AUSTRALIA

Improved business
prospects—
get there first in
a Pan American Clipper!

With the prospect of improved trading with Australia, now is the time to get out there quickly to present your proposition.

Your time is valuable—so you'll be interested in Pan American's 34-day Clipper* service—the fastest there is.

You fly via the U.S.A. This PAA way there are fewer documentation and health requirements, and there are liberal stopover facilities. So if you also have business in an American city en route, kill two birds with one stone. Or, if you can spare the time, spend a day or two beside the surf on a Pacific Island!

Meals, cigarettes and bar service are complimentary on Pan American first-class flights. Berths and Sleepette* service with fully reclining seats are available over the Atlantic, free over the Pacific. There's a similar service to New Zealand.

Consult your Travel Agent, or Pan American, 193/4 Piccadilly, London, W.1 (Telephone REgent 7292) and at Prestwick Airport, Ayrshire (Telephone Prestwick 7272 ext. 402).

SIR WINSTON CHURCHILL'S enforced rest has drawn the sympathy and concern of the Western world. That is the measure both of what he has done before and of the dominating position among statesmen that is his now more than ever before. Of no other man can it be so genuinely said that the wishes for his complete recovery are universal and heartfelt. And this has a corollary. Of no other man is it so important to consider how the gap may be filled if he should prove unable, at 78, to resume the carrying of far more than an ordinary Prime Minister's burden, which he has done at so many times in the past and has been doing particularly since Mr Eden fell ill in April.

In this light, the arrangements that have been made for the conduct of government during the Prime Minister's rest are unsatisfactory. Lord Salisbury, who is now acting Foreign Secretary, is outstanding in experience and ability, but no man whose rank is temporary and acting can carry quite the authority in diplomacy that these times require; nor can his decisions be as quick and precise as those of a man confident of his party's willingness to follow his leadership. For a month these things may not matter, or they may be severely damaging; no one can tell. The arrangement for home affairs is also risky. The burden of cabinet chairmanship and general responsibility now falls on the Chancellor of the Exchequer, the minister who above all others is already fully occupied not merely with departmental duties in the ordinary sense but with the general oversight of economic policy.

No doubt Mr Butler and the existing ministers can manage well enough, with reasonable luck and against a not very forceful Opposition, during the remaining three or four weeks before the parliamentary recess. But it is rash to rely on quiet times. Any setback would quickly expose the Government's limitations, particularly in the House of Commons. There Mr Crookshank is the only minister without heavy departmental duties. He is able and amiable, but he lacks the authority proper to the Leader of the House of Commons when the Prime Minister is absent. For all the abilities that some Conservative ministers have shown, and despite the Government's access of confidence in recent months, the lack of a clear guiding hand on domestic policy is still apparent; it has, indeed, been more noticeable since the Prime Minister became so immersed in foreign affairs. This is not a problem merely while Parliament is sitting. Between now and October the Government has to prepare a new policy: either a set of measures to put before the next session of Parliament, or a programme on which to appeal to the country for a new mandate. The issues involved—such things as rent control and agricultural policy—are complex, and the programme will not be balanced and decisive unless all the Government's resources for general policymaking are fully mobilised for the task.

At the best, that will be difficult. Even if the Prime Minister is restored to his full energy by one month's rest, he will no doubt again

7L
Xm56, M43
M42, 16R

concern himself chiefly with foreign policy. Mr Eden's return cannot be earlier than the autumn; and he will then be handicapped by having missed six months of great diplomatic movement. To leave things to an acting Foreign Secretary in the meantime would be to waste, both now and at the handing-back to Mr Eden in the autumn, those intangible results of personal contact by which the Prime Minister rightly sets so much store. Such repeated changes in the active control of foreign policy could hardly fail to weaken British influence.

There are, therefore, serious weaknesses in the present arrangement even on the most optimistic assumptions about the recovery of both Sir Winston and Mr Eden. And while everyone wants to make those assumptions, to rely completely on both would be an unjustified risk. Harsh though it may sound, the painful precedent of Mr Bevin makes it necessary to point out the importance of organising the Cabinet according to actualities, not according to prospects however hopeful and well founded. It is also worth remembering that last year was the first since the war without a major crisis, diplomatic or economic, in the August-September period. The Government as it is at present constituted is in no shape to weather the sort of storms that shook its predecessor with such distressing regularity.

★

The best way of guarding a little against these difficulties and dangers seems clear. It is, indeed, to do now what could with advantage have been done before ill health complicated matters. It is to appoint a new Foreign Secretary, not an acting one, in order that Mr Eden, when he returns, may be Leader of the House of Commons and deputy Prime Minister in fact as well as in name. This arrangement could be made now because it would be appropriate whether or not Mr Eden returns in full vigour. The relief to the heavy burdens on the Prime Minister would be valuable however good the health of both men. The need for some devolution of authority in home affairs was apparent a year ago. Since then, the Prime Minister's own pre-occupation with foreign affairs has increased, while the difficulties on home policy could easily recur. The spheres of Mr Eden's responsibility would have, indeed, to be clearly defined, so that Sir Winston and he and the Chancellor all knew where they were. But it is easy to see spheres that need filling. For example, the present row about schools is a useful reminder that, with Mr Butler absorbed by economic affairs, the Government lacks anyone who can look at the social services in broad perspective.

At the Foreign Office, four senior ministers are possible successors to Mr Eden: Lord Salisbury, Sir David Maxwell Fyfe, Sir Walter Monckton and Mr Macmillan. Of these, Lord Salisbury is undoubtedly best qualified by knowledge, experience and ability in foreign affairs. The right course for the Prime Minister would be the easy one of appointing him to the post

in which he is now acting. That would, admittedly, encounter criticism. Lord Salisbury's pronouncements on Abadan and on China were too vigorous for Labour, and he a peer. The Foreign Secretaryship is perhaps the one office where the Opposition's feelings deserve a Prime Minister's consideration; and, other things being equal, it is obviously better for the Foreign Secretary to be in the House of Commons. In this case, other things are definitely not equal. Moreover, the main disadvantage of Lord Salisbury's peerage is offset by the competence of both Sir Winston and Mr Eden to speak in the main debates on foreign policy, while Mr Selwyn Lloyd is well equipped to handle ordinary Foreign Office business in the House of Commons. It is egalitarian topsy-turvydom run mad if a man is to be barred from all the most important offices of state, irrespective of his merit, solely because peers are not allowed to be elected to the Commons. The Foreign Secretary is so heavily occupied with his department that his attendance in Parliament must in any event be irregular. Everyone agrees that the Prime Minister and the Chancellor of the Exchequer cannot be peers, but there is no need to extend the rule to the Foreign Secretary, particularly when spokesmanship on foreign affairs can be so well provided by others in the House of Commons.

The appointment of Lord Salisbury as Foreign Secretary would end much uncertainty abroad and give him the authority to redevelop foreign policy with, no doubt, the Prime Minister's guidance. It would, of course, go only a little way to meet the problems that will arise if the ill health of either Sir Winston or Mr Eden is more prolonged than their doctors hope. But it is an important permanent step that can advantageously be taken at once, without waiting for firmer medical reports. Indeed, whether the choice is Lord Salisbury or another, the appointment of a new Foreign Secretary should not be delayed. The Government would then stand ready to deal promptly with whatever issues the next few months may bring; the dislocation in foreign affairs would be kept to a minimum. The translation of Mr Eden to home affairs would also fit into a beneficial pattern, whether his recovery is fast or slow. All being well, he could by the autumn relieve the Prime Minister of much irksome business and, with his high prestige in the country, give a fresh and authoritative leadership to his party in Parliament.

For the rest, there are many less urgent ministerial changes that could well follow as soon as the Prime Minister is strong enough to deal with them. He can act in the knowledge that, considerations of health apart, questioning of his own position as leader of the Conservative party is now more remote than at any time since 1945. But this enforced rest indicates clearly on what conditions—husbanding his resources for the things he does supremely well—Sir Winston can go on leading in his ninth decade; to fit the disposition of his lieutenants to those conditions is the first act of leadership.

Lessons from Mr Rhee

IN contriving the escape of North Korean prisoners, President Syngman Rhee undoubtedly violated his own given pledge that placed the South Korean army under the United Nations Command. But that pledge was given only for the duration of the fighting in Korea. If, after an armistice, Mr Rhee were to withdraw his forces from the Command or otherwise disrupt the process of settlement, what precisely would he be violating?

Whatever else Mr Rhee may achieve—or destroy—by his present course of action, he has at least placed squarely before the world an issue on which the whole future of the present experiment in collective security may depend, but which has hitherto been completely ignored. The issue is this. When a dozen nations or more unite to carry out their freely accepted task of rescuing a small country from aggression, what obligations does this action impose on the rescued? In particular, have the rescuers any redress if the small country in turn disturbs the peace?

It may be objected that the problem is not wholly new. History can show many examples of the embarrassment that a brash protégé can cause to the powers that had supported or even created it—from the time, over two thousand years ago, when an obscure oriental client of Rome goaded Mithradates into an onslaught that rocked the civilised world, to Poland's unexpected occupation of Vilna in 1920. But the development both of international organisation and of international attitudes has brought about a basic change. In the nineteenth century, Napoleon III could, and did, instantly withdraw his support from his Italian protégés when they looked like drawing France too deeply into their quarrel with Austria. Tsarist Russia could inflate and deflate Bulgaria like a balloon to suit the needs of the moment. But today the world has come to accept, generally speaking, the thesis that aggression should be opposed from the moment it begins. The modern feeling that there is an international duty to aid the victim of any aggression has been roughly codified, first in the Covenant of the League and then in the UN Charter, and has found effective expression for the first time in Korea.

In theory, this is not a one-sided assumption of responsibility. If other things were equal, the UN Charter would amount to a pledge of "all for one and one for all"; it would be an insurance scheme whose benefits to a particularly hard-hit victim would be offset by his regular contributions to it. But other things are not equal. In the first place, a clear distinction is becoming visible between those nations that are not prepared to shoulder even a corner of the burden of joint resistance, and those that are expected to take up this burden as a matter of course. The non-Communist great powers in particular are commonly

regarded as bound, on the one hand, to shed their blood in the defence of any invaded country, however remote, on the other to bow to the criticisms of nations that prudently stand aside from the struggle. The frictions created by this atmosphere are real ones, and it is from them that originate such proposals as those lately made by Senator Taft.

★

The second discrepancy, however, is more immediately relevant. When America and its allies mustered under the banner of the United Nations to help defend South Korea, they did not take the opportunity of binding that small republic to accept and execute UN decisions thenceforward. In the bad old days of naked power politics, it was normal for a great nation to name, in advance, a stiff price for its aid to a weaker neighbour. (The custom is still observed by Soviet Russia.) But the founders of the United Nations abhorred any such thoughts. They sought to establish the principle that any victim of aggression should be defended without fee, arguing that its defence was in fact an interest of all nations. In so doing, however, they wholly neglected the need to impose on the assisted country any restraints that might ease the labours of its rescuers.

Action such as that threatened by President Rhee was, indeed, never faintly conceived at San Francisco in 1945, or in earlier debates on the creation of world institutions for the defence of peace. It was taken for granted that the maiden, once rescued from the dragon, would kiss the knight's feet and follow him home quietly. So the UN Charter, while emphasising the moral and constitutional duty of member states to unite for the defence of any invaded country, lays no corresponding obligations on the victim.

Yet the difficulty might well have been foreseen. After all, Mr Rhee is not a unique human specimen. On the contrary, he is almost purely typical of one of the most widespread of modern political phenomena—nationalism so intense as to pass all the boundaries of reason. This febrile emotion is not only common to most of the many small, newly sovereign nations of the contemporary world; it is also to be found in the most ancient of states and in every continent. In the international forum, it has expressed itself repeatedly in two contradictory forms. On the one hand, it is claimed that organisations such as Uno must secure for the smaller nations the rights which they regard as naturally and inalienably theirs; on the other, the same nations assert an equally absolute right to reject the rulings of international tribunals. An analysis of the records of the UN Assembly and the International Court—both bodies on which the smaller nations are in a majority—shows that the non-Communist great

powers have accepted unwelcome decisions by these organs far more rapidly than have the smaller nations concerned. One has only to think of Persia and Israel.

The belief persists, however, that the great powers are the worst offenders against international morality and the gravest threat to peace. Mr Rhee may, therefore, have done the world some service by revealing how this belief over-simplifies the truth. It is to be hoped that his actions will be well pondered by other governments, not least in Asia; for the South Korean president has, in fact, merely carried to their illogical extreme the doctrines which many other small nations practise less blatantly. Will those nations now come

Italy and its Allies

IT is just as well that there is a lull in the cold war at this moment. With Britain in the temporary charge of an acting Prime Minister and an acting Foreign Secretary, with France barely through its worst parliamentary crisis since the war, with Dr Adenauer approaching a critical general election in the autumn, and with Signor De Gasperi at the end of his most effective period of government, this is hardly a promising time for high decision. When President Eisenhower surveys the scene from across the Atlantic the ranks of his allies in Western Europe must indeed appear in unusual disarray.

A pause between major decisions, however, is a good moment for stocktaking, and it is in Italy that some of the freshest and most useful lessons may be drawn from recent events. For the Italian general elections of 1953 came so close to being a disaster that they can be ignored only at peril to the western cause. The narrowness of the margin in Italy between the present uncertainties and the situation that would have developed if the Centre had dropped still more votes has certainly not been generally appreciated. The reason is partly that, since no one expected the Communists and their allies actually to win and since the extreme Right did not in fact make as many gains as the gloomier prophets had foretold, the results have not been entirely unexpected or unwelcome. Yet, in fact, the friends of the West in Italy had a close shave and, if worse is not to follow in the future, the causes should be understood. Why did Signor De Gasperi's government so narrowly escape disaster? Why, when Italy is relatively more prosperous than it has ever been, did a record number of people vote Communist? Why has the comparative success of political democracy led to a greater vote against it, on Left and Right, than any since the war? These are very disturbing questions. For on the answers to them must depend the validity of the more comfortable assumptions with which the West as a whole has been meeting the Communist challenge.

Some of the explanations spring from factors internal to Italy; others depend directly on the impact of

THE ECONOMIST, JULY 4, 1953

to recognise, in the fiery irresponsibility of Mr Rhee, a sharpened reflection of their own image? Some of them are now among his strongest critics. Perhaps it is too much to expect that they will learn from him the lesson that small nations have as full a share of responsibility for the maintenance of world order as have the great powers. But if they do not, they will continue to endanger the success of the whole contemporary experiment in the strengthening of world order, an enterprise to which some of them owe their very existence. If it collapses, the great powers will not be the only ones to blame. That is the real lesson that should be learnt from Mr Rhee.

external affairs. In the domestic field, the government had to combat four special mental attitudes, and it lost ground because it failed to do so with full success. There was the natural swing against any administration which had been in office for five years. There was disgust at the attempt to "rig the elections" by means of the new electoral law. There was a lack of any real sense of urgency in the campaign against Communism. And there was the fact that the government's own policies had created a feeling of political relaxation and economic well-being such as Italians had not known for at least a generation. The swing against the government and the feeling of well-being are in a sense mutually contradictory, yet both had their effect. The disgust at the new electoral law sprang in part from the failure to recognise the surprising strength of the Communists; when it came to the poll, they and the Left-wing Socialists under Signor Nenni gained an extra 1½ million votes.

★

These gains were surprising in view of Italy's relative prosperity. It is true that no country can really be called prosperous when it has a hard core of two million unemployed, when its natural resources are too limited to raise its standard of living without the investment of capital on a scale which Italy is a very long way from being able to afford, and when there still exists an industrial psychology traditionally based on high prices and a small market. But by the standards of its own recent past Italy is undoubtedly prosperous. Real wages are higher than they have ever been, both internal and external trade is flowing at a comparatively high level, and progress on the programmes of land reform and development in the south is such as to put the whole much-vaunted Fascist era in the shade.

The Communists' electoral gains in these circumstances have been widely interpreted as a serious defeat for American policy. If that policy is regarded as consisting entirely of supplying economic aid without

THE ECONOMIST, JULY 4, 1953

regard to the political, moral and social facts of a nation's life, that is a correct enough interpretation. But there is, or there should be, more in the West's policy of mutual aid than mere calculations of political and military gain; it would in any case be unfair to say that America has done no more than apply economic aid in a spirit of cynicism and it would be a mistake to assume that, since Communism feeds on misery, simply to remove misery is to banish Communism. As the Italian election results once more prove, Moscow has many other strings to its bow besides economic discontent, and to ignore this fact is seriously to under-rate the adversary. Obviously the Communist appeal is potentially stronger when people are hungry, cold and desperate; but to make them better off is only a first—though necessary—step. Indeed, it should be remembered what would have happened in Italy if there had been no such thing as Marshall Aid. Rome would probably be in Malenkov's hands today. The rise in real wages, the liberalisation of trade, the beginnings of a changing mentality among industrialists, and certainly that half of the southern development programme which is financed out of counterpart funds—all these are the direct outcome of American help.

On the other hand, that help has clearly not been enough to swing the country behind a new government of the same type as the old. What else went wrong? Can the rest of the Atlantic community do anything to try to see that past mistakes are corrected? Three other factors contributed to the relatively low poll for Signor De Gasperi. Sir Winston Churchill's speech on May 11th undoubtedly played its part. By suggesting talks with the Russians he gave a boost to the idea that the crisis with Communism had passed its peak, and that there was, therefore, no longer an overriding need to vote against the Italian Communist party; some people even went so far as to feel that there was no longer any reason why they should not vote for the Communists. Then, there was the unwise speech made in Milan by the new American ambassador, Mrs Claire Luce. She gave Italians to understand that, if they did not vote for the government, the United States would have to reconsider its policy of aid to Italy. Naturally this was taken as open American interference in the country's internal politics, and was widely exploited by those in the opposition who have long been saying that Italy has become a mere American colony.

Lastly, votes were lost to the Right for reasons of frustrated nationalism. The leaders of the neo-Fascist and Monarchist parties did all they could to make Italians resent the unwillingness of their western allies to give them more support over Trieste. And they rubbed home the impression that the Italian voice is still not heard at the inner councils of the Atlantic community. To prove that it is being "ignored," they quoted time and time again the fact that Italy was not even mentioned in Sir Winston Churchill's far-ranging speech.

These factors cannot be dismissed as of no significance. Put at its lowest, the value of Italy's contribution to the western cause is negative. Until the quarrel with Yugoslavia is settled, the Italians can play only a minor role in promoting a wider system of co-ordinated defence. But it is only necessary to imagine Italy on the other side of the iron curtain to see at once how vital it is to do everything possible to prevent such a thing happening. Although the Italian peninsula lies outside the obvious central axis of a military front between western and Communist forces in Germany and Northern Europe, it does occupy a crucial strategic position astride the Mediterranean, as the war against Mussolini showed.

Even to state such possibilities is to throw fresh light on the way in which Italy's place as an integral part of the western community is normally taken too much for granted. Just as Rome is the place to which millions of Europe's Catholics look for their spiritual guidance and leadership, so is Italy the source of too much in the European cultural heritage to be written off as merely expendable. If it were lost to Communism at this or any future stage, the West as a whole would have sustained a political, military and psychological blow which might well turn the scales in the rest of Europe.

★

This truth is all too often ignored. Once it is accepted, two of the main lessons of the recent Italian elections stand out with greater clarity. They affect the very principles on which relations between members of the Atlantic community have been built up. No policy based merely on the cold-blooded interchange of purely economic and military aid is any longer sufficient. While it is far too early to jump to the opposite extreme and expect European federation in the early future, there is already enough sense of common destiny to make a positive sympathy between peoples essential to the proper working of the alliance. But this closer relationship is impossible if it is based on any idea that one country can dictate to another how to run its own affairs. The partnership must be as equal as it must be free. Admittedly, some western states are stronger than others, and all are to some extent dependent on the military and industrial strength of the United States. But it is just as much the task of statesmanship to reconcile these difficulties as to build on political realities. In terms of history, immense progress has been made in creating the Atlantic community since General Marshall made his famous speech at Harvard six years ago. If this progress is to be maintained, a country like Italy must be drawn even closer into the central web of nations and, what is more, it must be made to feel that it wants to be drawn in. Otherwise, as the elections have shown, it will slide down the slippery slope towards either Left or Right extremism. That is something which the West should know by now that it cannot afford.

What Goes into Coming Out

THE London season, now drawing to its close, has launched a record number of débutantes into Society. At the two presentation garden parties in May and at Holyrood last week some 1,500 girls in all made their curtsies to the Queen—an unusually high number because of a preference for coming out in Coronation Year. Even in a normal year, however, the number of girls seeking to be presented, far from declining, is if anything increasing. In one sense this runs counter to the general egalitarian trend. But the compass of the Court has been widened to include social strata which—unless they could gain entry by means of great wealth or achievement—were once far removed from it. The setting of the London season is no longer the town houses which were formerly opened up every season by members of a more or less closed circle. Entertaining is now done in hotels or in houses hired for the occasion; and many of the débutantes are living in furnished flats rented for a single season.

In contrast to the large number of women who still come to Court, the custom of presentation for men has died out. The last *levée* was held in 1939 and there is no sign of another. This is partly due to practical difficulties; few men can afford court dress, and the numbers who have qualified to attend *levées* might be unwieldy after all this time. But the main reason is no doubt that for men the advantages of presentation have disappeared. From the point of view of prestige, even for the girls, these advantages are not so obvious as they were. Presentation used to be indispensable for a certain kind of life. Without it one was not asked to Government Houses in the colonies, nor could one take part in the life of foreign courts. Today it is a memorable occasion that is an end in itself. But it is the usual accompaniment of “coming out”—and the purpose of coming out and of doing a season is the same as it always was.

