The net profit for the year, after providing for directors' salaries, contributions to pensions fund and ample depreciation, is £60,387, as compared with last year's figure of £39,402.

It is recommended that a final dividend of 15 per cent be paid on the ordinary shares, making a total of 25 per cent for the year, and a final dividend of 15 per cent be paid on the employees' shares, making a total of 20 per cent for the year.

Our subsidiary company has again shown a trading loss for the year, which is to some extent unavoidable. We are, however, steadily progressing with the development and mechanisation of this business and believe that in due course it will produce its full quota of profit.

During the year, we have acquired the lease of a new site at Exeter, and propose to extend our depot and facilities at this centre of our operations in that area. We have also purchased the freehold of a site at Birmingham, and are extending our activities in that area.

The overall position is that in face of difficulties and highly competitive conditions, we fully maintain our output and keep ourselves in readiness for expansion when the opportunity presents itself.

The report was adopted.

SIMMS MOTOR UNITS

MR J. AYRES JOINS BOARD

The annual general meeting of Simms Motor Units Limited, was held on July 23, 1953, at the registered office, Mr T. Thornycroft (chairman) presiding.

The following are extracts from his speech:

The profit and loss account shows an increase in net profit before taxation of £204,582 from £258,876 to £463,458. These results have made it possible for the directors to recommend a dividend on the ordinary shares of 30 per cent, and as a start to bring the authorised capital of the company nearer to the capital actually employed in the business due to profits having been ploughed back during the past years; a one in five free share bonus issue to ordinary shareholders is proposed.

A few months ago there developed around the board room table a difference of opinion. Certain decisions were taken that destroyed the hitherto happy and co-operative understanding among our directors; the solution was found by terminating Mr Scott's appointment, and his resignation from the board was accepted.

We have just completed an agreement with the American Bosch Corporation of Springfield, Mass., for the complete interchange of engineering knowledge, production technique and the use of patents relating to all types of fuel injection.

Mr T. Thornycroft did not seek re-election and retired from the board.

Mr J. Ayres, who was recently appointed general manager, was elected to the board.

Mr G. E. Liardet, managing director, is the new chairman.

TRUMAN HANBURY BUXTON & COMPANY

TOTAL SALES MAINTAINED

The sixty-fifth annual ordinary general meeting of Truman Hanbury Buxton & Company, Limited, was held on July 30th in London.

Mr G. Dent (the chairman), in the course of his speech, said: It is satisfactory to report that our total sales of bulk and bottled beer for the year to March 31, 1953, continued at practically the same level as the previous year. A small decrease in the bulk trade in London was more than compensated for by an increase in the sales of bottled beer and the sale of Burton beer. London sales in bottle, as was to be expected, continued to rise, but not at quite the same marked rate of increase as in recent years. The free trade, however, showed a satisfactory increase.

Trading profit for the year shows a decline on last year's figure, in spite of the maintenance of our barrellage, although it still exceeds the 1951 figure by £74,000.

The net profit of Truman's, after providing for taxation, amounts to £239,708, and after bringing in the amount of £50,000 from tax reserve, and adding the carry forward, there is an amount available of £609,070, as against £617,411 in 1952. It is proposed to pay a final dividend of 8½ per cent on the ordinary stock, making, with the interim dividend already paid, the equivalent of 11½ per cent on the ordinary capital for the year.

As regards the future, the indications are that the current year should show an improvement in profit rates owing to the lower cost of materials.

The report and accounts were adopted.

Qantas air networks link many of the world's major centres of trade and travel. There are over 60,000 miles of Qantas routes linking 21 countries on four continents with regular first-class services. The *Kangaroo* service (in parallel with B.O.A.C.) from London to Sydney provides alternative routes across Europe, the Mediterranean and India. Only by Qantas can you fly the direct *Wallaby* route—Johannesburg to Sydney—and other exclusive services from Sydney to Hong Kong, Manila, Tokyo, New Guinea, Pacific Islands and (with TEAL) to New Zealand. All the way on Qantas routes you enjoy impeccable service and warm Australian hospitality. Over 32 years' flying experience! Consult your travel agent.

For textiles in the making...

The raw materials of textiles may be natural or synthetic, but whatever their source, they all undergo a long series of improving processes in transition to the finished article. Very widely used for such processing is Lensitol, a solvent scour, and Teepol, one of the range of outstanding detergents and specialised wetting agents developed by Shell. Teepol has remark-

able wetting and degreasing powers and can be used at every stage in the wet processing of all types of yarns and fabrics. The wide application of Teepol throughout the textile industry is but one example of the way Shell Chemical products—many of them largely unknown to the general public—play an important part in the production of better quality goods for all to enjoy.

Second Session

AMID all the speculation about the possibility of an autumn election, few Conservatives have been heard to oppose the idea on the grounds that their party might lose. That is the measure of the change in the political situation over the past twelve months. There is some suggestion that delay might ensure the party a more secure victory, for it is doubtful whether the Conservatives have yet made much impression on the mass following of the Labour Party. But the doubts and uncertainties which beset Ministers twelve months ago have been dispelled by a mixture of good management, good luck and weak opposition.

The parliamentary session of 1952-3 does not end technically until the last week of October, but the few days left over for the autumn postscript will not provide much of significance, and the second session of this Parliament can be regarded for practical purposes as having ended last week. The Government may regard it as a moment for self-congratulation, if only for their success in learning from the mistakes of their first session. It will be recalled that, having won the election of October, 1951, the Government produced a King's Speech proposing three major Bills—Transport, Steel and Monopolies. By the end of the following July not one of these measures had even received a second reading. A Transport Bill had been produced, but only to be withdrawn hurriedly in the face of criticism. The idea of a Monopolies Bill was sunk without trace (and, so far as major proposals are concerned, has remained so ever since). The final humiliation of that first session came when the Government, unable even to handle its attenuated programme, was forced to bring into action the complex machinery of the guillotine for use on the little Licensed Premises in New Towns Bill.

The second session went better from the start, partly because of the encouragement given in its early weeks by the Wycombe by-election, which was taken as showing that any popularity lost by the Government in its first twelve months had been recovered, but mainly because Ministers approached their parliamentary task in more realistic mood than the year before. The Queen's Speech was not so ambitious, while the Government was ready to launch the two denationalisation Bills at once. Over the months there was some faltering, owing largely to muddled tactics over the Transport Bill, but the Government has on the whole managed, in spite of interruptions for royal occasions, to carry through its programme with ease.

The legislative programme, however, is neither an end in itself, nor is it the main criterion of a Government's success. Acts of administration make much more impact nowadays on the public mind than Acts of Parliament; and both tend to be overshadowed by acts of God—or at least by external circumstances beyond a Cabinet's conscious control. Certainly, the rise in Conservative stock in the last nine months has not been primarily due to anything the Government has done in the same period. In the main, it has been the result of their good fortune

and the mistakes of their opponents; and in so far as their own actions have had anything to do with the case, it has been the delayed effect of the steps they took in their first year that has affected their standing in the country rather than any new lines that have been struck out in the second.

For once, the stars in their courses have seemed to be on the side of a British Government. The largest piece of good fortune has been the favourable movement of the terms of trade which began just before the election of 1951, and has continued ever since at a pace fast enough to have a perceptible effect on the balance of payments without being so fast as to create great distress in the primary producing countries of the world and thus reflect back on British exports. The political climate of the outside world has also changed—apparently for the better—both before and especially since Stalin's death, and whatever doubts may be felt about the Prime Minister's great speech of May 11th as a contribution to world diplomacy, it certainly worked in the sphere of domestic politics to capture for the Conservatives all the credit that could be derived from the lightening (apparent or real, as the sequel will show) of a cloud that oppresses every citizen. The Coronation, too, has helped the Government. Scrupulous though Ministers were to avoid any suggestion of turning it to deliberate party advantage, there can be no doubt that the atmosphere of mingled loyalty, optimism and confidence that the Coronation inspired would be of some help to whatever party chanced to be in office at the time—but quite particularly to a traditionalist party such as the Tories. A fourth piece of external good fortune—external, that is, to the Conservative party—has been the behaviour of the Opposition. Oppositions always take their colour, inversely, from the Government. Labour was aggressive in the first session of this Parliament because of the general tendency to treat the Government as a transient and embarrassed phantom; and any Opposition would have been more placid in the face of the Government's greater strength this year. But it was a piece of uncovenanted good fortune for the Tories that they were faced with an Opposition quite as demoralised as Labour has been.

★

Against all these pieces of good luck, the only serious piece of ill fortune has been the crop of illnesses, culminating in the need for Sir Winston Churchill to take a complete rest. Even this has hardly risen above the level of an inconvenience. Indeed, it may even in the long run have done the Conservatives a good turn, since it has provided an opportunity of showing how strong an alternative government can be found within the party even when the leader and the deputy leader are away. Mr Butler, in particular, has borne his unprecedented burden in a way that has considerably enhanced his stature. One has only to think of what would have happened to the Labour Government in 1947 if both

Mr Attlee and Mr Bevin had been away at once to realise how much greater is the fund of administrative competence among the Conservatives.

Whether there is much more than administrative competence is the question that remains. The significant, and possibly the dangerous, thing about this second session has been that the Tories have done so well in terms of public esteem with so little effort at policy-making on their part. It was in their first year that they showed courage in adopting supposedly unpopular policies, such as the cuts in the food subsidies and the return to an orthodox monetary policy. From the start, these policies were not nearly as unpopular as had been foretold; but equally, perhaps, they did the Tories little good on balance in that first year. It is in this second year that they have been bearing their fruits, and that the Tories have been reaping the electoral harvest.

Why, then, have they not gone further? The country has had a clear demonstration of the truth of the central doctrine of Tory economic policy—that in economic matters freedom works better than control and is more popular. There is no doubt whatever that, in the housewife's mind, slightly higher prices are well worth paying if they are the means to freedom of choice and to the abolition of rationing. The demonstration has contributed to the *malaise* within the Labour Party, for it has reinforced the doubts of the right wing about the glib enthusiasm for controls still current on the Left. But why have the Conservatives themselves taken so little notice of their own success? Why have they been so much more cautious in the pursuit of "realistic" policies in their second year, when their effectiveness and popularity were a matter of demonstration, than in their first, when public opinion was still so suspicious? Why do they not do to housing what they have already done to food—that is, end the shortage by a realistic approach to prices? In default of any other explanation, the suspicion inevitably arises that they have not been acting on policy at all, and that their earlier strokes were accidents which have turned out well, but which they do not know how to repeat.

None of the elements that have contributed to the Government's popularity can therefore be regarded as stable. External events, either political or economic, might turn traitor at any moment. The Labour Party may succeed in re-discovering some leadership somewhere in its ranks; and in any case it will perk up, as all Oppositions do, if Ministers get into difficulties. And the impetus originally provided by the bold measures of the first few months will be exhausted within a few months unless it is soon renewed. What can be done by Bank Rate and denationalisation has now been done. If the Tories want to keep way on their ship, they will have to have some positive and forceful policies for 1954. The materials are at hand; so are the men who understand them. If (with or without an election) the two can be brought together, then this summer may not prove to be the high water mark of the Tory revival.

The Voice of Molotov

THE Soviet Note about a conference on Germany published on Wednesday is a useful reminder that Molotov is still at his desk in the Kremlin. If it were not for its moderate and reasonable tone, it might be mistaken for one of the missives that were exchanged before the Palais Rose talks of 1951. Otherwise there is no trace of the Malenkov "new line" that had been so eagerly awaited. The stubborn attitude taken up is familiar, the development of the argument is full of echoes of the past, and on this evidence the four powers are no nearer agreement on Germany than they were in Stalin's day.

For those who feared that the Allied note, with its whittling down of the Prime Minister's initiative, had ruined an opportunity, the Soviet reply brings some reassurance. For it agrees to a four-power meeting, even though it refuses to exclude the problems of Asia and the voice of China, and takes a view of the agenda exactly opposed to that expressed in the Allied notes. (It sounds like the voice of Her Majesty's Opposition.) The United States, British and French governments suggested precise and limited negotiation on ways of unifying Germany, the piecemeal approach of the good diplomatist. The Soviet Government suggests a wider and more general approach, with a vague agenda and references to such infinitely controversial matters as "military bases on the territories of alien countries." In fact Moscow has cleverly taken up Sir Winston Churchill's thesis of wide-ranging and high-level discussion without making any concession to his wish to meet Malenkov or someone other than the familiar Molotov.

★

There is a quite different sense in which it can be said that the Soviet Note might have been worse. Those who think that Sir Winston was wrong on May 11th, who doubt whether the Russians want German unity on any terms acceptable to the West (including the West Germans) and who are not satisfied that there is yet any substantial change in Russian foreign policy—to such people the Note will bring special relief. Nothing in it will embarrass Dr Adenauer in his election campaign; no new effort is made to divide the allies; no doors are closed, but none are opened on new and dark passages of negotiation where there might be fresh delays and confusion. Above all, the Russians have not done what they might have done—that is to say, offered to discuss free elections in Germany without any intention of letting them be held. Such an offer, made at this moment, would have caused the friends of the West in Germany acute embarrassment. They have, perhaps, the workers of East Germany to thank for this omission. Free elections in Communist Germany after the events of June are, for the time being, unthinkable.

Instead the Russians have said that they will come to a meeting of Foreign Ministers to discuss an agenda of

two vaguely phrased items: measures to decrease tension in international relations, and "the German problem, including the problem of the reestablishment of German unity and the conclusion of the peace treaty." That is tantamount to saying that they wish above all to discuss the security of the Soviet Union, as Sir Winston hinted on May 11th that they would; and when they refer to the "basic problems of Germany" they have in mind the question of what shall be the frontiers of a united Germany and who will guarantee their permanence. They do not care to say so in plain words, for this is not a good moment to let it be thought that part of the Russian price for German unity is acceptance of the Oder-Neisse Line. In fact, however, that is almost certainly the price, and to the Russians the allied insistence on such aspects of German affairs as free elections is an evasion of the basic question—how the Soviet Union is to protect itself against a resurgent Germany. This may possibly open an avenue to real negotiation once it is known who can speak for Western Germany.

It is not clear how the various arguments of the Soviet Note are linked to one another. They do not sound like hard and fast conditions. Is it seriously intended this time that China should attend the more general part of these talks? If so, Molotov must not expect to see Mr Dulles there. Does the Kremlin want to do a deal on bases? That is to say, if the Americans and British removed their bases from the territories of their allies, would the Russians remove theirs along the Baltic, the Black Sea and on the communications of Eastern Europe? It is an interesting possibility. But on such general matters the allies would do best to say again that they see no point in talking about each and every cause of international tension until they have tested the possibility of negotiation and agreement about the main one, Germany. They cannot contemplate for a moment, Sir Winston Churchill least of all, another Yalta in which the Great Powers attempt global bargaining—what the Soviet Note calls "a free discussion of the ripe international problems." Nothing would divide the allies more quickly than any such conference; and it must remain the prime object of the Russian Government, however sincerely it may seek a detente, to divide the United States from Britain and Europe.

The position therefore seems to be this: there can certainly be a conference of some sort, though perhaps only after a lot of wrangling over the agenda. But there is no encouragement for the belief that it would produce results of any substance. We are, then, back to where we were before the Prime Minister spoke on May 11th. There is, in these circumstances, still something to be said for trying to get a conference, and something to be said against it. But the decision has again become one of tactics, not of high strategy.

Diplomacy's Left Hand

THE Berlin fight for food parcels is the most fantastic and revealing thing that has happened in seven years of cold war. For over ten days stocks of food held in the western sectors of the city have been made available free to all hungry Germans under Communist rule who care to come and fetch it. Despite police action, denunciations on the wireless, reports of spies and restrictions on travel, they have come in their hundreds of thousands. Every East German traveller to and from the city, whether he carries a parcel or not, has become a witness against the Ulbricht regime, registering his protest against hunger and tyranny. And as West Berlin's precious reserves of food—held against another possible blockade—move behind the iron curtain, \$15 million worth of food from America, released and paid for by order of the President, is being unloaded in North German ports. Indeed, the latest move in this game is an offer from Dr. Conant to release funds in American banks standing to the credit of the East German Government so that it can buy American food for its suffering population.

All this looks, so far, like the perfect propaganda operation, the psychological warrior's dream: a simple idea, launched at the right moment with money and organisation behind it, has set hundreds of thousands of people acting publicly against their government. Yet neither the United States Government nor the American authorities in Germany and Berlin seem anxious to claim credit for it. Instead, they insist that this is a matter between the free Berliners and the Germans behind the iron curtain, a gesture of humanity and sympathy from the former, who decided very wisely to do nothing while the latter demonstrated in the streets on June 17th. The British and French authorities in Berlin appear to have opposed the idea of distributing food, and even some American officials feared that this political exploitation of hunger and discontent might prove a boomerang. So far it has had no grave consequences.

★

This Berlin incident comes as the climax of several momentous months during which the press and radio of Moscow and other Communist capitals have been full of denunciations of cloak and dagger work by Western agents. They have denounced saboteurs, political agents, incitement by wireless and leaflet, the passing of money to agitators among the workers—even the distribution of arms. Strange though it may seem, the men who kept the Greek frontiers ablaze and organised the blockade of Yugoslavia appear terrified of what the West has done against them. Even in Stalin's last months there were clear indications that the men of the Kremlin took very seriously this counter-attack in the

cold war, and since the fall of Beria the references to it have become increasingly hysterical.

It is against this tense and complex background that questions about these events in Berlin have to be asked. Was the distribution of food a carefully organised propaganda operation, with all the risks and advantages calculated ahead? Was it done with the full approval of the three Western governments? To what extent has Herr Reuter, Berlin's mayor, acted in this matter as a free agent and to what extent has he been promised full allied support? Is it the case that German organisations in West Berlin carry on subversive activities in Eastern Germany and East Berlin with the full knowledge and approval of the Western allies? If, for any reason, this food operation had gone wrong and had produced a diplomatic crisis in Berlin, these are the questions that would have been asked. Although it has so far gone right, they still need to be asked; for they go to the root of a vital question: What should be the role in Western policy towards Russia of political and economic pressure on the Communist empire?

Let us assume that the food distribution was a thoroughly prepared operation and not just a bright idea that happened to work; as such it had much to commend it. It would produce observable results, its effects could to some extent be controlled, and it could be stopped if it turned out to be dangerous. It met a genuine human need, it exposed the shortcomings of Communist planning, and it confronted the East German authorities with the impossible task of preventing hungry people from getting food they needed. By objecting to it the Russians would appear either cruel or foolish, or both. If the organisers were asked what was their ultimate purpose they would doubtless reply: to weaken still further the Communist hold in Eastern Germany and so bring nearer the day of unity and freedom for all Germany. Here, then, are some criteria of successful psychological warfare established in the field in Berlin. How far are they being followed elsewhere? The Voice of America, and the BBC (under the loose policy direction of the US and British Governments), Radio Free Europe and RIAS in Berlin (under even looser control), overt and covert propaganda stations ranging from Belgrade to Madrid, boom hour after hour into the Communist empire. Leaflets are floated into Czechoslovakia by balloon; counterfeit newspapers warn people against currency reform; pilots are rewarded with thousands of dollars and American citizenship for delivering Russian jet-aircraft. Clearly, all this activity does not and cannot conform to these criteria. The results are not strictly observable, the effects cannot always be controlled, and it is by no means clear whose job it is to stop or reduce these activities should allied policy require it. (Who, for instance, decided what RIAS Radio in Berlin should say when the

workers in the eastern sector began to demonstrate on June 17th?) It appears that many things are being said and done in the name of allied governments over which they have little control.

★

There is a further consideration of great political importance. If it is the intention of Britain, France and the United States to deal as a team with the Soviet Government, then they should be in a position to give a joint answer to any Soviet inquiries about cold war activities. It seems most unlikely that they could do so. Indeed, it seems doubtful whether London, Paris and Washington have anything but the most general agreement about the objectives of their policy in Eastern Europe. What precisely is their hope and purpose? If it is that the Russians will be persuaded eventually to withdraw their forces from Europe, then it would seem unwise to increase Moscow's fear that Communist regimes would not survive the departure of the Red Army. If it is that the Russians and their collaborators should be made now to feel that Eastern Europe is too hot to hold them, then the western powers must know precisely what they will do if—say—there is a successful rising against the Communist government in Prague. If they intend merely to look on in helpless surprise, as they did six weeks ago in Berlin, then it would be wiser and kinder to stop encouraging the spirit of resistance in Czechoslovakia. If, on the other hand, their policy has no long-term objective, if the purpose is simply to cause such political and economic strains in the Russian empire as will frustrate Moscow's planning and cut down the industrial and agricultural production of the satellite economies—well and good. The plan, if it is a plan, seems to be working, and it has the merit of putting the Communist Party everywhere in the embarrassing position of opposing instead of backing the demands of the workers.

There is no evidence that the purposes of psychological warfare have ever been worked out and agreed in such deliberate fashion. No doubt the whole western effort, seen from Moscow, looks systematic, powerful and sinister, for no one fears conspiracy more than a conspirator. No doubt in Eastern Europe people still feel, after seven years of oppression, that liberation must come by one means or another, and that their friends in the west know just how to bring it about. But in fact—apart from the carefully planned restrictions on west-east trade—it looks as if conduct of the cold war from this side of the iron curtain is still a thing of fits and starts, of bright ideas imperfectly directed, of organisations of exiles using large private funds to do more or less what they like.

There can, of course, be too much planning and too much red tape in these matters. But it is most important that the Americans and their allies should guard against two risks. The first is that their propaganda might produce behind the iron curtain an unexpected development that they dare not exploit because they

have not calculated the consequences of doing so. The second is that their activity may produce effects that run directly contrary to the purposes of their diplomacy. If, for example, they want the Russians to concede as quickly as possible free elections in Eastern Germany, should they or should they not encourage resistance to the Communist government there? It is not an easy point to decide but it should be clearly understood where the responsibility for deciding it lies. The West has, in its ability to switch the heat on and off the Communist governments of Eastern Europe, a most valuable weapon that the Russians clearly fear. But it cannot be properly used in negotiation unless the Americans, British and French show that they have the whole apparatus of subversion under strict and joint control. Even the Cominform got into difficulties when Stalin gave Zhdanov his head. The counter-Cominform will run into greater difficulties if the right hand of diplomacy not know what its left hand is doing.

Peace or Appeasement?

We can perfectly understand the ideas and arguments of those who hold that we ought to have no continental alliances whatever; that we should abstain from all interference either in the internal or the international affairs of Europe; that when we see . . . powerful states bullying and partitioning their weaker neighbours, we should . . . pursue our course of sublime and selfish isolation, regardless of the fate of others. But what we cannot understand is, that politicians who do not hold this hideous and shallow doctrine in all its nakedness, and who are not prepared to carry it out to all its consequences, should not at once perceive that if there ever was a case in which we could not honourably refuse to interpose—if there ever was an ally whom we were bound to support—if there ever were engagements which on every principle . . . we must adhere to—such have now presented themselves in this Eastern dispute. . . . If England flinches now, she may bid adieu to peace for ever. She has announced her conviction that Turkey is right, and her resolution to support her; and if she now backs out of the controversy, she proclaims to all the world . . . either that she will not, or dare not, or cannot, maintain what she deems right, or carry out what she has resolved to do. This is what Russia is now anticipating, and what has emboldened her to a course which a few years ago she would scarcely have ventured to take. She is deliberately calculating on our weakness, our love of peace, our hatred of expenditure; and, if by receding now before her, we show that her calculation is correct, the same calculation will be made, the same game will be played, and the same result expected, whenever any one of the great Powers finds it desirable to bully an ally or to trample on an interest of England. We shall not avoid war by such a course of yielding: we shall invite it—entail it—necessitate it. The only difference will be that, whereas now we have a good cause, a high prestige, an honourable character, a formidable name—on future occasions, if we yield now, we shall enter on our inevitable and self-incurred struggles with damaged reputation, with diminished strength, and with the odds against us fearfully increased.

Food at the Bar

THERE are still some trades in which a man can start with a few hundred pounds saved and build up a highly successful business. One is the snack bar trade, which in recent years has been a fruitful source of quick returns. Like the rest of the catering trade, it benefited from the meagre domestic rations that drove people to "eat out." Like the rest of the trade, too, it benefited from the inflationary boom and reached its peak around 1947. Like the rest of trade it has lost a substantial part of its custom since the beginning of 1951. But snack bars have not suffered from the recession as much as restaurants, which is not surprising since they provide a more utilitarian form of eating. The snack bars do not seem, however, to have captured any of the restaurant trade's custom. The customer, they find, is very conservative about the kind of service he wants. If he is used to a restaurant and it gets too expensive for him he goes to a cheaper one. The snack bars' new customers are not converts, but young people who have never developed a devotion to table service.

The 15,000 snack bars in the country include both the Mayfair salon where smart women eat slimming salads and the pull-up where strong men drink strong tea. But all ranks of the trade enjoy a common advantage. They can feed up to ten times as many people in a given time as a restaurant of the same size, and their labour costs are lower. Snack bars, to an even greater degree than restaurants, can employ women almost exclusively, and need pay them only 70 per cent of men's wages. Broadly speaking only those that keep open in the evening employ a man. The girl behind the counter gets, in London, a minimum of 74s. 6d. a week and her midday meal for a 47-hour week. In practice she gets about £5, because she expects some compensation for the tips that she would have got as a waitress. This is a big rise from the 35s. that was paid before the war for an average week of 54 hours. But it still makes for a low wages bill compared with the restaurant.

With labour costs that average perhaps 20 to 22 per cent of gross receipts, compared with some 26 to 28 per cent in restaurants, snack bars are able either to work to a higher percentage net profit or to give the customer better food value for his money. Most of them work to the principle that the food should cost them about 40 per cent of what they charge the customer. Net profit varies; but a typical big firm works to 7 per cent of its turnover.

It is a further advantage of the trade that the capital required to start with need not be large. It can be as little as a quarter's rent in advance, the price of a machine to brew coffee and tea, a large refrigerator, the cutlery and crockery. Experience shows that it helps to go into the business with a large family, preferably Italian. Then there need be no trouble about minimum wages or social insurance or sanitary accommodation

per number of employees. The bar can keep open in the evenings when its competitors, who would pay wages of time-and-a-quarter after 7 o'clock, find it not worth while—except perhaps on Saturdays and Sundays. It can be explained to the Ministry of Labour's inspector that everyone in sight is a partner and therefore exempt from the working of the Catering Wages Act.

If this is promising field for small enterprise it has also attracted large-scale business as well. Big firms in the chain café business are drawing very near to snack bar territory with the cafeterias they have installed in their former tea shops. The difference is that there are tables, and "main" as opposed to only "light" meals can be bought. But as many snack bars have a table or two as well as their shelves and high stools, the dividing line between cafeterias and snack bars is blurred. It has long been blurred between snack bars and milk bars, which form the largest form of undertaking in the trade. There are five big firms—three in London and two in the provinces—which between them operate nearly 100 out of the thousand or so milk bars in the country. A chain of 20 establishments may not sound a large business, but the annual turnover may well exceed £250,000.

★

Milk bars were unknown in this country until 1935. Their rapid development before the war was indirectly helped by the Milk Marketing Board, which made a payment to them, proportionate to their consumption of milk, for the purpose of advertising their milk shakes and milk soups. When the war came and milk was short they had to find other things to sell, and it was then that they started to provide snack meals. Since the war milk drinks have not regained their prewar popularity—partly perhaps because people drink more milk at home. The price no longer favours the milk bars. They used to get a discount from the wholesaler in proportion to the amount of milk they bought; for a flourishing chain of milk bars, this might be as much as 10 per cent. Now they always have to pay the full wholesale price. A milk shake that cost 4d. in 1938 now sells at 9d., at which price the retailer's profit margin and the customer's demand are both lower than they were before the war. The demand could no doubt be stimulated by reviving the national publicity for milk sales—and that may well happen now that there is again a surplus of milk.

Meanwhile proprietors have wasted no time crying over unwanted milk. They do better out of the cups of tea that the customer buys instead. Indeed, at some 200 cups per lb, it would be best if all their sales were cups of tea. They do not work to the same profit margin on all that they sell. The margin on tea can be set against other things about which the customer has a more than

usually tough price resistance; so can the margin on coffee. In the same way sandwich prices rarely reflect their relative costs. The more expensive varieties, the chicken and smoked salmon, are often better value than the lettuce or tomato sandwich. The customer likes a varied menu, but he will rarely pay more than about 2s. for a sandwich whatever it is made of.

There have been other changes in public taste. Customers now show a preference for well-known brands of fruit squash or ice-cream or whatever it might be. Ice-cream was a firm favourite after the war, but its popularity has fallen markedly—partly because sweets have become plentiful. This may be inconvenient for the milk bar company that makes its own ice-cream—and, indeed, for everyone, for ice-cream, unless sold ready wrapped, is one of the most profitable lines. But such adjustments have continually to be made. Cheaper ham, at least, has helped the snack bar trade at every level, for the ham sandwich is still by far the most popular.

On nutritional grounds it is clearly a pity that the public should give up milk shakes and resort to cups of tea. Is it also a danger to health that more people should eat the kind of food that is sold over the snack bar? This includes just the foods that most readily carry bacteria; milk itself, cooked meat, salads, synthetic cream and ice-cream. None of the recent outbreaks of food poisoning has been attributed to a snack bar; the majority are traced to meals in schools

or industrial canteens. But a snack bar that is selling salmonella sandwiches is not easily identified. As the victims are scattered and unknown to each other the cause of the infection does not leap to the eye as it does when an entire school takes to its bed after dinner. Not that there is any evidence that snack bars cause more food poisoning than restaurants. They do cause more anxiety, because what the eye sees the heart has good reason to grieve over. It too often happens that under the customer's eyes sandwiches are pressed together with a suspect palm, the counter is wiped with a dirty cloth, the food is spread out for the flies. But dramatic newspaper stories about mass poisonings are teaching people to be wary of the dingy haunt with the dirty net curtains and the curling sandwiches. They are learning to prefer the bar where the food is protected by glass cases and transparent wrapping.

As a nation that is being driven to the bar by high wages, the British ought to set about making snack food a speciality. At present, at all but the best snack bars, there is too much saffron and too little imagination. But the "popular" clientèle likes its food highly coloured; and except in a few (usually expensive) "butteries", there has been little attempt to reach the more discriminating customer. Even without that attempt, however, the trade can expect a widening market—not, it is true, a return to the palmy days of the empty domestic larder, but certainly to a steadily increasing custom among young people.

Notes of the Week

Conscription and Commitments

IT is plain that when Parliament meets again in the autumn there will be a row over the length of national service. So much was clear from the Labour speeches that followed Mr Crookshank's announcement last week of the Government's decision to maintain the two-year period after the end of this year. The 1948 National Service Act expires on January 1st next, but it can be extended by order-in-council. The Government proposes to extend it, apparently for another five years. The order-in-council will have to be introduced early in the next session, but some time next year the Government will also bring in a new national service Bill designed to extend the reserve liabilities of national servicemen. At present their obligations come to an end when they complete their period of service in the

Territorial Army. The new Bill will arrange for them to be transferred to the "Z" and "G" reserves; they will then gradually replace the conscripts of the second world war on whom these reserves at present wholly depend.

This is a logical step, which ought not to arouse much criticism. Those Labour MPs, however, who have been pressing for a cut in the national service period see their arguments reinforced by the change in the general international situation. But if the diplomatic climate is milder, it has not yet produced any curtailment of Britain's overseas commitments. If the Korean truce can be made permanent and a settlement can be reached with Egypt, then commitments might be reduced to a degree that would allow the term of national service to be reconsidered. But at the moment the strategic arguments which forced the Labour Government in 1950 to extend the period from eighteen months to two years remain unaltered. Of the Army and Air Force men serving overseas, 42 per cent are national servicemen. If their term of service were to be cut, the turnover in overseas units would be increased to the point

where it would be well-nigh impossible to maintain reasonable fighting efficiency, while a wholly disproportionate number of men would be in the transport pipeline.

Until the overseas commitments can be reduced, the argument about national service is thus somewhat unreal. Even if the situation improves, it is by no means certain that a simple reduction in the present two-year period would be the best course. Mr Head, in the freer days of Opposition and in the less onerous military circumstances before the Korean war, once advocated a radical change, under which the fighting services would be manned wholly by regulars but all young men would be called up for six months basic all-service training. It would be interesting to know if Mr Head revived this theory during the review of the defence structure held last winter. Certainly a change is not precluded by the decision to extend the present system. Whatever period the order-in-council may lay down, the Government can step in at any time; and its critics should at least realise that no Government will retain the unpopular conditions of national service a moment longer than its conscience will allow.

No Overhaul for the Civil Service

MR ATTLEE severely criticised, last week, the forthcoming review by a Royal Commission of pay, hours and conditions in the civil service. He did so on the grounds that it would merely duplicate, and indeed weaken, the Whitley Council machinery now handling these matters. If the commission's terms of reference were so interpreted as to make it merely an umpire in that non-stop Test match in which the civil service unions and associations bowl and the establishment division of the Treasury keeps its wicket as best it can, Mr Attlee's criticism would be well justified; and the mere fact that twenty years, the traditional interval, had passed since the last review would be an inadequate reason for interfering with present procedures. More widely interpreted, however—and Mr Butler's reply suggests that the interpretation will be wide—the terms of reference could cover a revision of the actual rules of the game. This is not a question within the competence of the players, nor can it properly be settled—as Mr Attlee would seem to prefer—merely by Government decision as a matter of policy.

A more serious criticism is that the question both of "the principles which should govern pay" and of possibly desirable changes "within the framework of the existing superannuation scheme" is logically and practically linked with a much wider question which the Royal Commission is not empowered to consider: that of the relations between the civil service and comparable occupations in the outside world, and between its own constituent parts. There is, for example, little movement between the home and the colonial civil services, and almost no interchange between the civil service and local government, the academic world, and business. This is wasteful of manpower and deplorably narrowing to the administrator's experience.

Cohesion and continuity are indeed valuable things, and a certain price may justifiably be paid in order to avoid the temptations of a possibly divided loyalty, and to preserve that disinterested integrity of which British administration

is rightly proud. In view, however, of the enormous changes both in the size and in the role and competence of the modern civil service, it is almost unbelievable that the rules framed to suit earlier conditions are really above all criticism. If it is time for a review of the civil servant's pay, hours and conditions "against the background" as Mr Butler said "of the modern society in which he has to work," it is more than time for a review of his place in that society. Without such a review, any conclusions about the "principles" to which negotiators should work are likely to be unrealistic and empty. The Royal Commission may not be superfluous; but it is, perforce, tackling the job from the wrong end.

Lessons from Vienna

THE new move made by the Soviet government in Austria has valuable lessons for the statesmen and diplomats of the West who are trying to decide what Malenkov and Molotov really mean and how best to treat them. The Soviet government has by-passed the three other occupation powers and has dealt direct with the Austrian government about the future peace treaty. This is the first lesson: that Moscow is trying a new way to divert Austria from the western camp. If, after the elections in Western Germany next month, the Bonn government is presided over by anyone but Dr Adenauer, then it may be presumed there will be moves from the Soviet side to open *tête-à-tête* talks with the Federal Government's representative.

The Note from Moscow to Vienna, followed by similar messages to the western foreign ministers, demands that the Austrians themselves shall decide independently to withdraw support from the abbreviated draft treaty that was put forward for discussion by the three western governments a year ago. It reveals, too, that the Austrian government sent a memorandum to Moscow on its own account last June, in which it approved the Soviet suggestion to continue talks through diplomatic channels. The next government in Federal Germany will certainly also claim the right to enter into direct relations with Moscow.

It was originally an American idea to offer for inspection by the Russians a bare skeleton of a treaty, in which their claims to German assets in Austria and many other points had been omitted. Nobody seriously expected that the Russians would accept it as a basis for reopening talks. In fact, they did not even answer the last western Note proposing this course and the shock tactics seemed to have proved worse than useless. But the second lesson of the present Russian move may well be that this bold kind of diplomacy pays better, in dealing with Moscow, than Whitehall's more gentlemanly methods. If the West uses aggressive tactics and makes exaggerated demands instead of offering concessions and stating minimum terms, the men in the Kremlin can save face by getting the western side's excess demands reduced. Then they can, if they really wish to relax tension, safely proceed to offer concessions themselves. They have always had the advantage of being able to offer to stop doing something they should not have done in the first place, as Sir Winston Churchill has pointed out. The West might try the same practice.

De Gasperi's Fall

THE fall of Signor De Gasperi marks the end of an era not only for Italy but for Western Europe. With Mr Bevin, M. Schuman and Dr Adenauer, he was one of the architects of European union, who never allowed anyone to forget that in this aim he saw the best hope of re-establishing Europe's prestige and influence beside those of the giant powers. With his eclipse Dr Adenauer alone is left, and he faces a crucial election in a month's time. Whatever comes of that election it is to be expected that new political forces will emerge as new personalities appear.

When a few weeks have passed the long premiership of Signor De Gasperi may already be looked back to as something of a golden age, in which Italy enjoyed good government and freedom, both at the same time. As his biographer recalls in a book reviewed elsewhere in this issue (p. 385) the task has been arduous. When Signor De Gasperi came to power in 1945 his country, lying in ruins from the war, was still widely regarded abroad as an ex-enemy. Today, although insufficient importance is often attached to the trend of events in Rome, Italy is one of the leading members of the Atlantic Pact. At home, real wages are 20 per cent higher and the production index stands around 150 compared with the nineteen thirties; 110 billion lire a year are being spent on the first comprehensive programme of development ever to be undertaken in the south; land reform has been pushed to the limit of what is politically practicable in the country as a whole; and, by its import policies, the government has begun to succeed in making Italian industry more competitive.

Not for over seven years had anyone other than Signor De Gasperi been asked to form a government in Rome until President Einaudi last Sunday approached the right-of-centre Christian Democrat, Signor Piccioni, a man of 61. He has been in the last four governments and has long been regarded as one of the two or three most likely successors to Signor De Gasperi. The latter's fall, after the narrow but apparent victory of the centre coalition in the June elections, was due primarily to the lack of support from

the left centre. If Signor Piccioni can get some of the Monarchists to give him even passive support from the right by abstaining from voting, he may yet be able to perform the trick of forming a "De Gasperi government without De Gasperi." There is, however, a chance that the former prime minister might become Signor Piccioni's Foreign Minister. Even so, confidence has been severely shaken. Italy can no longer count on a stable government and Signor De Gasperi will not have the power to pursue his previous European policy with the old vigour and clarity.

Nigerians in Conference

THE conference between Nigerian political leaders and the Colonial Office began under the presidency of Mr Lyttelton last week. Although the chasm between the northern and southern point of view seems unbridgeable in terms of the past statements on both sides, it was a major achievement to bring the leaders to the relatively neutral ground of Carlton House Terrace. It may yet be that compromise is attainable through a prolonged "hanging of heads"—as Africans put it—in private conclave. Both northerners and southerners at least agree in wishing Nigeria to remain as a unity, realising the importance for Africa as a whole of bringing into existence an independent state of 31,000,000 Africans. Although the North considers that it holds all the cards in economic matters (a northern spokesman remarked this week that the North could starve the South out at any time) its leaders appreciate that the whole area is interdependent, and that social and economic progress will be slowed down unless it remains so.

The southern leaders, and especially Dr Azikiwe and Mr Awolowo, have taken their stand on early independence—by 1956. Mr Lyttelton had to concede that discussions might consider this date. But the southern leaders may find that they are compelled to trade early independence for their own regions against their political influence in the rich and undeveloped North and "Middle Belt." The North is taking its stand on independence from the South; more particularly on its right to run and recruit its own public services so that it can prevent these from falling entirely into the hands of educated southerners, who increasingly appear as an alien, and not over-honest, bureaucracy. The South thus stands to lose a hinterland for the exercise of its talents, now being trained in thousands in its own university and overseas.

The strength of the North's position is impressive, and so far efforts by southern Nigerian nationalists to split its solidarity have had little effect. If Nigeria's federal structure is to be saved, as is infinitely to be desired, Dr Azikiwe and Mr Awolowo may find that they will be advised to make concessions if not about the date, then certainly about the exact form of Nigerian independence. The Colonial Office is in a more than usually strong position to act as honest broker, in as much as it can point to the steady progress of the Gold Coast towards Dominion status, and also to the new Gambian constitution, as evidence of British consistency and good will in making West African self-government a reality.

Kenya's Future

It will soon be a year since the Mau Mau insurrection burst into flame. It will have been a costly year for the colony, costly in life, money and good will. The building up and deployment of large military police and information forces, and the ensuing growth of the strength and proficiency of the Kikuyu home guard have at last turned the scales against the terrorists—but even now, though harried and bombed, they can still mount strikes in bands of over 100 which inflict heavy casualties. It is now recognised in Kenya that, though its grip on the Kikuyu has been broken and its bid to overturn the government defeated, the terrorist organisation will prevent a return to peaceful associations for a long time yet in disturbed areas. Prolongation of bloodshed, furthermore, is having incalculable effects on race relations throughout Africa.

But there are still few signs that either the settlers' leaders or the government in Kenya have constructive ideas about the inauguration of a new era. The absorption of their energies in the fighting keeps bitterness and the sense of grievance alive for lack of more hopeful topics of discussion. Settlers' leaders significantly expressed fears about the shortage of manpower—white manpower—when the Lancashire Fusiliers left the colony, thus underlining their dependence on Britain and the frailty of Kenya's past settlement policies. Former talk about the settlers taking full power seems to have died down. Nothing, apparently, will happen until "circumstances permit" a conference of representatives of all races about the political future; meanwhile little has been said or printed to suggest that the settlers have any agreed programme to offer—beyond the "bowler-hatting" of colonial civil servants of whom they have made scapegoats, and ill-informed denunciations of "Indian imperialism." Settlers assert that they forewarned the government about Mau Mau; but their foresight does not seem to extend to the post Mau Mau period.

This is unfortunate. To win the confidence of Africans and Asians in European leadership, some demonstration of leadership, other than prowess in guerrilla warfare, is necessary. The settlers have had Mr Troup's report on agriculture, and the Royal Commission's report will appear in time. Rehabilitation of "deeply indoctrinated" terrorists is starting, and the welfare schemes so unpopular before the emergency are being inaugurated. But no clear picture of Kenya's future emerges; no framework, within which the much-talked-of racial political co-operation can take place, has been sketched. Both the Colonial Office and the settlers will have to think more quickly on these issues—and not for Kenya's good alone.

FACTS, FIGURES, AND OPINIONS

Morning Calm in Korea

THE prisoners are coming home at last. Korean Americans, Britons, and men from a dozen other United Nations armies have begun their journey home from the prison camps where some of them have been held by the Communists for as long as three years. The joy with which their families and friends welcome them will be shared by all the peoples of the free world; but it must, for some time at least, be tempered by anxiety about the fate of the large numbers still unaccounted for. A Red Cross team has at last been permitted to enter North Korea to help prisoners during the last days of their captivity; but it seems that the Communists will severely restrict its movements, and it may never be possible to trace some of the United Nations soldiers who, although identified by fellow-prisoners as having survived capture, are not produced at Panmunjom.

Nevertheless, the general atmosphere in Korea has been transformed by the signing of the armistice. The guns have fallen silent and the casualty lists are being closed. The opposing armies have not wholly relaxed, but the strain on men's nerves is now relieved by the creation of an evacuated zone between the lines. The "neutral nations" have sent in their teams to supervise the terms of the armistice and to help in the disposal of prisoners. Korea, the "land of morning calm," is beginning to recover some of the quiet that earned it its ancient name.

The skies are by no means cloudless. First reports indicate that the Communists are still proving suspicious and obstructive, even over the modest proposals for reciprocal action put forward by Red Cross and neutral teams. Intricate problems lie ahead, almost untouched as yet—for example, the question of withdrawing the opposing armies. And President Rhee's intentions remain obscure. Yet the armistice must inevitably grow stronger with every day that its machinery moves forward, however slowly; and the idea that fighting might be started again, whether by the Communists or by South Korean intransigents, is one that the passing of time may make fantastic for all but the President himself.

Libya and Britain

AFTER months of negotiation and bargaining, relations between Britain and the twenty-month-old Kingdom of Libya have at last been defined and stabilised; last week a treaty of friendship and alliance was signed in Benghazi. The Libyans' determination to make the most of their new independence, their inexperience in matters of treaty-drafting and the intricacy of the arrangements for stationing British forces in the country, have combined to make progress slow. In the event, the outcome is satisfactory to both parties.

The main object of the British has been to retain the military facilities that they have enjoyed since the war. This they have done. The position of the British troops in Libya has been regularised, and the rights and facilities granted to the British military authorities should make it

PROGRESS IN ELECTRONICS

ONE of the earliest electronic devices to strike the popular imagination was the photo-electric cell or "electric eye." The public became familiar with it as a gadget for mysteriously opening doors or sounding burglar alarms.

The modern emissive photocell continues to perform these tasks, but in addition it is employed in a wide variety of control and measuring equipments, which are already indispensable to industry.

The cell contains a photo-sensitive cathode which emits electrons when light radiations fall upon it. This emission, or current, corresponds in strength to variations in the light intensity, even when minute, and when the current is amplified it can be used to

operate measuring, indicating or control instruments. With suitable photo-cathode materials and, if necessary, with the aid of filters, these photocells can also be made sensitive to colour.

Among the many applications of photocells are high-speed counting, batching and sorting of mass-produced articles; inspecting for variations in size or colour; control of temperature, smoke, liquid, position, printing register, or photographic exposure; safety devices in machines and furnaces; and sound-heads in modern cinema projection equipment.

Mullard photocells are used extensively for all these purposes, and research is constantly opening up new fields of application.

Scotch Whisky at its best

Even in these hurrying days there are no short cuts to greatness in Scotch whisky. Slowly and steadfastly Old Angus comes of age, gathering wisdom and authority with every passing year until maturity brings true perfection. Then — and only then — when it is smooth and subtle and full of years, this noble Scotch is sent out into the world to show men the miracle that careful blending and rare patience in the ageing have achieved.

OLD ANGUS

it's all in **FISONS** field

possible to retain and maintain this valuable base on the Mediterranean for the next twenty years at least. The Libyan government, for its part, has been anxious to make the most profitable use of its greatest asset—the country's strategic position—without flouting nationalist *amour-propre*. In this also it has succeeded. In future, the British forces are to be as unobtrusive as possible and are to provide their own accommodation outside the towns. In the past their presence in urban areas and their occupation of precious and scanty accommodation have caused friction and resentment. Their legal rights and obligations have also been carefully defined to take account of Libyan susceptibilities.

Much more important, for the next twenty years Libya is guaranteed generous financial aid to supplement its own scanty income and whatever other foreign aid it may get

from such sources as the Point Four and the UN technical assistance programmes. For each of the next five years, Libya will get from Britain £2,750,000 towards balancing its budget, together with £1 million towards economic development. (A five-year economic plan is now being drawn up.) The Libyans can no longer count on getting their budget deficit, however large, covered by British funds; on the other hand, the British taxpayer will in future dig a good deal deeper into his pocket on behalf of the Libyans. The leaders in neighbouring Egypt know they cannot themselves provide the strong economic support which Libya needs. Unfortunately, however, they take no steps to curb the sound and fury of their press and radio, nor have they put a stop to the open Egyptian intrigues in Benghazi. All this has annoyed the Libyans a good deal and will no doubt stiffen their attitude towards the criticism and abuse which the Arab League can be expected to hand out to its newest member.

Storm Signals in Turkish Politics

THE Turkish government, under bombardment by Soviet complaints of the visits of British and American warships to Istanbul, has also been contending with political troubles at home. Early last month the small, highly conservative National Party was temporarily banned on the grounds that it was engaged in subversive activities under a religious cloak, and a widespread judicial investigation

into its records and activities was begun. The government, undeterred by the outcry this aroused amongst its political opponents, later introduced several measures designed to preserve the country's political stability. The most important of these is to prevent the use of religion and religious feelings "to secure political or personal influence or interest"; it also aims at stopping the use of slanderous and insulting language at political meetings.

It is conceivable, as Mr Menderes's bitterest opponents assert, that the government has been acting with an eye on next year's general elections, that it has wanted to strike down a potentially dangerous rival party and to prepare new ways of curbing the political activities of its opponents. But the government did not itself produce the charges against the National Party. Action was taken on the basis of accusations made by dissident members of the party who had quarrelled violently with their leaders about their alleged failure to restrict reactionary elements who were plotting to undo the Kemalist reforms. No one can be sure that the government's efforts over the last year have really removed the sting from the latent forces of religious reaction; few doubt that these could represent a grave danger to the state.

If Mr Menderes failed to take adequate steps to safeguard the institutions of Ataturk's Republic, the Republican People's Party would be the first to condemn him. Indeed, the party supported the law to prevent the political exploitation of religion, although it opposed the anti-slander clause. This latter clause is, of course, a double-edged weapon; its wording is somewhat imprecise and it could be used to restrict unreasonably rights of assembly and expression. But there is nothing in the record of the Democratic Party government to suggest that it does not intend to do its best to play fair. Unless there is definite evidence to the contrary, it should be given the benefit of the doubt.

The Farce of Food Rationing

THE embarrassment of the Ministry of Food becomes greater every week. The foods it controls do not sell at existing prices, and these prices can be reduced only by throwing overboard the Government's financial policy and increasing the subsidies. The worst problems are meat, bacon and milk. There have been reports that the three-pennyworth of meat that butchers are allowed to sell to all comers will be raised to 6d. But that would be a superfluous gesture indeed. A customer who will take more than her entitlement is already very welcome at the butcher's, for the average person is spending only 2s. 3d. out of a theoretical limit of 2s. 6d. on each ration book. The bacon ration, equally, is a farce, for only about 80 per cent of it is sold. Lower prices will mean less profit on imported bacon and more subsidy on the home product.

But the Ministry of Food's stores are not only bulging with meat and bacon; they are also stacked with tins of milk. Milk production still rises, although less liquid milk is being drunk, and an ever-increasing remainder goes to the manufacturers, who, so far this year, are getting about 25 per cent more milk than before the war. Most of this goes into condensed milk, stocks of which are mounting, while demand lags well below the prewar level. At that

time many people used it because even the full-cream variety was cheaper than fresh milk. But it is now more expensive, for it is not subsidised; and it will be more expensive even after September 1st (when prices are to be reduced by between 1d. and 3d. a tin) and even though the usual seasonal rise has this week brought the price of fresh milk up to a record level. Could the surplus milk be turned into butter and cheese, which are still scarce? The chief difficulty is again the subsidy, which is far heavier on home than on imported supplies.

The root cause of all this chaos in food policy is the confused attempt to achieve two goals at the same time: to increase food production at home and to advance towards a free market. The consumer has ruined the game by refusing to play.

Subsistence Through Assistance

A DEAL of fuss was made recently about the few thousand unemployed whom the end of "extended benefit" would force on to national assistance and the means test. Yet the Assistance Board exists for that very purpose: to provide an income, enough for subsistence, for the few who have exhausted their right to insurance benefits or have never been eligible for them. What was never intended, in the postwar years when the social security

The scales for national assistance exclude any allowance for rent.

scheme was drawn up, was that people should have recourse on a large scale to the Assistance Board for grants to bring their insurance benefits up to the subsistence level.

The extent to which this is happening is brought out in the Assistance Board's latest report (Cmd. 8900) and illustrated in the accompanying charts. The cost of living had risen so much between 1946, when the insurance benefits were fixed, and 1948, when the scheme came into force, that if an allowance for rent was added to the national assistance

scales, benefits actually started off below the subsistence level. Thus the board began its new career in July, 1948, by having to supplement over half a million people drawing insurance benefits as well as providing a regular weekly income for nearly 300,000 others. Since then, the gap between insurance and subsistence has widened. By 1950, the allowance for a married couple, even exclusive of rent, exceeded the comparable insurance benefit. For a year, from 1951-52, the benefit of the older retirement pensioners caught up national assistance, while other benefits were left well behind. In 1952, however, insurance benefits of all kinds were equalised; but they were not increased enough to bring them up to the new assistance rate necessitated by the cuts in food subsidies.

Thus by June of this year nearly 1,700,000 weekly allowances were being paid by the Assistance Board, of which over 1,100,000 were to supplement insurance benefits. Until next year's statutory review, any attempt to alter benefits would be premature. But after the review has taken place the Government will have to decide whether the Assistance Board is to continue bolstering up national insurance on the present scale. If not, and an effort is made to place benefits on a subsistence level and to make this level inclusive of rent—a principle which all parties were once agreed on—the Government will have to impose a big increase in contributions.

How Malaya Pays its Way

A RECENT newspaper headline stating that "Malaya faces bankruptcy" is a considerable distortion of the facts. It is true, as almost everyone in the Federation knows to his cost, that the prices of rubber and tin have lately tumbled a long way from the peak levels reached in the early stages of the Korean war. Rubber has dropped from a 1951 average of 170 cents per pound (\$1 Malayan = 2s. 4d.) to around 65 cents, and tin from \$527 per picul to around \$295. And, since this year's Malayan budget was based on an estimated average price for rubber of 75 cents and for tin of \$480, Federal revenue, depending largely on export duties, is a long way below estimates. But it is wrong to jump to the conclusion that this is therefore a crisis which must mean slashing expenditure on either the emergency or the development of social services. The background to the Malayan Government's financial position is surprisingly strong.

Revenue in the calendar years 1950 to 1952 was, respectively, \$433, \$735 and \$725 million. Last year expenditure almost exactly equalled revenue, which meant that a surplus of \$322 million from the previous period was carried forward into 1953. The budgeted deficit for this year is \$97 million and this has already been met by a \$100 million loan. Although, therefore, the fall in commodity prices will mean a much larger deficit than originally expected, there is considerably more than enough in the surplus to meet it. As to the future, the existing price levels of rubber and tin imply a government revenue of about \$500 million; this may rise as income tax begins to take more effect. Normal expenditure, apart from the emergency, runs at just about this figure.

The problem, therefore, is to finance emergency measures. Their current cost runs at a rate of about \$200

million a year, but this year has probably seen the peak; on the other hand, whatever happens the cost can only be scaled down gradually. Malaya, however, has probably been more successful so far than any other country in recent history in paying for its war out of current earnings. Public debt only amounts to \$220 million; it would be legitimate to increase it and the government's credit is good. Naturally, the bare bones of these statistics leave out of account the question of increased aid from Britain, the hot dispute about the equity or wisdom of maintaining heavy duties on the rubber industry at a moment when the world market is poor, and the need for capital expenditure to develop Malaya's resources. But they do show that the Federal government is far indeed from "bankruptcy."

The Supreme Soviet Meets

RUSSIA'S seldom-convened parliament, the Supreme Council or Soviet, began its new session only a few hours before *The Economist* went to press, and at this stage only provisional comments can be made. Some clues to the political puzzle of the last few weeks may emerge when the Supreme Soviet reaches the second and last item on its brief agenda, the approval of decrees issued by its own Presidium. For the moment, however, the only direct reference to the fall of Beria has been contained in the new order of precedence among the Russian leaders. Malenkov is now followed by Molotov and Nikita Khrushchev, the first secretary of the Party.

Without any political prelude, the Soviet sat down to its long overdue task of approving the budget. The speech which it heard from the Finance Minister, Arseni Zverev, contained so many gaps that it must have left the delegates almost as much in the dark as the outside observer. Mr Zverev's task was certainly not an enviable one. The revenue side of his budget had been reduced for him by the moves to woo the consumer which followed Stalin's death. The big cut in retail prices, which involved a reduction of the turnover tax on consumer goods, diminished his main source of income. State borrowing has also been reduced. Finally, the need to placate the peasants, who seem to be now the

THE SOVIET BUDGET

'000 million roubles	1952 est.	Per cent	1952 actual	Per cent	1953 est.	Per cent
Revenue						
Turnover tax	260.7	51.1	n.a.	n.a.	240.4	44.8
Profits tax	62.0	12.2	58.4	11.7	80.6	14.8
Direct taxes	47.4	9.3	n.a.	n.a.	46.1	8.5
State loans	42.6	8.3	36.3	7.3	16.7	3.1
Other revenue	97.2	18.9	n.a.	n.a.	159.5	29.4
TOTAL	509.9	100.0	497.7	100.0	543.3	100.0
Expenditure						
Grants to national economy	180.4	37.8	178.8	38.9	192.5	36.3
Social and cultural services	124.8	26.2	127.8	27.8	129.8	24.5
Defence	113.8	23.9	n.a.	n.a.	110.2	20.8
Administration and justice	14.4	3.0	n.a.	n.a.	14.3	2.7
Other expenditure	43.5	9.1	n.a.	n.a.	83.7	15.8
TOTAL	476.9	100.0	460.2	100.0	530.5	100.0

regime's biggest problem (it will be recalled that one of the charges against Beria referred to grave mishandling of agriculture), has forced Mr Zverev to cut by nearly half the tax levied on farmers' income from their private plots. This last was never a major source of revenue, and the political gain probably outweighs the economic loss; but all the cuts combined must have left a big hole in the Soviet exchequer.

In spite of this, Mr Zverev has budgeted for a bigger income, a larger expenditure and a surplus of nearly 13,000 million roubles. It is apparently hoped that a bigger turnover and a more economic use of resources by state enterprises will increase both their profits and the share of the tax-collector. Yet, as can be seen in the accompanying table, the bulk of the increase is to come from the now huge unspecified source described as "other revenue."

Russian Defence in the Dark

ON the expenditure side of the Soviet budget, the enigmatic word "other" again accounts for more than half of the estimated increase. Although social and cultural services and grants to the national economy are increased in absolute terms, their shares of the total budget are to be cut. Admitted expenditure on defence is being reduced in both absolute and relative terms. But while a genuine cut in Soviet arms spending would obviously be a most welcome happening, it will not command much credence until more information is provided about the large unspecified items of expenditure.

It is astonishing that Mr Zverev did not try to make more political capital out of his announcement of a reduced estimate for arms. The Kremlin may have feared that the West would take it as a sign of weakness; it may have been equally worried about the reaction of the Russian military diehards, who are now in such a strong position. At all events, Mr Zverev wrapped up his sweet pill in an unappetising coating: "Taking into account the new threat of aggression from enemies of peace, the defence budget amounts to 110,200 million roubles, which will ensure the further improvement of our valiant armed forces." In this

way was introduced the first slight decrease in visible defence expenditure since 1947.

It is common knowledge that not all Soviet defence costs fall under "defence" in the budget. Thus, the building of arms factories comes under "grants to the national economy," and the maintenance of MVD troops and possibly atomic projects would be covered by "other expenditure" (though atomic research may also be partly included under education). The "defence" item, however, is not entirely meaningless. It presumably covers the upkeep of troops and the actual purchase of their conventional weapons. Moreover, as can be seen from the figures below, there has in the past been a clear relation between the real military effort and the share of the total budget allotted to "defence."

Percentage of Expenditure Allotted to "Defence."						
1932	1938	1942	1948	1950	1952*	1953*
3.4	18.7	59.3	17.9	20.1	23.9	20.8

*—Estimates.

This time, however, the picture is obscured not only by the swollen proportions of the unspecified items but also by Mr Zverev's tone. The whole budget, indeed, tends to strengthen the impression that the Soviet leaders are still undecided how to apportion their scarce resources and what posture to adopt towards the West.

Nursing in Mental Hospitals

THE latest report of the Board of Control (HMSO, 6d.) shows another increase last year in the number of patients in mental hospitals. A steady increase, in spite of the advance in methods of treatment in recent years, is an inevitable accompaniment of an ageing population. Unfortunately, the accommodation has not kept pace with the greater numbers; and the Board of Control points out that there were 17,522 more patients in the mental hospitals than they were designed to receive. Besides this overcrowding in the hospitals, the mental deficiency institutions have a waiting list of nearly 9,000.

There has, however, been welcome evidence lately that the mental health services are receiving much more official attention than they used to. In making the capital allocations to the regional hospital boards for 1954-55, the Minister announced that he is setting aside a special reserve for the provision of more accommodation in mental hospitals. Schemes financed from this reserve are to be additional to any schemes for the mental hospital service included in the boards' ordinary capital programmes.

The greatest problem facing the mental hospital service is, however, the shortage of nursing staff. Last year, according to the Board of Control's report, the numbers of trained nurses, and of student nurses, counting both men and women together, remained stationary. Since the wastage among student nurses is extremely high—80 per cent for the women, compared with 40 per cent in general nursing—any falling off in the number of students will have a serious effect on the number of trained nurses later on. Hitherto, mental hospitals have diluted their trained nurses with "nursing assistants." These are to be distinguished from the state-enrolled assistant nurses of general hospitals,

for they have no recognised course of training at all. The Ministry of Health recognises that the nursing shortage cannot be relieved except by the employment of even more nursing assistants, but it suggests that they should be given special courses of instruction. Mr Macleod has pointed out that in general hospitals the recruitment of assistant nurses has actually been accompanied by an increase in trained and student nurses to record levels. There has, however, been no mention of salaries. Are potential trained mental nurses going to be satisfied with rates of pay in training that are so little different from those of nursing assistants and even laundry maids?

Research at the Bedside

LITTLE use has so far been made of the Minister of Health's power, under the National Health Service Act, to promote medical research. This is partly because no one has known how the power should be exercised and what should be the relation between research projects promoted by the hospitals and those organised by the Medical Research Council. At one time the Minister appeared to want all research schemes to receive the council's approval, which would have given it a most undesirable monopoly. To clarify the matter, therefore, a joint committee of the Medical Research Council and the Minister's advisory medical committee was set up, and its report was published recently as a White Paper (HMSO, 9d.).

The committee was concerned solely with clinical, not fundamental, research, which implies "research into the mechanisms and causation of disease including its prevention and cure." Its proposals are three-fold. The Medical Research Council has already greatly expanded its own clinical research facilities in recent years. This trend will now be accelerated by the committee's proposal that a central Clinical Research Board should be established and made responsible to the council. Its purpose is to promote research that needs to be done on a national basis—therapeutic trials of new drugs are an obvious example—and which falls outside the scope of the hospitals, such as epidemiological studies. Secondly, decentralised research in non-teaching hospitals is to be encouraged. Where it is paid for by the Exchequer, and not from endowment moneys, an annual report on each project will have to be submitted to the Ministry and every fifth year these progress reports will themselves be reported on by the Clinical Research Board. This is a necessary safeguard that public money is not being wasted. The important point is that hospitals will be able to rely on a regular sum for simple clinical investigations, some of which may in the long run actually save money.

Clinicians have often been deterred from undertaking research because it is badly paid. The most far-reaching of the committee's proposals is therefore the recommendation that careers in clinical research should be equated with careers in the health service, provided that clinical training and responsibility are maintained. To carry out this recommendation may raise more practical difficulties than the committee appears to realise. But the general principle—that transfer from research to practice and back again should be made easy—will win general support.

Letters to the Editor

The Boothbyites

SIR—I have read the article in your issue of August 1st on foreign affairs and particularly Anglo-American relations. There is little point in taking the discussion further here, since your view is well known and consistently expounded. For the sake of factual accuracy, however, it ought to be pointed out that there is a tremendous weight of opinion in this country which is disquieted lest a concern for Anglo-American friendship should produce a servility and then a reaction of violent dislike. It does no good to dismiss this widely felt apprehension as the view of "Bevanites and some Boothbyites."

One had noticed a parallel tendency to dismiss certain economic policies as the views of a small minority of which Sir Robert Boothby is a distinguished member. The policies in question, which presumably constitute "Boothbyism," are based on a strengthening of the economic system which includes the Sterling Area and Europe, which is effectively the same as the European Payments Union and which it is the aim of the Strasbourg Plan to consolidate in other ways as well. No one would deny the importance of Sir Robert's contribution to these ideas. Nevertheless it ought to be added that the Conservative Party's "Imperial Policy" is in this sense Boothbyite. The metaphor of British foreign interests as a system of three overlapping circles (Commonwealth, European and Atlantic) is Sir Winston Churchill's and Mr Eden's. The National Conference of the Conservative Party has repeatedly gone on record for such a view, last year especially in an amendment carried by acclamation on its principal external affairs resolutions.

In the Labour Party, Mr Attlee has recently spoken of the vital importance of strengthening EPU. Mr Jay has emphasised the primary need to build up the Commonwealth's economy and the Party's official policy statement talks in the same sense. These are hardly "Bevanite" utterances.

The Working Party which prepared the Strasbourg Plan was presided over by Sir Cecil Kisch, and contained such economists as Mr Paul Bureau, Mr Brech and Mr Page. The European League for Economic Co-operation, in its study of "Trade Relations between Europe and the Commonwealth" and the resolutions of its Westminster and Brussels Conferences, has subscribed to views basically the same as appear in the Strasbourg Plan. Earlier still, Signor

Pella put forward a project since named after him, for the creation of a preferential area concerning Europe and its overseas associates, which attracted much favourable comment at the time.

Sir Robert has truly a formidable army! It might, in fact, be as well not to belittle this "minority" too harshly, lest we should ask to know where and who the majority is.—Yours faithfully,
House of Commons PETER BAKER

[This is not the place to discuss the wider issues of foreign policy raised in Mr Baker's letter. There are, however, two specific points that should be made in reply:—

1. Mr Baker puts the word "minority" in quotation marks, but it is not a quotation from the Note in *The Economist* to which he refers. We would agree that the various groups of people who, in their ways and for their various reasons, advocate a softer turn in British foreign policy are certainly not numerically negligible, and perhaps not a minority at all. That is what we find so alarming; it is what led us two weeks ago to express the opinion that the present period is "the most dangerous since the end of the war." We very much fear that the most lasting result of the Prime Minister's speech of May 11 may be that it has made wishful softness (which we mean to be a politer euphemism for appeasement-mindedness) once again respectable.

2. We have never derided Sir Robert Boothby's economic ideas. We may not have agreed with every detail, but over the last ten years or so, as a whole, we should have said that the economic ideas of the "Boothbyites" and our own had run on closely parallel lines. We have consistently held that, in economic matters, the facts of the postwar world compel Britain and most of the other non-dollar countries to steer a course different from that advocated by the Americans. What does alarm us is to see unwarranted and dangerous (as it seems to us) political conclusions being drawn from these economic views.—EDITOR.]

The Market in Oil

SIR—Your article in the issue of July 25th states that the system under which "prices for Middle East crude . . . remain linked to prices for crude oil at United States Gulf ports . . . has been much under fire by the Economic Co-operation Administration and its successor," the Mutual Security Agency.

The ECA and MSA have never attacked the system itself; they have merely asked for greater consistency in its application. The selection of the appropriate freight rate is the most important step in the proper solution of the system's formulas. However, when we were financing Middle East crude oil, we felt that we could not use any other rate in working out the formulas

than the one actually charged our European "clients" for freight in company fleet tankers—in recent years, the "London Award" rate.

As you point out, the companies are caught in a three-way squeeze among the domestic producers in the United States, the governments of the Middle East producing countries, and the governments of consuming countries in Europe. For this reason, they may ultimately find it desirable to adopt a pricing formula for both company fleet tanker rates and f.o.b. crude oil prices which appears reasonable to all three of these groups.—Yours faithfully,

CORNELIUS J. DWYER
Mutual Security Agency,
Washington, DC

SIR—Your article of July 25th rightly questions the relationship between the cost and price of Middle Eastern oil. There is, however, one very important aspect on the problem that you do not mention. Oil is the principal natural resource of the Middle East and it has in the past been exploited with comparatively little regard for the peoples of the area. To-day the impossibility of establishing a realistic price for oil which can be produced for as little as \$2 a ton gives the western world a chance to break the cycle of poverty in the Middle East and provide it with the capital it needs so badly. The area will receive perhaps as much as £200 million each year in royalties under the new profit-sharing

THE RISE OF THE MIDLAND INDUSTRIES 1600-1838

By W. H. B. COURT

(Re-issue) 21s. net

The author traces the industrialization of Birmingham and the surrounding Midland areas, between the sixteenth century and the Age of Reform, and shows how a growing industrial society flourished in the interstices of a rural and socially feudal system.

agreements and these funds can play a vitally important role in helping to raise the living standards of the Middle Eastern peoples.

Unfortunately there is one very serious difficulty. Except in Iraq where development in irrigation, flood control, transport and many other directions is already well in hand the countries richest in oil are poorest in potentialities for economic development. The countries of the Fertile Crescent receive only small transit dues although they offer the greatest scope for development. It seems that the need for a regional investment organisation perceived both officially and by academic observers several years ago is greater to-day than ever. If this difficulty can be overcome the maintenance of the link between American production costs and the world price of oil will enable the west to assist an undeveloped region without bringing into existence a debtor-creditor relationship or the suspicions that an aid programme can so easily engender.—Yours faithfully,
S. J. LANGLEY
Oxford

Trading in "Know-How"

SIR—Your article of July 18th points to the danger that the UN expanded programme of Technical Assistance may be stunted for lack of money. You contrast the programme's "modest but solid achievements" with the "impractical schemes frequently mooted for the development of backward countries." A major hindrance to such schemes—which are mooted only because they are urgently needed—is the inability of many under-developed countries to absorb capital fruitfully, due to lack of qualified personnel. It is precisely this lack which the UN Programme is designed to meet.

Britain's contribution to the programme can be called a bargain investment from the standpoint of the sterling area balance of payments. Even on the narrow question of the balance of advantage on technical assistance payments, it is authoritatively estimated that so many experts have been supplied from the United Kingdom, and so many people trained, that payments from the T.A. fund which will reach us and our nationals in 1953 would total \$3 million against the \$1.4 million we subscribed.

You draw attention to the fact that in the first two financial periods when the budgets were each for \$20 million, Britain reduced her pledge from £760,000 to £450,000. The grant voted by the General Assembly, including the United Kingdom, for 1953 was \$25 million. Full restoration in relation to the increased budget requirement, therefore, would put Britain's contribution at £950,000, which is roughly equivalent to the annual amount pledged by Britain to the Colombo Plan Technical Co-operation Scheme. It should be remembered that the US Government has agreed to contribute in the proportion of \$60 to every \$40 contributed by other

governments, up to a limit. Thus an increase in Britain's contribution would probably be matched by a further contribution of half as much again from the United States.—Yours faithfully,
London, W.1 GORDON EVANS

Guide Books

SIR—Your correspondent, in his admirable and judicious article on Guide Books (in your issue of August 1st), has taken into account almost all the facts; but it may not be out of place to call your readers' attention to one or two more which seem to be relevant.

1. It would seem—now that Baedeker has appeared in a new guise under the aegis of "Shell"—that the "Blue Guides" and the "Guides Bleus" are today the only "classical" guide books that are not copiously subsidised, and are run purely on their own merits as a straightforward commercial venture. They advertise nothing at all, not even motoring accessories.

2. The "classical" guide book is not intended solely as a travelling companion; it is designed to serve also as a book of reference, and its value (it is hoped) does not lapse with the year of publication. Hence the detailed index and topographical exactness.

3. Not all travellers are motorists, and the "Blue Guides" attempt to serve also those tourists who patronise public transport—especially the growing number of excellent motor-bus services which have opened up many remote and fascinating districts.

4. The problem of maps for guide books is probably insoluble, since a sufficiently large scale is incompatible with a sufficiently small bulk. Real explorers must carry separate maps. The Michelin maps are admirable so far as they go, but off the motorist's beaten track they are inadequate. They are not "in the same street" as the one-inch Ordnance Survey or Bartholomew's (unsubsidised) half-inch reduction of it, to which travellers of all kinds in Britain owe an immeasurable debt.—Yours faithfully,
L. RUSSELL MUIRHEAD
Editor, Blue Guides.

London, E.C.4

More Academic Than Free

SIR—Lest silence by Communists be regarded as their agreement with the extraordinary propositions about them put forward by your recent American correspondents, may I be permitted to say that (i) it is not true that the Communist Party is "committed to deliberate falsehood as a tactic"—although vicious persecution such as that practised in Tsarist Russia, in McCarthy-ridden America or in Hitler-occupied Europe has always driven people of various opinions to resort to falsehood for self-protection; (ii) it is not true that a member of the Communist Party has to "surrender his duty of independent criticism and even his conscience"—

least of all in matters of academic truth and error, where (unlike some more fashionable doctrines) Marxism enjoins on him to test his thinking by critical sifting of the evidence, by experiment and practice; (iii) it is not true that a member of the Communist Party is "powerless to control" the direction of his party, as anyone who attends Communist Party conferences and congresses knows.—Yours faithfully,
London, N.6 ANDREW ROTHSTEIN

Jerusalem

SIR—In the Note which you published in *The Economist* of July 18th, you state that "the idea of an international Jerusalem is . . . a dead letter." The stipulated unwillingness of foreign powers, including Britain and the United States, to deal with the recently installed Israeli Foreign Office in the New City of Jerusalem would clearly suggest that "internationalisation" is anything but dead; your interpretation would suggest that this stipulated unwillingness is simply a face-saving device of powers confronted by an "awkward decision." In the view of one recently returned from the Middle East, the Israeli Government's action appears as a highly significant and serious incident in a continuously deteriorating situation. Friends of the United Nations' Organisation throughout the world cannot be other than deeply concerned with this latest defiance on the part of Israel.

The Economist may consider it prudent to avoid the deeply seated religious issues involved in the Jerusalem situation; to do so is to ignore some of the most salient facts involved. There is at stake in the Holy City of Jerusalem the existence and preservation of the all-important Moslem, Jewish and Christian shrines, and all the ramifications which they entail throughout the world; the deeply disturbed economic future and political stability of the whole city of Jerusalem, both old and new; the prestige and ability of the United Nations to carry out its own resolutions. The world has everything to gain, both spiritually and politically, from a free International City of Jerusalem; conversely, it has a great deal to lose by the defeat of that plan through the unilateral action of either Jew or Arab.—Yours faithfully,

ROBERT J. MOORE

New York

[Against "spiritual and political gains" must be offset some economic difficulties. A free city installed in the teeth of the opposition of both its neighbours could not live on pilgrimage receipts alone if the two neighbours were both competing for visitors that neither can afford to lose. The economic *sine qua non* of an international Jerusalem would be the establishment there of some revenue-bringing international organisation. Which of these is going to move from New York or Rome or Geneva? At present, even the UN Relief and Works Agency prefers Beirut.—EDITOR.]

In this small island, we have fifty million people to feed. How to do so is the one fundamental economic difficulty of today. The same problem looms large in other lands, too, but here it overrides every political programme, because unless we can solve it, nothing can prevent an inevitable decline in our standards of life.

What are we to do?

In our own country, we must use every available technique and priority to increase food production. Even in this land of industrial power, that power should be geared to the production of food.

But the great Commonwealth with which we are associated could be the biggest development area of this century. It is 80 times the size of the U.K. Its resources are greater than any other single area in the world. It can grow whatever is grown and is potentially the richest group of nations in the world. If capital was diverted to the Commonwealth to carry out its development, we should see more than the commensurate return.

To see the Commonwealth prosperous and expanding, and our own economy more surely based, is worthy of every effort in our power.

French Balance Sheet

FRENCH POLITICS: The first years of the Fourth Republic.
By Dorothy Pickles.
Royal Institute of International Affairs.
302 pages. 25s.

INTRODUCTION TO FRENCH LOCAL GOVERNMENT.
By Brian Chapman.
Allen and Unwin. 238 pages. 18s.

BETWEEN the wars the British public had fairly clear images of men like MM. Poincaré, Briand, Herriot and Blum as political personalities; French politics and the French constitution were standard university subjects beside the political machinery of the United States and the Commonwealth. The decline of France as a power seems to have lessened the general interest. Most British people who know about Republicans and Democrats, Adenauer and Ollenhauer, would now be hard put to it to give even a rough account of the six main French parties. France enfeebled is, however, just as important to us as it ever was, and perhaps even more so. Fortunately, Mrs Pickles and Mr Chapman have provided between them a very complete picture of French public life since the war. The two books make perfect companions, since Mr Chapman's clear presentation of local government helps to put in their right perspective many of the parliamentary troubles in Paris which Mrs Pickles discusses in other terms. Mr Chapman's book is the first postwar study of his subject in either English or French.

Mrs Pickles—probably because she has written of these times elsewhere—is at her weakest over the initial two years' period of provisional government. Surely no history of the Fourth Republic should begin with such undramatic references to the liberation, which meant, among other things, months of Communist control of whole regions of France. For instance, the author's "conservative figure" of 3,000 for those summarily shot by "popular tribunals" is misleading. No figure under 20,000 has ever gained credence in France and estimates go up to 90,000. In fact terroristic reprisals, the long-drawn-out *épuration* and the black market set a political tone which lasted well into 1948. Satirical works such as Marcel Aymé's *Uranus* and Jean Dutourd's *Au Bon Beurre* give a better idea of the early postwar years than any conventional record in terms of governments, legislation and party attitudes. The crucial

feature of France then was the near rout of the country's traditional *cadres* under Communist and Gaullist attack. Thus, while Mrs Pickles gives a useful account of nationalisation and economic reconstruction, the matter of fact style of interim history seems to prevent her from doing justice to the psychological background of careerism and profiteering.

The author is, however, admirable in her careful exposition of Indo-Chinese, North African and European problems in the section on the French union and foreign affairs. "The Pursuit of Europe" is surely the best description of French European diplomacy that has appeared, although it is curious that nothing should be said about Jean Monnet's role. M. Monnet has, since 1950, been the main exponent of France's European policy to the Americans and second only to M. Schuman in dealing with the German Federal Republic. His name should at least appear in the index.

M. Monnet's exercise of power behind the scenes is a commentary not only on parliamentary instability and governmental impotence, but also on the continuity of French administration. This last is very well exemplified by Mr Chapman in his chapters on the functions of prefects, the running of *départements* and the Ministry of the Interior. The Prefect's gubernatorial mastery of his current tasks is seen in simple contrast with the utter confusion of the National Assembly in face of it. As Mr Chapman remarks: "the slow and infuriatingly impersonal process suggested by the term centralisation is far from being an accurate picture of French local government." If the Centre does well in the localities, one can also say that the slow and infuriatingly personal proceedings of the parliament are largely due to the deputies' parochialism in Paris, and not to defects in the constitution.

Mrs Pickles draws up a balance sheet of the years 1946-52. This, in consonance with the author's method of allowing Frenchmen to speak for themselves, shows the large area of political disagreement and the inconclusiveness of what has been done in French eyes. But the two most definite facts about France are surely the very high birth rate and, at very long last, the end of postmortems about the war. The last development is hardly a year old, but it should presage better things in the Fourth Republic's near future.

Limits of Economic Liberty

FREEDOM THROUGH LAW.

By Robert L. Hale.
Columbia University Press (London: Geoffrey Cumberlege). 591 pages. 48s.

EVERY student of political theory knows, or ought to know, the story of the elderly gentleman who rebuked the young man for twirling his walking-stick on a crowded pavement. "It's a free country," said the offender. "Yes," said the old gentleman, "but your liberty ends where my nose begins."

Where, in a free country, the citizen's nose may best be held to begin is the great practical question explored, through a century and more of British and American legislation and case law, by the author of this book. It makes a fascinating story, sometimes difficult, but never impossible, for the non-legal reader to follow; the subtitle—"Public Control of Private Governing Power"—emphasises Professor Hale's dualistic view of freedom as the power to impose sanctions and the power to resist sanctions. This theme is pursued through chapters on economic inequality (the law protects property, property confers the right to impose sanctions, unequal property means unequal power, hence unequal freedom) on common-law adjustments of conflicting economic liberties, on constitutional aspects (primarily of interest to American readers, but suggestive and stimulating even to others) and on wage regulation, valuation, price control and taxation.

The proposition that legal interference with the terms of a "free" bargain may bring about an increase rather than a diminution in liberty has, no doubt, a less paradoxical flavour in this country than in the United States; it is all to the good that there should be a re-examination of the grounds on which, in a liberty-loving community, such interferences may be justified. This final section, however, suffers in comparison with the rest of the book by reason of an unfortunate and perhaps not entirely conscious attempt to combine the notion of economic liberty with that of the *justum pretium*. One wishes that Mr Hale had chosen instead to follow up the line of argument adumbrated earlier: that constraint is imposed when there exists no tolerable alternative to the pursuing of a given course of action, the accepting of given terms, the fulfilment of given conditions. Liberty is enhanced less by making the obligation to act, accept, fulfil less onerous than by ensuring (as does, for instance, a policy of full employment in the field of the wage bargain) the existence of a wide choice of tolerable alternatives. If social and economic conditions are such that Esau need only cross the road for a meal, there is no need to interfere with Jacob's freedom to set an unconscionable price on pottage—and the chances of an economically "right" price being reached will be much better.

Mr Hale is not unaware of the

importance of reaching the "right" price, but his discussion of its functions and conditions is, comparatively, jejune. There is need for much more work on this particular segment of the frontier between economics and political theory; and it is not the least of Mr Hale's achievements that study of his book makes that necessity so plain.

The Green Men

JUNGLE GREEN.
By Arthur Campbell.
Allen and Unwin. 214 pages. 12s. 6d.

DRESS a soldier in a dirty green uniform, festoon him with arms and equipment, and he becomes Number Two on the Bren instead of Private Atkins. As Major Campbell confesses, "it was only in the shape and set of their floppy jungle hats that the men's personalities showed." In his narrative he attempts as much to explain why some of these hats are crammed listlessly on the head while others are worn with a swagger as to give an impression of the fighting in the plantations and jungles of Malaya. Primarily, his ambition—a worthy one—is to describe the impact that this campaign of patience, ambush, fatigue and sickness had upon National Service conscripts.

It is not unfair to Major Campbell to say that this ambition is a little too much for him. He is, after all, a highly skilled regular soldier, not a trained professional writer. The failure comes when fact is dressed up as fiction. Not all the incidents in this book were experienced at first hand by Major Campbell; undoubtedly, in General Templer's word, these incidents are "authentic," but the same degree of authenticity can hardly be attributed to the individual characters in the story or to the conversations they hold. Although these snatches of conversation are picked out with appropriate, though suitably bowdlerised, adjectives, their general tone rings hollow. And in describing the campaign and the soldiers who fight in it, Major Campbell has not altogether avoided the trap of blending sentimentality with brutality. A straightforward chronicle of events may have been duller, but its impression would have been more lasting.

In spite of these faults, the book should be read. The flavour and horror of war in the jungle are there.

Young James

HENRY JAMES: *The Untried Years*, 1843-1870.
By Leon Edel.
Hart-Davis. 356 pages. 25s.

THIS is the first of three volumes to be devoted to the life of James, and the proposal seems to promise a return to the amplitude of nineteenth-century biography. But there is nothing Victorian about Mr Edel; if he breathes of a past era it is Freud's. Thus he tells

how James, in a list of likely names for fiction set down when he was fifty, included "Ledward" and then improvised several variants: Ledward-Bedward-Dedward-Deadward. For the novelist, clearly, to be led to the marriage bed was to be dead, and "Henry James accordingly chose the path of safety. He remained single."

Nor is the explanation of such caution far to seek. Mr Edel surveys James's early environment and pronounces succinctly, "On all sides strong-minded, firm-handed women swallowing up their men." This diagnosis may be accurate, or it may be a reading back into the James family of a characteristic of a later phase of American culture. At least it is somewhat conjectural, and what one finds oneself most greatly admiring in Mr Edel's masterly book may perhaps best be described as the speed and persuasiveness with which the writer gets his story going. Parents, aunts, brothers, cousins are all deftly given their roles, and in no time the drama is ready to unfold.

It is indeed not difficult to cast the elder Henry James in the part of an inadequate parent. Neurotic and finding precarious salubrity in one or another speculative moonshine, he was assuredly hard put to it at times as the head of a turbulent household sheltering (as it happened) two of the most powerful American minds of the next age. His wife, being unintellectual, probably found things easier to manage. But there is again something conjectural in Mr Edel's strongly-drawn sketch:

Before the little boy's observant eyes there was this ever-present picture of ambiguity and reversal of relation: a father strong, robust, manly, yet weak and feminine, soft and yielding, indulging his children at every turn; and a mother strong, firm, but irrational and contradictory.

If we would seek in the qualities of the elder Henry any light upon the achievements of the younger, there may be something to be said for one or two quite old-fashioned considerations. The elder Henry could write well, flashing out with the sort of precise image which the younger Henry mastered in maturity, as when he calls Carlyle "the same old sausage, fizzing and sputtering in his own grease." He could also be decidedly hard on the reader; his interpretations of Swedenborg, William Dean Howells declared, "which sentence by sentence were so brilliantly suggestive, had sometimes a collective opacity which the most resolute vision could not penetrate." But if these characteristics became the son's by inheritance, something else became his by reaction. Mr T. S. Eliot has written of James as possessing "a mind so fine that no idea could violate it." This almost baffling escape from ideas is the less surprising in the vastly talented son of one so discernibly bombinating in an ethico-philosophical inane as is the author of "Society the Redeemed Form of Man and the Earnest of God's Omnipotence in Human Nature."

The Active Brain

THE LIVING BRAIN.
By W. Grey Walter.
Duckworth. 216 pages. 15s.

IT is barely twenty-five years since Hans Berger first showed that the human brain's activity was accompanied by minute rhythmic changes in electrical potential that could be amplified and recorded. Since then the development of electro-encephalography has been rapid and intense, and the study of patterns of "brain-waves" has contributed vastly to the increasing knowledge of epilepsy and other disturbances of the brain's functions.

Dr Grey Walter has been a pioneer in this subject, not only in the invention of techniques but in the construction of a framework of new concepts into which all this fresh knowledge can be fitted. There will be many readers of this stimulating and brightly written book whose ignorance of electrical physics and of the language of electronics may be a handicap. But they should not be discouraged, for this ignorance need not deny them an understanding of the author's ideas of how the ten thousand million cells of the brain are organised. His style, however, is so taut and elliptical that his meaning is at times unnecessarily elusive.

Much brain activity, it seems, is organised in homeostatic mechanisms whose effect is to provide a constant milieu for the body and for the brain cells themselves. These "feed-back" mechanisms, of which the simplest model is the governor on a gramophone-motor, release higher levels of the human brain from menial tasks. After describing the evidence for an internal "scanning" mechanism, which he believes to be involved in the final stages of perception, the author goes on to explore the mechanism of learning. Here he helps his exposition by analysing the behaviour of some highly ingenious working models that he and others have constructed. These toys, which are relatively simple in their mechanism, mimic many of the features of human behaviour. Dr Grey Walter asserts that although much of their performance is calculable and inherent in their design, they can show forms of response to fresh situations which were unforeseen, but which are found to correspond with the responses of the human brain to similar experimental situations. These "goal seeking" models are to be sharply distinguished from the much more complex electronic computing machines that have captured the public's imagination as "mechanical brains." Dr Grey Walter's "tortoises" have a far better claim to this title.

Cerebral electrophysiology is contributing much to knowledge of such topics as memory, types of imagery, pleasure and displeasure, hallucinations, sleep and aggressive crime, and this book deserves to be widely read beyond the circles immediately concerned.

THE ECONOMIST, AUGUST 8, 1953

Italy's Case

ALCIDE DE GASPERI NELLA POLITICA ESTERA ITALIANA 1944-1953.
By Adstans.
Mondadori, Rome. 230 pages. 1,300 lire.

THE *nom-de-plume* of the author of this book conceals someone highly qualified to write about Signor De Gasperi, and it may be assumed that the book has the broad approval of its subject. It is an account of Signor De Gasperi's unique and dominant role in shaping Italy's foreign policy since the war. It is divided into three sections entitled "Shipwreck," "Italy's return" and "In the community of nations." At each stage in this expressive description of Italy's recovery, the journeys, many of the thoughts and some of the pronouncements of Signor De Gasperi and, until his death, of that close colleague, Count Sforza, are carefully set out. The presentation is direct, simple and telling—and by no means hard reading for a non-Italian.

There may be many views about the rightness or wrongness of Italy's treatment at the hands of the western allies in the closing years of the war and immediately afterwards. But the reactions, hopes and efforts of men like Signor De Gasperi and those who worked with him cannot fail to command respect. The author describes how characteristic it was in the early days for Signor De Gasperi, when returning from negotiations in London about the peace treaty, to be dumped in Marseilles for the night by the pilot of his American military aircraft without any warning or choice in the matter. There was nothing to do but to take the discomforts and indeed insults in one's stride. Signor De Gasperi, however, never let up for a moment in his determination to fight for his country's rights and to present its case. And, if the task has gradually become easier—though it is by no means finished—the reason lies largely in the persistent hard work, patient temper and shrewd political sense of this man who has surely been one of the greatest heads of government in modern Italian history. This book establishes the extent of his country's debt to him. It well deserves to be translated into English.

Modern Philosophy

LOGIC AND LANGUAGE. Second Series.
Edited by A. G. N. Flew.
Blackwell. 242 pages. 21s.

SOME modern philosophers think that philosophical problems are generated by the misleading use of language and can be clarified or dispelled by careful attention to the ways in which ordinary people speak. This collection of articles is the second of a series claiming to exemplify their work. Nine of them have been published before in philosophical journals; three of them are here made generally available for the first time.

Philosophers dispute about nothing so hotly as about what philosophy is, and much controversy has centred upon the conception of philosophy here presented to the general public. Its devotees defend their account of what they are doing with the pained acerbity and ingenuity of any initiate who tries to get the blundering and the simple-minded to see the light. They even claim that the great philosophers of the past have really been exploring the grammar of their language, though at times they knew it not. The critics of the movement maintain that no philosophical problems have been or will be solved by a study of ordinary language. Why should philosophers, of all people, be so infected by the twentieth century cult of the common man that they should explore the ways in which he speaks? Bertrand Russell, in a recent article, went so far as to maintain that this view of philosophy is insincere, that it is capable of excusing ignorance of mathematics, physics and neurology in those who have had only a classical education and that it makes philosophy trivial.

A great many philosophers, however, are bored by discussions of the ideology of the movement and prefer to concentrate on the problems to be solved rather than on recipes for their solution. And this is a suitable frame of mind in which to approach this collection of articles. For, just as in the first series there were essays like J. Wisdom's "Gods" or F. Waismann's "Verifiability" or M. MacDonald's "The Language of Political Theory," whose intrinsic interest rendered the ideological introduction almost irrelevant, so this volume too contains many outstanding examples of philosophy at its best. It includes, for instance, G. E. Moore's classic on "Is Existence A Predicate?" and J. L. Austin's "Other Minds," which has proved almost a landmark in the discussion of this problem. G. J. Warnock's "Every Event Has A Cause," and D. F. Pears' "Universals," treat traditional problems with exemplary clarity, and F. Waismann's "Language Strata" gives a second instalment of the fascinating tale introduced in the first volume. More technical tastes are catered for by D. Gasking's "Mathematics and the World," and J. C. Smart's "Theory Construction," and in "Historical Explanation" A. M. MacIver deals competently with theories of history. What relation many of these articles bear to the professed ideology of the movement it is difficult to see; but they are admirable examples of philosophy.

The book is therefore to be thoroughly recommended as containing examples of modern treatment of traditional philosophical problems, though the reader should approach the ideological introduction with the same scepticism as he approaches a conjuror's patter. The writers deliver the goods, but perhaps in spite of rather than because of a study of the peculiarities of the English language.

Towards European Unity

L'EUROPE EN FACE DE SON DESTIN.
By Edouard Bonnefous.
Presses Universitaires de France. 386 pages. 900 francs.

THE title of this book is misleading. M. Bonnefous has written not an analysis of Europe's position *vis-à-vis* the rest of the world, but a work of reference outlining the development—until the autumn of 1952—of the movement toward European unity.

The first two chapters entitled "European Thought" and "The Historic Origins of Europe" are somewhat superficial. But those that deal with the plans to achieve European unity until 1939, ranging from Dubois (whose work "*De Recuperatione Terre Sancte*" needs a new critical edition) to Count Coudenhove-Kalergi, are happier. The core of the book is an account of events since 1945. Stress is rightly laid upon the links with the Resistance movements, and the importance of the voluntary movements in forcing governments to create the Council of Europe is fairly judged. The drafting of that organisation's statute is dealt with in detail. It clearly emerges from this that six Governments regarded it as only a first step, rapidly to be developed into a federal organisation, whereas the nine others considered they had made therein the maximum concessions possible. The story of the Council of Europe during the past four years has been the working out of this contradiction.

The way in which the story is told depends upon the personal position of the author. M. Bonnefous regards it as "*l'ère des déceptions strasbourgeoises*." If one shared this viewpoint, the logic of the Council of Europe is now to be found in the European Coal and Steel Community, the European Defence Community, and the new project for a political community. But even if this premise is accepted, the frequent criticisms made of Britain's attitude, as wrecking Europe's last chance of remaining a great power along with its own, look suspiciously like seeking a scapegoat to cover continental irresolution. In the first edition, published in 1950, the author despised the idea of Europe becoming "at most a regional unit in the Atlantic system." In 1953, he writes "the realisation of an Atlantic Community becomes more urgent than that of a united Europe." But it simply will not do to export European failure to solve its problems to the Atlantic level. Continental politicians who pretend otherwise are guilty of deliberate escapism, because they know that their people will never support the concept of Atlantic unity until it is built not on satellites but on self-respect.

The author's narrative does not answer the problems it raises. But because it is the most up-to-date narrative that exists, it should be read.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Congress Marks Time

Washington, D.C.

THE final days of a congressional session are always days of emotional strain. The first session of Mr Eisenhower's first Congress has been no exception. Its end was marked by the traditional condition of frenzy, with tempers short, political positions confused, and the usual tendency to make mistakes—the cut in aid to Indo-China, for instance—and to repair them, both with startling and unconsidered rapidity. But this year there were additional harassments: the Administration's last-minute effort to persuade Congress to raise the ceiling on the national debt, and the deep shock and sorrow at the death of Senator Taft.

The final agonies over the rising national debt were striking evidence that Congress had failed to realise in one session the Republican dream of destroying the towering structure of "big government." But the Administration has moved towards the achievement which the President claimed for it in June when he said:

Most important, we have instituted what amounts almost to a revolution in Federal Government. . . . We have set about making it smaller rather than bigger . . . finding things it can stop doing rather than new things for it to do.

And Congress has played a part in this process by cutting appropriations for government activities, often below the levels requested by Mr Eisenhower, and always below those suggested by Mr Truman just before he left the White House. In some fields, such as public housing, these cuts do reduce the government's activities almost to the vanishing point.

But Congress has not yet had its chance to attempt a comprehensive reduction of the functions of the federal government. Perhaps the opportunity will come when the new Hoover Commission, headed by the only living Republican ex-President and manned, with the single exception of Representative Chet Hollifield of California, by recognised enemies of "big government," makes its reports. The Commission has only just been appointed. Its scope is to be infinitely greater than that of the previous Hoover Commission: while this was limited to investigating means of improving the efficiency of the government, its successor is instructed to find the "non-essential services, functions and activities" of the federal government which can be weeded out. But many a month will go by and many an enemy of "creeping socialism" will confront many a foe of the "special interests," before the commission's labours are completed and Congress gets a chance to act on its recommendations.

Reasons are not far to seek for the failure of the Eighty-third Congress to work great changes. The split within the Republican party and the newly acquired unity, on the surface, at least, of the Democrats have perpetuated the legislative stalemate which has dominated the postwar years. Right-wing Republicans have been heard to speak nostalgically of the days when they could at least express their disgust with the progress of things in Washington by cursing the Administration and "that man in the White House" to their constituents.

Now, when taxes are not cut, when foreign aid keeps flowing, and the State Department obstinately refuses to disappear from the face of the earth, the conservative Republican raises his voice in protest only with the sickening realisation that he is thereby weakening the front which his party, with its wafer-thin majorities in Congress, presents to the opposition. Moreover, no newspaper-reading member of Congress can avoid the frequent reminder that, while General Eisenhower won a personal majority in 297 of the country's 435 congressional districts, Republican Representatives were elected in only 221.

★

When Congress meets again in 1954, awareness of the President's popularity will be heightened by the approach of the congressional elections which take place in the autumn. This may mean that Mr Eisenhower, unlike Mr Truman, will have greater control over his own party during his second year than he has had in his first. Mr Truman's troubles were caused chiefly by Southern Democrats, to whom the President's approval, far from being a political blessing, was a positive handicap with their constituents, because of Mr Truman's espousal of civil rights for Negroes. It would almost be true to say that the nearer an election came, the less likely were the Southern Democrats to co-operate with their President.

Mr Eisenhower, on the other hand, enjoys the incalculable advantage of having found the formula for victory, the political magic touch for the lack of which the Republicans spent so many unhappy years as a minority party. Against this must now be set the loss suffered by the Administration through the death of Senator Taft. By a tragic historical irony, the President finds his power in Congress seriously weakened by the removal from the scene of his erstwhile rival for the Presidency. Mr Taft, with his ability, his influence, and his loyalty, will remain irreplaceable.

This session of Congress not only failed to dismantle

the governmental structure erected under the New Deal and the Fair Deal; it also passed few of those measures on the Administration's original list of essential legislation that involved departures from existing policy. Hawaiian statehood and amendment of the Taft-Hartley Act fell by the wayside. The major exception was the "return" of the tidelands oil reserves to the individual states, and the importance of this has probably been exaggerated. It may be invalidated by the Supreme Court. Furthermore, the bulk of the mineral wealth in question lies beyond the states' seaward boundaries, and legislation has quietly been passed to arrange for federal control of these resources of the continental shelf. For the rest, what has been accomplished has involved either the simple continuation of previous policies, such as the reciprocal trade agreements programme, or an extension of a principle already in operation, as in the case of the President's schemes to reorganise the federal government.

It is easy to minimise such a record, and the Democrats are doing so with relish. However, recent Congresses controlled by the Democrats have not done a great deal better. It is clear that there is not, at present, a majority for an all-out attack on the welfare state, in so far as it now exists; nor is there a majority for substantial additions to it. Similarly, in the field of foreign affairs, while there is no majority to back a wholesale departure from the policies of Mr Truman and Mr Acheson, neither is there any longer a really firm majority in favour of continued moderation, foreign aid, conciliation of allies, and containment.

★

The policy of inaction, of maintaining the *status quo*, is entirely feasible in domestic affairs, at least as long as prosperity continues; indeed, it has been followed now for some years. But it simply will not do in foreign relations, where the problems refuse to stand still, and where policy, whatever Mr Dulles may pretend in public to think, must be a matter of give-and-take with other countries. The willingness of members of Congress to leave full authority—and responsibility—for the Korean settlement in the hands of the President is, in a way, a reflection of the fact that no single, coherent foreign policy any longer commands a congressional majority. It is noticeable that Senator Knowland and the other congressional representatives, who were to have accompanied Mr Dulles to Korea in order that he should be assured of congressional support, have made no attempt to follow him even though in the end Congress adjourned in time for them to have joined him almost before the negotiations with Mr Rhee had begun.

This situation troubles the congressional Republicans. But at least it has been shown that there was a certain element of truth in the rather despairing argument so much in vogue last year—that General Eisenhower would be better able than any Democrat to fend off the attempts of an irresponsible minority to substitute chaos for what is now mere inaction. After a session marked by such threats to sanity as the efforts to pass the Bricker Amendment, which would restrict the President's treaty-making powers, and the Simpson Bill, which would have undermined the reciprocal trade programme, it is clear that there is some virtue in managing to keep the isolationist Samson from pulling down upon himself and the world the temple of a reasonable American foreign policy.

American Notes

Republicans without Taft

THE Republican policy committee lost no time, after Senator Taft's state funeral, in confirming Senator Knowland, Mr Taft's own choice, as Senate majority leader. Mr Knowland, the senior but still youthful Senator from California, has been acting leader since Mr Taft first fell ill. To delay his appointment would have played into the hands of the little group of right wing extremists who oppose the President at every turn and suspect that Senator Knowland can be counted upon to do the opposite—except, perhaps, where the Far East is concerned. Senator Ferguson takes over Mr Knowland's job as chairman of the Republican policy committee.

Six months ago the Administration would have preferred Senator Knowland to Senator Taft, as a more pliable and congenial man to deal with. But after Senator Taft's demonstration of how tirelessly and selflessly he could work for party unity, despite the bitter frustration of his own ambitions, no one imagines that the untried and inexperienced Mr Knowland will be able to fill Mr Taft's

AN INTERNATIONAL BRIDGE

shoes. The new leader's problem will be to keep in line, not so much the party's wild men, as the much larger group of orthodox Republicans who regarded Senator Taft as their natural leader and were prepared to follow him, however grudgingly, into the President's internationalist and moderate camp. The President and his Republican Congress were fortunate to have Senator Taft to act as counsellor and peace-maker for their first session in power. Next year the President will have to fight his own battles and, lacking Senator Taft, may be compelled to rely even more than he has on Democratic votes.

★

Senator Taft's death might have cost the Republicans not only their most trusted congressional leader, but also their control of the Senate. The death of Senator Tobey, a fortnight ago, will mean no change, for the Governor of New Hampshire, who has the power to appoint a successor, is Republican, too. But this would leave the Senate, with Senator Taft's seat vacant, with 47 Republicans, 47 Democrats, and one independent, Mr Morse, who deserted the Republicans during the campaign to support Mr Stevenson. If Mr Lausche, the Democratic Governor of Ohio, were to play true to party form and nominate a Democrat to serve in Senator Taft's place until 1954, and Senator Morse were to take his revenge upon the Republicans who have cold-shouldered him, the Democrats might find themselves in the unexpected and not altogether welcome position of controlling the Senate and sharing responsibility.

But both Mr Lausche and Senator Morse are unpredictable. Mr Morse, though he held up the adjournment of the Senate by a tirade against the Republicans' "Cadillac crusade" has announced he will vote Republican when control and the committee chairmanships are at stake. Mr Nixon, the Vice-President and presiding officer of the Senate, would then be able to use his casting vote in the Republicans' favour. And Mr Lausche, though he may not go so far as to appoint a Republican, seems disinclined to fill Senator Taft's place with a partisan Democrat who would add to the President's difficulties.

MUTUAL SECURITY APPROPRIATIONS

(For fiscal year ending June 30, 1954; \$ millions, rounded figures)

Figures in left-hand columns are of new money just appropriated for the first time; italicised figures in right-hand columns are of uncommitted balances carried over from previous appropriations and now reappropriated.

	Europe		Near East and Africa		Asia and Pacific		American Republics		Totals

⁽¹⁾ Includes special funds for manufacturing arms in France and the United Kingdom (\$85 million each) and for support for Indo-China (\$400 million).

⁽²⁾ Mainly for Arab States, Israel, Iran, Pakistan and India; balance carried over is for Palestine refugees.

Reprieve for Foreign Aid

PRESIDENT EISENHOWER made more impression on the Senate than he had on the House when he pointed out the danger of cutting the foreign aid programme's throat for the sake of economy. The House had provided nearly 20 per cent less than the amount that the President considered to be the "honest minimum" needed; much of the reduction came from money which had been appropriated in earlier years but had not yet been committed and for which reappropriations had been requested. The Senate, however, complied with this request and took rather less than had the House from this year's new money; in conference only a token concession was made to the House's parsimony. In the end \$6.6 billion—\$4.5 billion in new money, \$700 million less than had been authorised, and \$2.1 billion in reappropriated funds—was handed over for the current fiscal year to the Foreign Operations Administration, the new co-ordinating agency which is to be headed by Mr Harold Stassen, the Director of the old Mutual Security Agency.

This sum, in the Administration's view, will be enough to "get along with," as indeed it will have to be. The cuts came mainly from military aid for Europe, for the Senate repaired most of the damage which the House had done to technical assistance, Point Four's present name, and to the various international relief organisations. But it was the Senate itself that nearly sabotaged the scheme for special help to enable France to carry on the war in Indo-China, by trying to cut \$100 million off the \$400 million intended for this purpose; this makes up nearly half of the funds for "mutual defence financing," the latest name for what was "defence support" last year, and straightforward "economic aid" before that. Senator McCarthy's attempt to make any nation that traded with Communist China pay for its temerity with its dollar aid was defeated, but France has been told that it must end discrimination against American commercial interests in Morocco.

America's surplus farm products are to be bought with

\$100 million of the funds; this is in addition to the \$100 million worth of these surplus products which the President has been authorised to give away to "friendly peoples" as he had already done to the East Germans. Another scheme which supplements the official foreign aid programme is that for rehabilitating Korea; this is separate from the United Nations reconstruction project to which the United States is contributing through the mutual security appropriation. So far an initial \$200 million has been provided for this Korean rehabilitation, but it is realised that much more will be needed, probably more than will be saved on military expenditure by the ending of hostilities. It is a pity that congressional fears that American soldiers might be used for "forced labour" have nipped in the bud Mr Dulles's imaginative suggestion that, with the help both of this money and of the occupation forces, South Korea might be turned into a "showcase for democracy."

Playing Politics with the Debt

THE Administration does not appear to be concerned at either Congress's reduction of \$1.4 billion in the funds asked for the armed services or at the less substantial cuts which were made in other Appropriation Bills. But it would hardly have welcomed the deeper cuts which might have been encouraged if the request for an increase in the permitted level of the national debt, from \$275 billion to \$290 billion, had been received before Congress had com-

pleted work on these Bills. Nevertheless, it seems a little weak to maintain, as did the Secretary of the Treasury, Mr Humphrey, that he had waited to make the request until he could judge from the amounts appropriated whether the increase would actually be necessary. For he also

admitted that it had been obvious since last May that sooner or later the ceiling on the debt would have to be raised; in any case, it is not this year's appropriations that are building up the debt, but the \$81 billion worth of commitments under earlier appropriations which the previous Administration bequeathed to its successor.

Buying in America...

the **IRS*** way!

IRS has the proven ability to gather, evaluate, report and make the best use of information in all markets.

IRS function is to help retailers sell more goods faster, better, more economically.

IRS member stores include 100 Independent Department Stores in America, and also representative retail organizations in various parts of the world. Each is the leading merchant of its city and trading area. Member stores retail volume exceeds \$500,000,000.

IRS maintains a permanent staff of 186 market specialists, under the leadership of six seasoned and retail-wise firm members.

IRS invites European retailers to discuss American market representation, and exchange of pertinent retail information.

Selling to America...

the **IRS*** way!

IRS is constantly on the lookout for good quality competitive European consumer goods (new or established products) that can be promoted into "best sellers" among IRS member stores.

IRS buys directly for its member stores, bringing import merchandise speedily and effectively to the American consumer.

IRS should be contacted by you, if you have a good consumer product and seek a direct and dynamic way to sell American Department Stores.

Independent Retailers Syndicate —
an American buying office servicing
retailers on a world wide basis.

BERNARD G. COHN, President

**INDEPENDENT RETAILERS
SYNDICATE, INC.**

33 WEST 34th STREET, NEW YORK 1, NEW YORK

There is therefore some justification for thinking that the Administration hoped, by delaying until the last possible moment, to be able to force its controversial request quietly and quickly through a Congress that was longing to go home. However, it was Congress's desire to get away that permitted the Democrats to kill off the Administration's request in the Senate committee, and to win a substantial political victory over the President. For he will probably now have either to call a special session of Congress in the autumn to deal with the matter or, more likely, to repeat his request next year, just before the congressional elections. In either case Democratic candidates will enjoy pointing out that an Administration which promised to balance the budget has, in fact, had to increase the debt.

Meanwhile the Treasury must do its best to avoid going through the ceiling. Senator Byrd insisted that this could be done by strict economy and by running down the government's cash balances, which are usually kept at about \$6 billion. Mr Humphrey, however, felt that this would be risky with no additional borrowing power to fall back on, since estimates of tax receipts during the next five months might not be fulfilled, and the government might therefore find itself unable to pay its bills. The decision on whether a special session of Congress must be called will apparently be made when the yield of the September tax collections can be assessed. The present difficulty, which seems almost certain to be repeated at the same time next year, arises from the system under which taxes are paid chiefly during the first six months of the calendar year. This means that between now and Christmas government spending must be met largely by loans. With the effective

level of the national debt at \$272 billion, the Treasury has only \$3 billion of borrowing authority in hand, and it expects to need an extra \$5 billion before the heavy tax-paying season begins in the new year.

Give and Take on Trade

THE President has succeeded in obtaining a year's extension of the Reciprocal Trade Agreements Act and, with it, authority to appoint a bipartisan commission to examine the whole field of international trade and make recommendations on policy. At the eleventh hour the House conferees gave up their demand, which was causing the deadlock, that a seventh member should be added to the Tariff Commission. The Democrats had made it clear that they were prepared to let the Act expire rather than open the door to a Republican, and possibly protectionist, majority on a commission which has always been bipartisan. The victory, however, had its price: the appointment, by the President, of a second advocate of high tariffs to a commission whose main task, in a year when no new trade negotiations are expected, is to review past concessions to determine whether applications for relief are justified.

It was the complaint that an evenly divided commission was incapable of coming to decisions except after long delays which prompted the President originally to accept the idea of adding a seventh member, something he has since repented of. Congress has recognised this grievance, however, by requiring the commission to report on applications for relief within nine months, rather than a year, and by providing that if the six-man commission is evenly split on an escape clause case, the President must decide. In the past, rejection would have been automatic.

The passage of the customs simplification Bill is also more of a token than a real triumph for the liberal trade policies the President has supported. The Senate version, which prevailed, eliminates the heart of the House Bill: the provision that, in determining dutiable value, the export price should be taken. At present, customs officials use the export price or the price at which the article is sold in its country of origin, whichever is higher. American importers, consequently, are likely to lose, for the purposes of duty, the advantage of bulk buying. Delays in determining the appropriate valuation are notoriously long. The Senate also refused to consider, on the ground that it, too, was controversial (that is, might reduce duties) and would need long hearings, the House's simplification of the methods of fixing foreign currency values.

The Senate's timidity has been a blow to foreign traders, who, while they are grateful for the Bill's minor relaxations, had hoped for a substantial stimulus to trade. Hope is not dead, however; the House has passed a separate Bill, embodying its valuation reforms, ready for Senate action next year. It is plain, however, from this year's indecisive give and take, that, if the balance next year is to be decisively tilted in favour of freer trade, the President will have to appoint a strong trade commission and be prepared to back it up.

The World Overseas

Turn of the Tide in Pakistan

FROM OUR CORRESPONDENT IN KARACHI

IT is perhaps too early to say positively that the tide has turned in Pakistan, but it is at the end of the ebb, the shoals are fully exposed, and the government now seems to have a clear idea of what it is doing and where it is going. Last week's welcome announcement of a British loan of £10 million for the purchase of capital goods to increase food production will help it along its way. But it is above all the American gift of a million tons of wheat—700,000 tons to be shipped at once and the remainder to be kept in reserve—that has averted an otherwise inevitable catastrophe and done much to transform Pakistan's economic outlook. In his broadcast last weekend, Mr Mahomed Ali spoke of the way in which the American gift had dissipated "the feeling of anxiety and tension due to fear of famine and distress." Not only has America's great act of generosity freed Pakistan's all too slender reserves of foreign exchange from being earmarked mainly for further imports of food-grains; it will also call into being a huge fund for development, consisting of the rupee sale proceeds of the wheat in Pakistan. If the wheat had been granted as a loan the country's dollar earnings for many years to come would have been absorbed by the service of the loan; this would have retarded development and would, among other things, have made it impossible for the government to consider taking another dollar loan from the World Bank. As it is, the Pakistan government has been able to decide that it can now safely go ahead with all approved development projects.

The next few years will therefore witness a marked spurt in industrial and agricultural progress, and a high level of business activity and employment. Admittedly, foreign exchange still constitutes a difficult problem, and for its external finance the government will have to rely to a large extent on various forms of foreign aid. But an immense amount of help in various fields has been, and is being received; and no really sound development project need be held up for want of foreign exchange.

Yet, rather paradoxically, the current flaws in the economic situation all derive from the fact that there is insufficient foreign exchange available for day-to-day requirements. Pakistan can import its requirements of generators, but not of toilet requisites; it has been helped to swallow the camels but still has to strain at the gnats. The deficit in the balance of payments in the second half of 1952 amounted to Rs 47.72 crores, and by the end of the year the gold, dollar and sterling reserves had dropped to Rs 60.61 crores. This was barely more than the statutory minimum required for the currency backing. In the first quarter of 1953 there was a small surplus of Rs 5.46 crores

and, though no figures have yet been published, it is understood that the improvement was continued in the second quarter. But it is not yet good enough, considering that during the half-year imports, especially of consumer goods, were reduced to a trickle by stringent measures of control, and the country cannot subsist indefinitely without imports.

The absence of a backlog of commercial commitments and the removal of the incubus of foodgrain imports should result in a marked improvement in the current half-year. There is, however, little hope of any marked expansion in export earnings. Jute will almost certainly fetch better prices, but this is mainly because the jute acreage has been reduced by about 50 per cent, as a precaution against over-production, so the aggregate earnings will be no larger. Cotton should have a reasonably good year, since the present low prices are fairly attractive to overseas buyers and the season will begin in September with no more than a nominal carryover; moreover, the Japanese, under the recent trade agreement, are pledged to take up 6½ lakhs of bales which represents roughly half the quantity likely to be available for export.

Starved of Consumer Goods

There is little hope that the import policy can be liberalised before the middle of next year. Not only is the government anxious to build up some reserves of foreign exchange but it is determined to cater for the requirements of industrialists at all costs. The public therefore must be prepared to remain starved of consumer goods for some time to come. Herein, now that the country is no longer in the red with its external balances, lies the chief immediate threat to economic stability. Between May, 1952, and May, 1953, the working class cost of living index has risen by twelve points. It should, however, be remembered that this was chiefly due to the rise in the cost of foodstuffs and the sale of American wheat at concession prices has already brought this down. Imported goods of all kinds, however, are rapidly acquiring a scarcity value which defies all efforts at price control. The obvious remedy, increased imports, is the one that cannot yet be adopted. The other remedy, increased domestic production, is one which is greatly exercising the government. So far as the middle classes, with their higher standard of living and more varied requirements, are concerned, this is a long-term remedy, and they must expect to undergo real hardships for the next few years until industrialisation has advanced considerably; but the essential needs of about 90 per cent of the population

THE First SINCE 1784

The United States had only just become a sovereign power when in 1784 the First National Bank of Boston was founded. The bank has grown with the country—indeed helped the country to grow—and maintains important branches in Argentina, Brazil and Cuba as well as a wholly-owned foreign banking affiliate in New York City.

America's oldest chartered bank offers traditionally courteous and comprehensive financial service to bankers and concerns engaged in overseas trade with North and South America.

The FIRST NATIONAL BANK of BOSTON

Head Office: BOSTON MASSACHUSETTS • In New York: FIRST OF BOSTON INTERNATIONAL CORPORATION, 2 WALL STREET • Overseas Branches: ARGENTINA • BRAZIL • CUBA
Special Representative in Europe:
146 LEADENHALL STREET • LONDON

INCORPORATED WITH LIMITED LIABILITY IN THE U.S.A.

are mainly food and cotton cloth, and production of these can be and is being rapidly expanded.

Given reasonable luck with the monsoon, the goal of self-sufficiency in foodgrains can be achieved almost immediately. Various short-term measures are being actively carried out, while the long-term prospects of food production stand to be greatly improved by vast new irrigation schemes. In Sind, the Lower Sind barrage should be completed by May, 1954, and this will provide an assured water supply for 2½ million acres of land. Preliminary work is also starting on the equally important Upper Sind barrage at Guddu. In the Punjab, the Thal irrigation schemes are nearing completion; and work has also started on the Taunsa barrage, which will provide for the irrigation of nearly 1½ million acres. In East Pakistan, the Ganges-Kobadak development project will, in course of time, increase the yield of foodgrains by 700,000 tons annually. Several similar schemes of lesser importance are also in hand.

It is claimed that Pakistan is now at a stage of transition from an agricultural to an industrial economy. This is true up to a point, though the food shortage has served to underline the fact that agriculture must come first. The programme of industrial development is quite impressive and, on the whole, soundly conceived. In five years' time the country should be self-sufficient in cotton manufactures, sugar, fertilisers and cement, and should be nearly self-sufficient in paper production; these are some of the main items which at present eat up so much foreign exchange. Even more important, Pakistan should be a substantial exporter of jute manufactures.

The Public Starts Investing

It is a happy feature of the present psychology of the country that the public are at last becoming investment-minded. The response to recent flotations, by both foreign and Pakistani interests, has been almost overwhelming, whereas two or three years ago the public would not look at industrial investment at any price. This is due first, to the substantial taxational concessions granted to industrial investment in the past two years; and secondly, to the fact that the monied classes have been forcibly made to realise that the import and export trades no longer offer easy money and that the industrial type of business activity is more likely to yield a good return.

On the face of it the industrialisation of the country has a bright future, but the labour situation is causing some anxiety. Supplies of unskilled labour are limitless and, left to itself, it would be only too anxious to do an honest day's work and earn a decent livelihood. Unfortunately, however, a class of professional labour leaders has grown up—mostly consisting of briefless lawyers with no true connection with industry or knowledge of the subject—who find this a fruitful field for political advancement and personal profit. They outlive each other in encouraging the labour unions to make the most extravagant demands for such things as free housing, free medical aid, and holidays with pay. It is clear that unless the government take a very firm line in this matter the Finance Minister's slogan of "production, more production, and yet more production" will be made to sound ridiculous. It is understood, however, that the labour policy of the government is to be based on the recommendations of a team of International Labour Office experts, and that the report of this body, which has now been submitted, has taken a sensible line.

Problems for Mr Holland

FROM OUR WELLINGTON CORRESPONDENT

NEW ZEALAND has not only succeeded in fulfilling its undertaking to the 1952 Commonwealth Finance Ministers' Conference that it would reach a surplus of £25 million with the non-sterling area by the end of June, 1953, but it has exceeded that target by £9,700,000. It has also achieved an overall surplus in its balance of overseas payments for 1952-53 of £34,700,000. In the preceding year it had a deficit in this field of £51,300,000.

This considerable achievement has been accomplished largely because wool prices have remained higher than was anticipated, and because the government reinstituted import control in the form of currency rationing and continued import licensing very strictly in the non-sterling area. There is little doubt that the controls need not have been so tight had the government and the Reserve Bank perceived the dangerous implications of New Zealand's 1951-52 import spending spree earlier than they did. The immediate result of the application of currency rationing was to upset the commercial community considerably. It has now largely recovered, but the experience has left behind it some unhappy memories and some prejudice against the government. Moreover, the compulsory reductions in New Zealand's imports struck particularly sharply against the United Kingdom at a time when many other British markets were being restricted. New Zealand emerged from the last trading year with a surplus of £21 million with Britain, but it is generally admitted that it would have been more satisfactory had the economies been effected at someone else's expense.

Another qualification is the serious lack of balance in New Zealand's trade with Australia during the period. New Zealand has accumulated trading deficits with its nearest neighbour for many years, but during 1952-53 the deficit reached the very high figure of £23 million. The fact that about £8 million of this had to be spent upon buying Australian wheat and potatoes is not a matter which a primary producing country like New Zealand can regard with any satisfaction. New Zealand's wheat yield is steadily dropping, mainly because farmers argue that the domestic prices fixed by the government are inadequate and because they find that land previously used for growing wheat shows a better return for less effort if it is turned over to grazing.

£100 A Head in Taxes

The announcement of these overseas surpluses is not an unqualified testimonial for the government, as they have revived demands for tax reductions and for a relaxation of the import restrictions. Official figures recently published show that New Zealand's taxation is now running at an annual rate of just under £100 a head, of which something over £22 is being taken for social security and health services. Just before these figures were released, the Attorney-General, Mr Webb, making a surprising foray into the preserves of his colleague, the Associate Minister of Finance, warned the public that there was little prospect of tax relief in the coming budget. The announcement had a frigid reception and at a subsequent caucus of the government party, some backbencher members holding marginal seats expressed misgivings about its effects.

These representations may well demand some attention

from Mr Holland when he returns early this month, for there is no doubt that his party has lost some political ground and that something is necessary to restore its stocks. One of the election slogans of the National Party was the rather rash claim—rash in the light of the economic conditions then prevailing—that it would make the pound go further. The pound has noticeably failed to respond to this electoral urging and this fact, together with the continuing effects of inflation and the high level of taxation, has put an important section of the electorate—the medium wage-earner—in a restive mood.

Moreover, during the same excursion into finance on which he announced that there were poor prospects of tax relief, Mr Webb gave a broad hint that the government intended to increase Reserve Bank credit to finance part of its large works programme. Investors who had just contributed a substantial part of the £20 million national development loan raised for this purpose, could not be expected to regard this prospect with pleasure. Moreover, one of the planks of the National Party was to curtail the use of Reserve Bank credit and it is now being sharply reminded of this by a number of its supporters.

Mr Holland will also have to do something to restore his own personal stock. His party, when in opposition, made a considerable clamour about the amount of overseas travelling by Labour ministers and promised, in the care-free manner so often adopted by oppositions, that when it returned to power it would do something to check overseas touring. In practice, it has done very little and it is now being asked why. There was no cavilling about Mr Holland's decision to go to London to represent New Zealand at the Coronation and to take two of his ministers and the Leader of the Opposition with him; but there is a tendency in certain quarters to ask why it has been necessary for the Prime Minister to extend his visit to a number of continental countries.

The financial accounts for 1952-53 showed that receipts had exceeded the budget estimates by some £8 million. One of the largest items contributing to this was an increase of £2,700,000 in the return from sales tax. This undoubtedly demonstrates the buoyancy of business, but it also provides an opportunity for the advocates of tax reduction to urge the government to do something to check the rise in retail prices. In short, Mr Holland is returning to a country which, despite its evident prosperity, has a number of grievances, real and imaginary.

Is all Quiet in Warsaw?

DURING the five stormy months since Stalin's death pugnacious Poland, strangely enough, has shown less signs of unrest than other countries within the Soviet orbit. So far in this transitional period the Polish leaders have managed to avoid panicky moves, and reports that the Berlin rising in June aroused echoes in Poland have not been confirmed. The Polish leaders did not, like the Hungarians, hastily criticise the too rapid tempo of industrialisation; nor did they, like the Czechs, countermand recent orders of the party or admit errors made in the drive to collectivise the peasants. Indeed, outwardly at least, the Polish scene has looked as if nothing happened on March 5th. It still seems more Stalinist than the Kremlin: the chorus praises the dead leader as usual, while President

Bierut occupies the centre of the stage in a manner that disregards Moscow's new rule of collective leadership. The reaction to Stalin's death may have been only delayed, but it is also possible that caution in the first stage will soften future shocks.

Polish Communists have learnt by bitter experience that it does not pay to get involved in Moscow's quarrels. The present leaders were only second or third rate figures in the party before the war, and have come to the top only because their elders and teachers—the élite of the Polish Communist party—had been exterminated in Russia during the purges of the thirties. This may explain their reluctance to stage, on their own, trials on the Moscow model. While Kostov was tried in Bulgaria and Rajk in Hungary, while more recently Slansky was sentenced to death in Prague, the former general secretary of the Polish party, Wladyslaw Gomulka, disgraced five years ago, has never been brought into the dock. After Stalin's death the Polish government behaved as if it had little faith in the permanence of the new mood that showed itself in Moscow. Now, after Beria's fall, it is trying to avoid getting entangled in the Kremlin tug-of-war.

Thus President Bierut, speaking during the recent celebrations of the ninth anniversary of Poland's liberation, took pains not to link Beria's "criminal activities" with internal Polish developments. He made no mention of Gomulka, but spoke at length of the "criminal designs" of the "Bonn Nazis and their backers from behind the Atlantic." He thus shifted attention to less dangerous ground: recalling Nazi atrocities and insisting on the German threats to the western territories, Bierut was striking the one chord to which most Poles—including staunch opponents of the regime—are sensitive. This anti-German feeling, if nothing else, must have precluded demonstrations in war-devastated Warsaw in support of the Berlin rising.

Reminder of the Ruins

The ruins of Warsaw probably help the government in another way: they are a constant and tragic reminder of the fate awaiting a rising that cannot rely on outside support. The daring escapes of Polish Mig pilots show that the spirit of adventure has not died among the opponents of the regime; but, with memories of massacre still fresh, where is the leader who would take it on his shoulders to send his supporters to certain slaughter?

In policy towards the countryside the government has little need to back-pedal because it has not advanced very far. Collectivisation has made less headway in Poland than in other satellite countries. Immediately after the war the state took over large stretches of land in the formerly German territories, and state farms therefore accounted for 12 per cent of the total agricultural area. By June of this year, however, there were only 8,000 collective farms covering together no more than seven per cent of the agricultural land. In other countries the collectivisation drive is now to be slowed down; in Poland it has always proceeded at a snail's pace. The new Soviet line may therefore mean for the Polish peasant a promise that the tempo will not now be speeded up (although existing collectives are to be cherished) and that his surpluses will have to be extracted not by coercion but by a more plentiful supply of consumer goods. President Bierut could foreshadow all this, while repeating the old slogans about the alliance

between the workers and the small and medium peasants.

Up to now, therefore, caution has paid dividends. The advocates of patience and prudence must have found in Beria's fall a justification of their views. As long as the new men in Moscow have not made up their minds, inertia is probably the safest course. Yet, caution will not be a sufficient safeguard once Moscow's policy has crystallised. If a definite pattern is set for all Eastern Europe, Poland will have to fall into line. Thus, for example, if collective instead of personal leadership is to be the rule throughout the bloc, then no special place can be reserved for Mr Bierut as the "leader and teacher" of the Poles. Or if the security services should be reorganised throughout the area, the Polish Minister of Security, Radkiewicz, has no guarantee of immunity. Poland cannot, in the long run, remain isolated from changes in other Communist-controlled countries. All seems to be quiet in Warsaw, but for how long?

Mr Nehru Goes to Karachi

FROM OUR CORRESPONDENT IN INDIA

INDIA expected no spectacular solutions from Mr Nehru's visit to Karachi; none were achieved. The only concrete decision is an agreement in principle to exchange a few Bengal border enclaves which affects 24,000 people. What India did hope for was an increase in friendliness, and the warmth and spontaneity of Mr Nehru's welcome in Karachi touched every Indian.

The Karachi meeting is only one of a series. The two Prime Ministers had already met in London and, briefly, in Cairo, and Mr Mahomed Ali is coming to Delhi in September. The Steering Committee of Officials has had a whole series of meetings, and talks on evacuee property are still going on in Karachi. The issues between India and Pakistan are so many and so complex that it may well require a Panmunjom to settle them. These are the first really friendly meetings since well before partition. From 1942 till the end of the war Congress leaders were in jail; from then till 1947 they never met Moslem League leaders except under conditions of extreme tension—even when they were both part of a coalition Cabinet in 1946-7 they often sabotaged each other; and Mr Nehru's meetings with Mr Liaquat Ali Khan after independence, were all at times of extreme emergency—in 1947 during the Punjab massacres, in 1950 when the East Bengal killings threatened peace. This time, not only was the atmosphere serene, but its serenity was proof even against the two Premiers' press conferences. Mr Nehru talked of common culture, Mr Mahomed Ali countered with the two-nation theory. Mr Mahomed Ali argued that Kashmir must be settled within a year, or other agreements would have to be reopened, Mr Nehru countershrugged with a reaffirmation that Kashmir is part of India.

The atmosphere had been improving for months before the meeting. Hindus of East Bengal are no longer maltreated. Migration to India has slowed to a properly visaged trickle. The February Passport Agreement, recently ratified, eases the worst hardships and at last reopens some of the land-routes between India and West Pakistan; there is even talk of a train service. Moreover the March trade agreement which removed discriminatory surcharges on

coal to Pakistan and jute to India (the main items of Indo-Pakistani trade) has turned a *casus belli* into a customs return.

Pakistan was then still under Khwaja Nazimuddin; it was he who first groped for a meeting. Mr Mahomed Ali's contribution was to put enthusiasm and feeling into the stiffness of his predecessor's gestures: he talked of Mr Nehru as his "elder brother"; he clamped down on mullahs; those in authority at last stopped threatening India with Jihad—the air cleared overnight. Even last spring's ripple over canal waters caused no spills. This change has been most welcome to India. Underneath all the bitterness and irritation which bubbles over at times of crisis, India has for Pakistan affection and good will. Pakistanis are ex-brothers and Pakistan is the neighbour whose stability represents the stability of India's most vulnerable and expanded border.

This friendliness, however, does not blur into wishful thinking. Most of the eighty odd issues between the two countries are minor enough to be settled by give and take, and of the major ones, the World Bank Mission may in due course solve the canal waters problem which was not discussed at Karachi. But Kashmir and evacuee property involve tenaciously held principles on both sides. No Indian can accept Pakistan's view that evacuee property should be dealt with by private sales by the evacuees: no Hindu or Sikh feels that he could go in safety to West Pakistan to dispose of his own—those who tried to get their safe deposits and the like under the agreement of 1950 have had some unpleasant experiences. Pakistan finds it equally difficult to accept the Indian theory that it should pay the £500 million or so difference in the value of evacuee property in the two countries. The problems of Kashmir are as familiar as they are old, but they have recently been complicated for India by the determination of Jammu, expressed in riots and strikes, to become completely part of India, and the blunt insistence of the Kashmir Valley that its autonomy must remain absolute independence; last year's Delhi Agreement has not been implemented yet and the Kashmir Premier was too busy to come to see Mr Nehru before he left. Indians are beginning to wonder whether their only role in the Valley is to patch its budget and guard its border.

Silence on Defence

At Karachi no scheme for joint defence seems to have been discussed. Mr Nehru has explained that he wants no military alliances because they postulate an enemy, and Pakistan is no more keen. But there does seem to have been an understanding about consultation on various aspects of foreign policy along Commonwealth lines; this does not mean much, since the foreign policies of India and Pakistan are already nearly identical. To India, indeed, perhaps the greatest merit of the Karachi meeting was that only India and Pakistan were there; after their Uno experience, Indians are highly suspicious of outsiders.

The barometer of Indo-Pakistani relations is Bhupat, India's leading murderer, who escaped to Pakistan two years ago. Whenever the two countries are on unusually good terms, there are rumours that Bhupat will be returned; there was one such rumour during the conference, but it was politely denied after Mr Nehru left. So the meeting has not been a complete success. But discussions have at least begun—Bhupat may yet live to be hanged.

Who Rebuilds Korea?

FROM OUR UNITED NATIONS CORRESPONDENT

THE recent request made by President Eisenhower for an additional \$200 million to be spent on Korea's "rehabilitation and economic support" brought only a forced smile to the lips of United Nations' officials working in that field. For one thing, no indication was given in the message whether existing United Nations' agencies would disburse these millions, or whether new ones competing for power, funds and personnel would be set up under American supervision. For another, the wording of the message led critics to believe that Mr Eisenhower had perhaps been misinformed as to both the agreed purpose and the plans of the United Nations' Korean Reconstruction Agency.

This would not be the first time that such a misunderstanding has occurred in high places. In the case of Unkra it is particularly hard to understand because the Americans, together with the Australians, took the lead in persuading the Assembly to set it up. Mr J. Donald Kingsley, its first director, and his successor, Lieutenant General John B. Coulter, who came to Unkra after serving in Korea with the UN Civil Assistance Command, both thought they were putting together something that would serve the exact purpose which Mr Eisenhower described.

General Coulter, in a statement obviously meant as a corrective postscript to the President's message, said that "there might have been a tendency to overlook the fact that the United Nations took not one but two unique steps to meet the challenge of aggression in Korea." The second of these was the establishment of Unkra in the winter of 1950. The agency went to work in 1951, spent \$70 million on reconstruction in 1952-53 and expects to spend \$130 million in 1953-54. Now that a truce has been signed, General Coulter thinks that "aid in the amount of at least one billion dollars will be required to restore Korea's economy to its prewar level." The economic analysis made for Unkra last December by an independent firm of economic experts called for \$1,750 million of foreign aid to make Korea self-supporting.

Eye-Witness Account

Clearly the requested \$200 million could be absorbed into such a programme with ease. If it were handed over, Mr Eisenhower would be forgiven the statement that funds given to Unkra, being designed to meet the immediate exigencies of fighting, could not be expected "either to meet the huge total cost" of reconstruction "or to set the foundation for a healthy peacetime economy." As a matter of fact, Unkra was specifically designed to do its biggest work after the fighting stopped, and to lay the necessary economic foundations for the country's independence.

It is perhaps the most ambitious, and at present the most active, of the international agencies created by Uno in the last five years to deal with various phases of the Korean problem. It will be remembered that the first was a temporary commission, followed in 1948 as matters grew more tense by the United Nations Commission on Korea whose observers were stationed on the peninsula from January to September, 1950, and were thus able to give the General Assembly an eye-witness account of the North Korean invasion. The Unified Command came into being after that invasion, and in October, 1950, the United Nations Commission for the Unification and Rehabilitation of Korea

(Uncurk) was set up in anticipation of a quick peace. Two years later, its first report sounds strangely ironic. The political objective of the United Nations, it said in 1951, must remain the establishment of a unified, independent and democratic Korea. Meanwhile, however, the Chinese invasion had made its work impossible. Uncurk still exists, still is focused on a political settlement, and still acts as the eyes and ears of the General Assembly. But as peace was postponed and chances of unification receded its fortunes and its prestige have tended to wane. It is generally agreed that if this agency is to play any part of the role designed for it, the Assembly will have to rebuild it on a different plan.

Meanwhile the daily work of civilian relief has been done neither by Unkra nor by Uncurk (both designed as primarily post-truce bodies), but by Uncack (United Nations Civil Assistance Command, Korea), operating under Eighth Army orders. It is the army which has been feeding mothers and children, resoldering water pipes and propping up walls for the civilian population. Except in name, Uncack is an American organ, and it is not impossible that this is the body which President Eisenhower had in mind to be strengthened and adapted to a peace-time role. It is this body which Unkra was meant to supersede, and on a much broader scale, when peace should be achieved.

These are by no means the only international bodies operating in Korea. Recently the truce has brought new units with new alphabetic designations and new tasks. The Military Armistice Commission has two committees, one for repatriating prisoners of war and one for assisting the return of displaced civilians. The Neutral Nations Supervisory Commission is there primarily to make sure that no troops or military equipment are added to those in Korea at the time of the armistice. The neutral nations also have set up a Repatriation Commission to act as custodian of all war prisoners who have not consented to repatriation within 60 days of the armistice. There are also joint Red Cross teams.

Confusion Over American Plans

But these new bodies are only interim devices for the perilous period between the end of the shooting and the establishing of an agreed peace. The rebuilding of Korea is still assigned to Unkra, and if for some reason the Americans find this agency (to which they have given millions, and promised millions more) suddenly unacceptable, the wastage will be great. The unfortunate Presidential wording may possibly be due to political double talk or to the influence of the President's new economic advisor on Korean affairs, who made his recent and thus far unpublished report direct to the National Security Council. They assume that the \$200 million, granted by Congress in its closing hours, is money already in the pipeline which would have gone for civilian relief had the fighting continued and is still needed for the same purpose.

The rebuilding of Korea under present circumstances is a job which no western nation in its senses could wish to undertake without the full co-operation of other nations. It is a task for which Uno would seem to be eminently suited, and in which it deserves full support. However, until Washington clarifies its stand this new uncertainty will harass officials. He who pays so much of the piper's costs may set up tremors in the tune by merely clearing his throat.

Synagogue and State

FROM A CORRESPONDENT IN JERUSALEM

BY 59 votes to 6 the Israel Parliament (Knesset) has lately annulled the clause in its compulsory service law that exempts women from military service on religious grounds. As the Bill was introduced, the famous trumpets which once rang round the walls of Jericho were sounded in Jerusalem's orthodox quarters. After a special service of intercession, demonstrators paraded the streets. Yet among the majority not only of the Knesset but of the population, anxiety not to cut right adrift from orthodoxy was mitigated by the very considerable concessions that had been made by the Ben Gurion government. It had provided that girls claiming special treatment on religious grounds are to serve under purely civilian supervision in hospitals, in immigrant camps, on farms and the like. They are to live at home whenever possible, and all matters concerning their service are to be dealt with by the Ministry of Labour, not by the Ministry of Defence. The overwhelming majority by which the step was taken, as well as the vehemence with which it was opposed, are a measure of the balance between secular and religious forces in the state today.

The leaders of orthodox Jewry have had twenty centuries in which to forget the art of treating with a Jewish government. Little of the skill they had often displayed when dealing with Christian or Moslem authorities on behalf of a depressed minority can serve them in a Jewish state. On the one hand they believe, not unnaturally, that it is they, the upholders and solidifiers of the Jewish tradition through the long dark centuries, who should have the dominant voice in the affairs of Israel. On the other hand, they cannot bring themselves to accept (and many cannot feel loyalty towards) a Jewish state which is not based, constitutionally and socially, on the laws of Moses. Most authority and influence in Israel is concentrated in the hands of men and women who are intent on the creation of a secular state where traditional Judaism would have an honoured, but not exclusive place. The traditionalist leaders abhor these purposes. They also lack the special respect for authority that a properly constituted government feels is its due. As a result, the first five years of Israel's existence have seen increasing friction between certain of the religious groupings and the secular parties that are in power. Terms like "clericalism," "theocracy," "heresy" and even "kulturkampf" have been increasingly bandied about in editorial columns and on public platforms. A long series of altercations in the streets and excited parliamentary debates concerning the keeping of the Sabbath, the breeding of pigs, the eating of pork and the education of the young have kept the issue fiercely alive.

Israel has the distinction of being the only country today which maintains compulsory military service for women. At the age of eighteen unmarried women are required to serve two years in the armed forces. In the lorry that is carrying military personnel home for the weekend, wind-swept heads are nearly as often female as male. This regulation is dictated chiefly by security considerations: surrounded by hostile states with larger populations, no able-bodied citizen can be dispensed with. But in addition, in this country in which half the population has been living for five years or less, the army has come to play an educational role of the first importance. It has become,

THE ECONOMIST, AUGUST 8, 1953

among other things, a school for the training of citizens, where native-born and foreign-born, old settler and new immigrant, come together on an equal footing, employ one language and work at a common task. It is conscious policy to channel young Israelis through the army and most observers are agreed that the results justify the practice.

Daughters of religious households have hitherto been excused from military service. The concession was made when the service law was first implemented. The extreme orthodox groups were violently opposed to their entry into the army and partly because Mr Ben Gurion's Knesset majority was then dependent upon the votes of some of them and partly because it was recognised that a first-class social problem was at issue, it was thought wise to dispense with the 2,000 or so girls who were involved each year.

It is essential to point out that the status of women in the very orthodox households is a decidedly subordinate one, while in the country at large women's freedom and equality have been pushed to lengths which might strike the European observer as exaggerated. The bareheaded girl in a socialist youth movement, dressed in her shorts and blouse, is in vivid contrast to the orthodox maiden whose head, arms and legs are covered in accordance with a concept of modesty which some, though not all, nations consider out of date. It is as plain to the agnostic as to the orthodox themselves that if the girls served in the army the pattern of orthodox household life would be destroyed.

Zealots and Trimmers

However, the principle of equality of sacrifice has enormous appeal here, and it was in deference to this (and in deference to the indignant parents of those girls who do serve) that the government sought some form of national service for these girls. The more liberal wing of orthodoxy has long been in favour of a compromise. The largest religious party, *Hapoel Hamizrachi*, is continually trying to reconcile progress with traditional Judaism. The more severely orthodox *Agudat Israel* was never Zionist and is bitterly opposed to compromise with the secular community. Out of it has sprung the tiny *Natorei Karta* (Guardians of the Gates) group, which is prepared to use almost any weapon in its zeal.

The story of the Bill, therefore, is virtually that of a trial of strength between religious parties that are ready to compromise with the state and religious parties that are not. Already *Hapoel Hamizrachi* and its smaller but senior partner *Mizrachi* had gone some way along the road of compromise by accepting the state's education Bill that lessened the hold of orthodoxy upon the schools. Now they have taken a second step despite the serious deterrents put forward by *Agudat Israel*, which pressed the Chief Rabbi to rule that the Bill would be contrary to Jewish law. His dictum seems to have had little effect upon the vote. From now on, it is therefore likely that the liberal wing of orthodoxy will tend increasingly to act independently and, in time, it seems possible that the orthodox community will divide clearly into those who will and those who will not compromise with the secular majority. There is still a call in some secular quarters for continuing attempts at compromise with the zealots. Its advocates feel that the problem of a religious minority within the state is not insoluble, that it will come with time, and that time is on their side.

ALUMINIUM

World supplies of aluminium, that valuable and versatile metal, will be increased by nearly half a million tons a year when the Aluminum Company of Canada's new smelting plant goes into full production at Kitimat in British Columbia. For this great project Simon Handling Engineers are designing and building a travelling pneumatic plant to discharge alumina (aluminium oxide) from ocean vessels to the Kitimat works at 180 tons an hour. This will be among the biggest Simon travelling pneumatic plants yet built, and the first of its kind to handle alumina at so high a capacity.

EXPORT QUESTIONS NEED EXPERT ANSWERS

Will Latin America take Airliners?

Whether you are exporting airliners or T.V. equipment, dynamos or omnibuses, the markets of Latin America pose special questions about currency, import regulations and exchange control. As the only British Bank with branches throughout Latin America, we are particularly well equipped to answer these questions promptly and accurately, and to advise and assist you in many other ways.

Our *Fortnightly Review*, a digest of reports sent in from our 56 branches in South and Central America, is an invaluable summary of economic information for all who trade in these markets. We shall be glad to send you a specimen copy on application to:—

THE TAX COLLECTORS There is little of their modern successors' ruthless urbanity in these 16th century Dutch tax collectors—from a painting by Marinus van Reymerswaele known as "The Excisemen". Ruthlessness, yes; for the gathering in of hard cash was apt to be a dangerous proceeding. Urbanity was to come with anonymity.

A hatful of coins on authority's table reminds us nowadays more of a bank counter and of those

little brown paper bags in which coins are packed. And paper bags—be they carrier bags, vegetable bags, or specially constructed bags for hygienic food handling—are as much part of modern life as the aloof manner of modern taxation. Many millions of paper bags are sold every year by Bowaters and this is just one of the ways in which their Packaging Division makes paper serve modern life. Paper for commerce, art or industry is the business of The Bowater Paper Corporation.

THE BUSINESS WORLD

Freedom Returns to the Metals

AFTER fourteen years of Government trading, dealings in copper were resumed last Wednesday on the London Metal Exchange. The market opened briskly, with 2,250 tons changing hands; cash metal fell to £215 per ton from the former official price of £252, and copper for delivery in three months' time fell to £200 per ton. These prices were virtually unchanged in the afternoon session, when 1,000 tons were traded. Most forecasts about the likely level of prices were confounded. The event emphasised that there is no substitute for an open market. Dealings in tin were resumed late in 1949; lead followed three years later and zinc last January. The London Metal Exchange now has its long-sought opportunity to re-establish itself completely as the effective world market.

The conditions in which it embarks on this task differ radically from those under which it worked before the war. Its own operations are now subject to exchange control, there are still many restrictions on trade in non-ferrous metals in other countries, and the direction of international trade in these metals has changed greatly. Before the war, this trade was predominantly from the producing areas towards Europe, and the United States was a considerable exporter. London was naturally fitted to be the world market, for it was at the centre of the trade. But during and since the war, the United States emerged as the largest single consumer of non-ferrous metals and became a considerable importer. There were some who thought that, because of this change, London would have to give place to New York as the world market. But the character of the American trade in non-ferrous metals does not encourage the development of a world market in New York. Production is largely concentrated among a few big companies who post their own prices. The New

York Commodity Exchange handles what are virtually only the residual supplies for the American market and the prices that are established for these marginal supplies are not necessarily representative of the world market. The effective guide to prices in the American market is to be found in the *Engineering and Mining Journal* which gathers information from the trade. For some years before dealings were resumed on the Metal Exchange in London, the Ministry of Materials based its sterling selling prices on the *E&Mj* quotations. The opening prices on the metal exchange for all non-ferrous metals have shown that these quotations could deviate considerably from prices established in an open market.

Despite the changed circumstances in which it now works, the London Metal Exchange has regained the main attributes of a world market remarkably quickly. It provides an effective free market in which prices are highly sensitive to conditions of supply and demand throughout the world. It has preserved its wide international connections, and it can rapidly dispose of large quantities of metal. This is a basic requirement of a world market and it accounts for the welcome that at least one US custom smelter has given to the restoration of dealings in copper; London offers an outlet for forward sales that is not available in the United States.

The course of prices of lead and zinc on the London market has nevertheless drawn some criticism—not wholly disinterested—from American producers. In their view, prices in London have fallen to unjustifiably low levels. They have, however, kept the price of lead in the United States in alignment with its movements in London. In zinc, American producers followed the decline in the London price until March, when they stuck firmly to their own prices; this they could do with some impunity, because European zinc has not yet won the full acceptance of American con-

sumers. Hence the occasion for arbitrage between London and New York, which normally would bring the two prices into line, has been limited. Tin, on the other hand, is a metal that the United States does not produce, and the sharp fall in prices since April has brought no expressions of pain from the other side of the Atlantic. Comparisons of British and American prices of zinc, lead and tin are shown in the charts. The normal margin between these prices reflects the cost of shipping metal from Europe to the United States.

Although the prices established on the London metal exchange are certainly the nearest approach to representative world market prices, few dealers would claim that the market is yet as effective as it was before the war. Except in tin, turnover has not yet reached prewar levels. For tin the average monthly turnover in the first seven months of this year was just below the average of 25,000 tons in 1938. Turnover in lead this year has so far averaged 20,400 tons a month compared with 32,300 tons in 1938, and in zinc 18,700 tons compared with 24,500 tons. These smaller tonnages mark the changed conditions in the metal trade and also the reduced volume of business, compared with the thirties, that reaches the market from British and Continental users of non-ferrous metals. New business has come in from the United States, and it may increase as Americans become more receptive to the idea of a free market in London. An increase in business from the Continent awaits the easing of local restrictions on the use that can be made of the London metal exchange.

The metal exchange is trying to encourage British users of non-ferrous metals to make more use of the market. Many buyers of non-ferrous metals in Britain have experience only of dealing with the Ministry of Materials, and they are understandably hazy about the way in which a free market works. They do not appreciate that the metal exchange enables them to insure their manufacturing margins and their unsold stocks against an unfavourable movement in raw material prices; nor that the facilities of the exchange enables them to reduce their physical stocks to the minimum.

A broader measure of support for the market also depends on the widest acceptability of the standard

contracts that the metal exchange authorities draw up for each metal. If the terms of these contracts seem to favour the convenience of producers, consumers will be less ready to use the market; if the consumer seems to be favoured, producers will be less willing to offer sufficient metal to the market. This does not mean that all business must pass through the metal exchange; traditionally much more business has been conducted outside the market, but at the market price. The necessary condition of a representative market is that it attracts sufficient business to make it so. The contracts for lead and zinc are now being revised, chiefly to shorten the period in which the producer has the option to deliver, and it may also prove desirable to revise the new contract for copper. A majority of the brokers on the metal exchange consider that producers must be allowed fairly wide latitude to encourage them to use the market. But it should not be impossible to follow the example of one of the largest American copper companies which recently offered to guarantee delivery in standard shapes and sizes, for a premium, in order to stimulate use of the futures contract on the New York Commodity Exchange.

It is only a short time since the wisdom of reopening the London Metal Exchange and other commodity markets was doubted, and not merely by Labour Ministers. Yet how sound the decision has proved to be. The timorous view that reopening the metal market would result in a substantial loss of dollars has been confounded. The hardening of sterling in world markets has virtually destroyed the profitability of "commodity shunting" in free sterling, and the metal exchange has been vigilant in discouraging deals which smacked of such devices. Events have justified the belief of the British authorities, and of many unofficial observers, that given a healthy pound, foreign holders of sterling would use it primarily to buy commodities in London, as before the war. The successful reopening of the metal markets is indeed a matter for gratification. It restores an important element in London's mercantile pre-eminence; it enables British trading skill to earn foreign exchange; and it gives British monetary policy an effective chance to extend its influence on the broad trend of world prices.

Oil by Sea—II.

Too Many Tankers?

THE growth of the world tanker fleet since the end of the war, and the changes in its composition were outlined in an article in *The Economist* last week. This showed that the planned increase of the fleet for the next few years (leaving aside the question of scrapping over-age vessels) may bring about a considerable surplus of tonnage even if the present slackness of demand for tankers should prove temporary. This maladjustment, if prolonged for any length of time, would be bound to have serious consequences, not only for the oil companies and the increasing number of independent tanker operators and owners, but also for the shipbuilders, since some 60 per cent of their present orders are for tankers.

A balance between the supply of and demand for oil tankers is, in the nature of things, not easy to achieve. At any given time the supply of tankers is extremely inelastic. Today there is the possibility of a growing surplus of tankers; yet this has followed a postwar period in which the principal concern has been to keep the supply of tankers in pace with the remarkable expansion of the oil industry. The expansion of tanker capacity that has already taken place is, in fact, greater than the mere tonnage figures suggest. While the deadweight tonnage has doubled, real carrying capacity is more than twice that of the prewar fleet, because the postwar tankers are in all respects larger, faster and more economical vessels. They are able to carry a greater quantity of oil over longer distances in the same time, and can turn round quickly because they load and discharge their cargoes at greater speed.

Although the production and consumption of oil has been expanding every year since the end of the war, the rate of increase has shown much variation. Since 1946 the world production of crude oil has increased at an average annual rate of about 9 per cent, but in one year there was little increase at all, whereas in the next year there was an advance of 12 per cent. The supply of tankers cannot be adjusted to such violent changes, and the inevitable result is a series of rapid fluctuations between high freight rates and low.

At times the oil companies either own or have under time charter as much as 90 per cent of the world tanker tonnage, the remaining 10 per cent "running the market." It is only this 10 per cent which is available for coping with the large annual—or even seasonal—variations in demand. From this comparatively small "cushion" of tonnage the marginal requirements of oil transport are covered by means of charters for single voyages or a series of voyages; and the rates for charters of this kind can be subject to the most severe fluctuations. It is the rate paid for this sort of charter which is generally referred to as the "market rate." These fluctuations in freight costs for marginal amounts of

petroleum products might be expected to have an unsettling effect upon oil prices. In practice, since 1949 the oil companies have endeavoured to introduce some form of stability into voyage rates by means of the "London tanker brokers' award." Every April and October a panel of tanker brokers fixes a basic rate. This notional rate is a basic time charter rate for a standard size tanker which, in the opinion of the brokers' panel, would have to be paid for a two-year charter by a charterer requiring such tonnage for prompt loading and it is accordingly subject to less severe fluctuations than single voyage rates. It does not necessarily have any significant effect on the actual rates at which business is done in the market for spot tonnage during that period.

★

The combined efforts of the oil companies and the independent tanker owners to keep the supply of tonnage in step with the expansion of the oil industry have been fairly successful. Although the variations in demand have been considerable, the periods of extremely high freight rates, accentuated at different times, for example, by the coal shortage and the war in Korea, have been fairly short. For the last twelve months the boot appears to have been on the other foot. Even last winter failed to bring about the normal seasonal strengthening of the market, and the steady fall in freight rates this year has raised doubts whether the planned expansion of tanker tonnage during the next few years has not been overdone.

In the long run the eventual pattern of demand for oil is the deciding factor and this, unfortunately, is as unpredictable as it has been in the past. The rate of expansion has, perhaps, been higher since the war than can be expected to continue; one oil expert has recently ventured the opinion that it might settle down to an annual average increase of about 5 per cent. On that basis, the rate of increase would call for an annual addition to the capacity of the world tanker fleet of about 1,600,000 tons d.w.

At the end of 1952, the tanker building programme envisaged an addition of about 15 million tons d.w. during the next few years. Completion of this programme would bring the world fleet by 1959 to a total of about 47½ million tons d.w., without any allowance for deductions through casualty or obsolescence. If the estimate that an additional 1,600,000 tons a year may be needed is sound, it would imply that the fleet required at the end of 1958 should be in the region of 42½ million tons d.w. Unless during the intervening period some 5 million tons d.w. are scrapped or otherwise removed from service, this estimate would suggest

that there would be too many tankers. Theoretically, scrapping ought to balance this growth in the fleet, since about 5 million tons of the present tanker fleet will be 25 years old or more in 1958, and 25 years is considered to be above the normal span of a tanker's life. In practice, however, things are not so perfectly regulated, and the oil companies, although they are in a good position to encourage the entry of new tonnage into the market, are not so easily able to push obsolescent surplus tonnage out, particularly as a much larger percentage of the total in a few years' time will be owned by independent interests. So long as there is a prospect that an upsurge of demand for oil might instead create a temporary shortage of tankers within a reasonably short period, owners of obsolescent tankers will lay them up rather than break them up. Today, when new and more efficient and economical tankers are coming into service at a rate that over the next two years is likely to exceed 3½ million tons per annum, the older tankers, many of them past their normal expected term of life and now quite uneconomical to run, are not being broken up in any large number. More than 1 million tons of them are now idle or laid up, in the hope, presumably, that before they eventually fall to pieces they will find a chance of earning more than their cost of upkeep.

This "free-lance" reserve of tanker tonnage would be useful in preventing another violent increase in freight rates if the demand for oil should suddenly and unexpectedly rise at short notice. But its existence also has the effect of discouraging the orderly introduction of new and more economical ships (which would need to be ordered now for delivery in later years) and strengthens the possibility that sooner or later the oil industry may be caught up in another shortage of up-to-date tanker tonnage. Looking farther ahead, the problem of adjusting supply and demand is likely to present even greater complications, for the war-time and postwar concentration on tanker building has created huge blocks of tonnage of similar age. Of the present fleet, over 14 million tons d.w. was built between 1940 and 1945 and nearly 6 million tons between 1946 and 1950; and by the end of 1954 another 12 million tons or more will date from 1951-54.

Thus it seems that after about five years in which the demand for oil may increase by 5 per cent annually, the world tanker market will again be just about in balance

and freight rates will begin to adjust themselves to such a prospect well before that time. But the prospect over the next year or two could well be serious. This year alone there may well be an increase of some 10 per cent in the world tanker fleet—even after making very generous allowances for delays in the delivery of new tonnage and for the quantity of old tonnage that may be scrapped. Many owners of old tonnage, therefore, will be under economic pressure to scrap their tankers as soon as they have completed existing charters; these vessels are handicapped not only by their age, and consequent survey and maintenance expenses, but also by their size, for they are smaller and slower than postwar vessels. The older tankers can only expect to operate profitably in times of high freight rates—which do not appear imminent. So the greater part of the readjustment in the tanker market may come about rather through the scrapping of old and smaller tankers than by the cancellation of contracts for new ones. Cancellations of new orders

will be restricted to those independent owners who have not already been able to fix their vessels on time charter to one of the oil companies.

Past experience has shown that the most painstaking estimates of future trends in the international oil trade are often upset by events which are unforeseen and could not properly be anticipated. At

the present time there is much discussion in the United States about the level of oil imports into that country, and a change of policy in this respect could have a far-reaching effect on the tanker market. Domestic producers of oil as well as coal are arguing that oil imports are too high. If American oil imports were to be halved, this might easily result in the laying up of a further million tons d.w. of tankers. On the other hand, some American "conservationists" are suggesting that imports of oil should be deliberately stepped up to two or even three times the current rate, so that domestic oil reserves can be stored in the ground to provide a stockpile of oil against the eventuality of war. Such a policy, if adopted, would increase world tanker requirements by as much as 4 million tons. This emphasises the extent to which the American oil market, which governs world oil prices, also dominates the levels of world tanker rates and the profitability of tanker operation.

In the thirties, the intrinsic difficulties involved in marrying inelastic supply and elastic demand for tanker

Source of voyage rates: Conrad Bore Ltd., Oslo. Examples of Ministry of Transport rates are: Aruba or Curacao/U.K. Continent 32s. 6d.; U.S. Gulf/UK Continent 38s.

tonnage led to the establishment of the international "tanker pool," which was operated by the International Tanker Owners' Association, with the support of the major oil companies. The members of this organisation contributed a proportion of the freights they earned to a central fund, out of which compensation was paid to the owners of tankers taken out of commission and laid up in order to relieve any surplus of tonnage. This scheme was designed to give some stiffening to the depressed freight market and to encourage the laying up of surplus tankers until demand recovered. There have been significant changes in the composition and ownership of the greatly enlarged tanker fleet since that time. Before the war the pool was operated with

some success simply because the major oil companies decided to co-operate. Though these companies now own a smaller proportion of the world's tanker fleet, their view would still be decisive and there is no evidence to suggest that they have any wish to revive the pool. The ideal, no doubt, might be to build up a world fleet just capable of dealing with any potential peak demand, which would also tend to prevent excessive rises in freight rates. This method would, at least, assure some stability of the freight element in oil prices, and it would, incidentally, give some protection to the world shipbuilding industry against its present vulnerability to the threat of widespread cancellations of tanker contracts.

Business Notes

The First Steel Sale

THE unscrambling of the steel industry has begun on a low flame with the private re-sale of Templeborough Rolling Mills to its former owners. The heat will not really be turned up until the early autumn when the first public offers of steel shares are expected. It had been hoped that one or two public offers might make their appearance before the holidays but there was delay in setting up the Agency, and there may also have been a closely fought debate on the terms of the first public issue. Sir John Morison, the chairman of the Realisation Agency, has indicated this week that this first offer will consist of ordinary shares in one of the "Big Seven"—Colvilles, Dorman Long, Lancashire Steel, Stewarts and Lloyds, United Steel, Whitehead and John Summers—but which one will first test the market is still the Agency's secret. The Agency hopes to float off the equity issues of these companies before making any offers of prior charge capital, but its mind is entirely flexible; it might slip in one or two offers for smaller companies and if there were any hitch in the ordinary share offers of the big seven, it might reconsider the possibility of offering prior charge capital.

The actual issues will be handled and underwritten by the issuing houses that were concerned with offers of steel shares before nationalisation—a galaxy of skill and experience made up of Barings, Bensons, Hambros, Helbert Wagg, Lazards, Morgan Grenfell, Rothschilds and Schroeders. In making these offers, preferential treatment (which effectively will probably amount to absolute priority in allotment) will be given to investors that held steel shares—either ordinary or preference—on vesting day; these shareholders will include a lengthy list of institutional investors who purchased steel shares shortly before February 15, 1951, as a cheap back door into gilt-edged stocks—a point that the Agency will not have missed in fixing these arrange-

ments. Applicants for each offer will have the option either of paying in cash or of tendering a wide list of Government securities (probably excluding only the "shorts") for conversion into steel shares; on the day when an offer of steel shares is made to the public the Bank of England (which will act as principal receiving agent for applications) will publish a list of these gilt-edged securities and the prices at which they may be tendered for conversion into the steel issue. These arrangements will give an edge to any operations by the authorities in the gilt-edged market before the early autumn and may have the effect of pegging gilt-edged prices for so long as the lists for any given steel issue remain open.

★

In advance of these offers, there may be one or two private deals similar to that arranged with the former owners of Templeborough Rolling Mills—a re-rolling concern that recently has been very profitable. One third of the shares—that is 72,001—in this company has been sold back to British Ropes and another third to William Cooke (a joint subsidiary of British Ropes and United Steel) at £7 5s. each; the remaining third is still owned by United Steel, which will be offered for sale *cum* the shareholding of this company. This price was arrived at only after hard bargaining and the fact that it is close to the take-over price of £7 is merely coincidence. Indeed, in commenting on this sale, Sir John Morison particularly emphasised that take-over prices are not relevant in fixing the prices at which the steel assets will be sold back. Moreover, the fact that Templeborough has been sold back without its former holding in Scunthorpe Rolling Mill (now owned by John Lysaghts) is a reminder that the physical assets of the steel companies may occasionally be reshuffled before a sale is made. Investors will also recall that major changes in the capital structures of some important steel companies have occurred during their existence as subsidiaries of the Iron and Steel Corporation.

£80 Million for Gas

SOON after the British Electricity Authority, the Gas Council makes another appearance in the gilt-edged market—and with one of the nicest calculations of terms. Its £80 million issue (largely intended for replacing temporary finance) is of 4 per cent guaranteed stock, with a 16-19 year life, offered at 99. It is conveniently not too long, but equally it gives nothing away; and although the gilt-edged market took the issue in its stride and did what it could to provide an encouraging background of firmness, there were few doubts that success for the new stock would imply the familiar process of official subscription and peddling out through the tap when conditions serve. If, as some judges think, the outlook for the next month or two is for steady to good conditions in the gilt-edged market, the authorities should enjoy adequate opportunities to do so.

The Rising Reserves

THE increase of \$89 million in the sterling area's gold and dollar reserves in July, nearly twice as great as the increase of \$46 million in June, is unexpectedly satisfactory. This is the worst season of the year for sterling area sales of wool, cocoa and several other staple commodity

* After taking account of the payment of \$181 million on December 31st for the service of United States and Canadian lines of credit, the United States lend-lease loan and the ERP loan.
† EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.

exports; it is also the season when British tourist expenditure on the Continent is at its peak. The principal feature in the dollar accounts for July was a surplus of \$51 million in what the accompanying table calls the "residual gold and dollar balance," which, for the most part, mirrors the sterling area's current balance with North America. In the last

eleven months, during which the reserves have risen by \$784 million to \$2,456 million, this residual balance has been consistently in surplus—at any rate if last autumn's purchases of arbitrage commodities and last December's dollar debt payments are excluded from it.

The other factors behind the rise in the reserves last month were receipts of \$36 million of American aid (which is above the average both of recent months and of what is to be expected in the months ahead) and of \$2 million from the European Payments Union. This month, for the first time since September, 1952, Britain will have to pay out some gold to EPU instead of garnering new reserves from it; half of the sterling area's deficit of £4 million with Western Europe in July will have to be settled in gold in mid-August. This impending payment of \$5½ million of gold to EPU, however, should be compared with the payment of \$99 million to it a year ago; it seems to be purely a seasonal phenomenon—due especially to tourist payments—and the only cause for surprise is that the recent liberalisation of sterling countries' imports from Western Europe has not thrust this account further into the red. Although any recession in America would change the picture overnight, there is no sign yet of any turn in the golden tide.

Four Month Bills Again

NOW that foreigners are no longer fleeing from sterling the Bank of England has wisely decided to rescind most of the restrictions on the granting of overseas credits that were brought into effect at the beginning of last year. The pressure to which sterling was then subjected was being accentuated—indeed, in large part, was being exerted—by the fact that non-residents were able to postpone remittances to sterling countries and to run short of sterling with the help of London banking credits. In order to counter this, the maximum usance of bills drawn under overseas credits was reduced from 120 to 90 days in February, 1952. In addition severe restrictions were placed on pre-finance and re-finance credits. The former, sometimes referred to as "campaign" credits, are facilities usually granted to primary producers—say, during the growing of cotton or the felling of timber—but before the actual commodities are ready for shipment and therefore before they can rank for normal documentary acceptance credits. Re-finance credits are intended to cover longer periods than the normal span of self-liquidating commercial transactions and, therefore, involve the automatic renewal of bills of exchange. Such facilities were openly used as a method of "bearing" sterling.

All these restrictions, other than those relating to re-finance credits, have now been lifted. In the case of re-finance credits each operation will be judged on its own merits and the ban will continue to apply only where there is evidence that these facilities are being used for purposes that are not genuinely commercial. Although the appropriate instructions have been sent to the banks, it must not be assumed that there will be a general movement to increase the usance of bills of exchange drawn under overseas credits from 90 to 120 days. Such extensions will be permitted by the Exchange Control, but the discount office of the Bank of England is unlikely to overcome its

strong and, on the whole, justifiable aversion to bills drawn for more than 90 days; and the Bank of England's aversion is apt to be translated not merely into a refusal to buy such bills but into critical comments to those who have accepted them.

Loosening Cash Credits

THE commercial banks have also been informed that they may grant cash credits of up to six months to non-residents who seek finance for the import of British goods. This is being done to meet the situation created by the evident need for more export credits and by the fact that many British exporters find themselves up to the hilt of their bank credit facilities. In such cases the necessary credit facilities can be extended direct to the non-resident importer, while the transfer and other risks involved can be covered with the Export Credits Guarantee Department. It is also hoped before long to reduce the considerable amount of clerical work involved in filling up E2 forms. These are the exchange control forms that must be completed to obtain permission to open credits for non-residents. The form will still be required for any abnormal credit; but for straightforward export or import credits of a self-liquidating character no exchange control permission will be needed.

These various concessions and relaxations represent another notable step in the restoration of London's position as an international financial centre. They may not, however, lead to any great revival of the commercial bill. With the commercial bill rate still pegged as high as 3 per cent, more or less by official ukase it is still more profitable for many traders to finance their activities by ordinary overdraft facilities—especially when the acceptance houses' normal commission of around 1½ or 2 per cent, the British stamp duty of 0.2 per cent, and the greater convenience to the borrower of the overdraft system are taken into account. A great deal more is likely to be heard in the next few months about the campaign for reducing the commercial bill rate, which already has the support of the accepting houses and the majority of the discount market.

The Supersonic Gyron

THE new de Havilland engine, the Gyron, of which news was given last week, is believed to be the most powerful jet engine in the world. It is the outcome of a bold bid by the de Havilland Engine Company to make up for the ground lost a few years ago when, alone in the aircraft industry, it continued to pin its faith to the centrifugal compressor, which other designers had abandoned in favour of the more intricate but apparently much more efficient axial. The performance of a jet engine depends very largely on the efficiency of the compressor, for a good deal of the power produced by the engine has to be tapped off to drive it, and the amount of power yielded is partly decided by how highly compressed is the air when it enters the combustion chamber.

The Rolls-Royce Avon, the first axial compressor jet to go into production, has recently been type-tested to give a thrust of 9,500 pounds. This is the highest figure yet reached under the conditions laid down for a test of this kind, during which the engine must run for long periods at a given power output, that then becomes its officially accepted rating (usually well below the maximum of which the engine is capable). Other and newer engines are giving more than 10,000 pounds thrust on the test bed—which is vastly different from passing a type-test at that figure—and the new Rolls-Royce Conway engine is believed to be giving considerably more than this. This suggests that the de Havilland engine must be in the 15,000 to 20,000 pound class; the company has already announced that it is intended for fighters operating at speeds well above that of sound. The company also claims that the Gyron is sturdy and simple to build, which is certainly a departure in jet engine design. It is possible that simplicity has been achieved by abandoning all effort to keep down the size of the engine. This would then make for larger, sturdier components and greatly simplify their production.

This unconventional approach may be the reason why de Havilland has only recently received financial support for the Gyron from the Ministry of Supply. It has had to develop the engine up to this point with its own money, and any Ministry contributions might therefore date only from the signing of the contract. As an engine costs in the region of £4 million to develop, and as a great deal of this has to be spent before the engine is ready for flight trials, it is not surprising that comparatively few aircraft companies

Source: Board of Trade Journal, August 1, 1953.

match de Havilland in its willingness to back a design out of its own financial resources. This may have serious consequences should Government expenditure on defence be curtailed to a point where the Ministry of Supply is able to support only one out of a number of promising designs. In the years immediately after the war, design contracts were freely handed out. This open-handedness enabled the country to get its Canberras, Swifts and Hunters. But, as the Treasury remembers, it also got its Brabazons.

Revolving Loan for Industry

UNDER the American Mutual Security Act of 1952, the sterling counterpart to a small portion (some \$9 million) of American aid to this country had to be used to "establish revolving funds which shall be available for making loans" to producers or otherwise to stimulate "free enterprise and the expansion of the economy." The highbrow answer to this legislation is, of course, that there is no such thing as a real "sterling counterpart" to dollar aid; since the dollars handed out as aid are used directly to buy dollar raw materials (especially those for the defence programme) they cannot be used twice over for new investment in this country. But since the truth needs to be brought home to the people of this country that American aid makes possible certain activities that otherwise could not be afforded, and since the resale to private merchants in Britain of the imports financed by aid receipts can be made to lead to the apparent generation of an idle sterling cash balance in the hands of the central government, Britain had a plain duty to "use" \$9 million of this apparent cash balance to finance certain hard-and-fast items of government expenditure; and then to use the tax revenue (which had really been raised to finance these hard-and-fast items) to carry out the necessary absorption of the surplus purchasing power thus created.

Cmd 8918, which was published this week, now details what these industrial purposes are to be. The most interesting feature is the establishment of a revolving loan fund of £1 million, of which £700,000 will be lent to industry and £300,000 to agriculture. Two committees (under the chairmanship of Sir John Woods and Sir Stanford Cooper respectively) are being set up. They will announce later what sort of applications will be considered and where applications should be addressed; the agricultural committee has already announced that its main purpose will be to grant loans to farmers and landlords for the purchase of grain-drying equipment and storage facilities, and to provide a wide range of capital for Agricultural Co-operative Societies. The rest of the industrial section of this counterpart fund will be applied as to £457,500 for the finance of advisory services by government departments, the British Institute of Management, the British Productivity Council and the National Union of Manufacturers; as to £519,000 for education and training, including the endowment of three chairs or University readerships in engineering and related subjects; as to £589,500 for research, including £400,000 for specific types of economic and social research; and as to £188,400 for publicity about productivity and technical developments. Britain is also contributing £257,500 to the European Productivity Agency, while £201,600 will be kept back in an unallocated reserve.

Atomic Trials at Woomera

REGULAR trials of atomic weapons seem likely to become a feature of the British atomic energy programme, as they are in the United States. The Minister of Supply announced in the House of Commons a week ago that such trials will be carried out on the Australian rocket range at Woomera in October, exactly twelve months after the first British atomic explosion at Monte Bello. The Woomera range is jointly owned by the British and Australian Governments, who have been using it so far for experiments with guided weapons and pilotless aircraft. Experience in the handling of these unconventional armaments is being accumulated in Australia.

Last year's experiment at Monte Bello showed not only that British scientists could design atom bombs, but also that the Commonwealth could provide suitable conditions for testing them. But although Britain's ability to carry out a development programme of atomic weapons gives this country a bargaining counter in negotiating an exchange of atomic information with America, this is not yet strong enough to get the necessary amending legislation through Congress.

There seems, therefore, no immediate prospect of sharing the burden of atomic development. The Minister of Supply said that "increasing sums" were being spent on research into civil applications for atomic energy, but any development of power generation from atomic piles is of great military significance. The experimental power plant that is now being built would equally be regarded as providing data for the development of atomic propulsion of submarines and aircraft, while the plant is generally believed to be operating in conjunction with a pile for producing plutonium, the explosive material for atomic weapons. The British approach to investment in atomic weapons and atomic fuel is essentially pragmatic: Lord Cherwell last year assured the House of Lords that there was no need to consider the explosive charge of the bomb as wasted; it could always be removed and used as a fuel for civil power plants.

Air Traffic in 1952-53

IN the financial year ended March, 1953, the nationalised airlines and their associates provided about 12 per cent more capacity on their services than the year before, but obtained only 10 per cent more revenue traffic, with the result that "overall load factor" fell in BOAC and BEA with alarming implications for their coming financial accounts. Traffic was affected last year by the cuts in services caused by the American fuel strike, by political disturbances in the Middle East, and by the reduced foreign travel allowance; nevertheless, the introduction of tourist fares on the North Atlantic routes stimulated passenger traffic, and the number of passengers carried on all services increased to more than 1½ million, 23 per cent more than the previous year. The Atlantic tourist fares caused passenger traffic on BOAC's western service to increase more than traffic on the eastern services, though the absolute

Seasonal Greetings!

Strange things happen
in a British Summer. But
if you really did see Father Christmas
on the pier one day this August you
might well swear off lobster lunches
for ever. Set your mind at rest, though;
this jovial chap is simply our impression
of the business man who has already placed
his order for advertising playing cards
for this Christmas. Have you ever thought
of advertising by playing cards? They
make an admirable gift and are a
very effective way of keeping your name
in mind. Their cost, too, is surprisingly
reasonable. Why not strike a new note
this year? Our designers can incorporate
your name or trademark into an attractive
playing card and the finished product will
have over a hundred years' experience behind it.
But orders must be received by early September
for delivery before Christmas. So please
telephone or write for one of our technical
advisers to call and show
you specimens and answer
all your questions.

March BEA has put the turbo-prop Viscount into service on tourist routes, and this week reported that these aircraft earned a clear profit of £70,000 during their first 2,000 hours service, and are the cheapest in the corporation's fleet to operate.

Staggered Holiday Spending

THE Bank of England should soon be able to reverse the special holiday increase of £25 million, to £1,625 million, in the fiduciary issue; in fact, it is possible that the increase was not actually necessary, for on both the Wednesday before the Bank holiday (when the peak was reached) and on the Wednesday after it the active note circulation stood at between £1,598 million and £1,599 million. Although this new peak is £84 million higher than the corresponding peak just before the Bank holiday last year, public demands for new cash have, in fact, been smaller in this holiday season than in the summer of 1952. In the five weeks from the beginning of June to July 29, the outflow of notes from the Bank of England amounted to only £55.2 million, compared with an outflow of £95 million in the corresponding period of last year. The comparison is, of course, distorted by the influence of the Coronation, which must have been largely responsible for the disproportionately large increase in the active note circulation in the spring and early summer of this year. This was followed by some reflux of notes in the first half of June; but as some notes were probably kept back by the banks and the general public in reserve against holiday spending, part of the true holiday demands never reached the Bank of England in June and July. In all, however, despite the higher level of prices and wages, the expansion in the note circulation in the six months from the January "low" to the end of July was almost exactly

the same this year as last (at roughly £150 million). This suggests both that the strong upsurge in cash spending that was in progress from last autumn to early this summer may have lost some of its force and that holidays have been more evenly staggered this year.

These hypotheses are confirmed by the small savings figures. Although net repayments of national savings certificates, of defence bonds and of deposits at the post office and trustee savings banks (but excluding defence bonds paid off on maturity) amounted to £16.8 million in the two weeks to July 25th, this was still £2.9 million less than the shortfall in the corresponding period of 1952. Moreover, the small savings position has been more satisfactory for the whole year; the cumulative deficit since the beginning of the financial year—when the improvement over 1952 first became marked—now stands at only £27.4 million. This is almost £10 million less than in the corresponding 17 weeks of 1952. This improvement has been entirely concentrated in national savings certificates and defence bonds; the net repayment of deposits at the savings banks have increased quite substantially—apparently because the public, unlike the Chancellor, considers that an interest rate of 2½ per cent, subject to taxation and to a tax probe, has become anomalous in present conditions.

Bidding for Bodies

THE bid made by the British Motor Corporation for the ordinary shares of Fisher and Ludlow, the motor body and component manufacturers, has much more intriguing implications than did Ford Motor's recent and similar purchase of Briggs Motor Bodies. Although BMC has had a number of contracts with Fisher and Ludlow for some time, Standard Motor has also been among Fisher and Ludlow's principal customers.

British Motor has assured the directors of Fisher and Ludlow that the present management will remain unchanged, that the future trading policy of the company will be materially unaffected, that all contracts will be fulfilled, that "the policy of diversification of output . . . will be continued" and that all inquiries and orders (whether from members of the motor industry or not) will receive the same attention as before. Clearly, then, there will not be any early manufacturing ties between British Motor

Source: Board of Trade Journal, August 1, 1953.

and Fisher and Ludlow as close as those already established between Ford and Briggs, and the odd situation now arises that a subsidiary of the giant of the motor industry will be producing bodies for one of its main competitors.

In response to the bid, Fisher and Ludlow's 10s. ordinary stock units were marked up 4s. 3d. to 52s. 3d. and British Motor's 5s. ordinary shares were marked down 6d. to 6s. 4½d. This fall in the shares of British Motor was to be expected in view of the proposed dilution of its equity; five new British Motor shares as well as 22s. in cash will be given for every 10s. ordinary stock unit of Fisher and Ludlow. The 1,277,808 Fisher and Ludlow shares will be sold ex the dividend of 22½ per cent just declared for the year to March 31st last but the new British Motor shares offered in exchange will not rank for the final ordinary dividend to be paid by British Motor for the year to July 31st last. Once these factors are taken into account, the offer, on the basis of the present price of 6s. 4½d. on the British Motor shares, is worth about 54s. for every ordinary stock unit in Fisher and Ludlow. It is not surprising therefore that Fisher and Ludlow's directors have agreed "in principle" to the offer, even though they had announced as recently as July 23rd that no offer had then been received. But it is also not surprising that that ill-timed announcement of July 23rd has caused some heartburning among those who had sold out after the Birmingham stock exchange had brought the price of the shares up from 37s. 3d. to 48s. within a month.

How Private are Cotton Spinners?

How private is the private spinner of raw cotton? The debate on cotton import policy in the House of Commons last week gave two answers. According to the Labour speakers, if he buys his cotton through the public agency, he somehow ceases to be private and it then becomes proper that the Raw Cotton Commission should provide him with cover facilities on the back of public funds. Only the spinner who does not buy from the Commission, on this view, is really "private." It then follows that public funds should not be used to cover the "mistakes, possibly the speculative mistakes," of the private buyer.

Government speakers took the more realistic view that a person "spinning for private profit" should not have cover from public funds, however he buys. This hair-splitting is mercifully not quite so silly as it sounds for both sides of

INDEX

The Index to *The Economist* is now published quarterly. The subscription rate is 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXVII (April to June, 1953) is now available from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1

the House accepted the conclusion of the Hopkins Committee that public funds should not be used to cover private trade; each was trying to spell out the Committee's report in its own terms by defining what "private trade" should mean.

The Government believes that means of providing cover for raw cotton from private resources must be found. Labour asserts that there is no alternative to public cover; the Raw Cotton Commission will therefore have to be restored to its former splendour, and private import of cotton brought to an end. The President of the Board of Trade, without committing himself at this stage, appeared to indicate that the most feasible means of providing cover would be to reopen the Liverpool Cotton Exchange on a modified basis. To avoid a loss of dollars, traders would not be allowed to take delivery of dollar cotton for payment in sterling on a maturing futures contract—as in the futures markets for grain. Mr Thorneycroft accepted the argument that unrestricted operations on a Liverpool market were not possible since they would require convertibility of sterling. He did not think that cover should be provided by hedging operations on the New York market, because this would cost dollars. The idea that cover might be provided by a futures market in Lancashire not based on raw cotton was "entirely new, and requires very careful study." The debate also suggested that, whatever may be the views of spinners next year, the Government may have to continue the Commission in being, as a purely merchanting body, as the political price for reopening the Liverpool market.

Debate about Standards

It is more than fifteen months since the President of the Board of Trade told the House of Commons that the textile and clothing industries expected to introduce their own voluntary standards of quality to replace those that died with the utility schemes, and that these new standards would be administered by the British Standards Institution. Since then the BSI has been in the unenviable position of an umpire who has bumpers bowled at him by both teams. Some textile producers have become openly hostile to the idea of any standards at all; others have argued interminably over points of detail; and all the time the BSI has been made aware of the anxiety in official quarters to see some tangible results emerging from the protracted negotiations.

The Institution has now taken the unusual step of publishing a progress report on the discussions, on their failures as well as on their successes. It is clear from this that the BSI is not very satisfied with the way that things have turned out. It reveals that the textile industries have decided against standards intended to give a broad indication of the general level of quality of certain classes of goods, and in favour of standards related specifically to certain properties—such as the limits of shrinking or fading that might reasonably be permitted. There are good reasons for this decision, but the BSI reports sadly that "no one pretends that non-technical buyers of consumer goods are yet sufficiently informed or protected from misrepresentation on factors which they are quite unable to assess for themselves at the time of purchase."

The BSI has had two main successes: in the general

Today's da Vinci needs TOMORROW'S ALLOYS

In Leonardo da Vinci's 450 year-old notebooks can be found sketch designs for flying machines, dredgers, machine tools and many other ingenious mechanisms. Many of da Vinci's most advanced designs were not put to the practical test in his lifetime because materials then were not good enough. Today the designer can turn to the metallurgist for help. Together they can look ahead to projects which in a few years time may depend on materials not yet commercially developed. Mond Nickel is working now on such problems in the field of nickel alloys. Now is the time for designers to . . .

There's a future in STEEL

THE WORLD'S largest walking dragline is in operation in the open-cast iron ore quarries at Corby. It weighs 1,650 tons, has electric machinery totalling 3,150 h.p., stands as high as Nelson's Column and walks to work on two steel shoes that weigh 56 tons each. A special high-tensile fine-grain steel was evolved to help make the 282-foot jib.

This Wellsian machine completely dwarfs the bulldozer working with it. It was designed and built in this country by Ransomes and Rapier Limited to strip overburden that no other single machine could cope with. With one man in control it bites out twenty-seven tons of earth every minute, deposits it nearly two hundred and sixty feet away and can work right round the clock. It is laying bare seams down to a hundred feet.

In this and other ways the steel industry is increasing its raw material supplies, both at home and abroad, to keep pace with the industry's continuous programme of modernisation and expansion.

Steel House, Tothill Street, London, S.W.1

Responsible advice **ON INVESTMENT**

AS AN EXECUTOR

AS A TRUSTEE

AS A SOLICITOR

AS AN ACCOUNTANT

Professional men, business men, even private individuals are often asked for advice on the safe investment of substantial sums of money, whether arising from a will, a maturing policy, the sale of property or other sources.

The investments offered by the Co-operative Permanent provide an ideal answer to such problems. Money so invested enjoys the security assured by a large financial institution with interests throughout the country. Moreover, capital is free from fluctuation. Interest at 2½% is paid with unfailing regularity and income tax is paid by the Society making the return equivalent to more than 4½% where there is liability to income tax at 9/- in the £. Invested money is always at call on short notice and can be realised without loss or expense.

Full details of the complete financial service made available by the Society will be forwarded on request.

*Everything points to the
advantages of investment

acceptance by the furniture trade of tests to show whether a piece of furniture will stand up to normal daily use, and in the acceptance by Bradford of descriptive labelling for wool textiles. For many years, the wool industry had refused to consider a general scheme to indicate whether a cloth was all-wool, or a mixture of wool and other fibres; and much diplomacy was needed to reach the present agreement. In future, the terms "wool," "woollen" and "worsted" will be used only to describe cloth that contains at least 90 per cent by weight of wool. If the cloth is a wool mixture, then it may be described as a "blended woollen or worsted" if it contains more than 50 per cent of wool; as a "fibre-blend with wool" if it contains less than 50 per cent. Although the use of these terms is voluntary, and manufacturers are not obliged to describe their cloths in this way, they will in future be open to prosecution under the Merchandise Marks Act if, for example, they call a cloth "woollen" when it does not conform to these definitions.

Dividends from Germany

WHILE Western Germany is piling up balance of payments surpluses with the rest of the world—another surplus of \$52.9 million was secured with other EPU countries in June, carrying its cumulative surplus with the Union to \$577.3 million—the German authorities are still showing considerable reluctance about allowing the transfer abroad of current earnings from foreign investments in Germany. This is a matter that will become of immediate urgency as soon as the German external debt agreement comes into force, as it will do in the very near future. From that moment the prohibition on transfers of current earnings on foreign investments, which was enacted by the occupying military authorities, will finally lapse; and the Federal Government will be left with full discretion in this matter. When Germany became a member of the Organisation for European Economic Co-operation it undertook the obligation, common to all other member countries, to make foreign exchange available for transfer abroad of current earnings in Germany; it was agreed, however, that this obligation should be held in abeyance for a short time, in view of Germany's desperate financial situation and heavy monthly balance of payments deficits at that period. As this position gradually improved and as the deficits were turned into equally impressive surpluses, broad hints were dropped from Paris that a start should be made on the transfer of current earnings. Germany replied that it would like very much to comply with these suggestions, but that its hands were unfortunately bound in this respect by military government legislation.

Now that these shackles on Germany's financial autonomy are about to be removed, the German Government is having second thoughts about its readiness to comply with its OEEC obligations. It is understood that the German delegate on the Council of OEEC is proposing that when transfer of current earnings begins, this should be limited to the transfer of earnings from foreign investments made prior to July 15, 1931, the day when the Standstill Agreements came into effect and Dr Schacht's blocked marks were born.

Germany's Capacity to Pay

IT is difficult to believe that this proposal is being made seriously, or in any spirit other than that of the orient bazaar. Its acceptance would deny the benefits of free transfer to the earnings on all investments that have been made in Germany by way of blocked marks, and would thus perpetuate a system of differential exchange rates that fits very ill with Germany's oft-proclaimed allegiance to liberal economic principles with its current balance of payments. The surplus on Germany's foreign trade amounted to DM 700 million in 1952 and the gold and foreign currency reserves of the Bank Deutscher Länder increased in that year from just over DM 2,000 million to nearly DM 5,000 million. Since then the reserve has risen further to just over DM 5,500 million.

It is true that when the external debt agreement comes into force Germany will be obliged to transfer a maximum of DM 567 million a year up to 1958, and that thereafter this sum will rise to a maximum of DM 765 million; this is exclusive of the German-Israel restitution agreement, which at present requires DM 200 million a year. It is estimated that some DM 12,000 million of foreign capital is now invested in Germany (other than the amount covered by the external debt agreement), and that if the profits on this capital were freely transferable an annual sum of DM 500 million might be required in foreign exchange. All these are maximum figures, and it is improbable that Germany would in fact be called upon to find as much as DM 1,000 million net in foreign exchange under all these heads in any normal year; this is about half the annual rate of increase in Germany's gold and foreign exchange reserves since 1951. There do not seem to be any grounds on which the Federal Government can justify the proposal that it is making to OEEC—not, at any rate, if it is to nurture any hopes about reinstating Germany's external credit and encouraging further investment of foreign capital in that country.

Who Has Liquid Assets?

THE question of who holds liquid assets is in many ways even more important for the stock exchange than who holds shares; for scurrying movements into or out of these liquid holdings are one of the main forces that drive market prices up or down. The savings survey in the current *Bulletin* of the Oxford Institute of Statistics (whose findings on share ownership were discussed in *The Economist* a fortnight ago) has thrown some new light on the probable distribution of this *masse de manœuvre*. Outside estimates suggest that total personal holdings of liquid assets (excluding currency) may have amounted to just over £9,000 million at the time that this survey was made in the spring last year. There were £1,726 million of national savings certificates then outstanding, £877 million of defence bonds, perhaps £3,000 million of deposits at savings banks, £1,290 million of shares and deposits at building societies, £227 million of shares and deposits at co-operative societies and (at a reasonable guess) perhaps

£2,000 million of the £6,500 million odd of deposits at the joint stock banks were held by persons rather than business concerns.

The liquid assets traced by this survey, however, when multiplied by the appropriate figure for the size of the sample, came to only £5,270 million; some part of the gap between this figure and the outside estimate of over £9,000 million may be accounted for by the holdings of people abroad, of executors, non-profit making organisations and business enterprises—but it is obvious nevertheless that some ordinary personal holdings have slipped through the survey's net. The author of the article and director of the survey, Mr H. F. Lydall, believes that many of these missing holdings may have been held by the relatively rich; the well-to-do were apparently more inclined than the working classes to regard the questionnaires as an unwarrantable intrusion on their privacy.

SHORTER NOTES

The Monopolies Commission has completed its report upon the facts of the export and supply in Britain of certain semi-manufactures of copper and copper-based alloys. The President of the Board of Trade announced last week that he had asked the Commission to report further whether the conditions revealed operate, or could be expected to operate, against the public interest. Reports from the Commission on imported timber and on the printing of woven fabrics are expected before the end of the year; the Commission has four specific subjects under investigation at present, including a new directive to examine the supply of hard fibre cordage, and to report both about the facts of the matter and about the bearing of the facts on the public interest.

Company Notes

CABLE AND WIRELESS. The annual report of Cable and Wireless Ltd, the nationalised telecommunications concern, was published this week in the form of a white paper [Cmd. 8913]; these accounts are, of course, to be sharply distinguished from those of Cable and Wireless Holding, the private enterprise company which has arisen from the ashes of the pre-nationalisation business and which now functions, in effect, as an investment trust. As an appropriate preface to the report of the publicly owned Cable and Wireless Ltd for the year to March 31st came the announcement that this company's 50.6 per cent shareholding in the Canadian Marconi Company had been sold to English Electric. This purchase, which at the current price quoted for the Canadian Marconi shares would cost English Electric about £3 million, will mean that Canadian Marconi will be reunited through the parent company with Marconi Wireless Telegraph; the company will continue to be run by Canadian executives as a Canadian enterprise but the new arrangement should help to widen the markets for British-made Marconi products across the Atlantic.

The severance of Canadian Marconi

from Cable and Wireless Ltd. is a logical step; since the Canadian Government took over Canada's overseas telecommunications facilities in 1950, the business of the two concerns has been very different. But the sale also comes at a convenient moment for Cable and Wireless. In order to finance development and renewals last year the company had to sell over £800,000 of Government and other securities (at a net loss); and the directors reveal in Cmd. 8913 that since the end of the financial year further realisations of investments have had to be made. In addition, the company has had to borrow £450,000 from the banks and to run its cash balances down from £1,830,286 to £1,166,982. The receipts from the sale of Canadian Marconi will obviously ease the company's task of meeting its outstanding capital commitments, which at the end of last March were estimated at £3,122,000 (compared with £2,200,000 the year before).

Fortunately, this heavy development expenditure is taking place at a time when the course of the company's profits looks more promising than it did a year ago. The company's operating receipts improved in the last financial year from

Burmah-Shell Refineries Limited (a new company incorporated in India and jointly owned by Shell and Burmah Oil) has under construction on Trombay Island, Bombay, an oil refinery of 2 million tons a year capacity. This new plant, when completed early in 1955, will be the largest in India; it will process crude oil from the Middle East, and will supply a considerable proportion of India's requirements of petroleum products including petrol, kerosene, diesel oils, furnace fuels, and bitumen.

The value of sales of wholesale textiles during the first half of the year was about 6 per cent higher than during the same period of 1952. Sales in June reached 70 (1950=100), a seasonal fall of 20 points from the May figure, but 7 points higher than in June last year. The amount of wholesalers' capital that is locked up in stocks continues to be much smaller than it was last year; the stock index in June stood at 89, compared with 107 twelve months earlier.

The Ford Motor Company has cut the price of the diesel-engined Fordson tractor by £40 from £536 15s. (without hydraulic lift) to £496 15s. Tractors with petrol or vaporising oil engines (both are cheaper than the diesel version) remain unaltered. Prices of the heavier Ford commercial vehicles have been cut by up to £24.

A new agreement has been ratified between the Turkish Government and the Ottoman Bank, whereby the bank, while retaining its registered branch in Istanbul, will be treated by Turkish law as a foreign bank operating in Turkey. The agreement, which will remain in force until 1975, is regarded by the chairman, Lord Latymer, as "a fair one which will prove to be satisfactory to both parties."

£10.2 million to £11 million; and so did its gross profits before tax, from £1,481,649 to £1,777,806. These increases appear to be due almost entirely to the higher charges paid on telegrams, for the total volume of traffic carried by the com-

pany's telegraph system declined for the first time since 1947, by about 7 per cent. This decline ran parallel to the ebb in international trade last year and, as might be expected with the change in the economic climate, traffic in the first months of this year showed a slight increase. But it is upon the higher charges for telegrams rather than upon an increase in traffic that the directors appear to base their estimate that "a slightly

higher profit" will be made in the current year. Whether this profit will be sufficient to allow the company to restore the dividend paid to the Government to its old level of 4 per cent remains to be seen; but, at least, the directors have taken a step along this road by raising the dividend from 2½ per cent (the rate to which it was cut a year ago) to 3 per cent.

★

NCHANGA. The publication of the full accounts of Nchanga Consolidated Copper Mines (which is under the wing of the Anglo-American Corporation) coincided with the first free dealings in copper on the London Metal Exchange. The fall in prices recorded in those dealings suggests that the next accounts of Nchanga will have a much less ebullient story to tell than those just published. Indeed, this report, for the year to March 31st last, may well record the peak of the boom in the Rhodesian copper belt. Everywhere it tells of fresh records—in production (the weight of copper sold rose from 79,499 to 90,150 long tons), in revenue (receipts from sales rose from £16,184,816 to £22,004,471) and in profits (which advanced from £9,982,246 to £14,042,101). This increase in profits, although accompanied by an increase in the provision for Rhodesian taxation, enabled the directors not only to raise the ordinary dividend from 10s. to 15s. on each £1 stock unit but also to appropriate £3,100,000 (against £2 million) to general reserves—an appropriation that enables the company to continue to finance its development programme from its own resources.

The progress of development in Nchanga's mines and plants can be measured by the expenditure of over £3½ million on buildings and machinery, and its results can be traced in the increase in production. The chairman, Sir Ernest Oppenheimer, expects yet another increase in production in the current year,

when the third stage of the company's development programme will be completed; but he adds the important proviso that this increase will depend upon adequate coal supplies and freedom from industrial disputes (such as those that brought work in the copper belt to a halt last autumn). Any further difficulties in obtaining fuel and any demands for higher wages, by adding to costs, will

reduce profits as directly as the fall in copper prices. It therefore seems virtually impossible that Nchanga's profits will be maintained this year; and although last year's ordinary dividends absorbed only £5½ million out of net profits of £8½ million, the recent fall in the price of the £1 ordinary stock units—in line with the declines recorded in the shares of the other copper producers—from 6½ to 6 and the yield of 12.2 per cent offered at this price suggests that the market is far from certain that dividends will be maintained either. But it should be remembered that Nchanga, like other low cost producers in Rhodesia, ought to be less vulnerable to the fall in copper prices than producers elsewhere in the world.

LONDON STOCK EXCHANGE

Next Account begins: August 19th.
Next Contango Day: August 19th.
Next Settlement Day: August 11th.

THE stock markets were in a cheerful mood both at the end of the holiday account and the beginning of the new one. Prices in the gilt-edged and industrial markets responded to the advances recorded on Wall Street and to the further increase in the gold and dollar reserves in July. It was this last factor that encouraged a little extra demand for the Funds on Tuesday and Wednesday and enabled the market, after only a slight pause, to take the news of the Gas Council's issue of £80 million of a 4 per cent stock (1969-72) at 99 in its stride. After the Bank Holiday most of the medium and long-dated gilt-edged stocks gained between ½ and ¾ of a point, and in the two days' trading to the close on Wednesday old Consols rose by ¼ to 61. Similar improvements were made by Colonial and Home Corporation issues, with the new Ayr loan improving to ½ premium. Banking and insurance shares followed the lead set in the gilt-edged market. In the foreign market Japanese bonds, particularly the dollar issues, were well supported; so were German issues, especially after the announcement that a delegation was to visit this country to discuss the settlement of the Potash debts. A certain amount of speculative support was also given to Hungarian and Bulgarian issues.

Almost all the leading equities shared in the advance in prices, and in the two days after the Bank Holiday the *Financial Times* ordinary share index rose from 120.5 to 122.0. Engineering, electrical equipment and stores shares were in the van of this advance, and the demand for oil shares was particularly strong; in the two days to Wednesday's close Anglo-Iranian jumped from 6½ to 7½ on suggestions that the company may make a bonus issue of shares. Rubber shares held firm, but tea shares tended to drift lower. Kaffirs remained firm, but copper shares, which had improved at the end of the old account, were marked down substantially after the fall in the price of the metal when free dealings began in the London market.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; Austria, manufactured gas; and Norway, electricity. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade: Belgium includes Luxembourg. (3) Monthly average of first quarter.

EXCHEQUER RETURNS

For the week ended August 1st there was an "above-line" surplus (after allowing for Sinking Funds) of £33,325,000 compared with a surplus of £248,000 in the previous week and a surplus of £14,193,000 in the corresponding period last year bringing the cumulative deficit to £151,199,000 (£202,153,000 in 1952-53). Net expenditure "below-line" absorbed £8,055,000 raising the total cumulative deficit to £320,196,000 (£433,100,000 in 1952-53).

Financial Statistics

THE MONEY MARKET

CREDIT has been fairly tight in Lombard Street in the week covered by Wednesday's Bank return. Considerable official help was needed on Thursday before the weekend and it was given both directly and indirectly through the banks. On Friday normal credit supplies proved just adequate, but on Saturday conditions tightened and small direct and indirect official purchases were made. Conditions eased somewhat after the Bank Holiday; official help was still necessary for some houses on Tuesday, but by Wednesday credit was adequate and the market could balance its books without any purchases by the special buyer.

Applications for the £250 million of bills on offer at last week's Treasury Bill tender reached the record total of £395.5 million—an increase of nearly £20 million over the previous week's applications. As a result, although the discount market maintained its bid at £99 8s. 3d., its allotment fell to 48 per cent of its application. At yesterday's tender, the offer rose to £260 million; but as matching maturities rose still further, the excess of new bills over maturities is likely to fall by £20 million to £20 million next week.

The Bank return shows a reflux of only £400,000 of notes in the week to Wednesday last. There was little change in the security portfolio in the banking department, but as public accounts were up by £10 million—possibly as a reflection of the large in-payments for Tax Reserve Certificates made last Saturday—bankers' deposits fell by £12.7 million.

COLTHROP BOARD & PAPER MILLS, LIMITED

WORKING TO FULL CAPACITY

MR FRANK W. J. SMITH ON THE OUTLOOK

The thirty-fifth annual general meeting of Colthrop Board & Paper Mills, Limited, was held on July 30th at the registered office of the company, Thatcham, Berks, Mr Frank W. J. Smith (chairman and managing director) presiding.

The following is the chairman's statement which was circulated with the annual report and accounts for the year ended May 31, 1953:

Before dealing with the directors' report of the results of the past year I should like to pay a tribute to the memory of the late Mr Charles Priestley Forster, who passed away on Friday, June 12th, after 35 years of service with the company. His death is very deeply regretted by a wide circle of business friends and associates over many years. He acted as secretary of this company since its inception and in addition was a director for some years past. He was greatly respected by everyone for his ability and rigid adherence to honesty and truth in all his business relations. He will be greatly missed, especially by us all at Thatcham.

The profit for the year ended May 31, 1953, before taxation amounts to £264,239. Taxation including excess profits levy for the full year amounted to a total of £142,747, leaving the net profit of £121,492 for the year, after deduction of tax. After adding the balance brought forward from last year of £50,014, and deducting the net cost of the interim dividend of £24,563, there is a disposable balance of £146,943.

DISTRIBUTION OF 27½ PER CENT

The directors recommend the payment of a final dividend of 17½ per cent, which, with the interim dividend of 10 per cent paid in January last, makes a total of 27½ per cent for the year, compared with 25 per cent paid last year.

The sum of £30,000 appearing in last year's accounts as a reserve for possible loss on wood pulp contracts is no longer required for the purpose for which the reserve was made. This sum has, therefore, been transferred to general reserve and the directors now propose to appropriate a further sum of £60,000 to that account, making the total of the general reserve £270,000, and to carry forward a balance of £41,911, against £50,014 brought forward from last year.

The provision in the Budget to abolish excess profits levy is a step in the right direction, but greater tax relief is still necessary to enable industrial concerns to expand and to provide for their re-equipment.

I concluded my remarks last year by stating that we could not expect the profit this year to reach the high level achieved during the two preceding years, and in view of the difficult conditions which have existed during the past twelve months, I feel sure you will regard the results as very satisfactory. In fact, with the exception of these two previous years, which were abnormal, our profit is higher than it has ever been in the history of the company.

Trading conditions at the beginning of the year were far from satisfactory, due largely

to repeated falls which occurred in the prices of raw materials. In addition, orders were in many instances withheld by our customers until their stocks had been cleared or until conditions became normal.

I am glad to report that during the past six months trading conditions have become more stable. We are now working to full capacity and our order book could not be healthier.

In the absence of unforeseen circumstances I feel confident that the results for the current year will again prove satisfactory.

It gives me pleasure to express my appreciation and that of my co-directors of the loyal and valuable services of our staff, which have resulted in the encouraging figures before you.

CHAIRMAN'S ADDITIONAL REMARKS

The chairman, addressing the meeting, said: Ladies and gentlemen, before commencing the business of the meeting, I wish to refer to the late Mr Charles Priestley Forster who had acted as secretary for this company from its inception and of latter years also as a director. His sudden decease came as a great shock to us at Thatcham and he is very greatly missed by us all.

An accident which unfortunately proved fatal occurred recently at the mill, which the directors very deeply deplore.

The acting secretary (Mr K. L. Collings) having read the notice convening the meeting and the auditor's report,

The chairman continued: As the report and accounts have been in your hands for the requisite time we will, with your permission, take them as read. (Agreed.)

The statement printed on the back of the report covers all the most important points, although it is not possible to cover everything, so I propose to pass at once to the resolution, after which I shall be very pleased to answer any questions you may wish to ask.

I now propose: "That the report of the directors and the accounts of the company for the year ended May 31, 1953, be, and they are hereby, approved and adopted; that a final dividend of 17½ per cent, less income tax, be paid to shareholders registered at the date of this meeting; that £60,000 be transferred to general reserve; and that £41,911, the balance of the profit and loss account, be carried forward."

Mr J. R. Henry, OBE (assistant managing director) seconded the resolution, and it was carried unanimously.

The retiring director (Mr J. R. Henry) was re-elected, and the fee of the auditors (Messrs Deloitte, Plender, Griffiths and Company) was duly fixed.

TRIBUTE TO CHAIRMAN, DIRECTORS AND STAFF

Mr F. E. Armstrong (a shareholder) said he was sure all shareholders would like to associate themselves with the sympathetic tribute that was paid by the chairman to the late Mr Priestley Forster, who was a man possessed of restless activity and tremendous

enthusiasm for the management side of the business. As the chairman had said, Mr Forster was respected by all and would be very greatly missed.

He would also like to propose a vote of thanks to the chairman, not only for presiding at the meeting, but also for steering the company through what was admittedly a very difficult year. A measure of the skill and foresight of the chairman and his board of directors was gathered from the experience of other firms in the paper and pulp trade. Whereas they found it necessary in some instances to bow their heads to the economic storm, in some cases to raise fresh capital, and in other cases to reduce their dividend, Colthrop Board and Paper Mills, Limited, had appeared serenely to ride the storm and had actually increased the dividend to the shareholders. He wanted to thank the chairman for bringing that result about, because it did not happen by accident, and he also wanted to thank his colleagues who had supported him and also the loyal staff who had made a material contribution to bringing about the successful year's trading.

Mr E. Davenport seconded the resolution and it was carried unanimously.

After a brief acknowledgment by the chairman, the proceedings terminated.

THE BRITISH BORNEO TIMBER COMPANY, LIMITED

REORGANISATION WELL UNDER WAY

The thirty-third annual general meeting of The British Borneo Timber Company, Limited, was held on July 30th, in London, Mr H. W. Horner (the chairman) presiding.

The following is an extract from his circulated address:

The year 1952 saw the start of the reorganisation of the company's undertaking in North Borneo in the altered circumstances of surrender, as from the end of June, of its concession and the inception of the exploitation of the new areas for which we have been granted a cutting agreement.

Our installations as a whole will be second to none in Asia, and the bandmill, with its complementary equipment, will be, we believe, quite outstanding.

The net expenditure in 1952 on buildings, sawmills, engineering works, machinery, production equipment, water craft, etc., totalled about £146,600. The total estimated capital expenditure for 1953 is £355,000.

Our operations last year were hampered by adverse weather generally, and by severe floods at either end of the year. This handicap affected all timber operations, and our 1952 production of timber was 2,258,900 cubic feet, rather less than the production for 1951.

Log sales showed a reduction in total of some 400,000 cubic feet due in the main to the severely restricted imports into Australia during the second half of the year and to the lower demand by the Japan market.

Sawn timber conversion was somewhat higher than in 1951 with the same milling facilities, but will be appreciably increased when the large modern bandmill can be brought into operation.

Under the terms of the agreement ratifying the arrangements for the termination of the company's 1920 concession, the Government have guaranteed that the aggregate of the net profits of the company for the three years

from July 1, 1952, to June 30, 1955, will not be less than the aggregate of the net profits for the three financial years 1948, 1949 and 1950.

The board recommend the distribution of the same amount of profit as last year, which equals, on the larger capital, 12 per cent, less tax at 9s. in the £.

The report and accounts were adopted.

CHARRINGTON, GARDNER, LOCKET AND COMPANY

EXTENSION OF ACTIVITIES

The fiftieth annual general meeting of Charrington, Gardner, Locket and Company, Limited, was held on August 6th in London, Sir John Charrington (the chairman) presiding.

The following is an extract from his circulated statement:

The accounts for the year show a group profit of £211,001, which is materially less than the record figure of £284,019 for the preceding year. To a considerable extent this reduction can be attributed to inactive conditions in the Port of London, and our lighterage trade suffered accordingly. We were affected also by the somewhat heavy fuel stocks held by industrial consumers at the beginning of the year, which reduced their requirements during the year under review.

The profit, after taxation, is £60,596, which is £21,265 less than last year's figure. We propose that the rate of dividend on the ordinary stock be maintained by the declaration of a final dividend of 12 per cent, less income tax, at 9s. in the £.

The results of the company for the last year are a good example of the effect of weather upon a business so largely occupied in selling the means of keeping warm. Our profits are reduced, compared with the previous year, but seldom, if ever, have I felt that the company has functioned better, been more active in extending its activities, or traded with greater efficiency while producing new ideas of promise for the future.

NEED FOR DECONTROL

The coal mines of this country have now been nationalised for 6½ years. The National Coal Board have had the support of all classes and parties in recognition of the stupendous task with which they were confronted. It must be admitted, however, that the progress made towards securing for the public the necessary quantity and quality of coal has been most disappointing.

It is devoutly to be hoped that the Government and the National Coal Board will be able, between them, to act with sufficient determination to reverse the present trend and thus pave the way for decontrol in the not too distant future.

I have reserved to the end of my statement what I regard to be the outstanding event of the year, the appointment of the company as sales agents in the area within which we trade for the fuel and gas oils which are now being produced by the Vacuum Oil Company at their new oil refinery at Coryton on the lower Thames. With the organisation of so well known a company as Vacuum behind us, we now expect our sales of fuel oil to advance rapidly; indeed, satisfactory progress has already been made.

However, shareholders must not look for an immediate and substantial increase in the company's profits as a result of this appointment.

The report was adopted.

OTTOMAN BANK

NEW AGREEMENT WITH TURKISH GOVERNMENT RATIFIED

LORD LATYMER ON PROFIT REMITTANCES

The eighty-sixth annual general meeting of Ottoman Bank was held on August 5th at Winchester House, Old Broad Street, London, E.C.

The Rt Hon Lord Latymer (the chairman) presided and, in the course of his speech, said: At the meeting last year you were told that the Turkish Government had given notice to terminate the Convention of 1933 and that a new Agreement had been signed which was to come into force on its ratification by the Grand National Assembly of the Republic of Turkey. This ratification has now taken place. Broadly speaking, under this new Agreement your Bank, while retaining its registered office in Istanbul, will be treated by Turkish law as a foreign bank operating in Turkey.

The Agreement remains in force until March 1, 1975, at which date it may be terminated by the Turkish Government after giving two years' previous notice to expire on that date. If such notice be not given the Agreement will continue thereafter, each party having the right to determine it on giving two years' notice at any time thereafter.

In the Agreement the Bank undertook to prolong its existence as a company for a period of not less than that of the Agreement itself, and you will be asked to agree to a resolution prolonging the life of your Bank for a period of 99 years dating from the ratification, that is to say from July 3, 1953.

These are the main provisions of the new Agreement and, in my opinion and in the opinion of your committee, it is a fair one which will prove to be satisfactory to both parties. Your Bank will continue to use every endeavour to be of all possible service to Turkey and I feel sure that it will carry out those very useful functions, to the benefit of the country, which it has always performed in the past.

TURKEY

Turkey, with a consistent policy and experienced statesmen, continues to exert a stabilising influence in the Middle East. The signature, early in the year of the Balkan Pact confirmed Turkey's co-operation with Greece and Yugoslavia. In the economic field, the progress made in 1951 was not only maintained, it was considerably increased, especially as regards agricultural production, resulting in important exports of cereals. At the same time, Turkey pressed forward with the equipment of her industries and the fulfilment of her plans for important public works.

As a result of the law to encourage foreign investment, ten or more foreign companies obtained permits to open up in Turkey. The Government, moreover, intends to widen the scope of this legislation. The Banque de Relèvement Industriel de Turquie, whose foundation I mentioned two years ago, continues to play an active part and to give increasing aid to the equipment of the country. Naturally, the overall increase in production is reflected in Turkey's foreign trade, which continues to increase from year to year. As in last year, half of Turkey's foreign trade was with Western Germany, England and the United States. Public finance shows satisfactory development. State revenue for the past year was considerably higher than

forecast. The current Budget based thereon is a definite improvement on its predecessors.

EGYPT

The prosperity of Egypt is indissolubly linked with the production and sale of the cotton crop, and it was unfortunate for the present Government that the world price for cotton was declining rapidly just at the moment when it assumed power.

The present difficulties which Egypt faces must not screen her main and permanent problem, that of increasing her agricultural output to feed and maintain an ever-mounting population. This must be done, however, without any serious decrease in her cotton production. What is vital is not only agricultural improvement, but agricultural expansion. There are in course a number of important plans, involving admittedly heavy capital expenditure, including several for bringing, by water storage and systematic irrigation, much land now barren into fruitful cultivation. When some or other of these are achieved, as with a return of economic stability they doubtless will be, Egypt will face the future with confidence. You will realise that 1952 was a difficult year for banks operating in Egypt.

Lord Latymer then gave a detailed review of the other countries where the Bank had interests, and continued:

BALANCE SHEET ITEMS

Turning to the balance sheet, it will be observed that deposits are down by some £14 million by comparison with the record figure last year. This reduction was not unexpected in view of the devaluation of the Israel pound in February, 1952, and the general falling off in international trade during 1952. It is satisfactory to note, however, that the figures are still above the 1950 level.

Our assets continue to show a liquid position with contractions proportionate to the lower figure of deposits. The ratio to deposits of cash and money at call is 29 per cent, bills receivable 19 per cent and investments (which are mainly short-dated British Government securities), 18 per cent. Advances and other accounts at £30,257,195 bear exactly the same ratio to deposits as last year, namely, 41 per cent.

As regards the profit and loss account, you will probably recall that I mentioned last year the increasing difficulty of remitting profits in time for them to be included in the figures for the year in which they were earned. You will not be altogether surprised, therefore, to see that the amount we have been able to include as result for the year is down from £303,038 to £189,621, whilst the figure in respect of profits of previous years is up from £113,946 to £262,968. It seems probable that this state of affairs will be continued in future years. The total available for 1952, including the balance brought forward from 1951 of £27,870, is £480,459, out of which the suggested appropriation to "reserve for contingencies" is again £250,000, leaving a balance of £230,459.

The committee propose that a dividend of 8s. per share be paid again this year, absorbing £200,000 and leaving £30,459 to be carried forward to 1953.

The report was adopted.

L'AIR LIQUIDE

(PARIS)

THE FIFTIETH ANNIVERSARY

The annual general meeting of L'Air Liquide was held on June 25th in Paris, M. Jean Delorme, chairman of the company, presiding.

The following is an extract from the directors' report: The accounts for the financial year 1952 show a net profit of Frs. 1,387,871,227, and mark a further advance as compared with the results for 1951. These results have made it possible to recommend a dividend of Frs. 650 net, as against Frs. 600 in 1951, in respect of both old and new shares. It should be noted that this improvement was gained in respect of a capital that had been increased by 50 per cent since the previous year, with the resulting influx of fresh capital becoming effective as late as May, 1952. The dividend for profit-sharing rights has been fixed at Frs. 2,531 net, as against Frs. 1,459 in 1952.

FURTHER EXPANSION ENVISAGED

The board's report also recalls the fiftieth anniversary of the formation of L'Air Liquide, celebrated on October 25th last, and states in this connection: The fifty years that have passed have not exhausted the possibilities of this sphere of endeavour, which has proved so profitable to us. The future opens vast perspectives of the large variety of purposes for which our techniques can be employed. We are witnessing in effect a dual tendency: on the one hand, in highly industrialised countries, the present-day extensive use of oxygen leads to an unprecedented increase in consumption; on the other hand, in countries more recently developed, a long familiar trend is evident once again; our presence tends to call forth new users who, relying on our punctual delivery service, take to the now classic welding and oxy-acetylene cutting processes with increasing eagerness. It is this continual challenge that has kept this company ever alert and expanding.

UNINTERRUPTED PROGRESS

In his address, the chairman dealt with the reasons for the vitality of, and the progress made by, the company, the inception of which at the beginning of the twentieth century was a response, he said, to the needs that were then in the forefront of industrial and scientific endeavour all over the world.

The company's uninterrupted progress and drive until 1939 insured her an increasingly important role in the economic life of France and other foreign countries. After the upheavals of the second world war, it had to overcome numerous difficulties which followed upon the liberation of France; the factories had to be re-equipped, steps had to be taken to re-establish ownership of their requisitioned properties abroad, and personnel had to be trained. Having successfully taken all these necessary measures, the company had continued on the road to progress, with the result that now the productive capacity of its factories had increased considerably, and the distribution of its products had shown a favourable rise. These satisfactory results were reflected in the growth of its turnover and in the increase of the distributed profits, which in the last seven years had risen from Frs. 200 million to Frs. 1,400 million.

REASONS FOR SUCCESS

Monsieur Edmond Deschars, deputy-chairman of the company, traced the formation and the beginnings of Air Liquide and recalled the activities of the early associates of Monsieur Paul Delorme, now the honorary

chairman of the company. He said that Air Liquide was in the front rank of French companies with private capital showing the highest net profits for 1952, and, in common with another big French company, paying the highest dividends.

The chairman said that the results were entirely due to the great variety of applications to which the products of the company lent themselves, to the excellence of the staff and the techniques employed, and to the consistently sound financial policy which the company had always followed.

The report and accounts were adopted.

AMALGAMATED DENTAL COMPANY, LIMITED

REASONS FOR SALES DECREASE

The forty-eighth annual general meeting of the Amalgamated Dental Company, Limited, was held at the registered offices of the company, 26-40, Broadwick Street, London, W.1, on July 31st, Mr Aiken Watson, QC, the chairman, presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1952:

The year under review has seen the full impact in the home market of the restrictions on free dental treatment imposed in 1951. Sales have fallen substantially and current trading supports the view that no appreciable increase in the home market is in immediate prospect.

As I said in my statement last year, I believe that the demand for dental treatment, which arose on the introduction of the National Health Service, reflected on the whole a genuine need. The importance of dental care in relation to general health is now universally recognised. It is to be hoped that the voice of the profession, which alone may speak authoritatively on these matters, will rouse the public to dental consciousness.

HEAVY BLOW TO EXPORTS

In our export trade we could not hope to escape from the general consequences of world economic trends. The imposition of import restrictions within the sterling area early in 1952 dealt a heavy blow to our expectations of increased trade in this area. The recent easing of these restrictions should be reflected in current trade. In Europe and overseas the emergence of strong foreign competition will tend increasingly to affect our price margins in these territories.

The gearing of the company in the most efficient way to meet all these changing conditions is engaging the constant and close attention of the board.

I am happy to say that the company's products continue to enjoy the widest support of the profession throughout the territories in which we trade. Sevriton—our new filling material—the introduction of which I mentioned last year, has earned high praise in use. In Canada and America it has created lively interest. Needless to say, intensive research continues on this and other products about which it is premature to speak.

A LIMITED MARKET

In an industry dealing in specialised commodities in a limited market any forecast of the future is fraught with peculiar hazards. That notwithstanding, with the continued loyalty and devotion of our managements and staff at home and abroad, to whose efforts and skill I gladly pay tribute and thanks, the directors are confident that the immediate future holds prospects of a steady if not expanding trade.

The report and accounts were unanimously adopted.

NCHANGA CONSOLIDATED COPPER MINES

NEW PRODUCTION SALES AND PROFITS RECORDS

The sixteenth annual general meeting of Nchanga Consolidated Copper Mines, Limited, will be held on August 26th at Nkana, Northern Rhodesia.

The following is an extract from the statement by the chairman, Sir Ernest Oppenheimer, which has been circulated with the report and accounts.

The results for the year ended March 31, 1953, show that new records have again been achieved by your company in the fields of production, sales and profits, and in consequence it has been possible, after providing for dividends amounting to 15s. per unit of stock, to maintain the policy of financing internally the company's capital expenditure programme. To this end there has been set aside out of the year's profits to General Reserve an amount of £3,100,000, apart from which a further sum has been temporarily provided by the retention of an increased balance of unappropriated profits.

Questions of power supply continue to receive the closest consideration from your board. The thermal power generating stations at the four big copper mines were interconnected during August, 1952, thereby ensuring to all the most efficient usage of available power and the greatest possible safety from breakdown. Ownership of this interconnection system and other assets of the Northern Rhodesia Power Corporation is being acquired by Rhodesia Congo Border Power Corporation, Limited, a company which has recently been formed in Northern Rhodesia and in which your company has a 25 per cent interest.

This new Corporation will also take over the responsibility for the importation of hydro-electric power from the Belgian Congo, which we hope will be available early in 1957, and has recently concluded an agreement with the Export-Import Bank of Washington for a loan of up to £8 million.

This money will be used to finance extensions to the existing power supply system as well as to meet certain expenditure in connection with the import of power from the Congo.

As to the long-term policy, it is confidently expected that active development of the hydro-electric scheme within Northern Rhodesia, on the Kafue River, will be commenced at an early date, following the recent setting-up of the Kafue River Hydro-Electric Authority. A further and larger scale project in Southern Rhodesia, known as the Kariba Gorge Scheme, is receiving the active attention of the Southern Rhodesian Government.

Since the close of the financial year considerable interest has been centred on the copper price which has dropped some £20 or £30 per ton since March. The Ministry of Materials has decided that the supply position is such that trading in this metal can once again return to the free market. The London Metal Exchange will in consequence reopen for dealings in copper on August 5th.

Given adequate coal supplies and freedom from industrial disputes, it is anticipated that production for the current year will be further increased with the commissioning of the remainder of our third stage extensions, and in this connection members will be interested to know that the board has under consideration extending the present mining methods to include open pit working, for which, our consulting engineers advise us, a section of

the company's property is eminently suitable and which would achieve a better long-term balance in the supply of ore.

Copies of the annual report and accounts may be obtained from the head office, Kitwe, Northern Rhodesia, or from the transfer offices at 44, Main Street, Johannesburg, and 11, Old Jewry, London, E.C.2.

WARNE, WRIGHT & ROWLAND LIMITED

SATISFACTORY RESULTS DESPITE TRADING DIFFICULTIES

AIR COMMODORE J. A. CECIL-WRIGHT'S REVIEW

The forty-sixth annual general meeting of Warne, Wright & Rowland, Ltd., was held yesterday at the Queen's Hotel, Birmingham.

The following is a précis of the review by the chairman, Air Commodore J. A. Cecil-Wright, AFC, TD, DL, FInstD, which was circulated with the accounts:

For the year ending December 31, 1952, the earnings of the group (including £11,080 profit accruing from the sale of shares in Timbrell and Wright (Successors), Ltd.) amounted to £191,636 as compared with £191,231 in 1951. The directors consider the result to be satisfactory, having regard to a number of setbacks experienced during the second half of the year. These included the scaling down of rearmament orders, the continued closure of the Australian market, reduced trading in other markets resulting from currency and quota restrictions, the general recession experienced by the nut and bolt industry, and a wet summer which lessened the demand for horticultural brassware, of which the group is the largest supplier in the country.

In order to write down stocks to present market prices and to provide for possible obsolescence, the sum of £30,000 was charged against current trading; reserves made in previous years therefore remain intact. The profit resulting from the parent company's own manufacturing business was deliberately sacrificed in order to expedite completion of the reorganisation of these works.

The balance sheet discloses the total assets of the group, excluding goodwill, to be over £1,500,000, and the surplus of current assets over current liabilities is £690,117. After spending upwards of £70,000 on new machine tools, the liquid position with £203,860 available in cash remains satisfactory.

FUTURE PROSPECTS

As to future prospects, the group made no attempt to pass on to its customers the cost of the wages increases awarded in November last. In this connection, speaking of industry generally, the chairman states that further increases in production costs allied to the enormous burden of taxation and the high cost of plant replacement may well price our products right out of world markets, the one sure consequence of which will be all the misery of widespread unemployment. Competition from Germany and other foreign countries is increasing, with its consequent effect on profit margins. These factors would seem to point to reduced profits in the immediate future, but against them can be set the gains in efficiency achieved by organising and planning which, under normal trading conditions, should yield maximum savings within the next two or three years. Therefore, unless a chain of unpredictable events spoil the forecast, the results for the current year should not differ materially from those of the year under review.

The report was adopted.

METAL CLOSURES, LIMITED

BROADENED BASIS OF OPERATIONS

MR W. V. ESPERSON'S REVIEW

The seventeenth annual general meeting of Metal Closures, Limited, was held on July 30th, at West Bromwich.

Mr W. V. Esperson (the chairman) presided and in the course of his speech said: Our consolidated profit for 1952 before provision for taxation is £193,700 as compared with £220,400 for the previous year. This is a reduction of £26,700 or about 12.3 per cent. The net profit remaining after provision for taxation is £53,400 as compared with £97,900 for the previous year—a difference of £44,500.

In the accounts under review, reserves for taxation have been made amounting to £140,200, while for 1951 similar reserves amounted to £122,500. Therefore despite the fact that the profit for 1952 was £26,700 less than for 1951, we have had to reserve £17,700 more for taxation—for excess profits levy alone we reserved £30,700; this is the penalty we have incurred for having progressed so greatly during the past few years.

During 1952, we considered it advisable to reduce some of our selling prices, and I may mention that the loss of profit due to this reduction accounted for a very large proportion of the decrease in the net profit. During the last two months of 1952, the requirements of our customers were greatly curtailed, and in consequence our output was considerably reduced. Nevertheless, our group turnover for the year was somewhat larger than the turnover for the previous year. In 1952, we met with many difficulties in the export market, due principally to restriction of imports by various countries, and, in some cases, shortage of sterling. We also had to contend with many trials and tribulations due to inferior raw materials, which was an expensive matter for us.

NEW ACQUISITIONS

During 1951 and the early part of 1952, the demands of our customers were so great and insistent that we considered it necessary to obtain further manufacturing space, and in pursuance of this object, we purchased the shares of a company operating a very modern factory in South Wales. The South Wales factory is now fully equipped to manufacture independently; it is working very efficiently, and is capable of making a very considerable addition to our daily output of closures.

In order to broaden the basis of our business, we entered the plastic industry last year by acquiring an established plastic closure manufacturing business. This business is showing profits which we hope and believe will be steadily increased as time goes on.

In regard to prospects for the current year, the falling-off in demand I have previously mentioned continued until early in March of this year, when market conditions began to improve, and they are now more stable than they were. The recession in our business was due, partly, to some of our customers having either overstocked or to their determination to carry smaller stocks, and partly to a recession in trade generally. Our trade is largely connected with the food industry, and as that industry is both vital and permanent, I believe we may feel assured that our business has a solid basis for the continuation of its existence on a profitable scale.

The report was adopted.

HACKBRIDGE AND HEWITTIC ELECTRIC

IMPROVED DELIVERY DATE POSITION

The forty-seventh annual general meeting of Hackbridge and Hewittic Electric Company Limited was held on August 5th in London, Mr Thomas F. Lister (chairman and managing director) presiding.

The following is an extract from his circulated statement:

The trading profits of the group have been well maintained at £459,351, compared with £464,737 for the previous year. There is available a net profit of the group, before taxation, of £403,545, against £415,903 the previous year.

The provision for taxation requires in all the sum of £249,387, compared with £257,357 the previous year. United Kingdom taxation requires £233,500, against £251,500, reflecting the small reduction in the standard rate of income tax and the changed incidence of profits tax. Nevertheless, taxation still absorbs 62 per cent of our profits, which is the same as for the previous year and, in my submission, is far too large a burden upon British industry.

If the stockholders approve the payment of a final dividend on the ordinary stock of 15 per cent, making a total of 20 per cent, less tax, for the year to March 31, 1953, the total dividend requirement, including the year's dividend on the preference shares, will absorb £61,725 net. This will enable the directors to transfer the sum of £75,000 to general reserve, which will then stand at the substantial figure of £400,000. The carry forward on profit and loss account will be £53,146.

I am glad to be able to report that in common with other companies in the heavy electrical equipment industry, we have experienced a decline in the demands made upon us, which is reflected in a reduction in our order book to a more manageable level, thus enabling us to give better delivery dates in respect of new business at home and abroad. While these remarks apply particularly to the transformer and switchgear divisions, the demand for our glass bulb rectifiers shows no falling off and our order book for these is the largest in the company's history. We have every reason to expect that our output and deliveries for the current year will be maintained and possibly increased.

