Malaya, which he handled with commendable decision and promptness. In the second year, however, the atmosphere completely changed. From a somewhat grudging acquiescence in a bipartisan approach to colonial policy, Labour's attitude has changed to one of downright hostility to the Colonial Secretary. The occasion of the change was Central African federation. The scheme, it will be remembered, was of Labour parentage, and though there were changes in it before it reached the statute book, it has always been very difficult indeed to see which of them could be considered important enough to justify the reversal of Labour's attitude.

The next episode was the outbreak of Mau Mau violence in Kenya and the adoption of stern measures to restore law and order, which provided a golden opportunity for the left wingers to make trouble. From these beginnings, Labour's indictment of Mr Lyttelton has grown with each incident: disturbances in Nyasaland; the suspension of the constitution in British Guiana; the sharp language used to Mr Awolowo and his Action Group over the Lagos award; and now the deposition of the Kabaka of Buganda. It is true that British colonial policy has recently been very unfortunate. But before an indictment is based on mere misfortune, two points need to be made. The first is that Mr Lyttelton's record is not all misfortune or constitutional retreat. Malaya has already been mentioned; but it should also not be forgotten that it was he who recognised Dr Nkrumah as Prime Minister of the Gold Coast and who approved a further step towards self-government in Jamaica and Gambia, or that it was under his chairmanship that last spring's conference on West Indian federation made such progress and this summer's Nigerian conference—apparently so hopeless at the start—came so near complete success.

The second point is to inquire whether any of the misfortunes of recent months would have been avoided, or would have been differently handled, if Labour had been in office. Would a Labour Colonial Secretary, for instance, have taken less stern measures to fight the Mau Mau terrorists? Would a Labour Government, having committed itself as far as Mr Attlee's did, have withdrawn from Central African federation? Would it have risked the establishment of a Communist state in Guiana? Would it have allowed the Kabaka to defy the Governor in Uganda?

★

Labour has two answers to questions of this sort. It will admit—or at least its leaders will admit in private—that there has been no real change in the fundamentals of colonial policy since the Conservatives came in. But they strongly condemn Mr Lyttelton's personal attitude and they accuse him of acting arbitrarily and precipitately without sufficient patience or deliberation. This latter accusation can hardly survive the last two debates, in each of which Mr Lyttelton has expounded at length and most convincingly all the alternative courses that were considered in Guiana and Buganda before strong action was taken, and the reasons why they were rejected. There may be a little more substance in the first complaint, that Mr Lyttelton obviously dislikes black men, thinks their interests are second to those of the Europeans, and makes no effort to enlist their sympathy and overcome their fears. It is true that the Colonial Secretary is a large, rawboned man with a rather large and rawboned manner and with more than a touch of that appearance of superiority which so often gets upper-class Englishmen into trouble with foreigners. It is also true that Labour's Colonial Secretaries, especially Mr Griffiths, made a great point of being accessible to all, and that it paid them one or two dividends. Mr Griffiths, for example, managed to persuade hostile and fearful Nyasaland chiefs to attend the Victoria Falls conference on federation, whereas Mr Lyttelton sent them home hurt and angry after the final conference in London this year. But smiles, blandishments and handshakes, though they may ease a tricky situation, are no substitute for policy and decision. All that Mr Griffiths managed to achieve by his accessibility was time—time in which to postpone a decision that was bound to hurt someone whichever way it fell. Unless it be held that a colonial power must never annoy anybody or disappoint anybody's impatient ambitions (and though Mr Fenner Brockway might base a policy on such principles, the Labour party certainly did not do so when it was in office), then there must be occasions when decisions have to be taken and the consequences faced. Amiable hesitation may make fewer enemies at the moment than brusque decisiveness; but it can hardly be put forward as a sounder base for policy.

At the very most, then, Labour's case against Mr Lyttelton amounts to little more than a dislike for his

mannerisms. Yet on this has been based in recent months a furious campaign of denunciation and vilification—led, it is true, by the Bevanites and other left wingers, but supported rather than restrained by the leaders of the party. When it comes to open debate, there is a pathetic absence of arguments that will stand examination. Twice running, the Socialists have allowed Mr Lyttelton, admittedly no Parliamentarian, to wipe the floor with them. Why do they lay themselves open so often to such scenes of humiliation? Nor is colonial policy the only subject on which they seem to scream first and think afterwards, to commit themselves under the stress of unthinking emotion to attitudes and policies that are inconsistent with what they did in office and would be sore embarrassments to them if they got into office again. Much the same behaviour, with much the same parliamentary results, has been exhibited in foreign affairs and in domestic social policy. Are they really happy about the impression they give—that they are a totally different set of men when they have access to official counsel and knowledge from when they are left to their own devices, that they have no stock of responsibility or statesmanship save such as they can borrow from the civil servants?

★

If the colonial debates of the last two weeks have the result of starting the Labour party on a bout of self-examination, they will have done good even beyond the limits of colonial policy, where they have undoubtedly cleared the air. Nobody would suggest that the Opposition should forbear from opposing. But there is a world of difference between responsible opposition and the sort of exhibition that has recently been put on. Unquestionably, there are black spots and bright spots in the colonies, and perhaps today the black spots appear to outnumber the others. But the black spots are not of the Tories' making. It is not true that Africa was a peaceful happy continent when the responsibility for it passed out of Labour's hands. It was seething with frustration, suspicion and discontent—but that was not the Socialists' fault. Up to about twelve months ago, one would have said that the merits of the two parties in colonial matters stood about equal. To-day Labour's irresponsibility has tipped the balance in the Tories' favour. But it would swing back if the Socialists would start showing as much sense and realism in opposition as they did in office. Mr Attlee pointed the way in one of the last debates on Central African federation, when he pledged his party's support to make federation, once it was decided, a success. Could he not give a similar lead in colonial affairs generally? It is to nobody's interests save the Communists' that the great experiment of Commonwealth, to which both parties are pledged and to which they have both made contributions, should fail of success through an excess of faction at home.

Scientists and Mathematicians

THERE has for some time been a lull in the argument about the number of scientists and technologists that the nation requires to sustain and increase its economic progress. The controversy is likely to be reopened by this week's very disturbing report* from the National Advisory Council on the Training and Supply of Teachers concerning the shortage of graduate teachers of science and mathematics in schools and technical colleges in England and Wales. It is already very difficult for the schools to find enough teachers of these subjects. But nearly twice as many of them will be required in the grant-aided secondary schools between 1955 and 1960 to deal with the children of the high birth-rate years of the nineteen-forties. By the normal processes of supply and demand there is virtually no prospect of getting them. Yet if they are not found, the effect will be cumulative, for it will mean fewer students of technical subjects (or at least fewer adequately taught students) and therefore still fewer potential teachers.