To the girls coming out is just a part of growing up: to some a glorious time that ends the drudgery of schooldays, to others a rigidly disciplined ordeal that must be faced in spite of shyness and other natural disadvantages. To their mothers, however, now as always, it is an expensive investment which, it is hoped, will result in a suitable match. But, alas, if the nature of the investment is unchanged, the returns are not what they were. The young men are not so rich; the town property, if any, is a two-roomed flat, and crowds flock round the country estate on Saturdays and Sundays at 2s. 6d. a head. Sometimes, of course, that does not matter; what better use of newly earned millions than to refurbish an ancient and impoverished title? But most young men do not want to saddle themselves with the financial burden of marriage before they are about twenty-three, by which time many tire of coming-out dances.

If the returns of coming out are not what they were, the outlay is greatly increased. There is some saving on the white court dress and three feathers that used to be worn at the evening presentation parties before the war; the garden party dress of today comes in again for Ascot or for summer cocktail parties. On the rest of the clothes needed for a season one can obviously spend little or much. But since she has to charm the same people night after night, a girl who does the season thoroughly needs at least ten evening dresses. She may buy these from a couturier at 200 guineas apiece or off the peg at 15 guineas apiece, or she may even—if she has enough skill and confidence—run them up herself.

★

It is less easy to economise over the entertaining. Broadly speaking, a mother who wants her daughter to be asked to dances must give a dance herself, or at least a party of some sort. She may in the interests of economy give only a cocktail party—a new development since the war—and this will pass muster. But the number of invitations her daughter receives is likely to correspond roughly to the number of other people's daughters she herself entertains. A favourite measure of economy is for two hostesses to give a joint dance for their daughters or protégées. Even so, the bill is fairly prodigious. A well-known hotel at which many of these dances are given charges 25s. a head, excluding the champagne, of which at least half a bottle a head must be allowed. A good band of five to ten players charges about 10 guineas each player for a five-hour dance, with rising rates for a longer one; the flowers might cost £10 to £20; tips perhaps £20. A dance for 400 guests would thus cost £1,000 or more.

The hostess, however, is not the only person for whom the evening is expensive; for she will call on the mothers of many of her guests to give dinner parties before her dance. This is how the young men are provided. Each hostess will be asked to give dinner to anything from three to a dozen débutantes, and it will be her duty to pair them off with young men. Mental strain is added to the financial burden if on arrival the young men prove faithless and leave her with a bunch of wallflowers on her hands.

Not all the men, however, will be found in this way. The hostesses will ask all those with whom they or their friends are even remotely acquainted, and there is in existence a “Boys List,” which is passed around. Young men can be inscribed on it on application, if they are approved as suitable. At the beginning of the century the test of eligibility, social and financial, was severe, but present-day hostesses gratefully exercise wide latitude. The young men who qualify enjoy free entertainment every evening during the summer, yet

THE ECONOMIST, JULY 4, 1953

even they did better before the war. Then there were two or three dances every night during the season. Now it is bad luck if two dances fall on the same night.

The dates of dances and cocktail parties are arranged some two months before the opening of the season (on the first Friday in May) at what are called “Mums’ luncheons.” A mother who is launching a daughter will get in touch with another, and so a party of mothers gathers together. They discover discreetly what other mothers are offering, bring out their diaries, and arrange the dates of dances and cocktail parties. So the season's list of engagements is built up.

But what of the mother who knows no one to ask her to a “Mums’ luncheon,” who wants her daughter to be presented but has never been to Court herself? She may have a relative who will help if the expenses are quietly shouldered behind the scenes. Or at worst she can approach one of the ladies who turn an honest penny by sponsoring girls through the London season. The size of the penny varies according to the rank of the sponsor and the facilities that she offers. If she takes a house or flat for the purpose it will obviously cost a great deal; but at the least she will probably receive a four-figure sum, excluding the expense of giving the dance and parties, and any other costs that she may charge for, such as her own clothes.

This practice is not new, but it is on the increase. It is, of course, a reflection both of the impoverishment of the upper classes and of the social ambition of others. The payment of fees does not seem to harm

the débutante. The other girls may say of her sponsor “She’s a pro.” But it does not prevent them from attending her dance or from asking her to theirs. Nor is anything done to prevent the practice. The Lord Chamberlain would blacklist a woman who was known to make money out of presenting girls to the Queen; but she has only to say that it is for her sponsorship during the season that she is paid. The association between the two is, however, close enough for the prestige of presentation to be damaged if this commercial element continues to grow.

The readiness to spend ever-rising sums on a daughter's coming out is an interesting sidelight on what parents regard as the best education that money can buy. It runs quite counter to the evolution of middle-class thought about women's education. Middle-class daughters think in terms of a university or professional training and a worthy job at a modest salary; not for them the outdated horrors of the marriage market. But, once the parents are well off, the marriage market seems to lose its terrors and an academic education loses its charms. A finishing school curriculum designed to give social grace and a good patten seems more desirable than any number of General Certificates. There may be a sad coming down to earth at the end of the season. Some of the girls will have lost their heads and some their hearts; a few will have found husbands; and many parents will have spent more money than they could afford. Let us hope that they will all still think that it was worth while.

Notes of the Week

Washington and Bermuda

FROM one point of view it is most unfortunate that the Bermuda conference has to be postponed. The impetus that Sir Winston Churchill has given to western policy in the cold war could be like that given to a cornice of snow by an incautious shout; it could cause an avalanche that would sweep away much that has been achieved with so much toil and sweat. The effort and solidarity of the western allies were already loosening in the spring; now the prospect of summer holidays and of legislatures in recess is also having a relaxing effect. The delay in bringing together the American President, the British Prime Minister and the representatives of France may enhance it.

From another point of view the postponement is welcome. It gives time to mend the mischief done in Korea, to estimate more carefully the strong and weak points of Russia—Senator Wiley has been saying very foolish things on this point—and to attend to those details of allied policy

which are so vital to the French and German governments and can sometimes be obscured by Sir Winston's broad brush. It was a good idea to bring Mr Dulles, Lord Salisbury and M. Bidault together in Washington next week to discuss some of these details before their chiefs begin to talk grand strategy. The three allies must present a common front on major matters and not make uncoordinated responses to a variety of tactical moves by Moscow.

As a public sign that this is their intention it would be not out of place to invite Lord Ismay to Bermuda. As Secretary-General of Nato he represents, both personally and officially, the Atlantic point of view and the interests of eleven governments which cannot attend these meetings. There would be a subtle but important difference between decisions taken by the Big Three with such a representative present and decisions taken without him. A return to private and secret diplomacy is highly desirable at this stage but there is no reason why it should ignore the headquarters of the Atlantic alliance.

M. Laniel the Concierge

Now that M. Laniel has formed a cabinet, France is in the situation of having a right-of-centre government to deal with a national mood that is left of centre. It is felt increasingly, both in the National Assembly and in the country at large, that France must end the Indo-China war. No solution by military victory is in sight, and even the prospect of further American aid is not sufficient to satisfy those Frenchmen who feel that nothing can compensate for the price being paid in lives. In order to bring the maximum of attention and authority to bear on the Indo-China question, M. Laniel has abolished the ministry for the Associated States and has not included M. Letourneau, the occupant, in his government. Instead, it is expected that the Prime Minister himself, together with his political patron and guide, M. Reynaud, will submit to Washington and London a possible programme for negotiations about Indo-China within the framework of talks on Korea.

Although M. Laniel, together with most of his colleagues, is a stout conservative in economic affairs, he has entrusted the vital portfolio of the Ministry of Finances to M. Faure, a young Radical who is known to share many of M. Mendès-France's views. In return for these concessions to the left, however, M. Laniel has given three minor cabinet posts to ex-Gaullists. This means the real break-up of the Gaullist bloc, an increasing number of whom will gradually take part in centre coalitions. This will certainly prove an element of stability in parliament, but it will at the same time increase the cohesion and determination of the Left throughout the rest of the country.

This shift to the right in the assembly and the tendency towards leftist solutions in public opinion is a dominant fact in present French politics. It means that M. Laniel's government represents an essentially political and artificial response to something of a national crisis of conscience. As a result of this latest crisis, moreover, and of the fact that a number of new solutions have been rejected in order to return to the programme of the previous government, parliamentary democracy has been further discredited in the eyes of the public. It seems unlikely that the Laniel government will be more than a caretaking regime for the summer recess and until the autumn presidential elections. The ex-Gaullists will withdraw their support if M. Laniel presses the issue of EDC, and his colleagues on the right will do little to help M. Faure in bringing about a radical programme of financial reform. It looks therefore as if this will be a government of inaction, with the gap between the electorate and the Assembly still further widened.

Moscow Denies Rumours

To deny rumours of an impending devaluation is a routine task for Western finance ministers, but when the Soviet Minister of Finance, Arseni Zverev, makes his denial in the columns of the Soviet press he is breaking entirely new ground. In Stalin's day Zverev would not have worried about denials. For years it has been unthinkable not only that a minister should mention the existence of

THE ECONOMIST, JULY 4, 1953

doubts about the stability of the rouble, but that Russians should dare—except during the war—to express such fears. Indeed, under postwar legislation such whispering was liable to severe punishment as a "counter-revolutionary activity."

Soviet Russia's new leaders seem already to be gathering the harvest of their campaign of liberalisation. On the one hand, the amnesty and the stress laid in Soviet propaganda on the constitutional rights of the citizen have apparently encouraged Russians to speak more freely; on the other, a stream of articles about the need to do more for the consumer must have whetted the appetite of the public just at the time that the cut in retail prices increased its purchasing power.

It is possible only to guess what prompted the Finance Minister to give this official reassurance. The rush to buy that normally follows a price reduction must have been foreseen by the planners, but it may, this time, have grown to exceptional proportions. Suspicious shoppers, fearing that this all looked too good to last, may have bought ahead of their needs, so threatening a dangerous inflationary pressure. There was probably a risk that stocks of some commodities would run out. It is a sign of change in the Soviet Union that the Government takes such pains to avoid a situation in which customers would leave shops empty-handed. It is even more significant that in these circumstances Zverev did not strengthen but weakened the disinflationary weapon at his disposal by halving the size of the annual State loan.

The Swing Goes On

THE Abingdon by-election on Tuesday provided the Government with another remarkable success. Indeed, the evidence of its increased popularity is the strongest of all that has been provided by the series of by-election victories beginning with High Wycombe last autumn. The Conservative majority increased by almost a thousand, from 4,883 at the 1951 general election to 5,860 this week. Nothing can be said on the Labour side to lessen the significance of this movement. The previous Conservative member—Sir Ralph Glyn before his elevation to the House of Lords—enjoyed considerable personal popularity and had an independence of mind that must have recommended him to Liberals when, in 1951, they had no candidate of their own. It is therefore unusually safe to assume, despite the radical tradition in Berkshire, that Liberal intervention in the by-election drew at least as many votes from the Conservatives as from the Labour candidate. The new voters who have come into the constituency since 1951—the electorate is 1,400 bigger—were believed to represent an additional Labour force in a largely agricultural area. The Labour party was well pleased with the quality of its candidate, his campaign was supported by a large bevy of ex-ministers and MPs from both right and left wings of the party, and his organisation had considerable resources and great vigour.

Nevertheless, the swing of votes in the Government's favour was rather greater than that which captured Sunderland South from Labour six weeks ago. If the Liberal votes are ignored (they cannot have much affected the relative strengths of the other two parties), the Government

THE ECONOMIST, JULY 4, 1953

gained about 1½ per cent of the poll from Labour at Sunderland and nearly 2 per cent at Abingdon. On the national scale, such a swing, compared with the last general election, would give the Conservatives a handsome majority at Westminster, and the obvious moral will certainly be urged on the Prime Minister if he soon returns to Downing Street in good health.

For the Liberals, the result is once again distressing. The by-election poll was heavy—75 per cent of the electorate—but, as at Sunderland, the Liberal vote was only half that of the general election in 1950; at just over 3,000, it was 7 per cent of the poll, compared with 15 per cent in 1950 and 19 per cent in 1945.

The State of Business

HOWEVER weakened by illness, the Government can survey not only the state of public opinion but also its immediate parliamentary position with a satisfaction that would have seemed like bliss at this time a year ago. With the summer recess only a month away, it was then painfully clear that not one of the three important measures it had proposed could get even a second reading in the session of 1951-52. Worse, the Government was on the point of placing itself in the ridiculous position of having to apply the guillotine on the trivial Licensed Premises in New Towns Bill. But the lessons of that summer were taken to heart. Now, by the beginning of July, all the legislative measures mentioned in the Queen's Speech last autumn stand on the Statute Book.

This is not to say that the Government's timetable is so well advanced as to free Ministers from all concern. Suggestions that Parliament might rise at the end of the third week of July, instead of the fourth, now seem over-optimistic. It has become customary for Parliament to adjourn and not prorogue at the end of July, and this gives the Government a two-week "overspill" to play with in the autumn, before the start of the new session. But two or three of these days are already earmarked for overdue debates on the nationalised industries and, in any event, certain business must be transacted by early August. Between now and the adjournment for the recess the Government must find two days for the report stage of the Finance Bill, at least half a day for the third reading, eight

days to complete the 26 allotted Supply days, two days on the Appropriation Bill and one day on the Order in Council setting out the constitution for the Central African Federation. This adds up to 13½ days and yet takes no account of the time needed to complete the admittedly minor Bills still passing through the House. In addition, there is now the new Monopolies Bill which the Government introduced on Thursday. Although it is limited in scope, this Bill must require at least two or three days—though not necessarily before the recess. There are only 15 sitting days before the end of the third week in July, and 20 before the end of the fourth. But, particularly since the timetable was dislocated a little by various royal occasions, grave and gay, the Government will have done well to complete the programme by the beginning of August.

Farm Workers First

WAGE claims and awards nowadays fall into a definite annual pattern. This year, as in July last year, an increase for farm workers is the first turn of the spiral. The Agricultural Wages Board on Wednesday recommended a rise of seven shillings a week in the minimum wage (which means rather more in actual earnings). The surprising and disturbing thing is that this is bigger than the increase (of five shillings) granted last year, although the award then followed a sharp increase in the cost of living and this year it does not. If, as must be expected, the new award is confirmed at the end of the month, the farmers will no doubt apply promptly for a special increase in farm prices. That should be refused, as it was last year. If there is a case for higher farm wages at all, it must depend in present circumstances on increased efficiency and more mechanisation, not on making the consumer pay more. Such a case might, indeed, be made out, if the award to farm workers were going to be a special one. In fact, it is likely to be the beginning of a spiral that will leave the farm workers worse rather than better off compared with industrial workers.

The claims now pending have reached vast numbers. The shipbuilding and engineering unions, as usual, have got in the largest, for an increase of 15 per cent. The shopworkers are asking for 15s. The cotton workers—who, because of the slump, missed last year's round and had their last increase in September, 1951—are still asking for 10 per cent. The dockers are also asking for an increase, and claims are being formulated by workers in electricity supply, clothing, furniture and tobacco. The railwaymen will discuss a claim at their annual conference, and so, too, will the miners. Theirs may be the least justified of all, in view of the fall in productivity.

The size of these claims bears unusually little relation to the increase in the cost of living since the last round of wage advances. The award to the farm workers had been preceded by some less important examples of the size of the advances that may actually happen. The wages councils for the retail food and drapery trades have recommended increases of 6s. and 5s. 6d. respectively for men and 4s. 6d. for women, against the claim of 15s. But even a third of what the unions are asking can do great damage to the export prospects of many industries.

Post-Mortems in Eastern Germany

THROUGHOUT the Soviet Union organised public meetings have been held to protest against the provocative activities of "foreign hirelings" which, it is said, led to the recent riots in East Berlin and the Soviet zone. But the East German leaders, who have been making a penitential tour of factories and workshops, could hardly fob off their audiences with such tales. They left the Russians out of the reckoning, but they did not spare themselves. "The present situation," said Herr Grotewohl, "is the outcome of a faulty policy by the Socialist Unity Party and the resultant wrong political, economic and cultural measures of the government." In particular it had pressed ahead too rapidly with the development of heavy industry at the expense of the consumer goods industries; and when difficulties then arose it had introduced coercive political and legal measures which had "widened the existing cleavage between SED, government and population." This is self-criticism with a vengeance, made not in the privacy of the party conclave but before largely hostile audiences.

The post-mortems on the riots have been accompanied by a flood of decrees and directives designed to make life easier for the workers. It is denied that there is any connection between the riots and the decrees; the latter are supposed to be the fulfilment of a policy decided on long ago. In fact, however, the new policies announced before June 17th aimed mainly at mollifying the middle classes and the farmers, whose exodus westwards had become an alarming drain on the zone's economic strength. The workers then received few immediate benefits, although they might expect to benefit eventually from the planned increase in the consumer goods industries. But the measures announced last week are clearly meant primarily to pacify the workers—the immediate release of large stocks of food and clothing, increased social insurance benefits, more workers' houses and, above all, no increase in norms.

Few East German workers can be fooled by Herr Grotewohl's assurances that all this results from the government's recognition of its past mistakes. Nor can the Russians have many illusions about the true state of affairs. But since policy in Eastern Germany is part of a larger diplomatic game they must want to smooth things over, and they probably reckon that so long as the Red Army is on the spot, they can safely let their puppets bow to the storm.

Hungry China

A MONTH ago Peking radio happily reported a speech by an Australian visitor who declared that China, thanks to land reform, had become "a bread basket for the whole Asian world," able to feed not only its own people but also those of India and Ceylon. This broadcast went out in English on short waves, thus escaping the ears of the Chinese themselves, who in the same week were receiving from their government frantic appeals and orders for greater efforts to check the spread of famine.

In the past three months, famine has been admitted by the authorities to exist in nearly half of the provinces of China proper. The government ordered all local Communists to set aside their political campaigning and get the

peasants to produce more food at all costs. The *People's Daily* castigated Communists who were still repeating the claim—originally made by this official paper itself—that China's food problem had been solved. In the big cities, the situation was saved by the release of government hoards of grain and by summarily deporting the thousands of peasants who had swarmed in from the stricken countryside; 12,800 were shipped out of Sian alone in a few weeks. But it was officially admitted that State reserves, even after three years of allegedly bumper harvests, were too small to fill all the empty stomachs.

Grudgingly, it has been recognised in Peking that this tragic state of affairs is at least partly due to mistaken policies. (Counter-revolutionary saboteurs have not even been mentioned in Communist reports on the famine.) Much of the peasants' apathy was traced to the brutality of Communist officials, who, according to their own press and radio, have arbitrarily ordered the uprooting of crops, withheld ploughs that should have been distributed to farmers, and imposed taxes that would discourage any peasant from increasing his output. But is it fair to denounce local Communists when they have only been zealously pressing forward to the goal, set by Peking itself, of a wholly collectivised agriculture? They are now being repeatedly told to respect the peasants' rights to land ownership for the time being, and not to force them into co-operatives. It is easy to see in these tribulations one good reason why China should want to ease the strain of the Korean war. It is less easy to see where the food promised to Ceylon and other nations is to come from—especially if China's population continues to multiply.

Hongkong Watches and Waits

THE possibility of a truce in Korea is being watched with particular interest in Hongkong, whose inhabitants are very conscious that American binoculars are levelled on their activities twenty-four hours a day. First thoughts suggest that some restrictions may soon be eased, but there are so many uncertainties about trade with the mainland that no clear commercial policy has emerged. Little doubt is felt that, at best, many months must elapse before the Americans would permit trade on the China coast to return to what it was three years ago.

Hongkong as a whole has not been very interested in the unofficial British trade mission which recently passed through on the way to Peking. It follows as strictly as possible the rules of the game governing trade with Communist China. And while the old China houses watch the activities of the "New Traders" with interest and sometimes envy, most of them have already had such difficult and disappointing experiences with the Communist regime that for the moment they rather relish watching others try their hand and possibly burn their fingers. Meanwhile, the atmosphere of moderate recession as a result of the current restrictions has been partly lightened by the significant fact that, in spite of all the suspicions and accusations fostered by Senator McCarthy and his followers, American trade with the colony has been improving; United States exports to Hongkong rose to \$8,836,000 in the first quarter of this year, compared with \$7,359,000 in the previous quarter and \$7,017,000 in the first quarter of 1952.

Schools Debated

WHEN the Select Committee's report on schoolbuilding was debated in the House of Commons on Wednesday, the Minister of Education was able to answer effectively much of the Opposition's criticism. She could point to the fact that under her regime the amount of schoolbuilding had increased. A Labour member made the nice debating point that she took the credit for having completed the schools and blamed the Opposition for having started them; but there was sense in Miss Horsbrugh's claim that at the time she took office the limited amount of materials was being spread over too much work.

Neither the Minister of Education nor the Minister of Housing, however, could find any effective reply to the committee's contention that new schools were not keeping pace with new houses. The best that Miss Horsbrugh could do was to suggest that in new houses the children slept better and that was a good thing from an educational point of view. Mr Macmillan could show that the amount of schoolbuilding had not been cut to build more houses; this government had succeeded in building both a good deal faster than Labour had. Nothing, however, can alter the fact that housing estates have gone up without schools to serve them. And it is plainly true—of the last government as well as this one—that some of the money used in high-cost, heavily subsidised houses, for people not in desperate need, would have been used to better purpose in schools.

It was in the nature of the committee's report that it should be the subject of party strife, but it will be a pity if this leads to its being otherwise ignored. Some of its recommendations were sensible—as, for example, that new schools should be planned three years ahead. Moreover, although the committee discovered nothing new about the state of Britain's schools, neither the Government nor the public should be permitted any complacency.