CANADIAN SUBSIDIARY

With regard to our Canadian subsidiary, I am pleased to report that our Canadian clients continue to place confidence in our rectifiers and that the orders, including contracts with the United States, amount to \$1,400,000. This is \$800,000 lower than a year ago, due to a large contract for the equipment of an electrolytic plant for the United States having been completed in the meantime. Now that we are able to promise better delivery dates with regard to transformers, we expect to derive our share of this business in Canada which will be available during the immediate future because of the large expansion programmes already in hand for the development of hydro-electric power in that country.

It was necessary last year to draw your attention to the difficulties which were being experienced as a result of the financial and other restrictions imposed on exports to Australia by that country. However, the authorities have been able to effect a decided improvement and the indications are that this improvement will continue, so that by the end of this year it hoped normal trading conditions with Australia can be resumed.

The report was adopted.

THE BRITISH SHAREHOLDERS TRUST

SUBSIDIARY COMPANY'S PROGRESS

SIR BERNHARD BINDER ON ONEROUS TAXATION

The thirty-first annual general meeting of The British Shareholders Trust Limited was held on August 6th in London.

Sir Bernhard Binder, FCA (the chairman), presided and, in the course of his speech, said: The net profit, before taxation, for the year to March 31st last amounted to £72,496, which is £11,544 less than for the year to March 31, 1952. This is accounted for by a reduction in the profits on placings and realisation of securities, offset to the extent of £2,000 by increased income from our investments.

Our subsidiary company, The Record Electrical Company Limited, continues to expand. Its trading profits for the year ended March 31, 1953, increased by approximately £27,000, but taxation took £22,447 more than in the previous year. The rate of dividend we received in the twelve months under review is the same as that paid to us for the year to March 31, 1952. The Record Company's order book is satisfactory, and although some of its business is due to the rearmament programme, there is reason to believe that that company will not only maintain but increase its rate of turnover compared with last year. Further developments have resulted in new products being added to the range of instruments manufactured, in particular, a new small electrical recording instrument, which has had a good reception from potential users from whom satisfactory initial orders have been obtained.

Your company, owning about 81 per cent of the ordinary shares of The Record Company, has had to provide this year in its accounts £17,116 in respect of The Record Company's liability to Excess Profits Levy, and of this sum, by law, we can only recover £14,474 from that company. The 1953-54 budget provides that as from January 1, 1954, the Excess Profits Levy will cease, so that in due course we may expect some relief in this direction.

TAXATION AND "ADVENTUROUS INDUSTRIALISTS"

During the debate on this year's budget, the Chancellor of the Exchequer stated that the Government felt that under the present burden of taxation, it was impossible to get that drive and spurt forward which the economy needed so much, and that the main need now was to lighten the load on our adventurous industrialists, and to give them an opportunity to compete. This year we have been given at long last, a slight relief from this burden, but one of the most onerous forms of taxation that has still to receive some easement is that of estate duties, particularly as they affect the owners of private companies, who are in so many cases the "adventurous industrialists" referred to by the Chancellor. For some time past we have been studying this question and hope to provide a new basis for assisting the owners of private businesses who are faced with this burden.

As the national revenue may not remain buoyant, the only effective step towards lightening the load of taxation referred to by the Chancellor is to reduce Government expenditure. To bring this matter into perspective, we have prepared and will shortly distribute copies of a financial survey of the United Kingdom from 1913 to 1952.

The chairman, having quoted figures from the survey, continued: If national expenditure is not reduced and at the same time the

national revenue falls, something drastic and unpalatable will have to be done to balance the budget and so preserve the value of our currency in the eyes of the world.

As to the future of our own business, we are about to place blocks of ordinary shares of two old-established businesses, particulars of which will be advertised in the next few days. We like to think, and I believe can demonstrate, that over many years we have taken great pains to see that any issue we sponsor is sound. In our business of finding capital for industry, everything depends in the end on backing the men who are responsible for the successful conduct of the various industries in which they are engaged. This we have always in mind, and I believe our record bears this out.

The report was adopted and the payment of a final dividend of 4½ per cent and a bonus of 2½ per cent, making, with the interim payment, 10 per cent for the year, was approved.

KELVIN AND HUGHES PROBLEM OF NECESSARY FURTHER CAPITAL

The sixth annual general meeting of Kelvin and Hughes, Limited, was held on August 6th in London.

Mr Ralph Gordon-Smith (the chairman), presided and in the course of his speech said: A year ago I referred to the financial problems arising from your company's rapid expansion. The consolidated profit after taxation amounts to £160,041, an increase of £63,000; taxation amounted to no less than £332,600, an increase of £184,000, which means we are paying away 68 per cent of our total earnings in tax. A first glance at the balance sheet shows that there is £154,000 in the bank; tax alone will absorb all of this balance and some £250,000 more. It is evident to your board that substantial further permanent capital will be necessary within the next year or so.

S. Smith and Sons (England), Limited, which already holds over 52 per cent of your company's ordinary capital, have offered what I, as chairman of both companies, consider a reasonable exchange, and those of your directors who are not connected with Smiths agree with this view. The offer is six 4s. ordinary shares in Smiths, a total nominal value of 24s., in exchange for one 20s. share in Kelvin & Hughes.

If the Smiths offer is accepted it will not signify any change in management or policy of your company; the Kelvin & Hughes group will continue to operate independently.

Output showed a substantial increase over the previous year's record, making an increase of over 70 per cent during the last two years. Our order book is satisfactory.

We have made further improvements in our development and research departments, and an interesting effect of their work is that your company's instruments have now been used to determine the greatest height attained in the air as well as the greatest depth under the sea; I am referring, of course, to the recent height record established by a Canberra aircraft and the record sounding made by the Danish research vessel Galathea. On land, one of our aircraft barometers was used by the successful Everest team to determine local barometric pressures. Our unique whale-finding equipment has now proved itself over a long period of severe operational conditions, and we have brought out a new miniature flaw detector. Steady progress is being maintained in the development of new instruments for the coming generation of high-flying, high-speed civil and military aircraft; in this connection we were recently awarded a substantial contract by the United States Air Force in Europe.

The report was adopted.

SPURLING MOTOR BODIES

WELCOME CHANGES

The sixteenth annual general meeting of Spurling Motor Bodies Limited, was held on July 30th in London.

Mr W. F. Spurling (managing director), in the course of his speech, said: Today we find ourselves five months through the present financial year, and during this period changes have come about, which we welcome. To me these changes signify definite prospects of bigger, better business, for those who are prepared to go out for it—bigger because the volume should be greater, better because our business will be much more free from demands appertaining to war conditions.

The first point we note is the steady rise in the numbers of cars and trucks coming from the factory, which will enable us to fulfil long-outstanding orders, and thus create more satisfied customers for Spurlings. The increased number of vehicles and chassis now coming off the line, we are told is only a trickle, compared with the quantity we can expect in the not too distant future.

Our production departments have climbed out of the hollow. Today business is very brisk, our order books again are heavy, and we are expecting a big demand for the new-type bodies now being demonstrated. As the holiday period closes we shall be increasing the number of employees in our shops.

The first stage of our expansion scheme is now in being. We have purchased premises at Wembley and plans for their development and improvement are in hand.

The report and accounts were adopted.

YORKSHIRE FINE WOOLLEN SPINNERS

The fifth annual general meeting of Yorkshire Fine Woollen Spinners, Limited, was held on July 31st, at Huddersfield, Sir Frank Binns (chairman and managing director) presiding.

The following are extracts from his circulated statement:

The statement of accounts show the profits of the group for the year 1952 to be £102,720 as compared with £137,291 last year. The net trading profits amount to £42,749 as compared with £33,695 last year.

The year under review has not been an easy trading year; fluctuations in wool prices have again caused us considerable anxiety. Until prices become more stabilised I am afraid that the industry as a whole will continue its operations under conditions which can only be described as being somewhat speculative. It would be very unwise to predict the future trend of our trade but throughout this period the mills have been employed fully. Yarn production, apart from labour shortages, has been to capacity, but, as I intimated last year, profit margins are not comparable per pound of yarn produced with the profits for 1949 or 1950. Competition is increasing rapidly, with the obvious result that quotations for the finished product are constantly becoming keener.

A number of new and interesting yarns have been introduced to the trade recently, which have been very well received. Some of them already in bulk production are being readily absorbed, and we have every hope that they will prove beneficial to the group.

The report was adopted and the dividend of 17½ per cent approved.

WEIR PUMPS

Direct-Acting

have a world-wide renown for efficiency, reliability and economy. They include designs for boiler feeding, general service pumps, oil fuel pressure and transfer pumps, etc., and are in constant demand for ships and all types of industry where reliability and efficiency are essential.

ask the typist

Who, after all, is more likely to know the pros and cons of typewriters than the girl who works with them? She may not be able to express herself in the language of the typewriter technician, but her 'It's a good machine in every way' carries more weight than all the wordy technicalities. So when our typewriters pass the typist's test—as they have been doing for many years and in many countries—we feel that a lot has been achieved.

No New Line

IF Parliament were now sitting there would be a lively new battle about a grim old subject. The Opposition would be charging the Government with changing its policy towards China, with concealing an important new commitment from the House of Commons, and—presumably—with appeasing the Americans. The grievance, as stated in a letter to *The Times* from two former Labour ministers, Mr Gordon Walker and Mr Jay, is this: that the British Government signed on July 27th (but did not publish until after the recess had begun) a declaration drawn up by sixteen members of the United Nations stating that they would jointly resist "a renewal of the armed attack in Korea." The statement concluded with the following sentence:

The consequences of such a breach of the armistice would be so grave that, in all probability, it would not be possible to confine hostilities within the frontiers of Korea.

That, say the agitated critics, is a half-promise—or at least it will be taken by the Americans as a half-promise—that this country, if war is resumed, will join in operations against the Chinese mainland. They claim that "extension of the war to China is contrary to the clear policy of both Labour and Conservative governments ever since 1950" and that "public opinion in this country is unanimously against it." Here, then, is the first complaint: that policy has been changed in a dangerous direction that no one in this country will approve. The second complaint is that ministers should have revealed the existence of this document before Parliament had dispersed.

The subject matter of these complaints is serious enough—nobody will try to shrug off the risk of war with China. But the complaints themselves, unfortunately, are all too characteristic of the baffling forgetfulness and irresponsibility with which former Labour ministers now speak on international affairs after only eighteen months away from the telegrams and the responsibilities of office. Their speeches in the House of Commons provide *Pravda* with its most telling points. They are consistently opposed to the British Government showing any firmness anywhere (except, of course, in Washington). Having agreed when they were in office to such bold and risky policies as the rearmament of Germany, the resistance to China in Korea, and the construction of an atomic bomb, having most resolutely and patiently built up strength to negotiate with the tough characters of Moscow and Peking, they now fail in courage and clarity at the very moment when the policy they inaugurated is beginning to pay. Especially surprising is their short memory. Has the debate of February 26th last year been forgotten? The Prime Minister then revealed that the Labour government had in 1951 agreed that, in certain circumstances, they would "associate themselves with action not confined to Korea." And has it been forgotten that this undertaking, certainly much the more explicit of the two, was kept secret for eight months?

That, at least, was a commitment; the sentence in the declaration of the sixteen is nothing more than a statement of probabilities. For it is as plain as a pike-staff that if war flares up once again in Korea, it will only with great difficulty be confined to that country. If the Americans (who have, after all, next to the Koreans themselves, borne most of the burden and taken most of the blame) have to start fighting again, they will be most unwilling (as we should be in their place) to go on fighting with one hand tied behind their back. That being so, what were the allies of the United States to do? Ignore plain facts and risk the Americans "going it alone," in which case we could not hope to avoid being drawn in eventually, any more than they could in 1917 or 1941? Or face the facts and maintain the partnership to which even General MacArthur was eventually forced to admit his responsibility? There is no doubt that they took the right decision even if their wording of it was unfortunate. There is no doubt that a Labour government would have done exactly the same thing, as it did in 1951.

★

If there cannot be, in the critical months ahead, some return to realistic bi-partisan thinking on the big issues of foreign policy, it will be extremely difficult for the three western powers to make any progress at all with Malenkov and his colleagues. The speech which he made, and they presumably approved, was a hard, confident, unyielding performance. True, it was primarily intended to impress critics and rivals and to reassure a people which had its fill of war alarms under Stalin. But it was the clearest statement of Soviet foreign policy that has been made for a long time. Tension is eased, said Malenkov; we are trying to get back to normal; stop all this cold war business and return to the conventions of diplomacy; there need be no war; we will negotiate. That, so far as it goes, was well enough. But he also made it abundantly clear that there would be no concessions. The Soviets could withstand all threats. And if he was frank in exposing economic shortcomings in the Soviet system (which are further discussed in an article on page 432), there was no hint that they would lead to any concessions in the foreign sphere—rather the contrary.

On specific points the speech was of the deepest interest. There was a bid to every major partner in the Atlantic alliance except Britain, to President Eisenhower, to France, to Italy, to Turkey. The intention is clearly to divide the allies of America as Hitler divided the allies of France. It will be best brought about by reducing tension, for "the North Atlantic bloc is rent by internal strife and contradictions and the lessening of this tension may lead to its disintegration." Aggressive circles are afraid of this process and, therefore, oppose the lessening of tension. Therefore, Malenkov deduces, let the "peace-loving forces" in each country overcome the aggressive circles, with a little help from

the Soviet Union, and there will be no need for the Soviet Union to make any substantial concessions. Malenkov is not urgently interested either in German unity, or in German elections, or in the Soviet-German partnership of which Stalin used to speak. The only aspect of the German question with which he is concerned is how the Soviet Union is to be given security against a German resurgence; the speech contains unmistakable warnings against German rearmament and adventures in Berlin.

★

At one point in his speech, Malenkov says that any negotiations between the powers must start from "stark reality, on the ground of facts, be they pleasant or not." This should be taken to heart in the West, and the starkest of the facts is that, if there is any "new line" in Soviet diplomacy, though it may be more subtle, it is certainly no more amiable or yielding than in Stalin's day. Indeed, for some time, Malenkov may be harder to deal with than Stalin. A man who has had to limit his defence budget, who has made large concessions to the consumer and the peasant and who has dismissed his police chief cannot risk the accusation of weakness in foreign policy.

If that is so, then the pattern for the months ahead is clear. The western governments will be struggling to hold those cards in Europe and elsewhere which force Moscow to treat them with respect, perhaps even with a certain fear. Yet this is the moment when the Opposition—and many non-Socialists who do not even have the excuse of a duty to oppose—raise the demand that all the cards be shown or surrendered before the four-power game begins. It is one thing to avoid a binding commitment to attack China if fighting begins again in Korea—no such commitment has been made, and if anybody still thinks that the sixteen-power declaration embodies one, the misapprehension can easily be removed. But what the critics apparently want, what any yielding to their clamour would effectively establish, is a promise by the British Government that it will not in any circumstances at any time countenance operations against China. That would be folly of the highest order, which would make war in the end more rather than less likely. It is incredible that, so soon after the 1930s, there are so many people who believe that a concessive diplomacy is more likely to secure peace than a firm and strong one.

Moscow's hope was made very plain in Malenkov's speech. It is that, with the solidifying pressure of immediate fear removed from them, the democracies will revert to their curious habit of putting the best possible construction on their enemies' intentions and the worst possible on their friends', and that this will eventually enable the Soviets to force a settlement on their own terms. The tactic is obvious and intelligent; the only puzzle is why so many people in this country seem anxious to fall in with it.

Ariel and Caliban

ONE of the subjects that the parliamentary recess left in suspense, and on which Ministers will have to do some hard thinking before the autumn, is their announced intention to introduce an element of competition into television. The story so far is a strange one, and the present state of affairs, though it is plainly embarrassing to Ministers and must be exasperating to many of those outside Parliament who are directly concerned, is one from which the spectator on the side lines can derive a certain amount of amusement.

The story goes back to the time when the Conservatives, in their first six months of office, were trying to make up their minds what to do about the report of the Beveridge Committee and the renewal of the BBC's licence. A small group of pertinacious backbenchers then succeeded in persuading the Government to commit itself to permitting "some element of competition" in television. It is doubtful whether ministers gave the matter much thought. It sounded like a small, comparatively simple and surely almost completely harmless example of the general policy of sending out private enterprise skirmishers to harry the flanks of those nationalised industries that could not be completely denationalised. So the phrase got into the White Paper of May, 1952, and the subsequent debate made it clear that the cautious wording was to be interpreted as meaning sponsoring—that is, finance by advertising.

After the first declaration of intent, the subject lay dormant, politically speaking, throughout 1952. But in the spring of this year it began to wake up. Two things were then discovered. First, it is said to be technically impossible—at least for some years to come—to have a whole host of competitive broadcasters; there is no question of free competition, but only of a single competitor for the BBC. Secondly, it has become apparent that, in addition to the expected and automatic opposition of the Labour party, there is a strong body of opposition to sponsoring within the Conservative party itself, including some much respected figures and heavily concentrated in the House of Lords. Moreover, this opposition bases itself on Good Taste and Morality; in that subtle way that is unique to this island it is not so much stated as taken for self-evident that only cads would want to have advertising on the air. This sort of argument, when urged by peers of the realm of impeccable antecedents, backed by the bishops, and supported in all the most respectable organs of the press, is a force that a Conservative government ignores at its peril.

Then came the Coronation, with its allegations of the most frightful breaches of good form by the commercialised American networks. Exactly what was inflicted on the American viewer on June 2nd will now never be known, unless some impartial judge can have resurrected for him the whole of the many programmes that

were put out on that day. Some say that it was vulgar beyond belief, and they parade the simian figure of Mr J. Fred Muggs, whose fame in this country is now far greater than any he is ever likely to enjoy at home. But Her Majesty's Ambassador, in response to an inquiry from the Foreign Office (the public has not been told whether the question began with *num* or *nonne*), reported that, in the Embassy's opinion, on the whole, it had been well done. A conflict of evidence like this, of course, is just what a good controversy needs and for a few weeks in June, the question of whether or not pills should invade television was the hottest topic of domestic politics.

All this put Ministers in an embarrassing position. They were committed to doing something, and the Conservative backbenchers in the Commons, mobilised in the 1922 Committee, insisted that anything other than the original intention would be a confession of weakness. They were not afraid of any archbishops. But there would obviously be strong opposition in the Lords and conceivably even a defeat there. Undoubtedly, if it put its foot down, the Government could push its policy through, but only at the cost of using up much more political capital than could be spared or than the whole subject is inherently worth.

★

So the search for ways out of the dilemma is now on. And there is one very obvious way out. What the Government is committed to is a measure of competition; what the critics dislike is the idea of programmes being provided, controlled or influenced by advertisers. Very well, let the alternative programme be provided by another public service corporation, constituted in exactly the same way as the BBC, let it keep complete control over its programmes (just as an editor keeps control of the editorial contents of his newspaper) and let it raise revenue (again, as even the most high-minded newspaper does) by allowing the advertiser to fill in the interstices with his announcements. There is reason to believe that this is the scheme that is currently in vogue. Politically, it is an almost complete escape from the dilemma. If the Postmaster-General could say, in effect "So great is our admiration for the BBC that we want to duplicate it; and as for advertising, we are only proposing that our new public service corporation should act as *The Times* does," he would silence, or at the least embarrass, that considerable part of his critics who have connections with those two august institutions, while the rest of the opposition would have to abandon the congenial contrast between the virtue of public service and the iniquity of private greed and defend the BBC's monopoly as such, which is less easy.

The catch about this plan is that it probably would

not work. It has always been very doubtful whether enough money could be raised by advertising to pay the very heavy costs of a television service—particularly since it is apparently not even to be the second programme, but the third, since the BBC has plans for an alternative programme of its own. Television is not exactly a goldmine even in America, and the sum total of incomes available as a target for advertisers—the amount of “advertisable income,” as one might say—is much smaller in this country. Moreover, the advertiser might offer considerably less money if he could not choose the programmes. The chances are that the new corporation would go broke.

But once minds have been opened to the possibility of a middle way, of something that is neither Ariel nor Caliban, an almost infinite variety of prospects opens up. Let us speculate a little. The BBC plans to create a second television programme. This seems to indicate that a margin of money sufficient for the purpose exists, or can be created, within the revenue raised by licences. Moreover, the Post Office still keeps some of the licence revenue. The public subscribes this money, not for the BBC, but for broadcasting. Why not take some of it to help out the new, second corporation, which with its two sources of revenue would then be better able to put up a good competitive show?

Perhaps, however, still not quite good enough. For it is a very moot point whether television, in the present state of things, could by any means be made to pay unless it were subsidised by sound radio. But if the principle of competition is right when applied to television, surely it is equally right when applied to sound radio? Let the second corporation, the deuterio-BBC, therefore, share some of the sound wave-lengths and, as an inevitable corollary, some more of the licence revenue. By this time, the BBC itself will be getting very poor. So the final stage in this speculation is that

it, too, might be permitted, and under the pressure of poverty willing, to make a little money by advertising, provided it continued to reserve to itself full control over its programmes other than the advertising announcements themselves.

This, of course, is pure crystal-gazing. But opinion on the whole subject is changing rapidly under the impact of party politics, and at each stage in the argument that has been set out above, there would be powerful reasons of politics and finance in favour of going further. It is no longer possible to dismiss such imaginings as pure fantasy. The result would be that the country would have two competing publicly appointed corporations, each dedicated to the principle of public service, each providing both sound and visual programmes, each dependent for the greater part of its income on licence revenue, but each empowered to supplement this revenue by a judicious amount of controlled advertising.

In the opinion of a growing body of people—and certainly in the opinion of this journal—that would be a very acceptable way of organising broadcasting—at least for the next few years, until technical developments permit even more diversity. It would certainly be better than either the present monopoly or the pure commercialism of America. But there is a point that should be noted by the political scientists. If such a result ever comes about, it will not be because wise men have sat down together and thought it out as an ideal system and have then commended it to their fellow citizens by reasoned persuasion. It will be because the subject happened, by accident, to fall among politicians, who then found themselves pushed by the pressures to which they respond along a path which may perhaps, if our speculations are well founded, turn out to be fairly satisfactory. This will not be very pleasing to the practitioners of reason. But it is the way of the world.

Malenkov's Gamble

THE attention of the whole western world was caught by Malenkov's disclosure about the hydrogen bomb, and his speech to the Supreme Soviet also included a variety of tempting tidbits suited to the palates of individual nations ranging from France to Japan. Yet it is arguable that the passage in the speech of greatest import to the free world was one of which it took little note, and which was primarily intended for the Soviet public. For almost an hour Malenkov criticised the present state of Russia's economy, and he appeared to be announcing a striking change of economic policy. The Russian economy is the pivot on which the whole Communist world effort turns. It supports the Red Army—and the Soviet atomic energy projects; its achievements are the bait held out to draw other peoples into the Communist camp; its material resources and its vast labour force are the hard core of

Communist power. Malenkov has now thrown some glaring light on the present condition of this normally shadowed monster, and pointed a new path for its future. What does this revelation amount to, and what has the world to hope or fear from it?

First, in a long historical panegyric, Malenkov repeated the familiar and impressive story of the development of heavy industry in the Soviet Union to a point where, on his showing, 38 million tons of steel, 320 million tons of coal, 52 million tons of oil and 133 billion kwh of electricity will be produced in 1953. Since 1940, output of “means of production” has trebled, while output of consumer goods has only risen by 72 per cent. He drew many comparisons with the Russia of thirty years ago, and took the opportunity to denounce “Trotskyites and right-wing traitors who . . . demanded the transfer of funds from heavy to light

industry.” The party was praised for having resisted this fatal error; but no shred of credit was given to Stalin. Indeed, Malenkov, having only lately acquired full responsibility, seemed to feel free to expose the dead master's failures with unusual frankness when he turned to review agriculture and light industry. While agreeing that it had been right to make these the Cinderellas of the Soviet economy, he spoke at length of “entire districts where agriculture is in a neglected state,” of failures in production of potatoes, vegetables and livestock, and even of inadequate fodder. Taxation policy as regards the collectivised peasants' personal small-holdings had been wrong and harmful; the collective farms themselves had been inflating their harvest statistics. As to consumer goods, they were not only scarce, but also shoddy.

We lag behind in the quality of consumer goods. . . . To the shame of industrial workers, the consumer often prefers foreign products. . . . A customer wanting some necessary article often has to go to another town. . . .

Malenkov went on to speak of jerry-building, of inadequate housing at new industrial centres, and of failure to provide schools and crèches. This was something more than the familiar denunciation of a particular industry or ministry. The strictures covered the whole range of items nearest to the ordinary citizen's heart—food, clothing, household goods, housing, schools. Small wonder that, according to the Communist press, Malenkov's frank exposure of present shortcomings has pleased the Russian public.

★

His promises have an even more pleasing sound. The Soviet consumer, that long-forgotten man, is now promised “within two or three years” (Malenkov used this phrase a dozen times) much more meat, fish, butter, sugar, clothing and household goods of all kinds, with better quality and nation-wide distribution. The peasant is to be taxed less, and paid more for his produce; his tax arrears will be forgotten, and the development of his personal smallholding encouraged—a concession to his property instinct which ironically recalls the fact that Beria was condemned for seeking to undermine collective farming and to restore capitalist ways. And all these concessions come on the heels of those announced earlier this year, such as the cuts in the turnover tax on consumer goods and on the amount of wages annually diverted into state loans.

This is a bid for popularity of a kind unprecedented in Soviet history. Under Stalin, small slices of the growing national cake were often passed on to the public, but never on this scale. The targets set for consumer goods in Stalin's last five-year plan are now swept aside; next year the retail trade turnover must reach the level promised for 1955. The implication is clear. Malenkov presents himself to his people as the efficiency expert, the man who can deliver the goods far faster than his cautious predecessor.

“All things to all men” is, indeed, no unfair descrip-

tion of the new management's policy. Malenkov assures the Soviet conservatives that heavy industry will be pressed forward as before; but almost in the same breath as his denunciation of the heretics who would divert funds to light industry, he speaks of “including the machine-building and other enterprises of heavy industry on a larger scale in the production of consumer goods.” The peasant will be paid higher prices for his foodstuffs, but the consumer will pay no more when he buys them. Taxation is to be cut at the same time that subsidies are increased.

Yet it is one thing to sign a promissory note, another to keep one's promise. Malenkov's notes are all redeemable “in two or three years.” He should have no difficulty in creating an immediate impression of comparative wellbeing. One of Stalin's cautious habits was apparently the accumulation of huge reserve stocks, some of which can quickly be put on the market. More food and consumer goods can be bought from abroad. Public money can be saved by pruning the overgrown administration. But these are strictly limited expedients which cannot possibly suffice to fill the enormous bill Malenkov has incurred by his dramatic announcements. There remains a gap even larger than that which loomed last week in Zverev's mysterious budget.

Malenkov reveals that the increase in consumer goods is to be achieved “at the expense of other resources.” But what other resources? Heavy industry is to be developed at unrelenting speed; acknowledged expenditure on defence remains virtually unchanged, and a costly hydrogen bomb project is apparently now in hand; agriculture has been promised additional

The Convenience of Cabs

The evil most to be apprehended from a free trade in cabs is, that our streets, like the river, would be more than ever crowded with convenient conveyances. What means the public may find out to avoid such a consequence, without any gentleman undertaking to put down the cab convenience, we do not foresee; but, should it arise, it will be the consequence of our streets having in many cases been built before carriages were invented, while the bulk of the people, like running footmen, had no other means of locomotion but their own legs; and the proper deduction from the discrepancy between old and narrow streets and modern modes of conveyance is, that the old houses must be pulled down and the streets must be widened, not the living multitude denied the use of carts, cabs and carriages. We know, however, as little of the means by which the inconveniences likely to be occasioned by the great increase now taking place in the number of vehicles will hereafter be avoided, as those knew of the present want of the public for cabs who first undertook to regulate hackney carriages. At the same time, the free trade system is wiser than theirs and that of their followers, since, both having reference to that future of which all are equally ignorant, free trade inflicts no present annoyances and curses no class, either cabmen or merchants, with restrictions which cause much present evil and impede future improvement.

The Economist

August 13, 1853

equipment, and nothing is said of the lowering of targets in any other sector of the Soviet economy. Stalin may have been an inefficient administrator, but was he so wasteful that it only needs the touch of a new hand for the Soviet economy to start pouring forth new benefits like rabbits out of a hat?

In his speech, Malenkov himself hints at only two possible means by which this sudden outpouring might be achieved. His emphasis on trade with the free world may imply a new awareness of the losses which earlier autarkic policies have inflicted on Russia. He is more explicit when he calls for higher productivity and lower production costs. In this passage, which serves as climax to the half of his speech devoted to internal problems, he cites severe losses in coalmining, timber, transport and building, and demands that every enterprise should cover its costs. Complaints of this kind and appeals for more productivity are familiar to a Soviet public that has lived with Stakhanovism for decades, and the current five-year plan already required a 50 per cent rise in productivity; but it may be that this time, with an efficiency expert at the helm, an even more intensive campaign is to be launched.

For the rest, it can only be concluded that Malenkov is gambling. Given more carrot and less fiscal stick, the Soviet worker and peasant—particularly the latter—may indeed prove to be even more productive than Stalin dreamed. But they will have to respond quickly and enthusiastically to the new stimuli if Malenkov's self-imposed pledges are to be fulfilled. He has staked his future on this experiment, and retreat is scarcely possible. On the one hand, the pressure from below

is very real; since Stalin's death, the aspirations of the Soviet public have been allowed to grow to such a point that the only way to check them now would be to conjure up a grave external threat. On the other hand, the more conservative minds in the Kremlin must be considerably disturbed by the Malenkov experiment, and any sign that it was failing might encourage them to force a reversal of policy.

What does all this imply for the free world? Although the Malenkov experiment is still in its early stages, some tentative conclusions may perhaps be reached. In reaching out for his goal, Malenkov seems to have made himself at least temporarily dependent on two factors not wholly under his control—a continued international *détente*, and more trade with the West. If this dependence is real, it must affect the bargaining strength of the parties in any future parleys between the great powers. Yet, if the Soviet experiment fails, Malenkov (or those who replace him) may find it necessary to increase international tension in order to persuade the Russian public to tighten its belt again. There would thus seem to be clear limits to the extent to which the West can bargain. But in addition to these facets of the more immediate situation, there is surely a long-term conclusion to be drawn. If Soviet Russia is now moving, for the first time, into a phase of its life in which the consumer, the ordinary man in the street, is no longer a forgotten man but a significant and growing political force, the whole range of Communist policies may have to be adapted, perhaps in startling ways, to fit this new situation. In that case, the free world too will need to do some intensive rethinking.

“This Desirable Residence . . .”

DURING the last two years a new feature has appeared in the suburban landscape; estate agents' notice boards, after mouldering in dark places for a decade, are being rescued and repainted in increasing numbers, and fixed to house fronts, declaring them “For Sale.” This is the outward sign of a change in the market for houses with vacant possession that is being watched with misgiving by perhaps as much as one-third of the householders in the country.

The pressure for houseroom since the end of the war has led a good many people, who would have preferred rented accommodation, to sink their savings in house purchase as the only way of finding a home of their own. Licensing has until recently restricted the chance of building a new house to those in a few special categories, and existing owner-occupied property has a very slow turnover (in the sense of sellers who leave the market entirely, as distinct from those who remain in the market to seek another house). But the operation of rent restriction since the war has kept the market supplied with a steady flow of houses for sale with vacant possession.

What landlord sought to re-let a controlled house as it fell empty when by yielding to an importunate purchaser he could often realise a sum that would earn twice as much in gilt-edged as the house would yield in income? By making landlordism unprofitable, the Rent Acts have helped to create a new class of property owner, and in the process to restore the building society movement to something like its prewar prosperity, in a period when its customary business of loans on new private houses has been almost unobtainable.

Competitive bidding and a plentiful supply of money continuously drove up the prices of houses sold with vacant possession, until by the end of 1951 any empty house in the medium ranges was worth three or three and a half times as much as it had been when it was twelve years younger—often twelve years of wartime neglect or even damage. On the whole, it was the dearest houses whose prices increased most rapidly—possibly because the operation of the Rent Acts held back the market in small property bought for investment and no for occupation, and thus tended to depress the value

tions on which building societies cautiously based their advances. But the almost continuous rise up to 1951, and the sharp downward turn after that date, are common to all classes, as is also the present uncertain equilibrium. Houses worth under £2,500 are generally said to have fallen by from 10 to 15 or even, in some areas, 20 per cent from the peak prices of 1951, and dearer houses by anything from 15 to 25 per cent, although in exceptionally prosperous areas (in Bournemouth, for example) the fall has been much less. On the whole, it is the dearest houses and the smaller pre-1914 houses whose prices have fallen most heavily and whose equilibrium is even now most precarious.

★

Until 1951, the consolation of those who snatched in a hurry for a house for which they paid thus extravagantly was that others were doing the same, and that their savings were appreciating in value as prices rose. For people with little financial margin to spare, moving from one town to another became a matter of balancing the simultaneous sale and purchase of houses in an operation as full of anxiety as crossing a deep stream from one boulder to the next. But movement was not impossible, and people who were accustomed to dealing in money terms of a few pounds per week could still manage the buying and selling of a single capital asset worth a hundred, or even a couple of hundred, times their weekly wages, with a margin for error. The change from a sellers' to a buyers' market since the end of 1951, however, has altered the position quite radically for owners without other resources. A fall in house prices has social effects quite different from a cheapening of any other commodity, not only because houses cost so much relatively to incomes, but also because the owner occupier's personal stake is usually limited to the narrow margin between total cost and mortgage—the margin which is eaten up by a fall in price.

When house prices are rising the man with a £2,500 house which he bought a few years ago with £500 and a £2,000 mortgage is no doubt annoyed at having to pay £3,000 for the same kind of property if he moves to a new town. But if he realises £3,000 for his old one he has in place of his original £500 a sum of £1,000 in hand and can start again with a mortgage of £2,000 as before (ignoring some out-of-pocket expenses). The reverse process, however, is not so satisfactory. Suppose the same £2,500 house, instead of rising in price, drops to £2,000—or anywhere near it. The seller, after clearing his mortgage, is often left without the ready means to buy even the cheapest house in its place. If he has other resources with which to start buying again, he is, of course, no worse off in the long run for exchanging houses on a falling market (that is, if he buys an identical house in another town for £2,000, with a £1,500 mortgage, he is still in the position of owning a house but with £500 less of debts to set off against his lost £500—so that, in an accounting sense, he is all square). But few people can see it like that, and still

fewer can find a second large sum in cash. The majority are faced with the choice of staying where they are or of living in furnished lodgings. The effect of such a situation on the mobility of the people concerned is almost certainly crippling. How many people are tied to their homes in this way it is difficult to guess. It depends on estimates of just when the curve of house prices on its way up passed the point it has now reached on its way down again; if it is assumed to be as long ago as 1948, building societies have issued mortgages to a million and a half people since then, which gives some indication of the number of people who may have been stranded by this receding tide.

The several reasons why vacant houses have fallen so sharply in price are obvious, but which factors have most weight it is hard to say. In the case of houses from £3,000 upward, the greater scarcity of ready money is obviously the most important. Fewer small businesses are making the bountiful profits that enable their owners to have the house they fancy at any price. The rising cost of living, affecting the upkeep of big houses, is also a constant pressure bringing more of them on to the market. More generally, the increases in the Bank Rate that followed the last change in government, and the anticipation of strong anti-inflationary measures were sufficient to make people “wait and see” before buying houses, and so start prices on the downward path, although the increased interest rates on mortgages were in themselves probably of little importance to intending purchasers. The promise of freer private building under a Conservative Minister of Housing also had an effect even before the end of 1952, when development charges were finally abolished and the permitted proportion of building licences for private enterprise raised to half the total number of new houses. Yet a third factor which deserves mention is the reaction of lenders on mortgage. Bank overdrafts have been tightened up, which may have affected a few purchasers of bigger houses; but even more important, the rank and file of buyers have become aware of the building societies' increasing reluctance to lend as generously as before on second-hand property, especially of the older type.

★

How much further prices will fall before reaching equilibrium is a subject of considerable speculation. It depends, of course, very largely on the speed and cost of private enterprise building. Until this year, the difficulty and delay in obtaining a licence to build a new house kept the price of existing second-hand houses well above the cost of building their counterparts from scratch. This margin (the value of the “bird in hand” to the prospective buyer) is disappearing now that restrictions on private building are coming off. Indeed, even some postwar houses sited in less popular places have been reselling at less than cost.

For a long time, however, the general costliness of houses relative to other commodities is likely to equate

the values of the so-called "modern" house of post-1918 vintage with that of new building. The "old" pre-1914 properties, on the other hand, while not unaffected by present-day costs, are drawn into a different orbit—that of the property investment market. It is the unique feature of houses as a commodity that the prices of intrinsically similar specimens are subject to such a variety of arbitrary influences. Old houses within the sphere of the Rent Acts—which includes the vast majority—and whose tenants, if any, therefore have security of tenure, realise three distinct prices according to whether they are valued as investments, for sale to the sitting tenant, or with vacant possession. The second and third alternatives represent a lesser or a greater degree of monopoly value to the seller. As new building gradually increases the number of houses for sale, buyers will be able to discriminate more than they did between the modern and the old-fashioned types, and the gap between their price-levels is bound to increase.

But so long as statutory tenancies under the Rent Acts remain in force for the majority of old properties, they cannot flood on to the market in great numbers; and so long as new building costs remain high and so keep modern houses out of reach of many people, an element of monopoly in a limited "cheap" market seems likely to persist for any old house offered with vacant possession. The biggest total fall in price will probably occur in the large old houses, too big by modern standards for single residences, passing out of temporary occupation for commercial or institutional use, and uneconomic to adapt to modern requirements

so long as local authorities can exercise a rent control on all newly converted flats.

Is there any moral to this story of boom and slump in the housing market? Probably none, unless it is the old truth that the aftermath of inflation must always hurt somebody; or the other old truth that control of prices, by creating anomalies, tends in the end to create as much injustice as it prevents. The moral is not, however, that home-ownership is itself an institution to be discouraged. The popular objections to it on the grounds that it discourages the mobility of labour are obviously true, and in times, like the present, of falling prices the financial barriers to movement are often absolute. But in normal times the greater reluctance to leave an owner-occupied as compared with a merely rented house is usually psychological and sentimental rather than financial. It is easy to exaggerate the social drawbacks of widespread home ownership, but the advantages can hardly be overstated. At a time when thrift has ceased to be a national habit and capital accumulation by whatever means has become an urgent necessity, the widespread practice of house-buying by people of small means represents a pure gain of considerable dimensions to the savings movement. By buying houses on mortgage during the best earning years of their lives, people who would not otherwise save a penny contrive to put by large sums invested in an essential capital asset. And this holds true whether the houses they buy are new or second hand. Any fashion which encourages thrift is not to be despised.

Notes of the Week

Conflict of Powers in France

WITH two million strikers paralysing the public services of France and the movement spreading to private industry, the initial cause of the outburst has been forgotten. The strikes are not now against governmental decrees, nor even against the principle of government by decree. They are clearly an attempt by the left-wing parties to change the parliamentary balance by outside action, to impose the right of opposition by strike. Unable to topple a centre-right government in the Assembly, they are trying to register their vote of non-confidence outside the chamber. It is a near-revolutionary situation which must cause France's patient allies the deepest concern.

The disparity between cause and effect is grotesque. Any

French government would have to take immediate measures to close the budgetary gap and long-term moves to prevent an almost permanent state of semi-bankruptcy, unjustified by France's natural and human resources. The decrees were only first cautious steps in the direction of solvency. Everybody in France agrees that the economy of the country cannot be restored without an operation, yet each successive doctor loses his job on producing the knife. From M. Laniel the workers are apparently unwilling to accept even pills. The decree on the age of retirement of public servants, the immediate pretext for the outburst, has finally proved fairly innocuous and the Government has expressed its willingness to discuss any grievances. Yet the strikes are unabated. The newcomer Laniel is paying the penalty for the inaction of his predecessors, and the workers mistrust profoundly any reform initiated by right-wing politicians.

Already under suspicion as a rich man's team, M. Laniel's

government committed one grave mistake. The special powers granted to it did not include the right to change the fiscal system. Presenting its programme piecemeal, it left itself open to wild accusations that it soaks only the weak—the civil servants or small shopkeepers—and spares the rich. At this point the Socialists had to jump forward in defence of the people who vote for them. The government may not be given the opportunity to disprove its critics, for the Assembly is hiding its head in the holiday sand. Meanwhile, M. Laniel, armed with special powers, sticks to his guns. Yet, with the threat of an imminent general strike, the few additional signatures—besides those of Socialists and Communists—needed to reconvene the Assembly may be found. The deputies will then have to make up their mind whether they still stand by M. Laniel or accept the dictation of the strikers and choose a surgeon more acceptable to them. The Socialists in particular will have to ask themselves whether, in trying to seize the leadership of the workers from the Communists, they have not played clumsily into their hands and let loose a movement against parliament that they will be unable to control.

Will Beria be Tried?

IT is by no means certain that Beria will be brought to public trial. On the last day of its session last week the Supreme Soviet approved, it is true, a governmental decree dismissing the former deputy premier and transferring his case to the Supreme Court for consideration. But this was a routine decision. More significant may be another decree, to which the same body affixed its rubber stamp, dismissing the present Soviet attorney-general and putting in his place Roman A. Rudyenko. This man is remembered in the West as the Soviet prosecutor at Nuremberg and has been attorney-general in the Ukraine. At the same time the election of three new members of the Court was approved. Otherwise, the Beria affair seemed to be played down during the Supreme Soviet's meeting and vituperation was left to two second-rate performers from his own native Georgia. One of them, A. I. Mirtskhulava, spoke with particular vehemence against the "traitor" who had attempted—of course without success—"to sow discord among Soviet people."

In anticipation of the verdict at a trial that may never be held, Malenkov's former left-hand man has already been deprived by the Supreme Soviet of all his titles and orders. This presumption of guilt contrasts strangely with the promises of "liberalisation" heard in the early days after Stalin's death. For the moment, at least, this trend must be judged to have been checked. Throughout the Supreme Soviet's proceedings there was no reference to the "constitutional rights of the Soviet citizen" and no mention of the amnesty. The project of a new legal code, which was to have been submitted to the Supreme Soviet within thirty days of the amnesty, seems to have faded into thin air. These facts seem to add further weight to the view, paradoxical though it may seem, that the police chief Beria was personally identified with the relatively liberal policy initiated between March and June. But they do not answer questions about his motives, which may have been those of personal ambition, of realistic statesmanship or of sympathy with all that Stalin had repressed.

The Liberals Win in Canada

THE Liberal Party in Canada has won the federal election with a loss of no more than ten seats. There is a possibility of minor change, as a result of recounts or from late voting papers from the Canadian forces overseas, but the results so far give the Liberals 171 seats, the Conservatives 50, the Co-operative Commonwealth Federation 23, Social Credit 15 and Independents 6. The Conservatives gained only two seats; CCF and Social Credit strengthened their holds on Saskatchewan and Alberta respectively. Mr St. Laurent has a working majority of 67 over every possible combination against his party, and in fact three of the independents are more likely to be on his side of the House than the other. Canada has clearly decided that it is not time for a change. Few thought that the result would be otherwise; indeed the only noticeable changes in the volume of support the Liberals have received in each province appear to have been in Saskatchewan, where they lost ground on the Government's refusal to push ahead with a large irrigation and hydro-electric power project on the South Saskatchewan River, and in Newfoundland, where they gained ground federally from the drive shown by Mr Smallwood's provincial Liberal government in fostering new secondary industries in the island. Above all, the Government has had the benefit of Mr St. Laurent himself as its leader. Canada is so vast that the personality of the man at the head of affairs is extremely important. He must be someone with whom every voter can feel he is at least acquainted, and Mr St. Laurent has become that kind of man.

But, in the end, the election has answered only one question: should the Liberals be given another term of office? It was not fought on any real major issue (the Conservatives' offer to reduce taxation by \$500 million was not an issue; it was a bait). It leaves the Government still facing its main preoccupation, external trade, with no more guidance from the electorate than the comment that it has done all right, so far. The Canadian Government is just as concerned over United States trade policy as this country is, and for very much the same reasons. It has the added anxiety of watching the price of wheat begin to slip, and with a record crop now reported. Mr Lester Pearson has still to walk his delicate path in foreign policy, by inclination drawn towards British caution, by proximity unable to move too far away from the Washington line.

Internally, this election, and its result, will have its greatest impact on the future of the Conservative and the Social Credit parties. It will be a long time before a party such as the CCF has any future in Canada (and when it does, its programme will not be that of the CCF today). Until that happens, the only alternative to the Liberals must come from the right. Having failed individually, will the parties of the right combine to create a more effective opposition?

Watchdog on the Boards?

PARLIAMENT set itself a vexed problem when it placed the nationalised industries under the control of public corporations. After the postwar rash of nationalisation and public corporations had subsided, it quickly became obvious

that the new bodies would not of themselves guarantee that the industries concerned—or the overseas ventures like the groundnut scheme—would be profitable or be run solely in the public interest. Parliament soon saw that, as the protector of the taxpayer and consumer, it had to exercise much more supervision than had earlier been thought necessary.

But where was the line to be drawn between direct, day-to-day supervision and general responsibility? And how much information was Parliament entitled to? Was the annual publication of accounts, with their subsequent examination by the Committee of Public Accounts, all that was necessary for Parliament to act as an effective watchdog? In December, 1951, a Select Committee was appointed to answer these questions as they affect the nationalised industries, and its second report was published this week (HMSO, 4s.). In its first report, which appeared last autumn (*The Economist*, November 22nd, 1952, page 523), the committee concentrated on questions to Ministers. In its second it makes much more far-reaching proposals. In brief these are that a new committee of the House of Commons should be set up which would take over from the Public Accounts Committee the work of examining the accounts of the nationalised industries; unlike that committee, however, it would have the power and the duty to have regard not merely to "present and past financial probity and stability but to future plans and programmes," and the power to get information on policy. Its staff should include an officer of the status of the Comptroller and Auditor-General and at least one professional accountant. The proposed committee would probably not be able to examine in detail each nationalised industry every year. The Select Committee therefore suggests that for the information of Parliament as a whole each corporation should publish with its annual accounts

the best estimate it can make of the percentage increase or decrease since the date of its establishment in the average cost to the consumer of its products or services, taken as a whole.

Further, the corporations should also be encouraged to prepare for the committee statements on their anticipated revenue and expenditure.

Perhaps the proposed committee would be a more judicial body if it could include members of the House of Lords—a suggestion the Select Committee regretfully and not very convincingly turns down. But it is to be congratulated on its bold and constructive attempt to ensure that the boards are effectively accountable to Parliament while still retaining their freedom in detailed administration.

Watching the Watchdog

IF public boards should be made more effectively accountable to Parliament, does the same thing apply to the universities? They are not state institutions, but they are in receipt of a great deal of public money. This is becoming a perennial controversy. Last year the Committee of Public Accounts raised the question; later the Select Committee on Estimates returned to the attack, and last week the Public Accounts Committee struck another and harder blow for Parliament's right to know more.

The striking feature of university financing in this country is that the sum of money voted by Parliament is

handed over to the University Grants Committee, which allocates it to the universities; and that the Treasury does not supervise the expenditure. There has been no criticism of this system as applied to the recurrent grants made for carrying on the universities' work. It is suggested only that the use of non-recurrent grants—those made for new building and equipment—should be scrutinised on Parliament's behalf by the Comptroller and Auditor-General. To this the Treasury replied, last November, that such inspection would have two objects: to see that the money had been used for the purposes for which it was allocated and to detect extravagance. Both these objects, it claimed, were secured by the present arrangements, through the University Grants Committee's auditors and through its works and buildings subcommittee. As the Treasury pointed out, control over expenditure on buildings would inevitably mean some control over academic policy. And that it is precisely what the existence of the University Grants Committee is designed to prevent.

The Committee of Public Accounts is not convinced by this reply. It has been particularly disturbed by what it regards as over-generous treatment of London University. Fears that the Treasury is in general "too generous" seem out of place at a time when the universities are struggling to maintain their existing work against a background of costs that rise faster than their income. Nevertheless, the Treasury and the universities might be wise not to dig in their toes too firmly. The amount of public money now going to the universities has increased too much since pre-war days for the same easygoing relationship to be entirely appropriate. Any sort of control by Parliament over academic policy is, of course, to be avoided—and even control over building projects could involve questions of academic policy. But it is the spirit in which arrangements

are worked that matters, and the universities are likely to retain more freedom if they acknowledge Parliament's right to increased information than if they risk giving the impression that they have something to hide.

Kashmir Coup

ON the question of Kashmir Mr Nehru and his government now appear to stand in a position somewhat similar to that of Mr Liaquat Ali Khan and his cabinet when the tribesmen first raided Kashmir in October, 1947. Mr Nehru, that is to say, must be taken at his word—just as Mr Liaquat Ali Khan was believed everywhere except in India—when he denies complicity in recent events there. But even if the coup last week-end, which substituted a more pro-Indian administration for that of Sheikh Abdullah, was not the work of the Indian government, it seems unlikely that no one in Delhi knew anything about it. The result has been to tighten India's direct hold on the Indian part of Kashmir and to strengthen considerably Mr Nehru's personal position in any further dealings with Pakistan. On the other hand, Sheikh Abdullah was extremely popular in Kashmir, whereas his successor, the former deputy prime minister, Bakshi Ghulam Muhammad, is not.

It is significant that the change has produced riots in Srinagar for the first time since the Kashmir dispute began, and it looks as if India might have won a plebiscite under the old regime but would not now. All this has been the climax to eighteen months of increasing friction between Delhi and Srinagar, in which Sheikh Abdullah, formerly Mr Nehru's friend and protégé of twenty years standing, had spoken and acted more and more boldly in favour of complete Kashmiri independence. Sheikh Abdullah was sometimes suspected, as a Moslem, of trying to lead his countrymen away from India for mixed reasons of religion, personal ambition and honest belief that it was the only road to peace. Whatever his motives or aims, his fault was to be too direct about it, and he is now in custody—after being dismissed by the young Sadar-i-Riyasat or head of the state of Kashmir.

Reactions in Karachi have been anxious and deep. Leaders of the Azad Kashmir movement have been called into conference and public opinion has strongly supported the move of the prime minister, Mr Mahomed Ali, to request a personal meeting with Mr Nehru at the earliest opportunity. If Mr Nehru's design continues to be to do nothing, he is in a better position to pursue it. But by so patently thwarting Pakistan's hopes, these latest events have precipitated a fresh crisis which may yet end in a serious renewal of dangerous Indo-Pakistani tension.

Bluntness Fails in Japan

MR DULLES'S visit to the Far East had two main purposes, only one of which—the wooing of Mr Rhee—has been generally remarked. The other concerned Japan. During his brief stay in Tokyo, the Secretary of State seems to have spoken with unusual bluntness to the

prime minister, Mr Yoshida, on the subject of Japan's contribution to its own defence. The armistice in Korea has made the Americans more anxious, and the Japanese more reluctant, to settle this question. Mr Dulles, apparently, asked rather tartly why Japan could raise only four divisions when South Korea had seventeen; Mr Yoshida, on the other hand, is inclined to think that the now strong South Korean army is a shield behind which his country can feel at ease without assuming too great a burden itself. Japanese confidence is further increased by the knowledge that the United States, prevented by the armistice from increasing its forces on Korean soil, but anxious to have reserves not too far from a battlefield that may come to life again, has already added a third division to its security force in Japan.

It is clear that there will be little immediate response to Mr Dulles's exhortations. But it is far from clear what the Secretary of State hoped to achieve. An article on page 459 describes the atmosphere in which Japanese rearmament has now to be discussed in Tokyo. On the one hand, the Yoshida government is already in a weak position *vis-à-vis* the opposition parties whose common factor is anti-Americanism. On the other, the Japanese are fully aware that the more slowly they respond to American appeals for rearmament, the greater their prospects of getting more economic aid. In these circumstances, every move which reveals America's anxiety that Japan should rearm at once is likely to be self-defeating. Given the present international climate, the Secretary of State might well consider whether it is now wise or necessary to press so vigorously for the rearming of a Japan which, like a number of other countries, has come to look upon the strengthening of its own defences less as a national interest than as an act of grace towards the United States.

Troubles in Ceylon

IN spite of widespread strikes and disorders the Ceylon government is standing firm on its budget decision to cut food subsidies. The troubles started with a three-hour strike of dockworkers in Colombo; but later there were more general disorders, and a demonstration outside the House of Representatives which led to violence. In parliament the opposition parties temporarily joined ranks and staged a walk-out; the Communists have not been slow in turning events to their own gain.

The budget proposals presented on July 23rd attempt to deal with Ceylon's steadily worsening economic position. Its gravest feature is the adverse balance of payments, which has resulted in a reduction of foreign assets to 685 million rupees at the end of June compared with 999 million rupees in June last year. Though some improvement, resulting from the restriction on imports, has occurred in the past six months, more fundamental measures are required. An important part of the government's programme is the six year development plan; but the funds to finance this project are lacking. The government therefore found it necessary to reduce its ordinary commitments so as to provide development capital out of revenue. The axe fell on the food subsidies. Imported rice and wheat formerly carried heavy subsidies; in the case of rice the government paid

oh the average 82 cents per measure (of 2 lb) which it sold to consumers at 25 cents. As a result food subsidies, costing the government 255 million rupees in 1951-1952 and in 1952-53 161 million, take over a fifth of the revenue.

The disputed decision puts a heavy burden on the labouring classes, whose main food is rice. But the government was able to soften the blow by increasing the basic ration of rice. This enabled consumers to buy all their requirements at rationed prices, whereas formerly they had to supplement their inadequate ration in the free market at prices well above the ration price. The Ceylon government's fortitude and good sense in relieving the budget of an intolerable burden are in refreshing contrast to the unrealistic policies of other Asian governments.

The Price of Burma's Rice

GREATER co-operation between Asian governments would simplify their individual economic problems. It is absurd, for example, that Burma should be squeezing money out of its neighbours for its own development programme, and thereby threatening the development programmes of these other countries—for example, Ceylon. In recent years Burma has taken full advantage of its strong position in a sellers' market to exact high prices for rice sold to neighbouring South East Asian countries. As the entire rice export trade is in the hands of a government body, the Burmese government has been able to dictate prices. In sales to neighbouring countries the price on government contracts has been £60 per ton, which is more by £5 per ton than the price paid by Ceylon for Chinese rice. It is impossible to make a comparison with the so-called free market prices which range from £80 to £90 per ton, as these are artificial markets protected in one way or another from outside competition by government action. There is, however, a general impression that since supply has now caught up with demand the price

asked by Burma is out of keeping with the current market situation. Many of Burma's customers have been reluctant to take up their allocations and there are reports of growing unsold surpluses piling up in the country.

The Burmese government has not so far shown any sign of reducing its price, though it is obviously worried. Indeed, it has sent goodwill trade teams to various countries, presumably in order to sound out the markets. The government's own explanation is that profits from the sale of rice are an indispensable part of its revenue and that it is working on an ambitious plan for economic development to cost more than £500 million over eight years. Most of this will have to be raised internally as Burma, for reasons of its own, has refused American aid; but some help may be forthcoming from the International Bank which has a mission in Burma at present studying the economic position. However, the problem would be simpler if the Burmese government could be persuaded to adopt a more accommodating attitude in regard to future sales of rice.

Wages and Exports

FOLLOWING what has become an established annual pattern, the accumulation of wage claims is working up to its autumn peak. It will be a considerably higher peak than that of last year, for the claims are partly a return to the attack on the 1952 agreements, partly an anticipation of the further increase in living costs to be expected as the apparatus of subsidy is further dismantled. The annual conference of the three railway unions has produced a claim for a general increase of 15 per cent. Last year the corresponding claim was for 10 per cent, although the ultimate award was only seven shillings a week.

The engineers' and shipbuilders' claim for an increase of 15 per cent is now being considered by the employers. At the annual conference of the unions' confederation this week the president, Mr H. G. Brotherton, rehearsed the familiar arguments: real wage rates—as opposed to earnings—have fallen since 1947, while productivity has increased and profits have risen uninterruptedly. He discounted the employers' argument that to grant the wage claim would endanger British exports. But the export statistics show that this argument cannot be dismissed so easily. Engineering exports in the first five months of this year were some 3 per cent lower than the average for 1952. In contrast, German engineering products have not lost any ground, and exports of machinery and vehicles from the United States are higher than the average for last year. It is market conditions in 1953 that are important in deciding the wage claim, not calculations of whether wage rates are or are not in real terms higher than in 1947. And why 1947 in any case? Why not 1938?

The engineering and shipbuilding workers have made the argument about higher productivity a speciality; but other unions may adopt it this year. Whereas the small rise in the cost of living provides no basis for large claims, there has undoubtedly been a rise in productivity. But this was only to be expected as there was so much short-time working last year; and again it is the existing economic climate that is important. All the pending and

higher mileage

is a REALITY!

Avon made certain of it long before the first Avon H.M. tyre was sold... Higher mileage was assured with a tougher rubber compound and a spectacular advance in tread design which permitted extra depth and thickness. Thousands of motorists have now proved higher mileage to be an absolute fact. It must mean a great saving to your pocket too!

Write now for an illustrated folder "The Story behind the Greatest Development in Car Tyre Construction", sent free on request to The Avon India Rubber Co. Ltd., Melksham, Wilts.

AVON

H.M.

HIGHER MILEAGE
Avon's thicker and deeper tread gives many thousands of extra miles.

GREATER GRIP
The wider Avon tread gives more road contact, extra bite.

BETTER BRAKING
Centre traction bars and multiple slots give extra stopping power.

actual wage claims will doubtless be scaled down; the policy of the try-on has its strategic advantages inside the unions and *vis-à-vis* the employers. But the effect of even a small rise in wages can be serious. The 3 per cent rise in consumption in the first quarter, and signs of a further rise since, are warning signals of a renewed threat of internal inflation—from which exports would certainly suffer.

Change in Uganda

THE changes to be made in the Legislative Council of Uganda next January, announced in an exchange of despatches between the Governor and Mr Lyttelton, represents a further step towards self-government for the protectorate. The balance between Africans, Europeans and Asians has, however, not been altered, though "unofficials" as a whole will become more influential in the new chamber. At present the Legislative Council consists of 16 official and 16 unofficial members; of the latter 8 are Africans, elected to represent the four provinces, four are Europeans and four are Asians, appointed by the Governor. In the enlarged council, there will be fourteen unofficial Africans, seven Europeans and seven Asians. But the Africans will be indirectly elected to represent districts on the West African pattern, which will mean that they will have constituencies in a more realistic sense. In addition, of the nominated official members, a proportion will be crossbenchers, on the Kenya model, required to vote with the government only on issues of confidence. There will, therefore, be much more room for manoeuvre in the larger house, from which may emerge the political experience and leadership to take Uganda a stage further—presumably to the introduction of unofficial "Members" for various departments as in Kenya or Northern Rhodesia.

★

It is specifically stated that these changes, like the recent constitutional changes in the Gambia, have been brought in on the British Government's own initiative and not as the result of local pressure. In the case of Uganda, the object of the changes seems to be to create a more defined sense of Uganda unity, or nationhood, from the diverse tribes composing the territory. If they succeed in this desirable object, however, the effect will be a strong demand for even greater African representation. Uganda, unlike Kenya and Tanganyika, is not a country of white or Asian settlement, but the shaping of its communal representation at the moment is nearer to the model of the proposed Tanganyika constitution than to that of the West African colonies. The Gambia, for example, suffers from political inexperience in the hinterland, or protectorate. Yet under the recent changes there the method of electing members has been extended; an unofficial majority will exist both in the Legislative and in the Executive Councils; and a first instalment of ministerial responsibility has been introduced.

It may be that the changes prepared for Uganda have been planned with an eye on the uncertainties of Kenya's constitutional future, and perhaps because recommendations about East African co-operation generally may appear in the Royal Commission's report. Although the way is cleared for political advance in Uganda, it is evident that there is no disposition to resort to the forced marches towards self-government being made on the West Coast.

Federation for Nigeria

THE interim communiqué from the Nigerian constitutional conference, which stated that the Northern Peoples' Congress accepted the principle of federation for Nigeria, suggests that the immediate deadlock has been broken. It was perhaps issued to show that the conference is moving to a constructive stage. As long as the Northern Peoples' Congress stuck rigidly to its eight-point programme, there was little prospect of the conference ending in agreement. The Congress's maximum offer was little more than a customs union, with a non-political federal agency to run communications from a neutral headquarters—for which purpose Lagos was to be detached from the Western Region. But the North's stand for autonomy in this form was always intended as a means of bargaining; what matters is the corresponding concessions made by the other Nigerian leaders to keep the Northern Province in the Union, and on this the communiqué was wisely and discreetly quiet.

Everything will depend on the form of federation which emerges from the discussion. The Macpherson Constitution broke down because it was too complicated and because it seemed almost to have been designed to perpetuate at the centre the regional differences of Nigeria; the result of over-legalistic ideas in the Colonial Office's drafting. The federal house proved in effect to be a conference of delegates from the regions, whereas in successful federations—which are fewer than is often realised—much depends upon the breeding of a federal politician quite distinct in attitude and outlook from the "parish pump politician" of the province, state or region. The difficulty of achieving this unity at the centre despite strong regionalism at the periphery is increased in colonial territories by the shortage of experienced parliamentarians, and, indeed, of public servants also. Nigeria is no exception; yet its future as a unified country depends to no small degree upon the evolution of a truly Nigerian federal government and federal administration.

But this can certainly not be achieved if there is a preponderance of southerners, and particularly Ibos, running the North. The North will certainly want its own provincial civil service, partly staffed by expatriates on contract, as well as cast-iron establishment rules which will guarantee a fair share of places to northerners in central administration. Once master in its own house, it may be readier to delegate residual powers to the federation. But the area of sovereignty it will grant the centre will no doubt be limited. It is on these points that the crucial discussions will pivot; and it is to be hoped that the Nigerians will reach a fair compromise upon them, and one that they can unreservedly recommend to their own peoples on their return.

Post Office Losses

THESE August days have reverberated with the strictures of one parliamentary committee after another. The Post Office has the distinction of being under fire by two at once: by the Committee of Public Accounts for buildings that cost five times as much as was estimated, and by the Select Committee on Estimates for its losses on tele-

grams. The deficit for 1953-54 on inland telegrams is estimated at £4,643,000, or an average of 2s. 9d. a telegram. The loss has risen as the number of telegrams has fallen—from 48 million in 1938-39 to about 34 million in 1953-54.

It would seem to follow that one way to decrease the loss would be to stimulate the use of the service. The committee itself seems to think so when it attributes the mounting deficit to the competition of telephones and of a more efficient postal service. Yet it accepts the statement of Post Office witnesses that loss is now inseparable from every telegram sent at present prices and that the fewer there are the better. But it was justifiably baffled by what appeared to be a complete lack of policy about this deficit. Post Office officials ventured no opinion about whether the deficit was too large or what, if anything, should be done to remedy it. Admittedly this is for the Minister to decide; but it is high time that he did so. The Postmaster-General has deplored the dwindling of what was once a handsome surplus to an estimated £5.6 million in the current year. But his thoughts seem to turn to a threepenny post rather than to measures to make telegrams pay.

Yet there is no reason why other users of Post Office services should subsidise those who send telegrams. Still less is there any reason why the public in general should subsidise the press; the cheap rate for press telegrams results in a loss of between £150,000 and £200,000. An increase in the minimum charge to 2s. 6d. or 3s. for 12 words (with the possibility of a slower service at a lower rate) should, as the committee recommends, be considered at the earliest opportunity.

Fine Arts and Finicky Ironwork

THE Royal Fine Arts Commission exists, according to the Royal Warrant that set it up in 1933, "to call the attention of" Government departments and other bodies to any project or development that may "appear to affect amenities of a national or public character." The list of matters to which the commission has called someone's attention during 1952 includes, according to its annual report (Cmd 8888), such diverse items as the tendency towards monumentalism in new generating stations and gas works, the finicky ironwork in a small public garden in Knightsbridge, street furniture (more humbly, electric light standards), Bucklersbury House in the City and Temple Bar. Fitzharris House at Abingdon, and the bridge at Llanfaes, Brecon, also appear on the list, but the commission, it seems, keeps a special eye on London.

The Royal Fine Arts Commission has an unenviable task, although there is no evidence its members do not enjoy their work. It is a kind of national maiden aunt, whose comments range from the traditional "Go and see what Johnny is doing now, and tell him to stop" to the more prim "If I were you, dear, I think I'd do it this way." Neither is likely to excite popularity, although usually the aunt is right. It would be too harsh to say that the function of the commission is based upon the two cardinal principles of the second-rate mind: that for every two decisions deferred, one will never be needed, and that, if enough barriers are placed in the way of positive action, only the right solution will find its way over all of them. The commission is undoubtedly right, for example, to oppose

monumentalism in buildings that are no more than machinery covers. But it is impossible to read this report without recalling some remarks in the report of the team from the electricity industry that went to the United States under the auspices of the Anglo-American Productivity Council:

It is by no means unusual in this country for two years or more to elapse between the selection of a site . . . and the receipt of the final permission to locate the site there. . . . The sponsoring Ministry has to obtain the approval of the Ministry of Town and Country Planning, the Ministry of Agriculture, the Air Ministry, the Ministry of Civil Aviation, local authorities, etc., before the site can be secured and the project commenced. . . . When the architectural outlines are complete they are submitted to the Royal Fine Arts Commission, which may recommend modifications which, again, may be technically difficult and expensive. . . . Yet the relatively free hand given to American undertakings does not appear to have any markedly detrimental results on the types of power station constructed. . . .

A maiden aunt, fifth wheel on a coach, a spanner in the works, or a wise counsellor and friend? The many authorities protecting the past do not always find it easy to play the right role.

Indonesia's Step to the Left

THE news from Jakarta is disturbing. Early last week the two-month-old government crisis was resolved by the formation of a new cabinet under Dr Ali Sastroamidjojo. For the first time since the transfer of power by the Dutch in 1950, the government contained no Moslem representatives from the powerful Masjumi party. The new prime minister is himself a moderate, but the Nationalist party (PNI) of which he is a member runs an increasing risk of becoming the pawn of Indonesia's resurgent Communist movement, and Dr Sastroamidjojo does not represent the real mood of some of the men who stand behind him. Although the new government is in theory just another coalition, it is a coalition of the Left favouring better contact with Moscow and partly dependent on support from quarters where Communist influence is growing.

Indonesia has lately been out of the news, but it remains the vital back door to South East Asia. It is by far the biggest state of the region, nearly self-supporting in rice and rich in natural resources. The period of quiescence since independence, broken only intermittently by incidents like the Westerling affair, by guerrilla lawlessness and by regional rebellions, does not mean that Indonesia's importance can be ignored. Whatever happens there must have a profound effect on neighbouring territories. That is why the effort to set up a parliamentary regime and make it work is of critical significance. The Communists suffered a crushing defeat in 1948 and the new state was launched under far better auspices than at one time seemed possible. But in spite of considerable economic recovery and the gradual restoration of law and order, Indonesia has not as yet managed to clip the wings of its extremists. The failure to hold elections and the personal nature of politics is robbing parliament of authority. Unless Dr Sastroamidjojo can do more to reverse these trends than at present seems likely, Indonesia may yet come back into the headlines for the wrong reasons.

Letters to the Editor

Guide Books

SIR—In my letter which was published in your issue of August 8th, I stated that "it would seem—now that Baedeker has appeared in a new guise under the aegis of 'Shell'—that the 'Blue Guides' and the 'Guides Bleus' are today the only 'classical' guide books that are not copiously subsidised."

This remark, I am told, has caused misapprehension; quite obviously it does not apply to those volumes in the Baedeker series which are published in this country in the original style by Messrs. Allen & Unwin Ltd., and which, happily, maintain the long-standing Baedeker tradition of complete abstention from advertisement.—Yours faithfully,

L. RUSSELL MUIRHEAD
Editor, Blue Guides

The Boothbyites

SIR—In your Notes of the Week of August 1st you said: "Characteristically the Bevanites in this country (and some Boothbyites) and the neutralists in France work with the China Lobby in the United States to make the Atlantic alliance creak and groan." This statement was sharply qualified in your subsequent footnote to the letter of my colleague, Mr Peter Baker; but I should nevertheless be interested to know precisely what you meant by it.

In the recent debate on foreign affairs I ventured to address to the House of Commons a sustained argument based on most anxious reflection, and the experience of five years' continuous membership of the Council of Europe. The concluding passage of my speech was a plea for the strengthening and development of the North Atlantic Treaty Organisation. Prior to that I had expressed doubts as to the wisdom of basing our foreign policy on the European Defence Community in its present form, and a rigid political federation limited to one half of a truncated and partitioned continent, for neither of which is there any great enthusiasm amongst the proposed participants. These doubts are shared by many who can by no stretch of the imagination be classified as neutralists or appeasers, including Mr. Walter Lippmann; although not, apparently, by yourself.

In so far as the term "Boothbyite" can now be associated with the ideas underlying the Strasbourg Plan, I am quite content; but I will not be branded, without protest, as a *saboteur* of the Anglo-American alliance or as an appeaser. I have repeatedly declared my conviction that the security of the free world depends absolutely on the North Atlantic Treaty Organisation;

and on the subject of appeasement I stand, with some confidence, on my record over the past twenty years.—Yours faithfully,

ROBERT BOOTHBY

House of Commons

[We must refer Sir Robert Boothby to his recent speeches. In them, he has, among other things, given expression to two views. First, he is inclined to think that a practicable line of approach to peace, sketched out by the Prime Minister on May 11th, has been spoiled by Lord Salisbury's weak surrender to American views. Secondly, he apparently holds that the Acheson-Bevin policy towards Germany was no more than an improvisation that can be abandoned now that something has happened, or is about to happen, in Russian foreign policy. We do not challenge his sincerity in holding these views, or even his consistency in combining them with belief in the North Atlantic alliance. But we do not think he has any cause for grievance when the obvious practical effect of his expressing them so strongly at this juncture—or the company that it brings him into—is pointed out.—EDITOR.]

Outpost on the Adriatic

SIR—Your article of July 18th on Albania said that this "Soviet outpost on the Adriatic . . . is preserved by the hostility between Yugoslavia and Italy." This conclusion was rather one-sided.

Two main themes have been used by the Tirana Communists in their propaganda, in order to frighten the Albanians into submission: first, that the Western-sponsored "Free Albania" committee is composed of ex-fascists and collaborationists; and, second, that the Soviet Union is the only defender of the independence and territorial integrity of Albania, which is threatened by its three neighbours.

Last June they grudgingly dropped the first theme. But subsequent events have added wind to their bellowing. It is true that a fortnight ago the Balkan Pact Foreign Ministers, as your correspondent maintains, "virtually declared that if Albania succeeded in detaching itself from the Soviet Bloc, they would respect its independence." But it is equally true that soon after, in more than one way, the Greek Government undid all this, by reserving the right to achieve through peaceful means its claims on Southern Albania (or Northern Epirus). This alone is enough to make any Albanian hesitate before acting against the Hoxha regime. But the trouble goes much deeper.

Both Greece and Yugoslavia harbour thousands of Albanian refugees. Both have organised a section, however insignificant, of these exiles in self-styled National Committees. And both have been actively indulging in guerrilla incursions across the frontier. In addi-

tion, Yugoslavia has an Albanian minority of some 800,000. And until 1948 Tito was Enver Hoxha's immediate boss. From time to time the Yugoslav Government has declared that it has no territorial claims against Albania. And just as frequently the Yugoslav-sponsored Albanian Committee has reaffirmed its determination to work for the establishment of an "independent and democratic Albania."

The policy of the Italian Government has been much more friendly and enlightened. It has officially renounced all territorial claims on Albania and has repeatedly emphasised its desire to see an intact, friendly and independent Albania. And the fact that the "Free Albania" committee enjoys full freedom to carry out most of its work in Rome is tangible proof of Italy's good will towards Albania.

It is the short-sighted and ambiguous attitude adopted by the Yugoslav and Greek governments, rather than the hostility between Yugoslavia and Italy, that has lengthened the days of the Hoxha regime. For it must be remembered that no Albanian would ever tolerate a solution, which would replace the Communist regime with the partition of the country and its eventual disappearance. A joint declaration by its three neighbours, guaranteeing in clear-cut and unequivocal terms the independence and territorial integrity of Albania, is the first essential step towards bringing this unhappy country in to the Western fold.—Yours faithfully,

A. ANDONE

Ilford, Essex

The Architect's Dilemma

SIR—Most of the statements in your article of July 25th are an over-emphasis of ephemeral postwar conditions.

As you say, there are 18,000 architects in Britain dealing with 15 per cent. to 20 per cent of all the building work—about the same as before the war, when it was not 5 per cent as stated in the article. There are about 1 million operatives in the building industry and at the present time they represent roughly £1,000 of contracts per year per man, i.e., totalling £1,000 million, and 20 per cent of this, namely £200 million, would then be the cost of the work within the sphere of architects. Assuming that a registered architect earned, or should earn, on the average from bottom to top £700 per annum, i.e., about twice the earnings of a building labourer, the total salary bill of the 18,000 registered architects would be approximately £13 million per annum, to which has to be added overheads, at certainly not less than 50 per cent of the salaries, giving a total cost of £20 million per annum, i.e., 10 per cent of the work with which they are concerned. It has been recognised from time immemorial that a proper charge for the architect is about 5 per cent and, therefore, it is clear that the national charge at the moment is twice what has hitherto been regarded as reasonable. As you say, less than half

the architects are in private practice; and as they cannot in any circumstances get much more, if any more, than the 5 per cent on their work, because that is how they are paid, it would appear that the cost of official architecture (to give the average overall charge of 10 per cent) approaches 15 per cent. Official architecture, that is, costs three times as much as private architecture. When this emerges, there must inevitably be a return to the private architect on sheer economy.

Another point which you did not develop arises from the present output of students. You state that it is 6 per cent a year, i.e., the whole profession is being replaced in 16 years, and as an architect's actuarial work life is about 35 years that would indicate that the output of students is twice as great as is required. But the position is even worse if the rate is over 6 per cent, as indeed it is. It is at least 2,000 students and pupils a year, which represents 10 per cent to 12 per cent, indicating that the output of students is four times what is required to replace the wastage of 18,000 registered architects. But the picture is even blacker than that. If architecture is to remain only a 5 per cent charge on building, and as the amount of building work cannot appreciably increase, there is room only for about 10,000 architects instead of 18,000; and from this it follows that the output of students is eight times the number required to deal with the annual wastage. —Yours faithfully, OWEN WILLIAMS
London, N.W.1

DESIGN IN TOWN AND VILLAGE

The authors are three well-known experts on design and planning. Dr. Thomas Sharp deals with village design; Frederick Gibberd with the design of residential areas; and Professor Sir William Holford with town centres. Fully illustrated.

Understanding the Tropics

THE TROPICAL WORLD.

By Pierre Gourou.

Longmans. 156 pages. 18s.

AFRICA: A STUDY IN TROPICAL DEVELOPMENT.

By L. Dudley Stamp.

Chapman and Hall. 568 pages. 68s.

THE failure of the groundnut scheme and the decay of the Mayan civilisation in the seventh century should convey the same warning. The first, according to Dr Stamp, was essentially the price of a disastrous ignorance about the soils of Tanganyika, and the second, according to Professor Gourou, was the result of precisely the same ignorance in Central America twelve centuries previously. The use of the hoe and shifting cultivation, even with unduly short bush fallows, delayed the final destruction of the agricultural land round the superb Mayan cities for a hundred years; the millions of pounds' worth of agricultural machinery at Kongwa came to grief in three or four. But in both countries disaster came from misuse of the impoverished soil of the tropics.

The greater part of the "underdeveloped" countries with which Point IV is concerned lie in the tropics; and the greater part of the free world's problem of poverty and malnutrition also lies in this geographical belt. Although the difficulties of raising agricultural production and living standards in the tropics are far better understood today than even twenty years ago, there is still much unthinking optimism, especially among the manufacturers of agricultural equipment; these books should serve as a corrective. The appearance of a translation of Professor Gourou's classic study is particularly useful by reason of its comparison between the three tropical regions in America, Africa and South-East Asia; and Dr Stamp's comprehensive study throws into vivid relief the differences between the agricultural and economic problems of tropical Africa and those of Mediterranean and temperate southern Africa.

Both books emphasise that the interference with the balance of man and nature in the tropics by western technology has so far been in the main ecologically disastrous. The wrong crops have, over wide areas, been grown in the wrong way, and the degradation of land has in many areas been irreparable. "Dust bowls" in temperate climates can, in time and by the lavish investment of capital, be restored to fertility; but the laterisation of many tropical soils is an irreversible process—a fatal cancer that turns soil into rock,

so that not even natural forest vegetation can reclaim it, however long it is left. But both authors show that a much higher production and standard of life are possible in the tropics without loss of fertility if modern science is combined with ancient wisdom—and with intelligent economics.

Tropical countries, Professor Gourou concludes, should specialise in "colonial" produce in which they hold a monopoly and which, skilfully cultivated, keeps the poor soil in good heart. Sugar, cocoa, coffee, bananas, tea, rubber, palm oil and so on are all tree crops that in some cases may also be grown under shade trees and with artificial fertilisers; they preserve the soil. Many subsistence crops, however, can be safely grown only under irrigation (for the expansion of which there is in Africa immense scope) or between extremely long fallows and in combination with animals kept for cultivation, not for wealth or religious reasons. Before the shifting cultivation practised by primitive people—which keeps the people poor and primitive but the soil as fertile as tropical conditions permit—can be safely replaced by permanent cropping, much agricultural research into soils, pastures, cover crops, pests and rotations is still necessary. In the main, the tropics will be most wisely developed to export "colonial" produce and import the balance of their food requirements in exchange. Any attempt—at least at present—to increase yields rapidly and on the basis of increased local production of foodstuffs to support an industrial population is likely to end in disaster. Yet industrialisation is frequently proposed as the proper answer to poverty, ill health and social backwardness in many tropical countries. It is not an answer in which anyone who has read these invaluable studies in applied geography will persist with undiminished confidence. Autarkic tendencies in world trade are likely, in the long run, to be fatal to the tropical world, however injurious to temperate lands in the meantime; salvation seems to lie in a wise development which makes tropical and temperate regions naturally and increasingly interdependent.

Rich Treasure House

WINCHESTER.

By Brian Vesey-Fitzgerald.

Phoenix House. 187 pages. 18s.

THIS is a pleasant, gossipy book. A visitor to Winchester will find it an agreeable companion for the railway carriage beforehand, and then for his

walks in and about the city. It contains a clear street plan to aid his explorations, and many charming photographs to revive the memories of his tour. Some, though not all, will like the extreme informality of the author's style and approach.

Mr Vesey-Fitzgerald certainly has a perceptive eye; but this work lacks depth of study and of thought. The reader without previous knowledge of the subject may well close the book supposing that he has learned more than is in fact the case. It has been derived too much from "bits" taken here or there, not always in just proportion, from secondary authorities; and too often statements are made on no evidence stronger than that the author "feels sure." Nor are the constant evocations of sentiment very significant; stimulus to feeling is excessively applied, sometimes upon trivial occasion. But the spirit of Winchester will not appear in response to easy magic.

The clear intention has been to write a popular book. While, in so doing, Mr Vesey-Fitzgerald has not avoided the danger of the superficial and the "chatty," the tone and the taste of the work are sound, and the modesty and sincerity of its author are evident. There is an unselfconscious attractiveness in his pages. Yet a place still remains wide open for the thorough and authoritative study of Winchester which in modern times has somewhat strangely been lacking to so ample a treasure-house of rich and varied materials.

Sudanese Administrator

THE MAKING OF THE MODERN SUDAN: *The Life and Letters of Sir Douglas Newbold.*

By K. D. D. Henderson.

Faber. 601 pages. 30s.

A CLEAR history of the Anglo-Egyptian Sudan from 1920 to the end of the last war is given in this book through the medium of the life story of Sir Douglas Newbold. A considerable part of the book is, in fact, compiled from letters written by Newbold to his mother and to colleagues in the Sudan Political Service. It is unlikely that this will be the definitive work on "The Making of the Modern Sudan," but it is certain to remain important to the historian and student. Newbold's letters spare no one, and it is impossible to read a page without a feeling of deep respect and admiration for this splendid administrator.

Perhaps because of the sympathy and understanding he shows for the Sudanese, Newbold appears to have but little appreciation of the Egyptian viewpoint; and since these letters were written the "Egyptian Case," as it has become known, has developed an increasing importance. For example, on his way back to the Sudan from leave in 1924, Newbold was in Cairo at the time of the murder of the Sirdar of the Sudan, Sir Lee Stack, and he wrote to his mother,

The British demands are pretty stiff but

not excessive when you consider this as the culminating episode of a whole series of intrigues and seditious acts.

Yet it was those British demands that scared even the thinking Egyptian into the belief that the British could, if sufficiently angered, deprive Egypt of Nile water on which the country must always depend.

Many readers who have no deep interest in the Sudan and its problems will enjoy large sections of this book. Of these, the early chapters describing Newbold's exploratory trips into the Libyan Desert, which later provided the Long Range Desert Group with valuable data, provide a combination of the best type of travel and adventure story. When Newbold made these journeys, however, his object was more romantic than utilitarian; he and his companions were searching for the Legendary Lost Oasis of Zergura.

The life of a district commissioner, with accounts of treks by truck, camel, horse and on foot over hundreds of miles of little known territory while he studies the different peoples and their problems, is entertaining reading for the non-specialist, and so—in quite a different way—is the "Interlude in Palestine in 1943." It is perhaps in his letters from Jerusalem, Tiberias and Haifa that Newbold, free from the cares of office and the responsibility of administration, shines most. He writes without inhibitions, and his description of the countryside, from "the squalor of the Arab slums to the perpetual Yiddish yammer," together with his political forecasts, is generally accurate and always good-humoured.

However, the important part of this work concerns the administration of the Sudan. Soon after Newbold began work in the country, the completion of the Sennar Dam over the Blue Nile and the opening of the Gezira irrigation scheme converted the Sudan into a land that might in the future be sufficiently rich to pay its way and provide for the expansion of some of the social services. Newbold always feared that the interests of the shareholder would be put before those of the people.

After a few years of work in the Sudan Newbold realised that the educated Sudanese of whatever race or religion must play an increasing role in the Government and in administration until a body of experienced Sudanese civil servants could administer their own country. The war, in which the Sudan played a far greater part than is usually supposed, naturally caused a slowing down in Newbold's plans because, as Chief Secretary of the administration at Khartoum, his first and most important task was to ensure the security of the territory from Italian attack. But throughout the war years he writes without humbug of future plans for Sudanisation. To those Egyptians and others who have so consistently maintained that the British were building up a civil service that would enable them to remain perpetually in the Sudan this book, with its disarming candour and frankness, is the complete answer.

Food and the Future

THE WHITE MAN'S DILEMMA.

By Lord Boyd Orr.

Allen and Unwin. 124 pages. 9s. 6d.

THE white man's dilemma, as Lord Boyd Orr sums it up, is the choice between on the one hand trying to keep the rest of the world in subordination by force—which cannot be done unless the rest of the world remains poor and hungry, which in turn means an inter-racial explosion; and, on the other, devoting enough effort and sacrifice towards raising the rest of the world from poverty and hunger, an aim which means the end of white predominance.

The point is worth making; for comparatively few people have ever really envisaged a situation in which the opinions, prejudices and aspirations of the African or the Malay shall have as much influence in shaping events as the opinions, prejudices and aspirations of Europeans and Americans. One may mentally substitute the notion of elder and younger brother for that of master and servant or tutor and ward, but the imagination boggles at the picture of mutual adjustment under conditions of genuinely equal power. Those conditions may be, on any assumption, centuries ahead; but it is on the conduct of affairs in the interim that the upshot depends, and it is this consideration which gives force to Lord Boyd Orr's plea that the white man should "join the human family"—that the western powers, with or without Russia, should "use their overwhelming industrial superiority to create a new world of plenty."

This thesis is argued—as one unfortunately knows pretty well in advance that this author will argue it—with an amiable but staggering naïveté, a nineteen-thirtyish faith in the existence of a huge unused margin of resources needing for release only the touch of co-operative goodwill and a light-hearted confidence in the ability of scientists and administrators to lift the whole process of food production clear of the sordid influence of commerce and economics. Why, in the last resort, is the world hungry? Because the target of food production has been "not the amount needed to supply human needs, but the amount that could be sold at a profit." (What a usefully emotive word is "profit.") Substitute, with greater accuracy, "the amount that could be sold without loss," and how uncomfortably stark becomes the question of whose shoulders should carry that loss, and to what total, and on what political terms.)

There is often value in naïveté, and so there is here. It enforces a reconsideration of comfortable formulae and unquestioned assumptions. It can sometimes show the outline of a wood where sophistication gets lost in the trees. But the white man's dilemma, genuine enough, needs for its solution something more than the combination of warm heart and woolly head.

Mountbatten Profile

MANIFEST DESTINY: *A Study in Five Profiles of the Rise and Influence of the Mountbatten Family.*
By Brian Connell.
Cassell. 226 pages. 15s.

THE five "profiles," or biographical essays, are devoted to Prince Louis of Battenberg, who was First Lord of the Admiralty at the opening of the 1914 war and resigned the position on account of his many German connections; Sir Ernest Cassell, the self-made German Jewish millionaire who became an intimate friend of Edward VII; his grand-daughter Edwina, who married Lord Mountbatten; Lord Mountbatten of Burma himself, the younger son of Prince Louis; and finally the Duke of Edinburgh, nephew of Lord Mountbatten.

The author is a journalist and the work, though akin to popular journalism, is well done and collects in a small compass a great deal of interesting information. It is illustrated with an abundance of photographs and contains a genealogical table two feet wide. There must be few who would willingly submit to an examination on this item. One might perhaps quarrel with the title, which refers to the Duke of Edinburgh's marriage. "Manifest Destiny" was a phrase coined a hundred years ago to express the fact that the United States, having started on the Atlantic, was bound to reach the Pacific. So it was. No marriage could be more appropriate, but one likes to think that the parties could have avoided it, had they been so minded.

To Lord Mountbatten of Burma is naturally accorded the longest essay, though obviously it cannot penetrate far into such a full and amazing career. Lord Mountbatten ranks as one of the three most brilliant figures, one supposes, of the last war on the British side, a figure much more diverse and much less clearly realised than either Churchill or Montgomery. Mr Connell, while a whole-hearted admirer, does not conceal the fact that various features of his hero's career have been subjected to unfavourable criticism. Some day this extraordinary man, by birth almost a royalty, by marriage almost a millionaire, simultaneously in his youth a brilliant naval officer and a member of the smartest of smart sets, and then, when only just over forty, entrusted with a series of stupendous responsibilities and emerging triumphant from each of them, will provide a splendid subject for biography.

Early Trade Unions

ATTEMPTS AT GENERAL UNION: *A Study in British Trade Union History, 1818-1834.*
By G. D. H. Cole.
Macmillan. 218 pages. 16s.

IT is well enough known that the agitation for parliamentary reform which culminated in the Great Reform Bill of 1832 was accompanied by a

number of other reform movements, although too few of their details are understood. In this new book, a revised and amended version of an article published at Amsterdam fourteen years ago in the *International Review for Social History*, Professor Cole puts straight the story of the nationwide trade union movements of the period. He supplements the Hammonds, corrects the Webbs, and has little difficulty—though he has taken much trouble—in showing that the early unions were far less black than they were painted at the time by their opponents. Their principal objects were the obvious ones of raising wages and reducing hours of work; their leaders sought to combine workmen from as many trades as possible, in order to exert more powerful leverage on employers. As a side-issue, they sometimes embarked on co-operative production for their members' benefit.

The salient impression that emerges from their own long statements of their aims quoted by Professor Cole is one of infinite pains devoted to improbable projects for the betterment of mankind. Most of the accusations of secret, nefarious plotting that were levied against them seem to have derived from an innocent masonic element present in many of their initiation ceremonies (the ritual for one of these is given in full). There was, however, a pronounced degree of secrecy in the affairs of the great Yorkshire Union, of which the exact nature consequently remains obscure. Less obscurity surrounds the work of Robert Owen, the founder of the last and greatest of these bodies—the "Grand National Consolidated Trades Union" of 1834, which was crushed out of existence through a more effective combination of employers. Open as the day, Owen possessed, as the author says,

an unconquerable optimism, even in the hour of utter defeat. In fact, he never knew that he had been defeated. He simply collected a fresh audience, and went on saying the same thing.

"Attempts at General Union" is written, with forceful economy of phrase, by an authority entirely at home in his period; it clears up dark passages for experts, and explains to anyone interested in the development of an industrial revolution much of what it may feel like to the working men involved.

Shorter Notices

THE RESTLESS ATMOSPHERE.
By F. K. Hare.
Hutchinson's University Library. 192 pages. 8s. 6d.

In this book Professor Hare draws upon recent developments in dynamic meteorology to give an account of climate not as something of means and averages, but as the constantly changing result of what is shown to be very truly "the restless atmosphere." After describing how the weather is made with a clarity and economy admirably suited to the non-specialist, the writer proceeds to a series of brilliant summaries of the climates of the various continents,

in which he shatters many of the established notions even of such a well-known area as Europe. It is an admirable book, to be strongly recommended to anyone seeking the explanation not only of the normal climate, but of such astonishing variations from the mean as afflicted Britain in Coronation week. For the geographer, and for anyone concerned with life and development in overseas territories, it is essential reading.

★

STABILISING CONSTRUCTION: *The Record and Potential.*

By Miles L. Colean and Robinson Newcomb.
McGraw Hill. 340 pages. 51s.

This is another research study sponsored by the Committee for Economic Development, the organisation of American businessmen that has given so much thought to the problems of maintaining a steady rate of growth in the American economy—and which has provided more than one important adviser for the new Republican administration. Across 175 pages of text—and 148 pages of largely statistical appendices—Messrs Colean and Newcomb set out an excellent analysis of the essential instability of expenditure on construction and of its contribution to cyclical crises; and then, in effect, express their intense dislike of "special interventionary actions to alter the flow of investment into construction" except in the "presence of most unusual strains." They believe that main reliance should be put upon a "freely operating price system, continuous technological advancement, adequate market information, and a political environment in which it will be possible for people to save and profitable for them to invest." Nobody denies that clean living is the best way to good health, but that is really not sufficient reason to deny that it is sometimes necessary to take medicine.

★

ATLAS OF SIERRA LEONE.
Edward Stanford Ltd. 20 pages. 12s. 6d.

This atlas has been compiled by the Survey and Lands Department of Sierra Leone. It contains climatic, physical, and economic maps as well as useful large-scale maps of the principal towns in the colony. The gazetteer contains some 500 names of towns and natural features; chiefdom names, which will be of interest to administrators, are also included. Some information is provided on communications, exports and land area by administrative and natural regions.

The economic geographer will regret that the economic maps have been allotted so little space and political maps of the world, and of Africa, so much. Thus no fewer than ten agricultural crops of varying degrees of importance are crowded on to a half-page map of agricultural products; the reader will find it difficult to understand the result. The mineral map, too, could have been more effective if the main areas of mining production had been shown, if possible on a quantitative output basis, instead of, or better still, in addition to a general map of mineral reserves. Iron ore, chrome, and diamonds, in particular, would have benefited from a more detailed treatment. These criticisms aside, however, this atlas represents an interesting and useful addition to knowledge of the Gold Coast; it will assist teachers of geography in the colony.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Democrats Close Ranks

Washington, DC

AS the members of Congress turn homeward for a modicum of rest and a plethora of speaking engagements, and Mr Adlai Stevenson turns homeward to an unpredictable future, considerable attention is being paid to the position and prospects of the Democratic party. It is a scant nine months since its defeat at the hands of General Eisenhower. This defeat ended a period of two decades of almost unbroken supremacy in national politics, and it was achieved, in the presidential race, by a majority of six million votes. The Democratic candidate, Mr Stevenson, carried no state outside the solid South, and the South demonstrated its lack of solidity by partially disintegrating into the lap of Mr Eisenhower. Since this cataclysmic event, the public opinion polls show that the new President has held his personal popularity intact, and enjoys the approval of something like three-quarters of the voting public.

In the face of all this, it is remarkable that the Democrats today seem full of resurgent confidence and fighting spirit, while their successful opponents appear troubled, divided, and apprehensive. One reason for this is that, while Mr Eisenhower was piling up his majority of six million, Democratic candidates for seats in the House of Representatives, taken as a group, polled some 200,000 more votes than their Republican adversaries. The Republican majorities in both houses of Congress were mathematically about as small as they could be; this meant that the Democrats in Congress have enjoyed the greatest amount of power that is possible without the counterbalancing responsibility of having control. The smallness of the Republican majority in Congress also indicated that the party, even after twenty years of Democratic mistakes, could not win the confidence of the country, but had managed to get a precarious grip on its affairs only through the magical and essentially non-political popularity of the Republican presidential candidate.

With this comfortable feeling in the background—a feeling not unlike that which permeated the British Labour party in the first months after its defeat in 1951—the Democrats have also been in a position to enjoy to the utmost the spectacle of a Republican Administration suffering from the kind of irresponsible attacks from right-wing extremists that had so plagued the Democrats themselves in the declining years of their dominance. The splits in the Republican party, never well concealed, have become every week more obvious under the burden imposed on the ruling party in the United States by the dichotomy

of power and responsibility between the Executive and the Legislature, between the White House and "the Hill." With the removal of Senator Taft's parliamentary skill these splits are likely to become more noticeable yet.

Meanwhile, the Democrats, who were as badly divided in the days of their supremacy, have rarely shown their differences during the congressional session, and then with a mutual forbearance that was as pretty to behold as it was unfamiliar. In the bitter debate over the offshore oil Bill there was all the fuel necessary for a good old-fashioned intra-Democratic row, but the expressions of disagreement between Democratic legislators from the conservative and offshore-oil-owning South and those from the Fair Deal North were accompanied by a gentle sound of bowing and scraping, never heard in Mr Truman's time. Those responsible for Democratic strategy point out that the Fair Dealers had not been pressing the issue of civil rights for Negroes in such a way as to injure the sensibilities of their southern colleagues; hence the Southerners were prepared to respect the feeling of political necessity which forced the Northerners to oppose the return of control over offshore oil to the states.

This was followed by the Supreme Court's ruling that it would hear further arguments before making up its mind on the cases involving the explosive issue of racial segregation in the state schools. Democrats see in this a direct challenge to the Republicans; as a high official of the party said, figuratively rubbing his hands in glee,

Mr Brownell [the Attorney General] will have to stand up in the Supreme Court and oppose segregation, and that will be front page headline news in every newspaper in the South.

In other words, the Republican effort to woo the South will run headlong into the necessity not to alienate the North, and the Administration will find itself in precisely the same dilemma that split the Democrats in recent years and sent men like Governor Byrnes of South Carolina into Mr Eisenhower's camp.

★

While the balance in the matter of party unity turns in their favour, the Democrats are also enjoying, or hoping soon to enjoy, benefits from several political issues that have recently arisen. The Republican preference for generation of electricity by private rather than public enterprise seems certain to redound to the Democrats' credit in the West. The "hard money" policy of the Treasury, which has

been under fire from so distinguished a Republican authority on fiscal policy as Mr Marriner Eccles, a former chairman of the Federal Reserve Board, will undoubtedly become the whip with which the Democrats will flay the Administration at the first sign of a business recession. If, by any chance, the wheat farmers should show sufficient signs of believing in the *laissez-faire* arguments of the present Secretary of Agriculture to vote against the controls on the area planted that are required by law as the prerequisite to full price supports for their 1954 crop, it is likely to be the Democrats who will reap the greatest harvest in the long run. The choice must be made this week, and a minority of one-third-plus-one of the farmers voting can block marketing controls and thus price supports. This would leave the majority of farmers—and, human nature being what it is, many of the minority—in a mood to blame the present Administration if their incomes drop sharply next year.

The Democrats are not without problems of their own. There is the truly formidable charm of Mr Eisenhower. The ingenious Democratic tactic of loyally supporting the President against the wild men of his own party seems at best a defensive manoeuvre; millions may have voted for Democratic candidates in spite of Mr Eisenhower, but it is not easy to imagine them doing so *because* of him. And there is no reason to believe that the party's new-found unity could survive the shock of victory in the 1954 congressional elections.

Even now, there is disagreement within the party on the part that Mr Stevenson should play upon his return to

the United States. His defeat last year is not held against him by most Democrats, who feel that no one else could have done nearly as well, let alone better, under the circumstances. His lack of an official position may put him at a disadvantage in relation to such rivals as Senator Lyndon Johnson or the former Secretary of the Air Force, Senator Stuart Symington. But it is not likely that a man of Mr Stevenson's talents will have any real difficulty in catching the public eye and ear, and it may even be an advantage not to have to stand up and be counted in the Senate on all occasions.

Many of the old guard Democratic politicians resent the vigorous efforts of Mr Stephen Mitchell, appointed as Democratic National Chairman by Mr Stevenson, to reform the party, to open up opportunities in it for young people, and to embark upon such novel ventures as the publication of a national magazine, the *Democratic Digest*. If Mr Mitchell should retain his office in spite of this opposition, the chances are that the party will make constructive use of its opportunity to rebuild its forces. If that is done, then the rest will depend upon how long President Eisenhower can manage to share his wealth of popular support with his poor relations in the Republican party.

Policing Private Enterprise

Washington, D.C.

TO the extent that the federal government interferes with the private enterprise system in the United States, it does so very largely through a group of agencies generally known as "the regulatory commissions." It would be difficult to give a definitive list of these agencies, for there are a great many government departments which have direct or indirect powers to regulate economic activities in various ways. But any list would have to include the Securities and Exchange Commission, the Federal Power Commission, the Federal Communications Commission, the Interstate Commerce Commission, the Civil Aeronautics Board, the Food and Drug Administration, and the Federal Trade Commission. Most of these are so-called "independent offices." That is, they are not under the jurisdiction of any of the major departments of the government; each stands alone, as befits a body which has a quasi-judicial role to play. An exception is the Food and Drug Administration, which is a part of the sprawling Department of Health, Education and Welfare.

The functions of these offices are indicated, with varying degrees of accuracy and adequacy, by their titles. Some are concerned with specific industries: the Federal Communications Commission, as its name straightforwardly suggests, polices the wireless, television, telegraphs and telephones. The Interstate Commerce Commission should perhaps be rechristened the Federal Transport Commission, except that air transport is dealt with separately by the Civil Aeronautics Board; the ICC controls the rates and many of the activities of the railway, shipping and road transport companies.

Other regulatory commissions are not concerned with single industries or families of industries, but rather with certain features of economic activity in general. The Securities and Exchange Commission, born of the speculative boom of the late nineteen-twenties and its tragic aftermath, attempts to protect the buyer of securities against such

things as fraudulent, misleading or inadequate descriptions of the properties concerned. Sometimes the functions of one agency are only narrowly separated from those of another. The Federal Trade Commission, among other activities, has the job of preventing the use of false and misleading statements in advertising; the Food and Drug Administration polices advertising, too. But the FTC is on guard against forms of advertising which may constitute unfair methods of competition, while the FDA is concerned with such things as the dangers to health that may result from false claims made for patent medicines. An example of how these functions may overlap, however, is provided by the various moves made by the FTC against cigarette advertisers who make exaggerated claims about the harmlessness of smoking particular brands.

★

The effects of a change of administration in Washington upon the activities of these regulatory commissions cannot quickly be ascertained. The machinery often moves slowly; many of the anti-trust cases initiated by the FTC under the previous regime, for instance, are before the courts and beyond the power of the new team to alter one way or another. The turnover among the commissioners themselves is not large. In most cases, the members of the commission are appointed to serve statutory terms. The political balance of the commission is usually dictated by law; if there are, say, five members, not more than three may be selected from a single party. In most cases, the President has been able to shift the balance of a commission from the Democrats to the Republicans by means of a single appointment, that of the chairman.

This shift is important enough, since the chairman usually has far more power than his fellow commissioners. In the FTC, for instance, he runs the agency administratively, and exercises the greatest single influence over the choice of cases with which the commission will deal. Furthermore, in controversial issues the shift from a bare majority in one direction to a bare majority in the opposite may be quite sufficient. To use the FTC again as an example, the commission recently reversed its attitude towards the Caperhart Bill, which would open the way to restoration of the "basing point" system of pricing in such industries as steel and cement. Interestingly enough, this change from opposition to approval took place despite the fact that there were still three Democrats among the five Federal Trade Commissioners after the appointment of the Republican chairman; one of the three, however, is a conservative Democrat. Bipartisanship, in a land of parties as broad and nebulous as those of the United States, may thus become something of a formality.

There are other ways in which a change in the political complexion of Washington can bring about a change of a commission's policy. Congress attached a rider to the FTC appropriations this year providing that none of the money was to be used to continue an investigation launched by former President Truman to discover why certain retail prices continued high in spite of a decline in wholesale prices. Another, less direct, instance is provided by the abandonment by the Interior Department of the Hells Canyon dam project, which it sponsored under the Democrats. This diminishes markedly the force of the testimony which the Federal Power Commission will hear against turning over the site to the Idaho Power Company, a private

corporation. On the other hand, the FPC can contribute to the slowing down of federal hydro-electric development by issuing licences to private companies permitting them to exploit portions of a river system for which an integrated programme of federal development has been authorised. This happened at Roanoke Rapids, Virginia.

There is no sign that the present Administration has any intention of eliminating any of the regulatory commissions, although it has set up a committee, on which government officials as well as outsiders are serving, to discover, among other things, how the work of the commissions may be speeded up and their operating costs reduced. There is no doubt, however, that there will be a gradual loosening of the reins on private business. It has sometimes been claimed that regulatory bodies tend, over a period of time, to become altogether too sympathetic to the special hardships and desires of the persons or organisations whose affairs they are meant to regulate. Thus, one is likely to find no stauncher friend of the railways than an Interstate Commerce Commissioner. To this tendency, in so far as it actually exists, is added the undeniable fact that the present Administration is more influenced by the wishes and opinions of the business community than any of its predecessors since 1932. The desire to have the business viewpoint represented has led to appointments such as that of Mr Howrey, who came to the chairmanship of the Federal Trade Commission from a legal career marked chiefly by the defence of several large corporations in anti-trust cases initiated by the commission.

The shoe is now firmly on the other foot in Washington. For years, Republicans claimed that, although the flood of

ON YOUR TRIP TO
NEW YORK
YOU CAN FLY TO

Bermuda

AT NO EXTRA COST!

Something extra special lies ahead of you on your flight to New York. Your first-class fare, via any international airline, can include a trip to Bermuda—and at no extra cost.

When business is over, refresh yourself with a delightful week-end in Bermuda. Stay longer, if you wish, for Bermuda is in the sterling area. Bermuda's less than three hours from New York, and there are frequent daily flights.

And there's nothing like Bermuda for sunning on pink sandy beaches . . . for leisurely living far from bustling routine . . . for rest and utter contentment.

If you
do business
in the States...

it pays to do business with Chase

Chase is New York banking headquarters for thousands of banks and business houses throughout the United States. As a result, customers' interests in any part of the country receive the attention of Chase officers who are currently familiar with the needs and developments of business in that particular area.

Through two offices in London this American banking organization is especially geared to serve British trade interests in the States.

New Deal legislation had long since shrunk to a trickle, the New Deal spirit was continuing to influence the activities of the regulatory agencies in ways so insidious that the average voter never realised what was going on. Now the Fair Dealers are not comforted by the fact that the Republicans have passed little reactionary legislation, for they say that "creeping conservatism" is manifesting itself in alterations of this immensely complex system of regulation, alterations too subtle even to be recognised by the public, let alone transformed into political capital, for years to come. If there is truth in both these complaints, it may perhaps be evidence that no system of public regulation can be completely free either of politics or of change.

American Notes

Truce with Rhee

IT may not have taken as long for Mr Dulles, the Secretary of State, to come to terms with the President of South Korea, Mr Syngman Rhee, as it did for the United Nations representatives to negotiate a truce with the Communists, but President Rhee has shown himself just as intransigent as are the Russians and nearly as adept at interpreting agreements to suit himself. The most flagrant example of this was his assertion, in an interview with Mr James Reston of the *New York Times*, that the United States was committed, under the verbal agreement made by Mr Rhee with the State Department's representative before the Korean truce was signed, to resume active warfare if the unification of Korea were not achieved after ninety days of the peace conference which the United Nations Assembly is about to arrange. It was this assertion that forced Mr Dulles to fly to the Far East, to try to establish a basis of mutual trust and understanding and to get some assurance that President Rhee would not sabotage a conference that, in his view, is a pointless waste of good fighting time.

Mr Dulles now has this assurance on paper, in the form of a joint statement that both governments will attempt to achieve the unification of Korea through the political conference for at least ninety days; after that each government will be free to withdraw if the conference seems fruitless, and to consult on what to do next. Furthermore, the statement only pledges the United States to seek the unification of Korea by "peaceful" means—without explaining what is involved in such means. To make these facts of American policy more palatable, Mr Rhee has also been given the mutual defence treaty he has long wanted, under which the United States and Korea agree to come to each other's aid should either be threatened with aggression.

Although attempts are being made to play down this treaty as only another strand in the existing network of Pacific pacts against Communism, it does in fact go further than the others, for it pledges the United States for the first time to intervene directly on the actual Far Eastern mainland. For this reason there may be some argument

before the pact is ratified by the Senate; and the extent of that argument will depend on how circumspect Mr Rhee has been in the meantime. Since the treaty is unlikely to come up for ratification until after the New Year, and since by then the vital ninety days of the peace conference should be over, Mr Rhee will be well advised to interpret the joint statement which he signed last week in the spirit in which Mr Dulles and the United States meant it. Another consideration which should make Mr Rhee more amenable is that Congress has so far provided only \$200 million of the \$1 billion which the United States expects to spend on the rehabilitation of Korea.

Prosperity's Profits

MANY businessmen are now once more postponing the long-expected economic adjustment, this time to the middle of 1954, on the grounds that the Korean truce had been thoroughly discounted and that an economy rolling along in top gear cannot lose its momentum overnight. The gross national product in the second quarter reached a new record annual rate of \$372 billion. If the wolf does finally materialise next year, it seems that the boom will be swallowed up with a bang, not a whimper. Corporate profits in the first quarter were running at an annual rate

of \$19.3 billion after taxes. This is higher than the total for any year since 1950, when an all-time high of \$21.2 billion was possible because the stimulus to profits provided by the Korean war had not yet been offset by higher tax rates.

The final figures for the second quarter are not yet available, but everything suggests that the tide of profits continued to rise. The National City Bank of New York, which tabulates reports from 550 companies, finds that profits in the three months which ended in June were 8 per cent higher than those of the first quarter, and 26 per cent above those reported a year earlier. Among the causes were higher sales, the installation of efficient new plant, capacity

or near-capacity production, falls in the prices of raw materials, and the end of controls on prices and output, which restored a free market. It is not only the defence contractors and makers of heavy industrial goods who did well, but also the distillers, the manufacturers of radios and television sets, and the food companies. They benefited from the continued rise in personal incomes.

It is not difficult for comparisons with the relatively lean year of 1952, and particularly with its first, least prosperous, half, to be favourable. Earnings last year were lower than they had been since the recession year of 1949, partly because of the tax burden, but also because of strikes in steel and oil and hard times for certain industries, such as textiles, electrical equipment, and radio and television. Inventory losses cost nearly \$1 billion. The present quarter may look less rosy, both relatively and actually, than the second, but for the year as a whole there is a good chance that profits after taxes may match or exceed those of 1951.

Cotton War

THE unexpectedly high yield—14.6 million bales—just forecast for the coming cotton crop, in this year's first official estimate, means that there will be an intensification of the civil war that has been going on among cotton farmers ever since it became probable that marketing restrictions would be imposed on the 1954 crop. But in

this civil war the Mason-Dixon line runs from north to south across the cotton belt, through eastern Texas, with on one side a million or more small farmers in the traditional cotton-growing states—Georgia, Alabama, Mississippi, etc.—and on the other a few thousand rich agriculturists of western Texas, California and Arizona.

For in the last few years these western farm factories have been giving increasing space to the production of cotton and, with the help of up-to-date and expensive fertilisers and irrigation systems, they have been largely responsible for the heavy rise in yield an acre. The 1953 crop, if it comes up to expectations, added to a carry-over of 5.2 million bales, means that supplies for the coming year will exceed normal demand by about 3.5 million bales and that acreage and marketing controls will be required by law if the government is to continue supporting cotton prices. Under the present system of controls, each farmer will be restricted to a percentage of the average amount planted over the last five years. The western farmers, who have nearly doubled their cotton acreage during that period, argue that they will therefore be forced to cut down their plantings, compared with this year, much more severely than will farmers in the south-east who have, if anything, reduced their cotton acreage recently.

The counter-argument is that it is easier for western farmers to change to other cash crops than it is for the poor and ill-equipped southern farmers; this is a view that carries much weight in Congress, since southern farmers have far more votes than do the westerners. On the other hand the Republican party is likely to earn better dividends in the 1954 congressional elections by cultivating goodwill in the west than in the habitually Democratic south.

Meanwhile Congress adjourned without making any change in the basis on which cotton restrictions are calculated; it did not even find time to raise the minimum permissible cotton area from the present 17.5 million acres as it was asked to do. This year 24.6 million acres were planted and therefore, unless a "meteorological catastrophe" falls on the cotton crop between now and October, total cotton plantings will have to be reduced by about one-third next season. The alternative, on which farmers will vote in December, is for the level of government price supports to fall by about 45 per cent; but it would be unprecedented for cotton farmers to choose this alternative. And since Congress will again be in session before planting time actually arrives, they can still hope for relief from some of the penalties of abundance.

Investigators Go to Church

FOR perhaps the first time in his career Senator McCarthy is not trailing clouds of glory as he returns to Wisconsin from Washington. For the congressional session ended in a series of setbacks for him. In spite of his protests—during which he dubbed Senator Fulbright's student exchanges the "half-bright programme"—the Senate restored almost the full appropriation for the government's overseas information services, which had suffered badly in the House. And Senator Margaret Chase Smith has given practical effect to Senator Monroney's proposal that greater control should be exercised over congressional investigating committees:

she has induced the Senate to prevent Mr McCarthy from issuing reports during the recess on his own initiative, without the approval of the rest of his committee. Following his usual counter-attacking tactics, Mr McCarthy then demanded that the State Department should refuse a passport to an official of the Central Intelligence Agency, Mr William Bundy, who is accused of disloyalty by Mr McCarthy. This the department refused to do.

Such open defiance of Mr McCarthy dates from his attempt to appoint to the staff of his committee a man who had publicly attacked the Protestant church. In the autumn this Mr Matthews is to present his charge, that "the largest single group supporting the Communist apparatus in the United States today is composed of Protestant clergymen," to the House Committee on Un-American Activities. This committee has recently been examining a Methodist minister, Mr Jack McMichael, who is accused of Communism, a charge he has denied heatedly. The chairman of the committee, Mr Velde, insists, however, that he is not, as has been suggested, investigating religion as a whole, but only individuals among the clergy who are suspected of Communist sympathies.

The first individual whom Mr Velde suspected in this way, the respected Bishop Oxnam of the Methodist Church, has at last been allowed to answer the charges against him. In a ten hours hearing the Bishop was able, with ample documentation from his diary and other records, to demonstrate how little foundation there was for the rumours and unsubstantiated allegations that had been built into the published case against him. His aim was not only to prove his own innocence but to expose the improper methods of the committee, which he had long criticised.

But the hearing also illustrated how, even if these congressional investigators manage to avoid trespassing upon the constitutional freedom of religion and the separation of church and state, they are likely to find themselves involved in church controversies. For the reactions of the audience of Protestant clergymen who had come to hear Bishop Oxnam showed that the attack upon this liberal churchman had not been unwelcome to right-wing Protestants.

Housing on Shaky Foundations?

AT a time when total outlays on new private and public construction are the highest in America's history, the first signs have appeared of a possible slackening of the building boom. The next American recession has been "just round the corner" for so long that the preliminary figure for the number of houses started in June, which showed a fall for the second successive month, was bound to cause anxiety.

No one knows yet whether the decline means that an end is now coming to the period during which housing starts can outstrip the rate at which new families are formed, or whether it is only the outcome of a temporary shortage of mortgage funds. If the latter, then the decision last May to increase the interest on mortgages insured by the Federal Housing Administration from 4½ to 4¾ per cent, and on those guaranteed by the Veterans Administration from 4 to 4½ per cent, may restore the relative popularity as investments which these mortgages lost when the Treasury's anti-inflation measures pushed up interest rates generally. It

may do so, but the effect so far has been disappointing and if, in fact, more fundamental factors are in operation, there will be mounting pressure on Congress and the Administration to take more drastic action. The Administration itself is waiting to see how the housing situation develops and asked Congress to leave well alone until next year, by which time a policy should have been thought out. On the whole this wish was respected, the Republican desire to fight socialism by reducing Federal activity in housing having run up against the Republican desire not to be held responsible for a recession.

An attempt to cripple the Federal National Mortgage Association, which purchases government-guaranteed mortgages when these prove unattractive to the open market, was repulsed and its operating conditions improved. The President was given powers, for which the Administration had not ventured to ask, to make the terms on guaranteed mortgages easier if present trends should in fact turn out to be the forerunner of a depression. On a \$12,000 house, for instance, he can now if need be cut the down payment from 20 to 5 per cent and extend the repayment time from 25 years to 30. Finally the Senate forced the House of Representatives to keep alive the federal government's low-rent housing programme. Only 20,000 houses, a third of those already under contract, will be built, compared with the 135,000 a year contemplated by the 1949 Wagner-Ellender-Taft Act. Congress may need to take the whole of this Act more seriously next year if housing starts continue to decline.

Waterfront Purge

THE time given the International Longshoremen's Association to clean up its own branches on the crime-ridden New York water front expired this week. As Mr Ryan, the association's president, who himself has been indicted for misuse of union funds, had nothing more to show for his period of grace than yet one more expression of good intentions, the executive council of the American Federation of Labour was unable to pretend any longer that he has either the will or the ability to free the docks of gangster control. The council, meeting in Chicago, has

MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

therefore recommended that the union be suspended from membership in the federation. If the AFL convention, which meets in September, agrees, the next step will be to charter a rival union, or establish local branches which will be responsible directly to the parent organisation.

The longshoremen's officials have dillied and dallied although they are threatened not only with expulsion from the AFL, but also with the drying up of their funds. One of the provisions of the programme of waterfront reform drawn up by New York and New Jersey, which recently received the blessing of Congress, prohibits the longshoremen's local unions from collecting dues after September 1st if any of their officers are men with criminal records. About 30 per cent of the union's officials fall in this category, although conceivably they might resign their titles and still rule. So far only one has been dropped, and the feebleness of Mr Ryan and his lieutenants in dealing with a revolt by the czar of the Brooklyn waterfront—Mr Anthony ("Tough Tony") Anastasia, the brother of the Anastasia of Murder, Inc. fame—has shown that they are unable to act vigorously even in self-defence.

The past reluctance of the AFL to intervene was due, not to indifference, but to the knowledge that a new union will have to wage a bitter and probably sanguinary pier-by-pier fight for control. By December, however, it will have the assistance of the new state code of waterfront legislation. This will require licences for stevedores and port watchmen, will permit the new control commission to bar from dock employment men with police records, and will substitute state employment offices for the "shape-up," the present unsatisfactory hiring system.

SHORTER NOTES

This year's special immigration Bill has gone through, though as a measure to admit 214,000 aliens in three years and five months, instead of 240,000 in two years, as originally proposed. The United States will take 100,000 refugees from countries beyond the Iron Curtain, and will relieve the over-population of three Nato countries to the extent of 60,000 Italians, 17,000 Dutchmen and 17,000 Greeks. Other categories provided for include 2,000 Chinese refugees and 2,000 European refugees from Red China, 2,000 Arab refugees from Palestine, 2,000 Chinese immigrants from Formosa and 3,000 immigrants from any part of Asia. Five thousand people already in America on temporary visas will be allowed to stay, and asylum will be offered to 4,000 orphans from anywhere in the world.

★

Using his veto power on an important Bill for the first time, President Eisenhower has killed the measure which would have relieved cinema theatres of the 20 per cent tax on admissions. The President said that the government could not afford to lose over \$100 million a year in revenue and that it was unfair to single out the cinema industry for special help when others needed it as much or more.

★

The cost of red tape to the US taxpayer was surprisingly low last year; it totalled \$4,700 for close to 9,000 reels, which were used for tying up stored documents.

The World Overseas

Soviet Flirtation With Austria

BY A CORRESPONDENT

MR MALENKOV told the meeting of the Supreme Soviet on August 8th that "No one can deny that a correct solution of the German question would help to solve the Austrian question too." This statement has understandably dashed many hopes in Austria where there was a tendency to believe that a settlement of the smaller problem of Austria might pave the way for a solution of the much greater problem of Germany. Indeed, before Mr Malenkov spoke, many in Austria tended to believe that the Soviet government was at last getting ready to conclude the long-overdue State Treaty. Now the pendulum is again swinging in the opposite direction.

Though the new rulers in Moscow have recently made a number of conciliatory moves—the latest is the abolition this week of the censorship in the Soviet zone—they have certainly not yet shown any real tendency to relinquish their hold over Austria. Actually the signs of a milder application of Soviet supervision began to appear some time before Stalin's death. For example, the issue of permits for goods to cross the inter-zonal demarcation lines began to be carried out with more regard for Austrian susceptibilities while Stalin was still alive, and by the time the system itself was abolished this summer it had ceased to be a real source of friction.

During the past few weeks, and especially since the arrival of the first Soviet civilian High Commissioner, Mr Ilyichev, a number of other steps have been taken to remove Austrian grievances. Mr Ilyichev himself was permitted to mark the resumption of normal diplomatic relations between the two countries by releasing a dozen or so Austrian political offenders from the Soviet-controlled gaols of Lower Austria. A corresponding change has occurred in the attitude of the Soviet representative on the Allied Council through which the four occupants, to the justifiable indignation of all Austrians, exercise a kind of foster-parental control over Austrian legislation and the acts of the supposedly independent Austrian government. At recent meetings of the Council, the Soviet representative has found himself able to join his western colleagues in approving at least some of the laws presented for their joint consideration.

So far, all the changes concern only matters of minor importance. Austria has at last been allowed, for example, to establish airmail services with West Germany and Japan which it has been trying to persuade the Soviet government to allow for the past six years. Again, after eight unsuc-

cessful applications, the Austrian government was told this summer that it may raise loans abroad. But when giving his approval the Soviet representative was careful to take the gilt off the gingerbread by adding that of course each individual loan would still require the Council's approval.

Other welcome straws included acceptance at long last of a law enumerating the various decorations the Austrian government may bestow on its citizens. This seemingly harmless enactment was blocked for years by the Soviet government because it contained no clause to prevent a decoration being awarded to "politically unreliable" persons. Similarly, last June, the Soviet government suddenly agreed that the Austrian government should be allowed to implement its membership of the International Police Commission by equipping the Austrian police with a radio service linked with that of the IPC's criminal police radio network. But at the same time, the Soviet representative flatly refused to approve the Austrian Law of Public Assembly, declaring that it was out of date; this was true as it had originally been enacted in 1867. He also rejected a decree raising the fees for university tuition to all but the poorer students though he accepted a parallel enactment raising the emoluments of university professors. Nor, so far, has he acceded to repeated requests for permission to establish an Austrian civil aviation company. And he still loses no opportunity to describe the Austrian government as undemocratic, determined to re-militarise Austria, and wholeheartedly devoted to Nazism.

The barometer has also by no means mounted to the region of set fair in the ordinary day-to-day intercourse between the Soviet and Austrian authorities although the Soviet government has abolished many of the sources of irritation which have galled the Austrians for the past eight years. Thus, a few weeks ago it agreed to the removal of a number of police officials who had been dismissed three years ago for disobeying orders but who had been maintained in office by the Soviet Commandatura in direct defiance of the Austrian government's decision. But Soviet police officers still try to kidnap Austrian citizens in the streets of the Austrian capital. Sometimes they succeed. On the other side of the ledger, again, a number of the retail stores set up by the Soviet USIA organisation to compete with Austrian private enterprise have been closed in the past few weeks. The Danube is once more open to Austrian shipping not only as far as Vienna but also with certain restrictions as far as Yugoslavia. Of perhaps greater

significance is the fact that the Soviet government has approved the return to the Austrian government of the site of the Ybbs-Persenbeug power station which it seized as one of the so-called "ex-German assets" in 1945.

While such signs of growing co-operation should not be minimised, no Austrian is likely to forget that the USIA installations and the Soviet-controlled oilwells around Zistersdorf enable the Soviet government to take out of their country each year just about as much as the American government has been pouring into it under the various aid programmes. If only for this reason, the recent Soviet gesture of declaring that in future the Soviet government will pay the cost of the Soviet Army of Occupation which was previously a charge on the Austrian budget to the tune of 151 million schillings, is not likely to be regarded as particularly generous. Austrians would much prefer to receive back the "ex-German assets" out of the profits of which this sum will come in future. And they have not ceased to wonder why the "peace-loving" Soviet Union still maintains an army of at least 40,000 in their country, including a tank division, anti-aircraft batteries, bomber and jet fighter aircraft.

Faced with these contradictory aspects of Soviet policy, the Austrian government finds itself in somewhat of a dilemma. In the past it has almost always sided wholeheartedly with the three western occupants and tweaked the Bear's tail whenever it saw an opportunity. But today its ranks are divided between those who distrust the Soviet government and want to go on tweaking and those who, while still distrustful, wish to adopt a conciliatory policy in the hope of extracting a few more plums out of the Soviet government's pocket before its mood changes.

Socialists Urge Caution

On the whole, the People's Party and the Socialists have been divided in their attitude to the Russians' conciliatory gestures. The Foreign Minister, Dr Gruber, for example, much to the delight of the Communists, recently expressed the view that Austria must steer clear of any military commitments with either the West or the East. The Communist newspaper, *Volksstimme*, has also praised the Premier, Mr Raab, for having shown "glimmerings" of international understanding—except when he has talked about Austrian oil. But both have been severely taken to task by the Socialists on the ground that they are too ready to accept Soviet blandishments at their face value. The Socialists stress that the Soviet policy of concessions is not irrevocable and could be easily and quickly reversed.

At the moment, the Soviet government is certainly profiting from the fact that its concessions to Austrian national *amour propre* have come after—a very long time after—similar concessions by the West. The Austrians, inevitably and naturally, want to use every Soviet concession to extract a fresh counterpart from the West in the hope of playing one side off against the other until both have only one trump left, namely, signature of the peace treaty. At present the Austrians do not seem to have much to lose by following such a policy. They do not believe the Soviet government would dare to throw down the gauntlet to the West by using its tanks in Austria as it did in East Germany. And they are still more confident that the West, with which their whole sympathies are bound up, would never abandon them to the tender mercies of the Russians. Thus they want to find a policy which will neither anger the Russians nor antagonise the three Western occupants.

Trade Between East and West

AN article in the most recent quarterly bulletin of the United Nations Economic Commission for Europe (ECE) discussed the decline in east-west trade during 1952. It is a familiar complaint that the fall is due to western strategic controls; what is often overlooked is that other factors have also been at work, and it is with these hindrances that the current report deals. It should be read by all those who, though they disagree completely with the Communist party's politics, nevertheless subscribe to its analysis of east-west trade. In the view of these optimists the economic ills of Europe can be cured simply by expanding trade with the East, and this trade can be increased simply by abolishing western controls.

The decline in east-west trade during 1952 was marked; in terms of volume, western exports to the eastern bloc fell

by about seven per cent, while the corresponding exports from Eastern Europe dropped by five per cent. With the exception of the Soviet Union and Finland the pattern of declining east-west trade is consistent. Russia throughout increased both its export and import trade with the West thus gaining a relatively larger share of the diminished volume of east-west trade. Compared with prewar, however, the present volume of east-west trade is little more than a quarter of its former size. It is easy to exaggerate the importance of the trade to Western Europe, though to some countries such as Western Germany and Austria, it is obviously of greater significance. Most West European countries, however, had in 1952 less than 5 per cent of their total trade with the eastern bloc. It is mistaken, moreover, to think that the position was much different before the war; Britain, for example, in 1936-38 had little more than ten per cent of its total trade with east European countries, including the Soviet Union.

In public discussion of east-west trade the question of price is often overlooked; but, as the report shows, it has been "a major obstacle to the development of trade." The east European countries have frequently asked prices for

their commodities which were higher than world prices: Polish coal has been as expensive as American coal delivered in Europe, and more expensive than British coal; east European exporters have demanded more for grain than the maximum fixed under the International Wheat Agreement. On the other side, it is alleged that west European countries charge a premium on exports to the eastern bloc. On the whole, however, it would seem that the eastern countries have sinned more than been sinned against on the question of price. That supply difficulties in eastern Europe are also a limiting factor is suggested in the remark "it is not clear . . . that supplies from east European countries would have been forthcoming in greater volume had their prices been lower and west European demand greater."

Myth of "Lost Markets"

Another limiting factor discussed in the report is the question of payments between East and West. The ECE has tried to promote a wider area of multilateral settlement through the sterling transferable accounts system, the European Payments Union, and by arranging that western-held balances are made transferable between iron curtain countries. Much of the east-west trade is, however, based on bilateral clearing agreements, which are often made more flexible by swing credits. During 1952 "deficits built up by east European countries became a serious impediment to the further development of trade." Many west European countries, far from wanting to increase their exports to the eastern bloc, have tried by various means to

GENERAL LEVEL OF EAST-WEST TRADE

	Imports into Western Europe	Exports from Western Europe
	Index numbers of volume (1950=100)	
1938	305	204
1949	111	103
1950	100	100
1951	89	98
1952	85	91

Source: ECE Quarterly Bulletin, Vol. 5, No. 2.

cut down their accumulated surplus with these countries. As long as east European countries are in deficit with western countries, there is little sense in talking about "lost markets in the east," for no west European country would be anxious to pile up rouble balances, or IOUs from "peoples' democracies." The bulletin emphasises that trade would be facilitated if western-owned balances in one eastern country could be used in another.

A point that becomes increasingly clear throughout the article is the need to separate the Soviet Union from the satellite countries when discussing the prospects of east-west trade. Though Russian exports have often been overpriced, it can hardly be said that western trade with Russia has been restricted on account of payment difficulties. Thus only in the case of trade with Russia is it true to say that the western security embargo has been a major factor

limiting trade. On the other hand, it must be realised that Soviet economic policy has forced the east European satellites to twist their whole economies towards Russia; they have thus been denied export markets in the West. In 1938, for example, only one and a half per cent of east European exports went to Russia; by 1950 this percentage was over thirty. Thus Russia's favourable position *vis-à-vis* the West is to some degree built up at the expense of the satellites. As a consequence of this, and also of the plans in progress for rapid development of heavy industry in these countries, their exports have become limited, and concentrated upon a smaller number of mainly food products. For the West these products are only attractive as dollar savers, for their prices are generally uncompetitive; but as the non-dollar sources of production are developed elsewhere in the world they may lose even this advantage.

Besides the factors mentioned there are other hindrances for which the eastern countries are solely responsible, for example, the dangers of dealing with bureaucratic national trading agencies which can cut off trade without warning; the obstacles facing western businessmen who wish to advertise, distribute, and service their products, or to inspect goods bought from the East; and many other similar tribulations. Even if western strategic controls were removed, many hindrances to east-west trade would remain, unless, indeed, the removal of controls by the West is bargained against corresponding relaxations in the East.

Rearming Japan

FROM OUR TOKYO CORRESPONDENT

TO the vast relief of the Americans, the Japanese conservative block has at last agreed to scuttle the MacArthurian Constitution by a deliberate flouting of the vital and embarrassing Article IX, which renounced all war potential for Japan. Last week the Japanese Foreign Minister announced that Japan and the United States had agreed on nine points of a mutual security aid treaty. The situation is heavy with paradox, rich in irony and pregnant with eaten words. Never have hairs been split more finely than when the Liberal Government reluctantly conceded that the new Japanese National Safety Force of 110,000 men was not a purely constabulary body, but still insisted that it was by no manner of means an army. Simultaneously, Mr Shigemitsu, leader of the Progressive party, which, as the strongest Opposition party, is slowly and coyly coalescing with the Liberals, swallowed his brave words of the past and agreed that no amendment to the Constitution was required to begin the open building up of "a military force for self-defence" as a necessary condition for receipt of American MSA aid.

Article IX of the Japanese Constitution, headed "Renunciation of War," says:

Aspiring sincerely to an international peace based on justice and order, the Japanese people forever renounce war as a sovereign right of the nation, and the threat or use of force as means of settling international disputes.

In order to accomplish the aim of the preceding paragraph, land, sea and air forces, as well as other war potential, will never be maintained. The right of belligerency of the State will not be recognised.

Nothing surely could be more explicit. Every Japanese

political leader who is now gratifying the Americans by contending that these blunt and simple American-dictated words do not mean what they say, in spirit or letter, would have been purged out of hand had he hinted half as much in 1947 or even 1949. The *volte face* exemplifies the abiding truth of the old cynicism that "international treaties lose their force when no longer sustained by the interests of the contracting parties." The only politicians who are defending the Constitution are the left-wing and right-wing Socialists, who do not want a Japanese army or the American security forces, and their bitter enemies the Hatoyama splinter Liberals, who were purged by the Americans during the Occupation, and who want an undisguised Japanese national army instead of the American security forces. The Socialists gained votes at the last elections because they opposed rearmament. The Hatoyama Liberals and the Shigemitsu Progressives lost votes because they wanted open rearmament and an amendment to the Constitution. The Liberals clung precariously to office because they pretended that they were not rearming but were only giving traffic policemen unorthodox training in the use of tanks and mortars.

The Progressives have now decided to profit from their error in insisting on a referendum which, in the present temper of the people, would be doomed. The Liberals have grudgingly recognised that their preposterous camouflage, which deceives no one, must be made more plausible. The Hatoyama diehards, with a persistency which does more credit to their Japanese hearts than to their political heads, alone remain implacable, ironically defending a former American directive on pro-Japanese grounds and flouting pro-Japanese sentiment on currently anti-American grounds. The Socialists seem to be in the soundest position with their demands for closer relations with Red China than with the United States in the devoted cause of "Third Force" neutralism.

An Oriental Fantasia

The confusion of the Yoshida government in this Oriental fantasia has been pathetic to watch. Accused of "secret diplomacy," because the Washington Ambassador has been quite legitimately exploring the American conditions of MSA aid, Ministers insisted that there had been merely "talks" and not "negotiations." The Foreign Minister, Mr Okazaki, contended that the Constitution "banned 'war-potential' but not tools of self-defence," and argued ingenuously that "armament" meant the capacity to wage war "independently." The Defence Minister, Mr Tokutaro Kimura, who had imprudently told reporters that he favoured a ground force of 205,000 men, a navy of 140,000 tons and an air force of 1,500 planes within five years, and then weakly denied that he had said so, explained that "the National Safety Force will merely oppose direct aggression as a democratic expression of self-defence." Under interrogation, the Deputy Prime Minister, Mr Taketora Ogata, claimed in all seriousness that "atomic bombs or jet fighters are really not war potentials unless they are actually used to resolve international disputes."

Then, with his unhappy facility for saying the wrong thing at the right time, Mr John Foster Dulles calmly revealed in Washington that the United States expected that Japan, whose government was vigorously denying any such intention, would increase its embryonic army to 150,000 men by next March. This indiscretion drove Mr

Yoshida—who has sought, with Voltaire, to distinguish between speaking to deceive and being silent to be impene-trable—into strong and angry protestations, which only darkened the atmosphere of mystery and conspiracy enveloping the "talks" or "negotiations."

As the liberal-minded *Asahi* newspaper observed:

It is regrettable that the feeling that a "self-defence" army can be created by Japan is now held by the conserva-tive parties in defiance of Article IX of the Constitution, which Prime Minister Yoshida himself interpreted pre-viously to mean renunciation of war even for self-defence. If one contends that the National Safety Force can be increased to 200,000 or 300,000 without making it a military force, then one can increase its strength indefinitely. And if one says that such a force is not a violation of the Con-stitution, then we do not need a Constitution.

Despite this stormy background of political doubletalk and public apprehension, an acceptable agreement has been reached between Japan and the United States on MSA aid totalling from \$100 million to \$150 million a year. The Japanese have succeeded in limiting any expansion of Japan's defence strength to the bounds set by Japan's "economic stability and development." As Mr Yoshida has said, this means that "the U.S. is thinking not only of military aid for Japan but also of aid aiming at Japan's economic independence." Unswerving determination to secure this implicit guarantee of continuing American economic aid has been the real purpose of the Japanese government's policy of passive resistance to rearmament, in whatever guise and under whatever name, notwithstand-ing the political advantages of hastening the withdrawal of American security forces.

Meanwhile, the Japanese Liberals, now assured of Pro-gressive Party support in their circumvention of Article IX, will probably apply MSA aid to fulfil at the outset a low rearmament target of 175,000 men, 220,000-ton navy and 1,200-plane air force set to a leisurely schedule of five or six years. An improved target and a faster timetable, to meet impatient American promptings, will doubtless be geared to, and dependent upon improved and faster Ameri-can aid. As ex-Colonel Masanobu Tsuji, chief staff planner in the old Imperial army, has declared: "In estimating the strength of the new Japanese army, we must count the arms before the heads. There will be no shortage of the latter."

End of the Dollar Famine?

THE most recent survey of the Economic Commission for Europe (ECE) brings some startling and encourag-ing news about western Europe's dollar problem, or at least that portion of it that relates to trade with the United States. Taken as a whole, the countries of western Europe have all but balanced their payments on current account with the United States. In the first quarter of this year alone their dollar reserves rose by some \$450 million, of which the United Kingdom was responsible for three-quarters. Look-ing backward over the developments from 1951 to 1953, the report shows that in the past year western Europe's annual deficit balance has been reduced to the manageable figure of \$68 million.

Such mass totals naturally obscure the fact that several

countries—Italy, Belgium, and in particular, France—experienced deficits. France, in the first quarter of 1953 alone, ran down its dollar balances in the United States by \$84 million.

WESTERN EUROPE'S BALANCE ON CURRENT ACCOUNT
WITH THE UNITED STATES
(Millions of current dollars)

	April, 1951 to Mar., 1952	April, 1952 to Mar., 1953	Change
United Kingdom.....	— 410	+ 169	+ 579
Other European countries	— 1,841	— 237	+ 1,604
TOTAL EUROPE.....	— 2,251	— 68	+ 2,183

ECE's analysis of how this remarkable improvement came about is instructive. Of the improvement of nearly \$2.2 billion, only \$222 million or roughly one-tenth is due to increased visible exports to the United States. Another \$600 million is the result of a surplus on account of services, and hidden within this total is a sizeable sum which is explained by such items as increased American military expenditure in Europe—troop pay and so on. Increased tourist earnings contributed less than one tenth to the surplus on services.

Over one-half of the improvement, or \$1.4 billion, is due solely to reduced expenditure on imports from the United States. Lower prices account for perhaps ten per cent of this reduction and the rest, as the accompanying table shows, has come about because Europe cut sharply its imports of a few bulk commodities—raw cotton, coal, chemicals, fats and grains.

UNITED STATES EXPORTS TO EUROPE
(Millions of current dollars, f.o.b.)

Commodity	1st qtr., 1951	1st qtr., 1952	1st qtr., 1953	Change 1st qtr., 1952 to 1st qtr., 1953	
				mns. of dollars	Per cent
Grains	209	213	158	— 55	— 26
Coal	38	93	19	— 74	— 80
Raw cotton	127	206	93	— 113	— 55
Animal fats and oils ..	43	58	21	— 37	— 64
Metals	54	87	56	— 31	— 36
Chemicals	43	53	32	— 21	— 40
All other.....	342	370	343	— 27	— 7
TOTAL	856	1,080	722	— 358	— 33

Whether imports can be maintained at this low level neither ECE nor anyone else can say. Lower grain imports may reflect a deferment of purchases in the hope that prices will fall. Where cotton is concerned, ECE suggests that European nations, and specifically Germany, have found other sources of supply—Egypt, Turkey, Pakistan. As for coal, the report notes that in spite of apparent surpluses here and there, western Europe is still working on far too slim a margin of coal supplies. If a general rise in European production should take place, Europe's current coal output would immediately be overtaxed and its industry would once again have to turn to American supplies.

ECE is dubious about the chances for any major expan-

sion of European exports to the American market and con-cludes that "the continuance of Europe's present relatively easy dollar situation depends, therefore, on continued restraint over imports and the course of the 'offshore' procurement programme." So far contracts signed under this programme have reached over \$1 billion.

Bread and Circuses in Bucharest

BY A CORRESPONDENT

FOR a fortnight more than 30,000 young people from 106 countries—amongst them many "youngsters" like D. N. Pritt and the Red Dean—are enjoying the charm of Eastern Europe's "Little Paris," Bucharest, where the Fourth Youth Festival is being held. To cover most of the expenses of their journey and stay in Bucharest, for the last two months an extraordinary "voluntary" tax has been collected from all monthly salaries over 200 lei in Rumania and probably in the other satellite countries as well. These young people have been brought together to see what the Rumanian press unanimously calls "the happy life" of the inhabitants of the model People's Democracy. "Everything possible will be done," declared Vasile Musat, first secretary of the Rumanian Communist youth organisation, "as it has been up to now, to make the memory of their two weeks in Bucharest last for ever in the minds and hearts of the thousands of young foreign people."

To achieve this, Gheorghiu-Dej and his men decided to construct a modern version of Potemkin's village. In less than five months of "permanent day and night work" a magnificent festival park, called "The Cultural-Sport Park '23 August'" has been created. The park, roughly 125 acres in size, has been provided with a stadium of 80,000 seats, an open air theatre with 4,000 seats, an open puppet-show, an artificial lake of over 6 acres, a tower 260 feet high with a metal bridge over 80 feet long for parachuting and other similar marvels. More than 20,000 trees, and over 10,000 species of perennial plants, a hundred artesian foun-tains and 1,000 megaphones were spread over all the park.

Six New Parks

At the same time the Rumanian capital has been blessed with a new opera house and a number of other open air theatres and cinemas. Several sport grounds have been erected in the six new parks and green squares spread over the different districts of Bucharest cover nearly 80 acres. All the old cinemas have been restored, and many bombed houses hitherto neglected have been rebuilt. The façades of 1,200 nationalised blocks of flats and 10,000 private houses have been repainted; 55 streets and boulevards paved and asphalted; tramway lines extended; 600 old tramway cars repainted and 25 new ones put in to use. In addition, there are innumerable triumphal arches, "peace towers" and other decorations.

It is not surprising that the Rumanian newspaper *Munca* complained on July 7th that the management of a factory at Moreni had not fulfilled its obligation, contained in the factory's contract, to provide facilities for the construction of 12 private houses. "For this there exist the necessary funds and land. But so far no construction has been started. The management pleads that it cannot get the construction

materials. It has asked for help from the ministry (of the oil industry) but the help has still not arrived, although the ministry registered this contract at the beginning of the year. . . .

Regular workers were commandeered from all over the country to help in the transformation of Bucharest. In addition, the local Communist organisations "mobilised" boys and girls—often between 14 and 16 years old—and sent them to the capital for "voluntary" work; and other young people spent their few days annual paid holiday in Bucharest working 8 hours a day at heavy manual work. "More than 700,000 people have given over 700,000 hours of voluntary work" boasted *Munca* in its leading article on August 2nd. According to a report in *Romana Libera* on April 23rd, young people working and living on the site of the big festival park were "organised as in the army" in "brigades," and they had to obey, without discussion, their "commandants." Twenty-two of these young people unloaded in three hours 16 wagons of cement and iron, "exceeding" their norm by 420 per cent. But another brigade beat this record, unloading 24 wagons in two hours (i.e., every member of the brigade unloaded more than 80 pounds a second). This report went on to describe life in a dormitory, where the "brigadiers" whispered in astonishment: "Why do Axinte and Dumitrascu (sons of peasants from near Pascani) want to leave?" There was even a strike. "One day Axinte, Dumitrascu and Matei did not come out with their brigade." But the commandant "discussed" the matter with them, and they not only went back to work, but Axinte became one of the most "zealous" at the unloading of trucks.

A New Cooling Drink

There remained only the problem of food supplies. The official statistical report for the second quarter of the year admitted that "the supply of some basic foodstuffs to urban populations has not been satisfactory" and that the planned distribution of meat, fats and sugar had not been carried out. It would not do for Bucharest's visitors to see empty shop windows and a starving population. So on July 5th the State reserves were opened and the shop-windows filled. Additional rations were given to the inhabitants of Bucharest and shortly afterwards to the rest of the country. In a couple of days food prices were slashed to a quarter and even less. A free hand was given to the bakers and the famous Rumanian pastries have reappeared in all their old variety. In addition, according to *Romana Libera* of July 24th, Rumanian light industry has begun to turn out many new products, "which have never so far been produced in Rumania" (it would have been more accurate to say under the present regime) in order "to show every visitor from abroad how Rumanians build for themselves a happy future." One of these new products was "a new material for trousers, the flannel."

The foresight of the government went so far as to remember the terrible August heat in Bucharest. Special attention was given to the provision of "cooling drinks" for this "oven month." The invention of a "new cooling drink far superior to lemonade" was announced. To crown all this, Gheorghiu-Dej's government added two touches of hospitality of its own—flowers in every visitor's bedroom, which have been forced in ten huge hothouses by Michurin methods, and a present for everyone provided out of "voluntary" donations collected from all over the country.

The circus will end on Sunday. There is no doubt that the average Rumanian has enjoyed as much as his guests the good food and the 100-120 daily programmes from the French *chansons* and pantomimes to the Mongolian circus, from sports demonstrations to concerts and film shows. All the same his feelings must have been mixed. They can probably be summed up in the following extract from a young Rumanian's letter to a friend abroad:

We are very pleased to have the festival here as we shall have plenty to eat and drink, at least for a while. Nevertheless, we cannot but hate and mistrust our visitors since the majority of them are Communists and fellow-travellers. As to the few "stooges" among them, we are only sorry that we cannot identify them and help them to see the truth.

Under All Flags

THOSE who know the new Secretary-General of the United Nations have awaited his first annual report with some interest, and they will not be disappointed. Mr Hammarskjöld has some quietly pithy things to say. He describes the Korean armistice not only as an unqualified victory for the principle of collective security, but also as a step towards the creation of a united and democratic Korea "by the peaceful means that are alone permitted by the charter." He looks forward to efforts to relax tensions elsewhere, but adds

I hope that the peoples will understand that such processes are usually slow, and that it may be necessary to bear with fortitude and patience a succession of painful disappointments, extending sometimes over a period of years, before acceptable compromises are reached. . . .

Mr Hammarskjöld believes that we have only begun to explore "the most fruitful combinations of public discussion on the one hand and private negotiation and mediation on the other." The international forum "should serve the members less for the voicing of complaints." Plunging boldly into controversy, the Secretary-General argues that to subordinate economic and social work to collective security is "correct, but only in a short-term perspective"; that collective security ultimately depends on the reduction of underlying pressures; but that the "economic and social approaches" in no way lessen Uno's importance as an instrument for preventing aggression. He also draws special attention to the fact that

the concept of a truly international civil service and of the independent authority in this respect of the Secretary-General and the Directors-General is not yet fully understood and accepted. There are, here, mutual obligations. . . . Members of the secretariats must abstain . . . from any activity which might throw doubts on their status as trusted and dedicated servants of the UN. . . . On the other hand, on this basis the international civil service should be left free from national pressures of any sort.

In the past, unfortunately, these mutual obligations have been violated on both sides; and it is probably too much to expect that the mere advent of a new Secretary-General, however talented, will ensure absolute respect for them henceforward. But it is something to have the case stated firmly and precisely by a head of the international civil service who is, as his first report shows, not only a man of principle but also a realist with a shrewd eye to what is practicable.

Schweppshire Shows the Way

6. GASWORKS REVIVAL

Once more, by a precise interpretation of the present, we anticipate the future. Nuclear heating has introduced a new fashion. In our cities, run without coal, gas or electricity, the atomic age has reduced power plants to the size of cigarette lighters. Our streets are deserts of cleanliness and glare. But Schweppshire provides its own antidote with the Return to Smoke. Factory styles are in fashion. Keynoting is the dove-cote shaped like a gasometer, the yew hedge clipped to a pylon shape. Lord Schwepstow's magnificent summer-house is constructed in "Waterloo Station Grid." In the public park the rock plants are prettily disposed on the mock slag heap. Between borders of "Goodszyard" docks and "Bonsite" thistles, our damsels of fashion display their new grease-patterned overalls, with the new "Coledust" make-up to match. In this glimpse of a Fogschwepster Park, observe the pleasant perschweptive of

smokestacks, with real smoke* from actual fires to veil the remorseless Fogschwepster sunlight from our eyes.

* The practice of representing smoke with plumes of gauze strikes a false note, as is rightly pointed out, in his essay, *Pseudo Gasworks*, by John Schwetjenan.

SCHWEPPERESCE LASTS THE WHOLE DRINK THROUGH

WE'RE INVITING INVESTMENTS

and this is why!

More houses are going up. More purchasers are asking building societies for advances to pay for them.

In the first six months of 1953 this Society agreed to lend £3,804,000 for the purchase of 2,582 houses newly built or in course of erection.

Money saved and invested with the Society is thus being used to good purpose.

Still more savings can be used. The interest offered is 2½% with income tax paid by the Society—equal to more than 4½% where the investor is liable for tax at the full standard rate.

If you would like particulars please write to the

THE BUSINESS WORLD

Operational Research

IN recent years a new technique—which originated, of all places, in the study of the working of radar equipment under field conditions just before the second world war—has become of some importance in British industry. This technique is called “operational research”; and under it teams that may include engineers, mathematicians, statisticians, economists and sociologists combine together in (to quote one of the more sober definitions of the art) “the use of the scientific method to provide executives with a quantitative basis for decisions regarding the operations under their control.” Sir Robert Watson Watt, who coined the term during the war, then defined the technique negatively:

Operational research is not doing arithmetic for air staff . . . not merely Probabilities for Politicians, or statistics for soldiers, sailors, strategists, and statesmen. It contains something of all these things, just as it contains elements of market research, consumer research, and the less naive and offensive elements of time and motion study.

Inevitably, this technique, like other “new fangled” ideas, has been greeted with some suspicion by business executives; but its use in British industry is growing, and, as might be expected, it has also been taken up with some enthusiasm in America. The largest single experiment in its application in Britain has recently taken place in an examination of the problems involved in transporting iron ore, and this experiment deserves attention as a case study.

The problems put before the “operational researchers” in this field can be briefly described. About 10½ million tons of iron ore are due to be imported into Britain this year; last month, at the peak of the ore shipping season, more than a million tons came into the country's ports. This is nearly twice the annual rate of imports in 1938, but by 1957 the British steel industry will probably need half as much again.

It is not surprising, therefore, that the industry is having to expand and reorganise the plant used to move the ore from overseas, to land it here, and to deliver it to the blast furnaces—plant that includes ore ships, port handling facilities, and railway ore wagons. In planning this re-equipment the industry has a problem of formidable complexity. It has had to take into consideration the worn state of much of the equipment that now exists; the widely different handling characteristics of ore from different sources; and the prospective changes in design of ore ships—with their effects, untried as yet, upon unloading rates. These rates of unloading, moreover, have to be assessed in terms not only of the operation of the handling plant, but in terms of the time the ships have to spend in port—ships' time being a costly commodity. The ore ships arrive fairly steadily during the year, but their arrivals are not regularly spaced; “bunching” and long intervals both occur.

The industry had therefore to decide at some point between the extremes of installing just enough handling plant for the yearly tonnage (at the cost of excessive delay to the ore ships) and of installing enough plant to deal with all ships as they arrived (at the cost of excessive idle plant). This decision, moreover, would affect and be affected by the sizes determined for the new ore-carrying ships, and the standards likely to be recommended for ore wagons on British railways. All these questions were aspects of a major economic decision—how to import the amounts of ore required with the maximum reliability at the lowest possible cost.

The industry considered this problem too important and complex to rest upon the intuitive judgment of any single man or group of men, however experienced. So, before approaching the decision, it appointed an “operational research team” of men trained in various

scientific skills to study the problem. The team naturally included engineers. It also had statisticians to analyse past unloading results and determine the importance of the variable factors affecting them; mathematicians developed a theory for predicting the effect on ships' waiting time of varying rates of discharge and the installed capacity at the port; sociologists were included to study the effect of various working systems on the port labour force; and economists had to evaluate the whole problem in terms of cost.

The effect of this combined study upon one aspect of the problem is illustrated in the chart, which shows the varying elements of costs in handling a million tons of ore a year at a port with either one or two berths. The top curves show how the total cost varies

according to the unloading capacity of the equipment installed at each berth (expressed in terms of the average tonnage that can be unloaded in a day). Corresponding to the unloading capacity is shown a scale of "berth occupancy"—the proportion of time that the berth will actually be occupied by a ship unloading, if a million tons are to be discharged in a year. The total cost shown is subdivided into three components—the cost of operating the unloading equipment, the cost of the ships' time at the berth, and the cost of delays to ships waiting for a berth. The cost of the unloading equipment per ton falls as the "berth occupancy" rises, but the other two elements rise; and in particular the cost of delay to ships becomes very great when berths are occupied for a high proportion of the time available. It will be seen from the chart that the lowest total costs for ports with this throughput are achieved at the points "A" and "B" (slightly displaced from the actual minima by outside factors), where the single or double berths concerned are idle for about half the time. It is uneconomic to operate at points "C" or "D," which are typical

costs incurred when the industry follows the apparently "natural" policy of trying to keep the berths busy.

These are not answers that many business executives would have arrived at if they had relied on pure "hunches" or on their accumulated experience of business conditions. They may, of course, be the wrong answers—and the same may be true of the answers formulated for other problems by this and other operational research teams. But the proponents of operational research do seem to have a case for arguing that only a deliberately scientific method could ensure any coherent answers at all to assist decisions from data so variously gathered.

★

This application of operational research to the problem of ore transportation is the most ambitious experiment in the technique so far made in British industry. But it has also been growing in other industries, often simply as a means of evaluating operating efficiency. In an increasing field of national activity the working of normal economic forces is to a greater or less degree ineffective, and the accountants' yardstick of profit or loss may be inadequate. This is true both in nationalised and private industry and in some aspects of social policy. In coal, for example, given current pricing policies, profit or loss has little meaning in measuring the efficiency of each pit; operational research is being used to study underground costs to provide comparisons between pits with widely different conditions. Other applications of operational research outside the directly managerial field include the study of accidents on British roads (as well as within particular industries and local environments); and its use has been suggested to assist social policy in studying, for example, population problems, the effect of subsidies, and the operations of the health service. One application outside the field of profit or loss that could be of very direct importance would be the study of the effectiveness of different structures of management within industrial organisations of varying sizes; it could do no better service, for example, than in providing some quantitative data in the still largely verbal controversy about the organisation of the nationalised industries.

But, in general, operational research makes its contribution to industry primarily in evaluating the operation or organisation of a plant or part of a plant to determine its most profitable employment. And its use in industry, mainly on such work, is growing. In Britain, the first concerns to use it were mainly large ones, such as United Steel, Pilkingtons, I.C.I., English Electric, and Courtaulds, along with the official research establishments and the co-operative research associations; but now some smaller firms are finding it increasingly useful. Sir Charles Goodeve, who recently surveyed operational research in Britain,* estimates that there are about 40 sections in Britain, ranging in size from one qualified man and an assistant to about a hundred, now

* See the current issue of *Operational Research Quarterly*.

doing work that could mainly be classified as operational research, though fewer than half of them use the particular label. In addition to these examples, at least 40 more companies carry out some operational research at some time or other. During the war the United States forces followed the British lead in applying the technique (they call it "operations research"), and now it is catching on in American industry, though with somewhat more of an academic flavour than it has here. American universities and institutes of technology have taken it up; characteristically, one well-known technical correspondence college in New York is already offering a course in the subject.

The main use of operational research in peacetime is clearly going to be to assist managements in making technical decisions that have strong economic overtones. Exponents of operational research do not exaggerate it into a substitute for executive decision. On the other hand, to the extent that operational research can set quantitative values on the limiting factors that affect any business decision, it will generally reduce the area in which judgment, flair, or hunch needs to be applied; and it is not surprising that on occasion it has aroused some suspicion among the men finally

responsible for taking those decisions. Some of these may feel uneasiness that they cannot assess such variables themselves in the same way; or they may feel that they ought to be able to get such aid (though they seldom do) from cost accountants furnished with the best technical advice. Some managers, too, are well aware that in recent months there has been more and more argument—from scientists—that more scientists are needed in top management; and they feel that this sort of propaganda needs to be resisted.

These disquiets should not obscure the fact that the task of the business executive is still to make decisions on the best evidence he can assemble. His judgment has to be based on his own experience and the reported experience of others—and experience cannot always be translated into a string of figures or a wallful of charts. But as modern industrial problems grow bigger and more complex, the executive has to make fast and accurate decisions, in which operational research may be able to help him. This is no wand to make managements unnecessary, but it is a new tool that, sensibly and sparingly used, may assist management's main job of economic decision—the most profitable employment of scarce resources.

Role of the Investment Trusts

MR BUTLER'S recent letter to the Capital Issues Committee, informing it that "in appropriate cases" it can authorise share issues of over £50,000 by investment and unit trusts, has brought an overdue relaxation of an entirely senseless ban. Indeed, there was an unconscious irony in the wording of the Chancellor's letter, which declared that his decision had been taken "having in mind the part played by the investment trusts in the supply of risk-bearing capital for industry and the need to encourage savings at the present time"—for it suggests that for eight years successive British Governments have been insouciantly leaving out of mind one of the gravest economic problems of our time. The object of this article, however, is not to dwell upon the strange philosophy of the recent past, but to undertake a statistical investigation of the part that the investment trusts play in the provision of risk capital at the present time—and of the prospects for an increase in their role in the future now that this ban has been removed.

The first stage of this investigation has been to assess the portfolios of the 234 investment trusts whose shares are quoted daily in the Official List of the London Stock Exchange. In addition to these 234 major trusts, there are, of course, a considerable number of (usually smaller) trusts whose shares are not quoted daily in Throgmorton Street, but make fitful appearances in the Monthly Supplementary List

and in the lists of the Provincial Stock Exchanges. The 234 trusts analysed in this article controlled at their latest accounting dates a portfolio with an aggregate book value of £468 million (or only about £25 million higher than the corresponding aggregate before the war) and a market value of £580 million.

Their investment holdings therefore still seem to be less than a quarter of those of the insurance companies, which at the end of 1951 held £1,167 million of gilt-edged stocks, £960 million of industrial shares and debentures, and £331 million of foreign government and municipal securities. Moreover, since about 45 per cent of the trusts' £580 million of investments is held in overseas securities (many of which are not quoted in London), they cannot hold much more than about 2 or 3 per cent of the total risk securities dealt in on Throgmorton Street; the market value of all stock exchange securities (other than British Government and Guaranteed stocks, of which the trusts hold only an infinitesimal amount) was nearly £12,500 million at the end of last March.

The influence of the trusts' activities on stock exchange values, however, is bigger than these bare comparisons suggest, for they are very active dealers—especially in ordinary shares. The balance sheets of these 234 trusts show that, after fairly heavy switching operations in recent years, most trusts now hold 75-85 per cent of their investments (at market value)

in British and foreign equities, compared with between 10 and 15 per cent in preference stocks and between 5 and 10 per cent in debentures. Indeed, although a small number of trusts hold as little as half their portfolios in equities, a few of them, mostly Scottish trusts, have been so keen to use equity investment as a hedge against inflation that they now hold as much as 95 per cent of their investments in ordinary shares. Similar influences have been at work in encouraging the trusts to add to their portfolios of dollar stocks (which were reduced practically to nothing during the war); in general, between 20 and 30 per cent of the trusts' investments are in North American securities (with a few of the Scottish trusts holding as much as 35 per cent of their investments in this way). Another 10 to 20 per cent is held in overseas sterling area stocks, and around 5 per cent in other overseas countries; investments in this last group—that is, in countries outside the sterling and dollar areas—are, however, notably less popular than before the war, when several trusts had their fingers badly burnt on mid-European issues. This geographical distribution leaves between 50 and 60 per cent of the trusts' total holdings—or, say, about £325 million in terms of current market values—invested in British industrial shares.

★

So much, then, for the resources that the trusts deploy and the ways in which they use them. What are the prospects that they will be able to attract more funds by new issues on the stock exchange, now that the Capital Issues Committee is to allow them to do so if they wish? Theoretically, of course, a movement such as this should be peculiarly well suited to the conditions of the present time—when a larger and larger proportion of the total (admittedly, the inadequate total) stock of personal savings is accumulating in the hands of people whose own portfolios are too small to secure an adequate spreading of risks. Unfortunately, however, it is precisely in this task of mobilising the small man's savings for risk investment that the trusts' achievements have so far been most disappointing. To understand the reasons for this, it is necessary now to turn the statistical searchlight upon the market in the trusts' own shares.

Between them, the 234 trusts analysed in this article now have in issue some £395 million nominal of share and loan capital; this capital is divided into about £152 million of debenture stocks (including a small number of terminable debentures issued by Scottish trusts), about £114 million of preference shares and £129 million of ordinary shares. The market value of this capital on March 31st last was around £481 million; actually this figure (from the latest annual statistics published by the stock exchange) related to a nominal capital £7 million less than that traced here, but the difference seems too small to worry about. The market value of this investment trust capital at the end of last March was almost exactly one-tenth

of the market value of shares in the giant "commercial and industrial" group in the stock exchange's classification; but the number of markings reported in investment trust shares debentures in the year to March was only one-twentieth as large as the markings in the commercial and industrial sector.

Figures for markings are, of course, notoriously unreliable guides to the actual activity of the markets, and it would be wrong to take more than passing note of this statistic. But it is unfortunately true that comparatively little investment trust stock comes on to the market for sale; and when part of it does come on offer it is quickly snatched up by pension fund investors and insurance companies, whose operations are gradually making the market in trust stocks even more restricted. The private unskilled investor fights shy of stocks that often change hands only in large units and that are sometimes delivered to him only after a lengthy delay. Nor is he well qualified to use the two indispensable tools to test the market valuation of trust stocks, the Directory of Directors and the slide rule.

INDUSTRIAL TRADING PROFITS AND THE TRUSTS' INVESTMENT INCOME

He must rely on his brokers' opinions about the management of the trusts (which cluster together in nests that are so inter-related that the trust movement resembles a rookery) and on his brokers' calculations about break-up values, earnings, dividends, capital gearings and priority percentages. In short, investment trust shares, far from being regarded as a haven for the small private investor who has not time for detailed study of market trends, are often themselves regarded as unconscionably complicated and "expert" stocks in which to deal.

This complication would not matter so much if the trusts' shares seemed to offer much greater stability of income and capital values for the small investor than the ordinary run of industrial shares. It is, of course, true that the trusts' own income fluctuates less violently than that of most industrial concerns; dividends change less frequently than profits even when there is no freeze in progress, and the trusts' holdings are widely dis-

persed. The remarkably even tenor of the trusts' incomes in the last five years is illustrated in Chart I, where the movements in industrial trading profits (which have been distorted by rises and falls in raw material prices) are plotted against the changes in the investment income of the trusts. In making this comparison it must be remembered that there is a time lag between the declaration of dividends by the trading companies and the corresponding declaration of dividends by the trusts who hold their shares. This lag, of which there are some signs in the accompanying chart, can be as much as twelve to fifteen months, but usually there seems to be a gap of about nine months before a sudden spurt in company dividends (or, alternatively, a sharp recession in them) is reflected in the results published by the investment trusts.

Unfortunately, this relative stability of income does not carry with it any similar stability of capital values in investment trust shares; nor does the existence of the time lag mean that, when trading profits are falling, investors are granted sufficient time to liquidate their trust holdings before the storm bursts. Chart II shows that in recent years equities in investment trusts have fluctuated in remarkably even step with—and rather more violently than—the average industrial equity; and that in the minor trading recession of 1949 investment trust equities at once dropped down through the floor. This alarming oscillation arises largely because the trusts are overloaded with prior charge capital, which must be serviced before equity stockholders can receive a dividend. The same factor, incidentally, makes it impossible for the trusts to go as liquid as a private portfolio can in times of falling values; income has to be earned to service the debenture stock.

There is thus some statistical justification for the complaint that the ordinary shares of investment trusts, which were originally supposed to offer the small investor the advantages of expert selection of investments and a wide spreading of risks, now themselves require rather more expert selection and carry rather greater risks of capital fluctuation than the average industrial equity—although their average yield has been slightly lower than that of industrial equities all through the postwar years of boom. This is not to say that any new issues by the trusts in the months ahead need be entirely friendless. Those who fear the outbreak of a world slump may remember that such a slump would almost certainly be accompanied by a depreciation of sterling; and the trusts' large holdings of dollar stocks provide a partial hedge against that—except to the extent that dollar dividends were cut. Those who believe that boom conditions will continue may remember that the trusts have been harder hit than most by dividend limitation; limitation is not yet officially dead, but it is being unofficially buried—and this holds out the promise of some increases in income for the trusts in the months ahead. There is also

the point that the market value of the trusts' own shares is still some £112 million (or 19 per cent) lower than the market value of the shares they hold. All these factors may encourage some new issues, but many of the trusts still have fearful memories of the late 1920s; at that time, under a regime of high interest rates and booming business, the trusts made many flotations—and tucked away the resulting funds on the stock markets just in time to catch the slump of the 1930s. The relaxation of the CIC's ban may be treated with some caution by those trusts that are not confident that the "feel" of 1953 is so very different from the "feel" of 1929.

All these complications suggest that the new latitude allowed by the CIC may be a very small drop in the very big bucket of the risk capital problem. As has been suggested in *The Economist* before, the time has come when the City and the CIC together should consider whether a much more active boost cannot be granted to issues by "mutual fund" trusts. These flexible trusts, which fall half-way between the investment trusts with all their discouraging complications and the original and not particularly successful fixed

EQUITY SHARE INDICES

Source: The Actuaries' Investment Index

unit trusts, would seem to provide the safest route into venture capital for the savings of the unskilled investor. In these trusts the risks of investment are spread; the composition of portfolios can be altered; there is no "gearing" problem, because the investor is in effect himself the owner of the underlying securities, and the price of the units cannot fluctuate more violently than the market value of the portfolio; and, after paying a reasonable fee for the skilled management of the trusts' portfolios, the unit-holders receive, in effect, the whole of the trusts' investment income. If mutual fund trusts could repeat in this country the success they have achieved in the United States, then a much sturdier step towards the goal of investing small savings in British industry would have been taken than the ordinary investment trusts ever seem likely to take on their own.

Business Notes

Heat-Wave Markets

THE stock markets in this holiday month have set the pundits a puzzle that is more than their heat-wave lassitude can cope with. For in the markets themselves there has been no such lassitude, and price movements have defied both the day-by-day disquiets from France and the implications of the Korean truce. Many people had long expected that, in the event, the effects of peace in Korea would prove to have been not fully discounted in the markets, and that the cessation of hostilities would therefore be followed by a renewed sagging of equities and probably by a more pronounced strengthening of gilt-edged. But, in fact, industrials in London have staged a rise that, by the standards of these holiday weeks, almost deserves to rank as a boomlet. By the close of business on Wednesday last, the ordinary share index of *The Financial Times* had risen to 122.6, compared with 120.3 on July 24. Since the year's low point was reached less than three months ago, it has risen by nearly nine points, and now stands at a higher level than at any time in 1952 (though a couple of points below the peak touched this spring). The recent rise has, moreover, been accompanied by some increase in the number of bargains marked.

Quite obviously, the markets are paying little heed to the uncertainties of international economics—perhaps because the international political uncertainties seem, despite the truce, to be almost as great as ever. The prospect of some slackening in world defence expenditures, and of other outlays that are geared to them, may therefore appear more remote than some people recently supposed it might be. In the circumstances, the only discernible new influences that may perhaps explain the renewed firmness of equities are mainly domestic ones—the unexpectedly satisfactory increase in the gold reserves in July, the rise in production and (in the longer run perhaps the most significant factor of all) the accumulating evidence that dividend restraint, protracted though its demise has been, will soon be very dead. These ingredients do not, however, make a prescription for sustained boomlet. The balance in the markets is, in fact, still precarious. The danger of walking on a slack wire was made plain this week when the warning from ICI that its exports might be lower than the record level achieved in 1952 brought the rise in equity prices to a halt.

To complete the paradox, the gilt-edged market has likewise been firm—though less noticeably so than the equity markets—and it has also enjoyed rather more activity than is usual for August. This firmness, of course, fits the original expectations of the effects of a Korean truce, yet does not square with the assessment of those effects that is apparent in the equity markets. Moreover, the market has ostensibly had to contend with the big gas issue—but the

presumption is that that operation has not, in fact, imposed any burden. The lists closed at 10.30 a.m. on Friday of last week, with the usual appearance of over-subscription—applicants for amounts above £250,000 were scaled down to 75 per cent. But, despite this window-dressing, it is generally assumed that virtually the whole issue was taken by official quarters. From one point of view, that fact may be argued to have bullish implications; it at least shows that the authorities saw no need at present to pitch issue terms at the point at which they would press upon the market. But the need for such pressure may recur—and the gas stock (and a few other tranches, too) remains to be sold.

Sharp Rise in Exports

A JUMP of £30 million in the value of exports, together with approximate stability of imports, makes the provisional overseas trade returns for July the most cheering for six months past. These returns show that exports in July rose to £234.2 million (f.o.b.) from £204.0 million in June. It is true that there were more working days in July than in June—when the Coronation impeded shipments—and that the returns for August will be more affected by industrial holidays. But since last month's rise of £900,000 in imports (to £292.9 million, valued c.i.f.) was partially offset by a fractional rise in re-exports (to £8.6 million), the gross visible trade deficit fell from £80.0 million in June to £50.1 million in July. This gross deficit is likely to contain a fictitious element of between £25 and £35 million (due to the inclusion of freight and insurance charges in recorded import values)—and it also excludes Britain's traditional surplus on invisible account.

In all, these July figures are the best since February, and they compare very favourably with those in the second quarter of this year, when imports averaged £291.7 million a month, exports £210.0 million and the average monthly deficit (including re-exports) was £73.7 million. Exports to North America continued at a very high level in July; they were £30.1 million, against £30.5 million in June and a second quarter average of £29.5 million. Exports to the United States, at £15.2 million, were higher than ever before, although exports to Canada dropped slightly below the previous month's record.

Engineering Exports in the Balance

THE Treasury has chosen to devote a considerable portion of its latest Bulletin for Industry to an analysis of British, American and German engineering exports—evidently as a gentle reminder that conditions are likely to

become increasingly difficult for British exporters. In terms of value, British sales are still high, but their average value in the first five months of this year was 3 per cent below the average for the whole of 1952. Over roughly the same period, German sales showed no change, and American exports rose 3 per cent. The value of German sales still lags behind British sales, however; it has been running this year at an annual rate of £673 million, compared with £1,017 million for Britain and £1,424 million for the United States. A breakdown of exports from the three countries shows that exports are rising now chiefly in those categories where technical advance has been rapid. Mechanical handling and machine tools are high on each country's list of rising exports; British exports of aircraft, industrial valves and earth-moving equipment are also rising, whereas German sales are expanding more rapidly in mechanical handling and miscellaneous machinery. Where designs have changed little—in cars, textile and agricultural machinery and prime movers—the markets appear to be contracting.

The Treasury puts forward several reasons for Britain's relative decline—among them, falling prices and import restrictions in sterling countries. But a similar analysis prepared by the British Engineers' Association suggests that the rising volume of output in exporting countries is likely to squeeze British exporters in markets where they have held undisputed, or scarcely disputed, sway since the war. The accompanying table, prepared by the association, includes exports of machinery and electrical apparatus only; it is, therefore, not comparable with the Treasury figures, which include vehicles and aircraft.

ENGINEERING EXPORTS

	1950 £ mn.	1951 £ mn.	1952 £ mn.	1951 as % of 1950	1952 as % of 1951
USA.....	636.8	818.4	913.1	128	113
United Kingdom.....	401.2	459.8	531.4	114	116
Western Germany.....	126.2	249.0	393.1	198	158
France.....	88.7	128.9	149.4	145	116

Canada.....	44.3	57.6	57.3	130	99
Japan.....	25.2	38.5	41.5	163	107

British exporters of engineering goods are still losing good will through late delivery; persistent delays in the delivery of locomotives have led the South African Minister of Transport to say that future orders may have to be placed in other countries even if British bids are lower. Some Canadians have expressed fears that the opening of the Toronto subway may be held up pending the delivery of carriages ordered from a British manufacturer; but in fairness to the company, it should be noted that the delivery date has not yet been reached and there is an even chance that the rolling stock will arrive on time. By contrast, an order for switchgear for the Shell Petroleum Company's Cardon refinery, which was damaged by a power-house fire, was recently delivered in less than 7 months, compared with a usual delivery period of eighteen. It should be possible, now that material supplies are no longer controlled, for

British engineering exporters to avoid losing good will in this way; but they may find that the buyers have long memories.

Brazil's Second Offer

THE Anglo-Brazilian trade and payments discussions took a more hopeful turn towards the end of last week. Brazil's first offer for meeting the commercial arrears of some £63 million owed to British exporters was a small initial token payment, followed by repayments spread over roughly twenty years at the rate of only about £3 million a year. The second offer represents a considerable improvement upon these derisory proposals. It suggests that the initial payment should be £10 million (the requisite sterling being obtained by Brazil from the International Monetary Fund); and that the remainder of the arrears should be paid off at an annual rate varying with the value of Brazilian exports to Britain. These annual payments would be £7 million when Brazilian sterling exports reached £50 million, and would increase or decrease according to variations in this figure—though they would never fall below £5 million. On this formula, the commercial arrears might be expected to be cleared in a little over seven years. Although that is still not a very heartening prospect for the commercial creditors concerned, in all the circumstances it can perhaps be regarded as providing at least a reasonable basis for discussion.

The Brazilian balance of payments may improve considerably if, as now appears likely, a steadily increasing proportion of Brazilian export trade is made eligible for clearing at the free market rate for the cruzeiro instead of the highly artificial official rate. A further step in this direction was taken on Tuesday, when the Bank of Brazil announced "minimum" export prices for coffee, cocoa and certain other export products, and authorised exporters to sell in the free market any currency proceeds received in excess of these minima. It was the expectation of some such development as this that was mainly responsible for some weakness in the price of coffee in the preceding few days. The assumption—and it is probably a reasonable assumption—is that the adverse effect on the Brazilian balance of payments of any such fall in prices would be more than offset by the larger volume of exports that would be shipped if the effective rate of exchange were brought a little nearer the purchasing power parity of the cruzeiro than has recently been the case. The resultant expansion in exports might be expected to be particularly marked in the case of cotton, the commodity that could make the largest single contribution to the improvement of Brazil's balance of payments with sterling countries; but cotton does not appear to have been included in the latest changes.

Although these more hopeful possibilities may be opening out, hard experience may still leave doubts in many minds on whether Brazil can be depended upon to hold strictly to the terms of a bargain that is to be completed only over a protracted period. While the Anglo-Brazilian payments discussions have been proceeding in Rio, negotiations between Brazil and the United States have been held in Washington to discuss the similar problem of the settlement of Brazil's commercial arrears to United States exporters. It will be recalled that an Export-Import Bank loan of \$300 million was made to Brazil last April, designed

to cover more than 75 per cent of Brazilian debts. Brazil agreed to mobilise the additional dollars necessary to complete repayment of arrears by the beginning of July and undertook "to institute and maintain a prompt remittance system for current imports from the United States." As neither of these commitments has been fulfilled, although the \$300 million of the Export-Import Bank loan has been paid over, the anxiety of the American authorities can be readily understood.

Shortage of Sterling

Two other countries—Turkey and Japan—have recently given evidence of a shortage of sterling, which, while not as serious as that of Brazil, is nevertheless increasing. Turkey's shortage, unlike that of Japan, is one not merely of sterling but of other currencies as well—especially of dollars and deutschemarks. This shortage is being temporarily remedied by Turkish purchases from the International Monetary Fund of £2 million, \$10 million and DM 18,480,000. Turkey is now the most active of the Fund's clients—it had previously purchased a total of \$15 million from the Fund. The latest batch of transactions brings the IMF's holding of Turkish currency to 174,289,641 liras, which represents 144.76 per cent of the Turkish quota in the IMF. Turkey has undertaken to repurchase the excess holding of Turkish liras, over and above 75 per cent of the quota, by payments in gold or convertible currencies within the next three and a half years. The Turkish government has also informed the Fund of the measures it is taking to strengthen the country's balance of payments and so to reduce its dependence on the facilities that the IMF has made available.

Japan, also suffering from a sterling gap, still appears to be convinced that it is a purely temporary phenomenon. The Japanese monetary authorities are, therefore, again prepared to ease the shortage by the somewhat expensive expedient of dollar swap transactions, i.e., by selling spot dollars to the United Kingdom for sterling, and undertaking to repurchase the dollars three months later. Transactions of this kind had been arranged earlier this year to the extent of £25 million; these contracts are now being extended for another three months and the total swap has been further increased by the equivalent of about £5 million.

Weakness in Wheat

WORLD wheat prices have started to fall again under the influence of bumper crops in North America and the huge carry-over there. In Chicago, September futures have fallen by 13 cents to about \$1.82 a bushel since the end of last week. The Canadian Wheat Board's prices, which closely follow American export prices at Gulf ports, have fallen by 6-7 cents a bushel, so that No. 1 Northern Manitoba is now selling both under the International Wheat Agreement and in the free market at the same price, \$1.97 a bushel, which is eight cents below the new IWA maximum of \$2.05. The fall was accentuated by the publication early this week of the US Department of Agriculture's crop estimates. Its estimate of the winter wheat crop, which is virtually harvested, has unexpectedly jumped by

57 million bushels to 878 million. This more than offsets a fall of nearly 30 million bushels, to 324.5 million, in its estimate of the spring wheat crop. The total American harvest thus promises to be some 28 million bushels above the previous estimate, at 1,203 million, compared with 1,291 million last year. This, however, is the time when prices are seasonally low, so that it is too soon to say whether the fall will be prolonged. Indeed, the real effect on prices of Britain's refusal to join the new wheat agreement may never be measurable. If the rust damage to the spring wheat crops in the United States and Canada is severe, prices would tend to recover. In any case, the effectiveness of the United States price-support for wheat, standing at \$2.40 a bushel, has not yet been seriously tested.

The renewed weakness in wheat comes just as the British grain trade is entering complete freedom for the first time in fourteen years. The Ministry of Food, having arranged last month for the transfer of its stocks of coarse grains to the trade, has now announced parallel arrangements for its stocks of imported wheat. It seems that for some time the millers will have to carry at their own risk the wheat they buy in the free market. Efforts to reopen the grain futures markets in Liverpool and London are making less progress than had been hoped, owing chiefly, it is believed, to the fear that these markets will not attract sufficient foreign business. To avoid a loss of dollars, the exchange control regulations will not allow a foreign buyer of dollar wheat to take delivery in sterling against a maturing futures contract. Another problem that remains to be thrashed out is the means of implementing, in the context of decontrol, the Government's guaranteed prices for home grains. Discussions on this are now beginning between the Government and the trade, but it should not be difficult to find a workable solution.

Car Sales—and Exports

CAR production has been rising steadily since steel allocations were ended, and by June it had reached an annual rate of nearly 600,000. Output in the first half of the year was affected by the prolonged strike at the Austin Motor Company's works, but in spite of that the half-year's total was 281,497 cars, compared with 228,052 in the same period last year. The industry's exports, however, not only failed to keep pace with rising production; they actually fell appreciably below the shipments achieved from last year's limited output. Not until mid-summer did monthly exports regain the level attained twelve months before. The total for the first half of the year was 153,763, compared with 183,979 in the first half of 1952.

When the export figures are examined in detail, the prospect appears less discouraging. The biggest fall has occurred in sales to soft currency countries. Only 22,000 cars were shipped to Australia in the first half of this year, compared with more than twice that number in the first half of 1952; considerable, though less spectacular, reductions are recorded for most other soft currency Commonwealth countries. By contrast, dollar sales have shown a marked rise. Shipments to Canada have jumped from 8,000 to nearly 22,000 during the half-year, and those to the United States from 13,000 to nearly 18,000. The lifting of import restrictions in some of the Scandinavian countries has also led to an increase in shipments.

In the Seaports of the East...

from the Arabian Sea to the Pacific Ocean the branches of the Chartered Bank perform a wide range of banking services connected with overseas trade and local industry. Merchants and manufacturers in the United Kingdom who trade into the East are invited to consult the Bank's managers in London, Manchester and Liverpool.

THE CHARTERED BANK OF INDIA, AUSTRALIA & CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley St., Manchester, 2.
Liverpool Branch: 28 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

PLASTICS for today and tomorrow

From derivatives of such prolific natural products as coal and oil man created plastics—a variety of materials in which he can produce predetermined characteristics with advantages which have profoundly influenced the design of countless articles for industry and the home.

The present and potential value of plastics to manufacturers is nowhere more clearly to be seen than in the many materials produced by BX—ranging from the original Xylonite, through the whole range of Thermoplastics.

Research, with our customers, during the past year, for example, has resulted in the production of such things as a flexible refill for oil-guns (Velbex); a yarn for making snow-boot insoles for use in Korea (Saran); and specialised fittings for aircraft (Cobex). Whatever your own problem it will pay you to talk to BX about it.

Higham Station Avenue, London, E.4
Telephone: LARKSwood 5511

An announcement from

Shell-Mex and B.P. Ltd.

Among outstanding exhibits at this year's Engineering and Marine Exhibition (Olympia—London, 3-17 September) will be seen—

A Ruston Gas Turbine

Ruston and Hornsby Ltd. will be showing a 750-1,000kW gas-turbine generating set in full working order supplying electricity for use in the exhibition halls. This machine will be lubricated with Shell Turbo Oil 29 and will be operating on Gas Oil, also supplied by Shell-Mex and B.P. Ltd.

A Peaceful use of Atomic Energy

For the first time in Britain—and possibly in any country—a live public demonstration of the use of radio-active isotopes in the measurement of wear will be staged on the Shell and B.P. stand (Row F, Stand 11). Demonstrations will be given at set times and admission will be by ticket. Application for tickets may be made to any Shell and B.P. Divisional Office or on the stand during the exhibition.

Shell-Mex House, Strand, London, W.C.2.

THE CAMEL TRAIN:

Transport takes many forms to-day in the ancient walled city of Kano. For though lorries, railways and aeroplanes now carry goods and passengers to and fro with modern speed and comfort, the long, slow, padding lines of the camel trains still wend their way in from the Sahara as they have done from time immemorial. The routes these camel trains follow are mainly the routes of the old caravans, which were originally the only trade links between the interior of Africa and the Mediterranean. Banded together for protection against bandits—a caravan might contain as many as twenty thousand camels—the old merchants made their deliberate way from oasis to oasis across the great desert, carrying gold, ivory, ostrich feathers, cotton cloth and corn.

Our branches in Nigeria are particularly well placed to answer your questions on market conditions, or local commercial undertakings.

Please address your initial enquiries to our Intelligence Department,
54 Lombard Street, London, E.C.3.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)

This pattern of exports cannot be expected to continue during the second half of the year. The car trade is highly seasonal and sales in the Northern Hemisphere—especially in North America—begin to fall off after midsummer. A high year-round level of car exports is possible only if the main southern markets—Australia, South Africa and New Zealand—will allow cars in during the winter months. Import restrictions in each of these three markets upset the postwar pattern of the industry's exports last year, but recent relaxations in Australia suggest that the prospect this

CAR PRODUCTION IN GREAT BRITAIN

year is more promising. Licences are now being issued for the import of unassembled cars at the level of 80 per cent of imports during the base year (1950-51) and for 40 per cent of the base year's import of assembled cars.

The home market also appears able to absorb a considerable number of cars. Judging by the number of orders on their books, manufacturers believe that there may still be an average waiting list of six months for small cars, though naturally the position varies from one dealer to another. Bigger cars, with the exception of the Jaguar, can be delivered immediately. It is, however, only a matter of time before the industry succeeds in adjusting the balance of its production between small and larger cars—but the size and behaviour of the home market remain something of an enigma.

Tin and Rubber in Travail

AFTER dropping further on the news of the Korean truce—to their lowest levels for over three years—the prices of tin and rubber this week looked as if the worst was temporarily over. Tin has, in fact, staged a rally; it is now about £592 per ton for cash metal compared with £579 a week ago, while spot rubber has held fairly steady at about 18½d. per lb. Unhappily, however, these two commodities—which are so important for the sterling area's balance of payments—share the distinction of being produced substantially in excess of commercial requirements; they are thus very much at the mercy of American strategic purchases. Estimates just published by the Rubber Study Group show that world output of natural rubber in the first half of 1953 fell by 30,000 tons to 827,500 tons; commercial

consumption rose by 57,500 tons to 792,500 tons, leaving an apparent surplus of 35,000 tons (although, because of idiosyncrasies in the production statistics, the real surplus was probably higher). As commercial stocks fell by an estimated 27,500 tons over this period, strategic purchases must have been of the order of 60,000 tons; the United States stockpile seems to have absorbed about 40,000 tons and the British stockpile about 12,000 tons. The Tin Study Group's figures for the first five months of this year show that world output of tin metal was running at an annual rate of 184,300 tons compared with 168,000 tons in 1952; commercial consumption also improved slightly, to an annual rate of 133,200 tons (compared with 127,500 tons in 1952), but commercial stocks fell. This suggests that the United States stockpile may still be absorbing tin at an annual rate of over 50,000 tons.

The disquieting feature of these statistics is that American strategic purchases are due to cease about the end of this year. This prospect, together with the fall in tin and rubber prices in the last few months, may give more power to the pleas of those who are urging the establishment of international commodity agreements of the buffer stock variety. Since the International Tin Study Group discussed a draft agreement in Brussels last June, tin has dropped by about £100 per ton; rubber has dropped by about 2d. per lb since the International Rubber Study Group discussed a similar agreement in Copenhagen last May. Though a majority of the governments represented at Brussels will probably recommend the reconvening of the United Nations conference on tin, the conference can hardly assemble before November, and if an agreement is reached it can hardly become effective before mid-1954. The management committee of the Rubber Study Group meets in London on October 12th to decide whether member governments should be asked if they now favour calling a United Nations conference on rubber to reconsider the draft scheme that the Copenhagen meeting left in abeyance. But here again—and at best—no action to stabilise rubber supplies and prices could be expected before mid-1954. And it seems more doubtful than ever whether any such schemes would be ratified by the American Congress; its attitude to commodity schemes for sterling area products has not been helped by Britain's refusal to join the new International Wheat Agreement.

Potash Loan Offer

NEGOTIATIONS for a resumption of service of the 25-year sinking fund gold loan of the German Potash Syndicate are again deadlocked. It was announced at the end of last week that the Royal Exchange Assurance and J. Henry Schroder & Co. had rejected, on behalf of the bondholders, the latest terms for a resumption of service put up by the Potash Syndicate, although these proposals represented some improvement upon the earlier ones. This latest offer provided for payment of future interest and funding of arrears on the lines indicated in the German External Debt Agreement of last February. The dollar clause would be honoured in respect of all future payments to the bondholders, but the distribution of £35 10s. per cent sanctioned by the meeting of bondholders held in March, 1951, was to be taken as having discharged a like amount of nominal capital without benefit of the dollar option. It was also suggested that any further sum becoming available for the service of

the loan out of the proceeds of potash sales should be utilised, not to improve the terms of settlement, but in acquiring bonds for cancellation, either by purchases in the market or by drawings. The maturity of the loan was to be extended for 25 years from the beginning of 1953.

The bondholders' representatives consider that this offer still does not conform to the requirements of the London Debt Agreement. They objected, in particular, to the exclusion of the capital repayment of March, 1951, from the benefit of the dollar option and to the proposed considerable extension of the maturity dates. The next step may be recourse to arbitration under the provisions of the London Debt Agreement. The news of this deadlock has had little effect upon the market in the bonds concerned. The 7 per cent bonds, which should have been paid off in 1950, have in fact risen slightly over the past week from 109½ to 110½, while the 6½ per cent bonds, which were due for repayment this year, have remained unchanged at 104½. These prices suggest that hopes of a mutually satisfactory settlement have by no means been abandoned.

Tourist Concession Withdrawn

THE Treasury has come to regret a friendly gesture that it made to dollar tourists. Visitors to this country from Canada or the United States have been able for the past four years to obtain from the banks five £1 purchasing vouchers every time they sold £15 (or, more recently, £10) worth of dollars for sterling currency. These vouchers entitled them to buy tax-free across the counter, and to use during their stay in Britain, goods that are normally sold subject to purchase tax—provided that they undertook to take the goods out of the country when they left. The scheme first applied only to personal clothing, but it was later extended to include all goods that attract purchase tax. Then, however, it became obvious that the vouchers were being used to buy without tax articles that could never be used in the United States and Canada—but were very useful to the visitors' English friends. A new list was therefore drawn up specifically excluding from the scheme certain articles, such as furniture, sewing machines, water softeners and garden rollers.

This arrangement, however, has not worked well from the Treasury's point of view, and the Financial Secretary reported to the House of Commons that "the imperfections inherent in this experimental scheme now outweigh the benefits derived from it." The issue of the coupons is therefore to cease at the end of the year. This decision does not affect the concession that is made to all tourists, wherever they come from, permitting them to buy without purchase tax goods that will be delivered to them either direct to their own homes overseas or to the ship or aircraft on which they leave.

In the first half of this year, more than 350,000 tourists visited this country, 17 per cent more than in the same period last year. The revenue from these tourists, including their fares, is expected to reach £125 million for the year, compared with £114.5 million for the whole of 1952. Personal expenditure by visitors while in this country (including hotel bills but excluding fares) seems to average about £110 per head, £22 of which is spent on shopping; this suggests that this year's tourists must have bought goods to the value of about £7.7 million in the first six months. The Treasury's decision to withdraw the dollar

visitors' special vouchers is not likely to make much difference to their spending. The reduction in tax rates has made the contrast between the price of goods before and after tax less striking than it formerly was, at least for the kind of things that tourists buy for their own use during a visit. The Treasury will benefit fractionally from the fact that Americans will in future pay purchase tax on the presents they buy for their English friends, while the shops will no longer have to go through the cumbersome process of claiming purchase tax rebates on goods sold against the special vouchers. Whether something will be lost in good will remains to be seen, for the great majority of tourists, whatever their nationality, are of the class that has to count its pennies.

The Brush Offer

THE long-expected application to the capital market by Brush Electrical Engineering is designed to raise some £914,000 net of new money. Each successive balance sheet of this concern culminating in the 1952 accounts which revealed that the group owed its bankers about £8 million and that it had been forced to pass its final dividend—has made the need for a new issue more obvious; but with the company's 5s. ordinary shares standing below par, it has also been obvious that an equity issue was out of the question. Brush has now attempted to overcome this difficulty by offering 940,000 new 6 per cent £1 cumulative convertible redeemable preference shares at par; the sponsors of this issue, Rowe and Pitman, have undertaken to subscribe for the whole of it at a commission of 6d. a share. Even with a high coupon rate and the promise of final redemption at 21s., a straight issue of this kind could not attract very widespread support, particularly as it will rank after the 5½ per cent £1 preference stock units already in issue; these are currently quoted at 15s. 9d. each.

Brush has therefore added a sweetener by offering subscribers the right to convert the preference shares into equity shares, at a rate equivalent to 6s. on each equity share, on every June 30th or December 31st up to the end of 1963. This option has no attractions whatsoever at the moment, for the company's ordinary shares are currently quoted at 4s. 6d. each. But there must be some investors who will think that, with a business with as wide a margin as that of Brush, there is a good chance that the ordinary shares will rise above 6s. in the next few years, but who are not sufficiently willing to back this hunch now by paying the current market prices of 4s. 6d. for an equity on which the last dividend was passed. To them the offer of a 6 per cent preference share while they "wait and see" might be tempting. They should remember however, first, that this issue will not go far in easing the group's working capital problems and that Brush will still be very dependent on loans from the banks; and, secondly, that it would be foolish to enthuse about the immediate prospects for the sale of diesel engines and some of Brush's other products in foreign markets. On the other hand, there has been a "shake-out" in the Brush organisation and the intention is, wisely, to concentrate upon the production of electrical equipment rather than upon diesel engines. The directors' sober assessment of the immediate situation is that "if conditions in world markets do not deteriorate further" earnings should cover all preference dividends, leaving "a margin of profit."

A go-ahead firm discusses a factory in Australia

"The idea seems sensible to me, but it's no good groping in the dark. Where can we get some facts?" "What about asking A.N.Z. Bank? They've got branches all over Australia and they've been there well over 100 years. They ought to know something."

Indeed we do—and we make our knowledge readily available. Our Overseas Department will send you two booklets which will tell you just what you want to know at this stage: "INDUSTRIAL AUSTRALIA"—containing authoritative information on industrial resources, markets, labour and finance. "COMPANY FORMATION IN AUSTRALIA"—a general guide to Company Law, with notes on current taxation.

Triumph in Titanium?

THE news that Imperial Chemical Industries is to instal plant to produce 1,500 tons of sponge titanium a year seems to indicate a most opportune triumph for its research scientists. ICI's last annual report mentioned guardedly that a very promising alternative method of producing this extraordinarily expensive metal was being developed in its laboratories; the construction of new plant, backed by a sales contract with the Ministry of Materials, implies that the development has been successful. Under the complex Kroll process at present in use, even though titanium ore costs only 1d. per lb, sponge titanium costs about £2 per lb and titanium in wrought form costs about £5 per lb; losses in machining, moreover, cannot be recovered as scrap. Simpler and cheaper methods of production have been under intense study in the United States, the major producer of this metal, and in Canada as well as in Britain. In the absence of indications to the contrary, it seems fair to conclude that Britain now leads the field.

Titanium-bearing ores are a common element, and ample non-dollar supplies are available in Norway, India and Australia. When converted into metal and alloyed with other elements it can have a tensile strength of about 70 tons per square inch, equal to the strongest steels at little over half their weight. It also possesses exceptional hardness and resistance to corrosion. Despite its high price, the metal is being used increasingly in aircraft construction—in the manufacture of compressor blades for gas turbine engines and in airframe parts. Any reduction in the price would certainly stimulate demand.

Production from ICI's new plant is expected to begin in two years. The Ministry of Materials will buy directly up to 75 per cent of output in the first four years (if not otherwise sold for use by Government contractors) and it has an option on the full output if needed for defence

purposes. It will pay the world price current at time of purchase. The new capacity is additional to the 150-ton-a-year pilot plant that should be in production early in 1954. For the last three years the company's output has been some 16 tons a year from a laboratory-scale plant.

Recovery in Copper

COPPER has steadily recovered much of the ground it lost when the market reopened last week. The advance, which has not passed unnoticed on the Stock Exchange, has been strongest in cash metal, supplies of which are fairly tight. By Thursday's close, cash copper had risen to £232 per ton, compared with £215 on the opening day, and with the last official price of £252 per ton. The initial fall evidently went too far, and the subsequent rise also owes something to the threat of a strike on the Rhodesian copper belt. The bulk of the business has been in forward copper, which is in easier supply. Three months' copper had recovered from £200 on the opening day to £212 on Thursday. Turnover on the market has been promising, averaging well over 1,000 tons a day, and some business has recently been done with the continent.

The firmness that has developed in London has probably helped to maintain the American price, which is still about 30 cents a lb (£240 per ton) for cash metal. The action of one of the leading custom smelters, which reduced its price to 28.50 cents (£228 per ton) shortly before London reopened, has been coolly received by other American producers. Barring a strike in Rhodesia (the vote on which had not been announced when this issue of *The Economist* went to press), or a cut in the present Chilean price of 35.50 cents (£284 per ton), the London market seems likely to settle at about the current level for some little time.

Company Notes

RUSTON AND HORNSBY.

Shareholders in Ruston and Hornsby would be unwise to assume that the Coronation bonus of 1½ per cent that has accompanied their normal equity dividend of 11 per cent for 1952-53 will be consolidated into the total equity dividend for 1953-54. This bonus may prove to be a once-and-for-all reflection of last year's sudden spurts in trading profits (from £2,475,750 to £2,824,364) and in net profits (from £898,301 to £1,126,522). After these achievements it is a little surprising that a concern producing such a wide range of capital goods as diesel locomotives, oil engines, boilers and gas turbines should be uneasy about the future course of trade. But in his annual report to stockholders the chairman of the group, Mr W. J. Ruston, enumerates sufficient reasons for caution.

In the first place, the group is short of liquid resources. Its cash balances have been reduced from £1,145,783 to £775,056, in line with an increase in stock values from £5,831,379 to £6,692,360—a level that the chairman describes as "too high."

Unless part of these stocks are liquidated in the current year, the group may have

	Years to March 31, 1952	1953
<i>Consolidated earnings:—</i>		
Trading profit	2,475,750	2,824,364
Total income	2,662,096	3,032,818
Depreciation	328,508	375,425
Plant replacement res..	120,000	120,000
Taxation	1,299,585	1,395,380
<i>Net profit</i>	<i>898,301</i>	<i>1,126,522</i>
Ordinary dividends	236,775	281,875
Ordinary dividends (per cent)	11	12½
Retained by subsidiaries	161,604	303,047
General reserve	457,957	484,918
Added to carry forward	29,627	4,951
<i>Cons. balance sheet:—</i>		
Fixed assets, less depreciation	2,519,296	2,888,884
Net current assets	7,758,889	8,665,336
Stocks	5,831,379	6,692,360
Cash	1,145,783	775,056
Reserves	5,972,010	6,937,302
Ordinary capital	4,100,000	4,100,000

£1 ordinary share at 39s. xd. yields 6½ p. per cent. * Including a Coronation bonus of 1½ per cent.

to look around for new sources of finance to meet its outstanding capital commitments of £840,000 for new tools and plant. Secondly, although the group's total order

book is as full as it was a year ago, it has had "to reduce production in several directions due entirely to market difficulties." Its customers in Brazil, Egypt, India and Pakistan are suffering from "either a lack of licences or of sterling." If these conditions persist, Mr Ruston believes that the group is bound to face "some recession in trade and earnings in the current year." He finds other reasons for concern in the growing threat of competition from German and Japanese producers and in the steady rise in costs in Britain. To some extent the group is combating these threats by developing new markets—Canada is one—and new products; but Mr Ruston's address drives home the warning that producers of capital goods in this country are now meeting some of the difficulties with which producers of consumer goods have been all too familiar for the past eighteen months.

JOHN BROWN. The setback in the net profits of the John Brown group in the year to March 31st last has proved to be much more severe than even the most pessimistic shareholders had expected. In spite of a reduction in the

provision for taxation from £1,892,455 to £1,280,282, net profits have slumped by nearly 33 per cent, from £1,040,278 to £699,659. In their preliminary report, the directors go out of their way to explain that "the fall in the group trading profit arises mainly in respect of subsidiary companies trading in tungsten-bearing products." It is known that heavy stocks of wolfram were being carried last year by the subsidiary, Firth Brown Tools, which consumes a good deal of tungsten in producing high speed steels; the fall in the price of wolfram suggests that once-for-all losses on these stocks may have played an important part in last year's results—in which case the group's prospects may not be as bleak as might appear at first reading of the profits statement.

It is also possible, however, that part of the decline in earnings should be attributed to a narrowing of profit margins as competition has grown keener in foreign markets and to the burden of building merchant ships at today's costs, while having to sell them at prices fixed under contracts agreed a few years ago. Be that as it may, the decline in profits has not prevented the directors from again recommending a tax free ordinary dividend of 7½ per cent. On the basis of this dividend the £1 ordinary stock units at the current price of 36s. offer a gross yield of 7.6 per cent.

FURNESS WITHY. The preliminary report of Furness Withy for the year to April 30th last bears out in almost every particular the warning given by the chairman last autumn that the earnings of this ship-owning concern would not match the records set up in 1951-52. Indeed, in spite of this clear warning, the fall in the group's net profits—from £2,893,688 to £1,869,877—is

rather bigger than most shareholders had anticipated. Gross profits have fallen even more abruptly, for the figure for net profits is struck after taking credit for substantial reductions both in the provision for British taxation (from £3,164,994 to £1,370,124) and in the transfer to the taxation equalisation account (from £444,740 to £284,481).

The reduction in profits, which must be attributed in part to the decline in shipping freight rates and in part to a rise in operating and capital costs, has forced the directors to cut the ordinary dividend rate from 12½ to 12 per cent and to reduce the appropriation to the fleet replacement account from £500,000 to £400,000. One small crumb of comfort is that the reduction in the standard rate of income tax means that the actual dividend cheques received by shareholders (after the payment of tax) will be a few pence higher than those received a year ago; they will total £396,000, compared with £393,750 in 1951-52. On the basis of the 12 per cent dividend, the £1 ordinary stock units at the current price of 32s. yield 7.5 per cent.

PATONS AND BALDWIN.

In a note in these columns on August 1st it was stated that the total income of Patons and Baldwins for the year ended May 3, 1952, was debit £482,660. This figure was actually the net deficit, and the strictly comparable figure with the total income of £3,795,819 in 1952-53 is the surplus or deficit brought into the consolidated profit and loss account plus the non-recurring and exceptional credits. On this calculation, which does not allow for the £700,000 written back from the contingencies reserve, "total income" in 1951-52 would amount to £237,945.

LONDON STOCK EXCHANGE

Next Account begins: August 19th.
Next Contango Day: August 19th.
Next Settlement Day: August 25th.

THE rally in industrial equities, which has been the most notable feature of the stocks markets since the Bank Holiday, continued until the market opened on Wednesday; then prices were marked down slightly after the report from ICI that its exports may be lower than they were in 1952. Gilt-edged stocks continued to gain some ground, with interest being particularly concentrated upon the long and medium dated issues; by the close on Wednesday old Consols were quoted at 61½ and the 1960 Exchequer stock at 100½, while the new Gas stock was quoted throughout this period at ½ discount to par. A little extra demand was also reported in Dominion and Colonial stocks, especially for the medium dated Australian and New Zealand issues. Insurance shares remained firm in quiet trading conditions but home banking shares tended to drift a little lower. In the foreign market, Japanese bonds, which had been dull before the week-end, responded quickly when a few more buying orders came into the market. By contrast, German issues, which had been firm over the week-end, were marked lower later in the week. Hungarian issues, in which there had been some speculative buying, also came on offer.

In the industrial market the rally in prices was centred on engineering, textile, stores and "take-over" shares. It was not brought to a halt until Wednesday when the *Financial Times* ordinary share index lost 1/10th of a point to 122.6 and when ICI shares were marked down 10½d. to 44s. 6d. Oil shares were also quieter though the undertone remained reasonably firm. Rubber shares were firm in idle trading conditions but tea shares, in similar conditions, gave some ground. Although interest in the Kaffir market was at a low ebb prices were generally steady—until Wednesday, when some "developers" lost a few pence. In base metal shares coppers rallied smartly following the improvement in the price of the metal.

(1) Petroleum production in Canada in 1938 and 1951 includes natural gasoline. Annual figures of electricity production in Australia are for 12 months ended June 30th of year stated and for New Zealand 12 months beginning April 1st; monthly figures for New Zealand represent about 87 per cent of total generation. (2) Copper production is smelter; tin is primary metal. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa relates to Europeans only. (5) Monthly average of first quarter.

EXCHEQUER RETURNS

For the week ended August 8th there was an "above-line" surplus (after allowing for Sinking Funds) of £29,174,000 compared with a surplus of £33,325,000 in the previous week and a surplus of £18,228,000 in the corresponding period last year bringing the cumulative deficit to £122,024,000 (£183,925,000 in 1952-53). Net expenditure "below-line" absorbed £9,396,000 raising the total cumulative deficit to £300,417,000 (£415,363,000 in 1952-53).

THE MONEY MARKET

CREDIT was generally short in Lombard Street in the week covered by Wednesday's Bank return. On Thursday and Friday before the week-end conditions were especially tight, and official help—given mainly indirectly through the banks—was necessary. On Saturday there was some improvement; credit supplies were just adequate without any special assistance. But on each of the first three days of this week the special buyer was again in action; on Wednesday, indeed, some houses were so short of funds that they were forced to part with November bills at 2½ per cent.

The offer at last week's Treasury Bill tender was raised to £260 million; in view of the tight credit supplies the market reduced its bid by 1d. to £99 8s. 2d. This had the effect of raising the average rate of discount by nearly 4d., to £2 7s. 3½d. per cent; the market's "quota" rose from 48 to 56 per cent. At yesterday's tender the offer again rose by £10 million to £270 million; as maturities also rose by this amount, the excess of new bills will remain at £20 million next week.

The Bank return shows a post-holiday reflux of notes of £19 million for the week ended Wednesday last; although there are now £45.9 million of notes in the banking department, the fiduciary issue has not yet been reduced. Government securities held in the banking department fell by £25.4 million—of which £11.6 million was accounted for by the fall in the Treasury special account. Public accounts fell by £8.4 million, while bankers' deposits rose by £11.8 million.

COMPANY MEETINGS

W. H. SMITH & SON
(HOLDINGS) LIMITED

A SATISFACTORY INCREASE IN SALES

THE HON DAVID J. SMITH'S REVIEW OF PROGRESS

The fourth annual general meeting of W. H. Smith & Son (Holdings) Limited was held on August 7th at the Holborn Restaurant, London.

The Hon David John Smith, the chairman, presided and the following is his statement which was circulated with the report and accounts.

I ended my statement last year by saying that I could not hold out any real prospect of a further large increase in sales, especially as it was hoped that the upward trend in prices had been halted. Prices, in fact, have not risen but in spite of this there is a satisfactory increase in sales to be reported in both the retail and wholesale sides of our business. This increase was obtained without any material alteration in stock or debtors.

Once again, however, we have had to face large additional expenses due to further increases in wages and carriage charges. As foreshadowed last year the easier newsprint situation has meant an increase in the average size and weight of daily and weekly newspapers and this factor has an impact on transport costs throughout the business.

Further wage claims have been made on behalf of the staff in our retail branches and those in London who are concerned with the packing and despatch of newspapers, books and stationery.

DEVELOPMENTS

Your directors have been seeking to develop the business during the year by opening new shops at Lewes, Harlow, East Grinstead and Exeter. All these shops show promise and are in towns which have never seen a W. H. Smith & Son shop before. In addition, Bowes & Bowes, the old and world-famous bookshop in Cambridge, has been bought and will continue to run under its old name.

On the wholesale side, one small business Grimsby has been added to one of our existing wholesale houses.

BOOKSTALL CONTRACTS

The main lines bookstall contract with the Railway Executive to which I referred last year has now been signed and the negotiations with the London Transport Executive for the renewal of our contract are in an advanced stage.

OVERSEAS BUSINESS

Export trade has continued to expand and your directors are considering further developments in this important side of the business.

Supplies of books, newspapers and stationery continue to be sent in increasing volume to the shops which serve our forces overseas, and here, again, we anticipate developments in new territories.

Your subsidiary company, W. H. Smith & Son (Canada) Limited has made further progress in sales, though it is not yet making a profit.

ACCOUNTS

The accounts are presented in a more modern form and it is hoped that the shareholders will consider that the change represents an improvement.

The profit shown in the consolidated profit and loss account of W. H. Smith & Son Limited and its subsidiaries, namely £1,802,099 before charging taxation, shows an increase of £45,640. This is after charging the first of certain annual supplementary payments for the benefit of prospective pensioners and also to meet an agreed liability in respect of our new women's superannuation fund.

The total charged for taxation (£1,069,421) shows a decrease of £116,201 compared with the previous year. To a large extent this reflects the change in the rates of profits tax which became effective from January 1, 1952. As against the reduction in profits tax there is an increase in income tax mainly because profits tax is no longer allowed as a deduction in assessing income tax.

After charging taxation, the consolidated net profit for the year amounted to £732,678. We have been able to transfer £443,800 to reserves, including a specific amount of £40,300 to cover the subsequent loss of purchase tax on retail branch stocks arising from the reduction of purchase tax in the April, 1953, budget. The balance of profit carried forward has increased by £7,835 to £194,516.

On referring to the consolidated balance sheet, it will be seen that the total of the capital employed in the business of W. H. Smith & Son Limited and its subsidiaries amounted to £8,304,033 at March 28, 1953, an increase of £576,242.

Fixed assets, comprising properties, plant, motor vehicles, fittings, fixtures, etc., have increased during the year by £83,093 after deducting depreciation charges and sales. The gross capital expenditure during the year under these headings amounted to £303,242. The surplus of current assets over current liabilities and provisions has increased during the year by £438,351.

STAFF

The recruitment of staff for the retail branches is a problem which has given your directors some concern, though the difficulty is not so great in our shops as in our bookstalls. This problem is present in all sections of the distributive trades today owing to the more attractive employment offered by factories and offices where the five-day week is worked. We are, however, tackling this problem realistically, and are obtaining sufficient recruits of a standard to ensure good management in the future.

I should again like to thank the staff for

their loyal and hard work during this past year.

PURCHASE TAX REDUCTIONS

The recent change in the rates of purchase tax referred to above has meant that your company has suffered a loss of £40,300 in marking down prices of stocks on hand upon which purchase tax had already been paid. Under the present system there is no redress. It is to be hoped that the Chancellor of the Exchequer will continue to examine ways and means of correcting this condition.

PROSPECTS

The year 1953-54 has had an encouraging start thanks to the extra sales of Coronation publications and souvenirs. Your directors believe that if the present trends continue the company should enjoy another satisfactory year.

Expenses, unfortunately, always have a tendency to rise, but they are continuously under the careful scrutiny of the board.

The board are pleased to acknowledge the continued support given to the company by the public.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting the chairman said:

As regards my statement I have one thing to add, which is that I am pleased to be able to tell shareholders that this week the contract between W. H. Smith and Son Limited and the London Transport Executive has been signed and sealed, which means that W. H. Smith and Son Limited will be bookstall contractors for another 21 years to the London Transport Executive.

The report and accounts were adopted.

ST. MARTIN PRESERVING
COMPANY, LIMITED

(Makers of "Chunky" Marmalade)

RECORD SALES

The twenty-fifth annual general meeting of this company was held on August 7th at Maidenhead, Mr P. A. J. Hammett, FCIS, presiding.

The following is an extract from his circulated speech, for the year to March 31, 1953:

The increase of competition in our industry must again be mentioned, for in the past year this feature became more evident. Sales resistance has had the result not only of lowering the national consumption of preserves but of diverting the reduced demand from higher priced varieties to those less expensive. This trend is likely to continue until such time as reductions are possible in the cost of our essential raw materials. It is hoped that the impending decontrol of sugar will eventually result in a reduced price for this commodity.

Your company's speciality, Chunky Marmalade, continues to enjoy the favour of the public and its sales again rose to attain a new all-time record. It has been considered expedient to forge a more positive link between this popular line and the other products of your company. Accordingly, all our jams, etc., will in future be marketed under the Chunky brand. It is believed that this measure will prove of material assistance in furthering expansion of sales. An obvious advantage is that our publicity, which has been centred chiefly on Chunky Marmalade, will now automatically embrace all our products. The report was adopted, and the dividend of 12½ per cent approved.

The Glasgow School
Of Management Studies
ROYAL TECHNICAL COLLEGE, GLASGOW
and
THE GLASGOW AND WEST OF SCOTLAND
COMMERCIAL COLLEGE
Session 1953-54

The School Will Offer The Following FULL-TIME
COURSES of one Session's duration:—

Course in
PERSONNEL MANAGEMENT
Course in
WORKS MANAGEMENT
Course in
BUSINESS ADMINISTRATION

Pitt Street, Glasgow, C.2.

Craven

for

Civic

honours

SIR JAMES BARRIE considered that a tin of Craven Tobacco was a far greater award than the freedom of the city. In 'My Lady Nicotine' he said:

"It is a Tobacco that should only be smoked by our greatest men. Were we to present a tin of it to our national heroes, instead of the freedom of the city, they would probably thank us more."

Craven Tobacco is unstinting in its service—mellow, slow-burning, deeply satisfying. Try it—every pipeful will honour you with smoking riches.

Obtainable in three fine blends
Craven Mixture 4/7 oz.
Craven Empire de Luxe Mixture 4/3 oz.
Craven Empire Curly Cut 4/4 oz.

Perhaps you
didn't know that
INTERLAKEN

is the Gateway to the glories of the Bernese Oberland? From Interlaken you can travel comfortably by railroad, ordinary or cog-wheel, to such world famous places as Grindelwald, Mürren, Wengen, or via the Kleine Scheidegg right up to Jungfrau Station and Hotel, both the highest of their kind in the world (11,333 ft. above sea-level).

But everybody
knows

how comforting it is, when travelling abroad, to have the address of a reliable Bank in one's possession. The Interlaken Branch of the Union Bank of Switzerland, will gladly cash your Travellers Cheques, effect payments under your Travellers Letters of Credit and be of service in any other way.

If you want to do business in Latin America— say so in

en español

LIFE EN ESPAÑOL—average net paid circulation 200,000-250,000 copies in Spanish, circulating in Central and South America.

LIFE INTERNATIONAL—average net paid circulation 250,000—300,000 copies in English, circulating in 120 countries outside North America.

These are the INTERNATIONAL EDITIONS of LIFE magazines.

TIME & LIFE BUILDING, NEW BOND STREET, LONDON, W.1

When a new magazine sells on sight, it's a publishing success. When the people who buy it so readily also represent a rich market for goods and services of all kinds, it's an important advertising medium. LIFE EN ESPAÑOL—the Spanish-language edition of LIFE INTERNATIONAL—is both. Since its first appearance in the Spanish-speaking Republics of Latin America last January, every issue has literally sold out on sight. Brilliantly edited by leading Latin American journalists, and with the same consistent picture-appeal of LIFE INTERNATIONAL's English-language edition, LIFE EN ESPAÑOL has a fast-growing circulation among men and women of the higher-salaried business, government and professional communities. These people, with the means to buy and the power to influence the buying of others, can open the markets of Latin America to your company. Once a fortnight, through the advertising pages of LIFE EN ESPAÑOL, you can talk business to them in their own language. The Advertisement Director will be pleased to send you full details.

No and Nyet

MR VYSHINSKY, who for six years was unchallenged holder of the title of the world's leading *nyet*-man, has returned to New York a creature of smiles and soap. The Russians are throwing caviare parties in Vienna, offering roubles to Uno and talking about another tour by the Dynamos. However unchanged the basic Soviet aims may be, Malenkov has jettisoned one of Stalinism's most salient characteristics—its surly rigidity. The tactical advantages to Moscow of this move are obvious. What is not at all obvious is the reasoning behind some recent American actions of an exactly contrary character. Such public pronouncements as those of Senator Knowland and Mr Lodge regarding the Chinese seat in Uno and the composition of the imminent conference on Korea would seem nicely calculated to transfer to the United States the reputation for mulishness that has so long—and so rightly—been enjoyed by the Soviet Union.

Every allowance must be made for the mood of angry frustration created in America by the Korean casualty lists, and by the obduracy in negotiation of a Communist China seemingly free to give armed defiance to the United Nations without risk to its own person. The world must remember both the American mood and its own debt; but neither of these things requires America's friends to be silent when their ally appears to be making grave tactical errors that prejudice the very cause for which it has given so much.

It is bad tactics to fall out with one's friends publicly over essentially procedural matters on the very eve of a meeting with one's opponents. It is bad tactics to define one's intentions too strictly in advance—in effect, to tear up good cards before playing the hand. (Week by recent week, this journal has been preaching this doctrine in a British context; but it applies to American policy with equal force.) Above all, in the present international atmosphere it is bad tactics to present oneself as the less reasonable party. Mr Eisenhower has allowed his subordinates to commit all these errors, apparently in the name of firmness. Yet firmness need not imply a clumsy rigidity; one has only to look to Moscow to see that. Still less does firmness necessitate clinging to strict logic for its own sake. There is, for instance, no visible logic in the suggestion that India should take part in the Korean conference; but the practical advantages leap to the eye.

Moreover, if firmness is still one of the tenets to which the West must cling, unity is still the other. Malenkov has now quite blatantly announced his plans for splitting the alliance of free nations that Stalin brought together. If the West can muster enough finesse, it may yet be able not only to survive this diplomatic offensive, but also to turn it back upon its opponents; the events of this summer have revealed cracks in the "monolithic" structure of the Communist bloc. But little progress in this direction can be expected while western policies remain dominated by puritanical logic and bull-headed pride. Mr Dulles might do worse than to glance through Mao Tse-tung's famous apologia for inconsistency, *On Practice*.

The Economy of Development

THERE is practically universal agreement that the "backward" or "under-developed" countries of the world (no one has discovered a really satisfactory alternative to these invidious and question-begging epithets) need to be helped along the path of economic progress much faster than in the past. The speed-up is needed, as a matter of sheer humanity, because in its absence a great many people, already uncomfortably underfed, will certainly starve; it is needed, as a matter of hard-headed Western economic interests, in order to maintain and enlarge the world market in which the West buys and sells; it is needed, on political grounds, because the combination of increasing hunger and increasing awareness of Western standards is politically explosive and would be so even were Communism entirely uninterested in exploiting it. So much is common form, though the emphasis—humanitarian, economic, strategic—varies with temperaments and opinions. The special agencies of the United Nations, the Point Four programme, the Colombo Plan, the schemes administered under the Colonial Development and Welfare Act, testify to this general agreement. No one, however, is really satisfied either with their achievements to date or with their prospects; and a flood of reports, pamphlets and books incessantly presses on Western opinion the case for more speed, for more resources, for a greater sense of urgency and for a more generous willingness to make short-term sacrifices. The latest of these, Mr Harold Wilson's "The War on World Poverty,"* is considerably more than an expanded version of his pamphlet "War on Want" published last year; but the leading ideas are the same, and they are sufficiently typical of "progressive" thought to deserve re-examination.

The driving force of the argument is moral, an affirmation of unqualified human solidarity. Whether Mr Wilson really believes, and will advocate, that all improvement in Western standards should cease until every last Bedouin, Eskimo, or Malay has caught up with them, or whether perhaps his morality goes even further and demands a thoroughgoing "soak-the-rich" policy among the nations until equality has been attained, is not an entirely frivolous question; but fortunately it is not a practical one either. His assumptions, stated and unstated, can be roughly listed as follows: Experts, home-grown or imported, can always tell what a backward territory needs and draw up appropriate plans of development into which all public, cooperative or private ventures, on every scale, can subsequently be fitted. There is no need to worry about the capacity of these developments to generate, whether directly or indirectly, enough revenue for their own maintenance.

* "The War on World Poverty." By the Rt. Hon. Harold Wilson, MP. Gollancz. 227 pages. 14s.

There is no lack either of the goods, or of the appropriate manpower, needed for the putting into effect of such plans, nor yet of people capable of teaching their beneficiaries how to run them and use them; all that is needed is the will to divert them (by the provision of adequate funds) in proper quantities to their proper work. Western obsession with global war, which now keeps these human and material resources busy on defence, is quite unnecessary; if only Russia were tactfully reassured—and given an earnest of good intentions in the shape, yet once more, of unilateral disarmament—it would cease from troubling and probably rejoin the human family. And finally, private enterprise cannot be trusted, except in quite minor matters, an inch; nor can colonial powers—unless, at least, they have reliably Socialist governments.

Against this background of sentimentality (sentimentality has been defined as refusal to face the implications of one's emotions), of wishful thinking, and of what may be called aggregate-mindedness, Mr Wilson provides a good deal of useful statistical information, a compendious history of the various agencies of development, and, case by case, a succession of well-argued pleas for steadier and more generous support for particular projects of proven worth. He is, moreover, well aware that whatever the West can do for the people of the backward regions must, if it is to be of lasting value, also be done through and with those people themselves. But this awareness, with all that it implies concerning the scale and tempo of progress, does nothing to shake his belief that the West has only to turn on the tap of capital investment in order to produce revolutionary improvements in double-quick time. Generosity, will-power and a peaceable disposition are, in fact, all that is needed.

★

These views are challenged, in a dry, hard-headed and to some people maddeningly academic manner, in Professor S. H. Frankel's "The Economic Impact on Under-developed Societies,"* a collection of essays (some of which have already appeared in pamphlet form and been noticed in *The Economist*) dealing for the most part with just these basic assumptions which Mr Wilson and progressive opinion generally take for granted. Professor Frankel refuses to attach any absolute meaning to international comparisons of riches and poverty measured in money units; what matters is the "real pattern of welfare," whose ingredients vary from society to society too widely for any common accounting symbolism. (The "income" of the desert

* "The Economic Impact on Under-developed Societies." By S. H. Frankel. Basil Blackwell. 179 pages. 15s.

Bedouin is a fraction of the "income" of a suburban clerk; it does not follow that in the Bedouin's own view, which is what matters, his welfare is correspondingly inferior).

Similarly, Professor Frankel attacks the assumption that "capital" in any useful sense can be identified with ledger entries, or even with tons of steel and miles of highway. Capital is as capital does, and capital can do nothing except in the hands of people who use it, maintain it, replace it, and consume its products. Use, maintenance, replacement, consumption, must all fall into place as part of the wider complex of economic activity, which again depends, in a rapidly developing community, on "painfully created new aptitudes for action and responsibility." Economic development on any scale whatever is, inseparably and identically, social and political transformation—which can neither be neatly summed up in statistical magnitudes by experts nor centrally planned by Governments and international agencies. Nine-tenths of Mr Wilson's book would, one concludes, be either nonsense or sheer anathema to Professor Frankel, even were his opinions about the competing urgency of defence needs as happily ostrich-like as Mr Wilson's own.

The conflict is not between progressive and reactionary, between generous friends and would-be stand-pat exploiters of the backward peoples, between optimist and pessimist, positive and negative. It is rather akin to the difference between the attitudes of the engineer and the biologist. For Mr Wilson, and that large body of generous-minded and compassionate people for whom he speaks, economic development is, paradoxically, something to be tackled as an engineer tackles the construction of a machine, or ten machines, or ten thousand machines. Let the prototype have proved itself, the blueprints, materials and technical skill be available, and all that is needed is the will to go to it and stick at it till the job is done. For Professor Frankel it is much more like a plant growing, cell by cell, according to the laws of its own nature. Husbandry can do a great deal for it, tending, grafting, transplanting; but always within the limits set by the plant's origins and by the ecological environment, limits which no well-intentioned exertions of willpower can alter. (One can indeed set plants growing, exorbitantly and regardless of their natural metabolism, by pouring hormone solutions on them. This is, as every modern owner of a lawn is well aware, the quickest way of killing them.)

★

What with the cold war and what with the unwillingness of the West—even of America, let alone Britain with its perennially precarious balance of payments—to commit itself in practice to a diversion of resources in anything like the amounts needed even on the most conservative estimate, there is perhaps little danger of large-scale killing-by-kindness. But it is all the more important that such resources as are diverted should go

to the right places, be embodied in the right things, and be integrated into their social setting in the right way; that they should not be grandiosely wasted in the groundnut manner, fribbled away in international boondoggling, sunk in projects destined to be a burden rather than a support to the communities concerned, assigned to the brash and glib-tongued builders of mere façades, or, for that matter, used to sweeten prospective Mossadeghs until such time as they are ready to cut off their countrymen's nose to spite the West's face.

It has been shown—and here Professor Frankel and Mr. Wilson are entirely at one—that the combination of self-help and tactfully supplied technical aid can make a very little capital work like the leaven of Scripture. At the other end of the size-range there are numbers of projects—in irrigation, flood control, transport—far beyond the scope of private enterprise or a village's mutual aid, but just as unmistakably filling a felt want, an identifiable gap in the framework of general economic activity. The essential is that capital, whether in large doses or small, whether in the form of credits or of free grants, should be sucked in rather than pumped in. Injections of capital are unlikely to do much good unless the community is already capital-minded. National governments can, of course, generally be relied on to suck with all their might; but that is not the point. It is the project itself, the demand for its benefits, the availability of willing hands and organising heads to use the capital applied, which should exert the effective pull. As Sir Keith Hancock once said, the question to ask in trying to assess a community's capacity for development is what it does with its own savings.

The sceptics and the optimists are unlikely ever to be completely reconciled, but at least in the conditions of cold war their agreement on priorities is more important than their disagreement over what is ideally desirable. Concentration on priorities is, indeed, almost as important politically as it is economically. There has already been far too much impulsive prophecy of pie in the sky, followed by precipitate back-tracking in face of a dearer reckoning of costs or a shift in political weather; and it has not always been the least fruitful, the most nebulous or marginal projects which have suffered. Nor would any concealment of economic realities behind the façade of an independent World Development Authority, such as Mr Wilson ambitiously advocates, do away with the power of individual Western states to reconsider policies and pledges of which their electors no longer approved. To undertake, and above all to promise, no more than can be certainly performed is the most elementary political wisdom. Nothing could play into Communist hands more effectively, or be for that matter more irresponsibly immoral, than a stop-and-go policy which would fill every backward territory with fragmentary "folies" to serve as reminders of hollow Western pride and broken Western faith. Hunger has been called the strongest ally of Communism; but a stronger ally even than hunger is disillusionment.

Single or Double Korea?

IN the Korean situation there are two facts; one is South Korea and the other is North Korea. Each is an organised state with its own government, administration, army and police, controlling a clearly defined territory; the boundary between the two areas is the neutral buffer zone established by the armistice along the former fighting front. Three years of war have left Korea divided as it was at the outset by roughly the same line of demarcation, with the barrier of mutual distrust and hatred reinforced by a prolonged period of bitter and ferocious struggle. It is from this situation that an international political conference is now expected to produce Korean unity. What are the prospects of success?

Normally, if two belligerents fight each other to a standstill in a dispute over territory and neither gains decisive victory in the field, it is assumed that neither side will yield at the conference table what it has held in battle. The task of the peace conference is then simply to fix an agreed frontier on the basis of the military situation at the close of hostilities. The war in Korea, however, has never been about territory. The governments of both South and North Korea have always each claimed to be the only legitimate government of the whole of Korea; indeed, the claim of the former has been endorsed by the United Nations to the extent that the South Korean government was set up after elections held under United Nations supervision, whereas North Korea refused to have anything to do with these elections. When the North Koreans crossed the thirty-eighth parallel in June, 1950, the invasion was designed to unify the whole of Korea under Communist rule. The Security Council authorised military aid to South Korea as against an external attack across a frontier; but the Assembly, after the rout of the North Korean army, instructed the United Nations Command to establish conditions of order "throughout Korea"—in other words, to carry out a military occupation of North Korea—as a preliminary to new elections.

Chinese intervention then threw the United Nations forces back again to the south, and the battle front has remained for two years in the neighbourhood of the thirty-eighth parallel. Thus both the Communist attempt to capture South Korea and the United Nations attempt to capture North Korea were equally thwarted. Unification, however, continues to be the watchword; only now it is to be attained somehow by diplomacy after force has failed. Unification, at any rate, is what Mr Dulles says he will demand. Mr Butler has told the House of Commons that this is also the aim of British policy, though he cautiously added that there might first have to be a temporary *modus vivendi*.

The unification of these two actually existing states can now come about only by their voluntary fusion or by the imposition on them of a settlement reached by

the great powers. Their voluntary fusion, after all that has happened in the peninsula, hardly seems within the bounds of possibility. What then are the prospects of an agreement between the great powers for unifying the country? The United Nations majority, including Britain and America, have always conceived unification as meaning that free elections should be held in the whole of Korea under the supervision of a neutral commission in order to produce a parliament and government representing the entire Korean people.

The Communist view of the matter is different. According to Mr Malenkov's last utterance, the war has been an attack on "the Korean people" by American "interventionists" aided by "hirelings of the Syngman Rhee clique," but the Korean people, aided by "volunteers" from China, has beaten back the attack. It would be too much to expect Mr Malenkov to give a more truthful account of what has happened in Korea, but the significant aspect of his speech is that it gives no indication that the Soviet Union will accept South Korea as a political entity on the same level as North Korea in negotiations for their union. The Russian attitude is that the Korean people as a whole is already represented by the so-called Korean Democratic Republic, even though the latter may be for the time being confined territorially by the violence of foreign "interventionists."

★

It would, therefore, be astonishing indeed if the Communists, being in absolute control of half of Korea, were to hazard what they already hold by agreeing to really free elections for the whole country. In Germany, where the practical problems of holding free elections would be infinitely easier than in Korea (which has had no previous tradition or experience of democratic government), the western powers have been trying long enough to get the Russians to discuss schemes for free elections, but they have preferred, and still prefer, to evade the issue. Similarly, it is unlikely that either Peking or Moscow can contemplate loosening the hold of Communism in Korea except on conditions which would involve virtual certainty of getting control of all Korea. After all, one bird in the hand is worth two in a very unpromising bush.