The Ministry of Education can hardly escape censure for this tardy recognition of the difficulties. Figures of the secondary school population can be predicted eleven years in advance, and some of the problems were in fact discussed in the advisory council's first report published in May, 1951. Perhaps the expectation at that time of a slight industrial recession led the Ministry to believe that the demand for scientists for purposes other than teaching would slacken and relieve the shortage in the schools. In fact, industry's appetite for scientists has not receded and the universities have swallowed up an increasing share of their own graduates for teaching and research. The result has meant not only that the schools have found difficulty in filling vacancies, but that the standard of applicants, measured by the degrees they hold, has fallen conspicuously. This is particularly true of the boys' schools, where only 39 per cent of the new trained teachers have

second-class degrees or better, compared with 60 per cent before the war (see Table I). In the girls' schools the standard has not fallen so much, but there is an absolute shortage: inquiries instigated by the women teachers' organisations reveal many unfilled vacancies in girls' schools.

These are the current difficulties, but they are nothing to those that are in prospect. The facts, which have now been fully ascertained for the first time, leave no doubt of the gravity of the situation. Between 1951 and 1953 some 690 graduate teachers with scientific or mathematical degrees left the training colleges each year, of whom about 120 went to independent schools, leaving 570 a year for the grant-aided schools and technical colleges. Between 1955 and 1960 the intake into the independent schools is not likely to increase sharply, as it seems improbable that their resources will permit them to take a large number of extra pupils. On the other hand, the grant-aided schools and establishments will need an annual intake of 1,020 science and mathematics teachers if the standards of teaching in these subjects are not to fall still further. This is a formidable increase.

This basic difficulty of the schools is the competition for scientists and mathematicians from the universities and from industry. This is very much higher than before the war. For every 100 men who graduate with honours in these subjects, 45 now go into university teaching and research, 30 into industry and only 15 into schools. The girls' schools are rather more favourably placed, since women scientists are less in demand elsewhere, and 50 per cent of the students go into teaching. The shortage of scientists persists in spite of the fact that the number of pure science students at universities in England and Wales has risen from about 7,500 before the war to nearly 15,000 in 1951-52.

The only ways in which the schools' difficulties could be met would be either by making teaching relatively more attractive, so that, say, 500 more graduates each year chose posts in the schools rather than in the universities or in industry, or else by such an increase in the total number of science and mathematics students in the universities that all the demands for them could be satisfied. The latter course would be the more constructive. But even if the students could be found—and where are they to come from unless there are more science teachers in the schools to bring them up to the university level?—very little relief could be expected until nearly the end of the peak period. This is no reason for not doing at once what can be done further to expand the science faculties. If the schools' demands cannot be met in the early peak years, they will be carried forward, and an over-production of science teachers is hardly conceivable so long as there is so much scope for improving the staffing ratios in the schools and for raising the standard of qualification.

TABLE I—GRADUATE TEACHERS LEAVING PROFESSIONAL TRAINING QUALITY OF DEGREE IN MATHEMATICS AND SCIENCE

	1938		1953	
	Men	Women	Men	Women

* Graduate Teachers of Mathematics and Science. HMSO. 6d.

But in the immediate future, the only hope is in palliatives of one kind and another. Older teachers can perhaps be encouraged, or induced, to postpone their retirement. More married women can be coaxed back to teaching. Economies in teaching time can be secured by appointing laboratory assistants. Much more effective than any of these, if it could be conceded, would be the exemption of intending science teachers from military service. This, of course, raises a very wide question, and it no doubt stands little chance of acceptance. But it would certainly be effective. Not only would there be an immediate benefit from those who have deferred their national service until the end of their university course, but there would be a powerful continuing incentive. If there are to be any exemptions at all from national service, it can be urged that there are very few other cases where so much long-term benefit would accrue to the national interest for so few individuals exempted.

Over the longer period, the Ministry will have to rely on more lasting remedies. There are three main possibilities: higher pay for science teachers; a higher share for the schools in the scientific manpower available;

TABLE II
(Percentages)

TOTAL.....	100	100	100	100

a larger total number of graduates from which teaching can meet its own demands. The National Advisory Council was precluded by its terms of reference from considering pay, which is the function of the Burnham Committee, but it recognised that financial prospects were a vital factor in the situation. This is a highly controversial topic. To raise the salaries of graduate science teachers in isolation would be bitterly opposed by the rest of the teaching profession, and more particularly because the demand will slacken off after 1960. Under the proposed new Burnham scales the salary of trained men graduate teachers will be £510-£805 a year plus £30 for a first-class and in some cases a good second-class degree, and arrangements already exist whereby special allowances of anything up to, say, £300 a year can be paid for special responsibilities. But it would be a distortion of the whole purpose of these allowances to hold them out as a starting inducement—yet it is at the point of recruitment that the inducement needs to be done.

A larger share for the schools in the current output of the universities would mean a smaller share for the

universities themselves and for industry. There are, no doubt, many individual instances in which a scientist or mathematician would be more usefully employed in teaching than as a superior lab-boy in a university or industrial laboratory. But it could hardly be seriously argued that too many graduates are employed in research or industrial development. The contrary is almost certainly true. The Department for Scientific and Industrial Research has just announced plans for a large increase in its recruitment of scientists. In its most recent report the Advisory Council on Scientific Policy recommended that the number of trained scientists and technologists employed in industry should be greatly increased.

★

A parallel may be drawn from a recent report* published in America by the National Manpower Council of the United States. The general problems of industrial and scientific development and the manpower requirements in the two countries, when differences in population are allowed for, have many similarities. The major difference is that the Americans have greatly expanded, and are still expanding, their educational facilities on the level just below the highest—in what may without disrespect be called the second-class universities. There are, in America, relatively no more scientists of the very highest rank than in this country—possibly fewer. What there are—and it is an enormous strength to the American economy—are large numbers of men and women trained up to a level, lower indeed than is needed for the most difficult pure research, but fully adequate for most of the jobs that scientists are called upon to fill. The British insistence that it is better not to expand higher education at all unless it be of the very highest standard is proving to be a damaging bottleneck. The only way to break it is to press on with plans to increase the number of men and women studying science, if not at universities then at other institutions that will equip them to take their place in industry and in the schools. These two or three thousand more students a year are the ha'porth of tar for lack of which the whole ship of British technological progress is endangered.

The pessimists will certainly object that the neces-

sary talent is not available. This is almost certainly not so. While few sixth-form pupils worthy of a university education fail to find a place, the wastage in the grammar schools at 16 is very high, and according to the teachers themselves includes a large number of boys and girls who could make proper use of a course of higher education. The revolution in secondary education is so new that the grammar schools are filled with children whose traditions, ambitions and family attitudes are still unfamiliar with the idea of a sustained academic course leading to the professions and the universities.

Communists and Consumers

THE process of bringing satellite policy in eastern Europe into line with Malenkov's new course inside Soviet Russia, which was begun in Budapest last July, was completed in Warsaw early last month. Broadly speaking, the main objects of the planners throughout the Soviet sphere are now in agriculture to increase production by greater investment and greater incentives for the peasants, and in industry to correct the disproportionate development of heavy industry in order to step up the output of consumer goods and the construction of houses and other amenities. In other words, according to Rakosi, Bierut and the rest, the consumer, whether he works on the land or in a factory, is to get something of a new deal.