The Unrationed Ration

THE butchers are up in arms against the Ministry of Food's attempts to get rid of surplus meat. An extra two pennyworth over and above the ration of 2s. 4d. is to be distributed to them from next Monday, and this they can sell to all comers. But in practice they expect to be left with fat pork and with large quantities of ewe mutton—which no one will buy, least of all the kind of customer who can afford extra meat. There is now less of this ewe mutton than there was, but it is harder to sell because more meat of better quality is available. The butchers are particularly indignant because they now have to accept their quota of ewe mutton if they want any meat at all, whereas in recent months they had been allowed to refuse it. This new rule is causing something like a strike in Scotland. Fat pork is also difficult to sell, but it causes less ill feeling because there was never any option to refuse it.

The sausage manufacturers will provide little help for them, presumably, would be interested only in replacing by pork the high proportion of ewe mutton that has been going into the "pork" sausage. It seems almost certain, there-

fore, that the Ministry of Food will be driven to reduce the price of the inferior meat; and it follows that the price of the more popular kinds should be raised, so that the amount of subsidy can remain constant. The logical further step would then be to lower meat prices in time of plenty and raise them during the winter scarcity.

If these changes were made, demand would be adjusted to supply and the justification for rationing would disappear. The difficulty is the necessity of finding a less rigid way of giving the farmer his guaranteed price. A decontrolled and unsubsidised price for beef might present no problem, because for the carcass as a whole the farmer would still get the same return, and this would probably be true also for mutton of reasonable quality. The real problem is pork. The Government has stimulated pork production by paying the farmer more than it could, in a free market, get back from the consumer; and thus the increase in home meat supplies is actually delaying the end of rationing. Such is the consequence of "planning" that does not take demand, supply and price into account. The next move is with the Minister of Agriculture, who should be plainly told that the present situation cannot continue.

Changes at the Treasury

THE administrative changes at the Treasury which are to follow upon the coming retirement of Sir Edwin Plowden, who has for over six years borne the title of Chief Planning Officer to the Government, are more than a mere reshuffle of persons; they embody two innovations of some importance. In the first place, Sir Bernard Gilbert, one of the Second Secretaries of the Treasury, is to be designated Deputy to the Secretary of the Treasury. The Secretary is also Head of the Civil Service, and cannot give more than part of his attention to the Treasury. This is not quite as bad as it sounds, since the Second Secretaries, who preside over the three main sub-departments—Home Finance (where Sir Bernard Gilbert is to be succeeded by Sir Herbert Brittain), Overseas Finance (Sir Leslie Rowan), and Establishments (Mr T. Padmore)—each have the rank (and salary) of a Permanent Secretary of any other department. Nevertheless it will clearly be an advantage for there to be a Deputy Secretary who can draw all the threads together.

The second change is to complete the incorporation in the Treasury of the departments and sections concerned with the central oversight of economic policy. No direct successor to Sir Edwin Plowden is to be appointed; the new Deputy Secretary of the Treasury will take his place as Chairman of the Planning Board. Similarly, the Economic Section of the Cabinet office, which has in recent years worked increasingly closely with the Treasury, is now to be incorporated in it; its present head, Mr Robert Hall, is to have the title of Economic Adviser to HM Government.

The concentration of forces thus formally recognised—it happened in practice some time ago—is unquestionably right. Extra-departmental thinking staffs can have an influence on policy only when the accidents of politics allow them to attach themselves to a Minister whose qualities of mind enable him to use such a staff and whose political standing commands a hearing. This was true of Sir Stafford Cripps when, for a short time in 1947, he was

Minister of Economic Affairs, and when the planning staff was first set up. It was also pre-eminently true of Lord Waverley when he was Lord President during the war and when, in consequence, the Economic Section of the Cabinet Office was able to do a great deal of useful work. But at other times—and that means at most times—the sort of slightly longer-term thinking that is labelled “planning” is best done immediately alongside the day-to-day administration.

Ministerial Merger

THE Government's proposal to merge the Ministry of Pensions with the Ministry of National Insurance has stirred up more opposition than might have been expected. The order putting the merger into effect was approved this week by a majority of only 14, with one Conservative member voting against the Government.

Criticism of the proposal has taken three forms. First there is the argument that the creation of one large Ministry out of two separate ones, so far from increasing efficiency, merely adds to the delays in getting decisions on policy. As long as the functions of the merged departments are unchanged, extra administrative hold-ups at the top outweigh small economies in staffing lower down. The functions of the Ministry of Pensions, however, overlap considerably with those of the Ministries of Health and National Insurance. Civilians are treated at Ministry of Pensions hospitals; ex-servicemen are treated in national health service hospitals; the Ministry of Pensions acts as the agent of the health service in the provision of surgical appliances and artificial limbs for civilians. The scheme for the casualties of industry, which is administered by the

Ministry of National Insurance, is based on the war pensions scheme, and the amount of disability suffered by workers and servicemen is determined by the same medical boards.

The second argument against the merger is that war pensioners should be given priority in treatment, and that this can be ensured only if they have a separate Ministry to look over their interests. It is, however, a cardinal principle of the merger that this priority should continue, and there is no reason why, after the merger, war pensioners should not be allowed, for instance, the same priority of treatment in the hospital service as they get now. The third criticism of the merger comes from the ex-servicemen's organisations, because, presumably, they will no longer have a special Minister to whom they can present grievances over the rate of pensions. In fact, however, there is little likelihood of war pensions, in peacetime, being raised without a corresponding rise in the social security payments for which the Ministry of National Insurance is responsible. Indeed, it is arguable that industrial injuries benefits set the pace for war pensions rather than the other way round.

Political Progress in Turkey

LAST week, the Turkish Prime Minister, Mr Menderes, said that inter-party relations were “better today than ever before.” A speech made on the same day by General Ismet İnönü, at the tenth congress of the Republican People's Party, showed that satisfaction over the development of Turkish party politics is not confined to the party in power. General İnönü said that the most difficult obstacle to real democracy in Turkey would be overcome once it was firmly established that the opposition was a necessary part of the country's political life and that it was impossible for either the party in power or the opposition to plot to destroy the other. He indicated that notable steps in this direction had been taken over the last six months.

This is a greater achievement than might appear. It is only three years since the Turks had their first real experience of how a parliamentary democracy works, when Kemal Atatürk's party was turned out of office at the general elections in 1950. The popular verdict was accepted, but political life grew dangerously tense and vituperative. Early this year a widespread reactionary organisation was discovered which aimed at ultimately overthrowing the present system by force. This made Turkish politicians realise that if they wanted parliamentary democracy to survive they must cherish it and abide by the rules. This led to a *détente* between the RPP and the Democratic party leaders and to exchanges of civilities which have done much to sweeten the political atmosphere. These developments, however, do not mean that political life in Turkey is becoming dull and formal; the stinging attacks on the government's economic policy at last week's RPP congress and the vigorous debates on policy within the congress itself, are sufficient evidence that this is not so. But they do mean that the steady progress made since the war in building up Turkey's defensive strength and in developing its backward economy is now being matched in the growth of its political institutions.

Getting the KMT Out of Burma

CONFUSION over the dispute about the Chinese Nationalist (KMT) troops in eastern Burma still continues. In the middle of last month the four-nation commission—America, Nationalist China, Burma and Siam—which has been meeting in Bangkok to discuss the problem reached a tentative agreement. This would have provided for the movement of KMT troops out of Burma by two or three different routes. One was by air into Siam and then on to Formosa; another was by road into northern Siam and from thence by air to Formosa, and yet another, it is reported, was via northern Siam and then Indo-China—though just how this would work it is difficult to see. The plan was to have come into operation within a fortnight of signature.

The planners had reckoned, however, without two of the actual participants. While it is reported from Formosa that the Chiang Kai-shek government is now itself willing to fall in with the strongly worded American desire that an end should be put to General Li Mi's adventures in eastern Burma, the troops on the ground are by no means ready to accept this ruling. Their deputy commander, General Li Tse-fen, has at last gone down to Bangkok to negotiate in person. At the same time, the Burmese have made many difficulties of their own. In the early days, the leader of their delegation, U Aung Gyi, declined to sit down with the representatives from Formosa. The Burmese were apparently afraid, not without reason, that they might prejudice their always delicate relations with the Chinese Communist regime in Peking if they sat around a conference table day after day with the Nationalists. This meant that everything had to be relayed to them by the Americans. Since then, the Burmese delegate has taken his seat at the table. But when it became a question of Burmese officers possibly going up to Monghsat to elaborate details with the KMT commanders on the spot he again said it would be impossible.

Fortunately, a good deal of ground has in fact been covered since Burma first protested to the United Nations about these unruly Nationalist troops on Burmese soil. It has been no small step to organise the present conference at all. But the delays and difficulties illustrate clearly both the prestige of Communist China in South-East Asia and the hesitant relationships of other Asian states with the unhappy regime on Formosa.

Money for the Colonies

MR LYTTELTON announced last week that new legislation will be introduced to carry on the intentions of the Colonial Development and Welfare Act. This is welcome. When the provisions of the Act expire in 1956, the British taxpayer will have found £140 million, and early in the 1954-55 session further provision will be made, depending on the information to be supplied by the colonial governments. Meanwhile, they have been given an informal guarantee of additional commitments amounting to £7

million over and above present authorisations, of which £3 million will be for the urgent necessities of the various schemes designed to meet the Commonwealth rice shortage. This will affect mainly British Guiana, Tanganyika and Sierra Leone.

It is clear from the two annual reports* which have appeared recently that additional funds will be needed—indeed that, in terms simply of what is desirable, the amounts needed will increase. Colonial evolution is accelerating, but while the advance to sovereignty cannot be halted, responsible government will come only if it accompanies a steady raising of social and educational standards. This is the difficulty. Tropical dependencies find it hard to raise social and economic standards to the point at which they sustain the steady flow of men with a secondary, higher or technical education who are necessary to man the public services and provide mature political leadership. This is the lesson, once again, of the West Indies survey. Welfare services continue to increase, but export income and public revenues have grown more from the general rise in prices for West Indian sugar and raw materials than from increased production; and now the rise in prices has halted. Yet the minimum annual requirements for West Indian education are expected to double between 1951 and 1961. Only the more rapid development of very limited resources can provide the surplus—over and above the subsistence needs of an expanding population—from which to finance such an educational minimum.

The West Indies may appear the most awkward case, but the same dilemma faces territories with far more apparent room for manoeuvre. The statistics given in the annual survey of the colonies tell the same story repeatedly. Education does, indeed, improve; each major region now has its university or is laying the foundations of one. But the local communities cannot win what is essentially a race against time without (among other things) a great injection of capital. Colonial development and welfare funds are invaluable in steering development in the right directions, but the need to attract capital from outside, and to induce savings amid poverty at home, remains the problem of most colonial territories.

Brave New Towns

MANY criticisms of the new towns were examined during the debate that Lord Silkin opened in the House of Lords last week, and this week the House of Commons debated the second reading of the Bill to provide another £50 million for the next stages in the building of twelve new towns in England and Wales and two in Scotland. These towns were to have been a solution to all sorts of problems—London's traffic, South Wales's squalor, Corby's labour lines, the class barrier, ribbon development and so on. Since 1946 economic realities have somewhat tarnished the dreams of social scientists and town planners. There is even some justification for the jibe that they have become so many more housing estates. This, however, is because spending has been so rigidly restricted to housing at the expense of

* “The Colonial Territories in 1952-53” (Cmd. 8856), “Development and Welfare in the West Indies” (Colonial No. 291).

THE UK TRADE GAP
£ MILLION

civic buildings, even of schools. It is the expression of modern priorities. The concept that a town's architecture began with the church, town hall, market or cloth hall built on a generous scale, while the citizenry ran up their own wattle and daub residences, disappeared with the age of faith. Living in a housing estate or garden suburb is the general notion of civic existence today, and the remarkable thing is that the new towns have, nevertheless, already achieved some civic character and pride.

Their difficulties, and perhaps also their achievements, are in part inseparable from the pioneer stages. Few of the new towns are more than three years old; against their combined projected populations of 480,000, they consist today of only some 12,154 houses and 83 shops in all. The eight new towns that ring London have special difficulties. Those on good communications inevitably tend to become dormitory satellites; they find inhabitants easily, but not a stable, locally employed population. Those, however, that are strategically isolated on quiet reaches of the old Great Eastern Railway have difficulty in attracting the industry to employ their tenants. Such industry as migrates tends to be light engineering of the kind employing relatively little labour, since wages have to be high to compensate for high rents. To keep employment and accommodation "in phase" as the towns grow is not easy; the corporations have to be super salesmen of factory space. Rising building costs, capital cuts and reinstatements, the competition of "development areas" for industry, the delaying tactics by the aboriginal population and the flat refusal of the managerial classes to chum up with the rest in the social planner's brave new world—all these are genuine complications. The corporations' standards have been at times extravagant in land, roadways and architectural good taste; civic soul might have been preserved at less cost in acreage and concrete. But on the whole the debates helped to show that new towns have not made too bad a start. The country may still be proud of the venture one day—and when the bills have been paid.

Capital Punishment on Trial

THE one thing to be said for the publicity given to the Christie trial is that it must have raised doubts in the minds of the staunchest supporters of capital punishment. It would probably have had that effect even if Christie's crimes had been the sole consideration. He was the self-declared killer of seven women. Had there been no capital punishment, the verdict would have been a matter of course, and the public would have been spared a great deal of the sordid story. But a man who is on trial for his life not only arouses a morbid fascination in his crime—and perhaps a secret impulse to imitate him in other abnormal people; he sometimes produces the wholly undesirable effect of winning public sympathy to his side.

But there was another, more disturbing, feature of the Christie trial. He confessed to murdering a woman whose husband was subsequently hanged. The fact that Evans was tried and sentenced to death not for her murder but for the murder of his child will not allay public misgiving. For Evans had originally been charged with the murder of his

wife as well; her death was part of the evidence produced at his trial; and in deciding whether a reprieve should be granted the Home Secretary takes into account all the evidence and the whole circumstances of the case. Sir David Maxwell Fyfe is giving urgent consideration to the question of an inquiry into the Evans case, and it may be that fears that there has been a miscarriage of justice will be dispelled. But, as Mr Silverman emphasised in moving his Bill for the suspension of capital punishment this week, if the penalty for murder were not death but life imprisonment, the possibility of correcting mistakes would exist. In the present state of the law they are irreversible.

When the Royal Commission's report on capital punishment appears in a few weeks' time, it will be concerned with restriction, not with abolition. In the last twelve months alone, however, there have been the Straffen case, the Bentley case and now the Christie case, all of them very different save that they have thrown serious doubts on the present procedure. Their effect may be that the Royal Commission's report will be out of date when it does appear. Public opinion may well have outstripped it.

Houses and Incomes

Report of the Superintendent of the Census (Jos. C. G. Kennedy, Esq.) for December 1, 1852. Printed by Order of the Representatives of the United States.

"It would be satisfactory," says Mr Kennedy nearly at the commencement of his report, "to institute some inquiry concerning the character of what are termed houses by the British census." That satisfaction is accorded to him by the recent publication of the Registrar-General and his assistants. It contains not only a definition of a house—"an isolated dwelling separated by party walls from another"—but a learned dissertation on houses, and the American Commissioner may be enabled to judge of the degree of comfort enjoyed by the British and other people by their house accommodation. "It would seem from the British report," says Mr Kennedy, "that the population of that country is supplied with houses almost in the precise proportion as in our own country." But he adds, "... While our country cannot boast the princely residences of European countries, the occupancy of which is limited to comparatively few persons, we think there is a general sufficiency and comfort in the house accommodations of the American people, and that, in the most remote regions of our country, where their accommodations are most limited, they exhibit a very satisfactory degree of comfort and cleanliness. The fact is notorious, that where wretchedness is at all general, there will be found a population, which formed habits and imbibed tastes in a foreign land." There can be no doubt that the number of princely residences, of noble mansions, of first and second rate houses, is much more numerous here than in America, which will explain the fact that the house accommodation of the two people may be on the whole and on the average about equal, while there may be many more wretched habitations and many people much worse lodged in England than in America. The distribution of wealth is more equal there than here, though we must believe ... that there is amongst us a tendency to greater equality, for it is pretty well impossible for many of our poor to become poorer, while the multitude now are becoming richer.

Letters to the Editor.

Opportunity for Adenauer

SIR—In the article in your last issue you point out that the unification of Germany, which seemed almost impossible a year ago, may now be possible, and you rightly perceive that this may prove an electoral asset to the Social Democrats. You suggest that Dr Adenauer should counter this by insisting upon free elections throughout Germany, an all-German government free to make what alliances it wishes, a peace treaty to be negotiated with—not dictated to—that government, and the fixing of Germany's frontiers in the peace treaty.

These terms have long been common ground between both parties in Germany, and are in line with the Social Democrats' "Action Programme" approved last September. To repeat them now could therefore scarcely amount to a very significant move in the electoral struggle.

The contentious question has always been the different one whether the incorporation of Western Germany in a western military alliance (whether EDC or Nato) should be pushed ahead, as Dr Adenauer and the Americans believe; or whether it should be held up, lest it should make four power agreement on German unity impossible.

You barely touch on this crucial issue in your article, in which your main pre-occupation seems to be to help Dr Adenauer out of his electoral difficulties. In your leading article on another page, however, you urge that the "attempt to fit a democratic Germany into the Western alliance" should be maintained. By a "democratic Germany" you appear to mean Western Germany since you go on to say "The only real choice is between having the iron curtain on the Elbe and having it on the Rhine."

If this is what you really believe, then you are in effect advising Dr Adenauer to preach unity as an election stunt, and then, having dished his opponents on polling day, to pursue a policy based on partition at the Elbe.

I can only suppose that you have been led into giving this highly disingenuous advice by your fear, clearly expressed in both articles, lest leadership in a united Germany might come to lie with the non-Communist left.—Yours faithfully,
KENNETH YOUNGER

House of Commons

[Mr Younger is too ingenious. Our phrase about the Elbe and the Rhine (which was obviously not intended to be geographically precise, since "the Elbe" is no more an accurate description of the eastern

border of the Federal Republic than "the Rhine" is of the western) merely—and, in its context, clearly—meant that, so long as there is hostility between Russia and the West, Germany cannot be neutral. Of course, if, by a miracle, the Russians permitted free elections in their zone and thereby surrendered it, "the Elbe" would have to be changed to "the Oder." But it would still be a choice, and we think that Dr Adenauer is right in believing that, if reunion takes place under the banner of neutralism, the iron curtain will finish up on the western, not the eastern, border of Germany. Germans may perhaps be forgiven for debating with themselves whether they put a western orientation ahead of national unity. But the British interest is perfectly clear, and we are shocked to find that, since he left office, Mr Younger's socialist prejudices have blinded him to it.—EDITOR.]

The Crumbling Ration Book

SIR—Referring to fatstock marketing, you say that "two solutions are offered, one at the expense of the consumer and one at the expense of the Government." You add that the National Farmers' Union would "keep up prices by regulating supplies," that a Fatstock Marketing Scheme would "perpetuate all the rigidities of the Annual Price Review," and "worse still, it would enable the producers to control imports."

No Marketing Board, whether fatstock or any other commodity, has power to control imports. Only the Government has power to control imports—a power which it can be relied upon to exercise objectively in the light of the balance of payments position, the availability of supplies from all sources, both home and foreign, in the over-riding interests of the public as a whole. Nor would a Fatstock Marketing Board be restrictive; its primary aim would be to expand and improve production. It would do this in three main ways:

(1) By moving fatstock direct from farms to abattoirs, thus cutting out collecting centres. It must be realised that fatstock are perishable, and this will avoid double handling and delay, which result in considerable loss of weight and bruising, besides suffering.

(2) By substituting grading "on the hook" and on a deadweight basis for the present system of live weight grading "on the hoof." This gives an incentive to the producer to market the type and grade of meat the customer wants, while it enables him to gain full benefit from his enterprise.

(3) By establishing national grades for home-produced meat so that butchers can get the quality they pay for and can know in advance exactly what they are

getting. Close and exacting grading, statutorily controlled, governs most of the food exported to this country.—Yours faithfully,

EDWIN DE GREY SEAMAN
King's Lynn

[Although it is literally true that only the Government has power to control imports, it is obvious that a producer board could exert considerable pressure on the Government to restrict imports, while the consumer, who is unorganised except at election times, would be unable to do anything about it. One has only to look back over the past annual price review negotiations to see what pressure organised farmers can bring to bear on the Government.—EDITOR.]

A Protest

SIR—As an American business man who has read *The Economist* for something over twenty-five years, I desire to register a protest at the nature of the reporting of political matters in this country in *The Economist*. It strikes me that your correspondents in Washington have failed to try to get any "feel" of what the new Eisenhower administration is trying to accomplish or why the American people voted for Eisenhower. Large segments of the American people became increasingly dissatisfied with the Roosevelt-Truman foreign and domestic policies as they became increasingly aware of their significance. Extravagant spending obviously brings with it inflation and corruption. A foreign policy based on Rooseveltian opportunism and his catastrophic miscalculation of Russia's intentions could only result in increasing failure to meet the optimistic expectations which had been held before the masses here. Further, your reporting seems to assume that it is the obligation of the United States to consider "the general interest" before its own. It is only natural that each foreign nation should consider "the general interest" in the light of the specific interests of that foreign country. However, it seems unfortunate that the British public is being informed by representatives of the British press in Washington that Eisenhower is "wrong" or "weak" for endeavouring to develop a policy which is designed to secure the support of wide elements in this country, as represented in Congress, and which would adjust our internal and foreign policies to the long-term national interest.