On its merits, the case for Korean unity is overwhelming. The Koreans are ethnically and culturally one people; they have formed a single kingdom for over a millenium, and even when they were annexed by Japan, their country was administered as a single unit under a governor-general. There is no real natural frontier dividing the country, and the distribution of economic resources, with the best agricultural land in the south and the principal mineral deposits in the

north, demands unity. The general sentiment of the Koreans aspires to a united national state. If it had been a long-established sovereign state and had been left to itself, the internal conflict might well have worked itself out through war, with one side or the other finally gaining control over the whole country. But this could not have happened in the situation that existed there at the end of 1945. When Japan surrendered, Korea was not a state at all, and there were no Koreans with experience of government or higher administration. The great powers which had liberated the country had to create the necessary conditions for orderly self-government. Unfortunately the two occupying powers strove to establish, each in its own sphere, two incompatible political systems which must inevitably collide when the forces of the protecting powers were withdrawn.

★

In each case, however, the sponsor continued to have a strong interest in the maintenance, if not in the expansion, of its own system. It was not only that the two halves of Korea represented the two sides of the universal cold war of the present-day world, and that the destruction of either of the two rival regimes would be a great blow to the prestige of its promoter. Important strategic considerations were also involved. On the mainland Korea is the gateway to Manchuria, and the Chinese do not forget that Japanese armies have crossed the Yalu from Korea three times in the last sixty years. But the argument is reversible. Southern Korea also fronts on the straits opposite Japan, and could be the springboard for attack on it if it came under the control of a major continental Asian power. In a time of full

peace it would be sufficient for the security of both China and Japan that Korea should be a neutral buffer state. But in a period of high tension, with Korea torn by bitterly opposed factions backed from abroad, the maximum security for both is provided by a situation in which the North is held by a government allied with China and South Korea by a government allied with the United States as the guardian of a disarmed Japan. In other words, by just the situation which actually exists.

Both sides, however, are bound to demand the unification of Korea. There will be perfect unanimity of view that Korea ought to be unified. It is only when the delegates at the conference get down to discussing the conditions of unification that the stonewalling will begin. Instead of the ninety days of which Mr Dulles has spoken, it would be better to prepare for ninety weeks, ninety months or ninety years.

Each side, of course, will place on the other the blame for preventing the unification of Korea. Meanwhile, the two Korean states can carry on just as they are now, with a healthy rivalry between the two camps to see which can spend the more money on the economic rehabilitation of its *protégé*. United Nations plans for large-scale expenditure in restoring the country have now been countered by Mr Malenkov's proposals to spend 1,000 million roubles of Russian money to "help the Korean people to heal the serious wounds inflicted by war." This kind of competition will be much nicer for the Koreans than the way money has been spent on them over the last three years. And if everyone is quite clear that another outbreak in Korea will mean a general war, a new breach of the peace there will be improbable. Korea may thus be peaceful, even though divided. Its division is deplorable, but the cold war is even more deplorable; as long as there are two worlds, it may be just as well that there should be two Koreas.

Future Weapons

ATOMIC weapons have, for the time being, been put in their place. After nearly a decade of often very wild speculation about what might be done with them on and around the battlefield, there is now emerging a view which is matter of fact, restrained and dispenses some illusions. It was expressed by the Chief of the Imperial General Staff himself last week, after an exercise at the Staff College, Camberley, during which British, American and Commonwealth officers studied the application of atomic firepower to land-air operations overseas. He and his advisers have, no great opinion of the American atomic cannon, limited in range and cumbrous to move; they do not expect to see the tactical fighter-bomber able to drop atomic missiles at crucial points in the enemy's array; the use of the strategic bomber and its load on the battlefield would be costly and perhaps wasteful—it would be better to direct it against airfields and communications.

In short, the view seems to be that Britain has been well advised to concentrate its attention at the Woomera ranges on developing the remaining possibility, a mobile and relatively cheap guided weapon or steerable rocket, which would provide genuine atomic artillery for long-range bombardment to the commander of an army or army group. If it were available in numbers at the right time and place it would provide just the answer to mass attack by men and vehicles that the allies in Western Europe might need. It could have important effects on the future strategy of European defence.

But these are not practical possibilities either for tomorrow or the next day. The guided missile for the artillery (ground to ground) will first have to compete for scarce fissile materials, for intricate equipment from a limited electronics industry, and for productive capacity with other atomic weapons—for example, with

the guided weapon with conventional warhead for anti-aircraft defence (ground to air) and with the weapon that will displace perhaps in the early sixties the fighter aircraft. It has to compete, too, for research facilities and materials with the claims of industry and power production, for the peace-time possibilities of atomic energy are no less important for Britain than its uses in war. It was revealed at Camberley that Lord Cherwell (the Prime Minister's right-hand man in these matters) had told the War Office that it would have to make a very strong case to obtain a share of fissile material. Among the priorities established for the use of fissile material and electronic equipment the strengthening of the British Army's fire power is not among the first.

Sir John Harding said that no firm decision had yet been taken in Britain about the most economical way of using fissile material in war. This statement might be welcomed as a sign that minds are being kept open for entirely new developments and that the programme of atomic weapons is to be highly flexible. But there is every sign that there already exists a production programme to provide the RAF's faster and higher-flying Vulcans, Valiants and Victors with atomic bomb loads. Indeed, there is good reason to believe that the long-range strategic atom bomber is becoming the backbone of this country's defence forces, as it is already the basis of American strategy. If that is so, then the Air Ministry has established a claim on scarce fissile materials that it will be hard to shake in the future; and a view has been taken of Britain's military role in the Atlantic alliance that will also be hard to shake. This view appears to be that the best way to defend these islands and the approaches to them is to provide the maximum deterrent to an aggressive enemy; that deterrent is to be a force of long-range bombers, flying so fast and high from various directions that no practicable system of radar warning and fighter interception can prevent some of them inflicting crippling damage. That is to say, the bombers can be relied on to get through for just so long as a potential enemy has not mastered the art of intercepting them by guided weapons capable of superhuman speed of climb and accuracy. Once he has done so, then it is only a question of time before the strategic bomber is obsolescent and replaced by the guided weapon.

★

Here can be seen in miniature the kind of decision that faces governments and their military and scientific advisers on the threshold of the atomic age. With limited resources in research, productive capacity and raw materials—to say nothing of money—they have to decide just how far ahead they can back the strategic bomber as an atomic weapon when they are simultaneously developing the guided weapon that will one day make it obsolescent. It will do so not only by increasing immensely the range and accuracy of what is now called fighter and anti-aircraft defence but also

by offering an alternative way of attacking an enemy with atomic explosive. In that sense the guided weapon might be expected eventually to provide cheaper and more flexible methods of defence that would give an advanced industrial nation great advantages over others; but in another sense it complicates the problems of defence by making the main arm dependent on a few key installations, a select band of technicians and scarce raw and manufactured materials. It is not difficult to imagine the difficulties that present themselves: the fighting man asking the scientist and the manufacturer for precise dates and performances; the manufacturer asking for guarantees of priority and stable orders; the official and the minister trying to hold the balance between military and civil claims on atomic and electronic know-how, knowing that ultimately their decisions will have an important impact on the national economy.

Against such a background, much of it secret and highly technical, it is not easy for the layman to judge whether great hopes should or should not be set on the tactical atomic weapon in the hands of the army—that is to say of the artillery. Until more is known it would be wise to be sceptical of all talk about a tactical revolution and a restoration of the balance of military power in Central Europe. It cannot just be assumed that the Soviet Union has not or will not have the same hopes. On the other hand, it is clearly desirable, now that the tactical effects of atomic bombing are known, that there should be careful and imaginative study of future possibilities: it will be necessary to make divisions more mobile, to make their essential vehicles less dependent on road systems which turn them into ideal targets, to study such possibilities as the replacement of motor by air transport, with the helicopter taking the place of the truck, perhaps to reconsider present prejudices against fortification as a means of forcing an attacking enemy to concentrate and present a target. These are all highly professional matters, even though they make their impact on the whole population.

★

Where the layman has, or could have, something to say, is in the politics of defence. In the past the bugbear of chiefs of staff in democratic countries has been the chopping and changing of plans that has occurred with changing governments and shifting policies; in this country it has in the past severely hampered the design of weapons, the continuity of research and the maintenance of production potential. It is quite clear that any repetition of such waverings in the years ahead would have costly and dangerous results. If the necessary human and material resources are to be available for research and experiment there must be confidence among scientists and in industry that they will receive continuous as well as adequate government backing—and in this field the government is, inevitably, the only employer. If production is to be

economically planned and the fighting services are to adapt themselves efficiently to new demands, then priorities must be decided and programmes adhered to. Above all—and this point has been argued before in these columns—there has to be a happier and more efficient partnership between the Ministry of Supply and industry than exists today. If these are the conditions to be met before Britain can be certain of maintaining the position it has won in competition with the United States—a healthy and desirable competition, be it said—there would seem to be a case for considering whether the two great political parties should not take, or try to take, an agreed view of atomic develop-

No Policy for Morocco

PASHA OF MARRAKECH *versus* Sultan in Rabat; Berber *versus* Arab; diehard *versus* progressive—Paris would have reason to be thankful if the confusion which reigned last weekend in Morocco were explicable in these simple terms. It could even congratulate itself if the clash were one in which it could stand aside or, better still, play the role of disinterested arbiter. But the French Government can claim no such immunity. If El Glaoui, the Pasha of Marrakech, attempts, as he did last weekend, to depose the Sultan of Morocco, France has serious responsibilities in the matter. It is implicated, first, because the treaty establishing its protectorate over Morocco binds it to lend all support to the Sultan; secondly, because its perfectionist policy of maintaining a centralised administration, run by Frenchmen, places it in a position to check such moves if it has a mind to do so; thirdly, because the Pasha would not have taken the steps he has taken over recent months had he not good reasons to believe that he had French approval. These reasons came to him from a divided France, and—what is worse—from within a divided corps of French administrators in Morocco. France's claim to detachment and wholly clean hands was forfeited when its Resident-General, General Guillaume, was instructed to use the Sultan's plight to extract from him transfers of power that some Frenchmen have long coveted and that were otherwise unattainable. Certain members of M. Laniel's cabinet—M. Faure, M. Mitterand, M. Reynaud, M. Pleven and, it is said, M. Bidault himself—were known to think this autumn a propitious moment for resuming negotiations with both Morocco and Tunisia. Its fumbling last weekend, to remedy a situation that it had allowed to lapse into a bad business, has rendered that prospect dim.

The background to the quarrel is less a difference between the Sultan and the Glaoui than one between the Sultan and Frenchmen. The Glaoui, as will be seen, comes into the picture largely as an appendage of the latter. The difference between the Sultan and the French would seem to be insoluble on one point

ment. It is carrying both security and partisanship too far when the government of the day conceals from the leader of the Opposition the fact that a decisive twist in the economic and defence policy of the country has been given by some decision in the atomic field. Too much power is given to too few ministers and too little thought is given to the fact that within a decade the guided weapon, the pilotless aircraft and the atomic power station may be normal features of life. The more that is revealed of the ramifications of this great technical revolution, the clearer it becomes that some form of public corporation for the control of atomic power is urgently needed.

only, but that point is fundamental. It is disagreement over the role that the French community, now over 450,000 strong, is to play in the elected institutions of the future—municipalities, joint bodies responsible for finance, and, ultimately, a Moroccan assembly. Are French residents to perform there as citizens vested with rights equal to those of Moroccan-born Moslems? This is what they wish to do on the basis of their justifiable claim that it is their enterprise, and the investment they have attracted, that have in forty years transformed the protectorate from a mediæval backwater into a modern land of promise. Or are they, as the Sultan would wish, merely to enjoy some protected status, fixed by negotiation, within an independent Moslem state?

This vexed question raises the issue of "co-sovereignty" that is the main bone of contention also in Tunisia. But in Morocco the controversy has for more than one reason a more acid flavour. In the first place, there are far fewer contacts between Moroccans and Frenchmen; the former are more withdrawn than the Tunisians, and, in Morocco, far too many local Frenchmen are newcomers simply out to make money or avoid home taxation, and behave as if the Moroccans were not there. Secondly, the very configuration of the territory has tended to drive the Sultan into agreement with the ultra-nationalists. About seventy per cent of its population consists of Berber elements over whose chieftains his forebears had no control. Since the protectorate, the French security authorities have, in the interests of keeping peace and quiet at low cost, maintained this framework of semi-autonomous vassals. They have superimposed a centralised administration but not destroyed the ancient pattern; the Sultan, fearing isolation, has therefore naturally, if unwisely, gravitated towards the independence parties of the cities of the Arab plain that is his home. He agrees with them on wanting complete independence, but differs on the pace at which this is to be attained. He is for, and the *Istiqlal* (independence) party is against, seeking it by stages negotiated with France.

But all his attempts to reach agreement on interdependence have been dominated by the co-sovereignty obstacle. Meanwhile, the French method of dealing with nationalist claims has varied with varying governments. In 1950 and 1951, Marshal Juin—then Resident-General—ordered the Sultan to denounce the *Istiqlal* or else to abdicate and, to reinforce his case, covertly encouraged a Berber march on Fez and Rabat. In 1951, the more light-handed M. Robert Schuman thwarted the nationalist attempt to enlist support at the United Nations by promising that negotiations were just round the corner. In December, 1952, General Guillaume seized the occasion of serious riots in Casablanca to exile the bulk of the nationalist leaders.

★

Meantime, the quarrel between Sultan and Glaoui was developing. It began, in 1950, with unsolicited advice from the latter not to rely so much upon townee supporters. High words passed, and the Sultan forbade the Glaoui access to the palace. Then, largely in press interviews, the Glaoui expanded his theme into indictments of pampering the left wing, "flirting with Communism" and encouraging the forces of irreligion in a way that was unsuitable in the nation's religious leader. In May of this year, the Glaoui obtained the signatures of 270 caids and pashas, by no means all of them Berber, to a protest on these counts and a claim that the Sultan should be deposed and deprived of his role of *imam*, or commander of the faithful. Other pashas and religious authorities deposited counter-claims and the Sultan, in communicating with Paris, invoked the clause in the protectorate treaty that promises him support. Many factions of French opinion were delighted at this turn of events—some because they prefer the Glaoui, who is a multi-millionaire closely linked to French business interests, and a diehard who freely declares his attachment to France, others because they saw in the Sultan's plight a chance to negotiate future arrangements in conditions favourable to themselves.

But they reckoned without the pace of developments. The Glaoui went to Europe for a summer holiday, and received a strong fillip from Marshal Juin and other supporters. Thus fortified, he hustled back to Morocco long before he was expected, and summoned to Marrakech the great conclave of notables that met there last weekend. From the premature publication of a newspaper article, it is clear that he intended to proclaim as Sultan the uncle of the present ruler, a mild old man whose mother was a Glaoui. The religious aspect of the quarrel was now enhanced in that El Kittani, leader of one of North Africa's great but unorthodox, saint-worshipping brotherhoods, backed the Glaoui, whereas orthodox religious leaders favour the Sultan. But the plan for deposition fell flat.

M. Laniel's cabinet, beset with the strikes at home and scenting more trouble than it had time to handle, had snatched General Guillaume from holiday and sent him post haste to Rabat with instructions to stop the

Glaoui yet simultaneously to extract agreement from the Sultan to various structural changes long desired by Frenchmen. He succeeded only too well. After surrounding the palace with troops, in less than a quarter of an hour he secured the Sultan's agreement to delegating both his legislative and his executive powers to committees presided over by his Grand Vizier (who is over 100) but largely composed of Frenchmen, and to promising to permit no foreign—that is, United Nations—intervention in Moroccan affairs. On Friday, General Guillaume descended on Marrakech to call off the Glaoui and his conclave, since all was "settled." This was true, but all was not settled as they would have wished. The Glaoui, who had been given by French officials every reason to believe that he was doing what pleased France, was obliged to save his face by announcing merely that the Sultan had forfeited his right to spiritual leadership.

What is the balance sheet of these confusing events? Divide and rule is an age-old policy, and French diehards may claim that it has triumphed again. But there are many signs that, this time, it has let division go too far. It has left on France's hands a browbeaten and resentful Sultan, a discomfited Glaoui, an *Istiqlal* farther from its target than ever before, clashes and murders in the main cities, a religious quarrel in the open, and no Moroccan faction of importance on which to build future policy. Do many Frenchmen seriously believe that they can educate young Moroccans in the ways of democracy and simultaneously stop the march of time in Africa? Or that they can permanently save French residents from the aspirations of the proletariat they have created by backing elderly feudalists like the Glaoui? Or that they can rule by *force majeure* a territory that contains five Nato bases run by the United States Air Force?

But the most serious aspect of the weekend's events is the flaw that it reveals in French machinery for handling the protectorates; it shows that these can, as they stand, far too easily become a stamping ground for the predilections of French officials. In the preface to a recent and most interesting special number of the periodical *La Nef* on the problem of the protectorates, M. Robert Schuman describes the impotence of a Foreign Minister *vis-à-vis* the officials on the spot owing to the shackles imposed on him by a divided cabinet and by a parliament which, vacillating between liberalism and the settler's die-hard lobby, can make up its mind only what not to do. Under the heading "Need for a policy" he wrote as follows:—

If we are to achieve a coherent and effective North African policy, we must begin by revising the administrative and political structure of the French services in the protectorate. . . . I am now convinced that no reform of value in the relationship between France and Morocco or Tunisia can be attained without a return to precise conceptions of responsibility and without subordination to a proper hierarchy.

The events of last weekend prove him disastrously right.

Notes of the Week

Assembly and Armistice

THE new act in the Korean drama is now unfolding on two separate stages, each far removed from the other. In Korea itself, the cease-fire has become an established reality and immediate attention is focused on the continuing exchange of prisoners at Panmunjom. Here, while some of the returning soldiers have grim stories to tell and there are grounds for serious misgiving in the reports that many prisoners are still unaccounted for, visible progress is at least being made. Day by day the jealously limited quotas come south through the "freedom gate"; the truce machinery is working up through the lower gears to normal running speed; the Indian contingents entrusted with the delicate task of watching over prisoners who refuse northward repatriation have begun their journey to Korea. Half of this stage remains, indeed, shrouded in darkness. The "trials" and "confessions" of North Korean leaders reported in such massive and unrevealing detail from Pyongyang only deepen the mystery as to what is really going on in the north. For that matter, Mr Rhee continues to play the difficult role of a highly articulate enigma. But, within the strict limits set by the armistice terms, what can be done in Korea is in fact being done with remarkably little fuss.

The New York stage provides a pointed contrast. There, the immediate task ought to have proved a relatively simple one. The special session of the United Nations Assembly was not asked to do more than agree on a site for a Korean peace conference and nominate negotiators. It was unavoidable that the cumbrous mechanism of Uno's supreme representative body should be brought out to perform this task; for the Korean war was a United Nations war, and the Security Council, the less massive organ which was assigned to this kind of duty in the original blueprints of 1945, has been reduced to impotence—indeed, made almost extinct—by Russian obstruction. But was it unavoidable that so much sound and fury should be generated in the performance of a carefully limited, and primarily procedural, function? Whatever the exact outcome, one result must be a loss of prestige not only for the organisation itself, but also for the nations that have carried its flag into battle for the first time.

Shape of a Table

WHAT is really involved in the choice of a team for the Korean conference? The tone of some commentators suggests that it is almost a social problem,

like that of a hostess making up an awkward dinner party. Others attribute importance to precedent and protocol. But the conference will not be a diplomatic reception. It will be, one hopes, a businesslike session in which the haggling should be curbed by awareness that—as an article on page 490 shows—no truly comprehensive settlement is possible at this stage. Disputations about whether the United Nations has here the role of belligerent or of conciliator are thus irrelevant. In this context, Uno's chief responsibility is to endorse the end of the conflict as it endorsed its beginning.

Mercifully, all parties seem agreed that this endorsement does not require the attendance of all sixty UN members at the conference. But there is no doubt that the presence of India, not so much in its individual capacity but rather as representing non-Communist Asia, would close an obvious gap. India, moreover, has been allotted an important practical task in the armistice agreement, a task that has already brought its envoys into working relationship with both sides. Without exaggerating the effectiveness of India's contacts with Peking, there is clearly a very strong case for enlisting its tactfully offered services in a delicate operation.

Sir Winston Returns

BY presiding over a Cabinet meeting on Tuesday for the first time for nearly eight weeks Sir Winston Churchill has presumably given tacit notice that he is back in charge of affairs. He had, however, already made this fairly obvious through the statement that emerged from 10, Downing Street on August 14th on the subject of the sixteen nations' declaration on Korea. That statement bore all the marks of Sir Winston's personal authorship and it was clearly intended to serve a double purpose. It aimed at clarifying the British commitments in the event of hostilities being reopened in Korea; at the same time it sought to answer the attacks made on the Government both for signing the declaration and for not having mentioned its existence during the foreign affairs debate in the Commons just before Parliament rose.

Sir Winston disposed of the second complaint in short order. He pointed out that the sixteen signatories had agreed to its release on August 7th. Whether or not the date was wisely chosen is immaterial. Once it had been agreed, the British Government could obviously not break the embargo. On the merits of the declaration, the Downing Street statement recalled its genesis nearly two years ago and reminded the critics that it was intended to cover only an "unprovoked" renewal of aggression by the Communists. The statement made it clear that, so far as

Britain is concerned, the declaration has no relevance to a breach of faith by President Syngman Rhee. The British commitments in the event of a new attack from the north are in principle, therefore, no more than those entered into by the Labour Government in 1951.

The statement, in fact, underlines the folly of the Labour MPs who have mounted sharp attacks on the Government. Those responsible may be treated coolly when their leaders return from abroad. Mr Attlee was told about the declaration, in confidence, on August 1st. It has been reported that he then agreed he would have had to take similar action had he been in power. In any case he was so little disturbed that he left for his Yugoslav holiday the next day. Mr Morrison was informed of the declaration on August 4th and left for a Swedish holiday two days later. Whatever doubts either may have harboured were doubtless stifled by chilling memories of what had happened eighteen months previously. Then, under pressure from its left wing, the Opposition tried to challenge Sir Winston on much the same point after his return from Washington. It was in the resulting debate in February, 1952, that Sir Winston disclosed the Labour Government's own commitment to carry the war across the Yalu. In last week's Downing Street statement that debate was pointedly recalled. It should stand as a warning to any Labour MP who might be tempted to plunge recklessly into such grave issues.

Morrison versus Greenwood

NOMINATION lists for the various Labour party elections closed last weekend and will be published at the end of this month in the final agenda for the annual conference. The most interesting item will be the contest between Mr Arthur Greenwood and Mr Herbert Morrison for the office of treasurer. Mr Morrison's supporters are increasingly confident of victory, but less certain of the long-term impact which his success might have on his general standing in the Labour movement. There is, therefore, quite a chance that he may yet withdraw from this tussle. In that case he would presumably pin his hopes of returning to the national executive on the proposal of the National Union of Seamen that the deputy leader of the Parliamentary Labour party should be a member of the executive *ex officio*, just as is the leader. If the Margate conference can be persuaded to approve this motion Mr Morrison would certainly be offered an easier path, although his readiness to fight Mr Greenwood may well have been carried to such a stage that it has already provoked any revulsion to be expected from his action.

However he may return to the executive, Mr Morrison will not be able to escape the gibes of the constituency parties whose verdict he is not prepared to risk again. He may indeed have withdrawn from this arena prematurely, for there is no certainty that the Bevanites will repeat their success of last year and capture six of the seven seats reserved for the constituency representatives. Although the left-wing candidates took two out of every three votes, they won so many seats only because their votes were concentrated while the right-wing votes were

spread over nearly a score of candidates. It is also clear from the figures that at least two constituencies out of five must have voted both for Mr Bevan and Mr Morrison. There is evidence that some votes were withheld from Mr Morrison as a temporary protest rather than a permanent criticism.

On how the Bevanites fare in the elections may rest the nomination for the executive's vice-chairmanship. This goes by strict seniority, this year's vice-chairman being next year's chairman. The two members next jointly in seniority are Mr Bevan and Dr Summerskill. Mr Bevan and his friends would naturally like to see him chairman in the year of the next general election; the right wing would be equally glad to keep him away from the chairmanship at such a crucial time. Whatever may be its technical limitations the chairmanship of the Labour party executive could be used as a powerful weapon in the hands of a man of strong personality. The new vice-chairman will be elected by the new executive at its first meeting towards the end of the Margate conference. On both sides there will be some shrewd calculating, some careful scanning of the executive election figures, and some desperate attempts to peer into the mind of the man who will decide when the next election is to take place, who will not be at Margate at all.

Nigerian Disagreements

IT is to be hoped that the withdrawal of the leaders of the Action Group from the Nigerian constitution conference will not, even at this late hour, prevent some final agreement. But Mr Awolowo's walk-out is, of course, much more serious from a practical point of view than that of Mr Nwapa and his colleagues of the National Independence party. The reasons given by each, however, throw light upon the strains within the conference, and begin to look ominous for the prospects of any patched-up agreement that may eventually emerge.

Mr Nwapa and his colleagues, who are among the most level-headed of Nigerian politicians, even though their electoral power has yet to be tested in the forthcoming elections in the eastern region, have withdrawn because the shape of discussions promises little more than an alliance of states, with the federal government federal only in name since each regional Prime Minister could apparently at any moment order home his central "ministers". How abundant might be the occasion for such breakdowns is indicated by Mr Awolowo's statement on his party's withdrawal from the conference. He wishes to reinstate the ministers from the western region whose withdrawal earlier this year precipitated the crisis, although the northern leaders have made it clear that they will not work with these particular gentlemen again, alleging that they disclosed "cabinet" secrets. The new federal council of ministers would, indeed, be even less like a responsible cabinet team than the old one. A second cause of Mr Awolowo's discontent is the proposal by the official side that Lagos should be "federal" territory (though its status would be more like Trieste than Canberra) after the delegates had failed to agree on this subject and referred it to the Colonial Office for adjudication.

It may well be that Mr Nwapa's strictures on the type of constitution that was emerging from the conference—and for which he did not blame the Colonial Office—have influenced some of the other leaders, and that they are beginning to think that they would be wiser to go home with no agreement at all than one which appears to carry the seeds of a worse crisis before long. It would be better, however, at whatever inconvenience, to prolong the discussion and attempt a more constructive approach.

Tables Turned in Persia

NO one can affirm that Dr Mossadegh has been counted out until the count is over. As *The Economist* goes to press he is reported to be under arrest, and military supporters of a new premier, General Zahedi, are in control of Teheran, Isfahan, and all the towns of Azerbaijan on the Russian border. But the days preceding this coup have been so full of reversals of fortune that nothing is yet sure.

On Sunday the Shah flew into Baghdad without warning, luggage or entourage, saying that he had left Persia of his own free will, but had not abdicated; he had nominated General Zahedi as Premier, but had been resisted by Dr Mossadegh, who refused to be dismissed. The Mossadegh version of this story, as put out by Teheran radio, was that the Imperial Guard had attempted a coup that had ignominiously failed and that the Shah had fled. Next day, statues and other mementoes of the Pahlevi dynasty were being dragged through the streets at the tail of lorries, and the Central Committee of the Communist (Tudeh) Party was urging Dr Mossadegh to put an end to monarchy. While the latter was hawking between the alternative methods of running a one-man show—that of establishing a Regency Council of his yes-men, and that of throwing over the constitution and proclaiming himself President—army officers turned the tables, seized the towns, and after some bloodshed put Dr Mossadegh to flight. General Zahedi, installed in Teheran, has cabled the Shah to return.

Perhaps the Shah calculated that by leaving the country he could best draw attention to Dr Mossadegh's isolation and insensate exploitation of the patience of the masses, but it would have been more dignified to remain in the

palace during the action required to get rid of the Prime Minister, and to have organised it well from the start. As far as Dr Mossadegh is concerned, the lesson of events is the familiar one that a dictator cannot hope to succeed unless he squares the army. As to the future, the army's seizure of all towns in Azerbaijan clearly indicates that the aspect of Dr Mossadegh's policy that it most feared is his refusal to recognise that by relying on Tudeh support he was virtually admitting the influence of the hated foreigner—Russian influence in Persian dress. But the western powers in general, and Britain in particular, must not expect immediate overtures from General Zahedi and his friends, good nationalists all. Persian tempers are still such that any leader who now embraced the West would court a bullet.

The Release of Mr Sanders

IT is three and a half years since Mr Edgar Sanders was thrown into a Hungarian prison on fictitious charges of espionage and sabotage. The explanation that he has now given of his subsequent "confession" only confirms what is already well known about the way in which Communists stage their show trials; moreover, Mr Sanders's business associate, Mr Robert Vogeler, who was tried with him but released two years ago, has already graphically described how he was "prepared" for trial. It is clear why the Hungarians have suddenly relented. They are anxious to increase their trade with this country, but the British Government had consistently refused to resume trade talks until Mr Sanders was released. In 1949, imports to this country from Hungary were worth about £6,800,000, and British exports to Hungary about £4,700,000. Last year only £12,000 worth of goods found their way round the British ban on Hungarian imports. British exports to Hungary have not been banned, but last year the Hungarians only scraped together enough currency, from sales elsewhere in the sterling area, to buy just over £700,000 of British goods.

It is not so long since the Communists in Hungary, as elsewhere in eastern Europe, were rejoicing at the extent to which their foreign trade was being diverted from western markets and concentrated within the Soviet bloc. Now they are singing quite another tune. In his speech of July 4th, in which he outlined the new economic policy for Hungary, Mr Nagy, the new premier, spoke of the desirability of increasing trade with capitalist countries. This is one of the few aspects of his speech which has not subsequently been watered down. On the contrary, the Hungarian press has severely blamed the planners who have tried to make the country self-sufficient, and has emphasised that it is vitally necessary to fulfil export plans if the standard of living is to be raised.

This, indeed, is the crux of the matter. The Hungarian people have been promised more goods in the shop windows; but the government clearly does not want to abandon its plans for heavy industry. (It appears, in any case, that it has just promised to supply large quantities of capital goods for the rehabilitation of North Korea.) To carry out these conflicting promises it would be useful to expand Hungary's traditional exports of wine, fruit and food in return for British consumer goods.

France Loses Patience

A FORTNIGHT of strikes has given new and disconcerting shapes to the twists and turns of French politics. Since the outburst looks like a spontaneous expression of discontent by large masses of workers and civil servants, none of the parties relying in some degree on support from these quarters can allow the Communists to gain the prestige of lonely leadership. The Socialist and Catholic trade union leaders, in particular, cannot dissociate themselves from the movement without risk of important losses to the Communist CGT. Hence the paradoxical situation that MRP (Catholic) ministers sit in the cabinet, while Catholic unions strike against their government's authority. No wonder that the MRP leaders are seeking for a compromise or that the Socialists are looking anxiously over their left shoulder. If the Assembly meets next week, with everyone from the centre to the left counting votes in the country, M. Laniel may find himself without sufficient support to face the strikers.

Yet more is now at stake than a mere balancing of groups in the Chamber. The underlying principle of the present regime is being put to the test. France has been working for some time on the tacit assumption that extremists should not be allowed to use democratic freedoms to wreck parliamentary democracy. The electoral law, aimed at Gaullists and Communists and supported by the Socialists, was drafted on that basis. The Communists, in particular, have become the untouchables of the Chamber. Apparently everything was working smoothly: the Gaullists lost strength and the Communists were put on the defensive. Yet successive governments were unable to deal effectively with the economic causes of the cleavage, and the present outburst created a strange rift between alignments within and without the Chamber. If those who entered into this tacit pact cannot find common ground in times of crisis, then the French parliamentary system will again face the double danger of resurgent extremism on both right and left—with the Communists imposing "unity of action" on the left.

The Sevenpenny Egg

CONSUMER resistance has been rediscovered and in the last few weeks has become a household word. It has successfully forced reductions in prices of mutton, pork and bacon, and this week has brought the 7½d. egg down by a penny or so. The Ministry of Food's response to the outcry about egg prices has been to import 7½ million eggs from Holland immediately, and these Dutch eggs, selling—like Danish—at 5d. or 6d. each, will further bring down the price of home-produced eggs.

A seasonal price rise at this time of year was inevitable, but 7½d. was reached rather sooner than the Ministry had expected. Private trade could have responded quickly by importing, in small batches, from Europe; but all imports are still made by the Ministry of Food—and will continue to be until the present temporary system of marketing eggs is superseded by permanent arrangements. The present arrangements leave much to be desired. One criticism is that eggs reach the shops via the packing stations, which grade them but also make them at least slightly less fresh; they ought to be stamped with the date. But the main

weaknesses of the scheme are that the prices guaranteed to the farmer are too favourable during the flush season, and that imports are controlled. It is right that the support price should encourage production in the off-season. It is not right that failure to import should have sent the retail price some 3s. a dozen above the guaranteed minimum for this time of year. Nor is it fair that the higher prices in the off-season should not be compensated by low prices in the flush season. People would have less reason to complain of 7½d. eggs if they had been able to buy them at 3d. in April and May. As it was, the price never fell below 4½d. for grade A eggs. This gives a much narrower price range than was usual before the war when peak prices were some two and a half times the lowest prices.

The farmers' representatives are no partisans of the egg marketing scheme, but their complaint is that they were not properly consulted. When a permanent scheme is evolved they would probably fight any proposal to reduce the support price during the flush season. Yet unless prices of home-grown food are made more flexible, according to season and quality, the Agriculture Act itself may well break down under the pressure of this new consumer resistance.

Full Granaries

THE farmers have been hurrying to bring in the harvest while the good weather lasted. Wheat is reported to be standing well, but barley and oats have been somewhat damaged by July's storms. It appears that there will be at least 200,000 tons more wheat than there was last year, but 60,000 less barley. The oats crop will be about the same as last year's.

Even in cereals expanding home production has become almost an embarrassment this year. Some 22,000 combine harvesters are hard at work, filling the granaries to overflowing. In earlier years the farmers have just managed to dispose of their grain because millers and compounders were required to absorb a certain fixed proportion of British grain. There was, moreover, considerable inducement for the millers to do so because British prices were below world cereal prices. That position is now reversed. Since the grain trade was freed at the end of July millers can buy where they choose; and as world prices are falling, they might well have preferred to buy

Sand into Shells

A mixture of dry sand and a special heat-hardening BAKELITE Resin is dropped on to a heated metal pattern. A strong, light 'shell' is formed, which makes a very suitable mould for metal castings. It sounds simple, but the process represents a revolutionary advance in foundry practice. It means cleaner, more accurate castings that need little or no machining. The development of a suitable resin is another example of the practical benefits to industry that flow from Bakelite Limited's research. The story of plastics is already a long one, but new pages are being written every day — by the organisation whose pioneering efforts were mainly responsible for the general adoption of these versatile materials.

BTH Industrial Motors

BTH is particularly well placed to meet the needs of Industry for electric equipment in general—D.C. and A.C. (single or polyphase) motors and associated control gear in particular. Present day production represents the results of over fifty years' continued progress in original research, design, and manufacture, of all types and sizes of rotating electric machines—second to none in performance and reliability. No manufacturer can offer a wider choice in electric motors. Whatever the conditions of service or type of drive there is a BTH motor well suited to the job.

imported grain. The Ministry of Food, however, has persuaded the millers to agree to buy British wheat if it does not sell adequately by ordinary marketing. This agreement is described on page 528. The millers will not lose by it, for the Ministry will reimburse them for any difference between the world and home prices. The farmer, on the other hand, will soon be able to make a profit on feed-grains, by buying imported grains and unloading his own on to the Ministry.

The arrangement with the millers should mean that the storage problem is not, after all, unmanageable—at least this year. But whatever the eventual arrangements for marketing grain, it is clear that the farmers themselves ought to make a great effort to increase storage and drying capacity in line with the great increase in the number of combine harvesters.

Dr Malan's Tactics

IN postponing for another month the crucial third reading of his South Africa Act Amendment Bill, Dr Malan is hoping to gain time to divide his opponents and thus ultimately get the dozen odd votes he needs for a two-thirds majority of both Houses. It is a shrewd move; but many observers have mistakenly assumed that Dr Malan in deploying this tactic is playing for time to avoid the humiliation of defeat.

The basic strategy guiding Dr Malan's actions remains unchanged: it is to divide his opponents and to deflect criticism from sensitive sectors, such as the country's economic difficulties. He has already succeeded in disintegrating the once united opposition front, which has now split up into four separate and hostile factions. But this is only the first objective; more important is the plan to break up the United Party (UP), and already there have been some ominous signs. Indeed, some UP members have seemed to be on the brink of deserting to the Nationalist side. Dr Malan judges—he may be right—that time will bring them meekly into his fold. If this fails there is another alternative. Dr Malan knows that under the present weak UP leadership the party's conscience on the constitution question is a greater obstacle to a rapprochement with his own Nationalists than any fundamental difference on the principle of white supremacy. Many

UP stalwarts would like to separate their pledge on the sanctity of the constitution from the particular problem of the coloured voters' representation. Hence if Dr Malan could discover a formula that satisfied his basic aim of removing the coloured voters from the common roll, yet at the same time left the UP with its conscience nominally intact, he could have his two-thirds majority and more for the asking. He needs time, however, to make the necessary soundings in his own party, as well as in opposition circles both inside and outside parliament.

A protracted political crisis, however damaging to the country's economic position, is not unattractive to the Prime Minister. As the recent budget debate showed, the opposition groups can quickly mend their ranks and make an effective stand against the government once the debate is shifted from the sensitive colour question. Dr Malan's tactical manoeuvre is, therefore, not a sign of weakness but rather an intelligent assessment of his opponents' differences.

Molotov's Dud

MR MOLOTOV's latest Note to Germany is a heavy dud that has landed in the western lines without exploding. It should not seriously worry Dr Adenauer in his election campaign. It is even slightly ridiculous to observe so clearly the workings of the Soviet Foreign Office; readers of the Note are almost in the position of attending the conferences at which it was decided that the Soviet Union could not afford to leave the western powers with the initiative on German unity. Though Molotov had only just replied to the western proposal for a conference on Germany by saying that the agenda must cover the world, he now blandly writes that there must be a meeting on Germany alone. This is all too clearly propaganda for the German elections.

But the propaganda is not even good, because it contains no concessions which point to German reunion in freedom. In his well-known repetitive, dreary style, Molotov has served up the old proposals made in Stalin's day, with a few embellishments. The Potsdam agreement is still to be the basis for establishment of a "peace-loving, democratic" Germany; the all-German government that is to take part in treaty negotiations is still not to be a freely elected body, but one nominated from the Grotewohl and Bonn governments, with participation of the Communist-dominated "mass organisations." This temporary all-German body is supposed to organise elections which would certainly be conducted in a way that would safeguard the Communists.

All these proposals have time and again been rejected by the West Germans, including the Social-Democrat party. It has repeatedly been pointed out that the East Berlin puppets who rule less than eighteen million Germans have no right whatever to claim equality with the freely elected Federal Government, which governs fifty million people. This is doubly true since the revolt of June 17th disposed of any idea that Herr Grotewohl or Herr Pieck held a mandate from the East Germans. To offset the damping effect of his proposals, Molotov has thrown in an offer to stop taking reparations from Germany after next January and to limit occupation costs to five per cent of German budgets. To smooth over the fact that only the Soviet Union is exacting reparations, he proposes that post-war State debts should be cancelled. This is a reference to Marshall aid, and other

Allied relief to West Germany, repayment of which has already been very drastically scaled down at the London debt conference. Mr Molotov does not mention whether the Soviet Government intends to return the East German uranium mines or the important industrial plants that are now Soviet-owned companies.

Respite for the Copperbelt

THE strike which threatened to disrupt production at the Nchanga copper mine, and probably to exacerbate racial tension in its course, will not take place, at least for the time being. The African Mineworkers' Union has obtained a mandate to call a strike when it thinks fit, and has not formally withdrawn the demands that the mining companies hold to be unconstitutional in terms of Northern Rhodesian labour legislation. But the intervention of the Commissioner for Labour and Mines has at least induced the African unionists to hold their hand, and their president is leaving for an overseas tour.

The dispute arose because the African unions demanded the dismissal from the companies' employment of a number of men who appeared as witnesses against the union in the trial of its vice-president. He was charged with threatening violence to some tribal representatives on the copper belt who were invested with robes of offices by the companies without prior discussion with the union. The union's case was weak; but feelings ran high, and the issue was one on which the European workers were able to make common cause with the employers. A trial of strength at a time when federation of the Rhodesias and Nyasaland is being inaugurated, and elections lie ahead, would be bound to have had unfortunate political repercussions.

The union has chosen the wisest course; more important issues face it—notably that of the colour bar. Its action suggests that the leaders have realised that they must hold their strength in reserve. The colour bar issue is clearly linked with the principle of partnership embedded in the new federal constitution, and the time to test it needs to be carefully chosen. On this point the African union can command wider support; that its leaders have appreciated the strategic possibility is perhaps indicated in their request for informal talks with the Chamber of Mines to discuss "general industrial relations in the copperbelt."

Nurses' Quarters

THE recent memorandum from the Ministry of Health on accommodation for nurses tackles the question from the wrong end. With certain exceptions, there is nothing inherent in the work of a hospital nurse that makes it necessary for her to live in a "nurses' home." If she chooses to live elsewhere, there is no reason why she should not, provided that living out does not impair her efficiency or prevent her from conforming to her hospital's routine.

This is the conclusion reached by the nursing committee of the Central Health Services Council, and it is one that many hospitals are already acting upon. Both the committee and the Ministry recognise that, in their first year particularly, student nurses should live in. So, too, for different reasons should most ward sisters and their

deputies. But although other grades of nursing staff should be allowed to live out, it is doubtful whether most of them want to—at least as long as other accommodation continues to be scarce and expensive. Nurses who live in hospital pay a fixed sum annually for their board, lodging and laundry, varying from £145 for a sister to £108 for a student nurse. These sums would be quite inadequate to pay for their board and lodging outside hospital and their fares. Moreover, if they live out, they may have to pay up to £30 a year for their meals on duty and for the laundering of their uniforms. Unless they live at home, they are thus badly out of pocket compared with resident nurses.

The Ministry's memorandum, however, makes no mention of this difficulty. It gives the impression that there are large numbers of nurses anxious to live out and that hospital authorities are consequently spending big sums unnecessarily on nurses' homes. It is quite true that these homes are costly and often unnecessarily so because of the elaborate standards of equipment and amenities. The Ministry of Health is right to emphasise that accommodation could be provided more simply. But it is optimistic to think that large capital sums can be saved by the expedient of allowing some grades of nurses to live out. Hospital authorities cannot act on the assumption that they need not provide accommodation for many of their nurses until the nurses in question are easily able to find alternative

Principles Before Party

The Session of Parliament, now virtually at an end... was marked by some important peculiarities; and the list we publish elsewhere of the number of public bills introduced, will show at a glance the immense number of measures and immense variety of business which have occupied the continued attention of Parliament. Much private business and many committees—election and others—have added much to the labours of Parliament, and have made this as arduous a session as ever met. Its most important result, however, is not engrafted into the statutes, though it may influence the formation of them for years. It will be remembered that the new Ministry opened the Parliament with a doubtful majority; before it closed almost all opposition had vanished. To that important result the character of the Ministers, and the confidence the public was disposed to place in them, powerfully contributed. But it would not have been sufficient had their measures not been distinguished by an earnest desire to do the duty expected of them in the best manner, and by great sagacity in finding the best means. Party has, by their mode of administering the Government, made way for principles; and at the close of the session the public think little of the men in office, but much of the measures they proposed. These, and their obvious sincerity and earnestness, made it evident that they were working less for themselves or a party—which, in fact, they scarcely had—than for the country, and rallied around them the reflecting and the wise of all parties. While they have studiously attended to their legislative duties in regard to our domestic concerns, they have not neglected our foreign interests or disparaged our honour. Their foreign policy has found no impugnors in Parliament; and they could not have been so zealous in promoting great financial, trade, and administrative reforms, had they not provided for the peace as well as the security of the Empire.

The Economist

August 20, 1953

lodgings, can afford to pay for them and have long enough periods off duty to enjoy their independence. The first condition is outside the Ministry of Health's control, and the other two would increase the hospitals' maintenance expenditure. Living-in should certainly not be insisted on. But in present circumstances, and provided the discipline of the nurses' home is sensible, it is as likely to attract recruits as to deter them.

Family Planning in India

IT is not often that the most significant part of a conference's proceedings consists in the inaugural speeches, messages and general formalities of welcome to the delegates. But it is no derogation from the interest and value of the recently published Report* of the third International Conference on Planned Parenthood to find this special significance in its preliminaries. The conference was held at Bombay in November of last year; it was inaugurated by an address from Dr S. Radhakrishnan, Vice President of India, and received cordial messages of welcome from Pandit Nehru and from a number of other holders of high office in the Republic. For many years India has provided the locus classicus of neo-Malthusian pessimism—an apparent demonstration of Asia's ineradicable propensity

People in Flight

THE REFUGEE IN THE POSTWAR WORLD.

By Jacques Vernant.

Allen and Unwin. 827 pages. 45s.

A SMALL stir was created last year when copies of a preliminary version of this report were given to United Nations delegates. Half a dozen governments protested at the way in which their treatment of refugees was described, and an attempt was made to suppress the report. Happily, this failed. The talented Secretary-General of the Centre d'études de politique étrangère—France's "Chatham House"—has been able to complete the task which he accepted two years ago. M. Vernant was invited by the United Nations High Commissioner for Refugees to undertake, at the costs of the Rockefeller Foundation, an independent study of the position of refugees in various countries. With the aid of an energetic team of eleven investigators, who between them have covered an astonishing amount of ground, he has

produced a remarkable work, which will surely join Sir John Hope Simpson's prewar study as a classic in this field.

The interim version of M. Vernant's report comprised a brief review of the origins of the various groups of refugees, an account of the international bodies concerned with their fate, and a detailed review of the conditions they encounter in most of the countries of western Europe, and in Egypt, Syria and the Lebanon. To this have now been added sections on Israel, the United States, Canada, Australia, New Zealand, the ten republics of South America, Mexico, Guatemala and the Dominican Republic, and on the European refugees in Shanghai who, unique in remaining on Communist territory, now present the High Commissioner with one of his most painful problems. But M. Vernant, who is interested in human facts, not organisational quirks, has seen no reason to restrict himself to the High Commissioner's mandate, and accordingly he has added further chapters on the refugee

to nullify, by mass breeding, any material betterment that modern science and technology might provide. Moreover, Indian mores and religious convictions seemed to oppose an insuperable barrier even to the distant hope that the spread of education and the influence of industrialisation would ultimately bring a solution.

The solution is still remote; but at least the myth of the insuperable barrier, the irrational and universal fertility-cult, can be regarded as officially discredited. One could easily make a list of countries in which any international conference on family planning would be banned outright; India welcomed it. One could make a longer list of countries where such a conference, even if tolerated, would certainly have to get on without the outspoken moral support of the Prime Ministers, Vice Presidents, and Commanders-in-Chief. It is true that the official Indian policy on birth control makes a cautious compromise with religious susceptibilities; but few countries go so far as to have a positive official policy at all. And among the forty papers reproduced in the report, ranging from the most general discussion of population problems to the most technical accounts of current medical research, there can be found surveys of opinion and cultural attitudes which provide solid, though necessarily limited, evidence that the minds of the ordinary people of India, as well as their statesmen's, are accessible to the common sense of family planning. From cultural, economic and technical standpoints alike the problem of establishing a demographic equilibrium in India remains immense. But the spirit in which that problem is being tackled could be emulated with advantage much nearer home.

problems in India, Pakistan and Korea. It seems hardly fair to complain of an omission in so thorough a survey; but the lack of reference to Finland is curious.

The absence of official endorsement and freedom from governmental inhibitions have enabled M. Vernant to make this prodigious study surprisingly human. Embedded in the wealth of necessary detail are many poignant and even domestic reminders that refugees are individual men, women, and (too often) children. There are the Russians, ejected from Yugoslavia after 1948 but preferring refuge in the west, throwing their 1946 Soviet passports out of the window as their trains neared Trieste; the Spaniards who manned some of the first tanks to enter Paris with General Leclerc; the Yugoslav who became the darts champion of Staffordshire. Again, in discussing whether Britain might have done more for the "hard core" of refugees left on the Continent, the report comments:

The uprooting after years, and for the second time, of old or invalid people, and their transfer, even in better material conditions, to a land of little sunshine and much rheumatism is not necessarily a benefit.

But this leavening of humanity has not prevented the investigators from looking coolly and sometimes very critically at the reception given to the refugees in each country. Charges are levelled, quietly and with a convincing back-

ground of fact, of bureaucratic callousness, racial discrimination, and ruthless exploitation of refugees' wretchedness in a number of countries. M. Vernant has no illusion that every refugee is an angel of light, and he is also at pains to give credit wherever reception and resettlement have been efficient and humane; but his picture as a whole is inevitably sombre. If, in general, the refugee is today less often an object of political suspicion, he nevertheless finds many new barriers in the way of his efforts to rebuild his life; and the fact that most of those barriers are economic makes them all the more difficult to remove.

Apologia for Franco

SPAIN RESURGENT.

By Sir Robert Hodgson.

Hutchinson, 260 pages. 21s.

IN 1937 Sir Robert Hodgson was called back into service by the Foreign Office to act as "Agent" with the unrecognised "Nationalist" Government of General Franco; he had held a similar position in Moscow in 1919, when the Russians were beyond the diplomatic pale. As the title suggests, these are no mere memoirs of a British Agent; this Sir Robert is a man with a mission. It is, in his own words, to rehabilitate Spain in the eyes of public opinion as "the vital part of Europe she is in fact" and to bring home to people "the errors, moral and factual," committed in outlawing Franco's Spain.

It is the first and only intelligent book on Spain in English written deliberately as an apologia; yet it may well be what the Spaniards call *contraproducente* (having the opposite effect to that intended). The crafty Galician may, indeed, take credit, as he did in a speech on June 5, 1939, for the *habil prudencia* of Spanish foreign policy; and we all know that he led Hitler up the garden. But the effect of Sir Robert's unimpassioned examination of the Franco phenomenon and the Caudillo's behaviour during the War (based on unimpeachable evidence from diplomatic documents and memoirs) is utterly damning.

Sir Robert's chapters on the Spanish political scene are an odd mixture of prejudice and good sense, of accurate fact and McCarthy-like invention. Thus, he records faithfully trivial yet important facts, for instance, that the crowd surging round the Royal Palace on the night of April 14, 1931, was an entirely friendly one and that Queen Ena was able to take her leave unmolested; he relates with consummate fairness the facts of intervention in the civil war—and is even open-minded about Guernica; and he justly condemns the treatment of Luis Companys and Besteiro, neither of whom could ever be described as hirelings of Moscow. Yet, because of insufficient knowledge and an anxiety neurosis about communism, he talks a deal of nonsense about the Spanish Republic. "No fewer than 33 Cabinets, including every shade of Left

thinking" is, for example, not just foreshortening but a complete travesty. The governments of the Second Republic (before the military rising and its stimulus to war-communism) were composed exclusively of liberals of varying shades; they never included any socialist wilder than the late Ernest Bevin, let alone a communist. The author admits, indeed, that, at the time when the monarchy fell, communism was both unimportant and unpopular; and, in fact, it remained so until some months after the outbreak of the civil war. Another *gaffe* is to talk of the opposition to Primo de Rivera as including "particularly Socialists inspired by the doctrines of the Comintern" when, actually, the principal Labour-Socialist leader, Largo Caballero, secured the passive support of the trade unions for the dictatorship, and he himself accepted membership of Primo's "National Assembly."

Part II, on the other hand, is a real contribution to history, even though it only puts together information already available in scattered form. It begins with a detailed account of the Tangier episode (1939-40) and then goes on to discuss Franco's deeds and misdeeds in the light of Anglo-Spanish relations, Spain and Germany, Spain and the United States, Spain and Italy. The final chapter covers developments up to the late summer of 1952.

The book is in many ways a commendable piece of work; but it is spoiled by its determination to make a case.

The Changing Law

THE CHANGING LAW.

By Sir Alfred Denning.

Stevens, 122 pages. 10s.

LORD JUSTICE DENNING is a great enthusiast for the common law, probably as much because he thinks it can change as because he thinks it worth changing. This book contains the text of a series of lectures he delivered, mainly at universities, on this theme. It is startling to find that those to whom the individual turns for the certainty of justice feel themselves free, indeed feel compelled, to change that law as, one might almost say, those who come before them want it changed. What certainty is there left?

Two chapters illustrate what goes on in a common lawyer's mind; one concerns the rule of law in a welfare state, the other the rights of women. Over the first, the fear Lord Justice Denning had was that the rule of law would be brushed to one side by the mounting power of the administrative machine and that the welfare state would come to mean a society in which the official decided what was welfare and who should have it, with no means of redress available to the individual. He proceeds to recount, happily, those instances in which the courts have been able to establish their controls over the administrative machine (and a satisfactory collection they are). But what the courts have been doing is establishing what they

think the relation between judiciary and executive should be.

In the chapter on the rights of women the recital is very much the same. Out of the apparently sterile material of the Rent Acts, for instance, the courts have been able to lay down quite broad principles, of great social importance, on the duties a husband owes to his wife and family, and which the courts will defend against third parties. But here there is some slight difference in the approach. In the case of the state machinery, the courts thought as common lawyers; over the rights of husband and wife they have tried to think as the man or woman in the street does, and the twist in the emphasis is an interesting study in itself.

Of course there are limits to the changes that the courts will permit themselves to make. The High Court recently declined to allow a sessions court to sidestep a prosecution under the order which fixed the price of steel. There must be limits, too, beyond which the courts should not go. But, in Lord Justice Denning's hands, the common law becomes alive and human, and for that demonstration one owes him gratitude.

English Rock

GEOLOGY AND SCENERY IN BRITAIN.

By T. G. Miller.

Batsford, 224 pages. 18s.

IT is fitting that the firm of Batsford, producers of so many books on the British countryside, should now offer what is in effect a geological introduction to their own series. Mr Miller begins his account of the influence of the rocks upon scenery and even on people's lives with a brief explanation of how they are made and of how these islands have been built in the successive geological ages. Thus instructed, the reader can pass to the major portion of the book, which contains a series of most interesting accounts of the geological individuality of the various regions of England and Wales (not, in spite of the title, of Britain) and of how this is reflected in scenery. The book is illustrated by a series of excellent maps and diagrams: Wales, for example, is shown with its various rocks like the skins of an onion—although here rumpled and there sliced away—in an unforgettable picture of a geologically confusing country. It is a pity that at the end of these stimulating chapters the reader will find no reference to more detailed works: the regional handbooks of the Geological Survey might, at least, have been mentioned.

The feature that distinguishes Mr Miller's book from more orthodox geological works is his sense of continuity, of the geological past reaching forward to be with us in mines and factories, towns and villages, today. Such an approach is a welcome change from that of the usual perambulating topographer, but has its own danger of a too simple determinism. The mining

landscapes which the writer describes so well could not have been developed without the occurrence of coal and iron in the rocks. But the fact that they grew up where, when and how they did is not purely a matter of geology; it is dependent also on a whole series of technical, economic and social circumstances. Even the natural scenery as it existed before the intervention of man is not directly related to the rocks; it depends, too, on the way that these have been sculptured by rivers, seas and other agents of erosion in geologically recent times.

Nevertheless, of all the influences upon scenery, it is geology that is fundamental, and Mr Miller's fascinating account of the nature and structure of the rocks which lie beneath the diverse regions of England and Wales should attract all country-lovers. It will surely stimulate many to an interest in a science in which the amateur can still find satisfaction.

Eighteenth Century Taxation

THE ENGLISH LAND TAX IN THE EIGHTEENTH CENTURY.

By W. R. Ward.

Oxford University Press, 188 pages. 21s.

AS every schoolboy knows, the eighteenth century in England was an age of administrative inertia. This full and scholarly account of the land tax, the latest addition to the Oxford Historical Series, amplifies and, in general, confirms this conventional judgment. What had been designed as a tax on income rapidly became a rate confined, with minor exemptions, to landed incomes only; and the collection of that rate became progressively less efficient. No attempt was made, though the possibility was often canvassed, to reform the tax and base it on a fresh and accurate assessment, and the attempts that were made to improve the actual collection of the tax had no significant success. Why the collection was inefficient is now reasonably clear: the men responsible for assessing and receiving the tax were amateurs; they were allowed inadequate expenses for their work, and therefore sought to recoup themselves by retaining large balances of the tax receipts and lending them out on interest; and the central government, even when it had the will, lacked adequate means of controlling the Commissioners and Receivers. Nor perhaps did it matter that the government had to wait a long time for its money; the state had to anticipate the delayed revenue by short-term borrowing, but, even if the interest so incurred is included, the administrative costs of the land tax compare not unfavourably with those of the customs and excise, which were in the hands of professionals.

It did, however, matter a great deal that the tax was based upon assessments made in the late seventeenth century, and that it failed therefore to tap the increasing wealth of the country. The problem which this created for the

finance of the wars of the eighteenth century is clearly described by Mr Ward, who shows how the pressure of the struggle against the American colonies at last stimulated attempts to reform the English financial system. When Pitt introduced his income tax at the end of the century, it did not, like the land tax a century earlier—indeed, like all earlier attempts at direct taxation—degenerate into a rate based upon stereotyped assessments, and this is a measure of the administrative achievement of the last two decades of the century. Effective direct taxation is something relatively recent in English history, and Mr Ward's study of the failure of the eighteenth century land tax sheds a revealing light on the way in which the necessary administrative conditions for an effective tax on income were created.

It is odd that we should have to wait so long for a history of the land tax, and even now it is not a complete history, for Mr Ward deals primarily with administration and politics and is not concerned with the economic effects of the tax or with contemporary economic thought on the subject. But within the limits he has chosen, he has produced a thorough and intelligent piece of work. No one is likely to choose this book for holiday reading, but no one will need to rewrite this particular chapter of administrative history.

The Liner Conference

INTERNATIONAL SHIPPING CARTELS.

By Daniel Marx, Jr.

Princeton University Press (London: Geoffrey Cumberlege).

323 pages. 40s.

THE title of this book is, perhaps, a little misleading. If a cartel is taken to be, according to Webster, "a combination of separate firms to maintain prices above a competitive figure," then it is open to doubt whether the word can properly be applied to the liner conferences which are the subject of Professor Marx's admirable study. As he explains, there is nothing in common between a liner conference and a combine of shipping companies linked by shareholdings or common ownership of assets. It was the tendency towards international shipping "mergers" at the beginning of the century, nevertheless, that largely gave rise to the suspicions of monopolistic practices which were examined by the Royal Commission on Shipping Rings in Britain and the "Alexander Committee" in the United States. The author analyses the findings of these committees in considerable detail, and faithfully examines the various developments of the liner conference system since these reports. His principal sources of evidence are the large volume of decisions, or "reports," of the successive American Government agencies set up by the Merchant Shipping Act, 1916, to regulate the commercial practices of shipping in the foreign trade routes of the United States.

It is surprising that the author, after sifting so much evidence and weighing so many pros and cons, has been able to arrive at any conclusions at all. His findings can be briefly summarised as follows: (1) self-regulation by the industry (through liner conferences) is necessary to prevent cut-throat competition and to establish a workable tariff, with differential rates, which takes into account the "traffic mix" and the competition of alternative sources and markets; (2) unilateral regulation—for example, by a Government agency—is needed to prevent undue discrimination and other monopolistic abuses; and (3) competition is required to provide incentives for efficient operation and to prevent excessive profits from being earned for too long. In fact, he finds that the present system—the international liner conference—is probably the most satisfactory. But he would add to the American procedure of governmental regulation—which incidentally is exercised by an agency whose prime function is the promotion of the American merchant marine—a regulation of the system by a supra-national agency, such as the proposed Intergovernmental Maritime Consultative Organisation.

Text and Reference Books

THE ISRAEL ECONOMIST ANNUAL, 1952.

Edited by E. Kollek.

The Israel Economist (Jerusalem). 352 pages. £3.

The fourth edition of this annual covers a wider field than its predecessors, but continues the previous pattern of sub-dividing the economy into distinct sections discussed by experts. The book deals mainly with 1951, but some information about the early part of 1952 is given, including developments associated with the new economic policy introduced in February, 1952.

BIBLIOGRAPHY ON INCOME AND WEALTH. Volum II 1948-49.

Edited by Phyllis Deane. International Association for Research in Income and Wealth.

Bowe and Bowes. 109 pages. 37s. 6d.

The second volume in this series covers the literature published on national income and wealth during the two years 1948 and 1949. There are over 800 cross-referenced entries and, as in the first volume, these entries are based on reports compiled by national income scholars in a large number of countries.

QUIN'S METAL HANDBOOK, 1952.

Edited by K. V. Henderson.

Metal Information Bureau. 752 pages. 25s.

The thirty-ninth edition of this standard reference book on ferrous and non-ferrous metals has been considerably enlarged, and by postponing publication by a few weeks the statistics are three to six months more up to date. Details are given of prices, production, consumption, exports, imports and stocks in all the important producing and consuming countries, and the data on prices of lead, zinc, iron and steel now include Continental countries. Its useful glossary of technical terms in English, French, German and Spanish has also been expanded.

Letters to the Editor

Labour and Korea

SIR—In your issue of August 15th, after referring to a letter in *The Times* of August 12th by Mr Patrick Gordon-Walker and myself about the 16-nation declaration on Korea, you talk of the “baffling forgetfulness and irresponsibility with which former Labour Ministers now speak.” Surely it is desirable that these serious issues should be discussed in a temperate and clear-headed manner. You go on to say that they (the reader would take this to mean Mr Gordon-Walker and myself among others) “are consistently opposed to the British Government showing any firmness anywhere.” This is a mere reckless use of language. The Labour Party publicly supported the decision to join instantly in resisting aggression in Korea, and carrying on inflexibly until an Armistice was achieved. But to see no distinction between thus establishing the principle of stopping aggression and confirming the moral authority of Uno on the one hand, and making empty threats against China on the other—if you really do not see it—argues an extraordinary blindness to the issues at stake in the world.

An extended war in the Far East would be disastrous, just because nothing could be more welcome to Russia, and dangerous to the democracies, than to have big American forces heavily embroiled with China. The danger to Western Europe would be much intensified. Is this not why Stalin so plainly welcomed, and prolonged, the Korean war?

Again, such a war, or anti-Communist crusade, would alienate the vast and stirring forces of Asiatic sentiment—from Indonesia to the Middle East—away from the democracies and push them towards Russia. It is yourself, I assure you, who, by apparently contemplating such a war with equanimity, are “providing *Pravda* with its most telling points.” Is it really too much to hope that you will abandon your extremist attitude, and use your influence to seek to explain the British point of view—largely bipartisan—on these crucial issues to your American readers?

Finally, you are again playing with words in arguing that a limited understanding to retaliate against bomber bases used to attack troops in Korea is a more serious commitment than a statement that “in all probability” (you ignore the operative words) the general war would be extended.—Yours faithfully,
DOUGLAS JAY
House of Commons

[Our criticisms specifically related to the attitude of Labour in opposition; Mr Jay's

examples of the party's ability to stand firm occurred while it was in office. That, indeed, is the point. There are, of course, some differences in the surrounding circumstances between Mr Morrison's pledge in 1951 and the sixteen-nation declaration of a few weeks ago. But they are small, and, whether it be “extraordinary blindness” or not (we leave our readers to judge), the only difference that seems to us to explain Labour's present indignation is that then the party's nose was kept on the grindstone of responsibility and now it is not. (Why, incidentally, does Mr Jay say that the Morrison pledge went no further than retaliation against bomber bases in Manchuria? In the only form in which it has ever been made public, it was not so limited.)

When Mr Jay accuses us of contemplating a general war in the Far East with equanimity, he is being neither temperate nor clear-headed, nor is he avoiding recklessness of language. He knows perfectly well that the difference between him and us is one of how best to avoid such a war. We hold that a purely one-sided promise not to fight is the best way of bringing it on.

Finally, we note with surprise his view that it is the duty of a journal of opinion to urge opinions which it thinks to be wrong whenever they are said (on what evidence we do not know) to be “largely bipartisan.” He flatters us too much, and rates his own party's clamorous powers too low, if he thinks any of our American readers take our own views to be those unanimously held in this country. Nor, we assure him, is it *The Economist* that is quoted with approval in *Pravda*.—EDITOR.]

Ariel and Caliban

SIR—As you have frequently pointed out, the arguments for a change in the organisation of British broadcasting tend to confuse arguments for and against competition with those for and against commercialism. There are strong justifications of principle for competition, but the justification for commercialism can only be expediency: that adequate finance cannot conveniently be found in any other way.

One reason for suspecting the supporters of sponsored television is that commercialism and profit-making are at least as far forward in their minds as competition for its own sake. They are silent about broadcasting competition in fields where profit opportunities are less spectacular than in television. Nothing is being said in the present debate about the suggestion that voluntary bodies, such as universities, might be allowed to set up their own low-power broadcasting stations. Nor do there seem to be any proposals that small-scale private enterprise should be given opportunities to establish sound broadcasting stations, or to develop wire-broadcasting beyond its present narrow limits. Yet, as the

experience of other countries shows, there are no real technical difficulties facing immediate development along these lines.

Technical and economic conditions must assure that competition in television can only be between a very small number of monster organisations. If the principle of competition in the dissemination of ideas is important, the field in which it can be applied most fully is that of sound broadcasting.—Yours faithfully,
A. C. L. DAY
London, W.C.1

Outpost on the Adriatic

SIR—In your issue of July 18th you published an article on Albania. May I point out an error of fact? Towards the end of the article, when talking of Italy's attitude, your correspondent writes: “About their own aims the Italians preserve silence.”

I would like to point out that the Italian attitude during these last years, as stressed by Count Sforza and Signor De Gasperi, has always been clearly based on the principle of Albania's independence. This attitude was quite recently confirmed in an official declaration of the Italian Ministry of Foreign Affairs (May 7th) stating that “Italian policy towards Albania could be embodied in these three points: Liberty, Integrity and Independence.”—Yours faithfully,
F. ANTINORI
Italian Embassy, London, W.1

Kenya's Future

SIR—Far from being blind to the necessity of adopting a constructive policy towards the future, as you suggest in your Note of August 8th, many of the settlers were, even before the present emergency, putting forward schemes for the improvement of living conditions in the African areas. The Electors' Union of Kenya, a settler body of which I was for some time executive officer, has for a long time been urging the adoption of comprehensive measures for Kikuyu rehabilitation. As long ago as 1946, upon the advice of a prominent District Commissioner, carefully thought out schemes for African village settlement, on lines very similar to the system subsequently adopted with notable success in Malaya, were submitted to Government and a memorandum on the subject was put before the Colonial Secretary of the day. These schemes are included among other memoranda being submitted to the Royal Commission by settlers.

For some time, the European elected members have regarded the working out of a future policy as being of primary importance. Mr Michael Blundell stated at a public meeting recently that a future policy programme is already in being and will be produced when the time is opportune.—Yours faithfully,
R. E. KENDALL WARD
London, W.1

THE CASE OF THE TRAFFORD TILE

Asbestos-cement tiles like this were used to roof a whole group of factories (a Burroughs one included) near Glasgow. If the stock control system in a Manchester office had failed, some components might not have been at the right place at the right time...

The factory roof had to be assembled in the office!

SOME TIME AGO, Turners Asbestos Cement Co. Ltd., a member of the Turner & Newall Organization, found itself with a pressing stock-record problem. The company's six factories turn out all manner of asbestos cement products, large and small, and, at the central office in Manchester, the management was finding it increasingly difficult to handle a rising volume of stores transactions. In operations that needed most accurate co-ordination (as in the distribution of supplies of roofing in Scotland) day-to-day knowledge of the exact stock position and location became imperative. Were all the components on the spot? Were there hook-bolts enough to secure the tiles?

It was at this point that the collaboration of the machine-accounting specialists of Burroughs Adding Machine Limited was invited to assist in solving the problem.

After investigation Burroughs suggested the installation of their latest Multiplying-Accounting Machines at

the Trafford Park Works of Turners Asbestos Cement Co. Ltd. By use of these machines, Purchasing Orders, the Stores Ledger and its Journal Audit proof sheet could all be calculated, extended and posted automatically—stock balances for all the six factories appearing at a glance on one card.

Result: The Stores Accounts system now gives a continuing picture of the exact position in all the factories. The Chief Stock Controller can tell at a glance the value of total stock and the stock balance at any plant. This system, with its absolute proof of accuracy, makes ordering and controlling possible far in advance of requirements.

What about you? If your business could benefit from faster and more accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and

Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service guarantees its efficiency in operation.

Call Burroughs today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service offices in principal cities round the world.

At work on the Stores Ledger for Turners Asbestos Cement Co. Ltd., is Miss Lilian M. Hopson. She is using one of the Burroughs Multiplying-Accounting Machines that helped to solve the Case of the Trafford Tile.

Indispensable cardboard

We all use board. It is part of our modern way of living. The man in the street calls it "cardboard" and takes for granted the ubiquitous cartons and fibreboard packing cases which play so vital a part in protecting and delivering his food and other necessities. Similarly he ignores the binding on his books and the wallboard in his home. But where would he be without these things?

Making "THAMES BOARD"—and "FIBERITE" packing cases—is the business of Thames Board Mills Ltd. This unique organisation—the largest of its kind in the British Empire—has increased its productivity fifty times in fifty years. Half the immense quantity of packaging board made in this country comes from the two mills of Thames Board Mills Ltd—a worthy example of essential service to the nation.

THE COST OF DRYING THINGS

Millions of tons of fuel are used in Britain every year in drying processes, many of which are inefficient and wasteful.

When coal was cheap no one worried unduly, but today the cost of fuel used in drying is a serious expense item which tends to get buried in general overhead without receiving the close control given to economy of raw materials. Furthermore, many drying processes are as ineffective as they are extravagant.

Eight years ago, we started a specialised service to the Metal Goods Industries by providing Gas Infra-Red Tunnels for drying paints and varnishes. Today our techniques have wide application as varied as those employed in fish curing and textiles.

We are ever looking for new drying problems to solve. Nearly every industry has one. Send yours to:

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Republican Score

Washington, D.C.

WHILE the Democrats have found life in opposition pleasanter than they had expected, the Republicans have discovered that the fruits of victory are much less appetising than they looked from a distance. When the first session of the Eighty-third Congress ended, neither the Administration nor the Congress was praised with much enthusiasm—even by their most fervent supporters in the press. *Business Week*, for example, which is edited by one of Mr Dewey's ablest advisers and which supplied the White House with its economic expert, found the record "not impressive" and the *New York Times* said: "It certainly leaves a great deal to be desired." The Luce magazines became more personal, with *Life* publishing an attack on Mr Roger Kyes, the Deputy Secretary of Defence. And Mr Joseph Harsch of the *Christian Science Monitor* called attention recently to the "widespread, almost universal, really appalling decline of European confidence in American leadership."

Nevertheless, if one concentrates on the domestic picture, General Eisenhower and his Cabinet seem to be, at the moment, in the position of a team which, with the help of some luck and a few desperate stratagems, and despite some missed catches, finds itself level at the end of the first innings. No advantage has been won, but no fatal mistakes have been made and everything now depends on the second innings. There is no harm, however, in pointing out that the Republicans could have made better use of winning the toss and reminding them that they will have to play the rest of the match without Hutton. For it is still impossible to say for certain how serious the loss of Senator Taft will prove to be.

Mr Walter Lippmann has described the last few months as an experiment in making the Presidency into a constitutional monarchy, an experiment which called for someone to fill the role of party leader and Prime Minister. Mr Taft tried to fill it—something that no Senator has ever done before—and yet, even with his unique position in his party and his great experience, the experiment had, in Mr Lippmann's view, been working very badly. Now Mr Taft has gone and the President is, as far as his theory of government is concerned, back where he started. Much of what he has learned during the past session is irrelevant to the next one because the key to many of his successes and failures is no longer there. Mr Lippmann thinks that Mr Eisenhower now has no choice but to recognise the facts of American political life and the nature of the Presidency

and to use his enormous personal prestige to recover and to exercise its powers.

Much will depend on the attitude of those members of both Houses of Congress who, in the past, followed Mr Taft blindly. If they decide to follow General Eisenhower, as the only alternative, and to do so equally blindly, it will not only be easy for him to assume the leadership; it will also be hard for him not to do so. If, on the other hand, the tendency of legislators to stick together reasserts itself, the leadership of much of the Republican party in Congress might pass into dubious hands. Among the possible leaders, there are none who could fill the role assigned by the President to Senator Taft and few with such sturdy beliefs. A wave of sorrow was felt at his death by many who regularly found it necessary to complain of his opinions.

Mr George Orwell once pointed out that Rudyard Kipling was further from being a Fascist than the most humane or liberal person is able to be nowadays. The same was true of Mr Taft. Though he was born a quarter of a century after Kipling, he seemed sometimes to possess even less of a contemporary mind. It was, indeed, his inability to understand the nature of Fascism that led him to many of his more curious statements on foreign affairs. His undeviating opposition to Communism was more of an opposition to the Socialist content of the Marxist philosophy than to the idea of totalitarianism, which remained unreal to one who had the luck to be brought up in the United States at the beginning of the century.

★

Many of the Republicans in and out of Congress who accepted Mr Taft's leadership to a greater or lesser extent also look upon Socialism as the true enemy, though they have not the innocence, or the excuse for innocence, of what totalitarianism means. Only a few days after his death Mr Scott McLeod, that strange figure who, as Mr Dulles's security officer, possesses, and exercises, powers of official life and death over what is left of the Foreign Service and the State Department, told the American Legion of the State of Kansas that Mr Norman Thomas, long the Socialist candidate for President, had made the "astounding statement" that there had been Socialists who had worked "honourably" in the State Department. Mr McLeod's reply was that he would never knowingly employ a Socialist in a policy-making position, that he was opposed to retaining any who were employed and intended to remove them. It is a pity that the accident of timing robbed the

world of the spectacle of Mr McLeod standing with a flaming sword to stop Mr Ernest Bevin from entering the Department's door.

Mr McLeod is, in fact, prepared to go even further; he asserts—an assertion that cost Mr Dulles an uncomfortable ten minutes at a recent press conference—that he has the backing of his superiors for his intention to replace any “individual who cannot be re-educated along Republican lines.” The question that this statement inevitably raises is “What Republican lines?” The gulf between the party's moderates and its right-wing extremists is possibly the clue to much of the disappointment felt by Eisenhower-before-Chicago Republicans at this stage in the Administration's career. The President's passion for compromise, and the fact that his reputation was built on his almost unique ability to bring quarrelling factions together, has led him, in many cases, to the curious course of appointing the avowed enemies of his policies to carry them out.

It is probably no accident that those heads of departments and agencies, Mr Humphrey and Mr Stassen, for example, whose advisers all came from the Eisenhower wing of the party, are precisely the men who seem to know what they are doing. They never find themselves in the kind of embarrassing situation that is becoming common in Mr Dulles's life since he allowed the Bridges-McCarthy wing of the party to provide him with Mr McLeod as his Administrator of the Bureau of Security, Consular Affairs and Personnel. A party that has been out of power for twenty years must be given the chance to learn, even if it makes its own task harder by refusing to use any of the experience accumulated during that time. The muddles and indecisions of the last six months will not have been in vain if the moral of Mr Dulles's difficulties has been driven home.

The *Washington Post* recently congratulated the President on the exposition of his “middle-of-the-road” philosophy which he gave the Governors' Conference at Seattle, but there is more than one way of going down the middle of the road and more than one road to go down the middle of. Too often this Administration has suggested that it is not sure which road it is on and has seemed to think that the best method of progress is with one foot on each pavement. Otherwise the President's statement that he did not “give a hoot whether a Democrat or a Republican is in this kind of job, we are all Americans” would not be denied a day or two later by one of his underlings.

The Philadelphia Formula

FROM A CORRESPONDENT IN PENNSYLVANIA

ONE of the most obvious, if one of the least lovely, elements in “the Roosevelt coalition”—that combination of political forces upon which the two decades of Democratic rule were based—was the power of the big city bosses. From Chicago to Memphis, in Boston as in Pittsburgh, the voters were organised by long-established “machines,” based on patronage, on the kind of informal (and inefficient) social services typified by “Christmas baskets for the poor,” and on a judicious attention to the special needs and aspirations of the various minority groups, national, racial and religious, which, taken together,

comprise the great majority in most big American cities.

The primary function of these Democratic machines was to control the municipal government; the interventions in national politics which helped to roll up heavy urban majorities for Mr Roosevelt and Mr Truman were by-products of the system. Inevitably, there was a tendency to corruption in these machines, a tendency carried to flamboyant extremes in such notorious places as the Jersey City of Boss Hague or the Kansas City of the Pendergasts. Corruption survived because of the citizen's chronic habit of underestimating the importance of local government, and his despairing conviction that politics, at least at the municipal level, was a dirty business at best.

Occasionally a wave of reform in a city overthrew the old machine, but usually the amateurs who form the backbone of such movements soon became weary of the unfamiliar effort of politics, or were outmanoeuvred. In New York City, the late Fiorello LaGuardia was a sensationally successful reform mayor, but he made the mistake of thinking that the dragon was slain, and so failed to build up a political system capable of beating off the inevitable counter attack; as a result, once LaGuardia was gone, the dragon revived.

★

The one metropolis in which reform never seemed to stir was also the one in which the old machine happened to be Republican, not Democratic. This was Philadelphia, where the government had not changed hands (except through human mortality) for 67 years. The impoverished, vice-ridden “river wards” (slums by the Delaware River) regularly turned in mechanical majorities for the cynical bosses in City Hall. Such Democratic organisation as there was lived parasitically on the crumbs from the Republican table, on petty favours bestowed as insurance against any quixotic attempts to upset the profitable system. The confusion of the city's finances was a standing invitation to graft; the water supply was so foul as to be a national joke; the police had become specialists in the art of looking the other way; and businesses shunned Philadelphia because of the high cost of appeasing the political incubus of City Hall.

It was this last point that finally turned the tide. In the late nineteen-forties a reform movement grew up of which the core was the hard headed business community of the city. Bankers, industrialists and corporation lawyers found themselves in the unusual position of planning the downfall of a Republican administration. The old regime tottered; there appeared the tell-tale sign of “reforms” from within the machine, designed to head off real reform from outside. Finally, in 1951, the revolution came. In April, a new city charter, the fruit of two years' work by an able commission, was approved by the voters by a two-to-one margin. In November, the Democrats, enjoying the support of both of Philadelphia's leading newspapers—the *Inquirer* backed a Democrat for Mayor for the first time in its 123-year history—swept into office with the aid of countless votes from Republicans who felt that this was the one way in which their own party might at last be forced to clean house in earnest.

The new charter gave the Mayor strong powers, with an integrated administration, regrouped departments, clear lines of authority and, above all, real freedom from the meddling of ward politicians on the City Council. It also established as many safeguards as humanly possible for

sound finance, with clear-cut responsibilities, and compelled the auditing of accounts by an independent body. Guarantees of efficient public service were also set up; the civil service commission was no longer to be nominated by the City Council, but by the Mayor, and chosen from a panel named by such non-political figures as the President of the University of Pennsylvania and the heads of local business and trade union groups; the commission was allotted a minimum percentage of the total city budget, to prevent financial starvation by City Councilmen interested in enfeebling the non-political civil service.

Since taking office in January, 1952, the new city administration has worked hard and accomplished much. Merely to put the new charter into effect required a major reorganisation of almost every branch of the government. But serious dilemmas have arisen. Shall the new government concentrate on climbing out of the deep financial hole which generations of irresponsible practices have dug? If so, what about the badly needed physical improvements which would make Philadelphia water both potable and palatable, would bring the road system up to date, might even clean up the river wards so that political plagues would no longer flourish there? Too much financial probity may mean too few social services, and voters might then feel that even a return to Christmas baskets was worth while.

Again, how can the extension of civil service practices, with their firm prohibition of political activities, be prevented from destroying the basis of political support for the new regime? If the men and women most vitally interested in maintaining good government are kept muzzled in this way, will the field not be left to the “old gang” who are already working at the state capital in an attempt to undermine the charter by restoring part of the patronage system?

★

The reformers have tried to find substitute methods of building up strength at the polls, to replace the old, personal method of relying on those who have jobs with the city, or hope to have them. The highly personable Mayor appears regularly on television and his first annual report came out as a Sunday supplement to two major newspapers, instead of being enclosed in a glossy but narrowly distributed booklet. Efforts are being made to enlist the collaboration of citizens, individually and in local groups, on various local problems. But unfortunately there are indications that these techniques are inadequate. The administration recently failed to secure approval, in a city referendum, of a bond issue needed for certain capital projects. Some of the experienced politicians connected with the new administration may be doubting the practical wisdom of the reformers' oft-repeated slogan: “Good government is good politics.”

To the far away politicians in the Democratic National Committee, however, the Philadelphia revolution seems to point the way for the moribund party machines in other cities. The huge majority given to Mr Adlai Stevenson in Philadelphia last year was in marked contrast to the general picture of defeat. Mr Steven Mitchell, the Democratic National Chairman, is trying to spread the idea that Philadelphia provides a new and honourable formula for maintaining Democratic strength in the cities. Certainly the old machines are as obsolete as the gas lights that still burn in many a Philadelphia alley. But the new way will be infinitely harder to sustain, as well as to manipulate.

American Notes

Wheat Plays Safe

WHEAT farmers, voting on price support policy for the first time in more than ten years, have turned a cold shoulder to the Administration's argument that there should be less federal control on the farm, but they may have saved it from a sharp rebuff at the polls next year. By a majority of more than 87 per cent, the growers voted to accept restriction of their plantings through marketing quotas rather than to forgo the government's high supports for wheat prices. A national acreage allotment for next year's crop of 62 million acres has already been set; this is about 20 per cent below this year's plantings. But only when the farmers themselves approve the imposition of marketing quotas can individuals be fined for exceeding their share of the allotted acres. In return for accepting this restriction (which need not be as drastic as it sounds, for farmers are free to intensify their production) the government will support wheat prices next year at 90 per cent of parity, the price which it is calculated gives the farmer a fair return.

If more than one-third of the farmers voting had rejected marketing quotas, there would have been no effective way of enforcing lower plantings, and the support price would

have fallen to 50 per cent of parity, an abrupt decline from a support price of \$2.21 at the farm to about \$1.21 a bushel. With wheat prices already driven down 30 cents or more below the support level, through lack of storage space and speculators unloading, and with the prospective wheat carry-over the largest in history, farmers refused to take a risk.

Theoretically, this is a blow to the Administration and to Mr Benson, the Secretary of Agriculture, who quite rightly dislikes the high support prices which invite overproduction and believes the farmer would like to stand on his own feet. Mr Benson probably would prefer the flexible price support system which is scheduled to replace the

present 90 per cent guarantee for the six basic commodities at the end of 1954. But twice already Congress has postponed its coming into operation, as too great a gamble with the farm vote in an election year; it may do so again.

Advocates of the present high levels of federal aid naturally welcome the wheat referendum as a renewed warning to the Administration that it will tamper with the *status quo* only at its peril. But in fact the vote was not necessarily a fair reflection of even the wheat farmer's attitude toward more flexible supports; a drop to 50 per cent of parity would be much more drastic than anything contemplated by the reformers. The Administration, indeed, may be thankful that the wheat farmers have refused to take the full plunge into a free market in an election year; farm distress might mean the difference between a Democratic and a Republican Congress in 1955.

Budget Operations

THE public is now being given almost daily bulletins on the health of the budget, with details of how the army has stopped buying new brooms, government roofs are going unrepaired and Mr Dodge, the Director of the Budget Bureau, is paying official visits by taxicab instead of government-owned Cadillac. Unless some \$2 billion can be saved by such economies during the next three months, the government will find itself without enough money in hand to pay its bills, until the till is replenished by next spring's heavy tax collections, and without authority to borrow

"Guess What — Again"

Herblock in the Washington Post

enough to see it through. If that happens, Congress will have to be recalled to Washington to raise the ceiling on the national debt. It refused to do this before leaving, but could hardly refuse a second time, especially if convinced that there is no alternative by the Administration's much-publicised attempts to cure itself.

The crisis in this particular attack of deficit fever is expected about September 15th, which is also the date by which government departments must prepare themselves for a more serious operation, the drawing-up of the 1955 budget for the year beginning in July, 1954. This must be presented to Congress in January and has particular importance as the first for which the Republicans will have full responsibility. Mr Dodge has notified all government agencies, to their distress, that he will expect deep cuts in their estimated expenditure for 1955, going even further than those on which he and Congress insisted in the first flush of victory.

The economies necessitated by the borrowing crisis are to be continued and extended in order that adjustment to next year's reduced appropriations may not be too sharp, and agencies have been warned that no requests for supplementary appropriations will be considered. Most of 1955's savings are evidently to come from those government activities which were spared this year because the new Administration had not had time to review them. The first job of the new Chiefs of Staff, for example, is to review long-term contracts for weapons to decide where reductions can be made, and shipping and airport subsidies are, it is said, to be cut by 25 per cent. Departments are being urged to live out of their store cupboards instead of buying new supplies, and to sell off mortgages whenever possible in order to raise ready cash.

Here again government saving is being stressed partly because of its psychological effect on Congress. Even with all these economies, the only hope, and a faint one, of balancing the budget next year, and of avoiding another borrowing crisis in the autumn, rests in keeping corporation and excise taxes at their present levels, instead of allowing them to go down, as scheduled in April. The President has already asked Congress to deal with this, without success, and Mr Reed, who held up the extension of the excess profits tax in the House Ways and Means Committee for so long, is likely again to be adamant. He is interested only in a reform of tax legislation as a whole, on which his committee has just completed hearings and which would in practice almost certainly mean a general lowering of the tax level.

Carpenters Saw Themselves Off

THE path to labour unity is strewn with pitfalls. The executive council of the American Federation of Labour, at the same meeting at which it voted to suspend the longshoremen in order to force decent elements in the trade union to oust its discredited leadership, also voted to approve a "no raiding" agreement with the Congress of Industrial Organisations. No sooner had it done so than the carpenters and joiners, 600,000 strong, seceded from the AFL, protesting that jurisdictional disputes inside the AFL were quite as troublesome as those between

the members of the two great labour organisations, and that internal differences should have been settled first.

It is not likely that the carpenters' quarrels with the plumbers, iron workers and cement workers will be settled any more easily from outside the AFL. Indeed, in New York City it is feared that the building boom may be crippled by a series of jurisdictional squabbles, now that the powerful carpenters are free to press home their argument that "if it ever was made of wood, it belongs to us." Elsewhere, the prospects are not so gloomy, but the trade unions in the building trades have been irritated by a new provision in many labour contracts which permits maintenance and even construction work to be done by permanent employees and freezes out professional building workers.

There have been rumours for some time that Mr John L. Lewis was plotting with discontented unions, the steel workers in the Congress of Industrial Organisations and the carpenters and teamsters in the AFL, to set up a third federation before the slow moving CIO and AFL could compose their differences and leave him out in the cold. This may not have anything to do with the carpenters' secession, but the AFL council has moved swiftly, to bind its nearly 10 million members more tightly together. The carpenters' withdrawal left a vice-presidency vacant. It was immediately filled by the appointment of Mr Dave Beck, president of the Teamsters Union, which, with its 1,250,000 members, is one of the most powerful in the country. Mr Beck now insists that he never had any intention of eloping with Mr Lewis. The council also recommended that two other vice-presidencies be created, to make room for the heads of other powerful affiliates and convince them that their membership is valued. The AFL may perhaps be stronger than ever now that its new leadership has shown itself able to deal promptly and effectively with threats of secession.

Trade follows this flag.

In every corner of the world, wherever trade is possible, the flag of The National City Bank of New York symbolizes the march of commerce.

The National City Bank provides the means of making trade easier, safer, and more profitable. In a world of complex and changing regulations it offers business men an invaluable service: up-to-the-minute knowledge of trading conditions in all parts of the world.

The National City Bank provides this service through its network of 57 branches in 19 countries, and through its banking correspondents in every commercially important city in the world. The London branches of the bank offer, as well, an intimate knowledge of trade with the dollar countries.

A visit to The National City Bank of New York will always ensure the speedy and successful transaction of your business.

More Aid for Age

WHILE Congress is in recess, the Ways and Means Committee of the House of Representatives is doing some homework on social security. Although in February he asked for legislation this year, the President only made his views known in detail in July during the very last days of the session. He wants to add to the 47 million already covered by the Old Age and Survivors' Insurance system another 6½ million professional workers, casual farm labourers and part-time domestic servants, and to give a further 4 million—state and local government employees and clergymen—the chance to come in if they want to.

The committee chairman, Representative Reed of New York, has made it quite clear that he does not favour piecemeal legislation, but wants to review the whole social security position. Despite successive extensions of coverage the insurance system still falls short of providing a single method of giving security to the old, without means tests and with benefits related to past effort. It operates by means of a payroll tax levied at an equal percentage rate on employer and employee. The money goes into a trust fund, from which pensions are paid according to average monthly earnings during employment. Inflation has driven down the value of these pensions and has driven many states to put up old-age assistance payments, which are non-contributory and involve a means test; thus the whole principle of the insurance approach to social security is undermined because there are pensioners at the lower end of the insurance scale who qualify also for assistance.

The present system is also under attack for not being a genuine insurance scheme at all, because the trust fund is

actuarially unsound. Suggestions have been made for doing away with the trust fund and basing payments frankly on current taxation. The US Chamber of Commerce would keep the payroll tax and the grading of pensions according to past earnings, but would balance income and expenditure in an annual social security budget. It would cut out federal subsidies to the states for old-age assistance, but would relieve the demand for such assistance by charging up to the payroll tax a flat rate pension for all those over 65 who have already retired without being covered by insurance. A more radical plan, associated in the past with the name of Representative Curtis, a Republican from Nebraska who is chairman of the social security sub-committee, would abandon altogether the attempt to relate pensions to past earnings, and would raise by a special income tax the means of paying out a flat rate pension to everyone reaching 65. But whatever principle Congress decides to work on next year the basic problem may still be to fix pension standards that are not immediately overtaken by the cost of living.

Oil on the Shelf

THE passage last May of the Submerged Lands Act, the controversial first achievement of the Eisenhower Administration, was necessitated by the Supreme Court's decision that the paramount rights over undersea resources belonged, not to the states off whose shores these resources lay, but to the federal government. But it is unlikely that the Act, which gave the states the right to develop these resources within their historic sea boundaries, has meant the end of litigation.

For in the first place, while the historic boundaries are officially fixed at 10½ miles out to sea for Texas and Florida, which joined the United States by special treaties, and 3 miles for other states, there is still plenty of scope for argu-

ment as to exactly where the boundaries are. Should they be measured from islands and other points that stretch out to sea, or fitted to every indentation of a coast which, especially around the Gulf of Mexico, is very irregular? In the second place, states with no coastline, led by Arkansas, are challenging in the courts the right of Congress to give away to the inhabitants of a few states a resource—undersea oil—that seemed, from the Supreme Court's decision, to belong to all American citizens.

The political damage which might be done by the charge that a national asset has been dissipated probably explains why the Eisenhower Administration put its weight behind the supplementary Act which gives the federal government

the right to grant leases for the development of mineral resources between the historic state boundaries and the edge of the continental shelf. Without this Act, which also has international importance as the first piece of legislation specifically devoted to the area beyond the usual three-mile national limit, such states as Texas and Louisiana would certainly have been pressing for control over oil rights out to the edge of the continental shelf. For in the Gulf of Mexico the land slopes off gradually for a long distance, sometimes over 150 miles, before it drops suddenly into the deep sea, and two-thirds or more of the potential underwater oil-bearing lands are thought to be beyond the state boundaries.

In fact, for Texas and Louisiana the Submerged Lands Act was not such a victory as they thought and they tried to recoup themselves by demanding that states should be allowed to tax minerals produced from the sea beyond their boundaries. This was refused but, to many people's regret, the Act dealing with the shelf does not, as the Senate tried to insist, provide that the royalties earned from the development of mineral resources shall subsidise schools in all the states. Instead these royalties, which are unlikely to be substantial for some time, will go into general federal revenues. Nowadays it is regarded as bad budgetary practice to earmark funds for special purposes, although it is an American tradition, to which the land grant colleges owe their existence, that revenues from public lands should be devoted to education.

SHORTER NOTES

The Senate, by standing firm, forced the House to accept all the safeguards against monopoly which the upper house, prodded by the Democrats, wrote into the Bill authorising the sale of the government's synthetic rubber plants. Congress will have the power to veto individual sales, as well as the whole disposal scheme, though only if the remaining plants being sold are capable of producing at least 543,000 tons of synthetic rubber a year; and the Attorney-General will be required to state formally whether the plan is likely to result in violation of the anti-trust laws. The commission must submit its work to Congress for review by January, 1955.

Secondary school pupils of the present generation are more learned than their parents were, and boys are better at reasoning than girls, reports a masculine official of the National Education Association. After a contest to find the brightest high school student of the year, the official stated that girls consistently received lower marks in the tests because they were "too conscientious."

A new method for selling nylon stockings and the powder to wash them with has been devised by two leading manufacturers of these products. The American housewife posts \$1 with the box-top from the washing powder to the hosiery company, and receives in return "a pair and a spare"—three stockings of the quality usually sold for \$1.25 a pair in retail shops; she thus saves 85 cents, and annoys the regular dealers in stockings.

The World Overseas

Germany's Economy Before the Elections

A FLOOD of money is seeping through the German economy as a result of the continuous excess of exports over imports. With every increase in trading surplus the central bank's reserves grow, and more money is set flowing. It is estimated that DM250 million a month is being let loose into the circulation and no certain end to this process is yet in sight. The *Bank Deutscher Länder's* reserves of gold and foreign exchange reached a record of \$1.4 billion at the end of June and are still increasing. At present, the bank has no way of freezing this money and nobody can decide what measures can be taken to counteract its possible inflationary effect. The discount rate has already been lowered to 3½ per cent and—not for the first time—the bank has lost its power to affect the cost of credit.

This loosening of credit is, of course, a familiar form of stabiliser that classical economists believed would prevent an external surplus from growing too large. But in the present circumstances of Germany it may be undesirable to foster an increase in internal spending. The surplus in foreign trade is largely because the terms of trade have turned sharply in favour of Germany, as of its main industrial competitor, Britain. The volume of imports is no lower than it was, but they are some 10 per cent cheaper than at the time of the Korea boom, when Germany became a large debtor.

Towards a Convertible Mark

Some of the contending pundits forecast that the situation will right itself, generally speaking, through the seasonal increase of imports in the autumn, though the start to it will be made in the transfer of payments under the London debt settlement, and the shipment of reparations goods to Israel. Other German economists believe that more could and should be done. On the face of it, the Germans could quite well afford to transfer profits on foreign investments, which are estimated at about DM 12 billion, as the maximum annual amount would only be some DM 500 million. But the Ministry of Finance in the outgoing Adenauer government is exceedingly anxious about the amount of blocked mark investments that might flee the country if any generous move were made to lift the ban on transfer—and still, more, if the mark were to be made fully convertible. The danger exists that the amount of blocked marks (now over DM 1 billion) would grow if it were thought that transfer would be permitted in future, because the London debt settlement provided for creditors to take payment in

full in blocked marks rather than reduced payments in foreign exchange.

In some German economic circles, however, there is strong support for a bold policy which would enhance confidence in Germany as a country for safe and profitable investment. At the moment, however, it seems that the cautious group will win; the only offer that will be made to the next meeting of the Organisation for European Economic Cooperation in October will be to transfer earnings on investments made before Dr. Schacht introduced his restrictions—that is, before 1931. The small value of this offer would be lost altogether in the welter of bureaucratic complications involved in sorting out investments.

The financial authorities wish to do nothing that might affect the hardness of the *Deutschemerk*, because they are taking one step after another to free it. The latest move was made last week, when official quotations of the dollar-mark exchange were returned to the commercial market. A number of other regulations have been made in the last few months as small but sure steps towards convertibility. Clearly, it is the intention of the officials to see how the mark stands this exposure to freedom before they make any adequate offers to foreign investors. One factor makes their caution understandable. The German public, after the experience of two inflations in thirty years, is particularly sensitive to fluctuations in the value of the mark against the dollar.

One school of thought holds that the German export surplus should be made the opportunity of increasing imports. The professors who form the economic advisory committee attached to the Ministry of Economics are not content with the present cheap money as a means of fostering imports. They advocate, vaguely, increased credit facilities for consumers, in order to right the balance of payments. This advice is in line with the policy of Dr Erhard, the outgoing (and perhaps, after the elections, incoming) Minister of Economics.

Free Trade and the Mark Gap

Dr Erhard advocates a policy, described in *The Economist* on April 11, 1953, which would resemble that of free-trade Britain in the nineteenth century, with modern improvements. Many of his supporters would like to see the high German tariff reduced in order to allow German consumers and industry to benefit from cheap imports. A high German tariff was fixed for the GATT conference at

Torquay with the idea of bargaining over a lower level; but, in the event, less bargaining took place than was expected, and the tariff remained high.

The plea for lower duties is naturally opposed by the farm bloc, which is already standing in the way of increasing the very high degree (over 90 per cent) of liberalised imports, but if Dr Erhard is in the Ministry of Economics after the September elections more will be heard of his campaign for enlarging the European steel-coal pool to a complete *Zollverein*.

German economists, officials and exporters are all agreed that one aspect of the foreign exchange surplus is disquieting. This is the large amount of forced credits that Germany is giving to various countries with which it has bilateral clearing accounts. Germany is owed about \$200 million by fourteen of the seventeen countries in this category, in which Brazil leads with a debt that still amounts to \$95 million. Various methods of working off these debts are being considered, or put into effect. Brazil is being asked to return confiscated German property; German firms are being established in Brazil and other South American countries, sometimes in conjunction with local enterprises; the German coffee duty has been cut and re-exports fostered in coffee and other commodities; low-quality Turkish wheat is to be bought (if German traders will fall in with the government's wishes).

In general, the principle is being followed of not cutting exports to debtor countries but increasing imports, and to a certain extent, investing overseas. But it is recognised that the underdeveloped countries have a "mark gap" which remains to be closed. One proposal that has been fostered by Dr Schaeffer is that the International Bank should grant mark loans to underdeveloped countries for spending in Germany and the Bank has taken this course in a loan to Turkey.

Crying in Vain for Capital

The problem of over-liquidity could be solved if the public would invest in industry; but, though there is money, money everywhere, German business enterprises are still crying in vain for risk capital from the public. To the great annoyance of the strongly anti-socialist German business world, the state and public bodies continue to scoop the pool with tax-free bond issues that give a yield equivalent to anything up to 20 per cent. It is obvious that the public, which has in any case never been a large investor in shares, will not look at less safe and remunerative offers from private industry while the state is so generous and private companies pay such small dividends. The state is, of course, also blamed for the low dividends. Though corporation tax on profits distributed as dividends has been halved, this concession is regarded as negligible and the pressure for complete abolition of the tax is strong. It is, however, doubtful whether the German industrialists would easily take to the practice of paying out handsome dividends, as long habit tends to make them plough back every available penny into their business. Nor can Dr Schaeffer or his successor rightly be blamed for raising loans in the market. His budget deficit for 1953-54 is much larger than he had bargained for, as the *Bundestag*, in the last hours of its existence, gave a disgraceful display of pre-election irresponsibility by initiating bigger payments to various groups of citizens. With prices stable and public saving, particularly for

housing, at a higher rate than before the war, it cannot be said that there is any immediate danger of inflation in Germany. But it is clear that the Germans are straying from the strait path of anti-inflationary virtue, and are giving way again to the national tendency to illusions. By paying out large sums on all hands—to people whose savings were cut in the currency reform, to the sufferers from any form of war losses, to all the officials of Hitler's Greater Germany—they are behaving as if the war's inroads on German wealth could now be forgotten. This trend will undoubtedly increase if a Socialist government comes to power after the September election. German industrialists dread that possibility; there will then be little hope of reduced company taxation and increased dividends to attract investors, for to the Socialist mentality (and indeed that of the Nazis) there is something disreputable about dividends. With Socialists in the Ministries of Finance and Economics the capital that is so urgently wanted will have to come at second-hand *via* the state, and the price, it is feared, will be State control, or outright ownership of at least the basic industries. German competitive power is not likely to increase to the same extent as hitherto should the poll on September 6th show a victory for the left.

France's Economic Ills

By next week the French National Assembly will probably have to take position in the conflict between the government and the workers. Having received 218 telegrams asking for its recall (the Constitution lays down 209 as the minimum) M. Herriot, the president of the Assembly, is unlikely to wait for handwritten signatures before interrupting the deputies' holidays. What part will Parliament then play in this trial of strength? It had given M. Laniel's centre-right government special powers to legislate by decree. Will it now withdraw them under outside pressure? Hitherto the Assembly has not given proofs either of courage or of consistency. An attempt will probably be made to coax M. Laniel into withdrawal or to force him to resign. A centre-left coalition could then try to ride over the immediate dangers by an inflationary dose of higher wages and a cut in the cost of foreign commitments. Yet the immediate troubles—the trade gap and a budget deficit amounting to Frs. 700,000 million for the current year and to some Frs. 870,000 million for the next—are only symptoms of a deeper economic illness. Sooner or later a French government will have to go *à la recherche du temps perdu*.

It is strange how France, which has always stood in the vanguard of world intellectual and artistic movements, has tried to cling to the past in economic matters. Protection can only be justified as a shield for a growing economy; yet in France hot house conditions have too often been used as a protection for backwardness. Much has been written about it. Earlier this year this state of affairs was put in sharp relief in the report of the commission of experts appointed by the present finance minister—M. Faure—and headed by a potential centre-left premier, M. Mendès-France.

The agricultural system of small, inefficient holdings takes from 25 to 30 per cent of French manpower but cannot pay with its exports for French imports of agricultural products,

nor can it provide cheap food: the trade unions, whose pays almost no taxes, but gets strongly pro-Communist aid for agriculture, furthermore been the party of the obsolete form of production, *etc.* Its leader is Sutan of surplus wine and beetroots for ker in South East Asia; duction for which there is no mark; independence, he has of State protected fixed prices in a coué party has worked in yield are great offers a differentia, community, teach-farmers and at the same time artificially upholds marginal producers. Their income is sufficient to prevent an exodus to the towns, but it is not enough to enable them to introduce more modern methods of production. The maintenance of small peasant proprietors may or may not have been a conscious social policy, but hitherto it has failed to pay economic dividends.

Whatever solution is adopted—industrialisation or more intensive farming—other obstacles will have to be faced. A flow of people to the towns would come up against the appalling state of French housing. France needs about 20,000 flats a year just to maintain the present unenviable state of affairs, but it builds about one third of that amount at a very high cost. On the other hand, should agricultural productivity increase there is no guarantee that the benefits would be passed on to the consumer. Middlemen take their slice and the share of distribution in the national income, 16 per cent, is higher in France than in any other West European country. Multiple stores are prevented by law from disturbing the peace of small shopkeepers.

Survival of the Unfit

In industry all is not black. The basic sectors have been restored and developed under the Monnet plan. Yet, the sound foundations seem to have been laid beneath a derelict edifice. In industry, too, the pace and the prices are dictated not by large modern enterprises, but by the small men who have escaped the fiscal net. Economic activity is directed neither by the conscious choice of the planners nor by the incentives and penalties of a free price mechanism. The expert report mentioned above shows an economy in which perpetuation of privilege and the survival of the unfit are the unwritten principle.

Hence the achievements have not been proportionate to the costs. It is a fallacy to believe that Frenchmen do not pay heavy taxes. If payments for social services are included public expenditure accounts for some 45 per cent of the national income (defence alone accounting for about 10 per cent). The burden, however, is haphazardly spread. To the inequality of inflation must be added the iniquity of a fiscal system full of loopholes. Some are there on purpose, most have been made by unpunished fraud. The wealthy farmer is most favoured by the law; the trader has more opportunity for escape than the industrialist. The capacity for "clever" accounting has become an equivalent of efficiency. As long as this is tolerated it is idle to appeal to the spirit of self-sacrifice of any group. The workers, in particular, who have no such opportunities to escape taxation, view it all as deliberate bounty for the rich.

The total wage bill is now lower than before the war and roughly the same if social benefits are included. The number of workers and the hours of work, however, have risen. Thus, even taking no account of increased productivity, the average worker's hourly rate is now lower than in 1938. To this must be added the rash hopes raised after the Liberation and never fulfilled, the disgust with parliamentary antics and the mistrust of an executive

On most of these questions the Socialists and the small Christian parties have tended to support the Masjumi, or at least its progressive wing led by Mr Natsir and Dr Rum. The Communists have backed up the Nationalist Party, and the dozen smaller parties have lined up somewhat arbitrarily. It is, in fact, personalities who largely condition party decisions, and this has always been one of the weaknesses of Indonesian politics. A great deal of the PNI

spontaneous and in many cases the reform issue became on a moving train. In an economy prof... The servants feel that they are underdogs and are the... The sensitive about their compensating privileges. When they thought that their pension rights were being tampered with, they struck. The conflict spread immediately and a demand for higher wages was put forward. The argument that such a rise would soon be swallowed up by a general upward adjustment of prices is sound, but it holds no weight with the workers, whom successive governments have failed to convince that they can hope for any improvement without direct action.

Crippsian Austerity?

M. Laniel has up to now shown more firmness than diplomatic skill. He had been warned that a rightist government does not command the hearing of a large part of the working class. Yet, he asked for his intentions to be taken on trust. The whole batch of decrees was presented in such a way that it strengthened suspicions that the rich would be spared the axe. Otherwise few would quarrel with most of the decrees. M. Mendès-France, widely tipped as a possible alternative choice, would probably have underwritten them. Indeed, with the choice apparently lying between a centre-right and a centre-left coalition there is a certain amount of common ground. Yet, how far would the alternative leaders dare to go with their respective policies? Would a rightist leader, if he has not missed the bus for the time being, dare to tighten the fiscal system, to attack price rings and privileges before resorting to the price mechanism? Would a leftist premier attempt or succeed in imposing a regime of Crippsian austerity on France? The doctors would be unwise to rely always on time and the strong constitution of the patient. The recurrent crises are symptoms of more than an illness of the body politic. The Assembly has failed many a test in the past. Do the deputies realise that the prestige of parliamentary institutions in the country cannot sink much lower?

Epitaph for Planners

A SENTENCE in the recent quarterly bulletin issued by the United Nations Economic Commission for Europe suggests an appropriate epitaph for planners: "reality differed substantially from this planners' heaven." Indeed the whole article, which discusses postwar experiments in national income forecasting in Western Europe, is a monument to the futility of basing detailed national economic plans merely on intelligent guesswork. The tables in the article which show forecasts matched against actual results are reminiscent of an unsuccessful football pool coupon.

THE ECONOMIC AND POLITICAL SITUATION IN INDONESIA

BY A CORRESPONDENT

Torquay with the idea of bargaining over a lower level; but, in the event, less bargaining took place than was expected, and the tariff remained high.

The plea for lower duties is naturally opposed by the farm bloc, which is already standing in the way of increasing the very high degree (over 90 per cent) of liberalised imports, but if Dr Erhard is in the Ministry of Economics after the September election, committed to full employment, a campaign for enlargement has passed reconstruction has been completed; the supply of nearly all commodities has been rapidly increased; and signs of deficiency in demand have appeared, particularly in foreign demand. The assumption of full employment can no longer be taken for granted. As events have changed so has the scope and objectives of national budgets; for example, manpower budgets have been abandoned and detailed programmes of resource allocation have been dropped. Present-day national budgets are almost entirely in money terms.

Some Remarkable Errors

Of course these budgets in Western Europe do not in any sense compare with the five-year plans of Eastern Europe. The main difference is that East European countries have the means and the will to see that fulfilment of the plan is given the highest priority whatever the consequences in human misery. National budgets in Western Europe express rather the aspirations of the government, and its general objectives; yet this does not excuse the excessive divergence of fact from forecast in nearly all the examples reviewed in the article.

The planners did not have the best of luck; events such as the Korean boom and the 1949 American recession would have sorely tried the most prescient forecaster. But the estimates were so uniformly bad that one must seriously doubt their usefulness. The only consolation is that the planners were on the whole on the pessimistic side in their forecasts. Strangely enough, the planners were better at forecasting price changes than volume changes; they generally managed forecasts on visible transactions in the balance of payments better than invisible items; they were fairly successful in predicting the volume of investment; they tended to be hit-or-miss with productivity changes; reasonably accurate with forecast budgets of public authorities; and weakest of all in estimating consumption and saving. As a rule, forecasts of consumption and saving were obtained as residual figures and were thus subject to the most remarkable errors.

Enthusiasts for Model-Building

The record of national budgeting in Western Europe is not very promising. The ECE bulletin bluntly says: "In retrospect, the ambitions of some of the enthusiasts for model-building look somewhat ridiculous." What of the future? Obviously a first requirement is to improve and refine the methods of gathering statistics. The second is to ensure that the forecasts are freed of bias whether optimistic or pessimistic. The third need suggested by the bulletin is not so easy to accept: it is that more complex models are required in order to reduce "the number of points at which purely subjective judgment has to be relied upon." It is a terrible thought that the planners are planning their come-back aided by still more complicated—and presumably equally unreliable—tools.

housing, at a higher rate than that said that there is any immediate change of policy and it is unlikely that the present dangerous instability can only weaken respect for parliamentary democracy; far too much energy is being wasted on debating political issues instead of on constructive effort.

The present Indonesian Parliament is a nominated body. Members are appointed by the political parties in proportion to the estimated strength of the parties several years ago. The new government has indicated that it will take immediate steps to organise the long-promised general elections. What will happen when they do eventually take place has caused much speculation and not a little uneasiness. The last two coalitions have been a working partnership between the Moslem Masjumi and the Nationalist (PNI) Party. These two, with just under forty seats each, are the largest parties, but neither is strong enough to form a government completely on its own. Each of them, too, has a small group of dissidents of half a dozen members who have split away to form little parties on their own. There are three parties with about fifteen to eighteen members, the PIR which is a conservative party, the Communist PKI and the Socialist PSI. The two latter, as well as the Masjumi, are believed to be under-represented in Parliament so there may be some radical readjustment when the elections take place. Finally, there are a number of small parties, right, left and centre, with about half a dozen members each.

Socialists Attract Youth

The Masjumi is almost certainly the strongest party in the country. Drawing its inspiration from its religious origin, it tends to be conservative, but it has a progressive wing led by the former Prime Minister, Mr Natsir, and the last Minister for Home Affairs, Dr Mohammed Rum. Much of the Masjumi's support comes from the rural areas, where village life is relatively untouched by politics in a party form. In the social ideas of its progressive wing can be seen much of the reforming zeal of Islam. The second largest party, the uncompromisingly nationalist PNI, is far more an urban party, the party of the middle-class, the professional man, the school teacher. Less well organised than the Masjumi, the PNI may lose strength in an election. Perhaps for this reason, in order to gain extra support, one wing has seemed susceptible to ideas indistinguishable from those of the Communists. The PIR is the next largest party, but it is quietly moderate, with backing in the civil service and has rarely taken a decisive part in national affairs.

Like the parties of the right, the left wing has its moderates and its extremists. The Communists (PKI) and the Socialists (PSI) have fifteen members each, but as they are much more active in organising mass support than the right wing parties, an election would probably greatly increase their representation. The Communists have never really recovered from the execution of their leaders after the abortive Madiun revolt in 1948, but they have worked

unceasingly, especially among the trade unions, whose central organisation, SOBSI, is strongly pro-Communist. The Socialist Party has always been the party of the intellectuals; but with a difference. Its leader is Sutan Sjahrir, the most able political thinker in South East Asia; but as he has not been in office since independence, he has been rather out of the limelight. The party has worked hard among the younger sections of the community, teaching and building up "cadres" throughout the archipelago. In the earlier days of the republic, many of its representatives abroad were Sjahrir's "young men" and still today it attracts the most able and idealistic of the younger generation. Although partially Marxist, the PSI is strongly anti-Communist, and it has been far more realistic than the PNI, for example, on such questions as the use of foreign capital. Despite its non-participation in the Masjumi-PNI coalitions, it has allowed one of its leading members, Dr Sumitro Djojohadikusumo, to serve as Minister of Finance; he has showed himself to be one of the few Indonesian politicians with a firm sense of economic realities.

The impatience caused by the stalemate among all these parties has recently caused much support to be given to the idea of a non-party Cabinet of "experts" under the vice-president Dr Hatta. From the standpoint of urgency, this would undoubtedly have been the best solution; but the Indonesian political parties were aware that such a Cabinet would reduce Parliament to the uncongenial status of a debating society. And, furthermore, it would be unable to iron out the party disputes.

Causes of Dissension

There are several major political differences which in one form or another have broken up or weakened the previous coalitions. The most recent was over the handling of land reform in North Sumatra, where the action of the responsible Minister, Dr Rum of the Masjumi, in dispossessing squatters from plantation estates, was strongly attacked by the PNI and the Communists. The consequent withdrawal of PNI support brought about the fall of the government. The holding of elections, the establishment of an embassy in Moscow and the ratification of the Japanese peace treaty have also caused dissension over the last few years. The PNI tried to win over left wing opinion by urging the early establishment of a Moscow embassy. This was opposed by the Masjumi who, in turn, attacked the PNI for being opposed to early elections. There has undoubtedly been a little reluctance within the PNI for early elections, due probably to personal fears rather than party policy.

The PNI capitalised on anti-Japanese feeling by opposing the ratification of the peace treaty, while the Masjumi was in favour of it (it was a Masjumi foreign minister who signed it). Then there was the PNI decision to demand nationalisation of the Sumatra oilfields which the Masjumi and Socialists felt could at present be more efficiently worked under foreign management and technicians. The Masjumi and the Socialists have, in fact, shown the greater realism over the need for enlisting foreign financial support. Even such a technical matter as the organisation of the army and national security has been dragged into the political arena and the advisory work of the Netherlands Military Mission has been greatly reduced by political

On most of these questions the Socialists and the small Christian parties have tended to support the Masjumi, or at least its progressive wing led by Mr Natsir and Dr Rum. The Communists have backed up the Nationalist Party, and the dozen smaller parties have lined up somewhat arbitrarily. It is, in fact, personalities who largely condition party decisions, and this has always been one of the weaknesses of Indonesian politics. A great deal of the PNI opposition to the Socialists has been due to personal jealousies, and the North Sumatra land reform issue became to a great extent a personal vendetta against Dr Rum. The able Sultan of Jogjakarta was forced to resign as Minister of Defence after a similar campaign.

At the moment, however, the most contentious issues are theoretically settled. Everyone is agreed about holding elections and setting up an embassy in Moscow and only the dates remain to be fixed. It is the insubstantial nature of the political differences and the element of personal rivalries involved that give rise to some disquiet; that these seem more important to some politicians than the stability of the administration and constructive hard work is hardly a good sign.

The Defence of Sweden

FROM OUR SCANDINAVIAN CORRESPONDENT

A PERMANENT paradox in the shifting scene of world events is the high level of military preparedness maintained by "neutral" Sweden. And this is no flamboyant militarism to mask political bankruptcy, but a sober, sustained and conscious national effort. Paradoxically again, in a country that has not been involved in war since 1814, it is stiffened, noticeably in the officer corps, by a very real military tradition. Since well before the war, it has been fostered by Socialist or predominantly Socialist governments.

An account of the defence effort of Sweden, which is nearly twice as big as the United Kingdom and yet has a mere seven million inhabitants, makes impressive reading. The Swedes do try to make the best preparations for defending their country, so far as their present policy permits. Whether an adequate defence is in fact possible within the terms of present policy is another matter. Neutral Sweden ended the war with large stocks of defence material and thus, instead of having to re-equip its forces almost from scratch, simply went on at a steady pace with replacement. It may seem surprising that in the postwar atmosphere of optimism Sweden did not take the opportunity of cutting defence expenditure much more. The answer would seem to be threefold. First, the vicarious success of a policy of armed neutrality strengthened its supporters. Second, the emergence of the Soviet Union as one of the strongest military powers on earth gave added reason for preparedness. Finally, not having been involved in the war, the Swedes were largely unaffected by the emotional aftermath of victory.

The first set of major postwar re-equipment plans has now been completed, and new plans for the different services have just been put into effect or are before the Riksdag. Last year a seven-year building plan was approved for the navy, involving an expenditure of 600 million kronor (about £40 million) during 1952-59. (Last week it was decided to

spread this plan over two more years and delay its completion until 1961.) There is also a six-year plan for weapons costing Kr 660 million during 1953-1959 (Kr 200 million being for the coast artillery which is part of the navy). The army is embarking on a programme to spend Kr 3,150 million over the next ten fiscal years. The air force, in the next seven years, plans to spend about Kr 350 million a year on re-equipping.

In the shorter term, total current expenditure on the defence vote in the 1953-54 budget year (July to June) is put at Kr 1,982 million (£136.5 million) or 23.9 per cent of budget expenditure and 4.7 per cent of the estimated national income. In addition Kr 110 million will be spent on the capital account (about 70 million on fortifications). A great deal is also spent on defence preparations under other heads—Kr 42 million on civil defence on the Ministry

of Interior's vote, Kr 27 million on measures for economic preparedness (stocks, bomb-proof dumps), on the Trade Department's vote, and so on. The 1952-53 defence expenditure amounted to Kr 1,570 million, which was 21.2 per cent of the budget outgoings or about 3.8 per cent of the national income. It is worth noting, however, that increased costs account for most of the difference.

Some of this money is spent on foreign equipment, such as Centurion tanks and the right to construct the Rolls-Royce Avon engine. But most of it goes on Swedish material which on a unit-cost basis, is probably more expensive than corresponding foreign equipment produced in countries better able to benefit from series production. The local production of equipment is, however, considered a necessary insurance against supplies being cut off.

Sweden has indeed managed to hold its own technically with products like the SAAB J-29 fighter and the improved Bofors 40 mm gun. Foreign sales of the latter (and in all probability of the former soon also) help to cover costs. Research is conducted into such things as radar (though most of the radar in use is foreign) and guided missiles. There is, however, no atomic research worth mentioning. And, of course, the position is simplified by the defensive role of Swedish forces; no large bombers, for example, are required.

All male Swedes from the age of 20 to 47 are liable for military service. Younger or older men or men exempt from service must, if fit, serve in the home guard or the civil defence. The period of conscript training is nine months, plus three "refresher" courses of 30 days each during the remainder of the time the man is liable for service. NCOs and specialists have 40-day "refresher" courses. The General Staff has tried to offset the effect on efficiency of such short periods by adopting modern methods of industrial training, using time and motion studies to improve drills, and by calling men up for refresher courses as members of a fighting unit rather than individually by age groups.

Defence Propaganda

In addition to such direct participation in military affairs, the Swedish citizen is reminded of his responsibilities by extensive and efficient propaganda. The General Staff issues large numbers of publications, and particularly a monthly booklet called "Contact with the Fighting Services." The government periodically distributes pamphlets such as that issued in millions of copies last autumn. It was entitled "If War Comes" and reaffirmed, with a mass of practical advice, the duties of the Swedish citizen in war. Its theme was "fight on," and it specifically repudiated in advance all idea of resistance ending so long as Swedes still had weapons.

All this, together with the establishment some years ago of a special committee on psychological warfare as a part of total defence, implies an understandable concern on the part of the authorities for the morale of the Swedish people. The apparent determination to give everybody something specific to do in war is probably of like origin. About 450,000 people are theoretically available for civil defence duties, apart from auxiliary formations. Special civil defence groups for the protection of key plants and installations are obligatory in towns and in larger potential targets in the country. The security precautions now normally observed in, for example, a large steelworks are quite alarming to a pacific Englishman—passes, guards, barbed wire fences, and elaborate air raid shelters. This branch of civil defence is entirely financed by industry. Industry is also prominent in supporting the "Nation and Defence" movement, which in collaboration with the armed forces co-ordinates the activities of some forty-one voluntary organisations.

The most obvious material weakness in Sweden's defences is the lack of indigenous petroleum products, rubber, chrome, tungsten and such specialised commodities as carbon black. But it is certain that large stocks are held of such key products. In food Sweden can be self-sufficient. All in all, therefore, and within their self-imposed limitations, the Swedish authorities have some reason to be proud of their efforts to build a total defence for their country.

FIRE! TRAGEDY AVERTED BY NU-SWIFT!

WORKERS IN THE TEAM Number 3 in a series

This thoughtful, sensitive face belongs to a craftsman. Walter Turner is a man for whom only first class work is good enough.

He started work with the Company in 1925 after serving his apprenticeship as a joiner. Today he is general foreman in charge of important work: and everyone knows that under Walter's eye even the smallest details will be attended to thoroughly.

He has shares in the Company—a privilege reserved for those who set an outstanding example. But his chief reward comes when a fine job has been done and its

quality is noticed: then, his face lights up.

He takes great pleasure in the Company's annual outings because there he meets old fellow-workers and they talk of past jobs tackled together. For all his work is shared. This is the real secret of the satisfaction he gets from life: good work done by a team of which he is one.

Steps to hygiene...

The Greeks worshipped Hygieia as the goddess of health. We do not worship hygiene but we practise it more and more, and the importance of food cleanliness is being increasingly recognised. Here a vital part is played by paper. Paper bags, paper wrappings and for bulk deliveries the multi-wall paper sack, protecting its contents from contamination as no other sack can. The Medway multi-wall sack is ideal for the packaging of sugar, flour and all sorts of human food and animal feeding stuffs. It is tough, resilient, sift-proof and resistant to moisture. It is indeed a revolution in hygienic packing and a typical example of the way in which the Reed Paper Group—with its great resources for the development and manufacture of paper products—is continually seeking to contribute better products to serve the nation's daily needs.

MEDWAY MULTI-WALL SACKS

Reed
PAPER GROUP

Head Office: 105 Piccadilly, London, W.1

In the campaign for clean, pure food Reed Group paper plays an important part: Aylesford kraft and M.G. sulphite papers for traders' bags and wrappings—Medway multi-wall sacks, corrugated paper and corrugated cases for wholesale deliveries—Powell Lane waxed bread wraps and confectionery packing.

Could *more* accounting work be done ... with fewer machines?

**Sensimatic Control* means limitless
adaptability in one machine**

BUSINESS NEVER STANDS STILL, and sometimes, accounting routines are not flexible enough to cope with heavy new commitments. But this doesn't mean that the office need get in arrears with its work, nor that a variety of different accounting machines must be installed.

There is one machine—the Burroughs Sensimatic—which can be switched in a flash to any kind of accounting operation. A single control-unit directs the Sensimatic through any *four* posting operations—and there is no limit to the number of *different* units you can use.

What does this mean? Simply, that a small business needs only one of these versatile machines to handle *all* its accounting jobs; that a large organization, as the need arises (perhaps, for the "peak-period" preparation of payroll), can switch every one of its accounting machines to one kind of work.

LOW INITIAL COST

The value of a limitlessly adaptable business tool like the Sensimatic is incalculable—but even its initial cost is far below that of any comparable machine. You owe it to your business to see it demonstrated in relation to your particular figuring problem. Call Burroughs today.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

THE BURROUGHS SENSIMATIC

Is now produced in 5 versions giving as many registers, or combinations of registers, as you may need.

*THE MEANING OF SENSIMATIC CONTROL

This sense-plate (the Sensimatic Control unit) guides the machine automatically through every mathematical function and carriage-movement of a complete routine. Every unit — there is no limit to the number you can use — controls any four different accounting operations in any combination.

For expert advice on business figuring

THE BUSINESS WORLD

Parliament and the Boards

TODAY, in practice, the nationalised industries are "accountable to Parliament" in only three ways. Members may ask Parliamentary questions about these industries, though only those held to concern matters for which a Minister is directly responsible, mainly in the field of general policy. They may debate the industries' affairs on various occasions, of which the most regular are debates upon the annual reports and accounts of the public corporations among members many of whom have not read and digested—as who does read and digest?—these bulky documents. Thirdly, they may write direct to the corporations on particular issues—and it is perhaps this method that has the most chance of getting anything done. True, Parliament is not the only organ through which these statutory monopolies are formally accountable to the public—there are the broadly ineffective consumers' councils and in the case of transport there is the fares tribunal, effective but limited in scope—but Parliament is obviously the main organ in which the public's representatives should be able to exercise the rights of public ownership. These rights should broadly correspond to those of shareholders in private industry, the right to obtain information about the conduct of the enterprise they own, and to act upon it. Not everyone may agree that the existing machinery for exercising these powers of ownership is inadequate; but few will disagree that so far it has been ineffectively used.

The nationalised industries, moreover, are fairly well protected from Parliament's two watchdogs on the use of public funds—the Committee of Public Accounts and the Select Committee on Estimates. The Public Accounts Committee, certainly, can and does on occasion examine the published accounts of nationalised industries. But the effectiveness of this committee in scrutinising the appropriation accounts of Government

departments derives in large measure from the reports and the advice of the Comptroller and Auditor-General, who is responsible for current auditing (in a somewhat wider sense than ordinary commercial auditing) of the departmental accounts. Commercial accountants (responsible to the Minister concerned), not the Auditor-General, audit the accounts of the nationalised industries, and the Auditor-General has no right to inquire into those accounts before the Public Accounts Committee considers them; so the assistance he can give in such cases, and the effectiveness of the committee's scrutiny, are greatly restricted. The Select Committee on Estimates, in its turn, is confined by its terms of reference to examining only such public corporations as have received subsidies from voted monies that appear in Government estimates, and the only nationalised industries that it has been able to study since the war are the three airline corporations. Publicly owned industries able to cover a loss by borrowing from the Exchequer, such as the National Coal Board or the Raw Cotton Commission, have thus escaped it; and others that by raising charges can fulfil their statutory duty of avoiding loss "taking one year with another," may stay for ever beyond its ken. Since the nationalised monopolies' owners are at the same time their consumers, the fact that a corporation thus avoids a loss is not calculated to allay public suspicion of its efficiency, or public desire to see it brought more effectively to book. It may be added, moreover, that the conduct of these statutory monopolies is expressly excluded from the scope of the Monopolies Commission.

Opinion in Parliament and outside on this matter is divided less about the need to make the industries' accountability to Parliament and public more effective than about the way to do it. The Labour Government had earlier rejected a Conservative suggestion that

it should be done by a Select Committee, inclining rather to the alternative of a full-scale inquiry into each of the industries about every seven years. Shortly after taking office the present Government appointed a Select Committee to

consider the present methods by which the House of Commons is informed of the affairs of the Nationalised Industries and to report what changes, having regard to the provisions laid down by Parliament in the relevant statutes, may be desirable in these methods.

That Select Committee first reported in October last year upon the rules limiting Parliamentary questions on these industries to matters for which the Minister is directly responsible, concluding broadly that these rules should not be changed. Its final report, briefly noticed in *The Economist* last week, recommends that a new standing committee of the House of Commons should be set up to undertake the task of providing Parliament with the information it needs about the nationalised industries.

★

The powers and duties proposed for this new committee are defined fairly broadly in the Select Committee's report. It should be set up "to examine the nationalised industries," with power to send for persons, papers and records, "directing its attention to the published reports and accounts, and to obtaining further information about the general policy and practice," with the object of "informing Parliament about the aims, activities and problems of the corporations and not of controlling their work." It is recommended that the committee's staff should include an officer "of the status of the Comptroller and Auditor-General," who would examine the reports and accounts of the nationalised industries in order to direct the Committee's attention to matters requiring examination, being assisted in this task by at least one professional accountant. The Select Committee suggests that the commercial accountants who now audit the nationalised industries' accounts should when preparing their annual reports be required to give "such information in addition . . . as may be of use to the Committee and of interest to Parliament"; but it qualifies this dangerously vague description. These accountants, it rightly holds, could not be expected to perform the role of the Comptroller and Auditor-General for the nationalised industries; and for the sake of good relations with the corporations whose accounts they audit, their approach should not differ too widely from that of ordinary professional auditors. It may be added that while the professional accountants, in evidence to the Select Committee, very tentatively outlined a number of aspects of the boards' operations upon which they might be prepared to give rather more information than the ordinary auditor's certificate, these suggestions and their elaborate qualifications made it clear that they would not be prepared to do for these industries the full job that the Comptroller and Auditor-General does for departments.

The field of interest of the proposed committee in respect of the nationalised industries would therefore be considerably wider than that of the Committee of Public Accounts; but its effective powers of investigation would, on the face of it, be considerably less. To give the committee's adviser "the status of the Comptroller and Auditor-General," could not make his examination of published accounts nearly as effective as the scrutiny of Government accounts by his counterpart. The Auditor-General's power to advise the Public Accounts Committee is based upon his performance of the actual auditing function in the departments under review, through his staff of about 500 constantly engaged on this work, many of them within the departments. Sir Frank Tribe, the Comptroller and Auditor-General, told the Select Committee that he "could" if required take over the whole task of auditing the nationalised industries' accounts, and hence of undertaking this wider general examination; but that would involve "dislocating" the accountancy profession in this country by recruiting into his own department from the commercial accountants some hundreds of their employees now doing this work. Assuming that is out of the question, any scrutiny of the financial affairs of the nationalised industries can hardly hope to approach the thoroughness of that made with the Auditor-General's assistance by the Public Accounts Committee. Sir Frank thought, too, that smaller staffs stationed inside these industries, empowered to inquire though not responsible for the actual audit, "would not really work in practice." That close financial scrutiny, however, was not what the Select Committee was asked to provide, though some of its members would obviously have desired to bring about equally effective powers of examination over a much wider field.

Various objections, some of them of substance, were advanced in evidence before the Select Committee to the establishment of a new committee on the nationalised industries. Lord Reith argued vehemently, and Mr Herbert Morrison with moderation and weight, that the proposal would offend against the whole concept of the public corporation, which in the past governments of all parties have tried to shape so as to combine public ownership with a measure of independence of ministerial control. They felt that with a powerful committee on the watch the nationalised industries would develop the civil service mind, and would frighten away the top men of initiative that these industries need, leading to a general (one might say an "even greater") caution and avoidance of risk. Sir Geoffrey Heyworth added

In my own job in my own business what I have to do is to turn up at the end of the year having made slightly more right guesses than wrong guesses. . . . Some of these decisions were quite wrong in the light of after events. The mere fact that I felt someone was looking over my shoulder, the less decisive I would become. . . . Any form of detailed control seems to carry with it the certainty of mediocrity or less. . . .

Mr Morrison argued staunchly for his own proposal of

the periodical full-scale inquiry into each board, holding that these would be less likely to sap managerial risk-taking than a standing committee liable to review each industry perhaps every one or two years. He added a personal preference for one form of what he and some members of the Select Committee term "an efficiency audit"—a team of expert consultants drawn from all the nationalised industries that could investigate the efficiency of any aspect of the industries' work, using physical as well as financial indices; this team's reports, he thought, might if desired be published independently.

The objection that corporations could be made too cautious is a real one, and undoubtedly did play some part in shaping the public corporations that now exist in Britain. So is the danger that supervision of these industries' behaviour, exercised too keenly, would inevitably lead towards more centralisation of decision by the men likely to be held responsible for their subordinate's mistakes, and away from the decentralisation that the industries probably need. But these objections would be more cogent here if the standing committee proposed were a little more formidable, and the nationalised industries themselves a little less.

The industries nationalised since the war, unlike the public corporations set up in earlier years, are statutory monopolies of major industries; the fact of monopoly, not of public ownership, is what counts most. As monopolies directed to observe "break-even" policies sharply divorced from those of ordinary business, they may

Switching in Canadians

BRITISH investors can now switch their portfolios of Canadian securities in exactly the same way as they have long been able to switch their portfolios of other dollar securities; to "switch" means simply to sell one security and buy another. Dealings in Canadian securities will still have to find their way through the ordinary and tangled labyrinth of exchange control regulations—but, at least, there will be no special Minotaur waiting for them at the end of their journey. That, in essence, is the principal consequence for investors of the new Anglo-Canadian arrangements for the repayment of Canada's wartime loan to Britain. These arrangements are so complicated that they deserve detailed analysis under three headings: their effect on the country in general, their effect on British investors, and their effect on the exchange control regulations under which the Stock Exchange works.

Their effect on the country is, briefly, that there will be some immediate drain on the central gold and dollar reserves; but, as an offset to this, there will be a caulk in the previous drain on private British holdings of Canadian securities (holdings that of course bring some current dollars in their train, in the shape of dividend

payments, into the British Treasury). Under the original arrangements for repaying Canada's 1942 interest-free loan to Britain, all Canadian dollars that accrued from the sale in Canada or redemption of Canadian securities by British residents had to be handed over from the British to the Canadian Treasury; by the end of last June the principal of the loan had been reduced by this method from the original sum of \$700 million to \$189 million. A later agreement that dollar proceeds from the sale of Canadian securities could also be used to finance approved new British direct investment in Canada (for example, the establishment of Canadian subsidiaries by British manufacturing concerns) had, however, slowed down repayment of the loan in recent years; indeed, judging from the recent pace of repayment (at about \$20 million a year) the Canadian government might have had to wait another 10 years for final redemption. Under the agreement reached last week, these arrangements are scrapped. Instead, the British Government will immediately pay to Canada \$39 million, reducing the principal of the loan to \$150 million. This balance will then be paid off in twenty equal quarterly instalments ending in December, 1958. The direct

drain on the reserves will, therefore, be around \$30 million a year for five years. There will probably, however, be an additional indirect drain. Hitherto some part of direct new British investment in Canada (£17½ million in the first seven months of this year) has been financed from dollars collected from British investors who have sold Canadian securities in Canada; now those investors will be allowed—and presumably will virtually always choose—to retain these dollars themselves to switch into other Canadian or United States securities.

★

The effect of this new freedom on British investors can best be understood by examining the alternatives that lay before the British holder of a Canadian security up to last week. In the first place he could sell such a security on the London Stock Exchange and at the prices quoted on that exchange; usually these prices would be above those quoted in Canada, but, of course, the investor would get payment only in sterling—and his only possibility of reinvesting the proceeds in other Canadian securities was then to find another British holder who was willing to sell for sterling at the London premium price. Alternatively, he could sell his security in Canada; if he did so, however, he had to hand the dollar proceeds of the sale over to the British Treasury (for repayment of the Government's interest-free loan from Canada) and receive their counterpart in sterling. Since the price received for such sales in Canada was usually lower than the price received in London, very few such sales were made; the only exceptions were Canadian securities for which there was no market in London, or for which (for occasional, rather freak, reasons) the London price had dropped below the Canadian price. Finally, however, any unfortunate who held a dated Canadian security that fell due for redemption had to sell the dollars arising from this redemption to the British Treasury; it was from such redemptions that the Treasury secured the lion's share of the dollars that had run down the principal of the loan from \$700 million to \$189 million by last week. The new arrangements mean that investors can keep back the dollars arising from such redemptions or from sales of securities in Canada for re-investment in other Canadian or United States securities.

This freedom has, of course, led to a re-shuffling of prices quoted for Canadian securities in the London Stock Exchange. To understand the nature and reasons for this it is necessary to appreciate the anomalies caused in the London market by the system now modified. Immediately after the war the regulations governing the repayment of the 1942 loan meant that the London market could deal only in the limited amount of Canadian stocks already owned in this country; and, so long as some investors had to liquidate or accept redemption of part of their holdings, this stock of Canadian securities was growing smaller. The premium on these securities above the price quoted for them on the Canadian stock exchanges therefore varied

with the demand and supply of the particular stock; for stocks of which British investors had accumulated large holdings before the war—for example, International Nickel—the premium could be practically negligible; but for new stocks that were in very limited supply in London, it could—up to about 1951 at least—be as high as 20 per cent.

Of course, this absurd state of affairs set dealers scurrying in search of methods of arbitraging to remedy it. British exchange control regulations have always allowed British investors to sell abroad any investments that carry dividends in soft currencies in order to switch into investments with dividends in harder currencies—provided they could find any foreign stock markets to accommodate them. For a time sales of Belgian securities provided a by-pass route into Canadian securities, and so did sales of Royal Dutch shares for American dollars. About eighteen months ago, however, there was opened up a much easier route by way of sales of blocked D-marks in Switzerland, purchases of US dollars with Swiss francs, and purchases of Canadian securities with these US dollars. In the last few months the cost of buying Canadian securities in this way instead of buying them direct settled down at about 6 per cent above the Canadian price (and dealers in Canadian securities in London quoted a price to a would-be buyer on this basis). This development therefore set the upper limit at which any Canadian security could be purchased in London at a premium of 6 per cent; although, of course, International Nickel and other Canadian stocks that were in ample supply in London continued to be quoted at much lower premiums than that. Nevertheless, these arrangements still put very real obstacles in the way of British investors' participation in Canadian stocks. Only the most determined bulls were willing to pay the premium of 6 per cent that obtained on the scarcer Canadian stocks; particularly as they knew that they would not be able to market their stocks on the Canadian market and since the general London premium on United States securities (which the British holder has been allowed for some time to switch in New York) was only 4 per cent.

★

These special obstacles have now been removed. In future, British residents will normally be allowed to switch from Canadian securities into either quoted Canadian dollar securities or US dollar securities, and from US dollar securities into quoted Canadian dollar securities; in addition, transfers between blocked sterling accounts in the dollar area can now be freely made. The establishment of what is in effect a common market in United States and Canadian securities in London immediately caused Canadian securities to be adjusted in Throgmorton Street to the common basis of a premium of 4 per cent (the same as the premium on United States securities) over the equivalent prices quoted on the Canadian stock exchanges; this meant that Canadian stocks that previously carried a very low premium (such as International Nickel

and Brazilian Traction) were marked up, while stocks that were at or near the limiting premium of 6 per cent (such as "Canpacs") were marked down.

The premium, it should be noted, was quoted on the middle rate of US \$2.80 to the £, and the fact that Canada has a fluctuating exchange rate meant that dealers had to work overtime on their slide-rules to translate the premium into actual market prices. Realising that this method of quotation was cumbersome—and possibly misleading—the stock market replaced it on Wednesday by basing the premium on the mid-points of the actual exchange rates for US and Canadian dollars; at the same time London prices strengthened relatively to New York prices, so that a premium of 3½ per cent was then quoted upon a US dollar rate of \$2.81½ to the £ and on a Canadian rate of \$2.78 to the £. Indeed, Throgmorton Street was obviously thankful that these new arrangements were announced in the holiday season, so that they have not been confronted with any rush of business before they have had time to settle down to the techniques required; the flurry in the markets was, in any case, far less than it would have been if the pool of Canadian securities had not been widened already by the stream of investment through the D-mark deals.

These new regulations have simplified to some extent the complexity of exchange control of security transactions. In brief, a resident in this country can now sell and reinvest outside this country quite freely so long as the securities he sells and buys are payable in the same currency—and, in this context, Canada and the United States are to be treated as one currency area; he can also usually sell a soft-currency security for

reinvestment in a hard currency one—but he cannot come back again, for example from a dollar stock into French *rentes*. Each transaction still has to be specifically approved and still has to be completed within two months of the granting of the permit. Usually, so as not to miss the market, the sale of a security is completed before a licence is sought; and the investor is granted three weeks' grace in which to secure it. Although small balances may be permitted to remain uninvested for a reasonable time after the expiry of the permit, the rule is that the reinvestment should be equated to the proceeds of the sale—but in dollar securities this principle is often satisfied merely by temporary reinvestment in short-term United States Treasury bonds. These bonds—together with Wall Street, which provides a freer market in well-known international stocks than the Canadian stock exchanges—may in fact be among the minor beneficiaries of the new move. The new regulations have no effect upon residents in the overseas sterling area, who have always been able—subject to local regulations—to switch Canadian securities, since the Canadian loan was made only to Britain.

In sum, therefore, these arrangements stop a drain on private British holdings of Canadian securities at the expense of opening a new one on official holdings of dollars; they remove some unnatural absurdities in the London stock markets that were crippling intelligent British participation in the fruits of the Canadian boom; and they make it slightly easier to codify and understand Britain's tangled exchange control regulations on security dealings. All these are real advances, and they represent another modest victory for liberalism and commonsense.

Business Notes

No Currency Inflation

WHATEVER portents there may be to warrant the fears lately voiced in some quarters that Britain is now facing a disquieting revival of inflationary pressure of demand, the trend of the note circulation is not among them. Except for its brief and inevitable expansion at the time of the Coronation, the demand for currency this year has in fact been unexpectedly light. Admittedly, the return of notes from circulation in the few weeks since the peak of the summer's holiday demand has been somewhat less this year than last—this latest week's reflux was £21 million, bringing the total to £40 million, compared with

£44 million in a slightly longer period last year, and reducing the total circulation to just under £1,559 million. But the seasonal expansion itself was a good deal less this year: from its lowest point between Easter and Whitsun to its August holiday peak, the circulation rose this year by £88 million, compared with a rise of £109 million last year. The spending at the time of the Coronation, and perhaps the fact that some people—including many of Britain's visitors from overseas—took their holidays earlier on that account, seem to have been reflected in smaller spendings at and around the peak of the season. If that is so, the inflationary "feel" of consumer demand in May and June may have been a somewhat misleading guide to the underlying mood of the spending public. The detailed statistics of retail trade in June—which have only just become avail-

able, and are discussed in a subsequent note this week—do, indeed, lend some support to this interpretation of the recent trend.

At all events, the more alarmist school of commentators has now to reckon with the fact that the note circulation this year shows a smaller rise from the year's seasonally low points (touched soon after Christmas) than in either 1952 or 1951. And the net expansion since the Christmas peak itself is now no more than £9 million, whereas in the similar period last year it was £33 million. There is still, of course, a substantial expansion on a twelve-months' comparison; but the difference on this basis has shrunk from £112 million at last Christmas to £88 million now. On this admittedly rather slender evidence, the dangers of renewed inflation are potential rather than actual—they reside especially in the wage claims now pending.

Two Prices for British Wheat

THE Ministry of Food and representatives of the milling industry have now agreed upon a scheme whereby the Government's guaranteed price to farmers for home-grown wheat can be implemented despite the freeing of the grain trade. When the guaranteed price is above prices quoted in the world market, the Ministry will compete with foreign offers by offering British wheat at a "free" price; this "free" price, although based on world market prices, will be agreed weekly between the Ministry and the trade. The difference between this price and the guaranteed price will, of course, be borne by the taxpayer. In order to ensure maximum disposal of home-grown wheat at harvest time, the millers will store wheat on the Ministry's behalf, paying the farmer the guaranteed price. When the miller consumes this wheat, the Ministry will reimburse the amount by which the "free" price may be below the guaranteed price at the time. The millers were also informed this week that it will be impracticable to re-open the Liverpool futures market for some time, owing to a shortage of storage space for a "landed" market; the reopening of the futures market in London is also being delayed.

World wheat prices seem, for the time being, to have withstood the pressure of bumper crops in North America—and of the huge carry-over there—without further retreat. Chicago futures fluctuated fairly sharply this week, but by mid-week they were back again to \$1.82 a bushel for September delivery, about the same as a week before; they were helped, no doubt, by the American farmers' vote (discussed on page 511) to accept marketing restrictions on the 1954 crop. The Canadian Wheat Board's prices have recovered by 5½ cents this week; No. 1 Northern Manitoba is now being offered for export both to the free market and under the International Wheat Agreement at \$2.02½ a bushel.

Merging Tractors

HARRY FERGUSON'S sudden decision to merge his company with the Canadian manufacturers, Massey-Harris, has hit the farm machinery industry like a bolt from the blue. All the shares in the Ferguson companies are to be

transferred to Massey-Harris in exchange for the issue (on the basis of approximate book value of net tangible assets) of 1.8 million Massey-Harris common shares, of which there are 7.7 million already outstanding. Harry Ferguson will then become the chairman of the new Massey-Harris-Ferguson company, with the present president of Massey-Harris, Mr James Duncan, continuing in that role for the combined organisation. The Ferguson company designs and sells farm implements, but does not itself make them. Since his break with Ford in America, Harry Ferguson has had his designs built for him on a fixed profit basis by individual engineering companies—he has an arrangement with the Standard Motor Company for the supply of tractors on these lines, and both companies have found it mutually profitable. Massey-Harris is one of three North American manufacturers with world-wide connections that have set up factories in this country to enable them to supply, against sterling, equipment that a number of countries cannot afford to buy for dollars from their North American

AGRICULTURAL TRACTORS—PRODUCTION AND EXPORTS

factories. The other companies that have established here are Allis-Chalmers and International Harvester.

The merger has certain obvious advantages for both sides. The North American companies have concentrated on building certain specialised implements in which British manufacturers are only just beginning to show an interest. Pick-up balers and combine harvesters, both designed primarily to save time and labour, are two typical examples. But they also intend to put into production a general run of implements. The only tractor that Massey-Harris makes in this country is a heavy-weight of 42 b.h.p., with implements to scale. The market for tractors of this size is specialised and limited; the bulk of sales comprise medium-weight tractors such as those produced by Ford, Nuffield and David Brown, and the light Ferguson. The merger means that a complete range of light equipment is made available to the immense Massey-Harris selling organisation. In spite of the general decline in tractor sales, Standard has for some months been producing Fergusons at the rate of 265 a day.

Through the Massey-Harris organisation, Ferguson will gain access to markets in the Eastern hemisphere that it has not entered before, and a sharp expansion in tractor

Folks with your future in their hands

Those young people have just bought a little car. One day they'll buy a bigger one. More powerful. More expensive. They're planning to buy a lot of expensive things before they are much older. Starting to buy some of them now. Will they choose *your* products? Today? Tomorrow, perhaps?

With its lively presentation of the news... its realistic approach to the problems of our time, the Daily Mirror appeals particularly to young readers. In fact, the majority of the 4,500,000 people who buy it every day belong to the vital vigorous younger generation. With long buying years ahead of them, they are forming brand preferences which may last them all their lives. They are the folks with your future in their hands.

Because it has the biggest daily sale on earth, the Daily Mirror can offer you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. And, *Daily Mirror* readers are young readers. Your customers today—next month—next year.

"WONDER DRUGS!" I'll give 'em wonder drugs. How about some publicity for us basic chemicals? Maybe Hexamine does not sound very exciting but you couldn't manage without me. Not if you wanted plastic bottle caps or light switches or covers for telephone receivers you couldn't. I'm one of the important ingredients in plastic manufacture. Got other uses, too. I kept the Olympic Torch alight all the way from Athens to London in 1948 and I provide the heat in the Army 'Tommy Cookers'. Proud? Of course I am. I come from Brotherton, one of the largest independent British manufacturers of Hexamine and other basic chemicals.

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Company Ltd., City Chambers, Leeds 1. Also at Manchester, Glasgow, Wakefield, Birmingham and Birkenhead.

ABELSON

Specialists in the supply of
PLANT, POWER PLANT &
miscellaneous MACHINERY

The Lady Godiva Statue was presented to the City of Coventry by Mr. Bassett Green and the photograph shows this being lowered into position on to its plinth standing on a garden island in Broadgate, the City Centre.

production is under discussion at Standard. But nothing has been said about future arrangements to produce Ferguson-designed implements. New implements, like the small combine that Ferguson has been anxious to sell for some time, will undoubtedly be made by Massey-Harris, which in this case can contribute something in know-how. But how many of the existing, as distinct from the new, Ferguson implements will eventually be made by Massey-Harris is a question that must be troubling many Ferguson suppliers.

Coronation Sales

THE London shops did well out of the lighthearted spending spree of coronation visitors in June. In that month, when retail sales for the country as a whole were 6 per cent above those for June, 1952, the central and west end area of London reported an increase of twice that percentage—a distinction for London that is quite contrary to the normal pattern, for London sales usually fluctuate less than do those elsewhere. Sales in the cafés and restaurants were 25 per cent higher on the year and those of sweets were up by no less than 65 per cent. London's food sales as a whole rose by 20 per cent, compared with an average of 9 per cent for the whole country. It is not clear whether sales of Coronation novelties did as well as the stores had expected—but this class of business is reflected in the rise of nearly 30 per cent in London sales of jewellery and "miscellaneous fancy goods." Sales of women's clothes in London also rose quite sharply by comparison with the rest of the country, and they also did well in the London suburbs. Much of the money spent on clothes seems to have gone on stockings, sales of which were up by 30 per cent in central London and 24 per cent in the suburbs, but by only 9 per cent in the rest of England.

The gala mood in London did not extend to the provinces, but some effects of the Coronation could be discerned in the spending there. The index of sales as a whole fell, from 126 in May to 121 in June (1950=100); but it was 7 points higher than in June, 1952. Sales of food, at 133, were ten points higher than a year ago and one point up on the previous month. Clothing sales taken as a whole were little changed from those of the previous year and, by comparison with May, showed a sharper than normal seasonal decline; but presumably most new clothing for the Coronation would have been bought before and not after Coronation day. Furniture, furnishings and the more homely kinds of household goods sold about as well as they were doing last year—but sales of television sets continued to run at a high level. The relevant index for the big retailers, which includes hardware and electrical goods, dropped on the month from 125 to 108, but was still 14 points above June, 1952. The independent retailers, who probably do more radio business than the big shops, recorded a drop from 171 in May to 139 in June—but this index was no less than 49 points higher than in June, 1952. On the whole, it appears that, outside London, the Coronation month brought little benefit to the shops. But it should be recalled that the index of total sales for May was 10 points up on the year, at by far the highest figure for that month (at 126) since the index was compiled. The gain was especially marked in clothes.

Productivity in Small Packets

THE seemingly elaborate arrangements made by the Board of Trade to administer the small revolving loan to industry and agriculture that is to be made available as the sterling counterpart of certain American conditional aid are presumably to be explained in terms of international good manners. The fund for this purpose amounts to £1 million, of which £700,000 will be for industry and £300,000 for agriculture; a fund of similar total size made available for fuel-saving equipment last year was passed over to the Industrial and Commercial Finance Corporation to lend out. For the new fund, however, a special committee is to assist the President of the Board of Trade in administering the industrial loans, headed by Sir John Woods, and a similar committee headed by Sir Stanford Cooper will assist the Minister of Agriculture and Fisheries to lend out his £300,000 to farmers.

The loans to industry will not normally be granted for periods of more than three years, and first consideration will be given to applications for loans that do not exceed £30,000; preference will be given to small and medium sized firms. In principle, any project with the object of raising productive efficiency in industry might qualify; in practice, loans will be restricted to projects that offer quick returns in this respect, and mainly, therefore, for the installation of new equipment and improvement of plant layout. Interest rates will vary according to the project, but for the most part, according to Sir John, will be around 4 per cent; this low rate may have been set to avoid the lack of interest shown by industry last year when the fuel-saving loans were offered at commercial rates. It is to be hoped that small companies will not hesitate to present projects to obtain these loans; the idea of a revolving fund, like various of the other projects to which the sterling counterpart of the \$9 million is to be applied, were shaped to a large degree by the terms of the Congressional amendment that made this American aid conditional, but the MSA authorities have been accommodating in applying these conditions.

The Navy's Aircraft Troubles

SAILORS, notoriously uncomfortable on horseback, have been having some difficulty too in finding their way round the air. The most recent report of the Select Committee on Estimates dealing with rearmament gave up most of its space to a discouraging post-mortem on naval aircraft ordered but not delivered through no fault of the makers. An aircraft design cannot be modified in the course of production in the way that, presumably, an aircraft carrier can, and the continual stream of requested modifications that emanated from the Admiralty has served to push the delivery date of some designs farther and farther away to a point at which the machine threatens to become obsolete before it is in service.

The Navy's aircraft are ordered on its behalf by the Ministry of Supply, and it is probable that liaison between the two bodies has not been as good as it might. The Navy has had a representative at the Ministry of Supply,

but the Ministry was not always represented when the Admirals discussed aircraft. A change is now being made to see whether matters can be improved. The staff at the Admiralty that is responsible for drawing up aircraft specifications is going to be "considerably increased in size," a phrase suggesting that earlier specifications were drawn up somewhat hastily. The Navy representative at the Ministry of Supply loses his old post and becomes a member of the Ministry of Supply under the title of Deputy Controller of Supplies (Air). He will in future be responsible for research and production of aircraft for the Navy, giving the Navy a spokesman inside the Ministry. In return, the First Lord has agreed that the Ministry's Controller of Supplies (Air) shall be allowed to attend meetings at the Admiralty when aircraft are under discussion. These changes put the Navy on the same footing as the Air Ministry in its relations with the Ministry of Supply. With the prospect of carrier-born fighters of great power—and great cost—some tightening up in organisation was clearly necessary if the history of the older types of machine is not to be repeated. But the power of the Ministry of Supply to decide in these matters whether or not a Service specification shall in fact be put out to the industry, is something that the services are coming to resent, and it will certainly cause friction when budgets become tighter.

Whisky Profits Diluted

THE Distillers' Company has this year, for the first time, followed the normal British practice of circulating the chairman's statement to shareholders at the same time as its full accounts. Unfortunately, however, these accounts make no distinction between the profits and assets of the company's distilling divisions and those of its industrial divisions. But Sir Henry Ross's statement, relating to the year to March 31st last, strongly suggests that the fall in the group's trading profits—from £21,265,450 to £13,205,539 was mainly due to the recession in the chemical and plastics trades and not to any weakness in whisky. The production of both grain and malt whisky has again been "satisfactory" and the stocks of maturing whisky have again been augmented; indeed, within the distilling industry total stocks of maturing whisky (at 150 million proof gallons) are back to their prewar level and compare with a level of stocks of only 82 million proof gallons in 1947. The overseas demand for these whiskies still continues to be greater than the amount of mature whisky that can be released from stocks. Clearly, then, the heart of the company's business continues to be sound and profitable.

In the industrial division, however, a sellers' market seems to have given way to a buyers' market all along the line. Even where demand is still rising—as, for example, it still is for the company's biochemical products—stiffer competition has brought down selling prices and profit margins. In addition a fall in raw material prices (especially of molasses) has helped to reduce the value of the group's total stocks from £56,416,256 to £55,120,669—and this in spite of an increase of over £3 million in the value of whisky stocks. To a very small extent this fall in working capital commitments has been accompanied by its usual corollary of an improvement in liquid balances; but the principal

factor here has been the increase in debenture capital from £10 million to over £18.2 million. Many of these debenture stocks can be converted into ordinary shares and holders of them will be as pleased as equity shareholders that the steep fall in gross profits has not prevented the directors from maintaining the ordinary dividend at 22½ per cent. And, though Sir Henry Ross cautiously avoids making any definite assessment of the group's future prosperity, current trends suggest that this dividend cannot be in any immediate danger.

Hard Sterling for Japan

STERLING has now become a hard enough currency to be able to look the dollar in the face in at least one very peculiar surrounding, namely in Japan's currency retention scheme. For some time now Japanese exporters who have traded in dollars to their exchange authorities have been allowed to keep back a proportion of them for the purchase of certain raw materials and other imports that are considered to lead to the promotion of exports. As from August 20th this scheme has been extended to cover export earnings from all currency areas. Generally speaking, those who hand in soft currencies will be allowed to draw back their 10 per cent retention only in currencies of equivalent softness; but apparently those who hand in £10 of sterling are allowed to draw back £1 worth of dollars or any other currency they like. The only limitation is that the exchange retained must be used to purchase any of the 185 items in the permitted list.

Presumably this additional incentive to sterling exports is being given in the hopes of bringing enough sterling into Japan's reserve to enable it to take up its right to repurchase in three months the spot dollars that it has recently sold against sterling in the London market. If Japan does not receive enough sterling to exercise its repurchasing rights, the sterling area gold and dollar reserves will benefit accordingly; but British and Commonwealth exporters, their market no longer protected by the cushion of a soft currency, will be likely to feel the pinch.

Tug-of-War in Coffee

BRAZIL, which grows half the world's coffee, is currently winning its traditional tug-of-war over prices with the United States, which drinks two-thirds of world supplies. After holding off for some weeks, American buyers have now been forced to come in on a rising market. The earlier recovery in prices met strong resistance from buyers in America and other countries, and in the first half of July prices had levelled off at about 445s. per cwt for extra prime quality, f.o.b. Santos. The predominantly seller's market of recent years seemed about to be reversed by the prospect of a big increase in supplies in 1954-55, when the Brazilian crop promised to exceed 20 million bags (of 132 lb) compared with about 16.5 million in 1953-54 and a yearly average of about 14.5 million during the last ten years. Buyers were biding their time.

Does your office stride through accounting routines... or hobble?

The Burroughs M200
Direct multiplication (answers calculated and printed automatically in one fast operation); automatic proof of accuracy; direct subtraction; entries fully described as desired—these are some of the features of this speedy multiplying accounting machine. Other styles of Typewriter-Accounting Machines are available for practically all accounting routines—sales, purchase and general ledgers, statistical applications, etc., with up to 21 totals if required.

**This incomparable Burroughs machine
handles complete routines—faster, and at less cost**

WHATEVER JOB THE OFFICE HAS ON HAND—stores records, cost accounting, payroll—the work normally divides itself into three distinct operations: calculating, posting or preparing, and checking.

On Burroughs Multiplying Typewriter-Accounting Machines the three steps are cut to one. Calculating and posting are done as a single, continuous operation—with automatic proof of accuracy.

The potential saving in time (and cost!) is obvious. This unique machine, the only one available with direct multiplication, not repeated addition, accelerates the production of complete and accurate records—giving management timely figures without posting "peaks." You owe it to your business to see it prove its efficiency in action. Call Burroughs today.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

For expert advice on business figuring

CALL IN Burroughs

Less waste—more speed. Illustrated here is the keyboard of a Burroughs M200 Multiplying Typewriter-Accounting Machine. The fact that all computing and typing keys can easily be spanned with two hands greatly reduces manual movements for the operator, and increases her speed and efficiency.

Then a severe frost hit the plantations in the two main producing states of Sao Paulo and Parana, and though its real effect will not be known until the coffee trees flower in September and October, the news effectively tilted the precarious balance between supply and demand again in the seller's favour. Prices quickly rose, to reach about 505s. per cwt for extra prime, f.o.b. Santos. They dropped sharply last week on rumours that the Brazilian authorities would at last allow some part of the export earnings from coffee to be exchanged into cruzeiros at the free market rate for the US dollar, which is roughly twice the official rate. This was widely expected to bring down the dollar price of Brazilian coffee. The rumours and the expectation both proved correct (the new regulations were briefly discussed in last week's issue of *The Economist*, but the market effect was short-lived).

Prices have since advanced from 460s. per cwt for extra prime, f.o.b. Santos, to about 484s. on the prospective tightness of supplies in 1954-55, on the appreciation of the cruzeiro and, latterly, on the re-entry of American buyers. A resumption of Continental buying is expected shortly. Nevertheless, the market does not yet appear to have regained its former vigour, and prices may fluctuate about the present high level until the autumn. If the damage to the Brazilian crops then proves to be extensive, a further advance in prices could meet much consumer resistance in the United States, where the retail price of a pound of coffee already leaves little change out of a dollar bill. In Britain, a minor market, consumption has fallen appreciably since prices approached world levels after they were decontrolled last year. Imports of the high-priced Brazilian beans have naturally suffered most, and imports from East Africa and the Belgian Congo now form a higher proportion of total British supplies.

More Price Falls in Materials

THE prices of basic materials continued to decline last month. The Board of Trade's index (which seeks to measure price changes in all basic materials used by British industry except fuel) dropped by another 1.2 per cent to 144.1 (June, 1949, equals 100). Increases in some materials,

notably lead (up by 4.6 per cent) and raw cotton (up by 0.6 per cent) were more than offset by falls of 12.0 per cent in tin, 5.0 per cent in rubber and 2.2 per cent in raw wool. The price indices for materials used by the mechanical and electrical engineering industries temporarily moved against the basic trend in July, rising by 1.0 per cent and 1.3 per cent respectively. This was mainly because of a jump of 21.3 per cent in the price of brass ingots. The chart illustrates the time-lag in movements between the highly sensitive basic index and the less sensitive indices for the two engineering industries. It shows, incidentally, that—in contrast to some private indices that are based on the prices of commodities dealt in on the commodity markets—all three of these official indices are still well above the levels of June, 1950, when the Korean war began.

Changed Pattern of Trade

DETAILED analysis of the trade figures for the first half of this year confirms that Britain has maintained the marked change in the geographical pattern of trade that was brought about by the crisis measures of end-1951 and early 1952. Despite the easing this spring of the restraints upon imports from OEEC countries and the greater freedom for some hard currency imports consequent upon the re-opening of commodity markets, British imports from non-sterling sources in the first half of this year amounted

UNITED KINGDOM TRADE BY AREAS
(Monthly averages in £ million)

	Imports, c.i.f. 1st half		Total exports, f.o.b. 1st half		Gross visible deficit 1st half	
	1952	1953	1952	1953	1952	1953
Dollar area	70	49	31	34	40	16
OEEC area	78	64	58	62	20	2
Other non-sterling areas	50	37	34	21	14	15
Non-sterling areas combined	198	150	123	117	74	33
Percentage of total ...	62	53	51	54	96	52
Sterling area	120	132	118	101	2	31
Percentage of total ...	38	47	49	46	4	43
TOTAL	318	282	241	218	77	64

to only 53 per cent of total imports—a proportion that contrasts with 62 per cent for the first half of 1952 but is roughly the same as that attained in the second half of this year. This contrast is clearly brought out in an analysis published this week by the Board of Trade, the salient figures from which are summarised in the accompanying table. The proportion of total imports coming from the sterling area, of course, rose correspondingly from 38 to 47 per cent. Simultaneously, exports to the non-sterling area rose from 51 per cent of the total to 54 per cent and those to the sterling area fell by three points

to 46 per cent. Non-sterling imports dropped by no less than 24.2 per cent, whereas total imports fell by 11.5 per cent, but non-sterling exports fell by only 4.9 per cent compared with a 9.5 per cent fall on the total. The gross visible deficit in the first half of 1953 was therefore almost equally divided between trade with the non-sterling and sterling areas, as it was in the last half of 1952; whereas in the first half of 1952 it was attributable almost wholly to trade with the non-sterling area.

This pattern is unlikely to be substantially altered in the second half of this year. Although some further easing of restraints upon imports from OEEC is generally expected, any such concessions will take time to show their full effect; on the other hand, a further relaxation of restrictions can be expected in Australia and other sterling markets. The rise this year in imports from the sterling area in the first half of this year chiefly reflected much larger shipments of raw wool and cocoa; imports of raw wool were 66 per cent higher by value than in the last half of 1952 and 36 per cent higher than in the first half.

The value of exports to the non-sterling area remained at the lower level established in the last half of 1952; an increase of £5 million a month to the dollar and OEEC countries together was offset by a fall in exports to other non-sterling countries, owing to smaller shipments of engineering goods to restricted markets in Finland, Egypt, Brazil and Argentina. Larger shipments of chemicals and refined petroleum accounted for most of the increase in exports to the OEEC countries. The recovery in exports to the sterling area, which were £5 million a month above the level of the second half of 1952, was spread over nearly all groups of manufactures, but was particularly marked in the metals and engineering groups.

Freer Dutch Exchanges

HOLLAND has taken yet another step towards a freer economy. Foreign exchange balances need no longer be handed over to the Netherlands Bank, but may now be held by all Dutch residents, enterprises and commercial banks. The immediate effect of the new freedom will be to "spread" Dutch exchange reserves, so that the holdings of the Netherlands Bank may be expected to fall in the coming weeks. This relaxation does not, of course, amount to convertibility for the guilder, under any interpretation of that much misused term. United States and Canadian dollars can still be exchanged only against guilders; but all other currencies may be converted into one another without restriction for current account transactions—although exchange control still applies to capital transactions in all fields.

The Netherlands now appears to exercise more liberal foreign exchange regulations than any other European country except Switzerland, and it seems well able to sustain them. Despite last winter's floods, it is estimated that the balance of payments will still be in surplus this year to the tune of about \$150 million; last year's surplus was over three times this figure, so that the Netherlands was able to renounce all United States aid early in the year, and has yet succeeded in raising its foreign exchange reserves to approximately \$1,100 million—a very large reserve indeed

for a country of this size. Holland's transformation from one of the most chronic deficit countries in Europe to its present position of strength has been achieved within the space of two years; and it should not escape attention that the improvement has coincided with a reversion—much criticised at first—to orthodox economic and monetary policies. Now that the Dutch Government has gone thus far, it could surely give the lead to some of its weaker neighbours by abolishing its obnoxious scheme for partial retention by exporters of dollar earnings.

Dispersal for Aircraft Designers?

THE de Havilland Aircraft Company has brought over to this country a small aircraft, the Beaver, built by its Canadian subsidiary. It is a highly specialised design, intended to meet operating conditions peculiar to the Canadian Great Lakes, and its landing gear offers a choice of wheels, skis or floats. It can carry a load equivalent to 6 passengers and a pilot. The importance of the Beaver is not that it is a pleasant and financially successful piece of designing but that it was designed in Canada. There is an obvious risk, in the event of war, in having designers in whose hands lies the future of the country's defences concentrated in so small and vulnerable an area as the British Isles. Aircraft design needs considerable experience, of a kind not easily found in an industrially young country; and, in an attempt to encourage it, one or two British companies have taken steps to allow their subsidiary companies in Commonwealth countries to experiment with their own local designs. The Beaver is the product of one such team. Its success in meeting a set of local conditions that are apparently not restricted to Canada is shown by the fact that more than 500 are now in operation; quite a number of them have been bought by the United States Army and are in service in Korea.

Designing on a far more ambitious scale has been undertaken by the Hawker Siddeley subsidiary, Avro Canada, which is responsible for the production of a night fighter—again designed for special Canadian requirements—and of the Orenda jet engine that powers it. Avro Canada is also reported to be designing a genuine flying saucer; its military role has not yet been disclosed.

Aircraft orders are not, however, so plentiful that companies can contemplate spreading their resources in this way on any great scale, nor is diversity of designs encouraged by the Services. But circumstances are forcing British companies to open factories outside this country—for example, the assembly factories now being set up for British-designed rockets shipped to Australia for testing on the Woomera range. Whilst British factories rely heavily on export orders for employment, their inability to deliver aircraft in times of general rearmament is leading Commonwealth governments to insist upon local production. India is building Vampires, and Australia, Canberra and Sabres, whilst Rolls-Royce has recently completed its first Canadian factory. Experience suggests that this is a slow and extravagant way of getting aircraft, but it appears an inevitable development from the present prospect of long-term international tension.

Quiet Freight Markets

ALTHOUGH the Chamber of Shipping index of tramp freight rates for July rose slightly from 73.8 to 75.8, fixtures made in the first three weeks of August do not indicate that this improvement is likely to be held. The period between the grain harvests is often one of inactivity in the freight market, and this year charterers in other trades appear to be equally reluctant to fix tonnage. On the Baltic Exchange a fixture at repeated rates, except for prompt tonnage, is regarded almost with vague surprise. The general level of rates, however, is still rather higher than about the same time last year. Last July, for example, the Chamber of Shipping index, computed on the new basis of 1952=100, was 73.5. Although it dropped to 71.2 in August, 1952, subsequent months saw it rise gradually to 88 in November and it remained in the region of the 80s until June last. It is probable that this seasonal pattern will be repeated this year. Time charter rates fell in July, the new Chamber of Shipping time charter index being 57.4 for this month, compared with 61.6 in June and 85.2 in July, 1952. The time charter index is based on an average rate in 1952 of 24s. 5d. per ton dw per month for oil-fired steamships and 27s. 10d. per month for motorships. Recent fixtures of vessels on time charter for varying periods suggest that rates will improve during coming months. Nevertheless, a substantial increase in freight rates will be needed to offset the recent advance (now somewhat modified) in oil bunker prices, which will seriously affect voyage accounts.

At current freight levels the margin of profitability must be extremely narrow, and there is no doubt that in certain cases it has disappeared. Some owners have accepted fixtures which are bound to show a loss, rather than incur the expense of laying up, in the hope that this may be avoided; but laying up cannot be deferred too long. According to the Chamber of Shipping, tonnage laid up

in the United Kingdom on July 1 for reasons other than repair amounted to 166,709 tons gross. Although this shows only a slight increase during the quarter, it compares with the small figure of 41,074 tons a year ago. The August decline in freights last year, however, resulted in an increase in the laid-up figure to as much as 290,393 tons on October 1; and the simultaneous incidence of higher bunker costs and lower freights may well cause another procession to the laying-up berths.

SHORTER NOTES

For the third time the Capital Issues Committee has turned down an application by United Dominions Trust for permission to increase its share capital. The chairman of the trust, Mr Gibson Jarvie, has declared frankly that he is "regretfully forced to the conclusion" that this refusal is due either to "wilful prejudice" or else to Government planners' "inability to discriminate between a hire-purchase agreement used purely as a security instrument in the acquisition of a combine harvester or ship's engines, for example, and a hire-purchase agreement covering a radio set or a washing machine." Mr Jarvie agrees, however, that the company is still "comfortably within the accepted ratio of capital to borrowings (whether by loans, deposits or acceptances)," and that even without an increase in capital it should be able to continue its present remarkable rate of expansion for some years to come.

★

The level of activity at British ports in the second quarter of this year, as measured by the tonnage of cargo shipping engaged in foreign trade entering them and being cleared, was the highest for the second quarter of any year since 1939. Vessels entering these ports totalled 17,600,000 tons, and vessels cleared 12,400,000 tons. Clearances from London were 14 per cent higher than at this time last year.

The directors maintain ruefully that the group has not had its "fair share of Government orders," but then go on to draw the cheerful conclusion that the group's business will not be undermined by any pruning in the defence programme. The immediate prosperity of the Pye group will depend more upon sales of television sets than on sales of radios; and it is not surprising that the report contains a strong plea for commercial television programmes. There is very little comment on the course of trade in the last few months, but trends here can hardly have been other than favourable; the Coronation and cricket will have seen to that.

★

PINCHIN, JOHNSON. In his statement accompanying the full accounts of Pinchin, Johnson and Associates, the chairman, Mr G. R. T. Taylor, confirms the earlier belief in the market that the drop in the group's trading profits (from £1,958,819 to £1,476,076) was due to a worldwide fall in demand for paint; this led to stiffer competition between paint manufacturers in narrowing markets both at home and abroad. For the first time

for several years the volume and value of the parent company's sales fell and its profit margins were reduced; abroad, the majority of Pinchin Johnson's subsidiaries were faced with equally difficult conditions. The group had wisely begun to reduce its stocks in advance of the fall in prices, and it has not had to suffer any heavy losses

10s. ordinary share at 32s. 9d. yields £6 2s. per cent.

on these. In fact, in the consolidated balance sheet the book value of stocks is shown to have risen from £5,055,055 to £5,201,934—an increase that suggests that some products were piling up unsold in the group's factories. Another sign of caution is that the directors have decided to leave the contingencies and stock depreciation reserve unchanged at £500,000 and to reduce the ordinary dividend from 25 to 20 per cent—a decision that was discussed in these columns on July 18th.

Indeed, perhaps the only heartening feature of the company's full accounts is that last year's loan stock issue has led to a substantial improvement in liquid resources. Moreover, the directors expect that bank loans and overdrafts of £912,959, which have been run up by overseas subsidiaries, will be substantially reduced in the current financial year. But

it is to an improvement in trade rather than to a strengthening in liquid balances that shareholders must pin their not very buoyant hopes for the year ahead.

★

DEBENHAMS. The 4s. ordinary shares in Debenhams have recently been the most active of all securities in the shops and stores group in the London stock market. They had almost exactly doubled from a low point of 15s. 9d. earlier this year to a peak of 31s. 3d. at one time last week. This upsurge followed rumours that Debenhams might write up the value of their properties to their present-day values and possibly make a capital distribution to shareholders—in the same way as Johnson (Dyers) Ltd. have recently done, after many rumours of possible take-over bids. In the event, however, the announcement by Debenhams this week, though it confirms these rumours to some extent, has disappointed the most determined bulls, for it offers no immediate gain to shareholders; the shares were therefore marked down by 1s. to 29s.

The company has revalued its investments in subsidiaries "on a basis considered fair and reasonable by the company's auditors," and has used this revaluation as an opportunity to capitalise £3 million from reserves so as to write up the nominal value of the ordinary shares from 4s. to 10s. each. The directors consider that the proposed scrip issue should not take place until after the annual general meeting in December, when shareholders will have in their possession the company's accounts for the year to July 31, 1953. The present price of the shares is therefore only justified by the hope that the scrip issue foreshadows an increase in equity dividends. There are grounds for optimism on this score, for recently the interim ordinary dividend was raised from 8½ per cent to 12½ per cent.

LONDON STOCK EXCHANGE

Next Account begins: September 2nd.
Next Contango Day: September 2nd.
Next Settlement Day: August 25th.

THE stock markets continued to make a good showing at the end of the old account and the beginning of the new Business in the gilt-edged market was at a low ebb but the undertone remained firm; some gains were made by the longer-dated nationalisation stocks and by the close on Wednesday the price of the new Gas stock had improved to ¼ premium. Insurance shares scored a few minor advances, but home banking issues tended to drift slightly lower. The foreign market remained quiet, though German issues showed some improvement. In the market for dollar stocks, the new exchange control regulations or switching operations established a common premium on United States and Canadian securities. At first a premium of 4 per cent (on the middle rate of \$2.80 to the £) was quoted, but later on a common premium of 3½ per cent was quoted on the actual exchange rates of the U.S. dollar and the Canadian dollar. In the initial re-shuffle, such stocks as International Nickel (which earlier had been quoted in London at only a very slight premium above the Canadian price) were marked up, while "Canpacs" and others that had previously carried a higher premium, were marked down.

Steady advances in prices were recorded throughout almost the whole of the industrial market and by the close on Wednesday, the *Financial Times* ordinary share index had improved to 123.7, compare with 122.6 a week earlier. Some of the biggest advances were made on the first day of the new account, while the share which were most in demand were those of the shops and stores group. Oil share which were a little unsteady at the end of the old account, staged a recovery on Wednesday under the lead of Anglo-Iranian, which were marked up to 7½ following the news of the revolt in Iraq. Very few price changes were recorded in the Kaffir market, but copper and tin shares continued to improve.

Company Notes

PYE. If shareholders in Pye can persuade themselves to turn away from the cartoons and articles (including one reproduced from *Punch*) in the 1952-53 report, they will find that the company's own accounts make equally cheerful reading. There was a much bigger expansion in the group's business last year than the rise in trading profits (from £783,554 to £955,992) would at first suggest, for profit margins fell following a judicious cut in selling prices. The group's export business also expanded, except in electrical appliances where the closing of the Australian market dealt the group a severe blow. Stocks fell in value from £2,748,174 to £2,606,210; and this, together with last year's issue of 578,747 deferred 5s. ordinary shares at 12s. each, enabled the group to reinforce its liquid resources. Its bank overdraft was reduced from £444,715 to £157,026 and its cash balances were increased from £36,007 to £197,464. This reinforcement of resources and the advance in profits were sufficiently strong to encourage the directors

to pay a dividend of 20 per cent on the new ordinary capital of £602,862, compared with 18 per cent on the original capital of £434,061 a year ago.

(²) Index numbers of unit value which compare the current value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (³) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only. (⁴) Notes only for France and Austria.

accordingly. This also applies to a number of markets in South America. The position, however, is such that any balances which we are unable to ship because of currency and other restrictions are readily taken up by other markets where no such difficulties exist.

I am satisfied that the policy which we have adopted and are continuing to pursue, i.e., the restriction of supplies within the limits of availability of our adequately matured stocks, is one which has undoubtedly enhanced the reputation of our brands in the markets of the world. It will, I am certain, bear fruit when more plentiful supplies are available. The essence of success in our whisky business lies in quality, and there can be no departure from the standards which we have set ourselves in this respect and have so firmly maintained throughout the difficult postwar years. This standard rests on a basis of unchallenged excellence, a true and unvarying hall-mark which is universally recognised and respected.

Last year I referred to the export of immature whisky and expressed the hope that the responsible Government department would decide to impose a complete embargo on such traffic. Unfortunately this hope has not been realised. Although the export of immature whisky has been made subject to license and comparatively small quantities are being authorised, once again I desire to place on record and emphasise my view that export from this country of immature whisky is utterly opposed to the best interests of the industry.

It may be appropriate for me to refer to a notion, which has been aired in certain quarters and which has also received wide press publicity, that some national benefit would ensue if the price of Scotch whisky exported to the United States were doubled, or at least substantially increased. To those who have practical experience of this sensitive and highly competitive market, the suggestion is in obvious conflict with logic and common sense. It is true that the demand for our major brands exceeds the available supply but the foothold of the industry in the United States, although slowly growing firmer, is still slender in relation to the total volume of domestic and other whiskies consumed in that valuable market. To trifle with such a delicate price structure would have a suicidal effect on our business. Scotch whisky remains the largest single dollar-earning commodity that this country possesses and I am glad to say that this Government, like the previous one, has endorsed our policy and is content to leave the question of price to the industry itself.

Two years ago I had occasion to refer to a compliment paid to the Scotch Whisky Association by the then Financial Secretary to the Treasury. I am happy to say that the efforts which we have made since that time have received further recognition. When addressing the Scotch Whisky Association in 1952, the Chancellor of the Exchequer, the Rt Hon R. A. Butler, said:

"... It is quite clear to me that your industry has borne a burden and performed a duty in a spirit which is wholly admirable, and I would like to take this opportunity, on behalf of the Government, to congratulate all those present, whether you have come from Scotland or England, for the sense of service with which you have performed your duty within your industry. ..."

GIN

I am pleased to report a successful year's trading by our gin companies, although due to higher costs of raw materials the profits were somewhat reduced. Home and export sales both show substantial increases over

the previous 12 months and the output from our plant at Linden, New Jersey, has also considerably exceeded that of last year.

There is evidence of growing appreciation in all markets of the care with which the high standards of our brands are maintained and, although in the home market the upward trend may be to some extent influenced by the shortage of whisky supplies, this satisfactory movement can be attributed, to a large degree, to the care and experience devoted to our gin products at every stage of manufacture.

During the course of the year we erected and brought into operation a gin-producing plant at Isando, South Africa. This plant has only been in production for a few months but I view its future with full confidence.

YEAST

Our yeast factories were well employed throughout the year. A new form of packaging has been adopted by our distributing companies which is more hygienic and more economical to the consumer than the former package. The total sales are somewhat less than the previous year, reflecting partly the economy afforded by the new package and the lower consumption of bread due possibly to the improved general food position. Despite active competition in this market, the year's results were satisfactory.

INDUSTRIAL SECTION

In my statement last year, I drew attention to the sharp recession in trade which had then developed and which, in fact, continued throughout the greater part of the year now under review. The change from a sellers' to a buyers' market developed rapidly, resulting in a general loss of confidence which was particularly reflected in the chemical industry. In common with most other industrial undertakings, the operations of the various groups which comprise our industrial section were adversely affected, both as regards turnover and profit margins, but this was most marked in the chemical field. The inflationary conditions which prevailed in the immediate postwar years, and the abnormally high prices of raw materials, were bound to have the repercussions to which I have referred, and although our earnings have suffered—I believe temporarily—there is little doubt that the present conditions of trade are healthier and on a more realistic basis.

It has to be borne in mind, however, that the emergence of Continental Europe, and in particular Germany with its accelerated economy, has constituted a strong competitive influence in the past year, and this problem still remains. It can only be met successfully by lower prices and increased productivity.

The forecast I made in respect of molasses, which is one of our principal raw materials for the production of ethyl alcohol, has proved to be correct, and towards the end of the year the price fell almost as sharply as it had previously risen. As you will have seen from the accounts, the reserve created for this purpose was used to write down our stocks of molasses and finished materials processed therefrom in order to reduce the selling prices of our derivatives to more competitive levels.

Our production of synthetic ethyl alcohol, as distinct from that derived by fermentation of molasses, is now a significant proportion of the total requirements of the United Kingdom. In the USA, there is sufficient synthetic ethyl alcohol capacity to supply the whole of its normal industrial requirements. It is therefore to be hoped that producers of molasses throughout the world will appreciate the necessity for maintaining

stable low prices for this by-product of the sugar industry, since this is the prerequisite for its continued use on a large scale as a chemical raw material.

Since the beginning of the present financial year, there has been a marked improvement in the demand for industrial alcohol and the various chemicals which we manufacture, and I am hopeful that this upward trend will continue.

Sales of carbon dioxide during this past year were a record for the company, and steps have been taken to extend our manufacturing capacity, part of which will be in operation during the current year.

British Petroleum Chemicals Limited.—The plant at Grangemouth has operated very successfully throughout the year, and its present output of synthetic industrial alcohol and isopropyl alcohol is in excess of the designed capacity. This plant, with its present main products based on petroleum should prove to be a valuable asset in the company's industrial operations, and, in due course, it is our intention to extend the range of products manufactured at Grangemouth.

I am glad to say that the monomeric styrene plant of Forth Chemicals Limited at Grangemouth was commissioned during the year, and is now operating to designed capacity, which is fully absorbed by the present sales demands.

Biochemicals Division.—Despite intensive competition both at home and abroad our factory at Speke has enjoyed a reasonable level of production of penicillin and streptomycin throughout the period. The new plant to increase production of both these materials was largely completed during the year, and this has assisted materially in meeting the requirements of consumers. New forms of these two staple antibiotics have been marketed and well received by the medical and pharmaceutical professions. Considerable progress has been made in developing supplements for incorporation in animal feeding stuffs, and it is anticipated that sales for this purpose will, in due course, make a useful contribution to our output.

Due to progressive process development and rising consumption, there have been a series of major reductions in selling prices over the last few years. Competition remains very keen, particularly in export markets where prices are still falling, but our modern plant and technical resources should help us to meet these conditions and secure a proper share of the business.

Plastics Division.—The consuming industries supplied by our plastics group were particularly affected by the recession in trade, and this was very marked in the sales of the older types of materials. However, I am glad to be able to report that during recent months the position has improved considerably.

The plant of British Geon Limited producing polyvinyl chloride is operating at full capacity. The ever-widening demand for this plastic material still exceeds production, and steps are being taken to increase our capacity by 25 per cent. It is hoped that this extension will become effective early in 1954.

Magnesium.—Our subsidiary, Magnesium Elektron Limited, has had a good year, and continues to supply its special light alloys to a widening circle of consumers at home and abroad. Our exports of special alloying materials to the United States and Canada have been well maintained.

South Africa.—Our associated company, National Chemical Products Limited, had a successful year, and has benefited from new plant and equipment recently installed. Further schemes of expansion in the manu-

facture of chemical products based on indigenous raw materials are now being progressed, which should add appreciably to the strength of this company.

Australia.—The new plant of our associated company, CSR Chemicals Pty Limited, to which I referred last year, has been commissioned, and is now producing a high quality cellulose acetate for the rayon and plastic industries. The solvents and chemicals factory of Robert Corbett Pty Limited, which has now been merged with CSR Chemicals Pty Limited, has recovered from the recession of last year and is now operating at maximum capacity.

At the close of the year, we decided to bring to an end the separate trading operations of a number of subsidiary companies on the industrial side and in future to carry

on these businesses as divisions of the parent company. It is hoped thereby to simplify the administration of this section of the business.

FUTURE PROSPECTS

In view of what I have already said in respect of what might be termed the severe processes of adjustment during the past financial year, arising out of the abnormal or inflationary conditions which have persisted for so long, I feel that shareholders will agree that the results for the year may be regarded as satisfactory.

Although, undoubtedly, the potable side of the company's interests will be confronted with fresh problems in the future, it is nevertheless equipped with such a background of experience and resources that I feel we can

THE ECONOMIST, AUGUST 22, 1953

confidently anticipate it will continue to contribute the major part of the earnings of your company.

So far as our industrial and general interests are concerned, these conform to a pattern which in conditions of national economic stability should show a satisfactory return to the shareholders.

STAFF

I would like to take this opportunity on behalf of the board and also of the shareholders, to thank the staff and all ranks of employees for their loyal and efficient service. The changing conditions of the past year have created many problems and difficulties, and the spirit and resourcefulness with which they have been tackled are deserving of the highest praise.

us as individuals—the opportunity to rise. No man, in present conditions, can establish a fortune unless through a lucky gamble: no man can build his fortune out of wages or salary. Natural incentives must be restored—the opportunity for reward to the able and the willing: hard fare for the able but unwilling. There is no longer real ambition because there is no longer any possibility of satisfying it. The rich are disappearing but no civilisation can exist without them.

Apathy has always been the besetting sin of the British people. It still is. There is little or no enthusiasm today for work or adventure. Too many simply want the maximum wage for the very minimum of work: the shortest hours and complete freedom from responsibility for either the present or the future.

The political economic philosophy of the Welfare State is not only bad economically but it is also morally bad. No civilisation based on spite or envy or on a sentimental altruism can survive. Nor can it live on a foundation of dependence on the State. We, and the people of the world, need freedom to think for ourselves, to act for ourselves and to live our own lives. And we need peace. But these are not compatible with frustration, regulations and restrictions or with class-conscious war or any kind of dictatorship. Peace will only be found when there is happiness, freedom and a reasonable prosperity in the world.

Our country today is like a good engine being driven with the brakes full on. If we are to prosper, nay, if we are to survive, our freedoms and our personal responsibilities must be restored to us.

The report was adopted.

OZALID COMPANY LIMITED

(Makers of Sensitized Papers, &c.)

DIVIDEND MAINTAINED

The annual general meeting of the Ozalid Company, Limited, was held on August 14th in London.

Mr C. A. G. Hewson, chairman and managing director, presiding.

The following is an extract from a summary of the chairman's statement:

I am pleased to announce a further expansion both in profits and turnover. As I mentioned last year, one must not overlook the inflationary trend or the Defence Programme when taking note of the results.

The results for 1953 to date compare favourably with those for the similar period in 1952, and there should be ample profit

THE ECONOMIST, AUGUST 29, 1953

Going up far, Captain Reece?

Standing on the tarmac in broiling weather at mid-day and then in a matter of minutes flying at 20,000 ft. in intense cold, is not the everyday experience of every pilot.

But it is becoming commonplace with the newest types of planes. Rapid changes from one extreme temperature to another call for new materials like silicones if the aircraft is to function perfectly. Silicones are a completely new range of heat and cold resisting fluids, greases, resins and rubbers, marketed by Midland Silicones Ltd., an associated company of Albright & Wilson. They are helping to make it possible for modern aircraft like the De Havilland Comet and the English Electric Canberra to fly higher, faster and farther than ever before.

Chemicals for Industry

ALBRIGHT & WILSON

UNITED DOMINIONS TRUST

GROUP'S NOTABLE CONTRIBUTION TO NATION'S WELL-BEING

MR J. GIBSON JARVIE ON COUNTRY'S PARAMOUNT NEEDS

The thirty-first annual general meeting of United Dominions Trust, Limited, was held on August 18th at Regis House, King William Street, London, E.C.

Mr J. Gibson Jarvie (the chairman), who presided, reviewed in detail the group's existing activities both at home and overseas and, after referring to his pending tour abroad, said:

Australia and Canada offer exceptional opportunities and both should prove fruitful fields for the varied activities of our group. As in South Africa, the Rhodesias and in New Zealand, we aim not to exploit any country in which we are operating but to grow with it: to save its needs to the best of our ability: to make each "United Dominions" Company a real Commonwealth link and to foster, in every way we can, each country's internal trade and its external business with the other members of the Empire—particularly Great Britain.

The group has a capital and surplus amounting to £4,500,000 and assets exceeding £26 million. Over the years United Dominions Trust has clearly made a notable contribution to the industry and commerce of the nation. Yet when we are ready still further to increase the usefulness of the group and to help restore the economy of the country, the Government itself raises an obstructing hand and says "Stop!" Let me explain. In 1950 and again in 1951 we applied to the Capital Issues Committee for permission to increase our capital and on both occasions that permission was refused. In April of this year we made our third application to the Committee, giving them a detailed description of the wide scope of our business and of the quality of the services we are rendering to the national economy. Despite this, our application to the Capital Issues Committee has now been refused for the third time!

A PIONEERING COMPANY

The history of United Dominions Trust gives me the right to describe it as a pioneering company. We are following the road travelled by those who made Britain a great industrial and trading nation and an Empire. At home and abroad our services are promoting the national and international trade of the Commonwealth. We are improving old-established services; we are adding new services. We have fairly established our right to live—and to grow.

Yet when we seek the further expansion which is entirely justified by our record, the

Government intervenes and applies a veto under out-of-date defence regulations! The character of our business and its essential place in our economic system make it incredible that any Government should take this short-sighted and despotic attitude.

I am regretfully forced to the conclusion that we are denied the right to additional capital because of Government planners' wilful prejudice against the company's continued expansion, or their inability to discriminate between a hire-purchase agreement used purely as a security instrument in the acquisition of a combine harvester or ship's engines, for example, and a hire-purchase agreement covering a radio set or a washing machine.

Taxation forces both individuals and companies to serve most of their time in providing the Government with money to squander. So that companies are denied the reserves which expansion and the constant rise in costs require. As individuals, we have no longer any real incentive to work or to save, because taxation leaves us so little of our earnings and destroys the right to provide for dependants on our death. Taxation has brought down Governments and caused revolutions in many countries—history records that it has even happened here. Are we now too supine effectively to protest; must we docilely accept every imposition merely because it is an act of the Government? Once a first duty was to keep taxation low. Constant watch was kept to save where saving was possible. Today all efforts seem to be devoted to the discovery of new sources of revenue and to finding schemes on which to squander the resulting taxes.

THE WELFARE STATE

The Welfare State is presumed and designed to abolish poverty, but if it has in fact reduced one form of poverty it has merely created another in a different class. The country is in a parlous state; there is a crying need for drastic changes in our conception of social rights and duties. There should be free competition between business concerns and between individuals. Our currency should be freed to find its proper level—in all probability a much higher level than that at which it is at present artificially maintained. There should be no interference with natural supply and demand which alone can bring orderly markets out of the present disorder. Only by these means shall we ever get real efficiency, maximum production and—and what is needed to stimulate

A comprehensive word, *needles*. Involving quite a profusion of packing problems. That's the point.

It is not commonly realised that many types of 'needles'—those used in electronic assemblies, for instance—may be held in storage for periods up to ten years, and are expected to be in perfect condition for use whenever they are taken from the packets. Air must be completely excluded from them; this is ensured by means of special mouldable wrapping and wax-dipping of cartons after packing.

On all such details, the P.I.P. organisation is as sharp as any of the various needles it handles. And that goes for other goods too. P.I.P., you see, is the Remploy group that specialises in Preservation, Identification, Packaging. Its advice on these matters is yours for the asking.

Remploy's P.I.P. organisation, the largest of its kind in the U.K., has 13 factories throughout the country. These provide everything for a complete packaging service—from bag liners and cartons to giant packing cases.

Bomb to End Bombs?

WHEN it was announced from Moscow last week that "one of a variety of hydrogen bombs" had been exploded in the Soviet Union the Kremlin added the assurance that no one need feel alarm. It was an ingenious thought but, as it proved, superfluous. For one reason or another no great alarm was shown outside the United States. If Malenkov reckoned that his explosion would shake western nerves before negotiations began about Germany and other matters he was mistaken; for he saw his thunder stolen three days later when the British Minister of Supply spoke of guided weapons now being developed which would hunt down and destroy the atom-bomber whatever its height or speed. What exactly the position is in the race between the H-bomber and the rocket the layman is not told; so for the time being he is puzzled rather than frightened by hearing of one set of scientists bent on defence wrestling for supremacy with another set of scientists bent on offence, both at great expense to himself.

The outcome of this struggle, however, is for the future. The question for the moment is whether the Soviet revelation changes the circumstances in which the Great Powers have to negotiate. It seems probable that neither the Americans nor the Russians yet know how to make and deliver a hydrogen bomb. What has happened is that each side now knows for certain that the other can produce a thermo-nuclear reaction. In terms of military striking power, therefore, things are probably much as they were: the American and British ability to use atomic bombs effectively is probably still greater than that of the Soviet Air Force. How long that advantage will last no one can tell; the important point is that it still exists at a time when critical negotiations between the Soviet Union and the western powers seem possible.

On the other hand the Soviet revelation must have deep and subtle effects on the attitude of Americans and on the prestige of their government in the world. Last year the Atomic Energy Commission said that the American lead over the Russians in "thermo-nuclear weapon research" was approximately four years. The news from Moscow suggests that it was wide of the mark. It appears that the hydrogen bomb, if it can be made, will not give the United States permanent decisive military superiority through one weapon; at best American installations will make them better and faster than Soviet installations. It is, of course, possible that both governments will decide that to build up a stock of these weapons—as distinct from making an experimental bomb—would be too expensive; if there is good reason to believe, on a long view, that the days of the strategic bomber's supremacy are numbered, nothing could be more wasteful than a hydrogen bomb race. Indeed, it may be that the attempt to attain decisive military superiority by such means is reaching the point of absurdity. But for the absurdity to be perceived it was necessary that both the United States and the Soviet Union should be certain

that the other was on the way to producing the bomb to end bombs.

This is not to say that the news of the Soviet explosion is welcome. On the contrary it marks an important military gain to a government that has been, until recently, openly and bitterly hostile to this country. That enormous destructive power should be in the hands of a ruthless regime, on which there is no effective check by parliament or public discussion, is a most disturbing thought. On the other hand, if this Soviet advance had to come one day, it was better that it should come at this early stage of Mr Eisenhower's Presidency and disperse some of the wishful thinking that had grown up around the notion of western superiority in atomic weapons. It will bring Americans themselves closer to understanding what Europeans—even the bravest of them—feel when they think seriously about atomic warfare; for if the H-bomb race goes on the United States will feel threatened as never before.

The Soviet Government has, of course, once again insisted that it wants international agreement to abolish all weapons of mass destruction. On this matter it is best to have no illusions. There will be no scrapping of atomic weapons under international auspices until adequate and enforceable controls have been devised; such controls are out of the question until the governments of the Great Powers will accept close and continuous international inspection of their installations and stockpiles. Is it conceivable that the United States and the Soviet Union, to say nothing of this country, will in the predictable future accept such an intrusion on vital secrets, such an interference with national sovereignty? Logic may point to their doing so and to the establishment of an international authority which alone could wield the supreme weapon and prevent war by the threat of its use. But such a body would in fact

assume the powers of a world government; and if it is the ambition of the United Nations to act in that role its prospects of success have never looked more remote than they do now. Clearly, the only hope of calling a halt in the atomic race lies in American-Soviet agreement, not in the first place about armaments but about some of the issues that divide them. Disarmament, if it comes at all, will come eventually from growing confidence that the risks of conflict are diminishing; and that confidence can come only from the gradual removal of differences by negotiation.

For the immediate future, therefore, the prospect is obvious. The technical competition between West and East, between offence and defence, between ways of getting the bomber through and ways of getting the bomber down will go on. If the West is to succeed in its policy of negotiating with the Soviet Union from strength it must keep its technical lead—not necessarily by stockpiling hydrogen bombs—but above all it must maintain its unity. Some way must be found of surmounting or removing the barriers that divide American and British scientists and military planners in the field of atomic development. It is absurd that the Americans should be—as it appears—secretly well ahead of the British in finding out how a hydrogen bomb can be made and dropped, while the British are secretly well ahead of the Americans in finding out how to clear the sky of bombers. Such lack of co-operation in research and development must make a serious drain on the resources of both nations. If they were working fully together and mobilising the resources of the Nato nations to assist them, it is a fair presumption that Soviet chances of cutting down seriously the western lead would be smaller than they now are. Malenkov's hydrogen explosion should strengthen their determination not to be divided on the really vital issues and to maintain a powerful Atlantic alliance.

A Triune Nigeria

THE conference on the Nigerian constitution ended last week with a far greater measure of agreement between the leaders of the three regions than seemed likely when they first arrived in London. The final compromise, the details of which will shortly be published as a White Paper, should make it possible to resume normal government immediately, and to proceed with further constitutional development in accordance with the Nigerian ambition of self rule and Dominion status. Great credit reflects on the Secretary of State and his Colonial Office advisers for their tactful handling of the talks; and also on the statesmanship of the Nigerians themselves in making the concessions, often difficult concessions, necessary to keep the major objective—the unity of a self-governing Nigeria—in view. Provided there is good will on all sides, Nigerians can

now move together towards the second version of a "Gold Coast solution."

Because unanimity was reached on so much, it would be most regrettable if the remaining points of disagreement were to undo the progress already made. The most dangerous of these unsettled issues is the position of Lagos—the problem of finding a federal capital. Between now and January, when the conference will be reconvened in Nigeria to study the fiscal commissioner's report on the allocation of revenue, a solution will have to be found. During these months, also, the Nigerian leaders will have to get the proposed constitution accepted by their followers. It is too soon to say what the response will be; but it would be optimistic to expect that, away from the neutral atmosphere of London, Nigerian politicians will find it easy to stand

by their conciliatory words. But they can all make out a good case to their—sometimes fire-eating—nationalist followers. For within the federal compromise, each region is getting most of its demands. The eastern and western regions have secured a big reduction in the Colonial Office's control and a large instalment of self-government now, with a promise of the rest in 1956 as their slogan demands. The northern region is keeping its present status and its trusted British colonial servants; and it is gaining a regional civil service in which northerners can be trained, given preference and be sure of promotion. Because the British Government has retained some control over central affairs, even after 1956, it, in turn, has felt able to concede the withdrawal of officials or ex-officio members from the Legislative and Executive Councils of the eastern and western regions.

But all this has been achieved at the expense of a much weaker central government. Dr Azikiwe has formally abandoned his insistence upon a strong centre—indeed a unitary government; his political mantle has fallen rather oddly on Mr Nwapa and the breakaway National Independence Party. On the other hand, northern leaders, including the Northern Peoples' Congress, have given up their demand that federation should be reduced to a mere "Central Agency" for administering a few common services, such as railways, harbours and customs—something more shadowy even than the East African High Commission. There is to be a real federal government to wield limited but important powers. In some ways it should prove better than that which preceded it, and whose breakdown caused the crisis and the outburst of anti-British rancour. It should be able to speak for Nigeria and (since it controls the police) to preserve the tranquil conditions in which the regional governments, which no longer have to send up their measures to the centre for approval, can carry on the government of Africans, by Africans, for Africans.

Yet it is necessary to emphasise that harmony depends on good will between the autonomous regions. The new federal constitution is not even Australian in form; for not only have federal powers been reduced and defined, but regional control over their exercise has increased. It is this that causes Mr Nwapa to cry woe. Under the Macpherson constitution, the regional houses were electoral colleges for the central house; and the central Council of Ministers consisted, besides officials and lieutenant-governors, of four African ministers drawn from each region and appointed by the Governor after consultation with the regional governments. This meant that, in effect, these "ministers" were envoys of the regions; and when the four from the West resigned, the Governor found it impossible to replace them with

others acceptable to the rest of the team. Thus government broke down. The centre was simply a standing committee with an executive sub-committee of the three regional governments. Though open to criticism, this arrangement was necessary because of regional jealousies. No region was ready to face the possibility of a true cabinet in which the North might well be dominant as the result of its preponderance in the central legislature where there were 68 northerners to 34 from each of the other two regions.

★

Thus, despite all the trappings of federalism, there was little more than a grand allied council. Because the North is still preponderant in population and voting power, it has not been possible to change this situation. One step forward has been taken: the central legislature is henceforth to be elected independently of the regional legislatures, as in the case of Canada and Australia, on the basis of separate single-member federal

constituencies (each with a population of 170,000). This may gradually encourage the growth of a cadre of federal politicians interested in the problems of the centre and not closely tied to regional caucuses; in time it may even make all-Nigerian federal parties possible. At present, however, there is potential trouble over the form the federal franchise should take; the North is holding out for indirect election, while the others are pressing for adult suffrage.

More important, the central Council of Ministers is to consist, besides officials, of three ministers from each region appointed by the Governor on the advice of the regional Prime Minister. Thus central ministers will be more than ever the prisoners of their regional governments. The dropping from the council of the regional lieutenant-governors will worsen matters. The Governor's role as mediator will become more lonely, difficult and thankless than ever. There may be fewer causes for dispute, but petty points can cause serious crises in Africa, where *amour propre* is so tender. This was shown at the conference when the northern leaders refused to have back the western ministers who had resigned, and who had behaved, they said, unforgivably; a stand which immediately caused Mr Awolowo and the Action Group to insist on reinstatement as a matter of high principle. The Action Group only returned to the conference when the northerners had been induced to swallow their pride.

This sort of thing can blow up at any time, and there will be issues enough as time goes on. The key to Nigerian independence as a whole lies in the northern region developing self-government fast; if it does not there will be recrimination in council. It is true that the

federal house might assert its authority over the central council in time; but the only guarantee of harmony in the short run would seem to be some approach to cabinet government that is responsible to the federal house and based on a majority in it. The central council, however, cannot be transmuted into a cabinet—in the way colonial executive councils do take on features of cabinet government—until the other regions lose their fear of being steamrollered by the North, and until the North ceases to fear that universal adult suffrage in federal elections is being forced on it as a means of putting educated southerners, or their northern stooges, into power in order to overthrow the rule of traditional tribal authorities.

The first problem, however, which must be settled before even the franchise question can be raised, is that of Lagos. It produced the dispute between Dr Azikiwe and Mr Awolowo, because, although 70 per cent of its population are Yoruba and it is commercially bound up with the West, it has been a Zikist stronghold. Dr Azikiwe has now resigned his Lagos seat and has transferred to a constituency in the East; but the Yoruba Action Group is determined to hang on to the city and its perquisites and will not have it alienated as federal territory. The Yorubas have a strong case on economic as well as ethnographic

grounds; nor does Washington or Ottawa provide a convincing precedent.

To create a new federal city in Nigeria would be extremely expensive; even to find a neutral site would be hard. But it may have to be done. Such a city would be a true symbol of the federal structure that has now emerged—a somewhat artificial, prefabricated, reach-me-down affair, lacking dignity or permanence (at first) and no doubt detested by the new federal public service and the new federal legislators alike. It would also weaken the already weak federal ties; but the West's threat to secede rather than be "decapitated" may leave no alternative.

Difficult as it was to reach the London agreement, to translate it into a working system of administration may be even harder going. Much of that effort will devolve on the British officials now on the spot and more or less under notice to quit. Perhaps their task in saving the federacy will be eased by the eagerness of the African politicians in the regions to seize upon the new powers now granted them. It must be hoped that these powers will be used with the public good in view, for upon sound administration in the regions Nigeria's credit and prestige in Africa will depend. The unity and progress of Nigeria now rest on three pillars; if any one of them crumbles, the roof will come down on the inmates.

Persians and Foreigners

MANY dictators have defended their policy with the maxim that "the will of the people is above the law." But few can have used it, as Dr Mossadegh did this month, in answer to protests that he was violating the constitution, only to be chased shortly afterwards by that same will out of house and office. Two useful lessons can be drawn from this sudden change in his fortunes: the first is that no leader, however politically agile, can neglect entirely the support of lesser political figureheads; the second is that no Persian leader can retain office simply by playing upon the nation-wide fear and dislike of foreigners, because no state that wishes to modernise itself can do without them. As Dr Mossadegh was to prove, a rigorously anti-foreign policy can be conducted without economic collapse, but its price is no Cadillacs and a return to the donkey standard; if Persia wants to be a modern state, it must deal with "abroad."

Exactly a month ago an article in *The Economist* commented on the number of enemies he had made for himself on the home front: the army, over the leadership of which he had quarrelled with the Shah; Mullah Kashani, whose personal ambitions he had thwarted; the several political leaders whom he had sought to implicate in the Ashfartoos murder (these included General Zahedi); and the Majlis that he had dissolved by the expedient of withdrawing his yes-men and so depriving it of a quorum. Since then, a further act swelled the ranks of his adversaries. This was the

"plebiscite" in the conduct of which he denied Persians the human right of secret ballot by erecting "yes" and "no" booths into which Teheranis had publicly to walk in order to give him his 99.9 per cent majority. Since Mullah Kashani instructed his followers to boycott this performance, Tudeh party members were unusually prominent among the whippers-in; they outnumbered the remnants of Dr Mossadegh's National Front and his "Pan-Iranian" movement supporters. The hand of the Soviet Union was more in evidence than ever before.

For nearly ten years Dr Mossadegh has been gaining fame and popularity as the apostle of an anti-foreign policy. His first appearance in international news was during the world war, when he introduced the law that forbade fresh oil concessions to foreigners until the war was over. Next, he led the opposition that denied the Russians an oil concession in the north. Then he reached his zenith with his famous success against the Anglo-Iranian Oil Company. All the time that he was living on the capital of his reputation as an enemy of the foreigner, he was ready to stretch a hand abroad for the money he needed to modernise Persia. For nearly two years he traded on his claim—not unfounded—to be a popular figure in the United States, and to have access to American bounty and investment capital. This year, when the claim was exposed first by Mr Dulles's pointed exclusion of Persia from his tour in May, and later by General Eisenhower's letter refusing

to be blackmailed for money, he was obliged to turn elsewhere for foreign support; his mistake was that he opened official talks with the new Soviet ambassador in Teheran on August 13th.

It was this combination of undemocratic procedures at home and of obvious and dangerous dependence on the Tudeh party that at last drove the Shah to act. He dismissed Dr Mossadegh and, after failing to oust him, himself decided to leave. Next day the Tudeh party rushed into print with its manifesto calling for abolition of the monarchy and the proclamation of a republic. (Moscow, pardonably a few hours behind the times, was still broadcasting this in Persian until quite late on August 19th, after the tables had been turned in Teheran.) As happened in Azerbaijan in 1946, the Soviet assumption that the Persian people would rally to support such a declaration was wrong. Public opinion was against, not for, this foreign-inspired lead; the army, when it struck its blow for the Shah and against Tudeh, carried with it a majority not only of Teheran's educated class but of its "broad masses." Behind this widespread support for the revolt were, without doubt, first the strong sense of dynastic tradition that permeates a people that is always conscious of its great past and, secondly, fear and dislike of the nearest and most menacing of all the hated foreigners. Not only the Shah but also the officer corps that touched off the explosion of public feeling in support of the dynasty acted mainly out of fear of the Soviet Union: not for nothing did General Zahedi's supporters announce when they first reached a microphone that they were in control of all the towns in the frontier province of Azerbaijan.

Seen from across the Soviet frontier, these events must be a disappointment and a puzzle. They are being explained as an "imperialist manoeuvre to regain the oil" and an "American gamble"; but Moscow must clearly be as surprised as are some other onlookers at the magnitude of Tudeh's failure. For nearly six years after the Azerbaijan fiasco a skilful and endlessly patient Soviet ambassador, Mr Sadchikov, has preached and practised a policy based on the Persians' antipathy to foreigners whom they can see. He was content to watch them slide toward social and economic chaos by ousting the British oil company and refusing American substitutes and to wait, like an animal under a fruit tree, for rotting fruit to fall. But this passive policy became less appropriate when, during the relaxation of tension that followed Stalin's death, President Eisenhower categorically declared that the American taxpayer was no longer to be moved by Dr Mossadegh's pleas that Persia would go Communist unless helped with dollars. Malenkov, in his great speech of August 7th, saw a chance to capture some ground. In a passage particularly friendly to Persia he said that he was ready for talks not only on a long-standing frontier dispute, but on "financial questions." This, to the all but

ruined Dr Mossadegh, spelt release of the 11 tons of gold and the \$800 million that Persia claims in respect of services rendered by it to the Russians during the war. He was therefore all agog to start talks with Mr Lavrentiev, who is Mr Sadchikov's successor. If the new ambassador knew, as seems likely, of the Communist manifesto, he was departing for the first time since 1946 from the tried policy of watching other foreigners take the brunt of Persian dislike.

★

The financial chaos bequeathed by Dr Mossadegh leaves the Shah and General Zahedi a limited range of policy decisions. Their obvious first purpose must be to succeed where he failed—that is, by their deeds to disarm adversaries within the country, and not to be dependent on any one foreign government. They also had to secure funds for development and welfare and to get Persian oil moving once again in quantity. Their first steps have been to state that, while negotiations with the Soviet Union will proceed, they must turn to the world for financial help. The decision to talk with the Russians will not be unpopular, since it spells a

The American Genius

On May 14th we referred to the improvements in navigation, suggested by Lieutenant Maury, of the United States. . . . We might be led into curious speculations were we deeply to inquire into the cause why the suggestion of such a useful scheme should have been reserved for an American. Something like it indeed—an instinctive clubbing of knowledge from all quarters—a free communication of scientific observations—has long been going on; but to suggest and adopt the plan to promote correct knowledge and general improvement, by inducing all ship-masters to record their observations in one certain form, and communicate them to some man or board of science to methodise and draw deductions from them, was reserved for Lieutenant Maury and the American Government. The Americans, however, seem to be an eminently practical race. Their numerous inventions all tend to the common and general advantage, to bring about equally beneficial results for all by less labour. Their intellect is exerted for the benefit of all. It is not warped to consult the gratification of a few. They open their eyes and their senses to present wants, and set all their faculties to work to gratify them. They look Nature in the face, attend to her minutest signs, learn to read quickly her directions, and they are inventive, skilful, and prosperous. Only they, we believe, could have constructed a village to move on rails, because only they have the opportunity of driving railways through a country into which they must carry as they go nearly all that they require. . . . Not being an old people, their senses are not perverted, nor their faculties benumbed, by a reverence for ancient prejudices. . . . They unite that perfection of the senses which is proper to the savage with the knowledge and appliances of civilised men. More than any existing people . . . they are free to use all their faculties to promote their worldly success, and they are eminently successful.

The Economist

August 27, 1853

readiness to tackle three topics on which all Persians feel strongly: the holding of the gold in Moscow, the dispute over sections of the northern frontier, and the Soviet-Persian treaty of 1921 with its outmoded clause giving Moscow the right to move troops into Persia if the country were to become a "base for aggression." Whether the Russians will be eager to talk with the new Persian regime remains to be seen.

As for the oil problem, Dr Mossadegh's decree offering supplies at half price to pedlars is to be rescinded; the funds immediately needed are to be sought by other means. Yet to imagine that General Zahedi will at once seek the services of a British company is to miss the point that he would thereby repeat Dr Mossadegh's error: he would be resisted by groups who would be as numerous as Mossadegh's adversaries. In sizing up the immediate future of the oil industry it must be remembered that the Persian dislike of foreigners is rooted in two ineradicable emotions: fear of being ground between the upper and nether millstones of Russia and Britain, and mortification that a nation once so great should lag so far behind the West in winning

wealth and power by scientific and technological achievement.

There is, therefore, no question of revoking the nationalisation of the industry or of restoring British management. If there is to be a compromise between the Persians and interested parties in the West it will have to start from these assumptions; but compromise there will have to be if oil is to be marketed and the revenues of the state restored. All this will take time, for crude oil is today a drug on the market and the reappearance of Persian supplies would mean checking production that is bringing income to other rulers. The Shah's plight, however, is too urgent and the political opening created by his *coup* is too important for the solution to be left to time. Somehow or other perhaps through the mechanism of international institutions, something should be done quickly and tactfully to help. Happily first indications are that this point is grasped not only in Washington but in London. The fact to keep in mind is not that the victor of Abadan is now in prison but that his failure is proof that the Russians can expect no walk-over in Moslem Asia.

Variety in Bread

NEXT Monday white bread will be on sale in Britain for the first time for twelve years. The millers will no longer be tied to a minimum extraction rate of 82 per cent of the wheat grain. Instead, they will be allowed to mill at the white flour rate of about 70 per cent, or indeed at any rate they like. But all will continue to make some of the prescribed national flour, whether off-white or brown, for bakers must still have the national loaf on sale at the controlled prices.

This freedom is unlikely now to produce a rush to buy white bread. Before the war, it is true, white bread, which once had a certain social prestige, had become the staple food of the poor, and nine-tenths of all the bread sold was white; it was only in the wealthier households that any other kind of bread found its way on to the table. But the expectation is that in the coming months the bakers will not sell more than one white loaf for every seven or eight made of national flour.

The reason is not that the public is convinced of the nutritional value of a higher extraction rate. It is merely that the off-white national loaf is white enough and palatable enough to suit most tastes. It is a very different loaf from the one that was sold during the war, when the extraction rate was 85 or even 90 per cent, and at one time contained barley and rye. The millers have learned how best to mill national flour and the bakers how to make a better loaf with it. Even so, most people would no doubt prefer white bread if it were the same price as the national loaf. But it will cost more, for the national loaf will still benefit by a

subsidy amounting to about 2½d. for a 1¼ lb. loaf. The big bakeries have decided to charge 5½d. or 6d. for a white loaf of 14 ounces, compared with 4½d. for a national loaf of the same size. Not many people are likely to think the extra worth paying.

If little white flour is needed to make bread, there will on the other hand be a general change to white flour for making cakes and biscuits. Flour itself has not been subsidised since last April, when the subsidy was transferred to the loaf. It will therefore cost the baker no more to buy white flour, which should produce better cakes—or will, if more fats also become available. And better cakes at no higher prices are what is needed to revive the flagging trade in confectionery. The return of unrationed sweets, together with the rise in prices of more essential foods, have combined to deflate an indiscriminating demand for cake of the synthetic slab or whited sepulchre varieties. With white flour, too, the public can be offered a wide selection of special bread, of richer mixtures or special shapes.

All this may give the small baker an opportunity to regain a little of the ground that he has been losing to his large competitors. The last ten years are strewn with the wreckage of small bakeries. In 1942 there were nearly 21,000 bakeries; in 1945, 18,000; in 1952, 14,000. The large firms have been spreading their tentacles everywhere, and even the country baker is no longer safe from the competition of the mass-produced loaves that are distributed mainly by grocers. The grocer has proved a formidable competitor because it

is convenient for the housewife to buy all her stores, including bread, at the same shop. Even the local bakery's ability to give fragrant loaves hot from the oven is to some extent offset by the good keeping qualities of the mass-produced loaf, especially if it is wrapped in waxed paper. And the small man cannot meet the growing demand for the sliced loaf, which, in spite of the extra penny charged for the wrapping, is often found—thanks to the unsteady hand of most housewives—to be more economical than the unsliced loaf. Many small bakers have taken to distributing the loaves of their large competitors, and many have met the grocer's challenge by going into the grocery business and stocking their shelves with canned food. Apart from such shifts, the best hope for the small man is to produce something that the plant bakery does not produce—something other than the tin-baked loaf that is its standard product. It is here that white flour may help him.

★

The methods of the plant bakery are so widely different from those of the small baker that it is unrealistic to treat the whole bakery trade as if it were homogeneous, as the Ministry of Food has had to do during the period of subsidy and control. The controlled price and the subsidy have been and are calculated to give the baker an average profit of 5s. on the bread made from 280 lb of flour. The small man often makes only about half that. It seemed likely that with decontrol he would be in an even worse position, for the big bakeries will get a discount from the millers on large orders. The Ministry, however, has come to his rescue with an additional subsidy of 4s. a sack on the first 25 sacks used each week, and if he uses so much this gives him an extra £5 a week. But for many bakers it must be feared that the reprieve is only temporary.

It is temporary not only because this is an interim arrangement, but also because the bread subsidy will presumably sooner or later go the way of the other subsidies and food controls. The pressure to retain it will, it is true, be stronger than for any other food. Before the war bread and flour provided about one-third of the calories in the working-class diet. Bread consumption has fallen steadily as the standard of life has risen, but even now the proportion is somewhere between 25 and 30 per cent. The other argument for retaining the subsidy is that it encourages people to eat the more nourishing national loaf. At the extraction rate of 80 per cent national flour contains, besides the endosperm or white kernel that is used to make white flour, some of the bran and enough of the germ to give an adequate supply of the important vitamin B₁ and nicotinic acid as well as of iron. (It also loses another valuable vitamin, riboflavin, but this is supplied by other foods in a normal diet.) The substances that are lost in milling white flour are now to be added

artificially, as is done, sometimes by voluntary action of the bakers, in the United States, Canada and various European countries. But replacement may not give as high a food value as if the substances had never been extracted. Some of the experts at the conference on the postwar loaf that the Ministry of Food held in 1945 were in favour of prohibiting the artificial addition of nutrients. As an alternative there is something to be said for encouraging people to eat national flour by means of a lower price.

To many people, however, it may seem rather absurd to go to such lengths to preserve the nutrients of British bread so long as it contains a substance that is widely feared to be harmful. Agene, or nitrogen trichloride, has been used as an "improver" in flour for the last thirty years. Its effect is to strengthen a weak flour so that it will produce a larger, lighter loaf. But in 1946, research showed that when given in large quantities to dogs it produced canine hysteria. There is no evidence, other than a single case—that might well be one of individual allergy—to suggest that it is harmful to human beings. But it would be very difficult to carry out experiments to settle the question beyond doubt, and the hysterical dogs were sufficiently disturbing to cause several governments to prohibit the use of agene, and the British Government to appoint a committee to look into the matter. In 1950 this committee recommended that agene should no longer be used. At first it was thought that chlorine dioxide, which is used in the United States, could take its place, but doubts have developed about this too. A harmless alternative might be aeration by means of a high-speed mix; but that might be a final nail in the coffin of the small baker, who has not the necessary equipment. Meanwhile, research continues under the auspices both of the Government and of the trade, and in most flours agene is used as before.

It is clearly right that Government money should be spent in an attempt to clarify the nutritional facts about bread. It is harder to justify, on the ground of public health, a bread subsidy which cost £41 million in the last financial year and which will cost rather more this year even if 10 per cent, say, of the demand is switched to unsubsidised bread. If it were right to subsidise bread then it would be logical to go on subsidising all the foods that are important in a properly balanced diet, including some, such as fruit and vegetables, that have not hitherto been subsidised. A better alternative is surely to try, by education and propaganda, to make people choose the food that is good for them. If a price differential in favour of national bread is important for reasons of nutrition, a tax on white flour would be just as effective as a subsidy on national flour. Apart from the general aim of reducing government expenditure and introducing realism into prices, it is always unsatisfactory to subsidise food that is not rationed, especially a food so freely wasted as bread. It must be hoped, therefore, that the limited freedom that millers and bakers will enjoy next week is the step before complete freedom.

Notes of the Week

Advice on Convertibility

MR LEWIS DOUGLAS'S report to President Eisenhower, made public this week, sets out with a rare clarity the essentials of the problem of convertibility for sterling. It explains British policy and concludes that "more remains to be done if sterling is to acquire sufficient strength and resilience to stand the rigorous test of convertibility." But with this Mr Douglas does not pass the ball back to the British Government. He goes on to insist to Americans that "it is for us as soon as possible to commence to remove from our own policies the impediments to freer trade and currencies." These impediments are clearly defined; they include

the persistent and stubborn maintenance by us of the policy of protecting the American market and subsidising American services which foreign enterprise can more effectively and cheaply render.

The report is thus a forceful and important expression of the liberal view on economic policy. It also emphasises that the interests of the United States are vitally concerned in the convertibility of sterling; and it recognises the dangers for Britain of too much haste. To have these points repeated so authoritatively, in a report made at the President's request, is of first importance in American politics. By putting them in a framework of brief analysis, rather than of detailed prescription, Mr Douglas has enabled President Eisenhower to give them at least a cautious half-blessing; he passes the report to the new commission on foreign economic policy as "an important document" for its consideration.

This technique has disadvantages that are easy to point out from this side of the Atlantic. Mr Douglas's report (which is discussed in more detail in the Business Notes of this issue) ignores, no doubt studiously, the main questions of strategy involved in any move to convertibility. Is convertibility of sterling possible, in any foreseeable conditions, without transitional support from some kind of dollar fund? If that is essential, how big would the American contribution have to be, what are the chances of Congressional agreement, and what form of American support would combine the maximum of economic effect with the minimum of political opposition? These are the direct issues in the United States. But American reactions will also be powerfully influenced by the way in which this country relates convertibility, as a technical currency operation, to the greater freedom in commercial policy—and especially the lessening of barriers against dollar imports—that is the gain Americans are looking for. With such matters of strategy so firmly set aside, Mr Douglas's report is deliberately little more than a powerful plea for good intentions in American policy. But it is not afraid to probe

into some of the implications of such intentions, not only for commercial policy but also for the buying of raw materials and for American investment overseas. All in all, it is the biggest dose of liberal realism that could wisely be administered, at this stage in the making of American policy, within one document.

The Korean Apple-Cart

GEORGE BERNARD SHAW himself could scarcely have drafted a more paradoxical script for the latest United Nations debate than the one that has actually been performed. Mr Vyshinsky, distantly echoed by Chou En-lai, has denounced the idea that the Korean conference should be an "across the table" affair of two parties only—an idea which the Communists at Panmunjom themselves insisted on introducing. The South Korean Foreign Minister, Dr Pyun, has reviled India as a "betrayer and appeaser," whose presence at the conference would be both dangerous and shameful; yet, almost in the same breath, he offered to agree to India's participation—provided it "openly stood at the Communist side." Some of those who in the past have accused the United States of using its largesse to tempt small nations into line are now wryly wishing that their accusations should be justified. In the present topsy-turvy situation, it might almost be thought that Dr Rhee held the money bags and was threatening to withhold a billion dollars of aid from a devastated America. It is certainly hard to realise that most of the nations, great and small, that have openly clashed with the United States in such an embarrassing way have for years accepted its bounty.

Let it be conceded that, in the argument over Indian participation at the Korean conference, both sides could make out a good case. The Americans could point out the foolishness of needlessly provoking the Indophobes of Seoul to further intransigence, and could ask in vain for a logical reason why India should be invited and its neighbours excluded. Logic had no answer, but—as was shown in these columns last week—common sense had. Unhappily, the damage is now done; whichever way the affair is settled, it will have left its ugly mark on the relationship between America, Europe and Asia, and on the proud record of the Korean campaign. It has enabled Mr Vyshinsky to sow a little more discord, and encouraged the Arab group to make an early start with the bargaining over Morocco. It is now high time for the upset apple-cart to be righted again, and set in motion without too many recriminations. This will not be easy; neither the Americans, nor the British and those who share their view, can abandon their position without losing face and

countering new difficulties. But, in view of the graver issues involved, it is surely imperative that all parties—and that includes the Russians—should now accept the collective verdict of the Assembly, to which all have appealed, and move on to the urgent business that still lies before them.

M. Laniel Reprieved

AFTER three weeks of strikes the conflict between the French government and the workers seems to have ended in a stalemate. By making a strict interpretation of the letter of the law a recall of the Assembly has been avoided for the moment. Non-Communist unions have agreed to call off the strike in return for the government's promise to raise the pay of the lowest-paid public employees, to convene the Collective Agreements Commission for the purpose of reviewing minimum wages, and to consult the unions concerned about the application of the decree on retirement and pensions which started all the trouble. Communist railwaymen and postmen have followed suit, under protest, and other strikes are now expected to die down. M. Laniel has won a reprieve and can now set about his original task of restoring French finances.

That has been made more difficult by the strikes. It is estimated in Paris that the post office and public railways alone have suffered a direct loss of over Frs. 20,000 million. Yet the total loss cannot be measured. Economic life has been paralysed for three weeks, tourist dollars have been lost, export orders missed. Confidence has been shaken and the government's borrowing ability has not been improved. The first batch of decrees having proved so costly, the government is now preparing a second series which aim apparently among other things at lowering the cost of living. A project of fiscal reform is also being drafted to be laid before the Assembly. M. Laniel may have learnt by bitter experience that, in a country where ostentatious luxury is a permanent irritant for poorly paid workers, any broader programme must begin by an attempt to lower prices or to attack fiscal privileges and fraud.

Otherwise the Communists will emerge as the victors from this struggle. They are already implying that more could have been won from the government but for the "stab in the back" by the leaders of the non-Communist unions. The mood of the rank and file is well illustrated by the fact that, while Catholic deputies helped to keep M. Laniel in office, Catholic unions are clamouring for a radical change in the government's social policy. Nothing has been achieved, nothing forgotten. The storm has been postponed, but for how long? M. Laniel cannot afford any more false steps in the few weeks he has left to try again.

Will Mau Mau Surrender?

IN Kenya the outlook for Mau Mau is beginning to seem rather bleak to many of the leaders of the insurrection, who have been inquiring about the terms that might be granted if their gangs laid down their arms. The spreading

of rumours that aid was coming from India and Egypt also suggests that morale is in a poor way, since the subsequent disillusion is likely to have a boomerang effect. The Kenya authorities have wisely seized upon the chance to embark on a new round of psychological warfare. By every means of communication, from radio to leaflets dropped by air, they are telling the Mau Mau rank and file what the situation is, and offering reasonable terms for surrender. If the operation is efficiently conducted, it may well have a most important effect and shorten the duration of the shooting war in Kenya.