In the West there is a good deal of doubt and controversy about the practical outcome of the brave speeches and pledges of the Communist leaders. It is probable that on the other side of the iron curtain the doubt and the controversy are scarcely less keen. Sometimes the new measures have been described primarily as a determined effort to correct serious errors in the original plans. On other occasions they have been presented more as a new step on the road to socialism, made possible by the economic progress so far achieved. In Rumania and Bulgaria, the first explanation was emphasised, in Czechoslovakia and Poland the second; while in Hungary the apologists have tended to shift from the first to the second.

To some extent these differences reflect each country's varying achievements. They also, however, reflect the uncertainty and hesitations of those who must interpret the wishes transmitted from Moscow without, on the one hand, disappointing too gravely the hopes of better days that they have aroused, or, on the other, seriously outraging those doctrinaire Communists who regard any slowing-down of industrialisation as a shockingly retrograde step. But whatever the differences in interpretation and application throughout the bloc, the common origin of the new measures is reasonably clear. They spring not so much

from a fear of imminent economic collapse—grave though the dislocations caused by over-hasty industrialisation is—as from a fear that the people are reaching the end of their tether. They are the result more of a political decision than of economic failure.

★

It is in the countryside that the Communist planners have met with the greatest setbacks, and it is there that they are now making the greatest efforts to remedy their mistakes. Investment in agriculture, which in the past has been gravely neglected, is to be increased. At the same time the peasants are to be persuaded to greater efforts by better prices, smaller compulsory delivery quotas and a larger and better supply of consumer goods on which to spend the money earned by increased sales on the free market. There is no reason in theory why such measures should not in time show good results. But in their dealings with the peasants the Communists are particularly hampered by their convictions. They have, it is true, relaxed their efforts to force the private farmer into the collective by making life outside completely intolerable for him. They propose also to make positive efforts to help him by seeing that he can get a fairer share of whatever fertilisers, seeds and machinery are going. Yet it is perfectly clear that the Communists have no intention of abandoning collectivisation. Mr Nagy who was the only one of the Communist leaders to promise the peasants that they could actually walk out of the collectives, was evidently exceeding his brief, since the Hungarian regime has done its best to wriggle out of the pledge. The Communists may for the time being—although this is not certain—be content merely to consolidate and strengthen existing collectives; yet so long as the goal of further collectivisation remains, so long will there remain the feeling of insecurity of tenure that has done so much to destroy morale in the countryside.

Moreover, for Communist planners who are still

determined eventually to "socialise" agriculture, the policy of helping the private farmer has definite limitations and drawbacks. In the first place they still want to make life outside the collectives less easy and attractive than life inside; it is therefore likely—and this is borne out by developments in Hungary and elsewhere—that whatever concessions and incentives are given to the private farmer, they will be less attractive than those given to the collective farmer. In the second place the type of private farmer most likely to benefit from a liberal policy is the kulak, the chief surplus producer, the minor capitalist of the countryside whom all good Communists are taught to regard as their arch-enemy. The regimes try to evade this difficulty by "backing the medium peasant." But a medium peasant who has been given a boost soon turns into a kulak. And if the planners, by taxation and other means, try to regulate nicely the amount of prosperity among the private peasants that will give increased yields without undesirable ideological consequences, they might easily defeat their own ends; for the peasants could well turn sour, cut their output and as so often before, resort to quiet passive resistance. The concessions already granted do not seem so far to have had a particularly beneficial effect.

★

Whether the Communists can successfully tackle their agricultural problems within the limitations set by their own dogma remains to be seen. What is certain is that they must pour both consumer goods and agricultural implements and supplies into the villages if they are to get increased yields. Conversely, they will not get larger supplies of consumer goods (nor of coal, steel and other vital raw materials) if they do not, among other things, improve supplies of food as well as of durable consumer goods for the industrial workers. There is, in fact, a close and vital link between economic policy in the towns and in the countryside; similarly a threat to political stability in the one involves an equal threat in the other. Throughout the Soviet bloc a series of price reductions, whose exact significance is hard to estimate, has been the first step towards improving the standard of living in the towns and providing greater material incentives for the peasants. A second step is the promise to cut the rate of capital investment for the benefit of consumption, and to devote a larger share of what remains to light industries and to agriculture.

It will take time for this change of policy to show results, even supposing that the planners have made up their minds exactly how to carry it through; and the hard evidence so far available is so meagre that it is hard to estimate its significance. It was stated in September, for instance, that investment in Czechoslovakia in the current year will be cut by 16 per cent and that next year it will remain at this revised 1953 level; but if, as is more than probable, the 16 per cent cut this year merely represents the estimated non-fulfilment of the target, then in absolute terms the amount of investment may be as high, if not higher, than in the preced-

ing years. As far as one can tell, it seems probable that the idea is to keep the level of total investments roughly constant; on the assumption that national income is rising all the time, this will give consumption an increasingly large slice of the national cake.

What exactly the shift from heavy to light industry will involve is also hard to say. It is clear from the way the Communist leaders talk that they would really like to increase the production of consumer goods without cutting down production anywhere else. Since this is impossible, they will probably try to limit the cuts in the output of heavy industry, especially in Poland and Czechoslovakia, where it is of vital importance to the whole Soviet bloc, to as little as conditions in the countryside and among urban consumers allow. They will do what they can by abandoning marginal projects, eliminating waste and increasing productivity. They will not in general cut down the production of basic raw materials, coal, steel and electric power; on the contrary, in these sectors, where production has been most seriously lagging, a determined effort is being made to reach the targets and a still greater effort will in most cases be demanded next year. Heavy industrial enterprises everywhere will be urged to turn over to the production of consumer goods and agricultural machinery. To some extent heavy industries have always manufactured some consumer goods as a sideline; but it is costly to do so on a large scale. The leaders of Hungary's heavy industry, who, to the indignation of the Communist press, complain: "Are we to produce meat mincers together with means of production?", have a good deal of sense on their side. That the Communists are insisting on this method of increasing supplies of consumer goods illustrates the reluctance and hesitation with which they are shifting from their old course.

It is obvious, however, that if the Communist planners are not to fall down completely on their promises—and it is reasonable to suppose that they will try to avoid this—they must in each country carry out some redistribution of the national resources (especially as a good proportion of satellite consumer goods must presumably be exported to the Soviet Union). But this does not necessarily mean that the Communists have abandoned their long-term plans to build up within their bloc an overwhelmingly powerful economic potential. It is much more likely that they have merely made up their minds to take longer over it, that they are determined to reach the original goal eventually, but by a longer and—as they hope—less thorny route.

From the West's point of view, the lesson to be drawn is clear: it is that the Communist bloc does not expect and is not preparing for a major war in the near future. If it had such fears, considerations of political expediency would everywhere give way to the necessity of increasing war potential. As things are, it looks as if the need to remove some of the causes of popular discontent will rank for Communist leaders as the most important task over the next few years.