I have been an Anglophile all my life and as a former history student have read English history with admiration. The policies which made England a great nation were based on enlightened self-interest and not on a philanthropic desire to broadcast England's wealth over the world. I think that your representatives in reporting on the American scene should endeavour to seek out and at least understand the point of view of us in this country who feel that our foreign policy should be based on our long-term national interest.—Yours faithfully,
JOHN K. JENNEY
Wilmington, Delaware, USA

The Practice of Voting

THE ELECTORAL SYSTEM IN BRITAIN, 1918-1951.
By D. E. Butler.
Oxford University Press. 222 pages. 21s.

THE British people and their politicians have been, at most times, remarkably content with the country's electoral system. Certainly the outstanding result of Mr Butler's careful study is to show how little part electoral controversy has played in the politics of the past thirty-five years. That is the more remarkable because the system was in fact changed considerably during this period. There was the great extension of the franchise in 1918, its equalisation as between men and women in 1928, and in 1948 the abolition of the university and business votes—besides many changes in the law governing the conduct of elections. But the truth is that, except for the abolition of the university vote, there was little opposition to these measures in principle. People who did not like them nevertheless regarded them as inevitable; for politicians, certainly, any vigorous opposition would have cost votes at the next election. The debates therefore almost always turned less on the merits of the proposals than on the propriety of putting them forward. Even in 1948, on the university issue, the main Conservative charge was that Labour had broken the "bargain" on electoral matters reached in the Speaker's Conference of 1944.

Mr Butler's analysis of this controversy is the part of his book that politicians will read most avidly. It is judiciously done, but the conclusion is somewhat muffled. The strongest charge that can be sustained against Labour is, in the author's view, that it had in 1944 "allowed certain misconceptions about the duration of the bargain to grow up . . . and that in shattering those illusions it gave many people the idea that it had broken faith." But were the "many people" reasonable in forming that idea? He says roundly that Labour was not guilty of "gross unconstitutionality," which is undoubtedly right; but what, in this context, is "gross"? Mr Butler's judicious analysis of the dispute is a little remote from the flesh and blood of the argument about political ethics.

But this is not a general criticism. For the rest, Mr Butler writes not only fully and carefully but also clearly, and with life and insight. His account of how lightly and how little the electoral system was discussed is also, by implication, a large part of the story of the

Liberal party's decline. Twice, in 1918 and in 1931, Parliament came near to passing the measure of electoral reform—either proportional representation or the alternative vote—that would have saved the Liberals. But in 1918, before the imminent rise of Labour was recognised, they were themselves divided on proportional representation and not even unanimously in favour of the alternative vote. In 1931 the need was clear and Labour reluctantly compliant, but the economic crisis rose in the path. It is difficult, however, to believe that in any event a fundamental change in the system of voting would really have been carried into effect when interest and understanding were so slight. The Liberals suffered not only from ill-luck but also from their own failure to make a case; their difficulties in this respect reflected, in part, the lack of such study of electoral systems as Mr Butler, in particular, has carried out since the war. British politics might now be very different if the intellectual climate for electoral reform had been created before the political power to achieve it withered away.

Mr Butler's analysis of the working of the electoral system follows his historical account. It also is clearly done, and it demonstrates some important new points—for example, how steadily support for the Liberal party declined between the wars. In both parts, much unknown ground is covered with scholarship and skill.

The case for and against electoral reform is too often argued in absolute terms; the merits of different voting systems should, as Mr Butler points out, be judged afresh for each country and each period of history. He also concludes the historical section of this book with the observation that "the significant evolution of the electoral system now lies in the parties' use of the weapons of organisation and publicity." There would be few more valuable political studies than to bring these two points together—that is, to re-examine the working of different electoral systems in the new conditions of mass publicity and centralised party organisation. Most politicians will, of course, regard such studies as entirely academic, if only because any electoral change is bound to hurt one party or the other and therefore to provoke too much opposition to be practicable. But it might be wise to bear in mind another of Mr Butler's conclusions; he shows that it has been the exception rather than the rule for changes in the electoral system to be agreed party measures.

Coin and Note

THE MINT. A History of the London Mint from A.D. 287 to 1948.
By Sir John Craig.
Cambridge University Press. 450 pages. 70s.

THE BANK OF ENGLAND NOTE. A History of its Printing.
By A. D. Mackenzie.
Cambridge University Press. 163 pages. 15s.

THE simultaneous appearance of books on the Royal Mint and on Bank of England notes provides readers with a good background picture of English means of exchange. Sir John Craig's substantial chronicle of the Mint goes more than 1,400 years farther back than Mr Mackenzie's deft monograph. The Bank's first notes date from 1694, the year of its establishment by charter. In part, Sir John Craig's history is inevitably one of vanished splendours, a decline and fall from gold and silver coin of high intrinsic worth to the first cupro-nickel issue in January, 1947. Maundy Money remains a sadly isolated survival, "the memorial," as Sir John remarks, "of a coinage standard [925/1,000 silver fineness] which had endured with one short break from the Saxon kings."

The separate mints of the Anglo-Saxon kingdoms make up most of the earliest history of money in England. Gradually coining came to be concentrated in London. At the end of the thirteenth century the London Mint was established in the Tower, where it remained until its translation in 1811 to the sober classicism of the present building on Tower Hill.

Much of Sir John Craig's book recounts technical advances. Peter Blondeau of the Paris Mint effected a considerable mechanisation of the Tower Mint in 1662. His coining press could perform the miracle of striking 20-25 coins per minute. When the removal to Tower Hill was undertaken in 1811, steam plant was installed there by the famous Boulton and Watt firm, whose chief engineer was the versatile John Rennie. The Mint's modern mechanical presses strike coins at rates of 90-120 to the minute. In 1950 electric furnaces were added to supplement the melting of crucibles by the luridly greenish gas flames that linger in a visitor's memory.

The Royal Mint's present constitution, with the Chancellor of the Exchequer as ex-officio Master, delegating administration to a civil servant, the Deputy Master and Comptroller, dates from 1870. Pre-eminent among Mint officials is Isaac Newton, Warden during 1696-9 and Master from 1700 to 1727.

Mr Mackenzie's little book deals mainly with paper and printing technique. The ordinary reader will be interested chiefly in the account of the Bank's pursuit of an inimitable note, vainly maintained for a quarter of a century. At an early stage, the watermark had been recognised as a means of

restraining the forger. After the restriction of cash payments in 1797, because of the war with France, a much expanded note issue was followed by an alarming increase in the circulation of forged notes. An appalling number of executions resulted—313, for instance, in 1817.

In 1791 the Bank belatedly established a printing department within its own walls. Its printers participated in the search for the inimitable note by imitating inimitable specimens submitted. A melancholy routine developed. On the submission of a claim to inimitability, the printing department would produce a copy sufficiently close to deny the claim. After the 1914-18 war, the Bank's printing work was transferred to the sombre stronghold that frowns upon the traffic in Old Street. It was once St. Luke's Mental Hospital.

London's Doorstep

MIDDLESEX.
By Michael Robbins.
Collins. 456 pages. 42s.

THE editor's aim in this, the first volume of what promises to be a substantial series, is "to describe the local history of England, relating it to the history of England as a whole" and "to give some account of the county as it is today, linking past and present." His intention is to summarise existing knowledge, in volumes more concise than the larger Victoria County Histories; his targets, the general reader interested in the past of his own district.

The author of this volume, hampered by restriction to the modern county, ignoring that older Middlesex which until 1889 contained most of its essentials, makes his points clearly. His first part covers the general theme. Geography and the influence of London were the keys. The flat river plain in the angle of Thames and Lea, good water communications, clay lands "adhesive and ungrateful," gravel and brick earth, were the ruling physical influences until railways and the growth of population created modern suburbia. Politically, the great lords preferred remoteness from the Court and, until the Reformation, the Church was the largest landowner. Thereafter moneyed men invested in Middlesex lands but founded no enduring dynasties there. Hampton Court had its moments of importance, as had the Middlesex elections of 1763-1837. Economically, the rich market of the capital dictated a county of market gardens and hayfields, until both were engulfed by suburbs and, during the inter-war years, by the light industries established along new arterial roads. Statistics best show these changes—70,827 (1801), 792,476 (1901) and 2,268,776 (1951)—when Plymouth was less populous than Harrow. Ecclesiastically the county was long a Puritan stronghold, with many Quakers. Yet in the years 1851-1951 the Anglican church

added 156 new churches to its former 71. Socially the county has "never yet had an independent and continuing social life of its own," lacking a resident culture independent of London. This lack the author feels deeply, devoting two chapters to a plea for a reform of local government, which will enable the keenness of local societies and the genuine interest of many in the affairs of their neighbourhood to play a constructive part in their own government.

The second part is a pleasantly written topographical survey assembling much information. Reflecting the author's interest in transport, it provides a valuable short history of each locality, supplemented by a bibliography setting out the materials used. How far reliance on printed sources—virtually ignoring both the riches of archives, public and private, and the handful of relevant degree theses—is adequate, the reader must decide. Helped by a pleasing format, good illustrations and a lively style, he will undoubtedly enjoy himself. Whether he will be wholly satisfied by a history of Middlesex which omits all that, until the last generation, was its most essential part, is more doubtful. As a describer of London's doorstep, the author succeeds, but his work would have gained beyond measure had he linked, however tersely, both sides of the threshold.

Mercantilist Weapon

THE FREE PORT SYSTEM IN THE BRITISH WEST INDIES.
By Frances Armytage.
Longmans. 176 pages. 21s.

EVER since Adam Smith erected the traditional trade policies of his day into the "Mercantile System" to provide the aunt sally for his free trade argument, historians have mostly ignored the fact that free trade in the form of smuggling was a regular, if limited, weapon in the mercantilist armoury. Much has been written about the upkeep of trade and shipping monopolies with British colonies, but far too little has been heard of the aggressive side of mercantilism, about breaking into foreign colonial monopolies and pushing such free exchanges of goods as would strengthen national power. Contraband trades with foreign colonies, carefully fostered by government, were vital instruments of mercantilist policy.

The British free port policy of 1766-1822 represents the ultimate refinement of contraband trade—pushing on a systematic scale. Mrs Armytage's scholarly monograph dealing with this topic, published by the Royal Empire Society in its series of imperial studies, is therefore a notable contribution in a neglected field of mercantilist trade policy. The author describes how, by the middle of the eighteenth century, the old-established illicit trade, carried in British sloops from West Indian ports to the Spanish colonies, had become so dangerous as to demand a change of

THE ENGLISH LAND TAX IN THE EIGHTEENTH CENTURY

By W. R. WARD 21s. net
(Oxford Historical Series)

This book traces the history both of a contentious political issue and of an interesting part of the machinery of government. Successive chapters show how land tax administration was built up and how, after the legal structure was completed in 1698, its working was affected by social and political changes. New light is cast upon the role of the land tax administration in the party battles under Queen Anne, in the system of influence in the middle of the eighteenth century, and in the fiscal developments occasioned by the American and French wars. Changing opinions on the place of the land tax in the revenue system are analysed, and a contribution is made to the social history of the English civil service in the eighteenth century.

OXFORD
UNIVERSITY PRESS

The Logic of British and American Industry

P. SARGANT FLORENCE
Professor of Commerce,
Birmingham University

"Professor Florence's book brings together a great mass of information about the structure of British and American industry. Many of the facts are the results of the author's own researches, while others are drawn from the works of numerous contemporary investigators in the same field. The scope of the book is very wide."—*Manchester Guardian*.

28s. net

Routledge & Kegan Paul

technique: and how, consequently, the British navigation system was modified to permit Spanish colonial vessels to bring raw cotton and dye-woods as well as bullion to certain British West Indian ports and to carry away British manufactures to be smuggled into Spanish America. The device of free ports was so successful that, at the peak of their prosperity in 1813, they re-exported to foreign colonies almost half of the goods that Britain exported to the West Indies.

In a sense, however, this study does not bring out the broader significance of the free ports. The stratagem of establishing centres of free exchange in order to entice foreign merchants out from behind the trade barriers set up by their governments, and thus persuade them to smuggle in the cause of British expansion, was employed not only in the West Indies, but in China and the foreign-held East Indies as well. Although the free ports seemed at the time entirely consistent with mercantilist principle, they proved heralds of the transition to free trade. Thus the liberalisation of the old trade empire began at its periphery, where its expansion was blocked by foreign monopoly.

Splendid Radical

WILLIAM COBBETT: *A bibliographical account of his life and times.*

By M. L. Pearl.
Oxford University Press. 266 pages. 25s.

THE many dreary passages in English history during the first three decades of the last century often have their dreariness enlivened by the writings of that splendid radical tiger, William Cobbett. A big, burly man, a great lover of liberty and a great hater of deceit, he began his political life as a Tory because he detested the French revolutionaries, at least in their most bloodthirsty phase, and ended it the most popular of the reformers at a time when the reformers' predominance in English politics seemed assured for good. He was far too big a man to bother to be consistent, save in his essential demand—that every Englishman should enjoy his natural right to that decent life without which, he thought, there is no freedom.

Mr Pearl has tried to illustrate Cobbett's career by listing the books and articles which streamed from his pen at a rate unequalled in English political literature save by his own best biographer, Professor G. D. H. Cole—whose collection of Cobbett's writings Mr Pearl was able to use—and to note in a rather haphazard fashion some of the contemporary attacks on him. The listing is not done in a way that would appeal to a bibliographer, and no room for extensive quotation has been found. This book is not useless to an historian, for the vigour of the subject character shines through it; but the principles on which Mr Pearl has composed it, and the readership which he intends to attract, remain obscure.

Tribute to a Scholar

VARIA POLITICA.

By William E. Rappard.

Editions Polygraphiques S.A. Zurich. 368 pages. Fr. 38.50.

THIS collection of papers and addresses, composed by Professor Rappard over a period which includes both World Wars, was made and published as a tribute by his friends and admirers on the occasion of his seventieth birthday. It is therefore a variant upon the more familiar "Essays presented to X," whereby in our academic world scholars do honour to a colleague with the production of their own several pens. It is a graceful tradition which has served to evoke or revive occasional pieces of more than occasional importance, even if the resulting volume usually lacks the unity that makes a book.

In the present case any such unity was the more difficult to achieve by reason of the wide range of Professor Rappard's interests, represented here under the six headings of *Academica*, *Economica*, *Politica*, *Internationalia*, *Helvetica* and *Americana*. As an academician Professor Rappard has some interesting things to say on the functions of universities and on the discharge of those functions, where they conflict with each other and with the interests and obligations of teachers outside the university; of the three purposes of the university—general education, training for the professions, and research—M. Rappard regards the last as the highest and purest.

As a former international civil servant M. Rappard compares the present trusteeship system of the United Nations with the mandates of the League, to the advantage of the earlier experiment, and he contrasts the Charter as a whole with the Covenant, again to the advantage of the earlier document, which he regards as less belligerent in its genesis and in its tone. On European union it is instructive to read the doubts, not to say scepticism, coming from Switzerland, a country which is held up by other Europeans and by Americans as the exemplar of unity. As a Swiss, Professor Rappard is frankly alarmed at the prospect of a federation of a part of a part of Europe, but as an observer of current affairs he comforts himself with the reflection that the scheme is unlikely to come to anything.

Specifically Swiss matters, such as consideration on the constitution of 1848, for the most part interest only the specialist, but a paper on the Initiative, Referendum and Recall in practice in Switzerland raises wider issues of the working of democracy after the introduction of universal suffrage. As Professor Rappard points out in a different paper, the Swiss people were probably more familiar than any other with the contents of the Covenant of the League owing to the referendum which preceded its acceptance by Switzerland. Since Professor Rappard wrote on these constitutional peculiarities, the invention of

THE ECONOMIST, JULY 4, 1953

television has strengthened the direct connection between people and political questions.

This volume, besides paying respect where respect is due, contains much worth pondering, especially if it is not read, as the reviewer perforce reads it, in a sitting or two. It also contains a complete list of the works of Professor Rappard, comprising 304 items.

The Making of the Australian

AUSTRALIA: HER STORY.

By Kylie Tennant.

Macmillan. 296 pages. 15s.

HOW many people know the texture of national experience which goes to make up that distinctive thing—the Australian character? In general the Australian is judged without understanding of his background—certainly to a far greater extent than the American or South African. Yet his history and environment condition his attitudes, which cannot be understood apart from them. And that history, that environment, are rich and compelling to a degree that few people in Britain are usually willing, in their ignorance, to believe.

The history of the Australian labour movement, for example, is interwoven with the fight of the free settlers against convict settlement and the successful land-grabbing of a "squattocracy" which has been as powerful an influence in Australian as the squirearchy in English life. The solidity and loyalty of the Australian unions, and their temporary capture by the Communists, require for their understanding a reading in the Australian republican tradition which was grounded in British chartism. Nor can the policies of "white Australia" be understood apart from the long history of colour conflict in the nineteenth century. How many British people know that long after British cruisers had crushed the slave trade off the West African coast, they were powerless to prevent it from operating between the South Sea islands and Queensland? How many know of the long agony of *Homo Tasmanianus* fighting against the white invaders—and of their last stand under a queen as brave, if more primitive, than Boadicea? How many know that Australia was a dumping ground for Chinese, as well as British, undesirables?

Miss Tennant has provided a most admirable background study of the Australian scene and the elements which make up Australian frustration, as well as Australian achievement. Her book should find a real use when the history of the Commonwealth is imaginatively taught in schools—and not in British schools only. She rightly quotes Mark Twain on Australia's unknown history: "It does not read like history, but like the most beautiful lies; and all of a fresh new sort, no mouldy old stale ones . . . but they are all true, they all happened." In their happening, they made the Australian.

People prefer wrapped bread

It saves them money; it's more economical because there's no waste—the bread stays fresh to the last piece. And, of course, it's more hygienic: that appeals to the housewife who wants all her food pre-packed and cleanly wrapped. So, more and more bakers are wrapping their bread in specially waxed paper, attractively printed before it is waxed—and more and more of them are using the waxed papers made by Powell Lane which, as a Division of the Reed Paper Group, can draw on the great resources which the Group brings to bear on every modern paper problem.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Breaking Mr Reed

Washington, D.C.

THE Eighty-third Congress has been in session since the beginning of January and has every intention of going into recess in a month's time until next January. Congress seldom pulls itself together for the passage of legislation until the last possible moment but, even so, this Congress has more important measures waiting in the ante-room—measures which the Administration had earnestly hoped to see translated into law—than it can possibly digest during the remaining month. Apart from financial legislation, the Reciprocal Trade Agreements Act has still to pass its final stages in the Senate, where there will be a stiff debate on the composition of the Tariff Commission; the Customs Simplification Bill has barely started through the legislative mill; and revision of the Immigration Act and the legislation to permit the entry of 240,000 Displaced Persons are hardly even contemplated as a possibility for this session, despite the President's renewed appeal this week for their consideration. The situation has been made no better by the fact that illness has forced Senator Taft to relinquish the leadership of the Senate to Senator Knowland, who has none of his sense of timing and knowledge of procedure.

This lagging progress in Congress is not solely the fault of the Administration, although the President's policy of maintaining the most cordial relations with his legislative leaders has prevented him in most cases from deploying his enormous popularity in the country to create a greater sense of urgency in Congress. Nor are the delays solely the fault of the Republican leaders; the Democratic "filibuster" against the offshore oil Bill consumed four weeks of Senate time in the spring, and the opposition of many Democrats and some Republicans to the cuts in the Air Force budget created an unexpected road-block. No Congress since the early days of the New Deal has probably, except in the emergency of wartime, passed more than half or two-thirds of the legislation which the Administration has requested. In part this is the fault of the workings of the congressional system itself, a fault which has been dramatically illustrated by the fact that one man—a Horatius in a blue suit and spectacles—has been able to hold back the legislation continuing the Excess Profits Tax until the moment of its expiry, against the combined forces of the President, the Republican leadership in Congress, and a large section of American opinion.

For thirty-five years the farmers of four counties in upstate New York have returned Mr Daniel Reed to the House of Representatives as their Congressman. For thirty-four years Mr Reed made no mark on American history at all, apart from a mild interest in the Inter-

Parliamentary Union, although he endeared himself sufficiently to his constituents to make it impossible for the Dewey machine in New York State to replace him with a more electrifying burgess. But in his thirty-fifth year, when a Republican majority was returned to the House, he became by right of seniority the Chairman of the Ways and Means Committee which has been, almost since the inception of the Congress, the committee responsible for revenue legislation. Like many other Republican Congressmen, Mr Reed had told his constituents last autumn that a Republican Administration would mean a reduction in taxes, neglecting to notice that his party's presidential candidate was entering a caveat in his campaign speeches that a balanced budget must come first.

Mr Reed introduced the first Bill of the session, to reduce personal income taxes on July 1st this year instead of on January 1st next year, and he began to conduct guerrilla warfare against the Republican leaders in the House when they refused to take action on it. But his honest faith was shaken to the core when, in the middle of May, the President announced his revised budget and declared that not only could there not be a reduction in personal income taxes before the beginning of next year, but that the Excess Profits Tax, which was due to expire on July 1st, would also have to be extended for another six months. The President and the Secretary of the Treasury both made it plain that they considered EPT to be a bad tax but that it was essential, to prevent the deficit rising above \$5.6 billion in the fiscal year which began this week.

★

At that point Mr Reed decided to demonstrate how great are the negative powers of the chairman of a congressional committee. The positive powers of a chairman, to promote a piece of legislation, are limited: if he favours a Bill he can order extensive and early hearings, he can present the evidence of witnesses in good light and he can urge it upon his fellow committee members; but their vote is decisive. His negative powers, however, are enormous: by long usage he alone can call for hearings on a Bill and can, therefore, postpone them indefinitely; and he alone can order, or refuse to order, the final vote by which the Bill is reported out of committee to the floor of the House.