It is, essentially, an attempt to separate the murderers from the less deeply implicated insurgents. No amnesty, or remission from due process of the law, is offered to those who have killed or who have committed "other atrocities." Such a course might seem a way to shorten the fighting, but it would be manifestly very difficult and probably impossible to take. It would mean making distinctions between those already apprehended and those who are just as guilty but cleverer at holding out; it would make nonsense of justice, and of the sacrifices of loyalist Kikuyu. The question is what proportion of the terrorists fall into the former category, and how many can expect to prove their innocence of anything more than aiding and abetting. Those with blood on their hands have the alternative of facing the judge or of shooting it out to the last. Inevitably many will choose the latter course, and seek to keep with them, and to inculcate, those who might otherwise get off lightly.

It would therefore be unwise to assume that the end of the emergency is yet in sight. The long struggle with banditry is likely to continue. Until waverers come over in considerable numbers, and find that life "outside"—even under rehabilitation—is far preferable to the forests, there may not be much obvious change. But this week's developments in Kenya are the most hopeful for a long time.

New Technique for Strikes

THE Electrical Trades Union has won at least the first round in its struggle against the employers in the electrical contracting industry. After the Ministry of Labour's conciliation officers had intervened, the employers agreed to reopen discussions on the claim for a substantial wage increase which they rejected last March. A meeting of the industry's Joint Industrial Council will be held on Monday; by then the electricians who are on strike will have returned to work, and the plan to call out more workers has been dropped.

As the employers have agreed so readily to reopen discussions it is difficult to see why they did not do so before the strike was allowed to take place. When they rejected the claim they did offer to discuss their reasons with the union. The union, however, not unnaturally interpreted this to mean that they would merely explain the rejection and considered this a waste of time. After meetings up and down the country had shown that the majority of its members supported a strike an ultimatum was sent to the employers on July 23rd, announcing that unless an offer was received by August 24th strike action would be taken. On August 25th the strike began; not a mass strike, but a

strike of men working on important projects in various parts of the country—on atomic plants, oil refineries, hangars, steel and tinplate works and, finally, on the radio show which is due to open at Olympia on September 1st. The strike involved only some 1,500 men—a number that the union could afford to support on full pay.

The union could at any time during the past months have asked that the dispute should be referred to arbitration. In the employers' opinion it was for the union to do so, as it was, so to speak, the plaintiff. But it was not difficult to guess that the ETU, being Communist-led, would prefer that feeling should rise high, and that any eventual settlement should be a victory for its own belligerence. What will happen to the substantial wage claim remains to be seen. But it will be unfortunate if the outcome is a further demonstration of the quick results that can be obtained, at little cost to the union, by a small, well-timed, well-planned strike.

The Prisoners' Purgatory

WHAT happened to the United Nations soldiers taken prisoner in Korea was something that had never happened before. Their physical treatment was, at least for the British prisoners, better than that of the Japanese prison camps of 1942-45. On the other hand, the Communists proved worse in several respects than the Nazis; for example, they permitted no Red Cross access or supplies to the camps. But the unique feature of this captivity was the unremitting propagandist pressure. Every method that ingenuity could devise was used to weaken the soldier's loyalty, to make him accept at least part of his enemy's case, and to use him—often unwittingly—as a tool for propaganda purposes. Shrewdly, his captors wasted few words on Marx-Lenin-Stalinism; the themes were "peaceful China," "aggressive imperialist America," and, above all, the idea that only western intrigues and warmongery were preventing the prisoners from going home.

Some of the tactics used were nauseating. One, in which the correspondents of Communist newspapers in the West played their part, was the offer of a chance to broadcast a personal message home, provided that some routine propaganda slogans were included. Such offers, often made to a man who had had no news from home for two years, and whose family had heard nothing since he was posted as missing, were too tempting to be always spurned. Other privileges and perquisites were offered for minor forms of collaboration. The reverse of the coin was that a man was liable to the loss of all privileges and even to solitary confinement if he proved "unco-operative"—if, for example, he failed to attend "voluntary" indoctrination lectures. Such "reactionaries" were segregated as soon as they were detected. This left the field clear for the small minority of true collaborators to assume the leadership in some compounds.

The evidence so far suggests that this minority was small indeed. It includes men against whom fellow prisoners are already levelling charges that, by spying for the enemy, they led their comrades to suffer penalties. But a clear distinction will surely have to be made, both in the War Office and outside, between these few (some of whom turned informer purely for gain) and the larger number

who compromised themselves mildly for what seemed to them at the time adequate reasons. Even those in this second group who have accepted, in a hazy way, some of the falsehoods so intensively pumped into their minds, are likely to shed their delusions quickly once they return to the real life of home. To overlook their occasional lapses would scarcely imply any lack of admiration for the many staunch men who have resisted blandishments and blackmail alike and who have returned with proud records of unyielding loyalty to the cause for which they fought and suffered.

New Sultan and Fresh Reforms

THE struggle to decide whether Morocco is ultimately to be an independent nation on Arab League lines, or a Eur-African state on some new western pattern, moved last week-end in the latter direction. The French Government has bowed to a display of Berber force and removed the nationalist Sultan, Mohammed ben Youssef, from the confused scene by deporting him to Corsica. There followed the enthronement at the hands of his Moroccan adversaries of his uncle Sidi Mohammed ben Moulay Arafa, the elderly and unassuming dignitary whom the Pasha of Marrakech and his resistance movement had declared to be the nation's new *imam*, or commander of the faithful. The French can fairly claim that the installation of the new Sultan was a Moroccan affair; they cannot, however, shed heavy responsibility for the events that led up to such a *dénouement*.

On a short-term view their swift removal of the Sultan has its merits. Morocco was on the eve of a major Moslem festival at which part of its population would have been praying in the name of one *imam* and part in the name of another. There was urgent danger of a clash that would have done incalculable harm not only to France but to the West throughout Islam. But it is impossible to feel confident about the long-term prospects of the policy. M. Laniel's cabinet says that it will "within three weeks" announce supporting proposals for sweeping reforms more liberal than those which the ex-Sultan accepted in the

turmoil of last week. These, it says, will be presented to the Moroccan authorities before publication. They are bound to make provision for elected Moroccan institutions, but are also bound to provide that the French settlers are represented on such bodies. This is the issue upon which the ex-Sultan—now in Corsica—and the Arab nationalists—now in prison—were adamant.

Meantime, quiet has been purchased at the price of arrests running into four figures, and disquiet is being vented in Madrid, which controls Spanish Morocco, and in the Security Council. Even France's best friends are among its critics. These can only exclaim, as M. Mauriac—a leader of criticism at home—has this week done in a moving article: "How I hope, for France's sake, that my forecast will turn out to be wrong."

Europe in Africa

THE sixth congress of the Liberal International which has just been held at Mondorf-lès-Bains in Luxemburg gave unusual attention to Africa. At first sight this looks like a good way round the difficulty that Liberals from different countries, when they come together, do not always find a great deal of obvious common ground. Liberalism today means different things in different places; an attitude of mind which at one time stood everywhere in the acknowledged vanguard of political and social progress is now apt to find itself seated on the right wing benches of continental parliaments. But in talking of Africa the Liberals were in fact meeting on ground which has become more common to European thought than is now generally recognised.

Continental interest in Africa—from which the Liberals excluded Arab Africa, partly on account of French susceptibilities—springs from the third force idea that Europe cannot stand alone between Russia and America. The economies of Western Europe and negro Africa are complementary; hence they ought to be combined more positively and broadly than they are. So the argument runs. But whether M. Roger Motz, as president of the Liberal International, was entirely correct or wise in urging greater international co-ordination in the development of Africa as a market for European goods is another matter. There is undoubtedly scope for closer teamwork between those European powers which have a stake in Africa, in trying to resolve the mounting problems of race relations; all European work in Africa, whether good or bad, is increasingly threatened by the challenge created by the reaction of primitive societies to the impact of the West. The idea, however, that Europe's main economic need is for markets is somewhat out of date. European industry needs sources of raw materials before it can look for markets. And while the existence of two complementary economies implies that they must progress in step, from the African point of view there can be no question that development of raw materials comes first. Only in that way can the standard of living be raised. Equally from the European point of view, it is only by first raising the African standard of living that the political clash between the races can eventually be resolved.

This, on the other hand, only serves to emphasise the chief weakness in the otherwise admirable case for

European-African partnership presented by M. Motz and others—that European countries are both short of capital themselves and lack the necessary surplus in this balance of payments to export the capital even if they had it. That was the essential drawback to the so-called Strasbourg Plan last winter.

Building Up Malenkov

SINCE the meeting of the Supreme Soviet, attacks on the "cult of the individual" have been toned down in the Soviet Press and the first breach has been made with the principle of collective leadership of which so much has been heard since Stalin's death. The prestige of Georgii Malenkov is clearly now being boosted. He was given the vital task of presenting to the USSR and to the world Soviet policy both on home and foreign topics. His speech has been reprinted in five million copies. Since then Moscow propaganda has played up the world's reaction to Malenkov, and the words of "the Chairman of the Council of Ministers" are being often quoted to support an argument. At last week's banquet for the East German delegation it was left to Malenkov, not to the Foreign Minister Molotov, to make a declaration of policy.

All this is still far away from the Byzantine cult of Stalin. The impression now being given is that the chairman's seat is properly Malenkov's; but there is a world of difference between the chairman's seat and the pedestal of a deity. Malenkov is still shown as the leader of a team, the efficient manager distributing praise and criticism, mapping the road ahead and promising good dividends for the nation; Stalin was hailed both as the Little Father and as a supernatural leader of genius. It has been argued that Malenkov has not the stature to be raised to a comparable position. Yet, who, in 1924, would have predicted the future rise of the grey, uninspiring general secretary?

Malenkov has considerable assets. To have come to the top by way of the Stalinist Party secretariat he must be an adroit politician. Already in the 'thirties he proved himself an able overseer of industry, and during the war he was the Soviet Lord Beaverbrook—the man who got the aircraft. His most recent pledge to improve the lot of the consumer and to grant concessions to the peasants must have increased his popularity with the nation. Yet he works under handicaps. Propaganda attacks on the cult of the individual may well have reflected something in the mood of the country; Byzantine ways do not fit with the jet and atom age. Moreover, he has come into prominence quickly; there has not been time for the kind of moves that built up Stalin's reputation and eliminated all competitors. It may prove difficult to add anything substantial to Malenkov's stature if his position is not yet secure from challenge by colleagues.

Inequalities at School

intention of preventing the secondary modern schools from being involved in the examination. A memorandum recently prepared by the National Association of Divisional Executives for Education surveys the advanced courses and the examinations taken by pupils in these secondary modern schools. It shows that the General Certificate, in fact, figures quite prominently, although serious doubts are expressed by many authorities about its value in the modern school. The bogey has become a respectable, if not a highly popular, feature of life in the modern schools.

Of necessity, the courses leading to a General Certificate are suitable for only a small minority of modern school pupils; but they are, nevertheless, a serious tax on the resources of these schools, where staffing ratios are less generous than in the grammar schools. The rest of the pupils can suffer considerably in consequence. It is, therefore, not surprising that "advanced" courses, related to local industrial or commercial needs, rather than to the General Certificate, are usually considered to be more suitable for the modern schools. Most of these courses are of two years' duration, for pupils aged 14 to 16. They combine general studies with such subjects as engineering, building, cabinet making, commerce, pre-nursing, typing and horticulture; the specialised part occupies about half the pupil's time.

Nearly all these courses are still experimental, and they are the exception rather than the rule. At present they accentuate the educational inequalities between one area and another. As the memorandum emphasises, it is in those areas where the proportion of grammar school places is already high that the local education authorities have been most active in encouraging special courses in the modern schools; where the number of grammar school places is low, "there is very little evidence of a deliberate attempt to compensate . . . by further provision in secondary modern schools." The sleepy authority still sleeps, and its brighter children are still handicapped.

Parking Penalties

ANOTHER attempt is at last being made to deal with the chaos of London's traffic. The "No waiting" rule is to be extended to 54 more streets in central and outer London, warning notices have been put up (themselves taking up valuable road space) in streets that already have the yellow band, and extra police have been detailed to enforce the regulations.

A determined attack on illicit parking, with inexorable summonses and maximum fines, could certainly do much to reduce congestion, especially in the narrow side streets, where cars parked on both sides of the road reduce the traffic to a single stream that freezes solid several times a day. If parking were harder many motorists who now bring their cars into central London would leave them at home and use public transport. That they should do so becomes more and more necessary because a large proportion of the 250,000 extra vehicles that come on to Britain's roads every year are circulating in the London area.

At the same time, it must be recognised that this is a most unsatisfactory way of curing London's congestion. Heavier fines are unsuitable for minor parking offences, and

strict enforcement of a mass of regulations unduly occupies the police and strains their relations with motorists. It is high time that more attempt was made to fit London to its traffic instead of *vice versa*. There has been no major improvement of the streets in inner London since 1905, nothing has been done to implement the improvements suggested in the 1951 report on traffic congestion; and nothing more has been heard of the proposals, made earlier this year by a special committee on parking problems, that garages should be built under some of London's squares and incorporated in new buildings. Any such schemes would be very costly, even though some of the money could be recouped through garage charges and parking meters. The cost must, however, be set against that of the great waste of petrol and manpower and the wear-and-tear of vehicles that are caused by continuing to do nothing.

Leg-up for East Germany

THE Soviet concessions announced by Malenkov last Sunday to Eastern Germany must not be misunderstood. Their effect, it is true, would be to make the unification of the two Germanies easier if the Great Powers could agree on how unity is to be achieved; but they do not themselves bring unity a day nearer. Since the troubles of last June revealed the sickly state of the Communist regime of Ulbricht and Grotewohl, Soviet policy has been to grant it economic favours but to remain stern and unbending on political matters. Malenkov did not diverge from this line save to promise the pardon of certain German prisoners-of-war. This will be glad news to thousands of German families but will hardly sway the voting in the Federal Republic against Dr Adenauer.

There is no more evidence than there ever was that the Soviet Government seriously intends to give up Eastern Germany. Plants are returned not to their owners but to the Communist government; reparations are to cease and occupation costs to be cut, but only after some \$25,000 million worth of materials, goods and plant have been, according to Social Democrat sources in Germany, removed to the Soviet Union. Food, coal and steel products worth \$150 million are to be pumped in this year, together with short-term credits, doubtless to reduce the present stark discrepancies between the standards of Western and Eastern Germany. These are quite considerable economic concessions which will impress Germans on the Asian side of the Elbe much more than Germans on the European side.

But of political concessions there is no sign. At one time, before Beria's fall, it looked as if the East German government would be diluted with non-Communist politicians who would give it an air of breadth and respectability and facilitate contacts with Bonn. The events of June 17th and after seem to have killed that idea. The frantic dash for Sovietisation seems to have stopped but Eastern Germany with its uranium mines, its valuable bases and communications, and its industrial resources is still being treated as a satellite, even though it is to exchange ambassadors with the Soviet Union. The fact that the vital uranium mines are not being handed over, but are being placed under joint Soviet-East German boards, scarcely indicates that an early Russian departure is being prepared.

Caretakers in Rome

SIGNOR PELLA, the new Christian Democrat prime minister of Italy, has cleared his fences in the Senate and the Chamber with comparative ease. By 315 votes to 215 and 44 abstentions the lower house has now confirmed him in office. It may well be asked how and why, after the previous defeats of Signor De Gasperi and of the first of his former colleagues to succeed him, Signor Piccioni; all three are Christian Democrats and no one has any illusions about this being a one-party government. The answer may best be summarised by saying that this is the nearest possible approach to an Einaudi administration. It is, that is to say, generally recognised as a caretaker cabinet of a "transitory and business" character—as Signor Pella has himself described it—put up by the President in order to get through the summer. Signor Pella has the reputation of being President Einaudi's most faithful economic mouth-piece and his keen disciple. His stewardship has been accepted so that deputies can resume their summer vacations.

The new prime minister has nevertheless shown a welcome mettle. His policy is broadly to carry on the work of the De Gasperi regime and he has already had a sharp passage of arms with the Communists and their allies in parliament. On foreign policy, he has pledged full loyalty to Italy's existing alliances, while at the same time backing Signor De Gasperi's speech on Trieste of July 21st which stressed a determination not to allow these alliances to prevent Italy standing up for what it regards as its rights. Signor Pella has thus shrewdly won at least passive support in many right-wing quarters. And, since he is bitterly opposed by the Left, this is the only way he can retain his place in the Chamber. It will mean, however, that in the eyes of the country this will be regarded as a right-wing government and, however unfairly, a step away from the central position at which Signor De Gasperi aimed for so long.

Around St. Paul's

MR MACMILLAN is to be congratulated on his decision, as the Minister finally responsible, not to veto the building of Bucklersbury House. For some four years now an enterprise (if the word may be allowed to carry some remnants of its former meaning) has been seeking permission for a new office building in the City of London, between St. Paul's and the river. The plans were discussed by the City Corporation and the London County Council, as planning authorities, and by the Royal Fine Arts Commission. As finally modified, they were approved. The question has also been debated in Parliament. But there were still objections, and the Minister was asked to turn the Planning Acts on their head and substitute his individual decision for that of all the bodies set up by Parliament to take the responsibility. He has declined, and on that he should be congratulated.

Whether Bucklersbury House will be an adornment to the City of London is another matter. It conforms to the City plan in lay-out and in the balance between floor space and ground area. It is a matter of opinion whether the

final design that has resulted from these conferences is a satisfactory piece of architecture. The real centre of the controversy is the City of London plan itself, whether it makes the best use of the possibilities inherent in the gentle slope from St. Paul's down to the river. The idealists have to admit that the prewar Post Office building, Faraday House, and the postwar power station at Bankside—both of them Government buildings—are already features in this landscape, and both have a long expectation of life. Will Bucklersbury House make a poor situation worse? Or will it give this London view a variety that is on the whole pleasing? These are difficult questions, and certainly one mistake does not justify another. But almost anything is better than turning the process of development into an interminable committee meeting.

Horseflesh

NOTHING appears to touch off the emotions of the British public so easily as reports of cruelty to animals. Thus blood sports were investigated a year or two ago, after a private member's Bill had unsuccessfully tried to prohibit them; and the report of the committee appointed to inquire into the slaughter of horses was published last week (Cmd 8925).

There is no doubt that the increasing sale of horse meat in recent years has provoked considerable uneasiness about the methods and conditions of slaughter. Last year, over 55,000 horses were killed, compared with over 76,000 in 1948 and about 15,000 in 1938. But more plentiful supplies of butchers' meat will reduce the trade in horseflesh and with it public uneasiness—unless the press as guardian of the public conscience rekindles it. A smaller trade does not, however, mean that the committee's report can be shelved. Even if few horses are slaughtered, they should be slaughtered humanely, and the committee makes some sensible recommendations about the licensing of premises and stricter enforcement of the existing law that ought to be adopted.

As the report points out, the slaughtering of animals is an unpleasant business which few persons, unused to it, could watch with equanimity. The committee's recommendations are designed to spare the horses unnecessary suffering. But when does a horse suffer? The transport of horses was outside the committee's terms of reference, and it was unable therefore to make recommendations to improve the physical conditions in which horses travel—a subject that has aroused much indignation. But even more indignation is caused by the alleged mental suffering of a horse. Does it have a sense of impending death if it sees in the slaughterhouse the carcase and offal of another? An expert on animal behaviour denied it, and the committee is inclined to agree, though recommending that the law forbidding this should be enforced. Are there any logical grounds for trying to prevent "a sense of impending death" in a horse, but allowing a hen to experience it? Because a horse is "the friend of man," does it think and feel like a man? Much of the indignation about the trade in horseflesh rests on the assumption that a horse has human attributes. But if a horse has these, why not a fox—on which many horse lovers are happy to inflict a sense of impending death?

Letters to the Editor

The Boothbyites

SIR—I hesitate to trespass further on your space, but I am completely bewildered by your note on my letter of August 15th. You refer me to a speech in which I am alleged to have expressed the view that the line of approach to peace sketched by the Prime Minister was "spoiled by Lord Salisbury's weak surrender to American views." It does not exist. In my speech in the House of Commons I said that the Washington Conference had done all that could be expected of it; and made no criticism of, or reference to, Lord Salisbury, for the very good reason that he had not then spoken in the House of Lords. In fact I agree with the Prime Minister that, in the circumstances, he achieved the best possible result.

As for the Acheson-Bevin policy towards Germany, how can any policy which of necessity accepts the temporary partition of Germany and Austria be described otherwise than as an improvisation? The present division of Europe is a standing threat to peace.—Yours faithfully,
S. Margherita, Italy ROBERT BOOTHBY

[It is true that Sir Robert Boothby did not refer to Lord Salisbury by name in his contribution to the foreign affairs debate of July 22nd; but he did criticise at some length the statement on Lord Salisbury's mission made by the Chancellor of the Exchequer. Having praised the "new tune" played by the Prime Minister on May 11th he went on to say:

Yesterday all that the Chancellor of the Exchequer could really do was to report to the House that the old tune was still being played. He could do no other; and, indeed, he played it as well as it now can be played. The fact remains that it is out of date and will no longer do.

Sir Robert's statement that he agrees with the view that Lord Salisbury achieved "in the circumstances the best possible results" should clear up the misunderstanding to which our original comment drew attention.—EDITOR.]

The Economy of Development

SIR—In your article of August 22nd you rightly say that there is practically universal agreement that under-developed countries need to be helped along the path of economic progress much faster than in the past. The points you make were emphasised, it would not be too much to say dramatically, at the meeting of the Economic and Social Council in Geneva which has just ended. In a very long agenda, overriding importance

was given to the report of nine experts from various countries who had been invited by the Secretary-General to consider the means by which economic development could be accelerated. They unanimously recommended the establishment of a Special United Nations Fund for Economic Development (SUNFED) to provide both grants and loans at non-commercial rates of interest.

While it is generally agreed by members of ECOSOC that self-help is the basis of economic development, most countries find it impossible to finance certain "non-self-liquidating projects," such as transport, on which all development depends. The present position is practically a deadlock. Domestic savings are, at present, quite insufficient though if development could be started their flow could increase quickly. External private capital can only be attracted to projects which give a quick and specific return. The report of the experts makes a modest and practical set of proposals which have caught the imagination of the under-developed countries. Balance of payments difficulties, and the demands of the domestic economy, cannot indefinitely be used by the British and American governments to shelve their responsibilities; nor can the refusal of the richest potential contributors to place more than negligible sums for economic development under United Nations control be maintained, without further impairing United Nations solidarity.—Yours faithfully,

MARGARET HALL
Somerville College, Oxford

Outpost on the Adriatic

SIR—Mr Andoni's letter referring to your article on July 18th on Albania is quite interesting, but unfortunately partial. This is so in respect to the Greek Government's attitude towards Greece's little red neighbour.

Northern Epirus (or Southern Albania, as your correspondent wants it) is essentially Greek. The population consists of Greeks, and the Greek language is mostly spoken (or at least was spoken, before the red "liberators" started "purging" that part of the country). When the victorious Greek Army entered Albania in 1940, chasing the Italians, the whole population was there to welcome their brothers, confident that at last what they had dreamt and hoped for through the centuries would become true: Union with mother Greece.

One should therefore not expect the Greek Government to abandon an enslaved part of Greece, just in order to

bring Albania into the western fold. Furthermore, it is scarcely likely that any change would be brought about by a declaration such as Mr Andoni wants.

As regards the accusation that Greece has been fostering guerilla warfare across the Albanian frontier, allow me to say that the United Nations Balkans Committee has firmly declared and proved that, on the contrary, it is our neighbours who have constantly been sending their armed bands to burn Greek villages and kill innocent villagers.

And as our Prime Minister, Marshal Papagos, declared, it is and will be every honest and freedom-loving Greek's ambition to see Northern Epirus free and united to Greece. And this will be achieved by peaceful means.—Yours faithfully,

E. KONSTAS
La Tour de Peilz, Switzerland

Kenya's Future

SIR—Your comment of August 8th calls for some reply, since you say that there are few signs that the Government in Kenya have constructive ideas about the inauguration of a new era.

Not only has there been a large scale development plan in Kenya since the end of the last war, but this plan has been both accelerated and expanded from time to time as the resources of the country have permitted. In the Budget for 1953 Mr E. A. Vasey, Member for Finance in the Government of Kenya, showed the following division of expenditure, which totalled £18½ million:

Administrative services, £4½ million; Development of resources, £5½ million; Social services, £4½ million; Other services, £3½ million; Allocation to development and reconstruction balances, £½ million; Surplus, £328,000.

The Development and Reconstruction Authority programme covers every aspect of development including imaginative schemes for the advancement of African farming and social services and the development of all the natural resources of the colony in the manner most likely to bring a productive return which can be shared by all inhabitants. If this sort of programme is not intended to bring about a new era of prosperity and opportunity in Kenya, then I do not know what these words mean. Mr Vasey also drew attention to the fact that in Kenya 25 per cent of the net budget expenditure is on social services, a figure which it would be interesting to compare with similar figures in other colonies with more or less the same income.—Yours faithfully,

GRANVILLE ROBERTS
Kenya Public Relations Office,
London, WC2

Firm Hand in Pakistan

SIR—My attention has been drawn to a comment that appeared in your paper dated July 18th. I am constrained to say that such a piece of writing is a slur

on the fair name of journalism. The most mischievous of all is the allegation that the Jamaat-e-Islami "aided" the Ahrars. This is an absolutely baseless charge. Even the Military Court could not trace any connection of the Jamaat with the Ahrars and the agitation started by them. When no case against Maududi could be made out, Martial Law authorities were relied upon to do the needful.

I am sending you copies of two booklets, "Trial of Maududi" and "The Qadiani Problem." The latter will enlighten you much, provided you are able to go through it with an attitude and spirit that is scientific. An unbiased perusal will reveal that the Qadianis are a dangerous group, who declare the parent nation as infidels, make a parade of their altogether separate entity, and conspire to establish a state within the state. If such a clique is formed in England, will you tolerate it for a single day? I know you will adopt ruthless measures to dig it out of the roots and throw it in the English Channel.

You have also alluded in a very subtle manner that there exists some "dissension" amongst the people "about religious aspects of Pakistan's draft constitution." This is totally a wrong assessment. With the exception of a microscopic minority every Muslim of Pakistan wants an Islamic Constitution. Unfortunately the helm of affairs in Pakistan at present rests in the hands of those who have doubts and misgivings. Anyway, one thing is definite: Islamic order shall be established in Pakistan. No opposition from within the country or from outside can stop the onward march of the people of Pakistan towards their cherished goal.

The Jamaat-e-Islami is the most organised and influential body of Pakistan. Maududi, the chief of Jamaat, is loved and respected as none else in this country. For you, it is a few "extremists" who staged demonstrations to protest against his death sentence. Are you so ill-informed that you regard a mere change in the country's administrative set-up to be a sign of the elimination of Islamic influences from this land? You seem to be advocating the establishment of a sort of dictatorial regime in Pakistan where opposition parties should be crushed by confiscating their properties, etc., and indiscriminate arrests and detentions without trial of its leaders and workers.—Yours faithfully,

M. I. FAZURI

Secretary,

Jamaat-e-Islami (Pakistan)

[Unfortunately for our correspondent's case, his letter and the documents he sends us only confirm the fact that the Jamaat-e-Islami has long agitated against the Ahmadi (or Qadiani) sect, denouncing it in the bitterest terms, and associating itself, in this connection, with the extremist Ahrars. Abul Ala Maududi asserts that, on the eve of the March riots, he ended this association; but he continued to issue statements attacking the government and tending to increase the violence that was already breaking out. This much is clear from the Jamaat's own documents.—EDITOR.]

Books & Publications

Investment and Settlement

HOME AND FOREIGN INVESTMENT, 1870-1913; *Studies in Capital Accumulation*.

By A. K. Cairncross.

Cambridge University Press. 251 pages. 30s.

IN the last decade, economists—Rostow, Phelps Brown, and Brinley Thomas, to name only the most recent—have made notable contributions to knowledge of the British economy in the half-century before 1914. Although economists have rarely been averse from embellishing their works with *obiter dicta* about the past, not since the days of W. J. Ashley and W. R. Scott have they exhibited so expert an interest in history. But whereas Ashley and Scott were diverted to history by an aversion from deductive economics, the modern historian-economists have been directed there by the current preoccupations of theory, and carry their analytical tools with them. This has its disadvantages: the questions suggested by modern theory are not always the most reasonable that can be asked of even so recent a period as the Edwardian age. But, as this book shows, the net advantage is considerable. Perhaps it is as well for our history, no less than for our theory, that English economics in the nineteenth century did not develop along the lines of the German Historical School.

The latest addition to this literature has been a long time in the wings. For several years, no article on this period has been complete without deferential acknowledgment in the footnotes to Professor Cairncross's unpublished thesis, immured since 1935 in the Cambridge University Library. Moved by the sight of his modest estimates, free from the necessarily debatable calculations which produced them, masquerading away from home as fully grown-up facts, Mr Cairncross has been persuaded to publish the full details of his series on home and foreign investment. To these he has added some studies of particular aspects of later nineteenth-century investment taken from his thesis and published on previous occasions. He has made important changes in his calculations, and has rewritten certain of the papers already published elsewhere, but he has not attempted to incorporate in any systematic way the results of later researches. Anyone who has had to work over his own manuscript after a long interval knows how cunningly it struggles against revision, and there are places where it may be suspected that the Mr Cairncross of 1935

has got the better of his successor; the book is not entirely free from the mixture of styles characteristic of transitional periods. Some parts, too—for example, the observations on the terms of trade—might have profited had the author been able to relate his conclusions to those of more recent workers in the field. But there is no doubt that Mr Cairncross has done his subject a much better service in publishing now than if he had left his manuscript longer in the finishing school.

There are two questions one can legitimately ask of a work of this kind. Are these statistics comprehensive and reliable? And are the conclusions consistent not only with the statistics, but with the general picture of the period derived by more old-fashioned but possibly more reliable ways? On the first point, Mr Cairncross writes his own review; as he points out, there are still some untapped sources. But those he has used—and they cover an impressively wide range—he has used with no less discretion than ingenuity. Anyone who pretended as soon as this to pass a definitive judgment on his estimates would be attempting a confidence trick. The estimates deserve, and will in due course no doubt receive, detailed scrutiny. But at least on a first reading they inspire confidence, and this book would be notable if it did no more than provide a reasonable statistical foundation for the study of investment in this period.

What about the conclusions? Despite its wide range of subjects the book has an underlying theme—the alternation of home and foreign investment. In the short run, as is well known, the two generally moved together, but "in the long run, foreign investment was largely at the expense of home investment and vice versa." And this, to put the matter crudely, was primarily because the periods of high foreign lending were also the periods of heavy migration and therefore of low investment in domestic building and public works. This thesis is demonstrated as amply and as convincingly as any generalisation about this period can well be; and it is clear that the built-in shock absorbers whose working Professor Cairncross describes helped very considerably to stabilise the world economy in this period.

Only one general criticism might be made of the book within its own terms of reference. In the picture presented to us, the main sources of instability are on the frontiers of the world; the fluctuations of domestic investment are

THE ECONOMIST, AUGUST 29, 1953

primarily repercussions of the fluctuating pace at which the regions of recent settlement were developed. But what determined the varying pace of this development? In his stimulating introductory essay, Mr Cairncross refers to the opening up of these regions as taking place

like all biological development, in spasms. In the human embryo hair will grow first on one place on the head, then in another. So in the development of the frontier, first one country came into the limelight, then another.

Biological analogies are the most treacherous of all, but the comparison is not unapt or out of place in an introduction. The trouble is that these spasms retain to the end their character of *dei ex machina* of somewhat uncertain origin. The chapter on investment in Canada, 1900-1913, where one might expect an account of the matter, does not help much, for it is primarily concerned with the transfer problem.

This work, then, is an acute and detailed study of the interaction of home and foreign investment rather than a general analysis of the determinants of investment in this period. But such an analysis would be asking rather a lot. We do not yet know, at all points, how the British economy worked before 1914, but we are very much nearer knowing than we were twenty years ago. And to this growth of knowledge, few scholars have contributed more substantially than Professor Cairncross. Few doctoral theses can have borne such good fruit.

Radical Chronicle

ENGLISH RADICALISM, 1886-1914.

By S. Maccoby.

Allen and Unwin. 540 pages. 42s.

THE period covered by this book was of critical importance for the English radical movement. Joseph Chamberlain, its most powerful politician, changed sides in 1886 and split the Birmingham radicals off from the rest; he thereby injected some reluctant care for radical interests into a Conservative party that was becoming increasingly the party of big business, while the importance of big business was growing. The last fifteen years of the century were years of phenomenal imperialist expansion, providing frequent targets for radical criticism, above all in the Boer war. In the aftermath of that war the Liberals came in; won a spectacular electoral victory in 1906; put some long-desired reforms into effect; were frustrated by the House of Lords from enacting more; and abolished the peers' permanent veto. Then the promise of reforms to come was swept away in the catastrophe of Europe. But before 1914 a hidden disease, which the war was to stimulate, had attacked the Liberal cause. Somehow, to change the metaphor, the Liberals missed the bus; and the radical enthusiasts on the left wing of the Liberal party transferred their allegiance to Labour.

It cannot be said that Dr Maccoby has covered this period well in the third of his chronicles of English radicalism. The volume on 1886-1914, even longer than the previous two and costing more than both of them together, devotes twenty-two chapters to the first twenty years, touches on a few problems separately, and sums up the last eight years in a score of pages at the end. He does not discuss at all the importance, or even the size, of the Chamberlain group that succeeded in 1886. His treatment of the following decade is spoiled by lack of reference to the best sources on the Irish complications, and by an apparent belief that Mr Gladstone was a radical—Gladstone, of whom Balfour said truly in 1895 that he "is, and always was, in everything except essentials, a tremendous old Tory."

Dr Maccoby quotes a few pro-Boer speeches, without communicating any of the generosity of feeling that inspired the pro-Boers. He mentions the "Chinese slavery" agitation, it is true—he mentions almost every agitation; but he does not argue whether it was justified or not. He rules the Fabians out of court altogether, and does not tackle the problem of why, and when, and how, English radicals became socialists. In his records of what concerned them, he restricts himself too much to printed sources, often somewhat elementary. The *Illustrated London News*, the "Annual Register," and the *Daily Mail* Year Book account between them for scores of footnotes; and it is odd to be referred, for a trade recession and several diplomatic crises, to "Whitaker's Almanack."

A New Kind of Textbook

A GUIDE TO KEYNES

By Alvin Hansen.

McGraw Hill. 237 pages. 27s.

"IT is the purpose of this volume," says Professor Hansen in his preface, "to serve, so to speak, as a tutorial guide." He might justifiably have laid greater stress on the quality that distinguishes this most valuable book from the numerous "short cuts" to Keynes—themselves often masterly examples of exposition, available to the general public or the neophyte student—and from the critiques of Keynesian thought that have proliferated ever since the publication of the "General Theory."

This "Guide to Keynes" is a serious student's companion; it assumes that the "General Theory" is open at its reader's elbow. It concentrates on crucial and difficult points whether of concept or exposition; supplements Keynes's text with references to past doctrines or subsequent debates; pauses for illuminating discussions of methodology; and—in a final section—links certain significant passages in the "General Theory" with the famous posthumous article of 1946 and the question of whether Keynes would still be a Keynesian today. It achieves, in fact, an objective rarely, if

ever, conceived in such explicit terms: that of providing the solitary reader with the nearest possible substitute for a flesh-and-blood mentor, an intellectual coach, who will not do his work for him but will show him how to do it. It is hardly too much to say that, in the evolutionary process of teaching by textbook, the "Guide to Keynes" represents a significant and enormously promising mutation.

There is room for some perfecting of the tutorial technique. One is not always clear, even with both books open on the desk, when Professor Hansen is summarising, when rephrasing, when supplementing and when criticising the text of the "General Theory." The signposts are generally there; but they have something in common with those which, on the English road system, madden the long-distance driver by concentrating on local directions, and the pilgrim to Little-Muddelcombe-on-the-Wold by reassurances that he is right for London. Occasionally, too—the handling of the symbols introduced by Keynes in his fundamental third chapter is a case in point—a crucial ambiguity is pointed out without being entirely resolved. It is no doubt an excellent thing that the student should puzzle out the resolution for himself if he can; but the ability to do so presupposes a more practised acrobatic skill than the book in general appears to assume.

These are, however, perfectionist criticisms—and may reflect as much on the reviewer's abilities as on Professor

Generals in Grey Suits

The Directors of the "I. G. FARBEN" Cartel - their conspiracy and trial at Nuremberg

JOSIAH E. DUBOIS

The full story of a great conspiracy for world control of industry and war-potential by the Directors of the internationally famous "I.G. FARBEN" Cartel. They were tried and convicted at Nuremberg. The facts are related by the Chief Prosecutor in this amazing case. 16s. net.

The Return of Germany

NORBERT MUHLEN

"A clear, intelligent account of what has happened, what is happening, and what may happen. . . . There is much in the book that Britons should know."—DAILY TELEGRAPH. 18s.

—THE BODLEY HEAD—

Hansen's exposition. "A Guide to Keynes" is unequivocally recommended to honours students of economics, to their teachers, to those general readers who, having learned their economics in the pre-Keynesian era, have never quite got round to grappling with the "General Theory" at first hand, and to writers of textbooks—not only on economics.

European Union

L'INTEGRATION ECONOMIQUE DE L'EUROPE.

By an International Study Group under the direction of Lucien de Sainte-Lorette. Presses Universitaires de France, Paris. 332 pages. 860 francs.

UNDER the guidance of Monsieur Lucien de Sainte-Lorette, Director of the *Collège Libre des Sciences Sociales et Economiques de Paris*, a number of international experts have collaborated in this study, which has been sponsored by the Carnegie Endowment. Their names are not affixed to the essays they have written, but merely enumerated in the introduction; this makes it hard to find out for which section an author is responsible. The nine chapters of the book—here again one has to do one's own counting—deal with the dependence of Europe on European and non-European sources of supply and markets. They discuss the varied, sometimes overlapping, attempts at integrating Western Europe, and probe deeply into the viability of the Europe comprised in the Schuman pact countries and of the Europe embraced by OEEC.

The merits of the study—and they are considerable—consist in the sober detailed analysis of the actual facts that greater integration has to take into account. There is very little wishful thinking in it. Its most suggestive chapter, for which Professor Triffin of Yale seems to be responsible, discusses European currencies since the war. The author's handling of the growth, the working and the shortcomings of the European Payments Union is very helpful. His suggestion that France, Italy and the Benelux countries should scrap their existing currencies and jointly adopt a new currency—called interfranc—thus renewing under modified conditions the old Latin currency union, is well worth considering. This, the longest chapter of the series, makes it very clear that genuine economic integration cannot be achieved or maintained without a flexible currency interdependence, functioning more or less automatically.

The study does not deal with the integration of Europe as a whole, but only with the rump Europe that lies westward of the Russian zone of Germany. It occasionally mentions its relation to that Eastern Europe which, for brevity's sake, might be called "Colonial Europe." It may be that that Europe is lost for the time being; but westerners should not implicitly ignore its European birthright.

Shorter Notices

AID, TRADE AND THE TARIFF.

By Howard S. Piquet.

Thomas Y. Crowell, New York. 358 pages. \$5.00.

The main purpose of Mr Piquet's book is to examine the probable effects of a complete, though temporary, suspension of all tariffs and quotas in the United States—surely an exciting and apposite project. Yet this study, though valuable to the specialist, is not so rewarding as it should be. The main trouble lies in his restricted method. His assumptions test the reader's credulity, and his analysis is both partial and static. As a result his estimate of the probable increase in American imports—minimum \$1.2 billion, maximum \$2.6 billion—has not the significance which it might otherwise have. This estimate is, incidentally, rather more optimistic than most other similar forecasts.

An interesting feature is his attempt to play down the consequences to American import-competing industry. This conclusion may not be entirely soundly based to judge by the statistical evidence, but it is certainly an interesting view coming from one who has had long association with the United States Tariff Commission. In fact the healthy liberal spirit underlying the whole book is one of the best features of the study.

There are only some seventy-odd pages of text; the rest is a useful reference digest of commodity imports.

THE AMERICAN SYSTEM OF GOVERNMENT.

By John H. Ferguson and Dean E. McHenry.

McGraw Hill. Third Edition. 1,056 pages. 48s.

This edition brings up to date to the beginning of this year a clear and efficient presentation of the structure of American government that was originally published in 1947. Apart from discussion, along conventional lines, of the basic principles of the constitution, excellent background material is provided on such subjects as taxation, law enforcement, fiscal administration, organisation of government departments, the civil service system and the conservation of natural resources. There are separate sections on state and city government. The arrangement of the material by chapter headings, the comparative charts, diagrams and bibliographies are of a uniformly high standard.

THE NANDI OF KENYA.

By G. W. B. Huntingford.

Routledge and Kegan Paul. 169 pages. 18s.

There is a nice antediluvian flavour about this short book. The author lived in East Africa from 1921 to 1940. His book belongs, in style and method, to the ethnological tradition of the first decade of this century when scholars at home still relied on the enterprising district officer and missionary for first-hand information about the native peoples of Africa. All honour is due to these pioneers for having blazed the trail for the professional anthropologist of today; and if their type of work is naive and superficial by modern standards, this is partly due to the demand created by themselves.

Mr Huntingford gives an unpretentious description of the most important social institutions of the Nandi, a well-known tribe of cattle-keeping warriors whose mode

of life is typical of that of many pastoral peoples of East Africa. One of the peculiarities of these peoples is that they have an elaborate stratification of the entire male population by age groups. This is closely related to their organisation for raiding and warfare, for it is only the men in the middle-age grades who form the fighting force. The principle is simple; but the way in which it is worked out in practice is often baffling in the extreme. Mr Huntingford makes excellent use of his knowledge of the Nandi to give a clear account of how their age set system works. He describes, in the same straightforward manner, the local groupings, the councils of elders, the elements of law and the main religious ideas of this tribe. The information given is accurate and well arranged. If Mr Huntingford's book has not the depth or the sophistication of the professional monograph of today, it is at least very readable. It is just the kind of book needed by a busy official who wants to get up the main facts about the social organisation of a tribe in a couple of days with the minimum of intellectual effort.

BUSINESS FINANCE.

By F. W. Paish.

Pitman. 144 pages. 12s. 6d.

Professor Paish's new book, based on a series of lectures, is for students only. In a book of this kind he cannot be expected to say anything new about the shortage of industrial capital in this country. Instead, he has contented himself with a discussion of the nature and risks of finance, of the principle of limited liability, of the ways in which new money can be raised (with separate chapters on alterations in shareholders' rights and on the dissolution of a company) and of the problem of replacing assets at a time of rising or falling prices. If the reader regrets the lack of originality he will welcome the clarity of Professor Paish's exposition and analysis. In fact, "Business Finance" is nothing more than a textbook whose influence will not spread—beyond the confines of a lecture room; within these limits, however, it is excellent, adding another well-forged link between the economist and the businessman.

MACAULAY'S HISTORY OF ENGLAND. 4 Volumes.

J. M. Dent. 2,396 pages. 28s.

That long rows of Macaulay's "History of England" lay emblamed in dust on the shelves of the second-hand booksellers can be blamed almost as much on the physical unattractiveness of these volumes as on the end of the Whig Supremacy in the teaching of history. The first reason for neglect can no longer be advanced, for the history has been reprinted in the new Everyman's Library series at a low price and in a handy form. Mr Douglas Jerrold has contributed a new introduction to this edition; critically he scores a series of inners without once hitting the bull. But any praise or criticism of Macaulay is now as well worn as an early Victorian penny. Perhaps it is not unfair to Macaulay to repeat his own judgment on an earlier historian, Burnet.

A writer, whose voluminous works, in several branches of literature, find numerous readers a hundred and thirty years after his death, may have great faults, but must also have had great merits: and Burnet had great merits, a fertile and vigorous mind, and a style, far indeed removed from faultless purity, but always clear, often lively, and sometimes rising to solemn and fervid eloquence.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Debt Dilemmas

Washington, D.C.

WHILE President Eisenhower's slump, like President Hoover's prosperity, remains "just around the corner," the end of the first session of the Eighty-third Congress has been enlivened by two interesting controversies about monetary policy and debt management. More will surely be heard of both in next year's election campaigns if the slump puts in even a shadow of an appearance. In one, a Democrat, Senator Paul Douglas, the Senate's chief, indeed its only, economist, enlisted the support of Mr Marriner Eccles, who was chairman of the Board of Governors of the Federal Reserve System from the beginning of 1936 until 1948, against the policy of the present Board. In the other, Senator Byrd, also a Democrat and the Senate's chief economist, tackled Mr Humphrey, the Secretary of the Treasury, over the Administration's last-minute, and unsuccessful, request to Congress for permission to increase the limit of the national debt from \$275 billion to \$290 billion, mainly so that there would be enough money to pay for armaments which were ordered in earlier years and are now about to be delivered.

From the moment that Senator Byrd managed to involve Mr Humphrey in an argument about whether it was practicable to allow the government's cash balance to be run down temporarily by some \$2 billion—and got him to admit that reducing it from \$6 billion to \$4 billion or a little less, which has been done before, would get over the immediate problem—Mr Humphrey was beaten. Mr Byrd has gone on to point out that a much smaller balance would be needed if it were kept in only one bank (it is now spread between 12,000), that there are only four months in the next eleven when, even if the cash balance were not

reduced, the limit on the national debt would be exceeded and that, by the end of the fiscal year on June 30th, the debt will be \$273 billion against today's limit of \$275 billion. There are a number of theories as to why the Administration, faced with such a marginal problem, tried to have the limit raised by \$15 billion, \$13 billion more than its own estimate suggested would be necessary in the immediate future. But the explanation was probably fairly simple: Republican officials wanted to emphasise dramatically the spendthrift nature of the previous Democratic regime and, at the same time, to provide an ample margin for a little spending by this one to prime the economic pump, should the need arise, without having to ask for another increase.

Whatever the real reason, Mr Byrd was given a splendid opportunity to make a point of apparent principle. The present level of \$275 billion was, he said, one of the milestones in the preservation of the government's solvency. If the limit were increased to \$290 billion now it would soon be \$300 billion—and then "over the precipice of financial disaster." The Secretary of the

Treasury, who has to try to sell about \$5 billion worth of government securities this autumn, and does not want their legality called into question, thinks, on the other hand, that "a debt limit is a secondary consideration." This it can hardly fail to be in a country in which the separation of powers ensures that the Executive, by and large, decides the level of expenditure and the Legislature, by and large, decides the level of taxation and the two, for strictly political reasons, seldom meet.

This argument had an air of unreality with Mr Byrd preaching the simple faith of the successful businessman, impatient of theory, but Senator Douglas and Mr Eccles

made some rather more sophisticated criticisms of the monetary policy of the new Administration. The Senator was worried because he had found himself quoted by advocates of a completely free money market to justify their decisions; he was inclined, he said, to question the nature, timing and degree of some of these decisions and he therefore asked Mr Eccles for his opinion. During the first phase of the Korean war, Mr Douglas pointed out, "the inflationary policies of the Federal Reserve Board brought on inflationary conditions and a surplus of money and credit supply in terms of available goods." He then strongly advocated measures that would slow down the increase in the money supply. The agreement between the Treasury and the Board in March, 1951, had been successful and until December, 1952,

we had virtually full employment, expanding production and relatively stable general prices. . . . It was demonstrated therefore that these goals are mutually compatible and that it is not necessary to have inflation in order to get full employment.

During this period the Federal Reserve Board, although abandoning the rigid support of government bonds, had nevertheless bought considerable quantities, enough to increase the reserves of the Board's member banks, and thus their ability to make additional commercial loans and add to the supply of money, at approximately the same rate as production was increasing. The restrictive credit policy of the new Administration had, on the other hand, Senator Douglas maintained, reduced the supply of money by 3½ per cent while the index of production was rising by 3 per cent. He said:

They moved too fast and too far. The results have not been happy. The Federal Reserve in late May tried to reverse its policy and that of the Treasury by buying government bonds when they had fallen 11 points below par and also by reducing reserve requirements. . . . But a good deal of the damage had already been done and many of the economic tendencies which were set in motion are irreversible.

★

Mr Marriner Eccles, who is, unlike Senator Douglas, a Republican, and one who tried unsuccessfully to get his party's nomination as Senator from Utah last year, agreed with him. After describing the course of the economy since 1929, Mr Eccles said that the policy of the Federal Reserve Board, between its agreement with the Treasury in 1951 and the beginning of this year, had been "adequate" except for "the excessive and unsound credit expansion development in the consumer and housing credit fields." The cost of living index had fluctuated for two years between 112.4 and 114, the wholesale price index had fallen from 113.5 to 110 between December, 1951, and March, 1953, and the supply of money had been growing slightly less rapidly than national production. Therefore, when the new Administration came to power last January, the economic danger was no longer that the dollar would be cheapened but that there would be some deflation. Shortages had largely disappeared and surpluses were taking their place, the peak of home building had passed and government expenditures were due to decline.

The monetary and credit policies pursued by Federal Reserve and Treasury officials during the first five months of 1953 had created for them, Mr Eccles said, a real dilemma. They were trying to curb inflationary develop-

ments, of which there was no real evidence, and they had to raise about \$12 or \$13 billion in new money as well as to refund about \$13 billion of maturing securities. The attempt to do this in a free, unsupported market showed that it was impossible, even with the favourable terms which were offered, to refund any of the short-term indebtedness into long-term securities, as had been planned, or to raise new money as long as a hard and tight credit policy was pursued. The public debt was too large and its influence on the supply of money and the stability of the economy too dominant for the Federal Reserve Board to be able to abandon its responsibility of managing the government security market.

The Administration should, Mr Eccles concluded, think twice before basing its policy on the assumption that inflation would continue and should learn from recent experience that it is unrealistic to create a tight money market and at the same time undertake to raise new money in a free market. No answer came from the government and there was no possible answer, because, by reversing its policies, it had already admitted the need for a change. But it may well be that Senator Douglas was going too far in saying that many of the deflationary economic tendencies set in motion in the early part of the year were irreversible. With the astonishing resilience of the American economy many of them seem already to have been satisfactorily reversed.

Uncertain Civil Servants

Washington, D.C.

ALTHOUGH the civil service system as a way of staffing the federal government is fifty years old this year, it is only in the last two decades that it has ceased to be overshadowed by the spoils system, under which the bulk of government appointments were rewards for political services rendered to the party in power. Since 1932, however, the number employed by the federal government has grown from under 600,000 to over two and a half million, and nine-tenths of these posts are non-political civil service appointments. Now, for the first time since the federal bureaucracy became so big and the principle of non-political appointments so well established, there has been a change of Administration in Washington. This has raised questions concerning the civil service that were almost forgotten during the long period of the Democrats' supremacy.

Any new Administration would have faced the problem of how to be sure that the people in the executive branch of the government who have policy-making responsibilities are wholehearted supporters of its programme. As early as February, it was being reported in the *New York Times* that

the new Republican heads of agencies regard the problem [of getting their men into policy-making jobs] as the most serious single one confronting the Administration except that of settling the Korean War.

In the effort to solve this problem, President Eisenhower has taken two general steps, reclassifying the group of federal employees, numbering perhaps 12,500, who have policy-making or confidential jobs but now no longer enjoy guaranteed tenure, and removing civil service protection from another heterogeneous group. There were 134,000 affected here but some, it is thought, will be restored to civil service status. In the heated debate over these moves,

Democrats charge that they were designed merely to open up jobs for deserving Republicans, and to score against anyone who had been able to work with the Truman Administration. Republicans reply that Mr Truman tried to make the Democratic influence lasting by giving his appointees a permanent hold on key positions, and that the new Republican team must either undo this or face the prospect of trying to carry out its policies through unsympathetic civil servants.

There is evidence for both points of view. There have been some individual dismissals of officials who were supposedly not subject to political change. There were also complaints from the Republican National Committee that too few jobs were available to the party faithful. This

"Pretty Sure Of Yourself, Aren't You?"

Herblock in the *Washington Post*

has diminished since the chairman of the National Committee was given more direct control of patronage.

On the other hand, there is something to be said for the view of the new chairman of the Civil Service Commission, Mr Philip Young, that men who have had to fight for the policy of one Administration, as under the American system it is frequently necessary to do, before congressional committees and elsewhere, are bound to become partisans of that policy, and therefore unfit to carry on in their jobs when the Administration and the policy undergo a change. Furthermore, there is the intangible but undoubted fact that the kind of people drawn into the higher positions in the federal service during the period of Democratic rule tended more often than not to be sympathetic with the general aims of the Democratic programme.

This is no more than to say that the New Deal attracted New Dealers. Their presence in Washington in large numbers has not made it easier for the Republicans to regain the feel of government after their two decades in the wilderness. Moreover, the Administration has had diffi-

culty in attracting suitable people of its own to the government. Federal salaries are meagre compared with business incomes; there is also relatively little incentive to enter the public service for a businessman whose main idea about the government is that there should be less of it.

Further problems have been created by the reduction in the total size of the government, to which the Republicans are pledged above all else, and which has in any case been made necessary by cuts in appropriations. Already the number of employees has gone down by nearly 100,000 since the Republicans took office, and by next July the figure is expected to reach 180,000. Much of this reduction is being achieved by not filling vacancies as they occur but, where dismissals have been necessary, haste on the part of the Administration has combined with the complexities of civil service regulations to create something close to chaos in many government agencies. When a person with civil service status is "rified" (dismissed as the result of a reduction in force), he may, under civil service rules, take over the job of someone with lower status, doing roughly similar work. This second person may, in his turn, "bump" a third man, if he can find one, and so on. The resultant confusion, compounded at every turn by the extraordinary preference given to all war veterans, can readily be imagined. One estimate is that in the end not more than one quarter of the staff of the Department of State, for instance, will remain at their original jobs. And the turnover in staff at the Department of Commerce is the official explanation of recent delays in the publication of foreign trade statistics.

Here is an actual case, much simplified, from a federal

THE
First SINCE 1784

The United States had only just become a sovereign power when in 1784 the First National Bank of Boston was founded. The bank has grown with the country — indeed helped the country to grow — and maintains important branches in Argentina, Brazil and Cuba as well as a wholly-owned foreign banking affiliate in New York City.

America's oldest chartered bank offers traditionally courteous and comprehensive financial service to bankers and concerns engaged in overseas trade with North and South America.

agency. Mr Brown, a man with 25 years' service, was "ruffed" (his job was eliminated); he "bumped" Mr Smith, who discovered, just as he was about to take Mr Jones's job, that he could, through a technicality, keep his job. Mr Jones, meanwhile, had resigned voluntarily, since he expected to be "bumped" soon if not this time, and he lacked the civil service status to push out anyone else. But now Mr Brown had to find someone else to replace; this was Mr Robinson. Mr Robinson "bumped" Mr Baker, but while appeals were pending, Mr Brown's office found they had to keep him after all, and Mr Robinson was given the job left vacant by Mr Jones. This would seem to have left Mr Baker in his job. But poor Mr Baker, although the immediate threat from Mr Robinson had disappeared, was not reinstated, but was granted a thirty-day extension of his tenure, the reason being that he lacked status and so was bound to be "bumped" sooner or later. This account leaves out details of appeals, delays and deadlines, which gave to the whole ordeal something of the quality of awaiting execution by firing squad. During the weeks and months that this was going on, it is safe to say that the public service was not receiving the undivided attention of these harassed men.

Efforts are being made to remedy this situation. The area in which a person is allowed to "bump" can be restricted, so that a man in one branch of a department may initiate a chain of "bumping" only in that branch; otherwise, he may replace a man only if the latter is without status and therefore unable to force out any third person. But the dilemma remains: every restriction on "bumping" diminishes the job security of civil servants; every attempt to increase job security runs the risk of making the government dangerously inflexible.

When to all this is added the fear engendered by the security programme, with its loyalty reviews, designed to eliminate subversives and other unfit persons from the government, but susceptible, many feel, to dangerous misuse, it is understandable that the morale of employees in many agencies is low indeed. The amount of damage done varies greatly, however; the Bureau of the Budget, small and professional, has managed its changes expertly and with a minimum of damage; the Department of State, the victim of every ill wind that blows, has been all but capsized by this one.

American Notes

Inquiry Into Trade

PRESIDENT EISENHOWER'S belief that agreement on any subject can be reached if those concerned sit down together and study the facts will be strongly tested when the newly appointed commission on foreign economic policy tries to draw up its report. Ever since April the plan to set up the commission, on which the President is represented by seven members and Congress by five from each House, has been the standard way of fobbing off anyone proposing changes in trade policy. But the legislation

establishing the commission was delayed until the end of the congressional session. Only about six months therefore now remain for the "broad-gauge study" out of which basic new proposals are supposed to emerge in time for consideration at next year's session of Congress.

The commission is instructed to examine, among other matters, all factors affecting the balance of payments between the United States and other countries. If it is to meet its deadline on March 6th it will need to take advantage of the material assembled for the various authoritative studies already made of the same subject. A report on the most recent of these inquiries, made by Mr Lewis Douglas, a former American Ambassador in London, into Anglo-American economic relations, has just been passed on by the President to the commission. Although Mr Eisenhower is unlikely to prejudice the larger study by responding to Mr Douglas's urgent plea for action now on some of his recommendations, he has made it clear that he expects the members of the commission to "search diligently for ways to widen and deepen the channels of economic intercourse among the free nations."

This is asking a good deal of some of the members, notably the Republicans appointed by Congress. Nothing short of a miracle would seem needed to produce an agreed policy for reducing trade barriers signed by, for instance, Representative Reed, the chairman of the Ways and Means Committee, and Representative Simpson, the author of this year's protectionist Bill. On the other hand persuasion through study might well work with Senators like Mr Millikin of Colorado and Mr Hickenlooper of Iowa, whose reputations as opponents of lower tariffs were gained before their party had the responsibility of office. The four Democrats are probably in sympathy with the President's call; and Mr Eisenhower's own nominees include a distinguished economist, Professor Williams of Harvard, a trade union leader from the Congress of Industrial Organizations, and several representatives of the big business interests that today are outspoken advocates of increased international trade. If an economic policy is recommended that accords with the position of the United States as the world's greatest creditor nation it will probably be thanks to the chairman, Mr Clarence Randall, who is prominent in the steel industry and has had some international experience on the staff of the Economic Co-operation Administration in Paris. It will be his task to guide these apparently irreconcilable elements gently in the direction of a unanimous and constructive report.

Bomb for the Budget

THE most immediate American reaction to the news that the Soviet Union had set off a thermonuclear explosion was resentment that the first announcement about this potential hydrogen bomb had come from Moscow, instead of from Washington, as it had when the Russian atomic bombs were exploded. Not only did this American caution embarrass a number of journalists who were misled into suggesting that the Soviet claim to the hydrogen bomb was false, but it was also felt, perhaps unjustifiably, that the Russians had been franker than had the American authorities. The allegation that the American people are being

cheated out of a democratic right, "the freedom to know," is one of the arguments being used in a campaign, led by the *Washington Post*, for giving fuller information about atomic developments. This is something which the President has already agreed would be desirable and now, it is maintained, there would be little, if any, danger involved, since the United States no longer has a monopoly of atomic knowledge. The contention is that people cannot judge whether they are being adequately safeguarded against atomic attack unless they are told more about the issues involved.

Recent Gallup polls, taken, it seems, before the hydrogen bomb announcement, showed that there was then little concern about atomic dangers and less about the weakness of civil defence. This lack of interest has been reflected in Congress, which appropriated only \$46.5 million for civil defence this year, although President Eisenhower had asked for \$125 million. The publication of a restricted report, known as Project East River, on the probable effects of a hydrogen bomb attack would, it is suggested, blow this apathy sky high. Similarly the publication of another secret report, Project Lincoln, on how the United States might be rendered comparatively safe from atomic attack would blow sky high the attempts to slow the expansion of the Air Force. Together the two schemes would cost billions of dollars and, even if adopted only in part, would certainly explode any hope of balancing the budget for years to come.

Meanwhile the hydrogen bomb announcement in itself has probably made it more difficult to balance the budget next year. For even if the new Joint Chiefs of Staff are prepared to agree to another cut in Air Force funds—the Bureau of the Budget is said to be again insisting on a \$5 billion reduction—the increased danger from the Soviet Union will reinforce the case of those members of Congress who were attacking the Administration on this point during the last session. Already they have received influential support from, among others, General Bradley, who has said that the Air Force is weaker than as a military man he considers safe; but he emphasises that the final decision on what the country can afford must rest with the civilian authorities.

Power Neutrality

THOSE in Washington who have been wondering why the Administration chose this moment to issue a detailed, but nevertheless vague, statement on its policy regarding the production and distribution of electric power have perhaps forgotten that the Secretary of the Interior has been visiting his native Pacific Northwest. There the generation and marketing of hydro-electricity is the liveliest political issues and he was probably driven to say where he stood. Taking the statement at its face value, he stands in the middle, between the advocates of federal power development and the private utility companies. The government is still prepared to consider the construction of hydro-electric generators and even transmission lines, particularly when these are part of multi-purpose projects (involving flood control, irrigation and so on) which are too large and complex to be handled by local authorities or private enterprise. But in the main it will be left to these two groups to provide the additional electric power the country needs.

In practice, as had already become apparent from specific departmental decisions, this was in any case the inevitable result of the Republican determination to get the government out of competition with private business, and to economise. For the present little or no federal money will be available for power developments, except to finish some that are too far advanced to stop, while both local governments and private companies have cash in hand. The statement leaves the federal authorities free to resume the building of power projects, should economic conditions make such public works desirable.

During the Democrats' twenty years of office, the country's annual production of electricity was quadrupled and the federal government became responsible for 13 per cent of this output instead of for practically none of it. In contrast to this aggressive public power policy, the neutral position of the Eisenhower Administration appears to favour private interests, and the Democrats are already talking about "the dim-out" and asserting that the utility lobby, which they fought for so long, has been handed victory on a plate, with electricity consumers left to pay the bill. Under the new policy federally produced power is to be transmitted and sold by private companies as far as possible; domestic and farm consumers are to be preferred to large industrial users, although, as is legally required, municipal and co-operative distributors will still come first.

This is worrying for aluminium producers and other manufacturers in the Northwest, who rely on plentiful and cheap federal power, especially since they have also been warned that charges are going up. What this neutral

The long experience of The Hanover Bank offers important advantages to firms engaged in trade with the United States and other countries in the Western Hemisphere.

THE HANOVER BANK

policy means in immediate terms of electricity prices may be made clearer by new contracts for the supply of federal power which are now being negotiated. What it means in

the broader terms of electricity production depends largely on the Federal Power Commission, the independent agency which must approve all new projects.

Storm in an Additive

HONOUR has been saved all round in the dispute that blew up last spring about the battery additive and the Bureau of Standards. It arose when Dr Astin, a distinguished scientist associated with the invention of the proximity fuse, was forced to resign from the directorship of the bureau by Mr Weeks, the Secretary of Commerce. The only specified reason was that tests carried out by the bureau at the request of the Federal Trade Commission on a compound called AD-X2, which is supposed to give new life to old batteries, were "insufficiently objective." The bureau had found after extensive testing that AD-X2 left the battery very much as it found it, and as a result the Post Office had issued a fraud order which would have stopped the manufacturer, Mr Ritchie, doing business through the post. The reflection on Mr Astin's professional integrity brought him such powerful support from his fellow scientists that Mr Weeks took shelter from the wrath by bringing in two groups of independent scientists, one to study the management of the bureau and the other to test the additive again.

Now after an interval of four months all is well. Dr Astin is reinstated; Mr Ritchie is found to have had no intention to deceive and the fraud order is withdrawn; and Mr Weeks is able to announce that his suspicions about the lack of balance in the bureau's activities and the faultiness of its administrative procedure have been confirmed. In future the Secretary of Commerce himself will decide whether the bureau will take on work for the Federal Trade Commission and whether an adverse report on a product should be published. Dr Astin will be relieved of administration, so that he can concentrate on science. Finally the Defence Department is no longer to occupy three-quarters of the time and resources of the bureau, but is to take most of its work to private laboratories. It is too early to tell what effect this will have or whether the Federal Trade Commission's policy will fall into line with Mr Weeks's doctrine

that the public should only be warned off products that are positively harmful.

That particular charge has never been made against Mr Ritchie's compound of Epsom salts and Glauber's salts, with or without the seven "trace elements" which are supposed to make AD-X2 all he claims it to be. Although the independent test has yet to be made Mr Ritchie has announced that he has finished fighting the government. "I'm going to start pouring AD-X2 into every car battery in the United States," he has said, and with all the free publicity he has received he may not fall far short of fulfilling his boast.

Contracting for Equality

ALTHOUGH he has not asked Congress for any legislation against racial discrimination, President Eisenhower has shown his good will by administrative action. Under his prompting the Services have moved nearer to the complete end of segregation and in March he banned it in the army schools. Now he has appointed a strong committee under the Vice-President, Mr Nixon, to keep a check on the enforcement of the fair employment provision in government contracts. Nearly all these contracts have a clause binding the contractor "not to discriminate against any employee or applicant for employment because of race, creed, colour or national origin," but it usually appears in small print. To judge from the record of enforcement so far neither party to the contract tires his eyes on it.

The new committee, which consists of six government officials and nine public members, including the presidents of the American Federation of Labour and the Congress of Industrial Organisations, will receive complaints of discrimination and see to it that they are taken up by the contracting agencies. This still leaves the actual enforcement of the clause to the agencies, which usually show themselves reluctant to press matters to the extent of cancelling the contract. The Vice-President's committee is given wide authority to work with official and unofficial fair employment practice commissions in the states and to conduct propaganda against discrimination generally. Its work will test whether prejudice can be effectively dealt with by firmness and persuasion without further compulsion.

The only legislation passed this year that affects a racial minority does in fact threaten the power of federal authorities to control policy. The Bill was intended only to ratify carefully negotiated agreements with Indian tribes in California, Minnesota, Nebraska, Oregon and Wisconsin, ending their special legal status and allowing Indians to appear before the state courts as ordinary citizens. Suddenly it was widened in the Senate to give any state the right to assume criminal and civil jurisdiction over its Indians. It was then sent to the White House virtually without debate in the course of the adjournment rush. The President was urged to use his veto to safeguard Indians from the danger of being deprived of their tribal government and removed from federal jurisdiction without any prior consultation. He finally signed the Bill in order not to hold up progress towards political equality in the five states primarily concerned, but asked Congress to put things right next year.

The World Overseas

Soviet Economy After Stalin—I

Malenkov Poises the Scalpel

HAS Malenkov's speech promising more and better consumer goods in the near future opened a new era in Soviet economic planning? During the preceding 25 years of planned economy all the energies of the country were harnessed for the development of steel, of heavy engineering and of a fuel and power basis. The consumer was getting from time to time a slice of the rapidly growing national cake, but basic production had first call on the scarce resources. The present or fifth Five Year Plan, drawn up before Stalin's death, was established on the same pattern. True, the consumers were promised a somewhat bigger slice than usual, but the emphasis was still on heavy industry. Now Malenkov has asserted that the targets for light industry must be reached ahead of schedule and the output of consumer goods speeded up. Since the Plan, now at its half-way mark, already assumed the fullest use of existing resources and a 50 per cent increase in productivity, any big jump in the output of light industry can be obtained only by a shift—presumably a cut in the heavy industrial sector. This article will review briefly the foundations of the economy bequeathed by Stalin to his successors and the difficulties they will find in applying the scalpel, let alone the axe, to the inherited programme of expanding basic industry. Later articles will deal with the position and prospects of the Soviet consumer, and with the state of agriculture, on which the standard of life of the population largely depends.

When reviewing the progress of Soviet basic production during the 25 years of the Stalinist era, Malenkov could juggle with dazzling percentage increases. Despite the upheaval of collectivisation and the ravages of war, the Soviet Union has advanced with giant strides. In the twenties its economy was still semi-Asiatic. Now the USSR is the world's second industrial power, and Europe's first

by a long way. To achieve this the wishes of the consumer have had to be ignored. Seventy per cent of industrial labour is employed in heavy industry and producers' goods account for 70 per cent of total industrial output. Throughout the period, about a quarter of the national income had to be reinvested every year and investment had to be channelled into heavy industry.

Stalinism was the political result of this gigantic experiment in planned industrial revolution at break-neck speed. Having paid that price, the Soviet economy is now catching up with the combined output of the United Kingdom,

France and Germany in coal, electricity, steel and engineering. Whatever its decision upon the final apportionment of the national product, the new regime is unlikely to arrest the development of the steel and fuel base of the country. The planned output for this year disclosed by Malenkov shows no departure from the established trend. Coal extraction is lagging behind, chiefly because of insufficient use of available equipment, and a great drive is being carried on for higher productivity in the coal mines. Crude oil extraction seems also behind its ambitious objective, but here progress is normally made by leaps and the planners may hope

to make up the loss through successful strikes in the "Second Baku" area. Output of steel and particularly of electricity, on the other hand, is likely to exceed planned targets.

The real opening for improvement lies in a shift from heavy to light engineering. Malenkov declared that this will be done, without stating on how big a scale. The output of the engineering and metal processing industries was to be doubled during the current five-year period, and the bulk of this production was earmarked for strengthening the basic economic potential of the country. Since, in the Soviet race with the West, the development of economic

potential is at least as important as direct output of arms, any important shift would involve a radical change of policy. Indeed, there may be more room for pruning in the production of conventional armaments. The relative decline of direct defence expenditure in the Soviet budget may be interpreted as a sign that output of conventional armaments has reached its peak, that demand in certain lines has been saturated, while in others it is preferred to concentrate on prototypes instead of piling up stocks likely to become obsolete. Yet the resources freed in this way could well be swallowed by atomic or hydrogen projects. In fact, if the Kremlin wants to keep up with American development, the drain on the Soviet building and engineering industries would be even greater. This could account for the mysterious rise in the residual "other" expenditure in the latest Soviet budget.

BASIC PRODUCTION (million tons)				
	Coal	Elec- tricity*	Oil	Crude steel
SOVIET UNION:				
1940	166	48	31.0	18.3
1950	260	90	37.8	27.3
1952	300	117	47.4	34.4
1953 plan	320	133	52.0	38.0
1955 plan	372	163	70.0	44.2
UK, FRANCE & WEST GERMANY:				
1952	425	158	2.0	46.0

* '000 million kwh

There is another possible explanation of this mysterious rise; the indecision of the rulers in Moscow. A revision of the Plan for the benefit of the consumer has been announced, but the revised targets have not been disclosed. A change in the structure of Soviet economic development could be carried out only in a changed international climate. The planners have been told to step up production for the consumer, but wherever they look for alternative resources they meet the policy-makers' veto. The dilemma of the new regime is that it has pledged itself to provide more consumer goods than Stalin had promised, yet feels unjustified, as yet, in altering the strategy on which the Stalinist plan of production was based.

(To be continued)

The Riots in Ceylon

IN a day of riot, looting, arson and bloodshed, 21 people lost their lives and 175 others were injured in the disorders that swept Ceylon on August 12th. The blame for this tragic episode rests squarely on the opposition parties, whose leaders recklessly ordered a hartal (stoppage of work) as a protest against the government's budget decisions. It must have been obvious to them that in the circumstances of widespread public resentment at the increased cost of living such action could only be inflammatory. The hartal was planned as a peaceful demonstration, but troublemakers soon got among the mob. Stones were thrown, cars were overturned and burned and at places the security forces were forced to open fire in self-defence. The

demonstrators were most active in disrupting transport services. Buses were halted, and saboteurs, acting on obviously prearranged plans, damaged railway lines leading to Colombo and other centres. It was no coincidence that the most ugly scenes occurred in Colombo, since it is here that the Communist influence is most strong. Indeed the municipal authority openly supported the demonstrators by hoisting a black flag over the town hall. The disorders were not, however, confined to Colombo; there were demonstrations in many other places, making more difficult the job of restoring order. Yet on the whole the security forces, which included police, army, and naval forces, maintained exemplary discipline. The excuse for the hartal was the government's decision to reduce the subsidies on rice and wheat, thus causing food prices to rise immediately. To add to the difficulties, increased postal, travel and electricity charges were also announced. Though these burdens are undoubtedly harsh and the government cannot escape censure for its past dilatoriness, the opposition cannot provide any reasonable alternative to cope with Ceylon's economic plight. Sensing the public's dismay at the new food policy, and realising the government's own embarrassments, the opposition leaders threw their energies into blowing the question up in the public mind. On July 25th, budget day, a crowd of demonstrators which had somehow learned of the government's intentions caused a disturbance outside parliament. They were applauded by the opposition. Later protest meetings were held in various places in the island; petitions were presented to parliament; and finally the hartal was staged. Inside parliament a running criticism of the budget was maintained, in which Mr. S. W. R. D. Bandaranayake, who at one time held office in the government but split away to form the moderate Sri Lanka Freedom party, took a prominent part. Unfortunately, since he is a man respected for his integrity and ability, he has allowed himself and his party to become the dupes of his extreme left-wing colleagues.

Marxism in 3-D

The Ceylon Communist party whose leader, Pieter Keuneman, is probably the most active in the left-wing group, has no monopoly of Marxist following in Ceylon. Dr N. M. Perera, leader of the Nava Lanka Sama Samaja party, a Trotskyite, and Mr D. P. R. Gunawardene, a Revolutionary Marxist, are also in competition for leadership of the extreme left wing. In fact, an attempt to form a popular front failed because the Communists demanded complete subservience to Moscow and Peking, which the others would not accept. The Communists and their Marxist collaborators undoubtedly welcomed the strike, if not the bloody consequences, as an opportunity of testing their revolutionary powers. There is some evidence that well-laid plans existed to cause countrywide disruption and even to start a Malayan-type insurrection; but the events of August 12th were probably not part of a deliberate plan. Nevertheless Communist agitators were well to the fore. It is regrettable that they had moral support from the moderate left wing, though the latter subsequently tried to disown any responsibility for the episode. The government's response was swift and decisive. A state of emergency was declared, a curfew imposed, and troops and police, reinforced by the newly formed home guard detachments, were placed in readiness to meet any

imprisons atmospheres

Design by Felix Kelly

TI imprisons atmospheres . . . life-saving gases, superheated vapours . . . in high-pressure cylinders, vessels and tubes of every variety of size and shape dictated by the needs of world industry, world transport, world science and medicine.

TI is a group of interrelated engineering companies whose manufacturing activities are wide: from precision tubes to bicycles, to components for cars and ships, aeroplanes, locomotives . . . to wrought aluminium, pressure vessels, electrical equipment and appliances, metal sections, mechanical handling, machine tools, gland packings, bus body framing and seating, paints, road signs, tubular furniture . . .

WE'RE INVITING INVESTMENTS

and this is why!

More houses are going up. More purchasers are asking building societies for advances to pay for them.

In the first six months of 1953 this Society agreed to lend £3,804,000 for the purchase of 2,582 houses newly built or in course of erection.

Money saved and invested with the Society is thus being used to good purpose.

Still more savings can be used. The interest offered is 2½% with income tax paid by the Society—equal to more than 4½% where the investor is liable for tax at the full standard rate.

If you would like particulars please write to the

Quality Furniture has BRITISH LEATHER UPHOLSTERY

For long life and comfort there's nothing like leather

Yours faithfully

FAITHFUL service to the needs of agriculture, commerce, industry and the people of Britain is the objective of the Bank, in which all the advantages of intimate local knowledge of people and affairs are used to the benefit of customers and prospective customers. Local Boards of Directors in important centres in association with resident District General Managers have, for many years, contributed much to the successful achievement of this objective in providing a distinctive banking service for everybody.

Enquiries will be welcomed and will meet with immediate and courteous attention at the local District Office or through any branch.

further outbreak of violence. As quickly as the trouble flared up so did it die away, and by August 20th the curfew was lifted, and a few days later the state of emergency relaxed. The government has, however, decided to strengthen the Public Security Act by an amending act which will give it power to crush any future trouble. It has also arrested certain Communists and raided their offices.

The lesson to be learned from the riots are many. Firstly, it should be a further lesson to non-Communist left-wing groups that they are bound to lose to, and be engulfed by, the better organised and ruthless Communist party, in any attempt to lead a stand on the barricades. Secondly, that even the most stable Asian non-Communist government has precious little freedom of manoeuvre. Finally, that even a pacific and democratic government such as Ceylon's must necessarily maintain expensive, but adequate, forces to thwart a Communist rising. It must be hoped, however, that the government, despite the danger, will not use the episode as an excuse for imposing the oppressive security measures any longer than is necessary.

Purge in North Korea

TREASON trials in Communist states are proof of serious dissensions within the dictatorial party-state, but they do not necessarily reveal the differences involved. The charges made invariably conform to a formula of conspiracy in the service of foreign imperialism. The latest batch of eminent Communists to perish as imperialist agents has been a group of North Korean leaders, including Ho Kai Ye, Vice-Premier, and Lee Sung Yup, Minister of Justice and Mayor of Seoul during the North Korean occupation of the city. Ho Kai Ye, after a period during which his name was not mentioned by press or radio, was officially declared on August 11th to have committed suicide, a few days after Lee Sung Yup and nine others were sentenced to death for espionage on behalf of the United States.

The careers of these two men have been strikingly dissimilar, although they are believed to have become very closely associated in a clique within the North Korean government. Ho Kai Ye, born in Siberia, was a Soviet citizen until 1945, becoming a functionary of the Soviet Communist party and an officer in the Red Army. He was one of the Soviet citizens of Korean origin whom the Russians brought into Korea when they occupied the northern part of the country in 1945 and used to set up a Communist regime. He headed the secret police organisation in North Korea in close liaison with the Soviet MVD, and was probably picked for the post by Beria.

Lee Sung Yup, on the other hand, belonged to the Communist party within Korea, and for two years after the expulsion of the Japanese his political activity was carried on in South Korea; he only migrated to the north in 1948, when the South Korean Communists were driven underground. In the early days of the occupation, when the American authorities in Seoul were by no means anti-Communist and were hoping for some kind of coalition, such as General Marshall was simultaneously trying to bring about in China, Lee had contacts with American officials which have now been turned against him at his trial; his negotiations were doubtless carried on with the authority of the party at the time, but any Communist who in

the party's service has contacts with non-Communist parties or states will have them represented as treasonable if ever he is put on the spot by his rivals, for such incidents provide a convincing element of genuine fact. According to a Pyongyang broadcast Lee Sung Yup confessed that

Immediately after the August 15th liberation I wanted to secure my political position under the ægis of America, and to this end I had been supporting the policy of the American forces which had landed in South Korea, especially at a press conference with American newsmen in September, 1945, when I issued a statement that the Korean Communist party would support the policy of the American forces and foster friendship with the USA. . . . [In May, 1947] Dr Noble [then political adviser to the American military administration] said to me: "America has no intention of aggression against Korea, but the North Korean Red regime and the Workers' Party are positively opposed to the USA. If patriots like you tried to establish a united government including the Leftist, Rightist and middle-of-the-road forces of Korea, it would be successful and the USA would extend active aid to you in the effort."

In view of the coalition-promoting policy of the Americans at that time, it is very likely that Dr Noble did say something of the kind and encouraged Lee to believe that he might be able to get both Russian and American backing. But for the allegation that he went to North Korea in 1948 as an American spy and sent back information through intermediaries in the American service there is no evidence but the confessions of the accused, which are of a kind with those of Zinoviev, Bukharin, Slansky and the subsequently cleared Kremlin doctors. In any case, the alleged motives for Lee's alleged crimes could not apply to Ho Kai Ye, who was of the purest Soviet breeding and had had no contacts with the Americans in South Korea.

Four Clues in the Mystery

The real reasons for the purge in North Korea remain wrapped in mystery, and there appear to be four distinct hypotheses from which to choose. The first is that, even though the accused may not really have acted as American spies, they nevertheless favoured doing a deal with South Korea and the Americans or playing them off against Russia and China, whose tutelage in North Korea may have become irksome. Lee Sung Yup's former contacts with the Americans may have led him to believe that direct negotiations with them might be profitable for Pyongyang; such suggestions would arouse suspicion and alarm among the more intransigent section of the North Korean leadership and in Moscow and Peking, where the possibility that the North Korean regime might crack under the strain of war must always have been borne in mind. It seems, on the other hand, unlikely that Ho Kai Ye, as the most "Muscovite" of the North Korean leaders, would be in favour of overtures to the west or of "Titoist" attempts to wriggle loose from international Communist control.

The second possible explanation is the exact opposite of the first. It is that the condemned men favoured carrying on the war *à outrance*. Reports reaching United Nations headquarters have indicated that opinions were divided in Pyongyang on the desirability of an armistice. The faction in favour of ending the war might find it expedient to discredit their opponents by compelling them, in the usual Communist manner, to confess to being imperialist agents. It would be as if the Americans were to arrest Syngman Rhee and make him confess that he had been acting under

instructions from Moscow (which might indeed be a most happy solution of the problem he presents on the other side of the line).

The third hypothesis is that the purge represents a victory of a pro-Chinese over a pro-Russian faction. The North Korean regime was originally set up under the Russian occupation, but since the Chinese intervention effective power in the country has passed to Peking. Two Korean Communists trained in Yen-an have recently been playing a prominent part in North Korean affairs, and Ho, as the boss of the earlier period, may have been marked down for elimination by the new men. If so, his removal must have been either in defiance of Russia, or with Russia's consent as a result of a bargain with Peking.

The fourth possibility is that Ho was a Beria protégé and that his elimination has been a sequel to the anti-Beria coup within the Soviet Union. Communist politics are essentially a system of political patronage, so that the purge of a leader involves the purging also of men he has promoted. If this is the explanation of Ho's "suicide," Lee and the others were probably also in their turn purged for attaching themselves to Ho. They received a trial with confessions, whereas Ho perished in darkness behind the scenes, nobody knows how. Perhaps it was thought unwise to produce him in public along with men who had been exposed to contamination south of the thirty-eighth parallel. In any case, they are now all dead.

Formosa—The Island Fortress

BY A CORRESPONDENT RECENTLY IN FORMOSA

TODAY the visitor coming to Formosa from other parts of South East Asia may be surprised at the evidence of good local administration, the correct behaviour and smart appearance of the army and the comparative prosperity of the peasantry. The combination of American aid and a determined effort at regeneration on the part of the Nationalists has indeed done much over the last four years to improve the relations of the Formosans with the men from the mainland. In 1949, when the defeated Generalissimo arrived in the island with his bedraggled and demoralised army and their dependents, the Formosans felt little love for their homeless overlords. They remembered the dismay with which in 1945, after the Japanese surrender, they witnessed the ruthless behaviour of Chiang-Kai-shek's representative, the notorious Governor-General Chen Yi.

Shock and shame have been the twin generators of reform among the Nationalists; it is their present policy to win back the respect of the mainlanders and the world at large by creating in Formosa a "model province." Their primary task has been to obtain the co-operation of the Formosans themselves, and in this they have largely succeeded owing to the vision, integrity and hard work of Dr K. C. Wu, a graduate of Princeton, and a former Mayor of Shanghai and Chungking, who has been Provincial Governor since December, 1949. Under his leadership and in close collaboration with his predecessor, the present Premier, the Provincial Government has carried out a series of administrative reforms, and, in addition, a growing number of Formosans have been given responsible posts in the local administration. But today, after four years of overwork, Dr Wu is a sick man with a job as yet unfinished.

Among the most important of the reforms is the land reform programme, which was begun in 1949 with the decision to reduce land rentals from over 50 per cent of the harvest to a maximum of 37.5 per cent. This was followed in 1951 by the sale of 36,000 hectares of public land (land confiscated from the Japanese State and private landlords). A second sale of 29,000 hectares, in recent months, makes most tenants the owners of the land they till. Each household may buy from one to four hectares and the cost may be paid in kind over a period of ten years. Though the success of this operation is by no means proven (land reforms can become a moneylenders' paradise), there is evidence that it has caught the imagination of the peasantry. At the same time the provincial government has initiated labour insurance. Inflation, one of the main causes of the downfall of the Kuomintang on the mainland, has been curbed, and the currency pegged to the US dollar.

The Kuomintang party has also had its reforms. Corrupt officials have been dismissed, and, with the exception of the Generalissimo himself, there are few in senior positions with

a "past" to live down. Of the men who surround Chiang, many were educated in the West, including the Foreign Minister, George Yeh, who has always been very friendly towards Britain. Chiang's eldest son, on the other hand, who was trained in Russia and has a Russian wife, is no friend of Britain. Although his "past" reputation makes him politically unacceptable as heir-presumptive to the Presidency, he wields considerable power in the island. As head of the Political Department of the Ministry of Defence, his job is to extirpate Communism from the island and to indoctrinate the Services in Kuomintang principles; to do this he applies authoritarian police methods. Of Chiang's other two sons (all three of different wives, the present Madame being mother of none), one commands an armoured brigade and the other an internal civilian airline; neither appears to have political ambitions.

Chiang himself is a lonely figure, living a simple life in a villa in the Grass Mountains outside Taipei. If, however, the presidential election which is due next year is in fact held, there is at present no sign that Chiang will stand down in favour of anyone else. There seems, indeed, to be no obvious succession to the leadership of Free China, unless it be the present Premier, Chen Cheng. With his cabinet colleagues he looks upon the Nationalist forces as the "spearhead of the ineluctable counter-revolution."

Few responsible Nationalists, however, feel that a return

to the mainland is feasible politically or militarily without the active and co-ordinated support of the anti-Communist guerrilla leaders on the mainland. The strength of the guerrillas is naturally exaggerated by the authorities in Taipei, and there is no evidence that they number more than some tens of thousands, or that they have anything more than a nuisance value. But the increasing brutality of Mao's regime, the Chinese resentment at overt Russian influences, the purging of deviationist intellectuals and the compulsory indoctrination of the peasantry are swelling the ranks of "maquisards."

A general is in charge of overt mainland operations from Formosa, and a covert organisation, known as Western Enterprises, responsible to Chiang himself and financed, so it is said, by the proceeds of the investments of the Soong family in various parts of the world, feeds partisan groups with arms and supplies. But although there is radio communication between various guerrilla bands and Taipei, and occasional visits by guerrillas to Formosa, resistance appears to be neither co-ordinated nor widespread.

Lack of reserves is the Nationalist weakness in all fields, military, financial and civilian—for few mainlanders of quality reach Taipei. Although the government has introduced the conscription of Formosans in certain age-groups, and the compulsory retirement of officers whose age or health or capabilities no longer qualify them for active service, the armed forces (whose average age is around twenty-eight) are a wasting asset.

Only Tip and Run

Some half a million soldiers, sailors, airmen, and marines are training with enthusiasm and discipline against the expected day of return to the mainland. But in spite of increasing American supplies, their equipment is still largely obsolescent. About half of them are well enough equipped for battle, but owing to lack of air support and landing craft they cannot do more than continue, and gradually intensify, the tip-and-run raids on the Chinese mainland. Recently their appetite for amphibious operations on a larger scale has been whetted by the visit of a US Marine troop-training unit, which gave "model" demonstrations of the technique of amphibious landing. And the Nationalists have managed to compel disclosure of the fact that, although "the wraps are off," they are still bound to consult Washington before launching any major offensive. This may save some of the face they have lost by confining their recent activity to attacks on merchant ships. But there is little prospect of Chiang being able to, or even wishing to, unleash a real attack on the mainland—as opposed to a probing "Dieppe" operation—unless and until the Americans give a promise of logistic support. On the other hand there is always the possibility of a Communist attack on the smaller Nationalist-held islands—such as Quemoy with its important bauxite deposits.

Altogether, there is much that is noble and much that is tragic in the Kuomintang regeneration. But despite growing restlessness in the mainland, there is no evidence as yet that non-Communist Chinese look to the Kuomintang and their American backers for leadership. The Americans, however, still feel it worth while to continue economic aid on a scale of a hundred million dollars a year, and there is no sign of any cut in either military or economic assistance for the "unsinkable aircraft carrier" one hundred miles from the coast of the Chinese People's Republic.

European Refugees in China

FROM A CORRESPONDENT

THERE are now in China between fifteen and twenty thousand people who must either receive an entry visa for another country or perish. The majority are stateless persons of Russian origin who are now caught by the spread of Communist control. Others include Armenians, Jews, Austrians, Greeks and Spaniards. All had been living peaceably in China. Now their means of livelihood have vanished. Small businesses have been expropriated; public utility companies get rid of unwanted employees; and the foreign firms employing others have been closed or are in the last stages of the struggle to continue, their payrolls carrying numbers of redundant Chinese replacing the foreigners whom they were forced to dismiss.

After losing a job, a person can expect to exist for just so long as he or she has goods to sell, or savings to spend, or can somehow receive foreign charity. Many families had already lost their menfolk through deportation during the past five years, leaving a high proportion of women, children and elderly people. Yet on the whole these people are relatively well adapted to earn their living in the free world. Many of them learned to speak English or French in China. They were usually either merchants or commercial employees, small traders or artisans, or else employed in the public service.

The "squeeze" affects all foreigners who are not directly useful to the regime, but the smaller groups of Jews, Germans, Austrians, Greeks and Spaniards can easily obtain passports and are not strictly refugees, though many of them need assistance in order to leave China. The remaining groups of stateless foreigners are in much the same plight as the stateless Russians. The attitude of the Chinese authorities to these people is clear: "Let these Western-minded elements get out to where they belong. There is no room for them in the New China, and there will be no pity for them if they stay."

The first wave of would-be emigrants was dealt with by the International Refugee Organisation, working from Shanghai, between 1947 and 1951. Of 29,000 registered by the IRO, 13,500 emigrated directly during those four years and a further 5,500 were removed to the island of

EARTHQUAKE IN GREECE

Donations to the fund opened for the relief of the victims of the Greek earthquake may be sent to

Cheques should be made to the order of "Greek Earthquake Appeal".

Donations can also be handed in at any branch of any bank in the United Kingdom.

Samar in the Philippines as an emergency measure. At the end of IRO operations in December, 1951, 4,000 registered refugees were still left in China, mainly in Shanghai. Since then the worsening situation has already added more than 12,000 elsewhere in China.

Since Communist rule has rendered Shanghai unusable for an international operation, the movement of refugees is now arranged through Hongkong. The UN High Commissioner for Refugees has assumed responsibility for their international protection and provides a limited amount of cash assistance to indigent, aged or sick people. Under his auspices a small Chinese ex-IRO staff remains in Shanghai to administer this programme. This staff remains in being *nolens volens*, for a reason which throws much light on the Chinese attitude. The Chinese say that the IRO has registered, and thereby assumed responsibility for, some thousands of persons in whom the West professes to be interested. Therefore, the IRO will not be allowed to wind up its work in China until it has dealt with the persons whom it has registered (i.e. the original 4,000, not the subsequent 12,000 whose registrations are held outside China). In fact, if not in name, the former IRO staff remain as hostages for the discharge of that obligation.

Since the close of the IRO, a joint office of the High Commissioner and of the Intergovernmental Committee for European Migration has functioned in Hongkong. Until recently, however, movement has been appallingly small. Fewer than a thousand refugees left in 1952 and, but for the efforts of the international voluntary agencies which also maintain offices in Hongkong, emigration would have been a pathetic trickle.

Closed Doors

At the beginning of 1952 the United States, Canada and Australia, three of the largest "takers" under the IRO programme, virtually cut off the immigration of refugees from China. What remains? Certain countries in South America offer the most reasonable immediate prospect, together with Israel for Jewish refugees. The international voluntary agencies, notably the Refugee Service of the World Council of Churches, have made use of these opportunities, and upwards of 4,000 visas have been obtained. To its lasting credit, Brazil has granted thousands of visas. Another honourable exception is the Belgian Government, which has granted permanent asylum to scores of aged refugees. But neither the scale nor the pace of these achievements has been commensurate with the size and nature of the problem.

There are three priorities for the solution of the problem of the China refugees, none of which is being adequately met at present. They are: visas for permanent immigration, expeditious processing, and money for movement, in that order. Entry visas are by far the most important and urgent. But the free nations still grant visas in miserly units, asserting their sovereignty by picking, choosing and excluding.

Final processing is at present done through Hongkong, where the authorities allow only a brief stay, and that only for persons already in possession of a visa for their country of destination. This makes necessary a complicated form of placement-through-correspondence by the voluntary agencies, leading to a request by the refugee for an exit-permit from China when it is known that a visa for another country awaits him in Hongkong. Special arrangements have been

made for the few people who have a chance of emigration to the United States under the quota system. In order to enter Hongkong, appear personally before the American consul and await the outcome, they have to be provided with a visa for another country to which they must proceed if the consul rejects them, or if the British authorities decide that they have spent too long in Hongkong. Half a dozen countries have each given a few such visas, known as "alternative end-visas" (50 in all) with the understanding that they may be used again if previous holders proceed to the United States. The Refugee Relief Act passed by Congress this month provides for immigration during the next three years to include 2,000 refugees "residing within the district of an American consular office in the Far East . . . not indigenous to the area." This gives new hope for the admission to the United States of a larger number of European refugees from China; but they still face the difficulty of finding a temporary haven, outside China but still in the Far East, where they may apply to a US consulate.

The third priority, money for movement, is the least pressing. This should not obscure the fact that relief is needed now, in China, for many people on the verge of starvation, and will continue to be needed, until visas are granted in sufficient numbers. Yet to continue emergency assistance through the Shanghai office until the end of December at the rate of only 37 cents a day will cost the Refugee Emergency Fund \$450,000.

False Sympathy

In his second annual report to the General Assembly last December, the High Commissioner stressed the Far Eastern refugee situation as one of his main preoccupations. His report was received sympathetically and the Assembly adopted a resolution which noted that the High Commissioner has insufficient funds and called on governments to give refugees a place in migration projects. But where are the deeds to match these words? Last September the High Commissioner addressed a letter to twenty-two governments calling their attention to the plight of refugees in the Far East and asking for the grant of visas. In October his advisory committee of governmental delegates endorsed the appeal. In four months only eight governments bothered to reply, and the replies held out little hope. One government wrote that it will "follow with interest" the efforts of the High Commissioner.

There has hitherto been a certain grim correctness on the part of the Chinese authorities who, after all, could have resorted to forcible repatriation. But nobody dare prophesy how long this attitude will continue. The voluntary agencies have done and will continue to do their utmost. Relatives and friends who themselves emigrated only three or four years ago have written in their hundreds offering to defray the cost of passage or to support the refugee until he can find his feet. But governments alone have the power to open the door adequately and humanely.

★

Correction.—In last week's article on "France's Economic Ills" it was incorrectly stated that "France needs 20,000 flats a year just to maintain the present unenviable state of affairs." The figure should have been 210,000.

There's a future in STEEL

THE WORLD'S largest walking dragline is in operation in the open-cast iron ore quarries at Corby. It weighs 1,650 tons, has electric machinery totalling 3,150 h.p., stands as high as Nelson's Column and walks to work on two steel shoes that weigh 56 tons each. A special high-tensile fine-grain steel was evolved to help make the 282-foot jib.

This Wellsian machine completely dwarfs the bulldozer working with it. It was designed and built in this country by Ransomes and Rapier Limited to strip overburden that no other single machine could cope with. With one man in control it bites out twenty-seven tons of earth every minute, deposits it nearly two hundred and sixty feet away and can work right round the clock. It is laying bare seams down to a hundred feet.

In this and other ways the steel industry is increasing its raw material supplies, both at home and abroad, to keep pace with the industry's continuous programme of modernisation and expansion.

OUT OF YOUR GROUND

There are so many occasions when one realises how difficult it is to be well-informed on all the financial problems which arise in these complicated days. That is why our organisation includes a number of departments which are each expert in one or other of these matters—departments which deal with Foreign Exchange, which understand the complexities of Wills and Trusts, which will not get lost in the labyrinths of Income Tax and so on. Customers may, in consequence, bring to us any matter of this kind, in the confident expectation that they will receive efficient attention and sound advice.

WESTMINSTER BANK LIMITED

Ships of the first Elizabethan age relied on the
MARINER'S ASTROLABE

Probably the earliest form of instrument designed for taking altitudes at sea, the Mariner's Astrolabe was invented by Hipparchus in 160 B.C. Its later development is credited to a German, Martin Behaim, who produced one in 1480.

The astrolabe was simple to include among a ship's instruments, but less simple to use; *Cossor Marine Radar* is both simple to install and simple to use. It gives a crystal clear display at all ranges, in all weathers, and in all climates. It is quick, accurate, reliable, and easy to maintain. Cossor is not the cheapest marine radar, but the discerning buyer considers more than price alone. Is the performance good? The answer is that more and more owners are fitting Cossor Marine Radar to their ships, having satisfied themselves that it is the best marine radar in the world. Write for particulars today.

Nothing left to chance...

COPPER CLAD

To secure a gas tight seal at the point where the lead wires pass through the glass envelope of Royal "Ediswan" Lamps a special wire known as Copper-Clad is used. This seal must remain gas tight over the range of temperature from cold to the highest value which the lamp attains when alight.

Copper Clad, made by a very specialised technique, consists of two metals hermetically bonded in such proportions that they will expand and contract at the same rate as the glass. This property together with the specially prepared surface, ensures that a perfect metal-to-glass seal is made.

* This is but one example of the intricate operations in the manufacture of Royal "Ediswan" Lamps, calling for the highest degree of technical skill and the utmost care and precision. Nothing is left to chance—only the finest materials are used and there is strict control at each stage of manufacture.

THE BUSINESS WORLD

Shelter for Sugar's Cinderellas

AFTER six weeks of delicate negotiation, fifty-one countries that import or export sugar have reached agreement in London on a scheme to regulate the "free" world market in sugar. This "free" or "unprotected" market is the poor relation of the world sugar trade. Sugar is the most blatant present-day example of the international maldistribution of labour. Since it enjoys a high yield per acre, it can be produced most cheaply from cane in tropical (and often overpopulated) countries with low wage rates. But since it also enjoys a relatively inelastic demand (and takes up only a small part of weekly household budgets) most countries have found that they can put up prices to the consumer and protect domestic or other favoured producers without raising an undue public outcry.

For political, strategic and often more dubious reasons, governments have therefore for many years greatly expanded production from beet in temperate countries under the shelter of subsidies and other protective devices; they have also conceded widespread import preferences to overseas producers with whom they have a political affinity. Thus, two world markets have been created: the protected and mainly high-cost market, and the unprotected and mainly low-cost "free" market—and the latter's share of world production and world trade has progressively declined. Exports to the "free" market now amount to only about 5 million tons a year, out of annual world exports of some 12 million tons and of a world production of about 35 million tons. In other words, over half of total world exports, and not much less than six-sevenths of total world production, is now sold under discriminatory arrangements of one kind or another.

This habit of discrimination is world-wide. The largest importer, the United States, hardly comes into the free market at all. It takes virtually all its import

requirements under preferential arrangements with its favoured wards in Cuba, the Philippines, Puerto Rico and Hawaii. Britain, the second largest importer, takes well over 1 million tons of "free" sugar, but most of its requirements are now supplied by the Commonwealth, under the protection of preferences and of the Commonwealth Sugar Agreement of 1951. This agreement provided an assured market for Commonwealth sugar up to a maximum of 2,375,000 tons a year, the most that is likely to be produced for some years. Of this total, Britain undertook to buy 1,640,000 tons a year at a price that is negotiated each year and that is considerably higher than the "free" price; the remainder finds a market in Britain and Canada at the "free" price, but with producers getting the advantage of the preference. Other groups of countries, such as the French Union and Benelux, have similar protective arrangements outside the free market.

The free market, with which the new agreement is solely concerned, is thus the residual supplier, the market of last resort. In consequence, relatively moderate changes in demand on it can have violent effects on prices. The delegates at Church House in this past month—so far from trying to manoeuvre against low-cost producers, as most commodity conferences do—were actually labouring to keep them alive. The scheme they produced is an attempt to ameliorate—though only slightly—the balance of power between the unprotected low-cost market and the regulated preferential market. That must be its justification, so far as it goes.

There have been two previous attempts to come to the rescue of the unfortunates who sell in the free market, but neither was as broadly based as the agreement signed this week. The Chadbourne Agreement

of 1931 brought together only the main exporters to the free market, with the result that several exporters outside the agreement increased their output and their share of the free market at the signatory countries' expense. The 1937 agreement had a wider basis; it covered four of the main importers and most of the principal exporters, but its effective life was cut short by the war. The new agreement, if fully ratified, will cover nearly all the sizeable importing and exporting countries, including even Russia and three countries of the Soviet bloc. The United Nations, which called the conference, could not invite Red China (prospectively an expanding importer) and East Germany (an expanding exporter), but provision is made for non-participants to accede to the agreement if circumstances allow.

★

The central feature of the new agreement is that the International Sugar Council will, before the beginning of each calendar year, estimate net requirements on the free market in the ensuing twelve months; they will be helped in this by information from importing countries about their prospective purchases from non-members (which, the importers have promised, will not rise above the level of 1951-53). In the light of its estimate, the council will then assign export quotas to the various free producers; these will be expressed as a proportion of their basic quotas, which are summarised in the accompanying table. Exporters undertake to export no more and no less than their permitted quotas. Any changes that are notified to the council (in the course of a calendar year) in an importer's requirements from non-members and in an exporter's ability to fulfil his export quota, will be redistributed among the other exporters *pro rata*. Exporters also undertake to adjust their production to the needs of domestic consumption, permitted exports and a specified level of stocks.

The agreement establishes a "stabilisation zone" for prices, with an upper limit of 4.35 US cents per lb, f.a.s. Cuban port, and a lower limit of 3.25 cents. The council—and this is a departure from the draft initially before the conference—will have the power to raise or lower export quotas while prices are still within this range; and it will be obliged to do so if the price has averaged more or less than the maximum or minimum for fifteen consecutive market days. In that case it must take action within ten days. If it cannot agree on the amount by which the quotas should be adjusted, they will automatically be reduced each time by 5 per cent of the basic quotas when prices drop below the minimum or raised by 7½ per cent when they go above the maximum. These provisions will probably have an important effect on market sentiment. When the price threatens to go above the maximum, buyers may tend to hold off the market, and sellers may hold off when the price seems likely to

fall below the minimum. This, in itself, should provide a stabilising factor, but the executive committee of the council will obviously need to show considerable market acumen.

In view of this need, it is a pity that the conference has decreed that the decisions of the committee should be subject to a vote; this may encourage members to feel and vote as if they are representing the interests of their particular countries, instead of acting as a cabinet of technicians collectively responsible for their decisions. It is also unfortunate that the total of the basic export quotas (5,390,000 tons) should be at least 500,000 tons higher than the probable requirements of the free market in 1954. This means that the agreement, if ratified, will start with the actual export quotas scaled down that much below the basic quotas; indeed, if the winds of the trade cycle blow, this could be the first rock on which the agreement might be in danger of foundering, since the council is not allowed to reduce actual quotas below 80 per cent of the basic quotas (that is, below a total of 4,320,000 tons). This problem has arisen, of course, because the basic quotas

PRINCIPAL EXPORTERS OF SUGAR

Countries	Approximate exports in 1951/52 (tons)		Basic quotas under new agreement
	Preferential Markets	Free Market	
Cuba	2,816,000	2,363,000	2,225,000
Dominican Republic ..	...	524,000	600,000
Formosa	...	450,000	600,000
Peru	...	304,000	280,000
Indonesia	...	7,000*	250,000
Philippines	636,000	100,000	25,000
British Colonies	1,391,000	...	...
Australia & S. Africa ..	116,000†	...	...
Others	2,041,000	1,252,000	1,410,000
TOTAL	7,000,000	5,000,000	5,390,000

* Indonesia exported over 1,000,000 tons in 1937/40. † Annual average exports from Australia and South Africa in 1949/51 were 456,000 tons.

originally asked for by each member were so excessive; the conference had a hard task to bring them even within the present measurable distance of reality.

Normally, at a conference of this type, there would have been a straight fight on the level of the proposed price zone, with exporters clamouring for a high price and importers for a low one. But nothing is normal in sugar. The largest importer, the United States, apparently tended to look at prices from an exporter's point of view throughout the conference; it feared that a low price in the free market would provoke pressure from its domestic consumers against its high support price for domestic production. Britain was in two minds. As the second largest importer, it is naturally interested in a low price for that part of its requirements that is supplied either direct from the free market or from the Commonwealth at the free market price. But since the politics of colonial welfare and development are

inextricably intertwined with the Commonwealth Sugar Agreement, it was in no position to clamour for a low price. Cuba, the largest exporter and a low-cost producer, sells roughly half its exports to the United States at a preferential price, and so is able to offer the rest in the free market at a price that, if necessary, could undercut practically every other producer; Cuba realised that a price high enough to encourage exports from marginal producers would increase competition in the free market and therefore be against its interests.

The negotiations about the stabilised zone were eased by this lack of rigid individual self-interests. In the end, the mid-point of the agreed zone, at 3.80 cents, is moderately below last year's average of 4.16 cents in the free market, but moderately above this year's average of 3.50 cents. If, as is quite possible, the free price tends to fall persistently below the minimum despite downward adjustments in export quotas, it will not be surprising if the zone itself is lowered to prevent further cuts in quotas. After a certain stage, most exporters would probably prefer a lower price to further severe restrictions on exports.

The biggest disappointment of the conference was that it had to discard as politically impracticable the section of the draft agreement that would have guaran-

Finance by Bills

IN the postwar revival of the traditional functions of the City, one of the most vigorous growths was that of commercial financing by bill of exchange. It was also one of the least expected. The bill reached its zenith in overseas trade in the boom of 1928-29, but was then struck a crippling blow by the world slump. Its struggle to get on its feet again during the trade recovery of the thirties made little progress under the weight of economic nationalism and bilateral trading. By the eve of the war, in spite of some moderately successful efforts to revive in modern guise the even earlier habit of using bills in internal finance, London's bill business was only a fraction of what it had been a decade before. Then, during the war itself, both types of bill finance virtually ceased, leading many people to suppose that they might never again play any really significant part. In fact they began to come into use again almost as soon as hostilities ceased, and within four years the total in the London market had probably surpassed its prewar money value. The re-opening of some commodity markets and the post-Korean boom then produced a much accelerated growth, so that by the spring of last year the money worth of London's bill turnover was not so very much below the high figures recorded in the very different conditions (but also very different pounds) of a quarter of a century ago.

ted exporters to the free market a share in any expansion of world consumption—at the expense of still more increases in the cushioned section of the trade. Low cost producers who do not enjoy preferential arrangements with any of the big importers must now pin what hopes they can to pious platitudes in the agreement that require participating governments to limit subsidies and reduce "disproportionate" burdens on sugar resulting from fiscal and other policies. These articles, incidentally, and those limiting production and stocks, will not be observed by Russia and the Soviet bloc countries, on the grounds that they have "full-scale planned economies."

The agreement is for five years, but it will be reviewed after three. Providing a sufficient number of governments ratify it, or give assurance of ratification, it will come into full effect on January 1, 1954. Those who are opposed to restrictive agreements in any field will no doubt shed a tear that the Cinderella section of the sugar trade is getting up to some of her ugly sisters' tricks. But the agreement is at least reasonably flexible, and liberal criticism should be directed not at the pact itself but at the rabbit warren of preferences and protectionism that has made it necessary to bring it into action.

Now, however, the market looks back upon a phase of dramatic reversal of this advance. In the past eighteen months the volume of business in commercial bills has contracted by perhaps 40 to 50 per cent. The very success of the earlier revival makes the City institutions most intimately concerned—the accepting houses and the discount houses—the more chagrined by this loss of business, and some of them are disposed to blame the monetary authorities for part of it. The basic rate at which the money market and the joint stock banks will discount first-class bank paper is still a pegged rate, and it is being suggested that the authorities are throttling bill finance by keeping this rate anomalously high. The case is not yet proven—indeed, a number of the houses concerned are noticeably less ready to sponsor it than those who have been most outspoken. But there is no doubt at all that a sufficient anomaly exists in the rate structure to merit examination.

Unfortunately, this is not a problem that can be resolved by objective statistical tests. The only comprehensive statistics of the bill supply are those that may be computed, subject to a moderate margin of error, from the Inland Revenue's annual receipts from bill stamps—which are not yet disclosed for any later period than the twelve months to March, 1952. A computation made regularly on these lines by one of

the discount houses, Jessel, Toynbee & Co., shows that the total of bills stamped in the United Kingdom in that year reached £575 million, precisely the same level as in 1929-30; this compares with the all-time peak of £738 million touched in 1928-29, and with a nadir of a mere £42 million in 1944-45. These calculations do not yet measure the recent decline; but in any case they embrace large quantities of paper that do not enter the market or are not "marketable" in any real sense. The present debate focuses upon first-class paper that is discountable at prime rates, and the volume of this can only be guessed—from the partial evidence afforded by the portfolios of the clearing banks (not shown separately before November, 1951) and the "rediscount" figures of the nine discount companies that publish accounts.

These figures strikingly reveal the loss of bill business sustained by the banks and the market. The clearing banks' portfolio, after reaching a peak of £187 million in February, 1952, dropped in the ensuing nine months to only £57 million, and after recovering to £71 million this spring, relapsed to £61 million by July. Similarly, the aggregate rediscounts of the discount houses (i.e. commercial bills re-sold but still outstanding) at their several latest accounting dates, ranging from September to April, stood at only £57 million, compared with a peak figure of £122 million shown in the 1951-52 batch of accounts. From this evidence, the volume of prime paper held or re-sold by the discount market as a whole may be roughly estimated at around £100 million at mid-1948, probably more than twice that amount at the peak early last year and under rather than over £100 million now. The total volume available to the clearing banks and the market would be rather larger at each point, because some bills reach the banks through channels other than the discount houses.

★

The major causes of this decline are beyond dispute. They are the collapse of the post-Korean boom in commodity prices; the drastic import restrictions imposed in 1951-52 by Britain and the overseas sterling area and by many non-sterling countries; and the special restraints imposed by the Bank of England early last year to stop foreigners from using the bill facilities of the London market as a means of speculating against sterling. Each of these major factors sharply cut down the value or volume of newly created bills. It is impossible to determine, however, whether they together accounted for an overwhelming, or merely a large, proportion of the loss of business experienced by the discount market. And that is the very point upon which the present discussion fastens. It is contended that the money market is not only suffering from the shrinkage in demand for finance, but is getting a smaller share of such business as is offering. The

Eastern and certain other banks in London that are traditionally major suppliers of overseas paper to the market are themselves choosing to retain a larger proportion in their own portfolios; some domestic business that has in recent years been financed by acceptance credit and discount of bills is now being financed by bank overdraft; and some overseas business—including some purely international finance—that was coming to the London acceptance and discount markets is now being arranged abroad. In each of these diversions of business, the present cost of bill finance in London has undoubtedly been a material factor. But it has not necessarily been a decisive one, except, in the sphere of domestic finance, in competition with bank overdrafts.

★

Since the raising of Bank rate to 4 per cent in March, 1952, the pegged rate at which the banks and discount houses will discount three months prime bank bills has been 3 per cent per annum. This means that even the most creditworthy of domestic borrowers, who might reckon upon borrowing from their bankers at $4\frac{1}{2}$ per cent, are unlikely to be able to secure bill finance at a total cost of much less than $4\frac{3}{4}$ per cent; the charge for the acceptance facility would only very rarely be less than $1\frac{1}{2}$ per cent. per annum and the bill stamp is equivalent on a three months bill to 0.2 per cent per annum. For less credit-worthy business the cost is of course higher than this, whichever method of finance is adopted; but at each level the bank overdraft is probably now the more advantageous—at least when account is taken of its flexibility, which permits the borrower to take and pay for funds, within the sanctioned limits, in such amounts and for such periods as his whole finances dictate, instead of committing himself to the full amount for a rigid period.

London bill finance for the overseas commercial borrower is probably usually somewhat more expensive than for domestic borrowers, for although the agreed minimum acceptance fee is only 1.2 per cent per annum plus a small charge for opening the credit, those are the charges made to the foreign banker, who in turn will make his own charge to the commercial borrower; and the cost of the overseas bill stamp has to be added to that of the London stamp. But overseas charges and practice vary widely, so that it is not easy to make precise comparisons between the total costs to the ultimate overseas borrower of financing through London or of securing finance in his own centre or in some other international market. In some instances it appears that London still has the advantage, but there are other centres, notably Amsterdam, where finer terms are quoted; an important share of the expanding German business is believed to be going to Holland. Market opinions diverge widely, however, about the extent of any resultant loss. The financing of much overseas business conforms to the channels of trade or to long-established connections, and is not really open

for competition in the international market. In any case, it is not easy to distinguish the effects of the cost factor from those of the measures to prevent the use of bill finance for speculative purposes, and in many quarters it is thought that London's loss of legitimate business may have been quite small.

A similar argument can, indeed, also be applied to the diversion of business to bank advances. Until the middle of 1951, the effect of the cheap money policy was to keep the cost of bill finance substantially below that of bank advances. Though the margin tended to shrink, this cheapness of bill finance played a big part in the postwar revival, since the supply of bills was inflated by the financing of types of business that had previously been financed by other means and did not conform to the purist tradition of the self-liquidating bill. Much of this unorthodox bill business, whether of domestic or external origin, has now reverted to its former channels, or has disappeared from the London market altogether.

★

For these several reasons, those who contend for a lower commercial bill rate may not find it easy to produce a clear-cut demonstration that the present rate is causing either a significant loss of worth-while international business or an undue switch to bank advances. They can, however, point to one unmistakable anomaly. The risk status of a three-months' acceptance of a London bank or first-class accepting house is not so different from that of a British Treasury bill that it deserves to stand at more than a fractional discount. Indeed, at one time the "two-name" commercial bill regularly commanded a slight premium over the (one-name) Treasury bill. During the thirties and throughout the war and early postwar years, this virtual identity of risk status gave to the commercial bill the full advantages that the cheap money policy extended to the Treasury as borrower. For many years the prime commercial bill rate was a bare one thirty-second per cent above the Treasury bill rate of 1 or $\frac{1}{2}$ per cent. But the problem raised by this anomalous cheapness of commercial bill finance by comparison with other commercial rates eventually called forth an equally anomalous solution. Concerted action by the discount houses levered up the margin by small steps, and then, in mid-1951, the banks and the market agreed, in the interests of their revenues, not to buy 3 months' commercial bills at any rate below 1 per cent—or virtually twice the rate then commanded by Treasury bills.

The present 3 per cent rate, though it now aggrieves some people in the market, followed logically from this market initiative taken in the days of Gaitskellian cheap money. Under the new monetary policy, the amount of each increase in Bank rate has been added to the pegged commercial rate. In consequence, the abnormal margin over the Treasury bill rate (now pivoting around $2\frac{3}{8}$ per cent) has been increased,

though not very violently; as a proportion of the rate, it has of course been sharply reduced.

Now that the authorities profess to be aiming at a flexible monetary policy and especially a flexible money market, the fact that this particular anomaly is of the market's own making ought not, however, to be held against it in any plea for a more sensible arrangement. Indeed, the market-created anomaly was really only its way of living tolerably with the Government-created anomaly of cheap money; and now that the primary anomaly is disappearing, there ought, in logic, to be no need for the secondary one. Unfortunately, however, the authorities still hope to get the best of both worlds; they have raised the general level of rates, but have been at pains to combine the maximum increase in charges to private borrowers with the minimum increase to the Treasury. The anomaly of the margin between the commercial bill rate and the Treasury bill rate is not necessarily or only that the former is too high; it may also be that the latter is too low. If the new monetary policy is to be given the chance to function really effectively as an economic regulator, the remedy for this money market problem is plainly to allow both rates a greater flexibility. No doubt that would produce some fall in the commercial rate, for some "outside" business is believed to have been done already at under 3 per cent. But if the movement went too far for the comfort of sterling, the proper course then would be to discipline the market by the traditional methods of the Bank of England—not excluding the tradition of the influential "hint." But the authorities show no sign of being prepared for any such genuine flexibility. The supply of Treasury bills is incomparably larger than that of commercial bills; and they are obviously afraid that in a flexible market the tail would wag the dog.

British Wholesale Prices

Many requests have been received for a continuation of the record of British Wholesale Prices which appeared for many years in *The Economist* and thereafter in the *Records and Statistics Supplement*. Accordingly, it has been decided to provide a similar service, with a somewhat extended list of commodities, on a subscription basis. The list will be issued every four weeks and will give prices for some 160 commodities for each week. Subscription £2 post free at home or abroad (air mail additional).

Subscriptions and enquiries (marked "Prices") should be sent to:

**THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, St. James's, London, S.W.1.**

Business Notes

Douglas in Detail

THE most important feature of Mr Lewis Douglas's admirably crisp and short-winded report to President Eisenhower lies not so much in its enlightened liberalism—for this was to be expected from a statesman of his reputation—as in its emphasis of the dangers of the present prolonged period of gestation of ideas. After saying all the right things about the advantages for America of sterling convertibility, and about the need for the abandonment of America's protectionist policies, Mr Douglas recognises flatly that "under the most favourable circumstances time would be required to pass legislation aimed at establishing a freer American trade policy. It would be unfortunate, however, for our national interests if, because of delay on our part, the progress towards economic liberty that has thus far been made should be arrested, the enthusiasm should cool off, and the impetus to freedom should falter."

The most specific sections of his report, therefore, contain proposals for mitigating the dangers of such a "cooling-off" period. First, Mr Douglas believes that "the United States Government, during the interval in which legislation is being awaited, could do nothing more helpful, or indeed more urgently required, than to make a prompt announcement that it is the determined policy of this country to work towards simplification of our customs practices and a progressive, vigorous and consistent relaxation of our restrictive foreign trade legislation." Secondly, he believes that the American Government should focus its "ingenuity on valid devices which might provide a reasonable transition from a period in which American dollars, through public agencies, have been invested overseas and the period when the flow of private capital becomes adequate." Two organisations that might be of use here are the World Bank ("the provisions of the indenture of an International Bank loan, more than the amount of credit which it extends, can define the terms upon which investments of private funds might be made with reasonable immunity against most of the political hazards") and the Commonwealth Development Corporation in London. Another specific device that Mr Douglas believes merits examination would be "the participation of American banking houses in sterling loans made by London banks with some sort of British guarantee of a rate of exchange and an Export-Import Bank guarantee of the transferability of the participating dollars." Finally, Mr Douglas calls for some measure of stabilisation of raw material prices; he urges "co-ordination between governments, so that purchases by public agencies may be diminished when the business community is building up inventory, and increased when the business community is liquidating inventory."

Britain and the Report

ALL this does as much as any single report could possibly do to set the stage for America's coming debate on its foreign economic policy in the right atmosphere of measured hurry. But the report also makes two other points crystal clear. The first is that there can now be no question of a dash for sterling convertibility; but only the hope, in Mr Douglas's words, of progress towards "an environment of world trade in which convertibility, at the appropriate time, could be safely considered with confidence that it would endure." There is no mention in the Douglas report of any measures that might tempt Britain into a dash for convertibility—such as an increase in the dollar price of gold, or a stabilisation loan, or an all-round increase in quotas at the International Monetary Fund. These omissions should not be read as a reflection upon Mr Douglas's liberalism but as a tribute to his experience as a diplomat. He knows the limits of the politically possible, and how far liberalism is wise to raise its flag above the trenches in the present sniping season.

★

The second point, which follows from this, is that it is useless to count the heads of protectionists and free traders among the commission to which President Eisenhower has now transmitted this report. There could be no question of sweeping changes in American policy as a result, for example, of a favourable majority and an unfavourable minority report from this commission—which is due to finish its deliberations by March, 1954. Any such conflict of reports would merely lead to interminable delay. The only hope lies in an agreed report, and the furthest limits to which specific proposals might conceivably reach in such an agreed report would be those enunciated in Mr Douglas's draft. The implications for the British Government are that it should now strive to publicise specific schemes for giving effect to Mr Douglas's rather vague musings on investment guarantees and stabilised purchases of raw materials; and that it should take note of his advice that "it is for the British Government to devise its own further corrective measures" if the advance to convertibility is to proceed. In this context, Mr Douglas puts his finger on Britain's main source of weakness since the war when he complains, at the head of a long list, of "the weakening of UK competitive power resulting from the existence of sellers' market conditions and opportunities for protected trade financed by repayment of sterling debts." Easy markets in the overseas dominions, much more than internal inflation, have been the locusts that have eaten away progress towards convertibility in the eight years since the war.

Rockets in the Air

THE Ministry of Supply has clearly felt that Britain ought not to be outshone in the latest round of the competition in news-releases of weapon successes. The Minister himself released last week a most colourful report on British rocket development. Mr Sandys described very briefly the uncanny and unquestioned ability of guided missiles to "home" on to their target however it manoeuvres to avoid them, the implication being that these new defensive weapons were the answer to the atom bomber. He did not, however, commit himself beyond saying that such missiles were under development. Certainly they have been successfully tested on the Australian Woomera rocket range against pilotless jet aircraft (Armstrong-Siddeley has designed a special range of jet engines for this purpose), but the fact remains that it will be some time before these weapons are in service.

The homing mechanism for these missiles, which consists of radar or television to track the target, and a computer to calculate the missile's course from this data and steer the rocket on to the target, cannot discriminate and can easily be deceived or put off the scent. Too many aircraft in the air at once can confuse the missile by sending its "brain" in a very human state of dither while trying to digest conflicting signals. Jamming devices were already known in the last war, and modern techniques are highly effective. Lastly, the missiles cannot distinguish between friendly and enemy aircraft, and a comprehensive defence based on ground-to-air missiles would create a special hazard for fighter pilots. It is more likely that the first guided missiles to go into service will be released from fighters when these are sufficiently close to the bomber to avoid confusion, and fighters of high performance are therefore a vital part of this defensive pattern.

★

Hardly a major aircraft manufacturer is not engaged in developing guided missiles, and hardly an electronics laboratory of standing is not concerned in some way with their internal mechanisms. Designers are confident that over short ranges they can promise the forces a high degree of accuracy, always provided that the signals to the missile are not jammed; but the accuracy of longer-range missiles still leaves much to be desired. Not until the nineteen-sixties are guided missiles likely to become the major weapon, but a gradual switch from conventional artillery, and armaments, is already under way. As a production proposition, the rocket is cheaper than the aircraft; its motor is a crude piece of ironmongery compared with the jewelled precision of a jet engine, and its casing is less complex to design. But compared with ground artillery or fighter-borne cannon, the cost is high. The development of missiles may thus produce shifts of emphasis within the engineering and the chemical industries. Present rockets use chemical fuels in fabulous quantities, and the development of plastic casings, hinted at by Mr Sandys, would make exceptionally heavy calls on chemical capacity. So long as a fighter aircraft is needed to carry the missile to its target, defence costs would seem likely to rise rather than fall. Only when the missile can replace the aircraft completely can it be expected to cut the costs of defence.

The Increase in Exports

THE full trade returns for July have thrown more light on last month's sharp increase in British exports, to £234.4 million compared with £204.0 million in June and with a monthly average of £210.0 million in the second quarter of this year. The greater part of this increase was due to the unusually large number of working days in July (27 days, compared with 24 in June), and it was centred almost wholly on a rise in the export of manufactured products; compared with the monthly average in the second quarter of this year, the shipment of engineering products in July rose by £7 million (including a rise of £4 million in vehicle exports), textiles by £5 million, metals by £3 million and other manufactures by £6 million. More significant still, the increase reflected a swift response to the partial relaxation of import restrictions by Australia; British exports to that country were about £21½ million in July, compared with £17½ million in June and with £9.3 million in July, 1952. This may merely reflect the first flush of enthusiasm now that some barriers to trade have been removed, but it is noteworthy that total exports to Australia this July were nearly as high as those in July, 1951, and that within these totals the exports of machinery and vehicles were actually higher. The argument that over-importing by Australia sucks away resources that should be devoted to producing capital goods for harder currency markets may be due for revival soon.

Imports in July totalled £293 million (c.i.f.); this is only £1 million more than in June, but it is £11 million higher than the monthly average in the first half of this year. The seasonal decline in imports of dairy produce, fresh fruit and vegetables in July was more than offset by an unusually large increase in imports of wheat, barley and of unrefined sugar. There was little change in imports of industrial raw materials in July, the seasonal fall in wool imports being balanced by larger imports of timber, iron ore and scrap. These changes meant that an increase in hard currency imports in July much more than offset a fall in imports from Commonwealth countries.

The Board of Trade's composite index of import prices (1952=100) was unchanged in July at 87, although the price index of manufactured imports rose by a point to 86. Similarly, the composite index of export prices was unaltered at 96, in spite of a fall of a point in the price index of manufactured exports to 96. For the third successive month, therefore, the ratio of import prices to export prices remained unchanged at 91 per cent of the 1952 average. This year's improvement of 9 per cent in the terms of trade must have generated an increase of over £300 million in the current annual rate of Britain's real income; but it seems likely that this windfall gain over the average for 1952 is temporarily stabilising at around this level.

Shadow of Abadan

DR MOSSADEGH did not manage to sell much Persian crude oil during the four months that he was offering it, for dollars, at half the world price—partly because the Anglo-Iranian Oil Company disputed the legality of pur-

chases from Persia and took his Italian and Japanese customers to court. The withdrawal of this dubious proposition by his successor and the reported desire of the Shah to "re-examine the World Bank proposals" may smooth the way towards resumption of negotiations about Persia's oil nationalisation. But the return of Abadan's refined products and of Persian crude to the world market, whatever the diplomatic tempo, could not be hurried.

The technical condition of the oil wells and the refinery, which has not operated since late 1950, is not known; but it would inevitably take some time to make good deferred maintenance before the plant could be brought into operation again. Moreover, the refinery is 2½ years nearer obsolescence, a significant period in the oil industry. But commercial considerations, rather than technical, would probably determine the pace at which Persian oil might be reintroduced into world trade if diplomacy were successful. The recent rise in the price of crude oil, and the consequent raising of prices for many refined products arose from the pressure of costs upon American crude producers, although the market for many refined products in the United States was already rather soft, with stocks at high levels. In the Middle East, where the American rise in price was eventually paralleled, production of crude oil was already somewhat in excess of demand, with the shadow of Persia's potential 30 million tons a year overhanging the market. Even the loss of the great refinery at Abadan had been largely made up during its two and a half years of idleness by the faster development of other refinery projects, the expansion of existing plant, and the operation of certain units to give exceptionally high yields.

Moreover, supplies of oil to Abadan's bereft customers throughout the world had been restored by considerable alterations in the pattern of the world oil trade. These were carried out by agreement among the major oil companies (the American companies indeed obtaining special anti-trust dispensations to co-operate). The period of readjustment overlapped one of a decline in the rate of growth of world petroleum consumption, which indeed made easier the measures to restore world supplies. Though the rate of growth may soon again be picking up—in Britain, for example, it recovered in the first six months of this year—Persian output would still have to be brought back into the world market gradually. Should restoration become possible, the return of this crude oil and refined products would have varied effects upon the economics of different parts of the industry—as will be seen from a later note, the loss of Abadan cost Britain dear and was of some benefit, in dollars, to other European refiners. But the long-term trend of oil consumption in the world is such that it could almost inevitably absorb Persia's restored output in a comparatively few years.

European Refining Prospects

ONE of the expedients adopted by the international oil companies after the Abadan refinery was closed was to operate the new refineries in Western Europe almost to the limit of capacity, in order to supply markets not only in Europe but elsewhere. Obsolete units were retained in service, the maximum yield was obtained from new plant, and cracking plant was used in parallel with regular distilla-

tion units to distil crude oil. The expedient was successful. The European refineries, besides satisfying an increasing proportion of the growing demand for petroleum products in Europe, were able to increase their total exports to a level much higher than had been expected (some 7.3 million tons in 1951-52), and to send a large volume of these exports to markets east of Suez, normally supplied from the Middle East (nearly 2 million tons in the second half of 1951 and some 4 million tons in 1952).

But the emergency operation was also, inevitably, costly. Some of the refining plant had to be operated in a way that would not have been economic in ordinary conditions; moreover, the loss of Abadan interrupted and complicated the steady reduction in the dollar costs of oil for Western Europe that had been planned, largely at the expense of Britain. The planned reduction in purchases of "dollar" crude and refined products, which was broadly fulfilled up to mid-1951, was replaced by an increased volume of imports in the next 18 months. The dollar cost of oil to markets normally supplied with Iranian oil rose after the loss of Abadan until alternative supply arrangements could be brought into force; most of the dollar burden of this increase was borne by Britain. The more rapid expansion of refinery throughput in Europe also involved additional costs, partly in foreign currency. But imports of refined products were reduced and exports increased; broadly, as a recent OEEC report on European repricing pointed out,

the effect of the Iranian crisis on the major European refining countries, other than the United Kingdom, was not unfavourable.

Any return of Persian oil and the Abadan refinery to the world trade, however carefully dovetailed into a recovering market, might bring the economics of some refinery locations in Europe into question. But that question, Abadan or not, may well have to be asked in the next few years.

Liabilities of Air Lines

IT is not generally known that the financial liability of the airlines to their passengers is limited—in the opinion of many, too stringently limited—by international convention. A possible revision of the terms of this convention is now under discussion by the International Civil Aviation Organisation, a branch of the United Nations. In 1929, the major airline operating countries signed the Warsaw Convention, which laid down two important principles. The first was that a passenger could hardly be expected to judge for himself the degree to which the cause of any accident could be attributed to negligence by the company or to outside circumstances. For this reason, when there is a fatal accident, or an injury to passengers or baggage, the airline is assumed to have been negligent in some way, and so liable to pay compensation, unless it can prove to the satisfaction of the courts that no negligence was involved—which, in the circumstances of an air accident, it is usually almost impossible for it to demonstrate. In the great majority of air accidents, the airline automatically accepts liability.

The convention, however, having insisted on this safeguard for passengers, then proceeded to limit the airlines' liability. The maximum to be paid out on the death of a passenger is 8,291 American dollars, or roughly £3,000. This seems a grossly constrictive limit—especially when

MOULDY ROT

"MOULDY ROT" is a fungus disease that attacks the rubber tree and restricts its yield of latex—the substance from which rubber is produced. Growing on the tree where it is cut for tapping, this fungus has caused irreparable damage on plantations in Malaya, for it spreads rapidly and the fungicides used against it in the past did not always control the disease effectively. Working on the problem in 1946, the Rubber Research Institute of Malaya invited I.C.I. to collaborate in developing certain newly discovered organic compounds with fungicidal properties. I.C.I. Dyestuffs Division accordingly produced a number of experimental samples which were tested in the Hawthorndale laboratories of the company's agricultural research station at Jealott's Hill in Berkshire, and then sent out to Malaya. In comprehensive field trials carried out by the Rubber Research Institute, one of these fungicides—subsequently named "Fylomac" 90—proved entirely effective in controlling mouldy rot disease. Easily applied by spray and containing a violet dye to mark trees that have been treated, "Fylomac" 90 is now widely used in Malaya—the largest rubber-producing and dollar earning country in the British Commonwealth.

INDUSTRIAL AND COMMERCIAL FINANCE CORPORATION LIMITED

Subscribers:

The English and Scottish Banks

I.C.F.C. is ready to consider the requirements of any industrial or commercial enterprise which is established in Great Britain.

The Corporation entertains proposals for additional capital—either for the purchase of additional buildings, plant and machinery, or for financing the expansion of business and carrying increased stocks and debtors. It is also prepared to consider more general schemes of expansion, including the financing of new ventures which are soundly sponsored and backed.

It provides capital both in the form of share capital and medium or long term loans—generally in amounts ranging between £5,000 and £200,000.

considered in relation to the average earning capacity of air-lines passengers. Unless the liability is regulated by specific contract, as in travel by the airlines concerned, no limit to the liability of the carrier is recognised by English law. There is either full liability or none at all. Hence dependants of a passenger killed on surface transport may sometimes obtain much more substantial compensation than if the same person had been killed in an air accident.

The legal principles are, of course, by no means so simple as this broad summary might suggest, while there is the further complication that not all countries are signatories to the Warsaw convention, so that a flight to or from the non-signatory countries is not in every case governed by these rules. On such flights, the airlines are accustomed to insert in their conditions of carriage a clause disclaiming all liability whatsoever—though in practice the bigger airlines generally assume "moral" responsibility to pay compensation on the Warsaw scale should an accident occur. (Since the beginning of this year, British airlines have been bound by the convention on all their flights.) These facts are probably not widely appreciated by air travellers; the informed few have availed themselves freely of the slot-machine insurance offered by the big insurance companies at the airports, but the majority fly with no more than the limited protection given to them by a convention signed 24 years ago—or with such protection as they obtain from life or accident cover arranged for general or other purposes. Some airlines might like to see a revision of the clause that presumes negligence until it is disproved; but at least those signatory countries that enjoy a high standard of living are prepared to raise the maximum liability—perhaps to around £5,000. Poorer countries oppose any increase, but until the new draft convention is drawn up, it will be impossible to judge how the discussion will go. But it seems clear that even an increased limit of £5,000 would still leave the air traveller in an unfavourable position compared with the man who uses surface transport. It is difficult to see what grounds the airlines have, now that they are so anxious to become a major means of transport, for claiming this differential protection.

Shrinking State Haulage

As the road haulage vehicles owned by the Transport Commission begin to be sold this autumn, the Road Haulage Executive will enter a period of shrinkage which may or may not be protracted but will certainly be uncomfortable. At the end of last year the Commission owned just under 40,000 vehicles, though about 5,000 were not then in use; the new Road Haulage Disposal Board set up last May will have the task of selling about 35,000 of these. Eventually the Commission will be left with a fleet of about 5,000 vehicles, comparable to the numbers owned by the railways when they were nationalised; but in the meantime it will have the task of conducting a diminishing service and attempting to give its customers reasonable service with this.

The Commission has decided that from October 1st the responsibilities of the Road Haulage Executive will be taken over by a new undertaking using the existing name of British Road Services. This will manage the road haulage assets of the Commission, and has the further responsibility of assisting the formation and disposal of transport units

in accordance with the Transport Act. It will be directed by a Board of Management, to lead which the Commission has appointed Major-General G. N. Russell, present Chairman of the Road Haulage Executive, assisted by two other members of that Executive and its present Secretary as full-time members, and with two more members of the Executive as part-time members advising on special subjects.

A Census of Retailers

THE first detailed volume of the census of distribution that was taken in 1951—the first count of its kind in this country—was published this week. A shortened version that appeared at the beginning of the year was discussed in *The Economist* of January 24th. The new full volume breaks down these figures into towns and regions, and adds one important new category, the service trades, that was not included in the short report. Later in the year, the Board of Trade expects to publish two further volumes, one giving a more detailed analysis of retail trade on a national basis and the second covering wholesale trade.

The second and third volumes will complete the picture of retail distribution as it was in 1950. It was a year in which consumer goods were still scarce, with their prices and selling margins in many cases controlled by the Board of Trade, facts that will have to be borne in mind in making any future comparisons between the present census figures and later counts. Some salient features of this week's report are summarised in chart form on page 557. The figures themselves show that in addition to the 531,143 retail shops listed in the shortened version of the census, there were 153,621 additional establishments grouped under the heading of "service trades." These include cafés and restaurants, hairdressers, photographers, funeral parlours, repair shops, car dealers and garages. The total sales of the retail shops amounted to nearly £5,000 million, on which their gross margin—analogue to "net output" for a manufacturing industry in the Census of Production—was given in the earlier summary as about £1,100 million; and they employed nearly 2 million full-time and 454,000 part-time workers. The service trades had a turnover of just over £900 million and employed 605,351 whole-time and 133,762 part-time workers. No figure of "margin" or of "net output" has yet been given for these trades. As might be expected, wages and salaries in the service trades constitute a much larger proportion of total sales revenue than in the shops. The shops spent £392,070,000 in wages and salaries in 1950, which would be about 8 per cent of the total sales revenue of nearly £5,000 million; this labour cost amounted to about a third of the gross margin they retained on goods sold. The service trades had a wage bill of £126,932,000 to find out of £900 million, i.e., 14 per cent of their total revenue.

The Service Trades

THE catering trade was in 1950 by far the largest section of the service trades, numbering 66,562 separate establishments with a combined annual sale of £227 million.

These figures give an enlightening picture of British eating habits: the 26,901 unlicensed restaurants took £128.5 million, while the licensed restaurants—only 776 of them—had a turnover of £24,266,000. The second largest group of eating places was the 21,367 canteens, which took £84,303,000 in the year. Britain also boasted 17,126 fried fish shops, whose takings reached £33,417,000.

The second largest group were the hairdressers; 29,827 of them had a turnover of no more than £34,333,000. Another trade where the average turnover was not much more than a thousand a year was "repairing," mainly shoe repairing; the 22,527 repair shops had a turnover amounting to only £24,547,000. To the 3,404 funeral parlours, twelve months of funerals brought in £13,563,000; the 2,320 portrait photographers, on the other hand—including as many street photographers as the census takers could capture—could earn only £4,340,000 in the year. But these figures, as indeed the returns of most of the "service" trades, give only a partial picture of the volume of this kind of business. Catering, hairdressing, photography, repairs and even funeral services are all carried out by department stores, and sometimes even by the variety chains, and a big volume of the business done must in fact be concealed under the totals of £1,665,000 recorded for these types of shops.

Perhaps the most interesting data on any service group are those dealing with car sales and garages. There were 2,735 establishments engaged primarily in selling vehicles in 1950, and their turnover in a year amounted to £185,981,000. This was in a year when deliveries of vehicles to the home market was severely limited; it was the peak year for the industry's exports, with few new vehicles available at home. The sales figures include second-hand cars (at prices that were inflated by scarcity), commercial vehicles and a certain number of tractor sales. The second big group in the vehicle market is made up of 18,403 repairers and filling stations, though the compilers of the Census have obviously had difficulty in drawing the distinction: many dealers repair cars, and most repair garages sell some cars. These establishments had a total turnover of £317,392,000, or more than that of the car dealers proper, but these figures may include a fair proportion of new and used car sales. Of this group 11,531 are filling stations with and without facilities for carrying out repairs; their sales alone during the year came to £10,970,000.

The Miners' Autumn Task

MOST of the miners have finished their fortnight's holiday by now, and the coal industry is getting back towards full production—with a stiff task before it for the autumn. This is to raise coal stocks to a safe level for the winter, and since those stocks today are fully 2 million tons lower than a year ago and about 3 million tons lower than they ought to be at the end of October, it will not be easy. Despite the prophecies of a coal crisis this winter, the National Coal Board is not yet too pessimistic about the chance of building reasonably safe stocks.

The extra week's holiday for all miners and the Coronation have already lost the industry about 4.7 million tons,

and it is hoped in Hobart House that the total loss of output through longer holidays, by comparison with last year, should not be more than about 5 million tons. Deep-mined production last week, when holidays were calculated to be costing about 150,000 tons more coal than in the same week last year, was 3,958,000 tons, about 20,000 tons more than in that week of 1952. The Coal Board, therefore, believes that with the full complement of miners back at work, in a week or two, the industry ought to be able to produce something over 100,000 tons a week more this autumn than it did last. If it can, that extra tonnage may take care of the margins by which inland coal consumption, exports and bunkers may be expected to exceed the levels of autumn 1952; and the industry may be able to put into stock roughly as much coal as it did during September and October, 1952. In the last eleven weeks before the end of the 1952 coal summer, the industry put about 2 million tons of coal into distributed stocks—in merchants or consumers' hands—and added about 1½ million tons to its own holdings at collieries and opencast stocking grounds. This, roughly, would fill the NCB's autumn coal bill—offering perhaps 18 million tons, at any rate, in distributed stocks at the beginning of November. That would not quite satisfy the Fuel Minister's hope of 19 million tons in stock—but it is perhaps about the critical figure for an average winter.

The industry has still about 400,000 tons of large coals to import, and is continuing its combing out of large coal consumers in this country. The "programming" authorities of the Ministry of Fuel and Power, which control coal allocation, are examining deliveries of large coal to local authorities, gasworks, and railways; and these major consumers may eventually manage to release some large coals to domestic consumers and take other grades of coal themselves. So far this year domestic consumers have bought about 200,000 tons more house coal than by this time in 1952, but deliveries recently have been lower; moreover, the merchants' stocks are today nearly 400,000 tons, or 30 per cent, lower than at this time last year.

Chile Retreats on Copper

CHILE has at last abandoned its attempt to hold out for an f.o.b. price of 35.50 US cents per lb for its copper. By its previous obstinacy it has lost its European markets to Rhodesian and Belgian Congo producers, and a sizeable part of its major market in America as well. The fact that the big Chilean mines are owned by American companies will assist Chile to recover the ground lost in the United States, but it may have a harder task to make headway in Europe. Unless there is a strike in Rhodesia, world copper prices may continue to sag in increasingly competitive markets. Demand for copper in the United States is easing, and a good deal of American metal is being shipped to London. It is being sold here at the ruling London price of about 28 cents a lb (or £225 per ton) for cash metal; this is about 1½ cents below America's domestic price, to say nothing of the freight charges involved.

A major question for the market is whether Chile will succeed in selling its surplus of some 84,000 tons of copper to the American government for the strategic stockpile. It is believed to be offering this copper at

29 cents per lb, f.o.b.; but the Americans are moving cautiously and formal negotiations have not yet begun. If negotiations do begin, the Americans are likely to require assurances about commercial shipments from current production, and they may also ask Chile to mitigate its fiscal and other burdens on the American-owned mines.

Where Two Shifts Pay

THE Minister of Labour's marked enthusiasm for wide extension of the double day-shift system in British industry failed to communicate itself to the employers and trades unionists in his National Joint Advisory Council when he raised the matter with it early this year. Members of the Council thought a widespread and general extension of this method of working "neither practicable nor desirable"; but they recognised that it might be valuable in certain cases, and with their concurrence the Minister has now sent a memorandum to employers and unions in selected industries, drawing their attention to the circumstances in which the system might usefully be extended.

The double day-shift system usually raises the labour costs for a given output, on balance generally somewhat reduces overheads, and considerably saves capital costs, since it gets twice the output off a given machine or the same output with half the equipment. Unless much more labour could be recruited, of course, a factory designed for single-shift working that turned to double shifts would have to set against the better utilisation of its most productive plant the cost of leaving some other plant idle. But where a plant or an extension to it is laid out for double shift work from the beginning, some extra advantage in productivity will probably accrue from the fact that the equipment will be worn out nearer the time at which it becomes obsolescent. In general, the decision whether or not to adopt double-shifting will depend upon balancing considerations of cost, such as the relation of capital charges to labour costs; considerations of demand, such as might justify some increase in labour costs, without installing new plant, in order to expand production; and considerations of labour. In general, where people are on double shift work they seldom complain of its social effects; but the time-table of shopping, entertainment, and most social amenities in Britain is designed for people who work during the day, and undoubtedly any employee asked to change to double shift working suffers some inconvenience, though wages are usually higher, and the working week somewhat shorter. Double shift working is obviously no industrial panacea, but it could in some cases be of considerable value in enabling the most economical use of funds for new industrial investment.

Rising Car Output

THE motor industry began to expand car output when control of materials was finally lifted at the beginning of the year, and the process appears to be continuing

unchecked even during the holiday months. In June, production averaged 11,500 a week; by July, which is not usually a period of noticeable activity, it had risen to 13,200 a week. This compares with an average weekly rate of only 7,500 in July last year. In the first seven months of the year, the industry has produced 334,341 cars compared with 258,071 in the same period of 1952.

Exports for the year so far have not shown the same buoyancy, only 185,763 cars having been sent abroad in seven months compared with 209,467 in 1952. This fall in exports is to be seen in shipments of commercial vehicles and tractors as well as cars. The July trade returns show that the value of the industry's total exports, including spares, has reached only £156.6 million compared with £184 million by the same date last year; without a rise in the shipment of certain types of spare parts the totals would have been even lower. There are signs, however, that the industry's foreign sales are recovering. Since May, car exports have not fallen below 30,000 a month, and in July they rose to 32,000. Commercial vehicle exports are also rising, and reached 11,400 in July. In both cases these figures are higher than they were a year ago; the slump in the industry's export sales set in in mid-summer and appears, from the figures, to have taken the best part of a year to work itself out.

Less Tobacco

THE British tobacco industry will hardly be very perturbed by indications of a fall in the production of flue-cured tobacco in the main exporting countries this year. British purchases from the American crop are likely to be held down to the equivalent of only about eight months' normal requirements, costing some \$60 million. Unless the Treasury relents and approves a supplementary allocation the shortfall will again have to be made good from stocks. Spot purchases from the 1952 crop were limited to \$35 million, but another \$50 million is believed to have been authorised this year to fulfil options on that crop. Imports from the United States during the earlier months of 1953 were therefore abnormally high and the seasonal decline in stocks was moderated. Figures published by the Commonwealth Economic Committee show that Britain's imports of all types of tobacco from the United States in the season ending last June were 103.6 million lb, less than half the 217.8 million lb imported in 1951-52 and 39 million lb below the low level of 1950-51. Stocks of all unmanufactured tobaccos in Britain in June totalled 400 million lb, 52 million lb less than a year ago.

The total 1953 crop in the United States is estimated at 2,125 million lb, a decline of 130 million on the previous year. Production of flue-cured tobacco, the principal grade used for British cigarettes, is put at 1,320 million lb, a fall of 46 million lb. The production of flue-cured tobacco in Canada may not increase proportionately with the higher acreage, and in Southern Rhodesia the crop estimate has been reduced slightly to 103 million lb; this would be 4 million lb larger than the 1952 harvest, but its quality is disappointing. World production of Oriental leaf, on the other hand, is expected to increase substantially this season.

Argentina Courts Foreign Capital

PRESIDENT PERON seems to be trying to woo foreign capital by raising the terms of any new marriage settlements, while keeping investors who are already forcibly wedded to Argentina under their present state of duress. The new law that he has introduced—and, of course, had passed—in the Argentine congress seems to be aimed chiefly at investors from the United States: it follows the remarkable improvement in Argentine-American relations that was initiated by Dr Milton Eisenhower's recent visit to Buenos Aires. The wording of the new law is so vague that no action can be expected under it until detailed regulations are forthcoming, from the central bank. Briefly, however, it provides that, subject to the government's initial approval, new foreign capital (whether in cash or equipment) that is invested in mining or industry will be placed on a special register. Two years after this registration, profits of up to 8 per cent annually of the registered capital may be transferred abroad; eight years later the original capital and capitalised profits can also be repatriated in annual instalments, at a rate of either 10 or 20 per cent as the Argentine government thinks fit. Existing investments in Argentina are still permitted transfers of profits only up to 5 per cent of registered capital—and even this permission has sometimes seemed to be part of Argentina's legal theory rather than of the exchange control practice of its central bank.

Without the help of foreign capital President Peron's "second five year plan"—whose inception has recently been postponed for the second time—would be likely to run on the rocks. Since any appeal for a direct loan from the

United States would be damaging to political prestige—even if it were accepted, which is not likely—Argentina is now struggling hard to enlist the support of private capitalists in the United States. In particular, it hopes to attract foreign capital into its infant oil industry—and only oil magnates are being treated with quite effusive hospitality. The main hope of British investors must be that, in this new atmosphere, the Argentine Government will some day have to realise that very few foreign capitalists are likely to be willing to invest new funds in their country while existing investments are treated as shabbily as they are today.

SHORTER NOTES

Last Wednesday's Bank return showed that the fiduciary issue had been reduced by £50 million, to £1,575 million. The issue had been raised by £25 million, to £1,625 million, at the end of July; in the first four weeks of August, however, just over £53 million of notes have flowed back from holiday circulation, and the reduction in the fiduciary issue thus still leaves nearly £30 million of notes in the banking department's reserve.

The £5,709,000 new issue by the East Africa High Commission—which took the form of a 4 per cent stock (1968-71) at 95, offering a gross redemption yield of £4 4s. 3d. per cent—was over-subscribed on Thursday. The London market absorbed only £4,500,000 of this issue, for £959,000 had already been taken up on behalf of Colonial Government funds and £250,000 had been reserved for local subscriptions.

and overdrafts in Britain (which reached £5,855,085 last year); the bank overdrafts of £2,375,807 shown in the consolidated balance sheet are loans in Canada and South Africa that are used to finance hire purchase sales in those countries. Having thrived in the field of retail furniture trade in this country and having crowned this success by eliminating the group's reliance on bank finance, Mr Wolfson declares himself ready to seize "the great opportunity that now exists to build up a complementary and perhaps larger business in Canada and in the United States." Any such expansion must have its risks at this time, and investors must decide whether it is exhilarating—or merely rather nerve-racking—to hitch one's wagon to a shooting star. Up to now, as the effective doubling of the price of "Gussies" shares over the past eight months shows, it has been exhilarating in the extreme.

RICHARDSONS, WEST-GARTH.—Although the directors of Richardson, Westgarth, the marine electrical and general engineering company, can look back with a certain amount of satisfaction on the past year's results, they are obviously rather uneasy about long term prospects in the shipbuilding industry. Their satisfaction with recent trading results is reflected in the decision to raise

the ordinary dividend from 12 to 15 per cent, for a year that saw an increase in trading profits from £814,568 to £897,250, and in stocks and work in progress from £2,166,421 to £2,900,734. Their uneasiness about the future is reflected in

	Years to Mar. 31,	
	1952	1953
Consolidated earnings:

5s. ordinary stock at 10s. 6d. yields £7 3s. per cent.

comments in their report about the growing activity in shipbuilding yards in Italy, Germany and Japan—together with their story of some cancelled orders in British shipyards and of threats to cancel other orders if costs rise any further. Their uneasiness is also reflected in the market by the relatively high yield of 7½ per cent, at the current price of 10s. 6d., on the company's 5s. ordinary stock. The group appears, however, to be achieving some success in the extension of its business in electrical and engineering capital goods outside the shipbuilding industry; and the increased dividend is well covered at the current level of trade.

TOOTAL. The Tootal group, like most of the other big Lancashire concerns, has clearly ridden out the recession in cotton textiles without any structural damage. In the year to June 30th last its trading profits rose from £783,000 to £1,227,964, and its net earnings from £224,789 to £540,676. The directors have celebrated this by effec-

tively raising the ordinary dividend from 15 per cent to 25 per cent; this increase, however, is cautiously described as a "Coronation bonus" of 12½ per cent plus a normal dividend of 12½ per cent, compared with last year's payment of a "bonus" of 2½ per cent plus the same normal dividend of 12½ per cent.

Other signs of the recovery in Lancashire are to be found in the group's balance sheet. Here the value of stocks is shown to have fallen from £4,926,726 to £3,008,468 and cash balances to have risen from £2,451,284 to £3,760,745. The directors explain that, owing to the seasonable nature of the group's business, its liquid resources are usually at a peak at the middle of the year, when the balance sheet is drawn up. This year, they say, liquid balances form an unusually large proportion of current assets because the group has been particularly successful in selling off its accumulated stocks. They then go on, in effect, to evince their belief that recession is a thing of the past by declaring

£1 ordinary share at 71s. 3d. x.d. yields £7 per cent.

that these liquid balances will be absorbed as the group begins to build up stocks again. If the Coronation bonus proves to be more lasting than its (probably misleading) name implies, the group's £1 ordinary shares, at 71s. 3d. x.d., yield a full 7-per cent.

LONDON STOCK EXCHANGE

Next Account begins: September 2nd.
Next Contango Day: September 2nd.
Next Settlement Day: September 8th.

ALTHOUGH the gilt-edged market remains quietly firm this week, the set back on Wall Street and the labour dispute in the electrical trade checked the advance in industrial equities on Tuesday and Wednesday. Demand for the Funds was sufficient to secure some slight gains in prices at the close on Wednesday, War Loan stood at 81½ and the new Gas stock was still quoted at ¼ premium. Dominion and Colonial issues were neglected after the East Africa High Commission had announced a new issue of £5,709,000 in a 4 per cent stock (1968-71) at 95s. Insurance shares lost a little ground and banking shares moved rather irregularly, with Canadian issues showing a few losses. Most of the interest in the foreign market was concentrated upon German issues which on Wednesday recovered part of the ground they had lost earlier in the week; elsewhere Chilean loans improved in response to a little support from New York.

The improvement in equity prices that had been just before the Bank Holiday continued until Monday's close, with especial support for the textile and building material groups; the *Financial Times* ordinary share index reached 124.5 on that day. But the set-back on Wall Street led to a general marking down in prices and by the close on Wednesday the index had fallen back to 123.9, although some of the "take-over" shares (notably Montague Burton) resisted this trend. Oil shares, which had started the week rather badly, took a turn for the better on Wednesday and Anglo-Iranian improved to 7½. Widespread slight gains were made in rubber shares, and tea shares also remained firm. Kaffirs were still dull in quiet markets; but Rhodesian copper shares, after making some slight losses, staged a mild rally on Wednesday.

Company Notes

GREAT UNIVERSAL STORES.

The full accounts of Great Universal Stores show that the group's success in the uneasy trading year to March 31st last was even greater than its preliminary statement (which was discussed in these columns on August 1st) had suggested. In Britain the group again sold more goods than ever before, and it also set up new records (in profits as well as sales) in Canada and South Africa; only in its direct export trade did it suffer any notable reverse. In spite of a general reduction in selling prices, therefore, its trading profits advanced from £9,954,976 to £11,388,271—an increase that the directors have greeted by effectively doubling equity payments to shareholders.

The balance sheet, like the profit statement, has a cheerful story to tell. In value, the group's stocks (which have been written down to cover any declines in prices) show only a slight fall; in volume, stocks are probably higher than a year ago. Despite restrictions at home and abroad, there has been another increase in hire purchase debtors (from £31,390,165 to £33,517,459, before deducting any provisions for unearned profits, interest and collection charges); the unrealised profit on these debts is now

£9,830,205 and will only be credited to the group's profit and loss account when these debts are finally collected. The chairman, Mr Isaac Wolfson, declares that these hire purchase debts are spread over some 1,800,000 customers and that bad debts are still negligible. The really surprising feature of the balance sheet, however, is that—despite the increase in working capital commitments—the group has completely eliminated its bank loans

Financial Statistics

THE MONEY MARKET

CREDIT was much tighter in Lombard Street in the week covered by Wednesday's Bank return. On each of the last three days before the weekend, some special purchases of bills were made by the authorities—mainly directly from the market. On Monday the lack of maturities caused by the fall of Whit-Monday three months previously made credit especially short, and very large special purchases were made, mainly indirectly from the banks. On Tuesday and Wednesday, however, credit supplies were adequate.

The market maintained its bid at £99 8s. 2d. for the £270 million of Treasury bills that were again on offer at last week's tender. Since total applications rose by over £10 million, to £358.2 million, however, the market's allotment fell from 71 per cent to 67 per cent of its bid. At yesterday's tender, a new record total of £280 million of Treasury bills were on offer; but owing to a rise in maturities, the excess of new bills will remain at £20 million next week.

The Bank return shows the expected reduction in the fiduciary issue of £50 million, to £1,575 million; as there was a further reflux of notes of £12.9 million in the week to Wednesday last, the reserve of notes in the banking department is still nearly £30 million. Government securities held in the banking department rose by only £44.7 million despite the transfer into it of £50 million, consequent upon the reduction in the fiduciary issue. Discounts and advances fell by £2.6 million and public accounts by £4.4 million; bankers' deposits rose by £7.8 million, mainly because of the note reflux.

COMPANY MEETINGS

GEORGE NEWNES LIMITED

A RECORD YEAR

STATEMENT BY SIR FRANK NEWNES

The fifty-sixth annual general meeting of the company was held at the company's offices on Thursday, August 27th, Mr H. C. Tingay (vice-chairman and managing director) presiding in the absence abroad of the chairman, Sir Frank Newnes.

The following are extracts from the chairman's statement circulated with the report and accounts:

The results for the year constitute a record in the history of the company. For the first time the trading profits of the group have passed the million mark, the figure being £1,111,003 as compared with £969,329 for the previous year. After deducting taxation of £476,842 the net profit amounts to £634,161 as against last year's figure of £506,672. This eminently satisfactory result reflects the vigour and enterprise of the widely spread activities of the organisation.

Expressed in simple terms the figures of the group, as a whole, show that after setting aside £83,150 for pension funds and after payment of dividends on the preference shares of Newnes and its subsidiaries and the proposed dividend on Newnes ordinary shares (£217,266), there remains a surplus of £333,745 to be added to the resources of the various companies.

PARENT COMPANY'S RESULTS

As to the parent company, Newnes, the net profits, after deducting taxation, amount to £409,153 as compared with £346,893 for the previous year. With the amount brought forward from last year, and after deducting preference dividends and interim dividend on the ordinary shares, there remains a disposable balance of £438,156.

The directors have given careful thought to dividend policy, and have reached the conclusion that in view of the group's financial strength—a position built up by the conservative dividend policy pursued over past years—the time has arrived when shareholders might reasonably expect some added consideration. Accordingly they propose a final dividend of 20 per cent, making 25 per cent for the year, as compared with a total of 20 per cent for last year. After allocating £11,000 to pension funds and transferring £225,000 to general reserve, there remains a balance of £84,656 to be carried forward to next year's accounts.

PROPOSED SCRIP DISTRIBUTION

They also propose, subject to the consent of the Capital Issues Committee to whom application has already been made, that £587,500 from reserves be capitalised by converting the present 10s. ordinary shares into £1 shares. A far larger sum than the present nominal ordinary capital is now employed in the business, and the course proposed will thus bring the ordinary capital more into line with the true position. On that footing the dividend of 25 per cent being paid this year would be equivalent to 12½ per cent on the increased capital.

(Chairman reported that consent of CIC had since been received.)

STRONG FINANCIAL POSITION

The detailed figures call for little comment, the changes showing mainly the

normal fluctuations of business. A study of the consolidated balance sheet discloses the strong financial position of the group. General reserves amount to £1,488,615, capital reserves to £327,083, and development reserves to £634,356. Undistributed profits, after payment of the proposed Newnes ordinary dividend, stand at £340,683, and cash and tax reserve certificates amount to no less than £1,486,849. Stocks show little change at £1,100,390. Plant and machinery has increased approximately by £47,000, representing further important additions to the plant of Temple Press Limited who, by the urgent nature of several of their publications, have to produce at high speed.

TRIBUTE TO MR HERBERT TINGAY

I should like to take this opportunity of congratulating Mr Herbert Tingay, vice-chairman and managing director, on the completion of fifty years' service with the company.

His leadership, breadth of vision, and hard work have largely led to the company's present success and his colleagues desire to pay tribute to him for the valuable services he has rendered to the company over these years. It is a happy thought that the occasion should coincide with a year when the company has reached the record profits to which I have already referred.

THE PUBLICATIONS

Revenues both from sales and advertisements create new records in the company's long life. "Woman's Own," our largest circulation weekly, has made further remarkable progress. Its present sale is now well in excess of 2 million copies per week, an increase of over 400,000 copies per issue as compared with this time last year. Advertisement revenues have kept in step with the circulation advance and show a record total. It is clear that advertisers readily recognise the immense influence of "Woman's Own" in the home circle where the outgoings of the family budget have to be studied with care and guidance. "Tit-Bits," which was founded by the late Sir George Newnes more than seventy years ago, becomes almost a publishing romance. Notwithstanding a remarkably long and successful life the circulation today is well over 800,000 copies per week, the highest it has reached for many years past. Last year at this time the figure was about half a million. The "Wide World" Magazine, now in its 56th year, remains the firm favourite of a very wide circle of readers spread throughout the English-speaking countries of the world. "Amateur Gardening" and "The Smallholder," still the leading weeklies in their respective fields, have reached peak circulation figures in a long and distinguished history. They provide almost unique opportunities to advertisers in reaching the buying public they seek.

The book publishing sections of the business have done well. In particular the Subscription Books Department, marketing important volume works including "Chambers's Encyclopædia," is able to record excellent results. The Australian company, formed as a result of an earlier visit of executives to that country, has amply proved the

wisdom of opening up a Subscription Books business on that side of the world.

COUNTRY LIFE ACTIVITIES

The Country Life group of publications have again had a good year in spite of conditions which might have been expected to produce a less satisfactory result. "Country Life" itself, that "supremely beautiful weekly" as it has been described, has maintained its pre-eminence among publications devoted to rural and cultural activities. Special arrangements made this year to cover a wider range of sporting events have had a warm welcome from readers. The Coronation provided an opportunity for using "Country Life's" unique resources to the full, and its special Coronation number has been widely praised as an outstanding achievement. It was the largest and most comprehensive issue of its kind, yet it was produced within four days of the actual ceremony. A large edition has been distributed all over the world. Another encouraging development is the rapid progress of our women's magazine "Homes and Gardens" in a field in which competition is especially keen. Both circulation and advertisement revenue show notable increases.

Although too many to mention individually, the other publications in our general and specialised list are doing well almost without exception. C. Arthur Pearson Limited, our largest subsidiary, has had a good year. Its earnings have been restored to more normal levels after a set-back last year mainly due to the high cost of paper.

TRADE AND TECHNICAL PUBLISHING INTERESTS

In the trade and technical fields we are represented by two powerful organisations, Temple Press Limited and National Trade Press Limited. Both companies function as separate units under highly skilled and efficient managements. Temple Press Limited, with its group of well-established technical or specialised journals and books, has had a successful year. With larger supplies of paper available, the circulations of some of their periodicals have reached record figures. The sales of "The Motor" and "Motor Cycling" in the past year have been substantially higher than at any period during their 50 years of publication. Temple Press journals (circulating all over the world) play a vital part in the industries with which they are connected. "The Commercial Motor" for instance is the representative journal of the important road transport industry, and "Farm Mechanization," which was started only a few years ago, has established itself as the foremost journal in this field of rapidly increasing activity.

The National Trade Press did well during the year, despite unfavourable conditions in a number of industries in which its journals enjoy a deservedly high reputation. Its seventeen trade and technical publications, spread as they are over a wide variety of industries, are usually able to counterbalance the difficulties in one direction by more favourable conditions elsewhere. A new quarterly, "Children's Wear," was launched by the company during the year.

The report and accounts were adopted.

DICTAPHONE COMPANY

SATISFACTORY YEAR'S TRADING

MR C. KING WOODBRIDGE'S ADDRESS

The forty-first annual general meeting of the Dictaphone Company Limited was held on Friday, August 21st, at the offices of the company, 17, Stratford Place, London, W.

Mr C. King Woodbridge, chairman of the Dictaphone Company and president of the Dictaphone Corporation, presided, and in the course of his address stated that the year under review had resulted in an operating profit amounting to £207,624.

After referring in some detail to the balance-sheet and profit and loss account, the chairman continued: Our profit this year compares favourably with last year. But we continue to pay heavy taxes, which limit the profits available for shareholders and for the development of plant and equipment.

The present tax position is crippling and no less than 64 per cent of our earnings finds its way to the Chancellor of the Exchequer in one form or another. We look forward to the lifting of the excess profits levy at January 1st next which is so seriously affecting this company, having regard to the phenomenal progress that has been made during the past five years.

In moving the adoption of the report and accounts, Mr Woodbridge said: When reviewing the accomplishments of the past and considering the possibilities for the future I have schooled myself to the analysis of our business and consider the factors we meet a good barometer.

Selling at a profit is our motivating force. Our current sales results are very good. Orders taken are ahead of last year. Deliveries of Dictaphone equipment break records. Dictabelt sales keep going up.

INCREASED SALES EFFORT

To reach our potential we have increased our sales effort in service and advertising. These strong sales factors have put added work in our plants, which are increasing output as rapidly as they can secure material and manufacture Dictaphone machines.

Our defence business is continuing at satisfactory levels. Our people are fully employed. Dictaphone's plans will continue to give impetus to selling and should provide for uninterrupted employment.

Improvements have been made in our factories and equipment through the use of earnings. This represents to me the insurance for the future for shareholders, employees and our customers.

OPTIMISTIC OUTLOOK

Business generally with this company and the parent corporation has never been better and we are experiencing, I believe, a reflection of two major factors. There is plenty of optimism over the business outlook. Business is enlarging, not contracting.

Most industrial groups are expected to spend more in 1953. Public utilities, manufacturing, commercial ventures, stores, warehouses, office buildings, are moving on under good momentum and with strong support.

The major factor is the absolute necessity for business, professions, and Government to double their capacity to get things done

and to increase earnings in order to meet the higher cost of doing business.

No modern device meets this situation that confronts us as does the dictating machine. The Time-Master and the Dictabelt have won an enviable reputation throughout the world. Men and women in professions and in Government find that once having given the Time-Master intelligent consideration, they wonder how they ever got along without it.

KEEPING PACE WITH OFFICE WORK

Sometimes I feel that we have so many opportunities around us that we get lost in a forest of potential sales. Within two weeks several businessmen have told me how little time was available to tackle correspondence and to take care of the details of their jobs. Then my sales kit comes out. I want to quote a note from a friend of mine who casually told me at a dinner recently that he was having a difficult time in keeping pace with his office work. "I have found the Dictaphone Time-Master the most valuable accessory to my needs that I could imagine. It absolutely fits the requirements of my particular situation." There are thousands and thousands of such individuals all over the country who are seeking ways to get their work done—top-ranking business executives—travelling by day who are using the Time-Master at the end of the day and posting their Dictabelts back to their offices.

We have been enjoying for some time a sellers' market, and since the beginning of the present year it has been brought home to us that we are no longer enjoying this condition, but our objective has not changed, and our objective is the business of rendering a service to individuals, corporations, institutions and Governments who, through the use of Dictaphone dictating machines, can double their capacity to get things done. This friend of mine, when I gave him the interpretation of our business, said: "Well, I have greater respect for you now—more than I would have had if you had told me your business was making dictating machines."

HUMAN RELATIONS ACTIVITY

Ours is a human relations activity, and I say to you that a sound business management is the result of vision, enterprise, and service, and those factors are the products of the heart and not of the market place. Industry has been influenced by individuals who believed that they could go and buy loyalty, buy brilliancy, buy this, that. But enduring business enterprise is not built up that way. You cannot purchase it. You cannot pick a successful organisation out of a hat. A good organisation depends on: the product—an understandable operating programme—an organisation that believes—and—the spiritual qualities which we must cherish and preserve.

The report and accounts were adopted and the retiring directors were re-elected.

The proceedings terminated with a hearty vote of thanks to the chairman, who in replying thanked Mr Gordon Paterson for his services to the company, the destinies of which he has successfully controlled for the past six years. The other directors present expressed their desire to be associated with the chairman's thanks to Mr Paterson.

THE GLOBE TELEGRAPH AND TRUST COMPANY

INCREASING PROSPERITY AND STABILITY

The eightieth annual general meeting of The Globe Telegraph and Trust Company Limited was held on August 25th in London.

Sir Edward Wilshaw, KCMG, DL, JP, LLD, FCIS (the chairman), presided and in the course of his speech said: We achieved our eightieth birthday last month. During these eighty years there has been ever increasing prosperity in your undertaking, which is in no small measure due to past directors, particularly those in the early days, who adopted a prudent policy which has been consistently followed through the years, with the result that today you have an investment trust company with which the stockholders may well be proud to be associated, and which has shown increasing stability with increasing returns to the stockholders.

The total gross income has risen by no less than £48,042. Against this expenses have increased by only £2,356. We cannot, however hope that every year our income will expand by an amount sufficient to cover the rising costs with which everyone, individual and company alike, is faced, and for this reason, as well as a general precautionary measure to guard against other possible contingencies, your directors have considered it advisable to add £50,000 to general reserve. The sum payable to the Income Tax authorities has again increased as a direct consequence of the higher profits, so that this year the figure stands at £203,033, or £19,578 more than last year.

The net profit for the year is thus £26,108 higher at £230,645. After deducting from this sum the cost of the 3 per cent interim dividend paid in February last (£61,145) and the amount transferred to general reserve (£50,000) there remains a sum of £119,500, which is sufficient to enable your directors to recommend once again a final dividend of 5 per cent, making a total of 8 per cent for the year. The balance of £12,739 is added to the profit brought forward, to make a total of £163,832 to be carried forward to next year.

From the balance sheet you will observe that the capital remains unchanged at £3,882,201; the capital reserve has been increased by just over £4,500 to make £412,545. The debenture stock remains unaltered at £3,542,704. The monies invested have increased by £54,465 to £8,305,022, £6,237,780 of which is in quoted investments and £2,067,242 in unquoted investments.

EXPANSION OF OVERSEAS INVESTMENTS

The analysis of our portfolio shows that the principal variation during the year under review is a reduction of 9.5 per cent in our investments in this country and increases of 3.4 per cent and 4.9 per cent in our investments in Canada and the United States respectively, by which exchange we obtain, after taking into account relief from double taxation, a higher yield on our money and a comparable class of security. I think you will agree that this has improved the spread of our holdings and at the same time it has enabled us, in so far as Canada is concerned, to pursue our policy of giving assistance to commerce both in this country and in the Commonwealth overseas. As you know, we are particularly interested in development in the Rhodesias and South Africa, and I have recently visited those countries so as to keep in touch with events in those areas. I am happy to report that I maintain the fullest confidence both in those countries and the companies in those areas in which we are interested.

The report was adopted.

GROSVENOR HOUSE (PARK LANE)

"EXPORT OR PERISH"—HOTELS RESPOND

BOARD'S POLICY OF EXPANSION

The twenty-fifth annual general meeting of Grosvenor House (Park Lane), Limited, was held on August 27th in London, Mr Charles S. Taylor, MA, DL, MP (the chairman), presiding.

In his circulated statement Mr Taylor stated that while stockholders would agree that the results were excellent, unfortunately that was not the whole story.

The net profit for the year ended March 31, 1953, at £273,027 showed an increase of £73,000, which was £35,000 higher than the previous highest record in the company's history, but Excess Profits Levy swallowed up £20,000 (the equivalent of a gross dividend of 4 per cent!), and when income tax and profits tax were also added to that figure the Exchequer would take £59,000 (the equivalent of a gross dividend of nearly 12 per cent!) out of the £73,000, leaving the company with less than one-fifth of its hard-won extra profits.

Year after year it had been dinned in the nation's ear by successive Chancellors of the Exchequer that we must export or perish. Tourism, in which the hotel industry played such an important part, was one of the country's largest invisible exports, yet punitive taxation was imposed when they succeeded in doing exactly what they were asked to do. That policy would not stimulate the expansion and improvement of hotel accommodation in Britain.

"We have to compete with new hotels in Italy and in Germany," stated Mr Taylor, "some of which, I understand, have been built with American dollar aid. Not only have we had no share of Marshall Aid for this purpose, but much too great a percentage of our own legitimate profits has been taken away from us by taxation."

A WELL-MANAGED BUSINESS

Stockholders would be interested to know that the increase of profits during the year was a result of an increased turnover in the basic revenue-earning departments, but

spending power was not what it was and the restaurant, bar and lounge takings had not shown a corresponding improvement. That was all the more significant in view of the fact that, because of the raising of restrictions, they were at long last able to serve really first-class meals, and their cuisine was regarded as among the best in London and now compared favourably with the finest in any capital city in the world.

Referring to the board's offer, which was not accepted, for the ordinary and preference shares in Gordon Hotels, Mr Taylor stated that they still believed that their proposals at that time would have been advantageous to all concerned.

The board had given considerable thought to the problem of how not only to consolidate the success of the company, but also to expand its activity as opportunity offered. With that in view a resolution would be proposed that the authorised capital of the company be increased by £500,000. While the board had no proposition immediately in mind, they were continually on the look out for worthwhile possibilities.

The report was adopted, a total distribution of 10 per cent (against 6 per cent) was approved, and the increase of the company's authorised capital was sanctioned.

OLDHAM & SON LIMITED

NEW DEVELOPMENTS IN BATTERY AND ELECTRICAL EQUIPMENT FIELDS

The thirty-fourth annual general meeting of Oldham & Son Limited was held on August 27th at the company's head office, Denton, Manchester, Mr John Oldham, OBE, JP (the chairman), presiding.

In his statement, circulated with the accounts, the chairman reported a net profit for the year of £262,541. After providing for taxation there was a balance of £109,247. It was proposed to pay a final dividend of 10 per cent on the ordinary shares which, with the interim dividend already paid, brought the total distribution on the ordinary shares to 17½ per cent for the year. During the year the ordinary share capital was doubled by a share issue of £200,000 from reserves. Thus the amount of the dividend which for last year was

expressed as a 35 per cent dividend remained unchanged.

BATTERY MARKET CHANGES

In the course of his speech Mr Oldham said:

During the financial year just ended it can be said that trading conditions affecting the car replacement and battery market reflect backwash of the Korean war. The twelve months which followed the outbreak of hostilities witnessed a considerable increase in the price of lead, this was followed by increased demands both at home and overseas as stocks were built up during this period through apprehension of shortages arising out of a possible extension of the Korean conflict.

In the period to which I now refer the reverse side of this minor boom has been experienced. With trade stocks of batteries now at lower and more stable levels together with more normal trading conditions, increased demands can be expected.

On the other side of the picture, it is satisfactory to report, as I have already stated that other departments have increased their business and this, together with the application of the new methods and processes of production upon which I commented last year, has been instrumental in offsetting to a considerable extent the effect of the departmental recession to which I now refer.

It is gratifying also to observe that overseas, our South African company and our French company report substantial increases in the volume and value of the business they have done during the past year.

THE VALUE OF RESEARCH

Of particular interest are our outlets many branches of industry—not only for the immediate value as markets but because the seems to be no limit to industry's capacity for devising new equipment to whose operation storage batteries are essential.

LARGE-SCALE FIBRAK PRODUCTION

The new Fibrak battery separator, to which I have referred in former reports and which has now got into large-scale production, together with the introduction recently of a range of emergency lighting equipment for use in hospitals, public buildings, and industrial concerns, are two illustrations which suffice to indicate the diversity of the long term research and technical development programme laid down to ensure the flow of new ideas and improved technique.

UNIVERSITY OF GLASGOW

ASSISTANTSHIP IN POLITICAL ECONOMY
Applications are invited for an Assistantship in Political Economy. Salary scale £400 to £550. Initial salary according to qualification and experience. F.S.S.U. and family allowance benefits. Applications (3 copies) should be lodged, not later than Saturday September 19, 1953, with the undersigned, from whom further particulars may be obtained.
ROBT. T. HUTCHESON, Secretary of University College.

VICTORIA UNIVERSITY COLLEGE

WELLINGTON, NEW ZEALAND
The Victoria University Council proposes shortly to appoint a Professor of Social Science, and now invites applications from suitably qualified persons.

Salary will be at the rate of £1,500 p.a., rising to £1,700 p.a. by annual increments of £100. Allowance is made for travelling expenses. Further particulars and information as to method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1. The closing date for the receipt of applications is September 17, 1953.

OPERATIONAL RESEARCH, COURTAULDS, LIMITED, has a vacancy for an Assistant in its Operational Research Department with a degree in applied mathematics, physics, chemistry or engineering and with an interest in investigational work. A knowledge of statistics is desirable but basic mathematics for learning statistical methods and related techniques is essential. Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds, Limited, 16, St. Martin's-le-Grand, London, E.C.1 quoting the reference number C.47.

GRADUATE in Economics (including also special study of commercial and company law), 28, with nine years' all-round banking experience, including accounting in U.K. and abroad, desires position in town or country where interest and scope for ability to think for oneself are predominant features.—Reply Box 321.

Colonial Problems and Prospects

The Times British Colonies Review, an illustrated quarterly periodical, brings together news and expert opinion on every aspect of Colonial development to-day. The next issue will include articles on the following subjects:—

- TRAVEL IN AFRICA
- COMMUNIST PROPAGANDA IN THE COLONIES
- WOMEN'S WORK IN THE COLONIES
- HORSE-RACING IN NIGERIA
- UGANDA'S FOREST SCHOOL FOR AFRICANS
- COLONIALS IN BRITAIN
- THE IMPERIAL INSTITUTE
- RESOURCES OF THE COLONIAL EMPIRE (X) COAL
- CAREERS IN THE COLONIES (IV) SURVEYING
- COLONIAL FINANCE AND COMMERCE

THE GLASGOW SCHOOL OF MANAGEMENT STUDIES

ROYAL TECHNICAL COLLEGE GLASGOW and THE GLASGOW & WEST OF SCOTLAND COMMERCIAL COLLEGE.

SESSION 1953-54

Day Courses

The School will offer the following full-time courses of one session's duration:—

PERSONNEL MANAGEMENT
WORKS MANAGEMENT
BUSINESS ADMINISTRATION

In addition the following courses will be available:—

MANAGEMENT AND LABOUR RELATIONS
(9 weeks full-time.)

INDUSTRIAL RELATIONS
(4 weeks full-time.)

PRODUCTION PLANNING AND CONTROL
(3 weeks full-time.)

WORK STUDY
(3 weeks full-time.)

EXECUTIVE PROGRAMME
IN BUSINESS MANAGEMENT

(Intermediate: Day Release and Remote Area Scheme.)
(Diploma: Day Release Scheme.)

Evening Courses

A general management course is offered leading to the

**MANAGEMENT DIPLOMA OF
THE GLASGOW SCHOOL OF MANAGEMENT
STUDIES.**

For commencing dates and full details see special pamphlet "Education for Management," obtainable on application from either of the following addresses:—

The Royal Technical College, George Street, Glasgow, C.1. The Glasgow and West of Scotland Commercial College, Pitt Street, Glasgow, C.1.

This tubular steel chassis for the Cooper-Bristol racing car is no skeleton in the cupboard — it has many important successes to its credit in England and abroad. The tubular steel construction gives great rigidity and strength to the framework and, at the same time, lightens the total weight considerably. Those who know tell us that this form of construction, using Accles & Pollock's seamless steel tubes, is pointing the way for future development in motor car design generally.

Influential business men
in over 100 countries prefer
TIME INTERNATIONAL
to any other publication

The four editions of TIME INTERNATIONAL, published in English, cover the world's most important markets outside the U.S.A. Every week these editions are read by more than 1,700,000 influential people in over 100 countries. Not only are 92% of TIME INTERNATIONAL subscribers in business, government and the professions, but the world's top business men prefer TIME INTERNATIONAL to any other publication. TIME INTERNATIONAL readers everywhere are the men and women who make trends, influence opinion, and help to determine the trading policies of companies and governments. To the advertiser, these are the people who *shape the course of business throughout the world!*

You can buy advertising space in all four editions—TIME Atlantic, TIME Canadian, TIME Pacific and TIME Latin American—or in the editions that cover the areas in which you are most interested. Full details from: The Advertisement Director, Time International, Time & Life Building, New Bond Street, London, W1

'ENGLISH ELECTRIC'

Massive ingots of white-hot steel are transformed into 15-ton coils of strip 5 miles long at speeds up to 50 miles an hour by the train of mills of which the rolling mill illustrated is the first and biggest unit. Its electrical drive, the largest of its type in Europe, was built by 'ENGLISH ELECTRIC' and consists of twin motors developing 27,600 horse-power.

bringing you

Steel plays a greater part in our daily lives than any other metal. Look at this picture and count the number of things in which steel is used — including the 'ENGLISH ELECTRIC' refrigerator, cooker and washing machine. In this, as in so many other ways, 'ENGLISH ELECTRIC' is meeting the nation's needs — by helping to increase our exports and at the same time bring better living to millions at home.

The Unions and Socialism

THE eighty-fifth Trades Union Congress is assembling this weekend in the Isle of Man. More perhaps than any of its predecessors, it is important not as a discussion of trade union affairs but rather as a forerunner of the Labour party's conference three weeks hence. The novel and controversial document that will come before the TUC delegates is the report on public ownership prepared by their General Council in response to the instructions of last year's congress. The instructions were to "formulate proposals" for taking new industries and services into public ownership. It was agreed that the formulation could not be, by this month, complete; "priority plans plus a progress report" were required. But they were to be plans that could, after endorsement by this year's congress, be "presented to the political wing of our movement for inclusion in Labour's General Election programme." The TUC debate will thus deliberately embrace the main theme of the party conference's own debate on future policy.

The TUC's influence on Labour policy is by nature more often a limiting than a positive influence. Since the unions provide the solid mass of Labour support, both in finance and in numbers of votes, party policy cannot move far out of line with union policy, whenever that is generally agreed and defined with any approach to clarity. The outcome of the Labour party's debate on nationalisation—whether the new party programme proposes much or little of it—depends largely on the force and clarity of what is said in the Isle of Man next week. There is no question about the direction of the TUC's influence. It will bolster the right-wing view within the Labour party, the desire for modesty in proposals of further nationalisation. The question is whether the TUC will declare itself for modesty with sufficient unanimity, and plainly enough, to put an effective restraint on the enthusiasm of the left-wing politicians for more nationalisation.

The leaders of the TUC, as they express themselves in the General Council's report, could hardly go further in opposing nationalisation. Comment on the report has perhaps fastened too much on the fact that the TUC counsels inquiry and caution in cases, such as the chemical industry, where the draft party policy embraces some—though an ill-defined—measure of nationalisation. This does not, it should be emphasised, represent a sharp division between the industrial and political wings of the Labour movement. The party policy is a compromise between Left and Right. In differing from it, the TUC is merely playing its usual part on the Right. Its report on nationalisation is no cooler than the personal views of many Labour politicians. The difference is that the trade union leaders feel more secure. Views about nationalisation are still, after all, a secondary concern of the trade unions, not a primary concern as they are in Labour policy-making. This helps the General Council to say more nearly what it honestly thinks without being afraid, as the right-wing party leaders are, of being voted down by their own followers. The

range of political opinion among union leaders remains, indeed, almost as wide as it is within the Labour party. But in the unions the greatest strength lies much nearer to the Right, and where the opponents of nationalisation among the Labour politicians have to swallow a compromise view tolerable to the Left, the TUC leaders can say—if they are tactful—what they think.

Tact is important. The General Council would be in hotter water than it likes if it did not give at least a temperately favourable verdict on the performance of the nationalised industries. British trade unions rejoice in that fundamental kind of conservatism which insists that what has once been thought must remain, in all essentials, true: at the worst, it may not be quite applicable to changed circumstances. This is the only intellectual process by which the TUC can abandon nationalisation. What it thinks now must be presented as the logical development—and a development no more than external changes require—of what it said in the 1944 report on postwar reconstruction. And if this is so with ideas, it is inevitably more so with emotions. The TUC may boast of an empirical attitude, settling the future of each particular industry on its merits, but the delegates would not brook any open doubt about where the General Council's heart lies: it does not need to be for socialism; but it must certainly be, as a general rule, against capitalism.

★

These things determine the form and manner of the General Council's report. If that is understood, its contents are seen to be more definite than has yet been generally recognised. They are not merely counsels of caution and moderation, of investigating further before making decisions. That is the General Council's slogan, not its detailed argument. The left-wing Labour politicians would like everyone to believe that it stops at the slogan; since caution is obviously not enough for a party programme, that would leave them with a fairly free hand. But the ways of the TUC should by now be familiar enough for it to be understood that the report goes far beyond caution about nationalisation. It goes against nationalisation. The present leaders of the British trade union movement have now said—with a wealth of detailed argument, and as clearly as the customs and folklore of the movement permit—that in their judgment any further nationalisation would almost certainly do no good, would probably be bad, and might even be disastrous.

To this there is one exception. The TUC favours the nationalisation of water supply. Significantly, it says so in six lines. It goes into no detail, although this is the only one of the required "priority plans" that the General Council is submitting to the congress. It also makes some tentative gestures about land and distribution, but these are obviously of minor concern to the industrial wing of the labour movement. All the remainder of fifty closely-printed pages presents, formally, the required progress report on the General

Council's thinking about public ownership. In fact, it is a sustained presentation of the case against further public ownership. Though the conclusion about many of the industries discussed is not a direct negative, but rather an admission of the scope for further discussion with or by someone, the "progress" is plainly of the sort that is intended to lead nowhere. The TUC does not share the naivety of one constituency Labour party which, in the resolutions for the annual conference, wants to declare that the next Labour Government will obtain such information as "will enable it to completely justify the replacement of free enterprise by nationalisation." The TUC does not prejudge inquiries so ostentatiously, but there is nevertheless no doubt what conclusion the General Council would hope and expect to emerge. Water always apart, it is opposed to any further experiments—for the present—in public ownership.

Even this "for the present" is not a very serious limitation on the argument. The TUC examines in a most sober and realistic spirit the economic position of Britain and the need for bigger exports. It concludes that in five years' time visible exports ought to be 20 per cent bigger than in 1951, which raises the famous postwar target—75 per cent more exports than in 1938—yet further, to 115 per cent more than in 1938. The TUC says—by implication, but plainly enough—that further nationalisation is largely irrelevant to this task. It might help in some respects and hinder in others, and the balance is hard to weigh; from which few reasonable men will fail to conclude that experiments in public ownership are best left alone. And this cannot be a conclusion merely for the very short run. The TUC fosters no illusions about the difficulty of exporting 115 per cent more than in 1938. If the unions see the country's economic needs in such terms, they cannot imagine that a purely temporary crisis is involved. To abstain from further nationalisation is not a prescription for riding out a short-lived storm, after which the march to socialism can be resumed. On the contrary, the arguments against further nationalisation are based on the permanent conditions of life for Britain in the second half of the twentieth century. The TUC's conclusion applies not to the party programme for one election, but to the foreseeable future.

★

It may be doubted whether many members of the General Council are looking so far ahead. The fact remains that in their pragmatism about present policy they have given at least some indications of long sight as well as of clear sight. It is a pity that their views are wrapped up in a lengthy report, which few of their constituents will fully digest, but this must be accepted as one of the facts of trade union life. It does not lessen the praise due to the union leaders for their courage and realism.

It is too early to speculate about where all this may lead to. It may prove to be a false start, or it may, on the other hand, be the beginning of a definite divorce

between British trade unionism and socialist theory. Even the immediate reactions of the delegates in the Isle of Man cannot be confidently foreseen. The General Council will certainly be accused of a lily-livered betrayal of proletarian interests. But if the volume of criticism is not too great, and if the General Council sticks to its guns, the report should have a powerfully moderating effect on the Labour party. It may at least restrain the annual conference from injecting into party policy more nationalisation than the draft programme already contains. That is one thing, and welcome.

It is quite another to know what Labour policy will be if it is not more and more nationalisation. The TUC, in discussing the aircraft industry, goes so far towards making its peace with private enterprise as to say that "the profits made by the firms are in the

Demagogy at Uno

THE spectacle of the United Nations preparing the Korean peace-making has been something more than disappointing. It has been alarming, sordid and unpleasant: alarming because the prospects of peace may have been made worse rather than better; sordid because of the blatant vote-gathering that went on among the recognised clients; unpleasant because of the rudeness and impatience—a kind of Vyshinsky-Dulles measles—that characterise its methods of negotiation. Personalities, it is true, were partly to blame; governments, too, had been less efficient than they should have been in telling one another of their intentions; but much of the blame falls on the working methods of the United Nations. That body, having enormously increased its prestige by opposing aggression so promptly and efficiently, has fallen below its opportunities; there must be something seriously wrong with an organisation that can, in less than a fortnight, bedevil a vital political conference, estrange the United States from its allies, and—incidentally and quite gratuitously—put a spoke in the wheel of Indo-Pakistan rapprochement. In the past some of the nonsense that goes on in the Assembly has been defended as a valuable letting-off of steam that might otherwise produce explosions. On this occasion the steam has very nearly blown away the chances of peace.

The chief cause of this sorry record is persistence in a method of diplomacy that does not work. Open diplomacy is, in fact, a contradiction in terms. When a diplomatist has a public audience something changes in him. He begins to make debating points, to seek effects and generally to behave as though it were his business to make a case and not to settle one; he becomes an advocate instead of a diplomat, and he merely brings the belligerency of the battlefield back into the council chamber. This weakness is inherent in all but the best of human natures, but its temptations

nature of an agency fee for managerial skills, and are also a price worth paying for the continued smooth running of the industry." The General Council may now be near thinking the same about other profits, but the Labour movement as a whole is still very far from admitting what freedom must be allowed to private enterprise if it is to do the job for which faith in public ownership has been lost. The alternative to an aggressive socialism in British Labour politics is still a vacuum, not a new political philosophy. And as long as it is a vacuum, any victories of the right-wing over the left-wing are likely to be temporary; they are holding operations, which will not prevent socialist doctrine from reviving whenever circumstances change. But at least the TUC has helped to clear the ground for an alternative policy if the Labour politicians are capable of devising one.

and effects are greatly increased—especially in the United States—in an age of popular journalism, radio and television. To ask Mr Lodge, for instance, to address the Assembly last week without giving a thought to the watching American public, is to ask the impossible. Consequently, his contribution to the problem of picking the members of the coming conference consisted in taking up a number of positions prepared beforehand (largely under pressure of public opinion) and refusing to budge from them. If the discussions had been private, he would have found it easier to explain and, if necessary, to modify positions which caused such embarrassment to his friends.

This is not to say that the record of secret diplomacy since the war has been one long triumph. Defenders of the United Nations may legitimately round on their critics and ask whether negotiations "through channels" about Germany and Austria have led to anything but frustration. The answer is, that they have at least not made matters worse in the way that the United Nations made matters worse last week. Indeed, if success be measured in terms of achievement, then secret negotiation has had its triumphs. The Japanese peace treaty was negotiated—by Mr Dulles—in secret; the North Atlantic Treaty was negotiated in secret from start to finish; the Berlin blockade was lifted as a result of secret talks; discussions behind closed doors on the Coal and Steel Community and on the European Defence Community achieved the not inconsiderable success of bringing France and Germany together on a number of points. Whether or not one approves of the results in these cases is here irrelevant; the point is that the end aimed at was achieved. Even the Saar, that thorn in Europe's western side, has been discussed sensibly and profitably by M. Schuman and Dr Adenauer; one has only to try to imagine what would happen if the Saar got on to the agenda of the United

Nations to realise the dangers of that organisation's present methods.

The experience of the last few years, reinforced by the events of the last few weeks, shows that the United Nations is going about its business in the wrong way. Its purpose is to settle international disputes and to lessen international tensions; but its machinery of public debate is being used for exactly the opposite purpose. It is difficult to believe that this is the only way in which the United Nations can function, and it should not be beyond the wit of Mr Hammarskjöld, the Secretary-General, to devise within Uno additional and more suitable working methods. Those who take the easy course of attacking the organisation lock, stock and barrel are wrong; it is not necessary to pull down the whole house in order to regulate the temperature. And those who, like Mr Dulles, place their faith in changes in the Charter are probably equally wrong. Tinkering with the Articles is not going to make very much difference, even though certain changes could usefully be made. For example, some method must be found of altering the permanent membership of the Security Council; the present arrangement specifies five states as Great Powers in perpetuity, but facts will one day make this proposition look silly.

Money for Malaya

DISCUSSIONS are now going on to determine the amount of further financial aid that Britain is to give to the Federation of Malaya in the early future. The Federal Government recently took the unusual step of announcing the fact of Britain's intended gift in principle, immediately after the meeting of the Executive Council, which followed the return from London in early August of the deputy High Commissioner, Sir Donald MacGillivray. The circumstances that give rise to this chain of events deserve to be more widely appreciated than they are, since they are certain to have a lasting effect on Britain's relations with the whole of southern Asia.

For almost exactly six years—the anniversary fell a fortnight ago—Britain has had a unique credit balance of goodwill in southern Asia, created by the manner and timing of the transfer of power to India and Pakistan in 1947. From time to time this balance rises or falls with the give and take of international life, but on the whole it falls. Meanwhile, during five of the six years that India and Pakistan have been independent, the struggle between Communist terrorists and the government has been raging in Malaya, a territory in which Britain still rules as the supreme power, although in some respects only indirectly. Since the war Malaya has, in fact, taken the place that India used to occupy as the focus of British interest and responsibility in southern Asia. Conversely, it is by their handling of

The United Nations has two principal functions in handling international disputes: to act to prevent aggression, and to settle and conciliate. In Korea it has shown that it can do the former but that, in attempting the latter, it is likely to open more wounds than it heals. The enforcement function depends on the will of the members; enough of them have shown that will. But the conciliation function depends not on will (which is no doubt abundant) but on skill, and on providing the right opportunities and environment for the exercise of skill. Mr Hammarskjöld is fortunate in having come to office after the United Nations had shown its mettle when provoked. He does not have to worry too much about will, but he does have to worry more about skill. He could do the United Nations no greater service than to devise ways of making it a more effective forum, not for squabbling but for settling. But no amount of ingenuity and vigour on the part of the Secretary-General will make any difference unless he has the backing of the Great Powers. If he is allowed to fail, then either the United Nations will go on doing more harm than good in the sphere of peacemaking or it will be abandoned, and the Great Powers will return to secret diplomacy in places where there is neither television, nor a dollar problem, nor a Latin-American bloc.

the problem of Malayan nationhood that the British will in large part be judged by Asians.

This problem of Malaya's political development has been posed neatly and completely by the Executive Council's recent announcement in Kuala Lumpur. The British government has come to the financial assistance of Malaya several times since the emergency began in 1948, but on this occasion there are two special new factors. The fall in tin and rubber prices has slashed Malaya's own revenue severely, and the military demands of the emergency, while still costing a great deal, are giving way to the longer term political needs of the future. The drop in Malaya's own revenue has thus occurred at the very moment when a new and ultimately vital stage must be developed in the political life of the country. Britain is therefore symbolically confronted, in terms of hard cash, with the immediate question of helping to frame and finance a social economic and political policy for Malaya, which may end by costing as much as the struggle with the Communists.

On several occasions since the war Britain has promised Malaya the eventual freedom to choose its own course, either inside or outside the Commonwealth. One of the most categorical promises was contained in the directive issued by Mr Oliver Lyttelton on behalf of the Conservative government to General Sir Gerald Templer, the present High Commissioner, when he

went to take up his post early last year. In order to be in a position to exercise any such choice, however, Malaya has not only to develop a democratic system of representative government, but must create a sense of nationhood by bridging the deep divisions which still exist between the main races in the community, Malay, Chinese and Indian.

The emergency created by the Communist terrorist attacks appears to be reaching the end of its more critical and violent phase. By the fifth anniversary of the outbreak of the insurrection on June 16th, 6,304 Communists had been killed or captured at a cost of the lives of 2,848 civilians and 1,563 members of the security forces. General Templer has given full warning that in this kind of warfare there is unlikely to be any sudden or complete victory in the sense that attacks of all kinds will cease. But now that the scale of the menace has been greatly reduced, the basic long-term problem emerges more clearly. Put at its simplest, it is: how and when is Britain to leave Malaya? No one who recognises the facts of Malayan life believes that any date should be set in advance. In reality, it will take at least a generation to bring this multi-racial community to the point where it stands a good chance of not becoming another Burma. Political pressures, however, are virtually certain to force the pace, and some day a date will have to be set. The difficulty is that to name a date far ahead is to play into the hands of the ultra-nationalists, while to name one too soon is to undermine the confidence of those who have placed their faith in Britain's ability and determination to honour its word, that Malaya will not be prematurely surrendered to the domination of any one section of the community.

Although voices are often raised in Malaya with the cry of independence, the first question to ask is what they really mean when they use the word. No country in the modern world can be truly independent if it is threatened by powerful forces from without and by sustained insurrection from within. Independence is often a mere catchword which no longer means either what it used to mean or what those who use it unthinkingly expect it to mean. When they speak of independence for Malaya many of them really picture a state in which the country is sufficiently at peace, and has the freedom to choose its own form of government and to run its own affairs. At present this is not attainable, however, without the help and protection which Britain is in a position to afford.

For the British the problem presents itself in three forms. One is the task of developing a genuine electoral system designed to function within the complicated framework of the existing constitution, which is based on treaty rights for the Malay sultans; a special commission is in fact just beginning to work on the whole federal electoral question, and action should be possible on its findings during the course of next year. Another aspect of the central problem of preparing Malaya for eventual independence is the need to promote the political advancement of the Chinese who, even in the Federation, now number nearly half the

population. A third, and perhaps the most difficult task of all, is to ensure greater Malay participation in the economic life of the country; attacks must be made on the rural backwardness of the Malay villages and an attempt undertaken to assist the Malays to hold their own in commerce against the more go ahead Chinese.

Without some measure of success in each of these three fields it is idle to talk of Malaya being ready for self-government, let alone complete independence. Indeed, it is knowledge of this fact that makes some sections of each community fear that the British may yet be hustled into premature evacuation by Communist pressure or by cynical exploitation of pseudo-nationalism; the Malays are already afraid that the Chinese would swamp them and the Chinese that the Malays would deny them their basic political rights. In spite of the emergency, some tangible progress has been achieved in each of the three necessary directions. Municipal elections have lately been started in the larger towns. Laws have been passed through all the stages of the laborious constitutional machinery to extend the range of citizenship to the Chinese, in accordance with decisions painfully hammered out in the Communities Liaison Committee. And a beginning has been made in helping the Malays to assume a more effective economic role in the community.

★

It is only necessary, however, to examine this progress in any detail to see at once how relatively little has been done and how much there is to do; in two and a half years, for instance, RIDA has only spent what goes on the emergency in ten days. A remarkable start has been made considering the crippling burden of the emergency, but only a relaxation of the many special emergency regulations and a loosening of the purse strings for normal civilian purposes can really speed things up to the rate which should be the aim. The slackening of the Communist attack at last makes such acceleration possible, and it is precisely at this moment that financial help from Britain could and should prove to be of the most value; this help is particularly needed now, since security precautions must also continue at a high rate of expenditure for some time yet.

Britain has nailed its flag to the mast of a multi-racial community in Malaya. It is the official view that only by ensuring that loyalty to this new and composite little country overrides the deep traditional loyalties of race and religion can a free and self-governing Malaya take its place among the nation-states of South East Asia. This multi-racial community is nevertheless a high ideal, of which history unfortunately offers very few successful examples—though to aim high is no whit less praiseworthy for that. Indeed, there seems little real alternative, and progress so far is not entirely discouraging. In Malaya itself a beginning has been made by political alliances between members of the United Malays National Organisation (Umno) and the Malayan

Chinese Association. In England the teachers' training college at Kirkby near Liverpool, where 300 Malayan teachers of all races are being groomed for the new schools programme, is an inspiring success. But it is one thing to have an ideal and another to let it run away with policy. There are many incalculable difficulties ahead, including the simple fact that once the emergency is really out of the way the centrifugal forces in Malaya may well gather new strength. What

Middlemen of Travel

THE public travels more than ever, both on business and pleasure; at one end of the scale businessmen fly to export markets and officials to conferences, while at the other holidays-with-pay have swelled the annual migration to the seaside, to the country and to "abroad." It looks a good wicket for the travel agent—and the public sometimes feels vaguely suspicious of the ubiquitous middleman of travel whose stock-in-trade seems confined to a windowful of posters, a counterful of leaflets, some timetables, a telephone and a rack of railway tickets. It looks easy money—even if changes in foreign currency allowances or strikes in France land him in trouble from time to time.

Holidays for the masses have been big business for decades and travel agency services have grown with it. But travel agents are far from admitting to any windfall profits since the war. Though in 1952 their turnover was nearly three times that of 1938—the best interwar year—the volume of business was no greater. Tours which cost £1 a day before the war cost £3 or £4 a day now. Costs have soared proportionately, but the productivity of counter clerks has not risen. The amount of work involved in arranging each individual journey has increased. The rate of commission varies from 5 per cent on railway tickets and 7 per cent on airline bookings to ten per cent on continental hotels, and perhaps averages 8 per cent; but it is now difficult for a large agency to make a profit on much less than 9 per cent of turnover.

Eight per cent may seem plenty for handing over some railway tickets, making some reservations and providing an itinerary; but it is skilled work. The public gets a service based on knowledge which takes a long apprenticeship to acquire: knowledge that makes all the difference, in terms of an undelayed journey or an unspoilt holiday, and is, therefore, unusually valuable. Inevitably, travel agents handle overseas rather than home travel. They arrange nearly all the 3,000,000 passenger journeys into and out of Britain annually—but probably not more than one holiday in ten is taken abroad. Of those taken at home, travel agents arrange mainly coach tours, a small if growing part of the total.

From their inception, travel agents thought of their function largely in terms of guided or inclusive tours; the only individual traveller who repaid the

is needed is patient and ungrudging help from Britain, a cool refusal to capitulate to political pressure wherever it may come from, and the determination to push on with those policies of which the foundations are now being laid. That is why more financial help is now required from Britain, and why the present discussions between Whitehall and the government of Malaya should be approached in as broadly generous and imaginative a spirit as the Treasury will permit.

trouble spent on him was (and is) the first-class passenger. The history of travel agency work has been the steady extension of the trouble-free, "packaged" tour to a widening public: the luring of the middle, lower middle and finally artisan classes abroad. The inclusive tour, whether conducted or unconducted, for which a lump sum is paid in advance and the difficulties of commerce with the natives are reduced to a minimum, is the staple of the travel agent's business and is, for carriers and hoteliers his *raison d'être*, for by it he creates new traffic, and new demand for holidays; with it he trains fresh generations of timid Britons to take to continental travel as an annual matter of course.

★

The inclusive tour, moreover, really pays. Individual items on the bill are not stated, and for large parties (even if they proceed as individuals) the agent gets special terms, from railways and hotels and from local bus operators. His profit margin on inclusive tours ranges up to 25 per cent, and is the means by which he offsets his less profitable lines. But costs are high. Tours must be planned in advance with a thorough knowledge of what the buyer will get, there must be plenty of choice, current travel fashions must be foreseen, sales literature must be attractive, and finally a skilled sales force must hook the enquiring prospect when he reaches the counter.

Competition is keen. About 370 travel agents are members of the two trade associations, the Institute of Travel Agents and the Association of British Travel Agents; but about 500 agents exist outside these bodies; some, of mushroom growth, seem to mulct their customers. The "big nine" organised in the Creative Travel Agents Conference, did about £44 million of the total £60 million spent with travel agents in Britain in 1952. These nine—Cooks, Frames, Dean and Dawson, Lunns, Pickfords, the Workers' Travel Association, Wayfarers, Co-operative Travel and Polytechnic—combine to run special British and Continental trains with pooled courier services, for which they get special terms; but the competition between them is unrestricted. Their respective holiday "guides" are closely compared, for price and quality,

every spring in thousands of British homes. Shillings count when a family of four is going on holiday.

Running a small agency may seem an attractive way of making a good living. So it is for the skilful few who know the business. But mortality in travel agencies compares fully with that among shops. Little capital is needed, but it is impossible to make a living from selling railway tickets except on the largest scale. Small agents are less dependent on the inclusive tour than the larger, and can make a profit out of individual service. The most successful among them are specialists—and probably half have served their apprenticeship with one of the big nine. They seek the coveted accounts of large firms who regularly send representatives abroad by sea or air. When selling holidays, they may specialise on particular territories which the proprietor knows well, and where he can not only get good commissions, but pay special attention to the little details which make up the whole impression—the wines, for example, or the arrival timed to coincide with the floodlighting of historic buildings, or excursions to little-known and charming places.

Many of the smaller agencies, particularly in the provinces, specialise in their clientele; they learn exactly what the inhabitants of a particular suburb, the workpeople of a particular firm, will take in the way of a foreign tour, and arrange it to formula. One agency deals with travel by cargo boats or British railway steamers, another covers sporting events, another arranges theatre and opera tours through Europe; others, again, specialise in scientific conferences. Such enterprise creates traffic for carriers and hoteliers and resorts as surely as the massed tours organised by members of CTAC; the smaller firms are often highly enterprising.

But neither for big nor for small agencies has the postwar holiday boom provided easy profits. It is doubtful how far restriction of foreign currency allowances has cut turnover, except when the allowance was reduced to nil and spoiled one winter sports season. It has been estimated that when the basic allowance was £50, the average traveller spent £42 on a continental holiday at the travel agent, of which £15 represented his fare, and was paid in sterling; only £27 came out of his allowance (for accommodation and service) leaving him £23 spending money. This was probably more than the average tourist needs for extras and souvenirs to smuggle triumphantly through the customs at Dover. On a £25 allowance, however, no spending money would be left, which meant very

austerely planned holidays; the £40 allowance, leaving £13 for personal spending, is held to be fairly adequate. But such restrictions do cut out the once-remunerative first-class passenger. However, even Americans travelling for pleasure, and uplift spend much less on the average than before the war; and the place of the first-class passenger is now taken by the business man with his special allowances.

More inconvenient to agents have been sudden changes in the allowance, either requiring last-minute economy cuts in advertised tours or coming too late to arrange additional comforts. In either event the agent loses commission, good will and business. Changes in fares have also hit agents. Since the war, too, the playground area has narrowed. Eastern Europe is off the menu, though the immense popularity of Yugoslavia this year may indicate the potential sterling earnings forgone by the people's democracies. Dollar countries are also excluded. Nor have the popular

prewar sea cruises come back. Agents used to charter liners from the Australian run in the off-season at 15s. per cruise passenger per day. Emigrants are now keeping the ships filled all the year round, while operating costs have leapt up. Limited foreign exchange allowances have made it chancy to seek to popularise areas further out—North Africa, for example. The tightness of the people's purse is the deciding factor—this and the aggressive selling of the coach tour operators at

home have kept down the demand for foreign travel, despite increased expenditure on holidays and leisure.

Are travel agents enterprising enough? Perhaps the first question that should be asked is whether they should, as on the continent, be registered, to prevent the frauds which are still perpetrated on the public. That problem apart, agents have done much to develop new forms of travel. The effort to develop continental bus tours ran up against the effective opposition of the French railways; but travel agents were largely instrumental in converting the airlines to the wisdom of developing tourist services at tourist fares, by chartering aircraft for parties at what were in effect tourist rates. Tourist air travel has immense possibilities. The first effect is to lengthen the actual holiday; the next effect should be to encourage holiday-makers to go much further afield. It may not be fanciful to foresee the day when "Commonwealth holidays" for the masses will provide agents with far bigger returns than ever did the "Maharajah and grouse moor" departments of a bygone age.

The National Income

THESE charts illustrate some of the findings from the latest blue book on national income and expenditure, which is discussed on page 647. The three top charts show what has been happening to national resources and their use. The gross domestic product as factor cost (which is less than the national product by the amount of net income received from abroad) was valued at £13,525 million in 1952—35 per cent higher than in 1948 in money terms, but only 11 per cent higher in real terms. The fall in real product in 1952 was met by a cut in personal consumption and by less stockpiling,

while more resources were used by the Government.

The remaining charts all relate to personal incomes and personal spending. The fourth chart shows the real movements in incomes after allowing for price changes, but incomes of small traders and farmers include provisions for depreciation and stock appreciation. Employees' incomes in total have kept ahead in the race against prices; those of small traders and those from rent, dividends and interest have fared worse. Changes in the pattern of real consumption are measured in the bottom chart at constant (1948) market prices.

Notes of the Week

Invitation to Lugano

THERE is just a dash of Churchill and not too much cold water from Dulles in the latest western Note to Moscow about Germany. In his speech to the Supreme Soviet, Malenkov asked for a return to more normal diplomatic methods—for he clearly finds that Soviet methods have boomeranged—and here it is. The Note is brief, courteous and businesslike; there is a precise invitation to Lugano—not, be it noted, Locarno—on October 15th; there is a suggestion that progress on the problems of Germany and Austria “could be expected to pave the way for fruitful discussion of other major questions.” The previous allied insistence that a unified and independent Germany must be free to form what alliances it pleases is presented in less emphatic form, doubtless out of consideration for the fear that Malenkov has expressed that the European Defence Community with Germany in it would be a vehicle of aggression against the Soviet Union. The Note gives nothing away, but makes it difficult for Moscow to refuse negotiation on reasonable grounds.

Indeed, Molotov may find himself not a little puzzled. On Sunday take place the elections that will determine whether Dr Adenauer and his policy of integrating Western Germany with Western Europe and the Atlantic Alliance are to survive. The chances are that they will, and sturdily. If Dr Adenauer wins, then Moscow's chances of stopping German rearmament and the ratification of EDC will have fallen steeply. If he loses, Molotov will want to exploit the obvious desire of the Social Democrats to appease Moscow if the chance is offered. In either case it would surely pay the Russians to talk with the West. On the other hand, there is no denying that the last few weeks have shown Soviet policy to be getting less rather than more conciliatory.

★

What may impress the Kremlin most is the possibility—which cannot be due to mere coincidence—that the conference with the Chinese on Korea might begin in Geneva on the same day that the Russians are invited to attend in Lugano. In other words, it would be possible to link, if necessary, the discussion of Asian and European problems by informal means. Mr Eden and Mr Dulles could disappear over the mountains and lakes with Molotov and Chou En-lai, as Briand and Stresemann did seven years after the first world war. It is difficult to believe that American policy has, at the moment, any such intention; and it is doubtful whether it is British policy to mix up Asian and European matters at this stage. But the bait for the Communists is there, and if they refuse it their desire for peace will become more suspect to the West than it is

already. Those who drafted the Note are to be congratulated on showing that negotiation from strength can be conducted with skill, restraint and a touch of imagination.

Forgotten Formosa

THERE are signs that Washington is impressed by the growing international support for getting the Peking Government, by some means or other, into the United Nations. But advice offered from the sidelines, like the recommendation this week from the Scandinavian governments' meeting in Stockholm, will have little effect if it shows no grasp of the Administration's basic difficulty. This is that the United States could hardly hope to be able to continue support of the Nationalists in Formosa if Communist China were represented at Uno. For if it were voted into the Nationalist's seat as the *de jure* government of China, one of its first acts would probably be to accuse the United States of aggression in helping a rebel faction. Some, at least, of the states that had voted in favour of the Peking government would then feel bound to condemn American policy in Formosa. This would create between the United States and its friends a rift much more dangerous than anything yet experienced at the United Nations.

The fact that Formosa's future is the real difficulty in this controversy is little understood on this side of the Atlantic; and the Americans have increased the misunderstanding by setting the whole matter of Peking's claim to China's seat on the high moral plane of not allowing an aggressor to shoot his way into the United Nations. Hence the widely spread impression that a rigid and doctrinaire American obstinacy is at odds with British realism and desire for peace. Actually it is two sets of facts that are at odds: on the one hand Communist China, with massive supplies from the Soviet Union, controlling the mainland and acting as a great power in the Far East; on the other hand Nationalist China still holding Formosa with American assistance and protection.

If any general negotiation about Far Eastern matters is to follow or accompany the effort to patch up peace in Korea, it will have to take account of these realities. Until there has been a complete change in the mood of international relations the only basis for peacemaking is acceptance of the situation that actually exists—a principle that cuts both ways. If the Peking Government is to be seated in the United Nations without acquiring a legal right to upset the present arrangements in Formosa, it may be necessary to recognise the latter as an independent state. There is no more prospect of the Americans abandoning the island to Communist conquest than there is of the Chinese abandoning North Korea to Syngman Rhee.

Shuffling at Dinner

OVER the dinner table at Chequers Sir Winston Churchill continues his intriguing discussions with ministers. Mr Butler and Mr Crookshank have followed Sir Walter Monckton, Mr Harold Macmillan and Mr Anthony Head in these visits to the Prime Minister's summer home; as one ministerial car after another makes its way up the drive amid the Chiltern beeches, speculation about a Cabinet reshuffle inevitably grows. The rumours are likely to be well founded, in the sense that some ministerial changes are certain to be made well before Parliament reassembles next month. What is still uncertain is their extent. Will they affect the real centre of political power in the Cabinet, or will they concern only ministers who, however important in the administrative team, are politically of secondary account?

This uncertainty arises because one central fact is still obscure. It is whether Sir Winston will by October be fit enough to face once again the full rigours of a Parliamentary session. The indications are that he fully expects to do so, and in that event Mr Eden is likely to remain at the Foreign Office and the other changes will not affect the main structure of the Cabinet. They will probably be confined to those ministers, such as the "overlords," whose functions have through the passage of time (or of legislation) become less necessary, or whose value in counsel has turned out to be less than was promised. But if the Prime Minister proved unfit to stand up to all the buffeting of the day-to-day battle in Parliament, the changes—probably carried out in two stages—would be great. Presumably Mr Eden, if his health is good enough, would then—in, it may be assumed, a second and major reconstruction, rather than in a preliminary reshuffling before Parliament returns—leave the Foreign Office to become at last a full-time Deputy Prime Minister. His official title would probably be that of Lord President of the Council, and he would take over the leadership of the House of Commons. That would bring the withdrawal of Sir Winston from the Premiership (though not necessarily from the Cabinet) well into sight, for it seems clear that Mr Eden has no intention of giving up his department until the time for his succession to the head of the Government is near.

Labour's Leaders

STRENUOUS efforts are now being made within the Labour party to prevent an ugly rift from developing at the Margate Conference, when Mr Herbert Morrison and Mr Arthur Greenwood are due to appear as rivals for the treasurership of the party. Mr Morrison has the backing of several influential unions in his bid to regain, in this way, the seat on the party executive which he lost in the Bevanite landslide last year. But "Uncle Arthur" Greenwood, who seeks re-election after holding the post for nine years, is not only personally popular; he can count on the Bevanite antagonism to Mr Morrison among many constituency associations. In such a contest victory might harm Mr Morrison's prestige only a few degrees less than would defeat.

In order to provide a way round this difficulty, the seamen's union has proposed the drastic step of amending the party constitution so as to give the deputy leader of the Parliamentary party a seat *ex officio* on the executive, a right at present extended only to the party leader. This would carry Mr Morrison safely back on to the executive. But even Labour party constitutions have their rigidity, and it is doubtful whether the change could be authorised before the early stage of the conference at which polling is due to take place for the new executive, including the treasurership. Mr Morgan Phillips, the party secretary, thinks it could be, but the Bevanites have plenty of lawyers fully capable of arguing that it should not. Mr Bing and Mr Sydney Silverman could hardly miss such a golden opportunity for their talents. Patching the rift may be by no means easy.

The nominations for the other places on the party executive, announced last week, show that this year the Bevanites will contest all seven seats in the constituency section, as against the six they fought—and won—last year. This is not, as appears at first sight, a sign that they are increasing their pressure for power, and that a renewed outburst of strife within the party is in prospect. Since Mr James Griffiths, the one non-Bevanite elected last autumn in this section, is almost certain to hold his seat, the Bevanites run the risk of spreading their support more thinly over seven instead of six candidates. They may, indeed, be regarded as having eight runners in the field, for Mr Mark Hewitson, who has been dropped by his union as a candidate for the trade union section and is running for the constituency group instead, shares the Bevanite view on many matters.

A final point of interest emerges from the official Labour statement on these events. Despite the apathy which every observer knows to be widespread in both the main political parties, the membership of the Labour party continues to increase. At 6,100,000, it is now 250,000 above the figure for last year. The increase cannot, moreover, be explained away simply by rising trade union membership; over a half of it was in the individual members of constituency parties, who now number just over one million.

The Economical Strike

THE Electrical Trades Union, having felt its muscles, has again shown that it would rather strike than negotiate. Its well-planned strike of workers in the electrical contracting industry last week forced employers to reconsider a rejected wage claim, although there was reason to think—in spite of some ambiguous replies by the employers—that a little correspondence might have achieved the same result. The strikers were duly back at work when the joint industrial council for the industry met on Monday. But it then appeared that the employers' representatives had no offer to make and that they wanted time to refer the claim to their branches. They promised an answer within a fortnight, but this was too long for the union leaders. Their attitude is that the employers' representatives should have come, as they themselves did, with plenipotentiary powers, that further delay is unacceptable when the wage claim was presented as long ago as February and the strike threatened as long ago as July. They immediately called the strike again, and in an access of special spleen they have

seen to it that all those who are negotiating for the employers have personal experience of the strike in their own firms. All this is too precipitate, as well as too vindictive and too smart, for the electricians to expect any public sympathy.

With or without public sympathy, however, the electricians are in a strong position. They are even stronger since the proprietors of the exhibition hall at Earls Court, in order to avert fiasco at the Radio Show, have given the strikers—including those who had been working for outside contractors—all that they asked. There is little hope that arbitration can end the deadlock, for the union has declared that it will not accept it. The employers are thus in an acute dilemma. If they now take a firm stand the strike could last a long time, for even when it is extended to some 5,000 men, as the intention is, it will still cost the union little in proportion to the dislocation it will cause; and, for a union with Communist leaders, the dislocation may even be partly an end in itself as well as a means of exerting pressure. If, on the other hand, the employers now offer a wage increase it may be a considerable encouragement to other unions to try similar tactics. The engineering union, in particular, might also be able to call out a few key men to support a wage claim affecting some three million workers. It is a disturbing situation.

Help for the Ionian Islands

THE devastated Ionian islands have been the object of a spontaneous and admirable first-aid operation by governments, organisations and individuals in a score of countries. Now the Greek authorities are busy assessing the damage, working out reconstruction plans and counting the cost. Over 380 people were killed in the three islands and over 760 injured; about 90 per cent of the towns and villages were destroyed; over 20,000 houses were ruined beyond repair; the total damage has been tentatively reckoned at around \$200 million. Various unofficial estimates, ranging from \$25 million to \$100 million, of the cost of reconstruction have been put forward.

It already seems certain that Greece's friends and allies are expected to foot the greater part of the bill. Mr Markezinis is unwilling to upset the first balanced budget for many years; he further argues that it would be short-sighted to divert funds from an economic development programme designed to benefit the whole country, for the sake of a sudden catastrophe in a small part of it. None the less the long-term reconstruction of the islands must begin. This is where Nato might come in. Indeed, it is astonishing that nothing has been done by an organisation which is continually bewailing its inability to find constructive, non-military work to do. The Atlantic Council, it is true, has passed a resolution of condolence with the Greeks; but it might more imaginatively have appealed to governments for action. Suppose that each member were giving up a little of the American aid received or expected this year; or that some of Nato's hundreds of staff officers were helping to mobilise prefabricated houses, transport and supply ships with building materials. People would then begin to believe that the famous Article 2 of the North Atlantic Treaty means something after all.

Fire under Trieste

THE angry exchange of words between Rome and Belgrade this week is a reminder that beneath the dispute over Trieste there still smoulders a dangerous fire. No one can know until Marshal Tito has spoken on Sunday whether the Italians have been justified in fearing that he would make a provocative new statement about the territory. So far, however, it looks as if there has been much ado about nothing much. The story began last week in Rome with reports that Marshal Tito was about to announce the formal annexation of Zone B of the Free Territory of Trieste; this has been occupied by Yugoslav troops since the end of the war, though Italy has by no means abandoned claim to it. Then on Saturday afternoon Signor Pella, the new Italian Prime Minister, set the cat among the pigeons by calling conferences with his chief of staff, with officials from the Palazzo Chigi, and subsequently with the British Ambassador and the American and French *Chargés d'Affaires*. Minor incidents have since taken place on the Trieste frontier, followed by accusations and denials.

If Marshal Tito has nothing remarkable to say on Sunday, it will be worth inquiring why this sudden storm should have rolled up so quickly in Rome. If he makes difficulties, it may well be asked whether British and American flattery has not gone altogether too far in Belgrade. The main reason for the storm is the state of public opinion in Italy. Few who have not been there in the past few months can realise the extent to which the course of the Trieste dispute has become for the nation the measure of Italy's return to its rightful role in the world. Signor De Gasperi took great pains to prevent this emotional issue from dominating the recent general elections. Signor Pella, perhaps by design, perhaps owing to less experienced management, is now allowing right wing fervour to bubble up once more into the forefront of public interest. This may strengthen his hand in parliament, but only at the risk of actual collisions between Italian and Yugoslav forces.

On the Yugoslav side, Marshal Tito is indeed playing with a smouldering fire if he ignores Italy's present feelings. The stream—excessive and unwise—of distinguished British

GOLD AND DOLLAR RESERVES
US DOLLARS [MILLION]

holidaymakers to Belgrade, from Mr Attlee to Field Marshal Sir John Harding simply sets nerves in Rome on edge. The Marshal missed a great opportunity of burying the hatchet with Italy when Signor De Gasperi was in power. Today, unless he is prepared to risk losing a great deal of the friendship and respect recently won in the West, he would do well not to tease the Italian moderates beyond the point of endurance.

Malenkov Aid for China

THE report that the Soviet Union has made a long-term loan of 5,000 million roubles to China has not yet been confirmed from either of the two capitals concerned. Should it turn out to be true, it will come as no surprise. It has frequently been pointed out that Mao Tse-tung's ambitious five-year industrialisation plan could not possibly succeed without substantial credits from some outside source. In recent months Soviet propaganda has declared that aid to develop China's resources is the next great task confronting the people of the Soviet Union.

The difficulties are considerable. Not the least of them is the need to rely on a slender and precarious agricultural surplus for the purchase abroad of the machines and materials required to begin the industrialisation programme. Even the Soviet Union was forced to seek foreign assistance in the early Five-Year Plans. Recently evidence has been accumulating that the Chinese are conscious of their limited capacity to buy in western countries the goods they urgently need. Efforts have been made to conserve foreign exchange, particularly sterling; non-essential goods offered in bilateral barter deals have been refused; and efforts have been made to woo the overseas Chinese, who have in the past remitted large amounts in foreign currency to their relatives in the homeland. These signs indicated that the Communist leaders were looking to the West for at least part of their requirements for the plan; indeed, this may still be their intention. But the Russians are doubtless alive to the possibility of an economic wedge being driven between themselves and the Chinese, and this may explain the speed with which the reported agreement has been reached. It is also a reflection of Mao's enhanced bargaining powers since the death of Stalin and the fall of Beria.

Whether Malenkov's aid will be sufficient to satisfy China's needs remains to be seen; but there is already an important lesson to be learned. It is that China's slight

Aircraft in Peace and War

No other sector of British industry is so exposed to changes in strategic conceptions and in commercial requirements as the

BRITISH AIRCRAFT INDUSTRY

Next week's issue of *The Economist* will include a series of special articles, measuring the industry's achievement and its response to the challenge of change.

ability to pay strictly limits the amount of trade the West can do with it. Western business can take a large part in the Communist industrialisation programme only if it will grant generous credits; but Peking's present attitude to the capitalist world and its close ties with Moscow do not make an encouraging background for lenders.

Commercial, Not Sponsored, TV

THE Postmaster-General, in a speech at the weekend, showed again that the Government has retreated from its first careless ideas about commercial television, but he did not show exactly where it stands now. Lord de la Warr said that the Government "envisaged a system whereby the station and not the advertiser is responsible for the programmes." He added:

What we do want to do is to provide alternative programmes, and because we distrust monopoly, from however good a source it may come, we want them to be provided by people other than the BBC.

So much—probably—for the BBC's plans for a second television service. But it is still not clear whether the "people other than the BBC" will be single or multiple, public corporation or private company.

If the Government does decide to give licences to one or more privately owned stations, it can be assumed that there will be no lack of applications. One company that has applied for a licence has already put forward just such a scheme whereby the station will sell time for advertisements in between, or perhaps in the middle of, programmes of its own devising. This recommends itself to many advertisers, for only some of the largest firms have either the resources or the experience to provide their own programmes: and, indeed, it has been approved by two societies of advertisers and advertising agents. On the other hand, some advertisers would be less interested in a service where they had no control over the programmes and would be unable to associate their product with a personality. It is by no means certain, therefore, that a privately owned station working on this system would be profitable.

A station owned by a public corporation would better meet the objections of the Morality and Good Taste faction that has forced the Government's retreat. A privately owned station, even if it operated according to a code of conduct, would design most of its programmes for mass appeal, whereas some that were edifying might be slipped into a public service. But would advertisers then be interested? Would they want to buy time between a scientific talk and a symphony concert? A public corporation could increase its income by advertising revenue, but it could hardly depend on it. Would the Government therefore be willing to break the BBC's monopoly of licence revenue? It seems that there is still much to settle before the White Paper on television appears.

Federation Begins

THE federation of Rhodesia and Nyasaland came into force this week. The first Governor-General, Lord Llewellyn, was due to arrive in Salisbury on September 4th,

and a Prime Minister and interim cabinet will shortly be appointed. The first federal general election will be held towards the end of the year. Three parties are likely to contest the election: the Federal Party, led by Sir Godfrey Huggins (Southern Rhodesia), Sir Roy Welensky (Northern Rhodesia), and Sir Malcolm Barrow (Nyasaland); the Confederate Party, led by Mr J. H. Dendy Young of Southern Rhodesia; and the Progressive Party, led by Dr Alexander Scott.

At this stage, it looks as if the Federal Party will be returned. The Progressive Party, which stands for eventual full partnership between the races, is at the moment almost confined to Northern Rhodesia and is too small to have any chance. The Confederates stand for racial segregation and reject partnership; they are in fact opposing the constitution itself, because the ideal of partnership is enshrined in its preamble. They are largely composed of the same people who voted against federation in the Southern Rhodesian referendum, and they may win votes cast not so much for their own views as out of dislike for Sir Godfrey Huggins. But their chief importance lies in the fact that, taking their stand on racial segregation, they are making native policy a party issue, whereas the Federal Party's view has hitherto been that since native policy is outside the sphere of the federal government, it should play no part in federal politics. But now that the issue is in fact being raised, it is disappointing that the Federal Party's definition of its policy towards racial segregation—a definition made last week, presumably in response to the Confederates' challenge—is so non-committal.