Notes of the Week

Atomic Address

PRESIDENT EISENHOWER'S test explosion on the United Nations proving ground appears, from first reports, to have been fully successful. Even commentators who were a long distance from ground zero showed an immediate and outwardly favourable reaction; but there are still many questions to be answered. It will not be easy to find for the proposed "international bank" of fissionable materials a location that is acceptable to all parties. The financing of any such scheme is bound to be the subject of hot debate; and even more so the question of its ultimate control.

To ask these questions is not necessarily to dub the plan impracticable, or to criticise Mr Eisenhower. Most great international projects must be sketched with broad strokes of the brush before their details can be filled in; and the President was careful to point to the private talks between the governments "principally involved" that had already been suggested by the Assembly as the right means of discussing these details. He was scrupulous in mentioning the realities with which his project would have to contend: his need to submit it to Congress, the probability that first contributions to the "bank" would only be small, and the necessity of guarding the "bank" against surprise seizure. Moreover, in the full context of his speech it was clear that he recognised that the creation of an atomic pool for peaceful purposes would provide no final solution to the much vaster problem of preventing war.

Unfortunately, Mr Eisenhower's own modesty has not been emulated by all his commentators. Some of them have seized upon passages from his address with the same apocalyptic fervour that followed Sir Winston Churchill's speech of May 11th. Attention needs to be directed to the solid value of the President's plan itself, and particularly to the fact that once again the Soviet government is given an opportunity to respond with "deeds, not words" to an offer of peculiar interest to the peoples of the "underdeveloped" world.

Under France's Skin

SMALL incidents and alleged breaches of diplomatic protocol at the Bermuda conference have been magnified by the French press into wanton attacks on their national prestige. Many Frenchmen already resented the fact that the conference had been called at such an inopportune moment, just before their presidential election. This alone, however, does not account for the disproportion between the pretexts and such outbursts of hurt pride as led one

leader writer to exclaim: "Have our representatives lost their concern for national dignity to the extent of passively accepting such insolent behaviour?"

The deeper cause of French resentment and uneasiness is revealed in a preceding sentence in which the same writer ponders whether Chancellor Adenauer, if invited, would have been treated in the same fashion. For some people, even M. Laniel's illness has acquired a symbolic significance. France may be likened to a veteran player, not in peak physical condition, suspiciously eyeing the German newcomer arriving at the team headquarters under the benevolent eyes of the selection committee. The veteran requires particularly careful handling, and guarantees that his position in the team will not be endangered; and some local experts, non-Communists at that, advise him that by merely threatening to ask for a transfer, or by brandishing some previous contracts, he may obtain these better terms.

The official Bermuda communiqué did little either to strengthen or to dispel French suspicions. On the two vital issues of the European army and Indo-China it was too vague to provoke reactions either way. France's qualms about EDC were acknowledged and its effort in Indo-China praised. Yet nothing specific was indicated about the link between EDC and Anglo-American troops, nor about the way in which a solution will be sought for Indo-China. Indeed, the only immediately tangible result of the conference—the Note to the Soviet Union—will provide another test for French susceptibility. It proposes that the Berlin conference be held early in January, before the new French president and cabinet have taken office, so that once again France will be represented by a caretaker. Should it be disclosed, however, that MM. Laniel and Bidault had brought back important assurances and pledges in their Bermuda bags, the slights to French prestige, whether real or imaginary, would soon be reduced to their proper perspective.

Labour and the By-Elections

THE recent crop of by-elections has not shown any real break in the party deadlock that has now persisted for nearly four years. Since Parliament reassembled after the summer recess there have been four by-elections and (if splinter candidates are ignored and the votes given to the Independent Conservative at Crosby are allocated to the official candidate) two have given Labour a slightly higher proportion of the poll and two have produced some slight Conservative improvement. Only from the latest Gallup Poll does it emerge that the Conservatives' standing is now slightly lower than at the general election—though not low enough to cause the party any concern. It is, after all, usual for governments to lose ground considerably between

general elections, but the present one can boast of the feat of actually capturing a seat from the Opposition in the summer.

Nor should Ministers find much to worry them in the issues raised during the recent campaigns. Labour fought them principally on rents and food prices. The two London divisions of Holborn & St. Pancras South and North Paddington are by no means typical, but they would certainly have mirrored any decisive swing against the Government on these issues. Instead Holborn's improved Labour vote was offset by an increase in the Conservative proportion of the poll at Paddington, and in fact both movements can be largely attributed to special circumstances connected with the previous Labour members.

The autumn by-elections may indeed prove to have rather more significance for the Opposition than for the Government. Of the two successful Labour candidates, Mr Parkin is regarded by the Bevanites as one of their own and they have hopes of Mrs Jeger. In addition, Mr Warbey,

* Independent Conservative. † Socialist party of Great Britain

elected for Broxtowe in September, showed pronounced left-wing tendencies during his previous sojourn at Westminster, while the unsuccessful Labour candidate in the famous Abingdon by-election in the summer was the husband of Mrs Castle, a leading Bevanite. Recently Mr J. P. W. Mallalieu incurred the anger of some of his fellow Labour members by drawing attention to the disparity between Mr Bevan's vote in the elections to the national executive and his vote in the Parliamentary Committee poll. Labour may well be seeing the beginning of a move by the constituency parties to ensure that their views, as expressed through the annual party conference, are more accurately reflected on the Labour benches in the House of Commons.

Militant Unions

THE General Secretary of the Amalgamated Engineering Union, Mr Benjamin Gardner, expressed the view on Wednesday that "unsolved wage problems" were "more ominous of coming trouble than the trade prospects

of the new year." He may well be right. The engineers and railwaymen are angry at the rejection of the claim both have made for an increase of 15 per cent; and both threaten to inflict serious damage on the economy. The railwaymen complain that the increase of 4s. a week offered them by the Railway Staff National Tribunal is niggardly, insulting and bitterly disappointing. The award, which would cost the railways some £14½ million, is designed to cover the rise in the cost of living to lower paid workers. The skilled railway workers, however, believe that this principle has been carried far enough, and want to avoid a further narrowing of the differentials between the wages of skilled and unskilled men. A decision on working to rule had not been reached at the time of going to press.

The engineers and shipbuilders, who have been offered nothing, have yet to decide what action to take. As none is now practicable before Christmas, their leaders have put off until December 23rd their decision on the four possible courses that have been proposed. The Amalgamated Engineering Union has suggested a ban on overtime and piecework; the Patternmakers' Association has proposed a ban on overtime, but none on piecework; the Transport and General Workers' Union has suggested a ballot to decide between arbitration and the ban on overtime and piecework; the Municipal and General Workers' Union wants a ballot to decide between arbitration and a strike. But on one thing all are agreed—that the men shall have a rise. Mr Arthur Deakin, the general secretary of the Transport and General Workers' Union, and Mr Tom Williamson, the Municipal Workers' general secretary, have both said so very firmly; and though they may not agree with the tactics urged by the Communists on the AEU's National Committee, they will probably support the majority's verdict if it comes to a strike.

Meanwhile the Ford Company's wage offer has confirmed the unions in their view that engineering employers, even today, can afford to grant wage increases; and the railway tribunal's award—in an industry less prosperous than engineering, if more sensitive to an increase in costs—suggests that arbitration would bring them something.