Both these tactics Mr Reed used. For many weeks he refused to order hearings on the Excess Profits Bill; when he did at last order them, under pressure from his political superiors, he seized on the opposition to the tax of the National Association of Manufacturers to show "that the Administration had failed to prove its case."

On June 20th President Eisenhower asked Mr Reed to step up to the White House for a little chat, from which he emerged quite unpersuaded and quite unruffled, although he did suggest a compromise date of September 30th, for both the expiry of EPT and the reduction in income tax, which the President rejected. Two days later the President, abandoning the dignity of his office, telephoned to Mr Reed, asking him to uphold the Administration and his party. Mr Reed was unmoved. It was a matter of principle, he explained, that election pledges should be fulfilled and taxes reduced; why, even Britain could reduce taxes, and if "socialistic" countries could do it, why not the United States? He sat like Humpty Dumpty (whom he somewhat resembles) on the Bill and all the President's horses and all the President's men could not dislodge him.

Eventually, with June 30th coming steadily closer, the White House and the Republican leaders in the House decided on extraordinary measures. Having failed to find a majority in the Ways and Means Committee for reporting out the Bill, the Speaker of the House, Representative Martin, and the Republican majority leader, Representative Halleck, obtained from the Rules Committee a resolution to the effect that the main body of the House could consider and vote on the Bill, without waiting for the Ways and Means Committee to report it out. In the end this unprecedented step did the trick. When the House reassembled on Monday it became clear that the majority of the members of the Ways and Means Committee were prepared to abandon their obdurate chairman and, on being assured that they would vote for EPT, Mr Halleck promised to drop the bludgeon of the Rules Committee's resolution. With great reluctance Mr Reed decided to call his committee together for July 8th.

Never before can so much naked force have been applied to the passage of such an insignificant piece of legislation, for the Excess Profits Tax can contribute only something over one per cent of the annual revenue. Mr Reed stood his ground to the last, and won considerable applause not only from those who agree with his principles of taxation, but also from the Democrats who, while supporting the tax, were not deeply sorry to see the Republican leadership in such grave embarrassment. But Mr Reed may have done some disservice to his own cause, for public opinion has had a clearer glimpse than for a long time of the Humpty Dumptyish powers of committee chairmen—"the disintegrate ministry" which governs Congress, as Woodrow Wilson called them. There may possibly as a result be a call for some changes in a system whereby an elderly gentleman representing some three hundred thousand rural dwellers can, merely by virtue of age, occupy a position from which he can defy a President elected by thirty-three million voters.

Frozen Asset

FROM A SPECIAL CORRESPONDENT

THE American people in 1952 spent about \$64 billion on food, of which \$875 million went on quick frozen products. It is doubtful whether even Mr Clarence Birdseye, when he launched the first company for processing and selling quick frozen foods with a capital of \$20,000, could have foreseen such a growth for the industry. That was in 1923, and he was just back from Labrador, where he had found that fish which was quick frozen was much better than that which had merely been kept in cold storage. Five

THE ECONOMIST, JULY 4, 1953

years later the first low temperature retail show case made its appearance. Today no tiny village grocer is without quite a large one, and there are about 5,000,000 home deep-freezers. It is estimated that between 11 and 12 per cent of all homes with electricity possess one. It has, indeed, become so fashionable to put everything into the freezer that last year the Department of Agriculture sent out a warning that deep-freezing was not a suitable way of preserving fur coats and winter woollens from moth.

The home deep-freezer usually looks like a large white coffin and is kept in the cellar or storage room. It differs from the ordinary American refrigerator in having only one very low temperature. The newest refrigerators are providing larger storage space for frozen foods, but in most cases they do not take anything as big as a turkey. Before the coming of the home freezer, the habit in rural areas was for people to hire a locker in a deep freeze storage plant. Into this locker the farmer, or a group of neighbours, could put a whole side of beef at the right time of year. The locker business has fallen off only slightly since the home freezers appeared, presumably because the deep-freezing habit is growing so rapidly. But the trade paper which used to be called *Locker Management* is now *The Frozen Food Center*.

In its early days, the industry had not only prejudice to combat—cold storage goods had a poor reputation—but also it had to solve the problems of packaging, keeping the food at zero temperature, and delivering it over long distances to the retailers, who in turn had to store it all the right temperature and get it to the consumer. Freezer space is still the limiting factor in a country where the climate in most regions makes refrigeration a necessity in summer. About 22 per cent of the public refrigerated warehouse space is now devoted to "sharp freeze," the temperature of zero or below needed to preserve flavour and freshness.

Even when enough storage space and refrigerated transport are available, there is still the risk of a power failure and of consequent defrosting. Several states, led by California, would not allow the sale of quick frozen foods until it could be shown that they become uneatable before they become dangerous. The National Association of Refrigerated Warehousemen now think they may have found a way of detecting defrosting, when it has occurred, in a new type of wrapping which reacts to water. One suggestion is that the wording on the package might start out "Not Thawed" and end up "Thawed" if anything had gone wrong.

It is hard to compare the cost of frozen packaged foods with the fresh variety. Obviously it is cheaper for farm families to eat what they grow as it ripens. But it is also a great saving for them to put their surplus produce into a locker or a deep freeze for use at the lean times of year. Many of the big super-markets have special bulk purchasing days for those who wish to restock their freezers and do not grow their own food. Even for those who do not possess a freezer and must buy prepared frozen foods there is a definite economy, in most cases in cost, as well as in time and labour. A 12-ounce package of frozen peas is the equivalent of two pounds of peas in the pod. When the cost of going to the shop and the time taken preparing the vegetables have been accounted for, the saving is quite big. Both the freezer manufacturers and the food packagers are stressing cheapness.

A great deal is being made of the Bureau of Labour Statistics figures, which show that, while between Decem-

THE ECONOMIST, JULY 4, 1953

ber, 1950, and December, 1952, the cost of living rose 6 per cent and the cost of all foods 7 per cent, the price of frozen fruits and vegetables declined 12 per cent. The poor tired housewife is being persuaded that if she gets to work and bakes a whole mass of pies and puts them in her freezer she is making a great saving and that all leftovers should be made into something or other and put there too. That she sometimes forgets all about them, or anything else that she has in the contraption, is shown by a new batch of advertisements for deep-freeze slates on which an inventory can be kept. What effects deep-freezing has on food values remains uncertain. But in response to many requests, all the allied industries are financing a university research project to find out.

Despite all its growing pains the quick frozen food industry has been a godsend not only to the housewife, but also to the economies of food-producing states. The New England fisheries benefit because their catch goes straight to the freezing plants. Florida's frozen citrus industry has grown to fabulous proportions, the frozen concentrate proving much more popular than the tinned juice. California is relying more and more on its fruit and vegetables. In 1944 it was responsible for 8 per cent of the national production of fruit and 17 per cent of that of vegetables; today the figures are 20 per cent and 26 per cent. The poultry raising states are also doing good business with their "cut-up-and-ready-to-fry" packages.

Concentrated citrus juices and vegetables lead the industry with 800 million pounds a year each. Fruit comes next, then poultry, and fish and shell fish. The butchers' unions are doing their best to stop any big development in the meat line, but already there is a choice of "cube steaks, steakettes, sandwich steaks, steakees, buttered and unbuttered beef steaks," to mention some of the beef alone.

There is nothing that the refrigerated warehouses will not tackle and, though dog food is now a staple packaged product, moose food is a new one. A firm in Milwaukee, Wisconsin, experimented for their zoo and put the leaves and branches that moose prefer in boxes which they stored at zero. The zoo authorities have to collect a box a day as the material deteriorates rapidly after defrosting, but they are now the proud possessors of a moose offspring, a very rare occurrence in captivity.

Pre-cooked frozen food has also come to stay. But in the opinion of the *New Yorker*:

on the whole, considerable progress will have to be made before the quality of frozen prepared dishes catches up with that of other frozen products. It is high time that cooks, as well as refrigeration experts, entered the field, for at present it gives the impression of being dominated by people who, unable to get anywhere selling television sets, are trying their luck at freezing stews and pies.

This is a pretty fair comment, though the field is now so big that some of the dishes are very good indeed. Oddly enough, fried potatoes are excellent and a tremendous labour saver. They are spread while still frozen on a baking sheet in a hot oven and emerge at the end of twenty minutes crisp and golden. Chicken and meat pies are now being put out by about fifteen firms and some are at least edible. Cooked shrimp, fish cakes, chicken "à la King," fried egg plant, whipped and puff potatoes, waffles, pizzas, blintzes and eggs "Fu Yong" can all be bought ready to heat. The "all-on-one-dish" meal is also here to stay and airlines and factories are serving them. Meat and vegetables all come cooked and frozen on thin aluminium trays with low partitions. The outside wrapping is removed and they are stacked into specially fitted ovens for a few minutes before serving.

Banking circles the globe

BUSINESSMEN with foreign interests need a bank whose services circle the globe. The National City Bank of New York, with 56 overseas branches and banking correspondents in every commercially important centre, is well equipped to offer such services.

The London branches of The National City Bank are staffed by men who are experienced not only in British banking but also in the financing of overseas trade. They are, also, uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, the worldwide organization of The National City Bank is at your service.

THE NATIONAL CITY BANK OF NEW YORK

Incorporated with limited liability under the National Bank Act of the U.S.A.

HEAD OFFICE: 55 WALL STREET, NEW YORK

American Notes

More Room for Credit

THE 1953 fiscal year ended on Tuesday with the federal government's books showing a deficit of \$9.4 billion, the most it has ever been in peacetime and more than had been forecast even recently. The actual shortfall of cash receipts below disbursements will, however, be substantially less. The failure of tax receipts to live up to Mr Truman's promises explains why the deficit was \$3.5 billion more than he had forecast in January. The inflationary effects of such a deficit, and of the further deficit which is coming in the new fiscal year, 1954, at a time when the country's resources are fully employed, should do much to counter any deflationary tendencies that may develop during the next few months. The deficit has already led to a relaxation of the squeeze which the Federal Reserve Board has been putting on credit ever since the new Administration took office.

For between now and the end of the year, the period when the government always spends more than it gets, the Treasury will need to borrow about \$9 billion. In addition \$21 billion worth of government securities fall due and will have to be refunded. All of this will come at a time when the credit requirements of business normally rise sharply, with loans needed to cover the new season's crops and the stocks being laid in for the Christmas trade. The knowledge that these new demands for credit were about to be forced into a money market that was already painfully tight explains the sharp protests of politicians and businessmen against the government's restrictive credit policy. But last week's action of the Federal Reserve Board was not the concession to these protests that at first sight many thought it to be, but a proof that the board was as well aware as were its critics that, if it allowed credit to become any tighter, there was a danger that the economy would be strangled.

For some weeks the Federal Reserve authorities, by buying Treasury bills and certificates, had been increasing bank reserves, and thus the supply of credit. But last week they suddenly opened the credit door much more widely by

THE ECONOMIST, JULY 4, 1953

reducing the reserves which banks belonging to the Federal Reserve System must hold. From July 9th, banks in New York and Chicago will be required to keep in reserve only

22 instead of 24 per cent of the amount of their demand deposits; in other cities the requirement was cut from 20 to 19 per cent and for country banks from 14 to 13 per cent. This releases over \$1 billion and in effect adds nearly \$6 billion to the available supply of loanable funds, exactly the amount which the government intends to borrow later this month. Because the demand for loans is so great, the Federal Reserve's move is unlikely to drive the interest rate

THE First SINCE 1784

The United States had only just become a sovereign power when in 1784 the First National Bank of Boston was founded. The bank has grown with the country — indeed helped the country to grow — and maintains important branches in Argentina, Brazil and Cuba as well as a wholly-owned foreign banking affiliate in New York City.

America's oldest chartered bank offers traditionally courteous and comprehensive financial service to bankers and concerns engaged in overseas trade with North and South America.

down for more than a short time, in a few places, but it will prevent the rate from rising distressingly high, as it might otherwise have done.

Civilian Command

THE House Appropriations Committee which approved and even slightly increased the Administration's cuts in funds for the Air Force, over which there has been such a storm, made much of the "chaotic fiscal practices" and "administrative hodge-podge" in the military establishment. The widespread belief that the Pentagon is an administrative monstrosity was one reason why the enemies of the President's plan to reorganise the Department of Defence mustered only 108 votes, instead of the 218 that would have been needed to defeat it in the House. As there was no organised opposition in the Senate, the plan went into effect on June 30th.

The fire of the critics was concentrated on the provisions enlarging the responsibilities of the chairman of the Joint Chiefs of Staff. These, they allege, are a move in the direction of a German-style General Staff and a military dictatorship. This is ironic, for the purpose of the plan is to strengthen the control of the civilian Secretary of Defence and of the civilian heads of the services by clarifying lines of authority, and to relegate the Joint Chiefs to the planning and advisory role for which they were originally intended.

What is objected to under the new arrangement is that the chairman, instead of the Chiefs of Staff jointly, will now control the work and personnel of the Joint Staff, a group of 210 officers who prepare the plans from which the Joint Chiefs make their recommendations to the President. The aim was to relieve the Joint Chiefs, who are the military heads of the three services, of distracting detail, and also to make the Joint Staff more independent than it has been as the creature of three jealous services.

The command responsibilities which the Joint Chiefs have exercised are transferred to the Secretary of Defence; so are the functions of the Munitions Board, the Research and Development Board and Defence Supply Management, which are now abolished; the Secretary is to have six new assistant secretaries to take over duties formerly spread about among advisory boards and committees. These changes should not only promote efficiency, but also serve the President's insistence that no function of the military establishment ought to lie outside the Secretary's authority and control. It is not likely that the steadily growing authority of the Defence Secretary is popular with the services, particularly when he is as controversial a figure as Mr Wilson. But General Vandenberg's swan-song, his open defiance of Mr Wilson on the Air Force cuts, must have confirmed the President's determination to reassert civilian control.

The Bookworm Turns

THE President's innocent general remarks about the iniquities of book-burning, made before he knew that a panicky purge of American information libraries overseas

was the State Department's response to Senator McCarthy, have been re-echoed tenfold by the American Library Association. In conjunction with the American Book Publishers Council it has issued a manifesto against censorship of anything except obscenity and it has come resoundingly to the defence of the foreign library programme, denouncing the "clearance" of authors as irrelevant and offensive. The President, though he refused as always to name names, has been encouraged to press his advantage; he has warned the association against the "zealots who would defend freedom by denying freedom's friends the opportunity of studying Communism—its plausibilities and weaknesses." This is hardly the loftiest ground on which to justify freedom of inquiry, but it does at least protect it.

A spokesman of the State Department itself has admitted that the book purge has discredited America abroad, though Mr Dulles, who was understood to have drawn up one of the six directives sent out recently, but who has denied all responsibility, considers it is the result merely of excess of zeal on the part of librarians. No doubt it was this which prompted one library to throw out Mr Whittaker Chambers's "Witness," though Senator McCarthy calls it sabotage. The new directive which is being drawn up by the information authorities will place primary emphasis, not on whether the author is a Communist or has refused to answer questions about Communist affiliations, but on whether the book itself will further the purposes of the information programme abroad.

What should these be? Mr William Benton, who ran the information programme for two years, says the purpose

WORLD-WIDE BANKING NETWORK

From the London and New York offices of The Hanover Bank, a world-wide network of correspondent banks is equipped to serve those engaged in international commerce.

THE HANOVER BANK

(Incorporated with Limited Liability in U. S. A.)

NEW YORK . . . 70 Broadway

of the libraries was originally conceived as being to give the foreign reader a balanced picture of American achievements and the main current of American thought; they were to stand as evidence of America's literacy and of its intellectual vigour and variety, as weather maps of a free intellectual climate.

Few Americans, not even Mr Benton, and certainly not the President and Mr Dulles, think that American libraries abroad should help to teach Communist doctrine at the taxpayers' expense, even though they might all agree that Americans at home should have access to Communist books. But this was the only ban which the President, at his press conference, felt should be imposed on the foreign library list, if an honest picture of America is to be presented. So far, however, there has been no unequivocal order to this effect and, even if the books are not for burning, Senator McCarthy can pretend not to have heard of it.

New Men for Old Jobs

MR JOHN L. LEWIS had no need to pour out his wrath on the heads of the Senate in order to prevent the confirmation of Mr Tom Lyon as director of the Bureau of Mines, for Mr Lyon did an amazingly good job of prevention for himself. In the first day of hearings on his nomination he made no secret of the pension, revocable at any time, which he receives from the Anaconda Copper Company, with which he would be dealing in his new work, nor of the fact that he had no faith in the federal mine safety law which it would be his duty to administer. At this his shocked friends advised him to withdraw from an appointment for which he was so blatantly unsuited.

Why this had never been realised in the two months during which his qualifications and record had been under consideration at the White House is a mystery that provides yet another example of the tactlessness which the present Administration has sometimes shown in its choice of men for jobs. But it must be admitted that when the right man does seem to have been chosen the Senate often thinks differently. Mr Lewis Strauss, the new head of the Atomic Energy Commission, has indeed been confirmed quickly, but this is probably as much because of his known reluctance to share atomic secrets with America's allies as because of his great experience and knowledge of atomic matters. But Mr Paul Nitze, of the State Department's policy planning staff, is, it seems, no longer to become Assistant Secretary of Defence for international affairs, apparently because Senator McCarthy has threatened a repetition of last spring's struggle over the appointment to the Moscow Embassy of Mr Bohlen, another man who had been directly associated with the foreign policy of the Democratic Administration. Mr Nitze is a Republican, but that is not enough to shake Mr McCarthy's determination that no "hold-over" from the previous Administration, however able, shall be allowed to remain in a policy-making post.

The President, who certainly recognises the value of continuity, particularly in foreign affairs, obviously does not go as far as the Senator, but he has just taken another step which will make it easier for the Republicans to put their own men in such posts. When the maze of "classified civil service," where employment is safeguarded, of "veterans'

preference," which safeguards exservicemen's employment even more, of the new Schedule C for policy-making and confidential jobs, of Schedule B and of Schedule A—when all this has been disentangled, it appears that the President's two orders, one in April, one last week, have opened up a large number, running into thousands, of government jobs of all types to Republican patronage. But even so, over 80 per cent of government employees still remain under civil service rules.

The Postman Knocks Again

SENATOR MCCARTHY's attack on his old enemy and courageous critic, Senator Lehman, for "gross abuse" of the franking, or free mailing, privilege accorded to Congressmen was particularly brazen and audacious. Galling as it must have been to find the Senate Folding Room preparing for posting copies of a speech Mr Lehman made in New York on "Creeping McCarthyism," Senator McCarthy must have known his attack would revive the charge that last year he himself sent out, at the taxpayers' expense, advertisements of a book he had written. Mr Lehman at least had his speech reprinted at his own expense instead of qualifying it for free distribution in the customary way by inserting it in the *Congressional Record*.

But abuse of franking, and indeed Congressional franking as a whole, at \$1.7 million a year, is not a big factor in the Post Office deficit. Mr Summerfield, the new Republican Postmaster, who is determined to end a tradition of red ink going back a hundred years or more, would be glad if the cost of all government mailing, amounting to \$34 million a year, could be borne by the senders; it might also induce economy. But this is a drop in the bucket of a deficit which was nearly \$800 million in the year which ended last June and which, with a cut of \$150 million in the estimates, will still be \$600 million in the next twelve months.

The Post Office will be relieved of a charge of \$80 million a year, which it should not have to bear, if the President's plan to transfer the airline subsidies to the budget of the Civil Aeronautics Board is not rejected by Congress. Domestic parcel post rates are going up, and so is international parcel post. The real money losers, however, are second and third class mail, and on these only Congress can authorise increased charges. Like his Democratic predecessor, but perhaps with more success, Mr Summerfield has applied for permission to raise rates in both categories.

Congress, however, is very jealous of its power to control postal charges, although one of its own committees has concluded that it is no longer able to do so efficiently. And it is sensitive to the complaints of newspaper and magazine publishers and of those who post circulars and catalogues, who accuse the Post Office of crediting too heavy a share of its costs to such second and third class mail and too small a share to first class, or letter, mail. This may be why Mr Summerfield proposes to raise \$150 million from a one cent increase in the rate for letters moving between cities and only \$71 million from increases on second and third class mail. But even this concession is unlikely to induce Congress to act before it adjourns this month.

ACROSS THE DEPTHS of the Pacific Ocean in one single section 3,467 nautical miles long, stretch two cables from Bamfield, on Vancouver Island in British Columbia, to Fanning Island near the Equator. These are the longest cables in the world. Yet they form only a very small part of the 150,000 nautical miles of submarine cable owned by the world's biggest integrated system of overseas telegraphic communications, Cable & Wireless Ltd.

From Fanning the cable circuits continue to the Fiji Islands, New Zealand and Australia and connect with the network to Asia, Africa and the Americas, and to Europe. Between those places the cables go, while wireless circuits give extra and alternative coverage. Together they connect

the units of the Commonwealth and the Crown Colonies, and they extend to many foreign countries where the Company holds concessions.

In 74 countries, Cable & Wireless Ltd. provides facilities for international messages to be sent in security and with all possible speed. A staff of nearly 9,000 mans the offices and stations. Eight cable ships are on constant patrol to make repairs or replacements to the cables.

Maintaining present standards and keeping ahead with new developments are obligations that are not made easier by the rising costs of labour and materials. The Company pursues its two-fold aim—reliable service to the telegraphing public, supremacy for Britain in international communications.