Restoring African Confidence

THERE is no doubt that a victory for the Confederates in the first elections for the new government in central Africa, or even their strong representation in the Federal Parliament, would intensify African fears of federation, which have been underlined by the new outbreak of violence in Nyasaland. Nor, it must be admitted, would the return of Sir Godfrey Huggins's party do anything to diminish them. An opportunity, however, will occur shortly for a gesture to be made that might well go some way towards restoring African confidence. Next week, talks will start at the Colonial Office on constitutional progress in Northern Rhodesia. Doubtless Sir Roy Welensky is willing to agree that more Africans should sit in the legislative council and perhaps to their direct representation in the executive council if more power is at the same time given to the Europeans. He would be showing greater statesmanship if he were to agree to the African advance without pressing for anything in return. The most able Europeans in Northern Rhodesia will shortly be leaving the territorial parliament to serve in the federal parliament. It is doubtful whether sufficiently able Europeans can be found not only to replace them but to take over more portfolios of government—which is presumably what the Europeans are looking forward to.

There is a further step that could be agreed on at these talks. At present, Southern Rhodesian Africans can obtain the franchise, if they fulfil the property qualifications, because they are British subjects. In Northern Rhodesia—

and Nyasaland, which has no franchise yet—Africans are British protected persons, and to obtain British citizenship, which is a qualification for the franchise in Northern Rhodesia, is laborious and not always possible. If an outcome of next week's conference were the extension of the franchise to all British protected persons who have the other qualifications, something would have been done to win back the African trust in Britain that federation has forfeited.

Arms and the Arabs

EGYPT is the pacemaker in current Arab moves to create a joint defence council, in accordance with the Arab League security pact of 1950. Last week, at a preliminary conference of chiefs of staff, and this week, when Arab defence and finance ministers are meeting to review progress, the Egyptian aim has been to produce plans for a joint force capable of assuming duties in the Canal Zone. Equipped with such a weapon, the Egyptians believe their strength in negotiating with Britain over future management of the zone would be usefully increased.

Such forces are more easily wished for than organised. Last week's conference was to have discussed expansion of forces, the standardisation of weapons and the question of a unified command; but not even the first item is plain sailing. Iraq, for instance, though by Arab standards well-to-do, is for the present loth to transfer funds from development to armaments; it is therefore regarded by many Egyptian militarists as unready to do its bit. As for standardisation of arms, there is no local industry for their manufacture other than Egypt's budding small-arms ammunition factories; the conference therefore faced the problem of how far it could accept the risk of becoming dependent on any single foreign source of supply. As for unified command, the proposal from Cairo is that this should go to the commander of the largest contingent, which is necessarily the Egyptian one. Syria can show two divisions, Iraq three and Jordan one. But neither the Iraqis nor the Jordanians are sure that the Egyptian soldier has improved his quality under Neguib.

The conference, it is true, was nearer to harmony than were its disastrous forebears during the Palestine war. But was it any nearer to achieving strength? It had its eye, naturally enough, on the \$1,860 million allocated to arms for the "Near East and Africa" in the new Mutual Security programme; but it may have forgotten that the price of aid on the scale it would like is compliance with certain American wishes, among them the desire that there should be peace between the Arabs and Israel.

Progress of the Balkan Alliance

IN recent weeks the three free Balkan powers, especially Greece and Yugoslavia, have been recipients of a number of friendly gestures from the Soviet Union and its satellites. Athens and Belgrade have both agreed to an exchange of

ambassadors with Moscow; a Greek-Bulgarian border commission is reported to have made good progress; and Yugoslavia is discussing border problems, with varying degrees of success, with all four of its Communist neighbours.

These developments may, perhaps, be responsible for certain reports that these Balkan governments are not getting on together as well as they were. But there is no real evidence that Soviet blandishments are undermining the determination of Greece, Yugoslavia and Turkey to work steadily towards greater military, political and economic co-operation. Progress towards a full-scale military alliance is bound to be slow so long as Yugoslavia remains outside Nato, and so long as the Trieste dispute remains inflamed. Slow but steady progress is, however, being made towards setting up the political secretariat upon which the three foreign ministers agreed last July. But it would be unreasonable to assume that all disputes and differences between the three countries will vanish as if by magic overnight, and that from henceforward they will see eye to eye on everything.

If Turkey and Yugoslavia think differently about the right response to the Russians' friendly gestures, they are certainly not the only ones to do so. If the Yugoslavs comment unfavourably on Greek plans to colonise the lands in Aegean Macedonia of those who departed to Yugoslavia

during the civil war, it may be that they feel bound to do so for purely internal reasons. And in view of their tense relations with Italy, it would be surprising if they did not feel nervous at the news that the Greek Premier and Foreign Minister are to visit Rome later this month. But so long as the three countries retain their basic desire to get on together these upsets and differences will fall into their proper perspective.

Suspect Soviet Statistics

MUCH is now being spoken and written about the Soviet economy's achievements, past and future. Some believe Soviet potential for war and peace to be far greater than is generally realised, and are alarmed at the ascendancy that the Communist bloc may soon achieve by the combination of planning, relentlessly hard work and relatively low living standards. Others believe that there are crucial flaws in the international economy—including China—of which the once self-sufficient Soviet economy is now the directing centre. Economic intelligence on these matters, such as it is, seems to clash with political judgment.

Both lines of approach are, in fact, hazardous. As an article elsewhere in this issue points out (p. 640) there is much in Soviet statistics to excite suspicion. On the other hand, estimates made outside the Soviet Union of present trends there, and based on the captured plans of 1941, have turned out remarkably accurate. Generally speaking, it seems likely that careful study over a period of Soviet statistics and published plans will produce a fairly reliable picture of the main economic trends; whereas the details are often blurred because of missing or misleading statistics.

Experience in Britain has shown how wildly wrong can be the estimates of the most honest and critical planners; experience in Europe has produced even more ludicrous examples. It is not to be expected that a totalitarian state like the Soviet Union should be immune from such failings, or that its managers and officials should not sometimes fake the books in order to escape the penalties of falling short of targets and norms.

Settlers' Plan for Kenya

WHEN the long-projected conference of leaders of the various racial communities meets in Kenya—if it ever does—the European section will now have a definite programme to lay before it. It may perhaps be doubted whether this programme, outlined by Mr Michael Blundell in a speech last week to the Electors' Union, will be received with any enthusiasm by Asians or Africans, but at least it is an agreed formulation of the settlers' ideas for Kenya after the emergency. It calls for the provision of "opportunities" for all loyal men whatever their creed or colour, for a strong state able to deal justice and freedom, for private enterprise, except where public enterprise is the best way to develop resources, and for all-round develop-

ment (which, however, may have to be financed by Britain).

On decisive issues, the settlers dig in their toes, calling for a "sense of security among all races" based on the maintenance of "the special rights of racial communities in the areas established for their respective use by treaty, ordinance or Order in Council"; in other words, the white highlands must remain inviolate—but so must other reserves. Furthermore, all races, the statement declares, must be protected from exploitation; no doubt this is meant to cover Asian infiltration of trade and administration at the expense of Africans, but it could imply a new code of labour regulations in the white highlands. Equally equivocal is the demand that "the direction of affairs of Kenya shall pass progressively to residents": there are five million African residents in Kenya. The settlers' programme also comes out for ultimate federation with Central Africa.

The "sense of security" to which the statement refers is most keenly sought by the settlers, and it may be significant that Mr Blundell, besides putting forward the new programme, has made a plea for an immigration programme of 30,000 Europeans and no Indians. By now, the Kenya settlers are a good deal readier to facilitate the immigration of European peasant proprietors—even, perhaps, of Italians, whose racial views have hitherto been thought too unsound for Kenya. At least, the statement of the settlers' programme opens the door to an inter-racial exchange of views, in which all communities may find elements of a design for living amicably together.

Squalor in Night School

THE Select Committee on Estimates, which was lately so critical of the Ministry of Education's school building programme, has been gentleness itself in considering technical education, with which it deals in its twelfth report published last week (HMSO, 7s. 6d.). It is, indeed, gentler than all that is commonly said about the importance of technical education might have led one to expect. Two of the committee's recommendations are attempts to improve the programming of building projects, two are intended to ginger up technical education in Scotland, and the fifth suggests further steps to find out if certain industries are suffering locally from the inadequacy of technical colleges.

None of these recommendations is startling. It is, indeed, evident that the committee was much impressed by the increase in the volume of technical education since the war, and by the efforts being made to fit a quart of students into a pint of building accommodation. The report draws attention to what are almost sealing-wax and string arrangements, to overcrowding and underlighting. But the number of students in England and Wales released by their firms for one day a week has risen from 40,000 in 1937-38 to 300,000 in 1952-53, while the number of full-time students has nearly quadrupled and the number at every class has nearly trebled. All this is evidence of a notable advance. In spite of makeshift conditions, students are pouring in and getting at least some sort of further education.

It is the quality rather than the quantity that is at fault. As was said in the evidence taken by the committee, lack

of suitable accommodation, or even of sufficient space to see demonstrations, prevents many students from benefiting fully from the classes they attend. Since the war few new technical colleges have been built. In general, students have been accommodated in temporary buildings, hired premises, or modest extensions—or quite simply by overcrowding. With technical education caught between the higher priorities given to both school and university building, only about 10 per cent of the building work "necessary to produce minimum facilities" has so far been completed, and the programme is running several years behind schedule. It is the other demands for building resources, not the Ministry of Education, that stands in the way. But it must be recognised that until better premises are available a large proportion of technical education will remain second-rate.

Educating Doctors

IT is nine years since the Goodenough Committee made some searching criticisms of the medical curriculum. To judge from many of the papers read at last week's international conference on medical education, those criticisms still hold good today. The conference, sponsored by the World Medical Association, was the first of its kind, and it was consequently all the more remarkable that there should have been so much international agreement on the basic faults in the education of doctors.

The tremendous advance made by medicine in the last fifty years has not been matched by any radical change in the training of those who practise it. The subjects that a medical student has to master have piled up, and he now has to embark on them in his last years at school. As Sir

Russia's Success

Even if the Porte accepts the suggestions of the Four Powers, and if Russia evacuates the Principalities, still the mischief has been done. The Czar has been virtually successful, and we have been virtually baffled. We do not say this by way of blame either to our own Government or to that of France. It could scarcely have turned out otherwise. In the present state of civilisation, the struggle must always be an unequal one between recklessness and caution—between love of peace and indifference to war—between unscrupulous aggression, on the one hand, and calculating prudence on the other. It was worth while for Russia to seize much, for the sake of being permitted to retain a little. It was worth while for Turkey to submit to a certain injury for the sake of avoiding the incalculable cost and the uncertain issue of a war. It was worth while for Europe to mediate between the robber and his victim, on the principle not of justice and of punishment, but of expediency and of bargain, in order to escape a conflagration which might have involved whole nations and burnt up many dynasties. Russia knew all this well, and calculated on it shrewdly. She probably never contemplated a war; but she knew that her opponents would connive at some portion of her unjust aggressions in order to avert one; and that however much she was compelled to recede, it could scarcely be to the whole extent of her advance. Aggression is a safe game to play, either with weak, with timid, with cautious, with scrupulous, with calculating, or with peace-loving antagonists. Probably our mistake—the mistake of France and England—was in not having, immediately the Russians crossed the Pruth, sent our fleets into the Black Sea, and declared the Dardanelles and the Euxine henceforth free to the navies of every nation. Russia would then have been glad to accept any terms in order to escape from an event which she dreads more than almost any other.

The Economist

September 3, 1953

THE UK TRADE GAP
£ MILLION

Lionel Whitby pointed out in his presidential address to the conference, the effect is not only that medical graduates often suffer from a "poverty of mind"; there is nothing in the curriculum to ensure that the knowledge demanded of them is integrated.

The student must never think of the various phases of his education as a vista of obstacles between him and his final qualification, to be overcome as soon as possible and, once overcome, to be forgotten.

All too often he does.

The division of his education into "separate blocks of instruction," into specialties within specialties, has its inevitable effect on the doctor at the end of his training. It is common for students to complain that they have been taught a vast amount of knowledge and of techniques but that the one thing they have not learned is how to approach and treat a patient. "The stethoscope, the X-ray and the electrocardiogram," said Dr Mallick, Dean of the Dow Medical College at Karachi,

have come so much into the limelight that the poor patient whose coronary artery or valve is the subject of this instrumentation is lost in the shadows of the umbras and penumbras.

That patients are not cases but people, not diseases but human beings with a disease, is, as he said, an old adage. But it is one that medical education largely ignores. It is perhaps significant of the neglect that the Central Health Services-Council devoted a section of its report to the consideration of patients as persons. If last week's conference

had done no more than re-emphasise old truths that are still valid in the new age of medical science, it would have fully justified itself.

Mauritius Goes Labour

THE general election in the colony of Mauritius, held under the new constitution, shows that the first effort to develop a "Mauritius for the Mauritians" party has failed. The *Ralliement Mauricien* obtained only two seats whereas the Labour party took thirteen, and four seats went to independents. Though the Labour party declares that it speaks for the working masses (the total electorate is less than 90,000), it is in fact largely a pro-India and Indian Nationalist body, and many of its leaders press for a sort of *enosis*, on the Cypriot model, with the motherland. But the other communities (European, and people of African and mixed descent), who constitute a third of the population, deny that India is the motherland, since they got to Mauritius first. It is, indeed, extremely doubtful how far the Indian sugar planter wishes to contract out of the colonial empire. Mauritian sugar is bought under long-term contract by the United Kingdom, and has enjoyed record prices, with record crops, in the past few years.

On paper the Labour party cannot expect to control the Legislative Council, since against its thirteen there are twelve nominated and three *ex officio* members as well as the other six elected members. But on individual votes it may win the day from time to time. Its policy is somewhat vague, but it is pressing for complete adult suffrage, instead of the present suffrage which requires sufficient literacy in any of the island's languages to sign one's name on the register, and for further constitutional advance towards self government. It will not doubt continue to press for higher wages and improved working conditions, but talk of nationalisation of the sugar industry is likely to remain rather nebulous.

The island's real problem is demographic. Population is rapidly increasing. Mauritians, like Maltese, face an emigration problem. It is not one that they can solve on their own; they need the resources of the Commonwealth. How these can be brought to bear, the forthcoming report on the small dependencies may presently disclose.

The Economist 1843-1943

This book was originally published to mark the centenary of the first issue of *The Economist*, which appeared on September 2, 1843. Owing to wartime restrictions, the edition had to be a small one, and it went out of print almost at once. It has now been re-printed and the new edition was published on September 2, 1953, the paper's 110th birthday.

In addition to chapters dealing with the history of *The Economist* and with the role that it played in its first century of publication, the book contains contributions by a number of distinguished individuals, including the following:

WALTER BAGEHOT
by the late Francis W. Hirst.

The Economist AS A SOURCE FOR THE HISTORIAN
by the late Sir John Clapham

A POLITICAL RETROSPECT
by Sir Llewellyn Woodward

The Economist, 1843-1943 is published by the Oxford University Press. Copies can be obtained through any bookseller.

the long and the short of it

Asbestos is made up of millions of fibres—some long, some short, according to the thickness of the seams, which are found between layers of rock. Amosite, for instance—produced from the Cape Asbestos Company's mines—consists of some of the longest fibres. When these have been divided and bulked together again, they occupy about twenty times their original volume because they trap thousands of minute air cells within their mass. It is this which gives the Company's famous "Caposite" insulation its unique light, open texture and exceptional insulating efficiency. But long or short, Asbestos fibres are playing an increasingly large part in industry. If you are in any doubt about the value of Asbestos materials for your own purposes, consult

The Ugly Record of IG Farben

DIE IG FARBen INDUSTRIE AKTIEN-GESELLSCHAFT.

By Fritz Ter Meer.

Econ Verlag Düsseldorf. 128 pages.

GENERALS IN GREY SUITS.

By Josiah E. Dubois.

The Bodley Head. 384 pages. 16s.

IN a slim, handsome volume of reminiscences, Dr Ter Meer, descendant of an old German family of dye-stuff manufacturers, production chief of synthetic rubber, pharmaceuticals and poison gas, and one of the defendants at the Nuremberg trial of IG Farben, has described the history of Germany's largest industrial enterprise. At the outbreak of war, when Germany's net industrial production amounted to some 40,000 million marks, IG accounted for a total annual turnover of close to 2,000 million marks. The historian of IG Farben wishes to convey to his readers the picture of a gentle business organisation, run by socially minded men striving for the good of mankind, at home and abroad. Of Hitler's drastic measures he merely reports that they found general recognition. Allied policy is described in such terms as demontage, requisitioning and works espionage. Dr Ter Meer's criticism of his own firm is revealing. He is unhappy about its use of the term "commission," because of its implication—from parliamentary practice—of adjournment and delay. He closes his book on a nostalgic note and spares his readers all unpleasant reminiscences of such products as magnesium bombs and extermination gases.

Not so Josiah Dubois, who describes Dr Ter Meer and other IG men as the master builders of Hitler's war machine. In condensing 150 volumes of testimony into one book, the former Chief Prosecutor of the Nuremberg trial of IG Farben has had no easy task. He, too, had to be selective. Taking too literally President Roosevelt's reference to the evidence on IG activities as a detective story, he writes one. His account gives the other side of the coin: an enterprise that from 1936 onwards forged ahead of the High Command with plans for the production of buna, magnesium, high-octane and poison gas, that set up more than 30 shadow factories for the "emergency" and delegated its most capable chemists to Goering's Four Year Plan Bureau and to the Army Command.

Simultaneously through mediators and middlemen, by pressure and persuasion, with tricks and treachery, IG

acquired all major chemical plants in Europe, from Austria's *Dynamit Nobel* to *Etablissements Kuhlmann* in France. Overseas, an elaborate system of economic and military intelligence was set up. In the United States, through the offices of the Karl Schurz Association and of American companies, influence was extended to America's oil and chemical industries. IG Farben's foreign policy and Nazi foreign policy were, according to one of the chief defendants, considered inseparable. At home, close liaison was maintained with Party and SS. In the words of an IG director: "Our new friendship with the SS is proving very profitable." This was truest of Auschwitz where, in the words of another of the accused,

at my request, the Reichsmarschall has issued special decrees to the Supreme Reich authorities concerned to meet IG requirements in skilled workers and labourers.

By the end of the war, the number of forced labourers at IG Auschwitz had risen to more than 100,000. Many had died from experimental injections with soporific drugs; more had been killed in Camp IV (Monowitz), where prussic acid produced by IG Leverkusen and supplied by an IG subsidiary had been administered in gas chambers.

After many months of interrogation and trial, 13 of the 24 "Generals in Grey Suits" were found guilty and sentenced on charges of plunder and spoliation in foreign countries and enslavement and maltreatment of human beings. In 1945 most of them had admitted their share in these crimes, but by 1947 they pleaded ignorance or pretended not to be "technically qualified" to speak for their firm. Brigadier-General Taylor, in his address for the prosecution, held that "there is no laughter in this case," and, summing up, Judge Hebert called it "an ugly record which went far beyond the activities of normal business."

Standards in Society

THE STANDARD OF LIVING: *The Concept and Its Place in Economics.*

By Hugo E. Pipping.

Societas Scientiarum Fennica (Helsingfors). 280 pages. 1,400 marks.

THE history of economic thought is characterised by a constant tug-of-war between what one may call specialisers and generalisers; between those who regard as most profitable and satisfying the cultivation of a territory limited by rigorous logic and those who

insist that economics is a "moral science" in a deeper sense than that of the Cambridge syllabus. There are signs that the latter are just now getting the upper hand. However infuriatingly to the specialist, who feels that he has plenty on his plate already, sociologists, anthropologists, psychologists and political theorists insist on tendering evidence which he can neglect only on peril of stultification, but which most uncomfortably fails to fit into economic modes of thought.

Thus the behaviour of producers is shown as a matter of playing to win a power-game, or of conforming to group opinion, or of nourishing an ego rather than a bank balance. Consumers have come in for considerably less attention; and few if any attempts have been made to study, in this wider sense, the all-round behaviour of people in their double role as consumers-plus-producers, complete economic agents. Professor Hugo Pipping's book is a valiant, conscientious and original attempt to build, on the semi-sociological concept of the standard of living, a theory of economic behaviour and a criterion of welfare policy. A standard conceived merely in terms of individual wants and their satisfaction, and measured by a weighted index of material consumption, is not nearly enough for him; his "standard" is a quadruple entity comprising not only consumption in the narrower sense but the balance of work and leisure, the maintenance of a family,

and the power to save. These are components whose magnitude, relative importance, and particular content vary with the way of life of different ages, nations, classes and other groupings. Only such a standard can have a formative value as an object or test of policy; for only such a standard has a real correspondence to psychological fact.

With some important reservations about the usefulness of this concept as a tool of thought—one can hardly imagine anything more unwieldy—and the consequent inadvisability of jettisoning, rather than supplementing, more conventional analysis, one can accept all this as true, valuable, and practically important. It is all the more pity that Professor Pipping's book plumbs depths of unreadability rare even among social scientists. His English, while not often actually incorrect, is maddeningly unidiomatic, heavy-footed and obscure. His scholarship is of the relentlessly conscientious kind which cannot observe that two and two make four without citing an authority; indeed Dr Strabismus (whom God preserve) of Utrecht is about the only authority left uncited. Platitudes are laboured, hairs microscopically split and then thrown away, with as weighty an attention as is bestowed on the most original and valuable parts of the work. That one should emerge from the long ordeal of reading it with the feeling that one's sufferings have been worth while is perhaps the best evidence of the intrinsic value of Professor Pipping's thought.

The New Democracy

STATES AND MIND.

By Michael Balfour.

The Cresset Press. 152 pages. 15s.

THIS book can perhaps best be described as a treatise on some of the functions and limitations of government in a democracy, whether a liberal democracy or a people's democracy. Its principal themes are the interaction of events and ideas, the consequent importance and the techniques of influencing opinion, and the need for cohesion in the society that the governors are called upon to govern. Political theory is not a subject on which it is easy or necessary to find anything original to say; and what is wanted in a book of this kind is a clear restatement of certain propositions, their relation to new phenomena (such as the expanding basis of government or new media of communication) and a willingness to re-examine axioms that have become so commonly accepted as to be removed from the sphere of debate. To reduce the seemingly obvious to the status of hypothesis requires a special kind of intellectual effort that is hardly ever wasted.

Mr Balfour comes well through all these tests. His thinking and his prose are refreshingly clear; his practical acquaintance with a government's difficulties in persuading people, happily wedded to his academic accomplishment, gives special point and value to his writing. In more than one place he prompts second thoughts about too easily accepted dogmas: as, for instance, when he questions the "article of the Liberal faith that persecution, so far from killing a thing, must inevitably nourish it and that in the end truth will prevail." Yet there is also something elusive about Mr Balfour's book; for although the ground is well prepared, the reader is not carried far off it and is left with the disappointing feeling that the author was capable of taking him farther but did not choose to do so. But Mr Balfour will probably have more to say on his subject another time.

Good Talk

THE OXFORD BOOK OF ENGLISH TALK.

Edited by James Sutherland.

Oxford University Press. 453 pages. 18s.

PHYSICALLY, at any rate, this book is satisfactory; for it is well printed and well bound—and the price of its 450-odd pages extraordinarily low. But we have come to expect of the Oxford University Press that very good value will be given for money.

Intellectually, the book is more than satisfactory. That temperate and very English adjective fails utterly to do it justice; even "eminently satisfactory" would be grudgingly inadequate. Professor Sutherland, who writes so much better than most professors can or, at least, do write, has covered six centuries of English talk: he starts early in the

fifteenth century and ends only yesterday. (It is, by the way, English not British talk.) To deal with the present day is fairly easy. But how deal with yesteryear and the long-past century? The editor has gone not only to the dramatists and the novelists in their more colloquial moods, but also to verbatim reports of state trials and of sessions cases, to letters and diaries, to broadcast talks, and to much else. He ranges from lord to link-boy, from lady to Moll Cutpurse; from the highest to the lowest, through all the intermediate grades. In short, he has supplied many cross-sections of English talk; not with a carefully doctored thesis, nor with a tendentious theory. By his method, he has edited both an anthology of everyday speech and a sociological record: but, then, he knew that he could hardly achieve the former without achieving also the latter, although the knowledge may have been subconscious.

The inevitable result is that here is a book at once instructive to all, valuable to the scholar and the student, and entertaining to the general intelligent public. The scholar can trust to the text, the general public to the readability of every "item." The editor, a notable scholar, almost as well known in the United States of America and on the Continent of Europe as he is in Britain, has done his work with skill and tact and good taste. The footnotes, models of brevity and adequacy, are kept to a minimum; and the preface, which is brief, pithy and very shrewd, displays a nice historical sense. Only when one regretfully comes to the end of this delectable volume does one realise that one has been watching an alert, orderly, well-informed and generous mind picking an unerring path through a very jungle of material, with the result that everything has been made easy for the general reader—and well worth the attention of general reader and student alike.

Guilty But Insane

BROADMOOR.

By Ralph Partridge.

Chatto and Windus. 278 pages. 21s.

ONE of the striking features of murder trials in recent years is that the public is rarely interested in whether the verdict will be "guilty" or "not guilty." The main interest is the ultimate fate of the prisoner: in other words, will he or she be hanged? And the only way for a guilty murderer to escape the death sentence being passed on him is to be found "guilty but insane."

Mr Partridge's book describes what happens to those on whom this verdict is passed, as well as to those who are sent to Broadmoor as a result of a medical examination while in the condemned cell—and to other criminal or dangerous lunatics, for by no means all of Broadmoor's patients are murderers. Yet it is the fact that so many of them have escaped hanging that gives Broad-

moor its peculiar fascination to the public at large, which is usually quite indifferent to life in an ordinary mental hospital.

Mr Partridge describes the different forms of mental illness clearly and gives apt case histories. His description of life at Broadmoor, however, is a bit too long. After all, Broadmoor patients, as he carefully explains, are not being punished; they are being treated, in so far as they are treatable. Apart, therefore, from the strict security precautions, life at Broadmoor is in many respects similar to life at an ordinary mental hospital, and Mr Partridge's account is sometimes a little naïf. As a whole, however, the book is readable and, though somewhat too uncritical, objective; it should dispel many popular misconceptions and prejudices about what is involved by a verdict of "guilty but insane."

Legal Hors d'Oeuvres

CURRENT LEGAL PROBLEMS, 1953. Edited by G. W. Keeton and G. Schwarzenberger.

Stevens. 324 pages. 37s. 6d.

IT always seems unfair to do no more than list the contents of a book and leave it at that, yet, lacking both the space and the talent of Lord Macaulay, what else can a reviewer do with a book like this? It contains fifteen studies. It begins with a paper on the influence of remedies on rights, by the chairman of the committee that spent six years in studying that problem. It ends with a paper on the Bonn and Paris Treaties that points out, among other things, a serious discrepancy between the text of the German and that of the French and English versions of the documents. It contains a section on the constitutional crisis in South Africa, another on constitutional developments in British West Africa, and another on copyright law revision and the as yet unratified Unesco copyright convention. There is an account of the failure of Lord Astor's trust for the shares in *The Observer* which is a most valuable study of the law of charitable and other trusts for the public benefit—a subject that must sooner or later engage the attention of Parliament; and there is another paper on recent practice in the law of extradition. Each paper in the book requires a separate review and Lord Macaulay would have seized upon them with the joyous certainty that a month of essay writing lay before him.

This is the best volume of the series yet to appear: this statement does not mean that the series needed six volumes to establish itself but that there have been volumes in the past of greater interest to the lawyer than to the layman. That is not true of this collection. It would be an exaggeration to say that each chapter is worth the price of the whole book, but it is fair to say that anyone who picks up the book to read on a particular subject will finish by reading them all with the same advantage and enjoyment.

Pulling Out the Stops

YOU HAVE A POINT THERE.

By Eric Partridge.

Hamish Hamilton. 230 pages. 12s. 6d.

ONE of the chapters of this instructive and entertaining book is called "Full Orchestra." In it Mr Partridge, who in the preceding chapters has explained the uses of all the instruments of punctuation, shows how they should be combined in a literary passage. He gives four versions of each passage: the first, untouched—that is, completely unpunctuated; the second, semi-literate or careless; the third, average or merely competent; the fourth showing punctuation as an art.

This chapter alone will be immensely valuable to any writer and encourage him to use colons and semicolons more freely. But he would be well advised to read first the chapters describing the theory and practice of punctuation and of its allies—capitals, italics, quotation marks, hyphens and paragraphs. Then he will feel more confident; prepared both to emulate Mr Partridge's punctuation of a piece of prose and occasionally, to criticise it.

Mr Partridge is definite without being dogmatic. He lays down no rigid rules; he is a guide not a dictator. But it is pleasant to find some of one's own whims approved by so authoritative a guide; and, when one's practice differs from his own, to feel that there is no real disagreement on theory. Disliking hyphenated words, *The Economist* decided long ago to write manpower as one word. Readers who think the practice peculiar will find it justified by Mr Partridge. It evidently conforms with current American practice; on this Mr John W. Clark, of the University of Minnesota, contributes an interesting chapter as a postscript to Mr Partridge's comprehensive work.

Shorter Notices

PARLIAMENTARY GOVERNMENT IN SOUTHERN ASIA.

Sydney D. Bailey.

Hansard Society. 100 pages. 9s.

This clear and concise little book constitutes a reference guide to the background of parliamentary government in Burma, Ceylon, India and Pakistan. It summarises the events which led up to the transfer of power to each country by Britain; outlines their present constitutions; and gives a picture of the rôle of the political parties, the methods—and difficulties—of holding elections, and the way in which cabinet government is related to the work of the legislatures.

Mr Bailey rightly reminds his readers that it is often taken far too much for granted that the new countries of Asia should automatically adopt the parliamentary system. That they did so was in reality "a momentous act of faith," the legacy of British tutelage, but remarkable nevertheless. For, as he says, "never before had the parliamentary system been successful for a prolonged period in a country where a substantial proportion of the electors were illiterate."

All four countries have, in fact, modelled their procedure on Westminster, adapting it to suit their own needs. The influence of

British thought and tradition emerges with particular clarity in an example which the author quotes from the constitutions of Burma and India; he notes in both cases that where the President acts only on the advice of his ministers, "the word *advice* is used in the same euphemistic sense as in the United Kingdom." Mr Bailey's book has been drawn up in co-operation with the Institute of Pacific Relations, and is one more tribute to the value of the work of that organisation as well as of its publisher, the Hansard Society.

MINERALS—A KEY TO SOVIET POWER.

By Demitri B. Shimkin.

Harvard University Press (London: Geoffrey Cumberlege). 452 pages. 52s.

"The student of Soviet economic life is faced with two difficulties: the scarcity of material and the difficulty of finding it. Mr Shimkin proves in his book how much can still be learnt through a patient collection and analysis of all the dispersed materials. His field is vast. It includes all minerals from coal to uranium; it covers ferrous and non-ferrous metals as well as non-metals. Yet Mr Shimkin has succeeded in presenting a coherent picture of all of them, giving all the available details of production, trade, consumption and available resources. To complete the picture he has added, whenever possible and important, data on developments in the Soviet sphere of influence.

The material is necessarily uneven. It is much richer for the prewar years than for the postwar period. The author cannot be held responsible for the growing secrecy surrounding Soviet life. Throughout he is scrupulously honest in distinguishing official figures from estimates and the latter are carefully computed. Where the book shifts to less firm ground is in the calculation of Soviet aggregate mineral consumption. This is done through an index based on American, not on Russian, prices. A "hypothetical standard" of Soviet consumption is also established with American industrial structure as a model. Mr Shimkin does not hide the limitations of such a method. Indeed, throughout he shows his sources, tools and findings. This is not a book for the general reader, but specialists in mineral economics and, even more, students of Soviet economy will owe the author a great debt for this valuable result of patient and intelligent research.

THE PARENTS' GUIDE TO SECONDARY EDUCATION.

By H. A. Wrenn.

Cambridge University Press. 85 pages. 3s. 6d.

The many parents who find it difficult to understand the recent changes in the English educational system will find this book most useful. It will help them to realise what type of education is most suitable for their children and to appreciate the value of different courses for different careers. The book describes simply and briefly the objects and methods of the different types of secondary school, the methods of the selection examination at 11, and the character and requirements of the examinations that follow. It also provides a useful list of careers and qualifications and details of the sources of financial aid for fees. If the book suggests a greater uniformity of curricula and methods than actually exists, it has at least the advantage of clarity.

Letters to the Editor

Europe in Africa

SIR—In your Note in the issue of August 29th, you say that Liberalism, "which at one time stood everywhere in the acknowledged vanguard of political and social progress, is now apt to find itself seated on the right-wing benches of continental parliaments." If by "right-wing" you mean reactionary or pro-privilege, that statement goes wide of the mark indeed. If, on the other hand, you mean opposed to the growing powers of the state, it is true enough. In that case, however, the implication that continental Liberalism is no longer in the vanguard of progress is scarcely apt. In trying to break out from the thicket of controls and restrictions continental Liberalism is playing an active and creative role in the best traditions of its past.

Nor is it quite correct to say in this connection that "Liberalism means different things in different places." The word has certainly tended to lose content during the last half-century, but today

the Continental Liberals all accept the general principles set out in the Liberal Manifesto. If they differ in their domestic policies, it is because each has to apply these principles to a different situation. It is significant that they are all broadly agreed on their application in the international field.—Yours faithfully, JOHN H. MACCALLUM SCOTT, London, SW1

Single or Double Korea

SIR—Your analysis of the Korean situation in the article "Single or Double Korea" is flawless up to the last paragraph where, after concluding that Korean unification is not possible in present circumstances, you find some grounds for optimism in this unpleasant fact and hold that the war will not be renewed. But have you not forgotten Mr Rhee? Has he not given every indication that he will renew the war, and is there any reason for expecting that he can be controlled? I do not wish to pass judgment on him; I think his

attitude can be understood. But he certainly is a very real threat to the peace. The American people attach a great deal of importance to the question of who is technically the aggressor, and if Rhee deliberately broke the peace he might not be supported. But if, after his invasion, the North Koreans and Chinese defeated him and poured over the 38th parallel, could the United States ignore this? Would not the belligerence of the South Koreans inevitably lead to a general war? I do not myself find much reason for optimism in the situation, and would like to see the big question of Mr Rhee tackled before it is too late.—Yours faithfully,

AN AMERICAN READER
London, W2

Penalties for Parking

SIR—In your Note last week you suggested that if parking were harder many motorists who now bring their cars into Central London would leave them at home and use public transport. I suggest it is time to realise that the right to park in crowded streets must be so limited that all traffic will flow freely. No one would dream of driving to an office in downtown Manhattan and parking there. Nor for that matter did people park in the City of London before the war: since the war, bombed sites have come to the rescue.

The parking evil has been greatly intensified by the common post-war practice of providing a car as a form of remuneration. This means, in many cases, that travel from home to office by car is cheaper than any form of public transport—if, indeed, it costs anything at all. Thousands of cars, with one passenger each, clog up the roads around London morning and evening, and spend the time in between standing idle in the congested centre; only a proportion of them ever move from their parking place during the day. It would be interesting to know what cost in national resources is represented by this form of travelling.—Yours faithfully, R. KELP-COHEN
London, SE19

Problems for Mr Holland

SIR—I would draw your attention to an error in the article by your Wellington correspondent which appeared in the issue of August 8th.

It is stated that New Zealand's surplus with the non-sterling area in the year ended June 30, 1953, exceeded the target of £25 million by £9.7 million. Your correspondent has apparently confused the overall and non-sterling surpluses. The latter, when calculated on a country-of-settlement basis, amounts to £36.4 million. This surplus is reduced to £27.8 million if transactions are recorded upon a country-of-origin basis. On either method of compilation, the commitment entered into at the 1952 Commonwealth Finance Ministers' Conference has been surpassed.—Yours faithfully, A. R. LOW
Reserve Bank of New Zealand,
Wellington

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Cleavages Among Allies

Washington, D.C.

ON August 27th, in Washington, Senator Alexander Wiley, the Chairman of the Senate Foreign Relations Committee, issued a statement to the effect that there was a "deep cleavage" between the Soviet peoples and their government and that the United States should do everything possible to exploit it. But this statement rang a little hollow, for two hundred miles away, at the

Special Assembly of the United Nations in New York, a deep cleavage existed at that moment between the United States and its principal allies which the Soviet Union could have exploited at will. The United States delegation was engaged in consolidating a technical victory, on the question of whether India should or should not be represented at the political conference on Korea, which disrupted the normal alignments of the non-Soviet world as no previous vote in the history of the United Nations had done. The resolution inviting India to be present failed to obtain the necessary votes of two-thirds of the Assembly, because the United States, after the application of the most severe pressure, was able to secure the support of seventeen Latin American countries and of Greece, Pakistan, and Nationalist China. Arrayed against the United States were twenty-seven countries, including the Soviet bloc, the entire British Commonwealth except Pakistan and South Africa, and all those Arab countries whose friendship Mr John Foster Dulles has recently been travelling so far to win.

The United States was opposed by its two immediate neighbours, Canada and Mexico. Every member of the North Atlantic Treaty Organisation except Greece, and every country which had sent troops to Korea, except Greece

and Colombia, either voted against the United States or abstained, and the abstention of France was secured partly by American opposition to the demands of the Arab and Asian representatives that the Moroccan dispute should be accepted by the Security Council. The *Washington Post* commented the following day:

Pyrrhus, with the help of elephants, inflicted a defeat upon the Romans so costly to his own troops as to make

him doubt the value of total victory. . . . The divisions and hard feelings in the free world may well make Ambassador Lodge doubt the value of total victory. As for the elephants, they were present symbolically in the uncertainties of Republican policy and the political commitments by the Administration respecting the Far East.

It is not altogether fair to attribute the whole blame for this unfortunate situation to Mr Henry Cabot Lodge. He was for most of the special session following a brief that had been worked out in Washington, although rather hastily, in the weeks following the armistice. The decision to press for a "two sided" rather than a "round table" conference was not based solely on President Syngman Rhee's almost morbid dislike of Mr Nehru, though that was an important factor, and Mr Lodge would have won more sympathy if he had explained its importance with greater

candour than he did. The decision was also based on considerably more scepticism than prevailed in other Foreign Offices about the possibilities of negotiating even a minor settlement in the Far East with Communist China at this moment, even though that country might be willing to see a conference convened in order to gain prestige in Asia from its failure. For this reason the United States Administration made up its mind that it would press for

DAKERS 12'6

a conference on the limited question of settling the problems left over by the Korean war, that is, for a continuation in a civilian context of the armistice negotiations at Panmunjom; but it would also be ready to enlarge the agenda and see other interested nations such as India brought in if there were the slightest signs that the Communists were in a mood to widen the area of negotiation.

While this was not in fact an illogical position, the inexperience of Mr Lodge in the techniques of diplomacy and his ignorance of the atmosphere of the United Nations very soon made it appear to be. In the first place, the haste with which the American position was arrived at, complicated by Mr Lodge's absence in Korea with Mr Dulles until a few days before the Assembly began, made it impossible to have any real discussion with the British or other delegations, or to reconcile the differences between the American and the Commonwealth points of view. In the second place Mr Lodge reduced his power of diplomatic manoeuvre from the start by giving frequent, and somewhat contradictory, statements to the press and the television cameras.

Thirdly, Mr Lodge has not fully grasped the difference between being a member of the United States Senate and being his country's delegate to the United Nations. Many of his statements, notably the one made at the end of the Assembly's first week, that the basic design of American policy towards the Korean political conference was "to do everything in our power to get our half-million young men home from Korea," seemed addressed to an American political audience rather than to his fellow diplomats. This remark sent cold shivers down the spines of the planners in the State Department and the Pentagon, in the first place because it was not true, and secondly because, even if it were true, a public declaration of such a motive would weaken the American hand disastrously at a Korean political conference.

★

Underlying the whole unhappy fortnight was the re-emergence of that difference in attitude towards the United Nations and its purpose, which has been growing imperceptibly between the United States and its principal allies for the past five years or more. With every General Assembly, especially since the Korean war, it has become a little more obvious that the United States regards the presence of the Russians and the satellite countries in the United Nations as an unfortunate accident, while the British and Commonwealth countries regard it as a godsend. In the American view the United Nations should be an activist organisation, wielding the force of the free world, while other nations regard its political functions as a means of relieving tensions which can no longer be resolved by ordinary diplomacy. This was latent in the conflict between the "two sides" and the "round table" approach to the Korean political conference, and it was for this reason that Mr Lodge's attitude was approved by the majority of American editorial opinion; his views prevailed, according to the *New York Times*, because they "happened to be right."

But the most powerful statement of this position came from the Secretary of State himself when he told the American Bar Association, in a speech delivered as the debate in the United Nations was reaching its most critical point, that the Charter would never have been accepted in its present form if the delegates had known of the existence

of the atom bomb, an assertion which the *Washington Post* described as "palpable nonsense." Mr Dulles went on to imply that the veto power is now unworkable because the wartime coalition on which the structure of the Security Council was based has collapsed, and to make a statement astounding to British ears but quite commonly accepted in the United States:

We see now the inadequacies of an organisation whose effective functioning depends upon co-operation with a nation which is dominated by an international party seeking world domination.

Yet the veto power was included partly at American insistence and it is still very doubtful if the United States Senate would ratify any revision of the Charter which excluded it.

The best explanation of Mr Dulles's remarks is that they were part of a speech in which he was putting up a fighting rearguard action against the Bricker Amendment to the Constitution which would limit the treaty-making power of the United States. He was also probably out to forestall American disillusionment with the United Nations by showing that it was an organisation that was capable of growth and change. Indeed, this week in his speech to the American Legion at St. Louis, he went so far as to claim that "the United Nations as the 'town meeting of the world' is the realisation of an early American concept." In that case, it is unfortunate that Mr Cabot Lodge, himself a descendant of the founders of the town meeting, should have so shaken the faith of other countries in the continuing American belief in this concept of the United Nations.

American Notes

Budget Turns the Corner

IT is only two months since the 1953 fiscal year ended with a surprisingly large deficit of \$9.4 billion, higher than ever before in peacetime. It was therefore with justifiable pride and pleasure that Mr Humphrey, the Secretary of the Treasury, announced last week that his latest estimate showed that the present fiscal year should close next June with a deficit of only \$3.8 billion, compared with Mr Truman's January forecast of \$9.9 billion and President Eisenhower's May forecast of \$6.6 billion. Moreover, Mr Humphrey now believes that it will be possible to balance the budget in the 1955 fiscal year. Thanks for these happy developments are due entirely to the combined efforts of Congress and the Administration to economise in government spending; revenue is expected to be slightly below Mr Truman's forecast, in spite of the extension of the excess profits tax.

Mr Humphrey, with the help of an unusually clear exposition by the Bureau of the Budget, drew special attention to two significant turning points in the recent history of government deficits. The 1954 fiscal year is the first since the Korean outbreak in which net revenue is expected

to exceed the amount authorised by Congress for current and future spending, even though the Administration will be asking for about \$400 million in supplementary appropriations in January. This year's new appropriations are also below the estimate for actual spending, which is itself expected to decline, something which Mr Truman had not forecast until next year. At last some impression is being

\$500 million, which means that in practice the cash budget may be in balance.

It would not, of course, take much to push Mr Humphrey's balanced budgets around another corner, even if the estimates on which they are based turn out to be correct. A worsening of the international situation would

do it, or a decision to try to make the United States safe from the hydrogen bomb, or a recession which would reduce the tax yield, or even an exceptionally good harvest. Apart from increased interest charges on the national debt, the only place where the Eisenhower Administration has had to spend more rather than less is on the farm price support programme, as the result of the accumulation of agricultural surpluses. This is one of the many fields in which, as Mr Humphrey pointed out, the amount that must be spent is dictated by law. Present law also says that some \$8 billion of revenue will be lost in the 1955 fiscal year through the expiry of various taxes. These must either be extended or Mr Humphrey must find some new source of revenue, if he is to keep his balanced budget within sight.

Another Pull at the Debt

THE economies in government spending which have made the budget outlook so satisfactory have also made the Treasury fairly confident that the national debt will not hit its ceiling this year. The new securities which the Treasury offered this week will not add to the debt since these are merely refunding issues, available only to holders of almost \$8 billion worth of 2 per cent 10-year bonds which mature on September 15th. The Treasury, however, was anxious that its offer should be attractive enough to keep to a minimum the number of holders of these bonds who would insist on cash repayment; if any substantial amount of money had to be found for this purpose, future borrowing operations, which will include the raising of new money in October, would be hampered.

It looks as if the Treasury should achieve its immediate purpose. It has produced a "package" offer, giving holders a choice of 1-year certificates or 3½-year notes. A similar package last February was very successful, with only 1½ per cent of the holders of the maturing security demanding cash. But the February issues were also the first attempt of the new Administration to achieve its underlying purpose of extending the term of the national debt, and in this they were much less successful; practically all the refunding was into the short-term certificate. But this time nearly half the holders of the maturing bonds are corporations and other non-bank investors, who are not so concerned about liquidity as are the banks, and it is therefore hoped that many of them will ask for the longer-term note.

They should be drawn by the 2½ per cent interest rate, the highest paid on a 3½-year note for two decades. It is nevertheless what had been said to be needed if the issue was to be a success, and the 2½ per cent rate on the 1-year certificate has been the going rate since June; a maturing Treasury issue of \$2.8 billion was satisfactorily refunded at that price in August. The cost of carrying the national debt has, of course, gone up with higher interest charges and these latest increases will give additional ammunition to the Democrats who are already insisting that Americans are being overburdened as a result of Republican policy. But the Secretary of the Treasury maintains that it is worth a good deal for the government to be freed from the necessity of having to go to the market as frequently as it must at present.

Insupportable Wool

FOR the first time since its change of membership the Tariff Commission has just opened an important series of hearings. It has been directed by the President to discover whether wool imports are "materially interfering" with the Department of Agriculture's price support programme or "reducing substantially" the use of domestic wool. At the same time the Secretary of Agriculture was asked to carry out a study of the domestic factors that have contributed to the decline in the number of sheep and in the production of wool. Under the Agriculture Act of 1949 the annual production of shorn wool was to be held at 360 million pounds by a sliding scale of price supports. In

fact that figure has never been reached since 1943 and, despite supports each year at the maximum rate, output has only risen from 213 million pounds (greasy basis) in 1949 to 232 million in 1952, and is expected to fall to 229 million this year. Moreover, of the 232 million pounds produced last year over 100 million is now in the possession of the Commodity Credit Corporation as the result of its price support operations.

The growers blame this situation on low American tariffs and the use by foreign governments of export subsidies. Last year imports represented 72 per cent of American consumption. This year they began coming in at a similarly high level, but dropped sharply in April and May. So far the commission has only heard the representatives of the growers, who are asking that anything from 12 to 15 cents be added as a special fee to the normal tariff of 25½ cents a pound.

In this they have had some support from Mr John Davis who, as president of the Commodity Credit Corporation, wants to get rid of half of his stock and avoid accumulating any more. He has just decided to reduce his prices to the market level, but even so he thinks he will need seven cents on the tariff, although "in theory we at the Agriculture Department are opposed to trade barriers." No one seems to know whether the Secretary of Agriculture will favour his department's theory or his subordinate's practical calculation. At the moment he is being squeezed between the Senators from the western wool states who want him to come out strongly for "adequate import fees," and the President who has written to remind him of "my concern and reluctance with respect to any measure which tends to hinder foreign trade."

Reds Disbarred?

AT its recent meeting the American Bar Association declared that membership of the Communist Party was incompatible with the practice of the law, and called on local associations to obtain the exclusion from the bar of Communist lawyers and those refusing to answer questions about Communist activity. It was emphasised that "present fitness and worth" should be considered rather than "punishment for past deeds and mistakes," but the reluctant decision of the Attorney-General, Mr Brownell, to place the association's smaller rival, the National Lawyers' Guild, on his list of subversive organisations may make it difficult to preserve the distinction. Anyone who has ever belonged to one of these listed organisations finds it difficult to get his loyalty acknowledged, no matter how far back in history the connection may be. Unfortunately, it may not be remembered that Mr Brownell himself has taken note of the fact that "very well-known and completely loyal Americans" had once been members of the Guild, including coloured lawyers who used not to be allowed into the Bar Association.

As for congressional investigations, the association is to make a study of their effect on individual rights. In the meantime it has called for the setting up of local panels of lawyers from whom witnesses can get reliable advice. It feels that lack of objectivity on the part of some counsel may partly explain the regularity with which witnesses have invoked their right under the Fifth Amendment to the

Constitution to refuse to give any answer that might incriminate them. Of course, if the possibility were removed so would be the excuse: quick action next session on the Bill before Congress which allows committees to offer an indemnity to a witness is therefore urged in a unanimous report from Senator Jenner's Internal Security sub-committee.

The report includes an impressive list of former government officials identified by ex-Communists and laying constitutional claim to silence, and documents the claim that the last government took little notice of earlier warnings until congressional investigations aroused public opinion. The new Administration is obviously working to the principle that the only way to stop Congress stepping into the breach is to close the breach. But, according to a statement of Mr Brownell's in a recent interview, the Communists are now much better organised and therefore harder to detect, as the result of being driven underground by the conviction of their leaders under the Smith Act.

Fire Changes Gears

THE disastrous fire that gutted the new General Motors plant at Livonia, Michigan, has spread through the whole automobile industry. For the factory was the only source of the "Hydro-Matic" automatic gears, which are used not only in General Motors' own Cadillacs, Oldsmobiles and Pontiacs, but by other manufacturers as well, notably the Nash and Hudson companies. The immediate result was a sharp fall in car production; only 227 Cadillacs were produced in the week after the fire, compared with 2,067 the week before, and the year's output of cars of all makes may be cut by as much as 10 per cent. The interim result will be a general shifting of automobile gears, with the Buick "Dynaflo" transmission going into Cadillacs, "Powerglides" into Pontiacs, and standard synchromesh transmissions into Oldsmobiles. The long-term result will be better earnings this year for General Motors' competitors and more room in the overcrowded showrooms of automobile dealers, to both of whom the fire has come as a blessing.

One competitor who gained a special benefit from the fire was the Kaiser Motors Corporation, for part of its Willow Run plant, recently closed down after the cancellation of an Air Force contract, is being taken over by the General Motors Corporation. The "Hydro-Matic" equipment is being installed as quickly as the tools can be reconditioned, but it will probably be three months before full production can be resumed. In the meantime General Motors is determined to keep all its models in production, even if only in token numbers, in order that their names shall not drop completely out of the showrooms. For that might mean that the public would forget them altogether, since other makes of cars are in plentiful supply and will continue to be, unless something interferes with their manufacturers' plans. And General Motors does not want its share of the automobile market to fall, instead of climbing steadily as it has been doing for years. However, the company, even though it was under-insured, can afford both the fire and its after-effects since it is now responsible for nearly 50 per cent of all car sales and its only serious rivals, the Ford and Chrysler companies, for only about 20 per cent each.

The World Overseas

Electioneering in Germany

FROM OUR SPECIAL CORRESPONDENT

IF Dr Adenauer wins next Sunday's elections, enthusiasm in the West will be justified; but it should not be boundless. Three outstanding features of the election campaign serve as a warning that parliamentary government is still not firmly established in Germany. One is the lack of speeches by candidates; the second is the party propaganda which, in varying degrees, all beats the patriotic, or nationalist, drum. And the third is the way in which even Dr Adenauer's present coalition partners play on public resentment against the western powers.

The seven parties who are fighting the election over the whole federal field have too little experience—not, in most cases, too little money—to convince the sceptical German public that its opinion is really being consulted. Though a high percentage of the electorate will doubtless vote on Sunday, most of the Germans will remain scornful of a system that is in any case branded with the label of the occupation powers. The public has been given no proper chance of hearing the candidates or the party leaders. In big capital cities like Hanover or Munich there have actually been days at the height of the campaign when no meetings have been held, and even at weekends the average has been no more than one or two gatherings. The contrast with the feverish activities of candidates in Britain is extraordinary—and deplorable.

In the Christian-Democratic Union's campaign Dr Adenauer is the beginning and the end. The situation is somewhat as if, in the 1945 election, the Conservative Party managers had taken Mr Winston Churchill touring the country, but the other candidates had stayed at home. The CDU organisers appear to think that Dr Adenauer is like an American president. They also seem to assume that their seventy-eight-year-old party leader is immortal. This fault will prove serious for the future, whatever party next Sunday's poll returns. Dr Adenauer, with his special train and panoply of motorised police (and fifty journalists), is indeed drawing the largest crowds, but nobody can maintain that he is establishing parliamentary democracy.

The fifty journalists who accompany Dr Adenauer have not filled the papers with his speeches; nor have the arguments of other speakers been reported to any extent. This is because the German press, since the battering it received under Hitler, has been timorously non-party. The election campaign hardly features in its columns, and then mainly in the form of reports of the numerous injurious actions for slander that have been taken by politicians against each other. The radio services have, indeed, car-

ried party speeches, but they lack that essential element of a campaign, the questions from the audience.

The slogans that the various party managers have chosen for placards do little to show the voter what difference there is between one party and another. All of them stress blatantly nationalist or patriotic themes. "For Germany, vote Adenauer," says the CDU. "Strengthen the Right Wing," shouts the extreme *Deutsche Partei*. "We stand for the German Reich," says the Right Wing of the Free Democratic Party. The Social-Democratic Party (SPD) and others denounce the European Defence Community with its linked "Germany Treaty," while on election posters not a single party supports them. Yet it is probable that this competition in nationalism among the party publicity chiefs does less than justice to the public. It would seem from the election audiences that the most burning issues are not German reunion, but pensions and compensation for the vast army of refugees, the bombed-out, the former civil servants and former members of the *Wehrmacht* (including the *Waffen SS*); while in Württemberg-Baden, the familiar continental controversy over Church schools overshadows all others. The party that acts simply as a champion of bigger payments to the victims of the war—the BHE—draws big audiences, particularly from the eighteen million women voters.

As champion of the workers, Social-Democrat speakers are making the most of the fact that the German income tax has been reduced to a greater extent in the higher than in the lower income categories. But they are embarrassed by the fact that employed Germans are not deeply discontented. This comparative lack of resentment against social inequalities has somewhat offset the most serious blow that Dr Adenauer had during the election—the Trade Union Federation's intervention in the campaign against the present coalition parties. Socialist and trade union speakers blame the government for hardships, and government speakers blame the occupation powers. Dr Dehler, Minister of Justice, and a leader of the Free Democratic Party, speaking in Munich last week, actually listed among Allied iniquities "the brutal currency reform, which was not our measure, but the military government's."

It is possible the government parties are too timid about the European Defence Community as an election slogan. There are symptoms to show that the public is not on the whole very antagonistic to the idea. For one, the neutralist party of Herr Heinemann, a leader of the Protestant Church, has been hard hit by its alliance with the group led by

Dr Wirth, which is known to have the blessing of the East German Communists. It is also a sign of the times that, in the experience of your correspondent, no speaker has met with more rapt attention than a Free Democrat ex-general of the *Luftwaffe*, Schulz, who produces reasoned arguments against neutrality and for an alliance with the West. True, his grounds are not altogether reassuring for British ears, as the General does not suggest there was anything wrong with Hitler's Wehrmacht except that it had no strong ally; and he is sure that, even without the European Defence Community, America will rearm Germany. But at least General Schulz pointed out that Germany cannot defend itself alone and belongs to the West. He was therefore a contrast to ex-General Andreas former commander in Crete, and recently released from Allied imprisonment. This general, speaking for the extremist German Reichs-Party in Lower Saxony denounced the Bonn treaties and declared, amid enthusiastic applause, that a rearmed Reich must defend itself against West and East, and Germany "stretches to Tilsit." The DRP has been banned in all but three *Länder* and is robbed by legal action of Dr Naumann and the air-ace Colonel Rudel, both of whom were to have been candidates. Nevertheless, if one DRP candidate is returned by direct election the party may still have a dozen members in the next Bundestag. This would not be serious, if it were the only party that represented those Germans who have learnt nothing and forgotten everything; but, unfortunately, nationalist elements are present in every one of the parties, the Social Democrats being freest of them.

Bombs in the Soviet Press

SINCE Beria's fall the Kremlin has given the impression of suffering from schizophrenia. It tolerates articles, broadcasts, statements and decrees contradicting each other, moving in different directions. It sometimes looks as if Soviet leaders were trying to ride on two horses at the same time. Some moves fit in with the spirit of reform inaugurated after Stalin's death, while others indicate a toughening of the line. The explanation of this split mind probably lies in the existence of two opposing trends within the councils of the Kremlin. Behind the monolithic surface of Soviet leadership a struggle is being waged over policy as well as over power, and it finds an echo at all levels of Soviet political and economic activity. This duality is well illustrated by two items published recently in the Russian press, one marking a step backwards towards Stalinism, the other a startling departure from precedent.

The Soviet hydrogen bomb did not have to wait long to be celebrated in verse. Ten days after the announcement of the first explosion the *Literaturnaya Gazeta*—organ of the Soviet Writers' Union—published on its front page a "soldiers' song" starting with the words:

Defence is our glory
The work of all the nation
We have the atom bombs
And the hydrogen as well.

This strange "ode" went on to say that this is obviously not a threat to the peace-loving, but a reminder to the quick-tempered on the other side. Russia, it argued, stands

for disarmament and peaceful negotiations between nations. At the same time a rattling of the sword could be detected in the references to the "terrible might" of the Soviet Union which, though it does not want war, "has everything which is needed."

The text of the poem as such has no other interest than as a "literary" curiosity. It is a primitive versified rehash of Malenkov's words on this subject. What is significant, however, is that such a thing should now be written, published and probably soon sung by thousands of Russian soldiers. Similar absurd songs were popular during the war. But for such a poem to be published now, the editors of the journal must consider that a touch of jingoism and a rattling of the sword would please the military and find favour with a section of the Kremlin.

Last week, on the other hand, *Pravda*—the party's official daily newspaper—presented its readers with a different sort of explosive material. It republished large extracts from a pamphlet on the international situation supposedly written by an American steel magnate, Mr E. T. Weir, after a journey abroad. Mr Weir's findings were not in themselves startling. They echoed things which have been said in many West European papers. Indeed, the purpose of the pamphlet, as reported by *Pravda*, was probably to draw attention to the discrepancy between European and American reactions. The Europeans, the argument runs, do not pretend that they know more about the Soviet Union than the Americans do. They think, however, that forces operating towards peace are at work there as well as in the West; that Moscow will not start a war; but that, on the other hand, it is idle to expect a Soviet evacuation from Eastern Europe as the price for a settlement.

All this—the divergence of views in the western camp, and assurances of Moscow's peaceful intentions—is part of the usual stock-in-trade of Soviet propaganda. Yet, the way in which it is written and shown to the Soviet public is not. Indeed, many a reader of *Pravda* must have gasped at finding in his paper, without any comment, references to the Soviet Union which for the last twenty years could have been heard only in foreign broadcasts. In one place it is described as a totalitarian state; in another the possibility of "a certain liberalisation of international relations and of the internal regime" in Eastern Europe is discussed. And yet another startling passage predicts that the most that can be expected from a settlement "is . . . that a period of peace may prompt Russia to weaken its iron control over its neighbours, which has only gained strength during the six years of the cold war." (Our italics.)

Totalitarian regime, satellites, Russia's iron hand—this is an extraordinary dish to be put before the Soviet public. And this revolutionary change has not been brought about unintentionally, or by mistake. Such things could not be published on two consecutive days in the party's official daily without the approval of some members at least of the supreme leadership of the party. Besides, since extracts were only quoted, it would have been quite easy to delete inconvenient passages. Thus, undoubtedly, some Soviet leaders judge it worth while to put more truth into *Pravda*.

Is this a prelude to more plain speaking, to a liberalisation of the Soviet press or is it an isolated move? The tug-of-war goes on behind closed walls and the outsider cannot judge whether the diehards have enough strength to defend the citadel of Stalinism. He can only take note of occasional bombshells which show that the battle goes on and wait till the balance of forces becomes more apparent.

India and Sheikh Abdullah

FROM OUR CORRESPONDENT IN INDIA

FURTHER negotiations on Kashmir have begun this week between Delhi and Karachi. These are necessary to settle preliminary issues about the withdrawal of troops before a plebiscite administrator can be appointed under the recent agreement between Mr Nehru and Mr Mohammad Ali. In Kashmir itself, Sheikh Abdullah's disappearance does not mean that India cannot win a plebiscite in the Valley—it only means that both its chances and its eagerness are reduced. The new Premier, Bakshi Ghulam Mahomed, is personally not liked and his brothers get far too many army and government contracts for the public taste. But he is a superb organiser and he has begun very shrewdly. The Kashmiris judge their government by no high-falutin' tests; they consider first what it does for their bellies, and, on this score Bakshi is doing well. The price at which the government buys the peasant's rice has been raised, the price at which it sells it to the Srinagar consumer has been lowered. The salaries of clerks and teachers are being raised, the import duty on salt has been abolished. Committees are being set up to investigate corruption and nepotism amongst government servants, and the irksome monopolies which Sheikh Abdullah, with his socialist ideas, gave to the co-operatives, are to go.

Bakshi is careful to insist on Kashmir's autonomy and on how little last year's Delhi Agreement limits Kashmir; he knows that the whole attraction of the present regime to his people is the more than semi-independence it gives them—and being much weaker than his predecessor, he must display more of the trappings of autonomy. Yet Bakshi does not flaunt this inherited autonomy at India, as his predecessor did; certainly he does not, like the Sheikh, in his last days, hint at independence, or circulate a draft constitution in which Kashmir would keep communications and defence, or place India and Pakistan on a par as countries between which the Kashmiris must choose. He is definitely on India's side—provided Kashmir's autonomy is not touched; provided, too, India continues to defend and subsidise Kashmir without getting anything in return.

Agitation in Jammu

The split between India and Sheikh Abdullah goes back to the election of the Constituent Assembly in 1951. The Assembly was elected at Abdullah's insistence, but it was India which had to accept the UN's displeasure; and in the elections the National Conference—Abdullah's party—won all the seats. In the Kashmir Valley, since the pro-Pakistanis were not standing, this may well have represented the electorate's views. In Jammu, it undoubtedly did not. The main opposition party, the Parishad, withdrew on the grounds that the elections were being rigged, and proceeded to start a movement for complete accession of Kashmir to India. This movement was not in the early months very important, but, as time went on, it brought two points very forcibly to the attention of the Indian public. First, they discovered (what many of them had not known) that there was a Jammu, that it was quite distinct from Kashmir, and that it had a whole series of grievances even against the best

reforms of the Kashmir government; all the provisions of the land reforms, for example, were based on Kashmir conditions, and did not always apply to Jammu's drier soil and different social structure. The agitation thus made Jammu's main point. The Indian public will now regard it as a grave dereliction of duty if their government accepts a plebiscite on terms which do not make it certain that Jammu, and also Buddhist Ladakh, can come to India whichever way the Valley votes. Anxiety over the Prime Minister's communiqué has only been quietened because of widespread reports of a private agreement that any contiguous area which votes for either country will go to that country whatever the overall results.

The other effect of this Jammu agitation, quite limited and partly inspired by vested interests though it was, was even more important. It revealed to India how near independence Sheikh Abdullah's autonomy was, how many privileges it involved for Kashmir, and how few duties. It also made Sheikh Abdullah feel that communalism in India was there, as he himself put it, "under the skin." Had not the communalist parties of India supported the Jammu Parishad? Abdullah increasingly felt that more time was needed to decide the Kashmir problem, that perhaps the idea of independence which the Korean war had made him discard, should be disinterred, that despite past Pakistani aggression, India and Pakistan should be considered equally as possible patrons of Kashmir. He refused to talk to the Parishad leaders and he forcibly put down their agitation.

Indian Indignation

The government of India supported him, but there was increasing uneasiness in India. In so far as the people of Jammu were Hindus wanting freedom from Moslem rule, they got little sympathy; that was communalism. But, in so far as they were asking for the Indian fundamental rights (including the right of compensation for property taken in land reforms which Kashmir alone has not allowed), for the Indian flag, and for completely common citizenship, it was difficult for Indians to see why their demands were unreasonable. Yet the proceedings of the Constituent Assembly made it increasingly clear that Abdullah would never accept them, that he wanted the absolute maximum of separateness. India had thought that the Constituent Assembly would define Kashmir's relations with India, would make it part of India, with however special a status. Instead the Assembly clung to every symbol of sovereignty.

Eventually in the summer of 1952, pressure from India forced Sheikh Abdullah to come to Delhi to discuss the position, and the Delhi Agreement was the result. Yet the Agreement only led to a further drifting apart. So strong was the tail wagging the dog that Sheikh Abdullah got what he wanted; the Maharajah went, though he was popular in Jammu; the State flag was recognised; residuary powers were to be with the State. In return, India got the power of reprieve for the Indian President and the recognition of the Indian Supreme Court as the tribunal for dispute between the Centre and the State. All the other vital issues, like fundamental rights, citizenship, financial integration, were postponed. And over the last months it has become more and more clear that Abdullah was determined to do nothing about them. This not only distressed Delhi and gave a fillip to communalism in India; it also split the Kashmir Cabinet. The two Hindu members were

naturally, not satisfied, and Bakshi was sufficiently practical to realise that Delhi, long suffering though it had been, was bound in the end to turn. The crisis came when Abdullah demanded the resignation of one of his Hindu Cabinet Members, only to find that Bakshi—the party organiser—had turned against him and taken the party away from him.

In India, Abdullah's dismissal has been a great shock. If even he, the friend of Nehru, cannot be trusted, then, it is felt, no Moslem can. India is the more indignant in that the Indian public feels its virtue in Kashmir has got it nothing but kicks from all sides. India went into Kashmir at Kashmir's request; it has not interfered in internal matters, it has spent millions of pounds, lost many lives, incurred world criticism and Pakistan's hatred. For what? So that Abdullah can behave worse than Syngman Rhee, who if he is tiresome at least provides most of the troops. The reporting of Abdullah's speeches in Kashmir has always been censored by the Kashmir government. The Indian public had, therefore, been quite unaware of what he had been saying over the last few months until the week-end of his dismissal; and they had never understood how very special a status he had always demanded for Kashmir. Now they are disgusted. They would like to see the issue settled and the plebiscite over. The only doubt is whether the extremists in Pakistan may not still succeed in substituting their old talk of hatred and jihad for those words of love and friendship with which Mahomed Ali has so beguiled Indian ears.

Germans Under the Gosplan

THE Soviet Empire is centralised to an extraordinary extent. If Whitehall were to fix the annual production of aluminium in Canada, or the number of sheep in Australia, the situation would hardly be more fantastic than that created by the Moscow bureaucrats. The failings of this centralised system can be seen in the Soviet Zone of Germany. The iron curtain does not hide what goes on there. Many German economic technicians and officials have come across to the West with first-hand details at their disposal. The Ministry of All-German Affairs in Bonn issues excellent booklets on the Eastern Zone, and other surveys are produced by the Berlin Institute for Economic Research. The system they describe is peculiar to East Germany and Austria only in that the Russians have actually owned the leading industrial plants and the uranium mines in that part of their empire.

The experts of the All-German Ministry are convinced that the Russians run Eastern Germany almost entirely as part of the Soviet Gosplan; that the planners in the state central planning office in Moscow hold the reins in East Berlin. For that reason, the accompanying chart does not show the pattern of government as it appears to the public, but as it actually is. This way of depicting the Soviet colonial system admittedly leaves out of account the influence that Molotov must have on the Soviet High Commission, and the fact that—until the fall of Beria at any rate—the East German security forces were responsible directly to their superiors in Moscow. But in the main, the chart correctly shows the lines of force radiating from the Gosplan office in Moscow.

The first lesson that a study of East Germany brings out is the dominating position of the local planning commission, which is the decisive, all-pervading force, stemming direct from the Gosplan. The integration of satellite economies in the Soviet five-year plan is complete. According to the report prepared by Dr Otto Walther for the Ministry of All-German Affairs, all the satellites and the Soviet Union are combined in a plan which is one of three drawn up in Moscow. The other two concern the Soviet Union alone, and the Soviet Union with China. China does not simply accept Gosplan orders, but the satellites have to follow without question targets of output laid down in Moscow each year. The local planning commission has to plan for adequate raw materials, investments, subsidies and labour, and has to submit its results for approval by a department of the Soviet High Commission that works under the Moscow Gosplan. Furthermore, the High Commission has to decide what East Germany exports and imports. The system is completely rigid, with no latitude for individual industries—or even "Ministries"—to change the targets that are laid down as law by the Plan Commission. This body, run exclusively by members of the Socialist Unity (Communist) party, works in the strictest secrecy. It can order arrests. Any factory manager who might, in a free country, meet an emergency by showing initiative, is afraid to move. It is easier to "cook" reports, and this is constantly done. The few remaining private businesses in East Germany are no more free than the nationalised industries.

Planners with Power of Arrest

The central planning commission is itself a vast, complicated structure. The Plan Control department, with sections for industry, finance and labour, has the task of supervising the execution of the plans down to the individual factories. It lays down the percentage figures that may be published and works closely with the central statistical office—and checks the political reliability of that key body's personnel. It is the only section that has the actual figures of production (in so far as they are not already distorted by the factory managers), and other decisive data. Its chiefs have the right to demand arrests for economic offences.

The financial section of the Planning Commission is responsible for co-ordination and for supervising the investments, subsidies and other financial affairs of branches of industry. Moreover, it supplies the so-called "plan values" which form the basis of the economic plan as a whole. It also fixes the production costs and selling (if such a capitalist term as selling can be used) prices that are to be taken as the basis for the financial plans for the individual factories, as well as for administrations and groups of nationalised or communally owned industrial, trading and agricultural enterprises.

The Soviet planning system is obviously dependent for its efficiency on the statistical office. But German statisticians, some of them on the basis of direct experience, condemn the Soviet statistical methods as inaccurate and primitive by western standards. The inaccuracies lie in two faults, both inherent in the system. The first is the actual method of calculation, and the second is the political terror, which induces factory managers and others at the lowest level to return false figures for fear of punishment. All enterprises, whether publicly or privately owned, have to send in statistical data, and key factories or mines have to do

THERE ARE BIG NEW MARKETS IN CANADA for men who move FAST!

THE MEN who are developing Canada's riches have never let distance mean a loss of time or of the personal touch. They think in terms of *flying hours*. And remember, the flying time between London or Prestwick and Montreal by a TCA Skyliner is less than between many Canadian cities. Canadians want you over there to talk business—and they like you to come by Canada's own Air Line.

AIR FREIGHT—Ask TCA about fast delivery of goods across the Atlantic to anywhere in Canada.

you should know about **THE BRUSH GROUP**

IF YOU BUY POWER. If you are a commercial attaché, in charge of an irrigation project, a mining engineer, a shipowner . . . if you buy engines for power stations, trains; if you buy power to light a city or pump oil, excavate a building site, or do the hard work on a farm . . . you will be interested in THE BRUSH GROUP.

Here we have gathered in one group the leading British diesel and electrical equipment manufact-

urers. Within this Group are a shared knowledge, an extensive range of manufacturing experience, world-wide servicing facilities, and a company of designers, engineers and craftsmen with a unique variety of technical skills. With this Group organisation and experience, it is certain that we can help considerably in any problems you may have connected with the supply and maintenance of power for your special needs.

STRUCTURE OF GOVERNMENT IN THE SOVIET ZONE OF GERMANY

Source: Ministry for All German Affairs, Bonn

so every ten days. The amount of data required is immense. The returns are collated by the central office, according to units of quantity and "plan values." (Plan values are those fixed for each individual unit of production.) German experts have found that, owing to the great differences in the values fixed in various years, difficult calculations are necessary in order to arrive at an accurate comparison of production from one year to another. Mere comparison of one set of published figures of gross production with the previous year's is misleading.

Professor Bruno Gleitze, of the Berlin Institute for Economic Research, has pointed out how important is the process of deception that begins in the factories of the Soviet world. In the west, a product is only counted if it is really saleable. In the Soviet area, everything counts that has been produced, and in most cases nobody knows or cares whether it is usable until complaints are made. This constant difference between calculated and actual stocks led in the autumn of 1952 to tense conflict between the Soviet Zone Ministries and to whole staffs being changed in the economic administration. The administration's plan reports incorporate all the distortions in calculations made on a lower level, in order to exaggerate successes or hide failures. It would be difficult for the administration deliberately to "cook" figures; it is more convenient not to make corrections. Through the cumulative effect of this distortion, fantastic results emerge. For example, the Soviet Zone economic administration maintained that in 1952 the level of industrial production had reached the index figure of 158 (1936=100). By cutting out distortions, the Berlin Institute concluded that production can at best have only reached the figure of 108. The most important corrections that are not made by the East German authorities are the deletion of raw material imports, and allowance for the continuous increase in prices and for changes in the Soviet plan.

Chain of Errors

The following values are used as the basis for planning in the Soviet area: gross production value, net production value, effective value (taking into account gross production cost and gross "selling" price) and, lastly, the so-called "goods production value." The last figure roughly represents the delivery value in capitalist economy. It includes the value of all goods that actually leave one particular branch of industry, combine or single factory. That is to say, quantities that are used inside the factory are deducted. Figures of gross production include total output even when it is used in other branches of production. This method of gross calculation means that output statistics are duplicated over and over again. When figures of gross production are published (in percentages) it must be borne in mind that they consist of an addition of all returns of gross output for all branches of industry, with this duplication hidden in them. No adjustments, such as all western statisticians make, are made to render Soviet statistics accurate.

Neither the cost of production nor the selling prices are the same as the "plan values," which serve the purpose of making the addition of different kinds of product possible. The Soviet German authorities themselves have warned their offices that these values are not to be taken as the basis for taxation or other financial calculations. As the values are changed from year to year, apart from containing duplications, they offer little basis for the outside statistician to

compute the progress of Soviet production. A system originally designed as a rough and ready method of planning for the highly diversified Soviet Union at the outset of the Bolshevik economic revolution has been applied to the whole Soviet area with hardly a change. The result is that a long chain of errors passes upwards to the Gosplan headquarters in Moscow, and is returned in the form of immutable key target figures to the uttermost corners of the Soviet empire.

Satellite Trade with China

IN an unusually frank announcement the East German Ministry of Foreign Trade has admitted the failure of its trade with China. The fault has been almost exclusively on the side of the Germans, since they have failed to carry out their export programmes; but the Chinese have not helped by rejecting certain deliveries as unsuitable. As the propaganda machines of both these Communist states have in the past been loud in their praise of this trade and wildly optimistic about its future, the present set-back will be hard to swallow.

Trade between the two countries is of the familiar balanced bilateral type. In the original agreement, signed in 1950 with the usual fanfares, East Germany was to export goods to the value of 520 million roubles to China and to take imports to the value of 390 million roubles. Things did not work out that way: the Germans were forced to ask the Chinese to reduce both sides of the agreement. This was agreed to, and the targets were fixed at 213 million roubles for exports from East Germany and 290 million roubles of imports from China. The new agreement signed in Peking on April 30th of this year envisages some increase beyond these figures, but to nothing like the original 1950 targets. The main trouble has been the inability of the East Germans to supply the type of goods the Chinese want, such as armaments, machine tools, heavy machinery and electrical equipment. The East Germans could supply specialised optical equipment and cameras as well as a range of consumer goods. The Chinese for their part cannot be happy with the arrangement whereby their exports of such commodities as feather, bristles, and tung oil, are re-sold to the West by the satellites—presumably at a profit—when a ready market is open to them in direct trade with Western countries in these things.

A new ruse which the East German government is reported to have tried, is an attempt to woo Western countries, particularly the Federal Republic, with an offer to act as an intermediary in trade with China. In a sense they do this already in being host in East Berlin to the China Import-Export Corporation; but, presumably they have ideas of grabbing a permanent share of the entrepot trade in the West's dealings with China.

The end of the Korean war may well shake the whole basis of Chinese trade with the Soviet bloc. China's need for armaments and strategic goods will be reduced, and the type of goods it requires for its industrialisation programme are to be obtained more easily, and probably more cheaply, from the West. The Chinese may be realising this more acutely now; but everything must wait upon a political settlement. Meanwhile, the West probably stands to gain by a policy of "wait and see."

Doing a useful job

CLEAN COAL

The growing use of mechanical coal cutters and the working of thinner and poorer seams inevitably increase the amount of dirt in the coal that reaches the pithead. Efficient coal cleaning is more than ever essential to prevent trouble at power stations, coke ovens, gasworks and other coal-consuming plants, and to avoid burdening transport systems with millions of tons of rubbish. Simon-Carves have been building coal washeries for half a century. Plants by Simon-Carves are today responsible for nearly half the coal mechanically cleaned in Britain, and post-war plants built abroad have earned handsome amounts of foreign currency.

PROGRESS IN ELECTRONICS

MANY of the great technical achievements of this age stem from scientific investigations that have led to improvements in the properties of materials. This is especially true of the electronics industry.

The rapid progress in electronics has been marked, for instance, by the development of new and improved magnetic materials. One of the most important of these is an efficient anisotropic or directional permanent magnet. Another is a magnetic ferrite of exceptionally high permeability eminently suitable for the cores of high frequency inductances. A third is a non-metallic permanent magnet which is actually a true ceramic.

All these remarkable materials, which were pioneered in this country by Mullard, have had a considerable influence upon the design of better and more compact electronic components and apparatus. Their successful use is due in no small measure to the work undertaken by the Mullard Applications Advisory Service, which is itself backed by a comprehensive research organisation.

THE BUSINESS WORLD

Where Real Resources Go

THE veering course of the British economy since the war defies comprehensive statistical analysis—even in the fifty different tables that the Government statisticians have spread across ninety-eight pages of very closely packed figures and text in this year's report on National Income and Expenditure.* But in these latest estimates, covering the seven postwar years to end-1952, the Central Statistical Office has once again provided the economic analyst with his best annual opportunity for taking a long, hard look at where the British economy has got to now. The CSO's estimates—as usual they are heavily revised estimates—now put the total of money incomes in Britain in 1952 at £13,653 million, or £977 million higher than in 1951, and very nearly £5,000 million higher than in the first complete postwar year.

When utilising these figures as an indicator of economic trends, however, it is better to take 1948, rather than 1946, as the starting point for analysis; it is legitimate to regard 1946 and 1947, when the after-effects of war—with some help from Dr Dalton—were twisting the economy out of all recognisable shape, as years that were too bad to be true. The rise in money incomes and expenditure since 1948 is shown in the first two of the accompanying tables, and the rise in expenditure in real terms is shown in the chart. It will be seen that in this period Britain's national income rose by £3,437 million (or by over 33 per cent) but more than two-thirds of this increase was due to the rise in prices. Of the "real" increase of £1,093 million (in terms of 1948 factor costs) £526 million was absorbed by an increase in government expenditure and £204 million by an increase in personal consumption, while £447 million went towards improving the

external balance; hence, over these four years, £84 million of resources had to be found by allowing real expenditure on gross capital formation to run down.

Within these individual constituents, the increase in defence expenditure accounted for two-thirds of the increase in public authorities' expenditure. It rose by £747 million (to £1,481 million) in money terms, and

WHERE THE INCREASE IN RESOURCES WENT 1948-52

probably by around £400 million in real terms. The increase in social service expenditure, especially in the health service, accounted for the rest of the rise in real public expenditure in these four years. Purely administrative expenditure in the public service still remains much lower than is commonly supposed. A new table in the blue book estimates public expenditure on "general administrative services" in 1952 at £131 million, that on "law and order" at £78 million, on "overseas services" at £41 million, and on "environ-

* Published this week as a blue book by H.M. Stationery Office, 6s. net.

mental services" (roads, sewerage, fire service, etc.) at £189 million. The first lesson to be drawn is therefore a familiar one: namely, that it is nonsense to suppose that anybody can solve Britain's economic problem merely by looking in the direction of administrative expenditure and making a magic wave of the axe.

TABLE I.—GROSS NATIONAL INCOME, 1948, 1951 & 1952
(£ million at current prices)

Gross national income.....	10,216	12,676	13,653

* Including additions to dividend reserves.
† Including additions to tax reserves.

The increase of under 3 per cent in real personal consumption in these four years was smaller than might have been expected in view of the fact that real wages and salaries (after payment of tax) seem to have risen by just over 10 per cent in this period; this estimate is derived by deflating the rise of some 35 per cent in the money value of employees' net incomes by the rise of 22 per cent in consumer prices. Indeed, in the two years from 1950 to 1952 real consumption actually fell by nearly 2½ per cent despite a continuing small increase in real personal incomes (of the order of 1 per cent). Virtually the whole of the fall in real expenditure in these two years occurred in clothing (down by 11½ per cent at constant market prices) and durable household goods (down by 14 per cent); consumers had, of course, stocked up heavily with these goods during the post-Korean spending spree. It should be recorded, however, that since the giddy days of 1946 real consumption of food has increased by 15 per cent, of clothing by 21 per cent, of household goods by between 35 and 45 per cent (with soap and detergents, exceptionally, up by 60 per cent) and of books and newspapers by 16 per cent; at the other end of the scale, real consumption of tobacco has fallen by 14 per cent, of alcohol by 5 per cent and real expenditure on entertainment by 6 per cent. Gladstone would have approved.

The explanation of the restraint in consumption in the last two years lies in a heartening—though belated—rise in personal savings. This is a trend that deserves

more attention than it has so far received. There is now no direct estimate of personal savings in the national income blue book; but the omnibus item labelled "personal balance: saving, provision for depreciation and stock appreciation" is put at £502 million for 1952 compared with £220 million in 1951 and only £80 million in 1948; this item therefore equalled 11d. in the £1, or over 4½ per cent, of personal disposable income in 1952, compared with less than 2½d. (under 1 per cent) in 1948. It should be noted that in America personal savings rose from 2 or 3 per cent of disposable incomes in the years immediately after the war to 8 or 9 per cent in 1951-53; the same trend may be in progress here, although, as usual, the British seem to be doing things by halves.

The £502 million of personal "balances" in 1952 combined with £1,324 million of new undistributed profits of companies and public corporations (including additions to tax reserves), with £413 million of surpluses in the current budgets of public authorities, and with £33 million of other oddments of savings (such as current transfers from abroad) to make a grand total of £2,272 million of investible funds last year. Only £50 million of this was needed to finance the increased cost of stock-carrying; and, since the physical volume of stocks ran down by £123 million in the year, the country had enough savings on hand to run a balance of payments surplus of £291 million (including defence aid) and to devote £2,054 million to gross capital formation.

TABLE II.—GROSS NATIONAL EXPENDITURE*
(£ million at current factor costs)

	1948	1951	1952
Consumer's expenditure.....	7,050	8,384	8,856
Gov't. current expenditure	1,732	2,395	2,841

Exports less imports.....	— 52	—460	+124
Gross national product.....	10,216	12,676	13,653

* At factor cost—i.e., after subtracting net indirect taxes.

In terms of 1948 market prices this £2,054 million of fixed investment was worth only £1,551 million—virtually the same as in 1950 and 1951, although a full 50 per cent above the £1,025 million of real fixed investment that was achieved in 1946. In terms of 1938 prices real fixed investment in 1952 was probably between £750 million and £800 million; this very rough estimate can be secured by combining an estimate of the rise in replacement costs of capital equipment between 1938 and 1945 (70 per cent) from Cmd 6707 of 1945 with the estimate of the rise in replacement costs between 1946 and 1952 (53 per cent) deducible from the new blue book. Actual expenditure on gross fixed investment in 1938 was £600 million, and the conclusion therefore seems to be that Britain is now devoting between one-quarter and

one-third more real resources to fixed investment than it did during the prewar slump.

It is still impossible to say, however, whether this level of fixed investment is sufficient to offset wear and tear on existing capital equipment in all sectors of the British economy. The only three groups that quite clearly are adding to their real capital are the public authorities, farmers and most of the nationalised industries. The central government and the local authorities accounted for £718 million (or about 35 per cent) of gross fixed investment in 1952; of this £350 million went on the local authorities' housing programme. Farmers undertook £81 million of gross fixed investment in 1952; this is the only group for which estimates of true depreciation (at current replacement costs) exist—true depreciation of farm equipment in 1952 was £54 million,

indicating a net investment of £27 million on British farms last year. The third group that is clearly still expanding its real capital is the nationalised sector of industry, with the electricity industry in the van. The public corporations undertook £410 million of gross fixed investment last year, or nearly two-thirds as much as total fixed investment by companies—despite the fact that the companies' share in gross national product appears to exceed that of the public corporations by some seven or eight to one.

The suspicion therefore remains that in many sectors of private industry capital equipment must be wearing out without replacement. This may not be true of corporate business; a very rough estimate, based on prewar depreciation allowances and prewar estimates of national wealth, suggests that companies may now be adding to their net real assets by between 0 and 1 per cent a year. But it seems fairly certain that net disinvestment is still proceeding apace in non-corporate businesses. Excluding new private housebuilding and agricultural investment, gross fixed capital formation in the non-corporate sector last year was only £111 million; and about a third of this seems to have represented purchases of vehicles—for the small business man has tumbled to the advantages of claiming depreciation allowances for his car.

The comparative atrophy of net investment in the greater part of the private sector of the economy has previously been explicable by the lack of available funds. In each of the four years 1948 through 1951 personal savings fell far short (by between £235 and

£370 million) of the sums needed to meet death duties and to finance real investment—chiefly on the farms and on new housing—in the personal sector; in 1952 persons saved some £50 million more than was needed to meet these obligations, although—when the volume of personal savings through life assurance and other institutional media is taken into account—it seems clear that persons were still net sellers of stock exchange securities and other financial assets. But the improvement in the liquid balances of companies last year was pronounced. The companies' surplus of new savings over domestic investment rose from £178 million in 1951 to £789 million in 1952. But with the replacement cost of machinery some three times its prewar level, with depreciation allowances still based on original cost, and with the increase in their net profits over the

last five years a very small proportion (it seems to have been under 3 per cent) of their total investment outlay in that period, the companies did not push ahead with development and modernisation to the extent that their financial resources would have allowed.

This problem of the disincentive to investment—and, indeed, the whole mosaic of the economy presented by the new blue book—is illustrated by Table III on this page. The first three columns of the table are self-explanatory; they show the components, by industry and type of income, of Britain's gross domestic product, of £13,525 million last year (this fell short of gross national product by the £128 million of net income from abroad). The fourth column of the table shows the share of gross national income that can be attributed to each of the ten main occupational groups; one incidental point to note here is that the share of agriculture, forestry and fishing, at 5.6 per cent, is the lowest for any country in the world. The fifth column shows the share of the main groups in the national investment programme, and suggests that only the two

mainly nationalised groups—"gas, electricity and water" and "transport and communications"—had a larger share in the investment programme last year than they did in the gross national product. The figure for investment in transport, however, is rather an odd jumble. It includes shipping, while, in inland transport, although the roads are getting fuller and fuller they are not getting better and better—and there is probably some net disinvestment in railway rolling stock. The shortfall in the other main industrial groups is explained by the very large share of investment absorbed by housing and the social services; the share of 32.3 per cent shown for the last three groups in the table is almost wholly accounted for by investment of this kind.

The sixth column of Table III shows an estimate of the percentage growth in real production since 1948 in each of the main occupational groups; this is a new feature of the blue book, and one that has been compiled in association with the Department of Applied Economics at Cambridge. The total growth in real

domestic product between 1948 and 1952 is estimated at 9.8 per cent (in terms of constant factor costs), and the table suggests that this average increase was exceeded only by "gas, electricity and water," "transport and communications," farming and manufacturing industry; it is noteworthy that the first three of these groups had a favoured share in the real investment programme. Finally, the last two columns of the table suggest that gross profits increased by exactly the same proportion (35 per cent) as employees' incomes in these four years. But there is an important correction to be made here. As consumer prices rose by 22 per cent in these four years, the rise in real incomes of employees was of the order of 10 per cent; while as the cost of making additions to stock rose by around 35 per cent and that of buying new capital equipment rose by 32 per cent, the rise in real profits was negligible. The pinch on profits, and the disincentive to risk-taking, continues. So long as it does so, the country's forward progress can only be a forward limp.

Limited Freedom for Grains

THE decontrol of the grain trade, under arrangements begun several months ago and completed this week, is by far the most significant stride towards the restoration of freedom for trading in commodities that Britain has yet taken. It does not, however, attain the ultimate goal of price flexibility and effective competition in the grain trade as a whole, nor will it put an end to governmental dealings in grain. The range of government intervention has been cut down, imports of grain have been freed, and control of domestic use of grain has been abandoned. But these important steps, and some others besides, could not achieve complete freedom in the grain markets so long as the Government remains obliged to operate the complicated system of guaranteed prices for domestic producers—the system embodied in the Agriculture Act of 1947.

Further progress towards freedom in the markets is not, indeed, ruled out by the principle of subsidising home production. But the technical difficulties of reconciling trading freedom with producers' subsidies could not be quickly overcome—and in fact can hardly be fully overcome without amendment of the Act, which will be a tricky process, politically. At this stage, therefore, the arrangements embrace a series of compromises, some of them very complicated ones, that make it hard for the lay observer either to discern what the new range of freedom really is or to appraise the problem of extending it. The uncertainties are not, indeed, confined to the outside observer: the season 1953-54 will be a trying one both for the trade and for the Ministry of Food, and even the best-informed will not yet commit themselves to guesses about how the new system will work.

For the past fourteen years, the grain trade has been a monopoly of the Ministry of Food. Under this system, the Ministry, acting through intermediaries, has been the sole buyer and seller of all grains, whether domestic or foreign. The millers, the compounders of feedingstuffs, the poultry farmers, the makers of biscuits and breakfast foods, the distillers and the rest, received only such quantities and grades as the Ministry could supply, at prices fixed by the Ministry. The millers, indeed, acted simply as the Ministry's agents, and worked on a predetermined rate of profit. Given this absolute control, the Ministry had no difficulty in fulfilling the requirements of the Agriculture Act to afford a guaranteed market and a minimum price for home-produced grains.

The new system of decontrol has shorn the government of some of its powers, but not of its obligation to fulfil these guarantees. The Ministry no longer buys foreign grains and the private trade has been left free to import grain for home consumption, and to do so on "open general licence"—which means, for the present, without any specific licensing at all. It can do so, moreover, in the cheapest market, irrespective of what currency is involved (the only restrictions apply to the re-export of dollar grains). And the prices in overseas markets are now generally below the minimum prices for home grains, and are likely to remain so. Domestic grains are once again exposed to full—or nearly full—competition from overseas supplies.

The arrangements that have been made necessarily meet the requirements of the Act, but they do so only at the cost of limiting the freedom of the market. The range of effective competition from overseas supplies

has in fact been narrowed down by several "voluntary" undertakings: to assist it in the disposal of home grain, the Ministry has enlisted the co-operation of certain sections of the trade, who have been persuaded that their new-found freedom would be jeopardised if they were to import too largely a commodity that is Britain's most costly import and is paid for mainly in dollars. In particular, the millers, who constitute the largest consuming industry, have agreed "in the national interest" to use nearly as much British wheat as in recent years, although this "soft" wheat is less suitable for bread-making than the hard imported varieties.

The arrangements for supply of domestic wheat to the millers—now again working on their own account, instead of as agents—will, indeed, not differ in essence from the former arrangements. Their "purchases" from farmers will be made at the guaranteed price, which the Ministry will immediately reimburse to them, and they will then store this home wheat on the Ministry's behalf, as before. They will not themselves take possession of the wheat until they need to use it, and will then pay a price based on the world market and determined weekly by a representative panel of the Ministry and the trade. (In practice, the price paid to the Ministry will be abated by storage charges incurred on its behalf.)

Under this system, it will be seen, there will be no effective price competition between domestic farmers, nor between the domestic farmer and the overseas farmer. Though overseas wheat will compete with home wheat, it will be the Ministry that suffers the competition, that carries and finances the stocks of home wheat, and that bears the risk of fluctuations in world prices. The weight of the resultant burden cannot yet be appraised. This year's wheat harvest is estimated at about 2.4 million tons, but it is impossible to forecast how much of it will be sold, because this is the first season since 1939 in which there have been no restrictions on usage. All that is known is that the millers will use their "best endeavours" to take up 1½ million tons, and that any quantities not used on the farm, and by the poultry farmers and other consumers, will be left with the Ministry.

★

In coarse grains, though there is similar freedom for private imports, the range of government activity will be still larger. The Ministry, through the intermediary of the merchants, will continue to buy from the farms, at the guaranteed price. It will sell through the domestic markets in London and elsewhere—at prices based on the world market and settled weekly by a representative panel, just as the wheat prices are settled.

In barley, the Ministry's problem of competition from overseas supplies has been eased by the habits of two of the largest commercial users, the brewers and maltsters, and the distillers. The brewers and maltsters have a traditionally close association with the growers

of high-grade malting barley, and consider it in their own interests to maintain the supply. For several years they have agreed with the farmers on a maximum and minimum price range, above the guaranteed price, to encourage the production of the qualities and types of barley they require. For these reasons, the brewers and maltsters do not propose to buy any foreign barley this year; they will continue to rely wholly on the higher-priced British product. The whisky distillers, who have not been allowed to use any foreign barley for the past fourteen years, do not expect to import more than 25 per cent of their total requirements this season. Their reasons are broadly similar to those of the brewers, but in some respects more subtle. The surplus of barley, and of the other coarse grains, oats and rye, will be held in the Ministry's own storage facilities.

Unless world grain prices in general stage a quite miraculous recovery, the losses incurred by the Ministry in buying at the guaranteed prices and selling at competitive prices are likely to be considerable. Before the next season begins it is hoped that a new system of marketing can be adopted in order to introduce some much-needed flexibility into the system of domestic subsidies and to promote more efficient production, while still continuing the guarantees to the farmers. For grains—and, indeed, for other agricultural produce, too—the most promising line of advance, even though a line of compromise, seems to be to revive the prewar system of deficiency payments. This would establish a "standard" price, corresponding to the existing guaranteed price, but would leave the farmers to sell in the open market, subject to later assistance from the Ministry. At the end of the season, or at intervals during the season, they would be paid the amount by which the national average selling price fell short of the standard price. The net difference in cost to the taxpayer might be small, though that would depend mainly on the absolute level of the standard price in relation to farming costs. In any case, a reform on these lines would permit the operation of a free domestic market—including competition between individual farmers—and would relieve the Government of active participation in the grain trade.

The process of preparing for the first big step towards freedom in grain has, of course, involved the Ministry not only in these arrangements for home grains, but also in negotiations for the transfer of its stocks of imported wheat. These will be sold at prices based on the world market at the time of sale, and these prices will likewise be settled by a representative panel of the Ministry and the trade. This month the Ministry is selling to the millers sufficient quantities to bring their total stocks of imported wheat to a level equivalent to not less than six and a half weeks' average supply of imported wheat, as at August 29th, the date of decontrol. In October and each succeeding month, the Ministry will sell not more than half a month's average usage of imported wheat, amounting to some 150,000 tons a month. The Ministry's total stock of imported wheat has never been divulged, but it is certainly very

large, and the monthly transfers are expected to continue beyond the end of the year. There will be no similar transfer of government stocks of imported coarse grains; the Ministry will simply be in the market as a seller, at prices that it will fix itself after consultations with a trade panel.

The millers will have to carry their stocks of imported wheat, and any new purchases they make, entirely at their own risk, for there are as yet no facilities to hedge against fluctuations in wheat prices. The size of their stocks, after allowing for the planned transfers to them from the Ministry, could permit them to postpone new purchases for about two months; given the present uncertainty about wheat prices, they are likely to be extremely cautious buyers thereafter. It might be argued that they could make good any loss on stocks of wheat by keeping up their selling prices for flour, but the pressure of competition may prevent this. If any large miller were to cut the price of flour in line with a declining replacement price for wheat, the others would certainly follow suit.

The delay in reopening the hedging markets in Liverpool and London has evidently resulted indirectly

from the Ministry's determination to ensure adequate supplies during the transitional period—with the consequence that available supplies are now larger than the hedging markets would care to face at their reopening. The pipeline is, in fact, bursting. Silos are choked, and grain ships are lying off Liverpool and other ports awaiting discharge. The Liverpool and London exchange authorities have accordingly decided not to start trading in futures until stocks have run down to more reasonable proportions. The Liverpool exchange, which was the principal futures market in Britain before the war, may be able to reopen by November, for deliveries in the New Year. The London exchange will reopen first in coarse grains, because official stocks of these are smaller than those of wheat and will be liquidated sooner. Futures contracts in coarse grains will probably be introduced in London before the end of the year, and trading in wheat futures may start by early spring. Despite its limitations, the whole experiment deserves a warm welcome—but will be anxiously watched for hopeful signs that still further progress towards normal marketing may be possible during the course of 1954.

Business Notes

No Fireworks at the Fund?

THE annual meeting of Governors of the International Monetary Fund, which is due to open in Washington next Wednesday, promised at one time to match in eventfulness the never-to-be-forgotten gathering of 1949, at the close of which—after many discussions in Washington hotel rooms—sterling and the majority of other members' currencies were devalued. At the beginning of this year, following the Commonwealth Economic Conference, there was some reason to believe that the Fund's agenda for its meeting of September, 1953, might bristle with such lively subjects as the tolerance of permissible exchange fluctuations under the Articles of Agreement of the Fund and the provision of additional stand-by credits to countries travelling the road to convertibility. Some people even assumed that such discussions might lead to specific policy decisions.

All such anticipations have, for reasons that are all too familiar, now been fundamentally revised. They were momentarily stirred earlier this week as a result of reports from Washington that United States official quarters might be considering a \$2,000 or \$3,000 million stabilisation fund

to underpin sterling convertibility; this fund, it was suggested, might be added to a stand-by credit of about the same magnitude that could be mobilised by aggregation of the combined quotas of sterling area countries at the IMF. Although these reports were given wide currency, it can be said that they were devoid of any real foundation. No doubt the possibility of such stabilisation credits, and the various techniques of making funds available by direct United States credits or through the mechanism of the IMF, are subjects of academic and exploratory discussion in Washington as they are in other capitals of the world. But pending the report of the President's Commission on Foreign Economic Policy, which is not due until next March, no such discussion or debate can emerge from the realm of purely abstract consideration. The British delegation that will attend this week's meeting—it will be led by Mr Reginald Maudling, the Economic Secretary to the Treasury, and will include Sir Leslie Rowan of the Treasury, Sir George Bolton of the Bank of England and Sir Edmund Hall-Patch, the permanent British executive director on the IMF—must expect to find that sterling convertibility and its related problems will be the main topic of conversation in the *coulisses* of the assembly room. But they will have no specific decisions to announce.

The Fund's Sterling Holding

ALTHOUGH there seems very little prospect that the IMF will find itself in the full limelight of the international financial stage—in 1953 at least—it is doing some useful work in the wings. Its recent revival has been largely due to the fact that sterling has followed the dollar in becoming a scarce currency in many parts of the world. At the end of June the Fund held sterling to the equivalent of \$1,332.8 million, or only \$32.8 million in excess of the United Kingdom quota. Since then this holding will have been further reduced by a purchase of \$5,600,000 worth of sterling by Turkey; while another purchase of £5 million by Japan and a probable purchase of £10 million by Brazil (in compliance with the reported Anglo-Brazilian agreement for the repayment of commercial arrears due to British exporters) are probably still to come.

Six years ago the United Kingdom purchased \$300 million of US dollars from the Fund; this was about \$70 million more than the initial part of the British quota paid in gold—in other words, Britain bought back with sterling the gold it had initially transferred to the IMF and bought 70 million of additional dollars with a new sterling payment in excess of its quota. No repurchase of the sterling paid over at that time has yet been made by Britain, but the sterling concerned has been in gradual process of repurchase by other members. The charges made by the Fund—and the amount that it is willing to lend—are determined by all operations in a particular currency and not merely by operations by the member concerned; the recent purchases by sterling-hungry members have therefore resulted in a small reduction in Britain's debt charges and a small increase in its borrowing potentialities for the future.

Dwindling Dollar Surplus

THE sterling area's gold and dollar reserves increased by only \$13 million in August, by far the smallest increase this year. But this slackening of the gold inflow was not as alarming as bare comparison with the increase of \$89 million achieved in July might at first sight suggest. As the accompanying table shows, the residual dollar accounts—which, for the most part, mirror direct sterling area payments with North America—were exactly in balance last month, compared with a surplus of \$51 million in July. In August, however, \$39 million had to be paid out to Canada in consequence of the new agreement governing repayment of its interest-free loan of 1942; when allowance is made for this, current payments with North America in August seem to have been at least as healthy as in the majority of months this year. Moreover, American aid receipts in August—at only \$19 million—were below their estimated average for the rest of the American fiscal year to June 30th next.

The least satisfactory trend of sterling payments at the moment is with the European Payments Union. Last month's payment of \$6 million of gold to EPU had already been announced. It is now revealed, however, that the sterling area ran another and larger deficit, of £10.6 million,

with Western Europe in August; one-half of this (or some \$15 million) will fall due to be settled by a gold transfer to EPU in the middle of September. It is true that all the seasonal factors—large tourist expenditure, no major commodity sales and the rest—were working against the

sterling area's balance with Europe last month. But this re-emergence into deficit with EPU does not provide a very favourable background to Europe's (perhaps still justifiable) hopes that Britain will announce further measures of import liberalisation before the next ministerial meeting of OEEC in the last week of October.

The Production Record

BRITISH industrial production in the first half of this year, as measured by the official index, was about 3½ per cent higher than in the same period last year, and slightly higher than in 1951. In June and July, months

Aircraft in Peace and War

No other sector of British industry is so exposed to changes in strategic conceptions and in commercial requirements as the

BRITISH AIRCRAFT INDUSTRY

of the slack season, the "all-industries" index was indeed probably 8 per cent up on 1952, though no more than level with 1951. It will not be until late October, when the forecast of the index for September "on the basis of information so far received" is published, that any useful indication will be forthcoming from this statistical series to show whether output this year will continue upward beyond the 1951 level; but it seems clear that the trend is well above the 1952 curve.

Manufacturing output fell more than total output between 1951 and 1952, and despite a marked recovery it has not yet really moved above 1951. It is too early to see yet whether the revival reported from some engineering trades will become general or be sustained; the output of steel is breaking records, and car output is very high, but many other sections of engineering are still

in the doldrums. Textile activity is not yet back to the levels of early 1951 before its recession began; in Lancashire, the steady growth of production seems to be limited in some cases by the lack of workers who have left the industry, and recruiting is even more difficult than in the postwar drive to get labour back into cotton. The statistical evidence from the index about particular industrial groups is generally far less up to date than the broad index. But the difficulties of accelerating this measurement are emphasised by the constant process of revision that the "all industries" and "manufacturing" indices require; the figures for April were twice amended upwards earlier this year and last week were amended a point downwards.

Credit Expansion Slackens

THE curve of credit expansion, which was moving quite sharply upwards during the greater part of the twelve months to end-June last, seems now to be flattening out. In the five weeks to August 19th, net deposits of the clearing banks rose by £27½ million, to £6,041 million, or by only

a little more than their rise in the corresponding weeks last year. In the short period covered by the previous make-up—roughly the first fortnight of July—net deposits actually fell by £10 million, whereas last year they rose by £27 million. The difference between these two comparisons does not necessarily mean that the trend is deteriorating again: because of uncertainties about the precise date at which the banks felt the contractionary effect of the use of Electricity loan moneys to repay bank advances (the last call on this year's loan coincided with the July make-up date), the best guide to the trend is to consider the two months together. On this basis, it will be seen that credit expansion since end-June has this year been little more than one-third of that experienced last year. This improvement almost counterbalances the deterioration shown in the closing weeks of the first half-year—though aggregate deposits are still £174 million net, and £192 million gross, above their level at this time last year.

The recent credit expansion has been wholly due to the financing needs of the central government, but its borrowings from the banking system have been much below the exceptional rate attained in the summer of 1952, though less markedly so in the latest five weeks than they were in the first half of July. On the other hand, the private sector of the economy has been repaying bank credit, but not so

rapidly as it did last year, when the delayed effects of the fall in commodity prices were reinforcing the first sharp effects of the credit squeeze. Total bank advances dropped last month by £53½ million, bringing their fall up to £86½ million since end-June, compared with £106 million in the similar period last. If it is assumed that the proceeds of the calls on the BEA loans and the application moneys on the recent Gas loan were fully applied, both this year and last, in repayment of advances, this would mean that over the seven weeks advances to other borrowers contracted by £47 million this year and £62 million last. Over the same period, the banks' holdings of commercial bills dropped by a further £5 million this year (compared with last year's fall of £19 million), to the new low point of £55 million. Total bank advances now stand at £1,676 million, their lowest since the beginning of 1951 and £276 million below

DAV. 1

In this small island, we have fifty million people to feed. How to do so is the one fundamental economic difficulty of today. The same problem looms large in other lands, too, but here it overrides every political programme, because unless we can solve it, nothing can prevent an inevitable decline in our standards of life.

What are we to do?

In our own country, we must use every available technique and priority to increase food production. Even in this land of industrial power, that power should be geared to the production of food.

But the great Commonwealth with which we are associated could be the biggest development area of this century. It is 80 times the size of the U.K. Its resources are greater than any other single area in the world. It can grow whatever is grown and is potentially the richest group of nations in the world. If capital was diverted to the Commonwealth to carry out its development, we should see more than the commensurate return.

To see the Commonwealth prosperous and expanding, and our own economy more surely based, is worthy of every effort in our power.

GROW MORE FOOD IN BRITAIN AND THE COMMONWEALTH

the peak reached in the spring of last year. On the other hand, in consequence of the governmental borrowings, total liquid assets are only £30 million below the level reached on the eve of last year's special funding operation, and the liquidity ratio, increased by 1.3 to 36.8 per cent during the five weeks, is only 0.6 per cent lower than it was twelve months ago.

Grumbling at Gatt

THE contracting parties to the General Agreement on Tariffs and Trade will have an uncomfortably full agenda before them at their next meeting, which opens in Geneva on September 17th. Two of the long-standing items on that agenda are the accession of Japan and the extension of negotiated tariff schedules beyond the end of this year. To these there are now to be added a controversial (though not very important) new resolution introduced by Britain and a sweeping demand by Australia for a comprehensive review of the whole agreement.

Britain is to ask for an amendment—or rather a favourable legalistic interpretation—of Gatt that would allow it to continue the duty-free entry of certain Commonwealth goods, even if it stops allowing duty-free entry to those same goods when they are imported from non-Commonwealth countries. This British initiative, which was foreshadowed in the communique issued after the Commonwealth Economic Conference last December, is strictly limited in scope. Britain probably wants to replace by tariffs the far severer type of protection that it now gives to certain kinds of agricultural products by means of quantitative restrictions—but without, at the same time, setting in motion the legislation that would be necessary to make comparable increases in tariffs on goods coming from Commonwealth countries. There is no intention of challenging the Gatt rule of “no new preferences”; those who have recently been suggesting that the British delegation to Geneva will be seeking, either at once or little by little, a release from this rule are talking through their Empire crusader's helmet.

The Australian initiative, however, seems to be cast in much more general terms. Mr Menzies stated at the end of last week that the Australian government had been far from satisfied with the operation of Gatt, and that his delegation at the Geneva conference would press for a comprehensive review of the agreement. This frontal attack seems to have been prompted principally by domestic political considerations. It certainly does not betoken a widespread Australian desire for freer trade within the Empire; that much is indicated by the announcement by the Australian Tariff Board that several Australian companies that are offshoots of parent companies in the United Kingdom have applied for tariff protection for their products against imports from Britain. One of them is Courtaulds (Australia), which is asking for a tariff on the two types of rayon yarn (viscose rayon tyre cord and acetate yarn) that it is just beginning to produce—apparently at very high cost. Rayon tariffs are not among the tariffs that Australia has “bound” under Gatt, but there are other uneconomic secondary industries in that country that are “bound” in this way. This point—and the fact that tariff concessions

by the United States are, in present circumstances, more valuable than those given by any other country—should be borne in mind by any eager British exponents of a “get-out-of-Gatt” campaign.

Engineering Loses Workers

EMPLOYMENT figures for individual industries are published long in advance of the “component indices” of industrial output, and the latest give some interesting indications of the pattern of industrial recovery in the first half of 1953. They emphasise the extent to which this has been concentrated in the consumer goods industries. The Labour force in the capital goods industries, with a few exceptions largely attributable to defence contracts, has been shrinking steadily since the year began. The largest increases in civil employment as a whole during the six months, accounting for two-thirds of the growth of 171,000 people, were in building—which had 56,000 more workers at the end of June than at the end of December, 1952—and in the “professional, financial and miscellaneous services” group (including catering and hotels) which took on 52,000 more workers. Both of these increases were seasonal. But the net decline of 32,000 in the metals, engineering and vehicles group was neither seasonal nor welcome.

Within this group, very few industries were increasing their labour force. Employment in aircraft and accessories rose by about 12,000 and employment in making scientific instruments rose by 7,000 in the six months. These were presumably directly due to defence work; the rise of about 5,000 in the radio industry no doubt partook both of defence and of the pre-Coronation television boom; and the growth of 2,000 (some 4 per cent) in the hollow ware industry directly reflected consumer demand. The railway wagon makers recruited an extra 2,000 men, presumably to fill the large railway orders placed last year. The motor industry, which had 2,300 fewer employees at the end of the six months, had combined this with a recovery in output, and some other industries had similar successes; the steel industry, for example, broke its records without taking on many extra men. But for the most part, the dismissal of workers indicated slackening output; and dismissals were widespread. Employment went down sharply in the iron foundries, in tinplate, and in the non-ferrous metal trades; machine tool employment dwindled slightly, while the stationary engine and textile machinery makers continued to lay men off, and a similar lack of orders affected parts of electrical engineering. The policy of reliance upon an increase in engineering exports was thus encountering a very sharp test in its initial stages.

Record Bill Issue

THE Government's borrowings on Treasury bills have been mounting steadily in recent weeks. Since the second half of July the weekly offerings of bills at the

tender have been stepped up from £240 million to the £300 million offered yesterday. This latest offer is the largest ever made, though it has to be remembered that in the war and early postwar years—when the total floating debt mounted to levels much above the present level of just under £5,000 million—the amount of the tender offerings was kept down by the existence of a large volume of Treasury deposit receipts, now discontinued. The pace of new issues of tender bills recently has much exceeded that of maturities, with the result that the total of outstanding tender bills is now at a new peak of £3,370 million, and will rise by another £30 million next week if yesterday's offering was fully allotted. At the time of the special funding operation that accompanied the launching of the new monetary policy in 1951, the issue was £100 million below its present level; on the eve of last year's funding issue the total was £3,120 million.

City circles are therefore now discussing the possibility of a similar operation this autumn—of an offer of short bonds, ostensibly for cash but effectively in exchange for bank holdings of bills, combined with a conversion offer for the maturing Serial Funding bonds (and perhaps also for the unconverted portion of the 1952-54 War Bonds). Such an operation does, indeed, seem probable—even though, from the standpoint of monetary policy, a funding of Treasury bills looks less urgent than it did at this time last year. It should be noted, too, that although the tender issue is reaching new high levels, its rate of increase both in recent weeks and in the whole of the current fiscal year to date has been appreciably less than it was last year. Then, of course, the Government was borrowing abnormally heavily—partly in consequence of the big shortfall on the domestic budget, and partly because of the massive swing of the external balance of payments from huge deficit into surplus.

Radio in the Dark

THE Radio Show opened in London this week in an aura of gloom that was not, for once, due to any lack of orders. On Monday evening, the electricians came out on strike for the second time, leaving the majority of stands structurally complete but for the great part unlighted and unwired. When the show opened the next day for the preview for invited guests, there was still a certain amount of disorder, and although the men went back to work on Wednesday the general lighting of the stands, and the wiring up of television receivers was not finished until the show had been opened some days. But the industry is in the dark in more senses than this. The BBC's television network over the main centres of population is completed, so receiver sales will not continue to get the automatic boost that they have enjoyed in the past few years from the opening up of new stations in densely populated areas. At the same time, there has been a surprising and inexplicable revival of interest in sound radio receivers.

In 1951, out of a total production of 2 million radio receivers, 1.4 million were sold at home. Last year production and home sales both fell 41 per cent, and total home receiver sales amounted to less than 800,000. In the first half of this year, the fall in sales appears to have been

gradually checked; estimates put the number of radio receivers sold at 345,000, which is 7 per cent below the average half-yearly sales in 1952. Most manufacturers believe now that the decline has not only been halted, but sales of sound radio are moving upwards. Home television sales are apparently booming. During the past two years they moved rather slowly; total sales in 1952 reached 784,000, which was only 13 per cent higher than in the previous year. But in the first half of this year, they are believed to have reached 517,000, an increase of 59 per cent on six months' sales in 1952. The Coronation was directly responsible for this jump and sales may not necessarily be maintained at so high a level. It is significant that the renewed demand for sound radio receivers dates in most cases from after the Coronation.

This new-found popularity of radio receivers is probably based on their price. The reduction in purchase tax from 66½ to 50 per cent, and a fall in manufacturers' prices, has combined to bring the majority of radio receivers to within a range of £12 to £25 including tax, while television receiver prices range from an average of £46 for a 9 inch screen to nearly £100 a set for screens of 15 inches and upwards. With the old, immovable cabinet radio rapidly becoming a thing of the past, the emphasis that has been laid on the "transportability" of new radio receivers is in marked contrast with the inevitable cumbersomeness of a television set. Another suggestion is that the better tone of sound reception from a new television receiver has made owners dissatisfied with the quality of sound from their aged radio receivers. But none of these explanations wholly accounts for the recovery in radio, and the future balance between radio and television sales is back in the melting pot.

Radio's Foreign Market

SALES abroad make up an important part of the radio industry's total market, and in spite of import restrictions and stiff overseas competition, exporters appear to be holding the ground that they won during the past two years. The industry's total exports have risen in value from £7.7 million in 1946 to a peak of £25 million last year, out of a total production of £125 million. Sales of receivers account for only a small proportion of the export total; they fell slightly last year from £4.8 million to £4.6 million and reached £2 million in the first six months this year. Import restrictions make the export of complete receivers hazardous and unpredictable; at the moment good business is being done in the South American markets and quota restrictions in otherwise promising markets like South Africa are being met by exporting the chassis only, leaving the importer to fit it into a locally-built cabinet. Very little export business is being done in television receivers, because the varying systems used in foreign markets require special adaptations to receiver designs that make it difficult for British manufacturers to compete with local producers' prices.

British manufacturers are, however, exporting television transmitters and studio equipment. A large part of this business is done by Marconi's Wireless Telegraph Company, and a recent order from Switzerland for an outside broadcast unit brings the company's television equipment exports since the war to "well over" £900,000. Abridged Particulars.

THE PYRENE COMPANY LIMITED

(Incorporated under the Companies Acts 1908 and 1913.)

OFFER FOR SALE

BY

SINGER & FRIEDLANDER LIMITED

OF

288,000 5½ PER CENT. CUMULATIVE PREFERENCE SHARES of £1 EACH at 20s. 6d. per share

and

1,290,000 ORDINARY SHARES OF 5s. each at 15s. per share

Payable in Full on Application.

The Lists will open at 10 a.m. on 10th September, 1953, and close on the same day.

SHARE CAPITAL		Issued and fully paid
Authorised	£600,000 in 600,000 5½ per cent. Cumulative Preference Shares of £1 each	£460,000
	£700,000 in 2,800,000 Ordinary Shares of 5s. each	£575,000
		£1,035,000

Application will be made to the Council of The Stock Exchange, London, for permission to deal in and for quotation for the whole of the issued Share Capital of the Company.

The Offer for Sale will show (inter alia):
1. The Company was made public in 1926 and manufactures and sells fire-fighting equipment, motor-car bumpers, and supplies chemicals for fire-fighting equipment. Among equipments of various types is the well-known 'PYRENE' fire extinguisher.
2. The Directors estimate that net profits for the year ending 31st December, 1953, should be approximately £470,000 (before taxation). On this basis they would propose recommending further dividends amounting to 15 per cent. (less tax), which, with the Interim Dividend of 5 per cent. (less tax), paid on the 12th June, 1953, would make a total distribution of 20 per cent. (less tax) for current year.

3. The net tangible assets of the Company as at 31st December, 1952, amount to £1,321,144, sufficient to cover the nominal amount of the Preference Shares nearly three times, and the estimated profit covers the fixed Preference Dividend (and additional Profits Tax) approximately thirteen times.

4. On a dividend of 20 per cent. per annum (less tax) the Ordinary Shares would show a yield of £6 13s. 4d. per cent. per annum at the price which they are being offered for sale.

Copies of the full Offer for Sale, on the terms of which alone applications will be considered, and Forms of Application can be obtained from:

SINGER & FRIEDLANDER LIMITED, SHELL HOUSE, 55, BISHOPS-GATE, LONDON, E.C.2.

ROWE, SWANN & CO., 22 & 24, OLD BROAD STREET, LONDON, E.C.2.

of these sales are being made in dollar countries. Marconi is supplying transmitters for the Canadian stations in Montreal, Toronto, Ottawa and Vancouver while Pye Ltd., which is a big exporter of studio equipment, has supplied cameras to 17 stations in the United States. Exports of transmitting and communications equipment reached nearly £11 million last year; they are running at a slightly higher rate this year, more than £6 million for the first six months. The balance of exports is made up of sales of loose valves and components, and a change in the method of recording valve exports means that figures since January, 1953, are not strictly comparable with those of previous years.

Wool Season Opens Cautiously

THE 1953-54 wool season opened cautiously this week. At the Australian auctions, prices are now on a par or slightly below the closing levels of last season. On a clean basis, greasy super merino top-making fleece, 64/70's, is about 188d. per lb compared with 195d. at last season's close; greasy merino good top-making fleece, 64's, is also about 7d. per lb cheaper at 176d. The market is feeling its way, but the fact that prices are so nearly in line with last season's closing levels—and in some instances identical—will tend to establish confidence. Actual prices of wool tops in Bradford, which have advanced slightly since the last season closed, may revert to former levels.

This is a satisfactory start to a season that opens in more promising circumstances than the last. A year ago the wool textile industries were climbing out of the recession, there was a heavy carry-over of raw wool in Argentina and Uruguay and a large world clip in prospect. But after a hesitant beginning, prices rose fairly steadily owing to the unexpectedly sharp recovery of public demand for wool textiles and the consequent need to build up manufacturing stocks. The entire clip and the Uruguayan carry-over were cleared and the carry-over in Argentina reduced by more than half to 70 million lb (clean). The wool incomes of Australia, South Africa and New Zealand were exceeded only by the record but unfortunate year of 1950-51.

This season the world wool clip is expected to be slightly larger than in 1952-53, when production increased by six per cent to 2,435 million lb (clean). With the carry-over in Argentina the world supply may total about 2,550 million lb. World consumption of raw wool in the first half of this year was running at a rate which, if maintained, would amount to about 2,600 million annually. Statistically therefore the position seems to be strong, but there are several uncertainties, especially on the side of demand. The continued recovery of activity in major manufacturing countries has resulted mainly from the need to rebuild stocks of semi-manufactures. Production of cloth fell by 4½ per cent in the second quarter, the second successive decline. The prices of woollen goods now reaching the shops reflect the higher prices for raw wool last season, and the public has yet to give its verdict. Japan, a very active buyer of Commonwealth wool last year, is threatening to reduce purchases, owing to its shortage of sterling, although it is prepared to buy poorer quality wool from Argentina for dollars. A fall in demand from Japan was expected to be offset by increased business from the United

States. But the US Tariff Commission is now considering proposals (discussed on page 633) which, if approved by the President, are designed to restrict American demand for imported raw wool and manufactures.

FCI and Steel

THE check to the expansion in the supply of capital by the Finance Corporation for Industry that took place in 1951-52 was reversed in the Corporation's latest financial year. Its investment holdings rose by just over £8 million, to £60.9 million in the year to March 31st last; in 1951-52 they had fallen by £1.7 million. Within this portfolio its holdings in the steel industry stood still, at around £39½ million (or just under two-thirds of its total investments). Clearly, however, the role that FCI should play in further investment in the denationalised steel industry is going to be its main problem for the year ahead.

The legal position is still that FCI can withdraw its steel loans by giving six months' notice; the Iron and Steel Realisation Agency has recently assumed the Iron and Steel Corporation's liability to pay off these loans. The only intimation of future policy given by FCI is that it will not withdraw these loans unless it considers that other projects should clearly have a higher order of priority. It would indeed be odd if it did start withdrawals at this time—particularly with the first public offers of steel shares in the offing. The new five-year development programme in the steel industry may require more than £20 million a year from financial resources outside the industry itself; the private capital market is hardly likely to be able to do more than to absorb the denationalisation issues, and the Treasury (which may make loans for the development programmes of companies still owned wholly or in part by the Realisation Agency) presumably does not intend to do anything more than to make day-to-day advances to keep these programmes ticking over. Once the equity issues of the leading seven steel companies have been floated off, FCI may find itself asked to become the lender in the first resort to the major companies, whose plans account for the greater part of the industry's development programme.

Whether FCI would be willing to accept any such request would depend largely on how profitable it considered new steel loans to be. The Corporation's "balance of income" fell from £489,540 to £200,963 last year; and the whole of this surplus had again to be applied to writing down investments, so that no dividend has yet been paid to its shareholders—who comprise insurance companies, investment trusts and the Bank of England. Last year's fall in income was partly due to the incidence of special receipts in 1951-52, but it also reflected a rise in the charges for bank advances—from which FCI derives most of its loanable funds—following last year's rise in Bank rate. Some of the "escalator clauses" covering the Corporation's investments did not provide for an increase in interest rates of this magnitude—though in its recent agreements the Corporation has been very careful on this point. One hidden source of strength is that the very generous settlement of £2½ million that FCI received in compensation for the loss of its conversion rights into equity shares of the steel companies, notably the Steel Company of Wales

came too late to be credited in the latest accounts. But—after its experience with Petrochemicals and others—the Corporation, even though it was founded to foster basic development rather than to make a large profit, is in no position to take any but the soundest steel investments on to its books.

More Dollars for South Africa

THE International Bank for Reconstruction and Development, whose Governors are meeting in Washington at the same time as those of the IMF next week, has just announced the successful conclusion of negotiations for two loans totalling \$60 million to South Africa. Of this, \$30 million is to be lent directly to the Union government and will be used chiefly to pay for imports of equipment needed to enlarge the carrying capacity of South African railways. The other \$30 million is being lent to the Electricity Supply Commission, under the Union Government's guarantee; it will help to finance a programme that is designed to increase the Commission's power generating capacity by 80 per cent above its 1952 level within the next five years. Both loans carry interest at 4½ per cent, run for a term of ten years, and provide for amortisation payments to begin in 1955. Both can be explained by the fact that the development of the new gold-mining area in the Orange Free State and the recent growth of secondary industries in South Africa have put a heavy strain on the Union's railway system, power supply and public services.

These are not the first World Bank loans to South Africa. In 1951 the Bank lent the Union government \$20 million for communications development, and \$30 million to the Electricity Supply Commission. These loans have now been fully disbursed—or will be in the course of the next few weeks. The additional \$60 million now authorised will allow the impetus imparted by these earlier loans to be maintained. A particularly significant aspect of these operations is that most of the equipment to be imported for the railway and power programmes will be purchased in the United Kingdom; but, nevertheless, according to the official announcement from Washington, "the loans will consist primarily of dollars," since South Africa is able to meet its debt charges in gold. The disbursement of these dollar loans will thus in due course help to fortify Britain's dollar reserves—an example of an untied loan that the British representatives at next week's World Bank meeting will no doubt greet with acclaim.

Rayon's Peak

RAYON production touched 37.1 million pounds for the first time in July, and there is no sign yet of the check in demand that would normally be expected if rayon users were in fact replacing the stocks that they ran down to nothing last year. The steady shift of spindles in Lancashire from cotton on to rayon is reflected in the still rising output of rayon staple. A year ago staple production had

dropped to 3 million pounds a month; by July this year it had risen to 18.2 million. At 2s. a pound, rayon staple is highly competitive with American-type raw cotton, and a good deal of staple-producing capacity is being brought into full operation for the first time this year.

Future levels of rayon production may depend very largely on the level at which exports can be maintained. Their value during the first seven months of the year reached little more than £25 million, only slightly below their level over the same period of 1952, but a good £10 million less than their value in the first seven months of 1951. The arbitrary imposition of import restrictions, and the clamour for higher tariffs from the domestic industries of importing countries tend both to depress the level of textile exports and to intensify the competition for markets between exporting countries.

By next year, however, figures for both rayon production and exports will begin to need considerable qualification. Synthetic fibres like nylon and "terylene" are included in

the figures given for rayon because they have generally only one producer and the Board of Trade does not reveal the production figures of individual companies. New large-scale plants for these and other fibres will be coming into production during the next few years and will swell the rayon production figures by several million pounds a month.

Recently the Board of Trade has announced that it will grant import licences for limited quantities of other synthetic yarns from dollar countries. Small quantities have been allowed in during the past eighteen months, about £30,000 worth has come in so far this year, and by the end of December the total imports of these fibres from dollar countries may reach £100,000. The purpose of granting licences for these fibres, mainly "orlon," with some "acrylan" and "dynel" is to give the British textile manufacturers an opportunity to experiment with them and to test the market. On the evidence of these experiments will be based the decisions whether these additional synthetics are put into production in this country. Many of them cost seven to ten times the price of rayon yarns, and unless the Board of Trade and the Customs and Excise departments together decide to admit some new classifications into man-made fibres, statistics of either the production of "rayon" or the exports of "artificial silk"—the two official terms for these fibres—will become meaningless.

Boys for the Jobs?

NO successor to Mr Ebby Edwards as labour relations member of the National Coal Board had been appointed by the time that Mr Edwards's period of service ran out this week, though betting in the industry had narrowed the field to two or three names. Constitutionally, Mr Edwards had been appointed by the Minister of Fuel and Power simply as one of the full-time members, and since the board still has its necessary complement of these, the appointment of a successor has not been a matter of urgency for the Minister. But labour relations is one of the departments for which individual members continued to have direct responsibilities when the board moved away from the functional principle some years ago; and it seems likely that a new member will be required for it. The job is not altogether a comfortable one. Negotiations with the National Union of Mineworkers no longer tend to reach Downing Street, but the labour relations member negotiating with NUM leaders has a chairman and a Minister above him to whom wages must be of vital interest. Moreover, the NUM is one of the bodies whose views the Minister is likely to consider in making his appointment. So the selection of a recruit both qualified and willing to fill this vacancy—like other vacancies in the hierarchies of the nationalised industries—may have its difficulties.

The lack of a full-time board member to head the department, in the short run, would hardly dislocate its operations. The NUM leaders were instructed at their annual conference this year to consider a further wage claim on behalf of the industry's lower-paid workers. This was to be buttressed by an inquiry into wages, costs, distributive margins and prices of coal to different classes of consumer; but whether the union will delay the claim until it has finished delving is perhaps doubtful. The department has still on its hands the interminable joint investigation, with the union, of the industry's wages structure; it does not appear that the investigators have advanced much further with this since it was interrupted by the wages increase early this year. The union can claim to have its own policy on this more clearly defined than the board, which is not surprising. It is easier to argue clearly and conveniently that the pay of day wage men doing the same jobs in all wages districts ought to be brought up to the average in the highest district than to count the cost and then to consider how far this principle is inevitable. Moreover, last year's elaborate statistical inquiry into the pay of workers at all the pits in the country has perhaps introduced some uncertainty into just what "district wage differentials" really mean. This unrewarding joint task is perhaps the most important issue with which a new board member taking on labour relations will have to grapple: some new thinking on the problem would certainly be opportune.

Company Notes

BEECHAM GROUP. The directors of the Beecham group, who have always been commendably aware of the advantages of advertising in all its forms, have again issued an attractive and informative set of full accounts to the 34,000-odd owners of the company's preference and equity shares. The story that these accounts have to tell, however, is that the group did little more than mark time in the year to March 31st last. The value of its total sales, at just over £25 million, and its profits, at just over £2.9 million, were practically unchanged; the dividend rate of 40 per cent was also repeated, but actual dividend disbursements rose from £324,713 to £390,350 following the recent "rights" issue of deferred ordinary shares. There were, however, some changes in the pattern of the group's trade. At home its sales of proprietary foods, medicines and toilet products continued to expand, while sales by the group's wholesale grocery companies again fell; abroad, the group's sales in the Americas and in Europe again increased but this was rather more than offset by a decline in sales in the sterling area countries.

The most satisfactory feature of the year was the reduction in the group's working capital commitments. The book value of its stocks fell quite sharply—

from £5,800,873 to £4,401,442—and cash balances rose accordingly, from £473,983 to £1,229,798, while bank overdrafts declined from £2,618,811 to £676,233. The group has already done much to consolidate its footing in American markets and it is now embarked on transatlantic diplomacy in reverse by trying to establish a mass market for Coca Cola in this country; if it succeeds, there is no lack

of liquid funds to prevent dividends from rising.

A. C. COSSOR. In the last few years the Cossor group of radio and television manufacturers has gradually put a previously battered house in order—partly with the help of defence contracts. Losses have been turned into profits; preference dividend arrears have been paid off; and equity payments have been resumed. It has always been clear, however, that this spring cleaning would not be complete until the group had raised new capital on the market. That stage has now been reached, and the directors propose that a further 2,500,000 5s. ordinary shares should be created; they intend "to take the first available opportunity to issue at least part of the new capital." The greater part of these new funds will be needed to pay off the bank overdrafts (totalling £793,433 at the end of last March) that have financed the recent expansion in the group's business.

The chairman has issued an assurance that the present dividend rate of 10 per cent could be maintained on an increased equity capital, and has even hinted that the company might be able in favourable circumstances to push up this rate a little. But much will depend on the profitability—and future—of defence contracts. In the year to March 31st last the group's turnover rose from about £5,750,000 to nearly £7,250,000 (including about £1,500,000 in export sales), but its trading profits actually fell slightly, from £482,876 to £464,917. This divergent movement in sales and in profits was due to the fact that

government defence contracts accounted for a considerable part of the increase in sales; and profit margins on these orders are, in Lord Burghley's words, "strictly limited." Clearly, then, the group is still very dependent upon defence contracts;

	Years to Mar. 1,

Stocks	2,875,437	2,504,496
Cash	18,853	145,629
Bank overdrafts	813,891	793,433
Reserves	754,781	793,380
Ordinary capital	600,000	600,000

and although these contracts have helped the group to keep its development and research programme abreast of its competitors, this dependence is none too sure a base for trade. Any prospective investors in the new issue should therefore weigh the question mark that hangs over the group's long-term prospects against the short-term consideration that new money will remove the group's reliance on the banks, whose increased charges last year played their part in reducing net profits from £96,014 to £63,816.

FURNESS WITHEY. A story that is now all too familiar to shareholders in shipping companies is unfolded in the full accounts of Furness Withy for the year to April 30th last. The group's gross profits were squeezed between the fall in freight rates and the steady rise in operating costs; they fell from £8,012,577 in 1951-52 (admittedly a peak year) to

£5,143,900. This decline in profits led to a fractional reduction in the ordinary dividend rate (from 12½ to 12 per cent), although, as was pointed out in these columns on August 15th, this reduction was rather more than offset by the reduction in the standard rate of tax deducted from dividend warrants.

The company has an estimated balance of expenditure for new tonnage at nearly £12½ million; although as it has ample cash and near liquid resources in hand to meet immediate capital commitments, it is therefore peculiarly hard hit by the burden of replacement. Indeed, in drawing attention to the rise in shipbuilding costs, the chairman, Sir Ernest Murrant, goes as far as to say that "the position is most unsatisfactory and the only remedy appears to be for shipowners to call a halt in ordering new ships except for bare necessities." Unless the Royal Commission on Taxation comes out with some

	Years to April 30,

Ordinary capital	5,266,287	5,316,787

£1 ordinary stock at 29s. x d. yields 8½ per cent. proposal to mitigate the peculiarly vicious problem of inadequate depreciation allowances in the shipping industry, the company's 5s. ordinary shares—which at the current price of 29s. x d. yield 8½ per cent—can therefore hardly be regarded as an expanding equity, to say the least.

LONDON STOCK EXCHANGE

Next Account begins: September 16th.
Next Contango Day: September 16th.
Next Settlement Day: September 8th.

ALTHOUGH gilt-edged securities continued to improve this week, industrial equities were more hesitant. There was a steady flow of small buying orders into the gilt-edged market and most of the medium dated and longer dated stocks were marked up; by the close on Wednesday War Loan had improved to 82½ and Transport (1978-88) to 81½. Dominion and Colonial loans, particularly the Australian issues, were also marked up but at the close on Wednesday last week's new East African loan—a 4 per cent stock (1968-71)—still stood at its issue price of 95. Banking shares were idle but firm; insurance shares were rather more active, with especial interest concentrated upon Caledonian Assurance, which rose to 6½ before denials by companies that had been suggested as possible bidders for the shares brought the price back to 5½. In the foreign market Japanese and German issues moved rather irregularly within narrow limits at the end of the old account; then, on the first day of the new account German issues made fractional losses and Japanese bonds fractional gains. Elsewhere United Railways of Havana were in demand on take-over rumours.

The nervous fluctuations in Wall Street brought rises in most sections of the industrial market to a halt. Generally, however, the undertone was reasonably firm. The only sectors in which any notable gains were scored were breweries and tobaccos; by the close on Wednesday "Imps" had risen to 55s. 9d., a gain of 1s. 7d. on the week. Oil shares remained firm, with Anglo-Iranian being in particular demand.

Rubber shares were steady and tea shares made a number of good gains. The World Bank loan to South Africa helped to give rather a firmer note to dealings in the Kaffir market, but prices improved by only a few pence. Base metal shares tended to improve after the new account had opened.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; Austria, manufactured gas; and Norway, electricity. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade: Belgium includes Luxembourg.

EXCHEQUER RETURNS

For the week ended August 29th there was an "above-line" surplus (after allowing for Sinking Funds) of £12,294,000 compared with a deficit of £42,321,000 in the previous week and a surplus of £15,498,000 in the corresponding period last year, bringing the cumulative deficit to £183,613,000 (£227,352,000 in 1952-53). Net expenditure "below-line" absorbed £7,764,000 bringing the total cumulative deficit to £380,166,000 (£488,619,000 in 1952-53).

Financial Statistics

THE MONEY MARKET

At last week's Treasury bill tender, the market unexpectedly raised its bid by 2d., to 99 8s. 4d. per cent for the record total of £280 million of bills on offer. Despite an increase of £12 million in total applications, the proportion of the market's bid to be allotted rose to the unusually high figure of 77 per cent; the result was that the average rate of discount was brought down by 8d. to 2 6s. 8.25d. per cent, giving the Government its cheapest borrowing since April, 1952. At yesterday's tender, a new record total of £300 million of bills were on offer; if all these are allotted the excess of new bills over maturities will rise to £30 million next week.

The authorities have again stepped in with special purchases of bills whenever credit has been in stringent supply; special help was in fact accorded on Thursday of last week and on each of the first three days of this week—although only on Monday and Tuesday did the authorities' purchases, both from the banks and the market, reach sizeable proportions. On Friday and Saturday of last week, however, conditions were temporarily comfortable without official intervention; in fact some funds from outside sources came on offer at 1½ per cent. At the middle of this week the big banks were buying November bills from the discount market at 2½ per cent, October bills at 2½ per cent and Septembers at 2½ per cent.

The Bank return shows that some £1,800,000 of notes have flowed back from active circulation. Largely because of this bankers' balances have risen by £1,200,000.

Ten million families put their faith in HOME SERVICE INSURANCE

Issued by the
Industrial Life Offices

New Bank in Papua, New Guinea

Papua, New Guinea is a focal point in Pacific affairs by reason of its first class importance strategically.

Commercially, this territory carries on a vigorous and expanding trade with many parts of the world, exporting rubber, coconut and sisal and importing a widening range of goods.

To help meet these developments, A.N.Z. Bank opened on 3rd September a Branch at Port Moresby, Papua where our Manager will gladly make 'on the spot' enquiries for Trade and Commerce.

Write to or telephone Overseas Department of the Head Office of the Bank in London for any information you may want regarding this region—

ON INVESTMENT

as an executor . . .

the principal objective is to ensure safety, a good steady return and the ability to realise on capital without loss should occasion arise.

as an accountant . . .

the problem usually revolves round the safe disposal of surplus funds or reserves: the ability to realise quickly and without loss when required is equally essential.

as a solicitor . . .

a variety of problems may arise — money realised by sale of property, the settlement of estates, the investment of legacies — but in all cases safety for capital plus regular interest and accessibility of money without loss are the main objectives.

everything points to the
advantages of investment

THE LONDON OMNIBUS serves the public

Walter Hancock's steam omnibus was first introduced to a waiting public in 1833 and was named, appropriately, the 'Enterprise'.

Another public enterprise is now presented by the London Assurance with the appearance of a selection from their omnibus collection of policies.

CONDUCT — EXCELLENT

And you will receive full marks as a father for prudence and foresight if you have provided for school fees and other educational expenses in advance by means of an Educational Policy.

COVER POINT

Few cricket seasons pass without some injury — and it may not always be a grazed elbow. Our Sportsmen's Policy covers you financially according to the risks of the game with premiums ranging from £1 for cricket to three half-crowns for bowls — and that's a point worth remembering.

BURNING QUESTION

How much loss would a fire cause you? Fires have a way of quickly spreading through your property, and though nothing can put back what goes up in smoke, our Fire Policy does make good your losses.

. . . and finally . . .

If you would know more about any of the policies outlined here, if we can provide information about any other particular policies or about insurance problems generally — pray make what use of us you wish. Our address is 1 King William Street, Department T.6, London, E.C.4.

THE LONDON ASSURANCE

COMPANY MEETINGS

CROPPER & COMPANY, LIMITED

(Carton Manufacturers)

DISTRIBUTION OF 42½ PER CENT

MR FRANK W. J. SMITH'S STATEMENT

The fifty-sixth annual general meeting of Cropper & Company, Limited, was held on August 27th at the registered office of the company, Thatcham, Berkshire, Mr Frank W. J. Smith, chairman and managing director, presiding.

The following is his statement which was circulated with the annual report and accounts for the year ended June 30, 1953:

Before dealing with the results for the past year I wish to pay a tribute to the memory of the late Mr Charles Priestley Forster, who passed away on Friday, June 12th last, after many years' service with the company, formerly as secretary and latterly also as a director. He was greatly revered and respected not only by his colleagues but also by a wide circle of friends. He will be greatly missed, especially at Thatcham.

Now it is my further sad duty to mention the passing suddenly of another late colleague, Mr Digby Cropper, a past director of this company. Mr Digby Cropper, who retired some years ago, attained a great age and had served the company faithfully for over 50 years. I, personally, missed him as a colleague on his retirement, and also as a great friend of so many years' standing.

The profit for the year ended June 30, 1953, before taxation, amounts to £246,617, and is the highest net profit in the history of the company with the exception of the years 1951 and 1952, which were abnormal. Taxation amounts to a total of £98,885, leaving the net profit of £147,732 for the year, after deduction of tax. After adding the balance brought forward from last year of £49,821 and deducting the net cost of the interim dividend of £17,52 and the preference dividend of £5,914, there is a disposable balance of £174,097.

The directors recommend the payment of a final dividend of 30 per cent, which, with the interim dividend of 12½ per cent paid in January last, makes a total of 42½ per cent for the year, compared with 37½ per cent paid last year.

TRANSFER TO GENERAL RESERVE

It is also proposed to transfer £80,000 to general reserve, making the total of that reserve £405,448, a figure which is not far short of the nominal amount of the issued capital of the company and considerably in excess of the issued ordinary capital, a fact, perhaps, worthy of note, and to carry forward £49,991.

To meet any possible reductions in stock values a sum of £28,000 was reserved in our accounts for the year ended June 30, 1952. The stock position now appears to have reached a period of greater stability and such losses as we did suffer through falls in stock values were met out of current revenue. It is, therefore, right and proper that part of the above reserve, which is now considered to be no longer required, amounting to £24,000, should be brought back to the credit of profit and loss account.

The financial position of the company and our subsidiary company, Containers, Limited, remains very strong. The current assets of the group, including bank balances of £706,532 and tax reserve certificates of £300,000, amount to £1,668,582, against current liabilities of £539,782. The fixed assets, which stand in the books at £365,810, are, of course, worth many times this figure.

CONTAINERS, LIMITED

Our subsidiary company, Containers, Limited, has also had a successful year. It has been possible to release from the reserve for future possible falls in the value of stock the sum of £77,000, now considered to be no longer required. The plant is working to full capacity and the order books are in a very satisfactory state, a remark which also applies to the parent company.

In conclusion, I would like to take the opportunity of thanking my co-directors, the staff, and all our employees for their loyal co-operation during the difficult year through which we have passed. Their united efforts have made it possible to achieve the satisfactory result now before you.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the Chairman said: As you have noticed in my statement, it is with deep regret that I have to inform you of the death last June of two of my late friends and colleagues; Mr Digby Cropper, who was associated with this company for a great many years and who was a director until a few years ago when he retired. He retained his position on the board of our subsidiary company, Containers, Limited, up to the time of his death. Also Mr C. Priestley Forster, who was our secretary for many years and was also a director during the latter years of his life.

I wish to pay tribute to these two men whose loyalty and endeavour I have appreciated and valued so much. Their loss is keenly felt by us all.

The Acting Secretary (Mr E. G. Hadcock) having read the notice convening the meeting and the auditors' report,

The Chairman continued: Ladies and Gentlemen,—As the report and accounts have been in your hands for the time required by the Companies Act, we will, with your permission, take them as read. (Agreed.)

At our meeting last year I mentioned that we were just emerging from a trade recession and that although buyers were returning to the market we could not expect a profit figure as good as that year or the previous year which were both abnormal, due to most unusual trading conditions. The events of the year under review have borne this out. We have passed through a year of falling prices, both for raw materials and our finished products, coupled with intense competition and increased wages. The productive costs have, however, been kept within bounds by the

machines and improved methods of production.

TRADING CONDITIONS MORE STABLE

Though I would be the last to claim that we have come through the vicissitudes of the past year unscathed, I feel sure you will agree, from the figures you have had in your possession for some time now, that we have weathered the storm reasonably well, and I am glad to be able to tell you that we have now reached a stage where trading conditions are more stable and prices steadier.

In the past I have frequently referred to the excessive burden of taxation that our companies have to bear. The Chancellor in his wisdom reduced this burden slightly in the past year, with the result that the charge for taxation in the current year is not quite so high as previously, and our profit and loss account also benefits by the amounts over-provided in previous years. Taxation is, however, still at far too high a level if industry is to expand and re-equip itself on modern lines.

I am glad to be able to inform you that at long last our repeated applications for a licence to extend the factory buildings of Containers, Limited, have met with success, and that a further extension is at this moment being added, which will help our production considerably.

In my statement I drew your attention to the strong financial position of our companies, and once again I should like to repeat that the fixed assets of the group are shown very considerably below their market value. Also the reserves, excluding that made for future income tax, have increased by no less than £187,000.

I now propose: "That the report of the directors and the accounts of the company for the year ended June 30, 1953, be, and they are hereby, approved and adopted; that a final dividend of 30 per cent, less income tax, be paid to ordinary shareholders registered at the date of this meeting; that £80,000 be transferred to general reserve; and that £49,991, the balance of the profit and loss account, be carried forward.

Mr S. W. Butters (assistant managing director) seconded the resolution, and it was carried unanimously.

The retiring directors (Mr J. R. Henry, OBE, and Mr H. V. Dove) were re-elected, and the fee of the auditors (Messrs Deloitte, Plender, Griffiths and Co.) was duly fixed.

TRIBUTE TO CHAIRMAN, DIRECTORS AND STAFF

Mr F. E. Armstrong, in proposing a cordial vote of thanks to the chairman, directors and staff, referred to the strong position of the company, with its consolidated balance sheet showing liquid assets of one and a half million pounds, reserves far in excess of the issued capital, no item for goodwill, no bank overdraft, fixed assets written down to almost a ludicrous figure, and £700,000 in cash and

to thank those who laid the foundation of the business, and amongst those early planners was the present chairman, who joined the board during the first world war and had thrown himself single-mindedly into the task of building the company up so that it should take its place in the forefront of efficient and well-run industrial companies, and he thought shareholders would all agree that he had succeeded, particularly in latter years in the face of severe competition and savage taxation. He would, therefore, like to propose a special vote of thanks to the chairman.

Mr J. E. Osgood seconded the resolution, and it was carried unanimously.

The chairman, in reply, said he was very pleased that the resolution included all the directors and all the staff, including the work-people, who had done very good work during the year. He hoped they would have another successful year—there was no earthly reason why they should not—but he could not say anything beyond that.

WM. CORY AND SON, LIMITED

THE HON. F. A. LEATHERS' STATEMENT

The Hon. F. A. Leathers presided at the fifty-seventh annual general meeting of Wm. Cory and Son, Limited, held on August 27th at Cory Buildings, Fenchurch Street, E.C.3.

The following is an extract from his circulated statement:

A year ago I recorded indications of a recession in trade which had already begun to reverse the upward trend of previous years. This depressing influence has made itself felt during the whole of the period now under review.

Our coal departments have experienced a falling off in demand. The natural corollary of this has been a lessened demand upon our discharging and lighterage facilities on the Thames and Medway.

Your company's fleet has traded at an enhanced profit. Two new motor vessels, *Corbrae* and *Corburn*, were added to the fleet during the year. The s.s. *Corstar* has been sold at a satisfactory price.

The oil side of your company's business has had serious problems to overcome, due to the reorientation of world supplies of petroleum products, but with new sources of supply becoming available it is now possible to look forward with greater confidence. We are discussing with Shell-Mex and B.P. Limited developments which would identify us more closely with the physical distribution of petroleum products in the United Kingdom.

Exports of coal from this country during the year have shown a substantial increase, in which we have fully shared, but this has been more than offset by reduced tonnage from the United States of America to Europe.

Our associated company in Northern Ireland, John Kelly, Limited, in which we are partners with the Powell Duffryn Group, are partners with that same impact of had to contend with that same impact of trade conditions to which I have already referred. Having regard to this the results can be considered as satisfactory.

I ventured to say last year that we could not look forward to any improvement in the transport difficulties in the Union of South Africa. Unfortunately, my forecast has been proved correct to an extent even greater than was feared. In South Africa, as in the home country, we have our programme of replacements and renewals designed to maintain the earning capacity of the organisation.

FURNESS, WITHY & COMPANY

PROBLEM OF HIGH REPLACEMENT COSTS

SIR ERNEST H. MURRANT'S STATEMENT

The sixty-second annual general meeting of Furness, Withy & Company, Limited, will be held at Furness House, Leadenhall Street, London, E.C.3, on September 23rd.

The following is an extract from the statement by the chairman, Sir Ernest H. Murrant, KCMG, MBE, which has been circulated with the report and accounts:

The accounts for the year ended April 30, 1953, are of a more sombre hue than the peak figures of the previous year, but the colours are brighter if they are viewed in relation to 1951, which was considered to be a very satisfactory year.

The consolidated balance sheet reveals clearly the strength of the group as a whole. The outstanding items are capital and revenue reserves and profit and loss balances £20 million (an increase of £2 million); bills payable (secured) in respect of new tonnage, which a year ago figured at £685,500 have disappeared from the present accounts, and the taxation equalisation account is increased to £4,647,180.

Fixed assets total £23 million odd, and current assets (including investments £8 million and cash balances, Treasury bills, tax reserve certificates nearly £10 million) total another £23 million.

The principal note on the consolidated balance sheet is the reference to the estimated balance of capital expenditure for new tonnage £12,454,735 which represents the unpaid balance of the cost, estimated at April 30th, of twelve freight ships and the Shaw Savill & Albion Company's passenger ship for the New Zealand trade, to which preliminary reference was made in my statement last year.

PROBLEM OF REPLACEMENT

Three ships were added to the fleet during the year, and two were disposed of. This illustrates the continuing process, common to the shipping industry, of replacement. It is not out of place to draw attention, by quoting figures, to the enormous effort that has been, and is being, made to maintain our tonnage and overtake the replacement arrears that accumulated during the war years when ship-owners were not permitted to build merchant tonnage to meet their special requirements. I need only go back four years to illustrate the nature and the extent of the problem so far as it concerns our own group. In the 1949-50 balance sheet the estimated cost of new tonnage then contracted for was £4,260,158; in the following year it was £5,106,177; then £6,356,240, and now in 1953 the figure is £12,454,735. This liability will fall due to be met progressively as the new ships are delivered between now and 1955-56, and the sources from which the liability must be covered are from depreciation earned and set aside, by other earnings after being taxed, and to a very small extent by what remains from the scrap value of ships sold at the end of their economic life after provision has been made for balancing charges. The consolidated balance sheet shows the extent to which we have accumulated such resources, but we are now rapidly using up and exhausting those accumulations with dwindling prospects of adding thereto whilst taxation remains at its present level.

It is not to be supposed that we are unconcerned at the continuing high and increasing cost of new building. On the contrary

we are alarmed at the serious nature of increases over original estimated costs which have been notified to us by our shipbuilding friends. It will be recalled that some time ago, and under pressure from owners, various shipbuilders made a serious effort to revert to the normal practice of quoting fixed prices, but the instability of the cost of materials, and labour, coupled with the uncertainty of production results, caused the effort to be a very expensive one to them. In consequence shipowners are now again required to run all the hazards of the instability of costs during a period of three or four years between placing a contract and obtaining delivery of a new ship. The position is most unsatisfactory and the only remedy appears to be for shipowners to call a halt in ordering new ships except for bare necessities. It should be noted in passing that both Germany and Japan have re-entered the international shipbuilding field at very competitive prices.

THE YEAR'S RESULTS

It will be observed from the consolidated profit and loss account that the total net revenue from all sources and before providing for depreciation and taxation, was £5,701,372. The provision for depreciation of fixed assets requires £2,046,585, and taxation (including the allocation to taxation equalisation account) requires £1,766,635.

The Board's recommendation is that there should be distributed to ordinary stockholders £396,000 in the form of 10 per cent dividend and 2 per cent bonus, both less income tax. Because of the lower rate of income tax deduction this represents a slightly larger net distribution than last year.

During the past year we have experienced many disappointments and aggravations. In general, freight markets have shown a steady decline both in rates and in volume of business; costs have continued to rise, notably in the case of oil fuel, and in other directions labour disputes have involved long and costly delays.

TAXATION

So far as concerns Governmental influences on commercial trading, there is today a greater measure of freedom from controls than at any time since the commencement of the war in 1939. However, we continue to feel that notwithstanding recent welcome reliefs, the burden of taxation lies too heavily on industry, and if one is permitted to express an unbiased opinion from a shipowner's point of view, it is that it lies particularly and unsatisfactorily heavily upon our own industry.

The extent to which our resources have been drained by taxation is emphasised by the fact that in the past five years' accounts an amount approximately equal to the whole of our issued preference and ordinary share capital has been provided to meet current United Kingdom taxation.

In my statement a year ago I warned stockholders that they should be prepared for the probability that the profit and loss statement now before us would reflect a reduced level of earnings. Results have justified that warning, and the immediate outlook regarding both rates of freight and volume of business, coupled with operating costs remaining at a high level, is today no more reassuring than it was a year ago.

Ask the Chief Typist

Experience has taught the chief typist to value a typewriter for qualities that may not be instantly discernible. Take the new Imperial. It's a quick, quiet and thoroughly efficient typewriter, but the chief typist will tell you that it's much more than that. Suppose, for instance, that a long and complicated balance sheet is being typed and an urgent letter is required. The long carriage, complete with balance sheet, can instantly be removed from the machine, the letter typed, and the balance sheet completed later. And that's only one of the many advantages made possible by the exclusive Imperial feature of interchangeable carriage, platen roller and type-unit.

NATURALLY enough, industrialists seeking new locations for expansion prefer places that can offer them building sites and export facilities equal to or superior to those which their home neighbourhood provides. Halifax can give them what they want—and more!

With the shortest sea access to major British ports and the expanding South African and South American markets, Halifax is the ideal location for industries designed to cater to those areas.

Successful and forward-looking industrialists in England are invited to investigate further and take advantage of the outstanding facilities offered by Canada's greatest Atlantic port. They will find wider horizons in the stable economy of this young and vigorous country. For further information write:

This cast steel water end, manufactured by David Brown for Oilwell Engineering Co. Ltd., weighs 3 tons.

British Equipment for 700-mile oil pipe-line

Until quite recently the supplying of highly specialised castings for the world's oilfields and refineries was confined to the United States. Aware that no British company made this equipment, the David Brown Organisation saw its opportunity, and took it. The exceptionally advanced techniques and high degree of skill of the David Brown foundries were concentrated upon entering this hitherto exclusive market. The result of this aggressive attitude towards foreign business is exemplified in the David Brown contribution to the Iraq Petroleum Company's new 30-inch pipeline, which will run 700 miles in the Lebanon. For this construction, David Brown supplied a quantity of castings for 16-inch oil pipeline valves—the largest ever made outside the United States. Today, David Brown foundries devote one-third of their entire output of alloy steel to the manufacture of specialised components markets for Britain. In doing so, they are winning new dollar

new opportunities in the greatest
of all National Trade Fairs

Bookings are now open for the 1954 BIF and—this year exhibitors who apply early will be able to choose the site they prefer.

More—the earlier you book the surer you are of getting into the advance catalogues; world-wide publicity to 25,000 business men before they travel to Britain.

Apply now to your Regional Office of the Board of Trade for space at the London sections of the Fair and for full information about exhibiting. If you have not exhibited before, they can tell you what the Fair can now offer to your particular business. For space in the Engineering and Hardware Section at Castle Bromwich apply, Chamber of Commerce, 95 New St., Birmingham.

The BIF of 1954, profiting by the experience of 32 previous Fairs, will be even better organised to show British goods to the world.

It will again provide contacts, inquiries, and orders—unobtainable in any other way—for every British industry represented.

Advance in insecticides...

ALDRIN and DIELDRIN are two new insecticides, at present little known in this country. But in many parts of the world—especially in the U.S.A., in the cotton fields, and in areas of locust plague—they have established a new degree of protection in the eternal war against insect pests. ALDRIN is a powerful new weapon against Wireworm, Leatherjacket and many other pests of the soil. DIELDRIN is similarly effective against Ants, Flies, both agricultural and domestic, and many other foliage and industrial insects. Thanks to Shell enterprise, these two invaluable new materials will be available in Britain in the near future.

A New Germany

THE triumph of Dr Adenauer in the Federal German elections is an event to which the British people and their leaders have given a sincere welcome. It removes any uncertainty about the strength of Dr Adenauer's hold on the German electorate and so decisively establishes him for the next four years that there is some danger of over emphasising the advantages of a Germany under firm Christian Democratic leadership and of giving less attention to the problems of Germany's resurgent political strength. But it must still be said that this is a result most satisfactory for the Western World. The electors in Western Germany have unmistakably rejected extremists both of the right and of the left, and have turned solidly towards the pro-western Christian Democratic Party. Not only in its foreign policy, but also in its efforts to smooth out acute internal differences between employers and labour, the party stands for steady progress and moderation. Even the charge that it is predominantly Catholic will have less force in future, for many Protestant areas of North Germany have swung in its favour. Moreover, the smaller parties of Dr Adenauer's coalition have also lost seats to the centre, and the pattern of a two-party system is thus beginning to emerge—a development most satisfactory in itself, for the existence of a multiplicity of small warring parties would always remind doubtful German democrats of the days of the Weimar republic, and is fatal to the efficient working of parliamentary government. As it is, the Christian Democratic Party, with the help of its ally, the *Centrum*, now holds just over half the total seats in the new *Bundestag*; on the other hand, the Social Democratic Party is still influential enough to feel that it may one day have a chance to win the electorate, so that a lively opposition will confront an effective government. The Social Democrats did not retain the support that they attracted during the peak of their campaign against German rearmament, but they still hold nearly a third of the seats. Nothing but good can come of the existence of a strong democratic opposition, particularly if Herr Ollenhauer can agree on the main lines of foreign policy with Dr Adenauer, and continue to fight the government on behalf of the German underdog.

When the motives that led the electorate to sweep Dr Adenauer to victory are examined, the picture is less uniformly encouraging. On the credit side, it can be said with certainty that the Germans voted for the present government because it has led them to their present prosperity and because it offers them stability. The Germans are still acutely conscious of their sufferings in the bleak years following defeat, and are fully aware of the progress they have made under the anti-socialist system of Dr Adenauer's government. They are correspondingly afraid of any experiment that might upset this hard-won recovery. Furthermore, the Germans are respecters of authority and tend to vote for the government, not, as in other lands, against it. By the same token, the neo-Nazis and nationalist groups suffered

from the general belief that this is democracy's day, seen from the wide viewpoint of the historian. Germany is no Oxford. It is the home of lost wars, but not of lost causes. Neo-Nazism is at least temporarily lost, and Communism has for years past been out of the running in Western Germany. The Communists are now without any seats in the new *Bundestag*, and their election campaign served only to take votes from the Social Democrats.

But the disquieting fact is that when Germans voted for the Christian Democrats they were, above all, voting for Dr Adenauer personally. The election result cannot be taken as conclusive evidence that the Germans are now convinced democrats. On the contrary, it shows how keenly they still follow a strong national leader, choosing a man before party or policy. Dr Adenauer had already achieved the status of leader through his success in establishing Germany's international position, and his party managers ran their election campaign on the strength of his personal prestige. The result surpassed their greatest hopes. Now it is clear that two dangers face the triumphant Chancellor; he will have to resist the temptation of *hubris* in a country that asks for strength from its leaders, and he must guard against a tendency in his own ranks to ape some of the dictatorial practices of the Hitlerite era. For the Christian Democrats are by no means free from undesirable elements, who might conceivably gain the upper hand in future. And who, when Dr Adenauer comes to retire from the stage, is to lead his party along the road he has chosen?

For Germany's neighbours, the outstanding fact of last Sunday's elections is that Dr Adenauer is established as the most powerful statesman on the Continent. The disparity between his position and that of the politicians who temporarily govern France and Italy is startling. So, too, is the contrast between the German vote that eliminated the Communists and the Communist successes in the Italian elections; or between the stable labour conditions in Germany and the strikes in France. All the portents suggest that for some time to come Western Europe will be led by the German nation; the awkward question for France is no longer whether it can re-establish its lead in the European community, but whether to co-operate with Germany. Given his present position of power, Dr Adenauer will not be likely to tolerate tutelage in internal German affairs, and he will give increasingly forceful expression to the German view on European defence and economic collaboration.

There are overwhelming reasons, none the less, why Europe should extract the greatest possible benefit from Dr Adenauer's victory. One is that he is securely in power for the next four years, and there is no danger that concessions granted to him will be misused by a successor within that time. He not only has his small absolute majority, but can even gain the two-thirds majority needed to make changes in the constitution if he secures support from the Refugee Party. This

means that the treaties setting up the European Defence Community and ending the occupation regime will probably pass their final stage in Germany. It also means that the Bonn government will be able to press further towards setting up a political federation and a customs union in Western Europe.

Dr Adenauer, therefore, has great power and great opportunities. But he will not hold power for ever. The strongest reason why Germany's neighbours should do everything possible to complete his work lies in his seventy-seven years. Though he is hale and vigorous, it is beyond the bounds of practical wisdom to count on his continuing for many more years. It may be that the ranks of the Christian Democrats will throw up another leader to take his place, but this is not a chance on which to gamble. Only the old generation that grew up before 1914, and only the western-looking Catholic part of this generation is likely to produce a politician of Dr Adenauer's outlook, and this group is dwindling in numbers. The middle-aged men whose minds were formed in the Hitlerite era, and the Protestants who look towards Eastern Germany and are traditionally bound to a national state, are not very likely to produce a European leader who would tie Germany so closely to the western community.

The time and the man are therefore at hand for forming a Germany that will not prove a menace to the world again. But the present constellation will never recur. If Western Germany's prosperity were to turn into a slump, the extremists would have their chance again; if the European army does not take practical shape, Germany may secure a national army with the aid of America, and so fall under the influence of the old-time militarists; and if the goal of political and economic federation does not offer the younger Germans an ideal and an opportunity for working off their dynamic energies, the drive to secure Germany's lost lands in the east will grow dangerously. Dr Adenauer's victory provides great opportunities for achieving the collaboration to which Western Europe aspired when Western Germany was weak and in turmoil. It is now strong and stable. The timid will be tempted to take fright at Western Germany's strength. Before they are led into silly mistakes, let them ask themselves whether Germany's growing power—which is a fact—is better deployed on the side of European unity or better left to develop in nationalist ways of its own.

Marking Time in Cabinet.

THE ministerial changes announced a week ago are disappointing. Criticism should properly be tempered, since they are not necessarily the end of the story as it may unfold even before the reassembly of Parliament. But that is speculation, and there is in any event no virtue in beginning with a mere nibble at the cherry of Government reconstruction. The three resignations—of Lord Leathers, Sir Arthur Salter and Brigadier Mackeson—in themselves provided scope for a considerable reshaping of the Government to meet the altered tasks that now require its attention. Instead, the Prime Minister has laconically confined himself almost to the bare minimum of consequent changes.

There are several grounds for regret. Quite apart from all questions of policy, there were strong reasons—both negative and positive—for making extensive changes in the personnel of the Government. It would have been beyond nature if all the appointments made nearly two years ago had turned out to be uniformly successful. Sir Winston was choosing his men from a party that had not held peacetime office for twelve years, and a party moreover that in character and policy had in the interval been radically transformed. It is never easy for a Prime Minister to correct the misfits and disappointments, but Sir Winston's task could be very much harder. He has the benefit of a pretty general agreement about which ministers have fallen below the hopes put in them. What is even more important, there is also general agreement—extending, privately, to the Opposition—both that certain ministers have been remarkably successful and that the Conservative ranks also contain, in the lower offices of government and on the backbenches, an unusual wealth of talented younger men.

This is, indeed, one of the leading phenomena of British politics in the nineteen fifties. The way to turn it to account, and to encourage future recruits of equal quality, is to give early opportunities to those with ability. At a time when inflation and the modern burden of parliamentary business have combined to make a political career so much less attractive, there are few more important services of long-term value that a Prime Minister can perform for his own party and for the country as a whole.

Hitherto, patience in this matter has been reasonable. It was right that Sir Winston should first try out a relatively experienced team rather than rush into experiments. But by now there is plenty of evidence on which to make a better assessment of talents than was possible in 1951; younger men can be promoted without taking undue risks. Yet the Prime Minister has stuck—indeed, in some respects he has retreated—to conventional paths. The changes last week included only one imaginative innovation. This is the creation of the new post of Minister of State at the Board of Trade, and the appointment to it of Mr Heathcoat-

Amory. The Secretary for Overseas Trade has of late been no more than a second parliamentary secretary at the Board of Trade, providing little real relief to the burden of decisions falling on the President. The higher office of Minister of State, which now replaces the secretaryship, is a proper recognition of the importance of export promotion among the department's activities; it should also mean that at the political level, as well as the official, the Government will give more thought to the permanent problems of trade policy than the Chancellor of the Exchequer and the President of the Board of Trade have time for. For these tasks, the choice of Mr Heathcoat-Amory deserves generous praise. He combines administrative ability and business experience with the non-partisan temperament that particularly fits him to deal in the House of Commons with issues outside party controversy.

★

This appointment shines, however, as an isolated example of what the Prime Minister might be doing on a far larger scale. For the rest, what he has in fact done is to bring his previous Cabinet innovation, the "overlords" system, to an end. Lord Leathers was appointed Secretary of State to co-ordinate two departments—Fuel and Transport—while Lord Woolton, as Lord President, was to be particularly responsible for general policy affecting the Ministries of both Food and Agriculture. It is now officially recognised that Lord Woolton, through remaining in the Cabinet, has dropped this co-ordinating function, and instead the two ministers concerned are promoted to membership of the Cabinet. Somewhat illogically, there is no corresponding rise in the status of the Ministers of Fuel and of Transport, though Lord Leathers's post vanishes with him. But for good measure promotion of the Minister of Education to Cabinet membership is thrown in. This means that the membership of the Cabinet rises to nineteen, which is too many for effective general discussions on policy.

Politically, the Prime Minister's reasons for abandoning the overlords are strong: they had become laughing-stocks. The cynicism of Sir Winston's letter to Lord Leathers is hard, nevertheless, to defend. He dismisses the dignified office of a Secretary of State as one created to suit Lord Leathers's particular talents, and comments that "the justification for this special post will disappear when your services are no longer available." It is not long since the value of co-ordinating ministers was argued in very different terms by members of the Government. Those arguments had, and retain, considerable force. The departure of the overlords as co-ordinators merely leaves a very difficult problem of modern government unsolved. The essence of the problem is that if the departments are

not to be inefficient and bureaucratic monsters, there must be many more of them than there can be ministers in a Cabinet that is small enough to be a good policy-making body. An hierarchical structure of committees and sub-committees, to which ministers outside the Cabinet belong, by no means entirely overcomes the difficulty. An important additional part might be played by a few senior ministers without day-to-day departmental duties of their own, but each of whom specialises in a group of subjects, acts as a chairman of Cabinet committees and as a spokesman for the Government, and is able to give the thought to long-term policy for which a departmental minister rarely has time.

In theory, the overlords could have represented a useful experiment in this direction. In fact they have been nothing of the kind, in part for purely personal reasons and in part because Sir Winston's Cabinet was in any event unbalanced by the inclusion of too many members of the House of Lords. Simply to abandon the overlords is to give the impression that the experiment has failed when in truth it has not really been tried. Moreover, this is being done just at the moment when the problems of co-ordination in government policy are particularly acute. The conflict between agricultural protectionism and the nation's interest in more and cheaper food supplies has already got the Government into great difficulty and must somehow be resolved in the near future. Co-ordination of the fuel industries is also a complex issue of increasing political importance, on which clear Government decisions are badly needed. It is difficult to be con-

fident that matters of this kind will be best handled by returning to a large Cabinet of prewar style.

In this retreat from what might have been an administrative innovation, as in the failure to bring forward enough younger men, the Government gives a regrettable impression that it is now marking time rather than pressing on with the considerable achievements that have been put to its credit since the summer of 1952. One may recognise, fortunately, that in this respect personnel and the structure of Government are not decisive. Policy may be got right in spite of them. By the time Parliament has reassembled, and when the Queen's Speech for the new session has been read, the Government may be presenting a very different face to the world. Indeed, more radical changes in its composition may have been made. It is still possible that a thorough reconstruction awaits a final report next month on Mr Eden's health. But, however difficult the circumstances, it is not any the less regrettable that the Government should give even a qualified impression of hesitancy or inertia.

The measures that the country's recovery still requires are extensive, radical, politically delicate, and urgent. While appearances may be deceptive, there are no indications that many of these measures are in active preparation, and they will not be helped forward by continuing doubts about how long ministers will hold their present posts. There ought not to be more than another month's delay before the Prime Minister's settled intentions, both for the structure of the ministry and for its policy, are made clear.

Handling China

THE divergence between British and American policies towards China is at present the most serious gap in the political defences of the free world. Because in this matter the British and American points of view are so far apart, there is an obvious opportunity for Communist diplomacy to drive in a wedge. The emphasis in recent Soviet statements on the international rights of Communist China suggests that the Soviet government will bring up this question on every possible occasion to accentuate the discord between London and Washington. In this situation nothing is to be gained either by ignoring the current differences, or by indulging in mutual recriminations about the past; the practical problem for statesmanship on both sides of the Atlantic is to explore all possibilities of adjustment and reconciliation.

In its simplest terms the contrast may be stated by saying that America wants a tougher policy towards Communist China than Britain is willing to pursue. It would nevertheless be misleading to put the matter in this way without qualification, for toughness in inter-

national relations is not merely a question of making defiant gestures or grimly refusing to speak to an opponent. Those Americans who suppose that British policy towards China is one of appeasement should remember that it was Sir Winston Churchill who, in the face of strong American opposition, insisted on the return of British troops to Hongkong on the surrender of Japan, and it cannot be supposed that he would have a stronger reason, ideological or otherwise, for handing over a piece of British territory to Mao Tse-tung in 1953 than for handing it over to Chiang Kai-shek in 1945. Positive ideological sympathies for the Chinese Communists certainly exist on the left of politics in this country—just as they do also, though now decidedly *sotto voce*, in America—but even the most passionately anti-Communist American can hardly imagine that the policy of a British Conservative Government is swayed by enthusiasm for endeavours to "build socialism" in China. Nor does it make sense to ascribe the attitude of the present British Cabinet to the influence of the Hongkong merchants. As a

country exceptionally dependent on foreign trade, Britain must always take account of commercial interests in the framing of foreign policy, but that the leaders of Britain to-day do not normally take decisions in world affairs for sectional interests or short-term profits should be clear enough to any fair-minded American observer from the political records of Sir Winston Churchill and Mr Eden.

Britain, indeed, is no less concerned than America to contain Communism in the Far East and to restrain the new regime in China from aggressive expansion. In relation to South-East Asia, Britain has even more grounds for concern than America, for large numbers of Chinese are under British administration in Hongkong and Malaya and these territories are far more accessible to Chinese Communist attack than are the Philippines or Okinawa. The difference of opinion, therefore, is about the methods to be adopted for resistance, not about the desirability of resisting.

Americans, whose awareness of the malevolence of the Peking regime has been sharpened by the experience of a war in which they have had thirty-five times as many soldiers killed as the British, are inclined to take up an attitude of uncompromising antagonism; they claim that with such a regime only toughness pays. The British criticism of this line is that in fact it is not tough at all; real toughness might or might not pay, but in any case it is no longer being advocated. There was a case for the MacArthur policy towards China, but it was rejected by the American Government, not under British pressure but, as General Bradley has made clear in his recently published memoirs, on the advice of the American Chiefs of Staff.

Having decided, rightly or wrongly, not to attempt direct offensive operations against Communist China, the logical sequel was to see whether it might be possible to achieve anything by diplomacy. To refrain from "hitting" China and at the same time to refuse to have any dealings with it is not being tough, but merely getting the worst of both worlds. It appears indeed as if the more extreme current American attitude arises from a kind of repressed MacArthurism. "We did not bomb the Chinese Reds," the argument seems to run, "but we can at least make faces at them from a distance." Unfortunately such manifestations of frustrated enmity do nothing to reduce the power or prestige of a strongly established regime.

The British view is that, however truculent and aggressive the Chinese Communists may be, no harm can be done by according them diplomatic recognition and seating them in the United Nations and that some benefit may accrue by giving them contacts with the world outside the Soviet bloc. It is not necessary to suppose that Mao Tse-tung is going to become a Tito or that the Communist tiger is going to be transformed into a domestic pet by being offered a saucer of milk. But there are considerable possibilities of friction between the policies of Moscow and Peking, and it is certainly not the business of western diplomacy to assist

the Kremlin by excluding Communist China from contact with anyone except the Communist states.

The case with regard to trade is similar. The British Government has already done all that can reasonably be expected of it to prevent strategic goods from reaching Iron Curtain countries, and if the manifold resources of international smuggling have sometimes defeated it, this cannot be blamed on British policy. There is much to be said, however, for a certain flexibility of policy with regard to trade relations especially with Communist China, not as a sacrifice of the defence of the free world to business profits, but as part of a competition for influence.

★

There is no doubt that the countries of the Soviet bloc are quite unable to meet the needs of China's industrialisation on the required scale; already China has had some unpleasant experience of non-fulfilment of promises from its Communist partners, and the new programmes of diversion to consumer goods in both Russia and the satellite states must reduce still further their capacity to supply large quantities of capital goods to China. If the western powers enter this market—exclusive of actual armaments and the stockpiling of war materials—it may be said that they will be strengthening China; but they will also introduce an element of economic interdependence which may exert a pull on China, however much its present rulers may try to avoid such consequences. There is no simple formula to apply in these matters; there must be a careful balancing of pros and cons in any relaxation of restrictions on trade with the Communist world. But at least serious statesmen should get away from the idea that it is a betrayal of the free world every time a motor lorry is sold to a Communist buyer.

On the questions of recognition and trade, Britain is entitled to ask Americans to reconsider views which have come to be held with undue rigidity as dogmas of political belief. There are other issues, however, on which Americans may fairly claim that the British have shown insufficient appreciation of American responsibilities. In British discussion of world affairs, it is too often forgotten that in any armed conflict between Russia and the Nato powers, the northern Pacific would be a theatre of war in which America would confront the enemy virtually alone. Singapore (with Hongkong as an isolated outpost) is really the terminus of the range of British strategic concern; the sea space between North America and Asia is, on the other hand, of the greatest strategic importance to America. For this reason British opinion should be more ready to pay attention to the American point of view on the consolidation of defence in the Far East.

This involves not only the defence of Japan and South Korea, but also the prevention of a Communist conquest of Formosa. America is now definitely unwilling to abandon Formosa, and if it is the British view that Formosa must be given up in order to reach

a settlement with Peking a permanent deadlock between British and American policies may ensue. But it should be quite possible for the diplomats to devise a formula for reserving Formosa from any settlement that can be made. It is not a simple question of intervening in a Chinese civil war; the Chinese Communists, after going to war against the United Nations in Korea, can scarcely claim rights of international law in their favour

against the Chinese Nationalist remnant now under American protection in Formosa. If a fragment is to be separated from the main body of China, it will be very much less of a national disaster than the partitions which the cold war has inflicted on Germany and Korea. There are occasions when peace can be secured only on the basis of the old diplomatic principle of *uti possidetis*—each side to keep what it has.

Vertical or Horizontal Living?

THE year 1953 entertainingly confronts two mutually abhorrent concepts of human dwelling. One is that of Ebenezer Howard: the diffuse and essentially anti-urban Garden City, which at Letchworth is now celebrating a half-century of real but limited success. The other is the concept of Le Corbusier: the compact, highly integrated *Unité d'Habitation*, whose twenty-storey prototype at Marseilles has this summer attracted architects from all over the world, and which has now been described for the British public in a characteristically pugnacious monograph.*

It would be an interesting exercise to trace the respective pedigrees of the horizontal and the vertical ideal. Behind the Garden City lies the village green; behind the *Unité d'Habitation* lie, perhaps, the walled stronghold and the cave-settlement. The village green, merely multiplied by unplanned expansion to urban size, turns from a shapely social entity into an amorphous and soulless mess, greedy of ground, extravagant in its demands alike on communal services and on the travelling time of its inhabitants—the suburb which, proverbially, the Devil made. The fortress similarly multiplied becomes a slum or, at best, a bleak and equally soulless territory. The Garden City is a country-minded attempt to overcome the one set of disadvantages; the scientifically integrated block, the complex of “machines for living in,” is an urban-minded attempt to overcome the other.

In Great Britain the opposing claims of centralisation and dispersal, vertical and horizontal, express themselves in a tug of war between economic and aesthetic reason on the one hand and the obstinate preferences of the common man (and his wife) on the other. The common man and his wife seem to want, ninety-eight times out of a hundred, to live in a horizontal settlement, with a detached or at least semi-detached house of their own and a bit of garden, also their own. Given shops within pram-pushing distance for her and works or office not impossibly remote, by train, bus or bicycle, for him, they are quite willing to forgo those communal amenities—from district heating to day nurseries—which denser concentration could, in theory, bring within their reach.

The common man's employer, however, has views

which are difficult to harmonise with this preference. Other things being equal, he wants his works, or office, sited in or near the middle of things. Unless he sees large economies in prospect, he is rarely willing to hive off to a garden city or new town. The common man's proviso is that his employment be accessible without an unendurable drain on his energies by way of strap-hanging and on his purse by way of fares; with the concentric spread of horizontal settlement, this becomes less and less practical. Meanwhile, the traffic problem at the heart of the magnetic field steadily approaches final deadlock; and the garden city or new town drifts towards the status of one more dormitory suburb, merely more inconveniently remote than the unplanned agglomerations of the past.

★

The magnetic pull of the big industrial and commercial centre has never been fully analysed by economists; nor have sociologists, confronted with the overwhelming public preference for horizontal living, sorted out its reasonable elements from those of prejudice and inertia. One may argue, too, that while the economy of concentration directly benefits the individual firm, the corresponding expenses of urban unwieldiness—from traffic congestion to the cost of treating neuroses under the health service—do not appear in the firm's accounts.

These may be arguments either for a special urban tax, leading businessmen to ask themselves seriously whether the advantages of the big centre are really essential to their particular business; or for an initially large subsidy towards the costs of dispersal, a subsidy tapering off as the new town cumulatively develops its own magnetic pull. But there is no good argument for compulsory migration, either of businesses or of workers. In any event, London and the great provincial conurbations are facts that cannot be planned away within this century; at best, the new towns can make hardly more of a dent in the town-planning problem than did the garden cities so hopefully founded in the nineteen hundreds.

But if the universal garden city is not a particularly desirable Utopia, need one therefore conclude that extreme concentration, Le Corbusier's vertical city, is

the right ideal? Le Corbusier's book is not unanswerably convincing. That it displays the most comically monstrous egotism since Victor Hugo—with whose literary manner, at its most exclamatory and Sinaital, Le Corbusier's has much in common—is irrelevant; so, strictly speaking, are the sample plans of some typical “flats” (really semi-maisonettes). They present, on paper and to an English eye, disqualifying defects. Kitchen units twenty-five feet from the nearest window, children's bedrooms twenty-five feet long by only six feet wide and lit from the narrow end, would be an abomination in Britain, but possibly quite endurable in Mediterranean sunlight.

These are essentially points of detail, modifiable within the vertical convention. The real question is whether life in “a bottle in a bin”—to use Le Corbusier's own metaphor—can fully satisfy the needs of normal family existence or whether it must continue to be regarded as a *pis aller* imposed by the sheer arithmetic of expensive urban acreage and large human numbers.

Certain disadvantages, evidently, are inevitable. No expanse of parkland made available by vertical concentration, no crèche on the eighteenth floor, will make up for the handkerchief of private garden where the children can run in and out at will, without benefit of express lifts. The privileges of opening a back door and calling “tea's ready,” of gathering up a tearful toddler within a few seconds of his tumble at play, of quieting a squabble between rival mud-pie makers without leaving the milk to boil over, may seem trivial to architects; by mothers they are quite rationally to be valued much above communal laundries or even central heating.

Other disadvantages are, perhaps, more conditional and subjective. The big block with its common facilities and services, from lift and corridor-lighting to shopping centre and gymnasium, means a common staff on which—possibly, no doubt, to their much greater comfort—the occupants must depend for innumerable things which, in the terrace house or semi-detached brick-box, they do for themselves. To dismiss the preference for greater self-sufficiency over greater comfort as mere reactionary blindness is a dubious social judgment. Behind this preference there lurks, moreover, a distrust far-fetched, perhaps, in Britain, but on Continental experience all too well-founded: the distrust of the *concierge* who is also a police spy, of the admirable focusing device which the big block provides for the watchful eye of Big Brother. The 98 per cent of British people who prefer houses to flats are rarely, one must suppose, consciously distrustful; they merely feel happier with a front door of their own. But this piece of apparent irrationality may not be entirely unconnected with that sound political instinct which has made Great Britain so unpromising a field for Big Brother.

The debate is not generally conducted on the level of social, psychological and political implications; it is indeed a merit of Le Corbusier's book that he raises it there. On the mundane question of costs he is both

dogmatic and evasive. He claims that communal amenities, far surpassing anything available to the horizontal settlement, can be financed from the saving in construction costs compared with those of villa developments. This runs flatly counter to British experience, which is that even the most economically planned blocks are more expensive to construct than small houses. The vertical-block with amenities included is apt to impose a level of rents far beyond the budget of the hitherto ill-housed masses to whose regeneration it is dedicated; and the *Unité d'Habitation*, already evolving into a settlement of the prosperous middle classes, is no exception. To meet the financial needs of the ordinary worker, vertical living must be stripped of most of its redeeming features, leaving its disadvantages untouched.

★

And yet the brutal arithmetical facts of numbers and acreage remain; it is impossible to dispense with the big block. Financially, high land values near the centre of the magnetic field outweigh the costs of vertical construction; socially, the disadvantages of wider concentric dispersion outweigh those of high density; aesthetically, the erosion of genuine countryside and the monotony of horizontal development outweigh the occasionally inevitable clash of new high building with its traditional setting. Recognition of this necessity does not, fortunately, mean big vertical blocks and nothing else. The typically British compromise is “mixed development”—houses, mostly at fairly high density in terraces, but with some detached and semi-detached for large families; tall blocks of flats, set widely in communal open spaces, for small families and single persons. This can get enough people on to each acre to meet the needs of concentration, can provide a genuine and shapely urban plan, and by its very variety of height gives scope for architectural composition and contrast.

If a good example of this compromise—such as the newest LCC plan, for the hundred-acre development between Wimbledon and Putney—is compared with Le Corbusier's pioneer example of the vertical city, one is disinclined to concede the latter's claim to superiority. Good architecture, vertical or horizontal, can always be effectively contrasted with rank bad architecture. Ingenious and imaginative planning can be contrasted with wasteful and inconvenient rule-of-thumb, and a realistic adaptation to twentieth century needs and technical possibilities with a hidebound adherence to obsolete formulae. But it does not follow, because an architect of genius has chosen to apply his just and delicate eye for humane proportion, his imaginative ingenuity, and his grasp of modern techniques, in the vertical rather than the horizontal style, that the future is with vertical living. It remains what it has always been: a thing not to be sought for itself but part of the price to be paid, preferably by those to whom it is least onerous, for the privilege of existence in a modern urban economy.

Notes of the Week

Caution, or Moderation?

THE Trades Union Congress, which has been meeting this week in the Isle of Man, has notably strengthened the Right and weakened the Left within the Labour movement. On most points of controversy, the TUC gave a definite endorsement to its general council's attempt to hold Labour policy, both industrially and politically, to caution in all things and moderation in most.

So much, at least, is certain. But the more detailed significance of many of the votes is by no means clear. The general council's report on nationalisation, which the congress approved by 3,702,000 votes to 2,640,000, was an argument for moderation. If words in a TUC document mean what they mean elsewhere, it took the TUC off the socialist side of the fence in the general argument about the ownership of industry. It could not turn against the nationalisation measures of 1945-50; it did deploy the arguments against more. In effect the general council said that it was pretty well satisfied, at least so far as ownership is concerned, with the mixed economy as it now stands; and the TUC's arguments against altering the balance very much are arguments that are likely to remain valid for a long time.

This is a moderate's position, politically no doubt nearest to that of the right-wing of the Labour party but certainly also nearer to the left-wing of the Conservative party than to the socialist theory of the Labour Left. But it is not the position that the general council's spokesman, Mr Geddes, defended on Wednesday. He said, in effect, that the TUC was for nationalisation, but it wanted to go cautiously and look very carefully for the best forms of public ownership. This is a reasonable case, and Mr Geddes argued it well, but it represents caution in tactics rather than moderation in principle; and it really cannot be squared with the contents of the TUC report. If Mr Geddes's interpretation were right, the report would have contained a discussion of the various forms of public ownership that have been put forward as alternatives to the familiar 1945-50 variety. In fact, there was no such discussion: the report merely set out arguments for and against public ownership, of some undefined kind, in various industries—and leaned heavily (except for water) against nationalisation.

The upshot is a confusion that faithfully expresses the unions' state of mind: the motives of the General Council's supporters are uncertainly mixed between the caution of Mr Geddes's words and the moderation of the report itself. It is also uncertain how far the 1,750,000 uncast votes represented delegates taking tea and how far they represented (as the Left will claim) a disagreement that the unions did not want to push to the point of defeating the General Council. Nevertheless, three things are certain: only a minority of trade unionists clings to a simple belief in nationalisation for its own sake; that minority has become

smaller, not bigger, in the past twelve months—while the Tories have been denationalising; and, whatever it may eventually decide, the TUC wants nationalisation left almost entirely out of immediate Labour policy. Those are the things that matter for the party conference at Margate in a fortnight's time.

Labour Cries for Peace

ANYTHING to do with the Labour party's internal conflicts is news, but the gesture made last week by Mrs Eirene White, the Labour member for East Flint, has attracted a rather exaggerated attention. Her criticism of Mr Deakin and others is not a new revolt; it rather confirms the ending of one clear stage in the Bevanite revolt. The history of the matter is this. Six years ago, when the Labour party was riven by dispute over Ernest Bevin's foreign policy, Mrs White's moderation and common sense won favour in the eyes of several leaders of the big unions, and their votes carried her on to the party's national executive committee. She was re-elected thereafter with the same backing. But at Morecambe a year ago Mr Arthur Deakin abruptly withdrew from her support the massive bloc vote of the Transport and General Workers' Union. This did not at the time secure Mrs White's defeat, and no public reason for Mr Deakin's action was given. But it was widely taken to mean that Mrs White was not quite sound on the Bevanite issue. There had been occasions when she had voted with Mr Bevan inside the executive; certainly she had not assumed the role, taken on so eagerly by Dr Edith Summerskill, of flaying the Bevanites every time they sat round the executive table.

Mrs White, facing the probability of defeat this year, has withdrawn her candidature and declares this to be a protest "against the exclusive intolerance shown publicly and privately by some of our more prominent leaders." She thereby provoked a growl of anger from Mr Deakin and Sir William Lawther (Sir William even accused Mrs White of the ultimate crime of being a professor's, not a miner's, daughter) and drew a shout of support from Mr Shinwell. Her gesture may be expected to rouse sympathy in the Labour party precisely because the bulk of it is heartily sick of the Bevanite controversy, which has degenerated into a slanging match over stale issues long since settled by events. What is important in it has been merged in the perennial struggle within the party between Left and Right.

Much of the party is content to forget the rest because the Bevanites as a group have been, for the present at least, defeated. They have entirely failed to translate their success at Morecambe a year ago into any comparable

success in the arena where power is exercised, at Westminster, and Mr Bevan himself will go before the party conference this year with much of his glamour (and some of his publicity value) departed. All the Bevanites' speeches and writings have made no deep impact on party policy, while between Mr Bevan and power the figure of Mr Herbert Morrison has again been firmly interposed—and interposed by the union leaders who in the past were among Mr Morrison's foes. The sympathy with Mrs White's protest is largely a measure of the degree to which the rank and file feel that the controversy has been settled, and that it is unnecessary to pay out old scores against those who may not have toed the anti-Bevanite line punctiliously enough.

Yet it is ironical that those who are now calling for peace within the party include some who, a year ago, were calling for more resolute action against the Bevanite "party within a party." Mr Deakin and Sir William Lawther have, indeed, sound grounds of complaint against the anti-Bevanites within the political wing of the Labour movement. The battle against Mr Bevan was left almost entirely to the union leaders. None of the politicians has spoken out so forthrightly or so steadily. Mr Deakin and his colleagues, and not those politicians who think as they do, have had to do virtually all the dirty work in combating Bevanism. If in their irritation they withdraw their support from a relatively obscure, even if a pleasant and able, member of the Parliamentary party, it is hardly a matter for great public outcry.

Trieste Deadlocked

IT may be as true as the Foreign Office asserts that, by not claiming to annex Zone B of Trieste last Sunday and by declaring that he would not use force, Marshal Tito has reduced the immediate tension between his country and Italy. But his speech has nevertheless slammed the door so hard on compromise that direct negotiation no longer looks like a realistic possibility. Indeed, unless something is done to force a solution from the outside, the two countries are now likely to be more completely at loggerheads than ever. That is a situation in which the deepening and spreading of passions may ultimately have untold consequences. And if they do it is primarily Marshal Tito's fault.

His actual proposal on Sunday was that Yugoslavia should incorporate both Zones A and B and that Trieste itself should become an international city. This proposal only reduced the immediate tension because it was so outrageous that it called for no immediate action and indeed left the Italians temporarily speechless—a position from which they are planning to recover; Signor Pella, the prime minister, is to make a further announcement about Trieste this week-end.

What really emerges from the recent renewal of activity in the Trieste dispute is that the hope, so long fostered in London, Washington and Paris, that Italy and Yugoslavia might settle their differences between them, must finally be abandoned. On the Italian side, Signor Pella has evoked, and depends on, right-wing nationalism to a greater extent than his predecessor; this is in tune with the shift of Italian political sentiment towards extremism in general. On the Yugoslav side, Marshal Tito, having apparently given up

even trying to be reasonable, has now committed himself to a position from which it would in any case be difficult to climb down. It now looks therefore as if the only way in which the Trieste dispute could be settled would be through firm pressure either by the western Big Three or by Nato as a whole. It is time that the Atlantic Council took notice of a political problem which critically affects the defence of southern and western Europe.

M. Laniel on a Tightrope

M. LANIEL, the French premier, must look enviously beyond the Rhine. While Dr Adenauer has now been guaranteed four years of tenure of office, M. Laniel is not assured of as many weeks. His precarious coalition has already been shaken by the Moroccan crisis and will find even more room for dissension over EDC when, as now appears, the treaty has to be taken out of cold storage. Yet M. Laniel is not looking so far ahead. For the moment he has enough trouble on the home front in trying to consolidate his position during the uneasy truce between the end of the strikes and the beginning of a new parliamentary session in October. For the workers, the major condition of the truce was the government's promise to reconsider the question of wages. Since a general rise in wages, starting an inflationary spiral, could jeopardise any broader economic plans, the government is attempting to create a climate in which wage claims could be limited to the lowest paid workers.

M. Faure, the finance minister, has hitherto proceeded on two lines. He has launched a campaign against fiscal fraud and a drive to reduce prices of consumer goods. The anti-fraud campaign has confirmed the well-known fact that many Frenchmen avoid the tax collector by exporting their capital and that many others live well beyond their declared income. It remains to be seen how strongly the arm of the law will fall on the culprits and how many will manage to escape it once again. The reduction in prices is to be reached through a combination of tax reliefs and voluntary cuts by traders, with the threat of coercion in the background. Since food accounts for well over half of the French workman's budget (against less than one-third in this country), the government hopes, chiefly through a cut in food prices, to raise real wages by 4 to 5 per cent. Meat prices in Paris shops have, indeed, already gone down, but the public still remains sceptical. The workers have little faith in pledges that depend on the civic sense and benevolence of their butchers.

Aware of the mood of the country and taught a lesson by the strikes, some members of the cabinet are pressing M. Laniel to raise the lowest wages before parliament reassembles. But all these are obviously expedients to avoid a new conflagration. M. Faure is expected to announce next week broader measures to instil life into the French economy; he has already prepared a reduced budget draft for next year. Yet he can no longer afford purely bureaucratic measures. The psychological effects of the present campaign will wear thin if the government does not show a new determination to deal harshly with frauds or reluctant traders, while granting some concessions to the workers.

In this explosive situation, one false step would be enough to deprive M. Laniel's team of the opportunity to put its full plan of reforms into practice.

No New Deal for North Africa

WITH unexpected ease, M. Laniel's government has smoothed over the recent upset in Morocco. Prophets who foretold immediate repercussions in Tunisia have proved wrong; there have been no disturbances even in Morocco; Spanish Moroccan protests have been valid, but not vociferous; in New York, the Arab-Asian bloc's attempt to place the matter on the Security Council's agenda has failed on the ground that the Franco-Moroccan affair is a matter of domestic jurisdiction. Thus all seems plain sailing for M. Bidault, who is said to be ready with a fleet of reforms for Morocco and has just appointed a new Resident General in Tunisia. The autumn ought to hold promise of the "dialogues" on progress towards self-government that Paris likes to imagine itself holding with the Moslem authorities in Tunis and Rabat respectively.

But last week's resignation of M. Mitterand from the Laniel cabinet suggests that there is a debit side to the balance sheet. M. Mitterand is a specialist in the affairs of the French Union. His main thesis, lately expounded in a book on the subject and in a cabinet memorandum on Tunisia and Morocco in particular, is that if France educates young Africans or Asians in its image, it would be wise to recognise their right to a say in their future. He therefore advocates, as the method to be followed when producing reforms, preliminary discussion in mixed commissions of local inhabitants and Frenchmen, of the kind that last year's Pinay government tried and failed to establish in Tunisia.

Three or four formidable groups are in disagreement with him. Marshal Juin heads their ranks. Behind him are ranged the French settlers in North Africa, who prefer reform conceived in Paris and presented, ready made, to the local authorities, and feudal notables of whom El Glaoui, the Pasha of Marrakech, is the prototype, and who are afraid to humour young nationalists for fear of losing authority in the process; the stately but timid Bey of Tunis hovers on the fringe of this class. The cabinet that let M. Mitterand go is to be seen in oddly die-hard company.

Inquiry for Electricians

THE Ministry of Labour has rightly decided that the strike of electricians, though they are few in number, could do a lot of harm and might be prolonged if left to itself. After fruitless talks, lasting far into the night, between the separate parties and the Ministry's conciliation officers, it has decided to refer the dispute to a Court of Inquiry.

This is not arbitration. There are two arbitration tribunals, but the circumstances of this dispute prevent it from being referred to either of them. Arbitration by the Industrial Court requires the consent of both parties, and

the union has refused to agree. Arbitration by the Industrial Disputes Tribunal can be instituted at the request of only one of the parties (and the employers are willing), but it is not used if a strike or lock-out is in progress. Its awards become an implied term of employees' contracts, but in practice the consent of both sides is required if they are to be effective. A Court of Inquiry, on the other hand, can be set up without the prior consent of either party. It does not make an award, but its report, which is laid before Parliament as a White Paper, usually contains some proposals for a settlement. Its value lies in giving publicity to the facts of the dispute and in guiding public opinion. As a strike or lock-out that is disapproved by public opinion is immediately weakened, the report usually leads to a settlement—though Courts of Inquiry have been used but rarely; they are supposed to be reserved for conflicts that could have important national consequences, when other means of reaching a settlement have failed.

In the present instance the court will have to decide on the merits of a claim that is based on the cost of living in January, 1948. The union says that the index has risen by 35.5 per cent since then whereas wage rates have risen by only 28.3 per cent. The employers, on the other hand, contend that if 1946 is taken as the base year the cost of living has risen by 36.8 per cent and hourly wage rates by 43.3 per cent. It will be interesting to see what the court makes of their argument that in any case 3.5 per cent of the rise in the cost of living was due to the reduction of food subsidies, which was compensated by tax changes—a point that is ignored in all the current wage claims. The union will not decide until Sunday whether to call off the strike, as the Minister has asked, while the court sits; but it will probably feel unable, even at this stage, to ignore the effect on public opinion of further intransigence.

Water Under Fire

THE water companies and authorities have made dignified pleas against their selection by the TUC as the victim of its ritual sacrifice at the altar of nationalisation. Public ownership of water supply was the one definite socialist proposal that the TUC's General Council could safely make, not because it is claimed to have much merit but because there are no powerful objections to it. There is no fear of dislocating production or, indeed, of making any real difference at all. The TUC's recent report includes no attempt to justify the proposal, beyond the perfunctory assertion that nationalisation is necessary, first, in order to provide a universal service and to eliminate waste; and, secondly, because increased investment is needed to meet expanding demand, mainly from industry.

These fair-sounding phrases ignore certain facts. A service as nearly as possible universal is being provided already, without waste that anyone has detected; some 95 per cent of the population already has a piped water supply or a nearby stand-pipe, and of the other 5 per cent a large part will be served by rural water schemes now in progress. Moreover, investment in water supply has been restricted not by private wickedness but by government policy—and by the Labour Government as well as by the present one.

The other motives for the nationalisation of water supply are unimpressive. It has a certain appeal for the sake of tidiness. It would round off the public ownership of similar utilities, such as gas and electricity. It would look better on paper than the existing complex, developed piecemeal over the years, of local authorities, joint boards and private undertakings.

But above all, with 150 private companies still in the field, as well as over a thousand small private suppliers, the old cry can be raised that this is a service that should not be dependent on considerations of profit. In fact, it is not so dependent. Exchequer grants are available for rural water schemes, and the Minister of Housing controls private undertakings. He can require them to make surveys, to extend their services, and to amalgamate to form larger units. There is a case for a more vigorous use of this latter power. But as none other than Mr Bevan, then Minister of Health, said at the Labour party conference in 1947, "We have all the machinery we need for an adequate water supply in Great Britain." In the minds of the union leaders, the reason for altering the machinery is probably no more than the belief that in this case nationalisation would at least be harmless. Even if that is true, it is a monstrously inadequate motive for occupying the time of Parliament and of administrators. And there should by now be a general awareness that measures which lessen local initiative, which take yet more power to the centre and further reduce the functions of local authorities, always run the risk of doing in fact considerable harm.

How to Stimulate Saving

THE margin of error in even the most authoritative calculation of total personal savings in Britain today is so enormous that no inference drawn from short-run changes, in either direction, can rank as much more than a guess. The handicap to discussions of policy, however, is not so serious as it might seem. For whatever figures emerge, they disclose a shortage of personal savings, and whatever policy is chosen, it must aim to correct that shortage.

Mr David Dear, the author of the Conservative Political Centre's newly issued pamphlet on this subject, sets his proposals against a background of historical analysis.* He examines changes in the prewar rate of accumulation of certain readily measurable types of savings—industrial assurance, life assurance, National Savings Certificates, Post Office and Trustee Savings Banks accounts, building society liabilities and mortgages repayments. From these some suggestive facts emerge. Changes in the rate of interest, notably the sharp drop in 1932, cause some reshuffling of assets but have no perceptible effect on the total; depression has, surprisingly, a much less destructive impact than a rise in the cost of living—which indicates that the "money veil" is much thinner than some Keynesians suppose. This conclusion is borne out by the postwar figures; whatever else may be done to stimulate savings, holding the line against inflation is the first condition of solid and permanent success. Since inadequate savings are themselves largely responsible for inflation, this analysis

* "Personal Savings." By David Dear. CPC Discussion Series, 29 pages. 6d.

uncomfortably re-emphasises the viciousness of the vicious spiral; but it does also indicate that any breathing space, such as that provided over the last eighteen months by more favourable terms of trade, offers a chance of reversing the spiral and making it virtuous.

In this perspective, specific proposals for encouraging and facilitating personal thrift fall into their proper auxiliary place. Mr Dear has several such proposals, mostly fiscal. He would extend the tax reliefs now allowed on life insurance premiums, and on contributions under group retirement schemes, to savings for retirement made by self-employed people, and also to the contractual purchase of Government stock; the second is, admittedly a matter of great administrative difficulty. At the same time, he proposes that the granting of earned income relief should apply also to the first £200 of unearned income.

The trouble with all these proposals is that they do nothing to solve the qualitative problem of personal savings—the problem, that is, of the relative and absolute shortage of risk capital. Even the most broadly based of investment trust units appears, to Mr Dear, too uncertain an asset for the small saver and so an unsuitable medium for official encouragement. Mr Dear advises a special approach to the "new rich"—particularly the families with several wage-earners—and possibly that should include an appeal to take a chance on industry rather than on the pools, at present a disproportionately popular medium of risk "investment."

Bulganin's Conscripts

MOSCOW announced officially last week that all Soviet citizens born in 1934 and not exempted from military service are being called up, while those who have served the time prescribed by law are being demobilised. The decree, bearing the signature of the Minister of Defence, Marshal N. A. Bulganin, marks a break with the Stalinist secrecy that had acquired morbid proportions during the years of the cold war. Since the passing of a special law about State secrets in 1947, the Russians have taken care to camouflage even the most innocuous data, and there has been no mention of call-up or demobilisation. Now they have revived the practice of prewar years, when such announcements were made annually in September.

This return to prewar procedure does not cost the Soviet government anything, for it involves no real disclosure. So little is known about the size of the Soviet armed forces that no precise deduction can be made about the troops now being released. Length of conscript service in the Soviet forces varies according to category, from two years for ordinary soldiers up to five years for certain specialists. Will the men demobilised now outnumber the 750,000 or so new recruits? Marshal Bulganin has succeeded in killing two birds with one stone. He gives to the Russians some feeling of stability, of a return to normalcy, while leaving the West still in the dark about Soviet strength.

There has been no lack of estimates of the actual scale of the Soviet forces, but they are necessarily based largely on guesswork. Malenkov's statement last year that the numbers under arms "do not exceed those before the war" has led many outside observers to put the size of the land

forces at somewhere around two and a half million. Now, with a possible shift from conventional to atomic strategy and a greater demand for manpower in light industry, a case could obviously be made for reducing the standing army. But Marshal Bulganin gave no clues in that direction. He merely showed to what absurd lengths Soviet secrecy was extended under Stalin and how little risk is involved for the Soviet Union in a partial relaxation from that grotesque degree of "vigilance."

A Strasbourg for Nato?

THE unofficial conference on the Atlantic Community held last week in Copenhagen found its most debatable issue in the proposal to set up a consultative parliamentary body, akin to the Strasbourg assembly, as an organ of expression for the Nato countries. Although discussion on this question revealed clear differences of opinion (which often cut through national delegations), the fact that the harmony of the gathering was thereby disturbed was in itself no bad thing. The delegates had not come to Copenhagen merely to listen to speeches by General Gruenther and Mr Herbert Morrison, or to adopt worthy but unexciting resolutions calling for greater publicity for the aims of the North Atlantic Treaty. Their meeting gained in value from the very fact that, while all those present supported the development of an Atlantic Community, their debates fairly reflected the real division of thought which exists on both sides of the Atlantic as to how that development should proceed.

Those who oppose the creation of a consultative

assembly for Nato are not simply influenced by cynicism about the record of the corresponding body at Strasbourg. They are also inclined to doubt whether enough true comprehension can be found among the peoples of an area stretching from Los Angeles and Vancouver to Narvik and the Caucasus to sustain such an assembly in its proper role. A Nato assembly that devoted itself to competitive parochialisms would be a positive danger to its own cause. There may be more prudent and less cumbrous ways of nurturing popular enthusiasm for the Atlantic ideal; and it is encouraging that the national groups represented at Copenhagen have decided to hasten their plans for closer co-operation on a practical level.

Trading Turks

LAST week the Turkish government took resolute action to deal with its balance of payments problem. The attempt, begun in 1950 with the backing of the European Payments Union, to liberalise Turkey's foreign trade completely is officially abandoned. In fact, to all intents and purposes it has been scrapped since last September when the government, alarmed at a trade deficit of around £T500 million, introduced a system of global quotas; this was designed not so much to reduce the volume of imports as to prevent it from increasing any further. The measures announced last week will allow the government to cut down on imports, since all are now to be subject to a strict system of licensing. At a later stage, however, it appears that the government intends to introduce a restricted list of goods, including certain industrial raw materials and spare machinery parts, which can be imported freely.

At the same time, the Turks are taking steps to boost their exports. The government is determined, for political and social reasons, not to reduce the prices paid to the Turkish peasant for his wheat, cotton and dried fruit. This policy meant that last year, when for the first time Turkey's determined efforts to expand its agricultural production showed outstanding results, no market could be found for a large part of its agricultural export surplus. If this is not to happen again this year some means must be found of putting Turkish produce on the world market at competitive prices. An export subsidy fund is therefore to be set up, financed by duties on "secondary and luxury imports." So long as the import duties are not used to protect uneconomic Turkish industries, this novel way of subsidising exports has a good deal to recommend it; but it should be regarded only as a temporary expedient. In present circumstances the long-term solution is to increase the productivity of the Turkish farmer.

Turkey's balance of payments difficulties are mainly due to the large imports of capital goods for its ambitious economic development plans. In so far as these plans are well-founded, the Turks can reasonably hope that their trade deficit will gradually become less troublesome. But the problem of developing their economic resources without seriously upsetting their foreign trade accounts would be lessened if they were more successful in attracting the foreign private investor. It is therefore encouraging to find that Mr Clarence B. Randall, chairman of the new US commission on foreign economic policy, has just been surveying the possibilities for private investment in Turkey,

and that the Turkish government is considering new measures to attract the foreign investor.

Broadcasting Finance

THE BBC's report for 1952-53, published this week, confirms the gloomy prognostications of last year's report. The corporation has made a loss of £759,000; in the previous year, income had exceeded expenditure by £123,000.

The accounts for 1951-52 showed the effect of only three months of the Treasury's appropriation of 15 per cent of the net licence income (after the payment of 7½ per cent to the Post Office for the costs of collection); those for 1952-53 reflect a full year of this burden. The gross licence revenue rose by £878,000, mainly because the number of television licences increased by 50 per cent, but this was far more than offset by the Treasury deduction. The BBC's income from this source was reduced by more than £500,000 compared with 1951-52. Capital expenditure that in a better year would have been met from revenue was financed from reserves. The corporation estimates that, if present trends continue, its deficit will be more than doubled in 1953-54 and that its reserves will be more or less exhausted during the year. The BBC would then have to rely on borrowing to finance the large development schemes that have been delayed by restrictions on capital investment.

The objections to such borrowing are hardly as weighty as the report implies. Naturally, the BBC would like to return to the short and happy period, from April, 1950, until December, 1951, when it enjoyed the whole of the revenue from broadcast receiving licences. But there is no reason why this tax should not make a contribution to general government revenue, as do the taxes on other services and trades. The BBC's present report, like last year's, is in effect a plea for exemption from this contribution. If it is really so unable to balance expenditure against present income, and so reluctant to borrow for capital development, there is still no reason to take a tragic view of the corporation's finances. With radio regarded as a domestic necessity, and with the number of television licences shooting up, there would be little difficulty in increasing the licence fee. An increase from £2 to £3 in the combined licence for sound and television—which was foreshadowed recently by the Director-General—would rightly make television development less dependent on the reserves built up by sound broadcasting. And a mere half-crown on to sound licences would bring in more than last year's deficit.

Education in Inflation

EVER since Sir Stafford Cripps put a ceiling on the food subsidies Great Britain has been gradually exchanging one kind of inflation for another. The repressed inflation of the war and immediate postwar years—the inflation manifested in "scarcities," long delivery dates, directed consumer choices, and general grit in the wheels—was replaced by an almost equivalent amount of the old-

fashioned open inflation whose simple and easily recognisable characteristic is a general rise in prices. The distinction between these two varieties, and their common root in an excess of personal incomes over purchasable output at current prices, is by now a commonplace of economic theory; but it has not sunk into the consciousness of the general public. Indeed, unsophisticated voters of all colours are still inclined to believe that so long as prices are steady all is well; while to a certain brand of left-wing sophisticate the hit-'em-and-hold-'em policy of monetary stimulus and physical controls, which is the essence of repressed inflation, appears as a thing good in itself which should be maintained, if possible, permanently.

Professor Frank Paish, in his presidential address last week to Section F of the British Association, not only analysed the differences between the natures, and the effects, of open and repressed inflation. He also gave a novel turn to the discussion by analysing the flow of purchasing power according to its active and inactive phases—its passage into and out of the "assets circulation" (stocks, securities and balances, whether personal or institutional) as well as its genesis and destruction by monetary and fiscal policy. For the student of postwar economic history this analysis provides a highly suggestive and illuminating guide. The general, unsophisticated public—which, when it votes, is apt unconsciously to express a choice for one sort of inflation over the other—is hardly equipped to follow his argument. But it falls into place

The Price Mechanism

Nothing could be more prejudicial to public interests than the attempt to avoid by any means the proper and natural consequences of scarcity, or of increased demand. The best, if not the only true, security against the evils or inconvenience of scarcity, is a rise of price; the effect of which is not only to economise consumption, but to encourage larger supplies at the moment, and increased production in the future. Nothing could have a more ruinous tendency at any time than to keep prices low, when the actual state of the supply should naturally make them high. This could only be accomplished by the interposition of some artificial regulation, which would not only not tend to increase quantity, but which, on the contrary, while it encouraged for a time a more lavish consumption, would also direct external supplies into other and more profitable channels. We have, therefore, to steer between the two difficulties. We have to avoid Scylla, and, if possible, not be drawn into Charybdis. We have to allay unnecessary apprehension and alarm, which at all times greatly aggravate the evil at the moment, and extend its scope in the future, while we have to leave scarcity to its own natural cure, by increased prices sufficient for the occasion. But this is a task far too delicate and too difficult to perform by any regulations. The nearest approach to its successful performance can only be obtained by a perfectly free, unrestricted, and unregulated trade; and by such a knowledge and intelligence on the part of the commercial public as will lead them to approach the nearest to an exact appreciation of the necessities of the occasion. When the Government has withdrawn all restrictions and interference in matters of commerce, the rest must be left to the intelligence and to the private interest of individuals, which, in spite of a popular notion to the contrary, the latter of which is always the same as the public interest.

The Economist

September 10, 1853

UNEMPLOYMENT IN GREAT BRITAIN THOUSANDS

as a contribution to a gradual process of enlightenment. The 1914-18 war and its aftermath educated the general public in the painful facts of open inflation; the 1939-45 war and Daltonian finance may in time prove to have provided the necessary postgraduate course.

Mr Strauss Quells a Mutiny

IN South Africa an incipient revolt by four right-wing United Party members, headed by Mr Bailey Bekker, chairman of the Transvaal branch, has been suppressed by the leader of the party, Mr Strauss. After hours of debate in a special closed session of the party caucus, Mr Strauss obtained last Sunday an overwhelming vote of confidence. The disgruntled mutineers, though smarting under the defeat, have been forced to toe the line; but Mr Strauss's supremacy is not assured, nor is it yet clear what impact his victory will have on the party's future policies.

It was just as well that the party endured this catharsis, for on Wednesday next week it must face another parliamentary test when Dr Malan's Separate Registration of Voters Bill comes up for the crucial third reading in the joint sitting of both houses. Ostensibly the revolt was against Mr Strauss's personal inadequacies as a leader, and the failure of the party machine during the election campaign; but in fact the trouble goes much deeper. The dissident group are actually the same people who have seemed to be most approachable to Dr Malan in his attempts to woo sufficient support from the opposition to push through his bill. There are undoubtedly many other members of the opposition who are basically disposed to accept a compromise if it can be wrapped up in some apparently honourable formula. But there is also a strong sense of loyalty and discipline in the United Party, which no doubt stems from the great days of Smuts. His chosen successor, however inadequate he has proved, can still count on a loyal core.

Some commentators have assumed that Mr Strauss's triumph will bring a shift in the United Party's policy towards a more liberal native policy. This is a misconception. Though the liberal element in the UP is growing it is by no means dominant. Furthermore, the brand of liberalism likely to be expounded by such a movement would hardly measure up to the ideals accepted elsewhere. Mr Strauss's victory is more of a triumph for the orthodox party managers than a shift to the left.

New Light on "Germ War"

AMONG the very last of the prisoners handed back by the Chinese in Korea last week were several American airmen who had been accused by their captors of dropping bacteriological bombs. The great world-wide propaganda campaign on germ warfare conducted by the Communists has been largely centred on the alleged confessions of these men, which were publicised with a wealth of superficially plausible detail; but although some of the airmen had been prisoners for a year or more, no independent witness had

ever been allowed access to them. Now some of them have told the sickening story of how the "confessions" were extracted in the course of agonising months of solitude and suffering. One second lieutenant, badly burned when his aircraft crashed, was refused medical treatment until he agreed to confess—although his tormentors blandly offered him a choice of three crimes to admit.

It appears from the released men's stories that after the signing of the armistice the pressure on them was actually increased, and that up to the last days before release they were being threatened that refusal to confess would destroy their chances of being repatriated. Presumably the Chinese were seriously concerned to preserve as much "face" as possible. This is also implied by the way that those of the accused airmen who resolutely withstood both threats and ill-treatment to the end have now been solemnly "acquitted" by their captors. A spontaneous and notable tribute was paid to these men by one of the other airmen who had himself succumbed to pressure; he said that they deserved the highest awards for bravery, while he and the others who had signed "confessions" considered themselves traitors. Public opinion will scarcely condemn such men as harshly as they condemn themselves; it will do well, on the other hand, to take note of the truth that is now emerging about the "germ warfare" campaign—one of the cruellest farces ever played on the political stage.

Prevention of Poisoning

FOOD poisoning has been common this summer and has sharpened public anxiety about standards of cleanliness in catering establishments and food shops. It is slightly reassuring, therefore, to have a 60-page handbook on "Clean Catering" published this week by the Ministry of Food. It makes practical suggestions about the kind of layout, construction and equipment that is easiest to keep clean. As such, it may be of some use in inducing those who are setting up new catering establishments to achieve at least the framework for hygiene; it may even promote improvements in a few existing premises. But its effect on the incidence of food poisoning is likely to be small. The most common cause of poisoning—intestinal infection carried on the hands—is not dealt with until the final chapter on "Practices." Nor is it the sort of pamphlet that would be read by the proprietor of a dirty little cafe; and if he did read it, he need not heed it.

Two years ago the Ministry published another pamphlet on food hygiene in catering establishments—the report of a working party. This drew up a standard code of practice, short and to the point, which included measures to limit infection by food handlers and minimum hygienic requirements for premises. The working party suggested that this code should be made immediately applicable, that local authorities should send it to all caterers in their area, and should take action against anyone not observing it. This was never done. Local medical officers do lay down their own requirements, and in many areas Clean Food associations are promoting higher standards by voluntary means. But in order that the public, as well as the catering trade, may know where it stands, there is a need for a simple nationally recognised code that is everywhere enforced.

How to Manage

THE PRINCIPLES AND PRACTICE OF MANAGEMENT.

Edited by E. F. L. Brech.
Longmans. 752 pages. 50s.

MANAGEMENT training in this country has long suffered from a lack of adequate textbooks written with British conditions in mind. Lack of textbooks, like lack of teachers, has severely hampered the development of a training course that practical businessmen would respect. Lack of prestige has, in turn, discouraged British students from taking management studies as a serious part of their training as industrial leaders and executives. Mr Brech has put the whole "management movement"—the cause of efficiency and higher productivity—into his debt by producing this up-to-date compendium. Alone, this one book may not break the vicious circle that prevents business schooling from getting results in this country as it does in America, but he and his co-authors have done as much as one team can do.

The publishers frankly declare that Brech on Management is not a book to be read through at a sitting; and that must be held good of reviewers as well as of management trainees. It is not a book that can be criticised in detail; yet to pick out any one section for particular scrutiny would be invidious. It can be said, however, that it is plainly written, straightforward, eminently practical and reflecting the wide experience, as well as wide reading, of its team of authors; and the word "team" is used advisedly, for the treatise has unity of purpose and a broad uniformity of terminology that make it entirely different from a collection of papers, or even separate books gathered under one cover. It states the principles of management—which will mean little to the neophyte. It moves steadily through the organisation of distribution; production (note the order); personnel management; cost; financial and other control to the practice of management—the work, in particular of the General Manager—which, by that time, should mean something to the neophyte who is learning on the shop floor as well as in a seminar. He can then apply principles to his experience, realise just what he is doing in the whole, and to what profession he has devoted his life.

In style, "The Principles and Practice of Management" is in refreshing contrast to the run of business textbooks turned out by American business professors. It avoids jargon, even if, perhaps, it overworks such words as "factor." Here and there—in the discussion of indus-

trial relations for example—the abstract nouns tend to get out of hand but matters might be worse. In general the book is admirably concrete, sticking to case histories or *pro forma* statements of procedure; and the authors wisely dogmatise on the best methods. If they are right, the student will know, once and for all; if he can fault them later on, that will be a sign that he really has the stuff of management in him. But nobody will ever put the mass of procedures explained in this book to the test: on the other hand, few management trainees faced on the shop floor with a problem of "how to get about starting the job" will turn to it in vain for a valuable suggestion or a prototype of his problem. The publishers urge the practising manager (if one may use the expression) to use it as a "desk book," which is asking rather more of it. Managers have so much to read already, and few are inclined to go to school again. But perhaps they should; if so, Mr Brech and his team are a ready-made refresher course on fundamentals.

White Man's Burden

BLACK MAN'S TOWN.

By Isobel Ryan.
Jonathan Cape. 249 pages. 15s.

NO doubt future historians will comment with some bewilderment on the reactions of public opinion in Britain to the existence of a worldwide British Commonwealth. For very many, it is a matter of complete indifference if not of active boredom. For a few, it is a tremendous field for theoretical judgments on the predatory activities of evil capitalists. For almost none is it an area where British men and women actually work and live, where they carry on administration, create wealth and contribute that extra dimension to British living without which Britain would be a small island of the Eurasian land mass.

Books such as Mrs Ryan's are therefore welcome, for they try to break through indifference by lightness and amusement in writing and to temper ideology by showing the substance of actual living, in the tropics—not the profits and the marketing and the "exploitation" but the nature of existence in jungle guest houses, the struggles with the encroaching insect life of Africa, the absurdities and heartbreaks of life in towns of makeshift modernity barely rising above the primitive bush. No one who has read, for instance, Mrs Ryan's account of life on the trading station at Burutu, far away up the swampy creeks of Nigeria, will feel in-

clined to dismiss quite so lightly the commercial enterprise of West Africa on whose transmission of wealth British living standards partly depend.

"Black Man's Town" is written on the surface. It gives a quick, often vivid, impression of the day-to-day life of Europeans in West Africa. It does not pretend to describe the deeper social and political causes conditioning the superficial attitudes and problems of the White Man's contact with the African. At the beginning of the book Dr Kwana Nkrumah is a young hothead in gaol for agitation. At the end, he is already head of the government. No intermediate steps are sketched in.

Yet the book is not without political value, for it illustrates a temper of mind without which probably no lasting partnership between African and expatriate can be secured. Mrs Ryan can look at both her own people and at their African neighbours with a detached eye. It is a friendly regard, sympathetic and unbiased, and it leads her to a conclusion which is the very essence of West African politics—"that European and West African have a great need, each for the other's co-operation, friendship and trust . . . ill-matched though they may seem. Their present relationship may appear as confused as was their past history. But live together they must, for the only alternatives for both are grave and equal loss." There can be no quarrel with this judgment. And Mrs Ryan also makes clear how much patience, good will and sacrifice will be demanded from British officials and businessmen if the ideal of partnership is to be worked out.

Lincoln Reassessed

ABRAHAM LINCOLN.

By Benjamin P. Thomas.
Eyre and Spottiswoode. 368 pages. 25s.

THE time was ripe for a new life of Lincoln. The stream of Lincoln scholarship has so broadened in the past thirty years that our factual information has enormously increased and our perspective of him has been sensibly modified. Much of the new material and the revised estimates have been made available to English readers in the works of two Illinoisans, the late John Randall and Professor Allan Nevins, but it has been left to a third son of Lincoln's own state (also the Secretary of the Abraham Lincoln Association at Springfield) to cast the new findings into the mould of a biography for the general reader. The endorsements which Mr Thomas's book has already received in the United States from these and other authorities prove on inspection to be amply merited. It can safely be said that this is the best one-volume life of Lincoln at present available.

Mr Thomas's greatest merit as a biographer is his willingness to present the facts with the minimum of trimmings. Above all else, this is a precise, fact-studded narrative. There is a ruthless winnowing away of legend—as over the Ann Rutledge romance—and a tight rein is kept on surmise, moralising and

underlining. Wherever possible Lincoln or his contemporaries are allowed to speak for themselves. Yet the narrative flows easily and one never gets the sensation that the man is being submerged beneath the material about him. Mr Thomas's selective artistry, for all its self-concealment, is always present. This is the sort of life that could only have been written by a man who knew ten times as much as he has allowed himself to put in.

The English reader will naturally be tempted to compare this life with the earlier and deservedly famous *Abraham Lincoln* of Lord Charnwood (and is indeed encouraged to do so in Mr Thomas's very fair and full bibliography). A first impression is that Mr Thomas, writing more immediately for an American public, assumes some of the historical and constitutional background that Charnwood felt obliged to fill in. It must also be admitted that Mr Thomas does not command as subtle or as eloquent a pen. There is an occasional lack of life about his narrative. On the other hand, he achieves a realism that Charnwood's rather remote and intellectualised portrait often lacks. The early chapters, in which Mr Thomas writes of the Mid-Western boyhood and youth that left such a mark on the Lincoln of the White House, have a particular force and vividness. And when Mr Thomas comes to the immensely intricate story of the Civil War years there is a simplicity and directness about his narrative which reflect the thoroughness and, more, the complete intellectual honesty of his approach. These are solid virtues, and such moreover as one feels Lincoln would himself have prized above all others in a biographer.

Urban Growth

THE GEOGRAPHY OF TOWNS.

By A. E. Smailes.
Hutchinson's University Library. 166 pages. 8s. 6d.

SINCE the publication of Geddes's pioneering "Cities in Evolution" in 1915, work on geography as applied to the town has gone on somewhat fitfully in Britain. Although workers in this field have contributed considerably to the techniques of town and country planning, the subject has attracted less attention than in the United States or Germany. In particular there has long been the need for an introductory account to which the general reader and the undergraduate could confidently be referred. This need Mr Smailes meets most admirably. In its short space his book gives a thorough introduction to the various branches of the subject. In the opening chapters he describes the development of urbanism, contrasting towns as they existed for some 5 millennia, isolated occurrences in a dominantly rural scene, with the sprawling agglomerations that they have become in the last hundred years. There follows a discussion of the various influences on the site and form of towns, influences both from physical geography and situation and from the cultural side. The

final chapters concern the physical structure of towns, the various types of internal region into which they can be divided, and the regions which they create for themselves in the surrounding countryside.

But this book is more than an outline of a branch of geographical study, for Mr Smailes draws on his experience to throw out many comments on current administrative and planning practice. We find him, for example, attacking the idea of the "neighbourhood unit" in towns, so beloved by urban planners, or denying the reality of the division between "urban" and "rural" in local government, or advocating the reform of local government units to coincide with the real tributary areas of towns. If there is any criticism to make it is that, even in the limited space available, rather greater reference might have been made to urban conditions abroad. But at least the frequent illustrations drawn from the British Isles are the unhackneyed product of original investigations. Altogether this is a book which fulfils its purpose very well, and which is often stimulating. It is a worthy member of an excellent series.

Inadequate Guide

THE MODERN WRITER AND HIS WORLD.

By G. S. Fraser.
Verschoyle. 351 pages. 16s.

THE dust-wrapper, preface and introduction to this book are loaded with unpromising statements. The work began as "a guide to modern English literature for the Japanese"; the bulk of it was "dictated . . . in the summer of 1950"; the author has in mind "Dr Joad's excellent guides" and proposes to "record the view of contemporary English literature that one thinks 'most people' take." Mr Fraser here does not quite mean that he rejoices to concur with the common reader, for "most people" are defined as certain critics of an older generation, certain friends of one's own generation, whose judgement one respects.

Mr Fraser's friends are active on page 27 ("I have not read Lawrence's own 'Lady Chatterley's Lover' but my impression of it from what my friends tell me is that it is an artistic failure"), but it is not clear whether they are still at work on page 91 ("Lady Chatterley's Lover," the frankest of his novels from this point of view, is by no means his best one. Indeed, it is perhaps his worst. But it was by no means a pornographic book," etc.).

In attempting on these principles what is in fact a literary history beginning with the 1890s Mr Fraser would appear to suggest that "most people" have no very lively interest in the earlier part of the period. George Orwell gets four pages and Conrad two paragraphs—his only work specifically mentioned being the short story "Heart of Darkness." Carpenter, Doughty and T. E. Lawrence are not named; nor is any work by Butler, Hudson, Rutherford, Gissing, Mr Masfield or Mr de la

Mare. Of the older writers it is Henry James about whom "most people" seem chiefly given to talking; yet the eighteen entries against his name yield only two mentions of actual works: in "An International Episode" James shows that he can evoke a scene, and Dr F. R. Leavis finds "The Ambassadors" a bore. On the other hand novels by Miss Lehmann and Miss Bowen are discussed in some detail. Nobody has heard of Mr Cary.

One suspects that Mr Fraser lacked the impulse to produce a comprehensive survey of this literary period. He would have been wiser to cut his losses with the Japanese and write a new book to which his present title might better apply. For where he is informed and interested he is stimulating and acute. His discussion of recent poetry is a contribution to its subject, and in the section on novelists there are some good and astringent pages on, among others, Mr Evelyn Waugh and Miss Ivy Compton-Burnett. It is perhaps indicative of the unfinished state of Mr Fraser's studies that he writes excellently on "Ulysses" but makes no attempt to tackle "Finnegan's Wake." That appalling masterpiece should hold few terrors for one who is free of the verse of Mr William Empson.

Stardust

STARS IN THE MAKING.

By Cecilia Payne-Gaposchkin.
Eyre and Spottiswoode. 160 pages+67 plates. 25s.