Back to Persia

THE resumption of diplomatic relations with Persia was a simple matter for Britain, where everyone thinks that contact is better than no contact, and so welcomes the step. For General Zahedi, by contrast, it represented a courageous act, for it immediately throws into vocal opposition all the fanatics—Mullah Kashani, Mr Makki, leader of the National Front, and Dr Baghai, leader of the Workers' Party—who foresee that their own importance will decline if the General's move is later crowned with some success. Mr D. A. H. Wright, at present head of the Economic Relations department at the Foreign Office, is to go to Teheran as chargé d'affaires. The reciprocal appointment of ambassadors agreeable to both capitals will no doubt follow in due course.

How soon the arrival of a diplomat experienced in economic matters will lead to a renewal of Persian earnings from oil is a matter of concern chiefly to the Persians. They

need the money badly, and no one else is desperate for the oil. This is a fact that it took them some time to realise, but which they now know thanks to painstaking explanations by the State Department's oil consultant, Mr Herbert Hoover, junior. It follows that they cannot afford to postpone action by the techniques of awaiting overtures, and devising petty exactions, which have served them well for decades, whereas the western envoys concerned can afford to bide their time and await developments. Persians are great at criticising the proposals of other people; do they really see themselves eternally playing this passive role? It remains to be seen whether there survives in them any spark of the spirit of ancestors who had it in them to act constructively.

One comment much heard in private in Teheran this week was that the return of the British had the great advantage of saving Persia from an American hegemony. The remark merits attention in the west, for it flashes a warning against the divided counsels that have so often given Persians scope for their talent at playing off one foreigner against another. The ideal solution of the oil question would be one in which the British and Americans, and if possible also the French, were to act in concert.

Another Truce Without Peace?

THERE has lately been considerable confusion over the possibility of negotiations leading to an armistice in Indo-China. But, as Mr Van Tam, the prime minister of Vietnam, now points out, the fact that Ho Chi-minh, the Communist leader, has announced his readiness to negotiate cannot be ignored. This announcement, first made in reply to questions submitted by a Swedish newspaper, has since been repeated on the rebel Vietnam radio, and it has received favourable public comment in Moscow. As a result, opinion in France, already largely in favour of negotiations if there were any possibility of being met part way by the other side, is becoming increasingly united in the view that a serious attempt to stop the war could and should now be made.

Ho Chi-minh's latest observations have removed one prime obstacle to negotiations but, for the moment at least, they have also raised a fresh one. Contrary to all previous declarations of Vietminh policy, there is no longer any stated insistence that the withdrawal of the French expeditionary force is an essential preliminary to a cessation of the fighting; as was shown by the recent parliamentary debate in Paris, the physical impossibility of the French fighting their way out without very heavy losses has lately been one of the main factors keeping them going. Now, the difficulty is on the other foot. Ho Chi-minh has cleverly made a bid to talk only with the French, thus ignoring the governments of the three Associated States, and causing great concern among many leaders in Vietnam lest they should be left in the lurch by their French allies.

The British and American view, as expressed to M. Laniel and M. Bidault at Bermuda, is reported to be that the French should not allow themselves to be drawn into negotiations without taking very careful account of the present favourable trend of the actual fighting. Under the Navarre Plan, it has been hoped to improve considerably the French

and Vietnamese military position with a possible view to negotiations later on. And, while it remains true that a purely military victory is inconceivable, a good start has now been made in the present campaigning season; it would therefore be folly to throw away its effects too soon. Ho Chi-minh, like the Chinese in Korea, might well be temporarily suited by a cease-fire, provided it came soon. But in Indo-China, just as in Korea, while it would be an enormous gain to stop the actual fighting, there is still a long way to go before there is any prospect of negotiating an acceptable, let alone a satisfactory, political peace.

Hush over North Africa

A BARE three months ago, French Morocco underwent a dramatic change of Sultan and was a major topic of world news. Since then, a virtual curtain of silence has descended on Moroccan affairs. Such items as percolate through it are disquieting to anyone interested in the future of the white settler in Africa.

The ex-Sultan was dismissed as the result of an unholy alliance between rural, tribal Morocco, and certain French administrators whose patience had run out as the result of the Sultan's steady refusal to co-operate along any lines that would afford French residents a say in the management of the territory. He was not an immense loss to the world's panel of hereditary rulers; he had, over the last few years, let down friends as well as adversaries by his unpredictable bestowals and withdrawals of support. But he stood—in the eyes of the young Arab townsmen whom the French as well as the Independence movement are educating in ever-increasing numbers—for a Morocco that would retain a personality of its own and an oriental pattern of statehood.

His successor is a little-known greybeard who has made no demur about signing decrees that promote the running of Morocco by mixed committees of "co-citizens," French and Jewish as well as Moslem. Some changes are therefore afoot, but the price paid for them is high. It is that of martial law applied with an iron hand. Any group caught

GOLD AND DOLLAR RESERVES
US DOLLARS [MILLION]

in confabulation courts arrest, and a chat with a foreigner is out of the question. Each day brings fresh news not only of attacks by Moslem on Frenchman and Moslem on Moslem, but of sinister "disappearances" of known nationalists. *Le Monde* this week inquires whether these last are plain arrests, or include nervy French reprisals such as took place earlier in the year in Tunisia, or are vanishing acts by people who think themselves in danger. Most thinking people in Paris are embarrassed when they have to retail such matters; relations between Moroccan Frenchman and Moroccan Arab are obviously far less free and easy than they used to be, and bode no good for the future of co-citizenship.

Silence prevails about Tunisia also, but the cause here is wholly different. The territory is so thankful to see the back of its late Resident General, M. de Hautecloque, that his successor, M. Voizard, is enjoying the advantages of a honeymoon. This will end if he proves unable to make any move towards meeting Tunisian claims for more self-government. It is his misfortune that the imminence of the Presidential election makes it unlikely that he will get instructions quickly. May the present quiet last until he does so; for if no compromise is possible in easy-going Tunisia, what hope is there in far more rugged Morocco?

More Smoking

THE contention behind wage claims that dearer food has brought real hardship to many people is hard to square with the latest figures of consumption. In the third quarter of this year, an extra £26 million was spent on food compared with the same months of last year and this practically compensated for the rise in prices. When revalued at 1948 prices, the figures show that the quantity of food bought was only slightly less than last year. But

even more striking is the fact that expenditure on tobacco, both in money and real terms, reached a new peak. As much as £221 million went on smoking in these months—£20 million more than the total spent on rent and rates. And while a little less beer was drunk than in the same months of 1952, the money saved there went on more spirits and wines.

Among other forms of spending for which details are available, household goods (which include wireless and television sets) continued to attract buyers and purchases were as heavy as they were before the "buyers' strike" of 1950-52. Slightly less was spent on entertainments, doubtless because of the spread of television, but the inroads of television into theatre-going and cinema-going are still slight. In the light of these statistics malnutrition certainly becomes a myth.