Canada's Election Prospects

FROM OUR OTTAWA CORRESPONDENT

ALL the Canadian parties have now laid down the general lines of their appeal to the electorate for the federal election which is to be held on August 10th. The parties are four, two major and two minor, and none is finding it easy to stir up any great measure of public interest in these long, relaxing summer days when farmers are busy and most other people are primarily concerned with country cottages and lakeside recreations.

The date of the election, at the height of the holiday period, is one of the first bones of contention. The Prime Minister, Mr St. Laurent, says that because of the Coronation he had no alternatives except August and November; and he bases this contention on the view that the compilation of voters' lists should not be done during the holiday season since it depends on people being at home. But the actual voting, he argues, can better take place in a holiday period, since it is then up to each voter to come home and vote. The suppressed premise of this argument, it may be suspected, is that the Government did not want to leave the election till later in the year because of the risk that economic conditions may then be showing more signs of slackness and that the crops may have caused disappointment amongst farmers.

One other incident, quite apart from the official party appeals, has given rise to a good deal of political feeling. This was the new appointment to the Cabinet which Mr St. Laurent announced simultaneously with the election date. Traditionally every province must be represented in the federal cabinet. The representative from Newfoundland since it joined the Confederation in 1949, Mr Gordon Bradley, has been appointed to the Senate, and his place in the Cabinet has been taken by Mr John W. Pickersgill, who has never been a member of Parliament and has never hitherto resided in Newfoundland. But Mr Pickersgill is standing for election in Mr Bradley's old seat, Bonaville-Twillingate. Mr Smallwood, the energetic Liberal premier of Newfoundland, has assured friends that he will have no difficulty in getting him elected.

Mr Pickersgill has long been one of the most influential figures behind the scenes of Canadian politics. He joined the civil service early in Mr Mackenzie King's regime and became, with various official titles, a sort of *chef de cabinet* to Mr King. Mr St. Laurent found him just as indispensable. He played a very important part in the organisation of the latter's only previous general election campaign in 1949. Later, however, he was appointed to the office of Clerk of the Privy Council and Secretary to the Cabinet, in suc-

sion to Mr Norman Robertson, now Canadian High Commissioner in London, there has been some controversy about whether the political duties which were unexceptionable in the Premier's executive assistant could properly be performed by the Clerk of the Privy Council. This controversy has been ended by the appointment of the Cabinet secretary to a Cabinet seat; and now the ground of controversy is whether it is desirable in a parliamentary democracy for a civil servant to step straight into the Cabinet before even being elected to the House of Commons, and then to be given what is believed to be a very safe seat.

No Rash Promises

This incident, however, is only on the fringe of the election campaign. The formal appeal of the Liberal party to the electorate is based on the claim to provide "good government"; and the claim is supported by the experience of the last 18 years during which the Liberal party has been in office. Mr St. Laurent, whose usually quiet and persuasive personality represents one of the Liberals' chief assets, refuses to make promises. "We shall do as well for you in the future as we have in the past"; this is the main burden of his case.

The other major party is the Progressive Conservatives, which last held office (without the "Progressive" part of its title) under the late Mr R. B. Bennett in 1930-35. It is now led by Mr George Drew, who captured only 41 seats (against 180 Liberals) in the last election in 1949. This party has a 16-point manifesto, of which Point 1 is the chief and the most controversial. It is a pledge to reduce taxes by \$500 million, one-ninth of the present budget. Possibly more important than the other 15 points is the party's contention that the Liberals have been too long in office and have grown tired, idle and arrogant. When Liberals reply to Point 1 that it is quite impossible to take \$500 million off taxes, Mr Drew answers that *for them* it certainly is impossible but only because they are tired and incompetent.

The two minor parties are the Co-operative Commonwealth Federation and the Social Credit party. Each had about a dozen seats in the old Parliament. Most of the CCF seats came from Saskatchewan and all the Social Credit seats from Alberta; governments of the respective parties are firmly entrenched in these two prairie provinces. Social Credit has also recently won control of the provincial govern-

ment of British Columbia, and it may pick up some additional federal seats there. Its appeal is not based, primarily, if at all, on the Social Credit theories of Major Douglas. It was a party of western revolt, and its principal leaders, including the Premier of Alberta, are regular Bible preachers. Even now the party seems to rest as much on its own peculiar brand of religious evangelism as on its free enterprise economics and its very right-wing political philosophy.

The CCF party is that extraordinary political phenomenon, an attempt to reconcile a socialist labour movement with a farmers' party. At the moment it appears stronger on the farmers' than on the labour side, and a revival of strength outside the Saskatchewan farmers may depend on a deterioration of economic conditions. Most of its appeal in the present election is based on the warning that Canada's economy is in danger, particularly because of the decline of sterling markets, and on the contention (which is largely true) that it is the only party which really believes in national health insurance.

In essence, therefore, the election is a struggle between the quite widespread feeling that "it is time for a change," and the opposing feeling that even if the Liberals have been in for a long time they can still provide better government than the Conservatives. Mr Drew's problem is not so much to persuade Canadians that a change would be healthy, as that his party—which is the only other possible government—would be a good one to provide a change.

The Modern Slavers

THE news that an international committee has laboured for two years to establish the fact that many countries use political prisoners as slaves may sound, to the casual newspaper reader, like an unusually needless exercise. The man in the street has little doubt that slave labour is a fact. Yet he has equally little idea of its scale, and its very existence is hotly denied by the governments concerned. Such denials inevitably carry some weight when the accusations are levelled by refugees or by governments politically opposed to the accused regime.

Real value, therefore, must be attached to the carefully objective and restrained report compiled by a United Nations committee composed of three eminent individuals representing three continents. Sir Ramaswami Mudaliar of India, Hr Paal Berg, former president of the Norwegian supreme court, and Sr Sayan, former foreign minister of Peru, issued their 620-page report on June 24th, almost two years after their appointment. They were instructed by the UN Economic and Social Council to study the extent to which forced labour is used not only for political repression but also as an economic weapon of governments.

These "three wise men" were faced at the start by the fact that during public sessions of the Council no less than 23 nations had been accused of practising forced labour. The 23 included Britain, Australia, France, South Africa, the United States, Eastern Germany, the Soviet Union, Czechoslovakia and Communist China. But the committee was required to consider other countries, too. In fact, it sent a brief questionnaire to all governments, whether members of Uno or not, asking for information about their relevant laws. Forty-eight governments replied;

those that did not included the Soviet group, thirteen of the Latin Americans, Persia, Egypt, Portugal and Pakistan. As to the 23 accused, each was supplied with copies of the allegations and of supporting documentary evidence where it existed, and asked to comment. The Soviet group and some of the Latin Americans declined to comment; indeed, the Soviet group boycotted the committee's whole activity.

In fact, while the committee was being denounced by Moscow and Prague as a tool employed solely to calumniate the Communist nations, it was painstakingly probing the truth of a long series of sweeping accusations which those nations themselves had made, in almost every case without any supporting evidence. For example, a Soviet spokesman declared that the British Control of Engagement Order of 1947 had "deprived the British workers of all their rights." The committee, however, found that only 15 directions to work were issued under this order in 1947, 14 in 1948, and none in 1949, while the order itself was revoked in 1950. Poland alleged that 20,000 Africans had been subjected to forced labour in one year in the colony of Gambia. A Byelorussian delegate described the Tanganyika groundnut scheme as having been "based entirely on forced labour." These allegations dissolved like mist on closer inspection, as did charges concerning eight other British dependencies, France, the United States and half a dozen Latin American countries.

But the committee in no way set itself to whitewash the non-Communist world. A scrutiny of Portuguese law revealed that Africans who went to work on the island of San Tome, albeit voluntarily, were liable to find themselves in a position akin to one of forced labour. In Spain, the committee found that very broadly defined political offences were liable to severe punishment involving forced labour. A system of forced labour of significance to the national economy was judged to exist in South Africa, in the indirect sense that most of the African population was channelled, by discriminatory laws, into agricultural and manual occupations in which many of the Africans were strictly supervised by the authorities.

"Stupendous Work" in Russia

The committee, indeed, went further. Its examination of the position in Malaya, Kenya, the Belgian Congo, Bolivia, and Nauru led it to conclude that in each case existing regulations might, if extensively applied and broadly interpreted, lead to the creation of a system of forced labour. The evidence did not suggest that such a system existed in these territories, but the possibility could not be ruled out. The same warning was given as regards vagrancy laws in some states in the United States.

All this, however, was overshadowed by the committee's findings with regard to the Soviet bloc. When studying these countries, the committee carefully refrained from accepting any estimates of the size of the slave labour population, reports on the location of Soviet prison camps, or evidence of mass deportations. It applied itself essentially to a study of existing Soviet and satellite laws and administrative practices. As to the Soviet Union itself, official publications clearly established the fact that persons suspected of political errors are sentenced to forced labour, often without any right of appeal or of representation by a defending counsel, and sometimes by an administrative organ instead of a court. They further established that

most of those sentenced are sent to labour camps or colonies either in remote and undeveloped areas or at the sites of big mining and construction projects. As one Soviet publication puts it, "the stupendous work done by the corrective labour camps is of enormous importance to the national economy."

The committee's finding that in the Soviet Union forced labour is used not only for political coercion, but also as an important element in the national economy, is applied also to Bulgaria and Czechoslovakia. As to Poland and Hungary, the committee did not find the evidence conclusive, but it held that the laws of these countries gave their governments power to employ forced labour as both a political and an economic weapon. In Rumania, it was established that forced labour was in fact used for political repression, and could also be made to serve economic purposes. The committee was unable to study the situation in Albania and Communist China since it could not obtain copies of the relevant laws and regulations. Further information was also needed about Eastern Germany, but the committee noted official Communist admissions of the existence of labour camps, documents establishing the fact that Germans were directed to work in the uranium mines, and extracts from the East German Criminal Code, which empowers courts to inflict forced labour "without conducting a full hearing."

Retrospect on Ho Chi Minh

THE expectation that the political conference due to follow an armistice in Korea may extend its scope to Indo-China has raised afresh the question of possible negotiations between France and Ho Chi Minh. In this connection the past record of dealings with the Viet Minh leader is of interest as affording some clues to his basic political attitude and character. In 1946 he reached a negotiated settlement with France which subsequently broke down through a succession of adverse incidents, but not without some evidence of an original intention on Ho's part to make it work. Although in some ways, with Communist China aiding the Viet Minh with supplies and the United States participating more and more in the struggle against it, the situation is even more complicated and intractable than it was in 1946, nevertheless the exhaustion of the country after six years of war and the longing of the Vietnamese people for peace put pressure on the political leaders of both sides so long as neither looks like winning.

At the end of the Pacific war in August, 1945, the Japanese controlled Indo-China, including Vietnam, after having crushed and disarmed the French colonial troops five months previously in order to prevent them from going over to the new Gaullist France (which was at war with Japan). On the northern frontier of Vietnam there was a Chinese army ready to move in, and with it were units of Vietnamese guerrillas controlled by a Chinese-sponsored federation of three revolutionary parties among exiles in China—the Vietnam Quoc Dan Dang (the VNQ), the Dong Minh and the Vietnam Doc Lap Dong Minh (the Viet Minh); of these the first two were purely nationalist, but the Viet Minh was dominated by the Indo-Chinese Communist party led by Nguyen Ai Quoc, a former member of the French Communist party who in 1943 took the new

name of Ho Chi Minh. The Viet Minh had a better underground organisation within Vietnam than the other two parties, and the Chungking Government recognised and subsidised Ho as the leader of the Vietnam national movement.

This was done in spite of the increasing tension between the Kuomintang and the Chinese Communists (with whom the Viet Minh always had close links). Kuomintang policy was to prevent any restoration of French power in Vietnam after the defeat of Japan, and for this purpose the Viet Minh had to be supported, even if it was Communist-led. But the Kuomintang also counted on its own army of occupation to regulate the postwar affairs of Indo-China; Chungking arranged with America, in spite of French protests, that China should take the Japanese surrender in Indo-China north of lat. 16°N, the southern portion being left to Admiral Mountbatten's South-East Asia Command. The Japanese might have been ordered to release and rearm their French prisoners, but they were not; they were given to understand that both the United States and China supported the Viet Minh, and so they turned over local authority to the latter.

A Divided Nation

Soon after the end of the war, however, a French expeditionary force arrived in the Far East and, with the co-operation of South-East Asia Command, occupied Saigon, dispersing the Viet Minh in the south of Indo-China. But in the north a Viet Minh Provisional Government headed by Ho Chi Minh consolidated its position under Chinese protection; the titular emperor of Annam, Bao Dai, had abdicated and lent his prestige to the new regime with the title of Supreme Adviser. Faced with this situation, the French opened negotiations concurrently with Ho Chi Minh in Hanoi and with the Chinese Government in Chungking. To Ho they offered recognition of the "Republic of Vietnam" as a "free state" within the Indo-Chinese Federation and the French Union, but not the *doc lap* or complete independence claimed by the Viet Minh. To China they offered renunciation of various prewar French treaty rights in China in return for transfer of military occupation control in Tongking. By the beginning of 1946 American policy had become much less hostile to French colonial interests than it was in President Roosevelt's time, and the Chinese Government, diplomatically isolated, came to the conclusion that a bargain with France was worth while. The treaty was signed on February 28th.

Ho Chi Minh, meanwhile, having failed to obtain recognition for Vietnam from America and no longer able to rely on Chinese protection, decided to make a compromise agreement with France, dropping the demand for *doc lap*. But the VNQ and Dong Minh were in opposition, denouncing any compromise as treason; it was clear that they would capture the leadership of the nationalist movement if the Viet Minh abandoned *doc lap*. Ho therefore went to the ex-emperor Bao Dai and proposed to hand over to him full governmental power for the purpose of reaching an agreement with France. Before Bao Dai had time to consider the offer, Ho withdrew it. The manoeuvre had alarmed the Chinese with the prospect of a collapse of the nationalist movement, and the Chinese political representa-

tive put effective pressure on the VNQ and Dong Hoi to enter a coalition with the Viet Minh so that all parties would share responsibility for a compromise settlement. There was still, however, delay in reaching it because an agitation within the Kuomintang sponsored by the War Minister, Ho Ying-chin, caused China to adopt the attitude that the change-over in Tongking could not take place until the staff arrangements were complete and that these were conditional on a Franco-Vietnamese agreement.

The renewal of Chinese military support enabled Ho to return to the demand for *doc lap*, which the French delegate, Sainteny, was forbidden by instructions from Paris to concede. But French troop transports were already on the way to Haiphong, and the Chinese War Minister, who was ready to risk war with France, ordered the Chinese commander at Haiphong to resist the landing by force. Throughout March 5th, while the French fleet hour by hour approached Haiphong, Ho Chi Minh argued interminably with Sainteny in Hanoi about the meaning of *doc lap*. But at nine o'clock in the evening General Chao Pe-chang, deputy-commander of the Chinese army of occupation, burst into the room and said to Ho: "Why have you not reached agreement with the French? You will plunge us all into war." Thus again deprived of Chinese backing, Ho again beat a retreat; just after dawn he accepted the French terms. The agreement came too late to avert hostilities at Haiphong, where the Chinese artillery opened fire on the French fleet at 8.30 in the morning; undeclared war between China and France continued for over two hours with casualties on both sides. But in the end the Chinese evacuated Tongking, and for a brief period it seemed that the pact of March 6th afforded a basis for a peaceful development of self-government in Vietnam.

An Opportunity Missed?

Many Frenchmen whose sympathies are very far from Communism believe that a great opportunity was missed in the ensuing months, and that the responsibility for the outbreak of war a year later was not all on one side. At any rate, in this period it was not Communism that was in question, but only Vietnamese independence; the international Communist affiliations of Ho Chi Minh do not appear to have weighed at all with the French negotiators in 1946, whatever were their views on the extent of the sovereignty that ought to be reserved by France. It was only after the victory of the Communists in China, and with the prospect of Vietnam serving as a stepping-stone for the expansion of Communism over all South-East Asia, that the war in Vietnam became a sector of the international front against the Communist power bloc.

Even now it is by no means certain that Ho Chi Minh would reject any settlement short of complete victory. The record of Ho as a negotiator is one of a rather supple and adaptable leader who is prepared to compromise when the situation requires it. He established very good personal relations with the French representatives with whom he had to deal, as also at one time with Bao Dai. His highest card has always been Chinese military support—of Kuomintang China in 1946, of Communist China today. Last time, when China wavered, Ho was ready for a reasonable settlement. It may be so again. But the key is in Peking.

Further Outlook in Nigeria

FROM OUR CORRESPONDENT

THE political barometer in Nigeria has risen slightly in the last week or two. Even the nationalist newspapers seem just a little lower-keyed, and the Government may be able to avoid prosecuting party leaders or press lords for sedition. Not that the press is cordial. The *Southern Nigeria Defender* is scarcely an organ that commands a national hearing or a universal respect, but a recent editorial expressed something of the emotional release many Nigerians think they are experiencing—

The Die is cast. The Rubicon is crossed. No more arm-chair nationalism. No more oratorical speeches. Action. Action. Action.

And Mr Awolowo, Action Group leader and virtual "Prime Minister" in the Western Region, continues to attack the Governor, Sir John Macpherson, in the most personal terms.

Yet the situation is a little easier partly because the political leaders have now agreed to attend the London talks, and partly because the early stages of elections to the Eastern House of Assembly are to some extent distracting attention. Leaders who have combined to attack the constitution root and branch are at the same time preparing to fight electoral campaigns against each other under that same constitution. Both Action Group and Dr Azikiwe's National Council of Nigeria and the Cameroons have embarked on electioneering tours; suggestions of a political truce have been rejected and the limit of agreement is that members of the two main parties should not call each other "imperialist stooges" during the campaigns.

Reforming the Constitution

But the main factor is, of course, the London conference. Nigerian leaders believe that they have inflicted a sharp lesson in tactics on both the Governor and the Colonial Secretary, and it is true they have succeeded in changing the whole basis of the talks. The Colonial Office, from this distance, seemed to have in mind a conference of the old-fashioned delaying type, which discussed what other conferences could be called and who should be invited to attend them. The Nigerians are not interested in such things. The formula for Nigerian representation, it was felt, should be decided in Nigeria, not in London, and instead of discussing just *how* to tackle reform of the constitution the conference must decide what changes are immediately required.

On the narrowest and most theoretical basis of detailed flaws in the existing constitution and the machinery of elections, agreement might not be hard to reach. The most awkward problem, in view of the Northern movement for secession, is the degree of regional autonomy. Otherwise there is fairly substantial agreement on adult suffrage, the abolition of electoral colleges, and direct election to the central House of Representatives. The present method of indirect election from the regional houses has simply meant a transference to the centre of all regional difficulties. But are these things on the London agenda?

A much more important item is to find some way out

THE ECONOMIST, JULY 4, 1953

of the present deadlock by forming a solid and acceptable central government. At the moment there is a "parliament" in the west without any central ministers, and in the east minority ministers without any "parliament." New elections in the east may dislodge the latter (and bring Dr Azikiwe into the central Council of Ministers?). But in the west the four Action Group ministers whose action precipitated the crisis are still the party candidates for office. No one else, it seems, will do; yet it is almost inconceivable that the Governor could sit at the council table with them again, after all that has been said recently. This is not a criticism of Sir John Macpherson. Part of the difficulty arises from the archaic position of all Colonial Governors today. As the Queen's Representative, head of the government and chief of the civil service, each Governor has all the responsibilities and none of the safeguards of royalty, premiership, and permanent head of the Treasury. It is, however, possible that the Joint Council of the two Western Houses which met on July 2nd can find some face-saving method of avoiding a direct collision on this issue.

Another major difficulty remains. The Nigerians regard the London talks as necessarily two-tiered; they believe them to be concerned in the first place with the urgent steps to be taken now and for an interim period, and in the second place with final arrangements for self-government. Can another direct collision be avoided on the time-table for the transfer of power? It might be if something like the principle adopted in the Gold Coast were accepted, and the British Government made a declaration recognising the existing demand for self-government within the Commonwealth, and expressing readiness to meet it—but without tying this up with a date.

Land Reform in Yugoslavia

BY A CORRESPONDENT

LAND policy in Yugoslavia since the war has been bedevilled by two conflicting aims—the need for a rapid increase in agricultural production and the desire of Marshal Tito and his government to "socialise" agriculture. This latter has meant drastic changes including the limitation (in 1945) of all landholdings to 25 hectares, the setting up of collectives, state control of buying and selling, and the compulsory sale to the state at fixed low prices of certain quantities of agricultural produce. In spite of many decrees and much compulsion over the past eight years this policy of socialisation has met with only partial success—by the beginning of 1952 state and co-operative farms were farming only 25 per cent of the country's arable land—and production in the last few years has declined. It is now agreed that the methods of socialisation defeated their own ends, and throughout last year the authorities were gradually disbanding those collectives which were running at a loss (about one-third of the total). The recent land reform passed by the Yugoslav parliament is a drastic attempt to start again; but the goal is still the same.

The law has two basic provisions; it legalises the disbanding of co-operatives and the return to private husbandry of those peasants who wish to leave co-operatives, and it imposes a new land reform by which all private holdings are to be limited to 10 hectares. The two provisions were not made known to the public at the same time. At the end

of last year the peasants first heard that they were going to be allowed to leave the collectives (or co-operatives as they are euphemistically called). This was hailed as a great triumph for the private peasants and a defeat for the government. In some of the villages where co-operatives had not been successful or compulsion had been most severe the peasants went about shouting "Long Live Tito and the Yugoslav Communist party," and only the local Communists had long faces. Richer peasants left the co-operatives without waiting for the appointed time and poor peasants who had little or no land and stock to take out of co-operatives found themselves faced with the prospect of becoming agricultural labourers under those who had lately been their colleagues. A howl of dismay went up from these landless peasants all over the country and the government's reply is the new land reform law.