FROM the night of their forebears men have felt most humble in the face of the stars. The immensity of astral space, however, pales besides that continuum of both space and time which paradoxically gives the word eternity a measurable meaning. As the Phillips Astronomer at Harvard says in the second sentence of her book "astronomers are incorrigible optimists"; but they are also so detached from, so humble towards, the comparative pettiness of earthly affairs, that in an era which extols the common man's omniscience, omniscience and unique value there is much to be said for Boethius's advice: "See where the stars still keep their ancient peace." The author begins by emphasising the vast spans of time and space involved in astronomy and astro-physics. She points out that for as long as human history is known the stars in their courses have hardly varied one jot, yet we know that their speeds of divergence are colossal; so vast are both space and time in the context of the astral creation. And astral creation and degeneration are Professor Payne-Gaposchkin's themes. She sets a stage, brings on the players (stars, dust and atoms), handles their groupings (binaries, clusters, systems), and then develops a *dénouement* of evolution and dissolution.

In many ways the book is not at all "according to Hoyle," which makes it even more refreshing than it would have been for British readers. The expositions

If you want to do business in Latin America— say so in

LIFE

en español

LIFE EN ESPAÑOL—average net paid circulation 200,000-250,000 copies in Spanish, circulating in Central and South America.
LIFE INTERNATIONAL—average net paid circulation 250,000-300,000 copies in English, circulating in 120 countries outside North America.
These are the INTERNATIONAL EDITIONS of LIFE magazines.

TIME & LIFE BUILDING, NEW BOND STREET, LONDON, W.1

When a new magazine sells on sight, it's a publishing success. When the people who buy it so readily also represent a rich market for goods and services of all kinds, it's an important advertising medium. LIFE EN ESPAÑOL—the Spanish-language edition of LIFE INTERNATIONAL—is both. Since its first appearance in the Spanish-speaking Republics of Latin America last January, every issue has literally sold out on sight. Brilliantly edited by leading Latin American journalists, and with the same consistent picture-appeal of LIFE INTERNATIONAL's English-language edition, LIFE EN ESPAÑOL has a fast-growing circulation among men and women of the higher-salaried business, government and professional communities. These people, with the means to buy and the power to influence the buying of others, can open the markets of Latin America to your company. Once a fortnight, through the advertising pages of LIFE EN ESPAÑOL, you can talk business to them in their own language. The Advertisement Director will be pleased to send you full details.

and explanations are simple and clear, and the diagrams are equally helpful to the general reader, to whom this book can be warmly recommended. But the dream is at the end: the 67 superb plates ranging from sunspots to that awe-inspiring spiral galaxy Messier 51. These photographs—all from American telescopes—tell by themselves a remarkable story of universes in being, coming to be, and departing from being. One gets the sense of flaming whorls, yellow and violet against black, which rupture the envelope of the sun; of solar chasms ten times wider than our world; of whirling galaxies strung out in space in shapes according to degree of development; and, ultimately—a chastening reflection—of novae and supernovae, brilliant like spatial glow-worms for an instant of eternity, because we now see where a star blazed up and snuffed out millions and millions of years ago.

Professor Payne-Gaposchkin treats us kindly but firmly; clear as her writing is, she demands concentration and sequence of thought. It is only asking for more to criticise her for so smoothly gliding over the physical assumptions she makes in order to mount her drama on such a vast stage. Likewise she avoids entropy, and the reasons for winding-up and running down. But this book abundantly shows the startling advance made in the last twenty years thanks to bigger and better telescopes, better photography and better spectroscopy, electro-measurement and wave-analysis. We have just got to the stage of realising that the numbers of "possible worlds" beyond

reach of our best telescopes (because they are too far-away-and-long-ago, receding faster than their light is coming towards us) must vastly outnumber those we can see, just as "they that are dead do greatly outnumber they that are living." This handsomely-produced book and its sane, sound and sympathetic author make us familiar with the eternities, and such familiarity breeds the contrary of contempt.

The Woman Doctor

STORMING THE CITADEL.

By E. Moberly Bell.
Constable. 200 pages. 18s.

THE citadel is not Harley Street; it is virtually the whole of the male medical profession. Guarding it outside the ramparts were the university senates and a host of well-meaning private citizens. Against this formidable and organised defence were pitted, to begin with, a handful of women, armed for the most part with nothing more than high intelligence and exceptional character and determination.

One had expected Miss Moberly Bell's account of the rise of the woman doctor to be interesting and fluently written. But she has made it oddly exciting as well; at least, that is, in the early chapters where, first, Elizabeth Blackwell, followed by Elizabeth Garrett (later Elizabeth Garrett Anderson) and Sophia Jex-Blake carry out their assaults. Their successes, failures, gradual mobilising of public opinion, and ultimate triumph over the enemy are woven by Miss Moberly Bell's skilful telling into a history that is as gripping as an adventure story. In this she is helped by the characters of the two protagonists. The contrast between Elizabeth Garrett's gentle, dignified persistence and Sophia Jex-Blake's energy and drive, offset by lack of judgment, is well brought out. In one respect, at least, Elizabeth Garrett had the easier part. Few believed, when she first started on her career, that a woman could possess the brains or the stamina to become qualified. Her success caused the defenders of the citadel to arm themselves more powerfully, and it needed the fiercer, more forceful temperament of Sophia Jex-Blake to lead the next assault and, eventually, to found the London School of Medicine for Women.

After the victory, when women were allowed to sit for university degrees and take qualifying examinations, the narrative flags somewhat. This is only natural. The period was one of consolidation; qualified women doctors showed their abilities in new fields, in India and in the world war. Victory, however, was still not absolute—not until after the second war, when medical schools had to become to some extent co-educational as a condition of receiving grants; even today no one would deny that prejudice against women exists when certain appointments are made in, say, the big teaching hospitals. But the security and status women doctors enjoy

today would not be theirs had it not been for the outstanding character and ability of the pioneers and for the support of those who had faith in them.

Text and Reference Books

THE BOOK OF ENGLISH LAW.
By Edward Jenks. Fifth Edition, revised by D. J. L. Davies.
John Murray. 347 pages. 21s.

This book is a classic, as any book in its fifth edition must be. It was written by Dr Jenks in 1928 to provide a convenient text-book on the laws of England for use in the London School of Economics by "laymen interested in the place of Law in modern communities and its influence on economic and social policy." It ran through four English editions in eight years and obviously a fifth has been needed for some time. It is a comprehensive, if comparatively uncritical, exposition of the law as it existed at the end of 1952, its origins and its machinery, its civil and its criminal branches; and it is certain that the need for it cannot be less than it was in 1928.

BUTTERWORTH'S COMPANY PRECEDENTS. Volume 3.
Butterworth. 689 pages. 63s.

The third volume of this massive publication sets out the legal procedures and precedents to be used when the capital of a company is to be reduced, when any schemes of reconstruction and amalgamation are put forward, when a company is to be wound up and when action is taken by debenture holders in a company. It will be invaluable for lawyers.

PAPERS IN ENGLISH MONETARY HISTORY

Edited by T. S. ASHTON and
R. S. SAYERS. 18s. net

Owing to wartime circumstances, some of the most important recent contributions to English monetary history have been overlooked or have become extremely scarce. The intention of the editors of this volume is to make these and certain other short studies more generally available. Six of the papers relate to developments and controversies of the late 18th and early 19th centuries; two to the Bank Charter Act of 1844; and two to the pre-1914 Gold Standard. The remaining item consists of delightful letters written during the crisis of 1825. The authors represented are Barrett Whale, Frank W. Fetter, J. K. Horsefield, T. S. Ashton and R. S. Sayers.

Banking circles the globe

BUSINESSMEN with foreign interests need a bank whose services circle the globe. The National City Bank of New York, with 56 overseas branches and banking correspondents in every commercially important centre, is well equipped to offer such services.

The London branches of The National City Bank are staffed by men who are experienced not only in British banking but also in the financing of overseas trade. They are, also, uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, the worldwide organization of The National City Bank is at your service.

THE NATIONAL CITY BANK OF NEW YORK

Incorporated with limited liability under the National Bank Act of the U.S.A.

HEAD OFFICE: 55 WALL STREET, NEW YORK

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Vulnerable America

Washington, DC

FOR the past six months the Alsop brothers have been demanding in their syndicated column that the United States take seriously the problem of its own defences against atomic air attack. Like Old Testament prophets crying in a wilderness of normalcy, they have been drawing public attention to the existence of a supposedly top secret study made last year for the National Security Council, known as Project Lincoln; this suggests that American defence against air attack is wholly inadequate, that in another two years the Soviet Union will have the capacity to deliver a "devastating" attack upon American industry, and that a vast programme of fighter, radar and rocket defences must be undertaken to provide even minimum protection to the industrial areas. Yet throughout the summer both the public and the Administration have engaged in their conventional pursuits, catching rainbow trout or playing golf, their sleep apparently undisturbed by these dire warnings.

However, since the beginning of July, and particularly since Mr Malenkov's announcement that the Soviet Union had set off a hydrogen explosion, there had been a quickening of public interest in the whole question of the vulnerability of the North American continent, and in the premises underlying the deep-rooted American belief that the United States has an overwhelming superiority in atomic weapons. Although it is generally assumed that neither the United States nor the Soviet Union has a hydrogen bomb that is already packaged for delivery, the comfortable assumption that the United States has a four-year lead in atomic weapons, which was still the official calculation as late as the beginning of this year, can no longer be maintained even by the most determined optimists.

The consequent soul searching has shown that there are three different elements in the question of whether American atomic and defence plans should be revised, although not frequently they are confused. The first, a psychological one, concerns information policy. Should the strict secrecy of all questions of atomic weapons be modified so that the American people could be given some indication of the relative sizes of the American and Russian stockpiles? This would enable the American public to judge the nature of the danger, and provide the rest of the world with a factual indication of American strength in this field. The second is a security question. To what extent will the pouring of data on atomic weapons, and possibly on more fundamental questions of atomic energy, with Britain and

the more responsible North Atlantic allies contribute to a strengthening or weakening of the security of the United States? Finally, there is a political question. If a vastly expanded air and civil defence programme must be undertaken to protect the American "heartland," to what extent is the American public prepared to pay for it? Is the Republican Administration going to put a balanced budget ahead of radar pickets and deep shelters?

★

On the first question, although the debate is not yet concluded, there is an impressive body of opinion in favour of revealing more information. When he retired at the beginning of July, Mr Gordon Dean, the former Chairman of the Atomic Energy Commission, strongly advocated a relaxation of the secrecy surrounding American atomic strength. In the July issue of the quarterly magazine, *Foreign Affairs*, Dr Robert Oppenheimer, the great paragon of American atomic scientists, who is still an adviser to the government on nuclear policy, made a most impressive plea for greater candour in informing the American people about atomic weapons and developments, for sharing some information with the allies and for taking more vigorous measures to create a workable air defence system. This has been followed up by arguments along the same lines by Mr Paul Block of the *Toledo Blade*, the leading expert on the subject in journalism, and by Dr Ralph Lapp, who was the Atomic Energy Commission's Director of Research and Development. Dr Lapp argues that the majority of experts familiar with the subject want to see more information made available from the secret files of Project Lincoln and Project East River (a study of civil defence), including the approximate size of the American stockpile and an estimate of the Russian one; estimates of the strength of the long range Soviet Air Force and of the effectiveness of current American defence plans; and information on destructive effect of nuclear weapons.

Ranged against this view is, or appears to be, the new Chairman of the Atomic Energy Commission, Mr Lewis Strauss, whose advocacy of extreme secrecy led him to oppose, three years ago, the shipment of radio-active isotopes to a Norwegian military hospital, and whose views seem to have changed little since. He is joined by another of the four commissioners, Mr Eugene Zuckert, who said in a recent broadcast: "From the standpoint of national security we are giving the American people all the information they really need." Despite the absurdities of the

present security system, which sometimes leads to the withholding from one military planner of facts known to his next door neighbour, which would radically affect his calculations, the policy of "secrecy in depth," that it is better to tell too little lest too much be accidentally divulged, still has many advocates in the Administration, in Congress and in the nationalist section of the press.

However, the decisive vote will have to be cast by the President himself. He made it clear, in a press conference earlier in the summer, that he believed that the United States should make available to its allies and the American people more information both on its own atomic weapons and on its estimates of the Russian ones. It is considered likely that when he returns from Denver one of his first major speeches will deal with this subject.

The question of sharing some information on atomic weapons with Britain and the North Atlantic allies is one that has been on the agenda for a longer time, and is more difficult. While no one could prevent the President from divulging what are at present administrative secrets, discussions with another power about any aspect of atomic energy, in however confidential a manner, are explicitly prohibited by the Atomic Energy Act of 1946. Although General Bradley tirelessly advocated revision of this section of the Act during the last year of his chairmanship of the Joint Chiefs of Staff, and returned to the charge in his recent articles in the *Saturday Evening Post*, there has been no very great support for the idea either in Congress or the press, and there are many determined opponents of it. While Dr Oppenheimer has said that

it is unfortunate that so talented and hard pressed a country [as Britain], so close to us in history and tradition, should be doing all this separately,

it cannot honestly be reported that the development of Britain's atomic bomb or the announcement of its new strides forward in guided missiles have greatly affected the arguments of Messrs Strauss and Zuckert, and their supporters. The new Chiefs of Staff will have to throw their full weight into the balance if they are to achieve a relaxation of the Act during the coming session of Congress.

★

Finally, there is the even thornier question of the defence of the North American continent against an atomic air attack. This can no longer be considered merely a theoretical possibility, which can be left to some future Administration to deal with. The axiom on which American planning has proceeded until now is that the best defence is offence, and that a strong strategic Air Force capable of dropping the atom bomb upon the Russian industrial cities is the best investment in its own defence that the United States can make. The Air Defence Command, which has been in operation for only two and a half years, is still very much the lame sister when it comes to aircraft priorities. The Civil Defence Administration, despite the energetic protests of its head, Mr Val Peterson, was voted only \$38 million this year by Congress or about .01 per cent of the military budget. (The programme is, however, largely a state one.) Two separate studies—Project Lincoln and the Kelly report—are said to agree that some \$17 billion would be necessary to provide an adequate air defence system in two years, while a third, Project East River, is similarly reported as considering some \$7 billion necessary to create an adequate civil defence system against atomic attack.

There are two kinds of conflict which at present bedevil any decision. The Strategic Air Command, still convinced that the power to retaliate is the best deterrent of aggression, fights tooth and nail against any diversion of limited resources to Air Defence, or to the Army's guided missile programme. All the Services join forces to oppose the very large investment in a foolproof early warning system which alone could give a civil defence system which has not the resources to build deep shelters the three or six hour breathing space needed to evacuate the great cities and industrial concentrations.

The other tug-of-war is between Mr Dodge, the Director of the Budget, who, with the Republican leaders in Congress, is intent on cutting federal expenditure and the civil defence authorities who are now thoroughly aroused to the vulnerability of the North American continent. It is only the President who can end this struggle. He will have to decide whether to rely on his military judgment or to practise his new learnt lessons in financial orthodoxy. There is every indication that the former will triumph.

TV Goes to the Ball Game

FROM A SPECIAL CORRESPONDENT

"BASEBALL," said Mr Wrigley of chewing gum fame, "is too much of a sport to be a business and too much of a business to be a sport." However, the sporting side must have been uppermost in his mind when he bought a leading baseball team, the Chicago Cubs, for he explained that he was merely giving himself a hobby. He could hardly pretend that he was investing in a sound financial undertaking, since those who have studied the balance sheets of the baseball industry have described it as the worst-run big business enterprise in the world.

The Supreme Court also upheld the view that baseball is a sport rather than a business, and was therefore not subject to the anti-trust laws since it was not concerned with inter-state commerce. But this was thirty years ago, and since then the business aspects of baseball have been developed by the exploitation of the game's by-products. This is especially noticeable in connection with sales of wireless and television rights to commercial advertisers. Baseball games are now regularly broadcast across state boundaries and organised professional baseball is once again being challenged in the courts as a monopoly.

This season a leading club, the New York Yankees, has made \$600,000, far more than even its very heavy payroll, out of the sale of the broadcasting rights over its games to beer and cigar manufacturers. Yet neither the owners of this team, nor those of the other teams which sell such wireless and television rights, are sure that it is a practical proposition. They are uncertain whether the revenue from television makes up for the loss of gate money from the fans who might have paid to see the game in person if it had not been available free on their television screens at home. There is a hidden loss as well, the 30 cents which each average visitor to the ball park pays out for hot dogs, soft drinks, parking space and other extras. In recent years, in spite of broadcast revenue, half of the 16 teams in the two major leagues have been operating at a loss; these are usually the ones which have been having a poor season

since the fans are not much interested in paying to watch the teams at the bottom of the leagues.

Doubts about whether television represents a net gain have been encouraged by the fact that the Milwaukee Braves, the only major team that does not allow its games to be televised, is getting far better attendances than any of the others in the major leagues. But this is at least partly explained by the abounding enthusiasm of the fans in Milwaukee, stimulated by having a leading team resident in their city for the first time this year. The Braves permit wireless broadcasts, but no one suggests that these undermine attendances; in fact it is acknowledged that, by whetting listeners' appetites, wireless broadcasting has drawn many of them to the ball park. The fear is that television, by giving viewers so much more, is giving many of them all they want. It is significant that attendances at major league games have been steadily declining since the peak postwar period, in inverse ratio to the growth in the number of television sets.

The increase in the number of television sets has, of course, meant an equivalent increase in the value of television rights. Eight years ago, when there were only 1,000 television sets in Washington, the local team, the Senators, sold the season's television rights for \$10,000 and the radio rights for \$75,000. This year, with 350,000 television sets in the city, the combined rights were sold for \$265,000, with the wireless rights bringing less than one-third. Yet the Senators doubt whether this will be adequate to compensate for the possible drop in gate money.

★

The baseball industry has spent over \$50,000 in making surveys of the effect of television on attendance without as yet finding any satisfactory solution. The obvious answer would be to allow only the televising of games played away from home, when local fans would not be able to attend in large numbers in any case. But the high cost of lines to carry the programme back to the home television station makes this remedy impracticable; line charges even for home games come to more than \$500 a time. Sponsors would hardly carry the extra expense, since they are already complaining of the strain on their advertising budgets and are sharing their baseball television rights with other firms.

There is one way in which television is proving a direct drain on the profits of the major teams. When these experts can be seen on the television screens, fans do not bother to go to the local baseball games played between the 284 teams belonging to the 38 minor leagues. In the last three years attendance at such minor games has dropped by 25 million and the number of minor clubs by a third. Many of these clubs belong to the owners of major league teams, who thus find themselves losing on the minor swings much of the television money they have won on the major roundabouts.

Furthermore they have used the minor leagues as places to develop new players for the major teams comparatively cheaply, and this flow of talent is being cut off by the collapse of the minor teams. This shortage of new baseball players has put up their price, for the industry is now forced to compete furiously for school and college stars even though they have not been seasoned by professional experience in the minor leagues. High school students are being paid bonuses of \$80,000 for signing contracts and the rich Boston Red Sox have spent \$500,000 within the past year tying up the

men who are thought to be the best school and college players available. It is only since television came to baseball that such bonuses have been necessary. Altogether it is not surprising that the alarmed owners of big league clubs are demanding that the television cameras be turned out of the ball park.

American Notes

Mr Vinson's Successor

THE unexpected death of the Chief Justice, the highly respected and greatly liked Mr Vinson, who had experience in all three branches of the government, has cost the President a personal friend and counsellor and created a somewhat embarrassing vacancy. Less than a week earlier, when the popular Republican Governor of California, Mr Warren, announced that he would not run for a fourth term in 1954, an anonymous White House source confirmed the rumours that he would be offered the first vacancy on the Supreme Court. But that was before it was realised that the opening would come so soon—Mr Warren has more than a year to serve as Governor—or that it would involve the Chief Justice's post.

The assumption had been that Mr Warren, in due course, would take the place of Justice Frankfurter, who is past the permissible retiring age of 70, and might be persuaded to step down in order to allow Mr Eisenhower to begin to redress the political balance on the court. After twenty years of Democratic rule, only one of the nine Justices, Mr Burton, is a Republican. Mr Warren, a progressive who enjoys a substantial Democratic, as well as Republican, following in California, and who was one of Mr Eisenhower's rivals for the Republican nomination, would be certain of broad support. He has, however, had no experience on the bench. Neither has Mr Dewey, the Governor of New York, who won his legal spurs as a prosecuting attorney, and is the other leading Republican light whom Mr Eisenhower would like to honour. Mr Dewey, however, unlike Mr Warren, may well prefer not to be extinguished, politically, by elevation to the Supreme Court.

Lack of judicial experience is no bar to the appointment of an Associate Justice. Surprisingly, and perhaps rather disturbingly, most of the present Justices had no experience of the bench before their appointments. But the Chief Justice is another matter. Logically, the President might be expected to promote one of the eight Associate Justices, but Mr Burton, the sole Republican, is hardly qualified, and none of the Democratic Justices is so outstanding as to justify the President in over-riding party considerations.

This is not the only judicial appointment, though it is by far the most important, which will give the President thought. Prominent judges and lawyers are strenuously opposing the suggestion that a vacancy on the influential second circuit of the US Court of Appeals, which covers

New York, Connecticut, and Vermont, should go to a political candidate, ex-Senator Danaher, who campaigned for Mr Eisenhower last year. In their view, the appointment has been earned more legitimately by Connecticut's senior US District Judge, Mr Carroll Hincks, who has served for over twenty years.

Expansion Under Review

ACCORDING to the Secretary of Defence, the Air Force's decision to do without almost 1,000 aircraft, over half of them fighters, which it had previously planned to buy, is not the result of economy but of a reassessment of needs. The truce in Korea means that fewer fighter aircraft will have to be replaced than had been expected and some at least of the money saved, nearly \$1 billion, will be spent on more up-to-date models. The planned expansion of the Air Force, to 120 wings in 1954, will not, it is said, be affected, for the planes involved were not to have been delivered for two years or more; most of them had not even been ordered.

There is, however, no attempt to suggest that the change in stockpiling policy, announced on the same day, will not delay, perhaps for several years, a programme that was also supposed to be completed in 1954. Here economy is admittedly the main consideration, although it has been facilitated by the relaxation of international tension which has made it seem less urgent for the United States to build up reserves of strategic materials that come from overseas. Here, too, actual requirements have been altered by scientific and industrial developments. The growing importance of guided missiles and electronic equipment, for example, means that no slowing down is being considered in purchases of such alloying metals as nickel and cobalt, which are being given the highest priority.

There are now almost enough reserves of more than half the 78 items on the present stockpiling list and about four-fifths by value of the complete programme was either on hand or under contract at the end of June. Future buying of the remaining items is to be concentrated on those considered most vital to the national defence. Purchases of the others will only be made gradually, at least until the stockpile objectives have been reviewed, in order not to interfere with the needs of industry and to lessen the impact on the commodity markets of the eventual cessation of stockpile buying. Existing long-term contracts are to be completed but such future contracts as are made—there is only \$190 million available for them and for spot purchases this year—are not to run for more than one year, except where they are needed to induce producers to expand their capacity.

Another government programme which encouraged the expansion of capacity, for industrial as well as raw material output, is also being reviewed. This scheme, under which the cost of new facilities for all types of defence production could be amortised for tax purposes in five years instead of twenty or so, is much nearer to completion than is the stockpile. Details have not been published, but almost all the goals set for 233 industries, from copper mines and steel mills to electricity facilities and railway engines, are now said to have been met.

Hot Work for McCarthy

WHILE everyone else of consequence from the President downwards is away on holiday or mending political fences, Senator McCarthy has been working on in the record-breaking heat of Washington and New York and obliging news editors with a much-needed daily headline. Even the distraction of being himself investigated has been at least partially removed. The Department of Justice has apparently decided that the Senator cannot be indicted for fraud on the basis of the evidence published by a Senate sub-committee, so that it looks as if he will escape unscathed, unless the curiosity of the federal tax collectors has been sufficiently aroused by the details of his bank accounts included in the sub-committee's report.

Whatever his secret anxieties about his own position Mr McCarthy has not hesitated in the last few weeks to widen the circle of his powerful enemies or to challenge principles that are deeply held. His method of questioning the editor of the *New York Post*, Mr James Wechsler, led four fellow-editors to affirm their conviction that:

The noblest Senator that ever lived cannot interrogate the meanest editor that ever existed, under the auspices of government power, without putting in jeopardy the people's right to a free press.

Since one of the four was the managing editor of the *Washington Post*, the Senator demanded an inquiry into the unethical practices of that paper in attacking him in its leader columns.

His next challenge, an attack on the right of the government to keep its confidential files to itself, seems likely to involve the authority of the President. It arose when, after forcing the Government Printing Office to go back on a wartime security basis, he moved to New York to do battle with the Army. A security guard and two quartermaster clerks confessed their Communist sympathies to him. So he demanded to see the records of the loyalty panel which had cleared them. The Army, standing on its regulations, refused and, if Mr McCarthy persists, the President may have to give a ruling on an issue which has been fought out before between Congress and President, with no President yet having given way.

A new security scheme for all departments is at present being worked out by the Attorney General, who claims that it will stand up to congressional inspection provided he is given a year free from outside interference to put it into effect. Senator McCarthy seems unwilling to allow him this, perhaps because he thinks the Administration might otherwise discover without his assistance those undesirable civil servants who slipped through the net of the old loyalty programme.

Vanishing Gap

SINCE the beginning of the year, the excess of American commercial exports over imports has all but disappeared, although exports as a whole seem likely to reach a new peak in 1953. As the chart shows, when military aid shipments are excluded, the merchandise

accounts of the United States are virtually in balance. For the half year, with exports at \$6.1 billion and imports at \$5.6 billion, the export excess was a mere \$500 million, compared with over \$1.8 billion in the first six months of 1952. Indeed, on the ground that a certain amount of economic aid is included in the commercial exports, some experts believe that there was a slight import surplus. In

any event, it seems certain that the merchandise trade of the United States will be closer to a balance this year than it has been since the nineteen-thirties.

Many Americans appreciate that this is no cause for congratulation. Although imports are slightly higher, the gap has been closed chiefly by the choking off of exports, which in the six months ended in June were 14 per cent lower than they had been a year earlier. The chief victim, as Mr Benson, the Secretary of Agriculture, knows to his cost, is the farmer. In June, agricultural exports were 20 per cent lower than they had been in June, 1952. Wheat flour, with a 55 per cent drop, and cotton, with a 25 per cent one, suffered the dizziest declines. Wheat and cotton growers are, of course, much more dependent on exports than the economy as a whole, which sells only from 8 to 10 per cent of its product abroad. But in many industries, exports mean the difference between profit and loss. The practical demonstration to farmers and businessmen that the United States cannot hope to sell more abroad than it buys should strengthen the hands of those who are trying to turn the Administration and Congress in the direction of a more liberal trade policy.

Flooding Into School

WITH the Labour Day holiday over, the pupils are flocking back to America's schools and universities; by the end of this month it is estimated that nearly 37 million students, almost a quarter of the population, will be enrolled in the country's various educational establishments. The tide of war and postwar babies continues to swamp the elementary schools; it was supposed to reach its peak last year, but a record number of three million children are

going to school for the first time this autumn. After next year the rate of increase will begin to fall off, although the total number in the schools will probably go on rising until 1960, by which time it is expected to be 10 million more than at present. The flood of elementary school children is now beginning to seep into the secondary schools and before long they too will be struggling to keep their heads above water. Even the universities are sharing this year's unprecedented demand for education, with registrations going up for the first time since the exservicemen from the last world war completed their studies. Now the Korean exservicemen are coming to college, although so far not with the same enthusiasm as their predecessors, perhaps because this time the government's educational grants are not so generous.

In this situation local authorities, even though they spent a record \$7.5 billion on education last year, are finding it almost impossible to make any impression on the perennial shortage of classrooms and teachers. The Republican Administration in Washington has apparently no intention of helping them except in those areas where the problem has been accentuated by army camps, atomic energy installations or other increases in population for which the federal government is directly responsible. New classrooms are being built at the rate of 50,000 a year, but double that number are required in each of the next seven years to meet the increase in pupils and to replace the obsolete and insanitary buildings which were allowed to accumulate during the depression and war years.

The present shortage of schoolrooms is put at 345,000, quite apart from overcrowding in existing accommodation,

Estimates of enrolments in public and private institutions during coming academic year made by US Office of Education in September of each year.

and of teachers in elementary schools at 72,000. By 1960 another 425,000 schoolrooms will be needed and perhaps 200,000 more teachers; only 47,500 were qualified last year, while some 70,000 left the profession. Average salaries went up during the year from \$3,240 to \$3,400 but even so are far below the general wage level. This was publicised recently, when a teacher earning \$85 a week resigned to become a lorry driver for a brewery at \$137.50 a week. So far it is mainly the elementary schools that lack teachers, but as the flood of pupils reaches the secondary

schools, so will the shortage of teachers. And in these schools the present expedient of using unqualified or ill-qualified instructors will be even more unsatisfactory than it is in the elementary schools.

Fitting Insurance to the Car

AUTOMOBILE insurance companies, rather unexpectedly, are usually bitterly opposed to making third-party insurance compulsory. They point to Massachusetts, the only state which does, as a horrid example of the inflation of claims and deflation of rates which follow state intervention. Their most recent victory was over Governor Dewey, who failed to persuade the New York State Legislature last year that the 5 to 10 per cent of the state's drivers who do not carry insurance should be required to. Nevertheless automobile insurance rates are coming down, for the first time since the war, and after seven increases, under the stress of competition. The two major rating groups, the National Bureau of Casualty Underwriters and the Mutual Insurance Rating Bureau, have agreed to a new classification of automobiles and their drivers which will mean lower insurance costs for about half of all motorists.

The main aim of the scheme is to win back the best risks who have been finding it profitable to buy their insurance

from other companies, particularly from the Allstate Insurance Company, a subsidiary of Sears Roebuck, the great mail order house and second largest retailer in the country. By dividing motorists into 32 classifications, Allstate has been able to cut premiums for the safer drivers and to build itself into the largest single seller of automobile insurance.

The extension of this system, with most of the underwriters now prepared to recognise seven classifications instead of three, and fit the rate more precisely to the risk, seems likely, however, to reduce an accident rate which kills 35,000 Americans each year and injures 2,000,000 or more. Its most interesting feature is the penalty placed on those who drive to work; those who drive more than ten miles pay even more heavily. If this succeeds in persuading more owners to leave their automobiles at home during the rush-hours, and take to public transport, the number of accidents should fall. More carefully classified penalties are also now to be visited on the driver under 25, who not only is 60 per cent more likely to have an accident than his seniors, but also usually has a more serious smash. Those who live at home and only have limited use of the family car are let off relatively lightly, as are married couples under 25. But for the rest, the cost of insurance will be more than twice that for cars used by adults—\$310 a year. In many cases this may be more than the cars they drive cost. It may be, of course, that this will simply mean more uninsured cars on the road—but in New York, at least, insurance is compulsory for drivers under 21.

The World Overseas

Report on Europe

THIS year's survey prepared by the Organisation for European Economic Cooperation (OEEC) for the Council of Europe opens with a general review of economic conditions in western Europe. It describes first the encouraging tendency of production to rise after a long interval of stagnation in 1952; during the second quarter of the current year industrial production rose some 3 per cent compared with the same period for 1951 and 5 per cent compared with that of 1952. Holland showed the most notable improvement and western Germany continued its steady expansion.

There are also favourable developments to report in the foreign trade of the west European countries. The total foreign trade deficit fell from \$1,607 million in the first quarter of 1952 to \$1,195 million in the corresponding quarter of 1953—a decline due largely to better terms of trade. Of the fall of \$412 million, \$300 million was the result of lower import prices. As noted earlier by the

Economic Commission for Europe, the dollar gap, too, has shrunk. The trade deficit with the United States and Canada declined from \$1,713 million during the first five months of 1952 to \$597 million during the same period of 1953. However, the warning, implicit in the report's statistical tables (reproduced on the next page) is that the present balance is precarious; exports, apart from those to North America, are now less by volume than they were, and any upsurge in production will call for correspondingly bigger imports.

Perhaps the most interesting chapter of the report is the one that reviews the progress of trade liberalisation—the programme, launched in 1949 at British instigation, which aims at gradually eliminating quantitative restrictions on private trade between the member nations. By now all participants are pledged to free from such restrictions at least 75 per cent of their imports on private account. In fact, seven countries, which together account for about 50

per cent of intra-European trade, have done much better than this: Italy (99.7 per cent), Portugal (92.4 per cent), Holland (92.3 per cent), Sweden (91.4 per cent), Switzerland (91.5 per cent), Germany (90.1 per cent), Belgium-Luxembourg (87.2 per cent). The delinquents are Britain, although it recently increased its liberalisation from 45 per cent to 58.5 per cent and a group of countries including France, Turkey and Iceland whose degree of liberalisation, because of balance of payments troubles, is nil.

OEEC on this occasion has gone further and has tried to analyse the extent of liberalisation in the various commodity groups. The results are very much what one would expect. Among those countries which have applied liberalisation, raw materials are now almost entirely free of quantitative restrictions. The record is less impressive for manufactured goods. Here, the seven countries with the best all-round achievement, have liberalised from 88-99 per cent of their imports of manufactured products. For the United Kingdom, the figure is only 65 per cent.

Where food and agricultural products are concerned, the picture is disheartening. Not only is government trading still strongly entrenched in this sector, but also the degree of liberalisation on private account is little more than 60 per cent. The commodities bought by governments are frequently the major ones—cereals, sugar, oils and fats, butter and meat. Moreover, even in the absence of government trading, these commodities, together with potatoes, fresh fruits and vegetables, eggs and wine, are often subject to quantitative import restrictions. The reasons for this poor progress toward liberalisation in agricultural products are, of course, rooted in political and social considerations; but as OEEC points out, it is sometimes equally difficult politically for countries which are large exporters of agricultural products to liberalise their imports of industrial goods.

The report adds two cautionary notes. Some of the countries with the highest degree of liberalisation—Germany, for instance—have retained very high tariff barriers particularly against food products. Until these are scaled down, liberalisation is something of a misnomer. The second warning has to do with the still precarious balance of payments position of some of the member countries. Italy, for example, with the highest percentage of liberalisation in western Europe has lately become a debtor instead of a creditor within the European Payments Union (EPU). Plainly there are fears—voiced very strongly in the accompanying report of the EPU Managing Board—that any precipitate move toward convertibility might compel such countries as Italy to reverse their policy of liberalisation. These countries can only be asked to contemplate convertibility after some of their reluctant customers—for example, Britain and France—have taken bigger steps in the direction of complete liberalisation.

The Paradox of Pella

FROM OUR ROME CORRESPONDENT

THE Italian Prime Minister's "energetic" reaction over Trieste seems to have surprised those foreign observers who saw in Signor Pella the moderate, the Italian Cripps, the expert technician whose aim, as befitted a caretaker prime minister, was to drive through a batch of highly necessary fiscal and financial reforms and who had made

such conciliatory gestures to the Left as the abandonment of the previous administration's electoral law. In the same vein commentators stressed his independence of the Christian-Democrat party machine. Signor Pella, it was said, was *au-dessus de la mêlée*. Hence his success. The inflexible Signor De Gasperi, who hated the extreme Right and Left as much as they hated him, had paid for his identification with his party by the failure of his coalition at the polls and by the subsequent desertion of his erstwhile allies, in particular the Saragat Socialists. Signor Piccioni, too, backed and rigidly controlled by the party machine, failed to form a new government.

Such an analysis errs on one point only. It was not just Signor De Gasperi who was defeated on June 7th. It was his conception of government by the Centre without support from either extreme. But the coalition gained such a narrow majority that it could not hope to govern without buying the support or toleration of one or other extreme group. Signor Saragat's demand for an "opening to the Left," which would have involved the entry of the fellow-travelling Nenni Socialists into the government, not only weakened what was left of the Centre but ensured that the new government, which could not possibly agree to those terms, would look to the Right. What price Signor Pella must pay for support from that quarter remains to be seen. In the meantime, the mere fact that after an election in which the Left scored considerable successes, he should remain faithful, though with greater efficiency and diplomacy, to De Gasperi's domestic policy means that he has moved noticeably to the Right.

Bitterness Over Trieste

Much the same shift in the government's course has been registered in foreign affairs. It is simplifying the issue to suggest that Signor Pella is merely playing to the gallery. Whether we like it or not, Italian resentment at the humiliation of defeat in the last war is focused on Trieste. Since Marshal Tito's desertion from the Cominform, the Allies' inability to implement the 1948 Tripartite Declaration has enabled the neo-Fascists and the Communists to accuse the government of standing idly by while Italians are oppressed or driven out of the Zone B by the Yugoslav government. Italians are particularly bitter at a situation in which the Yugoslavs have for all practical purposes annexed that zone, while Zone A continues to be administered by the Anglo-Americans, albeit with the assistance of Italian personnel; and they attribute Tito's increasing intransigence to the constant improvement of his relations with the West. The Communists seize on the opportunity to demonstrate that the Allies have sold Italy down the river, while the Right hankers after a march on Zone A, which would clearly come up against the Anglo-American occupation troops. Even the moderate *Corriere de la Sera* has contained bitter words about the guns sent by America to Tito for use against Italy.

Placed in this delicate position, Signor Pella had, broadly speaking, the choice between two policies. He could indulge in martial gestures on the lines of the Right wing parties' policy and agitate for Italian control of Zone A or he could place his case before international public opinion with a demand for a plebiscite in both zones. The latter policy, which is commanding increasing support, has been backed by the Saragat Socialists and the moderate parties in Trieste itself. But it would not be acceptable to Marshal Tito. The spectacular moves of troops and warships to the

It's no fantasy!

higher mileage

is a REALITY!

Thousands of motorists throughout the country have proved it beyond all doubt—you get far higher mileage from the AVON H.M. Thus day-to-day motoring triumphantly confirms years of Avon research—on unique testing machines and over 1½ million miles of roads. Lower the cost of your motoring. Fit AVON H.M. all round and enjoy the real economy of this remarkable higher mileage tyre.

Send for illustrated folder "The Story Behind the Greatest Development in Car Tyre Construction", free on request to The Avon India Rubber Co. Ltd., Melksham, Wilts.

AVON H.M.

HIGHER MILEAGE Avon's thicker and deeper tread gives many thousands of extra miles.

GREATER GRIP The wider Avon tread gives more road contact, extra bite.

BETTER BRAKING Centre traction bars and multiple slots give extra stopping power.

EXTRA SAFETY Immensely strong casing and buttressed shoulders make this the safest tyre ever built.

NEW BOAC TOURIST SERVICES

STARTING OCTOBER TO

CARIBBEAN IRAQ PERSIAN GULF

PAKISTAN INDIA CEYLON

Now more people can afford to get there sooner by air

With the extension of B.O.A.C. Tourist services further and further across the world, more people can afford to fly and save days, sometimes even weeks of valuable travelling time!

These new services are additional to B.O.A.C. Tourist services at substantially lower fares to:

UNITED STATES • CANADA • MALAYA
HONG KONG • EAST AFRICA • MIDDLE EAST

Fully pressurized 4-engined airliners are operated on all Tourist services and the same high B.O.A.C. standards prevail. Meals are complimentary—no tips or extras.

Also commencing in October!

SOUTH AFRICA

Tourist services operated by S.A.A. in association with B.O.A.C.

WEST AFRICA

Regular B.O.A.C. Tourist services to Kano, Lagos and Accra.

Book where you see this sign or at B.O.A.C., Airways Terminal, Victoria, S.W.1 (VIC 2323), 75 Regent St., W.1 (MAY 6611) or at offices in Glasgow, Manchester, Birmingham and Liverpool.

A NEW SOURCE OF OXYGEN

*A personal message from the Chairman of
The Butterley Company Limited*

The importance of oxygen as a factor in the smooth running of many works is fully recognised. Indeed it is as vital as the power supply, and any interruption of its availability might well cause a costly breakdown of production. Also, it is an important 'on-cost', and no doubt you have often been surprised when reviewing your consumption figure.

You may feel, as many others are feeling, that some substantial advantages should accrue if your works produced its own requirements, provided this could be done by practical and economical means. It gives me pleasure, therefore, to inform you that my company is now manufacturing oxygen/nitrogen generators, which have long since passed the experimental stages, and, in wide and everyday use, are demonstrating their economical and reliable performance.

This space does not permit me to touch upon the distinctive technical features of this up-to-date equipment, which is available in models and sizes that cover every industrial requirement, but a request made to our Oxygen division will secure for you a copy of our descriptive book **BUTTERLEY HIGH PURITY OXYGENERATORS**. We will welcome you at our stand at the Engineering, Marine and Welding Exhibition, where technicians will be in attendance to explain the characteristics of the small model which will be on display.

Brown and Polson starch products in drug manufacture

AMONG the most valuable weapons in the armoury of modern medicine are the anti-biotic drugs. An anti-biotic, broadly speaking, is a substance that one micro-organism produces to the detriment of other micro-organisms. Penicillin, the most important of them at present, is produced by the mould *Penicillium notatum* during its growth in a liquid medium. It is particularly effective against 'Staphylococci' bacteria, which, as it happens, resist treatment by sulphonamide drugs.

STARCH PRODUCTS AS MEDIA FOR CULTURES

PENICILLIN is prepared commercially by extraction from *Penicillium* cultures in large tanks of corn steep liquor—the liquid that remains when maize has been steeped in water in preparation for the wet milling process used in starch manufacture. Another valuable anti-biotic, streptomycin, is also prepared commercially by extraction from a culture. The organism that produces it is *Actinomyces griseus*, and the medium for the commercial cultures is a 'broth', the main ingredient of which is a starch product called dextrose.

A CONSULTATIVE SERVICE

The Brown & Polson group of companies manufacture 200,000 tons of starch products per year — 400 different products, bought by more than 80 different industries. Their wide experience is freely available to all who are interested in industrial uses for starch products.

The Industrial Division of

Brown & Polson

ontier areas are, however, as the independent right wing 'empo has icily pointed out, meaningless in military terms, particularly since Italy's forces are almost entirely dependent on American supplies.

Signor Pella, in a word, has drifted into a policy of countering chauvinism by an appeal to force. The acquittal by a Roman court of the young Fascists who set fire to the British Council offices here during the demonstrations over Trieste last March is a sign of the present temper of the country. Foreign experts would do well to prepare themselves for further shocks. Good intentions on the part of the present government are not enough. And its term of office, based on a working understanding with the Monarchists and the neo-Fascists, is likely to go far beyond the caretaker stage.

Soviet Economy After Stalin—II

Producing for the Consumer

AT first glance it would appear that all the forces of the Soviet economy are now harnessed to carry out rapidly the task of improving the lot of the consumer. This was the pledge which Stalin's successors gave to the Russian public and since Malenkov's recent speech before the Supreme Soviet the emphasis in Soviet propaganda on consumer goods has been strengthened still further. All Soviet papers are full of reports of new textile mills or shoe factories, of gadgets for the housewife, of shortcomings and of drives to improve the quality of goods. Even the *Literaturnaya Gazeta* has introduced a new section, a "goods' review" in addition to its books' review. As a symbol of the new era the arcades of the Upper Row facing the Kremlin will be reconverted into a giant universal store and become once again Moscow's shopping centre. During the quarter of a century of Stalinist planning, when the consumer was the neglected man, these buildings were used as government offices.

On closer scrutiny, however, there are no signs, as yet, of a speeding up of light industrial production beyond the targets originally set before Stalin's death. Nearly two-thirds of Soviet production of cotton textiles is still concentrated in Moscow and Ivanovo-Voznessensk and the mills now mentioned as under construction or put into action have all been scheduled for completion in the current Plan and in some cases in the previous one. The same applies to other factories advertised in the present campaign. Moreover, the targets outlined by Mr Malenkov for this year both for light industry and for the output of foodstuffs fit well into the planned pattern and give no indication of a sudden jump.

This should obviously not be taken as a sign of stagnation. The plan itself foresaw a comparatively rapid increase in light and food industries. Already the average Russian has a higher standard of life than before the war and by 1955, taking into account the rise in population, he should reach the level promised for 1942. Indeed, there is a certain resemblance between the third and the current plan. Both were drawn up after a long period of construction or reconstruction, thus giving the planners an opportunity to grant a bonus to the population. Last time the hopes of the Russian consumers were shattered by the German invasion.

Now they have every chance of being fulfilled, and this by itself would be quite an achievement.

Yet, this is only one side of the picture. The Soviet output of consumer goods does not correspond to the capacity of a country with a powerful engineering industry based on a steel production of 38 million tons. The light industry lags far behind basic production and this discrepancy was perpetuated in the current plan. Engineering production was to be doubled during the five years (1951-1955), while real wages were to be increased by only one-third. In this way the Soviet Union is quickly closing the gap with the industrialised west in economic power, but only slowly in standards of life. Malenkov has promised to quicken progress in this direction, but there are no indications as yet that his words will be backed by deeds.

Possibly the pace will soon be speeded up. With the Soviet Union's present industrial capacity the burden on the country's economy would be incomparably less than, say, in the thirties. Besides, the internal political advantages could outweigh the immediate strategic drawbacks of such a shift. New investments must take time to mature and Malenkov did leave himself an escape clause by stating several times that the fruit would be gathered in "two or three years' time." In the meantime, the Soviet Union may well draw on its stocks and imports to satisfy consumer demand. The Plan itself envisaged a quicker increase in the retail sales than in the production of many consumer goods. This discrepancy has now been widened. The cut in prices and the reduction of the state loan have increased the pur-

SOVIET OUTPUT OF CONSUMER GOODS

	Unit	1940	1950	1952	1953 Plan	1955 Plan
Cotton fabrics.....	mn. metres	3,885	3,815	4,935	5,300	6,140
Woolen fabrics.....	"	120	167	...	200	255
Shoes.....	mn. pairs	205	205	...	241	318
Sugar.....	'000 tons	2,150	2,515	3,055	3,600	4,475
Butter.....	"	207	325	360	400	560
Vegetable oils.....	"	724	775	845	1,077	1,370
Meat.....	"	1,184	1,267	1,632	1,865	2,400

chasing power of the population and resulted in a rise in consumption without a corresponding rise in production. The gap was probably filled by running down stocks. The planners may also be looking for some additional supplies not only to the satellites but beyond the curtain as well. In the long run, however, the standard of life must depend on home production and a big increase will require not only a shift from heavy to light industry, but also the success of the ambitious agricultural plans.

Campaign Against Shoddy Goods

If the new regime is to fulfil its pledges it will have to take care of the quality and variety of goods as well as of the actual volume of production. The present campaign against shoddy goods is not merely a propaganda trick. It springs from deeply felt needs of the Russian people. In the early thirties you could still find in the Soviet Union trousers with legs which did not match or knives not sharp enough to cut bread. After the ravages of the last war the bare-footed, scantily dressed Soviet citizen was grateful for any pair of shoes, or any suit. Now, however, shoddy goods meet consumer resistance. A symptom of this new mood were the first-ever sales held recently on a nationwide scale to get rid of outmoded and sub-standard goods. The managers of light industry and heads of Soviet retail

shops are faced with an entirely new phenomenon—a discriminating customer.

This does not mean in the least that consumer demand has been saturated. The hunger for consumer goods persists, but it is no longer limited exclusively to the bare necessities of life. Large scale production of light industry will have to become more diversified. The biggest demand is probably for furniture and, in view of the acute shortage of housing, for single room suites. The Soviet citizens have begun to clamour for certain comforts—for better pans and crockery, for smarter suits and dresses, for irons and watches, bicycles and gramophones. Something has already been done about it. Thus, for example, watches were an extraordinary luxury in prewar times and *davay chassy* (give your watch) became part of the vocabulary of any country where the Red Army set foot. Now, it is claimed, 26 million clocks and watches have been produced during the last two and a half years. But the demand for such goods in Russia is insatiable. Television sets and cars are still luxury goods for the lucky few; vacuum cleaners and sewing machines can only be hired in privileged towns like Kharkov; and there is already a genuine demand for, say, bicycles and gramophones.

L'appétit vient en mangeant and the appetite of Soviet consumers has now been whetted. Pressure from below may force the planners to go beyond their original intentions. The economy of a country can be measured by two yardsticks: its industrial power and the standard of life of those manning the industrial machine. Russia has shown that it can produce tanks, jets and even hydrogen bombs. It has still to prove its worth as a supplier of consumer goods. A socialist economy by Marxist standards should be based on plenty. The Soviet economy has been built on the utmost scarcity of consumer goods and yet by a curious trick of Stalinist dogma it was claimed that Russia had reached "socialism" and was on its way to "communism." Now an eminent Soviet economist has declared quite plainly that all the measures taken in 1953 are but a first step towards the improvement of the consumer's lot. Previously each minor concession was greeted as an epoch-making revolution. Such sober statements may encourage the Russians to think that something will really be done about improving their standard of life.

(To be Continued)

Storm and Calm in Brazil

DRAMATIC events, barely noticed in the outside world, have taken place in Brazil in the last few weeks. These happenings shed a good deal of light on the problems with which the Brazilian administration has to grapple at the same time as it tries to revive the country's foreign trade and to restore its credit.

President Getulio Vargas is now halfway through the four-year term for which he was elected in 1951. The wave of popular enthusiasm which then swept him back into power has subsided. Soaring prices, recurring shortages of food, and the failure to market Brazil's important export crop, cotton, have disillusioned many formerly devoted *Getulistas*. Moreover, election campaigns begin astonishingly early in Brazil, as elsewhere in Latin America, and would-be future presidents are already dissociating

themselves from the present government, in order to attack it more freely. Thus, in recent weeks Senhor Adhemar de Barros, ex-governor of Sao Paulo, who helped Dr Vargas into office by swinging his Social-Progressive Party behind him, has been launching violent criticisms at the President; and there have been stirrings of unrest even within Dr Vargas's own Labour Party. Brazil is still plagued by the evils of "personalised" politics, and party leaders who can offer no real alternatives to the present government's policies can all too easily gain a following merely by offering a change of faces.

It is against this background that the astute but now elderly President has pursued an intricate course, balancing rival groups against one another to make up for the lack of any reliable parliamentary majority. The impression has gained ground, however, that the government has no clear policy at all. In June, therefore, Dr Vargas sought to recapture public confidence by making a clean sweep of his cabinet. Several of the new ministers had served in his prewar and wartime governments; most of them had some reputation for vigour, but inevitably they also had old enemies.

A particularly controversial figure was the new Labour Minister, Senhor Joao Goulart, who has been closely associated with labour organisations and whose critics suspect him of *Peronista* tendencies. In July one of General Perón's chief supporters, Dr Hector Campora, visited Brazil, and it was widely alleged that he had conferred at length with Senhor Goulart with a view to the formation of a new Latin American labour front on *Peronista* lines. Some Rio newspapers enlarged this charge into an accusation that the government, under the Labour Minister's inspiration and with the backing of certain military figures, was "marching towards a trade union dictatorship." As the bubble swelled, the President himself was publicly accused of planning to overthrow the constitution and institute a form of syndicalism. In the first week of August, these reports were vigorously denied by military and governmental spokesmen, including Senhor Goulart himself, and the denials were capped by a presidential communiqué issued after a cabinet meeting.

Scandal in the Press

Little more has been heard of these allegations of an imminent *coup d'état* from above, but meanwhile the government had come under fire from another quarter. In June, a congressional committee had been ordered to investigate the affairs of the newspaper, *Ultima Hora*, and its associated group of publications and radio stations. Committee members later revealed that this group had incurred debts totalling some 270 million cruzeiros, and accused the Bank of Brazil of recklessly financing with public funds an undertaking variously described as a mouthpiece for the government and an agency of Communism. Senhor Samuel Wainer, the director of the *Ultima Hora* group, was imprisoned for refusing to testify to the committee, then released; but a few days later the Supreme Court annulled the *habeas corpus* granted to him. Eleven leading newspapers issued a joint statement, warning the public that an attempt was being made to prevent full reporting of the investigation into "specially privileged newspapers founded to destroy the free press." Finally, opposition deputies in Congress extended the attack to involve the President, who was charged with implication in the strange activities of

the Bank of Brazil. The allegations against Dr Vargas were at once denied, but the government appears to have accepted the truth of the charges made against the bank, of which a new president has now been appointed.

To an outside observer, it might well seem that simultaneous involvement in two such affairs as these would be a deadly blow to a government already labouring under severe economic difficulties and lacking a secure political foundation. But political storms often pass away as quickly as they blow up in Brazil, a country which is too vast to be easily swept by a single swift emotion. Despite all the government's troubles, President Vargas's name is still one to conjure with; and the very fact that such outspoken criticism of the administration as has recently been heard is possible in Brazil provides a safety-valve for dissatisfaction. Other Latin American countries which lack this safety-valve might learn much from the Brazilian example.

Verdicts on Adenauer's Victory

THE first echoes of Dr Adenauer's resounding victory have already sounded throughout the world. The Americans' delight over the triumph of their favourite and the Russians' sorrow at the complete failure of their tactics were both to be expected. Between these two extreme poles range various astonished European comments descending from enthusiasm, through cautious optimism to misgivings about the use to which Germany will put its newly won strength and prestige. One thing the German elections have accomplished already: they have put new life into the European Defence Community treaty, which many thought would soon be thrown into the waste-paper basket.

The Russians had committed themselves too much during the election campaign to make back-peddalling easy now. Soviet and satellite commentators have therefore tried to minimise the Christian Democratic victory by tales of intimidation "ranging from blackmail to open terror." In spite of this, Soviet correspondents argued that more than "eight million socialist and communist votes" (sic) were cast against Adenauer. The big guns of *Pravda* and *Izvestia* have not yet exploded, but it is significant that *Pravda's* commentator stressed that "as a result of the election the international situation has deteriorated." He also judged it worth while to repeat almost literally the warning from the Tass pre-election communiqué that after the signature of the Bonn and Paris agreements German unification would become impossible.

The eastern chorus of wailing and imprecations is of course joined by the western Communist press. *L'Humanité* on its first page carries an article on the victory of the *revenchards*. The tone of the remaining Western press depends upon the political allegiance of the papers and on their attitude to European unity. Thus the whole Dutch press welcomes the result and the Socialist papers console themselves for the defeat of their German fellows with the thought that this is a triumph for "the idea of European integration." The Italian Centre is also happy about the result. The former premier, Signor De Gasperi, cabled to his more fortunate Christian Democratic colleague that his success confirmed hopes for a new and united demo-

cratic Europe. An Italian journalist put it in more flowery language: "The opponents of European unity, who had roused larvae of hope and phantasms of fear, have been crushed by the electoral victory of Adenauer."

In France the news from Bonn has been received with mixed feelings. True, M. Robert Schuman of European fame and that other prophet of unity, M. Henri Teitgen, see in it a triumph for the "myth of Europe." Yet most French politicians, even those in favour of EDC, would share the misgivings of M. Bonnebous that instead of integrating Germany into Europe there is a risk of an attempt being made "to build Europe around Germany." At the back of all comments is the contrast between Dr Adenauer's strengthened position and the shakiness of French cabinets, between German economic development and the French crisis, between the imminent prospect of a German army and the Indo-Chinese drain on French resources. It is also feared that the United States will now make Germany the centre of its European policy. *Le Monde* pertinently observes that "of the three champions of European integration, to the extent of joining together the armed forces, the German champion alone still stands, more solid than ever."

Each group draws from the new situation its own conclusions. The Gaullists conclude that if France enters EDC without strengthening its own regime the gamble is doomed in advance. The Socialists give a warning lest the new Germany should become "the arbiter of a precarious international situation." Comfort is found in the fact that German extremists have been crushed and in the hope that from his strengthened position Dr Adenauer will be able to be more conciliatory over the Saar. The undertone of gloom in most French comment is due to the realisation that the centre of gravity on the continent this side of the curtain is shifting from Paris to Bonn. This has been apparent for some time, but the contrast between Dr Adenauer's triumph and M. Laniel's predicaments has brought it strongly home. The Frenchmen may possibly be dragged into EDC as a "lesser evil" solution, but they cannot now be expected to enter it with great enthusiasm.

Change of Plan in Rumania

BY A CORRESPONDENT

RUMANIA has now followed the example of Hungary in introducing a "new look" economic policy. In a long speech on August 23rd, the 9th anniversary of Rumania's liberation by the Red Army, Gheorghiu-Dej, the Rumanian Prime Minister, confessed that the development of heavy industry had been "excessively accelerated," that agriculture and the production of consumer goods had been neglected, and that immediate steps would have to be taken to put the Rumanian economy on an even keel and to improve the standard of living of the workers.

The Rumanian Prime Minister would hardly have spoken in those terms without the approval of Moscow. But reports from Rumania suggest that popular discontent had reached such alarming proportions that sooner or later the Communist regime would in any case have been forced to make some placatory gestures. The purge of Vasile Luca, Ana Pauker and Teohari Georgescu last year, was, at

least in part, an attempt to pin the blame for the country's economic troubles on some illustrious scapegoats. But this attempt, unaccompanied as it was by any change in basic economic policy, clearly did not help matters. The peasant, who had been deprived of his last savings in the currency reform of January, 1952, was unimpressed; he went on with his passive resistance and the townspeople went short of food. Workers' delegations again and again went to Bucharest to protest against their poor living standards and the constant pressure to make them work harder for less pay.

Sometimes their discontent has flared up into open violence, and the government has been forced to give way. The demonstration towards the end of last year by workers from the Grivitza Rosie railway workshops outside the Ministry of Transport was not an isolated incident; on that occasion it appears that the Minister was only saved from the anger of the workers by the intervention of the militia. The peasants too have resorted to open revolt. Last year there were reports from Moldavia of the burning of grain destined for the Soviet Union and in Transylvania the government's emissaries were said to have been taken prisoner by the enraged peasants. This year there have again been reports of peasants breaking into the government granaries.

Struggles Within the Party

It is perhaps surprising that the regime should have allowed this dangerous situation to continue unchecked for so long. Indeed, it appears that Gheorghiu-Dej himself would not have been averse to a more conciliatory policy. In an article published last January in Moscow in *Kommunist*, he advocated a more liberal policy towards the peasants; and on more than one occasion he has condemned the excesses of the "obscurantist" purges which have evidently played havoc with the administration of many industries. But Gheorghiu-Dej has not been master in his own house. The problem of the "unprincipled relations within the Party leadership" (i.e., the faction struggles) which Ana Pauker was accused of having "cultivated," was not settled

British Wholesale Prices

Many requests have been received for a continuation of the record of British Wholesale Prices which appeared for many years in *The Economist* and thereafter in the *Records and Statistics Supplement*. Accordingly it has been decided to provide a similar service, with a somewhat extended list of commodities, on a subscription basis. The list will be issued every four weeks and will give prices for some 160 commodities for each week. Subscription £2 post free at home or abroad (air mail additional).

Subscriptions and enquiries (marked "Prices") should be sent to:

by her removal from the scene. A strong faction within the government led by General Bodnaras, the Minister of Defence, and Constantin Parvulescu, who is in charge of the Party's security police, have made no secret of their belief in forced collectivisation and extreme "revolutionary vigilance." These two, however, appear to have been Beria's protégés; since his downfall their ability to make trouble must have been reduced and Gheorghiu-Dej—with, of course, Moscow's approval—must have found himself in a much better position to strike out on a new tack.

In his speech on August 23rd the Rumanian Prime Minister said bluntly that in the sphere of agriculture the main preoccupation of the Party and the government must be "the problem of bread." During the period 1953-5, agriculture is to have twice as much money invested in it as it had during the period 1950-52. Gheorghiu-Dej admitted that private farmers, who provide the state with 75 per cent of the total quantity of saleable cereals, had not received "due attention." In future medium and small farmers—but not the kulaks—are to get cheap credits for the purchase of livestock, tools and fertilisers and are to be helped with tractors and other machinery belonging to the State. But at the same time Gheorghiu-Dej was careful to destroy any possible illusions that the policy of collectivisation was to be abandoned. On the contrary, he said that "relentless attention" must be paid not only to the consolidation of existing collectives, but also to the organisation of new ones. The policy of collectivisation is not just to mark time; it is to march forward. The Communists evidently still nourish the hope that the collectives can be made so successful that the peasants will be attracted into them of their own free will.

Promises to the Workers

The government's more conciliatory attitude towards the peasants is accompanied by a series of promises to meet the workers' complaints. They are to get more foodstuffs, more shoes, more clothes, more pots and pans; by the end of 1955 50,000 families are to be provided with new homes; school fees and charges for public utility services are to be reduced; most wages are to be increased by the end of this year. The increase in consumer goods is to be achieved by cutting down investments in heavy industry and by pumping more money into the light industries and agriculture; the proportion of investment going to the consumer goods industries and to agriculture by the end of 1955 will be twice as much as in 1953.

How much production in heavy industry will have to be cut back if the new policy is seriously carried out is not clear. The reported decision to stop work on the Danube-Black Sea Canal must release a good deal of forced labour and material resources for employment elsewhere in industry—either light or heavy. Gheorghiu-Dej, indeed, claimed that the production of crude oil, which by the end of this year is to rise to 9,300,000 tons, would by 1955 be even higher than the plan target—11 million instead of 10 million tons. But in some other sectors of heavy industry, such as coal and crude steel, he seemed to be cautiously lowering the targets although he did not admit as much. In fact it is probable that Rumania's new economic policy has not yet been translated into concrete plans. Whether the country's rulers—and the Kremlin—seriously intend to do so, it is still too early to say.

COPPER CLAD

To secure a gas tight seal at the point where the lead wires pass through the glass envelope of Royal "Ediswan" Lamps a special wire known as Copper-Clad is used. This seal must remain gas tight over the range of temperature from cold to the highest value which the lamp attains when alight.

Copper Clad, made by a very specialised technique, consists of two metals hermetically bonded in such proportions that they will expand and contract at the same rate as the glass. This property together with the specially prepared surface, ensures that a perfect metal-to-glass seal is made.

* This is but one example of the intricate operations in the manufacture of Royal "Ediswan" Lamps, calling for the highest degree of technical skill and the utmost care and precision. Nothing is left to chance—only the finest materials are used and there is strict control at each stage of manufacture.

THE BUSINESS WORLD

Britain's Démarche at Gatt

THE meeting of the contracting parties to the General Agreement on Tariffs and Trade that opens in Geneva on Thursday will not be accompanied by another round of multilateral tariff negotiations; but it is likely to have a significant, if delayed, effect on the level of world tariffs. The accession of Japan, even on the provisional basis now contemplated, will itself make this almost inevitable. Japan is one of the world's principal trading nations; and as more countries grant it the privileges of Gatt membership and hammer out specific tariff bargains with it, the most-favoured nation clause in Gatt will make it necessary for them to extend the fruits—sweet or sour—of such bargains to other countries. Apart from this, the delegates at Geneva are to discuss arrangements for the extension beyond the end of 1953 of the tariff rates that have been secured as a result of the three earlier rounds of multilateral negotiations held under Gatt auspices. In a world in which—temporarily at least—import licensing seems to be loosening, the importance of this extension should not be underrated.

For Britain, the meeting will have quite special significance. If it secures permission from Gatt, Britain apparently intends to raise certain agricultural tariffs—perhaps in the next budget. That is the plain implication of the request that Britain has decided to make for waiver of the rule that now prevents it from raising duties on items not at present in the British schedule (i.e. on which Britain has made no commitments in negotiations with other Gatt members), but in which there is now duty-free entry for imports from the Commonwealth. Britain wants, in other words, a legalistic interpretation of Gatt that would allow it to raise tariffs against certain foreign goods, to continue duty-free entry for those same goods from Common-

wealth sources, and yet not to be regarded as running foul of the Gatt rule that forbids the widening of margins of existing tariff preferences.

A forewarning of this initiative—and an indication that Britain itself originally wanted to go rather further—was to be found in the communique issued after the Commonwealth Economic Conference of last December. That communique revealed that the British Government had originally suggested that all Commonwealth countries might join in seeking full release from the "no new preference" rule of Gatt, but that the majority of the overseas dominions had disagreed; they felt that any such approach to Gatt would ill accord with the basic objectives of the conference, which was supposed to be discussing measures for greater freedom in world trade. It can be said that the United Kingdom will abide by this majority decision. No attempt will be made by the British delegation at Geneva to revoke the basic "no new preference" rule—though some such buccaneering attempt does seem to be implied in the Australian Government's recent call for the general reconsideration of Gatt some time next year. The communique from the Commonwealth conference went on to state, however, that all the dominions had agreed to support Britain in a limited *démarche* to Gatt that might "enable the United Kingdom, consistently with the basic provisions of Gatt, to continue the duty-free entry for Commonwealth goods notwithstanding any increases that might from time to time become necessary in duties designed to protect domestic industry and agriculture in the United Kingdom." It is this *démarche* that is now to be made at Geneva.

Under present British tariff legislation, largely as a result of the pre-war Ottawa Agreement, a wide range of Commonwealth goods is guaranteed duty-free entry; it would be impossible for the British Government to

introduce amending legislation to revoke this duty-free entry without running into massive political difficulties within the Conservative party. The odd result of this, and of the "no new preference rule," is that Britain is unable to raise many tariffs that it never even considered "binding" with Gatt. It seems to be alone in suffering from this disability. Certainly the rest of the Commonwealth does not suffer from it. Many of the tariff schedules of the dominions grew up as a result of direct and deliberate attempts to secure protection for their secondary industries against imports from Britain; as recent and even current events in Australia show, there is no great political compunction in most overseas dominions about raising tariffs against Britain still further. And, of course, very few non-Commonwealth countries have preferential arrangements that in any way hamper their freedom to increase rates of duty on items that have not been specifically "bound" in bargains with other contracting parties of Gatt.

★

It is to remedy this somewhat invidious position that the British Government is making its sally at Geneva. Its immediate intention is apparently to give permanent protection to certain sections of British agriculture by imposing or increasing tariffs on a wide range of vegetables and fruit. At present that protection is given by the most arbitrary of all methods—by quotas and outright seasonal prohibitions that can, and at times do, come into operation with extremely abrupt severity; and the Government feels that it is actually following a liberal policy in wishing to switch from this harsh procedure to the less arbitrary method of tariff protection. It is therefore the liberals, not the protectionists, at Whitehall that have been most annoyed to find that many vegetables and fruit qualify for duty-free entry from the Commonwealth; in some cases this applies to vegetables and fruit that are not grown in—or at any rate not exported from—the Commonwealth at all.

What support is Britain likely to muster for its request to be freed from rigid legalistic interpretation of the "no new preference" rule in this particular instance of goods on the Commonwealth's duty-free list? It has already been promised support from the dominions and it may also secure support from the United States, which has a rather tender conscience at the moment in any discussions about the protection of agricultural products. To America and to some countries that often vote with it, Britain may plead that all it wants to do is to increase import duties on goods in which there is little or no Commonwealth trade with the United Kingdom, and that the additional duties will cause no substantial diversion of trade from foreign to Commonwealth countries. This line of reasoning may secure wide support, but it is not going to sound very convincing to the countries that are destined to be the main targets of the higher duties—especially the Netherlands, Denmark, Italy and France. Britain will try to comfort these countries by explaining that the

hated quotas and embargoes will be supplanted by the more tractable and foreseeable technique of import duties; and it may also promise them that they will be given due warning of the imposition of higher tariffs—together with the right of appeal to Gatt if they deem their interests to be jeopardised. If the British delegates are to make any headway here, however, they will have to use very honeyed words indeed.

★

To British eyes, there seems to be a great deal of reasonable logic in the Government's case. As matters now stand, the United Kingdom is the solitary contracting party of Gatt that is prevented from raising tariffs on a large number of items that it has not bound in bargains with other countries; and, among the bound items, it is often the only one to be deprived—by this bogey of duty-free Commonwealth entry—of the right to use Gatt's famous escape clause (by which members can go back on their obligations in respect of tariff, though not of preference, levels in order to protect domestic industries that are suffering genuine injury from imports). But Britain gains so much from Gatt—and especially from the reductions in the American tariff that have been negotiated under it—that it should tread very warily in its *démarche*. It should make it crystal clear that its initiative is intended to be consistent with the basic principles of the General Agreement, and that it desires appropriate provision to be made for the lodging of complaints by any injured parties if in fact it should unintentionally trample on those principles. It should go out of its way to proclaim that this is not the thin edge of the wedge of permanent, heavy and indiscriminate protection for British agriculture regardless of its comparative cost structure. The Government should come right into the open about the particular increases in duties it has in mind. Meanwhile, public opinion in Britain should follow the proceedings in Geneva with greater interest and vigilance than is usually devoted to these somewhat dull, arduous and not readily understandable gatherings. For the domestic economic policy of Britain this next meeting of the contracting parties will have a significance and importance that none of its predecessors has been able to claim.

QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

A Yardstick for Investors

AN analyst of the stock markets can only be as good as his tools. One of his familiar and well-tryed tools—the Actuaries' Monthly Investment Index with a base date of December 31, 1938—has just been discontinued. In its place the Institute of Actuaries has compiled a new and ambitious monthly series of index numbers of security prices and yields from a new base date, December 31, 1950; to provide perspective and continuity, the new indices have been calculated back to December, 1945, but only for half-yearly dates. The new index will appear monthly in *The Economist* in place of the earlier one—the first selection of indices appears on page 729 this week—since it is by far the best yardstick available for measuring general movements in British stock markets. It is clearly desirable, however, to subject this new instrument to a critical scrutiny and to explain in some detail exactly what it does—and does not—measure.

The sample of securities included in the index contains five British Government and home corporation stocks, 22 debenture stocks, 53 preference stocks and

ductive" or "distributive" equity indices) so that the importance—and, therefore, effectively the weighting—of each group in these indices was determined by the number of securities it contained. In the new series, however, the price index number for a combination of groups (e.g. "investment trust preference shares at all rates of dividend") is a geometric average of the index numbers of the constituent groups—and, as will be seen later, in the case of ordinary shares this is a weighted average.

It should be noted that the sample of stocks in the various indices is not a fixed one, for if the price of a preference or ordinary share falls below a fixed limit in relation to the index of the group it can be replaced by another security. The compilers' intention here—as it is throughout the index—is to provide an index of prices of high-grade shares in which institutional investors are likely to be interested. The individual investor who tries to measure the performance of his own portfolio against that of this index may therefore be setting himself a sterner test than he realises, for any

stocks that turn sour can be struck out of the index's list.

Within the separate groups of the index, those relating to gilt-edged and debenture stocks will perhaps be least helpful to private investors. Indeed, the gilt-edged section is now even thinner than before; it includes only old Consols and four home corporation stocks. For general purposes, separate indices for undated, medium dated and short dated gilt-edged stocks would have been useful, but such compilations were apparently of no real interest to the institutional investors, who prefer to base their deci-

INSTITUTE OF ACTUARIES' NEW INDICES OF SHARE PRICES
(December 29, 1950=100)

sions upon the detailed price and yield lists issued by stock market houses and upon the meticulous bespoke analyses made for them by the specialist firms. In the debenture section of the index the Institute has tied itself by a very stringent rule to include only those issues (of over £500,000) that are for all practical purposes irredeemable. Since most major debentures of most major companies are dated stocks, much of this section of the index is based upon little known securities whose middle market prices may not be very representative of the movements that investors might expect in an index of this kind. Within this section, too, the Institute has scrapped its old distinction between industrial debentures issued by "productive," "distributive" and "miscellaneous" concerns; instead, there is now a revised series for investment trust debentures and a new series for brewery debentures, "miscellaneous" debentures and brewery and "miscellaneous" debentures combined. There seems to be too much beer in all this; it is perhaps upon the indices for investment trusts and "miscellaneous and breweries" that attention will generally be focused.

The section for preference shares makes an intriguing innovation. The former preference share section was subdivided in the same way as debenture stocks. Now the subdivision depends upon the nominal rate of dividend paid on the shares—except that there are separate sub-groupings of investment trust and industrial preference shares. The aim of this subdivision is to test the argument that a preference share with a high coupon rate is more vulnerable, on the thesis that a company's directors may try to devise ways of getting rid of the burden it involves. An examination of the new series suggests, however, that the argument has been a false one—at least since the war; within the range of interest rates chosen by the Institute—effectively from 3½ to 7 per cent—the prices and yields of preference stocks have always moved together. This negative conclusion may have made the experiment worth while, but there seems to be little point in continuing to hammer it home indefinitely. A subdivision that aimed at showing, for example, whether the market puts a different valuation at different times upon preference shares in the capital goods industries compared with those in the consumer goods industries—as it does with ordinary shares—might be more valuable.

The section of the index that will attract most attention will undoubtedly be that for ordinary shares. There have been two major improvements here. First, the "financial" group has been extended and remodelled. Secondly, the old (and almost meaningless) combined indices for "productive," "distributive" and "miscellaneous" industrial equities have been replaced by a much more significant grouping into "capital goods" and "consumption goods"—with separate sub-indices for chemical, oil, shipping and miscellaneous equities that do not readily fit into those categories. In the capital goods group, the combined

index is calculated from the 47 equities in the five separate series for the building, electrical engineering, engineering, motor and aircraft, and shipbuilding trades; while the consumption goods index comprises 108 securities in 13 separate series—boots and shoes, breweries, chain stores, chemists, cotton textiles, food, household goods, newspapers, paper and publishing, rayon, department stores, tobacco, and wool textiles. All the industrial groups, as in the old index, are combined to form a single index of all industrial equity share prices. On each of these 243 equity shares a dividend must have been paid for at least five years consecutively; but, inevitably, the group contains some little known and not very representative shares. This, however, is not a serious criticism, for the effect of such issues upon the combined indices has been swamped by the ingenious system of weighting used. In the circumstances, it is a pity that this method of weighting was not explained in the Institute's memorandum to subscribers.

The weights given to each group of securities in calculating the total index (i.e. the industrial equity index) and the indices for the capital and consumer goods

CAPITAL AND CONSUMER GOODS EQUITIES

trades have been based upon the end-1950 market value of the securities originally considered for inclusion in the index. This is probably the best system of weighting available, but—like any and every weighting system—it involves some distortions. Among them is a surprisingly high weight for the tobacco group; since this group contains only three securities, movements in Imperial Tobacco shares may have a disproportionate effect. So may those in the equities of the giants of the oil industry. Since "Imps" and oil shares can fluctuate more violently than most industrial securities (especially in times of boom but yet of changing dollar import restrictions) these are points that are worth noting.

This is no more than a criticism of detail. Experience has shown that almost any general index that is scientific

cally constructed will show the same general movement in security prices; it is within the separate subsections that marginal errors of choice and weighting can cause mistakes that are glaring and misleading. Thus, if the new index of industrial equities is plotted beside the old for the period 1945-53, it shows almost exactly the same picture of events in the stock markets. This coincidence is a tribute to the principles of both the original and revised indices; but only those who pay no attention to the trends of the sub-indices will regard it as a sign that the compilers' new mountain of labour has brought forth only a mouse. A stern critic might perhaps argue that in the gilt-edged and preference share sections they have run away from the difficulties, and in the debenture section have used a method that could lead to distortions; but even such a critic will regard the new subdivisions of the equity index as a clear improvement upon the old.

The movements since 1945 in the main indices, so laboriously compiled, are shown in the accompanying charts. Two features in that record seem worthy of note. It affords, first, a statistical measure of the switch in equity investors' preferences from consumer goods towards capital goods, a switch that occurred between early 1950 and mid-1951 and has since been maintained, although not on balance strengthened. It is significant that, even after this change, movements in both indices continued to follow the same broad pattern.

Business Notes

EPU and Convertibility

THE Managing Board of the European Payments Union has been awkwardly situated throughout the general debate on convertibility in the last twelve months. On the one hand, the agreement establishing EPU was itself intended to prepare the way for a return to multilateral trade and general convertibility of currencies; on the other, the Board has always feared that an isolated advance to convertibility by any single major European country would wreck the mechanism that it exists to manage. In its third annual report, published this week, the Board has struggled hard to devise a philosophy that fits in with both these considerations. When it discusses the conditions that will make the world safe for convertibility it is careful to do so in terms of "the majority of European currencies." It admits that "some European currencies will be able to move faster and further towards currency convertibility and complete trade liberalisation than others," but it declares that "in

In other words, investors in equity shares did not see in the changes in the economic climate any opportunity to make a profitable and positive switch from the one broad category of equity into the other. When confidence was mounting between early 1950 and mid-1951 and all shares were rising, investors showed preference for capital goods shares; but when confidence was ebbing away after mid-1951 they apparently sold both types equally.

This tendency towards a lack of selectivity in the markets is also clearly illustrated in the charts of old Consols, debenture stocks, industrial preference and ordinary shares. All the fixed interest stocks have, of course, followed the same broad pattern of behaviour throughout the postwar period; and in retrospect this behaviour appears merely as the retreat from cheap money. But it is surprising that—with the certain exception of the equity boom of late 1950 and early 1951 and with the possible exception of the recovery in equity shares in the last few months—investors in equities have moved into and out of the markets in remarkably even step with investors in the gilt-edged market. Once upon a time it was regarded as rather odd if gilt-edged and industrial stocks moved up together for any length of time. But that was in the days when a myriad of minnows ruled the market; today the big institutional fish swim in more serried shoals, towards or away from the shore.

the opinion of the Board it would be greatly to be deplored if a general move to convertibility should result for some member countries in the necessity to impose new restrictions, probably of a discriminatory character, on their trade relations with others." It therefore believes that hopes should be centred in a joint and general advance. There must have been some critical glances from the EPU headquarters in Paris at Dr Erhard's suggestions this week that Western Germany and the United Kingdom might concert their plans for advancing the convertibility of their two currencies.

The Board is insistent that its desire for a concerted advance does not imply the indefinite postponement of any advance at all. In particular its staff is now studying the possibilities of closer co-operation with the International Monetary Fund, and the Board lays great emphasis on the value of the IMF's arrangements for stand-by credits. Above all, the Board reminds itself in its report that "the Union is intended only as a temporary system designed to assist European countries until they are able once again fully to take their place in a world-wide system." But perhaps its faith in the solidarity of European recovery is rather shaken when it regards the violently see-sawing movements that have taken place in every member's accounts with the Union in the last three years; the extent of this see-sawing is detailed in the accompanying table.

Discretion at the Fund

THE meeting of the Governors of the International Monetary Fund that opened in Washington on Wednesday has not so far brought forth any excitements. And if, contrary to expectations, any major plans are being hatched behind the scenes, no foretaste of them has been given in the latest annual report prepared for the Board. There is no longer any trace of the engaging capacity for indiscretion that allowed the 1949 report to make a fairly confident forecast of the devaluation of sterling and other currencies about a month before the event. This year's report is discretion itself—and somewhat boring discretion at that—in its general comments upon world currency trends. It does, however, dispense its usual meed of good advice to both sides of the dollar gap, telling the dollar world that it must maintain a high level of activity and employment, repeal the "Buy American" Act, and follow all the other copy-book maxims for good creditors; and it presses upon the non-dollar world the well-hammered lesson that "effective control of inflation has always been an essential condition for the achievement of balance of payments equilibrium."

These precepts are drearily familiar, but so neglected in practice that they can hardly be too often reiterated. The report does, however, take a very sanguine view of the reconsideration of United States foreign economic policy that is now under way; it affirms—a little ambiguously, it is true—that "there can be little doubt that the outcome of this re-examination will considerably influence the pace of further movement toward the establishment of a freely operating, multilateral system of payments." But it adds that, for the time being, the dollar problem has been exorcised; in the second half of 1952 the United States had

a deficit of \$107 million with the rest of the world, and in the first quarter of 1953 this deficit had leapt to \$504 million. Both these figures, of course, include American disbursements of defence aid as a debt on its current balance of payments.

Even a discreet report could not this year avoid discussion of the problem of convertibility. The IMF treats this in some detail. To the argument that no effective progress can be made towards convertibility until the dollar shortage has been relieved, it retorts that the relief of that shortage requires adjustments in the pattern of international trade to which a movement in the direction of convertibility would itself contribute. As its own contribution to the cause, the IMF makes much of its new device of "stand-by" credits, first applied to Belgium. This facility has since been generalised by a decision of the Executive Board, in its announcement that the Fund would consider requests by members for stand-by credit arrangements designed to give assurance that, during a fixed period of time, transactions up to a specified amount would be made on request by a member, and without further consideration of that member's position. This, says the IMF report, "was intended to remove the doubts that have led some members to the view that in formulating their policies they could not rely on Fund assistance." Of those convertibility discussions in which it has itself participated, the IMF records that none of these discussions has yet reached the stage "where concrete programmes are available for examination"; but it adds that the Fund is prepared to consider what part it can effectively play in the furtherance of their objectives. There is also one oblique comment on the issue of floating or fixed rates; the Canadian experiment in adopting a floating rate is regarded as being "in several respects unique." Clearly, there are no floaters in the Fund.

World Bank and Planned Investment

THE International Bank for Reconstruction and Development has now made over \$1,600 million of loans since 1946 and disbursed more than \$1,100 million on them. In the year to June 30th last it disbursed the equivalent of \$226.8 million; of this, \$39.6 million was disbursed in currencies other than US dollars but no less than \$82.7 million was spent outside America. The Bank is therefore injecting dollars both into the countries that borrow from it and into countries that can supply them with capital equipment. In presenting the Bank's eighth annual report this week, Mr Eugene Black, the distinguished American who has just been re-appointed as its President, could therefore speak with the refreshing authority of achievement on two subjects that are often discussed in only the woolliest terms—namely, the need for irrigating more dollars into the world economy by more liberal American trading policies, and the scope for investment in the under-developed countries.

By dint of much experience, the Bank has learned that the resources of most under-developed areas are adequate, if effectively used, to support a substantially higher level of production and income; the main obstacle to their development is not the lack of capital but such factors as "the lack of traditions of political responsibility, the weakness of economic initiative, low standards of educa-

tion and training and insufficient understanding that economic progress requires patience, effort and self-denial." From this, in a passage that may raise some political eyebrows in Washington, the report goes on to argue that "under-developed countries have much to gain from a better direction and balance of investment" and that the scarcity of capital resources "lays on government a responsibility to develop its own policies and investments so that they will help to stimulate the economy as a whole." This, it should be added, is not an exhortation to plan in detail on the Soviet model, though the report does add that "planning in terms of concrete projects and specific policies remains the work of other ministries and agencies" and notes with approval that an increasing number of under-developed countries have left the planning of their investment programme to a central governmental planning unit. It cites some of the units that the Bank itself has helped to set up; they stretch as far as a Planning Bureau in Surinam.

It would be a pity, however, if anybody were led to suppose that zeal in the establishment of national bureaux of this kind can do much to stimulate development, unless there is a much greater flow of risk capital across national boundaries. In this field the Bank has suffered from one disappointment in the past year. It has been studying proposals for an affiliate that might make loans to private enterprise without government guarantee and participate with private capital in international equity investment; but it has had to report that "the member countries upon whom the proposed corporation would have to depend for the bulk of its funds have not so far shown readiness to commit their capital." All action on this project has therefore been deferred, although "the matter is being kept under review." Despite these discouraging words, it is still not too late to prevent this deferment from relapsing into coma.

Finance for Aircraft Exports

THERE have been many recent proposals for the establishment of some sort of financing agency to provide long-term credits for British exports of capital goods; the late Mr Alan Good was particularly active in urging that there should be a consortium of merchant banks or even some Government-sponsored corporation to provide finance of a longer term nature than the commercial banks could consider. Up to this week all such proposals have run on to two rocks. First, the Bank of England and the Treasury have rightly insisted that the main demand for easy credit terms by overseas importers has come from soft currency countries, and that to make exports of capital goods easier to these countries would merely lengthen delivery dates; and thus restrict exports to harder currency markets; the authorities have therefore wisely stood out against anything amounting to subsidisation of long-term export credits, although since about the beginning of this year the exchange control regulations have been favourably interpreted wherever the commercial market has been willing to provide credits of this sort. Secondly, it has always been obvious that the degree of risk attached to long-term export credits varies from one foreign importing country to another; although rigid regulations are impossible in a matter of this kind, it has therefore been accepted

that any scheme that was brought into effect should—where possible—make the foreign importer, not the British exporter, raise finance on the London market.

The proposal announced this week to form a new private company, Air Finance Ltd., to provide long-term finance for the export of aircraft and aircraft engines seems designed to try out the most promising available scheme on the most promising available dog. The aircraft industry constantly finds that the smaller airline operators overseas demand long-term credits—up to five years at least; and if credits yield a gain of foreign markets now, they should lead to a gain in maintenance orders later. The new company is to be set up under the strong auspices of three large merchant banks (Lazards, Erlangers and Morgan Grenfell—who will act as its joint managers) and of the Finance Corporation for Industry; leading companies in the aircraft industry will join with these sponsors in subscribing to the new company's initial capital of £1 million. Since the aircraft industry's export target this year is around £60 million, this initial capital will not go very far; but the company will raise most of its loanable funds by direct borrowing from the banks and from the Finance Corporation for Industry (which is to provide it with special loan facilities up to £10 million). Presumably in some cases the foreign importer will have to raise finance direct from the new company, while in others the British exporter will raise finance on its own account and then pass it on at its own risk to its foreign customers; but under either system there will be wide scope for the specialist sifting of risks that is urgently needed in transactions of this sort. The experiment will be watched with sympathy and interest, and it has obvious potentialities for later extension to engineering exports in general; but it would be premature for exporters of general engineering products to assume that the ground has now been prepared for a period of prolific growth of financing institutions of this kind.

Wasted Energy

IT would be interesting, though not necessarily useful, to know whether fuel is used more efficiently in Britain or in the United States, though neither Britain, which used to have an abundance of cheap fuel, nor the United States, which still has, is the place where ingenuity in saving fuel will necessarily have reached its peak. The productivity team that visited the United States early last year to study "Fuel conservation" might well have sought to arrive at a conclusive comparison. Instead, it has chosen to indulge in what used to be called "the formulation of national fuel policy" before the Ridley Committee pricked that bubble. Its conclusion and recommendations are of a familiar, technocratic and ultimately authoritarian nature—a commission to formulate a fuel policy, an interim "declaration" by the Minister of Fuel and Power, and the setting up "at one bold stroke" of a permanent Fuel and Power Board to co-ordinate the fuel industries and "formulate whatever policy is necessary." As to the content of the policy, the team suggests "top priority" for fuel-saving plant (above defence? exports?), district heating and heat-electric stations, back-pressure generation, compulsory thermal insulation (perhaps "with financial incentives"),

improved coal distribution, less smoke, and many other suggestions, many of them undoubtedly virtuous. "Solid fuel, gas and electricity should each be used for purposes for which it is best suited, compatible with the best interests of the nation" with no chasing of those "false gods, competition and freedom of choice"; and the team's first hint to the super-planners of the Fuel and Power Board, as might be expected, would probably be that space-heating by electricity, "in our present circumstances, is fundamentally wrong," while gas may deserve encouragement.

It is not easy to see how the team's visit to America, where unrestricted and lively competition between the fuel industries results in what seemed to them "a higher level of efficiency in the utilisation of fuel and power than prevails in Britain" can have convinced them that the British consumer needs to be told exactly what fuel he shall use and induced, by the carrot of subsidy or the stick of "exposure," to use it "efficiently" (whether this pays him or not). Indeed, the parade of well-meaning arguments at the beginning of this report, which these fuel enthusiasts could surely have produced without ever leaving Britain, mars and obscures a useful and interesting discussion in the second half of some aspects of industrial fuel practice here and in the United States. Their impression that American fuel efficiency is higher may be correct. Coal furnishes about 90 per cent of all the energy used in Britain, while in the United States 54 per cent comes from other sources such as oil, natural gas, and hydro-electricity, fuels inherently easier to handle and less likely to be wasted; moreover, American industry replaces all its equipment sooner. This has to be considered, however, beside the ascertainable fact that "energy consumption per head of population is by far the highest in the world. The United States possesses such vast and relatively inexhaustible stores of energy that there are no inhibitions in regard to its use." Moreover, the relation between the cost of labour and the cost of equipment to replace it (not merely the costs of the energy that equipment may generate or use, which the team is inclined to quote alone) differs considerably in the two countries. This, eventually, determines the degree of fuel efficiency that it will pay American or British industry to buy; and that test of return on investment is the final measure of total, as against thermal, efficiency.

Confidence in Film Production?

CINEMA attendance and box-office receipts in the first quarter of 1953, according to Board of Trade statistics published this week, show little change from their recent downward trend, though figures of Entertainments Duty collected, which are available up to the end of June, suggest that there has been some check to the decline, at least in takings. The industry is at once hoping to increase the size of those takings and arguing about how they should be divided. It is united only in thinking that Entertainments Duty takes too much—in the first quarter of this year some 34 per cent. However, exhibitors are more concerned at the present moment with proposals to cut admission prices and win more patrons, and to "squeeze" the percentage of takings they pay in film hire. Since this desire for lower rentals has coincided with the announce-

ment of various three-dimensional and wide-screen film for which an unusually high rental percentage may be asked, some friction has developed between exhibitors and distributors of films. The British film producers are not directly concerned with this argument, though they are disputing an "appraisal" of recent British films derived from a poll of exhibitors. The exhibitors' broadly unfavourable verdicts, they argue, conflict with the actual earnings of these films, which they have however not disclosed.

However, the British film producers have some reason to feel satisfied with the internal politics of the industry this year. Although the trade has not yet agreed upon a voluntary extension of the Eady Levy scheme that gives producers about £3 million a year more than they receive through the ordinary pipeline, they have the Board of Trade's assurance that if necessary the levy will be made statutory, and the National Film Finance Corporation, which provides most of them with working capital, has also been promised a longer lease of life. True, their commercial earnings from showings in Britain declined somewhat last year, and the film finance corporation's last results were not as hopeful as twelve months before; but activity in the industry last spring seemed reasonably steady, and the process of thinning down production costs seemed to be continuing. At the end of March, for the first time since the Board of Trade began to collect statistics, the whole of the studio space owned by the major groups was busy. This had contracted during the year, following the disposal of some major studios; nevertheless, this full utilisation of capacity was a healthy sign, and could suggest that better financial results from production may have played some part in the improved profitability of the Odeon group. Bookings of studio space for future production, which rose sharply at the end of last year, were still high at the end of March; though some of the unusually long-term bookings made earlier seemed to have been cancelled, this is stated to have been due to the acceleration of production schedules rather than to cuts in production, and in any case long-term bookings of studio space nearly a year ahead are not frequent enough in the film business to be significant. There have been some cancellations of film plans, notably by one American company that finances production here, reflecting Hollywood's caution over new screen dimensions. Though British film producers will eventually have to face these decisions too, or accept those made in California, there seems no obvious reason for them to postpone production likewise. Despite Hollywood's large stocks of films in the can, the sharp cut in output there this year must eventually bring about a shortage of popular American films, however temporary, and this may offer British producers an opportunity.

Australia Cuts its Taxes

WITH Federal elections less than a year ahead and "incentive budgets" in fashion in other countries, it was inevitable that Sir Arthur Fadden would hand out liberal tax concessions in the budget that he introduced in the Australian Parliament this week. It is therefore unfair

More than 20,000 firms already use T.R. equipment the installation and maintenance of which, on a rental basis, is T.R. Service.

CROPHONES & LOUDSPEAKERS

FOR INSTANTANEOUS STAFF LOCATION .. IN OFFICE BUILDINGS

By newly developed equipment specifically designed to suit individual requirements in private offices.

Loudspeaker: For office use

IN FACTORIES

For finding anyone instantly; for announcements, time signals, and 'Music While You Work.'

Loudspeakers: For factory use

R. SERVICE includes also the installation and maintenance of Internal Automatic Telephones with optional loud speaking facilities, Synchronised Clocks, Time Recorders, Time Signals, Watchman Patrol Recorders, Fire Alarms, etc. Full details from:

THE UNITED
STEEL
COMPANIES LTD

What is United Steel?

The United Steel company is the largest producer of steel and allied products in the British Commonwealth, and makes one ton in eight of the steel production of Great Britain.

The United Steel company is a combination of individual producing units, giving employment to about 30,000 workers, and operating iron ore mines, quarries, coke plants, blast furnaces, steel works, rolling mills.

The integration of these units into a group provides centralised resources and services for finance, selling, research, recruitment and training and other functions which best respond to large-scale organisation. Each producing unit of the group, however, has a considerable degree of practical autonomy, giving it the flexibility of an independent concern of manageable size.

to poke too much fun at the weird economics that underlay his budget speech—such as his suggestions that because Australia's workers are fully employed the country has plenty of room for expansion, and that because a favourable turn in the terms of trade has enabled the country to build up its reserves it can now afford to go out and spend them. On Australian industrialists' own admission about 20 per cent of secondary industry there is now uneconomic (or rather "not competitive with foreign prices" to use the traditional euphemism) and another 10 per cent of it is hovering on the margin of uneconomic operation; this hardly looks like an economy that can afford to risk a new spending spree, even though it is in much better shape than a year ago. The new tax concessions, however, are not as discriminately directed towards the dominion's uneconomic secondary industries as had been feared, and the Treasurer's speech cannot fairly be said to be as saturated with the spirit of out-and-out protectionism as some recent utterances from Canberra. Perhaps, however, judgment on that point should be reserved until Mr Menzies makes his promised early statement about Australia's policy on "imports and other trade matters."

The tax concessions amount in all to £A118.4 million; this is, of course, an enormous sum for a country of Australia's size—on a *per caput* basis, these concessions are three or four times as large as those that Mr Butler handed out in Britain last April. In all, wage and salary earners will benefit from an average cut of 12½ per cent in income tax; public companies will pay 6s. (instead of 7s.) in the £ on the first £5,000 of taxable income and 7s. (instead of 9s.) in the £ on the balance, while private companies will benefit from a cut of 1s. in the £ on each of their equivalent rates. Goods previously subject to sales tax of between 20 and 50 per cent will now carry a flat duty of 16½ per cent (less in some cases), entertainments tax will be abolished altogether, and rates of customs and excise on spirits will be reduced by 21s. a gallon. Differential rates of tax on income from property will be removed and the exemption limits for both estate duties and payroll tax will be raised. It is improper to call all this a gamble, for it is really nothing more than a political *saute qui peut*; but it is true that it will not necessarily plunge Australia back into external deficit unless there is an unfavourable movement in the world price of wool.

Selling Aircraft to Lufthansa

ONE interesting outcome of last weekend's German elections is that immediately the results were known, a substantial German technical delegation, headed by the Minister-designate of Transport, made plans to come to this country to discuss ways of equipping the new German airlines. The German problem is to get quick delivery of civil aircraft of some kind or another. The Lufthansa, admittedly, cannot be re-started until the Bonn treaty has been ratified; but until the company is in existence again, no firm orders can be placed in this or in any other country. Whether it decides to start operations with new British gas turbine aircraft, or with the more familiar American piston-engined airliners, there will be a considerable time-lag

between the signing of the orders and the delivery of the aircraft. One of the points that the German delegation may therefore discuss with the British airline officials it is meeting this week is the possibility of taking over aircraft that British European Airways and the British Overseas Airways Corporation are about to put on the second-hand market.

BOAC, for example, will have its entire Hermes fleet of 19 long-range airliners on the market next month. These are modern piston-engined aircraft that cost, new, in the region of £250,000 each. They have had only three years' service with BOAC and, by airline accounting standards, therefore have at least five years of passenger-carrying operations before them. The medium range Vikings that BEA is selling are more travel-worn than the Hermes, but they could provide a useful stop-gap until, say, Vickers-Armstrongs could deliver new turbo-prop Viscounts to replace them. An arrangement to buy or lease aircraft from the British corporations has several features to recommend it to the Germans. Services could be started as soon as the necessary political and commercial formalities had been completed, and without heavy initial investment in new, costly airliners. The Germans would then not have to run the risk of equipping their new airline with piston-engined airliners that might, for prestige reasons, have to be taken out of first-class service before the end of their working life because competitors have switched to gas turbine power.

The talks with the British airlines will also cover the possibility of providing technical teams to get the German line re-started. This is a development that the British aircraft industry is watching with barely concealed eagerness, since it seems a foregone conclusion that British technical advisers would tip the balance in favour of British aircraft for full-scale operations even should the first services be started with a small fleet of American machines.

Copper Recessional

COPPER SALES AND PROFITS
(£'000)

Years ending June 30	Roan Antelope		Mufulira	
	1952	1953	1952	1953
Sales revenue	16,684	21,706	15,726	18,188
Operating expenditure	7,191	9,684	6,683	8,131
Operating surplus	9,635	12,424	9,336	10,536
Profit, before tax	8,281	11,477	8,269	9,575
Copper sales (long tons)	81,027	87,307	76,369	76,089

Ministry of Materials, and—in all probability—as the last year of the post-Korean boom. In that year, in spite of a three weeks strike in the autumn as well as the recurrent difficulties about fuel supplies, Roan Antelope was able to

increase its output and sales, to 87,307 long tons compared with 81,027 long tons in 1951-52; while Mufulira—a “wetter” mine than Roan Antelope—was just about able to maintain the volume of its sales at around 76,000 long tons. Both companies were able to earn higher profits in spite of the rise in operating costs, with Roan's profits before tax rising from £8.3 million to £11.5 million and Mufulira's rising from £8.3 million to £9.6 million. It has not yet been announced how far—if at all—equity shareholders will benefit from this rise in earnings; but since these profits will still be subject to British taxes (the domicile of the companies was not formally transferred to Rhodesia until July 1st last) the increase in distributable earnings cannot have been very large.

This change in domicile and hence in taxation charges will, however, be a potent influence in the current year. Profits this year are almost certainly going to be lower; the trend of prices in the newly re-opened London copper market and the unhappy course of the squabble with the African workers' rather weird trade unions both point to that. But shareholders should remember that Rhodesian taxes will not eat profits away as voraciously as the British Treasury has done: it is too early to say that dividends for 1953-54 will necessarily go down.

Aid for Trade

WHEN the Select Committee on Estimates examined the Export Credits Guarantee Departments last year, its main recommendations were that the department should make the services it offers better known, and that some expansion of staff was probably necessary. This week the department published its reply to the committee's suggestions, which cautiously accepts the suggestions about publicity and reports that “authority for a number of additional grades in the higher posts” has been received from the Treasury. In the meantime, the Select Committee has been examining the other forms of assistance rendered British exports by the Government and semi-public organisations. In a report published at the end of last week, the Select Committee found this assistance in the main worthy of praise, but felt at the same time that it often failed to reach the exporters that probably most need help—the small companies.

The Government's commercial representatives abroad comprise Trade Commissioners in most Commonwealth countries and commercial diplomatic officers in most foreign countries; the first are members of the Board of Trade staff, the second members of the Foreign Service who also deal direct with the Board of Trade. Both the Board and the Foreign Office were broadly satisfied with this arrangement, though some trade and industrial organisations that use the services of both types of officer urged the Select Committee that the commercial diplomatic officers should come entirely under the Board of Trade. One point that counted with industry was that Trade Commissioners generally stay longer in one country and become thoroughly *au fait* with its trading requirements; the commercial diplomats, who are members of the Foreign Service expected to be proficient in other diplomatic functions, are transferred about the world more often. The Committee

THE ECONOMIST, SEPTEMBER 12, 1953

recommends that areas where there is enough work on export promotion to justify its separation from the general work performed by the commercial diplomatic officers, a Board of Trade official should be appointed; where trade considerations outweigh political considerations in the commercial sphere, a Board of Trade officer might be seconded to the commercial diplomatic post.

The Committee also examined the work in this field of such organisations as the Dollar Exports Council, the Council of Industrial Design, and the British Standards Institution, finding all three worth the Government financial assistance they receive. But it recommended to all these promoters of trade a special effort to reach

the very large number of smaller firms, producing goods of a high quality, who could export, but do not. . . . It is these smaller firms who for various reasons get least information and least encouragement.

The problem of reaching these manufacturers is not an easy one; and their reluctance to take risks on exports arises from the fact that it is beyond the means of all but larger firms to set up their own sales organisations abroad. The Dollar Exports Council believes that the answer here is the formation of collective selling organisations by groups of manufacturers whose products are allied but not competitive. Some such groups have been formed with some success; but as the Council said and the Select Committee agreed, the initiative here must arise within the industries concerned.

Stability in Cotton Prices

FOR the past four months American prices of raw cotton have been fairly steady at a cent or so above the domestic support level, fixed at 32.70 cents a lb for middling grade, 15/16th inch staple. Recently the pressure of supplies has pushed the spot price in New Orleans and New

York down to this basis, and October futures in New York are fractionally below it. The sharp fall of seven cents a lb between last September and the beginning of this year has deflated the absurd prices asked for certain foreign cottons, and latterly even Brazilian growths have been forced into line with the American market. The weight

THE ECONOMIST, SEPTEMBER 12, 1953

725

THIS skeleton of a hen, drawn by George Stubbs (1724—1806), our finest animal painter, comes from his work “A Comparative Anatomical Exposition of the Structure of the Human Body with that of a Tiger and a common Fowl”. Stubbs himself taught anatomy; and worked with the greatest anatomists and surgeons of his time. Together with the enormous progress made in surgery since those days has marched a corresponding advance in veterinary and agricultural knowledge. The outstanding examples are the perfection of animal feeding-stuffs and artificial fertilizers.

One of the problems attendant on the distribution of these essential materials was to find a strong yet light form of packaging. The multiwall paper sack was the answer. Millions are sold every year by Bowaters. But there is more here than a cheaper and more efficient packaging material. The sacks are non-returnable; and are burned after use. So one of the agents for the spreading of diseases like Fowl Pest and Foot and Mouth is given a complete check. Thus yet another branch of the Bowater Organisation helps in its way to prosper the mechanics of science.

"Sales Accounting is only the start"

went on the company secretary. 'Followed by what?' queried the managing director. "Powers-Samas machines are now used for invoicing, cost accounting, production control, stores ledgers, payroll, personnel records." 'Where?' "In factories, business houses, retail stores, banks, Government departments, municipal authorities, co-operative societies." 'Enough,' said the managing director. 'Let's see if Powers-Samas punched card methods can help to solve some of our staff problems.'

There is a range of Powers-Samas punched card equipment for every type of application.

POWERS-SAMAS

Powers-Samas Accounting Machines (Sales) Limited, Powers-Samas House, Holborn Road, London, W.C.1

of supplies on the one hand and the American support operations on the other have confined movements in world prices as a whole within a narrow range. Barring a "meteorological catastrophe" in the development of the American crop or a weakening in the support operations, neither of which is probable, this relative stability seems likely to continue for some time.

The Department of Agriculture's second estimate of the American crop has risen by 554,000 bales to a bumper 15,159,000, almost as much as the 15,136,000 bales produced in the 1952-53 season. Allowing for subsequent adjustments in the estimate, and the huge carry-over of 5.2 million bales, the total American supply this year should be something like 20 million bales. Possible increases this year in world consumption of cotton, and prospective reductions in the Egyptian and other crops, are trivial in comparison with this massive American supply. As in wheat, it is so greatly in excess of "normal demand," calculated this year at some 16.4 million bales, that the Department will almost certainly have to reduce the acreage of the 1954-55 crop, and to ask growers to vote for marketing restrictions if they wish to avoid a cut of about 45 per cent in the price supports.

Such measures could not ease the disposal problem this year. Yet the American cotton grower is not entirely friendless, despite the blunt refusal of the Secretary of Agriculture to subsidise exports. Raw cotton continues to be exported "for free" under the foreign aid programme, and in its last session Congress approved an export promotion scheme that would permit foreign countries to buy American cotton with local currencies, instead of dollars. And there is always the Commodity Credit Corporation to take into loan the cotton that growers do not care to sell at the market prices. It seems fated to do a record business this year.

Records from Pye

THE chairman of Pye, Ltd., announced at the annual meeting this week that the company is planning to enter the gramophone record business, but he did not amplify this bald statement. Since the war, an intensive effort has been made to widen the company's interests and make it less dependent on the precarious business of producing and selling domestic radio equipment. The market for transmission and industrial electronic equipment—which is one natural field for development—is, however, an extremely exacting one, and heavy research expenditure is inevitable if a company is to meet its demands. Pye has succeeded in building up a substantial reputation as a supplier of television studio equipment, but has made rather less headway in the market for complete transmitters. It has done well in industrial radio, and recently branched out in a limited scale into the manufacture of domestic electric appliances.

Its attraction to the record business obviously derives from the activity and interest aroused by the industry's introduction of long-playing techniques, which date from 1950. Despite the recent entry of a number of small producers—some of them concentrating upon specialised recordings for a limited market—the field is dominated by two big producers, Decca and Electric and Musical Indus-

tries. When Pye enters the market, it will have to do so in a big way, because capital investment in plant to press records is too heavy for small-scale production; the small producers generally have their pressings done under contract. Although record sales are booming, they do rely to a large extent on the name of the artists, orchestras, and bands on the label; and the majority of the big names are already under contract to one or other of the established producers in this country, Europe or the United States. There is a big export of records from this country; a total of 8.6 million, valued at £1.3 million, have been shipped abroad in the first seven months of the year. But this trade requires either the establishment of extensive distribution arrangements in the export markets or the negotiation of agreements to exchange catalogues with local producers. Outside the Commonwealth, the United States is one of the biggest customers for British records. Therefore while the market for records may look extremely promising, Pye may prefer to enter it through an agreement with established companies rather than by a frontal assault.

Freedom for Softwood?

ONE of the problems that Lord Woolton, the new Minister of Materials, has inherited from his predecessor is whether to advise the Chancellor of the Exchequer to abolish the last remaining control on softwood, the licensing of consumption. The question is how much this relaxation would add to Britain's import bill, and whether the country could afford it at the present time. Imports of softwood are running at an annual rate of about 1.2 million standards, a cost of some £78 million at the current average price of about £65 a standard, f.o.b. Over half of this softwood comes from Scandinavia, one-fifth from North America and most of the rest from eastern Europe. The latest official estimate of the increase in consumption that would follow decontrol—and it is merely an intelligent guess—puts it at about 110,000 standards in the first year, 80,000 in the second and 40,000 in the third, a total of 230,000 standards a year in three years. Assuming a rise in prices of about £5 a standard as a result of decontrol, the extra cost in the first year might be of the order of £10 million. By itself, this hardly seems likely to injure the balance of payments, but softwood is not the only candidate that Mr Butler has to consider for import liberalisation this autumn.

The timber trade, which has lost, perhaps for good, several important outlets for softwood during the years of restriction, argues that decontrol at the present time would not lead to a sharp inflation of demand and of prices, because stocks are adequate and domestic users are very price conscious. The Ministry, on the other hand, may feel that the tendency for prices to rise would be almost irresistible, and that if the softwood market is about to break, which it may be, this is not the time to abolish licensing. Playing the market is not, however, a proper function of government, and the attempt has seldom been successful. The whole subject is rife with imponderables. What is not in doubt is that the restrictions on usage have led to some wasteful substitution of other materials, and that decontrol would thus tend to promote lower costs and more flexibility in the economy. On these grounds it deserves a

high priority on the Chancellor's list. In any event, a decision should certainly be announced before the buying season begins in October.

More or Fancier Shoes?

BRITISH shoe factories use exactly the same machines as their American counterparts; but a survey has shown that the American plants studied did the same work in between 60 and 74 man-hours as twelve British plants did, on the average, in 100. The British Productivity Council, which has recently carried out an investigation into the progress made in this industry since an Anglo-American team reported on it three years ago, has therefore been exploring a field where British shortcomings might be thought to be due to bad management or restrictive labour practices rather than to any deficiency in capital equipment.

The council is able to report that the best British shoe factories are getting much the same results as the best in America; and it quotes 28 instances where different shoe-making concerns have raised their productivity in the last three years by introducing time and motion study, or by overhauling their systems for managing the flow of work through these plants, or by cutting down the number of styles in production. The first two of these remedies are clearly desirable. There are difficulties about the intro-

duction of work-study methods and piece rates in the shoe industry, because piece rates cut across the accepted structure of district wage agreements based on time rates and make future arbitration impossible; but as factories that have changed to piece rates have found that output rises sharply, it is clear that every effort needs to be made to overcome these difficulties. Similarly, concerns that have overhauled their methods of transporting work from one operation to another report substantial increases; it should be noted, however, that the best technique for ensuring an even flow of work through a shoe factory is not easy to discover—after several experiments, it has been proved, for example, that the normal conveyor system is not always the most suitable.

The Productivity Council treads upon much weaker ground when it suggests that one of the keys to efficiency lies in greater standardisation of production. In the shoe industry, as in so many other consumer trades, manufacturers have recently been complaining that men, as well as women, are demanding fancier shoes, and that this means lower productivity. It also reflects the difference between a buyers' and a sellers' market. While the great mass of the British shoe industry lags behind, a handful of manufacturers have reached a pitch of efficiency at which they were able to sell nearly £1 million worth of shoes to the United States in the first half of this year (a sixth of total shoe exports). The majority of these make shoes that are conspicuous for fashion and variety.

the directors may have changed their minds since then.

The full accounts are frankly an uninformative document. The directors' report reveals that the shipbuilding and engineering works continued to be "well employed," that there are still a consider-

ODEON THEATRES. The preliminary statements from the J. Arthur Rank group of cinemas and film-producing companies—Odeon Theatres, Gaumont-British, and British and Dominion Film—show that all three companies continued their recovery in the year to June 27th last. The trading profits of Odeon Theatres rose from £6,397,278 to £6,762,467 and its net profits from £834,620 to £1,190,532; part of this rise in net profits can be attributed directly to a reduction in the company's interest charges (from £774,984 to £611,719), which, in turn, has sprung from a further reduction (of £971,740) in its bank overdrafts. Similar influences appear to have been at work in the accounts of Gaumont-British, where an advance in trading profits (from £2,895,094 to £3,103,467) has also been accompanied by a fall in interest charges (from £111,787 to £36,148) and by a rise in net profits (from £331,079 to £361,065). In the accounts of the smallest member of Mr Rank's trinity—British and Dominion Film—trading profits rose in much the same modest proportions (from £331,392 to £356,928), while net profits rose from £92,845 to £125,119.

This continuing recovery in profits and strengthening of the group's finances have immediately benefited shareholders. As Mr Rank promised last year, the preference dividend of Odeon Theatres has been brought up to date by payments for the last two years, although equity share-

holders are necessarily still left without dividends. The directors of Gaumont-British have again declared an ordinary dividend of 7½ per cent, while British and Dominion Film has re-entered the ordinary dividend list by declaring a dividend of 5 per cent. The directors of this latter company also intend to repay in cash 3s. on each of the company's redeemable preference shares later this year; this repayment will reduce the nominal value of each share to 17s., but it will not affect the right of shareholders to receive a premium of 3s. on each share when these shares are finally redeemed. The trends in the cinema trade that presumably underlie these modest increases in earnings are discussed in a Business Note on page 720.

JOHN BROWN. Shareholders of John Brown, perhaps the best known of all shipbuilding concerns in this country, will have to wait until the company's annual general meeting before they can know what caused the fall in the group's trading profits (from £3,008,234 to £2,236,883) in the year to March 31st last. At this meeting they will also be eager to know what the company intends to do when its former holdings in the steel industry are put up for resale to the public; last spring the chairman described any repurchase by the company of these earlier holdings as "improbable," but

able number of contracts on hand, and (rather surprisingly) that production is still being held up by shortages of steel. But it gives no answer to the important question of whether the fall in profits has been mainly due to a rise in working costs or merely to the uneven and accidental incidence of the completion of contracts. The group's balance sheet confirms that the yards are still busy, despite outside indications that some shipping companies are revising their commitments for new tonnage. The net value of the group's stocks and work in progress has risen from £4,590,387 to £5,670,972; this rise must

conceal an even bigger expansion in the gross value of stocks and work in progress (that is, before instalments received on account of work in progress have been included in the reckoning), but the directors have not disclosed any detailed information about this. In spite of the fall in net profits (from £1,040,278 to £699,659), the ordinary tax-free dividend of 7½ per cent has been repeated. Although it seems in no danger at the present level of trade, it would be very vulnerable if world recession returned.

★

GEORGE COHEN. In their amply documented set of accounts for the year to March 31st last, the directors of George Cohen (which controls the "600" group of iron, metal and machinery merchants and engineers) go to some pains to explain to shareholders that they must not expect the recent brilliant flow of results from the company to be maintained in the current year. Indeed last year's high turnover was only achieved because the company was willing to allow profit margins to be cut substantially below their exceptional level of 1951-52. In consequence, although the value of gross sales soared from £14,823,000 to £21,615,000, trading profits advanced only slightly (from £2,020,477 to £2,058,242) and net profits—thanks to increased charges for depreciation, bank interest and taxation—actually fell quite heavily, from £704,018 to £451,728. But this did not prevent the directors from effectively increasing the ordinary dividend rate from 10.4 per cent to 12 per cent; in 1951-52 the actual rate of dividend was 26 per cent but this was paid on a capital of £600,000 before last year's 150 per cent scrip issue of shares. Although the company's 5s. ordinary

stock has proved to be an expanding equity in recent years, stockholders should note that this latest increase in equity payments is a little hard to square with the chairman's warning that the group's orders are slackening and that he is expecting "a substantial reduction in turnover, with a consequent fall in earnings" this year. There are still three

cushions beneath the equity. Ordinary dividend payments still absorb only £97,688 out of net profits of £451,728; it is clear that taxation will not make such sweeping inroads into profits in 1953-54 as it did in 1952-53, when EPL alone absorbed £290,140; and the diversified interests of the group should protect it from the worst calamities. But these cushions, at best, suggest that ordinary shareholders can afford to sit quiet for a while.

LONDON STOCK EXCHANGE

Next Account begins : September 16th
Next Contango Day : September 16th
Next Settlement Day : September 22nd.

ALTHOUGH the industrial market had been a little uneasy before the week-end, the advance in equities was resumed when the markets opened this week. By contrast, prices in the gilt-edged market moved somewhat irregularly, with trading very slack and most stocks tending to lose a little ground. Dominion and Colonial issues were also torpid, and home banking shares drooped slightly. The West German election results prompted a burst of activity in the foreign market, where the Young loan was marked up as much as 4 points to 8½; later in the week, however, these German Government issues lost part of their earlier gains. Japanese issues were marked slightly lower, but Peruvian stocks remained in demand. In the foreign railways sector there was very active trading in United Railways of Havana following the news that the Cuban Government was to purchase the railway.

By the close on Wednesday the Financial Times ordinary share index had improved to 124.3, compared with 123.9 a week before. Most of the "blue-chips" shared in this week's rally; in particular, Imperial Chemical were marked up on Wednesday in response to vague rumours that the interim dividend was to be increased and that a bonus issue of shares was to be made. One of the most active sectors in the industrial market was the shops and stores group; "Gussies" continued to soar, and at the close on Wednesday the shares were quoted at 43s. 3d. (compared with 35s. 10½d. a week earlier). Although the market in oil shares was quiet, prices edged upwards, with chief interest concentrated upon Canadian Eagle. Rubber and tea shares continued to attract a fair number of inquiries. Kaffirs became firmer on a renewal of Continental buying, which was later supplemented by some local support. Copper shares were generally firmer, but tin shares, after initial rises, had turned a little easier by mid-week.

(1) Petroleum production in Canada in 1938 and 1951 includes natural gasoline. Annual figures of electricity production in Australia are for 12 months ended June 30th of year stated, and for New Zealand 12 months beginning April 1st; monthly figures for New Zealand represent about 87 per cent of total generation. (2) Copper production is smelter; tin is primary metal. (3) General trade (including re-exports) except for Canada, which is that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa relates to Europeans only. (5) Monthly average of first quarter.

EXCHEQUER RETURNS

For the week ended Sept. 5th there was an "above-line" deficit (after allowing for Sinking Funds) of £23,950,000 compared with a surplus of £12,294,000 in the previous week and a deficit of £39,451,000 in the corresponding period last year, raising the cumulative deficit to £207,563,000 (£266,823,000 in 1952-53). Net expenditure "below-line" absorbed £5,227,000, bringing the total cumulative deficit to £409,343,000 (£532,655,000 in 1952-53).

THE MONEY MARKET

PRESSURE upon the market from the heavy intake of Treasury bills recently has culminated this week in a phase of marked credit stringency. On Thursday and Friday before the weekend, the authorities left the discount houses almost "on their own," and one or two of them were obliged to seek seven-day loans at the "penalty" terms. On each of the subsequent business days up to Wednesday last the authorities have given aid, yet new money in the market has commanded rates up to 2½ per cent.

The need for borrowings at the Bank did not become apparent until just after the tenders for last week's bills; but the current stringency and the increase in the bill offering to the record level of £300 million led the market to reverse the tactics adopted at the previous tender. Having then raised its bid by 2d., it last week reduced it by 3d., to £99 8s. 1d. per cent; and, although the market proportion dropped from 77 to 66 per cent of its applications, the average rate for the whole allotment rose very sharply. Yesterday's offer was likewise for £300 million; and, if fully allotted, the issue will again exceed maturities by £30 million. The effect of the stringency and the rise in the tender rate has been to establish the clearing banks' buying rate for November bills at 2½ per cent, with ½ per cent above that for purchases made in response to indirect aid.

The Bank return shows a further moderate reflux of currency, but this was fully neutralised, whilst the visible effect of the week's market borrowings was offset by an increase in public accounts.

EXPORT QUESTIONS NEED EXPERT ANSWERS

*Will they take
ships in
South
America?*

WHETHER you are exporting liners or launches, tractors or transformers, the markets of Latin America pose special questions about currency, import regulations and exchange control. As the only British Bank with branches throughout Latin America, we are particularly well equipped to answer these questions promptly and accurately, and to advise and assist you in many other ways.

Our *Fortnightly Review*, a digest of reports sent in from our 56 Branches in South and Central America, is an invaluable summary of economic information for all who trade in these markets. We shall be glad to send you a specimen copy on application to:—

THE CAMEL TRAIN:

Transport takes many forms to-day in the ancient walled city of Kano. For though lorries, railways and aeroplanes now carry goods and passengers to and fro with modern speed and comfort, the long, slow, padding lines of the camel trains still wend their way in from the Sahara as they have done from time immemorial. The routes these camel trains follow are mainly the routes of the old caravans, which were originally the only trade links between the interior of Africa and the Mediterranean. Banded together for protection against bandits—a caravan might contain as many as twenty thousand camels—the old merchants made their deliberate way from oasis to oasis across the great desert, carrying gold, ivory, ostrich feathers, cotton cloth and corn.

Our branches in Nigeria are particularly well placed to answer your questions on market conditions, or local commercial undertakings. Please address your initial enquiries to our Intelligence Department, 54 Lombard Street, London, E.C.3.

COMPANY MEETINGS

METAL INDUSTRIES LIMITED

RECORD OUTPUTS AND PROFITS BY ELECTRICAL COMPANIES

RESEARCH AND DEVELOPMENT SECTIONS STRENGTHENED

MR R. W. McCRONE REVIEWS THE YEAR'S OPERATIONS

The thirtieth annual general meeting of Metal Industries Limited was held on September 8th at the registered office of the company, 145 St. Vincent Street, Glasgow, C.2.

Mr R. W. McCrone, the chairman, who presided, said:

Ladies and Gentlemen,—I would like to say how pleased we are to see our Honorary President, Sir Donald Pollock, with us today. Sir Donald continues to take a keen interest in the affairs of the Group, and as we do not so often see him nowadays, it is most gratifying that he has been able to attend this annual meeting.

I have to report, with regret, the death of Mr J. C. Wallace, one of our original directors. Mr Wallace was a great assistance to the company, especially during the early years, and we are sorry indeed that this link with the early days of the company has been broken.

Last year I told you how our Group was organised in divisions, each division having its own chairman and board of directors. I also gave you a brief description of the type of work carried on by the companies in the divisions. This year I propose to tell you how these divisions and some of the more important companies have fared during the year under review, the early part of the current year and what I consider are their prospects.

PROFITS

The consolidated profit of the Group at £1,477,905 did not quite equal last year's record profit figure of £1,638,380. This was occasioned mainly by reduced earnings by the metals division, which did not have a repetition of the unusual opportunities of the previous year and latterly by the impact of general engineering recession on the engineering division.

On the other hand, the charge for taxation at £858,971, which includes £36,500 for Excess Profits Levy, is down by £166,881, with the result that the net profit, after taxation, is rather increased at £618,934 against £612,528. The directors have placed £250,000 to general reserve, increasing it to £1,250,000, and after making minor provisions and setting aside the amount required for the proposed ordinary dividend, we have a total of retained profit in the Group to carry forward of £511,494 against £459,010.

DIVIDEND

The interim dividend of 4 per cent, less tax, already paid, and the final dividend of 8 per cent, less tax, now recommended, make a total ordinary dividend of 12 per cent for the year, which is equivalent to last year's rate of 15 per cent on the smaller ordinary share capital then subsisting.

BALANCE SHEET

The total for investments is reduced by some £460,000, representing the proceeds of adjusting sales of ordinary stock of The British Oxygen Company, Limited, and shares of subsidiary companies, and loans to them have increased by about the same amount, reflect-

ing the disposal of the cash arising from the investment sale.

CONSOLIDATED BALANCE SHEET

Stocks and work-in-progress are increased by approximately £500,000 as a result partly of increased level of trading and partly of the particular state of some contracts at the balancing date. Stocks are well controlled, and only in the case of one company are they regarded as more than normal to a moderate extent through an easing of customer demand which we hope to be temporary.

YEAR UNDER REVIEW

Investment Division: The directors took advantage of the opportunity afforded during the year by the bonus and cash issues of ordinary shares by The British Oxygen Company, Limited, to adjust the Group's holding to £1,500,000 ordinary stock against £1,100,000 previously held. Our holding had increased over the years from rights issues and in other ways, and the directors felt it opportune when the occasion arose this year to adjust the balance somewhat in favour of the company's other interests, whilst at the same time following out their basic policy of retention of a very substantial holding of British Oxygen ordinary stock.

This adjustment resulted in the realisation of a capital profit of £172,550, which has been credited to investment account and deducted from the book value of the investment, so that the £1,500,000 stock now held stands in the books at a value of 36s. 1d. per £1 unit in comparison with a Stock Exchange value of over 56s. The income from our investment holding will not be varied by these changes to any material extent.

Electrical Division: All the home companies in this Division have had record outputs and profits.

During the year a major rearrangement of the top management of the Division was completed and the new arrangements are working well. The outcome of these changes has been a much more flexible organisation and a wider sphere of activity for the senior executives with widened opportunities for the development of the Division as a whole.

At the same time the research and development sections have been strengthened in order to intensify the progress of new lines and the improvement of existing ones.

Last year I told you that Cantie Switches Limited was passing through a development period and I am glad to report today that this has progressed well and that the company has contributed to the profits of the Group for the year under review.

Our electrical subsidiary in South Africa is not yet showing a profit but is making steady progress.

Metals Division: A year ago two companies in this Division—Cox & Danks Limited and John Allan & Company (Glenpark) Limited—had high profits. These were brought about partly by the scarcity conditions then prevailing which inflated the value of all re-usable material, and non-ferrous metals. The year in this section was one of great variation in prices and of

unsettled conditions, with a natural effect on the profits of these two companies which were lower than the previous year.

In shipbreaking there was a great scarcity of ships for breaking up in the early part of the year and the yards were not fully occupied. As the year advanced the supply of ships steadily improved and at the end of the year the yards were working well up to capacity.

The shipbreaking activities, previously organised under Metal Industries (Salvage) Limited, have been concentrated since April 1, 1953, under our separate company, Ship-breaking Industries Limited, which continues to operate with satisfactory results.

Engineering Division: The sales of Sentinel (Shrewsbury) Limited during the past year show an increase over the previous year, with considerably improved earning capacity. Unfortunately, during the latter part of the year orders for certain products for export were cancelled, resulting in losses for which provision had to be made. Certain provisions also had to be made in writing down stock and work-in-progress and in bringing finished stock to a level in line with market conditions. The value of orders on hand at present, including Government contracts, is considerably in excess of the value at the corresponding period last year, although I must here give a word of warning that prices have had to be cut to very fine margins to obtain the business.

Fawcett, Preston & Company Limited had quite a good year but orders fell away to a certain extent towards the end of the year. It is hoped that this is only a temporary phase and the matter is having the close attention of those immediately concerned.

Ferrous Castings Limited also had a fairly good year, but in common with most grey iron foundries business fell away sharply about the beginning of 1953. This slackening in demand was attributed to customers being over-stocked and for a time the foundry was working only four days a week. I am glad to say that the position is now improving slightly and increased orders are being received.

CURRENT YEAR

Investment Division: Our holding in The British Oxygen Company Limited is now £1,500,000 ordinary stock, and assuming maintenance of the existing rate of ordinary dividend our return on this investment should remain materially unaltered. For information regarding the prospects of that company I refer you to the encouraging speech by the chairman at the last annual general meeting.

Electrical Division: The results so far this year are fully satisfactory and up to expectation. There is plenty of work on hand to keep the companies fully occupied for a considerable period ahead and I look forward with confidence to their producing good results at the end of the year.

Metals Division: Trading continues to be unsettled for the companies dealing in non-ferrous and ferrous scrap metals, and this has to some extent affected their results. However, there is indication that conditions are settling down and we hope that the

results for the remainder of the financial year will show an improvement over the early part of the year.

Engineering Division: Our engineering companies continue under the influence of the quick change from the seller's to the buyer's market involving the acceptance of business on a keener basis.

This, with the reduced demand also in several directions for capital goods, is affecting our position and, whilst we cannot yet say to what extent from a profit point of view, it is clear that our profits meantime are at a reduced rate.

That, then, is our position so far in the current year.

STAFF

We are very sorry that Mr Carnegie has decided to retire from the main board, having reached the statutory retirement age, but we are very pleased he has agreed to remain as chairman of one of our Divisions. Mr Carnegie has not been with the company for many years, but during his time with us he has been of great assistance, particularly in our Electrical and Engineering Divisions, in guiding the affairs of various subsidiary companies. Our best wishes go with him in his semi-retirement.

I have also to report the retirement of Mr Jerman, of The Hughes Bolckow Shipbreaking Company Limited, due to ill-health. Mr Jerman has been managing director of that company for many years and has brought it up to a very high state of efficiency, culminating in record results for last year. We extend to him our best wishes for a long and happy retirement.

Since the end of the year Mr Fleming, managing director of Igranic Electric Company Limited, has found it necessary for health reasons to relinquish his appointment. He has been managing director of that company for many years and has been largely responsible for its growth. We are very pleased, however, that although Mr Fleming has retired as managing director, he has agreed to remain as chairman of Igranic so that we shall still have the benefit of his advice.

I am pleased to be able to report that we have now started a works pension scheme. The response by employees has been most gratifying and fully justifies the launching of the scheme and the financial liability involved.

The directors of many of our subsidiary companies have been asked during the year to shoulder greater responsibilities and they have fully justified the extra duties entrusted to them. We have had the usual loyal service from our managers, staff, and operators, and I am sure that you will all join with me in thanking them for this loyalty and work.

PROSPECTS

Now I shall conclude with a brief summary of this year's prospects.

I expect this year that we shall again have good results from the Electrical Division.

In the Engineering Division, the change to the buyer's market and the lessening of demand for capital goods are likely to affect our profits adversely but I hope not to a great extent.

Shipbreaking, although it is not a large contributor to profits, will give an improved profit. The non-ferrous and ferrous scrap metal companies, I think, will show improved results for the remainder of the year.

I look forward to a result overall that will be found satisfactory despite any reduction in the total of profits that may be occasioned by continuance of the special factors I have mentioned.

PINCHIN, JOHNSON & ASSOCIATES, LIMITED

A DIFFICULT TRADING YEAR

FURTHER DEVELOPMENT AT HOME AND OVERSEAS

MR G. R. T. TAYLOR'S STATEMENT

The annual general meeting of Pinchin, Johnson & Associates, Limited, was held, on September 9th, at the Connaught Rooms, Kingsway, W.C., Mr G. R. T. Taylor (the chairman) presiding.

The following is the chairman's statement circulated with the report and accounts for the year ended March 31, 1953:

The report of the directors has referred to the reduced demand experienced in the period under review. This has resulted in net profits of the parent company and its subsidiaries, after all charges other than taxation, declining to £1,256,400, against £1,773,372 for the previous year, a reduction of approximately 29 per cent.

Total taxation of £718,159 was incurred on the 1952-53 profits, compared with £1,076,178 on the profits of 1951-52. After deducting profits attributable to minority shareholders the parent company's proportion of the net profit for 1952-53 is £422,496, compared with £520,893 available from the previous year's results.

I draw your attention to your company's balance sheet, as at March 31, 1953, which reveals a considerable improvement in liquid resources. Cash at £1,343,828 and tax reserve certificates of £425,000 compares with cash £434,359 and no tax reserve certificates, at March 31, 1952. The large increases arose mainly from the receipt of the proceeds of the issue of 54 per cent unsecured loan stock made during the year, and by a subsequent reduction in stock levels.

In anticipation of lower prices, we had initiated the reduction of stocks in advance of the fall in values which occurred in many raw materials, with the result that the depreciation incurred by your company was not unduly heavy, although some of our overseas subsidiary companies recorded depreciation in excess of normal. It will therefore be appreciated that the parent company's own trading results are an accurate reflection of the difficult conditions experienced throughout the year in the United Kingdom. Your directors are of the opinion that the fall in certain raw material values may for the time being continue, and in this connection you will recall that the contingencies and stock depreciation reserve was increased to £500,000 as at March 31, 1952.

In view of the possibility of future stock depreciation and the continuation of difficult trading conditions, your directors have decided, as a precaution, to maintain the reserve at the present figure and to recommend the payment of a final ordinary dividend of 12½ per cent, making a total of 20 per cent for the year. The adoption of this proposal will increase the balance carried forward in the parent company's profit and loss account by approximately £37,000.

The consolidated balance sheet now incorporates the assets and liabilities of the French company. Until 1952-53, when we obtained a majority interest in that company, our investment was included under the heading "trade investments."

It is anticipated that the item "bank loans and overdrafts," amounting to £912,959, shown in the consolidated balance sheet, and which relates to the overseas subsidiary com-

panies, will be substantially reduced in the present year.

DEVELOPMENTS AT HOME AND OVERSEAS

The acquisition of a controlling interest in Roxalin of Canada, Limited, has been completed, and part of the cost of our holding already paid leaving the balance to be settled in the near future. Our cash resources are ample to enable us to meet the call without embarrassment.

Since the close of our financial year, we have concluded the acquisition of a substantial interest in the Fishburn Printing Ink Company, Limited, of Watford, England, who have a first-class reputation in their trade. This investment will extend your interests to the printing ink field and is expected to yield a satisfactory return to your company.

Taubmans Industries, Limited, our Australian company, last year opened a new works in Brisbane, Queensland, which is illustrated in the supplementary pages accompanying the annual report. Since the close of their financial year the Australian company has disposed of their chemical company on satisfactory terms. The proceeds of the sale will augment the resources of the Australian company and permit the further extension of their surface coating activities. The capital profit resulting from the disposal of the chemical company will be reflected in the next balance sheet of Taubmans Industries, Limited, and the next consolidated balance sheet of the parent company and its subsidiaries. In the opinion of your directors, these developments will be to the ultimate benefit of shareholders.

GENERAL REVIEW

The reduced demand for the products of our industry in 1952-53 led to increased competition. You will be interested to know that the profits of the parent company were diminished by approximately the same proportion as were the profits of the overseas subsidiary companies. Thus the recession in the industry was experienced not only in the United Kingdom but also in many overseas markets.

I said last year in my statement to shareholders that it was probable that demand in the earlier months of 1951-52 was to some extent encouraged by the inflationary conditions then prevailing. The policies adopted by the British and other Governments to combat inflationary forces have since appeared to be having some success in curbing the unhealthy situation which was developing. Indeed, the reaction which has occurred in many industries, including the paint industry, may be one of the inevitable processes of adjustment. I am, however, convinced that if Governmental policies assist in achieving a reasonable degree of price stability, they will ultimately be to our advantage.

In 1952-53 the raw material position improved; our sales were not restricted to any considerable extent by lack of supplies of essential materials, but since then production

difficulties have occurred due to inadequate supplies of titanium pigments.

In our last financial year, your company's progress was retarded by circumstances beyond our control. The main problem we had to face, acute competition due to decreased demand, still confronts us. Despite this, we remain convinced of our ultimate progress and during the past year have carried our plant modernisation programme a stage further. Besides increasing our capacity, the steady development of our Manu-

facturing Units, Research and Laboratory activities that has taken place during the last few years has enabled us to maintain the pre-eminent quality of our established finishes and develop new coatings for industrial and decorative purposes. Our ability to supply a wide range of modern surface coatings to meet the exacting standards required by customers is therefore greater than ever before and I am confident that your company will quickly benefit from any increase of general demand which may occur in the coming months.

TATA IRON AND STEEL COMPANY, LIMITED

MR J. R. D. TATA'S SPEECH

The annual general meeting of the Tata Iron and Steel Company, Limited, was held on September 3rd in Bombay.

Mr J. R. D. Tata, Chairman of the company, presided, and in the course of his speech said:

"Since we last met a year ago important developments have taken place on the world's political and economic scene. Whatever the reason may be for the apparent change in Soviet policy, it could no longer be doubted that it has eased international tension both in Europe and the Far East, and brought hopes of better days to millions of peace-hungry people." Business and industry in particular should unreservedly welcome it, continued the Chairman "for there are few more untrue and yet more studiously fostered theories than that capitalism thrives on war or preparations for war. In actual fact, war and its aftermath of economic chaos more than any other factor in this century have been responsible for the decline or disappearance of capitalism, and, along with it, of democracy in large parts of the world. While business and industry may derive temporary stimulus from war orders, in the long run they can flourish only under conditions of peace and stability in which the people have an inducement to save and to build for the future."

MIXED ECONOMY

Commenting on the concept of a mixed economy for the country, which in India has found broad public acceptance and in which business and industry were anxious to co-operate, Mr Tata said, "A mixed economy, however, implies the co-existence of state enterprise and free enterprise, and cannot mean a wholly state-dominated economy where the industrial class is temporarily tolerated and permitted to survive pending further developments. A mixed economy can only function if there is within the community a balance of forces, with free enterprise operating as one of the autonomous forces pulling its weight alongside state enterprise, trade unions and other elements in society.

"I am led to make these observations," continued Mr Tata, "because I have noted a tendency on the part of Government, perhaps not deliberate, to deny to free enterprise a voice, or even consultation, in matters vitally affecting it or the economy as a whole. The manner in which, for instance, the Indian air transport industry was recently nationalised and the terms on which this was done would seem to indicate that Government sees no reason to carry with it the industrial sector and its representatives or even to give them a hearing before making up its mind. May I suggest that the time has come for Government to clarify their position and to state whether their ultimate goal is in fact a mixed economy, in which both sectors are permitted to function efficiently, or a state monopoly of all industrial enterprise.

"In contrast with conditions in our own country, a clear reversal of trend is taking place in most other free countries of the world after many years' experience of state ownership and rigid control of all economic activities. The truth is beginning to dawn, elsewhere at least, that state socialism in action as distinct from theory is hardly the economic and social panacea claimed by its advocates and that it does not lead to a classless society but to a dangerous concentration of all economic power into a few bureaucratic hands, which while acceptable in a totalitarian state is irreconcilable with real democracy."

This, explained the Chairman, was not a plea for a return to old-time "laissez-faire" in economic matters, for the interest of the nation as a whole had to prevail over the interest of the few. Mr Tata felt that the realistic and well-thought-out policies free from doctrinaire considerations and aimed at encouraging production, fostering savings, recognising honest and efficient management while deterring anti-social activities, would go a long way towards energising free enterprise and instilling in the private sector that sense of trusteeship advocated by Mahatma Gandhi. Such policies in respect of the private sector combined with state enterprise in appropriate fields, assistance to small-scale and cottage industries, and to the co-operative movement, land and social reforms and measures to control the growth of India's population, would provide the right kind of programme to revolutionise the economic activity of the country and to make a real success of the concept of a mixed economy.

POPULATION

Touching on the question of India's population, Mr Tata pointed out that it was increasing at the rate of nearly five million a year which meant that India would have to find work each year for an additional two and a half million employable men and women. "As the land is already overburdened with man-power," continued Mr Tata, "employment would have to be found for them outside agriculture, that is, in industry and services. Even assuming a much smaller capital expenditure per industrial worker than in western countries and a high proportion of employment in small-scale industries and services, requiring little or no capital equipment, the financial and other requirements are well beyond our present means."

Mr Tata observed that if it were possible for the next twenty-five or fifty years to keep the population of India static or at least reduce the rate of its growth, which was not beyond the medical, scientific and administrative possibilities of the day, the whole picture would change and every successive advance in India's economic output would result in some improvement in the living standards of the country. The Chairman, therefore, pleaded once again that "early

In conclusion, I am sure you will join me in thanking the management, members of the staff and all other workers throughout the world for their co-operation and loyalty in a year of trying conditions.

The report and accounts for the year ended March 31, 1953, were adopted, and a final dividend of 12½ per cent (less tax) was declared on the ordinary shares, making 20 per cent (less tax) for the year. The retiring directors were re-elected and the auditors' remuneration was fixed.

steps be taken to undertake a continuous and scientific study of this vital problem in its biological, economic and social aspects, for it is only on the basis of established facts and possibilities that subsequent action can be taken if found necessary and practicable."

Mr Tata, however, said that he could not for a moment suggest that in the negative task of controlling the growth of India's population lay the universal remedy for economic ills. "But," added he, "such control is necessary to enable constructive work to bear fruit. Real progress could be achieved only if, simultaneously, we continued to make every effort to increase the productivity of our country."

RATIONALISATION

Speaking on the subject of rationalisation, Mr Tata observed, "We are faced here with a continuing reluctance to learn from the experience of a century of industrialisation in Europe and America and to accept the fact that increased productivity does not lead to unemployment, but, through increased purchasing power, to enlarged opportunities for employment."

Continuing, he said, "If in their anxiety to deal with the present unemployment in the country our political and labour leaders adopt policies which frustrate attempts at improving efficiency and output *per capita* in industry such policies will jeopardise any chance that India may have of rapid economic progress, destroy her competitive position in world markets and, as a result, ultimately lead to still greater unemployment."

PROFIT-SHARING BONUS

Mr Tata informed the meeting of the fresh profit-sharing agreement with the Tata Workers' Union on terms similar to those of the previous agreement but with the percentage of net profits payable to labour increased from 27½ per cent to 30 per cent. He said that the management and the union, had discussed at length the means by which labour output could be increased and it had been agreed that the existing incentive schemes should be modified so as to lay greater emphasis on productivity. They had also had helpful discussions on the ways and means by which efficiency could be increased and discipline promoted.

TARIFF COMMISSION INQUIRY

Mr Tata then referred to the Tariff Commission's recommendation for a 2 per cent increase in the return on the gross block, subject to such increase being taken to reserve for the specific purpose of modernisation and expansion. This recommendation had been rejected by Government on the grounds that they had already agreed to advance to the company a loan of Rs 10 crores (£7,500,000) towards the financial requirements of the expansion programme.

In this connection, Mr Tata observed that Government must be aware that it could not possibly attract risk-capital, either Indian or foreign, to the steel industry on the basis of a gross return of 8 per cent and a net return of 3½ per cent. "Considering that the lack of capital has been, since the war, the main obstacle to the creation of the additional steel capacity so badly wanted by the country," continued Mr Tata, "I hope that Government will find it possible to reconsider the position they have taken up on this issue."

DEFERRED SHARE CONVERSION SCHEME

Referring to the deferred share conversion scheme, Mr Tata said that the legal and other formalities required to put through the scheme were in hand. Mr Tata mentioned two points concerning the scheme. One referred to the issue of bonus shares by the company, subject to the approval of the Government of India, of one new ordinary share for every ordinary share held after conversion. The other referred to the assurance given by him in 1950 and again in 1951 that the directors would not raise fresh capital in the near future and until the investment market improved. This assurance was renewed, said Mr Tata, "to the extent that we can finance such expansion out of internal savings and borrowings, we shall do so, but if, in view of the enormous cost of iron and steel-making plant, we have to seek funds beyond our own savings, some issue of capital may prove necessary. However, no decision to issue fresh capital will be taken without consulting the shareholders."

EDUCATIONAL GRANTS

The Chairman recalled that in his speeches of the last two years, he had mentioned the decision of the managing agents to forego a part of their commission with a view to placing it at the disposal of the company for providing engineering and other educational facilities in the areas in which the company's main operations are carried on. "In pursuance of this decision," he announced, "the managing agents waived a sum of Rs 7½ lakhs (£56,250) for each of the last two years and Rs 5 lakhs (£37,500) this year, bringing the total to the figure of Rs 20 lakhs (£150,000), subject to tax, which they originally had in mind. Out of the funds so made available, the board have already sanctioned grants of Rs 4 lakhs (£30,000) for a college in Chaibassa, Bihar, a little under a lakh (£7,500) spread over the next five years for engineering scholarships to Bihar students, Rs 6 lakhs (£45,000) to the Bihar Institute of Technology at Sindri, and Rs 3 lakhs (£22,500) for setting up a Polytechnic Institute in Hirakud, Orissa. These grants and proposals were in addition to the maintenance of a chair in geology in the Patna University at a cost of Rs 18,000 (£1,350) per annum.

The report and accounts were adopted.

GOLDEN HOPE RUBBER ESTATE, LIMITED

The annual general meeting of the Golden Hope Rubber Estate, Limited, will be held on September 30th, in London.

The following is an abstract of the address of the chairman, Sir Eric Macfadyen, circulated with the report and accounts:

At the close of the company's year in February, 1953, we had in all 16,947 acres of rubber and 2,419 acres of palms, 90 per cent of the rubber being mature and 10 per cent immature while all the oil palms except 81 acres were immature. All the immature plantings are postwar, 1,097 acres of them planted in the period under review. In the

current year we are adding 477 acres of replantings and new plantings, 381 acres of rubber and 96 acres of palms.

The company's present issued capital, £654,146, together with share premiums of £14,497 and development reserve, now standing at £275,000, total £943,643, which amount, the balance sheet shows, is largely invested in the fixed assets, which have a book value of £938,403.

The crop accounted for was 5,961,489 lb of rubber and the surplus of income over expenditure was £201,843 before taxation. After taxation £117,323 remains. This is raised by the balance from last year, £31,250, and by war damage grants, £29,127 net, to £177,700. The cost of the 7½ per cent interim dividend paid last October and the 10 per cent now recommended, making 17½ per cent for the year, is £52,135. Transfers to reserves take £85,074, leaving a carry-forward of £40,491 unappropriated to next year.

PYE LIMITED

CONTINUED PROGRESS

The twenty-fourth annual general meeting of Pye Limited was held on September 9th in London.

Mr C. O. Stanley, CBE, chairman of the company, presided, and, in the course of his speech, said:

Some people have written and asked my opinion on the commercial television dispute, but being a member of the Television Advisory Committee, I am not allowed to make any statement meantime. However, as soon as I am permitted, I will be delighted to state my personal feelings on this quite frankly.

Other letters have dealt with purchase tax and the credit stringency that restricts our export sales. I can add little to what has already been said in the report on the question of purchase tax, but there is one point that ought to be considered by the Government at the earliest possible moment. In our industry from the very earliest stage in production a television or radio set is identified by a number, by which it can be traced throughout its life, and in this respect it differs from most forms of bulk merchandise. The burden imposed on our retailers when a reduction in purchase tax occurs could be avoided by an early decision by the Government to allow rebates of purchase tax on identifiable goods held in stock by retailers at the time of reduction.

We have told you that the export market is becoming increasingly difficult, but in spite of this we have taken steps to increase our sales by making a special effort in this field during the present year. Our export organisation has established its contacts in fresh countries, and it is our intention this year to send several of our executives abroad to promote sales, and to obtain information that will help us to exploit the overseas market more fully.

GRAMOPHONE RECORD BUSINESS

For a number of years your company has wished to have an interest in the gramophone record business. We are at this moment actively planning to enter this new field of manufacture and selling, and we hope to be able to make a definite announcement in the very near future.

Our new television industrial camera is now in production, and the first models will be going to overseas customers within a very short time. Already it is clear that all over the world there is a large demand for this product.

After making full allowance for the reductions made last year in purchase tax and

income tax we have calculated that out of every 20s. we receive for radio and television sets sold, no less than 7s. 2d. is taken by the Government in taxation of one form or another and only 4d. is left. Out of this 4d. we have to pay dividends to shareholders. Only the small sum remaining is available for future expansion and the increased cost of replacing capital assets. For this reason we have from time to time to raise fresh capital.

In practically every section of the organisation production efficiency has been improved, business has been extended, and profits have been made. For the first five months of this year our turnover has been larger than during the same months in any previous year. Nobody can tell whether this progress will continue without interruption. Despite the costs of expansion we must remember that the television market has only just begun in this country and has an enormous future. That alone should ensure the success of the company for many years to come.

The report was adopted.

WILLIAMS & WILLIAMS LIMITED

HIGH PRESTIGE OF COMPANY'S PRODUCTS

INCREASE OF CAPITAL APPROVED

The forty-fourth annual general meeting of Williams & Williams Limited was held on September 4th at Reliance Works, Chester, Mr B. A. Williams, OBE, MIPE, chairman of the company, presided, and, in the course of his remarks, said:

Ladies and gentlemen, it seems fitting that in this Coronation Year I should present to you a report of the most satisfying results your company has yet achieved, but the present occasion is also the source of much personal pride. So closely has the Williams' family been associated during the past century with the manufacture of metal windows that today Williams' windows enjoy an enviable prestige throughout the civilised world.

The trading profit of the group amounts to £570,954, an increase over the previous year of £159,043. Taxation takes a very large proportion of the profits and amounts to no less a sum than £365,087 being in excess of £1,000 per day for the year ahead.

Permission has been obtained from the Capital Issues Committee for an increase in the issued capital of the company, partly by the capitalisation of part of the company's reserves, and partly by issue of new ordinary shares for cash. Your directors will in consequence be able to proceed with the developments and equipment necessary for the continued expansion of your business both at home and overseas.

I have over the years expressed my views on the inadequacy of depreciation allowances and the heavy burden of taxation. We hope that it will become a recognised part of national policy to reduce these burdens to such an extent that British industry can out of its net profits, after taxation, give effect to a uniform policy of continual modernisation. This would permit industry to operate at a lower rate of gross profit and not only make an important contribution to the lowering of the cost of goods in the home market but also improve its ability to meet competition in overseas markets.

GREATER FREEDOM OF RAW MATERIALS

I am pleased to inform you that with the exception of sheet steel our raw materials are now freer than they have been for many years, and we can now contemplate the development of those markets which were

unavailable to us while raw materials were scarce.

This greater freedom of materials creates an entirely new situation—a situation which gives your company the opportunity of contributing in peacetime, as it so noticeably did in wartime, to the implementation of the Government's declared policy. By this I mean that architects, county and local authorities, contractors, and all who use your company's products, realise that there is no limitation or restriction on their supply. Thus, in using Williams and Williams products they entirely preclude the expenditure of badly needed foreign currency and furthermore are actually earning it at a time when it is so urgently needed.

The report was adopted and the ordinary dividend of 25 per cent was approved.

Following the close of the annual general meeting, class meetings of the preference and ordinary shareholders respectively and an extraordinary general meeting were held. Resolutions giving effect to certain changes in the capital structure of the company, details of which had been previously circulated, were duly approved.

CONSOLIDATED TIN SMELTERS, LIMITED

DIVIDEND MAINTAINED

The twenty-fourth annual general meeting of Consolidated Tin Smelters, Limited, was held on September 10th in London, Mr Clifford Waite (chairman and joint managing director) presiding.

The following is an extract from his circulated review for the year ended March 31, 1953:

The net revenue of the parent company is £315,053, out of which your directors have made appropriations similar to those made last year—£50,000 to general reserve and £50,000 to write down the investment in subsidiary companies. They recommend a dividend of 2s. 6d. per £1 ordinary stock, the same rate as for the previous year.

The throughput of concentrates at our works showed a slight increase of 1.5 per cent when compared with last year, which, when all the relevant factors are considered, can, I think, be regarded as satisfactory.

PRODUCTION AND CONSUMPTION

World production of tin in concentrates as reported by the Statistical Bulletin of the International Tin Study Group has shown an increase in each of the last three calendar years. World consumption appears to have shown a steady decline, largely due to the figures disclosed for the consumption of the United States of America—the world's largest tin consumer.

The price of tin during the year under review was steadier but lower as compared with the year ended March 31, 1952. Since March 31, 1953, the price on both markets has continued to decline, the Singapore price falling to the equivalent of £620 17s. 6d. on July 8th, and the Settlement price on the London Metal Exchange to £612 10s. per ton on July 8th, the lowest price since July 4, 1950.

In Malaya the position has improved appreciably under the administration and

control of General Templer, but there is still much to be done in that country before it returns to normality and the inhabitants and business community can move freely about the country without fear of molestation. There is certainly no room for complacency.

CHAIRMAN'S SUPPLEMENTARY REMARKS

At the meeting the chairman referred to some comments regarding the accounts of the company made in *The Statist* in their issue of August 29th and said: In this article readers are led to believe that we take market risk on our stocks of tin and tin concentrates. In order to avoid any misapprehension in the minds of members of the company, I should like to make it clear that neither your company nor its operating subsidiaries takes a view of the tin market. It has always been our practice to purchase our tin concentrates on the basis of either the Singapore price or the London Metal Exchange price, whichever is applicable, on specified market days, and to sell the resultant tin on the same days. Thus it is our practice to "marry" our purchases of tin in concentrates with our sales of tin so that our market risk is negligible.

These remarks also apply to the tin concentrates having an approximate value of £4,800,000, to which reference is made in the accounts. This material either arrived at, or was in transit to, our works at March 31, 1953, but under the terms of our contracts with the producers of the tin concentrates the actual basis price for purchase was not due to be fixed until dates subsequent to March 31, 1953.

The report and accounts were adopted.

ACHIEVEMENT IN THE AIR

From Prototype to Production
Design for Speed

An Industry in Depth
New Conceptions in Air Strategy

From Prototype to Production

A SUBTLE change of attitude has been taking place in the British aircraft industry: something that a hostile critic might interpret as the first signs of complacency. The industry's exhibition at Farnborough this week gave evidence of this change in a number of small ways, not least in the flying display itself. With last year's tragic accident in mind, the Society of British Aircraft Constructors has put severe restrictions on the type of aerobatics that the test pilots might do in the aircraft that they demonstrated. Several of the exhibiting companies seem to have interpreted these restrictions as justification for a rather cursory display of their aircraft that amounted in more than one case to little more than a decorous fly-past and circuit of the airfield.

This type of display may be justified on the closing days of the exhibition when the public turns up hundreds of thousands strong, but it is not what the industry's civil and military guests have come—in some cases across half the world—to see. They are accustomed to look on the Farnborough show as the occasion on which they can see the latest British designs put through their paces and exhibited to the limit of their capacities. The experts who came from all parts of the world to watch demonstrations of this kind did so fully accepting the inevitable degree of risk that it involved for they—of all people—appreciated that new aircraft embody new principles of design that can only be proved—or disproved—by testing in flight. An audience of this calibre is entitled to expect more from the flying than trick demonstrations of supersonic bangs.

The industry's present attitude may in part be explained by the fact that the major research effort of the past six or seven years has in almost all cases been rewarded by production contracts. For the first time in years the exhibiting firms were not fighting for orders; they had signed contracts in their pockets to keep them comfortably employed for three years at least. The aircraft that were flown in the display this week showed, in miniature, the shape that the RAF will soon assume. The specifications for them were put up to the industry's designers shortly after the end of the war and a deliberate risk was taken to keep the RAF under-equipped until they became available. The strategic

role of these aircraft is described in a later article. The tally consists of three long-range atom bombers, the Vickers Valiant (the backbone of Bomber Command), the Avro Vulcan and the Handley Page Victor; and the medium-range Canberra bomber designed by English Electric and also built by Handley Page, Avro, and Short Brothers and Harland. Among the fighters are the Vickers-Armstrong Swift and Hawker Hunter day fighters—that is, fighters not equipped with radar and therefore suitable only for day interception—and the all-weather Gloster Javelin fighter. Fighters of the Javelin type, carrying radar and wholly independent of weather conditions, are likely to become increasingly important and the Javelin's competitor, the all-weather de Havilland 110, has been taken up by the Navy. The Navy has also sponsored the development of a special class of turbo-prop anti-submarine fighters, using this more economical type of engine for operations that require range to search over the sea and reserving pure jet fighters like the 110 and a fighter being developed by Vickers-Armstrongs, for high-altitude defence of the fleet. Fairey, Westland and Shorts are all building turbo-prop anti-submarine designs for the Navy.

Blackburn is building heavy freighters; several of the smaller companies are working on contracts for trainers; and Bristol, Vickers-Armstrongs and de Havilland also have substantial civil orders. The industry's total output is probably running this year at more than £200 million, about £130 of it for Government orders. Next year, Government contracts will probably increase to about £150 million and under the present defence programme will stay at that level for the next three years. Export orders and production for civil operators at home may rise to an annual figure of about £100 million, and some estimates would put the eventual figure as high as £150 million. The industry would appear to be facing a prosperous future, and this, combined with knowledge of the high reputation at present enjoyed by British aircraft and engine design, may explain why the once razor-sharp edge of the industry's salesmanship appeared to have been a little blunter at Farnborough this year.

Real competition in the aircraft industry is no longer between machines that are in the air today—those battles

CROWN ZELLERBACH CORPORATION

CONDENSED SUMMARY OF CONSOLIDATED RESULTS FOR THREE MONTHS ENDED JULY 31

	1953*	1952
Net Sales	\$70,281,778	\$59,107,967
Income before taxes on income	13,271,871	11,743,046
United States and Canadian taxes on income	7,101,000	6,563,000
Net income	6,106,000	5,148,564
Dividends declared	3,430,208	2,863,841
Earnings retained in the business	2,675,792	2,284,723
Additions and improvements to properties	3,056,045	2,735,868
Per share of common stock, based on average number of shares outstanding during period:		
Income before taxes on income	2.03	1.96
Net income	.90	.82½
Dividends paid	.45	.37½
Retained in the business	.45	.45
Production of paper and paper board—Tons	250,138	215,487

* (Figures for three months ended July 31, 1953, include results of operations of Canadian Western Lumber Company, Limited, and Elk Falls Company Limited for July, 1953, and of St. Helens Pulp and Paper Company for June and July, 1953.)

Copies of the quarterly report to July 31, 1953, may be obtained from the London Transfer Agents, The British Empire Trust Company, Limited, 52-60 Bishopsgate, E.C.2, on application.

Residents in the British Isles, whose shares are not registered in their own names, and other interested parties who wish their names placed on the mailing list for future communications, should notify the London Transfer Agents accordingly.

NOTICES

SCHOOL OF ECONOMICS, DUNDEE

Courses of study are offered for:
B.Sc. ECON. DEGREE OF LONDON UNIVERSITY.

A four-year course for an Honours Degree.
GENERAL CERTIFICATE OF EDUCATION ADVANCED LEVEL OF LONDON UNIVERSITY.

A one-year course in Economics, Economic History, Geography and British Constitution.
POST GRADUATE DIPLOMA IN BUSINESS ADMINISTRATION OF THE SCHOOL.

A one-year course for University Graduates.
Copies of the Calendar of the School can be obtained from the Secretary, 17 Bell Street, Dundee.

APPOINTMENT as General Manager or Controller, preferably overseas, is sought by a senior executive, aged 36. At present director and secretary to a group of companies in tropical Africa capitalised at £3 million with interests in mining, cement and hard-board manufacture, and marketing.

Advertiser has broad experience in the fields of accounting and financial control, production and distribution. Is interested only in serving a substantial organisation where efficiency in achieving maximum results with minimum costs is required. Interview U.K.—Box 317.

OPERATIONAL RESEARCH. COURTAULDS, LIMITED, has a vacancy for an Assistant in its Operational Research Department with a degree in applied mathematics, physics, chemistry or engineering and with an interest in investigational work.

A knowledge of statistics is desirable but basic mathematics for learning statistical methods and related techniques is essential.

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds, Limited, 16, St. Martin's-le-Grand, London, E.C.1 quoting the reference number C.47.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History, and Social Sciences, you may wish to sell (periodicals excluded).

BARRISTER, thirties, 6 years in charge of Internal Legal Department of leading Trade Association. Well versed in the pros and cons of restrictive trade practices. Experienced administrator. Desires to move.—Box 330.

CANADIAN woman Economics graduate, experience in marketing research, budgeting, financial statements, report writing, pension plan administration, seeks post in business administration or operational research unit.—Box 326.

CREDIT MANAGER wanted, experienced in granting credit and collecting from medium-size retail businesses in rural communities. London headquarters; some travelling in U.K. Give age, salary and experience.—Box 325.

PRIMAVERA of Sloane Street require lady with managerial experience to take charge of their showroom. Selling experience essential. Telephone SLO 5779 for appointment.

ENGLISH SALES EXECUTIVE seeks senior appointment with progressive American company. Considerable previous experience in U.S. companies and markets. Languages.—Box 319.

MARKET AND MEDIA RESEARCH ASSISTANT wanted for research department of important advertising agency. Previous experience an advantage but not essential.—Write Box 331.

have been fought and won—but between those that are barely on the drawing boards. With the major exception of the de Havilland Comet, the Ministry of Supply has carried the entire burden of the aircraft industry's development charges since the war. In the lean post-war years, when there were hardly any production orders, development contracts were handed out generously as a means of keeping the industry alive. Such public money may not be so freely available in future. Defence votes as a whole seem likely candidates for economy and claimants for a share in the Research and Defence vote are continually growing. The service staffs will have to limit their choice of projects to go forward for development.

British and American aircraft design shows great contrasts in wing shapes and outlines. These are strikingly illustrated by the delta winged Vulcan bomber, with a deep, thick wing that buries four engines and even the fuselage and . . .

As money becomes scarcer, future development contracts with the aircraft industry will be more carefully scrutinised. A specific problem under discussion at the moment may illustrate what is likely to happen. The industry has put forward four competing designs of jet airliner to follow the Comet III: the de Havilland Comet IV, and civil versions of the Vickers Valiant bomber, of the Avro Vulcan bomber, and of the Handley-Page Victor bomber. Each company wants the Ministry to finance the development of these airliners; each design has certain clear merits that would justify such support. But the Ministry will have to choose now between the four projects, and before there are sufficient data to show which of them is the most promising. In the military field, shortage of funds for development will sharpen the competition between alternative designs put up for the same specification—in former days all would have been supported; and certain types of aircraft will not be developed at all. Can Britain continue to spend freely on helicopters to develop them into an economic means of transport? Will the development of a light-weight fighter be sacrificed in the interests of economy?

To choose between competing designs and projects before the ideas that they embody can be put to the first practical test could have serious consequences for technical progress

in the aircraft industry—unless its members can find a formula for assuming at least some part of the cost of aircraft development. Since about three-quarters of the industry's orders seem likely to come from Government departments, and since the services are often capricious in their requirements, public funds will probably have to continue to carry a significant proportion of the burden of development, for it involves commercial risks that no private management could undertake. But the industry has now reached a stage of comparative stability at which it should be financially capable of contributing something towards the cost of development. It would be an act of sound political wisdom to do so. A recent example of this sort is provided by the Gyron engine of de Havilland. The company's engineers designed an engine for which no service specification existed at the time, and the company financed its construction up to a point where an engine had been built and was running on a test bed. The theory behind the design having been partially proved, it was then assisted by a development contract by the Ministry of Supply. Now that most companies have substantial production orders, it is not unreasonable to expect that they should either finance some of the cost of preliminary development or enter into partnership with the Ministry.

The aircraft industry is building up a substantial export business in civil and military aircraft; when deliveries get

. . . compares strangely with the American B47 bomber's exceptionally thin, narrow wings with the engines slung in pods beneath them.

under way during the next few years a third to a half of its revenue will come from sources other than the Government. Such an increase in sales, coupled with any development charges that the industry assumes will call for further increases in working capital. But there is among investors and in the City of London a new assessment of the outlook for the industry. And certainly an industry that lives by technical advance is not likely to show itself less enterprising financially.

An Industry in Depth

A "MASTER INDEX" at the Ministry of Supply lists about 18,000 items that may go into building a modern aircraft, and remarkably few of them can go into anything else. The aircraft manufacturers buy large quantities of basic materials, particularly light alloys and other metals, but much even of these will be to individual specifications that few other customers want. Again, there are some things used commonly elsewhere, such as upholstery, among the manufactured goods that the industry "buys out"; but the vast majority of its purchases are designed specially to suit its conflicting requirements of exceptional strength and lightness.

The same differences can be traced among the fighters—in the American Sabre, for example, with its thin narrow wing and sausage-shaped fuselage, and the delta planform of the Gloster Javelin.

Such estimates as can be made of the total amount the industry buys out are so approximate as to be nearly useless. The industry itself is too difficult to delimit and measure. To the pure airframe constructor such as Handley Page or A. V. Roe, even an aero-engine is something that it buys out or receives free from the Ministry on "embodiment loan"; but Rolls-Royce or Napier would hardly relish any suggestion that the makers of engines are outside the aircraft industry. The 1948 Census of Production valued the materials and parts purchased or received free from the Ministry at some £45 million out of a total output of £114 million of aircraft and accessories or just over 40 per cent (compared with 50 per cent bought out in shipbuilding and more than 60 per cent in the motor industry). That very broad figure may have some validity, but both the Ministry and the SBAC suspect that the more detailed figure given in the census for purchases of manufactured components and parts, which even with free issues would amount to only 20-25 per cent of the industry's output (compared with 40-45 per cent in the motor industry) is misleadingly low.

The industry's net "added value" probably is high. It seems, for example, to bear unusually large salary costs, perhaps inherent in its big design staffs and its degree of

research and development. Moreover, the trend appears to be for the proportion of work done by the airframe builder, in fabrication, construction and installation, to increase. There are about the same number of forgings on a Swift as there were on a Spitfire; but they weigh about six times as much and need about five times the machining. But even the proportions suggested above would mean that the aircraft and aero-engine manufacturers may now be spending more than £100 million on their purchases.

A more effective measure, however, can perhaps be given by valuing what goes into an aircraft or where the money spent on the air programme goes; though the complications here, too, are so considerable as to make some experts aver that "it is impossible to cost an aircraft realistically." The accompanying table breaks down the total cost of three aircraft—a wartime Lancaster, the Meteor fighter (now a veteran and very cheap to build), and the Canberra bomber—into broad categories of materials, bought-out parts, and "embodiment loan" items bought direct by the Ministry and supplied to the airframe constructor for

ANALYSIS OF COSTS OF MILITARY AIRCRAFT

	Lancaster (1943)	Meteor F.8	Canberra B.2
Percentage of total cost			
<i>Purchases by contractor:—</i>	%	%	%
Materials:—			
Steel	0.77	0.87	0.09
Light alloys	9.88	6.62	2.31
Other materials	1.58	0.41	0.60
Total materials	12.23	8.5	3.0
Proprietary parts (under-carriages, hydraulics, self-sealing tanks, etc.)	13.94	9.8	4.3
<i>Embodiment Loan Items:—</i>			
Bought by Ministry and supplied to airframe contractor:—			
Aero-engines	30.80	27.0	30.0
Other items	19.08	16.7	24.0
Total embodiment loan items	49.88	43.7	54.0
Construction and assembly by contractor and sub-contractor	24.0	38.6	38.7
	100.0	100.0	100.0

installation, including aero-engines, propellers, instruments and navigational equipment, cameras, armament, radio and radar. The maker's "proprietary purchases" on sub-contract are likely to include under-carriages, power-assisted controls, hydraulic and pressurising equipment, electrical equipment, and the mass of wiring that goes into an aircraft. In the same way that the table analyses costs for aircraft, the total cost of a Derwent jet engine

(which is fairly typical) is made up of 23 per cent for raw materials, 26 per cent for bought out supplies, of which the fuel system accounts for nearly two-thirds and the sheet metal combustion equipment, "canware," for most of the remainder, and 51 per cent for the work of the main contractor; practically nothing is supplied on embodiment loan.

Total expenditure on military aircraft, moreover, gives an indication of the contribution of different industries to the air programme:

	Per cent
Airframes:—	
New production	32.6
Modification and conversion	2.5
Spares and repairs	11.7
Engines:—	
New production	16.8
Modification and conversion	1.5
Spares	5.8
Propellers and gun turrets	2.0
Equipment:—	
Electrical and instruments	6.7
Miscellaneous	3.9
Electronics, radar, radio, etc.	16.5
	100.0

The extent to which the industry's main suppliers, in their turn, depend upon aircraft business varies enormously. The industry is a major customer for some makers of special steels and high-temperature alloys, such as Henry Wiggin; a large consumer of aluminium, though one among many; the largest user of magnesium and its alloys; and perhaps the only early customer for titanium, when that comes along. High Duty Alloys, perhaps the most important supplier of light alloy forgings, owned by the Hawker

The British Hunter (left) and the Swift both have wings that are noticeably deep in relation to their span, with engine air intakes placed in the wing roots.

Siddeley aircraft group, still finds possibly a quarter of its work outside the industry, and James Booth, another important supplier, has much larger interests outside aircraft.

Undercarriages are more specialised, though the makers usually do other work for aircraft. Some airframe constructors build their own, perhaps with assistance from a design team such as British Messier; Rotol and Dowty Equipment at Cheltenham are both almost wholly engaged

on this work and other parts such as fuel equipment for aero-engines. Wheels, brakes, and tyres engage some specialists such as Palmer Tyres, a large part of Lockheed's attention, and a very much smaller proportion of Dunlop's. Power controls generally come from electrical equipment specialists, though some major aircraft companies such as Fairey and Boulton Paul make their own and sell within

The Russian MIG, on the left, favours the narrow wing and nose air intake while the de Havilland 110 is another example of the deep, thick typically British wing.

the industry; in the same way Normalair, a subsidiary of Westland, is well known for pressurising equipment.

Most of the big motor accessory producers, such as Lucas, Rotax, and the Smith group, have large special divisions for aircraft accessories, while for such instrument makers as Sperry Gyroscope, Kelvin and Hughes, and Sangamo Weston, aircraft may constitute their largest customer. It is a less important customer for electrical equipment, while even during rearmament the demand for radio and radar equipment amounts to only about £20 million (in 1952-53) out of the electronics industry's turnover of perhaps £150 million a year but its demand is concentrated to some extent upon particular companies.

Outside the supply of proprietary components, perhaps 15 per cent of aircraft expenditure goes upon sub-contracting. Much is spent within the industry, which shares very large contracts and has some specialist sub-contractors such as Folland Aircraft and Heston; but major "outsiders" such as Standard Motor and Pressed Steel have been brought in on engines and airframe sub-assemblies. Extra capacity had to be created in some cases for components and parts, and the Ministry had to give "capital assistance" for much of this; the aircraft industry, with its sickening ups and downs, has never been a customer that most suppliers would consider worth risky investment. Capital assistance has perhaps been given generally in the creation of capacity for forging compressor blades in various ways; this consequence of the switch from centrifugal compressors to axial-flow compressors is almost a small new industry in itself.

Should rearmament taper off, or if the pattern of defence demand shifts from aircraft to other aerial weapons, some of this specialised capacity will become idle and the Government will have to decide whether, and if so how, to keep it ticking over. This is a familiar problem in the aircraft industry, but probably not a large one, for the materials and component suppliers.

Radar for the Jet Age

The rapid and safe landing of the modern fighter demands a radar of the highest quality—accurate, reliable and speedy in operation. Decca Airfield Control Radar 424 fulfils the most exacting requirements at an exceptionally low cost. Achieving a landing rate previously impossible, it adds vital minutes to operational sorties.

DECCA AIRFIELD CONTROL RADAR

DECCA RADAR LIMITED, 1-3 Brixton Road, London, S.W.9, England

The outstanding progress of British jet engines

IMAGINE a Comet airliner taking off from London one Monday morning early in September on a route that encircled the globe, a matter of 25,000 miles, occupying (with halts) under four days. Having returned to London, it sets off again on the same schedule.

Imagine this routine being maintained all through September and half of October until the Comet had flown ten times round the world, a total distance of 250,000 miles, as far as from here to the moon.

When the Comet came in to London Airport after the tenth circuit only then would its de Havilland Ghost jet engines be due for overhaul and, after being removed from the aircraft, they would be sent to The de Havilland Engine Company at Watford, where, at the present time, many Ghosts are being overhauled every week for airline service.

During the ten laps of the world the Ghost engines would need nothing more than the routine inspections of external parts and flame tubes, for which purposes the engines might be changed, but only for the sake of convenience, to avoid delaying the aircraft.

There is no other jet engine in the world which is being subjected to the rigours of airline operation. Military activity does not call for anything like the same prolonged and arduous service. The Ghost engine, which made the Comet possible, is now giving 600 hours (a quarter-million miles) of duty between overhauls, with extension trials to 750 hours already under way.

Ghosts are flying 600,000 engine-miles a week in airline service, and up to August 31 they have flown 32,000,000 engine-miles since the Comet went into service on May 2, 1952.

The new de Havilland Gyron jet engine, incomparably more powerful than the Ghost, in fact almost certainly the most powerful jet engine in the world to-day by far, has been designed out of the knowledge gained from all this experience. It is intended, in its initial form, for supersonic fighters, but is capable of development for other roles. It is essentially a light, simple, economical jet of enormous output, and like all de Havilland engines it is built for durability.

THE GHOST—THE JET ENGINE THAT MADE THE COMET POSSIBLE

DE HAVILLAND
ENGINES

Design for Speed

THE drawings that have been used to illustrate this survey show a number of aircraft that are in service or going into production in this country, the United States and France. The startling differences in the shapes seen in the sky are apparent to the most untutored eye. Some aircraft have wings that are thin and straight; some wings are thin and swept; a third group are delta or near-delta shaped; and yet a fourth type of wing, half-swept, half-straight, is fancied by more than one eminent designer. Some aircraft have massive tails, and others none at all. The one feature common to all these aircraft is that they are designed for very high speeds, at or just below the speed of sound, where flying conditions are peculiarly difficult. Each conformation is a different solution put forward by a different designer to meet these conditions.

This variety is confusing for the layman. It will help him first to understand that there are no absolute measurements in aircraft design, only relationships between one dimension and another. Even the speed of sound is relative, starting at 760 mph at sea level and getting lower as altitude rises. The existence of so many variable relationships, between weight and wing area, or between the span, the width and the thickness of the wing, allows the possibility that a number of different yet right solutions may exist for the same problem of high speed design.

Up to a point, the pre-occupation of designers is to get enough brute force to push an airframe through the air. The faster the aircraft, the greater the air resistance that it meets; and as the aircraft begins to approach the speed of sound, this drag rises steeply. Translated into terms of aircraft requirements, the amount of extra engine power needed to push an aircraft a few miles per hour faster is far greater in this trans-sonic region when it is flying just below or just above the speed of sound than it is when the aircraft is flying at sub-sonic or super-sonic speeds. The reason is this: before the aircraft reaches the speed of sound, some of the air flowing over its wings is already travelling at sonic speed; the small pressure waves caused by the passage of an aircraft through the air pile up on each other at the points where the flow of air has reached the speed of sound, and it takes a great increase in engine power to push through the jumble. This "compressibility" causes other difficulties, apart from extra drag. It affects both the steadiness of the aircraft, and so its value as a gun platform or a bombing station, and its controllability, which hazards the aircraft and its crew. This is what the "sound barrier" has turned out to be—a region extending just below and above the speed of sound in which

the aircraft meets, in relation to its speed, the maximum possible resistance from the air, and where flying conditions can be unpleasant and dangerous but not impossible.

A designer will do whatever he can to extend the point at which the air-flow becomes super-sonic and causes compressibility troubles. The greater the angle at which its wing is swept back, the faster an aircraft can fly before these effects start to occur. All designers would appear to agree on this point; but they differ on what a swept wing should look like. There is, indeed, more to high speed design than overcoming drag, and there is more than one source of drag. According to theory—which can let designers down with depressing frequency—a "high aspect ratio" wing in which the width, measured from front to back, is small in relation to its span, keeps part of the drag down. This means better range for bombers, longer endurance for fighters, and good altitude performance.

The classic example of this sort of wing in its sharply swept form is the Boeing B47 bomber, although to a lesser degree the Russian MIG, the American Sabre and the French Mystère all show traces of this thinking.

This principle of design has found less favour in this country. The narrow swept wing is difficult to build. To make it strong enough all along its immense span to withstand the stresses of flight at high speeds requires a degree of structural stiffening that threatens to make it extremely heavy. It cannot be used to house engines because it is sharply swept and is too thin. A single engine can go in the fuselage, but if there is more than one they have got to be slung

beneath in pods, a system that has not commended itself to British designers. Should one of the outboard engines fail, a sharp variation in the amount of engine thrust along the two wings affects the control and handling of the aircraft; this risk is less when the engines are housed close to the fuselage.

The narrow swept wing also has disadvantages in flight. It cannot be rigid, for it would then be so strong and thick that drag might be increased, not reduced, and its weight would be increased. This means that the thin swept wing has to deflect—or in a word, to flap—under pressure in flight. Such flexibility leads to troubles when the controls are applied, because the wing tends to twist at the tip and cancel out the movement of the controls. A new wing designed by Short Brothers and Harland has minimised this tendency to twist and combined it with a positive method of control, but this form of movable wing tip is in the early stages of experiment.

Other designers have put forward a different wing shape

VOCABULARY OF SPEED

Speed of Sound = 760 miles an hour at sea level, falling roughly $2\frac{1}{2}$ miles per hour with every 1,000 feet of altitude.

Mach number = $\frac{\text{Speed of aircraft}}{\text{Speed of sound}}$

Mach 0.9 = Aircraft flying below speed of sound.

Mach 1 = Aircraft flying at the speed of sound.

Mach 1.1 = Aircraft flying above the speed of sound.

Sub-sonic = Less than
Sonic = At
Super-sonic = More than } Speed of sound.

Trans-sonic = A speed range that the aircraft enters when some of the air flowing over its wings reaches sonic speed and leaves when the whole of the air-flow over its surface has reached super-sonic speed, i.e., the range of speed between Mach 0.9 to Mach 1.8

High aspect ratio = A long narrow wing of large span in relation to its depth from back to front.

Low aspect ratio = A short thick wing of small span in relation to the depth.

which, in their view, has compensatory advantages to set off against several of the points that it loses to the narrow swept wing. This design is the swept wing of "low aspect ratio"—in lay terms, a wing of which the width is quite large in relation to its span. Its ultimate form is the delta wing, but the principle of low or moderate aspect ratio can be seen in one form or another in most of the drawings of British aircraft. While the delta or near-delta wing has a higher drag than the long, narrow wing, it has a better lifting ability and in flight the two types end up about equal. Streamlining, too, is as important in reducing drag as sweeping back the wing shape. A streamlined wing can be as thick as the designer chooses, provided that the thickness is small in relation to its width from front to back. Here is another example of the way in which relative and not absolute measurements dominate aerodynamics. The delta wing of the Vulcan bomber and the Javelin fighter, the novel form of the de Havilland 110, where the tail is carried on twin booms to avoid the added weight of a long fuselage, and even the Swift and Hunter swept-wing fighters show wings that look thick in comparison with some of the other designs. But they are so deep that the rise from the tapered edge of the wing to its thickest point does not unduly disturb the air flow over the wings.

Large quantities of fuel can be stored in these thick, low aspect ratio wings, and the engines housed there too, if necessary, without disturbing their streamlining. This, in turn, has a bearing on the size and weight of the fuselage. A designer who is prepared to put more fuel in the wing, and place the air intakes in the wing root, may put up the drag from his wing but he reduces the drag from his fuselage and he has a structurally stiffer wing. His choice will be decided by what he wants the aircraft to do.

To sum up at this stage, a wing that departs from the thin swept outline of high aspect ratio can be made

The Handley Page Victor bomber strikes a balance between the excessively narrow and the excessively deep wing by using a "cranked" wing with three angles of sweep.

structurally much stronger, but at the expense of putting up the drag. At least two British designers have looked for a compromise between the two extreme types of thick and thin swept wing. Both the Valiant and the Victor bomber have wings that have a "high aspect

The French Trident rocket fighter, designed for true supersonic speeds, has reverted to the thin, straight wing.

ratio"—that is, relatively big span and narrow width, but the angle at which the tips of their wings are swept back is much smaller than it is at the root. This curious cranked wing enables the designers to make the root of the wing thick enough to bury the engines, and the tip thin enough to be only partially swept. The object in both designs is to avoid drag at the tips of the wings. The cranked wing avoids the structural difficulties of the thin swept wing, and ensures that the aircraft will handle well at low speeds—a point of behaviour that will decide the length of runway that it will need and thus its serviceability in military use. The controls on an aircraft's wing work most effectively at low speeds when they are at right-angles to the fuselage, and on this point both the delta and the straight wing or nearly straight tip score heavily over the swept wing. When this is combined, as it is in many British aircraft, with a tendency for the area of the wing to be large in relation to the weight of the aircraft, low-speed characteristics and manoeuvrability generally tend to be better than those of a thin swept wing. These may be advantages worth some sacrifice in terms of absolute performance.

None of the philosophies of high speed design described here are conclusively proved; their only proof is to build them into aircraft and test them in flight. A successful design may owe as much to intuition as it does to reasoned logic, and cherished theories are regularly being confounded. Structural strength in airframes is becoming a more dominant consideration as trans-sonic stresses are becoming better understood; and the specialist in aerodynamics sometimes has to take orders from the structural engineer. Tails and wing-tips appear especially vulnerable under trans-sonic conditions, and the thin, tapering, nearly pointed wing tip is becoming a thing of the past. The massive tails appearing on some aircraft are sometimes a token of the structural stiffening that has been required to keep them on at all.

Incidental difficulties not directly associated with trans-sonic flying seem to become more acute at these speeds. Flutter, a phenomenon where an area of resonance builds up on a small patch of surface and sets up such vibration that the structure can be destroyed, is troubling more than one British design. And what form design will take when

1953

is "Viscount" Year

FAR-SIGHTED airline executives realised years ago what the Viscount would do: gain a clear lead for Britain, tempt passengers away from old travelling habits, win profits where none existed before. But only this year have the general public and civil aviation as a whole discovered the truth. The Viscount is flying regularly—and most profitably—for BEA*, is just going into service on Air France routes, and is in production for six other airlines in both hemispheres. Many more orders are pending. 1953 is indeed Viscount Year.

VICKERS VISCOUNT—*already chosen for*

BRITISH EUROPEAN AIRWAYS

BRITISH WEST INDIAN AIRWAYS
HUNTING AIR TRANSPORT LTD.
IRAQI AIRWAYS

***IMMEDIATE PROFITS**

British European Airways announced in August that during the first 2,000 hours of scheduled commercial service their Viscount aircraft earned a revenue totalling £480,000, with a clear profit of nearly £70,000. This represents a profit of some £34 per flying hour and means that the Viscount is flying at the lowest cost per ton-mile of any passenger aircraft in the BEA fleet.

Powered by ROLLS-ROYCE Engines

The combination of Rolls-Royce engines (Four Dart propeller-turbines) with an aircraft designed to make the best use of them is one reason for the Viscount's success. The policy is pursued throughout Vickers jet aircraft: the Swift with a Rolls-Royce Avon, the Valiant with four Avons, the Nene-equipped Attacker and the V.1000 jet transport with four Rolls-Royce Conways.

Aircraft designers and operators know that BTH reliability—important on land, but vitally significant in the air—is traditional. BTH design and develop the complete electric power system, and supply the equipment appropriate to the application. But this is only one direction in which the specialisation and long

experience of BTH have built up an enviable reputation. It is the same in marine engineering, traction, power supply, mining—wherever first-class electrical products are needed. With over fifty-four years' experience and eleven factories, BTH can give outstanding service to industry in every sphere of electrical engineering.

Engines have enough power to push the aircraft well above the speed of sound into the region of true supersonic flight is a matter for conjecture. Designers do not yet know how to make an aircraft fly reliably at the speed of sound, let alone above it. Theory suggests that sweep back is no longer essential when all the air is flowing over the aircraft at supersonic speeds, about twice the speed of sound because there is no longer any appreciable saving in the drag. A straight, exceedingly thin wing would, it is believed, give the least drag under supersonic conditions. The French rocket-powered Trident is an example of this thinking, but unless designers can be certain that their aircraft will not spend any longer in the trans-sonic

New Conceptions in Air Strategy

BY A CORRESPONDENT

IN this age of jet-aircraft and atomic weapons, air power has become the predominant factor in Britain's strategic calculations. This is true not only because Britain could be crippled, if not defeated, by air attack alone, but also because neither sea-power nor land-power can provide the means of effectively restraining or striking at the only enemy it has to fear. The first objective of British strategy is to prevent war, or at least to prevent local conflicts developing into a world war. The second objective—in point of time if not of importance—is to defend this country in the event of war. The third is to ensure that Britain and its friends shall emerge from any war victorious or at any rate undefeated. In each of these tasks air power is of supreme significance.

The great threat to Britain's security comes today from the Soviet Union and superior air strength seems to be the only means by which Britain and its allies can deter the Russians from going to war, or can defeat them if they do. Indeed, one school of opinion points out that the United States and Britain each possess the air power to strike at Soviet territory with atom-bombs in very considerable strength, and it holds that the deterrent value of this power has already been proved. Tito's defection, the breaking of the Berlin blockade and the intervention of the United Nations in Korea were such grave diplomatic defeats for the Soviet Union that Stalin would hardly have accepted them if he had not stood in awe of American atomic weapons and of the power of the United States to deliver them.

The maintenance of this deterrent has a direct bearing on the problem of defending the British Isles against air attack, for it makes war less likely and also reduces the offensive capacity of the Soviet Air Force. Clearly the greater the Russian fear of strategic bombardment, the greater will be the need for the Soviet Union to give priority to defence in research, in production and in the line of battle. The best safeguard against Soviet air attack is surely to compel the Russians to concentrate on fighters rather than bombers and there is evidence that during the past six years they have been doing this.

The fear of atomic attack leads to a further curtailment of the Russians' offensive capacity in the air, since it compels them to disperse their fighters defensively to guard their widespread industrial and natural resources. Fighters deployed to protect the Caucasian oilfields cannot

region than it takes to push through it and will never have to manoeuvre in it, they must take into account trans-sonic flying conditions, where the characteristics of the straight wing are at their worst. Yet by the time this stage is reached, aircraft may be landing and taking off vertically, without any runways at all, as has already been done experimentally. Wing design, as known today, is limited by the need to lift the aircraft off the ground at a near-horizontal angle. In this delicate compromise between imponderables and unknowns, the measured opinion of the designer of one of the most advanced British aircraft on aircraft design is worth remembering: it is, he says, always about 30 per cent pure guess-work.

be used to support the Red Army in Central Europe, and it is now known that, since Greece and Turkey became members of Nato and thus provided the Western Powers with bases on the Soviet southern flank, the air defences of the Ukraine and the Caucasus have been strongly reinforced, in part at least by withdrawing jet-fighters from Eastern Germany.

Finally, if war were to come, attack may be the best defence in air strategy. Even the most efficient defensive

A modified form of "cranked" wing is used in the Vickers Valiant bomber, deep at the root and narrow at the tip.

system cannot guarantee 100 per cent security against the jet-bomber—probably 60 per cent interception would be a fair average—and there is no known defensive answer to the long-range rocket of the V.2 type. So long as piloted aircraft are employed in attack, there will always be the danger that the fighters will be saturated, and the counter-bombardment of hostile airfields may be the best means

of reducing the scale of attack to manageable proportions. And if rockets are used, it is likely that, until the scientists have developed an anti-rocket rocket, the only method of relieving the onslaught will be to strike at the lines of communication by which the missiles must be brought from factory to launching site.

It may be generally accepted, therefore, that the makers of British defence policy must place increasing emphasis on long-range strategic bombardment, whether by piloted aircraft or by guided missiles, both as a direct deterrent and as an indirect defence. It is not universally agreed, however, that Britain should have its own strategic air force. It is sometimes argued that the various Nato countries should concentrate on the production of those types of aircraft for which they are best suited, and that, since the United States is already producing long-range bombers in large numbers, the entire responsibility for strategic air-attack should be left to the USAF. This view has been rejected by the British Air Staff, which contends that the RAF cannot play its proper role unless it can attack as well as defend, and that Britain, by virtue of its experience in design and operations, can make a valuable contribution in its own right to Nato's strategic air arm. No single country is likely to preserve for all time a continued pre-eminence in one type of aircraft. The most successful alliance of Anglo-American resources must bring together British science and invention and American technology and production in all forms of air power.

Moreover, a great power—and especially one as vulnerable as Britain—cannot afford to rely on an ally, however loyal, to provide the offensive element in her air defence. If Britain were to do so, it would be taking a grave military risk; there would be no guarantee that in a crisis the US Strategic Air Command could give priority, or even adequate attention, to its needs. It would also weaken Britain's political authority, for if it were entirely dependent on the United States in this vital arm, its influence in Nato policy would be seriously impaired. This does not mean that Britain must maintain a strategic air force as large as that of the United States. Fifty V-class bombers, capable of carrying atom bombs, would be a more formidable force than the entire strength of RAF Bomber Command in 1945. Such a force would be costly to build up and to maintain; but the question is whether the same expenditure elsewhere would bring a comparable gain in Britain's political influence or military security.

In the purely defensive aspects of British air strategy, the greatest need is to maintain the depth provided by the bridgehead that Nato now holds in Europe. With the development of jet-aircraft, depth has become a matter of ever-increasing importance, since the range of radar cannot be extended to match the increased speed of modern aircraft; and depth is the only defence against rockets. With its outer radar screen on the Rhine, RAF Fighter Command today would receive warning of attack little earlier than it did during the Battle of Britain when it depended on the coastal chain of radar stations and when aircraft travelled half their present speed. Yet the

Will fighters eventually evolve into this?

need for early warning is now far greater since it has become desirable, if not essential, that RAF fighters should be able to make their interceptions well out to sea. And quite apart from the vast destruction that a hostile aircraft carrying an atom bomb might cause if it were brought down on land, there is also the threat of the guided bomb capable of reaching its target from a range of 50 or 100 miles. If such bombs come into use, the fighter will have to intercept the parent bomber before it has launched its missile, and this will demand a better warning system than is now available or within reach.

If the speed of modern aircraft places a premium on depth, the greater range given by flight refuelling makes it necessary for Britain to be prepared to meet attack from any quarter. The perfect warning system must cover all approaches and must be capable of dealing with attacks at all and any heights between sea level and 60,000 feet. The direct approaches from Germany may soon be adequately covered by radar, but there is a serious weakness in the north because no effective air defence system has been established in Denmark and Norway, and neither country is prepared to allow any other member of Nato to make use of radar stations and fighter bases on their soil.

Just as the system of warning and control must be designed for all-round defence, so the interceptor fighter must be equipped for all-weather operations. In Exercise Momentum, last month's large-scale test of British air defences, the percentage of successful interceptions was higher by night than by day—because the night fighters were equipped with radar and the day fighters were not. The lesson to be drawn from this experience is that either the scientists must develop radar equipment suitable for the new day fighters, the Swifts and Hunters, or else the new all-weather fighter, the Javelin, will be needed sooner and in greater numbers than is planned at present.

Even when it has met these many and varied requirements, British air power will still have two further heavy responsibilities. First, the Navy's ability to defend sea communications from submarine attack depends on the strength and quality of its air arm. It is significant that the naval authorities are showing such lively interest in high performance fighters equipped with radar. Secondly, strategic flexibility must be improved through the use of air transport. This responsibility may not necessarily be imposed directly upon the RAF; perhaps the provision of aircraft could be undertaken more economically by private operators. But by one means or another the capacity to move troops and equipment and to maintain a long-distance supply line by air is an essential element in Britain's strategic planning.

These are heavy tasks. Will they be greater than this country can afford to undertake? The question is a challenge to strategic planning. If too much is sought in air security, the country will find itself weakened in other ways. But if the sights are set too low, defeat in the air will mean that neither the Navy nor the Army will be able to save the country.

*Canada's Wharf
to the World!*

AS Phillips' "Table of Distances" clearly shows, Halifax is actually NEARER than any other North American mainland port to the leading ports of Europe and Africa—to the principal Atlantic ports of South America—and to all Asiatic ports, as far east as Hong Kong.

Manufacturers using the Port of Halifax are thus brought hundreds of miles closer to the most important overseas markets. They save long, costly hauls on imported raw materials and on their fabricated exports.

In addition, a Halifax location gives them first access to the nine hundred million dollar market of the Maritimes—including Nova Scotia, Newfoundland, New Brunswick and Prince Edward Island.

We are particularly interested in submitting surveys to meet the needs of any inquiring industrialist.

The Adenauer Way

IF there is a single moral to be drawn from the events that led up to Dr Adenauer's decisive electoral victory it is that doggedness pays.

Against a great deal of brilliantly argued, frighteningly candid and politically distinguished advice, those in the Atlantic alliance who believed in his foreign policy persisted in the view that Western Germany must first be securely tied into the free democratic community of the western nations before progress could safely be made with restoring German unity. They were told that this persistence would make the Chancellor and the western powers appear to be opponents of German unity, and that the West Germans would therefore vote against them. The advice proved to be wrong. They were told that the spirit of Europe had changed and that plans of political, economic, and military integration were out of date. The evidence is still to the contrary. They were told that the Russians would never accept an Adenauer victory. That has still not been proved correct. Indeed, it looks—one hardly dare say it—as if the clumsy Americans have been right and the pessimistic experts on Europe wrong.

The doggedness has had powerful help. The Russians helped with their wavering and inept handling of Germans, both east and west of the Elbe. The Germans who resisted their Communist rulers in June helped enormously; so did less publicised resisters in Eastern Europe. Sir Winston Churchill helped—though it is only now becoming clear how—by saying in one passage of his famous speech that Dr Adenauer would not be let down and in another that the Russians must be given satisfactory assurances about the security of the Soviet Union. But the fact remains that a clearly formulated policy of winning Western Germany for Free Europe—a positive and not a defensive policy—has won a crucial diplomatic victory for the West.

Because this idea was clear in detail as well as in general pattern, it held the field against vaguer rivals. Because the purpose behind it was firm, it could profit by such unpredictable boons as the death of Stalin and the riots in East Berlin. There lies the lesson for the future conduct of western policy: that clarity and firmness profit from any luck that is going. Admittedly the policy has dangers: for Britain as well as France there are defects and perils latent in the plans both of the defence community and of the coal-steel pool. But there is no effective alternative to what is substantially the Acheson-Bevin-Adenauer policy for Germany.

What has changed is our ability to calculate future possibilities more clearly than they could be seen in 1950. The need to meet Russian fears for the security of the Soviet Union is now widely admitted and discussed, after years in which it was never mentioned. It is coming to be seen that the question of the German frontier with Poland cannot be indefinitely referred to only in whispers. The basic economic problems of Western Europe are clearer than they were. The age of American aid is ending and a revolution in the weapons of war

is on the horizon. All these things modify the conceptions of 1950, but they do not alter the validity of the analysis that was then made, which, put at its simplest, took the following form. There are three possible ways of dealing with Germany as a power in Europe. Either you can have a disarmed and dependent Germany with a burning political grievance about its eastern frontier that the Russians can at any moment remedy on their own terms. Or you can have an armed and independent Germany with a grievance that can be settled only by force. Or you can have an armed Germany which has not complete independence in military matters and has allies that are not prepared to allow its grievance to be dealt with by force. The choice of the third solution was made in 1950, and it cannot now be withdrawn.

★

This is not to say that the European policy agreed with Dr Adenauer can or should be carried out in an impatient, bull-headed manner. There is all the difference between firmness and toughness; the former makes negotiation with the Russians possible, the latter merely puts it off. The western powers have to move forward within the limits and at the pace set by facts. Among these facts are the intense reluctance of many Frenchmen to contest *tête-à-tête* with the Germans the leadership of a European community; the state of French and Italian politics; the uncertainty about Soviet policy now that the voice of Molotov has reasserted itself; the expectations of four-power negotiations aroused by what has been said and done in the last six months; and the reluctance of American opinion to appreciate the part that can be played by patient manoeuvre in a cold war which has been lately going against the Communists. In this setting, and with an invitation to Lugano in a month's time awaiting the Kremlin's reply, it would be foolish to expect in a short space of time French ratification of the EDC Treaty, a start with German rearmament, and quick, decisive steps towards the unification of Western Europe. What is to be hoped for—indeed, it is an essential tactical requirement—is that decisive steps should be taken to show the Kremlin that German membership of a western political community is now a fact—not a fact to be negotiated about, but a fact from which negotiation begins. It can then be explained to the Russians in negotiation that the military risks for them of such an arrangement will depend on the future course of their own policy and relations with the West.

For example, it is clear that the EDC Treaty would be more quickly and easily ratified by the French Parliament if it was believed that the extent of German rearmament within the community would be dependent on the course of four-power negotiations with the Russians for a German settlement. Likewise, the Russians would be far more likely to accept the *fait accompli* of Dr Adenauer's victory and its implications if they had reason to believe that German power in the

EDC would be limited by Great Power agreement and guarantees against aggression. Dr Adenauer himself has already seen this point and made his suggestions of what Germany and the EDC itself could offer. The British Government, too, has its ideas on the subject; and there is no doubt that the Russians, if they showed enough interest to come to Lugano, might hear something to their advantage. The EDC, thanks to the arguments and misrepresentations of its opponents, has been made to look like a monstrous conspiracy to liberate Communist Europe by German soldiers using American tanks; whereas it is in fact an attempt to ensure that the restoration of independence to a German government will secure its allegiance to a European community and provide a limited—but only a limited—contribution to the common defence.

So long as the Russians have the faintest hope that the western ranks can be divided on this issue they will continue to represent the European Defence Community as the main obstacle to peace and German unity. That bluff must be called before any progress in negotiation can be made; and the way to call it is to press on with the political acts that are needed in France and Italy to bring the community into existence and the Bonn conventions into force. When that has been done, it will be time to discuss how quickly the plans for German rearmament shall be carried out. The decision would depend on the ideas and the mood that Molotov and his colleagues revealed at Lugano, or wherever else they may eventually make their views known. The essential thing is that their fear of German rearmament should be skilfully used to secure reasonable terms for the reunification of Germany and a lighter hand in Eastern Europe.

★

Doggedness along such lines, with free parliaments sitting and oppositions baiting governments with reminders of how recently Germany was the supreme enemy, will not be easy. But it is not possible to see, on the evidence furnished from the Soviet Union, any alternative tactic. Clearly the Malenkov regime wants to concentrate as much as possible of the country's energies and resources on simultaneously improving the standard of living, continuing the sensational progress in heavy industry, and assisting the industrialisation of China. To be left alone to pursue such aims it may be willing to pay quite a high price to the West.

But there is no sign so far of what the price might be; and the sign is lacking for the simple reason that the hesitations and disagreements among the western allies must have made Malenkov and his advisers hope that no price at all need be paid. Dr Adenauer's victory is a warning that the judgment was wrong; but it needs reinforcing by a clear determination to go on with the organisation of a strong Western Europe for the containment of Soviet influence and the restraint of German nationalism.

Supports for Farmers

THE Government announced on Tuesday its long-awaited scheme for the marketing of the cereals that will come from British farms next year. This is an important further stage in the development of an agricultural policy that will restore free markets while still providing a reasonable security of income for the farmer. It should, indeed, be a decisive stage. The scheme for cereals is welcome in principle, and in detail it is as satisfactory as could, for the first year, be expected. It should provide a model on which, despite the opposition of the National Farmers' Union, free markets will be restored for other farm products. About this—and particularly about the most difficult case, livestock marketing—the Government is still undecided; but at least the right precedent has now been set.

The cereals scheme is discussed in more detail in the Business Notes of this issue. The essential change is that minimum prices, paid to each farmer by the Government, are replaced by standard prices, which represent the Government's guarantee of a minimum average return for farmers as a whole. The farmer will actually sell his cereals in a free market, to whom and at what price he can; he will be in competition with other farmers and with imports. The quantities and prices of all sales will be recorded. If the average price actually realised by, say, the 1954 rye harvest exceeds or equals the standard price laid down by the Government—in this particular case, 25s. a cwt.—that is the end of the matter; the farmer has earned his income on a free market. But if the average price works out at less than 25s., the Government will make up the difference. The "deficiency payment" to each farmer will be the difference between the standard and the average realised price, multiplied by the quantity of rye he has sold.

The system works thus simply only for rye. For wheat, the standard price will be subject to seasonal variations, while for barley and oats the actual deficiency payments to farmers will be based on the acreages grown; they will be calculated from the price deficiency according to the average yield per acre. For barley, there are additional complications in reckoning the "average" price to be used. But such technical difficulties are not overwhelming and seem to be effectively dealt with in the Government's scheme. The underlying conception has been tried before, in the 1932 Wheat Act, which worked fairly satisfactorily. Deficiency payments are tolerably straightforward in administration, and in principle they provide the simple and effective way of letting prices move freely, to perform their main economic function, without putting the farmer at, as he sees it, their unrestrained mercy.

The National Farmers' Union has accepted this scheme "without prejudice to the form of the permanent organisation for dealing with cereals." This

presumably means that the NFU still hankers after some producers' marketing board to work in conjunction with government support for cereal prices. It points out regretfully that what is guaranteed by the deficiency payments scheme is a standard return to cereal-growers as a whole, not to the individual farmer. His deficiency payment for, say, wheat is based on the average price of all the home-grown output. If the price at which he has sold his own crop turns out to be below the average price, his total return—from the market and from the Government, through the deficiency payment—will fall short of the standard price. Other farmers, who have sold above the average price, will get a corresponding premium. Under this system, the price mechanism is allowed to give its proper reward to the farmer who is skilful in his choice of time and place to sell or whose product is above the average in quality. For crops so standardised and unperishable as grains, salesmanship and variations in quality are of comparatively minor importance. For livestock, which presents the Government with its major problem in agricultural marketing, they are of major importance. If the incentives provided by a free market with deficiency payments are a defect in the NFU's opinion, they are one of the scheme's merits for the public and also, indeed, for the enterprising farmer. A marketing board that was purely a co-operative body for dealing with the physical problems of orderly marketing would not affect this situation. But if it were a trading body run by farmers—a monopoly seller of domestic produce—its practical effect would almost certainly be to reduce the extra rewards for quality and for skill in selling. It would provide a flatter security for farmers at a serious cost in incentives and therefore in benefit to the consumer. The Government should set its face against proposals of this kind.

★

This is one test, the negative test, of the Government's determination to restore economic freedom. The second, and positive, test is its use of standard prices under the deficiency payments schemes. Those schemes are welcome as a beginning. In themselves, they provide merely a framework within which to apply a sounder agricultural policy. A sound policy is one that raises agricultural efficiency, that gets as much food as possible grown in this country, not (or at least not mainly) by keeping imports out, but because it can be grown economically at home. The cereals scheme, as it will begin to operate next year, has little to do with economic production. The standard prices will be almost the same as the present fixed prices that the farmer has been getting for his cereals. In effect, the scheme means that he may gain on the swings—if market demand is strong and pushes prices higher—but he will not lose on the roundabouts. The prices,

to be made up if necessary by deficiency payments, are those deliberately set, under the agricultural policy of the postwar years, to provide a general stimulus to high farm output. They enable the marginal farmer on poor land at least to scratch a hard living; because of the present wide spread in agricultural costs, they therefore necessarily provide the farmers of good land with profits that may be high even if they do not farm particularly well.

The public may quickly become aware of this situation. It is quite possible that, if importers are allowed to go on trading fairly freely, the market prices of cereals will next year be below the standard prices. The country may be taxed in order to provide a two-car standard for a minority of farmers. That hardly corresponds to the idea of "deficiency" payments. The correspondence will become even less if a similar scheme is applied, as in principle it should be, to live-stock marketing. There the present prices fixed for bacon and pork, in order to stimulate output, are much higher than the British product could command in competition even with quite limited imports from Denmark and elsewhere. The taxpayer's deficiency payments would be in fact—and obviously—a prop for much uneconomic production.

Immediately, this is unavoidable. In practical politics the Government cannot be expected to introduce a new marketing system and in the same move greatly reduce incomes in the countryside. The standard prices must start out near the previous guaranteed prices. This should be accepted, and not be allowed to stand in the way of a free market, with deficiency payments, even for livestock. But the Government would be wise to make it plain to the farmers that standard prices cannot be kept so high for long. Large and continued deficiency payments would place a crippling burden on the rest of the economy—thereby reducing British exports and making the balance of payments worse, not better; and politically it would not be accepted as fair, once the public had become aware of the facts, that even a small minority of farmers should do very well on public money. That is certainly not the sort of security to which the farmer is entitled, or indeed the sort that was promised to him in the Agriculture Act of 1947.

★

It is important to distinguish between the two purposes for which public money should be spent on agriculture. One is to give the farmer security in bad times, to provide an equivalent of the industrial worker's unemployment benefit. This is the proper scope of deficiency payments, and just as unemployment benefit is available to all without a means test, deficiency payments are the general right of all farmers, however large their profits in good times. But it follows from this that deficiency payments ought not to be large. The other purpose of public expenditure is to stimulate a bigger agricultural output in this country than would

be secured by pure *laissez faire*. To attempt to do this by disbursing large sums to all farmers, including those who would be making a living without them, is very expensive and, at the best, only partially effective. To continue the analogy with industry, it is like giving grants of public money in aid of all wages in order to get more work done. The economic way to expand output by state aid is to concentrate it, by a variety of specific grants and subsidies, on the places where it is needed—that is, on the places where it will result in food being produced that would otherwise never have been produced at all.

The line of policy, then, is to get away from the idea that general payments of public money in aid of farm prices—whether they be guaranteed prices or deficiency payments—are the main weapon of agricultural policy and should therefore be high and permanent. On the contrary, the aim should be to confine them to hard times and to move progressively towards making them no bigger than is necessary to enable the farmer of average efficiency to cover his prime costs (including in those a minimum wage for his own labour). It is, of course, easier to say this in general terms than to interpret it in specific price levels—particularly in times like the present, when so many years of high and rigid prices, of controlled marketing and of virtual freezing of rents have created an unusually wide spread of costs. At the present time, "average costs" have hardly any meaning, and to base standard prices on an arithmetical calculation would spell disaster, not the promised security, for many farmers. But to recognise this is not in any way to abandon the principle—that public money should be provided for the whole farming community only in bad years and in relatively small amounts.

If this is accepted, then the main reliance for raising the level of agricultural production will have to be progressively shifted on to the other leg of policy—an armoury of specific measures for concentrating the state's assistance (not all of it in cash) in places where it will do specific good in terms of bigger and better production. This is an area of policy to which quite inadequate attention has been given—partly because of the concentration both of the farmers' representatives and of the Ministry of Agriculture on the one expensive device of guaranteed prices—and it is the one to which concentrated thought should now be given. There is no occasion for the state to be mean or niggardly; if specific aids and subsidies are combined with progressive reductions in the standard prices to be assured to all farmers by means of deficiency payments, then there will in any event be a large saving to the Exchequer.

It is too early to tell whether Government policy for agriculture is likely to settle on such lines as these. Certainly there is a long way to go yet, and it is a way requiring courage and realism from politicians. But by leaving cereals to a free market and confining guarantees for these crops to the flexible form of a deficiency payments scheme, the Government is at least setting out on a road that promises well.

Peking's Paper Tigers

CHOU EN-LAI'S new rebuff to the United Nations, delivered on the eve of the new session of the Assembly, and dutifully echoed by the North Korean regime, should be a sharp and timely reminder of the nature of the government in Peking with which the outside world has to deal. As such, it deserves careful study. An article in *The Economist* last week discussed the problem of drawing together British and American policies towards China. That remains the most urgent task of diplomacy as regards the Far East. But concentration on it must not preclude—must, indeed, embrace—a thorough examination of the attitudes and activities of Mao Tse-tung's government itself, and of the hard realities behind it. A rank growth of illusions about that government has sprung up in both eastern and western minds, and before any useful settlement can be reached in the Far East this growth will have to be cut away. Nor will it be enough that the free world should view Peking more clearly; Peking's own eyes will have to be opened too.

How does the Peking government see itself? Chou En-lai's catalogue of refusals and demands is a concise revelation of the Chinese Communists' attitude. It is no surprise to find, in this portmanteau of haughtiness, humbug, and plain ignorance, no shadow of guilt or accepted responsibility for the extension of the Korean war, one year of which bloodshed was caused exclusively by Peking's demand for the surrender of its own fugitive conscripts, a demand eventually dropped as blandly as it had been made. What is, perhaps, surprising is the extent to which Mao Tse-tung sees himself not only as wholly innocent, but also as the victor over the United States and its allies. Indeed, some loud sabre-rattling was done in Peking last week by Peng Teh-huai, the Chinese general who, behind the façade of Kim Il Sung's wobbly authority, has commanded the Communist armies in Korea. General Peng's threats of a new onslaught on South Korea might carry more conviction if the world did not remember the earlier Chinese boasts that they would drive the United Nations' army into the sea; but the threats themselves reflected the unrepentant braggadocio now prevailing in Peking.

This mood has apparently led Mao Tse-tung's government to base its post-armistice policies on two assumptions. The first is that China now holds a commanding position in the Far East as a whole; the second, that the differences of view and interest between the non-Communist nations are so wide that China, by working on them, can secure all its political objectives. Only reasoning of this kind can explain why the Peking government has refused to meet the representatives appointed by the United Nations Assembly to a Korean

peace conference, and has demanded that the Assembly should cancel its own decisions, appoint a team approved by Uno's antagonists in the field, and invite those antagonists to take part in its own debates on the subject.

The substance of Chou En-lai's demands had already been brought before the Assembly by Mr Vyshinsky, and firmly rejected. The Chinese must be fully aware what humiliating terms they are offering to the United Nations, and their arrogance is blended with a sweeping indifference to Korea's real need for peace. Mao is not in the least concerned that his tactics involve the risk that the peace conference may not be able to meet until after the agreed time-limit, or indeed may not meet at all. He appears to be solely concerned to exploit the obvious divisions between the free nations, in sublime confidence that this proceeding will bring into his hands everything that he claims.

★

To judge from much that is said and written in the free world, Mao's delusions are widely shared. The Chinese problem is often discussed purely in terms of the readiness with which each successive demand from Peking should be satisfied. Yet between these assumptions and the realities of Communist China's position yawns a huge gap. In the first place, despite all its trumpeting of victory, Peng Teh-huai's great army has not won the Korean war. It has signally failed to achieve its declared intention of overrunning South Korea—while, on the other hand, the United Nations has punctiliously realised its original military objective of freeing South Korea from the aggressor. In 1950 the purpose was to reunify Korea under the Communist North; in 1953 such a consummation is militarily and economically no longer feasible. True, the Chinese have held their line; but they have been able to do so only because none of the nations that came to South Korea's defence wanted to make the conflict an all-out war. It is also true that Communist China emerges from the war as a considerable military power. Yet its offensive strength is still severely limited, both by its lack of naval forces and by its dependence on Soviet armaments; and its military expansion has been accompanied by the exhaustion of its North Korean ally.

It is even more important to remember that, in the long battle of wills at Panmunjom, it was China that eventually backed down, characteristically choosing to do so only after maintaining its inhuman demand for the return of unwilling prisoners for a full year. It would be ludicrous to suppose that this move sprang from a sudden emotion of tenderness towards the prisoners. The decision taken in Peking last March

can be ascribed only to a belated realisation that the Korean adventure had become a burden and a danger for China. Confirmation of this has been provided in recent months by Peking's own admissions of failures in its plan for industrialisation, of shortage of skilled manpower, of rural discontent and even of famines. Mao was doubtless willing to see the economy of his Korean allies indefinitely disrupted by UN bombing and by the strain of supporting the Chinese armies; but he drew the line at sacrificing his own plans. His decision must have been hastened by China's failure—now publicly admitted—to obtain the industrial supplies it had been promised from the Soviet sphere in Europe. Trading within the Comecon system has clearly proved a disappointment to the Chinese Communists; and this week's announcement that they are to receive a further instalment of economic "aid" from the Soviet Union does not affect the fact that their commercial approaches to Japan and the West now contain a strong element of genuine urgency.

In reality, then, it is obvious that Peking's present intransigence about relatively unimportant questions of prestige is little more than a mask for its real needs, which are peace and trade. It is equally obvious that the only strong card Mao can play is the threat of renewed fighting in Korea. To play that card, however, would be to jeopardise all his objectives, both political and economic, in exactly the same way as they were being jeopardised by the continuance of the fighting before the armistice.

★

Nothing in this situation bears out the idea that Peking's successive demands must be automatically granted. On the contrary, there is something fantastic in the sight of a government, already branded as an

aggressor, and sorely in need not only of a respite from the strains of its own war but also of supplies that its antagonists can provide calmly laying down its own terms and telling the United Nations to eat its words. Chou En-lai has made it clear that his government proposes to extend not merely the membership of the peace conference, but its scope, too; in other words, to make whatever settlement may be reached in Korea dependent on the satisfaction of Peking's numerous demands. That cock—or paper tiger, to use the Chinese Communists' own jargon—will not fight. As to the immediate issue of the membership of the conference, it would be a fatal blow to the authority of the United Nations if the Assembly now adopted, at the dictation of the aggressor, a formula it had already rejected.

It is doubtless too much to expect penitence from Peking. But it is not too much to require the Chinese Communists—and some of their hasty friends in the free world—to open their eyes to reality. Indeed, until Mao's government comes to see its own difficulties more clearly, it is doubtful whether any settlement with it will be possible. This objective is not made easier to achieve by those in the West who raise a clamour for the instant and unconditional surrender to China of every bargaining counter that the United Nations possesses. There is much that the world can offer ultimately to China as a reward for good behaviour—particularly in the form of trade. But as long as Mao believes that, by brandishing his paper tigers, he can gain all he wants without accepting any corresponding obligations, he will remain as confidently unreasonable as two years of Panmunjom showed him to be. If, however, the free nations can match his bluster with patience, it must be only a question of time before the weaknesses in China's bargaining position are revealed to all parties.

Pay as You Wear

THERE are many ways of buying clothes without paying for them—or at any rate without paying for them at once. The well-to-do can keep the tailor or dressmaker waiting or run a credit account at a high-class store. In the middle of the social scale, most people take it for granted that clothes are bought for cash; but further down comes a large section of the working-class population which habitually makes use of credit. The forms of this credit are seldom referred to in print, but they are sufficiently widespread to constitute an important element in the economics of distribution.

The extent to which drapery—that is clothing, footwear and household textiles—is bought on credit is not known, but there are plenty of indications that it is very large. During the war, when organised credit systems were greatly reduced, the government conducted a

survey among working-class housewives to find how far "easy payment" buying had survived; well over a third of those questioned admitted that they were still buying goods, mostly clothes, on credit. When government action in 1942 threatened to put a stop to a particular method of buying clothing on instalments, one firm alone marshalled half a million signatures in a month for a petition of protest. Nowadays the habit of buying clothes on credit has grown again to its prewar proportions. People with a day-to-day familiarity with wage-earners' budgets describe it as "the usual thing" or "almost universal," and although they may exaggerate, their conviction serves to underline a general ignorance on the part of economists about an important factor in the workers' standard of living.

There are, broadly speaking, two ways of financing

the consumer of drapery goods. On the one hand, there are the various schemes by which the drapery trade itself extends credit to its retail customers, and on the other there is the practice of "check" or "ticket" trading, organised by firms which deal solely in money lending and do not themselves buy and sell goods. The consumer as a rule cares nothing for the distinction. All he—or she—knows is the name of an individual who will arrange for a new suit or a pair of children's shoes to be obtained at once and paid for gradually over the next five or six months. But the difference between retailing and money lending is real and carries implications which ought to be better understood.

The drapery trade extends its own credit to customers to enable them to "pay as you wear" in a variety of ways. There is, for example, "straight credit" granted by the shopkeeper to customers he knows personally—the ordinary delay in payment common to the "butcher, the baker and the candlestick maker." Then there are the "Shop Clubs," of endless varieties.* They are sponsored either by a fair-sized shop or, less often, by a group of shops in any one district. Sometimes such a club is run for the shop by a woman among her fellow workers in a factory or large office. She collects, say, twenty girls, who agree to contribute 10s. a week to her club, and pays the £10 a week so collected into the shop, in return for a voucher. Each week the members draw lots for the voucher, and the winner can spend it at once. At worst, a member may have to pay for twenty weeks before buying anything; at best, she may have twenty weeks' credit for nothing. The organiser is paid for her trouble by a discount of perhaps 1s. in the £ on some purchase of her own, and the shop is repaid by the extra custom. At this stage it is the members, not the shops, that grant credit, but such clubs are often developed on a bigger scale in a neighbourhood instead of a place of work, and the draw-by-lot abandoned in favour of granting 20 weeks' credit to every member; they are sometimes each charged 1s. in the £, which the agent is allowed to keep as her remuneration.

★

A third kind of "pay as you wear" is familiar in the Sunday press—the mail order house which offers instalment terms to anybody purchasing goods by post. This is a gamble on the public's honesty and the bad debts are proportionately greater. Sometimes a customer is asked for the name of a householder to guarantee his payments; often the business obtained through advertisement is given a stiffening by the use of spare-time agents, who are provided with illustrated catalogues and paid a small commission to obtain customers from among their friends and relatives. In a widely scattered community, such as the American Middle West, this method of retailing has obvious advantages and flourishes accordingly. In a country as well served with retail outlets as England, postal buying has never shown signs of becoming a widespread habit, even with

the added attraction of deferred payment; as a source of credit it is relatively unimportant.

Yet a fourth kind of hire purchase in drapery is known by the somewhat ambiguous title of "Credit Trading." To drapers this has a quite specific meaning, as the name of a distinct system of retailing with a long history. The Scots call it the "English system," and the English refer to its agents as "Scotch drapers." Behind this confusion of titles lies a form of retail drapery business with sidelines in footwear and household textiles operated not from a shop but on a door-to-door basis. The credit trader has a "round" or list of households he visits week by week, selling goods on credit and collecting the money for them in instalments over 20 weeks or so. He usually charges 5 per cent of the price for his services, but the real reward for his trouble in collecting week by week on the doorstep is the steady continuity of custom which he or his agents maintain with families through years or even through generations.

He saves the expenses of running a shop and tying up capital in a large stock. He takes orders from samples, or for "another pair of sheets like last time," though the practice is growing of keeping a small showroom to which salesmen can send customers to choose fashion goods, and so also is the practice of arranging with wholesale warehouses to receive "customer's custom"—that is, to allow the credit-trader's clients to choose direct from wholesaler's stocks.

The trader's new customers are always personally recommended, his bad debts something less than one per cent, and when he dies or retires his "book" or custom is bought at a premium. A business so personal as credit trading does not lend itself to large scale operation. There are one or two nationally known companies; but the typical firm might be said to have 15 to 20 travelling salesmen and a turnover of £2,000 a week, and there are many small and even one-man operators. A cautious estimate of the amount of drapery sold in this way would be £10-£20 million a year, but it may well be a good deal more and it seems to be growing steadily.

In all these ways, by "straight credit," by shop clubs, by mail order instalment purchase and by credit trading the drapery trade increases its turnover by enabling its poorer customers to hire-purchase clothing, footwear and household textiles. The form of consumer credit known as "check" or "ticket" trading, on the other hand, is not provided as a means of selling goods; it is a purely financial transaction profitable in its own right. In essentials it amounts to this. An agent for a check company issues a customer with a check for, say, £1. The customer pays him a "poundage" of 5 per cent—that is, one shilling—and repays the sum by 20 weekly payments of 1s. each. Meanwhile, she can use the check to buy goods to the value of £1 at any one of a number of shops specified by the check company. The shopkeeper in due course claims a settlement from the check company which redeems its £1 checks at a discount—usually for 17s. 6d.

The shopkeepers' accounts are rendered monthly and

settled a month later, so that the average check is not redeemed until the customer has been paying her instalments on it for six weeks, as well as the 1s. "pound-age." The effective loan is therefore 10s. 6d. for 14 weeks and on this the gross return, 3s. 6d., looks enormous—some 125 per cent per year. There are, however, substantial expenses in running a business of this kind. Agents are paid a commission of 7½ per cent of their takings plus a 5 per cent bonus on any new custom; they need to be supervised, and their new customers' credit-worthiness confirmed. Then again, a simple check for £10 is often spent in small sums in half a dozen different shops, involving a lot of clerical work when it comes back for settlement. True, Sir Joshua Waddilove, who invented the system in Bradford in the eighties, died a millionaire, but his company had started with no competition and the shopkeepers paid him a high discount. As "the Prov," this company remains a household word, especially in the industrial north where check trading is strongest. It still does about half the total check-trade in the country; it has 300 branches, forty of them in London, and is reputed to deal with a million households. Its competitors all

work on a much smaller scale. There are said to be about a thousand of them of all sizes, from the network with agents in 60 towns down to the one-man operators who abound in the north-east. There are probably over 200, for example, in Middlesbrough alone, many of them sparetime check traders in back streets, people who have come into a little money and find customers among their neighbours, but operating in all essentials like the large companies. For a man—or woman—with a little money and the right connections such a club, with no overheads, is easier than backing horses and far more profitable.

Strong opinions are held about check trading. Social workers deplore it as a means of running improvident families into debt. The Drapers' Chamber of Trade denounces it as an interloper into legitimate commerce—and bids members copy its methods. The check traders defend themselves as benefactors of mankind, succouring the poor and needy. Without presuming to sit in judgment on such extreme claims, a subsequent article will attempt to discuss some of the more sober considerations involved.

(To be concluded)

Notes of the Week

France at the Centre

FRANCE'S wobbling cabinet sits this week at the centre of a bewildering web of events. The Germans want to talk about a European solution for the Saar; the British have defined the greater role they would play in the European Defence Community in a further effort to persuade the Assembly to ratify the EDC treaty; M. Laniel is to visit Washington, where he will have to balance the American desire for an offensive in Indo-China (with the help of \$385 million) against the feeling that Vietnam may be ready to treat, and all around the web people are busily and spitefully pointing out that France cannot afford to do what it ought to do and does not want to do what it could afford to do. There are even some voices—lately heard, as one would expect, in *Le Monde*—urging the government to defy the Americans, leave Nato, and join with the Russians in frustrating German rearmament. This picture of M. Bidault as the Syngman Rhee of Europe is a most unfortunate contribution to present allied reasons for exasperation with French difficulties.

In fact, of course, the situation is one in which a skilful and determined foreign minister (a French Adenauer), loyally backed by the Assembly, could get for France such

guarantees of security and protection against outside domination—whether Russian or German—as no prewar French statesman would even have dreamed of. But it would have to be done by compromise—for example, over the Saar; by patience—for example, over negotiations with Moscow; by determination—for example, in Indo-China, where the enemy's readiness to negotiate will not be increased by hints of French withdrawal; by loyalty—for example, over the Bonn and European treaties. Quick, drastic acts of initiative or defiance by weak governments will get France nowhere.

Dr Adenauer has gone straight to the heart of these difficulties by proposing talks on the Saar with M. Bidault. He will propose that the territory be Europeanised provided the population votes—as it did not recently—for such a solution. It is important that French opinion should grasp one particular point: it is that the German Chancellor will be bitterly attacked for this in Germany, not only because his nationalist opponents want the unconditional return of the Saar but because they know that successful Europeanisation of this territory would encourage the Chancellor to propose a similar arrangement with Poland for the Oder-Neisse territories. If the French refuse compromise on the Saar, important though it is to their weak economy, they will be helping to frustrate any hope of a peaceful handling of the eastern frontier question. But

they cannot be expected to accept all the risks of compromise with Germany unless the United States and Britain do everything they can to show that they too will think and act first as the good ally.

The Vanishing Security Council

ONE of the first controversial items on the agenda of the new United Nations Assembly which opened this week was the filling of three seats in the Security Council. As in previous years, the argument revolves round the East European seat which is claimed by the Russians as a pocket borough, while the United States has long taken the view that the Assembly is free to fill it by electing a state such as Yugoslavia, Greece or Turkey. The din of battle in these periodic debates cannot, however, distract attention from the fact that the Security Council itself has long suffered from a wasting disease.

This is not entirely due to the paralysis inflicted on it by Soviet use of the veto power. Since 1950, when Mr Malik's curiously clumsy tactics of boycott enabled the Council to authorise UN action against aggression in Korea, the Russians have, indeed, taken care to block any action it might take that would interfere with their plans. But in recent years the Council has also remained quiescent in regard to tension in areas such as Trieste and Kashmir. In fact, since the beginning of 1953 its sole activity has been the unexpected agreement on the appointment of the new Secretary-General, Mr Hammarskjöld.

In British constitutional practice, a public body which lapses into total inaction is often allowed also to lapse into extinction, or, to use a famous phrase, innocuous desuetude. Is it perhaps time to think of applying this convention to the Security Council? There may even be grounds for hastening the process. There is little point in wasting the Assembly's time and generating unnecessary frictions between friendly states in order to renew the membership of a body which has apparently ceased to serve any good purpose. Moreover, it is easy to see that the eventual solution of the problem of the Chinese seat would be easier if that seat were only one among sixty of its peers, instead of carrying with it, as it now does, the privilege of a permanent place in the Security Council and the power of wielding the veto.

The Liberals' Reorganisation

MR FRANK BYERS, who was Chief Whip of the Liberal Party in the 1945-50 Parliament, has withdrawn his prospective candidature in North Dorset, the constituency that he only just failed to hold for the Liberals in the 1950 and 1951 elections. He has explained that he cannot afford either the time to nurse the constituency or the time to fulfil his Parliamentary duties if he is elected. In this, Mr Byers is only one of a growing number of MPs and candidates who are being forced out by the increasing demands both of Parliament itself and of constituents:

during the week the MP is a prisoner within the walls of Westminster; at the weekend he may have to be a poor man's lawyer and patient guide through the maze of bureaucracy.

The withdrawal of Mr Byers has, however, a special significance. Whatever the other pressures on him, it is a confession that even the party's official hopes of a Liberal revival have fallen very low when one of its most outstanding and experienced leaders decides not to contest one of its most promising constituencies. Mr Byers's action fits, however, into the strategy that the Liberals have been following for the past eighteen months. Under the grandiloquent title of "Operation Basic" they have been engaged in the straightforward, but difficult, task of cutting the dead wood out of their constituency and regional associations. The task has varied from area to area, and has called for patience and considerable tact on the part of the teams sent out from the party headquarters in London. In some constituencies, older chairmen—and chairwomen—whose enthusiasm and long records of loyal service were no longer matched by their ability have been replaced by younger and perhaps less distinguished figures. In others, it has been necessary to secure an adequate balance of age and experience in an association which was being run with vigour but also ineptness by enthusiasts new to politics. The two big parties can overcome such difficulties by hiring paid organisers. The Liberals have to rely entirely on voluntary effort—as they are now relying, to a greater degree than ever before, on voluntary subscriptions from the constituencies to cover the cost of their London headquarters.

Mr Byers has played a leading part in this reorganisation, since he is head of the Central Association with the key task of watching over the choice of candidates. His decision to carry on with this work at the party headquarters, while abandoning Parliamentary politics for the present, clearly reflects the way in which realistic Liberals now see their function. No one can predict whether in some circumstances the party's cause might revive, but at least the enthusiasm of the hard core of party workers remains unflagging. What the party can therefore do is to give itself the more realistic and practical sort of organisation that would enable it to take the opportunity if events should move in the Liberals' favour. In this way the remote chance is kept in being.

Claims on Empty Kitties

AT the Trades Union Congress last week Mr Stevens, general secretary of the Electrical Trades Union, urged other unions to follow his example and to organise "vigorous campaigning" for higher wages; there was plenty of scope for them, he argued, by squeezing profits. Mr Deakin condemned this as "the economics of bedlam"; and, he asked, what about those industries "where there ain't any profit?" In the nationalised industries, he implied, higher wages could only lead to higher prices. Here was Congress talking about more and better nationalisation, but people were already asking what they had got out of it except higher prices.

The TUC seemed to understand Mr Deakin's warning;

at least, it emphatically rejected Mr Stevens's plea. Nevertheless, wage claims in two of the unprofitable nationalised industries were discussed in London this week. On Tuesday the representatives of the Railway Executive rejected claims made on behalf of nearly 600,000 railway workers and shopmen for an increase of 15 per cent in wages. For the railway workers the next step will no doubt be an examination of the claim by the Railway Staff National Council; the shopmen, for whom no such negotiating machinery exists, will probably ask for arbitration by the Industrial Court. On Thursday the executive of the National Union of Mineworkers decided what its claim for lower-paid miners should be. The Coal Board's deficit and falling production are an unfavourable background for any demand, and earlier this year the union had sense enough to decide against an all-round wage claim. A third claim has also been discussed this week. On Monday the leaders of the portworkers' union, representing some 77,000 workers, refused an offer by the employers' representatives, and agreed that their claim for a substantial increase should be referred to the Minister of Labour, whose officials they and the employers were to meet on Friday. The dockers are in a rather stronger position than they were, for unemployment has fallen this year; but the burden of paying men for whom there is no work still weighs heavily on the employers.