Truth Dawns in Ebbw Vale

TAKE the country as a whole, we are not very far away from the amount of total accommodation which the nation requires. . . . Sanitary inspectors in instance after instance have made house-to-house surveys, and in the middle-sized towns they have found hundreds of houses occupied by one person apiece. The nation is in grave danger, unless it is careful, of being stupidly extravagant. If . . . voluntary transfers were brought about, a good deal of additional new building would not be required at all."

The speaker, curiously enough, is Mr Aneurin Bevan. What is more, he gives a pretty strong hint of what he would do about it. He wants to "apply boldly the policy of allowing local authorities to take over the houses." He makes it clear, however, that he is "not suggesting for a moment that anybody, the nation or local authority, should have the power of compulsory transfer, for that would be quite unendurable. People are entitled to stay in their own homes for as long as they like." How then would the transfer of houses to the local authorities help to bring about a voluntary redistribution? The only possible answer is that local authorities, unlike private landlords, can fix their rents at whatever they see fit. Mr Bevan did not say in so many words that he wanted the houses to go to the local authorities so that there could be a sharp all-round rise in rents (with no nonsense about spending the increase on repairs). But that is the only way in which his remarks can be made to hang together; and he went out of his way to mention that the average proportion of rents to incomes among manual workers in this country has fallen from 11.3 per cent before the war to 7.4 per cent this year.

It looks, therefore, as if Mr Bevan must be welcomed as a convert to the price system, and there will certainly be more rejoicing in Heaven than over Mr Macmillan's very half-hearted obeisance to the same principle. It is true that Mr Bevan believes in the price system only when applied by local authorities. But every grain of wheat has its husk, and the municipalisation of houses is so obviously unpopular as a political cry that the winnowing should not be difficult. The important thing is that the truth is at last beginning to dawn. If rents were allowed to rise until they formed no higher a proportion of incomes than they did fifteen years ago, the only remaining housing

problems would be how to clear the slums and how to fill all the empty houses. Then the nation's resources could be devoted to the really necessary and remunerative forms of capital investment. The Sage of Ebbw Vale may yet be canonised with Adam Smith.

Turnips and Carrots for Repair

MR BEVAN has described the Housing Repairs and Rents Bill as a "mouldy old turnip" for landlords. From the point of view of the local authorities, it was described this week, at a conference of the Association of Municipal Corporations, as "a meagre and maggoty carrot." The local authorities have two objections to the grants which the Bill offers them for the temporary repair and maintenance of slum property. These grants assume a 50-50 split between taxes and rates, whereas previous housing legislation has put the major burden on the national Exchequer on a 2 to 1 or 3 to 1 basis. In the second place, it is claimed that the grants are adequate only for the most stopgap type of repairs. If other cities are to emulate Birmingham and renovate some slums to last fifteen or more years, the cost will probably be about £200 a house, most of which will have to be met from local resources.

Mr Macmillan's reply was that the Government does not wish to encourage the extravagant reconditioning of unfit houses or to blur the idea that they must be demolished as soon as possible. This is an adequate answer only to those local authorities (certainly in a majority) who can in fact clear their slums quickly. Birmingham's slum renovations have not been "extravagant," but have been dictated by the necessity of making conditions tolerable for people who must go on living in these houses for a long period. No city could or should take a lesser view of its duties as a landlord. Other cities do not possess the powers or the resources which have facilitated redevelopment schemes in Birmingham, and legislation is needed to give them similar opportunities.

The Government certainly is not bound by precedent to give local authorities a grant of more than 50 per cent; but if, as it states, the improvement of the slums has become "a national duty," and if results are to be obtained by persuasion and not coercion, then a higher level of grant is probably necessary. Local authorities may find themselves under strong political pressure either to demolish their slum properties at once or to repair them adequately. This, no doubt, is all to the good; but it is a prospect from which many authorities will recoil unless they have stronger inducements and clearer leadership.

German Refugees Settle Down

SINCE the new government was formed in Bonn, moves have been made to strengthen German claims to revision of the Oder-Neisse frontier. This is perhaps due to the fact that there are no less than 27 refugees among the Christian-Democrat members of the *Bundestag*, and the

"BHE," the party devoted solely to refugee interests, is a new and unruly addition to Dr Adenauer's cabinet. In recent weeks some disquieting remarks have been made by refugee leaders. Herr Oberlaender, a more nationalist Minister of Refugee Affairs than his forerunner, has made the impossible proposal that the Munich agreement might form the basis of a settlement with Czechoslovakia when the Germans return to the Sudetenland. And a few days ago, the same Minister told the world that to regain "the German East" is a "German and European task." At the same time, the organisation of Silesians in the Federal Republic has demanded that the Eastern territories should be represented in the Upper House.

The refugees' political leaders are constantly at work to keep the revisionist spirit alive. To encourage the settlement of the expelled Germans without maintaining their interest in a return to their old homes would be, it is said, "a betrayal of human rights." Herr Oberlaender has declared that the refugees must be given better conditions because "the German East" will only be resettled if their economic and social position is maintained in the meantime. It is true that those unfortunate unemployables among the refugees who have lived for years in penury will eventually lose their strength and willpower and become uninterested in moving back to hard conditions in their old homes. And it has also been shown by experience that those refugees, forming the great majority, who have found a fair living in the West are settling down well. This is borne out by some very remarkable results that have appeared in a recent public opinion survey among refugees. In answer to the question whether Pomerania, Silesia and East Prussia should be regained by every means, even war, 77 per cent answered "not by war," 12 per cent said "by war if necessary" and the rest did not reply.

Only 66 per cent of the refugees questioned thought that the lost lands would return to Germany, and 11 per cent believed them to be gone for ever. The most encouraging result for the future was that little more than half of those who expected the territories to come back to Germany would certainly return themselves, if the provinces were "free again tomorrow." Exactly 20 per cent would definitely prefer to stay where they are, and 17 per cent would perhaps return. The older generation, now gradually thinning, would be more ready to go back than the young people. These answers are a tribute to the extraordinary extent to which the refugees have been absorbed in Western Germany.

Allies and the China Trade

IN reply to Senator McCarthy's latest anti-British tirades, Mr Nutting has flatly denied in the House of Commons that any strategic materials have been supplied to China with the knowledge or approval of the British Government during the period in question. It is obvious that, if Britain had in fact violated the United Nations embargo on the export of war supplies to China or North Korea, the American government would have been the first to protest, as would have been its right. It has not done so; and on the other hand it has shown a sympathetic understanding of the peculiar problem of Hongkong, which lives on trade with, and food from, mainland China, and which would be liable to complete ruin under conditions of blockade. It is the fact that Hongkong has continued to trade with China, although only in non-strategic goods, that provides the appearances so easily worked up into demagogic accusations by Mr McCarthy.

The personal ambitions of the Senator from Wisconsin, to whom the exploitation of latent anti-British sentiments in America is merely a means to a quite unrelated political end, must not be allowed to bedevil a sector of Anglo-American relations in which reason and compromise have hitherto been surprisingly successful. Last week Mr Dulles dealt severely with Mr McCarthy himself. On this side of the Atlantic, however, it needs to be made clear that the contrapuntal chorus in favour of unrestricted trade with China, which provides Mr McCarthy with much of his propaganda material, is no more representative of informed British opinion than the Senator is of American opinion.