DISTRIBUTION OF LAND IN JUGOSLAVIA

Sector	('000 Hectares)	Estimated Redistribution in Land Reform ('000 Hectares)	(Percentage of total)
State	467	100	21
Co-operative	1,998	100	5
Private	7,302	200	3

The expropriation of land will affect only 90,000 out of over two million peasant owners. The figure of 10 hectares is not to be strictly adhered to, since land and local conditions vary so very greatly throughout the country—but whatever the special circumstances, no private family will be allowed to farm more than 15 hectares. In lush areas like the Sumadija, Fruska Gora or the good earth of the Vojvodina, 10 hectares is ample for a normal sized family; in the "passive" areas in parts of Croatia, in the arid mountains of Montenegro and in other regions 20 or 30 hectares are needed for even the barest existence. Wherever patriarchal communal holdings of the old style *zadruga* still exist (notably in Macedonia) they are to be allowed to retain more land. Decisions of this kind are to be left to local committees to be set up for the purpose. These will also have to decide on the compensation to be paid in annual instalments over a period of 20 years in state bonds; the good land will be valued at 100,000 dinars per hectare, and the poor land at 30,000 dinars. The price is fair—though much depends on how local committees grade the land, and it will certainly not console expropriated peasants for the loss of their most precious possession.

More Competition . . .

so there is even more need than before to know what is happening in overseas markets.

The reports published every three months by The Economist Intelligence Unit give a concise and up-to-date analysis of business conditions and prospects in each of fifty countries, or groups of countries. Each report is prefaced by a one-page summary of the main facts and conclusions, and contains a comprehensive statistical appendix supplemented by maps and diagrams.

Descriptive leaflets and a specimen copy of the reports may be obtained from:

THE ECONOMIST INTELLIGENCE UNIT
22 Ryder Street, St. James's, London, S.W.1

The 200,000 hectares which, it is calculated, will thus be made available to the state are to form the basis of a "land fund" to which will be added 100,000 hectares from co-operatives that have been disbanded, and 100,000 hectares from state farms that have failed to pay their way. Previous land reforms in Yugoslavia, in 1921 and 1945, weakened production because expropriated land was given in small plots to landless peasants; but in this latest reform the land fund is to be used to create state farms—co-operatives under another name—and these are to be worked and run by landless peasants on the system of workers' management and profit sharing which is now applied in industrial and other enterprises. Part of the land will be used to reconstitute some of the co-operatives that have been disrupted by the departure of the original members.

The situation in the co-operatives is very confused. But it is probable that when those peasants who wish to leave have done so, between 2,000 and 2,500 co-operatives will remain; these will receive state aid and careful supervision to see that they do not run at a loss. It is now hoped to encourage private peasants—middle and small peasants as they all must be—to make more use of the general co-operatives, and to take some part in communal or co-operative farming, even if only on a small scale. The idea is that certain operations—deep ploughing, fertilising, the cultivation of special crops, even harvesting—shall be undertaken by group farming; general co-operatives are to increase their ability to provide machinery, credit and other facilities in addition to the marketing services that they have provided so far. This will bring them more into line with co-operatives in some non-Communist western countries such as Denmark.

Will the Peasants Co-operate?

It remains to be seen how far private peasants will co-operate in this scheme. Even though expropriation has affected less than 4 per cent of peasant farmers it has undoubtedly come as a shock to all land-holding peasants except the poorest. It confirms their worst fears and perpetuates the feeling of insecurity which has been one of the main reasons why private peasants have not increased their production in recent years. Half a million hectares less land is being farmed in Yugoslavia today than before the war. Between 1949 and 1952 the numbers of cattle, sheep and poultry declined by between 10 and 12 per cent—and the biggest decline was in the private sector.

The present land reform will not of itself make for more production; indeed it is remarkable how little it changes the structure of Yugoslav agriculture. When the change has been effected, state and co-operative land will be 28 per cent instead of 25 per cent of the whole. Thus the general picture of Yugoslav agriculture will still be of a multitude of fragmented holdings run by poor peasants. President Tito will continue to be faced with the problem of whether to cajole or coerce them into greater production. Both have failed in the past eight years. Perhaps there is some significance—and not necessarily a sinister one—in the fact that the very able Alexander Rankovic, hitherto associated mainly with the efficient organisation of security, has recently been brought forward to speak about agricultural questions. One thing is clear—that the present land reform is mainly a political move: the economic problem still remains to be solved.

Cabinet Crisis in Finland

THE resignation of Mr Kekkonen's Agrarian-Socialist coalition government on Monday was not entirely unexpected. The crisis came, as many people expected, because of a growing rift between the two partners on the right policy to cope with Finland's serious economic problems. The problems—a high and rigid wage-price structure, and the difficulties of absorbing the reparations-born metallurgical industries—are admitted on all sides; but there is no unanimity on corrective policies.

The previous government had reached an uneasy compromise on a programme of cost reduction of a long-term nature. The hitch arose from the employers' desire to sever the link between the cost of living index and wage rates, which the trade unions, as represented in the Social Democrat party, strongly opposed. At one time it appeared likely that this thorny question would be solved by a wage-escalator lagged by a certain margin to the cost of living index; but apparently agreement proved impossible.

Finland's cost level is out of step with most of its trading partners, with the result that a succession of adverse trading balances has been experienced. The problem is particularly acute in trade with the sterling area, where Finland's traditional export staple—wood-products—has been largely priced out of the market. There has been strong pressure to increase trade with the Soviet Union and its satellites, and indeed Russia is now Finland's biggest customer; but it can supply only a fraction of Finland's consumer goods needs. A series of tripartite deals with the Soviet Union and its satellites has not wholly solved the problem. Those who advocate closer trading relations with Russia—they are not all Communists—choose to forget the problem of piling up virtually useless rouble balances.

Possibility of Devaluation

If costs cannot be sharply cut, the only alternative is devaluation of the Finnish markka. Most observers, both in Finland and elsewhere, believe this to be inevitable as the degree of over-valuation is about 50 per cent. Devaluation, however, is feared because of the inflationary impact: it has, furthermore, become a contentious political issue and the retiring prime minister was obliged to give a personal pledge that he would resign rather than devalue. It is not to be supposed that the present crisis is in fulfilment of that pledge; but the time may not be far distant when Finland will be forced to ask the International Monetary Fund to agree to a new parity.

There is no clear picture of the probable outcome of the present crisis. Some form of coalition is necessary as no single party commands a majority. One possibility is a right-centre coalition under Mr Kekkonen or some more acceptable candidate. Another would be a purely caretaker government appointed by the President, whose powers are more extensive than, for instance, are those of the French president. The Social Democrats are anxious for a general election as soon as possible, but the tradition of Finnish politics is strongly against foreshortening the life of a parliament; the present one's life terminates in July, 1954. Whatever the shape of the next government its tasks during the next few months are unenviable.

revolution

The Viscount has started a revolution in medium-range flying in a very quiet way. By reducing considerably the noise and vibration, this turboprop airliner makes the journey between European capitals a new and restful experience. There's little engine roar in the cabin to make conversation an effort—and no 'tired-out' feeling at the end of the trip. It's a new kind of air travel in the Viscount—one of the fine aircraft claiming world attention in this vintage year of British flying.

THE BUSINESS WORLD

Factors in Gilt-Edged

FOR the first five months of this year the gilt-edged market enjoyed the unfamiliar experience of being the one consistently favoured section of the Stock Exchange. But amid all the festivities of June, it relapsed into comparative friendliness. Its fall from grace was not, indeed, of the violent kind that had rudely shaken it so often in these postwar years. The decline in prices from the peaks touched three weeks ago was a gradual one, and the whole movement was not very large—in the long-term market it amounted to a full point, or a little more. The moderateness of the movement, and the rally this week, clearly show that gilt-edged investors are not convinced that the underlying trend has decisively changed. But the moderate recession in June has a significance out of proportion to its size, for it prompted the first serious questioning of the view that has dominated investment decisions for the past twelve months—the view that the long-term prospect for gilt-edged was good, and that any short-term set-backs were not likely to be large. This is no moment to rush into prophecy; the market has good grounds—though it cites some bad ones as well—for its indecisiveness. But it is a moment at which a stock-taking of the principal factors may be helpful.

The first point to observe is that the broad sweep of the market's progress has gone a good deal farther than many people have yet realised. They are apt to assume that the gilt-edged market is still suffering sorely from the body-blow launched upon it by Mr Butler's revival of an effective monetary policy. This, however, is no longer true, except among the short bonds. In the long-dated market, prices on June 11 last were roughly nine points above the depths plumbed in the mid-summer slump of last year; the gains ranged from 10½ per cent for Savings Bonds 1955-65 to over 12½

per cent for War Loan and Old Consols. Over these twelve months the yield basis had been cut down by between ½ and ¾ per cent, reducing the flat return from irredeemables to 4½-½ per cent and the redemption yield on long-dated stocks to 4 per cent or less—smaller yields, in fact, than obtained on the eve of last year's budget and the fixing of the 4 per cent Bank rate. That is a striking comparison. But there is even more food for thought in a comparison with the market level on the eve of the "new" monetary policy. On November 7th, 1951, when Bank rate still stood at 2 per cent and the Treasury bill rate at ½ per cent, Old Consols were quoted at 64½ net, War Loan at 85 3-16 net and 1965-75 Savings Bonds at 88 13-16 net. Three weeks ago the corresponding net prices were within 2½ and 3½ points of these 1951 levels, and the difference in yields varied from ¼ to just over 3-16 per cent. The moderate setback in the last few weeks does not perceptibly diminish the force of these comparisons. Even now, the index of fixed-interest securities compiled by the *Financial Times* (which covers a wider range than the gilt-edged market proper) stands more than 1 per cent above its lowest 1951 level.

The principal reasons for this massive recovery are readily discernible. First in point of time was the evidence, last summer and autumn, that the "hump" of Britain's crisis would be surmounted without disaster. The emotion then was the negative one of relief at the lifting of fears of new and acute pressure upon the market. It soon gave place to the positive influence of reviving confidence as the gold reserves rose and the surplus on total external payments came in sight. Through both these phases, if one can believe the figurings of the national income statisticians, private savings were rising; and a good share of these funds

was attracted to the gilt-edged market in the belief that the monetary discipline, which had played so large a part in provoking the fall, could and would be gradually relaxed—and in any case held no more terrors for the long-term market.

Three more major considerations, all of them intricately intertwined in the market's judgments, were then added to the case for gilt-edged: first, the vaguely formulated doubts about the future of world trade; secondly, the renewed talk of a coming recession in the United States; and then the peace offensive from the Kremlin, quickly followed by the resumption of truce negotiations in Korea. It is worth noting, too, that one of these influences helped the market negatively as well as positively. The disappointments at the economic policy that was taking shape in Washington,

which partly explained the revival of apprehensions of an American recession, simultaneously pushed aside the one remaining possibility that had been regarded as holding any major threat to the gilt-edged market—the possibility of an early plunge into convertibility.

These external influences have been overwhelmingly the most important ones in recent months. Each of them separately reinforced the view that the postwar phase of world inflation had ended at last, and implied that henceforward it was the opposite danger that had to be feared. And since these influences impinged upon a mood of satisfaction at Britain's external recovery, the long-term prospect for gilt-edged looked assured. The very influences that were depressing equities—and prevented them from responding to the stimulus of the budget—were correspondingly good for gilt-edged. Similarly, the recent setback was quite clearly attributable to renewed questionings about this ending

of world inflation—questionings provoked by the misbehaviour of President Syngman Rhee and the trouble in East Berlin, by the continuance of high activity in the United States, and even by the suspicion that inflationary forces are reviving in Britain.

★

If the market has been rational in its response to the external influences, it has not been equally logical in its appraisal of the principal domestic factors. There has been a good deal of muddled thinking both about the implications of Government economic policy and about the coming denationalisation of steel. Inevitably, the City's responsibility for co-operating in the marketing of the steel securities has played a restraining part, by causing institutional funds to be held back from investment or placed temporarily in the short bond market. But there is no reason at all to regard these impending operations as a source of fundamental pressure upon the market; to the extent to which the Government receives cash for the steel securities that are sold, it will promptly return the funds to the market, and it is most unlikely to allow any undue pressure to arise on the eve of an issue.

If it were seeking to tighten its monetary policy, any given steel issue would provide it with a minor opportunity, since the funds could be employed in repaying indebtedness in the form of Treasury bills held by the banking system (thereby causing a corresponding contraction of bank deposits) instead of in purchases of long-term securities on the market. But the choice would depend on the needs of monetary policy at the moment, and there is no inherent reason for expecting any such tough attitude to be adopted. If, on the other hand, the proceeds were wholly employed in the long-term market, the effect might be stimulating—since the supply of gilt-edged would be diminished, and that of equities expanded, in conditions when investors may still be preferring gilt-edged to equities. This week's indication that the first issue is likely to be delayed is not, therefore, a very logical reason for a marking up of prices.

These questions of tactics for steel marketing are, in any case, only part (and a relatively minor one, at that) of the general problem of monetary policy. Although the market was disappointed in its earlier hopes that a reduction in Bank rate might accompany the budget, a fair part of the popular case for gilt-edged is built, even now, upon the assumption that a reduction will be conceded before the end of the year. It is not a deduction that can fairly be drawn from the trend of policy in the past few months. So far, the tactics of the authorities have conformed pretty closely to the indication given in the budget speech that the then foreseeable conditions of 1953 would require broadly the same degree of monetary pressure that obtained at that time. In point of fact, a moderate relaxation has been proceeding ever since last November—in the sense that bank

advances to industry, after their substantial reduction in the first year of the "new" monetary policy, have now been rising for six months. This tendency, however, is probably due much more to the necessary re-expansion of industry's working stocks as production rises than to any overt easing of bank lending standards; and it is believed that such an easing would not be acceptable to the authorities. Certainly, the Government's attitude in face of last week's Labour attack during the Finance Bill debate gave no hint of any intention to concede any specific relaxation.

The conclusion to be drawn from the recent Exchequer Bond issue was, indeed, that a minor precautionary tightening was deemed prudent—to moderate the seasonal rise in the banks' liquidity ratios—but that any major tightening would be out of place. Monetary policy, in short, is still reasonably in tune with the theme of the budget. If the Chancellor were already being swayed by the spreading view that the budget was, after all, somewhat too soft, he would presumably be using the flexible weapon of credit policy to redress the softness, and would not have deferred his attack upon the problem of refinancing the large maturities that lie ahead. As it is, the weapon is still in reserve. And, paradoxically, the very fact that is causing concern among some of the Chancellor's critics—the declining trend of Britain's external surplus—may make a tightening of monetary policy look less necessary in the short run, because it will correspondingly lessen the strain on the Treasury's domestic finances.

What Future for Films?—II

Shape of Screens to Come

NO lions will leap into the filmgoer's lap, nor stereoscopic guillotines fall on his neck, unless he is wearing specially-designed spectacles, and every time a patron borrows a pair of these to enjoy such experiences, it costs the cinema sixpence. That is what the exhibitor has to pay to hire the spectacles with the three-dimensional film. But this extra sixpence cannot simply be passed on in the seat prices. To add sixpence to the price of any cinema seat attracts a corresponding increase in entertainments duty: a 2s. 3d. seat, for example, with sixpence extra for the spectacles, requires 4½d. more in duty, so that in practice the exhibitor would collect the odd halfpenny and charge 3s. 2d. for the seat. This incidental aspect of Three-D may serve as a reminder that the changes now impending on the cinema screen are less a technical revolution than an economic manoeuvre, in the face of the growing threat from television examined in a preceding article.

What the industry is trying to divine from its new visions, therefore, is not only the chance these may offer of countering "the fatal fascination of the little television square," but also the price of that chance.

But if world uncertainties are pressing upon Britain's balance of payments, there is no sign that they are causing any simultaneous decline in domestic demand. Consumption seems to be rising, which probably means that personal savings are declining. If, as most people believe, investment outlays are rising too, the case for keeping monetary policy taut is incontrovertible. The only circumstances in which an overt softening might seem feasible would be those in which general uncertainty was doing the work of restraint that is now assigned to monetary policy. But if that happened, the slackening of pressure upon the domestic economy (which might temporarily divert further funds to the gilt-edged market) would almost certainly be a harbinger of still further pressure upon the external balance; and to ease monetary policy deliberately when that danger lay ahead would be extremely rash.

The gilt-edged market, in short, ought not to count on a lower Bank rate—though, as the comparisons given earlier in this article show, it seems to have discounted all but the psychological effects of a reduction already. The bulls of the market now are, in fact, the bears of world trade. They may be right; but they should remember that nowadays it is only a minor recession that is "good" for gilt-edged. Anything more than that would quickly raise the dollar problem to a new intensity—and another crisis of the balance of payments could not leave the gilt-edged market unscathed, no matter what the level of Bank rate.

★

The first question admits only of judgment and conjecture. So the second, a question of pounds shillings and pence to be paid by different people—though finally by audiences that seem today progressively less anxious to pay even present prices—may be the key to the shape of screens to come.

The hire of spectacles—with payments for those spoiled or lost—is only one of the extra costs of the exhibition of a stereoscopic film. To project two separate images—one for each eye—on to the screen, both projectors must be used, perhaps strengthened to take longer reels of film, and synchronised by an electrical or mechanical linkage that may cost £50-£250. The normal screen of the flat cinema, built to diffuse (and depolarise) light falling upon it, will not do: a new, aluminised screen, ideally 20 per cent larger, is needed, costing perhaps 12s. 6d. a square foot (say £325 to convert a medium-sized screen originally about 18 ft by 24 ft); aluminised paint, however, may give fair results.

Running costs also mount. Polarising filters on both projectors, costing £10 the pair, deteriorate under heat and cannot be used for more than a day or two; the constant use of two projectors, plus the loss of light through the polarising filters and spectacles, will require roughly two-and-a-half times the power for lighting; and extra staff will be required to distribute, collect and sterilise the spectacles.

An alternative to stereoscopy—the wide screen—may offer exhibitors more for less, particularly in running costs. Its most ambitious version, Cinemascope, would admittedly cost far more, but at present this seems out of the question. The more modest wide screen techniques, from Cinemascope downwards, cost less. The normal screen, and hence the normal film frame, is about one-and-a-third times as wide as it is high. Films shot on the existing pattern can be “topped and tailed” by a masked aperture on the projector, then projected to fill a screen about one-and-a-half times as wide as it is high—at the cost, perhaps, of losing occasional heads and feet. Films shot with a wide angle lens, with action mainly across the centre of the film frame, can be masked to permit projection on to a screen perhaps twice as wide as it is high. Cinemascope, demonstrated in London this week, makes use of a curved screen more than two-and-a-half times as broad as it is high. This is the first system in which a very broad scene is first filmed through an “anamorphic” lens that compresses the image laterally into a film frame even slightly narrower than the normal, and then is projected through a lens that reverses the process and opens out the image once again on the big screen.

Most of the large screens now being installed are aluminised, and might cost much the same per square foot as stereoscopic screens (the 18 ft. by 24 ft. screen instanced above, for example, widened to the extreme Cinemascope dimensions, would cost about £500). New aperture gates for the projectors, and probably rather better lenses, would be required, and if an “anamorphic” lens were required, this would cost about £50-£100 per cinema. But only a single projector, and normally-sized reels of film, are required for these systems. The wide screens would

perhaps call for 20 per cent more lighting. But other running costs would be affected little—though the installation of a big screen might in some cases mean removing a few front rows of seats, and slightly reducing a cinema's earning capacity.

But in the film industry's counter-attack against television, the picture is at present held to be only half the battle. Stereoscopy and the wide screen alike are offered with an additional feature, the so-called “stereophonic sound.” This involves the use of more than one sound track, relayed through separate speakers located at various points throughout a cinema, in order to heighten the illusion of “audience participation.” Demanding at a bare minimum three separately placed speaker units and the corresponding amplifier heads, and at the most ambitious perhaps 14 speakers operated by several different sound tracks, these systems require a considerable capital outlay in the cinema. Sound equipment may cost £1,500 to £2,000 per cinema,

plus, say, £50 or more for each additional speaker; and to obtain really good results, most British cinemas would require special acoustic treatment at a cost equivalent to perhaps £1 a seat. “Stereophony” would thus be the costliest improvement of all for the cinema owner—offered, moreover, to audiences that are seldom very discriminating about the quality of sound reproduction in a

cinema provided that the dialogue is clear.

What would these improvements cost for a medium-sized British cinema—say of 1,250 seats with an existing “flat” screen of 18 ft by 24 ft? A comprehensive conversion might require:

Widened, aluminised screen	£
Sound equipment	500
5 extra speakers	1,500
New and auxiliary lens	250
Projector linkage	100
Installation and electrical alterations	150
	100
Acoustic treatment of cinema	2,600
	1,250
	£3,850

For comparison, it may be noted that the Cinemascope “package” system now offered by 20th Century-Fox

is estimated to cost between £1,750 and £5,000, depending on the size of cinema. But less ambitious sound equipment, perhaps obviating the need for acoustic treatment of the auditorium, might cut the estimate of capital cost shown above by more than a third.

★

The new film dimensions will cost other sections of the industry much less. Stereoscopic film would require double the film stock and processing for exhibition copies; distributors, who arrange this, would also have increased costs in canning the film and transporting it, and would perhaps need more labour for its inspection and rewinding between cinemas. Films for wide screens need cost no more than the normal to process or distribute. Stereoscopic productions in Hollywood so far have been expensive, as are the first Cinemascope films now being made. But technically all that Three-D is is the doubling up and coupling of cameras and the provision of twice as much negative; wide screen films will require special or auxiliary lens; and “stereophonic” sound needs only extra work from the recording unit. These are not large items in production cost; and it may be that the new screen techniques, calling for longer sequences, may reduce other production costs enough to offset them. But one proviso is that so far most of the “new vision” films are being made in colour; this may become universal, and if it does it will raise average production costs.