None of the unions concerned in these claims shows any disposition to sidestep the machinery of negotiation and arbitration. That, in essence, is what the TUC means by wage restraint. Last week, when Congress decisively rejected the motion to abandon all restraint, it did not mean that industries which cannot afford wage increases should not be asked for them. Even Mr Deakin meant only that demands should not be made in the brusque manner of the Electrical Trades Union.

Industrial Serenity

AFTER some grumbling, both parties in the dispute over electricians' wages complied with the Minister of Labour's request that there should be a truce while the Court of Inquiry sits. First, the employers decided not to proceed with plans they had apparently been making to dismiss strikers. The union, on its side, had at first resented the decision to appoint a Court of Inquiry; nevertheless, it recommended its members who are on strike to return to work on Thursday when the court sits. A strong recommendation did not at first satisfy the employers, who regard this as different from a withdrawal of strike notices; but on second thoughts they decided to ask their member firms to make no difficulty in allowing strikers to return to work on Thursday.

At the last minute, therefore, what the union calls "industrial serenity" prevailed when the court met. Its deliberations will probably last four or five days, and its findings will not be known until the publication of a White Paper, perhaps a week or two later. This gives tempers a little time to cool. They are already wonderfully cooler than they were a few days ago, when relations had undoubtedly become very bad—not least because of the resentment of the employers' representatives that they

themselves should be singled out as victims of the strike. A measure of serenity is certainly needed if a settlement is to be brought about by the simple process of inquiry. But at least it is a good sign that the union is not insensitive to public opinion. It has taken care that its strike should not directly inconvenience the public at large, and the milder attitude now shown may perhaps be due to Mr Stevens's failure to get the support of his fellow trade unionists in the Isle of Man.

The Rise of Nikita Khrushchev

ON the rumour that Nikita Khrushchev is Malenkov's brother-in-law theories have been built that Khrushchev's rise to the position of first secretary of the party is due to Malenkov's backing. In fact there is no certainty that the two are linked by family ties; in any case, such ties are a very poor criterion of Soviet political alignments. Trotsky and Kamenev were brothers-in-law, but that did not prevent Kamenev siding with Stalin against Trotsky (a Spanish proverb comes to mind: "He who goes to church with his brother-in-law comes out alone"). Indeed, it would seem that Khrushchev stands in Malenkov's way, that he is a potential, if not an actual competitor. After Stalin's death it looked for a moment as if Malenkov would inherit both the premiership and the party secretariat. Then it was announced that Malenkov "resigned" from the secretariat, thus leaving Khrushchev as the senior man in that crucial party body. Yet, Khrushchev was not officially proclaimed first secretary until now, that is to say well after Beria's fall.

Khrushchev is an old party stalwart and was a full member of the Politbureau already before the war. The Ukraine was his main field of action and he has been both party secretary and premier of that republic. Since 1949 Khrushchev has concentrated on agriculture. It was he who carried out the supplementary collectivisation, the joining of farms into larger units. He even drew pictures of an industrialised countryside with farmers living in agro-towns. This threat to the last remnants of private property, however, evoked strong protests. Khrushchev was rebuked but not disgraced. At last year's Party Congress he was in the limelight as the rapporteur on the party statute. After Stalin's death Khrushchev was first pushed aside, but soon succeeded in wresting the secretariat from Malenkov. It is not impossible that he was a leader of the anti-Beria group. Anyhow, after Beria's fall he immediately rose in the Soviet hierarchy and now his strong position is officially acknowledged.

Beria was accused, among other things, of trying to restore capitalism in the countryside. By the irony of fate Nikita Khrushchev—the man of the agro-towns—is now carrying out a policy of concessions to the peasants (analysed on page 788). To throw your opponent overboard and then to be forced to adopt his policy is a common event in Stalinist annals. Khrushchev is now officially placed as third in Soviet ranking. As agricultural policy-maker and boss of the party machine his power is probably second to none but Malenkov. It is even to be wondered whose voice does and will carry more weight in the councils of the Kremlin.

The Town in No Man's Land

THIS weekend sees the inauguration of one of the strangest communities ever founded. The 22,000 Chinese and Korean soldiers captured by the United Nations who have asked for sanctuary have been brought up from South Korea to the demilitarised zone which runs along the former battlefield, and settled in a tent city covering some five square miles. They are behind barbed wire, and guarded by 5,000 Indian troops; but elaborate and costly arrangements have been made to ensure that they may choose freely whether to spend their future lives under Communist rule or in the free world. With them, in Shanti Nagar (which means Peace Town to the Indians, but is bound to become Shanty Town to others), live the Poles, Czechs, Swedes, Swiss and Indians of the repatriation commission, whose joint responsibility the prisoners now are, and over a hundred Chinese and Korean Communist "explainers," who will be given repeated but carefully supervised opportunities to talk them into going north. This bizarre assembly is to last for three months, after which the Korean peace conference will make a final brief attempt to find an agreed formula for the disposal of those prisoners who remain, and then, in January, they must go free.

This painstaking experiment in fair play, which is in striking contrast to the forced indoctrination and brutal pressure applied by the Communists to their prisoners, is full of delicate problems. For example, the Communists claim that some of the Chinese really want to go home, but dare not because their comrades have forcibly tattooed them with Nationalist slogans. Can General Thorat, the Indian commander, find among his medical orderlies any capable of removing tattoo marks? Again, the Communists are now bound to hand over to the international commission the few Korean and United Nations prisoners who, they announced, have also refused repatriation. Originally the Communists claimed that there were 400 of these men, but the correspondents of western Communist newspapers, who often act as their masters' mouthpieces at Panmunjom, have now given signs of an imminent climbing down from that figure. It is to be hoped that this will not merely swell the lists of UN prisoners still unaccounted for, which are already grievously long.

Bulgaria Falls into Line

ACCORDING to unconfirmed reports the new economic fashions spreading through eastern Europe have been creating dissensions and doubts among the Bulgarian Communist leaders. Whatever the truth of these reports, the differences now seem to have been resolved and the doubts overcome. If, as was reported, the Premier, Vlko Chervenkov, took a trip to Moscow, that no doubt was the deciding factor. Soon after his return reductions in the prices of consumer goods were announced; and last week, at the anniversary celebrations of Bulgaria's liberation by the Red Army, Chervenkov announced further economic concessions and modifications of economic policy. If he had private doubts as to the wisdom of these changes, he at least must

have had the satisfaction of confounding those who had said that his days were numbered; he was supported on the platform by the most prominent of his alleged rivals and opponents.

As in Hungary and Rumania, the economic changes announced by the Bulgarian Prime Minister are designed to allay popular discontent by providing more food and consumer goods. Bulgaria's second five-year plan, which began this year, is to be changed (to an unspecified extent) so that light industry can be developed more rapidly at the expense of heavy industry. Chervenkov admitted that the government had made plenty of mistakes, but he did not eat humble pie to the same extent as his Hungarian and Rumanian colleagues have done. He said frankly that Bulgaria could not hope to develop all branches of heavy industry; and he implied that it had never intended to do so since membership of the "socialist camp," where there was a "correct socialist division of labour," made this unnecessary. It appears that Bulgarian industry is to play second fiddle to agriculture; which is to be developed as rapidly as possible. Already collectivisation has proceeded so far—over 60 per cent of the arable land belongs to the "socialist sector"—that the regime evidently does not feel compelled, as elsewhere in eastern Europe, to woo the private farmer in order to secure bigger food supplies. Almost all its efforts are concentrated on making life for the collective farmer easier and more rewarding.

The Allegiance of Sir Lincoln Evans

THE Trades Union Congress last week supported, by a handsome majority, Sir Lincoln Evans's much-criticised action in becoming vice-chairman of the Steel Board. In this much more was implied than an undoubted personal triumph for Sir Lincoln himself. Not for the first time, but more clearly perhaps than ever before, the controversy has brought out the clash between rival ideals of what trade unionism should be. The delegates who sought to condemn Sir Lincoln as, in effect, a renegade and turncoat, did so in the name of political trade unionism, the spearhead of the class war, the instrument of Socialism. The job of the workers' leaders, in terms of this ideal, is to fight for Socialism and against all anti-Socialist measures;

BRITISH WHOLESALE PRICES
INDEX NUMBERS 1938=100

when Conservatism is in power, they should be alongside the Labour Party in active opposition.

Sir Lincoln Evans justified himself in terms of an older ideal: according to this, the job of the workers' leader is to represent the interests of his constituents regardless of political circumstances, furthering them—with a "sacred egoism" akin to that of the national patriot—by war if necessary, by peaceful negotiation if possible, by influence and a word in season when neither war nor overt negotiation is called for. On this reckoning it is a union leader's duty to take a position in which, as a spokesman and representative of labour, he can safeguard and further its interests more effectively; and this remains true whether he fills that position in his capacity as a trade unionist or in his capacity as an able and experienced individual, and whether the position concerned is created in the course of a Socialist or an anti-Socialist policy.

Congress accepted this view, very properly. But there remains a certain tension between the oldest, non-political interpretation of Sir Lincoln's duty and that which is, in our time, emerging not only from the development of such bodies as the Steel Board but from the whole evolutionary growth, at every level, of workers' participation in control. The man who, whatever his past experience, takes a share in management must henceforward be a manager, with a manager's responsibilities to the enterprise as a whole, to its customers and the community as well as to its workers. There may come a time when Sir Lincoln or another will find himself impelled to address, to those who feel themselves entitled to his exclusive consideration, an industrial equivalent of Burke's letter to the Electors of Bristol.

Beveridge on the Rocks?

LORD BEVERIDGE has repeated his warning that the principle of comprehensive social security is being undermined by inflation. National assistance payments were originally regarded as a residual catch-all; instead, they are constantly growing as higher prices cut the real value of insurance benefits. Merely to halt inflation now is not enough; benefits must be scaled up and the principle of comprehensive security re-established. It will be expensive, but first things, said Lord Beveridge, come first; other social and economic aims must if necessary give way.

The trouble is that no social service can, in principle, be treated as an unconditional first charge on the economic system. The "first thing" which must come first is that system's own upkeep, running expenses and renewal. It is highly desirable to provide the growing body of pensioners with adequate security as of right; but if that can be done only by laying on income-earners a load that cramps and distorts their productive efforts, or by cutting those social services that maintain their health and earning power and provide for the rising generation, then it is the principle of comprehensive security that must give way. A more specific and radical criticism of the whole "Beveridge" approach to social security is voiced in a newly published (and extremely well-written) Fabian pamphlet.* "Insurance" is a misnomer where there is neither genuine financial

* "The Reform of Social Security." By Brian Abel-Smith. Fabian Publications. 41 pages. 2s.

independence nor actuarially related contributions and benefits. Like Lord Beveridge, the author wants all benefits raised, as of right, to the Assistance Board's subsistence level and adjusted to an appropriate cost of living index. But he would substitute for the contributory system, with its special administrative expenses, anomalies and rigidities, the combination of a special flat income tax and payroll levy; and he would replace retirement pensions by superannuation benefits, payable, after a certain age, to workers and non-workers alike, rising from a low initial level to a full subsistence standard, and ending "the artificial division of life into so many years of work and so many years of retirement."

This is psychological as well as economic wisdom; and it goes to the root of the matter. Changing the fiscal basis of benefit will of course—apart from administrative economies—make no difference to the real cost of maintaining non-producers; and it is the real cost that counts. But opening the door to that gradual and elastic extension of working life which should be the counterpart of increased national longevity reduces the proportion of non-producers; and in real terms that proportion is equally important. Whether the "superannuation payment" at its maximum should equal the Assistance Board's scales or should remain an unconditional element supplemented only in cases of need depends, however, on the state of the real national income and not on political and psychological desirabilities.

Teeth and Drugs

THE latest report of the Ministry of Health (Cmd. 8933) gives some additional information about the effect of the various charges imposed in the health service. This is particularly so for the dental services, where the figures support Mr Macleod's assertion some months ago that the £1 charge for dental treatment and the Labour Government's charge for dentures were between them enabling dentists to give more time to the treatment of children. In the second half of 1952, courses of treatment for children of 14 and under were running at the rate of 1,250,000 a year, compared with 640,000 in 1950-51, when there were no charges at all. This may, it is true, merely mean that more children are being treated by health service dentists than under the school medical service; but as more dentists are now being employed by local authorities, there has probably been a real increase in the number of children being treated in one surgery or another.

The effect of the prescriptions charge has been more disappointing. The Ministry's report goes no further than the end of 1952; and it was possible to hope that the sharp increase in the number of prescriptions dispensed last December—following a big drop immediately after the shilling charge came into force—was only temporary. It was, in fact, caused by the fogs and illness that characterised the period. But last May Mr Macleod said that the number of prescriptions was still rising. It seems quite clear that the charge, so far from being a deterrent—and therefore in Labour eyes a hardship—has been taken in people's stride. The report, however, does not explain why, since more prescriptions are being dispensed, the charge is yielding less than was estimated. Nor does it give the number of

repayments that were made to persons on national assistance and to war pensioners.

The Ministry's report provides so much information about the health service—particularly about the hospitals—that one hardly likes to ask for more. But the publication of this report nearly nine months after the end of the period covered underlines the need for an explanatory memorandum to accompany the health service estimates every March. This would be of much more practical value than a delayed retrospect.

Preferences and Europe

THE members of GATT—the General Agreement on Tariffs and Trade—are now meeting in Geneva. Although the British Government seems to have hoped that its effort to substitute higher tariffs for quantitative restrictions on imports of some fruits and vegetables would meet with little opposition, this now seems unlikely. Technically, Britain's difficulty springs from its wish to impose such tariffs without extending them to imports from the Commonwealth. The real opposition, however, will come not from the purists who condemn imperial preference on principle but from those west European exporters—Italy, Holland, France, Belgium and Denmark—who would have to pay the tariffs.

The British Government has attempted to appease these exporters by pointing out that fruit and vegetables for the British market are now subject to complicated and capricious quantitative restrictions; for the exporters themselves, a stable old-fashioned tariff should be an improvement. So far this argument has not cut much ice. Europe's agricultural exporters maintain that Britain is already committed by the OEEC programme of trade liberalisation to a progressive reduction of quantitative restrictions. This programme is not concerned with tariffs. The European countries, consequently, suspect that once British market gardeners have found refuge behind tariff walls, the market will remain permanently protected, whereas there was always hope, while protection was provided by quantitative restrictions, that it would eventually be removed under the liberalisation programme.

A broader criticism, perhaps in the long run more important, is that if Britain is permitted to replace quantitative restrictions by higher tariffs, a precedent will be established which other countries may promptly follow. If they do, the OEEC's whole objective of trade liberalisation will be frustrated. This issue translates the British proposal from the economic to the political sphere; is the Foreign Office willingly standing by while the Board of Trade deals a blow at one of the main projects of European co-operation? The blow might, indeed, be easier to take if it were quite clear that British policy is inspired purely by considerations of agricultural protectionism that are unlikely to change. European exporters might then make the best of it. But it is hard to see why, for the sake of agricultural policy, the British request should be pressed now instead of being incorporated in the general reconsideration of GATT that will in any event be made next year. Other possible motives are not, of course, far to seek. The Conservative party conference will be sitting in little more than two

weeks, and it would no doubt be pleased with a Minister who could report that even a strictly limited freedom to increase imperial preferences had been regained.

Steps Toward a Steel Cartel

QUITE early in the life of the European 'Coal-Steel Community there were signs that the steel producers were anxious to resuscitate some of the cartel arrangements they had used in prewar days. The treaty which governs the community forbade any such practices within the common market, but was ambiguous on the subject of what might be done in markets outside the area. In this the steel industries of the five member countries saw their opportunity; last spring their representatives met independently in Brussels and agreed on a common price that all would charge their overseas customers.

Recently the producers have buttressed this understanding with the introduction of a system of penalties under which a producer who violates the agreement will be fined \$50 per ton on any "ungentlemanly" sales. For the moment the High Authority apparently feels that it has no constitutional justification for interfering with these arrangements. Now, however, there is some talk among the producers of yet another extension of their agreement—the fixing of specific sales quotas. If they do take this step it might well be that the High Authority could legally step in with the claim that such a practice would be contrary to those principles of the treaty which aim not only to expand production but also to concentrate it in the most efficient plants.

Science Shortages

THE shortage of science teachers in the schools was heavily stressed by Mr Robert Birley, Headmaster of Eton, in his recent address to the British Association. He pointed out the futility of planning for scientific develop-

ments in Britain if the schools could not provide the necessary foundation for them.

Anxieties of this kind have gained a fairly wide currency, and it is surprising how little precise information on the subject can be obtained. It is confused by considerable special pleading from the various interests involved. Broadly speaking, the local education authorities are not anxious to give too much prominence to a difficulty that might involve them in a higher salaries bill. Conversely, science teachers are ready to argue that at the present level of teachers' salaries the competition from industry is much too great. In 1950 and again in 1952 the principal organisations representing secondary school teachers collected some information about unfilled vacancies. It suggested that 250 posts were unfilled at the approach of the new school year in 1952 and also showed special deficiencies among sixth-form teachers.

Evidence collected in this way is not, however, conclusive or even necessarily impartial. Something more authoritative is required as a basis of policy. Last June the Minister of Education asked the National Advisory Council for the Training and Supply of Teachers to find out the extent of the shortage and to recommend steps to overcome it. The facts are now being gathered. It is to be hoped that the committee will consider them expeditiously and will publish them fully. In their absence even Mr Birley's authority will not move matters as fast as, if he is right, they should be moved.

Cold Fish War

THE well-advertised and colourful attempts to revive the import into this country of Icelandic white fish have given a new twist to the year-old dispute between the Icelandic Government and British trawler owners. Early last year the International Court of Justice found in favour of Norway's claim to extend the limits of its territorial waters. The Icelandic Government naturally followed suit; it redrew the outer limits in such a way as to protect the white fish breeding grounds off its coast. Although a certain amount of local fishing is still permitted, all seine net and trawler fishing in these waters has been prohibited.

British trawler owners naturally resented this decision, which drove them off some of their most profitable fishing grounds; in retaliation, they succeeded in putting a total stop to imports of Icelandic fish into this country. The present threat to break the boycott has revealed to public gaze the mechanics by which it has been maintained. Mr Dawson, the intending importer, has been denied every facility at the ports, including the minimum supply of ice necessary for marketing the fish. This unanimity of opposition is being achieved by the threat of the local fishing fleet not to sell to any merchant who handles fish caught by Icelandic trawlers.

The trawler owners' case has not been improved by evidence that the boycott has made white fish dearer than it would be with Icelandic competition. Arguments for protection against that competition should be considered in their own right; they should not be confused with the quite distinct issue of retaliation. The trawler owners were never on good ground in adopting the strong-arm tactics

of a boycott. As an unofficial diplomatic weapon, it has been ineffective. The Icelandic Government has not withdrawn its decree, even though its fishing interests have suffered some damage. The proper approach to the whole question would, of course, be by an international inquiry into the problems of overfishing in the breeding grounds. It should cover not only the disputed grounds off Norway and Iceland, but also those off the coast of Scotland as well, where the local industry has been sadly crippled by the depredations of foreign trawlers without receiving any protection from the British Government.

Round the Rugged Rocks

THE medievalists will have their hour when the International Court hears the dispute between Britain and France over the Ecreho and Minquier islets, which lie between Jersey and the French coasts; for this dispute goes back some 750 years, to the French conquest of Normandy in 1204. In 1682 a distinguished Jerseyman described the islets as "being of noe use at alle"; but his fellow-islanders have taken a very different view. Although the islets have boasted no permanent population since the fifteenth century, Jersey fishermen have for centuries made them a base for summer fishing, and substantial buildings have been erected there. In 1850 a Jerseyman named Pinel took up residence on Maitre Ile and remained there for 45 years, although his wife left him after only 32. There is plenty of evidence that the islets have been subject to Jersey's legal authority for many years; and this legal right has been jealously upheld by the islanders, who on many occasions have repulsed French attempts to fish in these troubled waters, by diplomatic or more forceful methods. In the 1930s, however, French fishermen began to appear around the islands in force; and in 1945, when the German garrison on Jersey held out for some time, the Frenchmen seized the opportunity of getting to the islets before the Jerseymen. So the ancient rivalry flared up again.

That the massive machinery of international law should

have to creak into motion to settle a family quarrel may seem incongruous. Unlike the Anglo-Norwegian fishery dispute, the case of the Ecrehos and Minquiers is unlikely to create any precedents which would bind other nations. But when the Attorneys-General of the United Kingdom and Jersey travel together to The Hague to plead their claims to the Pipettes, Gross Tete, La Vieille, Les Maisons, the Tas de Pois and a host of other charmingly named rocks, they will at least be setting an example of respect for international law in small things as in great. And if the Indian, Brazilian, Russian, Chinese and other judges of the Court are so bemused by the dog-Latin of the parchments on which much of the case turns that they deliver a judgment which seems unfair to British eyes, responsibility for the confusion can be placed squarely on King John, who originated the whole affair by losing Normandy and who, as every schoolboy knows, was a Bad King.

The above paragraphs appeared in *The Economist* on December 22, 1951. They appear as relevant today, in view of the International Court's new hearings, as they did then. This fact, however, prompts some reflection on the speed—if that is the right word—at which the Court is accustomed to move.

Pay Packets or Study?

THE universities' long vacation has nearly ended and as the dons return the controversy about the merits and demerits of vacation jobs for their students is being renewed. A vacation job seems now to be regarded by most undergraduates as not only unavoidable, or at least respectable, but even as desirable. This is a sharp change from prewar days even if it is still different from the attitudes of most students abroad. But British dons are still by no means sure that it is sound.

No exact figures of the number of students who do holiday jobs are available, but the National Union of Students, which finds rather over 7,000 jobs a year, estimates that it covers only about one-third of the total. Opinions differ sharply about the proportions in which students are divided between those who take jobs because they cannot otherwise make ends meet and those who like the independence of a paypacket and the feeling of not being a charge on their parents. But a change in outlook there certainly is. To some extent it must reflect the smaller proportion of undergraduates who come from homes where a position of dependence until the age of 21 or 22 is accepted as normal. The habits of independence learned during national service no doubt also play their part.

Whether vacation work is good or bad for the undergraduate is open to endless argument, but it is very doubtful whether much can be done about it. The Ministry of Education policy is not clear a year ago, when its maintenance allural protection students were revised, that it regarded maintenance during vacations mainly as the responsibility of students and their parents. Even a large increase in the vacation allowance would compare unfavourably with paid work. Vacation jobs are mostly unskilled: farm camps provide a companionable life but industrial jobs are better paid. For example, the canning industry has a high seasonal demand, and the weekly wage

of about £6 for men may be doubled by overtime. At Christmas Post Office and railway work, particularly on night shifts, are also paying. Women students do not seek vacation jobs in such large numbers, partly because the jobs are less well paid, but perhaps more because the convention of the independent male has not—as yet—been widely imitated by daughters.

The Recorder's Angel?

ON October 27th, for the first time for 23 years, London and the Home Counties are to have another daily newspaper. *The Recorder*, a weekly paper, will transfer its name to the new twopenny daily, and will itself become *The Recorder Weekly*. It has long been the intention of the editor and proprietor, Mr William J. Brittain, to start a daily paper, and he has seized the opportunity provided by the removal of restrictions last May. It is a brave venture. The circulation of existing national dailies seems at present unstable; some are rising, some falling. The smallest are *The Financial Times* with 60,000 and *The Daily Worker* with 90,000—figures that look large, however, beside *The Recorder's* present circulation of 22,000. The new daily will continue the policies of the existing weekly—down with Socialism, up with the Empire, and Brittain for the British. Rumours that Lord Beaverbrook was financially interested in the venture were strengthened by a remarkable article in one of his newspapers this week; it argued at length, and vigorously, that his Empire crusade had failed because his papers had mishandled it. Was he going to pass the torch to *The Recorder*? But Mr Brittain categorically denies that Lord Beaverbrook or any other press lord has any connection, financial or otherwise, with his new paper.

The English Inn

England is ringing from end to end with complaints against publicans. Innkeepers' charges, like cab fares a few months ago, are now fiercely assailed. . . . The best cure, we must say as good Free-traders, would be found in carrying into all trades and all departments the admirable principle of "unrestricted competition." Already, it is said, confectioners are offering—though they dare not sell wine, nor spirituous liquors, nor beer—accommodation to travellers. Temperance hotels have probably no need of licences. If it were possible, with a due regard to the interests of the revenue, to set the trade of the publican wholly free—free alike from the jobbery of justices, the trammels of the excise, and the inspection of the police—we should apprehend that competition would again, and everywhere, make the inns of England superior to those of the Continent. In former times, they enjoyed a great reputation. An English inn was about as pleasant a place to "take one's ease" at as could be devised or desired; and unrestricted competition might restore their lost honour. Common consent now confers on the American hotels, which enjoy perfect freedom, a reputation similar to that once enjoyed by our own. . . . We must have unrestricted competition in every branch of business. Hotel-keeping, with beer-brewing and licensing public-houses, is a favourable one on which to prosecute the great experiment.

Letters to the Editor

Labour and Korea

SIR—In your issue of August 22nd (which I have only just seen) you make a really remarkable statement about the Korean policies of the Labour Government and the present Government. "Why," you ask, "does Mr Jay say that the Morrison pledge went no further than retaliation against bomber bases in Manchuria? In the only form in which it has been made public, it was not so limited."

Your researches must have been singularly brief or myopic. On February 18, 1952 (the day after Sir Winston's "disclosure" in the House of Commons), Mr Attlee issued a statement in which he said that in discussions with America the question had arisen of what action should be taken in the event of "heavy air attacks being launched against the forces of the UN by aircraft from bases on the far side of the Yalu river." He went on to say that his Government had agreed that, after consultation, "the General Officer Commanding should be permitted to attack those airfields from which the attacks were being launched." Mr Attlee concludes that it is clear that "there was no departure from the general policy of confining operations to the Korean theatre of war."

When the present Prime Minister made his "disclosure" in a form deliberately designed to misrepresent the facts, he can scarcely have hoped to be so successful as to get even *The Economist* to forget everything but his own version of the Labour Government's commitment.

You owe Mr Jay an apology. And, since the main basis of your argument has disappeared, you should withdraw your unworthy charge that the Labour Party, once it has been out of office, ceased to support the war against aggression in Korea.

The issue now is not the prosecution of this war, but the best way of securing peace in Korea and of preventing a general war in Asia. Because we strongly disagree with the Government on this issue it cannot fairly be argued, as you argue, that we failed to support the war up till the conclusion of the armistice.—Yours sincerely,

P. C. GORDON WALKER

House of Commons

[The point at issue is neither Sir Winston Churchill's gloss on the Morrison pledge nor Mr Attlee's, but what was actually contained in it, explicitly and by necessary implication. That has never been revealed; and until it has been we are unwilling to believe that any British Government would be so silly as to set limits on the military action it might take in hypothetical circum-

stances, or so short-sighted as to ignore the wider consequences that might follow from bombs dropped on China.

Both the Labour Government and the Conservative Government have hoped that the fighting would be confined to Korea. Both have had to face the possibility that, if the other side extended its aggression, such a restriction might not continue to be possible. There is no real difference between the two positions in the Far East; the only differences are in the state of politics at home.

Why does Mr Gordon Walker say we accused the Labour Party of "ceasing to support the war against aggression in Korea"? We think the quality of their support has been affected by their domestic political preoccupations; but we have never thought they intended to withdraw it altogether. As the naval officer said of the War Office, "In their own queer way, they are on our side."—EDITOR.]

Suspect Soviet Statistics

SIR—While what you say of the crudity and exaggeration of Communist statistics is undoubtedly right, I cannot insist too much that it gives no ground for complacency. Deflate them how we will, these statistics continue to show a rate of growth of industrial production permanently and considerably greater than that ever achieved by any "capitalist" country. I have yet to read an expert, however sceptical or politically hostile, who proves the contrary.

The study of the Soviet economy—if not of other Communist economies—has gone by now a very long way. We may regard the above finding as incontrovertible, securely based on painstaking and dispassionate research. It is a great pity that the primary source-book, *Soviet Economic Growth* (ed. A. Bergson, Row-Peterson, Illinois, 1953), has found no mention in your columns. I do not hesitate to say that it is the most important work on economics since Keynes' General Theory: not, I hasten to add, for any originality or profundity of thought, but simply because it presents facts that must surely, as their consequences are absorbed, bring about as great a revolution in our economic attitudes as ever did Lord Keynes.

I am not the coryphaeus of this revolution, and am quite in the dark as to the form it will take. But the consequences for home and foreign politics are easier to adumbrate: how, for instance, will Frenchmen vote in 1970, if no one denies that Bulgarians are better off than they? "Economic intelligence on these matters," you say, "such as it is, seems to clash with political judgment." The economic intelligence is clear enough, but I wonder what you can possibly mean by "political judgment." On what evidence

THE ECONOMIST, SEPTEMBER 19, 1953

is it based? Or is perhaps politics an *a priori* science and our wishes the fathers of its judgments?—Yours faithfully,
P. J. D. WILES
New College, Oxford

[It is a reasonable political judgment that serious social and economic difficulties have revealed themselves in the Soviet Union and Eastern Europe since Stalin's death; but the evidence is not of the kind that the economist would call reliable intelligence. Indeed, it conflicts at many points with the economic statistics and plans that are published.—EDITOR.]

Broadcasting Finance

SIR—In your comment last week you were surely being something less than ingenious. You wrote "If it [the BBC] is really so unable to balance expenditure against present income . . . there is still no reason to take a tragic view of the Corporation's finances." And you go on to point out "there would be little difficulty in raising the licence fee." While certainly it is true that at present prices there is only one bargain better than a sound licence (and that is a TV licence) it is scarcely fair to neglect the fact that licence fees are controlled by the Government. The BBC is perhaps understandably doubtful of the upshot of any plea to the present Government to increase licence fees. Such a plea is much more likely to be taken as an argument for commercialising. So too, when commercial TV is established, the fact that it must cater first, last, and all the time for the largest common denominator of public taste will be taken as a reason for further Exchequer raiding of the licence fees of an institution failing "to give the public what it wants."—Yours faithfully,

ANTONY FLEW

University of Aberdeen

Firm Hand in Pakistan

SIR—I would add to your terse comment on Mr Fazuri's letter in your issue for August 29th that he lacks a sense of proportion.

The Qadianis, whom Mr Fazuri describes as "a dangerous group . . . who conspire to establish a state within the state" number no more than half a million. Their main sin in the eyes of religious groups in Pakistan is that they believe in Mirza Ghulam Ahmad as a Prophet after Muhammad. Surely the Qadianis can be allowed to enjoy this belief in peace, and need not be "crushed by confiscating their properties, etc., and indiscriminate arrests and detentions," a course which Mr Fazuri abhors but which, ironically enough, his movement (the Jamaat-e-Islami) has persistently advocated against the Qadianis.

Pakistan is on the threshold of an era of progress and development. It would be a great pity if she were deflected from her path and the energy of her people wasted by religious leaders whipping up religious hysteria amongst the uneducated masses.—Yours faithfully,

MUSA E. MAZZAWI

In Defence of Monopoly

THE BBC FROM WITHIN.

By Lord Simon of Wythenshawe.

Gollancz. 360 pages. 16s.

IN all the controversy about the Government's intention of ending the BBC's monopoly in broadcasting and introducing commercial television, the arguments used by both opponents and supporters of the scheme have been curiously lacking in substance. The debates have turned on generalities about taste and monopoly, freedom and popular culture.

The reason for this degree of abstraction may well have been the lack of any general handbook giving the facts and figures about British broadcasting and the systems in other countries. Few people could wade through the monumental report of the Beveridge committee on the BBC or afford time to sort out its massive evidence. Today, however, there is no reason for either side to be so lacking in factual arguments. Lord Simon of Wythenshawe, who for five years was chairman of the BBC, has produced a very clear and thorough guidebook both to the British system of broadcasting and to the methods employed in the United States and the Commonwealth. Particularly in those sections dealing with the actual administration of the BBC, he gives the reader information that is probably not available anywhere else.

Although it is written in the terse style of a handbook, Lord Simon's study does not only provide facts. It pleads a case as well. The author is a convinced advocate of a continuance of the BBC monopoly, and the basis of his conviction is that, since broadcasting is one of the great forces transforming the modern mass electorate into a responsible democratic community, it cannot be left to the exploitation of mass taste at a low level which, he believes, is the inevitable result of commercial broadcasting.

This attitude had no *a priori* basis in Lord Simon's mind. Those who knew him in his early days as chairman will recall how resolutely he preserved his critical sense and how often he troubled zealous BBC officials by his "open mind" on the question of commercial radio. His conversion to the BBC monopoly has sprung in the first place from his intimate knowledge of the BBC. In spite of his continued criticism of what seems to him its over-centralised administration, the excessive power of its Directors-General and a certain timidity and complacency in its general tone, he has come to believe that it amply fulfils its function of enlightening, educating and entertaining.

But a more decisive influence was undoubtedly his study of American methods. It was his visit paid to the United States in 1948 that finally settled his convictions. His impression of the American system was of an immensely expensive and often wasteful business, giving to an overwhelming extent nothing but cheap entertainment. Timidity in comment was another bane; he quotes the American radio critic John Crosby: "Virtually everything from pregnancy to freedom of religion is considered a controversial subject, leaving almost nothing except homicide as a fit subject to enter our homes." Worst of all, the violence of the programmes designed for children left Lord Simon appalled and convinced that, under any system whatsoever, television should be banned between 6 and 7.30 when harassed mothers are coaxing obstreperous children to bed.

Lord Simon defends the BBC monopoly on the ground that the safeguards represented by an alert press—to which the BBC is always "news"—the Governors, the advisory councils, external pressure groups and, in the last resort, Parliament are ample to ensure that no regimentation of opinion occurs. He describes in detail the efforts made within the BBC to ensure that all types of opinion are heard. Lord Simon recognises that complete monopoly as in Britain or complete commercialisation as in the United States are not exhaustive alternatives. In a valuable chapter, he describes the little-known mixed systems of Canada, Australia, New Zealand and South Africa. But in each case, he argues that commercial broadcasting draws audiences away to light entertainment and leaves the public systems with no means of educating the people as a whole to wider and more serious tastes.

Lord Simon seems to consider that competition between public corporations would be the least dangerous method of breaking the monopoly, and the least likely to debase public standards. But on commercial broadcasting, his verdict is emphatic. Instead of acting as a creative force in democratic society, he thinks it is one more instrument of inertia and passivity.

Criteria of Loyalty

THE FEDERAL LOYALTY SECURITY PROGRAM.

By Eleanor Bontecou.

Cornell University Press (London: Geoffrey Cumberlege). 377 pages. 32s. 6d.

SO much has been written hysterically about America's anti-Communist hysteria that no book could be more wel-

come than this scholarly, sensible and well-written study of the United States Government's attempts to protect itself from betrayal from within the ranks of its own servants. Miss Bontecou, a member of the New York Bar, explains the successive attempts to define the danger, and shows how procedures were tightened under public pressure as the cold war developed. In 1951, "reasonable grounds for belief" in the disloyalty of a civil servant were replaced by "a reasonable doubt as to" his loyalty as grounds for his dismissal.

But the question that must haunt a conscientious member of a loyalty board is what constitutes a reasonable doubt. Is the only loyal man he who has never joined an organisation that now, or at any time hereafter, may be named as subversive by the Attorney General? If a man joined the Washington Bookshop to get a discount, the International Workers' Order to get a pension, the Abraham Lincoln Brigade in the nineteen-thirties because he thought Fascist victories in Spain bad for the United States, or the American Council on Soviet Relations in the nineteen-forties because he thought Russian victories good for it, is his loyalty necessarily suspect? Perhaps he was part of the Communist infiltration that undoubtedly captured these organisations; perhaps he was not. Evidence supplied by the Federal Bureau of Investigation is raw and unassessed; the witness is often anonymous, the board has no subpoena power, there is no opportunity of exposing malice and misconception. Miss Bontecou found little evidence of deliberate witch-hunting: most of the fumbling and occasional inhumanity in the operation of the loyalty boards stem from the sheer impossibility of finding a single piece of litmus paper with which to test a man's whole life for loyal intentions. It is hardly surprising that, when given the chance, many boards shift gratefully from the dilemmas of loyalty to the wider, yet less perplexing ground of security as a reason for their doubts, and since this book was written, the new Administration has concentrated attention on security as offering more "objective" standards. Although this change has made Miss Bontecou's account out of date in a few details, the basic problems remain. Habitual drunkards, drug addicts and sexual perverts are obviously security risks; when it comes to deciding whether a man has "associated over a period of years" with Communists the new boards will again be on shifting ground.

In her last chapter, Miss Bontecou examines the British way of dealing with a similar problem. The American civil servant whose loyalty is in question has many more safeguards of a quasi-legal kind than his British counterpart. But on the other hand, in the United States neither private vigilantism nor the government seems prepared to treat a favourable verdict as final, and the happy solution has never been found of setting suspect defence officials to the guarding of ancient monuments.

Disintegration of Europe

DOCUMENTS ON GERMAN FOREIGN POLICY, 1918-45. Series D. Volume V. HMSO. 977 pages. 25s.

THE publication of this volume of the "Documents on German Foreign Policy" rounds off the picture of international politics as seen from the Wilhelmstrasse between the autumn of 1937 (when Mussolini visited Berlin) and the occupation of Prague in March, 1939. Despite the thickness of the volumes (containing more than 3,500 documents in all) and the assiduousness of the editors, it is not a complete picture. Thus, the important part played by Nazi Party agencies abroad is only occasionally reflected in the more conventional archives of the German Foreign Office. Hitler alone saw the full pattern of German policy, and he was not given to confidences.

Nevertheless, this tripartite enterprise, with its combination of British, American and French editors, has already more than justified itself by the wealth of information it has brought to light on the foreign policy of Germany and of the other European States. It is to be hoped that the three governments will carry through this major historical project to its full conclusion and that some of the earlier series dealing with the period before Hitler will soon appear.

At first sight the present volume serves to fill in the gaps left in documenting the major events of the Anschluss, the disruption of Czechoslovakia and the Spanish Civil War in the preceding volumes. This is a misleading impression. The three principal chapters all contain material of great interest in its own right. The first follows the course of German-Polish relations in the eighteen months before Prague and serves as a prelude to the dispute that finally led to war. The second is concerned with the relations of Germany and the states that lay within its field of power to the south-east—Hungary, Yugoslavia, Rumania and Bulgaria. It illustrates not only the effectiveness of the pressure Germany exercised upon their governments, but the uneasy manoeuvres of each of them to preserve some remnant of independence while standing well with the new masters of Central Europe and also their sly attempts to exploit German patronage to their own advantage. In the third chapter the same story is repeated in the case of the Baltic states.

The theme throughout is the use by Germany of its combined political and economic strength to exploit the fears and weaknesses of the smaller powers in face of the failure of the Western powers to come to the aid of Austria and Czechoslovakia. It is a study in the disintegration of Europe skilfully exploited by the menacing technique of the blackmailer; a telling illustration of the consequences of that mixture of blindness, shallow optimism and fear which the statesmen of the day dignified with the name of appeasement.

June to August 1939

DOCUMENTS ON BRITISH FOREIGN POLICY, 1919-1939, Third Series, Vol. VI. HMSO. 882 pages. 52s. 6d.

THE latest volume of the Foreign Office Documents covers the period from June 8th to August 14, 1939. Its pages are devoted for the most part to the Anglo-French negotiations with Russia. These are fully dealt with for the first time, at least in their tactical and diplomatic aspects, up to the opening of the military discussions.

The acceptance by Great Britain and France of the Russian demand for military conversations, before a political agreement had been reached, was the last of the many concessions to the Soviet Government that marked this phase of the negotiations. "His Majesty's Government," wrote the Foreign Office on July 27, 1939, summing up what the volume has to say on this subject,

have given way to the Soviet Government as regards (1) covering the case of the Baltic States, (2) not specifically covering the Netherlands and Switzerland (3) providing . . . for the case of indirect aggression, (4) binding the signatories not to conclude a separate armistice of peace, (5) including the definition of indirect aggression within the agreement itself. The Soviet Government on their part have made no concessions of substance.

On the question why the Western powers were in this weak position, it was not to be expected that the volume would add anything new at this stage of our knowledge and reflection. But it is confirmed in these pages that the British Government was at least aware of its weakness and of the reasons for it. And it is some comfort that, despite this fact, it was never tempted to depart from what, after the German occupation of Prague, had become its only course—in terms of eventual security no less than of immediate self-respect. "The Russians," wrote Mr. Strang from Moscow, "have . . . at least two alternative policies, namely the policy of isolation and the policy of accommodation with Germany." Great Britain had no alternative but to oppose further German aggression, with Russia's help if possible, without it if necessary; and no one any longer looked for any other way out.

The issue of peace or war thus lay with Germany, and another main topic of the volume is the increasing German menace to Poland, with the Danzig question at its centre. Other aspects of Anglo-German relations—the German denunciation of the Anglo-German Naval Agreement and, in appendices, the ineffectual activities of the Kordt brothers and of Mm. Dahlerus and Wenner-Gren—are also briefly dealt with.

The third subject of the volume is the British negotiations with Turkey which continued throughout the period and which, like those with Russia, were part of the attempt to build up a common front against expected German attack.

Latin America

COLOMBIA.

By W. O. Galbraith. Royal Institute of International Affairs. 140 pages. 13s. 6d.

CHILE.

By Gilbert J. Butland. Royal Institute of International Affairs. 128 pages. 12s. 6d.

CHATHAM HOUSE deserves to be encouraged in its present undertaking of a series of short studies of Latin American countries. Although the prices of these books may seem somewhat out of proportion to their brevity, the latter itself should count as a virtue. It is sadly fashionable to treat all the twenty republics south of the Rio Grande as a unit; the result, particularly in the United States, has been a flow of ponderous volumes, each of which tries to deal with the whole continent and fails to do justice to its parts.

The present series, while seeking to fill this void, has set itself a modest aim. Mr Galbraith's study of Colombia is typical in this respect. He has contrived to pack into his pages the essential outlines of Colombia's economy, geography, vital statistics and administration, and has done this difficult job well. Facts and figures are skilfully deployed to bring out such points as the early and remarkable development of airlines in this geographically fragmented country, and the interesting experiment in co-operation between government and foreign capital in the oil fields. Mr Galbraith's historical and political sections will provide the reader with a convincing explanation of this year's dramatic political events, although they were written before General Rojas Pinilla overthrew President Gomez. But the heart of the book is the all too brief chapter in which the Colombian, with his quick mind, his personal loyalties, his felicitous language and what he himself calls his "indigenous malice," is brought to life with sympathy and understanding.

Dr Butland's book on Chile was first published in 1951. This revised edition is able to take account of the abrupt political change involved in General Ibanez's recovery of the presidency in the 1952 elections. But, although a section is devoted to relations with Argentina, the reader is given no inkling of the new president's past or present relationship to General Perón. Indeed, throughout the historical and political sections of the book—in which, admittedly, much useful information is very concisely presented—there is a marked lack of analysis and explanation. Dr Butland takes us briskly through all the fantastications of Chile's geography and the problems of its economy, providing copious statistics and some very necessary maps. Nevertheless his competent but dry (and sometimes ungracefully written) study contains little to stimulate the interest of the general reader or to touch the imagination of the student.

THE ECONOMIST, SEPTEMBER 19, 1953

On the mid-day train to Paris

She is cutting up a salad for the children's lunch—but in her thoughts she is leaving Victoria en route for Paris and the autumn collections. As a matter of fact, there is a connection; her table is surfaced with WARERITE Plastics—the material used by British Railways in standard compartments, toilets, dining and sleeping cars. For making brighter living and lighter work in home, factory, office and school there is nothing to touch WARERITE. It is widely fitted to new furniture and can be used to resurface old furniture to make brighter homes everywhere. The growing popularity of WARERITE is just one of the many successes of the Bakelite organisation, whose pioneering efforts have been mainly responsible for making plastics a part of daily life.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Dropping the Plumber

Washington, DC

THE resignation of Mr Durkin, the Secretary of Labour, marks the frustration of President Eisenhower's original attempt to steer a middle course in his conduct of domestic, and particularly labour, affairs. Mr Durkin was unique in a Cabinet which was once described as consisting of "nine millionaires and a plumber." The president of the plumbers' and steamfitters' union of the American Federation of Labour, Mr Durkin is a Democrat who voted for Mr Stevenson last November. His selection, which Senator Taft called "incredible," was taken as evidence of the President's anxiety to wipe out the anti-labour reputation the Republicans had acquired, and build a trade union following for his Administration. Mr Durkin is not one of the most influential trade union leaders, and his appointment did not commit even the AFL to co-operate with the Republicans. But now that he is gone, the President may find it increasingly difficult to resist the conservative pressures in his own Cabinet which made it impossible for Mr Durkin to remain.

In his election campaign Mr Eisenhower promised to recommend amendments to the Taft-Hartley Labour Relations Act which would remove some of its injustices. Mr Durkin, once he had become Secretary of Labour, worked out, in consultation with White House advisers, members of Congress, and other members of the Cabinet, a series of nineteen amendments to the Act. It was Mr Durkin's understanding, though this is denied, that the President agreed to this programme, and had planned to send a message to Congress on July 31st recommending the alterations. But on that day Senator Taft died. On the same day there leaked out in some newspapers an outline of the proposed amendments. These articles made much of the fact that many "concessions" to the AFL would be recommended.

The death of Senator Taft threw the machinery of the White House out of gear for some hours and the work of completing the message to Congress was delayed. Meanwhile, the publication of the newspaper articles raised an alarm among conservative Republicans in Congress, who began to protest to the White House. Mr Nixon, the Vice-President, argued forcibly that it would be "political suicide" for the President to "appease" labour. As a result, the message was held up.

A major conflict then developed in the Cabinet, while President Eisenhower was on holiday in Colorado. The conservatives, led by Mr Nixon and the Secretary of Commerce, Mr Weeks, a Boston financier, threw their weight

against the proposed concessions to labour. When it became apparent to Mr Durkin that they had won over the President to their point of view and that there would be no new Republican labour policy for him to lay before the trade union conventions which meet this month and next, he resigned and returned to his union post.

This victory of the Republican right wing was a windfall for the Democrats as they gathered in Chicago to regroup their own badly divided forces and pick the ground on which to fight next year's congressional elections. Had the President supported Mr Durkin and submitted his labour programme to Congress at this time, much of that ground would have been cut from under the Democrats, and the AFL, whether its leaders liked the idea or not, would have been forced to voice its approval of the President's "progressive" labour policies. Mr Durkin's departure greatly weakens, if it does not end, any hope of associating the AFL with the Administration.

★

In fact, the labour programme worked out by Mr Durkin and the White House, which caused such alarm in the right wing of the Republican party, was not the surrender to the trade unions which the frightened conservatives imagined. Many of the changes in the Taft-Hartley Act suggested in the "lost message" of July 31st had been approved by the late Senator Taft. Nevertheless, they would have been welcome to the labour movement, and particularly so to the AFL. For example, they would have liberalised the Act's restrictions on "secondary picketing," which are keenly felt by the building trades unions of the AFL.

One proposal which particularly alarmed the conservatives involved the strange section of the Taft-Hartley Act which provides that when a state labour law and the federal labour law conflict, the more stringent of the two shall prevail. In other words, the federal labour law is supreme in cases involving interstate commerce, unless the state law covering the same subject is more repressive. Mr Durkin would have made the federal law superior in all cases. If this were done, at least thirteen states would no longer be able to forbid the union shop, which the Taft-Hartley Act permits. Under a union shop contract, workers need not be members of a trade union to secure a job, but they must join within a specified time.

The conservative forces which have prevented the President from sponsoring changes in the Taft-Hartley Act just

MAXIMUM PRICES:— Bottles 35/-, ½-Bottles 18/3, ¼-Bottles 9/6, Miniature Bottles 3/8, as fixed by the Scotch Whisky Association.

now may also succeed in stiffening its enforcement. On the National Labour Relations Board, the five-man agency which administers the Taft-Hartley Act, there are at present two members appointed by Mr Truman, two appointed by President Eisenhower, and one vacancy. There have been indications that the two members put on the board by President Eisenhower will try to tighten up their interpretation of the Taft-Hartley Act in a manner not to the liking of the trade unions, who appear before the board as litigants. But it will be the man chosen to fill the remaining vacancy on the board who will break the existing tie, and determine the board's attitude on the administration of the law.

This fifth seat on the National Labour Relations Board has remained empty because Mr Durkin objected officially to the man President Eisenhower had intended to nominate. He is Mr Lawrence Gooding, a member of the labour relations board of the State of Wisconsin. Mr Gooding is sponsored by Senator Wiley, of Wisconsin, the chairman of the Senate Foreign Relations Committee. Mr Durkin protested against the nomination because the trade unions in Wisconsin, both those affiliated to the AFL and to the Congress of Industrial Organisations, had bitterly assailed Mr Gooding as a man hostile to organised labour.

The President did not attempt to nominate Mr Gooding over the official opposition of the Secretary of Labour. But no other candidate was proposed, and pressure had been put on Mr Durkin to change his mind. Only the day before Mr Durkin resigned, he was approached by the Postmaster General, Mr Summerfield, who handles political matters for the Cabinet, and asked to withdraw his objection. Mr Durkin refused. But with his departure from the Cabinet, there remains no obstacle to the nomination of Mr Gooding to the strategic vacancy on the labour board, except, perhaps, the need to demonstrate that no anti-labour shift, such as the Democrats allege, has in fact taken place in the Administration.

California Without Warren

FROM A CORRESPONDENT IN SAN FRANCISCO

BY declaring that he will not seek a fourth term in 1954, California's Governor, Mr Earl Warren, has opened the way for political realignments in the state which promise to have national repercussions. Of most immediate interest is the question whether the subdued but real rivalry between the personal followers of Mr Nixon, who was one of the two Senators from California before he became Vice-President of the United States, and the official leaders of the Republican party in the state, Governor Warren and Senator Knowland, will erupt to a point where California's Democrats can make capital out of it. In view of the struggle for power now developing in California, Mr Warren's temperate announcement that "periodic change . . . sharpens the interest of our people in the election process" and "kindles new ambitions" seems a masterpiece of understatement.

At stake is the continuance of a very nearly model state administration run on bipartisan lines and reasonably adapted to California's phenomenal postwar growth of population—there are now 12 million inhabitants. The Governor's programme for better schools, roads and welfare

services has set a pattern for moderately progressive and solvent government, in spite of legislative setbacks. It has been possible for Mr Warren, a Republican in a state where the Democrats theoretically have a majority, to develop this programme because his bipartisan, technical approach to government has attracted the steady support of many of the state's Democratic and independent voters. The weakness and disunity of the local Democratic organisation has also favoured the Warren administration.

But California's Republicans are nearly as disunited. Not only are there the insurgent followers of Mr Nixon in Southern California, but also the Warren-hating, isolationist supporters of the Lieutenant Governor, Mr Goodwin Knight, who include leading lights of the California Medical Association and important oil interests. Then, too, there is a more independent and predominantly internationalist wing of the party, typified by such commanding figures as Mr Roger Lapham, a former mayor of San Francisco and head of the Economic Co-operation Administration's mission to Greece, and Mr George Cameron, publisher of the influential *San Francisco Chronicle*. As the heir-apparent to the party leadership of Governor Warren, Senator Knowland must now try to weld these diverse elements together. He can hardly succeed without the help of Mr Nixon's politically aggressive and well-financed followers. This group of young men has introduced into state politics a new brand of public relations professionalism which, it is boasted, has never lost an election.

To enlist their co-operation, Mr Knowland will have to make concessions, particularly in the touchy matter of patronage. Up to now all of the Republicans from California who have been given positions in the Eisenhower Administration have been hand-picked by Mr Knowland, with the help of Senator Thomas Kuchel, the able former State Controller, who was appointed by Mr Warren to fill Mr Nixon's vacant Senate seat. This has naturally strengthened Senator Knowland's hand, both in Washington and in California itself, but it has also deepened the split between north and south in the state—Mr Knowland comes from near San Francisco and Mr Nixon from near Los Angeles—which was so evident at the Republican National Convention in 1952. Then Mr Nixon's open preference for General Eisenhower undermined the California delegation's pledged support of Mr Warren for the Republican presidential candidacy. It is now assumed that one of Mr Warren's motives in announcing his withdrawal from next year's gubernatorial race at this early stage is to give Senator Knowland an opportunity of mending this breach while he is at home during the present congressional recess. Mr Knowland will presumably attempt to regroup the Republican forces and unite them behind a strong candidate in order to meet the expected Democratic bid for control of the state.

★

Thus in California as in the United States Senate, Mr Knowland seems fated to play a crucial role as the successor to a powerful and seasoned political personality. And just as Republicans in Washington look upon his sudden elevation to be Senate majority leader in Mr Taft's place with mixed feelings and expectations, so the followers of Governor Warren are concerned about the quality of the leadership which Mr Knowland will offer the state. This concern comes from the realisation that Mr Warren's unique

influence is the result of a generous and far-sighted political philosophy and a warm and amiable personality. Fundamentally a conservative, he has moved with the times to lead a moderate, cautious progressivism in the party, and has gained in the process a large personal following. Mr Warren is a good listener and when in doubt he seeks expert advice. Mr Knowland, on the other hand, makes a point of being aloof. He rarely asks advice and rarely listens to anyone. He too is a conservative, a man of good will, dedicated to what he believes best for the country, and there are no doubts about his integrity. But there are doubts about his judgment, and of his ability to unbend sufficiently on his home territory to heed the advice he will need if he is to hold together the factions in his party.

In particular, Mr Knowland's consuming preoccupation with American policy in the Far East and his pretensions to speak for all of California on this issue, without reference to local opinion, have worried his party associates and alienated many independent voters. It is significant that this has been an issue between him and Governor Warren, who has made a point of acquainting himself with the basic complexities in postwar Asia. Mr Warren has never endorsed any of Mr Knowland's extreme positions, ranging from a demand for impeachment of Mr Acheson in 1949 to his recent declaration that the United States should withdraw from the United Nations if it admits Red China. By contrast, Mr Warren has warned Americans that they would be involved in a war between Chinese Nationalists and Communists, and he has repeatedly expressed his belief in collective security through the United Nations. Mr Warren's bipartisanism and firm internationalist position have helped to win him the continued support of such important independent papers as those of the McClatchey chain in California, which have attacked Mr Knowland's views on these subjects and can hardly be expected to stop doing so now.

★

Senator Knowland's fundamentalist attitude on Asian affairs, his easy simplifications, his demand for Japanese rearmament and his encouragement for the ambitions of Dr Syngman Rhee and General Chiang Kai-shek undoubtedly won him considerable support when his stand seemed to constitute an attack on the Truman-Acheson regime. But there are signs that his adamant position may become embarrassing to the Eisenhower Administration and to California as well. This is indicated by a recent despatch from Washington outlining a plan to "fill the legislative gap left by the death of Senator Robert A. Taft." The plan, evolved under the guidance of the Vice-President, Mr Nixon, is to call on such Eisenhower supporters as Senators Ives of New York, Duff of Pennsylvania, and Smith of New Jersey to act as Administration "spokesmen" on labour, military and foreign affairs respectively. Other such spokesmen in special fields will be designated, according to Mr Nixon. He stresses that the plan is not aimed at undermining the influence of Senator Knowland as Senate majority leader, but Californians cannot help reading between the lines of this news.

They realise that the Vice-President's talents as a "fixer" and behind-the-scenes strategist are being used to improve the chances of the President's legislative programme. But they realise, too, that Mr Nixon's role in this plan places him in an extremely delicate relationship with Mr Know-

land and one which seems likely to accentuate the rivalry between these two men, both of whom are thought to have aspirations to the Presidency. It gives Mr Nixon an influence which Mr Knowland cannot ignore if he is to consolidate Republican forces in California. It may also, however, make Mr Knowland understand that the succession to power, both in Washington and in California, will be determined by ability to shift successfully from chronic opposition to responsible leadership.

American Notes

Stevenson on Trial

MR STEVENSON seems to have passed, with flying colours, the first test of whether he is to exercise effective leadership of the Democratic party. His report from the world, which was broadcast and televised from the Chicago Opera House, was a thoughtful and moving plea for the United States never to shut the door to the conference room, to seize the present opportunity for a new approach to disarmament, and to avoid the appearance of inflexibility and surrender to McCarthyism which disturbs its friends. Mr Stevenson is most at home at such a lofty level, but it is a trifle rarified for the practical politicians. However, many of the bosses who came to Chicago to bury Stevenson seem to have stayed behind to praise him.

This is only a preliminary canter. Loyalty to a defeated leader is the exception, not the rule, in American politics. If Mr Stevenson wishes to be the candidate, rather than merely the conscience, of his party, he has a long, hard road ahead. At the moment there are no serious competitors in sight, but Mr Stevenson must solve the problem of how to remain in the limelight without benefit of any elected office. It is suggested that he may spend some months travelling around the United States, becoming acquainted with the local Democratic organisations. If he does, there will not be much doubt that he is willing to run again.

For the party, however, there are more immediate problems. The deficit from the last campaign is not yet cleared though, at \$100 a plate, the Chicago banquet raised enough to reduce it from \$250,000 to \$150,000. The South remains in a state of sullen rebellion. Of eleven southern Governors, only four appeared at Chicago, and of its twenty-two Senators, only seven, though these were the brightest and the best. It is an evidence of the inexperience of Mr Mitchele, Mr Stevenson's campaign manager, against whose chairmanship of the National Committee there are many grumbings, that he would have liked to drag into the open the "loyalty pledge" exacted from the South at the last convention, which still causes so much resentment. Here the wiser counsels of Mr Rayburn, the party's leader in the House, prevailed: the whole question was postponed, if not buried, by referring it to committee. The convention in

1956 will have to decide whether to dig up such a bone of contention.

It is only in issues to fight next year's elections that the Democrats are rich. Mr Truman, joyfully back in controversial harness after months of loyal silence, ticked them off: the fall in farm incomes, the cuts in the defence budget just as the Soviet Union has let off its first hydrogen explosion, dearer money, the reversal of Democratic plans to expand public production of electricity, and "government by postponement"—a reference to the Administration's fondness for turning over all difficult questions of policy, such as the tariff, to advisory commissions.

Wall Street Looks Ahead

THE shivers that attacked the New York stock market last week came not from delayed shock at the Korean truce but from the announcement, which greeted businessmen returning from their holidays, that government spending was about to decline and that the cash budget was almost balanced. This definite assurance that little or no further inflationary stimulus was to be expected was accompanied by a series of slightly pessimistic reports, from the Department of Commerce and elsewhere, on construction activity, steel output, inventory accumulation,

and durable goods sales and so on. None of these reports was serious in itself, but the cumulative effect was to make it look as if the boom was really about to cloud over at last.

The reaction of the stock market makes it more probable that the clouds will actually materialise. Industrialists who have already decided to spend slightly less on new plant and equipment in the fourth quarter of this year than they did in the same period of last year are now likely to think again and may reduce next year's spending still further. And the wholesale and retail traders whose buying season is about to begin may view their heavy inventories with more alarm and place their new orders with more caution than they would otherwise have done.

The economists insist that there is no reason for Wall Street to have fears about the future, that the only serious factor in the economic outlook is the decline in farm income and that even that will be checked before long. Expansionist

forces may be weaker than they were but that does not mean that depression is certain. Particular satisfaction is shown in the record high level of employment and the record low level of unemployment in August, for as long as earnings are steady there is unlikely to be any substantial falling off in consumer demand.

But in fact there have recently been a number of minor lay-offs and reductions in working hours, resulting from cut-backs in military contracts and from fewer orders for certain types of durable goods. To send the White House quick reports on such lay-offs and reductions, which are regarded there as one of the most significant indications of the course of the economy, is the chief function of the economic experts who are being enlisted voluntarily all across the country. The President's economic advisers—there is still one vacancy on the three-man Council—and his Advisory Board on Economic Growth and Stability are drawing up a plan both of what the government can, and of what it should, do if these reports show that recession is imminent. There is no doubt of the Administration's willingness to act quickly if necessary. Whether it will decide to act quickly enough is another matter, but it will certainly be spurred on, if the recession materialises in the next few months, by the knowledge that 1954 is an election year.

Sources of Defence

THE Secretary of Defence's preference for single sources of production for individual military items recently appears to have found expression in the allocation of several important contracts. In the case of army lorries only two firms, one of them the General Motors Corporation, are being left in the field, and in the case of medium tanks one of the three present manufacturers was ruled out and the remaining two, the Chrysler and General Motors Corporations, were invited to bid against each other for a \$200 million contract. As the result of winning the bid the General Motors Corporation, which already makes all light tanks, will from April onwards be the sole manufacturer of tanks in the country, unless anything comes of the idea of a new heavy tank to be developed by the Chrysler company.

Although Mr Wilson's slogan that what is good for General Motors is good for the country may be true in this case as far as saving money is concerned, his critics have pointed to the recent disastrous fire at the General Motors plant at Livonia, which was the "single source" of a particular type of transmission gear for automobiles, as an example of what could happen to key military items. It was partly in order to prevent the defence programme being vulnerable in this way that the Truman Administration worked on the principle of the "broad mobilisation base." According to this, defence contracts were to be spread among as many firms as possible, thus giving them the experience and the reserve capacity which would enable them to switch rapidly into full production in the event of an emergency.

During his first few weeks at the Department of Defence, when he was looking around for opportunities of effecting major economies, Mr Wilson created much dismay by giving the impression that he regarded the principle of the broad base as wasteful. Later he explained that all he

was aiming at was to prevent the programme becoming "diffuse." Since then every new move concerning defence production has been scrutinised for evidence that Mr Wilson is reverting to his original ideas.

In the case of the tanks and lorries the Army has claimed that the decision was its alone, and it is unlikely that Mr Wilson intervened directly, though from his point of view it was perhaps rather unfortunate that the main beneficiary in each case should happen to be the firm of which he had formerly been, president. But whichever came first, the intention to concentrate or the intention to economise, the effect is the same and it was the Defence Department's decision to cut down the combined monthly expenditure on tanks and lorries from \$160 million to a mere \$50 million by next March that forced the Army to act as "there just is not enough work to go round." It has, however, been arranged that when the Chrysler company goes out of production its machine tools will be put into store, so that tank output could start again quickly in a crisis.

Natural Gas Rises

NATURAL gas, the cheap and efficient fuel which over 20 million Americans use to heat their homes and cook their meals, is moving out of the bargain basement. The Federal Power Commission began last month to dispose of claims for rate increases totalling over \$170 million a year, and in its first two decisions displayed a new generosity. The United Fuel Gas Company was allowed to raise its charges by at least \$10 million a year, and the Texas Gas Transmission Company by nearly \$8.5 million. The permissible rates of return, to the industry's great satisfaction, were set at 6½ per cent and 6 per cent. Last year, Mr Truman's FPC tried to reduce the rate from the traditional 6 per cent to 5½ per cent and even 5¼ per cent.

The two new members of the commission whom Mr Eisenhower has been able to appoint were expected to be sympathetic to the pipelines' gurgles of distress. But the Administration, which is so often accused by the Democrats of favouring big business at the consumers' expense, no doubt was glad that their votes were not needed. They were not even present when two members of the old commission reversed their stand in the pipelines' favour.

The natural gas companies argued that the lower rate made it difficult to attract the capital needed by one of the country's fastest growing industries. Only one great market is still without natural gas—the Pacific Northwest, which both Canadian and American firms are burning to serve, once the FPC has decided between them. The New England market has finally been divided, the Texas Gas Transmission Company having agreed to share it if the FPC would allow it to export gas to Canada. But virtually all the major pipeline companies are busy extending their networks to supply new customers, who are expected to increase by about a million a year until 1956.

In addition to their need for capital, the pipeline companies justify their claims by pointing to the soaring price they must pay for natural gas. It now costs them 15 cents for a thousand cubic feet, compared with 3 cents in 1946. Many consumers consider this should bring a blush to the commission's cheek. Mr Truman courageously vetoed the Kerr Bill which would have exempted from federal regula-

tion the price which the independent producers charge the pipelines. But the commission itself then caved in and declared itself without power to set such prices. It has now been sharply contradicted by the US Court of Appeals. The cities and states which fought the case in the interests of their consumers no doubt will be forced to fight it again before the Supreme Court. Unfortunately, even if they are successful there, the gas and oil interests may persuade Congress to pass another Bill exempting them from control. It is far from certain that Mr Eisenhower would follow Mr Truman's example and veto it.

SHORTER NOTES

The President has wound up the Psychological Strategy Board, now that he has been convinced by Mr William Jackson's committee that there is no such thing as psychological strategy, but only strategy put to good effect. To make sure that the maximum effect is obtained from the decisions made by the National Security Council, a new Operations Co-ordinating Board is to work under General Bedell Smith, the Under Secretary of State. The other members are the Deputy Secretary of Defence, the Directors of the Central Intelligence Agency and the Foreign Operations Administration, and the presidential assistant, Mr C. D. Jackson.

The re-use of coloured spectacles in plastic frames, given out to patrons of cinema houses showing 3-D films, has been banned by the Chicago Board of Health, which reported an "almost epidemic" increase in eye infections in the city. The board said that the methods used to sterilise the spectacles before issuing them again were ineffective; the 14 theatres showing 3-D films must now use disposable spectacles with cardboard frames.

A decline in the demand for motor-car tyres and competition from natural rubber, as a result of the fall in price, have together made the government decide to close its largest synthetic rubber plant in West Virginia this month. This plant has been operating below its capacity of 90,000 tons a year for some time, and stocks of GR-S synthetic rubber are nearly at the maximum level permitted by the Budget Bureau. The government also plans to reduce production from its other synthetic rubber facilities during the fourth quarter so that total output for those three months may be only about 120,000 tons, compared with 150,000 tons in the same quarter of 1952, and sales of 175,000 tons in the first three months of 1953.

In spite of suggestions that it would do better to stay outside the union, where it might be eligible for foreign aid and ineligible for federal taxes, the State of Ohio was officially declared to be one of the United States of America last month, when an oversight of 150 years ago was corrected. Special legislation has been enacted because in 1803, when Ohio's boundaries and constitution were approved, Congress forgot to admit it formally to the Union. However, no one seems seriously to be questioning the legitimacy of the chief executives who came from the state known as "the Mother of Presidents."

The Pedigree Car with the Jet-Bred Engine

The new Armstrong Siddeley Sapphire has the performance of a very fast car—the appearance and appointments of a luxury carriage.

The engine is a new 120 B.H.P. 'square type'—built on the same production lines as the Sapphire jet that powers the world's fastest aeroplanes. Top speed is 95 m.p.h., acceleration is very responsive, yet fuel consumption is amazingly low—over 20 m.p.g.! Special anti-roll bars are fitted front and rear to give far faster, and safer cornering. Gears may be either synchromesh or new "Selectric". Both give ready racing changes. Externally, the lines of the coachwork are sweeping and elegant. Inside, the fittings are quietly luxurious... with deep-piled carpets, polished walnut panelling, finely grained hide upholstery.

The price is £1,215 plus £507 P.T., total £1,722. "Selectric" gearbox £43 extra. You will find the Sapphire at your local showroom, ready for your inspection and your demonstration drive. After you have driven it you too will agree "There is no finer car on the road today than the Armstrong Siddeley Sapphire".

Anti-roll bars... for smooth cornering.

Extra large boot... holds all family's luggage.

New 120 B.H.P. "Square-type" engine... top speed 95 m.p.h. — amazing fuel economy, over 20 m.p.g.

Assembly and Agenda

FROM OUR UNITED NATIONS CORRESPONDENT

THE Soviet group's insistence on fending off the United Nations Assembly's usual opening procedure for two hours, and in that period trying to get Communist China seated before the Assembly had even chosen its new president, may or may not have been a tactical error. But it was an unusually clear demonstration of the strains and stresses to which the mechanism of Uno is now subjected by the widening gulf between theory and reality. The UN Assembly was originally designed to be a full dress meeting of the nations, coming together for perhaps two months every year to ponder the problems referred to it by its specialist councils, the Security, Trusteeship, and Economic and Social Council. In essence this was an eighteenth-century concept, a parliament of the world in the French rather than the English sense, a debating society in which everything would be discussed and very little decided. The first two or three meetings followed that plan, but then reality began to take hold.

By 1952 the needs of the faster-moving twentieth century had distorted the Assembly's pattern and strained its powers. The seventh session, which has only just ended, met not for two months, but at intervals over ten months, during which time the Assembly showed an increasing tendency to burst the seams of its eighteenth-century small clothes and conduct itself like a twentieth-century meeting of the rank and file. Ostensibly the prescribed forms were still reserved, but in fact the Assembly devoted its major effort to a problem—the Korean question—in which the appropriate council had by its own rules been rendered unable to act. The Assembly's deliberations thus took on an importance and an urgency which had hardly been contemplated in the original design, and for which its structure was ill-prepared. The resulting fatigue, frustration and sentiment showed themselves both in the peevish temper of the August meetings and in the speed with which delegates fled to fish in Canada or sail off Maine so as to free their minds for the eighth session.

How much the eighth session may suffer from the acrid smoke left behind in the big glasshouse by its predecessor remains to be seen. It is true that only the political committee was technically involved in the August struggle, but every member nation belongs to that committee, and all of them must sit in plenary as judges of their actions when acting as members of the political committee. Thus, though the delegations could be smaller in August than in October, the strain on responsible men was heavy.

That this strain showed itself most sharply in the much advertised British-American split is perhaps more fortunate than it looked at the time. Not only did the public begin to worry, and the press to point out that only the Soviet Union could gain from such a quarrel, but even the principals themselves benefited in an indirect way. There is evidence that the vigour with which the difficult British position was defended has strengthened Britain's prestige in the Assembly, while the Americans, who got most of what they wanted, learned some salutary lessons from the cost of the forced victory. The agreement between the two countries to oppose Russian attempts to seat Communist China before the New Year was the first fruit of these mutual lessons. Perhaps the Assembly's approval of that course was the second.

The episode has left behind problems for the eighth session which will echo in corridors but do not appear on the formal agenda. Thus far, that agenda shows little that is unexpected. A dozen items considered in 1952 have disappeared, to be replaced with a dozen more or less new ones boiled up out of council meetings and presented for Assembly action. Some of these are important; others represent merely the weary acquiescence of delegates in minority energy on behalf of a weak idea.

Korea, Morocco, Tunisia—all the political sore spots await debate in the political committees. Burma is there, having made its first polite moan against China last spring; so is South Africa, which not only found a Uno resolution about its treatment of people of Indian origin "unconstitutional," but even refused to recognise a Uno committee; so is South-West Africa, about which the Union is somewhat more co-operative; so is the Ewe problem in Togoland, and the other multi-syllabic problems of trusteeship, which create new areas of incomprehensibility every time they are discussed.

The Korean problem appears formally in the shape of a single item which brings together reports from both Unkra and Uncurk, the UN agencies most immediately concerned, it echoes also in the germ warfare item, to which Iron Curtain countries devoted such passionate oratory when the United States proposed that an impartial committee be formed to investigate their charges. (Thus far that committee, its letters to China and North Korea unanswered, has not been able to function, but it must still report).

The two serious reports by the Korean agencies provide a factual background for at least one major question which

confronts the whole organisation—what part will Uno play in the reconstruction of Korea, how is that role to be apportioned among its various entities, and how can its work best be geared in with the far more lavish plans under consideration by at least one of its member nations, the United States? Thus far, it is common talk that Uncurk, which during the fighting has acted as Uno's eyes, ears and messenger service, must either be remade to suit new conditions, or replaced by another body. Its own report, containing an important footnote to history in the shape of an account of what makes Mr Syngman Rhee tick in his own peculiar way, lends colour to this rumour, as it lays no stress on any need for its own continuance. Unkra, on the other hand, less modest or less trustful of the library work which harassed delegates can do, is quite sure that it should be continued in being. It asks for \$130 million to pay the cost of its relief and rehabilitation programme for 1954, and its agent-general has reported that outside aid of at least a billion dollars will be needed to put Korea's economy where it was in 1949. The Assembly must face at least the first of these estimates.

A Propaganda Plum

The economic and social problems which confront the Assembly are a mixture of the hardy perennials, such as the Covenant of Human Rights to which the Americans gave a body blow at Geneva, and new seedlings like the forced labour item, which Ecosoc tried to side-step by deferring consideration until a later date. Refusing to be deprived of such a propaganda plum, the United States now asks that the Assembly itself take up the report of the UN-ILO Committee and "record the seriousness with which it regards the situation (of forced labour in four countries) and its determination that forced labour should be abolished."

It is expected that the most vigorous debate on economic matters will revolve round continuing efforts to aid the progress of what are called under-developed countries. If those which admit the name follow the Geneva pattern they will form the most articulate and determined bloc in the Assembly. Meanwhile, of course, the countries able to supply capital are showing an increasing tendency to applaud the principle rather than the practice. Nevertheless, the struggle continues. Three projects face Assembly debate—one the proposed fund known as Sunfed, for grants-in-aid and long-term low interest loans; another the suggested international finance corporation to enlist private as well as public capital; and third, a complex of items concerning technical assistance, which burgeons in popularity while pining for funds.

Of the items awaiting other committees, the personnel problem will start fireworks (Senators McCarthy and Jenner are contributing lighted brands), while the Secretary-General's report on the organisation of the secretariat and the items on possible Charter revision are almost sure to get less attention than they deserve.

Meanwhile the reactions of China and North Korea to political conference plans remain outside the agenda. So does the effect which the August hubbub may have had on India's sensitivities. It was with almost embarrassing reluctance that India gave up hope of being asked to attend the political conference. It is anybody's guess whether the presidency of the Assembly will prove to be sufficient compensation for that disappointment.

Bonn Galaxy

FROM OUR SPECIAL CORRESPONDENT

DR ADENAUER has been negotiating with party leaders since his election triumph and the new German Federal government will soon be formed. It is not likely to bring many new men to the fore. Dr Adenauer will certainly continue to hold the office of Foreign Minister as well as Chancellor, though he will probably appoint Dr von Brentano as his deputy. Dr von Brentano is the leader of the parliamentary group of the Christian-Democratic Party and has represented the Federal Republic at Strasbourg. He is, of course, an advocate of the European Defence Community, but is not above giving a sop to the German nationalists now and again, as on the occasion when he pronounced that Germany must at some time recover the frontiers of 1937.

The post of Vice-Chancellor will probably be taken from Herr Blücher, whose Free Democratic Party lost heavily in the election. For this result the British are largely responsible, as their exposure of the activities of Dr Naumann and other extremists in the party led to an ill-concealed split and loss of votes. Herr Blücher himself is a reliable democrat and a liberal conservative who was minister for ERP affairs at the time of Marshall aid. He may receive a new post in the government, but his influence, as head of a divided party with only 48 seats, will be less than formerly. The position of Vice-Chancellor—hitherto a mere title—will probably go to the head of the Christian-Social Union (CSU), Dr Franz Josef Strauss. The CSU, the Bavarian branch of Dr Adenauer's party, has gained in strength, and wiped out the Bavarian Party—a strongly federalist party—at the polls. It now has more seats than the Free Democrats and will keep a sharp watch on any attempts to centralise government in Bonn beyond the limits allowed by the federal constitution. Dr Strauss is also a candidate for the post of Germany's first Minister of Defence; but the French will not allow this post to be officially created until all the countries concerned have ratified the EDC treaty.

Erhard Economics

No change is likely in the key post of Minister of Economics. Dr Erhard has been so successful in his policy of free market economy that he is sure to continue to direct economic affairs. Dr Erhard has just repeated his determination to expand German production and consumption, and to keep in step with Britain on the road to convertibility. He will press for the coal-steel community to be turned into a full customs union, and, as an open opponent of state controls, he will try to prevent supra-national organisations from adopting powers that the German national state has discarded.

Dr Erhard is guided by an optimistic belief that the utmost freedom in the international economic field will benefit the Germans. His relations with the German industrialists are marred in only one important respect—by his honest objections to restrictive cartels. The influence of the industrial and business world has been strong enough to prevent the passage of an effective anti-cartel law; and in the new *Bundestag* these circles are even more strongly represented than before. The fate of anti-cartel legislation, so dear to the Americans, is therefore probably sealed.

Dr Schäffer, who has proved extremely efficient as Minister of Finance, will also remain in a key post. His great task, if he returns to the direction of State finances, is to reform the German taxation system, which is incredibly complicated. Taxes are to be reduced in the course of this reform, which should greatly benefit German enterprises. Dr Schäffer, however, has had to struggle against the irresponsible way in which the *Bundestag* voted increased expenditure without any thought of how the revenue was to be raised, and he or his successor will be faced by a fairly considerable budget deficit. As a shrewd and orthodox finance minister, Dr Schäffer has put brakes on various claimants to German money—the occupation powers, the federal Länder (although Dr Schäffer, as a Bavarian, is ideologically a federalist), Dr Erhard and all others who demand lowered taxes, transfer of earnings from foreign investments, or convertibility of the D-mark. With the *Bank deutscher Länder*, Dr Schäffer represents the cautious, anti-inflationary school of thought in Germany and his influence will be needed in the period that has now opened; this should be one of consolidation as well as expansion.

Soviet Economy After Stalin—III

Incentives For Peasants

SOME 125 million people, or over two-thirds of the Soviet population, are still living in the countryside and the rural problem is probably the most difficult issue bequeathed by Stalin to his successors. The property instinct of the peasants dies hard even after years of collective farming. Besides, collectively owned farms cannot be run as easily by the planners as the State-owned industries. After the amalgamation in 1950 of collective farms into less than 100,000 larger units, some leaders—of whom Nikita Khrushchev was the most prominent—advocated that the gap between town and country should be bridged through the creation of agro-towns. This policy, however, had to be shelved from fear of peasant opposition. Stalin in his last economic pamphlet, which significantly concentrated on agricultural problems, warned against rash moves, but maintained that the gap must be closed "step by step" through a shift from commodity trade to a system of direct barter in the exchanges between town and country.

With this aim all Soviet leaders would probably agree, but Stalin's successors have an immediate task to tackle. They must rapidly raise the production and supply of food-stuffs and agricultural raw materials to fulfil "within two or three years" their pledge to the Soviet consumers. Meat, eggs, milk and other dairy products for urban dwellers, cotton, wool and leather for factories are the key to the Malenkov plan for improving the lot of the consumer. This has dictated the radical change in Soviet agricultural policy announced by Moscow last week. In this urgent situation the government expects to get extra supplies not by long-term measures, but by an immediate appeal to the material interests of the peasants.

Paradoxically this policy of concessions to the peasants has been entrusted to the prophet of agro-towns, the party's first secretary Nikita Khrushchev. His lengthy review to the Central Committee of the state of Soviet

agriculture spared no criticisms. It prescribed as an immediate remedy the lightening of burdens and the strengthening of incentives for the peasants. The collective farmer's private plot of about one acre—that last vestige of private property—was threatened by the agro-towns. Now it is to play an increasing role in the supply of potatoes, vegetables and dairy products. These plots were burdened with heavy taxes and high compulsory deliveries for the State. To avoid payments the peasant was cutting down his production in many lines. Farmers' sales on the free or so-called collective-farm market dwindled and the share of that market in total Soviet retail trade turnover shrunk. Now the tax on the private plot has been nearly halved, the debts cancelled. Farmers who have no cow will be freed from taxes for the time being. Compulsory deliveries have been reduced; prices paid by the State both for compulsory deliveries and supplies above the quota have been substantially raised.

Collective farms have also been given material incentives. Their compulsory quotas could not be cut in most cases without endangering the system of supply for the towns, but deliveries of potatoes and vegetables have been reduced. Prices for these and for livestock products have

SOVIET AGRICULTURAL PRODUCTION
(Million tons)*

	1947	1950	1951	1952	1955 (planned)
Grain	118.8	124.5	121.5	130.0	180.0
Cotton	2.7	3.75	3.95	...	5.95
Sugar beet	21.0	23.5	27.5	...	39.5

* Biological yield.

been increased. It is hoped that the greater revenue of the farms will enable them to pay higher work-day rates both in cash and in kind thus inducing peasants to work more for the collective.

This shift to money incentives and market operations has been prompted by the immediate need to close to some extent the gap between industrial and agricultural production. This time-lag is largely due to the difficulty of making up the terrible ravages in the countryside wrought by two wars, a civil war and forced collectivisation. Moreover, Mr Khrushchev admitted that hitherto agriculture, like light industry, has had to be sacrificed for the sake of heavy industry. Even so, the results did not correspond either to the planners' expectations or to the actual investments in machinery and fertilisers. While industrial production has more than doubled compared with prewar, agricultural production rose by only 10 per cent.

Grain output, which has a very ambitious target for 1955, showed its first big jump last year when it reached 130 million tons. It must be remembered, however, that Soviet yield figures are inflated because they are calculated on the basis of the biological standing crop. Moreover, the rise was achieved by increasing the area under cultivation and the yield remains very low at about 12 quintals per hectare. Still, according to Soviet sources, the bread-grain problem has been largely solved, chiefly through a shift to wheat production (which now accounts for about half the total); but there is still a shortage of barley and oats. The production of cotton and sugar-beet has been encouraged

TWA knows America

- and what this means to you!

Flying TWA you get full value for every precious minute of your U.S. trip. TWA knows America. Wherever you want to go in the States you will find friendly TWA people, ready to help you in every way possible. They know schedules, connections, people—the ins and outs of U.S. air travel. TWA offers you a knowledge of America that is *unique*. Why? Because TWA is the only airline flying from London to *and* across America.

There's a TWA service to and across America to suit your pocket book—from luxury coast-to-coast "Ambassador" Super Constellations to thrifty stretch-out-comfort Sky Tourist flights.

Why did the paraffin
give up smoking?

"'Morning, Mr. Painter! It's about time we got acquainted. After all, I've been working for you a good many years now, in a manner of speaking. My name's *sulphur dioxide*. That's right—working for you. Not actually *here*, but at an oil refinery. You see, I clear the impurities from the paraffin you use in this blow lamp of yours. Without what you might call my 'refinement', the woodwork you're cleaning up would be covered with a thick layer of greasy soot. Just as, if I weren't used, paraffin lamps, cookers and heaters would smoke and smell horribly. But they don't—thanks to me and Brotherton. There's another name for you to remember. Brotherton—one of the largest manufacturers of liquid sulphur dioxide in the world."

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds, &c. Also at Manchester, Glasgow, Wakefield, Birmingham and Birkenhead.

all the time, and here there is no need for additional incentives.

The picture is less bright for vegetables—which are badly needed for the towns—potatoes and fodder crops. This, combined with the shortage of coarse grains, hinders the development of livestock, the sorest spot in Soviet agriculture, which has been hit more than any other branch by the calamities of Soviet history. Despite the postwar recovery livestock numbers, with the exception of pigs, are still lower than in 1928. At first, after the war, ambitious targets were set, though not reached. In the current Five-Year Plan the objectives are more modest, yet even these would probably not have been reached without the present reform. During the amalgamation of farms collectives were taking over private property, while farmers were apparently killing stock. This year the number of cattle is smaller than in 1950.

SOVIET LIVESTOCK
(Million head)

	1928	1940	1950	1952	1953	1954*	1955*
Horses	36.1	20.5	13.7	14.7	15.0	...	15.2
Pigs	27.7	27.5	24.1	24.6	28.5	34.5	35.5
Sheep & goats	114.6	91.6	99.0	97.8	109.9	144.4	159.5
Cattle	66.8	54.5	57.2	58.7	56.6	65.9	68.0
Of which: cows	33.2	25.3	24.2	23.7	24.3	29.2	...

* Planned.

The policy of incentives fits well into this picture. Prices for compulsory deliveries of cattle have been increased 5.5 times, for butter and milk twofold, for vegetables by from 25 to 40 per cent. Prices for additional state purchases of meat and milk have also been stepped up. These measures are to meet the immediate needs. But the long-term plans have not been forgotten. A ten-year plan for the supply of fertilisers has been revealed. Between 1954 and 1957 500,000 tractors (in 15 h.p. units) are to be supplied to the countryside, that is, as many as during the whole postwar plan when the tractor park had to be completely restored. Finally, a great many agricultural specialists and mechanics are to be sent into the countryside. Although there are 350,000 agricultural specialists in the Soviet Union, only 18,500 are in collective farms and 50,000 in the MTS (Machine Tractor Stations). The rest are dispersed in ministries and among local authorities. Like mining engineers, they are not keen on going "down the pit." Next year, however, 100,000 will be sent to the MTS.

The 9,000 MTS—these outposts of the state in the countryside—are, in fact, to be strengthened. Tractor and combine drivers and mechanics are now becoming permanent members of the MTS from which they will receive bigger salaries and a plot of land. As a counter-balance to the effect of the concessions to the farmers, Mr Khrushchev will have at his disposal a powerful army of about 2 million specialists in key positions. True, their pressure will be economic and on the political front a major concession has been made through the abolition of the post of "vice-director for political matters." This, the security man who ran the countryside from the MTS, was particularly hated by the peasants. Now the first secretary of the local party will be responsible for agricultural policy, while one of the secre-

taries will sit permanently on the MTS. Yet even without the security commissar the numerically strengthened party-controlled cadres will act as a check against any upheavals provoked by the policy of concessions. Mr Khrushchev has announced, not a capitulation, but a tactical retreat during which the outposts are to be reinforced. Once the crisis has been averted, more machinery supplied and more consumer goods made available, he may launch from these strengthened outposts his real campaign for bridging the gap between town and country.

(To be concluded)

Germany and the Arabs

WHEN *The Economist* last described the German trade drive in the Middle East in its issue of November 29, 1952, West Germans were agitated lest an Arab boycott should be imposed out of wrath at Dr Adenauer's arrangements to pay reparations to Israel. Events in the months between have shown that these fears were groundless. German reparations payments to Israel have begun, but there has been no resultant slackening of Arab interest in Germany as a source of supply; on the contrary, German exports to the Arab countries and Persia in the first seven months of 1953 show a substantial increase over the same period of 1952. Clearly, most Arabs have rated Germany's assistance to Israel as of less significance in their calculations than Germany's value as a source of supply that has no ex-imperialist label; in Persia and Egypt, Germans are favoured by hostility to Britain, in Syria by antipathy to France. Simultaneously, the very energy with which German exporters have pressed their suit in Arab countries has created a local impression that Germans can help not only with technical problems but with credits where these are needed. The Egyptians in particular have been deep in consultation with German emissaries as to how to meet the big bills for development that they would like to incur; these same Germans are reporting back to Bonn that unless credits can be arranged, contractors of other nationalities will win the day.

News items as to German activities in Middle Eastern countries therefore abound. Some tell of the actual award of large-scale contracts; those for the Tigris barrage that is part of Iraq's Wadi Thathar flood-control scheme, and for the two new Baghdad bridges over the Tigris are two leading examples of German success. Others mention increasing use of German consulting engineers; for instance the well-known German steel-industrialist Dr Rohland is at present advising the Egyptians on their plans for a steel works at Helwan. Germans are also advising on the possibility of constructing the new Nile dam that the Nguib government hopes to be able to afford above Aswan. Reports from all countries suggest that German firms outnumber other tenderers for major jobs—they do so for the Aswan hydro-electric power scheme and the Helwan steel works in Egypt; they outnumbered by four to one the British firm which this week secured the contract for the Wadi Thathar sluice gates in Iraq, and they are said to be the most numerous of the contractors who plan to submit tenders next month for the Dokhan dam in northern Iraq. They are active also in Syria where they are said to be contemplating taking out a licence for oil prospecting in areas that were, three years ago, abandoned

by a subsidiary of the Iraq Petroleum Company; they are also showing interest in building a refinery, and the now somewhat pathetic Dr Schacht is said to be interested in other Syrian development projects. Further south, they have just signed a \$2 million contract with Saudi Arabia for telecommunications equipment, and in the Yemen they have secured an oil exploration concession on a basis of shared costs as well as shared profits.

Yet a study of current German trade figures with the area shows that the future of some of these schemes is unclear. All is well in the countries which earn foreign exchange from the sale of oil. But elsewhere—that is, where there is no capital available for major works—even minor payments raise a problem if imports from Germany outrun local capacity to export to it. If Egypt, Lebanon, and also Syria were to start ordering German equipment in any quantity, they run the risk of finding themselves in the plight already familiar to Turkey—that is, confronted with a large debit account run up for them by eager German salesmen; and then, having reached agreement with the German government on sales transactions that would enable them to pay off the debt, meeting with an unwillingness on the part of German importers to buy their goods at their prices.

With Egypt, Germany has for some time past had a payments agreement which allowed a \$15 million swing in

either direction; now, the volume of German exports has caused Egyptian indebtedness to reach the limit of the swing, and a protocol has been added to the agreement whereby the Egyptian government is to take measures to get the account back into balance by encouraging the export of cotton to Germany. Whether German importers want this is another matter; despite encouragement, they bought less Egyptian cotton in 1952-53 than in 1951-52. Egypt has, therefore, as from August 3rd, last, added the Deutsche mark to the currencies—so far only sterling and dollars—in respect of which it runs an "import entitlement account" that allows of imports from Germany only in relation to exports thereto. As in the case of the similar sterling account, an exporter to Germany has the right to sell his earnings in marks at such premium as he can get from would-be importers. He is thus in a position to offer German spinners cotton at a discount equal to the premium he can get, and to pass the cost of the premium on to the importer, who in turn passes it to the consumer, so raising the price of German goods in Cairo and tending to penalise the German exporter. Egyptian exporters are to have access only to 75 per cent of the D-marks they earn; the remaining 25 per cent will be used by the government.

Countries which must go to such lengths in order to

balance their day-to-day trading accounts are scarcely in a position to lodge big orders, German commercial expansion in the Middle East in general and in Egypt in particular is therefore not all plain sailing. Bonn, which has been assisting firms to get back into markets in which they were prominent before the war may have to strain itself to go on helping them in countries that cannot pay. Nor is Germany having matters all its own way *vis à vis* western rivals; competition is hot, and German engineering firms now seem to find that France, not Britain, is their most serious rival. Even the Japanese, who are said to be ready to build a railway from Aswan to the Red Sea in return for supplies of the iron ore it would carry, are beginning to elbow for room on a crowded floor. In such circumstances, Middle Easterners can hardly be blamed for their belief that foreign investors are to be had for the asking.

Australia's Incentive Budget

FROM OUR MELBOURNE CORRESPONDENT

IN a Budget designed to give a "strong and genuine incentive to the community," the Federal Treasurer (Sir Arthur Fadden) made good his government's pledge to give substantial tax relief to the Australian people with cuts in direct and indirect taxation amounting to £118.4 million a year. Despite an overall reduction in personal rates of income tax by 12½ per cent and a reduction of about 20 per cent in rates of company tax, the Treasurer budgeted for a decrease of revenue of only £6.1 million, while total expenditure is expected to rise by £7.1 million.

The Commonwealth Government was able to concede substantial reductions in rates of personal income tax, company tax, and sales tax because of an increase of 10 per cent in the national income in 1952-53. The Treasurer clearly counted upon a further increase in the national income in the current financial year to enable the same amount of tax yield to be obtained in the face of substantial reductions in tax rates. The government has now fulfilled a pledge made earlier in the year that substantial reductions in taxes would be made a part of its policy to achieve economic stability after the high boom of recent years. As Sir Arthur Fadden pointed out in his budget speech, "it is remarkable that the transition from violent boom to comparative stability has been accomplished with relatively so little unemployment, dislocation and loss." The sharp fall in export income from £988 million in 1950-51 to £678 million in 1951-52, chiefly as a result of the drop in wool values, was not followed by any catastrophic downturn in business activity in Australia. There was an inevitable tightness of credit as the balance of trade deteriorated, but the situation was saved by a bounteous season last year, with increases in production of major farm commodities, plus the effect of rigid import restrictions.

The Commonwealth Government justifiably prides itself with having taken measures in the last three years to arrest the insidious tide of inflation which struck Australia with great force when wool jumped to 14 times its 1939 value. In his 1950-51 budget, Sir Arthur Fadden imposed heavy additional taxation in order to reduce the excessive monetary demands for goods and resources, and the surplus so achieved was applied to finance State public works. In

her words, current revenue was used to meet capital expenditure which normally would be paid for by the nation over a long period of years.

In the year ended June 30th last, there was a rise of less than 4 per cent in retail prices, a favourable contrast with rises of 20 per cent in each of the two preceding years. In other words, the great wool boom inflation in Australia seems at last to have dissipated itself and the government now claims that it has practically attained the stability it set out to achieve in the strenuous days of 1950 and 1951. This is true, but it should not be forgotten that the present Commonwealth Government did practically nothing to prevent the full blast of the inflationary rise in wool values from assailing the economy. No attempt was made in Australia, as in New Zealand, to set up any form of stabilisation funds so that the abnormal returns from wool would be set aside against the inevitable day when prices should fall. The inflated returns from export commodities hit the economy with great force causing a tremendous pressure on labour and resources with the inescapable rise in prices and wages. Australia then not unnaturally led the world in the postwar rise in retail prices.

Foreign Competition

As a result of all this, Australia is now saddled with a cost-price structure greatly out of line with those of most other countries, particularly those manufacturing countries with which it trades. The rise in internal costs has made it difficult for farming industries to operate profitably at current world prices, wool being a notable exception, while secondary industries find themselves unable to meet the competition of their lower-cost competitors overseas. The Commonwealth Government is fully aware of these difficulties and in his budget speech Sir Arthur Fadden mentioned three factors which could thwart Australia's efforts to expand just as effectively as inflation did. These he named as the problem of costs (which is a direct result of the great wool inflation of two years ago), the problem of savings which are still too low to sustain an adequate rate of national expansion, and finally the ever-present problem of increasing productivity.

Sir Arthur Fadden thinks that the best way of dealing with Australia's high cost structure is to achieve greater efficiency by both labour and management. By reducing taxes and so making wages and profits more worth earning, the government hopes to provide an inducement to greater effort and efficiency. If the current budgetary measures lead to greater efficiency—and businessmen have claimed that high taxation has been the greatest incubus on enterprise and efficiency in recent years—a major economic crisis will have been averted by voluntary and relatively pleasant means. In the past, an inflated cost structure has usually been reduced by much sterner means.

But in Australia today, the pressures are not so much working towards greater industrial efficiency through organisation and co-operation, but towards greater protection by means of import restrictions, increased tariffs, or a higher rate of exchange, all of which would still further increase current costs. These are the solutions advocated by the many pressure groups which grow more active as they see goods costing less than their own invading the local market. At best these solutions are only a palliative; at worst they will only aggravate the malaise and bring closer the inevitable day of reckoning.

Life in North Korea

KIM IL SUNG, Nam Il and other Korean Communist leaders have gone to Moscow, presumably to be briefed on how North Korea should approach the coming peace conference, and almost certainly to plead for more aid; their party newspaper, *Nodong Sinmun*, has expressed a fervent hope that their journey would help to lay "firm economic foundations for the fatherland." This may seem odd; Malenkov has already announced that the Soviet Union will extend a billion roubles' worth of aid to Kim Il Sung's regime. But Kim himself, in a major address to his subjects last month, was careful not to represent this aid either as adequate for North Korea's needs, or even as being an outright gift. On the contrary, he strongly implied that North Korea would have to work its own way back to recovery, and that it would get Soviet "aid," as China has done, only at a stiff price.

Kim's speech portrayed conditions in North Korea in a very different light from that usually shed by his own propagandists. Pyongyang radio, for example, is now daily exulting over the rapid rebuilding of factories and towns, and the laying out of new streets named after Kim, Mao, and Stalin (the last of these must have an old-world charm for visitors from Communist states that have virtuously renounced the "cult of leadership"). Its broadcasts have stressed—doubtless for the benefit of listeners south of the armistice line—the flood of consumer goods now pouring into newly-opened state stores and "consumers' union" shops.

Search for Manpower

Kim Il Sung, however, has evidently read Malenkov's speech to the Supreme Soviet. He devoted long sections of his address to castigating the "hopelessly backward and worthless" quality as well as the lack of variety, of consumer goods produced in North Korea, the "displays of mouldy, dusty and disarranged goods" in state stores, and the "irresponsible and bureaucratic manner" in which officials distributed goods so that some places were glutted and others neglected. But it was notable that Kim was not so much championing the consumer as complaining that owing to these blunders the state trading apparatus was failing to yield revenue. He announced, however, that funds for his exchequer were nevertheless to be secured by "enabling the people voluntarily to mobilise their surplus money"; in case this phrase might be misunderstood, Kim explained that they would be required to buy state bonds.

Manpower, according to Kim, is an even greater problem than funds. He referred not only to war casualties, but also—a remarkable admission—to "those who have fled to the South." Peaceful reconstruction, it seems will play second fiddle to North Korea's continuing military effort; the workers called up during the war "are still in the vanguard of the defence of the fatherland," and manpower must be sought elsewhere. Fortunately, "our women possess inexhaustible capacities for work." "Migrant peasants," who in the past have successfully eluded the grasp of the authorities, will be firmly directed into industry. There must be "strict control over the movement of labourers" and "patriotic labour mobilisation of masses of the people." But even this will not suffice. "One of the most important tasks" must be the "resetting of the old work standards

(norms) in keeping with reality." Kim claimed that in some cases norms could be increased tenfold.

But what of the promised aid from "brotherly countries"? Kim indicated that much of it would take the form of visiting Soviet experts, from whom the North Koreans must "humbly learn" in the "short period of time" that they would stay. Some Soviet machinery will be imported; but Kim hastened to warn his people not to expect too much: "What I mean by mechanisation is mainly that by initiative and invention engineers and workers should be able to do their work more efficiently." Importing possibilities are strictly limited by what North Korea itself can "export to our friendly nations for the acquisition of foreign currency." For this reason, imports of petrol will be severely cut, and imports of woollen clothing material are to stop altogether: "a person's dignity will not be lowered just because he wears cotton clothes." Again, "how can we expect to import such materials as timber, bricks and cement?" (It may perhaps be noted here that the Soviet Union has lately held out to Japan the prospect of timber exports from its Far Eastern provinces). On the other hand, "the Party must pay special attention to the search for and exploitation of materials desired by our friendly nations to obtain the maximum possible foreign exchange." The way of life offered by Kim Il Sung to his subjects sounds remarkably like what, in a non-Communist country, would be dubbed "semi-colonial exploitation."

New Zealand's Budget

FROM OUR WELLINGTON CORRESPONDENT

MR HOLLAND'S 1953-54 budget, delivered in the House of Representatives on August 27th, was an effort to reconcile irreconcilables by providing tax concessions without appreciably reducing the heavy works programme or decreasing the financial burdens of the social services. His solution to the problem of finding more money and at the same time cutting taxes was to announce that the government will go on the New Zealand market later this year for a further development loan of £10 million. It has only just raised £20 million for the same purpose and found it none too easy!

Its decision to go to the loan market for another £10 million, though it is generally approved as a counter-inflationary measure, will cause some further difficulties for local bodies who are already experiencing trouble in raising their loan requirements. The present high cost of living and high taxation have had a depressing effect on small savings and it is evident that the government will have to work hard to obtain the extra money it now proposes to borrow. Its best market may be with the farmers, but most of these want to use their money for the development of their own holdings.

At the same time as he announced the loan, Mr Holland also announced various tax reductions amounting in all to some £6,500,000. The concessions were chiefly made to the family man by increasing the income tax exemption from £200 to £230 and the deduction on account of dependent children from £50 to £65. It was difficult for Mr Holland to refuse tax concessions because the day before he returned from his Coronation trip, his deputy, Mr Holyoake, had

stated that some "worth while" reductions could be expected.

Mr Holland did his best, by expatiating upon the tax relief already given in his previous budgets, and adding it to his latest concessions, to give the words "worth while" some meaning. He pointed out that since it came to office in 1949, his government has reduced taxation by over £22 million and that its latest concessions will bring the total to just under £29 million. He did not give equal emphasis to the fact that since the National Party has been in power, the actual collection of taxes has risen from £158 million to £200 million, though he did point out that this was the result of increased prosperity. Similarly, though he emphasised the efforts made to prune departmental votes, he did not emphasise that the expenditure from the consolidated fund this year will be £6,250,000 more than last year.

Cost of Social Services

The real obstacle to any considerable reduction in New Zealand's taxation, the cost of social security services, passed almost unnoticed. Yet the financial statement showed that the taxation collection for the various state welfare services under the general heading of social security, is expected to amount to £62,100,000 in 1953-54 compared with £177,500,000 which it is estimated will be collected from all other sources of taxation. It also showed that once again the social security fund will require a subsidy of £14 million from general revenue. Figures released prior to the budget show that last year over £57 million was paid out in direct monetary and health benefits under social security and that more than half of these payments (chiefly the 10s per child family benefit) were not subject to any means test.

Mr Holland was able to show that the works programme, estimated originally to cost £82 million this year, had been pruned by £9 million. One of the largest increases (£2 million) will be in the cost of building new schools and other educational buildings. New Zealand will spend £20 million this year on education, a good deal of it in an effort to catch up with the lagging building programme.

The Prime Minister was also able to show that the government has resisted the temptation to cut the defence vote and that in spite of the apparently improved position in Korea (where the war has already cost New Zealand over £14 million), the total amount allocated to defence (£27,500,000) will be about £1 million more than last year. He hinted that he would like to dispense, at least in part, with food and other subsidies, now running at a rate of just under £14 million a year, but, after pointing out the effect this would have on the cost of living index, he said that the subsidy programme would continue, reduced by the removal of a subsidy at present paid to gas users.

On general issues, Mr Holland struck an optimistic note, as he was entitled to do. Production, he said, was increasing; there were good markets for New Zealand's exports and prices generally were satisfactory. Full employment had been maintained, the business outlook was steady and New Zealand was enjoying the blessings of industrial peace. He did not add that very shortly the New Zealand Federation of Labour, on behalf of the trades unions, will apply to the Arbitration Court for a substantial wage increase and that if the unions are not satisfied by the result of this application industrial peace may suffer or, alternatively, that if they are satisfied, costs of production will inevitably rise.

THE CASE OF THE SHOP THAT WAS OVER SUCCESSFUL

At Lipton's self-service store in Leeds business was so good that money couldn't be taken fast enough to keep customers inside the shop moving through—and those outside were waiting...

Getting customers in was easy—but not getting them out!

LIPTON LTD., the famous grocers, were quick to accept a popular demand for provisions sold on a self-service basis. But, in one of the shops they opened—in Leeds—the very popularity of this way to shop was causing the management some concern.

Space was limited, and it was essential that when shoppers had made their purchases they should be able to pay for them quickly and make room for new customers. But at the check-outs—that part of the store where the value of goods is totalled, cash taken, and receipts issued—there were hold-ups. However hard the staff worked it was proving impossible to handle transactions fast enough to get customers through the check-outs without congestion.

With this problem, Liptons invited Burroughs' collaboration in an experiment, asking one of their machine-accounting specialists to demonstrate a Burroughs Itemizing Cash Registering Machine in action. The speed at which one girl could use the machine to register purchases, give tickets and change, was timed.

Result: So satisfactorily did this Burroughs machine work under pressure, that Lipton Ltd. installed one straight away (later two more) in their

Seen demonstrating the use of a Burroughs Itemizing Cash Registering Machine is Mr. Paul Stark, the Burroughs representative who helped Lipton Ltd. to solve the Case of the Shop that was Over Successful.

Leeds shop. The increased speed it has brought to transactions there—and the consequent improvement in customer relations—has led to the installation of similar machines in other self-service stores operated by Lipton Ltd.

What about you? If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service guarantees its efficiency in operation.

Call Burroughs today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities round the world.

My dear fellow

It doesn't matter tuppence whether you want only one new desk or furnishing for six office floors. Talk to Peter Catesby and his staff about it. They won't go so far as to suggest puce striped wall paper—but they do take great pains to give some individuality to your furnishings. They will adapt a piece of furniture to suit your exact physical needs. In short, they'll give you what you think you want—only a lot better.

THE BUSINESS WORLD

ABC of "Input-Output"—I

Demand under the Microscope

THE emergence of new techniques of economic analysis does not usually excite the practical businessman. Advances in the physical sciences and technology are much more likely to influence his thinking. Such an attitude should induce humility in the professional economist. But the business man who is not repelled by economics, or by the need to wear a wet towel for an hour or two, might try to meet a recent development in the field of applied economics at least half way. This development lacks at the moment a convenient shorthand name. It now goes forbiddingly under such titles as "inter-industry" or "input-output" analysis. "Input-output" is essentially a double-entry reckoning of all the transactions between different branches of industry. It should be able to tell industry a lot of new facts about its customers; this is doubtless why it has already produced discussion well outside academic circles in the United States. In this country work is proceeding on the first large-scale British input-output table. It may well be that the new input-output technique—which will always be associated with the name of its American exponent, Professor W. W. Leontief—is destined to become an influential guide to industrial decisions and to economic policy in a broader sense.

The business man owes it more than a passing glance, if only for the reason that it goes such a long way to meet his objection that economics is an inexact science—that economists base their theories on models of the economic system that are either so simplified as to have no reality, or so abstrusely mathematical as to be beyond the grasp even of a man able to direct profitably the largest of industrial empires. By contrast,

an input-output table, for all its complications, is realistic and utilitarian; it offers the prospect of anatomical investigation upon the body politico-economic.

Simply described, an input-output investigation provides an enormous table that shows for a particular year what each industry supplied to every other industry and to the final consumer. This table is known as an "input-output matrix" or grid; it is arranged so that each industry, or supplier, appears as a producer down one side of the table, and again, in the same order, as a consumer along the top. By this arrangement the table can show, for example, how coal is used by all industries and by households, including the coal needed by the coal industry itself to provide its own power. Last year, for the first time, the blue book on National Income and Expenditure presented certain data of output in different sectors of the economy in an "inter-industry" form; the enlarged table in this year's blue book, relating to 1950, is reproduced on the next two pages. This is a big table by ordinary standards; but it is in fact the tiniest sketch of a full input-output table employing a more elaborate classification of the different industries in the economy. A recently published American table for two hundred industries, in type far smaller than that used in the table overleaf, runs to six sheets, each of them four times the area of a page of *The Economist*.

The importance of input-output analysis is that it reveals intermediate as well as final demands in detail. When these intermediate demands are related to the final product in the last column, one has a reliable map of the interconnections of the whole economy—in greater or less detail according to the scale. It can bring to account every transaction in goods and services

in the economic system. Final demand, which appears down the last right-hand column, is split into what is bought by the private consumer (households), by the government, by the overseas customer (exports) and what is set aside in the form of gross investment. The basic inputs are labour, rent, return on capital, and imported raw materials and intermediate commodities.

The degree of refinement of such a cross-section depends on its size. The input and output of each producing sector of the economy—whether an entire industry, a trade or an independent profession—is expressed in “pounds’ worth,” the values being those for the year of the table itself. The full table will be an exact, if condensed, account of all the commodity transactions that occurred in the United Kingdom—in 1948, to take the case of the table now being calculated in the Department of Applied Economics, Cambridge, with the co-operation of the Board of Trade. It is a double-entry accounting synopsis of everything that passed from producer to consumer throughout the economy, recording not only the pattern of final demand, but the process of inter-industry transactions that continuously weaves that pattern.

The results of an inter-industry analysis of this kind differ significantly from calculations of the national income. The national income estimates deal with three aspects of economic activity: total production, industry

by industry; total consumption; and additions to wealth. Input-output statements deal analytically with the first of these aspects—the production or transformation of materials. National income analysis shows changes in such aggregates as Government expenditure on goods and services, private savings or business investment; but it does not trace how these changes may cumulatively affect the country’s industries, services and agriculture. One would not look, for example, to the national income figures for guidance on the detailed intermediate effects upon different industries of additional rearmament spending or of a decline in general demand. Yet to the business man, the making of such forecasts is all-important, and he is not to be blamed for holding that, so far, the economist has done little towards helping him to make them.

An input-output table can help the economist to make the forecasts which governments and businesses need. Its value for this purpose lies in the fact that it is a two-way statement. Since it traces in quantitative terms the interconnection of commodity transactions, it can obviously be rearranged to express, for a given unit of a given commodity in intermediate or in final demand, the variegated content of materials, services and labour requirements needed to produce it. The preparation of an input-output table expressed in money values, therefore, is only the first step. The

second step is to “invert the matrix,” producing a table of coefficients that shows, in the same layout, the amounts of every other product required to bring into existence a pound sterling’s worth of any given product. From this second table, forecasts can be made of the effect throughout all industries of a change in demand for the product of one industry—though the reliability of such forecasts rests on the assumptions that a given change in output will call for proportionate changes in inputs and that technological conditions remain unchanged for the period of the forecast.

A photographic representation of the economic system is not a new idea. The French economist Say visualised such a *tableau économique* two hundred years ago, but it was not until censuses of production and distribution became precise and detailed that statistical, rather than algebraic, inter-industry relationships could be established. W. W. Leontief produced the first input-output table in the United States before the second world war, broken down into nineteen industrial groups. Leontief and the Bureau of Labour Statistics have in the intervening period worked out a much larger and more detailed table; in 1952 a 50-industry tabular breakdown of the structure of the American economy was published, and the 200-industry table has since been produced. The application of their work to British conditions was begun in the Economic

Research Division of the London School of Economics soon after the war. In 1952 Dr Barna published in the journal of the Royal Statistical Society an inter-industry analysis of the British economy based on the 1935 census of production, showing the relations between 36 industrial groupings. But though of great interest to economists, a 36-industry table is still too condensed a picture of “the real thing” to carry much conviction with the individual manufacturer. This defect should be removed when the Department of Applied Economics at Cambridge completes the two 450-column tables based upon the Census of Production for 1948, in three years’ time. The statistical computations are multitudinous, and the process of “inverting the matrix” requires the solution of so many simultaneous equations that punched cards and possibly electronic calculating methods will be employed by the British research team.

It may immediately be asked whether such a comprehensive accounting record of the British economy as it was in 1948 will have much use in making forecasts and assisting economic decisions by the Government and industry in the conditions prevailing in 1956. In fact, it seems that the time-lag may not greatly impair the usefulness of the tables; this question of the uses and development of input-output analysis will be examined in detail in a second article.

Firedamp in the Oven

THE gas industry in Britain is accustomed to buying part of the gas that it distributes through its mains. In 1951-52, about 12 per cent of all the country's gas was bought from outside suppliers, and in the East Midlands such purchases accounted for nearly half the gas sold. Nearly all of this is coke-oven gas, plus some oil refinery gases, such as butane. But the gas industry has not hitherto bought gas straight out of the earth; and the arrangement under which the Northern Gas Board is now passing into its Whitehaven gas mains methane drained by the National Coal Board from the local Haig colliery is the first contract for a supply of such natural gas in this country.

Methane, alias firedamp in the coal mine, alias marsh gas in the swamp, is also the largest constituent of the natural gas found with petroleum. It is a rich hydrocarbon fuel, and there have been attempts to utilise it in a practical way for many years. One early pioneer lit Heathfield railway station in Sussex by "marsh gas," and in another of its forms, sewage gas, methane has been used as fuel by large sewage works for years, and by one municipality, Croydon, as a fuel for corporation vehicles. It is most frequently found in coal workings, from which any concentration of methane of more than one per cent must be removed, or diluted to innocuous proportions. These special precautions have to be taken, since methane concentrations of more than 2 per cent in air are highly dangerous. In the past, methane has generally been removed from British mines by the forced draught ventilation systems, which bring it out of the updraught shaft in concentrations of about one per cent in the exhaust air. Enthusiasts contend that even in this low concentration the methane would be combustible enough to run a gas turbine for pithead power; but the Coal Board is still waiting for its first gas turbine.

At the Haig mine, and at 23 other British mines, methane is being removed by a Continental technique of drainage. It is collected through boreholes driven from the coal workings into the seams and overlying strata, and piped off independently to the surface. This has been done for half a century at another mine, Point of Ayr, where in recent years the methane drained from undersea coal seams has been used to fire the colliery boiler. At Whitehaven gas from the Haig pit was at first used for the same purpose. But (in theory at least) a colliery boiler should be fired with low-grade, almost unsaleable coal, and methane is too good for the job. So methane from the Haig is now being piped to the Whitehaven gasworks, and surplus gas from Point of Ayr will also be sold. The colliery gas has a heat value of about 1,200 B.Th.U. a cubic foot, against the 500 B.Th.U. for ordinary coal gas, and its flame speed is low; to use it pure would require new

burners on most gas stoves and equipment. At Whitehaven gasworks—an obsolete plant that was already due for closing, leaving the town to be supplied through the Ennerdale gas grid—part of the methane is therefore being passed over a catalyst that re-forms it into hydrogen and carbon monoxide; mixed with the pure methane, this can be burned efficiently in ordinary gas appliances.

About 750 cubic feet a minute of pure methane is now being sucked out of the Haig pit; one borehole alone, has yielded more than 100 million cubic feet of gas in the last 2½ years. The flow fluctuates, and the duration of the supply can hardly be guaranteed; hence the need for combining it with a flexible gas system in being such as the grid at Whitehaven. A gas undertaking, which has legal safety obligations to maintain its supplies, could hardly depend solely upon methane drained from coal even if the quantities were sufficient. So no great number of these links between colliery drainage and gas undertakings is likely, and the yield of methane from the pits, as the Coal Board has emphasised, is fairly small. If it were eventually found practicable to drain methane into gas systems at, say, 30 pits, with an average flow of about half that at the Haig (this is an exceptionally gassy pit) the quantity supplied might amount to about 5,000 million cubic feet a year. To put this quantity in perspective, the Coal Board alone sells about 40,000 million cubic feet a year to the gas industry from its coke ovens, and the total sales of town gas amount to more than 500,000 million cubic feet.

The Gas Council, it is fair to say, has rosier hopes of natural gas from other sources. It accepts these modest estimates of the methane that may be available from the coal measures. But it is co-operating with the Anglo-Iranian Oil Company in prospecting for natural gas elsewhere in Britain. There is a gas field in Scotland, though the quantities available are not known, and the Gas Council and Anglo-Iranian hope there may be much larger supplies in Yorkshire. Last year, Imperial Chemical Industries too, obtained permission to prospect for methane near Whitby.

The ICI venture was a reminder to the Coal Board that methane might be regarded as too rich a hydrocarbon to be used for burning; it would make a valuable raw material for the production of formaldehyde, acetylene and various solvents, if available in economic quantities. But chemical synthesis might require amounts of the order of 50 to 100 tons a day—far more than seems likely to be available from any colliery. Methane could also be used as a motor fuel, and might even carry the cost of liquefying and transport in cylinders and still be competitive with petrol for heavy vehicles; but it could not compete

with diesel fuel. The board is using methane in a mixed gas-diesel oil engine to provide electricity and exhaust heat to warm pithead bath water at one site; such a mixture, three-quarters methane and a quarter diesel oil, might give the methane a notional value of about 6d. a therm, but the board is not hopeful of finding consumers ready to pay that price.

In the first Whitehaven contract the coal and gas negotiators had the problem of settling a price for something that had hardly ever before been sold in this country. The price range, obviously, was limited by alternative uses or supplies. The lower limit would be represented by the cost of the coal that would alternatively be used to fire the colliery boiler, say 2½d. a therm; and the upper limit by the cost at which gas could be manufactured and supplied in the area, possibly about 6d. a therm. In some parts of the country, a local gas board might find it worth while to buy gas from outside at considerably higher prices, for example butane at 10d. to 1s. a therm, because the alternative would be to squeeze more gas from a gasworks that formed part of the industry's obsolete and uneconomic tail, where a therm of gas might cost 2s.

Business Notes

Bank Rate "Unified"

THE City was taken utterly by surprise on Thursday morning by the "posting" of a reduction in Bank rate—from 4 to 3½ per cent—immediately after the weekly meeting of the Bank Court. The surprise was heightened by the fact that this was the first peacetime change since 1932 to be made in the traditional way, solely by communication from the Bank. Not for some time did the City discover that the tradition had been supplemented by an official explanation—and one that robbed the change of a good deal of its traditional significance. The statement explained that, whilst Bank rate as such—i.e. the minimum rate at which the Bank of England will discount approved bills of exchange—had been reduced by ½ per cent, there would be no reduction in the Special rate at which the Bank makes seven-day loans to the market. This rate, previously kept at ½ per cent below Bank rate, was introduced at the time of the launching of the new monetary policy in 1951, with the object, it is now explained, of "easing the transition to a more positive policy." Hence the effect of Thursday's change was to "unify" both official rates at a

or more to make against the national average of about 9d. a therm.

The price paid for these first experimental supplies from the Haig pit has not been disclosed; both sides describe it as provisional, and obviously considerations such as regularity of supply enter into the question of price. To the gas industry, the first price set for a gas that they hope may become available in significant quantities from more than one source, to replace gas made from coal that becomes more expensive with the years, is obviously important as a precedent. Coke-oven operators, for example, would argue that the prices paid by the gas industry for coke-oven gas are still lower than they should be because it was originally sold as a "waste product." The Coal Board, less sanguine about the amounts of methane that may eventually be produced, prepared to use the gas itself at most collieries, and in any case draining methane primarily for safety, has been perhaps less concerned to haggle. So this co-operation between the two nationalised fuel industries has shown no sign as yet of producing the wrangles over price that have long attended the NCB's sales of gas—and coal—to the gas industry.

level of 3½ per cent; and the object of this unification is officially stated to be "to allow more freedom in the day-to-day operation of the market" and to "facilitate the flexible use of Bank rate in either direction as circumstances may require."

This statement, by creating doubts about what precisely lay behind the change, caused much bewilderment in the City—and especially in stock markets. At the close of business on Thursday, when this issue of *The Economist* went to press, the implications were still uncertain, and so was the future structure of rates. On the one hand, it is certain that the authorities are anxious that their move shall not be construed as a sign that the danger to Britain's economy has passed; their general attitude towards monetary policy remains almost unchanged, and no revision has been made in the so-called "directives" to the banks requesting restraint in advances policy. On the other hand, it is equally clear that the move cannot be dismissed as of merely technical significance.

The technical aspects, however, are certainly of high importance. Since commercial bank lending rates are related to Bank rate proper, the existence of the Bank's Special rate had the effect of producing a wide spread between rates charged to commercial borrowers and those

charged to the Government on Treasury bills. The resultant anomaly was even more clearly shown in the margin between the 3 per cent rate for first class commercial bills and the $2\frac{1}{4}$ per cent rate that has been general for Treasury bills. (The implications of this particular distortion were fully analysed in an article in *The Economist* three weeks ago.) But the narrowing of these gaps in order to make the Bank rate more effective could have been secured either by reducing Bank rate or by raising the Special rate. To satisfy the purely technical objective of promoting a more flexible and more normal market, the Bank had to impart either an upward or a downward twist to at least part of the whole rate structure.

It has chosen the latter, and thereby brings about automatically a reduction in the rates charged for the majority of bank advances—excluding those to personal and business borrowers whose loans are running at rates that, though technically based on Bank rate, are subject to high minimum charges. The very fact that there was this impact upon advances rates has caused some softening of rates elsewhere. But since the Bank's move was not a simple cut of $\frac{1}{2}$ per cent in its own rates, the clearing banks seem to have decided to reduce by only $\frac{1}{4}$ per cent the rates that are under their own control. Deposit allowances are

apparently to be fixed at $1\frac{1}{2}$ per cent, instead of 2 per cent, and rates charged for call loans against Treasury bills are likely to move similarly. The commercial bill rate will, of course, fall more sharply, and may be allowed to become a flexible instead of a pegged rate. But, in either case, the unnatural margin over the Treasury bill rate will be narrowed.

All this, in short, is an important contribution to normality in the rate structure, and will undoubtedly increase the Bank's freedom for manoeuvre. But it is idle to pretend that it is wholly technical, and does not betoken a feeling of greater confidence. The stock markets, however, seem in their first response to have put too much emphasis upon the confidence ingredient and too little upon the technical. Gilt-edged prices were marked up immediately and, despite the uncertainties about the technical implications, they climbed even faster. At the close on Thursday, the whole list had been lifted substantially, with the gains in the longer dated and irredeemable stocks ranging up to $1\frac{1}{2}$.

Tale of Two Markets

FOR the industrial sector of the stock markets the news of the reduction in Bank rate came as the crowning feature of a hectic fortnight; the immediate consequence was that the *Financial Times* index of industrial ordinary shares rose by 1.6 points to 124.8, in Thursday's dealings. At the beginning of the fortnight some investors' optimism had seemed ready to take wings, while in the middle of it the news of the decline in Wall Street had overshadowed everything else. The underlying—and perhaps wistful—attitude in the markets is clearly that, if only the American economy could be relied upon to continue at its present high blast, the prospect for British industrial shares might at long last look bullish. Britain's internal balance of spending and earning does not now threaten any economic crisis this year; and—whatever else the reduction in Bank rate means—it is an understatement to say that the Government does not

LONDON, WALL STREET AND WHEAT

* *Financial Times* index for London industrials and Dow Jones index for Wall Street industrials, rebased on June 25, 1952 = 100.

now seem to see any reason for an immediate tightening of monetary policy. Thanks to the increase in industrial production (more than 7 per cent up in the period April-July compared with a year before) and to the re-opening of some Commonwealth markets, British companies' profits—when struck net of stock appreciation (and this is the calculation that matters in terms of dividend potentialities)—are probably as high as at any period since the war.

It is true that profits statements for financial years ending on December 31st, March 31st and even June 30th last have all shown average profits down by somewhere between 5 and 10 per cent. But that is because they have had to bear

Does your office stride through accounting routines... or hobble?

The Burroughs M200
Direct multiplication (answers calculated and printed automatically in one fast operation); automatic proof of accuracy; direct subtraction; entries fully described as desired—these are some of the features of this speedy multiplying accounting machine. Other styles of Typewriter-Accounting Machines are available for practically all accounting routines—sales, purchase and general ledgers, statistical applications, etc., with up to 21 totals if required.

**This incomparable Burroughs machine
handles complete routines—faster, and at less cost**

WHATEVER JOB THE OFFICE HAS ON HAND—stores records, cost accounting, payroll—the work normally divides itself into three distinct operations: calculating, posting or preparing, and checking.

On Burroughs Multiplying Typewriter-Accounting Machines the three steps are cut to one. Calculating and posting are done as a single, continuous operation—with automatic proof of accuracy.

The potential saving in time (and cost!) is obvious. This unique machine, the only one available with direct multiplication, not repeated addition, accelerates the production of complete and accurate records—giving management timely figures without posting “peaks.” You owe it to your business to see it prove its efficiency in action. Call Burroughs today.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

the adverse experience of last summer's recession in the consumer goods and export trades. As this experience recedes into the past, it will not be surprising if most profits statements for the year to September 30th—at any rate those issued by producers of consumer goods—show profits at least equal to those in the preceding year; and, on the assumption that there is no American or world-wide trading recession, their statements for the present calendar year (and, still more, for the year to next March) could show both profits and dividends very significantly up. It was to pleasant musings of this sort that those in charge of the investment of institutional portfolios returned from their August holidays. It was not surprising therefore that by September 10th the *Financial Times* index of industrial ordinary shares had risen to 124.7, only 0.3 points below its previous 1953 high point of last March (just before Stalin died).

It was on September 10th, however, that Wall Street went into its nervous wobble, with the Dow Jones index of industrial stocks dropping by 3.8 per cent in the course of three working days; the index recovered more than a third of this loss in the next two days, but on Wednesday of this week it was still nearly 12 per cent below its high point of six months ago. At this stage the *Financial Times* index in London stood at 123.2. The reduction in the American Government's budget deficit, the signs of slackening demand for automobiles, and the fall in farm incomes—to which the accompanying chart, showing the movement in Chicago wheat prices, draws attention—are all causing nervousness about the business prospect across the Atlantic. Despite the Bank rate reduction and the immediate trend of British profits, the London market—which, as the chart shows, has been consistently stronger than Wall Street ever since it passed its low point in June last year—could still be jolted sharply back to nervousness, too.

A Bigger IMF?

THE bald official news from this year's meeting of the International Monetary Fund inevitably conjures up yet another variation upon a topical theme. Never have so many gone so far to achieve so little. It would perhaps be reasonable, as well as charitable, to assume that the many high authorities who went to Washington found reward for their journeys in the behind-the-scenes activities and discussions; but if these yielded useful results, the general public must still remain in the dark about them. What is known about the proceedings is that great emphasis was laid by spokesmen for the Fund upon the new facilities for stand-by credits. These are regarded as the answer to the criticism that access to the facilities of the Fund has been so hedged around with restrictions that the quotas did not add to the available volume of international reserves. If this criticism is really met by the new stand-by credits, then the Fund will indeed be coming into its own, and at a very appropriate moment. But Britain obviously thinks that something more is needed. At the Washington meeting, the British representative officially proposed an increase in members' quotas. This reflects a change in the British attitude towards the Fund—though it does no more than confirm hints already made in this country that the British

authorities regard the Fund as the channel through which the increase in international reserves needed for convertibility is most likely to be provided.

This view of the prerequisites of convertibility did, moreover, find indirect justification from another event at the Fund meeting—the categorical and almost brutal refusal by the official United States delegation even to consider the case for an increase in the world price of gold. This suggestion was once again put forward by the South African delegate. The debate on this issue opened no new vistas. The Governor of the South African Reserve Bank advanced the proposal on the ground that a higher price for gold would provide the most powerful contribution to the progress towards convertibility. He was answered by Mr Randolph Burgess with the familiar arguments that any tampering with the price of gold and with the dollar would focus attention on the wrong factors in the problem of disequilibrium in world balances of payments and would, in fact, be detrimental to the whole cause of convertibility by undermining the soundness of the dollar. Sound money is, in fact, the flag now firmly nailed to the American mast; it is significant that, at this IMF meeting, the official United States welcome to the Commonwealth Economic Plan was based on the fact that the plan emphasises the need for sound money and appropriate domestic policies in the countries concerned. This is playing for safety. Pending the publication of the Randall report next March, no American minister or official is going “to put a foot wrong” by showing in public any overt sympathy for a liberal and expansionist foreign economic policy. What was said by them in private on this issue may have been much more reassuring. But it is unlikely that it will have been reassuring enough to hold out the promise that the next Commonwealth Economic Conference—which is likely to be held in Australia in December—can be the source of great decisions.

Easier Australian Markets

THE Australian public, which last week was handed out £A118 million a year in tax concessions, has now been told that after October 1st it may spend £A45 million a year more on imports. The import relaxations follow the now familiar lines of an adjustment of the very stringent quotas imposed in March, 1952. “Category B” or less essential imports—most of them imports of consumer goods—are increased by one-quarter, from 40 to 50 per cent of imports in the base year 1950-51. “Category A” or more essential imports are increased by one-eighth, from 80 to 90 per cent of imports in 1950-51. These relaxations do not apply to imports from the dollar area or Japan, but it has been announced that permits for imports from Japan will be increased “in line with” imports from other non-dollar countries; presumably the intention here is to prune down restrictions rather than to raise Japanese quotas by flat percentage amounts. Finally—and this could be very important—a long list of items that are at present subject to administrative (which means, in effect, to rather haphazard) licensing will now be granted licences quite freely, provided importers can show that they will be able to lay hands on the goods concerned.

within a year. The list includes replacement parts for cars and for a wide variety of other manufactured goods, some raw materials (such as aluminium and nickel), cinema films, scientific instruments and various medicinal preparations.

It is difficult to say how the £A45 million of permitted new imports may be distributed among different exporting interests; but—as a very rough rule of thumb—most industries that benefited from the two previous and very similar essays at relaxation, in March and June last, can expect to benefit by about the same amount as on each of those occasions. This is good news for British exporters of textiles and motor cars. Thanks mainly to the previous relaxations, British exports of cars and motor chassis to Australia leapt from an average of between £800,000 and £900,000 in the period January-June to some £2,179,000 in July; this was a sudden upsurge in response to the relaxations rather than a level that is likely to be maintained, but perhaps a similar upsurge may be expected this winter. After the recent tax remissions the Australian market should be in a sufficiently inflationary state to take up most goods that can be offered to it, although much will depend here on the course of Australian protectionism. Mr Menzies, in announcing the relaxations, seemed to go out of his way to invite Australian industrialists to apply for tariff protection in place of the "import quotas" protection that is now being whittled down; he announced that membership of the Tariff Board has been increased from four to seven to enable it to deal expeditiously with the flood of applications from industrialists that is now expected.

Bank Advances Before and After

It is still, of course, too early to judge the effect of the reduction in Bank rate on the lending policies of the banks; for reasons explained in an earlier note, some borrowers will now automatically get their loans more cheaply, but the increase in borrowing may not be—and certainly for the health of the economy ought not to be—large. The latest return by the British Bankers' Association (for the three months to August) confirms earlier evidence

HOW MUCH DEPRECIATION?

The Economist Intelligence Unit compiles index numbers showing changes in the cost of replacing industrial and other assets. Indices available:—

Plant: chemical, electrical, food processing, machine tools, mechanical handling, printing, tanning, textile, foundry.

Also agricultural machinery, factory buildings, commercial vehicles, and office equipment.

A descriptive leaflet may be obtained from

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, St. James's, London, S.W.1

that the downward trend in the supply of bank credit to private trade and industry, which began in the spring of 1952 but was interrupted in the early months of this year, was definitely re-established during this summer; but it also suggests that the latest decline was mainly of a seasonal character. The return shows that total advances fell by £76.6 million during June, July and August, to a total of £1,788.5 million. Within this decline, the public utilities group's borrowings fell by £34.2 million, or by only about half as much as the calls made during this period on the British Electricity Authority and Gas Council issues. As "personal and professional" advances fell by less than £2,000,000—exactly equal to their fall in the previous quarter, and far smaller than the reduction experienced in the quarters following the more stringent scrutiny that began in November, 1951—bank finance for private business dropped by £40.5 million. This followed two quarters of moderate expansion; but the fall was far less than that of £81.3 million experienced in June, July and August of last year.

Detailed examination of the lending to separate industrial groups confirms the impression that the decline was mainly seasonal. The largest fall was registered by the food, drink and tobacco group, down by £27.4 million to £118.5 million. Advances to retail trade fell by £13.1 million to £164.2 million—but this fall of 7½ per cent was only about half the drop experienced from May to August in 1952. The engineering industry reduced its bank loans for the second quarter in succession (by £13.1 million) and its outstanding bank borrowing is now below that of August of last year. Chemicals, cotton and nine other groups (including personal borrowers and public utilities) also recorded some fall in advances in the period. Increases were recorded by eleven groups. Among them, coal mining increased its borrowing by 28 per cent to £2.3 million, and the iron and steel industry increased its borrowing by £9.5 million; this brought total advances to the iron and steel industry to £61.3 million, almost double the £33.5 million outstanding a year ago. The moderate increases secured by the wool, building and other industrial groups in this slack season suggest that few businesses can now be really squeezed for credit. The economy is certainly in no state to return to a regime of easy lending; and it would be a gross misreading of this week's reduction in Bank rate to suppose that the Government has any such return in mind.

Federation and Board

STILL the investor awaits the first steel issue; the "early autumn" evidently has not yet arrived, but when it comes there may be the mellow glow of reduced Bank rate to shed its warmth, if not to promote an Indian summer in the markets. The degree of success of the early steel issues will go a long way towards determining how far the steel industry as a whole in this country will revert to private ownership and how large a proportion of it (on the best assumptions, it is likely to be a significant proportion) remains in public ownership.

These delays in embarking on the new share offers do not, however, concern other major areas of decision involving the steel industry. Of these, perhaps the most important

WORKERS IN THE TEAM
Number 3 in a series

This thoughtful, sensitive face belongs to a craftsman. Walter Turner is a man for whom only first class work is good enough.

He started work with the Company in 1925 after serving his apprenticeship as a joiner. Today he is general foreman in charge of important work: and everyone knows that under Walter's eye even the smallest details will be attended to thoroughly.

He has shares in the Company—a privilege reserved for those who set an outstanding example. But his chief reward comes when a fine job has been done and its

quality is noticed: then, his face lights up.

He takes great pleasure in the Company's annual outings because there he meets old fellow-workers and they talk of past jobs tackled together. For all his work is shared. This is the real secret of the satisfaction he gets from life: good work done by a team of which he is one.

Marconi Television for Thailand

A B.O.A.C. Photograph

Thailand, the first country in South East Asia to install Television, has placed the order for its system with Marconi's Wireless Telegraph Company Ltd.

The order includes vision and sound transmitters, Marconi Image Orthicon television cameras and associated equipment.

The system will operate on the international 625 line standard.

This new order follows those gained by the Company for installations in Italy, South America, Canada and the U.S.A.

Marconi high or medium power transmitters and high-power aerials are installed in every one of the B.B.C.'s television transmitter stations.

is the future balance of forces between the Iron and Steel Board and the British Iron and Steel Federation. Sir Archibald Forbes and his colleagues at the Board are entrusted with the task of exercising the public interest in what the steel industry does; and no doubt one of the first stages of their work will be to decide upon the technical and statistical instruments that they will require for these duties—decisions which must inevitably involve the future of a good deal of the work that the Federation has hitherto carried out in formulating plans and computing costs and prices.

It is a good thing, when so many features in the higher policy and development of the industry are still in doubt, that the Federation should have appointed Mr Frederick Grant, QC, as its independent chairman—an office that had been vacant since the death of Sir Andrew Duncan. Mr Grant's experience in a position of eminence at the tax bar and as a member of the Monopolies Commission from 1949 to 1952 promises precisely the authority and the judicial approach that his new office demands. These qualities will equally be required in the Federation's relations with the Board; Mr Grant's appointment must be read as an indication that the Federation will neither willingly become a cipher nor that it will refuse any forms of helpful co-partnership with the Board.

Testing the Coal Guesses

FOR the last two months the National Coal Board's hope of beginning the coal winter with thin but probably sufficient distributed stocks has had to be based partly upon estimates of the coal that miners would have produced, if they had not been on holiday. That is inevitable in holiday months. But this year rather critical importance has attached to the estimates that have been made by comparing output this year, plus the estimated amounts lost through holidays, with the same figures last year. From the beginning of May to the end of August, for example, these calculations (which make no allowance for the loss of opencast coal through contractors' holidays) would suggest that the "potential output" of the industry was perhaps 120,000 tons a week higher than in the same period last year. This brand of figuring will receive its most important test in a week or two's time, when the miners' holidays have ceased to affect the figures. Last week, when holidays cost the exceptionally high amount of some 355,000 tons of coal, such calculations put the industry's "potential" total output no more than about 40,000 tons higher than a year before, though the notional "margin" for deep-mined output alone should be about 65,000 tons a week higher.

Notional coal and potential output does not fill the cellar. Moreover, the industry has lost about 4,000 men since the end of July—a thousand of them went in the first week of this month—so that a drain on manpower could upset the calculations. And the stakes in the gamble that the miners will produce enough more to build safe stocks during the next seven weeks are extremely high. The National Coal Board was saved from a full-dress inquiry last year by the Minister of Fuel and Power. It came safely through last winter; but any significant interruptions to supplies this winter could put it—and its protector—back into political

jeopardy. Moreover, the performance of the board and the minister are not judged by the figures of distributed stocks and the possible adequacy of stocks in industrial consumers' yards. Both will be judged by the stocks in merchants' depots and domestic consumers' cellars—that is, by stocks of large coal. Merchants' stocks are still dangerously low—about 1,150,000 tons against 1,500,000 tons last year, when merchants were already complaining—and consumers have bought no more coal this summer than they did twelve months earlier. The National Coal Board appears to have received most of the 400,000 tons of large coal that it decided to import this autumn from the Continent. Will it have to buy more?

Will Cinemas Close?

MR RANK'S statement that unless Entertainments Duty is reduced "many" of the Odeon group's cinemas will have to be closed should be taken seriously in Whitehall, where talk of closing cinemas has been disregarded before. Of the 550 cinemas in the Odeon and Gaumont-British circuits, Mr Rank said this week, 236 operated in 1952-53 at a loss totalling some £725,000 before charging interest on capital employed, but excluding profits on the sale of ice-cream and confectionery; even allowing for profits on such sales, these 236 cinemas would still show an aggregate net loss before charging interest. This implies that the other 314 cinemas in the group made profits from admissions and ancillary earnings somewhat exceeding the final figure of £2,855,444 shown as the group's net operating profit on exhibition in the British Isles; the group would have been better off, that is, without 40 per cent of its cinemas. Moreover, those net operating profits on British exhibition are more than 8 per cent down on the year (to June 27, 1953), while ancillary earnings in the group, though undisclosed, have probably been rising; so the decline in the profitability of the cinemas' primary business may be worse than these figures show. The actual magnitude of ancillary earnings in the industry has never been published, for understandable reasons. But while it remains hidden, its existence will always be quoted to put out of court the cinema trade's arguments about the insufficient profitability of showing films. To close cinemas down would—and perhaps will—be to make the trade's point in the hardest way.

Mr Rank had some equally pointed remarks to make about his group's film production, which showed a marked improvement in its financial fortunes on the year. The group showed a net profit of £350,000, following some years of losses, on "film production and distribution"; since distribution is a fairly stable and fairly profitable activity, the improvement was largely concentrated on production, though the aggregated figure does not make it clear whether a profit was actually made on production alone. This marked improvement, and that of the two preceding years, was due very largely, Mr Rank said, to receipts from the Eady levy (which the group pays as well as receives). He added that unless the trade could agree on a voluntary scheme to extend that levy, or the Board of Trade could fully outline a statutory levy scheme, "within the next month or so," the group

proposed to "reduce materially" its production programme following those films now on the floor and likely to be completed in the next couple of months.

Standard's Baby Car

THE Standard Motor Company gave details this week of its "baby" car. It will probably not be the only example of a small car in which a deliberate bid is made to keep costs down to the minimum. Sir John Black started a new trend in the motor industry by concentrating on one model only, the Vanguard, and he has stuck fairly consistently to this policy until now. The new baby car, with its spartan fittings, its woven plastic upholstery and its fixed boot (reached from inside) costs £339, or £481 with purchase tax. Fuel consumption is put at roughly 50 miles per gallon and the car's one luxury is a four-speed gear box, a refinement that several larger and more expensive cars cannot claim.

The present spread of prices for small British cars is intriguing. The Ford Anglia is still the cheapest of the 8-h.p. cars, costing £313 without tax, but it has been in production for so long that its costs can hardly be comparable with newer models. The second cheapest is the new Standard followed by the Austin A30, which costs £355 before tax and £504 with tax. Both the Standard and the Austin have four doors, while the Ford Anglia and the Morris Minor—costing £373, have two doors, although a four-door version of the Minor is available at extra cost. If it is fair to assume that few motorists who could afford a bigger car would buy a baby car, the difference of a few pounds in price may become the deciding factor in the competitive race for the small car market. The pace may become quicker when the Ford Motor Company shows its hand, as it is expected to do before the Motor Show.

The baby Standard is the first new British car to be put into production unhampered from the start by restrictions on supplies of components or licensing of materials; indeed, it was not shown publicly until a production rate of 100 cars a day had been reached. This is being stepped up gradually to 300 a day, compared with about 200 for the Vanguard. The Standard company therefore seems to be pinning considerable faith on a successful entry into the small car market, with its keenly competitive conditions.

London Airport's Next Stage

THE Minister of Transport has described this week the plans for the main terminal buildings at London Airport. At present, the airport is little more than a system of runways and essential technical aids. Aircraft are housed in temporary hangars, staff in temporary offices, and passengers use temporary buildings. Some permanent hangars are under construction, and work has now started on the permanent buildings that will improve the amenities

of the airport—though they will perhaps not add much to its high standard of efficiency. The plan shows the new terminal area, which lies in the centre of a completed network of runways and is reached through a tunnel leading from the main road beneath the runways. Only a quarter of this central area is being developed; it will have a control tower, one building for handling passengers and baggage, and a second for offices, restaurants, and the inevitable public enclosures that, as a possible source of income, cannot be ignored. Aircraft will be parked on taxiways ringing this central area. When traffic is particularly heavy, and the inner taxi-ways are full, passengers will be taken in buses through a subway that goes beneath the inner taxi-ways to an outer ring.

The decision to make a start on these terminal buildings was taken because London Airport will shortly have to handle all the traffic now going through Northolt, which amounts to about 750,000 passengers a year to London's

half-million, and extra space will in any case be needed to accommodate them. The two airports are too close for comfort when large numbers of aircraft are being handled, and, for this reason alone, Northolt will have to be closed down for civil air operation. Supporters of the Gatwick extension argue that this makes the start of work at Gatwick a matter of urgency, since Gatwick will not merely be a diversionary airport for bad weather, but will also have to handle the peak summer traffic that London Airport is too small to accommodate.

London Airport when completed will cost about £26 million; the three new buildings including control tower equipment, lighting and services, are expected to cost £6½ million. It is expected that revenue should reach about £1½ million, and this will no more than equal estimated running costs, without allowing for interest and depreciation.

Price Arrangements for Home Grains

THE deficiency payments scheme for home-grown grains, to be introduced in time for next year's harvest, has wide implications for British farmers which are discussed in a leading article on page 761. Its incentive effects on quality production should be real. Its mechanics, however, are relatively simple. A standard price will be set for each of the four grains—wheat, barley, oats and rye—in the Ministry of Agriculture's annual review, as the guaranteed prices are set now; an escalator for wheat prices will be continued, to encourage farmers to spread their sales beyond the harvest peak. Farmers are free to sell in the open market at the best price they can secure. The merchants will make a return of all sales to the Ministry of Food, and from these returns the average price realised by all farmers for the four grains will be calculated. The deficiency between this average realised price and the standard price guaranteed by the Government will be made good to all farmers alike. For wheat and rye the farmer will receive the deficiency payment on the tonnage that he has sold. For barley and oats, which are heavily consumed on the farm, the deficiency payment per ton will be converted into a payment per acre grown.

A special arrangement is required for striking the average price for barley, which would otherwise be weighted against the grower of feed barley by the premiums obtained for high quality malting grades. The approximate margin between the price ranges of feeding and industrial barley is taken to be 1s. a hundredweight and the average price on which deficiency payments will be made will involve a double operation—first the deduction of a shilling from the average price realised for all barleys, and then the recalculation of the real average price, which will govern the actual deficiency payments, from all sales below that margin. For administrative convenience, however, the deficiency will be paid on all barley, so the grower of malting grades will receive a small windfall. Standard prices for wheat and rye (a negligible crop) will be the same in 1954 as the current guaranteed prices, namely 30s. 9d. and 25s. a cwt. The standard price for oats is 1s. 10d. higher at 24s. and for barley 6d. higher at 25s. 6d. a cwt. A similar system of deficiency payments was operated up to the war under the Wheat Act of 1932, the main difference being that the funds were provided by a levy on sales of flour. In 1938 the system was extended to oats and barley under the Agriculture Act of 1937, but for these grains funds came directly from the Exchequer, as they will for the new scheme in the first instance. The permanent financing and administration of the scheme has still to be decided.

Trade in August

WHAT happens to the trade figures in August is always at the mercy of the holidays. For those who worked, there were 25 working days, two fewer than July, but the seaside, not the quayside, is the dominant August note. The provisional trade figures show that both imports and exports fell identically by 12 per cent. Exports fell to

£198.1 million (fob) from the high level of £234.4 million in July, and imports dropped to £249.2 million (cif) from £293.0 million. Allowing for re-exports, a little higher at £8.8 million, the visible trade deficit was cut to £42.3 million from £50.0 million in July; it was nearly half the June figure of £80.0 million and only slightly above the deficit of £38.9 million in February, which had 24 working days. The fall in the daily rate of exports from £9 million in July to £8.3 million in August can be taken to reflect the holiday shutdown.

If July and August are taken together, they compare favourably with the averages for the first and second quarters of this year. The average of exports for the two months was £216.3 million, against £210.0 million in the second quarter and £208.5 million in the first. On the same basis, the average of imports was £271.1 million compared with £291.7 million for April-June and £272.4 million for January-March.

The fall of just over 12 per cent in exports to North America in August was in line with the total decline. Exports to the United States fell to £12.7 million from £15.2 million in July; there was a slightly larger fall of £3.1 million to £11.8 million in exports to Canada. Average total exports to North America for the two months, at £27.3 million, were £2.2 million below the average for the second quarter, although £3.2 million above the average for the first.

Fall in Jute

THE sweeping cut in the Indian export duty on hessian cloth is likely to weaken the price of raw jute still further. When the duty was £20 12s. 6d. a ton, European mills could just compete with Indian hessian in world markets. Now that the duty is only £9 a ton, Calcutta can probably undersell European mills by nearly 10 per cent. Prices of hessian in Calcutta had been drifting lower for some weeks in anticipation of a cut in the duty. The United States, the largest consumer, had made only spot or afloat purchases. Buyers have now withdrawn from the market for the time being, but there is probably a substantial potential demand at a little below the current price of about 70s. 9d. for 10 oz./40in. cloth per 100 yards, fob—Calcutta.

The raw jute market, which opened firmly when the season began last August at about £97 to £98 a ton for Firsts, cif UK/Continent, has fallen steadily in the last few weeks, and Firsts are now about £88 to £91 a ton. The initial firmness came mainly from local speculative buying on the prospect of a much smaller crop in Pakistan. Demand from most foreign consumers was poor, and is likely to diminish under the pressure of competition from Indian hessian.

This season's crop in Pakistan should amount to between 3½ and 4 million bales, compared with 7½ million bales in 1952-53. There is a carry-over of about 2½ million bales, but the bulk of this is low grade jute which is largely unsuitable for overseas markets. Exports from Pakistan last season totalled about 5.7 million bales, of which India took 1.4 million. As India has undertaken to buy between 1.8 and 2.5 million bales this year, it is possible that supplies in Pakistan will be small when the season ends.

Two answers for the price of one

1 The result of each individual calculation is shown here. To add it to, or subtract it from, the amount in the top answer dial involves only one key depression. Either dial can be cleared independently, or both dials cleared together.

2 The final answer—grand total or net result—appears automatically here when all calculations are complete. No "recapping" needed.

The calculator that cuts out "recapping" can save up to 40% of an operator's time!

On routine figure-work, it is the calculating machine that gets to the final answer with the lowest number of intervening steps that reduces operating costs. That is why this Burroughs is equipped with two answer dials—one for results of individual calculations, and one for grand totals or net results. One key depression clears a result from the front dial, and accumulates it automatically in the rear dial. The operator can take a total or net result at any time without re-entering any figures, without any "recapping."

The savings in time (and cost!) are obvious. Whatever your problem—payroll, invoicing, stock records, analysis—you owe it to your business to let Burroughs show you how this speedy, all-electric machine (or any one of the wide range of Burroughs calculators) could be applied in your office. Call Burroughs today.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

TWO FIRSTS!

Burroughs, always ahead in providing answers to figuring problems, were the first to introduce an all-electric calculator, and the first also to make a Duplex calculator, giving direct subtraction.

SHORTER NOTES

The Treasury has made one of its now customary con-
version offers to holders of the 3 per cent Defence Bonds
that mature between January 1 and June 30, 1954. These
holders are invited to continue to hold these bonds until
July 1, 1954—when they will be paid a full six months'
interest and the maturity premium of £1 per cent, and
then their bonds will be exchanged into the same amount
of 3½ per cent Defence Bonds (Conversion Issue). If this
offer is not accepted, by filling in the special forms, then
interest on the maturing bonds will stop on the tenth
anniversary of the date of purchase.

★

The new series of London wool sales opened firmly this
week. There was good competition, particularly from
Bradford buyers, to obtain these spot supplies well in
advance of arrivals from the primary markets. This was
most marked in the small offering of greasy crossbred wool,
supplies of which will not be arriving from New Zealand
until the end of the year. The price of good average cross-
bred carding wool, 48's/50, was about 77d. to 79d. per lb,

clean basis, compared with 73d. at the close of the last
series. Good merino topmaking wool, 64's was about 145d.
per lb clean, 5d. higher than the present landed price of
comparable qualities at the Australian auctions. Super
topmaking merino wool, at about 155d. per lb, was also
5d. dearer than the comparable landed price at the Aus-
tralian auctions.

★

After announcing that the company's interim equity
dividend would be maintained at 7½ per cent, the directors
of Associated Electrical Industries have announced their
intention of capitalising £8,870,596 from reserves in order
to make a scrip issue of one new £1 ordinary stock unit
for every one now in issue. For connoisseurs of the word-
ing of such scrip issues, and of the hints about dividend
disbursements that they can convey, the directors rely on
the studiously non-committal technique of the conditional
future tense. They announce that the issue "will not
affect earnings, and that on the assumption of the gross
amount paid as an ordinary dividend being unchanged the
dividend rate would be halved."

Company Notes

ODEON THEATRES. In the
last four years the revival in the fortunes
of the J. Arthur Rank Organisation has
in the main been attributable to a cutting
of the losses on film production and to the
reasonable stability in profits on exhibi-
tion in this country. In addition the group
has earned fairly high profits from its
manufacturing activities and from the
cinemas' ancillary services, such as the
sale of ice cream and advertising space
(which, for the first time, are specially and
separately mentioned by Mr Rank in his
comments on the group's trading results
for the year to June 27th last). In the
last financial year a loss of £146,515
on film production and distribution
was turned into a profit of £352,760;
this played a major part in
bringing about a further advance in
Odeon Theatres' operating profits (after
depreciation) from £5,047,104 to
£5,350,629. This rise in profits enabled
the company to pay off its pre-
ference dividend arrears (as a similar
advance in profits enabled the directors of
Gaumont-British to maintain the ordinary
dividend at 7½ per cent) and to reduce its
bank overdraft by another £971,740 to
£5,804,998, or about £10½ million lower
than it stood in June, 1949.

These figures make for a brighter show-
ing in the group's accounts, but Mr Rank's
detailed analysis of them is still sombre.
In the first place (as is explained in an
earlier Business Note) the profit on film
production was only achieved with the
help of the British Film Production Fund
—and recently the continuance of this
levy on cinema takings to help British film
producers has been in doubt. Secondly,
profits from the exhibition of films in this
country have been declining for two years,
largely as a result of competition from
television—which Mr Rank described as
"2,300,000 free theatres in people's
homes." Indeed, the group's total box-
office earnings fell from £30,018,278 to
£28,737,691 and profits from the exhibi-
tion of films in Britain from £3,202,764 to
£2,855,444. Basically, therefore, two
major problems still confront the Rank
organisation. First, it must keep a very
tight rein indeed on film production until
the future of the Eady levy is assured.
Secondly, it must decide, after the next
Budget, whether it can continue to afford
to run nearly half its cinemas at a loss—
particularly as it is faced with the likeli-
hood of extra capital expenditure on con-
verting some of its cinemas for the exhibi-
tion of Three-D or wide-screen films.

INTERNATIONAL TEA. The
International Tea group of grocery stores
and factories can look back with satisfac-
tion on the year to May 2nd last. The
group's trading profits rose from
£1,695,497 to £1,735,834; its stocks were
reduced in value by about £600,000 (to
£5,057,744); and the consequent rein-
forcement in liquid resources encouraged
the directors to raise the ordinary divi-
dend from 16 to 20 per cent—the first
increase in equity payments since 1947.
But, as the chairman of the group, Mr
Frank Wilson, makes clear in his statement
to shareholders, these were no easy suc-

cesses, and they do not warrant any com-
placency about the future.

In the first place, the increase in turn-
over (which underlay the increase in
profits) took place only because the com-
pany was willing—and in some cases was
forced—to accept lower profit margins.
As the rise in prices was checked and as
costs continued to increase, these margins
—particularly on "many high tonnage and
high priced commodities"—were progres-
sively squeezed. Indeed, Mr Wilson goes
so far as to say that the advance in profits
is "meagre" when set against the increase

* Operating profits are shown after charging depreciation.

in equity payments was due merely to a tax rebate, which, in itself, holds out no firm promise that the bonus will be consolidated into total dividends next year. But, as the increased dividend is covered about three times by net profits, there seems to be no reason why this consolidation should not take place. It would not be surprising if some other producers of equipment that was very vulnerable to the recession of 1952—and that would, of course, be equally vulnerable to any future recession—have some pleasant surprises for shareholders in their accounting periods to August and September of this year.

THE MONEY MARKET

THE "unification" of Bank rate—the rate at which the Bank of England will discount approved bills of exchange—with the special rate at which it is willing to lend against Treasury bills was announced after the meeting of the Bank Court on Thursday. It was achieved by lowering Bank rate from 4 per cent to 3½ per cent, while leaving the special lending rate against Treasury bills unchanged. Reactions in the money market to this change will be discussed in this column next week: our usual table below shows the rates that were ruling before the change, on September 16th.

Before the change Lombard Street had been experiencing a tight week. Although the authorities did not leave the market "on its own" the special buyer's operations were limited and calculated to maintain a marked stringency.

The stringency in credit supplies and the maintenance of the bill offer at the record level of £300 million led the market to reduce its bid by 1d. to £99 8s. at last week's tender. As applications fell by £7 million, the market's quota rose from 66 to 68 per cent of its bid, and the average rate of discount rose by nearly 4½d. to £2 7s. 11.85d. The offer at yesterday's tender was reduced to £280 million, but the excess of new bills will remain at £30 million.

The Bank return shows a reflux of notes of only £2.4 million. After allowing for an increase in government securities in the banking department and a fall in public accounts, bankers' deposits rose by £9.7 million.

London Money Rates on Sept. 16

Bank rate (from 2½% 11/3/52)	%	Discount rates	%

WE'RE INVITING INVESTMENTS

and this is why!

More houses are going up. More purchasers are asking building societies for advances to pay for them.

In the first six months of 1953 this Society agreed to lend £3,804,000 for the purchase of 2,582 houses newly built or in course of erection.

Money saved and invested with the Society is thus being used to good purpose.

Still more savings can be used. The interest offered is 2½% with income tax paid by the Society—equal to more than 4½% where the investor is liable for tax at the full standard rate.

BRITISH MATCH CORPORATION, LIMITED

MONOPOLIES COMMISSION REPORT: MISLEADING IMPRESSIONS

POSITION ACHIEVED BY COMPETITIVE SUCCESS

THE HON. HUGH KINDERSLEY'S STATEMENT

The twenty-sixth annual general meeting of the British Match Corporation, Limited, was held on September 16th in London, the Hon. Hugh K. M. Kindersley, CBE, MC, the chairman, presiding.

The following is the chairman's statement, which had been circulated with the report and accounts:

Since our last annual general meeting, Mr Arthur Hacking, OBE, has had to resign his appointments as chairman of the Corporation and of its principal subsidiary, Bryant and May, Limited, owing to continued ill-health. Mr Hacking had been a member of the board since the formation of the Corporation and had taken a large part in the management of the group. I am sure you will share our regret at losing his services and will wish him improved health in his retirement.

At March 31, 1953, Mr Harald O. Agrell resigned his appointment as joint managing director, but I am happy to say that he remains on the board, and we shall continue to have the benefit of his invaluable experience. Mr Joseph H. G. Reed, your other joint managing director, was appointed deputy chairman as from January 1, 1953. In these circumstances the board decided that new managing directors should not be appointed.

HOME TRADE

During the year under review we were able to import substantial quantities of timber and to maintain the production and sales of matches at approximately the same level. The importation of matches from Western Europe was once more placed on open general licence as from March 25, 1953.

OVERSEAS INVESTMENTS

Your overseas investments continue to be satisfactory on the whole. In most of the markets in which we are interested there was, however, some recession in demand during the last nine months of 1952; since then we have been glad to note a tendency in most of the markets concerned for the demand to improve.

A special mention should perhaps be made of your Canadian interests, from which we received during the year dividends totalling nearly Can.\$250,000. In present circumstances this is a welcome contribution towards the hard currency resources of this country.

ACCOUNTS

In his statement last year, Mr Hacking drew attention to the considerable influence which the Brazilian rate of exchange has upon the profits brought into the group. The official rate at that time was still Cr.\$52.416 to the £, although the prospect of remittance of dividends was uncertain. In March, 1953, however, a free exchange market was established in Brazil, through which remittance

of dividends has been allowed. By March 31, 1953, the free rate had fallen to approximately Cr.\$120 to the £, a depreciation of about 129 per cent by comparison with the official rate.

This depreciation is responsible for the reduction in the net profits of the group shown in the consolidated profit and loss account. It has also given rise to a loss on exchange of £442,526 on conversion into sterling of the net current assets of your Brazilian investment. As explained in the notes annexed to the accounts, this loss has been charged to the exchange adjustment account.

You will notice that in the consolidated profit and loss account the balances proposed to be carried forward are reduced by £163,501 to £1,380,633. This reduction arises from the fact that a substantial proportion of the balances brought forward at the beginning of the year has been capitalised by one of our subsidiary companies.

Following an actuarial report on the Brymay Pension Fund, the contributions made by the Corporation and its subsidiaries have been increased since April 1, 1953, in order to bring the total contributions into line with the benefits receivable by the members. In addition a series of annual payments is to be made to the Fund, the first of which is shown in the consolidated profit and loss account.

REPORT OF THE MONOPOLIES COMMISSION

On March 1, 1949, the President of the Board of Trade referred to the Monopolies and Restrictive Practices Commission, the Supply and Export of Matches, and the Supply of Match-making Machinery. The Report of the Commission was published on May 13, 1953. In the year which has elapsed since the last evidence was given changed conditions have rendered out of date much of the contents of the report.

On June 18, 1953, the President of the Board of Trade stated in the House of Commons that he proposed to explore the possibility of removing some of the obstacles to competition in the match industry. He added that some of the steps he was contemplating called for consultation with the British Match Corporation. These consultations are proceeding and, therefore, it would not at this stage be right for me to discuss them, or any alternative action which might be taken by the President or by ourselves.

We remain free, however, to express our opinion on the body of the Report and to attempt to correct the misleading impression created by its presentation. On June 19, 1953, we sent a letter and memorandum to the Board of Trade giving them our views on the report and expressing our opinion that the Corporation have been unfairly criticised both in the Report and, in consequence, by the press.

On June 25, 1953, we invited the press to

a conference, at which we placed before them certain facts which showed the match industry in a different light. As a result of this conference most of the responsible newspapers published articles drawing attention to those major elements in the situation which had been ignored or given insufficient emphasis in the Report of the Monopolies Commission. The truth cannot be too widely known and I therefore make no apology for returning to the subject.

The Report drew attention to the fact that about 30 per cent of the ordinary stock of the Corporation is held by The Swedish Match Company. This has, of course, been public knowledge ever since the Corporation was formed in 1927. The Swedish Match Company does not control the Corporation nor has it ever attempted to do so.

The remaining 70 per cent of the ordinary stock is widely held and of the 9,544 ordinary stockholders to whom the final dividend will be paid there are 8,290 whose holdings do not exceed £500 stock.

The Report has alleged that our profits have at times been high. We have emphasised to the Board of Trade that the rates of profit in the match industry in this country since the war are not high compared with those earned by industry in general and we do not accept as valid the grounds on which that allegation was made. We maintain that in order to remain healthy an industry must be able to earn fair profits. The Commission, by using historical costs as a yardstick and rejecting a fair assessment of working capital, have over-stated the rate of profit earned by the match industry.

FACTS ABOUT THE MATCH INDUSTRY

Some important features of the match trade are not fully appreciated by the general public:

(1) In 1939 a box of matches cost 1d. Since then the duty has been trebled but the price has only doubled.

(2) The Exchequer takes more than 1d. in duty out of every 2d. the public pay for a box of matches. The duty referred to brings to the Exchequer £12 million per annum—40 times as much as the taxed profits of the principal match manufacturers and importers.

(3) Unless the duty on matches is reduced there is little or no prospect of the general public being able to buy matches more cheaply than they can now. In fact, the President of the Board of Trade said in Parliament on June 18, 1953: "The Commission's Report makes it clear that any measures which may be taken can, in the nature of things, have only a slight effect, either on the economy or on the individual."

(4) The Report says there is little or no competition. Last year 1,064,697 gross boxes of competitive matches were imported

into this country, partly from behind the Iron Curtain, where politics and the need for foreign exchange count for more than normal commercial profits. Although the Corporation is quite prepared to meet fair competition, the fact remains that the potential dumping is enormous. In accordance with our undertaking to the Board of Trade we maintain our own average contents at 47 matches but boxes are now being imported by our competitors containing 43 matches, saving the importers about 1s. 2d. per gross in duty because of the reduced contents. For these matches the public are induced to pay 2d. per box.

There have been two competitors manufacturing in this country for 20 years and they had no complaints to make to the Commission of the way in which the Corporation had treated them. The Corporation has supplied timber to these competitors without profit, and continues to do so.

(5) The Report alleges that our costs have "at certain times" been high, but it shows that the costs of our competitors in this country have been higher than ours, and so have those of our overseas companies. There is no other comparison available.

(6) There is nothing whatever to prevent competitors, at home or abroad, from making matches and selling them in this country. If our costs, prices and profits had been too high, others would have come into the market.

Ignorance of these facts has caused the industry to be judged unfairly by the public and the more widely stockholders can make these facts known the better they will be serving their own and the Corporation's interests.

HICKING PENTECOST & CO., LIMITED

The seventh annual general meeting of Hicking Pentecost & Co., Limited, was held on September 17th at the Victoria Station Hotel, Nottingham, Mr Leonard S. Pentecost, the chairman, presiding.

The following are extracts from his circulated statement:

The net profit of the group, before taxation, again shows an increase over the previous year. Taxation also shows an increase, partly owing to the impact of Excess Profits Levy. After meeting this liability the net profit for the year (available for distribution) amounts to £97,858.

Our total turnover for the year constituted a record for the company. Your directors have felt justified in recommending a dividend of 15 per cent which represents a small increase over that paid in 1952 and leaves a satisfactory sum to be ploughed back into the business.

We are continuing our policy of steady expansion and are equipping ourselves with the most modern plant to deal with fabrics manufactured from the various new synthetic yarns. Our plant for dyeing and finishing goods made from nylon has been fully occupied and we are fully prepared for processing fabrics made from the new Terylene yarn when this comes through in larger quantities next year.

Whilst we must be ready to accept growing competition, trading conditions would appear to be more stable than at the same time last year and we feel that we are well equipped to deal in a competitive manner with whatever comes along.

The report and accounts were unanimously adopted.

A COMPETITIVE SUCCESS

The British Match Corporation has achieved its position by being a competitive success and not by restrictive practices. We are proud of our record:

(a) We have built up an industry threatened with extinction by dumping so that, when the war came, there were matches to be had.

(b) We have expanded our British sales from 8½ million gross boxes in 1927 to 13 million in 1952, and this on a static total market.

(c) We have, by manufacture and import, provided a wide range of matches second to none in quality.

(d) We have never created an artificial scarcity.

(e) We leave the trade free to buy where it likes and sell at what price it likes and have no black lists.

(f) We have built up interests in the Commonwealth and abroad, where our trade is twice as large as at home, and from which this country has received, since the war, overseas currency averaging about £300,000 per annum.

(g) We employ over 3,000 persons at good wages, in good conditions and without industrial strife.

APPRECIATION

In conclusion I should like to express to the directors of the operating companies and to all our staff and workpeople, both at home and overseas, sincere appreciation of their loyal and conscientious services throughout the year.

The report and accounts were adopted.

SWEARS & WELLS, LIMITED

IMPROVED TRADING RESULTS

The twenty-sixth ordinary annual general meeting of Swears & Wells, Limited, was held on September 15th in London, Mr Cyril J. Ross, OBE (chairman and joint managing director), presiding.

The following is an extract from his circulated statement to January 31, 1953:

Improved trading results were obtained in the various sections of the company's business. The consolidated profit and loss account shows a profit of £421,034 and compares with last year's figure of £310,370. The directors recommend an ordinary dividend at the rate of 10 per cent for the year, compared with 5 per cent in the previous year.

In retail fur trading, your company continues to hold its leading position. The company's policy of continuing to specialise in the fur trade in branches situated in the principal towns, in conjunction with its production activities, has enabled it to maintain its position as the largest furriers.

The company's fur dressing and dyeing works in a "Development Area" of Wales is now fully established and their product, which is greatly sought after, has been available for the export as well as for the home market. In the company's Fashion Section, which comprises branches in practically every larger town throughout Great Britain, turnover has been maintained. The company's interests in departmental stores continue to prove profitable.

With regard to trading conditions in the current year, there is every reason to anticipate a maintenance of the good results.

The report and accounts were adopted.

NIGERIAN ELECTRICITY SUPPLY CORPORATION

The twenty-fourth annual general meeting of the Nigerian Electricity Supply Corporation, Limited, was held on September 15th in London, Mr George Hemmant, CMG, chairman, presiding.

The following is an extract from the chairman's review:

I have pleasure in reviewing the work and results of the year ended on February 28, 1953, as shown in the directors' report and accounts which have been submitted to you.

The increase from £231,959 to £274,782 in the revenue from power sales was due to a combination of favourable circumstances. The annual dry season was not unduly prolonged, and the additional water impounded at Tenti, where the height of the dam had been raised in the previous year, proved to be sufficient to provide power up to the end of the dry season without any restriction of power consumption. In the two preceding years it was necessary towards the end of the dry season to restrict consumption but such restriction should become unnecessary in any normal year when the second Jekko power station, now approaching completion, is in operation.

HIGHER RATES

During the year under review power rates were raised and the higher rates coincided with a considerably increased demand for power by all consumers. The increase in the revenue from power sales due to these favourable conditions amounted to £43,000 and was made up thus:

The increase in the number of units sold realised £17,000
The increase in the rates for power realised £26,000

The number of units sold rose from 54,830,619 in the previous year to 59,503,037 in the year under review—an increase of 4,672,418 or 8½ per cent. Bulk sales to the Electricity Corporation of Nigeria increased by 20 per cent and have doubled in the last five years. They still represent only 9 per cent of our total power sales.

Operational costs rose by £11,000, of which £9,000 was due to increased expenditure on wages and materials. An additional £10,000 has been provided for depreciation, and the appropriation of £20,000 to plant replacement reserve of last year has been repeated. The usual dividend and bonus are recommended and the balance carried forward will be increased by £16,000.

JEKKO POWER STATION

Turning to the balance sheet it will be noted that fixed assets have risen by £120,067 to £1,326,349. This increase was due primarily to the construction of the new Jekko power station. Work on this construction, which had been interrupted by delay in the delivery of the heavy plant from this country, was resumed at the beginning of the year under review, and good progress has been made without further interruption. Unless the unforeseen happens the station should be in operation in November.

Relations with consumers have been most cordial and their co-operation has been of great value to the board and to our manager and his staff.

The good results in the year under review could not have been obtained without the loyal and efficient services of our manager, Mr H. P. Brace, and his European and African staff in Nigeria, and our thanks are due to them and to our secretary and his staff in London.

The report and accounts were adopted.

CONSOLIDATED SISAL ESTATES OF EAST AFRICA

A SATISFACTORY WORKING PERIOD

The seventeenth annual general meeting of the Consolidated Sisal Estates of East Africa Limited was held on September 15th in London, Major T. E. Baring, OBE, presiding in the absence of the chairman, Mr N. C. S. Bosanquet.

The following are extracts from the chairman's circulated statement:

The profit and loss account and the balance sheet of this company for the year ended March, 1953, disclose the trading results of a full year in which the substantially reduced selling prices of sisal fibre are reflected. Comparing 1952-53 with 1951-52 our sales, averaging £116 per ton, are £60 per ton below the average selling price of the previous year. This means that our total proceeds of sales are less this year by £326,000 in spite of the increase in crop harvested.

After providing for depreciation and taxation the profit for the year is £147,525 and we have a total of £172,688 to deal with. We paid an interim dividend of 7½ per cent in January last costing £9,844. We have placed £90,000 to general reserve, £10,000 to a special reserve for Excess Profits Levy, and we propose a final dividend of 3½ per cent costing £44,687, making 40 per cent for the year, and to carry forward the balance of £18,157.

This last twelve months has been a satisfactory working period as far as the estates are concerned. To begin with we have again had an increase in crop and at 6,961 tons we are over 500 tons in excess of the previous year and slightly better than the estimate which we gave you when we last met. This improvement in production would have given us even better results if climatic conditions and sun scorch had not militated against a high percentage of the higher grade of fibre being turned out.

Taxation again takes an enormous slice of our earnings; a sum of £5,000 in excess of the authorised and issued capital of the company, increased to £265,000 by the necessary provision of an additional reserve for Excess Profits Levy which may overtake us next year.

CAPITAL EXPENDITURE

On capital account we spent £122,000 last year. While that sum is £50,000 less than the capital expenditure in 1951-52, it by no means signals the end of our capital requirements, which continue to demand attention and expenditure. On development we are spending less money this year on opening new land, the bulk of expenditure in that department going towards the upkeep of young areas, but improvements and additions in factories and machinery are a running expenditure which reflect the increase in crops which we now enjoy following the development and rotation methods which we have consistently practised on these estates.

The current year has started reasonably well. Our estimate of 7,800 tons of fibre yield, I hope, be realised. To the end of July, that is four months of our financial year, we have harvested 2,496 tons of fibre.

Our report tells you of the forward sales which have been made. The selling price of No. 1 is holding fairly steady at £90. Our cost of production is slightly down, but it is here that we must concentrate attention with the object of widening the margin between cost and selling price.

The report was adopted.

INTERNATIONAL TEA COMPANY'S STORES

INCREASED TURNOVER

The annual general meeting of The International Tea Company's Stores, Limited, will be held on October 6th in London.

The following are extracts from the annual review of the chairman, Mr Frank Wilson:

A substantial advance in turnover enables me to report a small increase in the group trading profit of approximately £40,000 to £1,735,834. The group net profit, after providing for increased tax liabilities and a larger sum to cover depreciation, is slightly lower at £557,391. We propose to transfer the sum of £200,000 to general reserve, making a total for the group of £244,533, and to transfer the sum of £10,000 to the future staff pensions reserve.

We feel that the improved liquid condition of assets enables us this year to recommend the payment of a final dividend of 11 per cent, making 16 per cent for the year, plus a bonus of 4 per cent on this occasion, making a total distribution of 20 per cent. The bonus is the first increase since the year 1947, a small recognition of the forbearance of our ordinary stockholders, who throughout the period have watched profits being ploughed back into the business.

It must be admitted that during the years since 1947 nearly all sections of the public have enjoyed some increase in income, whether earned or State-provided, and we feel that our recommendation is justified not only from the point of view of recognition previously referred to, but also because so many members of our staff throughout the group have invested a part of their savings in the business. These appropriations enable us to increase the carry-forward on the group profit and loss account by £5,312. Our financial position is sound. I am confident that the actions taken and the recommendations made by the board will meet with the approval of our stockholders.

A SOUND BUSINESS

We are satisfied that the type of business we carry on under the "International" name is sound and more than holding its own in the territory covered by our branches. In the "John, Quality" and "Payantake" sections we are continuing to carry out conversions of existing branches to self-service. Wherever self-service has been introduced we have been successful.

The results of the "George Mason" section are indicating that the steps taken by us in connection with the business are proving successful. Much more must yet be done, and we are looking forward to still greater improvements. Our factories produced increased profits which helped considerably in our final figures. Our transport department has continued to render most excellent service and our fleet of lorries and vans is well maintained.

It is with a sense of great pride that I repeat that all directors, departmental directors and senior executives of the "International" commenced in the business on the lowest rung of the ladder, and gradually they have won promotion to their present positions. I feel it is essential in these times that men in control of large businesses should have knowledge and experience of the job they are called upon to carry out.

I thank all members of our staff, office, warehouse, factory, transport, and especially those at the retail branches who keep our good name so high with our customers, for the hard work they put in at all times.

ALLIED INDUSTRIAL SERVICES, LIMITED

MR W. H. RHODES ON THE CONTINUED PROGRESS

The nineteenth annual general meeting of Allied Industrial Services Limited will be held on October 7th in Bradford.

The following is an extract from the circulated statement by the chairman, Mr W. H. Rhodes, CBE:

During the year the combined output of your various factories and plants has been in excess of any previous year.

The net profit of your company for the year, after providing £326,516 for taxation, amounts to £191,238, to which sum has to be added a further £25,045 in respect of previous years' taxation adjustments. The proposed final dividend of 17½ per cent when aggregated with the interim dividend paid last February will result in an increase of approximately £24,500 net for distribution to the ordinary shareholders.

Last May the authorised capital was increased to £1 million by the creation of 1,200,000 ordinary shares of 5s. each, and at the same time the issued ordinary share capital was brought up to £700,000 by the capitalisation of £235,937 10s. from general reserves.

During the past year capital expenditure on buildings, plant and vehicles amounted to £23,000.

Despite extended holidays in some industries, our July and August output equalled that of the corresponding months in 1952, and in the absence of unforeseen circumstances I am hopeful that the total output will be maintained.

BEAUTILITY FURNITURE

The twenty-second annual general meeting of Beauty Furniture Limited was held on September 14th in London, Mr Herbert E. Down, FCA (the chairman), presiding.

The following are extracts from his circulated review for the year ended March 31, 1953:

Turnover shows a further increase, but net profit, £264,962, is reduced by £31,242, compared with the preceding year. This reduction was foreshadowed in my survey last year, when I referred to the increased wages and to further increased costs of production. Taxation absorbs £159,764, a reduction of £10,910 compared with the preceding year, and includes a provision of £20,000 for excess profits levy. £50,000 has been added to general reserve, compared with £30,000 in the previous year. Total capital and reserves amount to £739,766, which is an increase during the year of £67,354.

During the year we have expended £65,550 on fixed assets, and the charge for depreciation is £42,198, compared with £42,185. During the current year we have again before us a substantial programme of capital expenditure. Current assets at £1,052,503 show a surplus over current liabilities of £600,651, compared with a surplus of £556,819 in the preceding year. It is proposed to pay a final dividend of 25 per cent, making 40 per cent for the year.

During the year the utility scheme of furniture has been replaced by the "D" scheme, under which your company's productions attract Purchase Tax. I am happy to say that this has not affected turnover or our policy of continual improvement in the value offered to customers.

The report was adopted.

WESTERN MINING CORPORATION LIMITED

MR G. LINDESAY CLARK'S REVIEW

The twentieth annual ordinary general meeting of Western Mining Corporation Limited was held on September 10th in Melbourne.

Mr G. Lindesay Clark, BSc, MME (the chairman) presided and said: This company has been testing the areas in Western Australia to the South of the Golden Mile by diamond drilling for a repetition of the Kalgoorlie system, of ore veins. The recently issued annual report and statement of accounts review the information obtained to June, 1953. Four holes have been drilled, and the data obtained so far has confirmed the initial interpretations of the geology of the area.

(The figures quoted are in Australian currency.)

Net profit for the year was £189,255 compared with the £73,906 earned in the previous year. This was mainly due to additional dividends received from Central Norseman Gold Corporation NL from which we received £164,063 compared with £32,812 in 1951-52. Dividends received from Gold Mines of Kalgoorlie (Aust.) Limited amounted to £28,889, compared with £28,867 in 1951-52.

The net profit carried to the credit of appropriation accounts amounted to £189,255. This amount, together with the balance brought forward, £488,876, gave a total to the credit of appropriation accounts of £678,131. Taxation amounted to £4,098 and dividends Nos. 10 and 11 each of 6d. per stock unit, which were paid on August 22, 1952, and February 27, 1953, took £139,718 and left a balance to be carried forward to the credit of appropriation accounts of £534,315. Since the close of the year dividend No. 12, also of 6d. per stock unit, and taking £69,859, has been declared and was paid on August 21, 1953.

In order to pay off the residue of the Western Mining Corporation loan and provide extra working capital, a rights issue at par to shareholders of New Coolgardie Gold Mines NL, on a basis of one share for each five now held, is being made by New Coolgardie Gold Mines NL. Western Mining Corporation is entitled to rights to 106,400 shares from this issue. Arrangements have been completed to sell these rights, which will leave Western Mining Corporation still holding 52 per cent of the shares of New Coolgardie Gold Mines NL.

Additional finance is needed by Great Western Consolidated NL to carry out an expedited development programme. This has been provided on loan by the company's bankers, the loan being guaranteed by Western Mining Corporation Limited. In return for giving this guarantee, Western Mining Corporation Limited is to receive the option to subscribe for 500,000 ten shilling shares at a price of eight shillings each for a period of five years from May 25, 1953. This option supersedes the previous option granted to Western Mining Corporation Limited.

Over the last few years output has been increased and the mines have been mechanised wherever possible. This has offset considerably the inevitable effect of basic wage increases against an almost static gold price.

The chairman then reviewed in detail the mining developments, and continued:

For some time the board has thought that the affairs of the Corporation would be more balanced if it engaged in the mining of other metals in addition to gold. In times of inflation, economic conditions move against gold while other metals tend to be buoyant during such periods. It may be that development of uranium resources would provide a means of putting this policy into effect. The board will accordingly endeavour to acquire a uranium prospect warranting development.

The report was adopted.

KALGOORLIE SOUTHERN GOLD MINES NO LIABILITY

The third annual ordinary general meeting of Kalgoorlie Southern Gold Mines No Liability was held on September 9th, in Melbourne.

Mr G. Lindesay Clark, BSc, MME (the chairman) presided and said: This company has been testing the areas in Western Australia to the South of the Golden Mile by diamond drilling for a repetition of the Kalgoorlie system, of ore veins. The recently issued annual report and statement of accounts review the information obtained to June, 1953. Four holes have been drilled, and the data obtained so far has confirmed the initial interpretations of the geology of the area.

The importance of this prospect, and the encouraging present phase of the investigation, warrant the following summary of the geological interpretation of the data so far assembled.

The Kalgoorlie Syncline, on either side of which the eastern and western Golden Mile lode systems occur, has been located in all drill holes as it pitches southwards beneath Black Flag sediments, and a new fold, the Cavalier Syncline and Anticline, has been revealed by holes SE3 and SE4 to be forming to the west of the Kalgoorlie Syncline. This seems to follow the pattern typical of the whole Kalgoorlie field, and it, as seems likely, the Cavalier folding gains in strength going south, the Cavalier Syncline could be the host of a major ore occurrence.

The main ore bearing areas on the Golden Mile are surrounded by two types of altered rock, first a bleached quartz dolerite greenstone, and then, beyond this, a much more extensive zone of quartz dolerite greenstone. These features would be expected to surround any southern repetition of the Kalgoorlie orebodies, and well-developed faulting should also be present.

The drilling so far carried out has proved that quartz dolerite greenstone, showing some bleaching and a general similarity to the host rock of the Kalgoorlie ore system, lies below the Black Flag sediments in the area drilled. There is therefore every encouragement to continue the testing. Hole SE3 encountered, in the Black Flag sediments, brecciated and bleached material with strong shearing. Some gold has been found in the drill cores, and although nothing of economic value has been cut, it is significant in indicating the presence of gold mineralisation in the country tested.

The discovery of the Cavalier fold means there are three main possibilities: Firstly the first major ore repetition may be in the Kalgoorlie folding; secondly, it may lie further south in the Cavalier fold, or thirdly, a smaller but important ore position may be found in the Kalgoorlie folding, with the prospect of a major repetition occurring further south in the Cavalier Syncline.

Hole SE4 is now being extended to test under the interesting section disclosed by Hole SE3. It is then proposed to make another test of the Kalgoorlie folding further south, starting the drilling far enough west to obtain a preliminary test of the Cavalier Syncline.

The report was adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

GOLD MINES OF KALGOORLIE (AUST.)

ACQUISITION OF PARINGA LEASES

The second annual ordinary general meeting of Gold Mines of Kalgoorlie (Aust.) Limited was held on September 9th in Melbourne.

Mr G. Lindesay Clark, BSc, MME (the chairman), presided and, after paying tribute to the memory of the late chairman, Sir Walter Massy-Greene, in the course of his speech said:

(The figures quoted are in Australian currency.)

The balance to the credit of appropriation accounts at March 31, 1952, was £40,067, which, after crediting net profit of £164,319, made a total of £204,386. Loss on realisation of equipment, £5,639 was debited to this account, together with £96,055 for dividends Nos. 2 and 3 of 9d. and 6d. per stock unit respectively, leaving a balance of £102,692 to be carried forward. A further dividend, No. 4, of 9d. has just been declared, and will be paid on November 6, 1953.

Average working costs at 72.23s. per ton were 6.99s. per ton higher than for 1951-52, and more than offset the additional revenue received from the rise in grade, working profit per ton having declined from 22.82s. in 1951-52 to 20.67s. in the year under review. Gross profit is therefore £15,478 lower at £178,656, and net profit, which was £180,616 in 1951-52, was £164,319 for year just ended.

Gold Producers' Association Limited sold gold relating to the full year's production and actual and estimated receipts from this source are included in the accounts at £42,255, equivalent to 17.3s. per fine ounce of gold produced.

Development for the year totalled 9,142 ft, of which 2,990 ft, or 32.7 per cent of the total footage, was in ore averaging 9.2 dwts over 64 in. These results are reflected in the ore reserves, which were estimated at 579,000 tons, averaging 6.5 dwts per ton, compared with 486,000 tons, averaging 6.3 dwts, at March 25, 1952.

Favourable developments have continued since the close of the year. Of 2,466 ft of development completed, 713 ft, or 29 per cent, was in ore averaging 11.5 dwts over 65 in.

The most important event during the year was the acquisition of the Paringa leases. The orebodies in the Paringa leases can be worked much more economically as part of Gold Mines of Kalgoorlie than they could be by the Paringa Company operating alone. In consequence, we expect that substantial tonnages from known lodes will be profitable for this company to mine. In addition, these leases bring under the control of Gold Mines of Kalgoorlie (Aust.) Limited most of the north-easterly extensions of the productive part of the Kalgoorlie field.

Our geological section has had continuously in hand the analysis of the conditions under which ore occurs in Kalgoorlie. Marked progress has been made over the last year. One of the features which has emerged is that the vicinity of the contact between the quartz dolerite and the calc schist in the Brownhill Syncline, and particularly along the eastern flank, is potentially a larger source of ore than had previously been thought.

In consequence of the added ore potential the output has been increased to 15,000 tons per four-weekly period, which is well within the capacity of the plant.

The report was adopted.

COSSOR, famed as English pioneers in radar and leaders in electronics, found after tests elsewhere that Halifax is the ideal location for their Canadian plant.

So also has another leading English firm, Fairey Aviation, selected Halifax for its Canadian counterpart, and already has close to eight hundred employees busily engaged.

Here are the attractions: low cost sites—versatile labour—ample supplies of cheap power and raw materials—nearest North American mainland port to the markets of the world. If you would like further facts write the Mayor.

MAYOR OF HALIFAX
CITY HALL • HALIFAX, CANADA

Are you

worthy

of

Craven?

SIR JAMES BARRIE in 'My Lady S. Nicotine' said: "When he was at school, Jimmy Moggridge smoked a cane-chair, and he has since said that from cane to ordinary mixtures was not so noticeable as the change from ordinary mixtures to the Arcadia. Were I anxious to prove Jimmy's statement, I would merely give you the only address at which the Arcadia is to be had. But that I will not do. It would be as rash as proposing a man with whom I am unacquainted for my club. You may not be worthy to smoke the Arcadia Mixture"—acknowledged by Sir James to be "no other than Craven Mixture".

Try CRAVEN

Your own appreciation of such rich, cool smoking luxury will prove you worthy of this fine tobacco.

Three deeply satisfying blends

Craven Mixture 4/7 oz.
Craven Empire de luxe Mixture 4/3 oz.
Craven Empire Curly Cut 4/4 oz.

53% of DAILY HERALD homes take no other national daily

The DAILY HERALD is seen every week-day in the homes of 6,750,000 people who are one-third better off today than pre-war (despite the increased cost of living) . . . In more than half these families two or more wage packets are taken home each week . . . and their total combined spendable income exceeds £1,000,000,000 a year.

No other newspaper, or combination of newspapers, appeals directly to all of them, for in the homes of 53% of DAILY HERALD families only one national daily newspaper—the DAILY HERALD—is taken and read.

Copies of QUANTIFICATION—a media-planner's guide to the better use of the DAILY HERALD—and copies of the first of a new series of Commodity Reports on the "Buying Habits and Purchasing Power of DAILY HERALD Readers"—Boot and Shoe Cleaners—will be sent on application. Other reports in this series will deal with Pet Foods, Footwear, Outerwear, Buying by Mail, Holidays, Bicycles and Accessories, Razor Blades, Shaving Soaps and Dentifrice.

Factory walls should be made of daylight. All the evidence goes to show that natural light—and the more the better—has a beneficial effect on workers, and their work. Big windows sensibly placed to transmit the maximum amount of daylight; translucent panels of "INSULIGHT" Hollow Glass Blocks to give light, privacy, and thermal insulation; "INSULIGHT" Double-Glazing Units to let in the light without letting out the warmth—with the help of these you can make daylight pay a dividend. For advice on the best way to use glass in your factory, consult our Technical Sales and Service Department. Supplies are available through the usual trade channels.

What would grandfather say, Mr. Horsefall?

The development of plastics has given industry and the home many useful materials. Polyvinyl chloride is a case in point. Already familiar as curtains and garments and cable coverings, it now provides flexible belting for coal mines which is singularly unaffected by hard wear and tear. In an allied form it is a floor-covering material of exceptional durability. Organic Phosphorus Compounds (for which Albright & Wilson supply the intermediate) are often used as the plasticizers to maintain the flexibility and to make the finished plastic flame-resistant.

LIFE IN ENGLISH—average net paid circulation 250,000—300,000 copies in English, circulating in 120 countries outside North America.

LIFE EN ESPAÑOL—average net paid circulation 200,000—250,000 copies in Spanish, circulating in Central and South America.

These are the INTERNATIONAL EDITIONS of LIFE magazine.

TIME & LIFE BUILDING, NEW BOND STREET, LONDON, W1

Wherever you go in the world, LIFE INTERNATIONAL is the one magazine you are never surprised to see. The consistent, international appeal of its brilliant pictorial journalism has created world-wide reputations for advertisers who once were known only within a limited market. Every fortnight, the English-language edition of LIFE INTERNATIONAL goes to more than 120 countries outside the U.S. and Canada. The new Spanish-language edition circulates in the Republics of Latin America. In every country these editions are read not only by families who can afford the best of the world's products, but by executives and officials responsible for the purchase of capital equipment. In the large, beautifully printed pages of LIFE INTERNATIONAL, these people see advertisements for what they consider the foremost names in the business world. If you want your company or products to be counted among them, go into LIFE INTERNATIONAL Editions. The Advertisement Director will always be pleased to send you further information.

The City's Indian Summer

THE Bank of England strove hard to present last week's change in Bank Rate as a purely technical matter. Technical justifications for it, indeed, are not lacking; they are analysed on later pages. The Bank Rate of 4 per cent has been something of a symbol for some time; it has not been playing its true and traditional role of the price at which the "lender of last resort" will provide money; and the resulting slight dislocation of the structure of money rates has had its inconveniences. Apart from this it is an undeniable fact that a certain strengthening in the gilt-edged market at this time would be convenient to the Treasury and to the Iron and Steel Holding and Realisation Agency—it would be as silly to deny this obvious fact as to assert that it provided the main motive for the change.

It may very well be that market considerations of this kind were all that lay behind last Thursday's decision. But the City and public opinion at large have read much more into it. They have seen it as a deliberate expression of judgment on the economic outlook as a whole. There is no other way of interpreting the sharp reaction of markets. For what is actually changed is very little. Those who borrow money from the Bank of England on commercial bills can now do so at half of one per cent cheaper. But the market is not very often "in the Bank," and when it is, it tends nowadays to offer Treasury bills as security, on which the rate has not been altered. The base of the credit structure has not by this action been perceptibly cheapened or broadened. If, then, markets have risen all round it must have been because everybody thought the Bank was showing the green light. Perhaps the extent of this reaction has taken the Bank by surprise. But there is at least this negative justification for it—that it is difficult to imagine even the most purely technical reduction in Bank Rate being undertaken if the authorities, either in Threadneedle Street or in Great George Street, had been acutely apprehensive about conditions at home or abroad. The command was certainly, at the best, no more than "stand at ease," and nobody should confuse it with the old naval signal "all hands to dance and skylark." But it cannot by any means be twisted into a warning or an alarm.

To be told for once, in the late summer when crises usually blow up, that things are not too bad is very pleasant. There is no call for any blue-nosed warnings against the dangers of complacency. A touch of pride—just a touch—may not be out of place, since there is no doubt that the British national economy is in better balance today than for a long time past. To talk of "balance" does not mean that any of its long-term problems are significantly nearer solution. It means only that there is a fair equilibrium between inflation and deflation at home and between credit and debit in external transactions. But that is something, and it is right to take a little pleasure in it.

There is, however, another reason for looking slightly askance at anything that is taken as a green light. If satisfaction is less of a danger

than at many other times, any relaxation of attention would be peculiarly dangerous at this moment. For if the economic situation is not unsatisfactory, it is also precarious. So many predictions have been made about the impending end of the long postwar boom, and have so consistently been wrong, that even the most congenial pessimists have learned caution. But if one thing is certain it is that the tide will turn one day, and that it will do so without notice. And though there is no convincing evidence that it will turn between now and Christmas, there is even less reason to believe that it could not do so.

The centre of the riddle lies, as usual, in the United States. There has been quite a perceptible change in sentiment there in the past month, in which the behaviour of Wall Street has played its familiar role both as effect and as cause. The sharp fall in the market was caused by an excess of selling orders over buying—that is, by a net balance of scepticism about industrial prospects—and, in its turn, it will deepen the scepticism and put a brake on all those many capital expenditures that are justified only on the assumption of continuing high industrial activity. There are, of course, other factors at work in the American economy, some of them bullish. But almost overnight it has become the majority view that there will be “an adjustment” in the next few months.

Even the majority view does not make it so. The inarticulate and anonymous pressures that determine the shape of the national economy can prove even the best opinion wrong. Outside Wall Street, there are very few positive danger signals flying in America. There are, of course, weaknesses, such as the declining trend of farm incomes, but they are no stronger than many others that have been smoothed away before now by the groundswell of expansion, and several of them, such as the very high level of consumer indebtedness, are dangerous more because they would intensify a

downturn after it had started than because they would help to precipitate it. Only those who are determined to be alarmed can as yet find evidence of anything going seriously wrong in America.

But the picture could change very quickly. It is not wholly irrelevant to recall the timetable of the autumn of 1929. The stock exchange was still rising well into September and at the present date the sky seemed to be much bluer than it does today. The first panic day was not until the last week of October and the first monthly figure for industrial production to show a sizeable drop was that for November, which was not published until well into December. Yet when President Hoover asked Congress early in January to reduce taxes and initiate public works, it was already too late—it would have been too late even if Congress had responded at once. These facts are not recalled because there is any reason to suppose that another 1929 is coming, but simply to make the point that when a change in the economic weather does come, it will come with lightning speed.

How much governments can do in such a situation is considerably more doubtful than the post-Keynesian public has been led to believe. But it is clear that whatever they do will be much more effective if it is done quickly and done whole-heartedly. It is also reasonably clear that when one says “governments,” one means mainly the United States Government, partly because America is so dominant in the world economy, partly because the American Government, almost alone in the world, can act without worrying about its balance of payments. But that is no reason why others should not be vigilant and prepared. This autumn is a time for keeping the watchtowers manned in double shifts and for getting the blueprints out of the pigeon holes. They may not yet be needed. But if they are they will be needed at once. It would be a great pity if the City's Indian summer gave rise to any false feelings of security.

Suaviter in Modo

MR DULLES and Mr Lodge have been trying in the last few days to remove the impression that American policy is rigid and intransigent. This is what America's friends have been asking for, and it should be welcomed. The process began with Mr Dulles's speech to the Assembly of the United Nations last week, which seemed to non-Americans to be much more felicitously phrased than some other of his speeches since he became Secretary of State. That this was no accident was shown on Tuesday of this week, when Mr Cabot Lodge in his turn began to show that there was some elasticity in American policy. He announced that the United States was prepared to send a representative at once to meet the Chinese and North Korean Communists either at San Francisco or at Honolulu or at Geneva and he hinted

that Washington was no longer quite so firmly opposed to the participation of neutrals in the political conference which is supposed (one cannot help being a little sceptical) to assemble in a very few weeks' time to decide the future of Korea. These American steps are not very large, nor very certain—Mr Lodge, when questioned, appeared anxious to reinstate some of the old doubts—but they were so warmly welcomed by America's allies that even the blindest in Washington must have seen how much there was to be gained by a little flexibility.

Mr Dulles's address to the Assembly last week made a pleasant contrast to Mr Vyshinsky's on Monday. For once the apparent roles of the past few weeks had been reversed; it was the Americans who

were giving the impression that they are less inflexible than the world had been led to suppose, and the Russians who had reverted to their old dog-in-the-manger attitude. Impressions may be wrong; but they can be very important. There are many millions in the western world who, having attached their hopes to American leadership, have been worried and sorry that Washington does not appear to be leading them the way they want to go. But the fact is that impressions count for a great deal in the present stage of the cold war and the United States has lost several tricks this summer by the way its words and actions have sometimes been interpreted abroad. A story going the diplomatic rounds has it that, with Mr Eisenhower and Mr Dulles riding together in an automobile, the Secretary of State says to the President: “Don't look now, but I think nobody is following us.”

There have been times in recent months when this story would have been too true to be funny. Yet all the time it has been true that the substance of American policy has been approved by official, and by the bulk of private, thought throughout the western world. If the fundamental questions are asked—is it right to stand up to the Communists?; is it right to be strong?; can peace best be secured by firmness or by making concessions?—public opinion in all, or nearly all, the free countries would give the same answers as in America. Conversely, no European who knows America has ever had any real doubt that on what may be called the MacArthur question—is the aim to smash Soviet Russia or to preserve the peace?—American opinion would, by a large majority, give the same answer as European. Nevertheless, it is difficult to keep the public mind concentrated on fundamentals, and the conductors of American policy have allowed a dangerous degree of estrangement to grow up between their own people and their allies by what has seemed to be the inflexibility of their methods and the belligerence of their words. It is too soon to be sure that they have modified their tactics to heal the breach. But it is very much to be hoped that they have, and the speeches of the past week encourage the hope.

★

As for the substance of what Mr Dulles and Mr Vyshinsky said, the American Secretary of State approached his general survey with two clear attempts to go further towards meeting the Soviet point of view than he has in the past. First, he insisted that the United States is “prepared to explore ways to end the present tension. We shall . . . never grow weary or discouraged in our quest for peace.” The bid for a meeting with the Chinese and North Koreans is now some proof of that. It is understood that during his recent trip to Denver Mr Dulles went over his speech very carefully with the President, and it is notable that this was the first concerted call to the Russians to prove their desire for peace since President Eisenhower's own major policy statement of April 16th. Secondly, there

was a marked change of tone in what the Secretary of State had to say about the peoples of eastern Europe. No longer was there any reference to “liberation” or to “striking off the shackles.” Instead Mr Dulles contrasted American policy with Russia's own. “Our creed does not,” he declared, “call for exporting revolution and inciting others to violence.” It is not so clear, and perhaps he did not mean or feel able to make it so clear, just what American policy towards the peoples of eastern Europe was, beyond the view that they must themselves be allowed to feel that they can “live by their traditions and their faith.” In both these approaches, however, official American policy has patently moved towards a readier acceptance of the principle that relations with the Communist bloc can be adjusted without war. And that is a gain to the whole free world.

Mr Dulles also briefly surveyed the problems of South-East Asia and Germany. In both matters, he again appealed to the Russians to turn their words into deeds; and in both he was subsequently brushed aside when Mr Vyshinsky addressed the Assembly. It is true that no negotiations with the Communist world can be conducted by demanding unilateral concessions. But the point which Mr Dulles may fairly claim to have made was that, having promised American readiness to seek a compromise, he was inviting the Russians at least to name their terms. This may not be the best way of going about a general settlement but it is at least a way of trying to open talks on specific problems. And experience in dealing with the Russians certainly emphasises the normal lesson of oriental bargaining that it is no use giving anything away before you begin.

Speaking about Indo-China, Mr Dulles flatly challenged the Communists' pretext that their action was designed to promote independence rather than to expand the Soviet camp by violence. In this, he was justified in so far as the French, on the one hand, announced on July 3rd their definite intention of completing the transfer of power—negotiations only need to be conducted on the ways and means—and, on the other hand, the Communist armies have no shadow of a claim to be regarded as the champions of an independence movement. They are supplied and victualled from China, and no one supposes that the Viet Minh could do anything but collapse if this help were withdrawn. It was fair therefore to say that “South-East Asia affords the Soviet leaders a chance to give substance to their peaceful words (and) we anxiously await their verdict.”

When he came to Germany, Mr Dulles again seemed more concerned to appeal to Russian reason than to breathe defiance. If what the Russians fear is a rearmed Germany, the same is true of Germany's western neighbours; that is why the European Defence Community was invented. Under it, no single member of the community will have national military strength to serve national ambitions, and “that is a result which the Soviet leaders should welcome if they honestly want peace.” Mr Dulles might have added, moreover,

that an alliance is an unwieldy weapon when it comes to aggression, and that history can produce few examples of alliances which have worked satisfactorily for anything except defensive purposes.

The reminder to the Russians that they have still to reply to the invitation to a meeting at Lugano on Germany met with no response when Mr Vyshinsky came to speak. Indeed, his return to all the traditional Russian arguments about disarmament and the control of atomic energy was notable for the omission of his traditional remarks about the desirability of a great power meeting. This has always been wrapped up in general terms in his addresses to the United Nations General Assembly. This year, when it could have been an appropriate move in the play of diplomacy—which

now includes proposals for a vital Far Eastern peace conference as well as a meeting on German unity—Mr Vyshinsky said nothing.

It will take more than one or two speeches to pull the public opinion of the western world back on to its proper course. But at least the past week's batch of speeches have been helpful. Mr Vyshinsky's has been no less helpful than the others, for though it is disappointing to have the last hopes of a new course in Moscow so vigorously slapped down, it will at least serve the cause of realism. And if Mr Dulles has really made up his mind to remember that the whole world is listening when he speaks, and not only a handful of Republican Senators, there will be a return to realism also in the world's judgment of American policy.

Sentence of Death

AFTER over four years of deliberation, the Royal Commission on Capital Punishment has produced its report. So long indeed is it since the commission was appointed that it is worth recalling its terms of reference. The question of whether the death penalty for murder should be abolished altogether was precluded from its consideration. Instead, it had to decide whether the use of the penalty should be limited or modified. It also had to consider ancillary issues: for instance, the method of execution and the practical effects on the prison system of sending more murderers to imprisonment.

It is remarkable that on most issues the members of the commission are unanimous. The only point on which there is a notable divergence of opinion is the age-limit for liability to the death penalty: six members recommend that it should be raised to 21, the other five preferring it to remain at 18. But all agree that women should not be exempted from the death penalty; that the gas chamber or electrocution has no advantage over hanging—though the possibility of lethal injections should be reconsidered when the science of anaesthetics has progressed farther; and that the prison system should be able to absorb any increase in the number of murderers sentenced to long terms of imprisonment as a result of fewer executions.

It is, however, the commission's findings on the major issues that have been most eagerly awaited. At the time of the great controversy over capital punishment in 1948, it became clear that many people favoured the retention of the death penalty in certain cases of murder—for instance, murder to escape arrest—but felt strongly that it should not be imposed in cases where it would not be carried out. In England and Wales, 45 per cent of those sentenced to death are reprieved by the Home Secretary. In these cases, the pronouncing of the death sentence is a farce, and the disposal of the convicted is in the hands of

the executive instead of the court. The royal prerogative of mercy would be used less frequently if the imposition of the death penalty were made less rigid.

The murderers for whom a modification of the death penalty is thought, on this argument, to be desirable fall into two broad classes: the "insane" and those whose crimes have extenuating circumstances. This second class has many sub-divisions. Sometimes the court is able to find that the accused is guilty of manslaughter, instead of murder; and by recommending that the definition of provocation should be widened to include provocation by words the Royal Commission is helping a court to bring in the lesser verdict more often. On the other hand, it proposes no change in the law by which an accomplice can be found guilty of murder if his companion is found guilty.

The first big question that the commission had to decide was the practice relating to murderers whose sanity is in doubt. For a hundred and ten years the M'Naghten Rules—that is, the rules propounded by certain judges after M'Naghten had murdered Sir Robert Peel's secretary in mistake for Peel himself—have laid down the criteria for a defence of insanity to be established. The accused, so the essential rule runs, must be suffering from such defect of reason due to disease of the mind (a) that he did not know the nature and quality of his act, or (b) that if he did, he did not know it was wrong.

It has been said that if the M'Naghten Rules were strictly interpreted, M'Naghten himself would not come within them. They have, on the whole, worked well in practice because the judges have usually interpreted them liberally and brought within their scope many murderers who were certainly mad but certainly knew what they were doing and knew that it was wrong. But they have not always been interpreted liberally or realistically. Last year's trial of Straffen was an instance where, because of a rigid interpretation of the

rules, a jury found criminally responsible for his actions a man who had been found unfit to plead to a similar charge seven months previously.

The Royal Commission had to consider whether the rules should be modified, in the light of greater knowledge of mental illness, or be abolished. If they are retained, it recommends that they should be modified as follows: first, the words "or mental deficiency" should be added after "disease of the mind" in order to make it quite clear that mental defectives come within the scope of the rules; and secondly, a person may be found irresponsible for his act if, as a result of disease of the mind or mental deficiency, he was "incapable of preventing himself from committing it," even though he knew what he was doing and knew it was wrong.

The commission discusses whether this new criterion, which it prefers to the narrow and largely discredited concept of "irresistible impulse," would cover many cases at present outside the M'Naghten Rules. It comes to the conclusion, with one dissentient, that the new rule would serve a purpose provided it is interpreted widely. On a narrow interpretation it would merely cover murders committed in a state of, say, epileptic automatism or frenzy. In other cases, the prosecution could still maintain—and judge and jury could agree—that the accused would not have committed the act if a policeman had been standing beside him; that, therefore, he was not incapable of preventing himself from committing it.

★

Because of this difficulty of framing a formula a majority of the commission would prefer to abrogate the rules altogether. These members agree that the purpose of the rules is to help the jury to decide the issue of insanity and irresponsibility as a question of fact. But they argue with great weight that this theory has broken down in practice; it is not the law or "fact" that prevails in most instances, but common sense. They agree with the view that although the jury are solemnly charged about the implications of the M'Naghten Rules, they simply ask themselves: "Is this man mad or not?"

With three dissentients, the commission recommends, therefore, that the jury should be left to determine, as a straight issue, whether a person is mad enough or mentally defective enough to be held irresponsible for his act. The judge could then bring to their attention, as he was free to do before 1843, all the evidence that might help them to come to a decision; he would not have to direct them to concentrate on points specified in a formula. Furthermore, although the commission agrees that prosecution and defence should continue to call their own expert witnesses, there would be less conflict of evidence to bemuse the jury than arises now when psychiatric evidence has to be distorted to fit the M'Naghten Rules.

Of all those committed for trial for murder in the first half of this century, 45 per cent have been deemed

mentally abnormal, either before or after trial or by a jury, and have not been executed. But there remains another large class not deemed abnormal but for whom the death sentence is considered, even by those in favour of retaining it, inappropriate. (An extreme class are the so-called "mercy killers.") After exhaustive inquiries and in spite of its determination to "discover some effective method of classifying murders so as to confine the death penalty to the more heinous," the commission came unanimously to the conclusion that its quest must be abandoned.

This, however, is not its last word. It did not relax its determination to reduce the rigidity of the present law and to remove from the executive much of the task of correcting the anomalies arising from the rigidity. If the death sentence is retained and yet is not to be—as all are agreed it should not be—imposed in cases where it is inappropriate, and if murders cannot be classified, then there is only one answer: either the judge or the jury must have an unfettered discretion whether the death sentence should be imposed or not. The commission argues strongly that the discretion should not rest with the judge, mainly because of the onerous responsibility it would place on him. Equally strongly, therefore, it argues that the discretion should rest with the jury.

The commission fully recognises that its proposal is, for this country, a novel one. What it amounts to is that when the jury convict anyone of murder, they should be asked to find whether there are extenuating circumstances, and such a finding would preclude the judge from passing sentence of death. A murder trial would consequently fall into two parts: the first being concerned with guilt or innocence, the second with extenuating circumstances. In the second part the jury would have an unfettered discretion; in particular, it should give due weight to the condition "psychopathic personality," which, the commission decides, ought not at present to exempt a person—as insanity does—from criminal responsibility.

★

This proposal is the core of the commission's recommendations. Nor does the report mince words about it. Since the proposal would change the traditional function of the jury and has practical difficulties, "its disadvantages may be thought to outweigh its merits." In that case, the commission concludes,

a stage has been reached where little more can be done effectively to limit the liability to suffer the death penalty, and . . . the real issue is now whether capital punishment should be retained or abolished.

This is indeed the real issue. The commission's proposal would place on ordinary men and women, subject to ordinary emotions and influenced by the state of public opinion, the grave duty of deciding whether circumstances justify a lesser sentence than death. This would surely lead to serious anomalies. The difference

in the circumstances of the crimes of a reprieved murderer and an executed murderer may be barely perceptible; yet the distinction in their treatment is absolute, and to leave it to the jury would make it erratic and inconsistent as well.

Is it thus worth adopting the proposal, with all its disadvantages, when by the abolition of capital punishment it would be made unnecessary? The only real argument for retaining capital punishment is that it acts as a deterrent. But the commission, after examining the evidence, does not find more than a *prima facie* case that it exercises a stronger deterrent effect than other forms of punishment on normal human beings, while on many offenders its effect is negligible.

Rouble Diplomacy?

SOME observers like to detect the Soviet rulers, from time to time, moving belatedly through steps already trodden by the western world; to see Malenkov, for example, discovering how delicately tortuous Persian politics can be, or enunciating the principle that the consumer is always right. Yet there has been little public comment upon the interesting fact that, while in the west the cry now is "trade, not aid," the Communist empire appears to have launched out on a course that might be described as rouble diplomacy. Since Stalin died, his successors in the Kremlin have publicly promised substantial amounts of economic aid to China and North Korea; they have pledged a smaller but significant sum to the United Nations programme for technical aid to backward countries; and they have offered credits not only to Eastern Germany but also to a non-Communist country, Argentina. These actions are not entirely without precedent. The Sino-Soviet treaty of 1950 included, at least in theory, a Russian credit to China of \$300 million. But never before has there been such an apparently widespread distribution of Soviet largesse.

To what extent can this be interpreted as the opening of a new phase in Russia's dealings with its satellites, friends and trading partners? There has, naturally, been an individual motive for each individual action; and before the picture can be judged as a whole, its parts call for some further examination. For example, the concessions granted to Eastern Germany in August were not merely timed to affect the elections in the west; they were needed to prevent the economy of the Soviet zone from foundering altogether under the burdens still laid upon it by its masters in Moscow. The two-year interest-bearing credit of 485 million roubles (nominally, about £44 million) was only a minor item in the list, alongside far more welcome ones such as the cancelling of outstanding reparations and the handing back of some of the industrial plants operated by Russia since 1945. The concessions as

There is a further point. Much of the morbid interest taken by the public in murder trials arises from the fact that the accused is on trial for his life. Nor would this interest be in any way diminished by the commission's recommendations for giving more discretion to the jury. Throughout the trial, the issue to the public would still be: not, is the accused guilty?; but, will he be hanged? For all the long labours of the Royal Commission and its earnest desire to provide a solution within its terms of reference, its report can lead to only one conclusion: capital punishment should be abolished, and all the anomalies—and perhaps injustices—that the commission is trying to prevent will disappear as well.

a whole were essentially a matter of scaling down Soviet demands, not of extending positive aid; and the fact that a credit was included at all may be attributed simply to the urgent necessity that the Communist rulers of Eastern Germany should be enabled to buy enough food and other essentials to stave off complete disaster.

Moscow's undertakings towards China and North Korea, however, are of a very different character. True, the offer of a billion roubles' worth of aid (nominally, some £90 million) to Kim Il Sung's regime was a logically necessary, if inadequate, riposte to American and United Nations plans to finance the reconstruction of South Korea; there is some parallel here with the East German situation. But the granting of aid to a proven ally is a more positive action than the reduction of claims on a defeated enemy—although both concepts are comparatively novel in Moscow. The evolution of Russian aid to China is even more interesting. The five-year credit granted in February, 1950, to enable China to buy Soviet railway and industrial equipment evidently revealed its inadequacy very quickly, and the Chinese Communists soon grasped the fact that they were not only having to do all the fighting in Korea for the Russians, but were also paying them handsomely for ammunition and aircraft. Having failed to get satisfaction by more discreet methods, Chou En-lai himself descended upon Moscow in August, 1952, with an impressive entourage of army, air and naval commanders, and ministers responsible for machinery, fuel and other industries. But even the Chinese prime minister could get little from Stalin except honeyed words and a meaninglessly vague agreement. Chou went home, but he left his expert advisers behind in Moscow to continue the haggling; and Stalin was barely cold on his catafalque before this eight-month effort bore fruit. With almost indecent haste, Malenkov and Beria agreed before the end of March that, instead of merely supporting China's industrialisation plans by lending the services of experts, they would also provide equipment

for electrification and the mining, machinery, and chemical industries. It was made clear, however, that China must pay for this with increased exports of food, minerals and wool.

Some at least of this promised Soviet equipment was actually delivered during the summer. But the hard bargaining in Moscow continued. Last week, a meeting of the Chinese government council heard a report from its delegation to these negotiations, and adopted a resolution of fulsome gratitude to the Soviet government, which has now agreed to help with the renovation or construction of 141 Chinese industrial plants and enterprises on which work is already in hand or will be undertaken within the next six years. The tone of the Chinese statements suggests that, for the first time, they are now satisfied—at least for the time being.

It may be assumed that Malenkov is also satisfied, for he has, in effect, bought North Korea back from the Chinese, who in the past three years had come to dominate it by virtue simply of military occupation. Mao Tse-tung, of course, cannot afford to reconstruct North Korea himself; a Chinese contribution to this task has indeed been announced, but in terms so vague as to imply that it will amount to little more than the employment of the luckless "people's volunteers" on earth-shifting work. (A nation-wide levy for Korean relief has drawn only £2½ million from Chinese pockets, which yielded much more for the earlier "unofficial" appeal for funds with which to buy MIGs and ammunition.) The way is therefore clear for the Russian technicians who, in Malenkov's promise to Kim, are featured much more prominently than material supplies, to restore the original Soviet hegemony in North Korea. Any doubts the Chinese may have about the matter will be tempered by their own dependence on Russian aid.

★

That is how rouble diplomacy works within the Communist sphere. Outside the sphere, it has hitherto been confined to the granting of a modest credit of under £11 million to Argentina, and the offer of four million roubles (£357,000) to the UN technical aid programme. Nobody has yet seen the colour of this money, although both offers were announced in July. The Argentines expect to receive Russian industrial equipment against delayed payment; Uno does not yet know whether any of the Soviet contribution will be paid over in dollars, sterling or some other internationally used currency, or whether it will amount only to providing the services of technicians from Communist countries. But one of the interesting features of this experiment will be the light it may shed on the real value of the rouble. In dealings between Communist governments, prices can be adjusted so arbitrarily that it is impossible to tell the true value of the Russian aid promised, for example, to North Korea. But it will be something of a blow to rouble diplomacy if whatever Russia eventually delivers to Uno falls far below what could be expected

if the nominal exchange value of the rouble were a realistic one.

On the available evidence, there is still nothing very impressive about the total amount of "Malenkov aid" both inside and outside the Communist sphere. (No comprehensive figure for Russian aid to China has been announced at all since 1950.) The scale of the whole operation is puny when compared with American achievement in this field. But it is a striking new departure, for it has long been Soviet policy to ignore even the most anguished appeals for help from satellites or potential friends in economic difficulties, sending only reminders that a good Marxist must learn to paddle his own canoe. The more conservative minds in Moscow may well be uneasy at the sight of Malenkov unlocking the treasure chests on which Stalin sat for so long, while the gold accumulated under his mercantilist posterior. However small the real sums involved, they will not make it any easier for Malenkov to carry out the sweeping promises he has now made to his own people.

Nevertheless, rouble diplomacy may have come to stay, if only for the reason that the new rulers of Russia cannot do without it. It must always be remembered that Malenkov is not Stalin. Lacking his predecessor's unquestioned authority, he must conciliate not only various groups inside Russia, but also others outside, and particularly the Chinese. In one sense, it is fortunate for him that nearly every country in the Communist sphere desperately needs economic help, for this makes rouble diplomacy a more effective weapon. On the other hand, the role of fairy godmother, once adopted, is not easy to relinquish, as America and Britain have found in their time; and it may be that Malenkov's troubles are only just beginning. Economic aid for China is a good investment, but it will not pay off for a long time, and meanwhile Peking may develop a frightening capacity for absorbing Russian resources. Moreover, now that the Soviet cornucopia has been officially unsealed, how long will it be before other aspiring recipients join the expectant queue? The Poles and Czechs will undoubtedly drop pointed hints about any favouritism shown to the East Germans, all the more because they are being required to contribute, through the Comecon, to the refloating of Pieck and Ulbricht. And the Asian countries before whose eyes Moscow had previously dangled visions of plentiful capital equipment may ask what Perón has done to deserve superpriority.

Moreover, unless ingratitude is altogether lacking from Marxist minds, the time may come when Communist leaders who have long denounced American aid, because they see strings attached to it, will begin to compare the lightness of those strings with the chains that trail from Malenkov's roubles. Ulbricht and Kim Il Sung have already given the world some inkling of the weight of these chains. Soviet Russia has long enjoyed the benefits of leadership in the "camp of peace and democracy." Now, perhaps, it may have to begin to take account of the price of leadership too.

The Clothing Check Trade

LAST week an article on credit facilities in the drapery trade suggested that not nearly enough was known about the methods by which the cheaper sorts of drapery are sold to working-class households. Apart from the trade's own methods of extending credit, the system known as check trading, carried on purely as a form of money lending, does a business that cannot well be less than £40 million a year, and may easily be twice as big. This trade is concentrated largely in the industrial Midlands and North, and almost wholly in working-class consumption. It is certainly more important and influential than the lack of publicity would suggest. One obvious example of its influence is provided by the large number of shops that have established clothing clubs of their own, employing agents to issue checks in the same way as the check traders themselves; even the Co-operatives have abandoned their traditional cash basis and formed Mutuality Clubs to do the same.

Check trading is carried on almost entirely by private persons or private companies using their own capital. When occasionally it is mentioned in the press, it is usually because of some abuse incidental to its widespread operations among the poorer sections of the community. "Trafficking" in checks—that is, selling them for ready cash at something less than their face value, instead of using them for their legitimate purpose to buy goods—was made illegal in 1948; it may still go on, for it is a tempting way to raise money in a hurry, to draw a £10 check from an agent and offer it to a neighbour for £9 cash. Some big stores which accept checks insist that the customer exchange her check for metal tallies marked with the shop's name and use these to make her purchases; needless to say the tallies, being even more anonymous than checks, find a ready market at a sharp discount. There is also the classic story of the woman who was fined 10s. by a magistrate for some trivial offence, and having only 4s. in hand was faced with a night in prison; she avoided this by obtaining a £2 check with her 4s. (2s. first instalment and 2s. poundage) and using it to buy blankets, which she promptly pawned for 14s., thus paying her fine and retaining her original 4s. This is not as unlikely as it seems, since next week's troubles are a long way off for many households; the story, in fact, expresses a recklessness by no means uncommon in people who budget from one week's pay packet to the next.

This sort of abuse is hard to prevent in any system of lending money; the check traders themselves cannot be held responsible for all the unreasonableness of human nature. They try for their own sakes to ensure that their customers' credit is good; they prosecute illegal "trafficking" when they can; and whatever opportunities the fringes of such a trade may seem to

offer for unscrupulous practices, the vast majority of check trading firms are impeccably honest businesses giving a straightforward service for a reasonable return. Their satisfied customers are, indeed, their warmest advocates.

★

Another objection to check trading is voiced by the spokesmen of the drapery trade, who naturally regret that outsiders should make an indirect profit out of drapery sales. They point out that the check traders' discounts are a severe cut out of the profit on sales to check customers. Drapers' retail profit margins vary widely; they may be anything from 22½ per cent to 35 per cent in different shops or on different classes of goods. But if 27½ per cent (or 5s. 6d. in the £) on returns is taken as a good working average, then as discounts stand at present, the check company gets 3s. 6d. (2s. 6d. discount and 1s. "poundage") for every £1 worth of goods sold on checks, and the shopkeepers 3s. (plus perhaps 4½d. for the wholesalers' discount to him).

Why do shops agree to accept checks on these terms? At first, they do so in the belief that check sales will represent a net addition to their existing cash trade, and so help to pay for their overheads even if the rate of profit on check custom is small. It is invariably a condition of such an arrangement that check customers must not be charged higher prices than cash customers, and this is fairly strictly enforced, but it is hard to believe that shops with a large check custom can satisfy this rule and survive without raising their prices to all customers. The "desirable" proportion of check to cash sales is said to be 40 per cent check custom; but, once accepted, it may not be easy to keep at that level. Moreover, if a retailer can spare 12½ per cent discount on even one-third of his turnover it is reasonable to think either that his prices have been raised on that account, or that retail margins generally are too generous. And discount rates are rising again; before the war they were as much as 17½ per cent.

While it is impossible to measure the effect of check trading on price levels, in those regions where it is firmly entrenched, the effect must be considerable. The argument that strictly cash shops provide an effective competition is not as sound as it looks. The working-class mother of a family is often convinced that no one can teach her anything about value for money in clothing. But any manufacturer knows that within fairly wide limits no layman—and few tradesmen—can judge whether the garment a few shillings dearer than the next represents a bad bargain or better workmanship. Moreover, where check trading is prevalent its influence is likely to be felt in all the shops in the district selling

a certain class of goods, with the exception of a few chain stores.

The argument that wins over the individual shopkeeper—that by accepting checks he will increase his turnover—loses its force when applied to a whole town or district. Check trading might increase the total local consumption of drapery by a little, but not sufficiently to pay for its cost; obviously as soon as check trading in any town becomes at all widespread, shopkeepers no longer accept checks as a favour, a welcome addition to their normal business, but as a necessary self defence.

The drapery trades' answer to the success of check trading has been to copy it on a fairly wide scale. Indeed, shops have occasionally bought up check companies and continued to operate them as independent businesses, and check companies have sometimes opened stores of their own as a sideline. In such cases the distinction between shop clubs and check trading becomes hard to draw. But the social and economic effects are the same, whoever's capital is employed. The issue of clothing checks—as distinct from "straight credit" to known customers, or "credit-trading" as a form of door-to-door retailing—is undoubtedly an expensive form of consumer finance. Its advantages have to be paid for whoever operates the service.

★

Two questions therefore arise. Does the clothing check, expendable at a variety of stores, constitute a service to the public that is socially desirable or undesirable? And if desirable, who should pay for it? As regards the service itself, it is easy to be misled by the many "hard cases" familiar to social workers dealing with families in trouble. An institution should not be condemned because the weaker brethren stumble in operating it. If check trading were suppressed by law, the people who today commit themselves, with several different clothing clubs, to payments far beyond their means would tomorrow be paying the street money-lender "a penny in the shilling a week" to borrow money. No legislation can protect fools and there are good reasons why it should not try to do so.

The usefulness of consumer credit applies to all items of expenditure that are large in relation to income, and this is almost as true of clothes in large working-class families as of houses for bank clerks. It is not, admittedly, the most needy who are granted check facilities; people in real poverty are not credit-worthy. But many working-class families with incomes of £6 or £8 a week and several children would never save enough money to be as well dressed as they are if they did not commit themselves to regular weekly payments, with the obligation that arises from having the article and the fear of being blacklisted if they default.

But if the service provided by clothing checks is itself a good thing, is it a good system that disguises from the consumer the true cost of providing the service? In effect that cost is spread evenly over cash and credit customer alike, through the retailer's dis-

count to the check company. Should the cost of check trading not fall where it belongs—that is, on the price the check customer pays for his check? Why should he borrow £1 for five months for as little as a shilling, when the check company pays its agent 1s 6d to lend that pound to him—not counting the other expenses involved?

If it charged the customer the economic price for his check in the first place, the check company would not need a large discount from the shopkeeper; general price levels would not be inflated by the presence of check trading; and the cash customer would not have to pay for the check customer's privileges. And without the illusion of near-free credit, the habit of real thrift would receive a healthy stimulation in many families.

Check companies, however, are competitive businesses. It would be unreasonable to expect them of their own accord to shift the onus of their tariffs in a way that would reduce the volume of their business. Individuals—consumers, shopkeepers or check companies—are powerless alone. Only more public knowledge, leading perhaps to legislation governing the way credit is charged for (not to an attempt to prevent it), could alter the trend.

(Concluded)

The Cloud in the East

Europe has now been lying under sentence of war for six months—respite from time to time, but still left for execution; and this moment the hopes of ultimate escape from that last calamity seem more faint and wavering than ever. The two armies of Russia and Turkey lie opposite one another each anxious for the strife . . . and any ambitious commander or any rash and reckless subaltern may fire the signal for a struggle the extent, the issue, and the duration of which neither diplomatist nor sovereign can foresee. . . . No one will accuse us of having ever shown ourselves insensible to the evils of war. . . . As vigilant guardians of the commercial interests of a great country, our tendency and disposition must naturally be to regard all interruptions of universal amity with even an exaggerated alarm and dislike, and to purchase the continuance of peace at too high a price. But we must not forget that a precarious and ill-conceived peace—the uncertainty that must ever attend arrangements which, being unjust in their nature and reluctantly submitted to, can never be otherwise than temporary—is almost as fatal and discouraging to commerce as actual hostilities. If . . . a hollow peace be patched up between the disputants on terms which will leave in the breast of one party all the rankling irritation of defeat and injustice, and in the breast of the other all the longings of unsatisfied and checked ambition—that sense of security so essential to commercial operations will be as effectually destroyed as if a war had actually broken out. . . . What we need, it cannot be too often repeated, is not a formal and temporary reconciliation, but a permanent settlement of an ever-recurring difficulty—a final solution, once for all, of a problem that has kept Europe in hot water for half a century. To avoid war—considering what war is—is worth every exertion and almost every sacrifice: to postpone war, may often be worth no effort or sacrifice at all.

Notes of the Week

The Margate Contest

THE Labour party assembles at Margate this weekend for its annual conference in a somewhat less virulent mood than when it gathered at Morecambe a year ago. The Morecambe conference had been preceded by six weeks of bitter accusations that Mr Bevan and his friends were running a "party within a party"—a charge for which the Bevanites themselves provided the most substantial evidence when their list of six candidates, reaping the reward of a concentrated vote, swept all before them in the contest for the constituency seats on the national executive committee. No party, of Left or Right, could tolerate the existence of an organised group of this character within its ranks, and counter-attack was inevitable. Its vehemence was increased by the defeat, in these constituency elections, of Mr Herbert Morrison, the most important of the right-wing leaders. All this injected into the Morecambe debates an element of personal strife, with the delegates feeling that what was at stake was no less than the future leadership of the party.

During the past twelve months this dispute has faded, even if it has not been settled; it has certainly gone against Mr Bevan. At Westminster in November the parliamentary party rapidly forced the Bevanite group to disband, defeated Mr Bevan's bid against Mr Morrison for the deputy leadership, and placed Mr Bevan in the humiliating position of just scraping on to the party's parliamentary committee. Since then Mr Bevan has become less conspicuous while Mr Morrison has steadily rebuilt his prestige—assisted by the leaders of the big unions, who have made it clear that he is now their choice for the succession to party leadership. All this takes much of the sting out of the proceedings at Margate. It is now clear that even if the Bevanites were to win all seven constituency places on the national executive (which is unlikely), they would still be a very long way from gaining access to real power in the party.

There will, nevertheless, be a personal contest between Mr Morrison and Mr Arthur Greenwood for the party treasurership. The executive has decided to support Mr Morrison's return to it automatically, in his capacity as deputy-leader of the parliamentary party, but neither this nor other last-minute efforts to avoid the open contest seem likely to succeed. Mr Greenwood commands much support beside that of the Bevanites; the National Union of Railwaymen this week decided by a narrow majority of its executive to give him its 317,000 votes. This leaves little doubt that the election will be a close-run thing.