Maltese Experiment

UNEXPECTEDLY, Mr Lyttelton last week made public his proposals for transferring responsibility for Malta from the Colonial Office to the Home Office. The island's new constitution, which came into force in 1947, while safeguarding Britain's strategic interests, went far towards meeting Malta's patriotic wish for autonomy. For some time, however, there have been nationalist rumblings off-stage and the storm finally broke over the

alleged slight offered to Dr Borg Olivier, the Prime Minister, when he was not ranked with the Commonwealth Prime Ministers at the Coronation.

Mr Lyttelton's counter proposals to the demands that Maltese affairs should be transferred to the Commonwealth Relations Office reached the island just before Dr Olivier's government suddenly fell. Perhaps Mr Lyttelton could not justifiably have remained silent until after the elections; but in many ways it is a pity that the proposals have been thrown into the cockpit of Maltese politics at a time when the electors' ears have already been deafened by partisan shouts. For they have much intrinsic merit. There are good reasons why Malta should not be given the full status of a dominion, however proud its record. The island is too small and too weak economically to rank on equal terms with the great self-governing dominions. But for the Maltese the idea of being classed as colonials is understandably invidious; the Colonial Office is symbolic of an inferior status. The suggestion, therefore, that, for administrative purposes they should be transferred to the Home Office should appeal to them. The Channel Islands, which would presumably be used as a model, feel no stigma in a relationship that in itself would neither weaken nor strengthen the island's ties with the Commonwealth.

The proposals have not, of course, appealed to those nationalists who advocate dominion status as a polite synonym for total independence. So long as the island remains a bastion of British power in the Mediterranean (and it is to Malta's interest that it should do so) Britain is bound to retain the final say in matters of defence and foreign policy. Nevertheless, irritations in the working of the dyarchy should be removed. At present, for instance, Maltese ministers have to take up all questions with their opposite numbers in this country, notably the Service Ministers, through the Governor and the Colonial Office. Again, Maltese politicians assert that many powers still retained by the British Government could without prejudice be handed over to local control. Flexibility will have to be shown on points such as these if the Maltese are to agree to an experiment that offers great possibilities for a developing Commonwealth.

Poisoned Air

SHOULD people feel a duty to help control the nuisance—as unpleasant as the name it goes by—of "smog"? The committee on air pollution (known as the Beaver Committee) in its interim report published last week, has no doubts on the point. The worst producer of smoky fog is not industry, but the domestic hearth; and moral persuasion is the only weapon that can be used against it. The table shows how the emission of smoke, grit and sulphur dioxide—the chief noxious elements in smog—is divided between industrial and domestic users. In closely populated areas the domestic proportion increases and 60 per cent of the great London fog of last December was due to domestic fires.

It was the London fog that made the nation anxious about smogs, but the main damage is done by the less spectacular fogs that hang over many of Britain's indus-

"Undoubtedly the VISCOUNT has been the AIRCRAFT OF THE YEAR"

In these words, Mr. Peter Masfield, Chief Executive of British European Airways, sums up the Viscount's achievements in 1953. Here are some highlights:

The VISCOUNT has earned a profit for BEA of £64 per flying hour.

The VISCOUNT has carried 64,000 passengers during its first six months of operation, and on some routes has brought about an increase in BEA passenger traffic of over 100%.

The VISCOUNT has cut travelling times and set up new route records between many European cities.

The VISCOUNT showed its versatility by arriving first among transport aircraft in the New Zealand Air Race, establishing a record for London-Melbourne and flying 3,600 miles non-stop.

The VISCOUNT—one of Britain's leading export successes—is now on order for eight airlines and the Indian Air Force.

Marmite, in its handy wide-topped jar, is now a familiar sight in grocers' shops—and in kitchens—up and down the country. The Marmite salesmen mightn't have done such a fine job without efficient backing from headquarters . . .

Customers could never complain of a bottleneck (nor could the head office!)

AT THE WAR'S END, the Marmite Food Extract Co. Ltd. were faced with a problem—and an opportunity. For years, supplies of Marmite had been far below demand. Raw materials were short, and most of the output went to the Armed Services. Then the situation changed. It was time for aggressive selling. The sales-force was ready; new

Seen operating a Burroughs Typewriter Accounting Machine in the offices of the Marmite Food Extract Co. Ltd. is Miss Doris Miller. This is one of the fast and versatile machines that are helping to keep the salesmen (and their customers) satisfied.

territories could be opened up; new demand could be created and *satisfied*.

But, in support of this sales campaign, could the office departments cope with the great volume of figuring work involved? To plan its production in advance, the company realized that it must have detailed statistics on the selling operation—sales analyses by travellers, by areas, and by class of outlet, would have to be prepared *day by day*.

Some years earlier the company had used Burroughs machines to cut six weeks off the time needed to make up the books at the year's end. Now, with this new problem, Burroughs were consulted again. After investigation, Burroughs specialists recommended the installation of Burroughs Typewriter Accounting Machines on which complete records of sales, purchases, and other data could be classified in many different ways.

Result: So smoothly and quickly do these Burroughs machines serve the

company's offices that a fact-and-figure picture of the whole sales operation is always on hand. Details of sales in any kind of shop in any county can be produced at a moment's notice—a great help to the company in planning production and distribution in advance.

What about you? If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service *guarantees* its efficiency in operation.

Call Burroughs today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities round the world.

CALL IN Burroughs

trial areas for thirty or more days in the year. These seep into the lungs; they blacken and erode buildings; they corrode metals. The committee estimates the annual cost to be as high as £100 to £150 million a year. The only way, as it points out, of stopping this waste is the wholesale introduction of modern boilers and stoking methods by industry, and the scrapping of the cheerful open hearth in favour of appliances which can burn smokeless fuels.

Legislation to control smoke emission from factories

Type and Use of Fuel	Quantity of Fuel (mns. of tons per annum)	Pollutants Discharged (mns. of tons per annum)		
		Smoke	Grit	Sulphur Dioxide
RAW COAL				
For domestic use	36.9	0.9	0.1	0.9
For electricity works	35.7	Neg.	0.2	1.0
For railways	13.9	0.4	0.1	0.4
For industrial and miscell. uses	65.1	0.8	0.2	1.8
For coke ovens	25.2	Neg.	Neg.	0.1
For gas works	27.9	Neg.	Neg.	0.1
Total consumption of coke (other than at gas works)	26.1	Nil	Neg.	0.7
Total	230.8	2.1	0.6	5.0

Neg. indicates negligible or small amount.

already exists: exhortation has the backing of the law. But probably the only way to induce industry to install modern boilers is to make its old ones too expensive to run by raising the price of coal. The smokeless fuels needed for houses are not produced in anything like sufficient quantity, nor is it easy to see how, given the supplies, landlords could be induced to install the appropriate sort of grate. Until such problems are tackled there is little point in proceeding with the proposed smokeless zones that include residential districts (the two which are at present enforced cover only factory areas). Meanwhile, preventive measures, such as fog warnings and exhortations to stock small quantities of coke, are the merest first aid.