For the greater part of the week, however, the conference should be able to set its mind to policy matters. On foreign affairs, if Mr Attlee's broadcast last weekend is any guide, much loose anti-Americanism will be voiced. Fortunately some forthright younger politicians seem to retain their

sense of realism, and the arguments will not go all one way. On domestic policy, the debates will not move far from familiar ground, and particularly the degree of future nationalisation. It seems probable that the platform will be able to defeat all the left-wing attacks on the draft party programme, which is close enough to the go-slow attitude of the main unions to ensure their loyalty. Education at least should provide a more free-ranging debate, but it is by no means certain that in any respect the conference will provide firm evidence of which way the party is really going.

Final Talks in Egypt?

BRITAIN and Egypt are now so close to agreement on the Canal Zone base that the folly of failure seems inconceivable. Perhaps it was this that led an Egyptian spokesman to tell some pressmen on Tuesday evening that they could expect a settlement very soon. This is by no means certain and, in fact, the negotiators met again on Wednesday night with the Egyptian side still worried about how long Britain thought it necessary for British technicians to help the Egyptian army in the base. The range of difference is so slight that it should be capable of adjustment, but the evil genius that has haunted Anglo-Egyptian relations since the war precludes certainty until an agreement is signed.

Over the dinner table, during the last few weeks, the negotiators in Cairo have done much to restore mutual confidence, and from this have been able to yield gently to each other. The basis of the settlement has been there ever since May, when the Egyptian side agreed to the retention of British technicians and accepted the regional importance of the base. Britain, for its part, agreed to evacuate if a reasonably practical plan of base maintenance were devised. Since then, the problem has been to make evacuation and maintenance mean the same thing to each side, and the delegations have gone far towards doing so.

Apart from the period during which British technicians would remain in the base, there is still some disagreement about the circumstances in which Egypt would consider it necessary for British troops to re-enter the base, but much progress has been made towards defining the region of vulnerability. Clearly Egypt, sheltered by desert and sea, cannot make its frontiers the test of immediate danger. There is, however, every reason to think that Britain and Egypt will be able to define what constitutes an adequate reason for reactivating the base, and who will decide when.

As ever in Egyptian diplomacy, the internal situation is vital to the ultimate result. The present military leaders are not dictators at heart and are worried about the decline of their popular support. It is a matter for the British

Government to bear carefully in mind that the little extra required could be the straw that breaks the camel's back.

There is little reason to doubt that some of the older politicians have tried to exploit the weakened internal position of the regime. How far this has justified the recent arrests of politicians is difficult to judge, but the arrests constitute a dictatorial act which cements the army's power at a crucial moment in Anglo-Egyptian relations. They also suggest that the present army leadership has the courage to go forward to a settlement. But how much further?

The British have conceded the main point: the withdrawal of those troops that maintain Britain's power physically in Egypt. If any agreement is going to work it will be because Britain has secured Egyptian goodwill. At present the base is working at less than 50 per cent efficiency, despite the fact that there are 50,000 troops protecting the 30,000 who maintain it. It is unlikely to be more efficient under the Egyptian army, but if the political atmosphere is good Britain may be able to be more helpful than the agreement stipulates. It is against this fact that the last details of disagreement should be measured.

New Stage in Indo-China

THE rains are nearly over in Indo-China, but the uncertainties remain as puzzling as ever. How strong will the Viet Minh offensive be, and where will it be directed—against the Red River delta, or down into Laos again, or both? How effective has General Navarre been in his out-of-season raids against Viet Minh supplies, and can he take the offensive himself? What are the chances of a negotiated peace? How much independence have the French really handed over or promised to hand over? Can the approach to full independence now undermine the Communist appeal? How soon can the Vietnamese national army take over enough responsibility to enable the withdrawal of French troops to begin? To this long series of critical questions there are still no generally acknowledged answers.

Over the past few weeks, the Viet Minh have been massing troops in the delta area; intelligence reports suggest that these now amount to five divisions. At the same time, on the French and Vietnamese side, the American promise of another \$385 million for Indo-China will enable the French to send out several extra battalions and to speed up the training and arming of the Vietnamese; this sum brings the American contribution to almost \$800 million a year, or about two-thirds of the cost of the war. In France itself the pressure for some attempt at negotiation is mounting, and M. Edgar Faure, the Minister of Finance, recently showed that the new American contribution makes this possible. Without the money, that is to say, some form of withdrawal would have been essential; with it, General Navarre may just be able to build up enough military pressure to make negotiations possible on a reasonable basis. And while this looks like an unduly defeatist argument, although advanced for primarily economic reasons, there can be no doubt that, one way or another, the campaigning season now about to open could have more decisive results than the battles of the past two years. That does not mean that either side will win the campaign. But it does probably mean that the stage will be set for a serious attempt at a negotiated truce.

The immediate prospects will be clearer after the important debate on Indo-China that is to take place soon after the French Assembly meets.

★

The attitude of the French public towards the war in Indo-China has not been rendered more favourable by the "piastre scandal" now being ventilated by a parliamentary commission. It was always common knowledge that profits were being made through a franc-piastre traffic at artificial rates of exchange. Some of the reports before the commission, however, also imply that, as in the notorious Stavisky affair, the traffickers were backed by important political personalities. The mood of the country is well illustrated by the comments of a witty Parisian journalist who has dubbed the commission's chief informant an imbecile, a Dostoyevskian idiot, a savage fallen into civilised society unaware that it is based on graft and nepotism. This mood does not help the present regime, nor does it strengthen enthusiasm for the war in Indo-China.

Farmers' Fury

THE National Farmers' Union has established an emotional connection, at least, between the Government's two recent decisions on agricultural policy. Those are, first, to introduce a deficiency payments scheme for cereals and, secondly, to refuse the farmers' request that the present fixed prices for farm crops should be subject to a special review because farmworkers' wages have been raised. The second has led the NFU council to declare that

the Government's refusal to grant a special price review could only cast further doubts on the sincerity of the Government's expansion and price policies for agriculture.

Sir James Turner, the NFU's president, followed this up by declaring more roundly than ever that "in no circumstances" would the farmers accept an extension of the deficiency payments principle to fat stock marketing. Their fears of a free market are put firmly in the way of the Government's efforts to deal with the confusion and decay of meat rationing before consumers lose their tempers—with the Government or with the farmers.

The NFU's suspiciousness is genuine enough; it has strong roots in the past; it outruns, indeed, that of the most embittered trade union leader who still expects to find capitalists plotting to grind the faces of the poor round every corner. But the NFU is making a mistake if it thinks that the farmers' fears gain conviction every time they are paraded. It is difficult to believe that anyone ever seriously thought that the Government would grant a special price review. It refused when farm wages were raised last year, and the farmers' case was stronger then than it is now. The rise in wage costs is likely to be offset, in part at least, by falls in other costs, and the Government's decision to wait and see how things have turned out by February, when the regular price review is due, is obviously right. For the farmers to make a great fuss about it can only persuade people that they will never allow any reasonable agricultural policy to work smoothly. And the Government may then be tempted to decide that, if it has to endure the farmers'

fury in any event, it may as well fight as a lion, believing in the benefits of free markets for consumers, not as a sheep dependent on the rural vote.

Sheepishness certainly has not paid in the case of eggs. The interim marketing system—adopted early this year to placate the consumers while making some move towards freedom—has worked badly, and this week the Government has had to make “special arrangements” to keep it working. The main arrangement is to raise the support price to 4s. 7d. a dozen—roughly the price that producers had been getting—although this is the period of relative scarcity. There is little freedom, and less efficiency, in a system that requires Government intervention of this kind.

Plump Pay Packets

THE figures published this week by the Ministry of Labour put the average earnings of men in April, 1953, at £9 5s. 11d. a week. This compares with £8 13s. 7d. twelve months earlier.

For the purposes of wage claims every union is anxious to show that its workers are in real terms far worse off than they were at some date in the past, and great statistical prowess is shown in finding a date since when it can be claimed that prices have risen more than wages. An interesting date to take is the official beginning of Sir Stafford Cripps's wage “freeze” early in 1948. Since then,

as the chart shows, average weekly earnings have kept consistently ahead of the rise in retail prices; over the five years, they increased in real terms by nearly 6 per cent. But earnings are never taken into account by the unions in formulating wage claims. Wage rates have followed a more uncertain course, but on the whole have kept pace with prices; they were losing ground earlier this year, but the fall in the retail price index of one point in August

brought wage rates into almost exactly the same relation with prices as they had in 1948. These figures, and still more the figures for earnings, make complete nonsense of all the talk about the workers' falling standard of living that so often comes out of Labour meetings.

Good Pay for Youth

THE Burnham Committee has just completed the full-dress review of teachers' salaries that has become a triennial event. The increases it recommends, if accepted by the constituent bodies, will come into effect in April, 1954. A cost-of-living bonus of £40 for men and £32 for women was granted as recently as the middle of last year, and there is nothing startling about the new proposals. With one exception, they are simply a further step in pursuit of the cost of living. The new basic scale for qualified assistant teachers compares with the previous scale as follows:

	Present	New
Men	£415-£18-£670	£450-£18-£725
Women	£370-£15-£536	£405-£15-£580

Increases in the allowances for head teachers are also recommended. The new provision is an allowance for graduates with first-class degrees of £30 for men and £24 for women. This may also be given to second-class graduates at the discretion of the local authority. It is an addition to the existing allowance (£60 for men, £48 for women) given to all graduates.

The effect is that next year a first or second class graduate teacher should start work at £540 a year (for a man). This is markedly better than his civil service counterpart, and slightly better than industry or the universities usually offer. The trouble with teaching is that the prospects are so poor. The male teacher reaches his maximum at about 37 or 38; thereafter, unless he gets a headship, there is nothing further to hope for except a “special responsibility” allowance which will only occasionally bring the schoolmaster over the £1,000 mark.

The solution cannot be a large and universal increase at the upper end of the scale, which would be prohibitively expensive even if the majority of teachers were worth more. A selective policy is needed. Many local education authorities have made little use of the “pool” of 4s. per child that they were empowered to create three years ago, as a fund from which to increase salaries in specific cases. Attempts will probably now be made to get such pools used more effectively, rather than to alter the basic scales in favour of special categories of teachers.

Green Light at Strasbourg

THIS week, it seems that the log-jam of interlocking objections that has so long blocked progress towards the European Defence Community is at last beginning to shift. On Monday, when delegates from the six governments of the Schuman community assembled in Rome, they

were in pessimistic mood. Despite the impetus given by Dr Adenauer's electoral victory to the European movement as a whole, the project for a six-nation political community which the Rome meeting was to discuss had run up against the fears of the Gaullist elements in the French coalition—an ironic as well as an awkward situation, for it was originally France that devised the political community as a check on German influence in the EDC. The news from Strasbourg, where the Council of Europe was debating M. Spaak's call for early action on the EDC, was not encouraging; the Germans had taken exception to a Dutch proposal for the “Europeanisation” of the Saar, and a number of delegates—among whom several British MPs were prominent—had successively attacked M. Spaak and one another without in any way advancing the general cause.

On Tuesday, however, the Foreign Under-Secretary, Mr Nutting, made a strong impression on the delegates at Strasbourg when he described the relationship that Britain was prepared to accept as regards the EDC as

closer than any we have known before . . . even closer than the relationship we hold with the High Authority of the Coal and Steel Community.

The reaction was immediate. Later on the same day, M. Guy Mollet, the secretary-general of the French Socialist Party, told the Council that in view of Mr Nutting's declaration his party hoped to be able to vote for the ratification of the EDC treaty. M. Mollet made this offer conditional upon a satisfactory agreement on the form of the political community; but it was none the less an important initiative for the French Socialists to rush into the breach in M. Laniel's coalition created by its right wing's opposition to the EDC. Without belittling the obstacles that still lie ahead, it can surely be said that this week's events at Strasbourg have given Europe the green light for at least one move forward.

Herr Ulbricht Surveys Defeat

THE East German Communist leaders have now taken stock of their situation after the victory of Dr Adenauer in the Federal elections. Herr Ulbricht has surveyed future policy in a long address to the central committee of the Socialist Unity Party. It is a very sorry state of affairs that he discloses, in both the economic and political fields; and the Communist doctrine can find no effective way in which to deal with it. One of the most important revelations made by Herr Ulbricht was that many party members have given up hope as a result of Dr Adenauer's success, coming as it did after the concessions made to East Germans and the June revolt. “Bourgeois vacillation” is now affecting large numbers of the faithful, particularly among the 400,000 members of the party who are former Social Democrats. As a result, the Communist regime is in future to rely almost entirely on the solid core of reliable “activists,” of whom there are, according to Herr Ulbricht, only about 150,000. They are to stiffen the security police in the factories and in all branches of administration, and will have to be busy men indeed.

The “new course” in the East German economy that was announced last summer has not been entirely reversed; but Herr Ulbricht made it plain that no way can be found

to avoid increasing the existing inflation except the orthodox one of making output rise at a greater rate than wages. “Norms” on which piece-rate wages are based will, after all, have to be raised, although one of the main reasons why the workers revolted in June was their objection to this step. In spite of the Soviet government's help, Communist policy is faced with bankruptcy, and it is, in the circumstances, almost pathetic to hear Herr Ulbricht churn out the old story that East Germany must and will prove to the West Germans that the Communist system is superior to capitalism.

It seems evident from Herr Ulbricht's survey that the Soviet government will make no concessions on German unity at any four-power conference. Germany, he still repeats, can only be united by the forceful overthrow of the Bonn regime; and that can only be achieved if the Social Democrats make common cause with the Communists. Herr Ulbricht emphasised to his anxious colleagues that a Germany united in this way would, of course, take over the basic features of the eastern system. In view of the German election results, it is no wonder that he himself forecast that reunion on these terms is a long way off.

Northern Rhodesia Unagreed

THE conference on the Northern Rhodesian constitution broke up this week and with it has gone any hope that the racial tension heightened by Central African federation will be quickly relaxed. The African and European delegations failed to reach agreement, and Mr Lyttelton was therefore forced to put forward his own proposals. The constitution at present provides for a Legislative Council of 23 members consisting of 9 officials, 10 elected Europeans, 2 elected Africans and 2 nominated unofficial members representing African interests. The Executive Council consists of 11 members of whom 7 are officials, 3 unofficial Europeans and one is an unofficial nominated member representing African interests. Mr Lyttelton's proposals will increase the size of the Legislative Council to 26. The official membership is reduced by one and there are to be two additional elected representatives each for the Africans

and Europeans. The Executive Council is to be reduced to 9 by the removal of two officials whose functions have now become a federal concern. All members are to hold portfolios and will constitute, in embryo, a government front bench.

The Colonial Office have given away as little as possible. Official members will still hold the mathematical balance on contentious issues and the small concessions to both races are equal handed. Yet, if only because their case was most modest, Mr Lyttelton appears to yield more to the Europeans than to the Africans. They asked for three new seats in the legislature and have got two; the Africans, who wanted parity with the Europeans, have gone away the more disappointed.

The damage has been done, however, not by the new solution, but by the false expectations that preceded the conference. The African argument for equal representation is that federation has left native affairs to the territorial government and that in this they have a right to insurance against their suspicions of the new federal government. But to have given in to this demand would have looked like an admission that the federal structure was unsound and would have placed an unbearable strain on the infant federation by angering the Europeans. It is a pity, however, that Mr Lyttelton has not made, in compensation, the gesture that was open to him, by extending the franchise to British protected persons. At present an African who satisfies the

other qualifications can vote on the common roll only if he becomes a nationalised British subject. To change this is admittedly difficult, because it raises the whole issue of separate racial representation. But if Mr Lyttelton could meet the Africans on this point when he visits Rhodesia next year some prospect of racial harmony might be restored.

Ceiling for Houses

HOUSE-BUILDING is not going so smoothly as it was supposed to be. According to an official of the Ministry of Housing, not more than 300,000 houses will be built this year. To hit this famous Tory target within two years of the Government's taking office is, of course, a great achievement from its own point of view. But it has been anticipated for some time. Indeed, the monthly rate of completions has been so high that the 300,000 seemed likely to be exceeded by a comfortable margin. In the seven months that ended in July 172,510 houses and flats were completed in Great Britain. This is an increase of 30 per cent compared with the same months of 1952. If the same percentage increase were maintained for the rest of the year, nearly 312,000 houses and flats would be completed in 1953.

The Ministry, however, seems to estimate that not more than 255,000 houses will be built to let and 45,000 for sale, making 300,000 in all. More houses than ever have been started, but the rate of completions in the last months of the year is not expected to maintain its lead over the rising rate of the year before, because materials are becoming scarcer. Bricks have been scarce for months. It is true that the capacity of some brickyards is not being fully used, in spite of Ministers' exhortations to the housing authorities, and the Ministry of Works has therefore never admitted that a "general shortage" exists. But most builders are very conscious of it all the same.

The ceiling set by the shortage of materials deprives the Minister of Housing of one of his stock replies to Labour critics. He has always been able to maintain that he is not building houses for sale at the expense of council houses, because the numbers of both were increasing. Labour will no doubt now be quick to say that the private houses are holding back council building. This does not make Mr Macmillan any less right to encourage house building without subsidy, but politically he will no longer be able to have the best of both worlds.

Malan's New Gambit

DR MALAN's bill, which would have removed the Cape Coloured voters from the common roll, failed by 16 votes to get a two-thirds majority at a joint sitting of both houses of the South African parliament. Undismayed by this setback, the government introduced last week a bill which proposes to divide the Appellate Division of the Supreme Court into two sections, one dealing with civil and

the long and the short of it

Asbestos is made up of millions of fibres—some long, some short, according to the thickness of the seams, which are found between layers of rock. Amosite, for instance—produced from the Cape Asbestos Company's mines—consists of some of the longest fibres. When these have been divided and bulked together again, they occupy about twenty times their original volume because they trap thousands of minute air cells within their mass. It is this which gives the Company's famous "Caposite" insulation its unique light, open texture and exceptional insulating efficiency. But long or short, Asbestos fibres are playing an increasingly large part in industry. If you are in any doubt about the value of Asbestos materials for your own purposes, consult

The Economist

1843-1943

This book was originally published to mark the centenary of the first issue of *The Economist*, which appeared on September 2, 1843. Owing to wartime restrictions, the edition had to be a small one, and it went out of print almost at once. It has now been reprinted and the new edition was published on September 2, 1953, the paper's 110th birthday. In addition to chapters dealing with the history of *The Economist* and with the role that it played in its first century of publication, the book contains contributions by a number of distinguished individuals, including the following:

WALTER BAGEHOT
by the late Francis W. Hirst.

The Economist AS A SOURCE FOR THE HISTORIAN
by the late Sir John Clapham

A POLITICAL RETROSPECT
by Sir Llewellyn Woodward

The Economist, 1843-1943 is published by the Oxford University Press. Copies can be obtained through any bookseller.

ELECTRICITY

spells

PROSPERITY

BRITAIN IS WORKING HARD and British Electricity is building more and more power stations to meet Industry's needs.

Year after year new records of construction are being achieved.

Britain's electrical generating plant today adds up to many millions of horse-power more than it did a few years back. That plant could easily produce MORE electricity. As things are, the plant is giving full output only for short periods once or twice a day; continuous full operation would cheapen the cost of electricity production.

That is why British Electricity welcomes an increasing use by the housewife of electricity for cooking and water heating, as well as an increasing industrial demand for electricity.

The more our factories use electricity, the higher Britain's productivity will be — and the higher our productivity, the higher will be the prosperity of the country.

PROSPERITY

Are you an advertising agent?

Then here is an important fact about.

Good Housekeeping magazine which should be made quite clear. Particularly so in respect of your clients selling goods to women for the family or the home.

Good Housekeeping is not just another high class magazine.

It is a specialist publication, supported by the world's most famous authority on homes and homecraft—the Good Housekeeping Institute.

Its readership has a specific and concentrated interest—home interest.

Good Housekeeping is, in fact, as much a specialist journal for the home as is a motoring magazine to the enthusiastic motorist or a gardening journal to a gardener.

Remember this when planning your clients' advertising campaigns for 1954.

*As the Hulton Readership Survey 1953 shows, Good Housekeeping is read by more ABC Class Housewives with children under 16, than any other Home Monthly magazine.

Good Housekeeping—Britain's foremost home magazine

THE NATIONAL MAGAZINE CO. LTD., 28/30 GROSVENOR GARDENS, S.W.1

criminal appeals, the other with constitutional matters—the obvious assumption being that some or all of the judges sitting in the constitutional section would be newly appointed. Thus is revealed the hitherto secret plan to circumvent the constitution.

The temporary reverse in parliament is not causing Dr Malan undue concern. Indeed, on balance he may feel that he has gained more than he lost. It was always obvious that he commanded insufficient voting power in parliament to push through the bill, and thus he cannot have lost prestige among his own supporters. On the other hand he can now claim that he has at least gone through the motions of seeking constitutional sanction for the policy of *apartheid*. Furthermore, it will be easy to switch the charge of undermining the constitution, which his opponents effectively used against him, back on to them. It is all the more likely to stick because of the doubts and dissensions within the United Party. Thus, baulked for the moment in parliament, Dr Malan can nevertheless feel he has secured a tactical triumph over the opposition. There are ominous symptoms of disintegration in the United Party, whose coming party congress may well be decisive.

The new bill is a transparent manoeuvre to muzzle the courts. It may be that, having got it on to the statute books, the government will take the indirect step of packing the Senate, and then reconvene a joint sitting and thus force through the Coloured voters bill. In this way it would hope to avoid the charge of tampering with the courts, while still having the assurance of a sympathetic hearing to fall back on, should there be an appeal to the newly created constitutional division of the Supreme Court. But, once having forced through a measure which strikes so fundamentally at traditional court procedures, the government would have no further need of devious tactics; it would be in a position to legalise virtually anything.

Projects Without Stalin

THE "Stalin great projects" have ceded pride of place in Russian domestic propaganda to "the needs of the Soviet consumer." Indeed, very little is now to be found in Soviet articles or broadcasts about the various plans for "changing nature" which before Stalin's death received so much publicity. Does this mean that all the plans for new canals and power stations, as well as the irrigation schemes, were dropped as soon as their nominal author left the stage? On balance it would seem that work on many of the projects will proceed, but that the great advertising campaign is no longer appropriate. Before Stalin's death, when the energies of the country were concentrated on the development of heavy industry and armament, much ado about the "great projects of Communism" provided a useful smoke-screen, a proof of the peaceful character of Soviet construction. Now that the Russians have admitted that they have developed atomic weapons, and are also looking for all possible resources that can be switched to consumer goods industries, there is no need for such a cover story.

While these projects received a share of publicity out of all proportion to their actual role in the Soviet economy, they do play nevertheless an important, if secondary, part in it. Thus, the two biggest ones—the Kuibyshev and

Stalingrad projects on the Volga, to be completed in 1955 and 1956 respectively—are intended to provide 20 billion kwh per annum, irrigate 2.5 million hectares of land and supply water for an additional area of 11.5 million hectares. The additional grain, cotton, sugar-beet and rice that can be grown on irrigated land should be of great assistance to Khrushchev in his plans for stepping up agricultural production.

Some more ambitious schemes—such as the transformation of western Siberia through changing the course of its rivers—may be postponed, if they were ever really contemplated for the near future. The whole rate of construction may also be slowed down to release resources for more urgent tasks (it has been disclosed that the irrigation of the Volga region is badly behind schedule). This would account for Khrushchev's silence on this topic in his latest long report, which contrasts strangely with the fact that, not so long ago, the projects were held to be a perfect panacea for Soviet agriculture. The "great projects," like the Soviet Constitution and the Five-Year Plans, have lost the epithet "Stalin." Their myth disappeared together with the cult of their patron. Yet as indispensable, prosaic constructions, the more realistic of them are likely to survive the myth.

The Price of Publicity

THE cost of presenting the Government to the governed is being reduced again this year. The *White Paper** on the information services for the current year, now belatedly published, shows a cut of some £250,000 in estimated expenditure on home information; this 10 per cent cut leaves a total of just over £2,250,000. By contrast, the cost of the overseas information services has been held almost constant, at just under the £10 million mark.

Last year's cuts included the total disbandment of the Crown Film Unit and the mobile projector service associated with it. The reductions this year are piecemeal; the chief sufferers have been the Ministry of Labour, the Ministry of Food, and, taking a broom into its own house, the Treasury; the Service departments have come off lightly. Most of the money saved comes from the Central Office of Information's vote, which means that economies have fallen largely on the Government's specialised publicity programmes. The Ministry of Labour, for example, has largely handed over recruitment advertising for the mines to the National Coal Board, and the Ministry of Food has cut heavily into its programme for advertising, exhibitions and lectures.

There is thus a welcome shift of emphasis within the information services. The Government is providing less information direct to the public through advertising and through its own publicity devices, while the machinery for giving information to the press has been maintained: indeed this service has in some departments been considerably improved. Economy apart, governments should not be trusted to do much purveying of their own information, but it is probably now true to say that the process of pruning information staffs cannot be carried much further without beginning truly to lessen public knowledge.

* Cmd. 8949.

Alarums and Excursions

IT seems increasingly unsafe for the guardians of the Iron Curtain to allow their subjects to get anywhere near the exits. The world has become accustomed to the flow of refugees from Eastern Germany, which, despite its remarkable proportions, has virtually ceased to be "news." But the past fortnight has seen some more sensational defections from the Communist camp. Dr Korowicz, a member of the Polish delegation to the new United Nations Assembly, had only been three days in America before he eluded his bodyguards and sought asylum. Another Pole who appealed for sanctuary in Korea had, ironically enough, been sent there by his government as a member of the "neutral" mission entrusted with the care of prisoners of war reluctant to return to Communist rule. And the North Korean who flew his MIG across the lines on Monday contributed his own paradox when he revealed that he had heard nothing of the famous reward of \$100,000, but had escaped simply because he wanted to.

A background of events like these, not to mention the latest chapter in the Maclean story, makes it readily understandable that this week's reports of the escape of Lavrenti Beria should have been given such prominence. The Beria stories have, of course, become less credible as they have multiplied. Yet, given the macabre secrecy that now shrouds the Communist world, and the melodrama that necessarily surrounds any escape from it, it is hardly surprising that the reaction of many people to the Beria reports has been one of suspended belief rather than blank incredulity.

Germany Invests Overseas

FEDERAL GERMANY is now launched on its postwar career as overseas investor. The Bonn government's new economic agreement with Brazil is the first to reflect Germany's position as a creditor to under-developed countries and its determination to secure long-term markets overseas. In order to even out the Brazilian debt, which is still about \$90 million, German deliveries will be less than those in the other direction. German sales are to amount to \$90.5 million, of which nearly half will be essential capital equipment to be financed by long-term German credits. Five years is mentioned as the probable length of credits. Another \$17 million is to consist of machinery, while \$10 million is set aside for supplying and assembling vehicle parts—an item no doubt required on account of the Volkswagen factory that the Germans have established in Brazil. Apart from stipulating that at least 30 per cent of German exports shall be capital equipment on credit, the Bonn government approves the setting up of joint German-Brazilian enterprises, and of purely German factories that will buy their equipment in Germany.

A joint German-Brazilian commission is to be formed to supervise the carrying out of the agreement. The commission will investigate German proposals for investments with an eye to their benefit to Brazil's economy and Germany's position as long-term supplier of engineering goods. The German section of the commission will come

under the Bonn foreign office, an arrangement indicating the sound appreciation which the Germans have of the part that trade relations play in foreign politics.

The big steel works in India for which Krupp and Demag have secured the contract will also represent a German overseas loan. The two German firms will set up a joint company to finance and erect the works, which will have an initial capacity of 500,000 tons of crude steel a year, and will double this figure in the second stage of construction. The first stage will cost \$150 million, of which a German consortium will provide \$20 million, the Indian government and the International Bank supplying the rest. This development, with the Brazilian treaty, is a fresh landmark in Germany's recovery. Though the loss of contracts is bitter to British industrialists, the overriding consideration must be that German enterprise should find a safe outlet. If Krupp does not build guns, he must be allowed, in fair competition, to build steelworks, or the consequences for Europe will again be disastrous.

Obscenity, 1953

LAST week, at Douglas, in the Isle of Man, Boots Book-lovers Library was fined a nominal sum of £1 on each of two counts for "lending upon hire an obscene book." The books in question were two reputable novels included in the library (as no doubt they are included in many other lending libraries) as part of its normal stock in trade. The prosecution was under a Manx Act that does not seem to be substantially different from the law in force in the United Kingdom. It was heard by the High Bailiff, who said that he found the library "guilty" with reluctance, but was bound by the law. The word "obscene" meant "suggesting unchaste or lustful ideas." These books could do that; therefore their lending was a criminal offence. And no doubt any police constable in any part of this country could have taken two similar books from any other library shelf and could have undertaken a similar prosecution and secured a similar conviction.

On the whole, the average man has a pretty good idea when a book sets out to trade on obscenity and when the "obscenity" in it is technical rather than dangerous. But how can that sense of fitness, or taste, be reduced to a legal formula which will not make nonsense of itself? To perverted minds, there is probably some "obscenity," in the dictionary sense, in a considerable proportion of published novels. Can the reactions of a minority be allowed to dictate the judgments applied to all literature? It is true that one magistrate will be shocked by a book that will leave another indifferent. Is that an argument for setting up a board of censorship, to secure uniformity?

The reply to each question is, of course, "no." Probably the only solution—and it may be thought of as an evasion—is to leave prosecutions to the good sense of the police authorities. There is certainly a case for one legal change, laying it down that no prosecution should be started without the consent of the Director of Public Prosecutions; that would eliminate the elements of chance and local prodigality. But it is hard to see how obscenity itself can be redefined in a statute, for standards of taste change far more quickly than the written words of the law.

Letters to the Editor

The Economy of Development

SIR—On August 22nd, in a leading article reviewing Mr Harold Wilson's book, "The War Against World Poverty," you were severely critical of all of us who urge that Britain ought to make a much larger contribution to the economic development of under-developed countries. You left on my mind the strong impression that in your opinion, despite our naive warm-heartedness, we are actually doing more harm than good by recommending a course which, if pursued, would lead to a rate of economic growth greater than the "ecological environment" of the underdeveloped countries will allow; and I am sure that you gave great moral comfort to all those who do not want us to contribute anything to meet the needs of peoples far poorer than ourselves.

On September 5th you were considering the same problem, not in a general and (if I may say so) somewhat doctrinaire manner, but in relation to the hard practical problems of Malaya. In Malaya you found no risk whatever of economic development outpacing the environmental possibilities. On the contrary you found that grave dangers are arising because the rate of economic development is too slow, and that all the practical necessities of many useful forms of economic development are already present with the exception of adequate assured finance. You ended by hoping that the problem would be approached "in as broadly generous and imaginative a spirit as the Treasury will permit."

Sir, you will know well enough that what the Treasury will permit is governed, largely though not exclusively, by the Treasury estimate of the state of public opinion.—Yours faithfully,

RICHARD ACLAND

House of Commons

Role of the Investment Trusts

SIR—Agreed that the market in the ordinary shares of investment trusts is narrow, and that share prices fluctuate considerably; such shares are therefore not attractive to the small short-term investor. But to conclude, as you do, that they are not particularly suitable for any small investor is another matter. For surely they are bought as long term investments to be locked away (hence the narrow market). For that purpose many of them—those that are well managed—have served well. They have provided stability of income with a gradual upward trend both of income

and of capital values over the past 20 or 50 years.

Is the well managed investment trust really so difficult for the small investor to choose? To buy the stock that is cheapest in any particular week does involve highly complicated calculations which are probably beyond him. But to buy a good long term holding the past record of the management provides a fair guide, and one that is readily available.

But even if the small investor does not acquire many ordinary shares, what of the debentures and preference shares that made up £243 million of the £395 million of investment trust capital in your sample? They seem to have been omitted from consideration in the rest of your article. Are they not suitable, or at least as suitable as any other fixed interest investment in an age of inflation, for the small investor?

You state, "Unfortunately, however, it is precisely in this task of mobilising the small man's savings for risk investment that the trusts' achievements have so far been most disappointing." Have you studied the share registers in order to discover to what extent the trusts do mobilise the small man's savings? If not, how do you know? The only indication you give of the use of funds for risk investment in Britain is the estimate of £325 million invested in British industrial shares. That surely is only one small part of the information needed. How important are the trusts as subscribers to and underwriters of new industrial issues? To what extent do they help to make a market in such issues? What about the nursing of small firms prior to issue done by the Glasgow Industrial Finance group in Scotland and by others in London?

It will probably be found that the contribution made by the investment trust movement to the solution of the risk capital problem is small and might be enlarged; but the difficulties are considerable. The investigation of numerous small risky projects at or before the new issue stage of development is a very different job from the management of a portfolio of established securities.—Yours faithfully,

RONALD F. HENDERSON

Australian National University,
Canberra

European Refugees in China

SIR—Your correspondent's article of August 29th is a very worthwhile plea on behalf of the many thousands of European refugees caught in a desperate trap in Communist China. However,

his information on the movement of these refugees to new homes overseas is outdated.

It is true, as he states, that fewer than a thousand refugees left in 1952. (The exact number moved by the Intergovernmental Committee for European Migration was 878). Since February, however, there has been a steady increase in their evacuation and the first seven months of this year have seen the departure of 1,714 refugees for permanent resettlement, principally in the Latin American republics. Despite the fact that movements have increased, there were still over 3,700 potential visas on hand at the start of July, some 2,000 more than at the start of the year. In addition, the recently enacted US Refugee Relief Act of 1953 provides for the issue of 2,000 visas to non-Asian refugees in the Far East before the close of 1956.

This encouraging progress is largely due to the search for placement opportunities carried on by the voluntary agencies. The money for the movements accomplished came from a special Trust Fund, created by the International Refugee Organisation at the time of its liquidation. This fund will be exhausted some time in December of this year, at which time there will still remain in China roughly 17,000 refugees, of whom it is estimated that 10,000 would be able to immigrate to other countries over the next two or three years, assuming that the political situation remains substantially unchanged.

ICEM estimates that these movements would cost approximately \$6 million, and the organisation has launched an appeal to its 22 member governments and others to assist.—Yours faithfully,
SIDNEY SHORR
Geneva

London Airport

SIR—There is one point that was not mentioned in your Note on the developments planned at London Airport—indeed, it is a point on which there seems to be a conspiracy of silence—and that is how the passenger is to be transported between the airport and London. British European Airways have recently removed their terminal to a new site some 3½ miles further away from Heathrow than the old. The buses are timed to leave there an hour and a quarter before the plane departs, and you are asked to be at the terminal at least fifteen minutes before the bus leaves. (Nor will it pick you up en route even if it passes your front door, but that is another matter.)

What is the point of spending £26 million on the airport if it has such ridiculous communications with the city it is supposed to serve? Yet the Waterloo terminal stands alongside an electrified railway line which passes within a mile and a half of the new airport; a connection could be made right into the basement of the terminal building for a fractional addition to the £26 million. The railway is quadruple-track

most of the way and not unduly burdened; trains could cover the distance in twenty minutes. The BOAC terminal in Buckingham Palace Road could also be connected, though less easily, as there would not be a straight run through Clapham Junction.

I believe there was a plan to provide this railway link at one stage. What has happened to it? Is it gripped in the paralysis that seems to affect everything connected with the railways? If it is right to spend so much money on an airport, surely it would be worth while to do the job properly.—Yours faithfully,
GLOBETROTTER

Mr Deakin

SIR—Discussing the decision of Mrs White to withdraw from the contest for membership of the Executive of the Labour Party you state with every sign of approval: "But at Morecambe a year ago Mr Arthur Deakin abruptly withdrew from her support the massive bloc vote of the Transport and General Workers' Union." Is a state of affairs when a single individual can "abruptly withdraw" over a million votes wholly in conformity with the usual democratic process you so fervently (and rightly) uphold? Who can disagree with your conclusion that "... Mr Deakin and his colleagues ... have had to do virtually all the dirty work in combating Bevanism"?—Yours faithfully,
Cockermouth T. BALOGH

[It would be equally foolish to argue that the "usual democratic process" is denied whenever an elected Government does anything without holding a referendum. Does Mr Balogh misunderstand the phrase "dirty work"?—EDITOR.]

Ariel and Caliban

SIR—In his letter in your issue of August 22, 1953, Mr Day states that technical and economic conditions must assure that competition in television can only be between a small number of large units.

This seems questionable. If the ultra-high frequencies of Bands 4 and 5 are used, up to 93 channels would be available. Even if allocations did not cover the whole of those two bands, in accordance with the Television Advisory Committee's recommendations, it still allows for about 50 stations. Since the Americans use these frequencies, there is no reason why the British radio industry should not be able to do so as well. It does not appear that technical conditions necessitate oligopoly.

It is more difficult to assess the economic factors. But it was stated in your issue of December 27, 1952, that during 1953 the USA would have more than 250 television outlets. There are seven in New York City. Moreover, it appears that there have been a considerable number of applications for licences to transmit in this country. Practical working may thin out the numbers—but it need not necessarily do so.—Yours faithfully,
Leeds JOHN G. WALKER

Books & Publications

Practical Unionist

PROBLEMS OF ECONOMIC UNION. By J. E. Meade. Allen and Unwin. 102 pages. 9s. 6d.

PROFESSOR MEADE has an advantage over most other academic economists in that he takes proposals for economic union seriously. He does not regard the field as already overpopulated with a rather frightening army of back-benchers, formidable lords and ladies, and emotional continentals, all grinding their idealistic axes above the undergrowth. Instead he dives terrier-like into the undergrowth himself; drags out about a hundred difficulties in approximately as many pages; subjects them to a professional economic analysis; and then either propounds sweeping solutions or—more usually—sadly lays them aside unsolved. Sometimes, unfortunately, the analysis is clothed in the ugliest jargon. There are pages and pages to explain that the "arguments for free trade—the optimisation of trade and the maximisation of production—rely throughout upon the assumption that prices correspond to marginal utilities to consumers and marginal costs to society," followed by more pages in the same style to explain why this assumption is often flat nonsense. Then, quite suddenly, Mr Meade has a delightful habit of sitting back and poking fun at his own jargon. Is the British system of taxing wine and subsidising milk, he suddenly asks,

an inadmissible interference with the optimisation of trade and, incidentally, an indirect protection of a home industry, since milk is home-produced and wine imported? Or is it a legitimate case of social economies and diseconomies to encourage the feeding of milk to British babies at the expense of the drunkenness of British fathers? And who, pray, but Her Majesty's Government is competent to decide such an issue?

In the end, Mr Meade believes that—on one proviso—it should be possible to move towards an integrated international market that would be characterised by free movement of goods, while leaving each national government sufficient freedom of action in controlling the trade cycle and influencing the distribution of income and property within its own boundaries. The proviso, which has become something of a King Charles's head in all Mr Meade's works, is that exchange rates should be allowed to fluctuate. But Mr Meade does not believe that national governments would have similar freedom of action in any economic union that aimed at unfettered movement of labour and capital; it is no accident, he remarks sadly, that "in the federal democratic states which really

work in the modern world more and more economic power is passing from the member-states to the central union."

Mr Meade's own preference is, therefore, for moving steadily forward "by a long process of small stages, acclimatising ourselves to the change in conditions at each step." Among the first steps he would like to see Nato developed further into an instrument for fair sharing of the common burden of defence; the World Bank become an instrument for the efficient and just administration of an international budget of grants-in-aid; and Gatt institutionalised into an international trade organisation with its powers increased for the effective removal of trade barriers. Then he would like to see the International Monetary Fund, the European Payments Union and the sterling area become instruments for exchange equalisation between countries whose exchange rates were free to fluctuate in markets which were cleared of controls over imports and current payments; perhaps, as a start, this completely free market would have to exclude the dollar world.

All this is not what the federalists mean by economic union. But it would strike what many will regard as a fair balance between the long-term economic advantages and the short-term economic inconvenience of any union at all. Whether it would lead to greater political harmony or merely open more doors to international political friction is a problem for statesmen—and emotionalists—to decide.

Prewar Tory

ORDERS OF THE DAY. By Lord Winterton. Cassell. 369 pages. 21s.

LORD WINTERTON rounded off 47 years of highly combative politics as Conservative Member for Horsham with a period as Father of the House of Commons, a role which he treated not as a courtesy title but as a major responsibility. In it he made a considerable contribution to the functioning and development of Parliament, not only on the Committee of Privileges and on the Committee which planned the rebuilding of the Commons, but also in day-to-day interventions on matters of procedure and taste. There was nothing pedantic or prissy about these interventions. "The noble lord," to give his Commons title (he added an English peerage to his Irish rank in 1952), rightly saw the function of Parliament as that

of providing an arena in which the political battles of the day can be fought to a finish without quarter but also without malice.

Lord Winterton combined a capacity for being vehemently partisan in his political opinions with an easy tolerance and reasonableness about matters of Parliamentary conduct and practice. He was a strong, though not always an orthodox, Tory throughout the interwar years, and it is largely as an unashamed expression of the Tory views of those days that this book has lasting value. Lord Winterton was for Munich at the time, and he is for it now. He praised Baldwin then, and he praises him now, fitting him, along with Mr Attlee, as the most astute political leader of our time. He recounts with relish his days in opposition to the Liberals before 1914, when he certainly did his best to see that the Whig dogs got the worst of it, and he speaks of Communism and Socialism in much the same terms of loathing and contempt. Yet he is warm in his praise of the Parliamentary qualities of Labour leaders and backbenchers in the postwar years, scorns those who think that Mr Bevan's powers of abuse can be set alongside those of Mr Lloyd George of the Irish Nationalists before 1914, and admits to having "rather liked" the first Communist MP, Mr Saklatvala of Battersea.

As a good Parliamentarian, Lord Winterton sees the main task for oncoming MPs as that of combating the growth of bureaucratic power, and he hints that too much has been made in recent years of alleged breaches of privilege. These, and a host of other points, important and unimportant, he sets out with that honesty and forthrightness which made him such an attractive and, at times, such an infuriating figure in the House of Commons.

Growth and Depression

IMMATURE AND STAGNATION IN AMERICAN CAPITALISM. By J. Steindl. Blackwell. 248 pages. 30s.

IN this study—No. 4 in the monographs of the Oxford University Institute of Statistics—Mr Steindl sets out to examine whether the depression of the American economy from 1929 to 1939 was the product of a long trend towards secular stagnation. He emerges not only with conclusions on this point but also with two sets of theoretical concepts which are a distinct contribution to the increasing effort to create a dynamic theory of economic growth.

These new tools are a dynamic theory of the firm, which develops the theory of imperfect competition so that it may be linked to a theory of growth, and also a new model of growth itself, based on original propositions concerning capital accumulation. The whole represents a sophisticated neo-Marxist theory of how capitalism, becoming increasingly monopolistic, runs down.

The general proposition that binds Mr Steindl's analysis of the American

economy to his partial and general dynamic theories is, roughly, this: investment is systematically related to past business savings, to the relative (fixed) indebtedness of business, and to the degree of utilisation of capacity. The rate of profit affects this system not only through its consequences for business savings but also through its psychological effect on the degree of (fixed) business indebtedness that is acceptable to outside lenders.

Using inadequate American data with energy and imagination, Mr Steindl seeks to establish the proposition that, round about the turn of the century, the growth of monopoly produced a systematic tendency towards excess capacity in American industry; this process, in turn, set in motion a self-reinforcing long term decline in the rate of capital accumulation, business savings, utilisation of capacity, etc. Although the greater degree of monopoly raised profits in the short run in the monopolistic sectors, the general rate of profit declined over the longer period, affecting the level of business savings, capital accumulation, and so on.

Existing data by no means support these related hypotheses unambiguously; and the author is rigorous in pointing to gaps and movements in the statistics contrary to his hypothesis. Broadly speaking, it may be said that the evidence on the effective degree of monopoly in American industry by no means bears the weight that this hypothesis would place on it; that any treatment of the period 1929-39 which ignores the world context in which the American economy operated after 1919 is bound to be incomplete; and that to move from evidence of decelerating growth rates to a persuasive case for secular stagnation requires the exploration of bodies of evidence that the author, *ex hypothesi*, wholly ignores.

Mr Steindl's major problem, in his own terms, is that his theory of American stagnation proves too much: after all, until 1929, the United States was not in the grip of cumulative depression, but growing rapidly at relatively full employment, despite some possible (but not wholly clear) evidences of long run deceleration. Mr Steindl finds a temporary compensatory factor, which concealed the underlying erosion of American capitalism, in the development of corporation finance by share issues to the public. This institutional innovation permitted business to substitute external savings for its own savings without increasing the proportion of external fixed obligations, of which the author makes so much. The collapse of the stock market in 1929, by cutting off this fortuitous source of equity capital, revealed the true decadence of the American economy.

There is hardly a page in this trenchant analysis where the reader will not have questions or wish to introduce factors ruled out by the author in order to produce his simple, powerful analysis. Mr Steindl is not wholly persuasive. His book is, however, a serious, original

contribution to dynamic theory; and his chapters on firm and industry are of major importance, linking as they do the determinants of general growth to those factors which determine the performance of the individual *entrepreneur* and of particular sectors of the economy.

Dry Churchill

THE MARSHAL DUKE OF BERWICK. By Sir Charles Petrie. Eyre and Spottiswoode. 368 pages. 25s.

MONTESQUIEU, who knew him well, found the Duke of Berwick reserved and rather dry; and Sir Charles Petrie's painstaking biography only confirms this judgment. The author has enjoyed access to the archives of the Duke of Alba, but these appear to have yielded little fresh information. Berwick, the illegitimate son of Arabella Churchill and James II, was educated by Jesuits in France and early acquired an authoritarian cast of mind. Nervous of the vicissitudes of politics, he preferred to be the unquestioning soldier. He had a considerable share of the military ability of the Churchills, but his talents and tastes were for the defensive. It is hard to imagine his uncle, Marlborough, saying as Berwick did that what he had most coveted during his whole life was to have had a good fortress to defend.

Sir Charles Petrie's sympathy with the Jacobites has prevented him from bringing out the irony of Berwick's career,

Save yourself...

Almost certainly, you will be able to save yourself a great deal of time and trouble if you apply first to us for books on economics and on the political and social sciences. We make no claim to infallibility. Yet, inevitably, a bookshop reflects the interests of its clients. Our clients include Universities, Government Departments, libraries, banks, learned bodies—and learned men. Their discriminating custom has enabled us to build up a stock, and a service, that we are told is unrivalled in its field.

Mail orders receive the personal attention of the Manager.

International Combines in Modern Industry

By Alfred Plummer, B.Litt., M.Sc., LL.D.

Third Edition. 25s net.

"Dr. Plummer, in his survey and analysis of international combines in modern industry, has performed an exceedingly difficult task with intelligence and clarity."—*Financial News*.

"A practical and comprehensive book for all students of economics and industry."—*London Chamber of Commerce Journal*.

Parker Street . Kingsway . London . W.C.2

PITMAN

which was devoted to the laborious defence of France rather than to his family's dream of retaking the position abandoned in 1688. Berwick not only sought service in the armies of Louis XIV but became a French subject. He saved Spain for the Bourbons at the battle of Almanza and was rewarded by being made a Marshal of France and a Grandee of Spain. When in 1715 his half-brother, the Old Pretender, appointed him Commander-in-Chief of the forces in Scotland, Berwick refused as being a subject of France and fortified by opinions from "men of sense, able lawyers and casuists." James's sulky comment was that he had suffered "the humiliation of courting a disobedient subject, and a bastard, too." But Berwick was appointed to the military command of Guienne; and when he died he transmitted wide lands and two dukedoms in France and Spain to his sons.

Sir Charles Petrie has broadened his study by attempting to make it, as his sub-title shows, a picture of the age. But, as he acknowledges, his general conclusions are largely derived from the works of Dr G. M. Trevelyan and Sir Winston Churchill. Frequent quotations advertise the scissors-and-paste technique, though the pungency of some of these quotations, particularly those from Sir Winston Churchill, enliven a narrative which is otherwise like Berwick's own personality, "rather dry."

Crusader and Promoter

MAN BORN TO LIVE.

By Ellen Hart.

Gollancz. 371 pages. 22s. 6d.

THE Red Cross that is now a familiar emblem, clutched at in battles and disasters in almost every corner of the world, is less than a century old; its founder, Henry Dunant, was born just 125 years ago. He came to manhood at a time when people's consciences were unusually stirred by human suffering in its most dramatic forms—the suffering of prisoners, slaves and wounded men. Prison reforms and the abolition of slavery were under way, and indomitable individuals such as Florence Nightingale had begun the onslaught on the horrors of the military hospital. But even the efforts already made were limited by national barriers; at Solferino in 1859 wounded men who fell into the enemy's hands expected nothing but cruelty. Dunant's flaming account of their sufferings started a fire that has never been extinguished since. There is no need to exaggerate the debt of gratitude that humanity owes to him and to the band of pioneers who struggled with him through the first painful years of the Red Cross.

Yet Dunant himself was fated to sink into obscurity and poverty long before his death, and even today his personality is a shadowy one even to many of those who follow in his footsteps. Miss Hart's biography is all the more welcome in that it reveals no saintly stereotype, but

one of the strangest of characters. Henry Dunant was a good Geneva republican with a longing for aristocratic salons; a Calvinist enamoured of mystical Napoleonism; a tirelessly successful evangelist who was at the same time a tirelessly unsuccessful business man. Business brought him to Solferino in pursuit of concessions from Napoleon, and thereafter his long crusade was still interspersed with ill-fated speculations and promotions. Moreover, this man, who for years fought against the apathy and obstinacy of a continent, lacked confidence even in himself; he who did so much for his fellows came more and more to distrust, even to fear, them. Miss Hart may not have been able to expose the deepest roots of this complex and contradictory personality, but she has written a fascinating story which must give rise to further speculation about the human origins of great causes.

Arabia Revised

SAUDI ARABIA.

By K. S. Twitchell.

Princeton University Press (London: Geoffrey Cumberlege). 231 pages. 32s. 6d.

OF the Arab countries, only Saudi Arabia and the Yemen remain little known. They are seen in the distance by travellers who fly or sail to the east, but closer acquaintance is seldom made because neither is keen to give visas except to Moslem visitors. Yet Saudi Arabia is important, both spiritually and materially, to much of the world, for it contains both the holiest city of Islam and ten per cent of the world's oil reserves.

When Mr Twitchell's handbook was first written in 1946, it provided the traveller with information unobtainable elsewhere on everything from roads and the right behaviour with a coffee cup to history and antiquities. Since then, the face of certain parts of the country has greatly changed. Income from oil has risen from about \$13 million to about \$170 million per annum; a railway has been built from the capital at Riyadh to the Persian Gulf; the area under cultivation has considerably increased; a US Air Force base has been established at Dhahran and the country's new wealth, instead of flowing entirely and directly into the pocket of the ruling family, is channelled or partly channelled through a Saudi Arabian Monetary Agency. Unfortunately Mr Twitchell seems to have lacked facilities for thoroughly revising his book. It is printed in its old form but with footnotes directing the reader to a new last chapter on developments since 1946. These are given in the form of notes supplied by foreign commercial companies working in Saudi Arabia and are fragmentary; the author's emendations to them are maddeningly located in a separate series of "notes to the text." But half a loaf is better than no bread, and this is—apart from Aramco's excellent handbooks for its employees—the only English book of its kind.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Paying for Security

Washington, D.C.

WHEN the Secretary of the Treasury held a press conference on August 27th to discuss the revised budget, he complained that a wrong emphasis was always put on the monthly cost-of-living figures when they were published. In concentrating on the rise of the index a day or two before to a record level, he said, most people had missed the real significance of what was happening. In his view the important fact was that there had been a change of only one half of one per cent in the cost of living in a year—a proof that the United States had a stable economy at a high level. The latest figure, published this week, increases the rise to three quarters of one per cent above last year, and, as usual, all the headlines spoke of new records. But this does not detract from the truth of what Mr Humphrey said.

The stability of the economy has, indeed, been remarkable ever since the end of the sharp inflation which followed the outbreak of the Korean war. The gross national product has risen steadily from an annual rate of \$340 billion in the first quarter of 1952 to one of \$372 billion a year in the second quarter of 1953; personal savings are now 6.9 per cent of disposable income as against 6.3 per cent for the same quarter of last year; and wholesale prices are almost 2 per cent lower than they were a year ago. Yet uneasiness about the future is in the air.

It is easy enough to point to evidence to support this feeling, but it should also be added that far-sighted people have seen much of that evidence on the horizon for many

months and the economy has remained unmoved. Today, however, there has to be added to the facts previously available the coming decline in government expenditure. The revised budget showed that, for the first time since 1948, actual expenditures in this fiscal year will be substantially greater than the authority to incur new obligations granted by Congress. This means, as Mr Humphrey pointed out, that expenditures will decrease progressively over the next few years.

Senator Douglas, in a recent statement, expressed his fears that there would be some worsening of economic conditions and an increase in the number of unemployed during the winter and spring. He mentioned the falling-off in residential construction—from a seasonally adjusted annual rate of over a million and a quarter new houses started in February to one of only a little over a million today—and said that he expected a drop in all types of building. He also pointed to the increasing difficulty of selling motor-cars and farm

machinery and the recent unsteadiness of the stock market.

The Senator added that, if unemployment reached 5 per cent, "we should get ready to move swiftly" and that programmes should be put into effect the moment it reached 7 per cent or 8 per cent. Mr Humphrey—even though he told the National Press Club last week that the best thing to do was to "let the free, competitive economy operate itself"—would probably agree with him and some, at least, of the new Administration would agree with Mr Humphrey and would be prepared to take whatever

steps are thought necessary to turn the tide. The Administration is, however, to some extent—though to what extent it would probably take a minor emergency to discover—the prisoner of its campaign promises to reduce spending and, even more, of its Congress.

The revised budget was, in its way, a gratifying performance—and one for which Mr Humphrey and Mr Joseph Dodge, the Director of the Budget, were entitled to take the credit they claimed. But close examination of the figures and close questioning of the Secretary of the Treasury about the future revealed how difficult the fiscal year ending in June, 1955, is going to be for the Administration.

Revenue for the present fiscal year is now estimated to be \$68.3 billion and a budget deficit of \$3.8 billion is expected. In the next year, however, receipts will be some \$8 billion lower because the excess profits tax will expire at the end of the year and individual income taxes will be reduced 10 per cent at the same time, while some excise taxes will die and the corporate tax rate will be lowered at the end of March. Unless new sources of revenue are discovered, expenditure will have to be cut by nearly \$12 billion below the present reduced rate to achieve a balanced budget. It is not easy to see how this can be done, although some savings will flow automatically from the reduction in obligational authority, nor is it easy to see how new sources of revenue are to be tapped without a terrible struggle with Congress.

More than 85 per cent of this year's reductions in government spending have been at the expense of the national security programme—a term used to cover the military functions of the Defence Department, the Mutual Security programme and atomic energy—and the rest comes largely from more efficient, or, at least, cheaper, management. In some cases chaos rather than greater efficiency seems likely to result from the dismissal of able employees in the name of economy. But even if order is established, it is unlikely that further great savings can be made on the management side. And the cuts in the national security programme which have already been planned can hardly be carried much further. Congress could, and well may, cancel some of the unobligated appropriations for foreign aid, but anything saved on mutual security will no doubt be spent on continental security. The Russian hydrogen explosion has ensured that.

★

The alternative seems to be that new sources of revenue must be found or that Congress must be persuaded to extend taxes which only too many of its members are pledged to kill. That the President realises this was clear from his statement—buried in the patriotic peroration of his Boston speech—that no tax is too hard to bear which is necessary to the defence of American freedom. Attention has been concentrated on the possibilities of a federal sales tax—because the Secretary of the Treasury said at a private dinner that it was “very much in the picture”—but this is, in fact, only one of forty methods of finding the necessary money that are being studied. Among the others, according to Mr Humphrey, when he was speaking in public, is an increase in the income and corporation taxes and a manufacturer's excise tax. None of these ideas will be popular with Congress. The President's own party has been waiting for years to fulfil its promises to reduce both

income and corporation taxes, and the day-dreams of Republican Congressmen are dying hard.

The party of big business might be expected to prefer a sales tax or its less obvious version, the manufacturer's excise tax—levied as is the purchase tax in Britain—but next year is an election year and the Republicans cannot afford to lose an unnecessary seat in either House. Mr Reed, the chairman of the House Ways and Means Committee, has given his opinion of a sales tax in no uncertain terms. Senator Carlson, who is close to the President, has stated his opposition as well as his belief that the Administration will not propose one. For the Democrats, Senator Douglas has already warned Mr Eisenhower that, if a recession should be threatening, “the worst thing that could be done” would be to cut income and corporation taxes and impose sales or excise taxes instead, and has added that the opposition would not allow the country to forget that the rich were being spared at the expense of the whole body of consumers. The next session of Congress will therefore see a fight between those, among whom is Mr Humphrey, who believe that the budget can, and should, be balanced at any level, those who will support alternative methods of doing so and those who refuse to face the political consequences of balancing it at a high level. If precedent is any guide, the latter will win; the budget will remain unbalanced and the unexpected speed of Soviet atomic development will take the blame.

No New La Guardia

FROM A CORRESPONDENT IN NEW YORK

FOR reasons which go deep into history and political habits, the choice of political candidates at a primary election in New York City is usually a pallid affair, bearing little resemblance to the vigorous campaigns more customary in the west. Last week's primary was no exception. In the Republican and Liberal parties there was no public contest. Their candidates for Mayor had been chosen by the respective party leaders. The Democratic party was split between two factions, yet only about a quarter of its two million enrolled voters bothered to take part, although the battle was the first real one in sixteen years, and the need for an able candidate was painfully apparent.

Mr Robert Wagner, the son of the famous Senator secured 350,000 votes. The present Mayor, Mr Impellitteri, received hardly more than half as many (181,295) and the remaining 14,000 were divided between two almost unknown district leaders. Mr Wagner is therefore officially designated as Democratic candidate for Mayor in the November election. He represents the party's liberal wing; he is backed both by the local boss and by the men who want Mr Stevenson to be the next Democratic candidate. Unless Mr Impellitteri can get sufficient backing to run as an independent, Mr Wagner stands a chance to win in a three-sided contest against Mr Harold Reigelman, the Republican candidate, and Mr Rudolph Halley, the choice of the Liberals, a party that operates only in New York State.

It is too early to say with any certainty how good that chance is. If Mr Wagner wins, he will inevitably put the city squarely back in the hands of Tammany Hall, the local

Keeping an eye on the ball

HOURLY the items come crowding in—Home news, foreign news, Court news, financial news, sporting news, letters, criminal cases, articles, pictures. The Editor must sieve and decide, and sometimes regret. But, having put first things first, the Manchester Guardian always finds ample space for sport.

There is no reason (the Manchester Guardian believes) why those who write about sport should not also write well. Too often a curious jargon afflicts the sports reporter. You can trust your Manchester Guardian to be as stern against cliché, jaded simile, silly slang, in its sports columns as in all its other features.

Those who love ball games will gain renewed pleasure in following their sport in the Manchester Guardian. They will find there the felicity of judgment, the telling phrase, the respect for the English language, which mark the Manchester Guardian as a whole.

*If you have any difficulty in getting your
Manchester Guardian regularly, please write to:
The Manchester Guardian, Manchester.*

A gracious welcome to your guests

De-Nicotea smoking
ensures

nothing but pleasure
from each cigarette

This Dunhill Holder contains a Crystal Filter which cools the smoke, keeps tobacco particles from your mouth and absorbs nicotine and tar. It enables you to keep on smoking your favourite brand of cigarette with the added enjoyment of filtered smoking too. Each filter lasts for 20 cigarettes and is changed in a moment. Ask your tobacconist to show you the Dunhill De-Nicotea today. Price 17/6 (in box with 10 filters).

DE-NICOTEA
CRYSTAL FILTER

Cigarette Holder

Renowned for pipes, lighters, cigarettes and tobaccos.

Democratic machine from which it slipped momentarily during the Impelliteri regime. The Tammany tiger is old, corrupt, ridden by parasites and nearly toothless, but it still has power enough to fill subordinate posts and perform expensive political favours, especially if it can find a respectable front.

Mr Wagner is better qualified to play this part than the present Mayor. A first-generation American of German descent, he is not only the son and namesake of a widely loved father, but he carries the endorsement of Franklin D. Roosevelt Jr and thus symbolizes all the nostalgic sentimentality which rings a halo around the New Deal in the minds of those who remember that interlude with affection. (This may cost him the votes of those Democrats who do not.) He has a liberal background, certain social graces, a good education, and some political experience. Graduated from Yale in 1933, married to a lady who took him into that America Debrett, the New York Social Register, he has also served a term as President of the Borough of Manhattan. If he has not yet established a reputation for much strength, he still ranks as a coming young man. Obviously he looks very useful to a political machine which both the Irish and the Italians are fighting to control, and which is in need of a cloak of political virtue.

Those who rely on the fact that New York is traditionally a Democratic stronghold expect Mr Wagner to win in November, and count on that victory to aid the party's national aspirations in 1956. They argue that the public's resentment of the rent increases, and the trebling of underground fares, will be directed against the Republicans at the State capital, who forced them on the city, and that labour corruption on the piers will be laid at the door of Mr Impelliteri, who was, during part of the time, at odds with the leader of Tammany. The same Democratic optimists expect that the opposition vote will be split between Mr Reigelman, the Republican and Mr Halley, the Liberal. However, this triangle has some of the characteristics of an equilateral. Mr Wagner poses as a liberal, and as labour's friend. So does Mr Halley. Mr Halley, President of the New York City Council, knows a great deal about the government of New York. So does Mr Reigelman, founder and head of that private watchdog organisation, the City Budget Committee. All three of them vie in protestations of intent to reform the city's government.

★

These protestations are necessary because New York is caught in a particularly unpleasant version of those ills which afflict several big American cities. In the public mind, the task of governing the city is a dull administrative job. It attracts men of high calibre only about once in a generation, when matters get so bad that they feel impelled to turn from more interesting affairs to set the municipal house in order. The rest of the time the bosses rule, and only as well as is convenient.

The present period, however, is one in which the power of the bosses is declining. At the same time, able men are moving from the centre to the suburbs, leaving municipal affairs more than ever to the venal and the mediocre. The result is a creeping decay. Even the charter under which New York City is governed creaks at the joints. The city is in debt to its eyebrows; its physical plant, worth some \$14 billion, has been shown, in recent private studies, to be deteriorating; its harbour, source and symbol of its great-

ness, appears in public studies as a combination of the archaic and the corrupt.

This should have been one of those years when Tammany's opponents unite to bring forth a political genius. The city needs one, and the omens were favourable. Twenty years ago it was Fiorello La Guardia who became such a leader, forty years ago it was John Purroy Mitchell. For a time it looked as though an energetic New York Congressman, Mr Jacob Javits, who is a Republican, would be chosen to follow in those distinguished footsteps, but the necessary alliance between the Republicans and the Liberals failed to materialise. It is said, though perhaps unfairly, that Governor Dewey did not want New York City in the hands of a Mayor of his own party during a period when financial straits were such that the city's rulers must come periodically to beg favours from the state.

As for the Liberals, they are divided between non-partisans yearning for a new La Guardia, and a group ambitious to see their party replace the city's ineffective Republicans as the real contenders against Tammany. This group was willing for an alliance with the Republicans until a newspaper poll convinced them that the Liberals could win on their own with Mr Halley. The temptation was too great, and the moment of possible fusion passed without action.

Thus New Yorkers must choose between three men, no one of whom has yet given signs of being the Moses (or in New York terms, the La Guardia) needed to lead them out of their present morass. The struggle will be lively. The real question is how many citizens will find it important to listen or take part.

American Notes

President's Problems

ON his return to the White House after six weeks in Colorado President Eisenhower faces a large accumulation of business. Apart from finding a new Chief Justice and a new Secretary of Labour, he has important decisions to take in foreign and home affairs. One of these will be whether to deliver what must be by now the most rewritten address in American history: the "candid" explanation to the people of what atomic and hydrogen bombs imply for them. One of the implications, as the President has already hinted, might well be an end to the policy of reducing expenditure on defence.

The series of speeches for which the President is booked during the autumn, together with the radio talks which he may give, are expected to provide some lead to the members of his party in replying to the Democrats, who showed at their recent Chicago rally that they are ready to go into business as an opposition. Because this lead has not yet come the Republican reactions to the Chicago rally were bound to be rather uncertain, and the possession by a

BREAD is our staple food

You now have a free choice of bread. Even if you're the most casual reader of newspapers, even if you glance only occasionally at a magazine, you've probably read the opinions of three or four different journalists on this subject, and as no two of them ever seem to think alike, you might wonder what all the arguing is about.

To understand the thing properly you have to start at the wheat which is the basis of bread, and to realise that the making of flour is not quite so simple as it looks. Even a single grain of wheat is not a simple thing—small though it is, it is made up of many different parts, some of which are better suited to the feeding of animals than to the nourishment of human beings. So the miller's job is not just to grind the wheat grains into powder, but to break them up in such a way that he can separate and sort the different parts. Each can then be used for the purpose to which it is best suited. Broadly speaking, the main constituents of a wheat grain are:

1 The starchy white kernel—the technical people call it endosperm—which is the only part used in the manufacture of pure white flour.

2 The bran, which is composed of the six layers of skin on the grain. This is mostly used for the manufacture of animal feeding stuffs.

3 The germ, which might be compared with the yolk of an egg, for it is the embryo of new life. If the grain is sown in the ground it is the germ

which will develop into the new plant. It is this part, incidentally, which contains a high proportion of the wheat's food value.

The miller, then, has to separate these things from each other and make the flour in the way which he thinks will best please the baker and, more important, you who will buy and eat the bread. He mills the grain, in fact, according to any one of a number of standards and leaves the choice to you. These standards differ, but here are a few of them:

Pure white flour. The bran has gone. The germ has gone, too—and this is a pity, for with it have gone important elements of the wheat, and a very pleasant flavour. To make up for these dietary losses the flour may be "fortified" with vitamins and other nutrients, real or synthetic.

"National" flour. Some, but not all, of the bran and germ have gone. The loss of the bran worries some expert dieticians, pleases others, but they mostly agree that the low germ content is a disadvantage.

Wholemeal. Just what it sounds—the whole meal, or wheat berry, ground to a powder, with nothing added and nothing taken away.

Hovis flour. The bran has gone to do its most useful job, that of feeding the animals. The germ goes too, but only temporarily. At one point in its manufacture the flour is in its natural creamy state—unbleached of course—and then the important things start happening. The germ, which you remember contains so much of the wheat's natural goodness and flavour, is cooked by a special process to prevent deterioration; it is then put back into the flour. More than that, many times more germ is added to make it richer still.

Nature's Best

Well, it's going to be entirely up to you to choose your standard. Bread of any kind is a valuable food, possessing as it does, body building properties and providing abundant energy. We don't try to hide the fact that this announcement is made with the intention of influencing your choice—because we sincerely believe that nature's best is still the very best. But whatever you do, remember that bread is a staple part of your diet; choose carefully.

Hovis Limited SEPTEMBER, 1953.

convention of Republican women of a platform in the same city a few days later was not of much avail. Senator Ferguson, who is chairman of the Republican Foreign Policy Committee, duly denounced Mr Stevenson's suggestions on foreign policy as amounting to appeasement, but is in real danger of seeing them all endorsed by the Administration. Already at the United Nations Mr Dulles has acknowledged Russia's right to an assurance of her security and has repudiated a policy of forcible "liberation" of eastern Europe, and Mr Eisenhower is now reported to be considering, what Mr Stevenson thought was needed most of all, a new American initiative over disarmament.

Looking round for issues that might destroy the Republicans' precarious hold on Congress in the 1954 election, the Democrats clearly see most hope in the government's obligation to promote legislation on agriculture and labour relations in the next session. The Republicans may well be right in claiming that Mr Durkin's resignation as Secretary of Labour has not cost them vital support, as the trade unions were against them anyway, but a swing in the farmers' vote could make a big difference. This would explain why repeated references by Mr Benson, the Secretary of Agriculture, to his faithful execution of existing provisions for keeping farm prices at a fixed high level, have replaced his former, well-grounded strictures on the system. Still, the present law expires next year, and the government will have to commit itself before the election either to keeping the same system going or to trying a more flexible method that would save on subsidies but might be costly in political support. The Democrats can be relied on to make the most of the dilemma that they have been bequeathed to their opponents, even though at Chicago two of their own ex-Secretaries of Agriculture were caught on opposite horns of it.

Nixon in the Lions' Den

THE dispatch of Mr Nixon, the Vice President, to the convention of the American Federation of Labour shows that the Administration is anxious to waste no time repairing the damage done by the resignation of Mr Durkin, the Secretary of Labour. It is not customary for the President to do more than send a written message to a trade union convention, although by tradition he is invited to attend in person. The AFL shows no signs of being mollified by the appointment of this Ambassador extraordinary and the conciliatory message he brought. Trade unionists were not likely to forget that it was Mr Nixon who, with Mr Weeks, the Secretary of Commerce, was credited with having persuaded the President not to sponsor the amendments to the Taft-Hartley Act which Mr Durkin felt he must secure to justify his remaining in the Administration.

The President, in his message, promised that his own suggestions for amending the labour law would be sent to Congress when it reassembles in January and that labour's views would continue to be sought. He did not retreat, however, from his position that the Act had been successful in protecting the rights of management, the trade unions, and individual workers, although it had defects which should be remedied. Mr Eisenhower was diplomatic enough not to refer to Mr Durkin's departure in more than general terms. Mr Nixon, however, flatly asked for a withdrawal

of Mr Durkin's statement, made to the convention a day earlier, that the President had gone back on an agreement with him. The dispute over what may have been a simple misunderstanding has now gone too far to be settled amicably. Mr Meany, the president of the AFL, in any event, had hardly set the scene for a reconciliation when, in his opening address, he charged the Administration with subordinating human values to the material welfare of the "greedy few." Such prospects as ever existed of a broad agreement on amendment of the Taft-Hartley Act have now flown out of the window, and the life of the next Secretary of Labour is not likely to be an easy one.

On the other hand, the breach between the Administration and the AFL will remove at least one of the obstacles to a closer working relationship and perhaps eventual unity between the AFL and the Congress of Industrial Organizations. The conclusion of a no-raiding pact with the CIO, along with work on machinery to settle internal jurisdictional disputes, is the main business of the convention. As long as the AFL felt it had the ear of the President, the CIO was likely to suspect the sincerity of its desire for a common front.

Compatible Colour

AT the end of last month when a televised transmission in colour of the puppet opera "St. George and the Dragon" was seen in black and white on ordinary sets with unusual clarity, colour television moved a big pace nearer the American home. The Radio Corporation of America had proved that its colour system was truly "compatible," because definition was good whether or not the programme was actually received in colour. The same point was made in sixteen volumes of technical evidence presented by the National Television System Committee, representing the leading manufacturers, to the Federal Communications Commission with the request that RCA's method should be declared the standard one for all colour television. This request even had the support of RCA's rival, the Columbia Broadcasting System, whose incompatible method had been adopted as the commission's standard just before the Korean war put a temporary stop to development.

As the commission's deadline for the receipt of opposing views passed without any substantial protest, and the three main companies now putting out television programmes will be staging a full-scale test in a hotel on Long Island on October 15th, it looks as though a favourable verdict may be reached by the end of the year. Then for competing broadcasting companies, and for television set manufacturers and dealers, the battle of the colours will really be on. The timing is very convenient for the manufacturers, who were afraid that their present high rate of production, running now at 7½ million sets a year, could not last beyond 1954. By then the industry expects to have met the bulk of the demand from new viewers brought in by the rapid growth in the number of television stations; in the eighteen months since the FCC raised the ban imposed while it was sorting out the allocation of wavelengths, the total number of stations with permits to operate has gone up from 108 to 229.

It is the retailers of television sets who are most worried

at the moment. Their sales are already failing to keep pace with rising production, and they are afraid that they will be left with large stocks of old models on their hands while customers wait for the arrival of cheap colour sets. To protect themselves the retailers are planning a "powerful programme of consumer education," pointing out that the only colour sets available next year will be expensive (\$800 to \$1,000) and small, with only a 14-inch screen, and that mass production is several years off. But these arguments may be upset by the announcement of one firm, the Emerson Radio and Television Company, that it will be supplying the new kind of receiver at only 25 per cent above the cost of the old eighteen months after the FCC has given its consent for colour transmissions.

Arming for Tariff Battles

THE Randall Commission, which is to chart a new Republican course on foreign trade for the President, held its first meeting this week at the White House to receive its marching orders. This is none too soon if the commission is to have its recommendations ready by March. Even that may be late in the session for debate and action by a Congress already eager to make an early start on its election campaigns. The President's parting instructions to the commission were to be realistic and bold, and to apply faithfully one standard: what was best in the national interest.

In view of the special interests which are ready to bombard the commission, and the tendency of many Congressmen, particularly if they come from farming states, to think of the national interest in terms of stimulating exports rather than imports, Mr Randall is fortunate in the launching, just at this time, of a new Committee for a National Trade Policy composed of distinguished representatives of big business. It will be devoted to spreading the gospel that, without the expansion of trade and opportunities to earn dollars, foreign countries will not be able to provide for their own security and may be driven back on trade with the Communists, and will point out that the size of American export markets is determined by the ability of other countries to earn dollars.

Although the unfreezing of American trade policy must wait for the Randall report and perhaps a good deal longer, the President himself will have opportunities before then of applying his own principles. Under the Act extending the reciprocal trade programme, he must break ties on the Tariff Commission, which is now split evenly along party lines over the demand of the glass industry for relief from foreign competition, with the three Republican members favouring increased protection. An application for relief which carries more political dynamite is that of the owners of lead and zinc mines, which is to be heard in November. Falling prices have closed many marginal mines, which came to life during the Korean boom, but have not discouraged imports of the metals. The unemployment in western mining towns had already led two Congressional committees to ask the Tariff Commission to make an investigation even before the industry submitted its request for a 50 per cent increase in duties over the levels prevailing in 1945 (they are now lower) and the imposition of quotas whenever prices fall to 15 cents a pound or less for either metal.

SHORTER NOTES

The first casualty has occurred among the business men who came into the government this year. Mr Craig Sheaffer, one of the Assistant Secretaries at the Department of Commerce, has brought on himself the wrath of the scientists by recommending the dismissal of Dr Astin, head of the National Bureau of Standards, for disregarding market considerations in the testing of commercial products. Now his scheme for enlisting the help of the manufacturers in organising the Defence Production Agency has been arousing the critical interest of the Anti-Trust Division of the Department of Justice. Mr Sheaffer decided that he would rather go back to Iowa and manufacture pens.

★

In compliance with this year's special Immigration Act, the President has formally transferred the responsibility for administering its provisions from the Department of Justice to the State Department. This means that the State Department's Security Officer, Mr McLeod, who is already so popular with Senator McCarthy, will have the opportunity of making an equally good impression on Senator McCarran, who was responsible for writing into the Act the elaborate screening arrangements that may well defeat its stated object: the admission of an extra 209,000 refugees and immigrants from over-populated countries in the course of the next three and a half years.

★

It is to be hoped that the return of Mr Emmet Hughes, President Eisenhower's most successful script writer, to the staff of *Life* will not have too noticeable an effect on the President's forthcoming series of speeches. Mr Hughes joined Mr Eisenhower's campaign staff at a time when the general's prose style seemed in danger of foundering completely, and was responsible both for his promise to go to Korea if elected and for part, at least, of the best speech he had made so far in office: the address on foreign policy to a group of editors on April 16th.

★

After 51 years of giving financial help to education, the General Education Board of the Rockefeller Foundation is to close its books this December, for its resources are nearly exhausted; it is spending its last \$5 million this year. Since 1902, the Board has paid out \$316 million, the bulk of which helped colleges and universities, especially in the poor southern states where education needed the encouragement that money could give.

★

The hot, dry weather in August seems to have saved the Secretary of Agriculture from having to impose marketing controls on next year's maize plantings, although it is still likely that they will be required for cotton as well as wheat. The September forecast for the maize crop, at 3,216 million bushels, was over 100 million bushels lower than the August estimate.

★

A rise in revenue and a reduction in underground travel have been the expected results of the fare increase on the New York City transport system in August. In the third week of its 15 cent fare there were 11 per cent fewer passengers, and total earnings rose by 33 per cent.

The World Overseas

New Blood in Iraq

IRAQ is a country in which cabinets that appear to be coasting in style seem to tire and topple overnight. Last week, the one which had ruled since the general election of January collapsed without public warning. Its elderly premier, Jamil el-Madfai, was in poor health and some say, unwilling to face another session of Parliament without a firmer majority. Since he had Nuri Pasha in his cabinet, and Nuri's following holds eighty-four out of the 141 seats in the lower house, this second suggestion is flimsy. There were other impulses behind the change, and one of them was royal awareness of a discontent that has often been described in *The Economist*—that of a younger group of liberals and radicals who despair of achieving social change so long as cabinets consist in the main of elderly feudalists.

For some weeks, therefore, discussions had been taking place between the royal house and senior politicians. Iraqis are always well informed about events in Persia, and it is possible that the ex-Regent thought to take time by the forelock. One of the prominent Iraqis whom he consulted, Dr Fadhil el Jamali, expressed disagreement with the future plans of the men in power, and after some days spent in debate with both the young king and the ex-Regent, was asked to form a cabinet. He is a well known figure abroad as he frequently represents Iraq at the United Nations.

In some respects the novel and unfamiliar group that Dr Jamali has produced shows considerable promise. Its handicaps are that it is young for a country in which age, not youth, is normally the generation to have its way; that it includes many men with no ministerial experience; and that it contains only four members of the majority party—Nuri Said's party—and might therefore become vulnerable to attack in parliament. As against these drawbacks, it includes a few tried and able men. Its Minister of Finance, Abdel Kerim el Uzri, has held the job before and held it with distinction; in 1949-50 he set Iraq's finances straight after the disastrous months that followed the Portsmouth treaty riots, and he played a leading part in pushing into being a national Development Board founded on the oil royalties. Its Minister of the Interior, Said Qazaz, who is a Kurd, was—at Mosul—perhaps the most efficient *mutassarif* contemporary Iraq has known; being an older man and a person of strong character, he may supply the group with some necessary ballast. It brings an intelligent experienced mind to the ministry that runs the Development Board, and a young man of promise to that of Agriculture. Their parliamentary problems apart, men of this calibre could do

Iraq immense service simply by re-organising the machinery for carrying out a government's intentions; parts of the civil service have run down sadly in recent years, principally owing to over-staffing and to a consequent lapse into old-fashioned habits of passing much time in chat.

One great national advantage to be derived from a steady cabinet would be the gift of time in which plans already set in motion by the Development Board can continue to mature. Of the Board's new big schemes, that which will afford the Tigris flood an escape into the immense depression of the Wadi Thathar is the farthest advanced; tenders for the next big one, the Dokhan barrage on the Lesser Zab river, are invited next month. *The Economist* is among the many onlookers who regret that Iraq, in its new Development Law passed in July, altered the shape of its Development Board from that of a permanent body of experts responsible to Parliament only through the Prime Minister, into an ordinary ministry; it felt that the chances of continuity were sadly impaired by the change. The new Minister of Development, Ali Haidar Sulaiman, is—as was his predecessor—a competent man, and is unlikely to interfere with programmes that are already afoot. But for the future, there remains the risk that if cabinet changes are as frequent as in the past, development may be reshaped according to personal predilections, and be tampered with to the detriment of work on schemes that ripen slowly; it is to be hoped that this ministry will, by long survival, postpone that evil day.

In a word, this cabinet is unlike all its predecessors; for the first time it offers responsibility to a generation that has been highly critical of Iraq's older men. Though representative of Iraq's small but growing population of middle-class townsmen, it is wonderfully free of the impractical idealists of whom that brave new world is largely composed. A feature that could work for it or against it is that it contains more Shiah members—seven in all—than any of its predecessors. From Turkish days, the ruling class has been of Sunni persuasion, but the Shiah sect forms the majority in the country; the change reflects the spread of education to people who were once underdogs. There is no reason to suppose that the cabinet will make any changes in foreign policy. Its chances of success lie in its patent capacity for work; the principal threat to long survival is its dependence on the conservative majority in Parliament. For the moment, the die-hards will no doubt be condescendingly ready to watch it manufacturing rope with which to hang itself. Its testing time will come when they tire of novelty.

Swiss Trade Behind the Curtain

FROM OUR SPECIAL CORRESPONDENT

NEITHER in government nor commercial circles in Switzerland is an optimistic view taken of future trade prospects behind the iron curtain. True, it is realised that something may come of the interest in the home consumer recently shown by the Soviet government and, in a lesser degree, by the rulers in Prague and Budapest; and nobody would object to buying food and coal from these familiar and former sources if the prices were reasonable. But experience has shown—and the evidence of individual businessmen confirms—that trading policy behind the iron curtain is at the mercy of Moscow's complicated centralised planning, and that important structural changes in the pattern of Eastern Europe's economic activity have been made which cannot be changed easily.

Indeed, Switzerland's experience provides valuable evidence of the extent to which eastern—rather than western—policy has deliberately restricted commercial exchanges; for in that experience consideration of cold war and unofficial blockade have not played the part that they have played, say, in American or German policy. For Switzerland has not been subject to the restrictions of the Battle Act. A typical example is provided by Czechoslovakia. That country furnished in 1938 3.6 per cent of Switzerland's total imports and in 1947 the amount rose

SWISS IMPORTS FROM EASTERN EUROPE

* Half year.

to 5.4 per cent. After the Communist seizure of power in 1948 the figure fell from 2.1 per cent in 1950 to 1.2 per cent in 1952 and to 0.9 per cent for the first half of this year. Swiss trade figures, recently analysed and published by the *Neue Zürcher Zeitung*, also show how the surpluses that used to provide the eastern exports to Western Europe have been dwindling and disappearing. In 1938 one-third of Switzerland's grain and fodder needs were met by the Soviet Union and the satellite countries; now the figure is under 4 per cent; one-quarter of its petroleum came from Rumania, now there is none; from Poland in 1938 came 150,000 tons of coal—in 1950 this had dwindled to 50,000 tons, largely because of the high price.

The way in which, hitherto, the governments of these countries have favoured capital goods imports rather than consumer goods is illustrated by the fall in Swiss textile exports, by the rise in machinery exports from 4,832 tons in 1938 to 12,878 in 1950 (with a sharp fall to 6,578 in 1952); and by the fall in Swiss watch exports from 1.6 million (watches) in 1938 to 264,000 in 1952. One or two agricultural articles imported into Switzerland from Eastern

Europe have held up well and Swiss exports of instruments have remained steady. But the general picture is of sharp decline. The satellites have not been offering the food and raw materials that Switzerland wants, either in sufficient quantity or at competitive prices. One main reason is that Communist planning has raised the percentage of their trade done with the Soviet Union from $\frac{1}{2}$ per cent in 1938 to about 30 per cent in 1952; the second is the concentration of their investment in heavy industry at the expense of agriculture. Other contributory causes have been Communist price policy, ranging from excessive prices for coal to dumping prices for textiles; payments difficulties; and the success of the Swiss in paying their way for what they want from dollar, sterling and other sources. If the old pattern and scale of trading is to reappear in the way Communist propaganda says it could, there is a great deal of work and negotiation to be done.

Assize of French Radicals

LAST week the fashionable spa, Aix-les-Bains, was flooded with important political personalities and offered an impressive display of oratory. The Radical-Socialists had come down for their annual congress. True, they are no longer the power of prewar days, but with over 70 deputies they are a crucial element in any centre coalition. They have also in their ranks a large collection of important political figures headed by the party's chairman, the president of the National Assembly, M. Herriot, and including present ministers, like the finance minister M. Edgar Faure, former premiers—MM. Queuille, Mayer and Daladier—and a potential premier in the person of M. Mendès-France. Indeed, the rank-and-file were overshadowed by the leaders.

Coming after the biggest postwar strike wave in France and after Dr Adenauer's electoral victory, the congress turned out to be something of an anti-climax. True, there was much talk of the revolutionary situation and parallels were drawn with the French Revolution, of which the Radicals claim to be the heirs. Yet the contradictions, indecision and patched up compromises were not of a nature to provide leadership for the cure or transformation of the new *ancien régime*. On the main issues—the cure for France's economic crisis, and its attitude towards EDC and towards the vague socialist proposals of a "socialist and democratic front"—the congress gave no clear answer, or rather it avoided choosing between conflicting replies.

Indeed, the Radical party presented in miniature the weakness and dilemmas of the present coalition government. It has been aptly compared to a "club" rather than to a disciplined and homogeneous organisation. Though it participates in M. Laniel's cabinet, the government's policy does not find favour with many members of the party, even the economic policy directed by a Radical. On European defence the Radicals are as divided as the government itself. Finally, they cannot make up their minds whether the balance of the parliamentary centre should shift to the left or stay on the right. Covering themselves both ways, they have ministers in the Laniel team and a much fancied outsider in M. Mendès-France.

No amount of rhetoric could hide these discrepancies. M. Faure, naturally enough, defended the present economic

policy as one of "effort and hope." In the absence of several leftish delegates from the south-west, the postmortem on the crisis was harder on the strikers than on the government. True, nobody denied the need to improve workers' conditions, but the emphasis was on the need to prevent strikes by public employees. All agreed on the need for change, yet it was left to M. Mendès-France to reiterate his alternative policy. Once again he sounded the tocsin and demanded not expedients but a new deal. He did not spare M. Faure and criticised the investment plans of the government. He attacked the delusion that it is possible to give more to some without reducing the privileges of others as well as unproductive resources (i.e., defence). The strikes were caused by "sadness, despair and discouragement," and the workers would not accept a new fraud. And M. Mendès-France ended on a historical note: "Listen to this growing clamour. We are in 1788."

Necker and Turgot, Too

M. Herriot, that past-master of historical analogies, must have kept his tongue in his cheek when he complimented M. Mendès-France as the Necker of our time. Did he imply that he would not be given his chance or that no Necker can arrest the course of events? In all these parallels it is not quite clear on what side the Radicals want to stand in a French crisis. As a commentator observed, they would like to have Necker and Turgot, too. They cannot make up their mind what attitude to take to the new fourth estate—the workers. The Communist slogan of "united front" must be a popular one, since the Socialists have countered it with one of "social and democratic front." Yet, nothing concrete is known about that front except that it would exclude Communist card-holders. It implies, however, a sort of alliance between the Socialists and the left-wings of the Radicals and the Christian Democrats (MRP). To accept the invitation, therefore, would involve a shift of confidence from the present ministers to M. Mendès-France. The Radical leaders do not think that the clamours have been loud enough to impose such a change of emphasis and prefer to hedge for the moment.

Even greater art was needed to reconcile the conflicting views on EDC. While MM. René Mayer and Maurice Faure pleaded that this is the only possible solution, M. Daladier argued that the "treaty was no more acceptable than a year ago," when the Bordeaux congress branded it as unconstitutional. Both he and M. Herriot advocated top level talks with the Russians on the lines prescribed by Sir Winston Churchill in his "Locarno" speech. Only if these fail should France fall back on EDC. In the final compromise the congress adopted an attitude slightly less hostile than last year. It deplores the fact that the problem has to be tackled prematurely and subordinates its approval of the treaty to the prior internationalisation of the Saar, to additional protocols, the limitation of police forces and the creation of a supranational European executive.

Patched-up compromises and semi-solutions are no panacea for a crisis. If France is really back in 1788 the Radicals provided no manifesto to unite forces either for the cure or for the rescue of the present regime. The recent strikes have not upset, at least as yet, the balance of the centre coalition nor of the "radical club." But in the Palais Bourbon, when Parliament passes its verdict on the handling of the crisis, the Radicals will have to be more specific than in the festive atmosphere of Aix.

Britain Alarms Dutch Traders

FROM A CORRESPONDENT IN HOLLAND

THE British request to be allowed to give new tariff protection to certain of its industrial and agricultural products has naturally been received in the Netherlands with disappointment and apprehension. At a time when the world is resounding with slogans of liberalisation and freer trade, it is rather sad to find that Britain is considering measures which must tend to cut down the exports of other countries. These measures are all the more disturbing because they will especially hit a few small countries, which have few other markets for their perishable agricultural products; countries, moreover, which are important customers for British goods and which themselves have the lowest tariffs in the world.

The British market is vital for the agricultural industry in which the Dutch specialise, and which they have built up over many decades through their diligence, experience and scientific research. They therefore find it difficult to understand how the British request will help to free world trade, facilitate the international division of labour, lower the costs of living or—last but not least—advance the interests of the British consumers. Although the Dutch prefer to defer judgment until the concrete British proposals have been fully aired, it is certain that the Netherlands—together with other European countries in the same boat—will be opposed in principle to them. It seems that British circles too realise that to raise British tariffs against non-Commonwealth countries while maintaining tariff exemptions for Commonwealth countries is in opposition to the Gatt pledge not to enlarge existing tariff preferences.

Gatt's Blind Eye

Whether the other signatories of Gatt will be accommodating enough to turn a blind eye to this evasion of Britain's undertakings is an open question. Nobody's interests, certainly not those of the small nations, will be served if strong tensions should arise over this issue among the signatories. It would be unfortunate if, as a result, Britain should only reluctantly continue its membership with a view to abandoning Gatt as soon as possible. (Already recent official declarations at Commonwealth meetings and in Washington have given rise to the suspicion that the Commonwealth will in any case pull out in the near future.) Moreover, it is felt that if other countries accept the present British request they will create a precedent of "benevolent interpretation" which will open the door to similar requests that Gatt should consider other special cases; in this way the trump card of "no new preference" will be sacrificed.

Last year when the Netherlands opposed the United States attempt to evade its Gatt commitments by increasing duties on dairy imports, it enjoyed the support not only of other European countries, but also of Canada and New Zealand as well. It is clear that the conscience of all signatories of Gatt, the countries of the Commonwealth included, will be severely tested by the British request.

In any case, if their request is to have any chance of

THE UNITED
STEEL
COMPANIES LTD

What does United Steel make?

The range of steel products of the United Steel company is easily the most comprehensive in the country. Engineering, mining, constructional work, shipbuilding, electrical and other primary industries, railway, motor vehicle, aircraft, hardware and domestic, textile and other trades depend upon steel in all its forms. This widespread demand is touched at almost every point by the United Steel company's production. The practical and economic advantages of such a range of output are manifest. All needs of large and small individual consumers can be supplied through a single selling organisation, securing from one product goodwill and contacts for another.

Of prime importance is the ability to adjust production to variations in demand, giving widespread stability and security to the whole organisation.

THE COST OF DRYING THINGS

Millions of tons of fuel are used in Britain every year in drying processes, many of which are inefficient and wasteful.

When coal was cheap no one worried unduly, but today the cost of fuel used in drying is a serious expense item which tends to get buried in general overhead without receiving the close control given to economy of raw materials. Furthermore, many drying processes are as ineffective as they are extravagant.

Eight years ago, we started a specialised service to the Metal Goods Industries by providing Gas Infra-Red Tunnels for drying paints and varnishes. Today our techniques have wide application as varied as those employed in fish curing and textiles.

We are ever looking for new drying problems to solve. Nearly every industry has one. Send yours to:

consideration and success, the British will have to accept some conditions. Apart from the Commonwealth, the British tariffs will have to be non-discriminatory as regards other countries. There will have to be an undertaking that the existing proportion between total British imports from Commonwealth countries and total imports from non-Commonwealth countries of the goods concerned will not be changed to the disadvantage of the latter. Further, it is essential that the new tariffs shall not be prohibitive. Just as Britain will not resign itself to prohibitive American tariffs, so the Netherlands and Denmark must fight tariffs which would practically cut off the road to British markets. Finally, the countries concerned will certainly insist that an end should be put to the rather arbitrary methods by which imports have been kept within the limits desired by Britain. Imports under the new tariff will have to be absolutely free.

It is to be feared that even the enumeration of these conditions will incense many people in Britain and in the Commonwealth and will supply Mr Menzies with some new followers. But the world has become too small for any country (or group of countries) to go its own way without upsetting things elsewhere. It is essential that Britain shall consider what consequences its proposals will have for its trading partners in Europe; so far as can be judged, it is difficult to see what advantages they can derive from them.

Changes in Czechoslovakia

LAST week's cabinet changes in Prague follow—somewhat tardily, it is true—the pattern set by the Kremlin after Stalin's death. The ministries of state security and of the interior have been merged, and Vaclav Nosek (who, incidentally, held power during Beria's day) has been replaced at the latter by Rudolph Barak, a comparatively obscure party man who entered the cabinet as a vice-premier only last March. As a concession, probably, to popular prejudice against a party-dominated government, party and government posts have been carefully separated. In particular, Antonin Novotny, who was recently elected first secretary of the central committee of the Czechoslovak Communist party, has lost his vice-premiership; but this does not mean that his power is any the less.

Finally, as in Russia, there has been a reshuffling and reduction (but only from 33 to 28) of cabinet posts. The ministers who lost their jobs have not been purged; they have been thanked for their services and officially assured that they will get new posts in the government or the party. All the same, five of them have been in economic ministries (including Agriculture, Fuel, Energy and Railways), which have been making particularly heavy weather, and their dismissal, together with the streamlining of the administration, was no doubt designed to clear the decks for the revised economic policies announced shortly afterwards to the National Assembly by the prime minister.

Mr Siroky's speech cannot have come as a surprise to his audience. Both from their own experience and from the constant complaints and laments made in the press and by government spokesmen, they must have had a quite clear idea of Czechoslovakia's economic troubles; and they probably realised that in dealing with them the prime

minister would take his cue from what has already been undertaken by his colleagues elsewhere in the Soviet bloc. Mr Siroky made the now ritual admission that the targets for heavy industry had been placed too high, and those for light industry too low. He promised a slowing-down in the development of heavy industry, increased investment in agriculture and increased supplies of consumer goods. In the current year—the last of the five-year plan—capital investment is to be reduced by about 16 per cent, and next year it is to remain at about this revised level.

Pep Talks and Promises

In one important respect, however, Mr Siroky departed from the usual brief. The government has decided to pay more attention to the development of the basic industries, and, according to a government directive, during the remainder of this year material and financial resources are to be concentrated "in the most important projects, especially those affecting the raw material branches of the economy." The development of Czech industry is, in fact, hamstrung by inadequate supplies of coal, power, iron and steel. And the lack of these basic necessities has, in turn, been accentuated by the failure of the engineering industry to produce enough of the necessary equipment. *Rude Pravo* recently pointed out that

the Ministry of Heavy Engineering returned a gross production target for the quarter of 97 per cent. Yet that Ministry is fulfilling its plans for the production of certain important types of turbines, boilers, and rolling equipment to 25, 33 or 40 per cent only. These are pieces of equipment that are anxiously awaited by power stations, steel works and mines.

But it is the discontent of the workers, the lack of labour discipline and the high rate of absenteeism, that is the chief cause of the trouble. This has been a major worry to the regime for a long time, particularly in the coal-fields. Communist leaders have been making repeated efforts to bully and cajole the miners into fulfilling their targets, and to persuade party and trade union officials that it is their duty to enrol as a "volunteer brigade worker." Only the other week, President Zapotocky, accompanied by his wife and four cabinet ministers, toured the Ostrava coal basin and delivered a series of stirring pep talks, including one to Czech army labour units working in the mines at Karvina.

How to Serve Food

But pep talks unaccompanied by more food, more houses and more consumer goods, will not cut much ice. A series of measures designed to remedy these deficiencies has therefore been announced. Increased investment, more fertilisers and more machinery are to be pumped into agriculture. The private farmer, who, as Mr Siroky acknowledged, is still the dominating factor in Czech agriculture, is to get his share of whatever help is going in order that he may raise production and yields. But the premier made it quite clear that the policy of collectivisation has not in any way been abandoned. New collectives must only be formed by strictly voluntary means; but if old ones do badly—as many of them seem to be doing—the members must be told that the fault lies not in the collective as such but in their own inadequacies. And, unlike Mr Nagy in Hungary, he made no promise that peasants would be allowed to walk out of collectives.

The sweeping series of government directives on

improved housing and social welfare facilities, on bigger, better and cheaper food supplies, and on higher living standards in general, reveal by implication and sometimes by open admission the sad state of affairs which they are designed to remedy. Both the directives and Mr Siroky's speech also betray, sometimes in a rather ridiculous way, the almost desperate desire of the regime to make people more contented with their lot. "Life in Czechoslovak towns, villages and enterprises," pronounces one directive, "must be increasingly pleasant and happy." And while Mr Siroky insists that "food must be served in a cultured manner," another directive on improving social and cultural life insists, with a fine disregard of human limitations, that "the number of outstanding sportsmen must be increased."

The trouble with the Czech government's new plans is that they try to do too many things at once. Mr Siroky promises more food and consumer goods and better living conditions for workers and farmers. Next year, production in the engineering industry is to be designed to this end. Thus while engineering production as a whole is to be increased by 7.9 per cent over the 1953 level, consumer goods produced by the engineering industry are to be increased by 15 per cent; and in order to secure higher imports of consumer goods and of raw materials, exports of machinery and equipment are to be increased by 27.3 per cent. How then is the engineering industry to produce also the additional supplies of heavy machinery and equipment that Mr Siroky insists are essential to secure greater output from the mines, foundries and power stations? The dilemma is acute. Failure to fulfil Mr Siroky's promises to the workers must provoke still more discontent; but it is not easy to go slow with the development of the Czech basic industries because, unlike those in, say, Rumania and Bulgaria, they are vitally important to the development of the whole Communist bloc.

Burying Beria in Georgia

LAST week's wholesale purge of the party and government leadership in Soviet Georgia was a second blow against Beria's followers in his native land. In July, after his fall, some of his men were eliminated from office, in particular the minister of the interior, V. Dekanozov. That two months, however, were needed between the first blow and a general attack is a sign that Beria's victors are not having an easy time, that the ideas associated with Beria die hard and that his men offer resistance. Beria's policy of "liberalisation," of greater freedom for the national minorities must have found an echo throughout the non-Russian republics and the sweeping purge is likely to spread from Tiflis to Kiev, Minsk or Vilna. But it is with the Soviet Corsica, with Georgia—the home of Stalin as well as his own—that Beria was most closely linked, and the conflict is best seen through events in that republic.

Last week's purge was the fourth act or rather the second scene of the third act in a yet unfinished drama. It started in April of last year when the Georgian cabinet was dismissed and the first secretary of the party sacked. The purge was revealed a few months later at a regional party congress by the new first secretary, A. I. Mgeladze, who accused the disgraced leaders of "bourgeois nationalism" and anti-Russian manoeuvres. Mgeladze played an im-

portant role at the All-Union Party Congress in October. His policy, therefore, must have had Stalin's tacit approval. Yet it was clearly opposed by Beria, and immediately after the Leader's death Beria struck back.

In April of this year Mgeladze was replaced as first secretary by A. T. Mirtshulava; V. M. Bakhradze, who had held office in Georgia before the war when Beria was supreme there, was appointed premier; and another companion of Beria, V. Dekanozov, became head of the ministry of security. The former minister, Rukhadze, was accused of criminally fabricating charges of "bourgeois nationalism." The former "culprits" were rehabilitated and their accusers attacked for following an "incorrect nationality policy." All this was in keeping with the first moves of the post-Stalinist regime, with the amnesty, the reversal of the doctors' plot, the promise of a new code and of a better treatment of minorities. A congress of the Georgian party was scheduled for the second half of May, probably to eliminate Beria's opponents from all positions of trust. Whether the anti-Beria forces were already gathering strength or for some other reason, the congress was never held and in June Beria was officially branded as a "traitor."

Three-Act Guignol

The third act was soon opened in Georgia. In July a meeting of the Central Committee was held. General Antonov, army head in the Caucasus, was prominent among the new accusers, and Major-General P. I. Yefimov was elected to the party's bureau, thus showing the part played by the army in Beria's fall. Dekanozov was sacked from his post and soon the same fate awaited all the republican ministers of internal affairs nominated during Beria's rule. But Beria's appointees were not limited to those offices. In Georgia, for example, they still held the supreme posts in both government and party. In vain did Mirtshulava and Bakhradze vituperate against Beria at the recent meeting of the Supreme Soviet. This has provided them with only two months' grace. As soon as they found it safe the opponents of Beria attacked the disgraced leader's strongholds. The Georgian Premier and first secretary are now being thrown overboard, together with the entire bureau of the party. The secretary of the All-Union Communist party, Shatalin, came from Moscow to supervise the purge.

The struggle, however, is not finished. The policy of "liberalisation" followed during the first hundred days after Stalin's death was not Beria's own doing. It must still have many adherents in the peripheral republics and within the Kremlin itself. His opponents cannot therefore strike without careful preparation. This may account for the conspicuous silence over the Beria affair since his initial denunciation, and opportunities for vituperations against the "traitor" have not been lacking. Thus, for example, Beria had been accused of trying to wreck the collective farm system, yet Nikita Khrushchev did not judge it opportune to mention him a single time in his report on shortcomings in Soviet agriculture. During the prewar purges, trials were prepared by intensive campaigns of vilification. In Beria's case a campaign reminiscent of the thirties was started and then stopped after a few days. His case was transferred to the Supreme Court and a new prosecutor has been appointed. Yet there are no other signs of an impending trial. Having won one round, the Stalinist diehards seem to have difficulties in bringing their opponent into the dock.

THE TIN *that never was*

TINS AREN'T TIN at all, but steel. The tin is a paint-thin coating on a steel container. We call the metal tinplate (and the opener a tin opener!) but it is still steel.

Tinplate making is one of the oldest crafts in Britain: the origin of the name "Britain" means "land of tin". The industry has grown mainly in South Wales over several hundred years by traditional methods of hand-rolling. Over the past fifteen years modern continuous plant has been brought into service in this country to cope with the vastly increased demand. At Ebbw Vale in Monmouthshire and later at Trostre in Carmarthenshire immense continuous mills have been installed.

Tinplate is counted by a "basis box" of approximately 100 lbs. These new mills have made possible an output which in 1952 reached a total of twenty million boxes of tinplate, or about one million tons.

Not a job to be knocked off casually, with grease and hessian, timber and nails. That way is about as obsolete as a flint axe-head.

The modern method is exemplified by Remploy's P.I.P. organisation (Preservation, Identification, Packaging). First, the axe-heads are chemically cleansed. Then they are treated with a hard, chip-resisting preservative that forms an airtight covering. Next, the handles are protected with a wood preservative. The packing cases are specially designed so that the axe-heads interlock in safety, 'cradled' against shock, and

the projecting handles are bound together with cushioning material. Consignees appreciate these niceties!

There is an old and apt saying, 'Put the axe on the helve,' meaning *Solve a problem*. P.I.P. is ready to do just that for you, on anything that concerns packing, with any kind of goods.

Remploy's packing is on all M.O.S. Inspectorate approved lists. The P.I.P. organisation, largest of its kind in the U.K., has 13 factories throughout the country. These provide everything for a complete packaging service.

THE BUSINESS WORLD

Two Views of Bank Rate

SECOND thoughts on last week's surprise reduction of Bank rate have been of two quite distinct and even contrasting kinds. On the one hand, to most of the great majority who hailed it with jubilation the second impression has merely confirmed and strengthened the first. In the stock markets, and probably in the business community generally, it is seen as a clear official demonstration of confidence that the dangers that necessitated the plunge into dearer money have been safely surmounted. To such observers the reduction appears as a major pointer to economic policy as a whole; but those who see it in this light do not all read it optimistically. There are some who believe that the Bank's gesture was related less to Britain's recent progress than to an apprehension that a low-pressure system may soon move eastwards across the North Atlantic. Though this interpretation is not common in the City, it is noteworthy that the initial reponse of stock markets was rather less violent in industrial equities than in gilt-edged. In any case, both the optimistic and the pessimistic wings of this school of thought are rapidly convincing themselves that the trend of interest rates will now be downwards, and a few of the more volatile prophets among them are already counting the weeks to a 3 per cent Bank rate.

On the other hand are the City institutions most intimately and directly affected by the Bank's action, the banks and the money market. These appreciated from the outset the official explanation that the change was designed to serve an important technical purpose, and was something less than a straightforward reduction of Bank rate on the traditional model. That would have been apparent to them in any case, merely from the fact that, whilst Bank rate (the "official minimum rate of discount") had been reduced, there had been no change in the Bank's rate for seven-day loans (which,

since 1951, had been at $\frac{1}{2}$ per cent below Bank rate if Treasury bills were offered as collateral). The banks and the money market had long been acutely aware that frictions were developing in the rate structure because of the wide margins that had been established between rates for Treasury bill finance and for other short-term credit, notably commercial credit obtained on bills of exchange. The "unification" of the two Bank of England rates was therefore immediately recognised as a move to permit the correction of distortions in the wider structure of short-term rates.

But the Bank of England had not been content merely to count upon such an interpretation by the experts; it had also taken special steps, in the form of an official announcement and also in explanations given informally, to emphasise the importance of the technical aspects of its "adjustments" for "unification" (the word "reduction" was not used officially at all). The technical considerations, as *The Economist* noted last week, were emphasised positively—in the explanations that the privileged rate for loans at the Bank against Treasury bills had been a temporary measure introduced in 1951 to "ease the transition to a more positive policy," and that the unification now would facilitate a more flexible use of Bank rate "in either direction" and ensure that it does not get out of touch with market rates. They were also emphasised negatively—by the assertion that the "adjustments" had not altered the "tighter" monetary policy of the past eighteen months, by a reminder that the so-called selective control of bank advances had not been changed, and by a strong hint that the Bank's action did not mean that a green light had been signalled on Britain's way ahead.

The very fact that explanations were given, and given partly by formal statement, plainly showed the authorities' anxiety to try to prevent the wider public from

jumping to precisely the conclusion that has in fact been drawn. No doubt they reckoned that an uninhibited response was inevitable in any case at the outset but hoped that the public reaction would be tempered by a cool assessment in the City of what they themselves were aiming at. These hopes, however, were never realised. The second day's rise in gilt-edged was as large as the first, and not until the middle of this week were there clear signs of a corrective movement. These rises, superimposed upon the strength of this market throughout the summer, restored the long-term section to levels that last obtained when Bank rate was still resting inert at 2 per cent. The gilt-edged market behaved, indeed, as if this "unification" were not only a normal reduction of Bank rate by $\frac{1}{2}$ per cent but also a clear precursor of further reduction.

★

In the circumstances, the original intentions of the authorities are not easy to gauge. However much they counted upon the success of their precautionary explanations, they obviously knew that their act would give an important psychological stimulus to business confidence—or at least to hopes of cheaper money. They also knew that the reduction in Bank rate, although it was not a normal one, would affect the whole structure of short-term rates, not only psychologically but also directly. Hence, however much weight was attached to the technical objective of removing anomalies from the general rate structure and thus of promoting flexibility in the money market, the consequences were bound to be more—perhaps much more—than merely technical. The technical aim could not be attained in the foreseeable future unless the authorities were sufficiently confident to give (or should one say, to risk giving?) this two-pronged stimulus. That fact being granted, the unabashed enthusiasts in the gilt-edged market may even conclude that their first easy assumptions were justified after all.

MONEY AND BILL RATES

New Pattern of Rates

But that is not how the matter appears to the banks and money market. Second thoughts there make the technical aspects appear even more important than they looked at the outset. All the evidence that has accumulated so far suggests that monetary "flexibility" is now intended to become a reality instead of the pious hope that it has mainly been in these past two years. There are signs that, though most short-term rates have been lowered now, they are becoming a "taut" structure—in the sense that the whole pattern can be quickly raised or most of it lowered, in small or large gradations, by the traditional levers in the hands of the authorities. Some salutary surprises may be in store for those who still think in terms of the unnatural and rigid patterns of rates and the spoonfeeding of the money market that have been characteristic of monetary technique since 1932—not excepting the past two years.

The changes in rates in this first week have proceeded from the fact that since 1951 charges for bank advances had become again effectively linked to Bank rate, subject to over-riding minimum rates. These arrangements are defined in the individual contracts; for example, they may fix Bank rate as the charge at one extreme and 2 per cent over Bank rate at the other extreme, subject to differing minima. The effect of a change in Bank rate is therefore automatic; and on this occasion, broadly speaking, the minima have become effective only for those smaller industrial borrowers and strong personal borrowers whose loans were running at 1 per cent above Bank rate with a minimum of 5 per cent. Most of those who were previously paying more than 5 per cent and virtually all the very important customers who were paying less than 5 per cent have secured the full $\frac{1}{2}$ per cent reduction.

This being so, a reduction was also inevitable in the banks' interest allowances on deposit accounts—despite the fact that these rates have a natural relationship to those in the money market, and the further fact that one influential rate there, the Bank's "penal" charge for seven-day loans, had not been reduced at all. In the ordinary course, the two principal rates fixed by agreement among the clearing banks, their maximum deposit allowance and their minimum charge for call loans to the money market, would both have been reduced by the same amount as the reduction in Bank rate. This time, because of the special complication, and in acknowledgment of the objective of getting rid of the unnatural spread between Treasury bill rates (which are, of course, closely related to call money rates) and other rates, the banks compromised by cutting their deposit rates and money rates by only half

the amount of the Bank rate reduction. And they dropped altogether the agreement with the market for the fixing of discount rates for commercial bills.

The upshot of these changes is that the rate for Government finance on Treasury bills has fallen less sharply than those for other forms of short-term finance. At the Treasury bill tender on the day following the Bank rate change, the average allotment rate was roughly £2 3s. per cent, compared with £2 8s. per cent in the previous week—half the advantage that has been reaped by all strong commercial borrowers from the banks. The rate quoted in the market for three months' first-class commercial paper at the outset was $2\frac{5}{8}$ to $2\frac{3}{4}$ per cent in contrast with the pegged rate of 3 per cent that had been maintained since March, 1952; but on Wednesday, when the clearing banks reduced their rates for loans against commercial bills by a further $\frac{1}{4}$ per cent (and for loans against bonds by a further $\frac{1}{8}$ per cent), the discount rate eased to $2\frac{1}{4}$ per cent.

Towards Real Flexibility

The margin between Treasury and commercial bill rates has therefore almost disappeared; it is approaching the $\frac{1}{2}$ per cent that obtained during the thirties, and the war and early postwar years. In the circumstances, the distinction still made by the banks in their call money rates is surely no longer justified; the clearing banks' minimum rate is now $1\frac{3}{4}$ per cent for money against Treasury bills, whereas against commercial paper it is 2 per cent. At the Bank of England, the comparable distinction has been swept away by the "unification": the special rate applicable to Treasury bills has gone, and the seven-day loans at the Bank will be available against all forms of "approved" collateral.

The distortion in the pattern of call loan rates may, however, be merely one of the surviving anomalies that will gradually disappear. For there is no doubt that the new impetus towards a genuinely flexible market is stronger than can be gauged merely from the greater cohesion that the whole rate structure now exhibits. The authorities themselves are lending no support at all to the maintenance of arbitrary margins or rate agreements; and it is apparently intended that the Treasury bill rate, as well as the commercial rate, shall be really flexible. If that is so, then official influence in the market has to be exercised in the traditional manner, by open market operations in either direction for small adjustments and by the "flexible" Bank rate for larger ones; and this implies that the money market cannot expect the authorities to be as solicitous as they have been in the past in saving it from the need to borrow at the "penal" rate. If these are indeed the official techniques, the remaining distortions and rigidities will steadily diminish. Some of the clearing banks have already drawn the welcome conclusion that there

should be more room for manoeuvre in their money rates; accordingly, a smaller proportion of their call money will be more or less "fixed" at the minimum rates.

This new effort to restore true flexibility will involve many technical changes; but it is of much more than technical significance. It is a movement strictly in harmony with the wider trends towards economic freedom, and especially with the reopening of commodity markets and the easing of restrictions upon the granting of bank credits to foreigners. These trends make the London market and the course of sterling much more exposed to the impact of normal commercial and speculative decisions taken by business men throughout the world; and it is imperative that the monetary authorities in London should be re-equipped with the only technical apparatus that can be used to regulate these influences speedily and sensitively.

Before this can happen, however, commercial bankers as well as the authorities have much to re-learn. It is therefore especially important that nothing should be done to encourage the cynical view that the drive for flexibility need not be taken seriously—on the ground that for months past the word "flexibility" had become little more than a derisory catch-phrase. The authorities should bear in mind that nothing could be more

derisory now than any seeming confirmation of the lurking suspicion that all this parade of virtue is directed simply to a smooth launching of the steel issues and a cheapening of the terms for the Treasury's own refinancing operations. In short, if they want to prove their faith in flexible money, they should carefully abstain from putting any pressure upon the banks to "support" the refinancing. And if the froth does not soon disappear automatically from the gilt-edged market, they should themselves take care to blow it away before the new issues are announced. This is one of the occasions in which a counsel of perfection would pay dividends—and steadily increasing ones—for the authorities themselves.

Facts for New Forecasts

AN input-output analysis of the British economic structure showing in detail how each industry depends for its supplies and its markets on all the rest will be ready by 1956. The nature of this realistic map of the economic system was described in last week's article. It consists essentially of a set of tables that will show, horizontally, the output of some 450 industrial groups and vertically the inputs that each industry requires from all the others in order to produce its own output. From this table it will thus be possible to trace in considerable detail the effect of changes in demand throughout the economy.

It will, indeed, be a formidable tabular statement. A 50-industry matrix in readable type would occupy nearly two pages of *The Economist*, and a similar space would be taken up by a corresponding table of coefficients—from which it is possible to deduce the input of materials, components and other services required for any given output of a particular product. The 450-industry tables will obviously take on the dimensions of wall maps; they may indeed have to be consulted sectionally like ordnance survey maps. Yet, even so, to limit the analysis of the economic processes of Britain or America to 450 production flows still involves a considerable simplification. How far will the simplifications of the table limit its effectiveness as an instrument of forecasting, and to what legitimate uses can it be put?

The 450-industry tables are based on various data; the columns dealing with manufacture are derived from the 1948 census of production, and are about as detailed as existing census methods permit. For agriculture, information has been specially prepared by a number of Government departments and for transport the nationalised and other industries have supplied data. The Census of Distribution has enabled final demand and distribution to be calculated in greater detail, while information from the various "controls" in recent years has been particularly useful. The detail is sufficient to make it necessary to conceal by various expedients figures that would otherwise reveal confidential census information about the turnover of some individual firms. There are many difficulties, especially in dealing with such aggregates of products and processes lumped together in the census as "engineering"; one such problem is the allocation of costs of joint products, and another is the grouping of like manufacturing processes so that it is possible to generalise about their behaviour—to give an extreme example, is the production of wooden clogs to be included under Boots and Shoes or under Furniture and Upholstery? The problems arising from increases or reductions in stocks cannot be described in a general article; each one has needed careful investigation. Despite a lively con-

troversy on methods, a considerable degree of refinement of the crude figures has been achieved.

It does not follow that, because the input-output table is based on 1948 data, it will be out of date eight or ten years later, because of changes in demand, in price relationships (following devaluation, for example) or in technology. The substitution of one product for another is continually occurring, but over the whole field of industry technological change is slower than is commonly supposed; in America calculations based on 1947 figures have been found to apply closely to conditions in 1952. Allowances have to be made for broad price changes by means of appropriate indices. But individual price changes of importance, whether caused by technical or economic changes, may also bring into play the use of substitute materials, components, or labour. The art of using the input-output table will lie in a realistic understanding of the possibilities of substitution, and studies into this important subject have been started.

What kind of forecasts can be made from these tables? As an example, it should be possible to estimate the aggregate bill of goods that would be required to sustain a ten per cent increase in the housing programme—not merely the labour and materials required to build another 35,000 houses a year, but also the additional steel, wood, coke, linseed oil, clay, machinery and labour. Similarly the chain-reaction to a reduction in the demand for houses, involving a drop in house-building by ten or twenty per cent per year, could be traced throughout the economic system. Beyond that, the tables will show the resources that would be taken up by different programmes of public works, or any other stimulus to demand.

But they are most certainly not ready reckoners for full employment, nor do they inaugurate an era of "push button economics." Any government committed to maintaining full employment would have a much clearer idea, with the help of input and output tables, of the detailed consequences throughout the economy of given changes in demand. Such forecasts can never be perfect, so long as demand is made up of individual decisions, and so long as the consumer can substitute one factor or product for another. But they should yield, for example, information highly pertinent to a Chancellor's decision to reflate against an expected slackening of production, such as Mr Butler made last April.

Again, the interest originally taken by the American authorities in Leontief's work* was occasioned by the

* Rather oddly, it was the Deputy Secretary of Defence, Mr Roger Keyes, who recently ordered the suspension of work on American input-output data; the colleagues he left behind at General Motors who used to share his mistrust of input-output had tried to persuade him to keep it going.

wish to know the impact throughout the economy of an expansion of government spending on arms—the extent to which other types of production would have to contract, and the "bottlenecks" that might arise. War-time experience (when demand is concentrated in Government hands) immediately suggests the value of even a rough guide to such future events; it would assist the authorities to control scarce materials, to encourage their production or substitutes for them well in advance, and to arrange for more imports.

The general structure of the British table will naturally differ considerably from the American, in that overseas trade is more significant to the British economy. But the first table will make it possible to calculate with some accuracy the import content of a wide range of British exports. It will thus be possible to define what are "high-priority" imports, and at what level a decline in exports might imperil the whole import basis of the economy. It should be possible also to work out forms of pump-priming that would draw to a minimum extent upon imported materials.

It would be idle to deny that input-output data could be exploited as a formidable instrument of planning. It should, however, encourage very much better planning than has been the rule in the past, and above all make possible the achievement of particular national objectives with the minimum of physical and administrative control. It would define the technical limits within which economic policies must be formed, and would admit the use of the discriminating force of financial policy in preference to the cruder forms of physical control.

The value to individual industries of these studies

may seem more limited, but any industrialist would be happier if he knew not only his immediate customers, but also the extent to which their demand for his products might be affected by economic change. Input-output analysis is not market research, nor will it replace the entrepreneur's role of profitably anticipating changes in taste and technology. But it will provide many useful indicators of the consequences of broad economic change, both for the larger firms and for smaller firms through their trade associations. It should help nationalised industries so to arrange their investment programmes as not to be mutually incompatible and to appreciate their relations with "the private sector."

Indeed, the value of input-output analysis will rest on its contribution towards economic policy under conditions of dynamic change. If it enables politicians to see in real terms the cost of welfare postponed in accelerating development at home or overseas and raising productivity, or if it provides accurate forecasts of employment under different conditions of demand, it will become an important buttress to sound economic decision. In time, something approaching a dynamic model of the economic system should come into existence; many economic hypotheses will be tested against the facts for the first time, and their truth or falsehood settled. But anatomy is not healing, and radar is not navigation. Elaborate input-output tables will help to define much more closely the economic consequences of choice by individuals and governments within free and "mixed" economies. But they will not make them choose, or choose wisely.

Business Notes

Second Thoughts in the Markets

THE stock market has now had time to make up its mind about the implications of last week's reduction in Bank rate—but it is doubtful if it has yet in fact done so. All that seems to have happened so far is that an excessive impact effect has given way to a phase of mild correction, and then to one of perplexed rather than of masterful inaction. The first delighted reaction continued with full force through the Thursday afternoon of the Bank's announcement and the whole of Friday; by the close on Friday 3½ per cent War Loan stood at 86½ compared with 84½ two days earlier, while the *Financial Times* index of

industrial ordinary shares had risen concurrently from 123.2 to 125.8. On Monday a shoal of small investors was still flocking into the market, and the number of bargains marked was the highest for eighteen months; by this time, however, some sceptics—broadly, those who had taken due note of the technical factors that have made this year's reduction in Bank rate much less of a green light than previous reductions—were understandably inclined to profit-taking; from Monday onwards, therefore, long-dated gilt-edged began to slip back, and they were followed by industrials on Tuesday. The Government departments, who have been peddling out stock from their large holdings of the two recent public utility issues (Electricity 4½ per cent and Gas 4 per cent), successively raised their tap prices during the week; but these prices had been unduly low even

before the Bank rate reduction, and the authorities' action merely tidied up the pattern of yields—it certainly should not be read as an authoritative encouragement to bullishness.

By Wednesday evening, therefore, the position among typical gilt-edged stocks was that War Loan had gained $2\frac{1}{2}$ points in the week to 86 (after touching 86 $\frac{1}{2}$), 3 per cent Savings Bonds, 1960-70, had gained $1\frac{1}{2}$ points to 90 $\frac{1}{2}$ (after touching 91), and 3 per cent Serial Funding, 1955, had gained $\frac{1}{2}$ of a point to 101 $\frac{1}{2}$ (but had stood still

extremely difficult to justify. With an unbalanced budget still generating inflation on a massive scale, a gaping deficit in the balance of payments and a gold and dollar reserve which is exiguous, the reduction of the Bank of France rate must, obviously, be interpreted in political and not economic terms. It must have been taken by the Minister of Finance and not by the Governor of the Bank of France. The sole justification advanced for it, namely, that it will help to reduce costs of production and therefore prices in France, comes straight out of the economics of Bedlam.

On Tuesday of this week the Danish National Bank lowered its discount rate from 5 to $4\frac{1}{2}$ per cent. This move can be regarded as a direct and logical consequence of the fall in the Bank of England rate. There is a strong and long tradition for credit conditions in what is now the Uniscan area to move closely together. It is noteworthy, too, that a sudden sagging of money rates in the New York market followed the London decision. At the beginning of the week it was announced that the latest issue of 91-day US Treasury Bills had been made at an average yield of 1.634 per cent compared with a figure of 1.957 per cent a week previously and a yield of slightly over 2 per cent maintained over the greater part of the summer months. Tenders for the latest bills were sent in after news had been received in New York of the fall in the London Bank rate and were undoubtedly influenced by this development. The expansion in member banks' reserves that followed the lowering of reserve requirement percentages in July had been largely eliminated by August as the result of further expansion in circulation, commercial loans and bank deposits and some loss of gold. Reports from New York reflect expectations of a further easing of reserve requirements which may later be supplemented by a reduction in re-discount rates, returning them to $1\frac{1}{2}$ per cent from which they were raised to 2 per cent last January.

New Labels for Transport

THE Transport Commission has twelve months—and longer if the Minister allows—to prepare a scheme for the reorganisation of the railways. What is done now in the recasting of railway management can, therefore, be only *ad interim* and without prejudice to the statutory scheme. The arrangements announced this week by the Commission are wholly of this character. The vacuum created by the disappearance of the Railway Executive is filled—as it had to be—by the Commission moving over to Marylebone and taking over the existing headquarters staff. One tier of management is cut out, and five years' experience of double-deck management had long shown the need for such a step. The question now is whether the concentration of power in the Commission for major railway policy, including finance, and general direction will still lead to the excessive centralisation of decision that so seriously impeded progress and initiative during the old regime.

There is room for hope in the wider powers that are to be given to the chief regional managers. They will no longer be officers of the Railway Executive with their powers undermined by an absurd functional system of control which put their subordinates under the control

of the technical members of the Railway Executive; instead they will take charge of commercial, operating and technical services in their regions, and will be answerable directly to the Commission. "For the time being" the six regions will remain as they are; obviously their future character will be a major consideration in the permanent scheme. As for the other components in the grand conception of unified transport as enacted in 1947, the "Executives" for British Road Services, Docks and Canals and for Hotels are replaced by boards or committees of management—self-evident changes of title that leave wholly aside such major questions as the successful disposal of road haulage fleets and the advantages of keeping or disposing of ancillary activities.

Thus the interim arrangements, as far as they go, hold out the prospect that the statutory scheme will admit the widest practicable degree of decentralisation. There will be work enough for the Commission in the tasks that must be done centrally—in financial responsibility, wages and staff policy, technical standards, and the broad co-ordination of the railway systems. The rest calls for decision on the spot, exercised by regional managers with effective power.

Opening Sallies at Gatt

THE eighth session of the contracting parties to the General Agreement on Tariffs and Trade has got under way at Geneva, in an atmosphere that is dominated by the uncertainty about America's future trading policy. In his speech on the opening day, Mr Waugh, America's Assistant Secretary of State for Economic Affairs, had necessarily to follow his Administration's present line of being exceedingly cautious in every forecast—and then of falling back on the usual generalities about the need for sound money. Mr Waugh did, however, agree that all-round re-assessment of everybody's economic policy would be needed before an effectively multilateral trading system could come within grasp, and he believed that a basic review of the constitution of Gatt would have to be undertaken as one feature of that reassessment. He then added "while it may be unwise to establish too rigid a timetable for international discussions on this subject, it is the present thinking of my government that the coming year may prove to be an appropriate time."

The British President of the Board of Trade, Mr Thorneycroft, replied flatly that any attempt to cure the present "chronic unbalance of world trade" was doomed to failure unless America fundamentally changed its commercial policy. The specific features of American policy of which he complained included "tariff rates of 50 per cent, 60 per cent or even more," difficulties of customs valuation, the Buy American Act, America's discriminatory shipping policy, and its "reciprocity provisions which inhibit the unilateral lowering of trade barriers, which is axiomatic to a solution of unbalanced trade." Until uncertainties on such points had been removed, Mr Thorneycroft believed, "we should not try to plan for a world the exact nature of which we do not yet know." For this reason he felt that decisions of major policy should be postponed, and he considered that it was in nobody's interest to press the "difficult issue" of Japan's application for membership of

Gatt at this time. If the issue is pressed—and America has thrown full support behind Japan—Britain will abstain from voting; it will also, apparently, take advantage of the Gatt rule that allows it to refuse most-favoured-nation treatment to new members and will not itself enter into tariff negotiations with Japan.

Request for the Waiver

IN his speech, Mr Thorneycroft also referred to Britain's request for a waiver of the Gatt rule that prevents it from raising duties on items of agricultural produce from foreign countries so long as it still allows that produce duty-free entry from Commonwealth sources. The British Government is emphasising that this is a technical problem; but that, if the waiver is refused, it will either have to ask Parliament for legislation to increase import duties from the Commonwealth (and thus reinforce the ranks of the "get-out-of-Gatt" school in Britain) or else continue the use of quotas to protect British agriculture. The question has now been referred to a working party of ten members on which three countries that would be likely to be among the main sufferers from any imposition of agricultural protective tariffs by Britain (Denmark, France and Italy) are represented. So far the main battle in this working party seems to have centred on the unwillingness of the British representatives to specify the articles on which tariffs would be raised. Britain has replied that the items in question are those in which there are next to no Commonwealth imports and where, therefore, the grant of the waiver from the strict rules of Gatt would cause no substantial diversion of international trade.

One cheering development at the Gatt meeting is that there should now be no difficulty in extending beyond the end of this year the "bound tariff schedules" already in existence. The United States representatives are, in fact, proposing that the extension should be for eighteen months, not for twelve months, as had been generally anticipated. This proposal may have some significance, for it would carry the termination of the Gatt schedules to June 30, 1955. This suggests that the United States Administration has now accepted the fact that it will not be able to secure a fundamental revision of its Reciprocal Trade Agreements Act by June 30, 1954, when the present extension of the Act expires. The Randall Commission will not have reported before March, 1954, and it will clearly be impossible to induce Congress to incorporate its recommendations in the form of permanent legislation within three months. In these circumstances it seems likely that the Administration may seek to extend the Reciprocal Trade Agreements Act for twelve months until June, 1955; and that any battle it feels able to wage with Congress to secure more liberal trading legislation will be fought out with that date in mind.

Quite apart from criticism of its general trading policy, America has found itself "in the dock" on many specific counts at this eighth session of the contracting parties. It is being attacked for the restrictions that it has recently imposed on imports of dairy products, fats and oils under section 22 of the Agricultural Adjustment Act. It is also under fire from Greece, Italy and Turkey following the increase in its import duty on dried figs; in fact, the

Financial Times Ord Share Index.	131.8	108.9	103.1	123.2	125.8	125.2

* One for three rights issue January, 1952. † 60 per cent share bonus, August, 1952.

since Friday). Concurrently the *Financial Times* index of industrial ordinary shares had gained 2 points in the week to 125.2, after touching 126.0 on Monday. The big institutional investors, who have a habit of sitting back and waiting for the dust to settle during phases of excitement of this sort, still seem to be watching rather than acting. With the market's initial reaction plainly based on tradition rather than on analysis, in daily expectation of a cash-cum-conversion of short-term gilt-edged and the first of the steel flotations, and with Wall Street industrials now $2\frac{1}{2}$ per cent above last week's lows, the floor is still filled with light fantastic trippers—not with the heavy plodders.

Foreign Reactions to Bank Rate

THE drop in the Bank of England rate, however technical an adjustment it may appear to informed opinion in Britain, has inevitably caused considerable ripples in the pool of international credit. The Bank of France reduced its official rate of discount on the same date and by precisely the same amount, from 4 to $3\frac{1}{2}$ per cent. This, however, appears to have been a wholly coincidental and not consequential decision. Given France's financial and balance of payments predicament, it is a decision which is

Turkish Government has taken retaliatory measures that are being criticised in turn. Complaints have also been lodged about America's import restrictions on filberts and about the export subsidies it has granted on sultanas, oranges and almonds. One consequence of this hailstorm of complaints may be that in the working party that is discussing the British request for permission to increase agricultural tariffs, Britain may derive its main support from the Americans. Birds of a feather . . .

BOAC Scrapes By

FOR the second year in succession, British Overseas Airways Corporation has managed to make a profit and to square its accounts without going to the government for a subsidy. This estimable result for the financial year to March 31st nevertheless requires a proper interpretation. When BOAC talks of "profit" it means the balance on its operating account plus net miscellaneous revenue; when it talks of "surplus" (or "deficit") it means the balance after paying interest on its capital. These accounting conceptions are entirely proper—and they enable the figures to be compared more or less directly with those of other airlines—but it is important that they should be understood. BOAC made a small operating profit in 1952-53 of £10,161 on a total traffic revenue of £35,699,176; in the previous year its operating profit amounted to £1,403,061 on a total traffic revenue of £32,831,296. That is the crucial comparison in the latest report. "Profit" including net miscellaneous revenue amounts to £103,875 (against £1,233,722 for 1951-52) and the "deficit" after interest charges was £838,664, compared with a true "surplus" of £274,999 for 1951-52. This deficit was whittled down to the manageable sum of £292,718 by taking into account certain capital profits and other surplus amounts totalling £545,946; this more modest deficiency has been added to the accumulated shortfall, which now amounts to £1,778,171.

There is good justification for BOAC's abstention from claiming an Exchequer grant to make up last year's deficiency. It was unlucky to be hit by a number of events that would not normally be expected to recur. The oil refinery strikes in the United States and a temporary grounding of the corporation's Stratocruisers cost between them £750,000 in passenger revenue. Other unexpected factors that are more liable to recur, however, included disappointed hopes of increased mail traffic, resulting from restrictions on trade imposed by Australia and South Africa, and an unusually foggy winter that severely affected the services.

But there were also factors of an apparently more fundamental character at work last year which do not promise to make the Corporation's task in 1953-54 at all easy. Operating costs are rising; wages, fuel prices and materials and spares are all up. The effect of these cost increases on the "break even" point is most unwelcome. Last year's revenue showed a satisfying increase from £33.6 million to £36.2 million. But to earn this higher revenue, BOAC offered for sale much more capacity—215 million ton miles, compared with 195 million ton miles in 1951-52—and unfortunately for the financial out-turn the average

load per aircraft fell from 65.7 per cent to 64.5 per cent, whereas the "break-even" point at which BOAC would cover all its costs and interest on its capital has risen from 65 per cent to 66 per cent. These comparisons have an important bearing on the corporation's future finances. The rise in various costs has meant, according to the present report, that operating costs per ton mile have risen from 38.8 pence to 40.1 pence, despite the fact that more flying was done; and the average loading has fallen, despite the high load factors of over 80 per cent achieved on the Comet services to South Africa and Singapore. The seemingly slight movements in these percentages are in fact the source of BOAC's financial dilemma.

The Year of the Comet

ALTHOUGH BOAC last year had to struggle to make only a little money, it had the outstanding triumph of bringing into service the de Havilland Comet. It earned a profit on these new Comet services immediately—"an unusual result," the report declares, "even for a conventional aircraft in its first year of operation." The introduction of any new type of aircraft is generally a costly business, and with the Comet experience of totally new operating conditions had to be gained in proving flights before commercial services could begin. The fact that the Comet earned a profit because it so powerfully attracted traffic and could be worked at a high loading ratio is a tribute to the designers who delivered an aircraft that has proved remarkably trouble-free in service and to BOAC's engineers who have been responsible for its maintenance.

But there is something of a contrast between BOAC's success with its first Comet flights and its attitude towards development expenditure that is always involved before new aircraft go into regular service. Crews have to be trained, radio aids tried out, and development flying has to be carried out along projected routes to plan time-tables and ground services. Such costs are heavy; the cost of keeping an airliner in the air runs into four figures an hour, and several thousand hours of development flying may be required. BOAC, with the Comet II and the Britannia in prospect (the latter powered by Proteus engines of which experience has to be gained), cannot be blamed for its concern about the costs that should fall on its accounts when a new aircraft is prepared for service. Such costs are especially heavy when an airliner is going into service for the first time, as the Comet was with BOAC and the Viscount with British European Airways; but it is also relevant that the first airline to get deliveries is also the first to be able to offer customers a new service—and this can carry a substantial commercial reward, as the Comet has shown.

BOAC declares that if the development costs of new aircraft that it has on order are commensurate with past expenditure, its financial results in the years immediately ahead will be even more seriously affected—a state of affairs, the report roundly states, that "cannot be contemplated." It is discussing "with the Ministries concerned" means of recouping these development flying costs. The Ministry of Supply usually pays for the cost of designing and developing new airliners to the stage at which they can be developed for operational service; should it also meet the cost of

MARKET INFORMATION SERVICES LIMITED

MARKET RESEARCH & PLANNING

Market Information Services Limited undertakes market research by means of sample surveys of every sort on any required scale. Its field of operation covers habits and characteristics, and public opinion. It has a fully qualified technical staff, its own force of field investigators, and the punched-card tabulating equipment and calculating machinery necessary for this type of work. It specialises in devising and applying new techniques for the solution of difficult problems.

MARKET INFORMATION SERVICES LTD.

24, BROOK'S MEWS, LONDON, W.1. GROSVENOR 2211

Too small? . . Are you SURE?

Size is illusory. But we don't want to get metaphysical—we just want to get your business. In Hollerith Punched Card Accounting, the yardstick is not physical size, but number of accounting transactions. Have you ever counted the number of transactions your counting house handles in a week—a year? We wager that before you'd recovered from the shock you'd have lifted the receiver and asked us to call—to see whether (and how) Hollerith could help you. This move would cost you nothing.

Underground Movement

EVERY SHIP that heads down the Tees to the sea sails over an underground tunnel carrying I.C.I.'s pipelines deep below the river bed. One of the boldest engineering projects ever undertaken by a chemical company, I.C.I.'s pipeline tunnel connecting the Wilton chemical plants with those of Billingham, nine miles away, cost more than a million pounds, and provides the vital link that makes the Billingham-Wilton system the largest concentration of chemical industry in the world. From Wilton, pipelines carrying the valuable 'olefine' gases butylene and propylene, petrol (which is a by-product) and 'tail gas' (a mixture of residual gases rich in hydrogen) run a mile and a half up-river to the tunnel header shaft, where they plunge down to the nine-foot diameter tunnel.

Having completed their dark journey, the pipes surface on the opposite bank, which stretches away across desolate salt-marsh country to Billingham. There, high-pressure plants convert the propylene to isopropyl alcohol—another important chemical raw material—and the hydrogen in the tail gas to ammonia, while the butylene is used to improve the by-product petrol—and to make the 'bottled' gas that provides heat and light for yachtsmen, caravanners and country dwellers. Soon, the tunnel will carry back another raw material—brine. From boreholes on the north side of the Tees, a pipeline will feed this raw material—essential for the manufacture of chlorine and caustic soda—to plants now being built at Wilton. Forty road tankers a day would have been needed to carry the petrol, butylene and propylene that now pass unseen from one great chemical works to the other, while, were it not for the pipeline, the tail gas would have had to be wasted. The Billingham-Wilton link is a good example of that special kind of industrial efficiency that can be achieved only on a large scale—and with large resources.

Imperial Chemical Industries Limited

grist to the million

Any day, anywhere, you see them, their baskets filled with the necessities (and luxuries) of life, quite unaware of how much they depend on board—the "cardboard" which makes shopping easy and practicable. Board for protective cartons, board for sturdy packing cases; board everywhere, much of it produced at Thames Board Mills. From these modern mills where fifty years' experience goes into every day's work, come the "THAMES BOARD" and "FIBERITE" packing cases used for the effective distribution of hundreds of products to millions of homes.

putting them into service? If the British air corporations make a loss, the Exchequer provides a subsidy for them through the Ministry of Civil Aviation; if the loss arises from the particular costs of development flying should it be recouped by some special means other than the subsidy arrangements laid down by Parliament?

The Miners' Latest Claim

THE new full-time member appointed to the National Coal Board this week, Mr W. H. Sales, succeeds Mr Ebby Edwards and will presumably fill the same functional post in charge of labour relations. He will immediately be busy; the National Union of Mineworkers is shortly to present its claim for an increase in the wages of all day wage workers, laying as usual particular emphasis upon the plight of those workers who are on or about the minimum wage of £6 7s. 6d. a week. In the second quarter of this year the average earnings in mining amounted to about £10 18s. 9d. a week, though the spread between classes of workers was considerable, with miners at the face earning an average of £12 13s. 6d. a week and men on the surface earning an average of £8 13s. 4d. a week. The union has always contended that there are a considerable number of men earning little more than the national minimum wage and during the last few years these have been placed in the forefront of all wage claims. This is understandable; piecework rates are negotiated locally, and the money that day wage men can earn may well be brought into these myriad wage discussions at the lower levels. The Coal Board's attitude towards this new wage claim has not been indicated; but the cost of the miners' extra holiday this year, and of the unofficial third week's holiday that the miners are taking through absenteeism, is not likely to encourage concessions (leaving on one side the board's unhealthy finances). Since the war, however, it has never managed to withstand an increase in wages, and the clamour about a coal crisis this year will not make a stand easier.

The Cost of Coal Holidays

IN the second quarter of this year the total operating profits of the National Coal Board and its surplus after providing for tax and interest were both slightly higher than in the first quarter, and the comparison looks even more favourable with the second quarter of 1952, when the board's profits were insufficient to meet these charges. In fact, however, the second quarter's financial results were disappointing; they suggest that in the current quarter the board faces a considerable deficit and possibly even an operating loss on its collieries. This may already have been discounted in Hobart House as part of the cost of a second week's holiday in the coal mines (another part of the cost is he present danger to coal stocks for the winter). But it makes the industry's financial prospects for 1953 as a whole much less hopeful than appeared likely when coal prices were last raised this spring.

Total colliery costs in the second quarter were in fact about 2½ per cent lower than in the first; but since the output of saleable coal from the mines was down by nearly 6 per cent, mining costs per ton rose sharply—by some 2s a ton. The board had the benefit of increased prices over the whole of this period, and therefore still managed to make a profit of nearly 2s. 6d. a ton on mined coal. It produced about 3 million tons of opencast coal during the quarter, and may have sold rather more; at face value, therefore, its esti-

COLLIERY OPERATING ACCOUNTS, NATIONAL COAL BOARD

12. PROFIT (before charging interest)	3.1	1 2.5	5.5	2 0.1	6.3	2 5.2

mated total profit of £430,000 on opencast coal would mean a profit of nearly 3s. a ton, though the opencast accounts were presumably still blurred by the high cost of stocking coal at the sites. Since the end of June the Coal Board has managed to sell about a million tons from these opencast stocks in addition to its current output, so opencast profits in the current quarter may be higher. The outlook for profits from the board's ancillary activities is uncertain; these fell sharply in the first six months of this year. Coal-mining, however, is the preponderant item in the board's profit figures; and colliery costs seem unlikely to have fallen in the current quarter enough to offset the fall in proceeds that must result from the drop in output caused by the miners' extra holidays.

New Policies in Coal

ONE consequence of the duty to break even by which the National Coal Board considers itself bound is that about half its coal production, taking one year with another, tends to be mined at a profit and about half at a loss. Whatever the external effects of this price policy upon the national economy as a whole, one internal effect is to make the industry inherently difficult to run. Which should a manager regard as most important, getting his output up or getting his costs down, when the break-even point gives him no real yardstick for his own pit? This is a practical problem of higher management, which only the overriding

demand for every ton of coal that could be got anywhere has enabled the board to set on one side in recent years; and at its recent summer school at Oxford, Mr E. F. Schumacher, the board's economic adviser, offered some tentative suggestions as to the way to approach it.

Mr Schumacher suggested that in the 283 pits which in 1952 produced some 35 million tons at a loss of 10s. or more a ton, costs should certainly receive the most attention—"We are not looking to these pits, and to this sixth of national output, for the additional coal we need." That these pits should get costs down, even if that means some loss of output, is a fairly simple principle for a mine manager to accept. It may not be so easy for the individual manager to accept its necessary complement—that in the 340 pits producing about 51 per cent of the country's coal at profits ranging from a penny to more than a pound a ton, output should be raised even if profits fall. A manager producing the excellent results of, say, 15s. a ton profit on all the coal he raises may not take kindly to the suggestion that he should get all the coal he can at higher and higher costs, even if it brings his profit down to nothing or occasionally puts the pit into the red. The extra coal that he may be able to produce down to a loss of say 5s. a ton could replace coal that today has to be mined at a loss of 50s. a ton, saving the industry money. This would mean telling the top 340 pits to go primarily for output, and the bottom 283 to look mainly after costs. For the middle band of about 275 pits, producing a sizeable proportion of the country's coal at losses up to 10s. a ton, Mr Schumacher would hazard no such generalisation; for them the primary emphasis should be decided on the spot. He was understandably at some pains to emphasise, moreover, that he was not advocating the immediate closing of 283 pits and the shelving of financial considerations at 340 more fortunate ones. The formula, as he said, is a crude and theoretical first approximation, but it does represent an attempt to behave sensibly in an economic situation where some of the traditional rules have been excluded by definition, or at any rate by tacit acceptance. Whether it could achieve the degree of refinement and flexibility that this 900-piece industry requires would seem most doubtful; but it is one indication, among others, that the board is at least facing some implications of its accepted policy.

Signals in Export Prices

THE terms of trade moved one point in Britain's favour in August, to 90 (1952=100), after three months of stability that seemed to presage a halt to a prolonged period of improvement. The Board of Trade's indices, published this week, show that although the composite index of import prices remained at 87 for the third successive month, the composite export index rose by one point to 97. The export index for metals and engineering goods, which had been stable for the previous three months, rose by one point to 101. The index for textiles, which was unchanged in June and July, rose by one point to 93, while the index for "other manufactures" fell from 92 in the previous two months to 91. A decline of one point, largely seasonal, to 96 in the import index for food, drink and tobacco, and an equal fall to 85 in the index for imported

manufactured goods was offset by a rise of one point to 81 for imported raw materials.

The immense improvement in the terms of trade during the last eighteen months has increased Britain's real income by well over £300 million a year and has contributed greatly to its economic recovery. But a continuation of this improvement, especially from a further rise in export prices, might be a mixed blessing. Last month's increase in export prices need not be exaggerated; it was actually less than a full point. But it does indicate a change in direction. The price index for metals and engineering exports is now one point above the 1952 average, and it has never been less than 100 throughout the past twelve months. The index for textiles has dropped only four points in the same period and is now within two points of the August, 1952, level. There is nothing in the present or foreseeable state of world markets to suggest that British export prices could be raised with impunity. And any significant decline in the import price index would be matched by a further drop in the earnings of the sterling area's primary producers, which in turn would almost certainly react on the export trade. Perhaps the stage has now been reached when it will be better for everyone if Britain's terms of trade "improve" no further.

Volume of Exports Increases

THE full details of Britain's overseas trade in August throw little light on the trends in exports and imports; the month had two fewer working days than July and—as a note on the preliminary figures in *The Economist* of last week pointed out—the nominal working days were, for many, holidays. A better guide to the trade pattern is obtained by comparing the average of July and August with the monthly average in earlier periods. For the two months, exports averaged £216.3 million (f.o.b.), three per cent more than the monthly average of the second quarter and four per cent more than the average in the first quarter. The index of export prices rose by one point last month, but the Board of Trade attributes the increase in exports for July and August, taken as a whole, to a larger volume of trade. The greater part of this increase was in textiles (notably wool manufactures), which were 11 per cent higher than in the second quarter. Exports of "other manufactures" and of metals also increased, but shipments of cars and machinery fell by £2 million a month and of coal by a further £600,000 a month.

Imports in July and August averaged £269.1 million (c.i.f.), five per cent less than the average in the first half of the year and about three per cent lower in volume. This decline was largely seasonal and mainly affected arrivals of raw wool and other raw materials from the sterling area, which were about 12 per cent below the average of the previous six months. Imports of grain and flour averaged £6 million a month more, and were probably chiefly responsible for the small net increase in imports from the non-sterling world compared with the first half of the year. The improvement in exports in July and August is estimated to have been almost wholly in sales to the sterling area, which were about six per cent higher than in the second quarter. Australia appears to have been the main factor in the

improvement, for shipments to that country increased by about 20 per cent compared with the average for the second quarter.

Decontrolling Sugar

THIS month the British sugar trade moves somewhat nearer to decontrol. The subsidy on sugar sold to the public has been removed; the Ministry of Food has announced that its remaining responsibilities for the export trade in refined sugar will be returned to private hands in January; and sugar will shortly be taken off the ration. Price controls are expected to be abolished at the same time, with the probable exception of refiners' prices. Since sugar refining is dominated by a single firm, the Ministry may wish to exercise some control over these prices as long as it is responsible for the supply of raw sugar for domestic consumption.

The most difficult part of decontrol still lies ahead. Britain supports the price not only of domestic sugar, but of the major portion of its supplies from the Commonwealth as well. The domestic sugar beet industry, which produces some 600,000 tons of raw sugar a year, enjoys with other farm produce a guaranteed market and a minimum price, under the Agriculture Act of 1947. The Commonwealth Sugar Agreement provides Commonwealth producers with an assured market in Britain, at a price negotiated annually, for 1,568,000 tons. Before the sugar trade can be freed and the market reopened, some means will have to be found whereby domestic and negotiated-price Commonwealth sugar would be fully taken up, despite competition from the cheaper sugars bought in the free market.

One possible method would be a system of "weighting" the prices of raw sugar for domestic consumption so that, while the existing price guarantees would be honoured, fixed-price and free-market sugar would nevertheless be equally attractive to the refiners. Under such a scheme, changes in the price of free-market sugar would entail a related adjustment of the equalised price. If the many technical problems could be overcome, it should then be feasible to restore an international futures market in London, provided that the Treasury was prepared to permit a reasonable amount of arbitrage. Such a scheme would also seem to avoid the need for a deficiency payments system for beet sugar, such as that being introduced to overcome a similar difficulty in home grains. But other methods will no doubt be canvassed by the various interests concerned, and it seems unlikely that decontrol can become a fact until well into 1954.

Expansion for Cocoa

THE problem of cocoa, unlike that of many commodities, is how to expand, not restrict, production. Demand for chocolate and other cocoa products recovered quickly after the war and is still increasing. Yet the production of cocoa, which fell by 30 per cent during the war, has failed

to respond, even though cocoa prices have soared to six times their prewar level. Only in 1950/51 did world production approach the record crop of 787,000 tons in 1938/39. The 1952/53 crop is put at about 745,000 tons and no substantial increase is expected in the near future. The world conference on cocoa, which met in London last week, considered that, given a reasonable price level, the world could very soon absorb one million tons of cocoa a year. Expansion of production would be in the real interest of the producing countries, raising their living standards further, particularly in British West Africa, which produces over half the world's supply.

But the hundreds of thousands of small peasant cultivators will not easily be persuaded. Over-production and low prices between the wars still leave them with the fear that a large increase in production would again drive down prices to a low level; and they are only too conscious of the fact that the shortage of supplies in recent years has brought them great prosperity. How can they be persuaded, as Mr Paul Cadbury put it at the conference, that cocoa is potentially an expanding market, but that it will not expand if prices rise beyond a certain point? If these mental attitudes can be changed, the prospects of increasing supplies should be bright. It is now possible to raise the yield per acre to over 1,100 lb. of good cocoa, compared with the present average of about 400 lb. There are also promising possibilities of introducing the cocoa bean to new tropical areas, such as Malaya, where it is considered that 100,000 tons a year could be produced. It is at least a hopeful sign that in the Gold Coast and Nigeria the farmers are now supporting the campaign against swollen shoot—which, with other diseases, cost the world some 200,000 tons of cocoa a year.

Revival in Tinplate?

EVER since the tinplate handmills in West Wales began to be closed down or put on a "care and maintenance" basis early this year there has been some controversy among the tinplate producers and their customers about the effect that closure might have upon tinplate supplies later this year and after. The producers in West Wales, particularly the larger companies that own modern strip mills as well as the obsolescent handmills, have maintained that they had built up the stocks they could carry at their own works to a physical and financial maximum, and that the closing down of capacity, with the inevitable dispersion of workers, had to follow. The decision to concentrate production upon their more modern units—which in any case produce tinplate of higher quality for which demand fell much less—was an obvious one for these large organisations; a number of the independent handmills were eventually forced to follow suit.

Some of the major consumers of tinplate in this country, however, arguing that the recession in demand was simply a ripple in a trend that must continue fairly steadily upward, argued that the Welsh tinplate industry should have made more effort to retain its capacity—of which in the handmills labour must be counted the most important part—in being. Otherwise, they forecast, the labour would not be there to be had when demand began to revive in a few months; the handmill workers are well aware that in any

case many handmills are due to be closed when the second tinplate mill of the Steel Company of Wales is brought into operation at Velindre in a few years' time, and have every incentive to find new jobs. The result, as these consumers see it, is that the Welsh industry may not be capable in the interim period before Velindre opens of producing all the tinplate that could be sold. Other countries are bringing new continuous mills into operation and offering tinplate for export; Britain, after the United States the largest exporter, may lose business that it could nurse along with the handmills until Velindre comes in. These consumers argue, too, not unnaturally, that the producers had creamed enough profit out of their large export premiums since the war to be able to afford a few months "temporary" under-employment.

Demand has now begun to revive—as both groups in the argument agreed it would this autumn—and the Steel Company of Wales has decided to reopen nine of its handmills at Pontardawe and Gorseinon. These reopenings may offer a first test of the argument about lost labour. The tinplate producing companies, though fairly optimistic, are not disposed to underrate the difficulty of getting back their full complement of men. Not many tinplate workers are still registered as unemployed. In spite of the high earnings to be obtained there, this reprieve, or stay of execution, for the handmills may not sound too attractive.

Footing the Bill at Woomera

THE Minister of Supply's recent visit to Australia evoked a display of irritability from certain sections of Australian opinion that marked the considerable dissatisfaction over the burden of commonwealth defence costs that has been falling on Australia. These are likely to remain high but Mr Sandys does appear to have removed a small but acute source of friction between the two governments. This is connected with the arrangement under which the costs of the Woomera rocket range were divided between them. About £25 million has been spent on setting up the range; and it was always intended that the two countries should share the cost. But the formula by which the costs of running the range were divided between the two governments appears to have been that the British government assumed financial responsibility for all work done in this country, while the Australian government paid for work done in Australia. This simple arrangement worked well enough while rocket development was in its early stages, when most of the work was done in Britain. Recently, however, activity at Woomera has risen sharply and the majority of the British companies engaged in rocket development have found it necessary to set up establishments at the range itself where the missiles and other equipment arriving for test are assembled. There are altogether more than a hundred British companies participating in these tests, doing an increasing amount of work at Woomera itself and calling increasingly on the Australian government for payment. In addition, the Australian government has been responsible for designing and building several pilotless jet-powered aircraft that have been used as trial targets for the missiles.

If Australia's share in the costs of the Woomera range

has been disproportionately high in the past, the new financial arrangements announced last week appear to recognise the fact. In future the Australian government will pay only for work done specifically at its request; the provision of target aircraft would seem to fall into this category. The British government will pay for all work done to its order—and that may involve most of the work at the range. This seems to be a new definition of "sharing" of costs, but the Woomera range has a particular value that may justify a high cost. Its vastness enables the scientists to recover and examine the remains of, missiles, which yield most valuable information. It may even be that they have established a technical lead over American research teams who use ranges firing out to sea and rarely see their rockets again.

Inco's Iron Ore

IRON is a major ingredient of the ores from which most of the world's nickel is produced, and the possibility of extracting it from the tailings in a usable form at an economic price has long interested nickel producers. It has been mentioned, for example, in connection with the Nicaro project financed by the American Government for obtaining nickel from laterite ores in Cuba, and a little Cuban laterite is already worked as iron ore, though the chrome associated with iron in these ores is hard to remove. But the largest development in the field so far is the new process announced last week by the International Nickel Company of Canada. Inco is erecting a \$16 million plant at Copper Cliff, Ontario, that will yield a million tons of iron ore a year as a by-product of nickel extraction from the company's Sudbury ore deposits. The Sudbury ores contain iron, copper, nickel and sulphur, and up to the present only the two non-ferrous metals have been extracted; the Copper Cliff plant will extract iron (thus making nickel extraction from lower-grade ores than are now used a commercial proposition) and the company thinks that it may eventually become feasible to take out sulphur too.

Markets Overseas

If you are seeking new markets abroad or want to know more about your present ones, the quarterly reports by The Economist Intelligence Unit will help you. These reports give concise and up-to-date analyses of economic and business conditions and prospects in other countries, and they contain a wealth of information of value to the exporter and investor. Each report is prefaced by a summary of the main facts and conclusions, and contains a comprehensive statistical appendix supplemented by maps and diagrams.

This service of reports was started by the Unit last year. From the outset the demand was large and came from many parts of the world, and in response to requests from subscribers the list of countries included in the service has been extended. Fifty reports are now published every quarter on a total of seventy territories.

Descriptive leaflets and a specimen copy of the reports may be obtained from:

Nothing left to chance . . .

MOULDED SEAL. The production of a strong, permanent bond between the metal cap and the glass bulb of Royal "Ediswan" Lamps is achieved by the use of specially designed "keys" moulded in the glass. Ediswan Engineers are successfully applying this technique to a greater range of types than ever before.

* This is but one example of the intricate operations in the manufacture of Royal "Ediswan" Lamps, calling for the highest degree of technical skill and the utmost care and precision. Nothing is left to chance—only the finest materials are used and there is strict control at each stage of manufacture.

MANUFACTURED TO BRITISH STANDARD SPECIFICATIONS

The iron concentrates that will be obtained from this nickel process will be of an exceptionally high grade—much richer than the ores from the famous Mesabi range, for example. They will contain at least 65 per cent Fe content, with less than 2 per cent silica. International Nickel states that such ores will command a premium price for direct use in open hearth and electric furnace steel production in Canada and the United States—high-grade ore is always charged into open-hearth furnaces in small quantities, along with iron and scrap. Its statement last week hinted that the price "per ferrous unit" of this by-product ore may well be competitive with the high-grade ores that the United States steel industry is now having to import from Venezuela, Sweden, Liberia and Brazil. This may be true, though the trend of world ore prices seems to be downward; and it will be interesting to know how it will compare with the price of the rich Quebec-Labrador hematite ores now being proven and developed. But for a by-product, assisted by a spread of overheads, the new Inco process may offer considerable possibilities; it has been extensively investigated for several years and worked successfully at the pilot plant stage. This may be counted as one of the first rewards of the tremendous research efforts now being devoted to the development of new methods of extracting metals from increasingly lean ores.

Higher Prices for Wood Pulp

PRICES of Scandinavian wood pulp for shipment in the fourth quarter of this year are moderately higher for nearly all grades. Demand is strong and supplies, particularly of some grades of chemical pulp, are fairly tight. The price increases range from about £2 to £3 10s. a ton for chemical pulp. Mechanical pulp, from which newsprint is made, is about 10s. a dry ton higher, but this does not affect the price to British mills, the major buyers of this type of

Scandinavian pulp. Britain buys six months' ahead, and the price fixed for the last half of this year is the same as in the first half, namely £27 10s. a dry ton, c.i.f. East Coast port. The price of bleached sulphite pulp, which is used in the manufacture of fine grades of paper, is now very firm at about £53 a ton, c.i.f., showing an advance of between £3 and £3 10s. a ton. Kraft pulp, which is used for making bags and light board, is £3 higher at about £39 a ton, c.i.f.

This hardening of pulp prices follows the generally slight reductions made for shipments in the third quarter of this year. British users of pulp had therefore been tempted to look for a period of price stability, and though they have swallowed their disappointment and in most cases have accepted the new prices they would probably show strong resistance if the Scandinavian pulp producers seek to raise prices again in the first quarter of 1954. It may be significant that the price of bleached rayon pulp has been left unchanged at about £65 a ton for the standard grade; the price of £70 a ton for second quarter shipments met strong resistance from British rayon producers, who cancelled many of their orders.

SHORTER NOTE

Associated Portland Cement and British Portland Cement have increased their interim ordinary dividends to 1s. per £1 stock unit, compared with the equivalent of 9d. per £1 of the present stock units a year ago; the directors explain, however, that they have for some time realised that the interims have been low compared with the final dividends (which last year were equivalent to 2s. 3d. per £1 of the present stock units), and that this decision does not mean that total distributions for the year will necessarily be greater. Profits in the first half of 1953 are stated to have been satisfactory, although increased demand in Britain (resulting from flood damage and defence contracts) have caused more cement to be diverted from the very profitable export market to the less profitable domestic market.

Company Notes

CALICO PRINTERS' ASSOCIATION. Like most other textile companies Calico Printers enjoyed a steady increase in the volume of production and an improvement in earnings in the first six months of the present calendar year; but losses sustained by subsidiaries—especially Australian Cotton Textile Industries, Ltd.—prevented any increase in profits or dividends for the year to June 30th as a whole. The preliminary statement, which shows the net profit of the parent company at £216,255 compared with £220,319 for the previous year, needs, however, to be read with some care. This "net profit" is struck after deducting charges totalling £2,123,283 (against £1,616,030 in 1951-52); the charges deducted include £986,277 for mainten-

ance, depreciation, etc. (against £980,507 in the previous year) and sharply increased provisions for losses of subsidiary and associated companies (£290,006 against £110,523) and for taxation (£719,000 against £397,000). This tax provision,

	Years to June 30, 1952	1953
Parent company figures:—		
Maintenance, depreciation, repairs, etc.	980,507	986,277
Debt interest	128,000	128,000
Provision against trading losses of subsidiaries	110,523	290,006
Estimated taxation	397,000	719,000
Net profit, after deducting the above	220,319	216,255
Dividends	211,128	221,181
Ordinary dividends (per cent)	12½	12½
Reserves	250,000	650,000
Carry forward	121,710	113,784

however, takes no account of a credit of £647,000 that has arisen from the belated settlement of the company's liability for wartime Excess Profits Tax. As a result of this credit and of the year's net profit, there is £863,255 available for reserves and dividends, compared with last year's £466,319 (which itself included £246,000 in respect of an EPT credit). But shareholders are not receiving any of this year's windfall, as £450,000 is to be placed to general reserve and £200,000 to a reserve against overseas investments (which had received £100,000 last year). Similar complications affect the consolidated profit and loss account for the group. This shows an aggregate profit of £774,131 (against £296,737 last year); it is struck after including an EPT credit of £769,347 but after deducting £1,051,769 (against £1,065,888) for maintenance, depreciation, repairs, renewals and upkeep, and £710,628 (against £348,564) for taxation.

During the year the ordinary stock has come up from a "low" of 31s. 7½d. to the

present price of 46s. The dividend of 12½ per cent (which has been maintained for the fourth year in succession) offers a yield of only about 5½ per cent on this price. This does not look unduly generous, but the company's current level of domestic profits must be considerably higher than a year ago; it was probably only the bumper from Australia that bowled out shareholders' hopes of a higher dividend for the year just passed.

★

DAVY AND UNITED ENGINEERING.

For the third year in succession, Davy and United Engineering have had to report a fall in trading profits, this time from £584,455 to £442,798. Even after allowing for a fall of nearly £55,000 in taxation, net profits have declined from £221,302 to £131,699. It seems probable, however, that these disappointing figures are a reflection of the uneven incidence of heavy engineering contracts, rather than of a genuine decline in profitability. The chairman, Mr D. F. Campbell, explains in his statement to shareholders that one large contract was nearly, though not quite, completed by the end of the financial year on March 31st; the profit on it will be brought into this year's results. Moreover, whereas last year Mr Campbell had to report that no rolling mill contract of any size had been placed by the British steel industry for two and a half years, this time he is able to announce a very big contract indeed. The company has recently secured orders worth about £4 million for rolling mill equipment from Richard Thomas and Baldwins, and from the Steel Company of Wales; this is probably the largest group of rolling mill contracts ever placed with a single company in Britain. Although some recent contracts for export work, on which the company had been mainly depending, have been less than usually remunerative, this rolling mill order should go far towards keeping the company in full and

fairly profitable employment, even if a minor world trading recession recurs.

Although the gross amount of work-in-progress has risen by £737,000, advance payments have risen sufficiently to offset this—in fact net stocks and work-in-progress are slightly down. But fixed investment has continued at a high rate, and the group's bank overdraft has increased from £221,157 to £303,268 despite last year's share issue. The group has therefore decided to raise more permanent capital by another rights issue at par, this time on a one-for-twenty-one basis. Capital expenditure commitments are stated to be £276,000, against £204,000 a year ago.

	Years to Mar. 31, 1952	1953

Ordinary capital.....	987,132	1,035,322

Despite the sizeable drop in net profits, the usual 10 per cent dividend is maintained on the shares. In the chairman's words "stockholders must be prepared, in a business like this, for some ebb and flow of profits." Perhaps some stockholders are feeling that there has been a little too much ebb in the last few years; but with the 10 per cent dividend more than twice covered by net profits, with the rolling mill contract in hand, and with the £1 ordinary stock at 31s. 3d. yielding £6 8s. per cent, the new rights issue should have a wide appeal.

THE ECONOMIST, SEPTEMBER 26, 1953

LONDON STOCK EXCHANGE

Next Account begins: September 30th.
Next Contango Day: September 30th.
Next Settlement Day: October 6.

THE market's first excited reaction to the reduction in Bank rate sent prices surging upwards until Friday's close, by which time 3½ per cent War Loan (at 86½) had risen by 3½ points in two days and the *Financial Times* index of industrial ordinary stocks (at 125.8) had risen by 2.6 points. On Monday, dealings were still very active; in fact, bargains marked totalled 10,819, the highest figure since February 18, 1952. But by that time long-dated gilt-edged were already inclined to sag, and by Wednesday's close War Loan was back to 86—and declined further on Thursday. At the beginning of the week, however, there was an increase in the top prices of Electricity 4½ per cent and Gas 4 per cent, which had moved out of line with other gilt-edged stocks both before and during the excitement. By Wednesday's close Electricity 4½ per cent 1974-79 stood at 101½ compared with 101½ on Friday and with 100½ before the Bank rate reduction, Savings 3 per cent 1955-65 at 97 compared with 97½ and 96½, and Serial Fundings 3 per cent 1955 at 101½ compared with 101½ and 100½.

Industrials were still strong on Monday, and the *Financial Times* ordinary share index rose to 126.0, the highest for the year, compared with 123.2 on the eve of the Bank Rate change. In the stores group, "Gussies" and Debenhams went ahead; while elsewhere National Canning spurred 13s. 9d. to 123s. 9d. on the proposed share bonus, and the newly issued Newcastle Breweries 4½ per cent debentures got well away to a premium of 3½. By Tuesday, however, considerably quieter conditions had spread to all sections of the market with a generally downward tendency. Profit-taking set in in industrials, despite a rally on Wall Street prices; by Wednesday's close the *Financial Times* index was back to 125.2.

Elsewhere in the market there were modest mid-week rallies in oils, Kaffirs and copper shares. Teas were slightly better, but rubbers remained dull in spite of a small recovery in the commodity. German bonds went ahead on Wednesday following the first transfer of foreign currency under the debt settlement.

EXCHEQUER RETURNS

For the week ended Sept. 19th there was an "above-line" deficit (after allowing for Sinking Funds) of £43,296,000 compared with a deficit of £20,206,000 in the previous week and a deficit of £21,432,000 in the corresponding period last year, raising the cumulative deficit to £271,064,000 (£319,426,000 in 1952-53). Net expenditure "below-line" absorbed £8,000,000, bringing the total cumulative deficit to £490,270,000 (£605,715,000 in 1952-53).

THE MONEY MARKET

AFTER several stages of adjustment, the pattern of money rates in alignment with the new Bank rate is now emerging; it is set out in tables below and on page 867. The clearing banks immediately reduced their call loan rates (as well as deposit allowances) by $\frac{1}{4}$ per cent immediately after the new rate was announced, to $\frac{1}{4}$ per cent for loans against Treasury bills and $\frac{1}{2}$ per cent against commercial bills and bonds; but on Tuesday bond money was cut by a further $\frac{1}{4}$ per cent and commercial-bill money by $\frac{1}{4}$ per cent. Discount rates for commercial bills, now entirely flexible, have fallen steeply—for the three months' bill, from the pegged level of 3 per cent down to $\frac{1}{4}$ per cent by Wednesday last.

Business in Lombard Street has not yet reflected the indications that the new flexibility will mean that the market will not be so consistently aided by the authorities as in the past. Special help from the Bank's buyer was needed and given on every day of the week to Wednesday last to meet the strong demand for funds; and on Monday and Wednesday the "smoothing" purchases—made mainly directly from the market—assumed really large proportions.

The average rate of allotment of the £280 million of Treasury bills offered at last week's tender was nearly $\frac{1}{4}$ per cent lower than in the previous week, at £2 3s. 0.06d.; the market's bid was raised by 1s. 3d. to £99 9s. 3d. for 91 day bills, on which its "quota" was 76 per cent; but full allotment of the 90 and 93 day bills raised its average quota to 80 per cent. Yesterday's offer was down to £270 million, and the excess of new bills to £20 million.

The Bank return shows a further reflux of notes of £6.4 million; bankers' deposits rose by £13.2 million over the week.

Retained in the Group			136,299
			£326,100

Extracts from the Chairman's Statement are appended:—
"The latest Gestetner '260' range of duplicators which was recently launched marks the biggest advance in duplicating apparatus that has ever been made. The machines in this range outmode any other duplicators which have hitherto been produced.
"We have continued to play our full part in exports and to be the leaders in our field. Last year I stated that the majority of duplicators exported from this country were of your Company's manufacture. This year I report with pride that our lead has increased. This is indeed gratifying and, having regard to the increasingly competitive conditions in the world in general, is further proof of the technical superiority and quality of your Company's products. We are proud of our claim to be the oldest and biggest firm in the duplicating industry, whilst still showing the qualities of youth in spirit and desire to progress."

Copies of the Accounts and Chairman's Statement may be obtained from the Secretary, Gestetner Works, Tottenham, London, N.17.

NOTICES

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

Applications are invited for a Research Assistantship in Economic History. Graduates in either History or Economics may apply, though some qualification in both subjects is desirable. The person appointed will be expected to undertake a research project bearing on the industrial history of South Wales. The appointment (which carries a salary of £450 p.a.) is for one year in the first instance but is renewable for a further two years.

Applications, with the names of two referees, should reach the undersigned, from whom further particulars may be obtained, by October 17, 1953.

T. MAELGWYN DAVIES,
Registrar.

NATIONAL INSTITUTE OF ECONOMIC AND SOCIAL RESEARCH

Economics graduate with good shorthand typing required to act as private secretary to the Director. Applications in writing only, giving full details and salary required, to the Secretary, 2 Dean Trench Street, Smith Square, S.W.1.

MARKET RESEARCH.—A vacancy exists in the Market Research department of a well-known manufacturing company in the Home Counties for a young man with an honours degree in economics, and some experience of industry or commerce. The post offers exceptional opportunity for gaining a wide experience in the planning and operation of market research enquiries. The initial salary will be not less than £600 p.a. plus non-contributory pension and life assurance benefits. Applicants are invited to write in confidence, giving full details of their age, qualifications and experience, to Box 340.

OPERATIONAL RESEARCH. COURTAULDS, LIMITED, has a vacancy for an Assistant in its Operational Research Department with a degree in applied mathematics, physics, chemistry or engineering and with an interest in investigational work.

A knowledge of statistics is desirable but basic mathematics for learning statistical methods and related techniques is essential. Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds, Limited, 16 St. Martin's-le-Grand, London, E.C.1 quoting the reference number C.47.

SALES EXECUTIVE with wide commercial experience (home and export) and a sound knowledge of building technique, with extensive connections in government departments and industry generally, seeks a progressive appointment. Box 333.

PHYSICS DEGREE or equivalent. Assistants (male or female) required for research and development work on Timber. Good prospects in a rapidly developing field; excellent working conditions. Apply to The Aircrow Co. & Jicwood Ltd., Weybridge, Surrey, stating age, qualifications and experience.

SALES EXECUTIVE, 36, wide experience, assistant to Managing Director of small manufacturer, desires wider scope in management. Experienced in advertising, supervision of staff, planning, administration. Box 335.

ADVERTISER, late 30s, seeks appointment as Senior Marketing Executive in progressive company of national standing. Wide experience with front rank companies in Home and Export, Advtg., Mktg., Sales Prom. and Production problems. Languages. Box 308.

NEWCASTLE-UPON-TYNE EDUCATION COMMITTEE

MUNICIPAL COLLEGE OF COMMERCE

Applications are invited for the post of Principal, which will become vacant in April 1954, on the retirement of the present Principal, Mr J. Lamb, B.A., B.Sc.
The College, which attracts students from a wide surrounding area, has an annual enrolment of approximately 4,000 part-time day and evening students and 100 full-time students. University Degree and Professional Courses in Accountancy, Librarianship, Management, etc., are provided.

As the post entails considerable contact with business firms, professional organisations, etc., candidates should have had responsible business experience and be aware of modern methods and needs in commerce and industry. A high degree of organising ability and wide interests are also essential.

Salary £1,390 x £50—£1,640.
Further details and forms of application may be obtained from the undersigned, to whom completed applications should be returned within fourteen days of the appearance of this advertisement.

H. V. LIGHTFOOT,

City Education Office, Northumberland Road, Newcastle-upon-Tyne, 1.

BRITISH ASSOCIATION SCIENCE AND INDUSTRY COMMITTEE

Applications are invited for two research posts on the staff of the above Committee which is studying problems of speeding up the application in industry of the results of scientific research. At least one appointment will be concerned with case studies in industrial developments. For this post previous industrial experience is essential. The period of appointments will be two years. Salaries will be in the ranges: Senior £1,000-£1,250, Junior £400-£550—according to qualifications and experience.—Further details may be obtained from Prof. E. R. Williams, University College, Keele, Staffs.

ARE YOU COMING TO HEAR Lord Derby, Miss Margaret Potter and Mr. Maurice Winnick? They will all be at the Central Hall, Westminster, at 7.30 p.m. on Monday, September 28th, discussing competitive television. Admission is free.—Popular Television Association, 78 Buckingham Gate, London, S.W.1. Tel.: ABBey 4437.

NATIONAL TRADE ORGANISATION in London has a vacancy in its export department for a young man (21-25) of good education in foreign languages is desirable. A knowledge of one or more should write in their own hand giving full details of education, previous experience (if any) and interests to Box 337.

SENIOR EXECUTIVE with judgment, initiative and organising ability, seeks responsible appointment with prospects. Flair for negotiation at high level and for absorbing essentials quickly. Flair for graduate, widely travelled, several languages, ex-Major, mid-30s, but other suggestions welcome.—Box 334.

COMPANY MEETINGS

FINANCE CORPORATION FOR INDUSTRY

INVESTMENTS AND COMMITMENTS EXCEED £82,200,000

BRITAIN'S FINANCIAL AND ECONOMIC POSITION

RADICAL CHANGE IN CIRCUMSTANCES VITAL

FUNDAMENTAL PROBLEM OF THE DOLLAR GAP

LORD BRUCE ON NEED FOR NEW AND IMAGINATIVE APPROACH

The eighth annual general meeting of Finance Corporation for Industry, Limited, was held on September 23rd in the Conference Hall of the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

The Rt Hon Viscount Bruce of Melbourne, PC, CH, MC, FRS, the chairman, who presided, said:

"Shareholders will have observed from the report of the directors that Sir John Morison and Sir Archibald Forbes have felt compelled to resign from the board following their appointments as chairmen of the Iron and Steel Holding and Realisation Agency and of the Iron and Steel Board respectively. These resignations were received by the board with deep regret and I am sure that regret will be shared by all those interested in the corporation."

Sir John Morison was one of the original directors and his great wisdom and experience have been invaluable in resolving the many and difficult problems that have faced the corporation in the early years of its existence.

Sir Archibald Forbes, who joined the board some three years ago, has also rendered great service and his judgment and wide knowledge of industry have been of the greatest assistance to your board.

Our best wishes go with them in their new and important spheres of activity. To me I render my personal thanks for the faithful help and assistance they have accorded to me."

CONVERSION RIGHTS IN STEEL COMPANIES: CLAIM SETTLED

In my speech at our annual meeting last year I referred to our claim for compensation in respect of our conversion rights in Steel Companies which were subsequently nationalised. This claim was the subject of long and difficult negotiations, and up to the date of the closing of our accounts for the past year it had not been settled. Consequently it was necessary to insert a reference to this claim in Note 2 on the balance sheet. Agreement has now, however, been reached, and you will have learnt from the directors' report that we have accepted a sum of £2,250,000 in full settlement of our claim. This figure is, I think, a fair one, and that view is shared by all members of your board.

It is perhaps desirable that I should remind shareholders how this claim arose, particularly as it links very closely with the policy that your directors have pursued and are pursuing wherever practicable in respect to the advances we make.

At the time an advance is made, we give careful consideration to the eventual capital structure to be adopted and when it becomes possible to substitute permanent finance for FCI's advances. Our policy is to make our advances at the lowest possible rate of interest during the construction and de-

velopment period of any new venture or expansion of an old one. To our advances, however, we endeavour to attach conversion rights into the equity, so that should the project prove a pronounced success we will be able to obtain some reasonable compensation for the risks we have run.

In a number of our advances to the steel companies, we inserted a provision of this sort, including in the case of the Steel Company of Wales the right to convert £10 million of the loan into the equity.

Under nationalisation all our conversion rights in these companies disappeared but a provision was included in the Act for compensation in such cases.

While I have said that the amount of £2,250,000 which we have received appears to me a fair and reasonable settlement under all the circumstances, I am confident that had not nationalisation taken effect our rights in respect to such conversions would have realised an even greater amount.

This compensation, together with the profit that will accrue to us in respect to the advance to F. Perkins, Limited, of Peterborough, to which I referred at our annual meeting last year, constitute a very substantial cushion against losses. This should be reassuring to any of our shareholders who may have felt some anxiety with regard to the large amount uncalled upon the shares they hold in the corporation.

BOARD'S INVESTMENT POLICY

Shareholders will have observed that your directors have again this year considered it desirable and necessary to apply the whole of the profits for the year in writing down our investments. I feel that I should say a few words as to the reasons that have led your board to adopt this course.

On our balance sheet you will see a note to the effect that investments by way of loans and participations in other companies include interests in companies in the development stage, the value of which cannot yet be assessed. From the very nature of our business it is inevitable that that should be the position. I would remind you that our charter imposes upon us the duty of making advances for new industries or for the expansion of old ones which are desirable in the interests of the national economy and for which the necessary finance cannot be found through ordinary channels.

For such new ventures or expansions a period of time is required for construction and the installation of the necessary plant and machinery, and after this is done a period of operation must elapse before it is possible to determine the success or otherwise of the venture and the possibility of replacing our finance by a private or a public issue.

During this period of construction and installation, and before operational results have demonstrated the value of the project,

it is impossible for your directors to assess, with confidence the value of the securities that we hold.

PETROCHEMICALS

An outstanding example is our investment in Petrochemicals. Last year I referred to the position of this company in some detail and told you that the company had passed from the constructional to the operational stage. Unfortunately this coincided with a recession in the chemical industry, to which many references have been made in the press and which has been reflected in the results of the big operators.

Notwithstanding these adverse conditions, a marked improvement in the operational efficiency of the plant and the company's sales organisation has been effected by the new management during the past twelve months. This is reflected in the results, which are better than those of the previous year but are still quite unsatisfactory. It will take some years of hard work and concentrated effort on the part of the management, staff and workers before Petrochemicals will be in a position to meet its heavy charges for interest and depreciation.

In these circumstances it is impossible to assess with certainty the value of our investment in this company. In view of the magnitude of this investment, however, it is desirable and prudent that the fullest possible provision should be made against any eventual loss and this course your directors have adopted.

BALANCE SHEET FEATURES

I now turn to the balance sheet and profit and loss account. The accounts for the past year have been in your hands for some three weeks and while I think they are self-explanatory you may like me to emphasise one or two essential features.

You will observe that in the balance sheet this year we have divided our investments between those in nationalised steel companies and those in other companies.

Repayment of our advances to nationalised steel companies is now guaranteed by the Iron and Steel Holding and Realisation Agency, and repayment can be made or called for by six months' notice. To date your directors have not deemed it desirable to give such notice.

During the year under review £30,000 has been repaid under the terms of the original contract.

Investments by way of loans and participations at cost less amounts written off at March 31st last totalled £60,884,426, to which must be added the figure of further commitments £11,250,000, making a total of investments and commitments of £72,134,426, against £69,961,076 12 months earlier—an increase of £2,173,350.

The total of new business entered into during the year was £4,500,000. The difference between this figure of £4,500,000 and the total increase of £2,173,350 is accounted for by repayments of some of our earlier loans and the further amount of £200,963 written off investments in the year under review.

INVESTMENTS AND COMMITMENTS

Our investments in and commitments to companies other than steel companies stand at £32,659,426 as against £30,186,076 at March 31, 1952. Since the date of the balance sheet we have increased our commitments by £10,105,749. This means that the Corporation has advanced or committed itself to advance £82,240,175 out of its total resources of £125 million.

It is interesting to examine how this position has been progressively reached over a period of seven years, when the amount invested plus commitments has risen from £1,335,000 to £82,240,175.

31st March	Investments less amount written off	Further commitments	Total
	£	£	£
1946	254,500	1,080,500	1,335,000
1947	1,862,051	799,400	2,661,451
1948	4,737,801	41,275,750	46,013,551
1949	10,969,029	50,079,557	61,048,586
1950	32,702,386	34,160,255	66,862,641
1951	54,506,992	13,945,000	68,451,992
1952	52,836,076	17,125,000	69,961,076
1953	60,884,426	11,250,000	72,134,426

Since March 31, 1953, the loans agreed by the Corporation have increased by £10,105,749, making the total to date of investments plus commitments £82,240,175

We are entitled to call for repayment of £39,475,000 of this amount in respect to our advances to steel companies. Nevertheless, I would hesitate to regard the whole of this sum as a deduction from our commitments for the reason that, if the steel industry is to continue its programme of development and modernisation to meet our national needs, FCI will no doubt be called upon to play some part in this progressive programme.

In considering how far in the future we will be able to continue with our present resources to assist in the financing of worthwhile projects for the benefit of the national economy, we have to bear in mind what I have already pointed out, namely, that most of the projects which we finance take some years to develop and to reach the point where our loans can be repaid or replaced. In consequence, during these early years of the corporation, as the table of advances and commitments which I have just given you shows, there has been a steadily increasing outflow.

Progressively, however, there will be a growing inflow to set off against this outflow. How far the inflow will balance the outflow remains to be seen and will depend greatly on the demands for finance of the type your corporation provides over the next few years.

AIR FINANCE COMPANY

Personally, I believe the calls upon us will be substantial, because I am convinced, from my experience as your chairman, that there is a gap which your corporation alone can fill. The latest evidence that I have had that this is so is in respect to the Air Finance Company, the formation of which was announced recently.

We are all gratified at the success that has been achieved by our aircraft designers and constructors. The British aircraft industry has in recent years won for itself an outstanding technical position both in civil and in military aviation. In particular it can offer

to the operators of civilian air lines in any part of the world aircraft and aero-engines unrivalled in price, efficiency and reliability for the services for which they are designed. Experience, however, has shown that there is a real need for organised credit facilities if full advantage is to be taken of the present opportunity to expand the sales of British aircraft and aero-engines in world markets.

Under the leadership of three of the banking houses—Lazards, Morgan Grenfell and Erlangers—a scheme which has the full co-operation, financial and otherwise of a number of leading firms in the aircraft industry has been evolved to meet the position. To implement this scheme additional finance to the extent of £10 million is required. This finance your corporation has agreed to provide.

PROFIT AND LOSS ACCOUNT

I now turn to the profit and loss account. From it you will see the available balance is less than that shown twelve months ago. The

figures for 1952, however, were swollen by a payment of £98,000 for interest which we had allowed to be deferred from the preceding years. The balance of the difference is attributable to the increase in the Bank Rate, which would have had a still greater effect but for the existence of an "escalator" clause in a number of our agreements.

I do not think there are any other points with regard to the accounts that it is necessary for me to touch upon. If, however, there is any matter that it would be desired I should deal with further, I will do so in reply to any question that may be addressed to me.

THE NATIONAL ECONOMY

At our annual meetings over the past few years I have stressed to shareholders how closely our affairs are linked with the national economy. Our assessment of probable trends greatly influences us in our decisions as to how far we are justified in making advances for the creation of new industries or the expansion of old ones.

I propose again to make some observations on this important question. In doing so, I must make it clear that I, and I alone, am responsible for what I am about to say.

In the past I have expressed grave anxiety as to the financial and economic position of Britain. The year that has gone has deepened that anxiety. The grounds for my inquietude—which I have elaborated at considerable length on previous occasions—I would briefly summarise.

As a result of her unparalleled efforts in two world wars, Britain in 1945 found herself in a gravely weakened position. Leaving out of account the debts we incurred in the first world war, we find that Britain had an external debt of some £200 million by 1945 and that subsequent borrowings have raised this figure to about £2,150 million in 1953.

In 1938 Britain possessed long-term investments overseas with a nominal value of

£3,545 million. By 1946 these had been reduced to a nominal value of £2,329 million and the latest estimate puts them at £1,985 million at the end of 1951.

In June, 1938, Britain's short-term liabilities—the sterling balances—were about £750 million, but against these liabilities Britain held gold and foreign currencies worth about £800 million. Hence she could pay her depositors on demand and the £ was freely convertible. By the end of 1945 however, Britain's short-term liabilities had grown to over £3,600 million, while her holdings of gold and foreign currencies were worth only some £600 million. By the end of 1952, her liabilities stood at nearly £4,000 million but the gold and foreign currency reserves amounted to only some £700 million. As a result the £ has no longer been freely convertible, except for one brief and disastrous experiment some years ago.

Before the war Britain and the sterling area balanced their gold and dollar transactions in the normal course of trade. Since the war balance has been precarious and infrequent; there have been recurring crises; the £ has been devalued and Britain has been saved from collapse only by the receipt of grants and loans exceeding \$9,000 million. Now this aid is steadily diminishing and may very soon cease altogether.

INADEQUACY OF GOLD AND DOLLAR RESERVES

Despite the immense aid received, Britain has not yet succeeded in building up gold and dollar reserves to an adequate level. At the end of August, 1953, they stood at \$2,469 million, compared with \$2,476 million at the end of 1945. I draw your attention to the fact that between 1945 and 1952 there has really been no increase in our gold and dollar reserves. The reserves are far too low for safety and the slightest adverse movement in trading conditions can bring about a fresh crisis. The increase in the reserves over the last year, though gratifying, is wholly inadequate for full recovery.

In the light of this situation, the economic position of Britain and the sterling area can only be described as extremely insecure and any other attitude is frankly unwarranted by the facts.

IMPORTS AND EXPORTS

After the war it was clear that if Britain was to restore her financial and economic position and protect the standard of living of her people she had to increase her export and reduce her imports to the minimum level compatible with her vital requirements of food and raw materials.

Drastic action has been taken in respect to her imports and there is now little more that can be done in this direction. In any case, restriction of imports is a negative action and can never bring about the radical change in our circumstances which is absolutely vital.

Exports have been increased in a remarkable and gratifying manner. In 1952 the volume of our exports was nearly 60 per cent above the 1938 level.

In assessing this achievement of our exporters we have to bear in mind certain underlying factors. For some years after the termination of hostilities the world's need to re-equip, reconstruct and restore the ravages of war created a strong sellers' market. By 1950 this need had to a considerable extent been met and the sellers' market was rapidly turning to a buyers' market. This trend was checked by the outbreak of the Korean war, the acceleration of rearmament and stockpiling. The need for, been met and most of the shortages that appeared as a result of the Korean war have been overcome by greater production.

GERMANY AND JAPAN—FORMIDABLE COMPETITORS

With the buyers' market again upon us Germany and Japan have re-established their industrial production and their competition—which was absent in the immediate postwar years when our exports expanded so rapidly—is progressively and rapidly becoming more formidable.

Having regard to these facts, we are clearly faced with the gravest difficulties in maintaining, let alone expanding, our exports. In these circumstances it is imperative that we should increase our production and reduce our costs. This need is clearly recognised, particularly by such bodies as the Federation of British Industries and the Trades Union Council, and their efforts in these directions are wholly commendable.

COUNTRY'S VITAL NEEDS

What I venture to suggest is not so clearly understood is how desperately our financial and economic position is and how seriously are our standards of living menaced unless as a nation we make a supreme effort to overcome our difficulties.

Were there such a recognition there would be an immediate disappearance of that irritating complacency which exists in far too many quarters as to our industrial progress at home and the development of the Commonwealth and Empire overseas. There would also be a cessation of soothing statements as to our improved financial position. We might also see a more realistic approach by all political parties to the problem of taxation.

Our vital needs today are to increase productivity and reduce costs. The level of taxation today is such as to remove all incentives to increase productivity, and the overwhelming taxation burden carried by industry makes it almost impossible to finance the improved methods required to reduce costs.

The lowering of taxation is vital in the national interest. If, in order to effect it, we have to adopt the unpalatable course of a standstill or even a reduction in the amount we spend on ourselves we must do so. We are living in a fool's paradise if we think a nation can indefinitely enjoy social services beyond what its national income can provide. Better to face the issue while there is time than to see not only the social services, but our standard of living swept away by hard and inexorable circumstances.

In the event of our achieving increased productivity and decreased costs, where are we to find the markets for our expanding exports? I gather it is hoped that the necessary markets will be found by the successful operation of GATT ensuring a freer flow of international trade and by an increase of imports into the USA. This solution I cannot accept.

In view of the world-wide increase in industrial production, resulting in practically every manufacturing nation insisting on meeting its own requirements while seeking overseas markets, can anyone believe there is a possibility of a lowering of tariff barriers and the removal of Customs restrictions to permit a greater import of British goods?

UNITED STATES POLICY

With regard to the possibility of increased imports into the United States, we must all greatly welcome the statesmanlike and impressive report which Mr Douglas has submitted to the President.

With admirable clarity and great courage, he defines the tariff policy that the United

States should pursue, not only in the interests of the world but of America herself. I believe this report will bear fruit but it will take longer than we can afford to convince public opinion and the politicians in America to follow the wise course he suggests.

In the immediate future we must, I fear, recognise that the United States will not continue to pursue a liberal tariff policy once the flow of imports embarrasses the local producer.

NEW APPROACH TO BRITAIN'S PROBLEMS URGED

Because I hold these views strongly, I suggested at our annual meeting last year a new approach to our problems. Broadly, what I proposed was an immediate examination of the basic food and raw material needs of—

- The world;
- The sterling area;
- The British Empire.

Having obtained this information, I suggested the next step should be to examine the resources and production potential of the Commonwealth sterling area in relation to demands for these basic requirements. When this was ascertained I suggested the policy to be pursued could be considered in the light of the fundamental problem of today—the dollar gap. In other words, we should consider whether we should increase production to meet our own needs, thus saving dollars, or to satisfy the requirements of the USA, thus earning dollars.

How great the requirements of the USA are likely to be is brought out very clearly in the Paley Report.

It would be invaluable to have a similar report on the Sterling Area, analysing its import requirements and exporting capacity over the years. If it were found that the Sterling Area, like the United States, is moving from a surplus to a deficiency in respect of essential commodities which might cause serious shortages in the future, fresh urgency would be added to plans for increased production.

The ascertainment of the facts I have suggested as to the need for food and raw materials and the potential sources of increased production should not take long—if they are not already available, which they should be. Their ascertainment appears to me an essential starting point, particularly as I understand that there was unanimous agreement of the Commonwealth Prime Ministers in December last that throughout the sterling Commonwealth investment should be concentrated as far as possible upon projects which directly or indirectly contribute towards an improvement in the balance of payments.

Without the information which I have suggested should immediately be made available, I find great difficulty in seeing how any Prime Minister can determine how best he can implement the undertaking which he gave to the conference.

I also suggested that a Commonwealth Finance Corporation should be established, somewhat on the lines of our corporation and in view of the vast capital investment involved, that the co-operation of the USA should be sought.

In a subsequent speech I put forward the idea of a working party, under the auspices of the UK Government, the Colonial Development Corporation and the Commonwealth Finance Corporation, to give continuous study to the problems involved. The suggestion of a Commonwealth Finance Corporation was adopted by the Prime Ministers' Conference last autumn.

CLARIFICATION OF PROPOSALS

With regard to the other proposals I have put forward, I have gained the impression that they have been misunderstood—possibly with some justification from the words that I employed—as contemplating a far more cut and dried plan than I had in mind. In view of this, it is possibly desirable that I should try to make rather more clear what I was actually proposing.

I contemplated that when the facts as to the basic food and raw materials had been ascertained and the production potential of the sterling Commonwealth and Empire examined, consideration would be given to what is the most urgent and promising field in which to make a start. After a decision had been reached the procedure I visualised was as follows:

Assuming that a raw material was under consideration, probably the area of operation would be in one or more parts of the Empire. In that case the UK Government and the government (if any) of any other part of the Empire interested in the increased production of the raw material would jointly approach the government or governments of the territory where the development was contemplated, with a view to considering the action that might be taken. The government concerned would also get in touch with the industry or industries requiring the raw material, with a view to their co-operation. The interested parties would then proceed to formulate plans, possibly using the working party I have earlier suggested.

In these plans the respective parts of the Government and private industry would be defined. For example, governments or their agencies would have to assume responsibility for transport, harbour improvements, power, housing and social amenities. Private industry would have to assume responsibility for factories, machinery, equipment and actual production. The expenditure involved in the proposals would be estimated and the assistance of the Commonwealth Finance Corporation would be available to enable private enterprise to carry out the task.

The financial co-operation, if necessary, of the World Bank and other sources in the USA would be contemplated and the approach would be by the UK Government or the UK Government jointly with the other governments concerned or by the Commonwealth Finance Corporation.

From the press I understand that a meeting of representatives of Commonwealth and Empire countries is to take place in Australia early in the New Year, to consider the financial and economic position. This meeting will afford an opportunity for a new and more imaginative approach to the vital problems that face us.

It is my earnest hope that advantage will be taken of it.

In conclusion, I desire to express to my fellow directors my deep appreciation of the patience, tolerance and help they have extended to me during the past year. I have to make this statement to you annually, but I can assure you that it is with the utmost sincerity that I make it, because my task as chairman would be quite impossible without that ever-willing help my co-directors afford to me.

I also want to express my gratitude to Mr Nelson, our general manager, whose unwearying efforts and ability have been of the greatest service to the Corporation. I also extend, on behalf of myself and my colleagues, our grateful thanks to Mr Nelson's small but, I venture to suggest, increasingly competent staff for their very great efforts in the interests of the Corporation.

The report and accounts were adopted. The retiring directors, the Rt Hon Viscount Bruce of Melbourne, PC, CH, MC,

FRS, and Sir Findlater Stewart, GCB, GCIE, CSI, were re-elected; the remuneration of the auditors was duly fixed; and the proceedings terminated with a cordial vote of thanks to the chairman for his conduct of the meeting.

J. WHITTINGHAM & SONS LIMITED

ACQUISITION OF NEW SUBSIDIARIES

The twentieth annual general meeting of J. Whittingham & Sons, Limited, was held on September 23rd at Bradford, Mr L. C. Taussig (Chairman and Managing Director) presiding.

The following is an extract from his circulated statement:

The net profit of the company and the wholly owned subsidiary, Albion Warehousing Co., Limited, for the year to March 31, 1953, after charging all expenses, but before taxation, amounted to £423,449. United Kingdom taxation absorbed £224,652, leaving a net surplus for the year of £198,797. These figures do not include anything from our new subsidiaries, to which I will refer in a later paragraph.

In view of the satisfactory earnings for the year, the directors, having paid an interim dividend of 8½ per cent, less tax, upon the "A" Ordinary shares in June, 1952, decided to pay a further dividend on the "A" Ordinary shares at the rate of 11½ per cent, less tax, making 20 per cent for the year, compared with the forecast of 17 per cent. The holders of the "B" Ordinary shares received the appropriate proportionate rate. After providing for the dividends I have enumerated and for transfers of £75,000 to a reserve for contingencies, and £100,000 to general reserve, there remains a balance to be carried forward on profit and loss account of £229,820.

I am particularly happy to report that in February of this year, shortly before the end of our financial year, we acquired the whole of the share capital of the old-established and well-known business of H. Haigh and Co., Limited, wool merchants and top-makers, of Bradford, with their wholly owned subsidiary, Moorlands Combing Co. (Birkenshaw), Limited, of Birkenshaw, near Bradford. The latter company owns and operates a wool-combing plant which is being advantageously employed for the benefit of both the principal businesses and also being gradually expanded. By reason of this purchase our investments have been increased by £357,000, but the profit-earning record of H. Haigh and Co., Limited, over many years is an admirable one and your directors are confident that their future earnings will provide a valuable contribution to the profits of your company. Since June 30, 1952, their profits have continued to be satisfactory. Accounts for the year to June 30, 1952, of H. Haigh and Co., Limited, and its subsidiary, Moorlands Combing Co. (Birkenshaw), Limited, show a net profit for the year of £154,485 before charging taxation.

Arrangements are approaching completion for the acquisition of two further and smaller subsidiary companies, both of which are engaged in businesses similar to our own.

The consolidated balance sheet of the J. Whittingham & Sons Group shows a sound financial position, the capital and reserves aggregating £1,658,209 as against the issued capital of £750,000. Amongst the current assets the stocks (including wool in processing) amount to £2,508,653, of which the larger part is sold against forward contracts at prices showing a reasonable profit margin.

Since the end of the financial year our turnover has been well maintained.

The report was adopted.

THE GREAT UNIVERSAL STORES LIMITED

PREVIOUS RECORDS EXCEEDED

MR ISAAC WOLFSON'S REVIEW

The thirty-fifth ordinary general meeting of The Great Universal Stores, Limited, was held on September 22nd, in London, Mr Isaac Wolfson, chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to March 31, 1953:

The year under review has again been a record one.

HOME TRADE CONDITIONS DURING YEAR

As to trading conditions during the year under review, at home, greater freedom has been given to manufacturers to produce goods of their own design and at prices which previously had been subject to certain restrictions. This has provided a greater degree of flexibility in merchandising problems and has enabled the public in general to obtain a larger variety of goods in many cases at better values than hitherto.

Merchandise prices and the flow of goods have remained at a more constant level, and we have not had to contend with the large reductions in commodity prices which were encountered during the previous year.

As against this, and despite relatively full industrial employment throughout the country, there is not the surplus spending power which has been evident in the last few years and there has been increasing competition. This is all to the good, for healthy competition is better for industry and the customer alike.

The retail turnover achieved in the United Kingdom was again a record in the history of the group, and has accordingly strengthened our buying power. This,

together with the support of our suppliers, has enabled us to give to the public even better quality and value which I am confident will in turn bring to us steadily increasing sales.

EXPANSION IN CANADA AND USA

Overseas, our Canadian subsidiaries have had a more successful year. Trading continued at a higher level, and I am pleased to state that turnover increased by no less than 22 per cent in relation to the previous year. Profits earned have also increased.

As you well know, the Group has over the past twenty years carried out a most successful policy of expansion in the United Kingdom. It is my firm opinion that a great opportunity now exists to build up a complementary and perhaps larger business in Canada and in the United States based upon our proven trading methods in this country but coupled with resident management with full knowledge of local conditions. I feel that this is of such importance that I intend to devote a larger part of my time to this project in order to ensure the degree of development which I have in mind.

I have every confidence that our trade expansion in these great countries will not only add to our profits but will also increase our exports of British-made goods. I am also pleased to tell you that I have made adequate financial arrangements to ensure that the above programme is carried through over the next few years.

In conclusion, I am pleased to state that the turnover and profit of the Group for the current year to date are in excess of the same period last year.

The report and accounts were adopted.

GROUP PROFIT, APPROPRIATIONS AND NET ASSET POSITION FOR THE YEAR ENDED MARCH 31, 1953

Group trading profit	£	11,453,461
Less: Depreciation, interest paid, interests of outside shareholders of subsidiaries, etc.		1,523,526
Group net profit—before taxation		9,929,935
Less: Taxation (including £1,546,936 excess profits levy)		6,746,550
Group net profit—after taxation		£3,183,385
Appropriated as follows:—		
Written off goodwill, etc.		29,881 (Cr.)
Transfer to reserves and increase in profit and loss account balance		2,420,651
Preference dividends, net		59,633
Ordinary dividends, net		732,982
		£3,183,385
Preference stockholders:—		
Issued capital		£2,250,000
Dividend covered by net earnings after tax		53 times
Capital covered by net assets		11.4 times
Ordinary stockholders:—		
Issued capital		£2,696,026
Rate of dividend paid on present capital		50% p.a.
Rate earned on present capital		210%
Net assets attributable to each 5s. ordinary stock unit		43s. 4d.
Group net current assets		£25,463,072
Comparative Group Trading Profits		
1949	1950	1951
£4,599,656	£5,906,133	£8,173,679
		1952
		£10,013,975
		1953
		£11,453,461

UNITED DAIRIES LIMITED

TOTAL RESERVES EXCEED £10 MILLION

A BETTER YEAR FOR MILK PRODUCTION

CONTINUED RISE IN COSTS

SUCCESS OF "VAC-PAC" FOR FOODSTUFFS

MR LEONARD MAGGS'S REVIEW

The thirty-eighth annual general meeting of the members of United Dairies Limited was held on September 18th at the Connaught Rooms, Great Queen Street, London, W.C., Mr Leonard Maggs (chairman and manager director) presiding.

The secretary (Mr Ernest Evanson, ASAA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman to the members which had been circulated with the report and accounts for the year ended March 31, 1953, and was taken as read:

Once again I am circulating my remarks with the directors' report and accounts for the benefit of those members who are unable to attend the annual general meeting on September 18th.

As the consolidated statements published give a clear and concise picture of the financial position of the whole group, I do not think the accounts call for much comment.

As mentioned in my statement last year, there was written off in the accounts for that year the balance standing in the books of subsidiary companies in respect to plant and machinery, fixtures, fittings, transport vehicles, churns, rail tanks, etc., which were acquired prior to March 31, 1945. These assets, the value of which at cost, less depreciation, was £941,050 at March 31, 1945, have been eliminated from the accounts for the year under review, although many of them are still in use in the subsidiary companies.

PROVISIONS

£1,502,268 for taxation.

This amount, which is provided in conformity with the latest Finance Act, takes into account an adjustment in respect to excess profits tax, for which the group's liability has now been agreed with the taxation authorities.

Although provision for Schedule "D" tax this year is at 9s. in the pound, against 9s. 6d. during the previous year, the present rates of taxation are still very high, and quite disproportionate to the balance of profits left for other purposes, including replacement of assets, as well as payment of dividends. I hope the day is not far distant when substantial economies in the running of the country can be effected so that there can be some material alleviation of the present burden of taxation on industry.

RESERVES

The following are the reserves of the group at March 31, 1953:

The share premium account	£5,814
Capital reserves:	
General reserve	£154,548
Profits, less losses, on realisations of:	
Properties	£184,236
Investments in subsidiary companies	£99,582
Revenue Reserves:	
General reserve	£4,000,000

Insurance fund	£100,000
Depreciation not required on properties sold	£49,411
Future income tax	£1,574,603
Profit and loss appropriation accounts	£4,095,426
	£10,263,620

These reserves are after dealing with the provision for deferred repairs in the manner set out under that heading below.

The total of the reserves at March 31, 1952, was £7,855,075.

Consequent upon agreement of the group's liability to excess profits tax the postwar refunds to the companies treated as a group for this tax have been agreed with the taxation authorities. These are in the aggregate £154,548 after deducting income tax, and this amount, as you will notice, has been included in the accounts of the group as a capital reserve.

DEFERRED REPAIRS

As I forecast in my statement last year, agreement has been reached regarding our claims in respect to deferred repairs in relation to excess profits tax. In the main all repairs to buildings, plant and machinery that had to be deferred during the period of excess profits tax have now been carried out. The cost of these repairs during the six years ended March 31, 1953, has been charged against current trading, and not against the provision made for deferred repairs. This provision, amounting to £1,132,203, is therefore no longer required, and has been written back and brought into credit in the appropriation accounts of the subsidiary companies concerned.

There has been taken to general reserve in the subsidiary companies' accounts £750,000, and the balance of £382,203 becomes an addition to the undistributed profits of the subsidiary companies.

WORKING CAPITAL

The issued capital does not represent the capital actually employed in the business. The total capital and surplus as shown in the group balance sheet is £18,598,820, of which the issued capital represents £8,335,200. More and more capital becomes necessary to run the business. Owing to higher prices greater amounts are needed now than before the war to finance stocks. The value of stocks at March 31, 1953, was £4,104,769; at March 31, 1939, it was only £999,057—and this despite the fact that in 1939 we had to finance the whole of our stocks, whereas today the Ministry of Food purchases the bulk of our manufacture of milk products almost as soon as made. It will be readily realised that increased working capital will be required to finance stocks to be marketed over a period, if and when the Ministry of Food ceases trading.

In addition, owing to inflated prices our accumulated depreciation funds, although greatly in excess of the amounts allowed for

taxation by the Inland Revenue, are insufficient to meet the cost of new equipment, and the balance has to be found from retained revenue.

These considerations influenced our decision to leave with the subsidiary companies as working capital the amount of the provision for deferred repairs not used for the purpose for which it was made.

COSTS AND PROFITS

During the year under review costs have continued to rise. After representations from the trade the Ministry of Food has increased the margins for services in connection with liquid milk to take account of such increased costs, but always there has been an inevitable time-lag, which means that the notional target margin of net profit on liquid milk which the Ministry of Food intends the trade to enjoy is never in practice achieved.

In connection with milk products that are acquired by the Ministry of Food, prices are fixed retrospectively, and the true weighted average manufacturing costs of the industry are in the main recovered, and the notional margin of profit eventually realised. This process naturally involves delay, and the latest date to which final prices have been agreed is September 30, 1951. For all manufacture subsequent to that date the prices paid by the Ministry of Food have been "on account" prices: these will be subject to adjustment when final prices can be negotiated.

MILK SUPPLIES

The year under review turned out a better year for milk production than the previous year. Although one hesitates to make prophecies, with the present trend of production and the diminishing sales of liquid milk there seems unlikely to be any serious gap between supplies and requirements of milk for liquid consumption during the lower-production months immediately ahead.

The decline in the sales of liquid milk which I mentioned last year continues, no doubt due to a combination of factors—higher consumer prices, and the greater availability of other foods. Admittedly, the price of milk has increased considerably since before the war, but not, I think, disproportionately to the increase in the prices of other basic foods. The prices payable to wholesale milk producers are about three times as great as those paid in 1938-39, while the retail price of milk is less than double what it was then. I estimate that the margin left for distribution has risen during the same period by about 25 per cent.

SEASONAL PRICES TO CONSUMERS

Since the close of the year under review the Ministry decided to revert to seasonal prices to consumers for liquid milk, and reduced the price during May and June of this year by 4d. per gallon, with increases during subsequent months. The reduction

had little or no effect on consumption, but undoubtedly the subsequent increases are arousing consumer resistance.

It will be realised that sales under the "Milk-in-Schools" Scheme and the National Milk Scheme are not affected by alterations in price. Deliveries under these schemes in England and Wales are, I estimate, about 14-15 per cent of the liquid consumption.

A SATISFACTORY MANUFACTURING YEAR

The higher production and the lower off-take of liquid milk left more for manufacture during the year under review, and of this we had a reasonable share, thus enjoying a satisfactory manufacturing year.

Since the close of that year, on account of increasing quantities of milk available for purposes other than liquid consumption, the Minister of Food permitted from April 1st the manufacture and sale of cream, including (for the first time since before the war) tinned sterilised cream—there being now no shortage of tinplate. Owing to the relatively high price that has to be paid for milk for manufacture into cream the prices at which we are having to sell cream are also necessarily high, with the result that sales of fresh cream and clotted cream are much below pre-war level. The demand for tinned cream, however, has been substantial, due, no doubt, to its absence from the market for so long, and our brand, "Diploma," is selling freely throughout the country.

ENGINEERING AND TRANSPORT COMPANIES

The U.D. Engineering Company, Limited, continues to make steady progress in supplying modern machinery for the dairy and other industries to meet the high standards demanded at home and overseas.

In this connection it is of interest to record that our central laboratory is rendering invaluable assistance to our engineers by carrying out research work on the development of new machines.

In spite of severe competition at home and abroad, I am happy to be able to report a healthy order book for our engineering company.

During the year the Dairy Supply Company, Limited, has introduced improved types of milk churns and bottle crates. These have been very well received by the trade both at home and abroad, and the demand for them, and for other equipment which this subsidiary manufactures, steadily increases.

Mickleover Transport, Limited, in addition to work for other subsidiary companies, continues to expand its business of building and mounting special bodies and equipment for vehicles of all kinds for commercial and Government undertakings.

This company has been assisting in the development of electrically propelled vehicles for milk distribution, in view of the substitution of electricity for horses in retail milk delivery.

We heard with relief of the decision to exempt vehicles of this type from purchase tax.

AN UNIQUE DEVELOPMENT

As a result of the inventive ingenuity of one of our staff, we have developed a process for vacuum-packing dry and semi-dry goods, including foodstuffs, in packages made of flexible laminated materials somewhat similar in appearance to cellophane. This process has been patented in most parts of the world, and we have licensed Messrs E. S. and A. Robinson, Limited, of Bristol, on a royalty basis to develop the project throughout the

world, which they are doing under the trade name "Vac-Pac."

It will be of interest to you to know that much of the food for the recent Mount Everest expedition, including the whole of the rations for the final assault, were specially packed in "Vac-Pac" by our subsidiary company, Wilts United Dairies, Limited. The lightness of the pack, and the sound condition in which it preserved the various foodstuffs, undoubtedly were contributory factors to the success of the expedition.

OVERSEAS INTERESTS

Australia—I am glad to be able to report that the erection and equipping of our new factory, which have taken so much longer than we first envisaged, are now in their final stages. It is expected that it will begin to operate during the next milk-manufacturing season in Australia, which, of course, is during our coming winter, and that we shall then see some return from the investment.

New Zealand—Again our subsidiary company has had a good year's trading and earned a satisfactory profit. Extensions are at present being carried out with a view to expanding production.

FAVOURABLE INDICATIONS

The year under review turned out better than expected. Every credit must be given to those who helped to achieve this result, but adventitious factors, such as the substantial increase in milk production which kept the factories busier than usual, were to a large extent responsible.

Indications of present trading results are favourable, but as we are faced with an increase in wage rates in the industry, and as other costs continue to increase, it would be unwise of me, to attempt a prediction of the results for the year ending March, 1954.

DIRECTORATE

Mr J. H. Maggs is the only remaining member of the board who was appointed on the formation of the company in 1915. Under the memorandum and Articles of Association he was not required to retire by rotation.

Mr J. H. Maggs was chairman of the company for twenty years, vacating that office in 1942, and to his firm guidance the present strength of the company is largely due. It is highly desirable that his vast experience and wise counsel be still available to the company.

APPRECIATION OF STAFF

On your behalf I should like to thank all the officers and staff throughout the group for their services during the year, and for their ever-helpful attitude during changing conditions and the difficult times, particularly during last winter's exceptionally foggy weather.

The report and accounts were unanimously adopted and the final dividend on the ordinary stock at the rate of 10 per cent actual, less tax, making 15 per cent for the year, was approved.

The chairman proposed the re-election of Mr Joseph H. Maggs as a director.

Mr G. Ivor Price, seconding the motion, referred to Mr Maggs's unique position in the industry and expressed the hope that he would continue for many years to serve the company which he had graced for so long.

The resolution was unanimously approved.

The remuneration of the auditors, Messrs Peat, Marwick, Mitchell & Co., was fixed and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

THORN ELECTRICAL INDUSTRIES

PROGRESS OF FERGUSON TV AND ATLAS LIGHTING

The seventeenth annual meeting of Thorn Electrical Industries Limited was held on September 23rd in London.

Mr Jules Thorn (chairman and managing director) presided, and in the course of his speech said: The results show continued satisfactory progress of the Group. The trading profit amounts to £771,292, an increase of £90,123. The net profit before taxation of £547,432 exceeds the previous year's earnings by £47,428. Taxation, after deducting an adjustment of £25,000, takes £324,000, nearly 60 per cent of the net profit.

The Ferguson Radio and Television Division has had a very successful year. Its progress has exceeded our expectations, and Ferguson now enjoys a leading position in the TV market.

Further technical advances have been registered in the field of high-fidelity sound reproduction, and the Ferguson 500 Record gram has raised the prestige of your company here and abroad. Our sales of all record models reached a new record.

The Atlas Lighting Division continues to make excellent progress. Your organisation's position in the front rank of the lighting industry is now firmly established. We have been successful in obtaining, in face of fierce competition from many countries, further substantial contracts from the United States Government for supply of communications equipment to NATO Forces in Europe.

The report was adopted and a dividend of 12½ per cent approved.

SILENTBLOC LIMITED

The eighteenth annual general meeting of Silentbloc Limited was held on September 23rd in London.

In the absence, through indisposition, of the chairman, Mr H. Vezey Strong, his speech was read by Mr Frederick E. Corbin, FCA, FSAA, from which the following is an extract.

The results of the year under review reflect twelve months of difficult trading, from which, however, your companies have emerged strengthened and toughened for the competitive contest. The consolidated profit and loss account discloses that the combined net profits—after making provision for depreciation, reserves and taxation—amount to £60,051, compared with £72,582 for the previous year. The reason for this reduction does not lie in any diminution of sales, which, under the conditions prevailing, were well maintained—indeed, the volume of output was higher—but in the necessity to operate at lower profit ratios on a buyer's market. In all the circumstances, your directors consider this performance not unsatisfactory.

It is proposed to pay a final dividend of 2½d. per share, making 5d. (less tax) for the year, which is the equivalent of 7½d. per share before the bonus issue made two years ago.

As foreshadowed in my speech last year, plans have been completed for a new factory at Crawley, Sussex, where a magnificent site of eleven acres has been secured, and work already started upon Silentbloc's new home. There, your directors believe that current problems will be overcome, efficiency promoted, production costs lowered and your company firmly launched upon a new era of expansion.

The report was adopted.

DAVY AND UNITED ENGINEERING COMPANY, LIMITED

IMPORTANCE OF EXPORT ORDERS

HIGH LEVEL OF ACTIVITY

MR D. F. CAMPBELL'S STATEMENT

The eightieth annual general meeting of Davy and United Engineering Company, Limited, will be held on October 9th at the Royal Victoria Hotel, Sheffield.

The following is the statement to be made by the chairman, Mr D. F. Campbell:

I do not propose in this statement to comment on the details of the accounts. Such items as call for special attention are already referred to in the directors' report.

RETIREMENTS FROM THE BOARD

I would, however, like to refer at the outset to the retirement of Mr E. J. Fox from the Board. Mr Fox became chairman of the company in 1934 when industry generally was passing through a period of acute difficulty, and much of the credit is due to him for the company's emergence from that period. He has been associated with the company, either as chairman or director, for 22 years, and members will undoubtedly wish to express their gratitude to him.

The retirement of Mr K. C. Gardner on December 31st last was a matter of great regret to his colleagues. He has been a director for 16 years, and his wise counsel and personal interest in the development of your company have been of immeasurable value. On your behalf, I offer him also our grateful thanks for all he has done.

REASONS FOR LOWER PROFITS

This year's profits are lower than last year, but, in reviewing the company's results from year to year, I have emphasised, on several occasions, the way in which they are affected by the particular character of our business. A high proportion of our output in any normal year consists of a small number of contracts, each of considerable individual magnitude. We do not normally take credit for the profit on any contract in a year's accounts unless the work is wholly delivered by the end of that year. It follows that your company's profit in a complete year depends within quite wide limits upon the number of major contracts completed within it and, of course, upon the margins of profit earned on the contracts themselves.

In the year under review one large contract was nearly, though not quite, completed by the year end so no profit on it was taken into the year's accounts, although, in fact, most of it was earned during the year.

WORK FOR EXPORT

In my statement last year I remarked that the bulk of the work then before us was for export and that some of it had been obtained in the face of severe foreign competition. In short, some of these contracts, though desirable for several reasons, were known from the outset to be less remunerative than usual. The full effect of the less remunerative work is likely to be felt in the current year, ending March 31, 1954. This, however, should be no more than a temporary phase, as we still have a total order book of very great dimensions and more profitable work will fall due for completion thereafter.

I would remind stockholders that, prior to the beginning of 1953, no rolling mill con-

tract of any great size had been placed by the British steel industry for about 2½ years, the industry's investment programme having been devoted during that period mainly to blast furnaces, coke ovens and other plant which your company does not make.

RECENT CONTRACTS

However, I am glad to announce that we have, in the last few months, received contracts for the new cold reduction strip mills for the Ebbw Vale works of Richard Thomas and Baldwins, Limited, and also for the new Velindre works of the Steel Company of Wales, Limited, together with ancillary equipment for the Steel Company's Abbey Works at Margam. The work includes two 5-stand tandem cold strip mills, together with the necessary temper mills, and additions to one of the existing tandem mills at Ebbw Vale. This work, valued at approximately £4 million, must be the largest group of rolling mill contracts ever placed with a single company in Great Britain.

Stockholders may note that hitherto it has been considered necessary to import much of this massive strip mill machinery and may take pride in the fact that our efforts over the years to create capacity in this country for the manufacture of such plants have been crowned with this measure of success.

The sugar machinery business of your Duncan Stewart subsidiary has continued to make good progress and several interesting installations were completed during the year. Davy and United Roll Foundry at Middlesbrough have also developed their roll and steel castings business and contributed handsomely to group profits.

FUTURE PROSPECTS

Viewing the company's position as a whole, stockholders must be prepared in a business like this for some ebb and flow of profits. Taking all factors into account, your directors do not regard the past year as in any way unsatisfactory. The fundamental condition for our success is that our workshops should be kept operating at a high level of activity. Over the next two or three years this seems reasonably assured, but on the longer view it is clear that we must look increasingly to exports for our livelihood. Export orders are not necessarily less remunerative than home orders, but the hazards are greater and they are often subject to international influences over which we have no control. Increasingly, for instance, the need for long-term credit arises, so that skill in contracting and collaboration with the Government in national trade policy continues to grow in importance.

If it is true that the big postwar surge of demand for rolling mill equipment is now approaching its end, it is equally true that several of the big plants constructed in Europe in the last few years were a part of the Marshall Aid scheme. As this form of aid has now ceased and seems unlikely to be renewed, further development in the metallurgical industries will presumably be open to us on normal competitive conditions. Although some of our potential markets have been satisfied by the generosity of the

American taxpayer, the modern machinery provided has raised the standard of quality of flat rolled steel so much that many of the older mills have become obsolete. Thereby, the market for our products may be further stimulated.

MAINTENANCE OF COMPETITIVE EFFICIENCY

But as engineers and founders, the maintenance of competitive efficiency in the technical sense must always be at the root of our continued success. The constant process of design improvement, the systematic replacement of obsolete plant and the intensive study of methods of utilisation of assets are the key to the future of your company and, indeed, to the future of British industry as a whole. I can assure stockholders that their engineering plants are in a high state of modernity and efficiency and that the company is staffed and manned by a fine body of men and women devoted to its interests.

The difficulties of export trade, such as financial and exchange problems and lengthy and complex technical discussions with foreign engineers, have placed a heavy burden on your managing director and his associates in your various works and offices. To all at Sheffield, Glasgow and Middlesbrough I would, on behalf of the stockholders, express thanks and appreciation.

HACKBRIDGE CABLE HOLDINGS LIMITED

EXCELLENT RESULTS

CONSISTENT DIVIDEND RECORD

The fifth annual general meeting of Hackbridge Cable Holdings Limited was held, on September 23rd, at 55-56 Pall Mall, London, S.W., Mr Claude I. Steen (the chairman) presiding.

The following is the chairman's statement which was circulated with the annual report and accounts for the year ended March 31, 1953, and was taken as read:

The accounts now before you disclose, as I am sure you will agree, very satisfactory trading results; in fact, they constitute a record for the group.

CONSOLIDATED TRADING RESULTS

The net profit of the trading subsidiaries before charging depreciation was £453,544, compared with £214,374—an increase of £239,170.

The charge for depreciation is £50,190 and the provision for taxation is £246,047. After providing for these items the net profit is £157,307.

DIVIDEND AND RESERVES

The amount available for dividend and reserves shows a net increase of some £70,000 over the corresponding figure in last year's accounts. Consequently, your directors, after careful study of the group's requirements, have decided to recommend that the final dividend for the year under review be 12½ per cent, less tax, which, with the interim dividend of 7½ per cent, less tax, paid in January, makes a total of 20 per cent for the year—the rate paid consistently each year since the incorporation of the company. After charging this dividend, the revenue reserves in the hands of the group, quite apart from the provisions for future taxation, have now reached the satisfactory figure of £230,000, an increase during the year of approximately £100,000.

OUTLOOK FOR THE FUTURE

As many important buyers are, for the present, restricting their purchases to a minimum, we do not expect in the current year to reach the figures for 1952-53, but, as the demand for our products must expand, your directors look forward to the future with confidence and enthusiasm.

STAFF CO-OPERATION

Needless to say, the loyalty and co-operation of all employees has played an important part in bringing about the gratifying results which are now before you. I am sure you would again like me to express on your behalf, as well as on behalf of my colleagues on the board and myself, our sincere appreciation of their efforts.

The report and accounts were unanimously adopted and the final dividend of 12½ per cent, less income tax, making 20 per cent, less income tax, for the year, was approved.

The retiring director, Mr. Ernest William Farr, was re-elected, and the other formal business having been duly transacted, the proceedings terminated with a hearty thanks to the chairman.

A. C. COSSOR

PROPOSED CAPITAL INCREASE

The fifteenth annual general meeting of A. C. Cossor, Limited, was held on September 23rd in London, the Rt. Hon. Lord Burghley, KCMG, LL.D., the chairman, presiding.

The following is an extract from his circulated statement:

The background of the year's operations was a further large increase in the turnover of the Group, from some £5½ million to nearly £7½ million (including some £1½ million of exports). This increase in turnover was not, however, accompanied by a corresponding increase in profit. Government contracts, largely in connection with the rearmament programme, accounted for a considerable part of the increase. Our sales of television receivers were marked by increasing success.

The net Group profit on trading was lower at £294,132 than the previous year's figure of £352,768. No less a sum than £205,200 has had to be provided for income tax, profits tax and excess profits levy.

Prospects for the current year appear reasonably good, and we shall be disappointed if we do not do at least as well as last year.

I now come to the proposal to increase the ordinary share capital. That your business is in need of further capital is, I think, self-evident. The object of asking you to create a further 2½ million ordinary shares of 5s. each is to enable your directors to issue further shares as and when a favourable occasion may present itself.

The report was adopted and the dividend of 10 per cent approved.

The proposed increase of the company's capital to £1,750,000 by the creation of a further 2,500,000 ordinary shares of 5s. each was approved.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

The Reporting Manager,
The Economist,
22 Ryder Street, S.W.1.

ASPRO LIMITED

HOME SALES TURNOVER AN ALL-TIME RECORD

The eighteenth annual general meeting of Aspro Limited was held on September 21st at 16 Berkeley Street, London, W., Mr Maurice A. Nicholas, the chairman, presiding.

The following is an extract from his circulated statement:

You will, I am sure, be gratified to observe that this year's group trading profit has shown an appreciable increase on last year's and after providing for directors' remuneration and depreciation it rose from £585,321 to £701,245.

The amount available in the parent company for distribution this year is £175,158, to which is added £41,159 carried forward from last year, totalling £216,317. We have already paid £14,610 for Preference dividend and £39,375 for the interim Ordinary dividend, and your directors now propose to allocate £41,861 to general reserve and £10,000 to the staff contingencies reserve, both of Aspro Limited, and to recommend a final dividend of 20 per cent less income tax in the Ordinary stock, amounting to £55,000. The balance of profit and loss account carried forward will be £55,471, as against £41,159 last year.

Following the acquisition of the minority interest in our South African subsidiary, Nicholas (South Africa) (Proprietary), Limited, to which I referred in my statement to the stockholders last year, this company went into voluntary liquidation. This winding-up has resulted in the conversion of what had been undistributed profits of the group to the extent of £295,377 into a capital profit.

GROUP'S FINANCIAL POSITION

A concentrated view of the group's financial position as a whole, condensed from the consolidated balance sheet, is as follows:

NET ASSETS

Current assets.....	£ 2,057,435
Less: Current liabilities.....	1,018,441
Not current assets.....	1,018,952
Property and plant.....	679,077
Trade marks, patents, and goodwill.....	1,045,393
	£2,743,422
Represented by:	
Preference capital.....	500,000
Ordinary capital.....	500,000
Total capital reserves.....	1,000,000
Total revenue reserves.....	555,360
Total deferred liabilities.....	1,995,995
Minority shareholders' interest in subsidiary companies.....	42,693
	53,374
	£2,743,422

Stockholders will also be pleased to note the steady improvement in the net asset value of the group.

Our cash position has improved appreciably and this is mainly due to increased group sales and the resultant increased profits, together with a reduction of inventory levels. In my report last year I stated we were watching our stocks and these have been reduced as we consider the need for maintaining high inventories has passed.

It gives me great pleasure to report that our home sales turnover in the year under review reached an all-time record, reflecting the faith of the British public in "Aspro."

The report and accounts were adopted.

THE ECONOMIST, SEPTEMBER 26,

E. W. TARRY AND COMPANY, LIMITED

SATISFACTORY RESULTS

The annual meeting of E. W. Tarry & Company, Limited, was held on September 23rd in London.

Sir Harold Fortescue Flannery, Bart., chairman, who presided, said: I have doubt you will have been gratified to find that the turnover for the whole year was slightly down on the total for 1951-52, which was the largest in the company's history, a satisfactory achievement which must be regarded as control of most imports into the Union of South Africa. As far as the outlook for the current year is concerned, it is difficult to forecast what the results will be, for we are now in a period of keen competitive trading and there may be a tendency for sales to fall.

The trading profit is £138,692 compared with £198,560 a year ago. The net profit of the year is £41,719 as against £64,886 a year ago, a result which can be considered satisfactory, I think, having regard to the circumstances under which it was achieved.

The current assets stand at £1,044,800 compared with £1,250,556 a year ago, and current liabilities have declined from £477,200 to £235,414.

The increased ordinary share capital ranks for the full year's dividend, and the board have pleasure in recommending payment of a dividend of 15 per cent, and, better return than the 20 per cent paid last year on the smaller capital.

The report was adopted.

GEO. BASSETT & COMPANY, LIMITED

FAVOURABLE PORTENTS

The twenty-seventh annual general meeting of Geo. Bassett & Company, Limited, was held on September 24th in London, Mr E. M. Mott, chairman and managing director, presiding.

The following is an extract from his circulated statement for the year ended March 31, 1953:

Our trading profit was practically the same as for the previous year and we recommend the same final dividend of 17½ per cent making 22½ per cent for the year.

The outstanding event of the year was the abolition of confectionery rationing and production last February. The main effect was to intensify the sellers' market. So long as demand was restricted to 6 oz per week consumers were selective, and some firms were beginning to find it a little difficult to sell all they could make. In the case of our company, however, demand was far in excess of our ability to supply even before derating our sales.

Our prosperity depends not only on the overall demand for confectionery but also on the share of the demand which we enjoy. Although we are now producing a substantially higher tonnage of our leading speciality, Liquorice Allsorts, than before the war, the line, that even this increased output is quite insufficient to meet the demand.

The report and accounts were adopted.