Society and the Homosexual

THERE is one big difference between the present excitement over homosexual offences and the similar excitement, a year or so ago, over crimes of violence. Then, the agitation came from the general public, backed up by some of the judges, whereas the Government kept its head and refused to be stampeded into panic measures. Today the public appears to be largely indifferent to the so-called vice wave, and the denunciation of it appears to have come mainly from public figures.

The whole subject is indeed badly in need of dispassionate consideration before emotions become more widely roused. For, like all forms of sexual activity, it is a question on which public emotion can be whipped up very quickly and towards which the attitude of society can vary hugely from one generation to another. Thus, the increase in the statistics of homosexual offences, though it is indeed notable (more than fourfold since 1938), does not tell the whole

story. What one does not know is whether in the meantime there has been a change in the attitude of the police towards prosecuting the offenders. More information is also needed on the extent to which homosexuals pervert the young. According to a parliamentary answer given last week, the Home Secretary appears to believe that most of them are a danger to children. But is his belief perhaps merely based on the fact that cases in which children are involved are the ones that are most likely to be reported to the police?

Few people will dispute Sir David Maxwell Fyfe's contention that children must be protected from the homosexual as from other sexual offenders—though some will maintain that more harm can be done to the child by the court proceedings than by the offence itself. Many people, however, think that a distinction should be drawn between offences against children and homosexual relations between adult males in private. It was not, after all, until 1885 that Parliament made "gross indecency" committed by males in private a misdemeanour liable to be punished by two years' imprisonment—and in doing so presented blackmailers with a wonderful opportunity. There are, in fact, strong grounds for an objective inquiry into the working of the law against sexual offences of all kinds and the right method of dealing with offenders, and it is greatly to be hoped that Sir David Maxwell Fyfe will agree to appoint one.

Punishment for Wife-Beaters

Day after day the police reports teem with cases of brutal men being punished by fine or imprisonment for ill-treating women. Doubts have been expressed whether this proceeding, by depriving women in many cases of their usual and sole support, and by exciting the anger of the men, may not make the condition of the women worse than it is; but no doubts whatever can exist that if the punishment is to be efficacious as an example, and influence the conduct of those by their apprehensions who live beyond the immediate circle of the punished and angry individuals, it must be known that it is inflicted. What means, then, are taken for making it known throughout all the "back slums," "alleys," *culs de sac*, and out-of-the-way places of the metropolis, that severe punishment is regularly inflicted for wife-beating? Are the newspapers relied on? Those which the poor read are published only once a week, and only a few of the wife-beaters read even the weekly papers. Nor do the papers make such cases known with authority or in a way to make them impressive. As the cases are described *viva voce*, and a knowledge of them is spread from the parties punished to their neighbours and in the localities, they are discoloured and misreported; and even if correctly reported and in a way to make an impression, a knowledge of the facts can by these means be spread only very slowly through the classes the punishment is intended to reform. . . . It is in truth little better than a waste of suffering—a sort of gratuitous cruelty—to inflict punishment as an example, and not make the infliction known. We would hint, therefore, to all concerned, that every instance of punishment for ill-treating women should be shortly but emphatically described by the police authorities, printed on large posting bills, and displayed on the walls and thoroughfares of all places where it is likely to be useful.

Letters to the Editor

Middle Eastern Alternatives

SIR—In your issue of November 21st you say that the Egyptian negotiators have “the growing feeling that if they wait until 1956 and then exercise their right under the Treaty of 1936 to appeal to the United Nations against the unwanted presence of foreign troops, they are sure of a heavy vote against any British claim to stay.”

I do not pretend to know the feelings of the negotiators, but if you are right, they have misread the 1936 Treaty.

So far as the treaty itself is concerned, 1956 is merely the date at which negotiations for a treaty to replace it must, as opposed to may, commence. The new treaty, however, must provide for an alliance between Britain and Egypt by which *inter alia* “in the event of war, imminent menace of war or apprehended international emergency” Egypt will accord to Britain “all the facilities and assistance in its power including the use of its ports, aerodromes and means of communication.”

Subject to the foregoing, the new

Readings in Price Theory

EDITED BY G. J. STIGLER and K. E. BOULDING. “The most important of this whole excellent series . . . invaluable to any serious student of economic theory.”—*The Economist*. “Performs the valuable function of bringing together 25 noteworthy articles from the periodicals of the last 40 years.”—*The Times Review of Industry, American Economic Association Series*. 30s. net

Readings in the Theory of International Trade

“ . . . coupled with a comprehensive and systematic article bibliography, the papers here reproduced provide an indispensable survey of modern theory from 1923 to 1947.”—*The Economist, American Economic Association Series*. 30s. net

Monetary Theory and Public Policy

KENNETH K. KURIHARA. “Mr. Kurihara is a highly competent economist, with an unusual capacity for relating and synthesising theories developed by different thinkers . . .”—*The Economist*. 30s. net

40 MUSEUM ST., LONDON, W.C.1

treaty must be made by agreement of the parties; but if they fail to agree, the difference is to be submitted either to “the Council of the League of Nations . . . or to such other person for decision in accordance with such procedure as the parties may agree.” It is commonly but erroneously supposed that the United Nations Organisation has replaced the League of Nations for this purpose. That this is not so, is made clear by the Foreign Office in *Anglo-Egyptian Conversations*, Nov. 1951 (Cmd. 8419), page 3, note 2, where it is stated that “clearly only arbitration of the latter kind is applicable now.” The hypothetical arbitrator must therefore be one agreed by Britain as well as Egypt, and the field is open.

The stationing of forces in the Canal Zone is governed, under the Treaty, by Article 8 and ends when the parties “agree that the Egyptian Army is in a position to ensure by its own resources the liberty and entire security of navigation of the canal.” Again, in default of agreement on this question after 1956, there is provision for arbitration.

That in circumstances prevailing after 1956 an arbitrator agreed by Britain and Egypt would determine specifically that “the Egyptian Army is in a position to ensure by its own resources the liberty and entire security of navigation of the canal” is anything but a foregone conclusion.—Yours faithfully,

J. ENOCH POWELL

A Mission to Moscow

SIR—Mrs Joan Robinson attacks you for saying that the British Council for the Promotion of International Trade “has associations with the Communist party and its discredited offshoot, the World Peace Movement.” This she “knows personally to be entirely without substance.” It is disappointing to find that she does not provide facts to prove this. In the absence of such information, I, for one, am bound to agree with the opinion of the Foreign Secretary that the BCPIT is a Communist front organisation.

The World Peace Council, “whose work should now become the pivot of the entire activity of the Communist Parties” (Cominform resolution of November 29, 1949), at its meeting in February, 1951, passed a resolution which states: “The World Peace Council decides to convene in the Soviet Union in the summer of 1951 an international economic conference of economists, technicians, industrialists, businessmen and trade union leaders of all countries. . . .”