The lion's share of extra costs will naturally fall on the cinema exhibitors, who have the largest financial stake in the film business and little chance of compounding with the television foe. Compared with their existing investment in bricks and mortar—probably some £100 million in Britain, taking historical costs—the extra capital may not seem large. Conversion for occasional stereoscopy, a wide screen, and some improvement in sound reproduction, might cost the 2,400-odd cinemas with more than 750 seats each, which account for about 80 per cent of the takings of the trade, less than £5 million in total; the 2,000 smaller cinemas, where conversion might be limited by physical dimensions as well as the owner's pocket, might be adapted to show stereoscopic films on a fairly wide screen for a few hundred pounds each. The larger circuits could hardly afford nor to convert most of their halls once some agreement about systems begins to emerge; they have locked up in cinemas too much money that might go bad to be able to stint a little more. The same is true to a lesser degree throughout the trade, though this further call on capital resources in order to present an altered product might close some of the smaller cinemas and further concentrate the industry.

Moreover, the British cinema trade's freedom of choice whether or not to invest in conversion is somewhat limited. It still depends mainly on showing American films to a public that broadly prefers them; and as the American product changes, so must the British

purveyor's arrangements to retail it. At present, a survey of British cinema dimensions is being taken to see what shape of screen would be most suitable here; and Hollywood will have to take note of this, since British earnings make up today an increased proportion of its income. But if, then, the Americans turn to the wide screen, as seems likely, with the use of stereoscopy restricted to specially suitable subjects, it would require a sharp rupture of the existing pattern of the cinema trade for Britain not to follow suit, albeit more cautiously. In the next two years, one may expect considerable confusion in the trade—with a shortage of films really made for the new dimensions, a costly stock of “flat films” to be partly re-shot or disposed of in some other way, and continued argument about systems. Some form of wide screen—which after all offers a sheer size and sweep that domestic television cannot duplicate, even if colour or stereoscopy appear one day on the drawing-room set—at present seems likely to provide the future standard.

But the capital charges of cinema conversion, plus any higher running costs—and at one remove any increase in distribution costs—will have to be recouped by filling the cinema more frequently. The cinemagoer may be prepared to pay extra for stereoscopic spectacles occasionally, but not a higher price for his usual seat; indeed, the exhibitors have recently been arguing that patrons are already priced out of the cinema. There remains the trade's argument—growing steadily in weight—for a cut in entertainments duty, but too much hope cannot be placed on the Chancellor's promised benevolence. So the move into new screen dimensions must sharpen the contest that prompted it: how well can the cinema stand up to television?

★

Only time can answer that—though in Britain, today, the decision whether sponsored television is to come or not must greatly affect the cinemas' chances. Whatever that decision, television will expand, and for some time still, perhaps, at the expense of the cinema. Opportunities may occur for the occasional truce between the two forms of visual entertainment—“trailer” programmes over the air, the release to television of old films, televised news events in cinemas, and for film producers an alternative though specialised new market. Moreover, the two forms of entertainment remain fairly distinct. Unless some acceptable way could be devised of making the viewer pay to see individual programmes, there is no way in which a feature film could profitably be given a “first run” on television; and equally, neither the BBC nor a commercial station could afford to commission a programme worth at least £120,000 for an hour and a half. So though the little screen may continue to win patrons away from the big as viewers multiply, some balance between the two visual entertainments seems likely to be reached in the long run. But how much of the market that balance will leave to the cinema, few people in Wardour Street—however many dimensions they hope to call in aid—care yet to guess.

Business Notes

More Gold Gained

THE performance of the sterling area's dollar balance of payments in June was appreciably better than is suggested by the month's increase in the gold and dollar reserve. This increase amounted to only \$46 million, the smallest monthly gain this year. Allowing for the \$28 million of defence aid received from the United States and \$10 million in gold or dollars from EPU, the "true" dollar surplus amounted to \$8 million. It should be borne in mind, however, that some \$22 million was paid out last month to the United States in respect of the repatriation of the 24.8 per cent ordinary stockholding in Associated Electrical Industries Ltd. that was previously held by the

* After taking account of the payment of \$181 million on December 31st for the service of United States and Canadian lines of credit, the United States lend-lease loan and the ERP loan.

† EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.

General Electric Company of New York. Allowing for this special payment and for other more modest transfers of capital to Canada during the past month, the reinforcement of the reserve does not appear unsatisfactory. Moreover, this is the time of year when sterling area products are not earning large amounts of dollars. The seasonal rise in dollar income earned from primary commodity exports from the sterling area is due to begin in a couple of months with the opening of the Australian wool sales. It remains to be seen how the new freedom in the grain market will affect the flow of the reserves.

In June the balance of payments was probably beginning to feel the benefits of the unusually large tourist expenditure in Britain before, during and immediately after the Coronation ceremonies. Tourist dollars take some time to go through the accounts, but the heavy payments for air and sea traffic were undoubtedly reflected in last month's figures. On the other hand, British tourist expenditure on the Continent is now beginning to gather momentum; but since it is cleared through the EPU mechanism, its effect will not become apparent in the reserve figures until next month. The EPU surplus earned by the United Kingdom last month amounted to £1.5 million. It will fall to be settled later this month, involving a receipt in gold or dollars of £750,000 and an equal reduction in the United Kingdom overdraft with EPU. The modest proportions of last month's EPU surplus were in part due to the mounting tide of British tourist expenditure on the Continent and also to the fact that in June exports of sterling area commodities to the Continent of Europe are at a seasonal ebb. The June figures were also burdened by the payment of interest on the British overdraft with EPU and by a repayment of some £1,500,000 of Italian sterling balances.

First Quarter's Deficit

THE Exchequer returns for the first quarter of the fiscal year are this time much more closely in line with the pattern indicated by the budget than they were at this time last year—when the Treasury was at pains to explain away a large discrepancy by citing the notorious unreliability of the first return as a guide to the full year. Last year's return in fact proved the exception to this rule, for most of the shortfall from estimates still remained at the year-end. Another exception would be welcome this year, since the impression given by this week's figures is quite favourable. Ordinary revenue, it is true, is down by £26 million, at £845 million; but expenditure, including sinking fund provisions, is down by nearly £71 million, at £1,002 million, so that the "above-line" deficit is £45 million smaller than last year, at £156 million.

These figures, however, like the budget accounts themselves, are nowadays distorted by the intrusion of the sterling counterpart of dollar aid, which is brought in as an undisclosed abatement of defence expenditure. This artificial accounting had not begun to operate in the early months of 1952-53, so that the whole of the £85 million for that year was credited in the last nine months. In this past quarter, the full proportionate share of the year's estimated credit of £140 million has been duly applied; and this merely

...artificial accounting difference explains half the reduction shown in total ordinary expenditure. Elimination of this distortion does not, however, make the budgetary prospect look worse; if defence aid is excluded from the accounts, the estimated decline in expenditure for the full year becomes, not £92 million, but only £37 million—and all but £1 million of that decline has been shown in the first quarter. But in the similar period of 1952-53 defence expenditure was heavy, and the full benefit of the year's reduction in subsidies had not been felt. It would be unwise to deduce that the Government is succeeding in under-spending. On the revenue side, no conclusions can safely be drawn. The fact that ordinary revenue has already lost more than one-third of the £71 million loss expected in the full year is not informative, because so large a proportion of the direct taxation is collected in the final quarter. Income tax, expected to rise by £46 million in the year, has so far lost £21 million; but profits tax has lost no more than that, although the eventual loss was estimated at £162 million. EPL, expected to yield £96½ million more, has so far contributed only £10 million. Customs and excise, expected to drop by £38 million, have risen by £5 million.

Upon the above-line account, the only reasonable comment is "so far, so good." The below-line trend looks more positively satisfactory. Net expenditure (excluding interest debits and credits outside the permanent debt charge) has dropped by £34 million, to £120 million, so that the total deficit for the quarter is £277 million, compared with £356 million in the first quarter of 1952-53 (but in contrast with only £109 million two years ago). It is not clear, however, whether the below-line improvement can be expected to endure. A large part is due to an unexpectedly sharp decline of £18½ million in new loans to local authorities, whose borrowings for the full year were estimated at only £12 million less than in 1952-53. Yet there is no reason to suppose that the authorities are using their new freedom more vigorously than seemed likely at budget time.

The Coal Horoscope

IT is prudent to begin worrying in June about a coal crisis next winter; but it is not easy to make any realistic assessment of the danger. To the National Coal Board, the 1953 coal winter now looks less safe than 1952 but more comfortable than 1951. Both those years, of course, had mild winters.

To start this coal winter with 18½ million tons of coal in distributed stocks, the industry would need to put an extra three million tons into stock from current production by the end of October; it has about 14½ million tons in those stocks already and a spare million besides in its abnormally large opencast stocks. This task may just be within its powers. During the same four months of last year it added more than 3½ million tons to its stocks at collieries and opencast sites; coal was not easy to sell. The recent rate of mining production, when the effects of holidays are taken out, may be about 100,000 tons a week higher than at this time last year, according to involved calculations by the Coal Board; such a rate of output might offer an extra 1½-2 million tons by the end of October.

On the other side of the account, the second week's holiday for the miners will probably reduce output by some 3-3½ million tons more than holidays did last year; inland consumption is rising steadily, and the board would like to export more in the second half of this year than it did in the second half of 1952. Such a sum of conjectures suggests that the industry has a chance of attaining its safety level of stocks, but not a comfortable one.

Whether stocks in consumers' hands totalling 18½ million tons would preclude shortages of certain types of coal is no more sure than that stocks somewhat less than 18½ million tons would necessarily spell crisis. The industry needs about 9 million tons in these stocks at the end of the winter, and stocks, the arguments go, might run down during the coal winter by 9 million tons or more; though since accurate records began to be kept in 1943, they never have done so. For the present, the danger of any general coal crisis looks rather less than that of shortages of house coals, which indeed appear fairly certain. The installation of thousands of the new economical grates that will burn small coals has not made consumers any less insistent upon large coal; indeed, most of the new grates now in service were designed to burn coke, and the householder's dislike for nutty slack is not to be derided. Nevertheless, there may well be a case today for a measure that the Ministry of Fuel and Power forbade the Coal Board to bring into effect this spring—namely, price changes that would make the larger coal more expensive and cheapen the smaller coals that people like less but have to take.

The Princess Victoria Report

THE full report of the inquiry into the loss of the motor vessel *Princess Victoria* in the Irish Sea on January 31st was published this week, and it was announced that the British Transport Commission, which owned this cross-channel steamer, had three weeks in which to decide whether to appeal against the court's findings. These were, broadly, that the vessel was unseaworthy because the stern doors were inadequate, as were the arrangements to clear water from the freeboard deck; and that the loss of the vessel and 133 lives was caused by or contributed to by the default of the owners and managers. It is not yet known whether the Commission will appeal; but Lord Leathers stated that the Minister had no intention of ordering a re-hearing.

Dr. A. M. Robb, Professor of Naval Architecture at the University of Glasgow, who was one of the three assessors to the court of inquiry, signed the report with certain reservations, proposing alternative answers to those given by the majority to three of the 48 questions covered in the report. He has since amplified his views on these points in a memorandum to the Minister of Transport which is now published as an addendum to the formal report. He holds that the list caused in the ship by an accumulation of water on the freeboard deck, which culminated in its capsizing, might have been reduced by the opening of the sliding doors in the sides of the ship; but since this would have been a choice between evils, he does not hold that failure to open these doors amounted to default on the part of the ship's company. He does not agree with the other members

that failure to provide sufficiently strong stern doors constituted default upon the part of the owners and managers, believing that the owners had not received sufficient indication of the weakness of these doors from an earlier incident in 1951 to make their failure to strengthen them amount to default. Finally, he holds that the loss of life in the sinking, primarily due to the default of the owners and managers, was contributed to by default upon the part of the ship's company. This conclusion he bases upon the view that the flooding of the ship's lounge, which contributed to the capsizing of the ship, did not appear to have been investigated as soon as it began; and that the positions given in radio signals from the ship, which appear to have delayed the arrival of the Portpatrick lifeboat upon the scene of the disaster, were inconsistent, some of them appearing to be inaccurate.

Equalising the Rate Burden

Few matters in the mysteries of local government finance and its relations to the central Exchequer are more complicated, or more controversial, than the working of the Equalisation Grant. In principle, the Equalisation Grant is intended to secure sufficient equality between the financial resources of county and borough councils so that expenditure on essential services shall not be jeopardised by the smaller rateable capacity of the poorer authorities. In practice, the equalisation system works with the crudest of rough justice. Some prosperous authorities receive a grant; others less well off do not. The anomalies arise largely through the formula that is used for calculating the grant. If a county or county borough has an actual rateable value below its "standard rateable value," it is entitled to grant. The system, in effect, presupposes common and nationwide standards of valuation for rating that do not exist. A revaluation was to have been completed by last April; it has been deferred until (it is hoped) April, 1956, and it remains to be seen whether a uniform national basis of valuation will emerge from it.

The Committee that has been examining the working of the Equalisation Grant was limited, by its terms of reference, to mitigating some of the anomalies in the existing system, and not with radical revisions which, if they come, will have to await a later occasion. Its report suggests an amendment to the formula for calculating the grant by using a datum figure of £7 of rateable value per head of weighted population instead of the national average of about £6.2 per head. This change would bring twelve local government areas into grant that do not at present benefit. For the special case of London the committee suggests an entirely new scheme, by which 70 per cent of the expenditures of all the boroughs would be pooled; this would encourage more equal rate poundages throughout the London area.

These are the barest bones of the committee's recommendations. But two general points can be made about them. First, it is desirable (as the committee urges) that county district councils, whose independence has tended to become submerged under the combined weight of the counties and of the central government, should have a direct participation in the grant, if they rank for it. It is, however, distinctly doubtful if the consequential changes in

district rates and county precepts that might then occur would be universally welcomed. Secondly, this report, complicated though it necessarily is, throws light on only one aspect of local government finance and its relations with the central Exchequer. The prospects of a renewal of healthy and independent local government rest upon more radical revisions of these relations than the committee was asked to undertake.

Teeth for the Merchandise Marks Act?

THE Merchandise Marks Bill, which received its second reading in the House of Commons last week, seeks to fulfil a promise made by the Government, when the utility schemes were abolished more than a year ago. Its object is to provide the public with better assurances of quality than those that were alleged—not always with justification—to have been provided by the utility schemes. Under the old Merchandise Marks Act, a trader could be prosecuted for wrongly describing the weight, measure, materials or method of manufacture of an article. The new Bill recognises that fraud, where it exists today, involves more technical subtleties. For example, new materials and new methods of treatment can be used to impart special properties to fabrics, and descriptions of goods specifying these properties do not fall within the scope of the existing Act. It is rare to find a black-and-white case of an article described as something that it is palpably not, but unjustified claims that an article has certain properties are not unknown. The new Act seeks to meet these cases by covering not only wrong descriptions of the substance of the article, as at present, but also claims for "quality, fitness for purpose, strength, accuracy, performance or behaviour of any goods." It also provides for prosecution in cases where an article is described in a way that is misleading, even if not technically untrue.

The revised version should provide the public with stronger safeguards against the possibility of unscrupulous exploitation than either the existing Act or the "British Standards" for consumer goods. These standards are still under protracted discussion; they have provoked mixed feelings in the industries concerned and have not evoked the interest of the public on whose support their success depends. But the Bill is at present so worded that, in the opinion of those who know the difficulties of conducting a successful prosecution under the existing Act, there is real doubt whether a good legal case could ever be based on it. The President of the Board of Trade may have had this weakness in mind when he said, in presenting the Bill, that he hoped it could be improved in Committee. The two key words, "quality" and "misleading," on which the effectiveness of the Bill rests, are too difficult to define as they stand. Several attempts have been made to relate these terms to "the physically ascertainable and definable characteristic of such goods," a phrase that would help the lawyers to provide some tangible evidence of what went to make up the properties that wrongly-described goods were alleged or even implied to have possessed. Unless some means is found of defining "quality" with precision, false or misleading descriptions will themselves remain undefinable.

CHAGAS DISEASE

IN large areas of South America, up to half of the population suffer from the effects of Chagas disease—an illness that causes acute debility, fever, and often idiocy, paralysis and death. There is no known cure for Chagas disease, and, until recently, there was no effective method of preventing its spread, for the large, bloodsucking bugs that carry it are immune to most insecticides. In 1948 I.C.I. undertook experimental work in the control of the Chagas disease carrier when a technical service man from I.C.I. General Chemicals Division visited South America in connection with the use of "Gammexane" insecticides. Laboratory tests carried out in Chile, Argentina, Brazil and Uruguay gave such promising results that a full scale field-trial was arranged. This took place at an up-country village in Uruguay where the interior of every infested building was sprayed with a "Gammexane" preparation. The trial was an outstanding success. A single application of this powerful insecticide wiped out the entire bug population of the village. As a result of this technical service work by I.C.I., campaigns to eliminate Chagas disease are now being undertaken in a number of South American republics.

THE UNITED
STEEL
COMPANIES LTD.

THE LARGEST STEEL PRODUCERS IN THE BRITISH COMMONWEALTH

The United Steel company has, since its inception and during the lean inter-war period, prided itself upon progressively foreseeing the needs of the steel-consuming industries, and upon its ability to extend itself to meet these needs from plant of high technical efficiency. Since the war, very large sums have been invested in erecting new plants, adopting new methods and modernising older equipment, to improve the quality of the product and the efficiency of production.

Developments such as these have made the high reputation of British steel throughout the world. The United Steel company is one of the leaders in technical progress and is as efficient a producer as any in the country.

Cheaper Aluminium

THE £11 reduction to £150 per ton in the price of virgin aluminium ingots, announced this week by Aluminium Union, should give a flying start to the resumption of private trading in the metal. The company, which is the trading organisation for Aluminum Company of Canada, supplies about 80 per cent of Britain's requirements, and its new price sets the standard for the industry. The output of British Aluminium, the only home producer of ingots and the second largest fabricator, covers slightly less than half its needs; it buys the remainder principally from Canada.

This is the second reduction in aluminium prices this year. The first, made by the Ministry of Materials in April, was a cut of £5 per ton. Between the end of 1951 and October, 1952, the price jumped by 34 per cent, largely reflecting the hardening of the Canadian dollar against sterling and other cost increases, but perhaps explained in some part by Alcan's understandable desire to recoup some of the costs of its vast expansion programme as quickly as possible. This year's reductions reflect the weakening of the dollar, and the desirability of stimulating consumption in this country.

In contrast to the United States, where the market is still very firm, British demand fell off sharply towards the end of last year, owing mainly to the decline in industrial output, to the easing of the steel shortage, and to buyers' anticipation of lower prices. Consumption has recently improved, but most of the bigger aluminium rolling mills are still working well below capacity. The new price should encourage consumers towards more confident buying and to rebuild their stocks. Aluminium fabricators have been quick to announce correspondingly lower prices for their products. Aluminium has lost nothing of its competitive advantage in relation to copper, lead and zinc, but has been losing ground to steel and tinplate and also in certain marginal, but potentially important, uses. In overseas markets, the industry has been meeting sharper competition in standard lines from West German, Austrian and Japanese producers. If the new price fails to encourage consumption sufficiently, the ingot producers should have some further room for manoeuvre, providing the down trend in costs continues.

Herrings for Russia

BRITAIN has entered into another barter deal, similar to the one made last year, to take canned salmon and crab meat from the USSR to the value of £1,090,000 in exchange for cured herring valued at £973,000 and tinplate to the approximate value of £117,000 to "clothe" the salmon and crab and balance the deal. Last year the Government took £950,000 of Russian salmon and crab. The present barter arrangements are that the Russians will buy British caught fish from Associated Herring Merchants, Ltd., acting for the Herring Industry Board; they will also buy tinplate from British firms; for both of these purchases the Russians will pay cash. On the other hand the Ministry of Food undertakes to buy for cash Russian salmon

and crab to a value equivalent to the Russian payments for herrings and tinplate. The Russian shipments are expected to reach this country in the autumn. Both governments have entered into this bargain to assist their own industries; neither government would classify the fish imports as "essentials."

Before the war Britain imported annually about 55,000 tons of canned salmon, mainly from Canada, the USA and Japan, countries with which there are now balance of payments difficulties, and also from Russia; imports have since fallen off and last year amounted to only 8,000 tons, though they cost £2.3 million. The imported canned fish sells readily at the controlled prices, canned salmon at 5s. 6d., 4s. 6d. or 3s. 6d. a lb, according to quality, and canned crab meat at 3s. 9d. a half lb.

Rayon Staple Price Cut

THE decision of Courtaulds Limited to cut the price of rayon staple yarn by 3d. to 2s. a pound was to be expected. Since wood pulp prices began to fall last year the textile industries have been assuming that the price of rayon yarns would eventually reflect this fall in raw material prices. The rayon industry, which experienced a sharp fall in production last year, must have been carrying heavy stocks of pulp bought earlier at high prices, and it was certainly carrying heavy stocks of yarn made from high-priced pulp. Stocks of yarn had been disposed of by the end of the year, when the rayon factories resumed work at full capacity, and this first price cut suggests that stocks of expensive pulp are also disappearing. In spite of its low price, rayon staple is highly vulnerable to competition. It is a yarn with few uses outside the clothing trade, and sales have been affected by the recent return to favour of cotton. Spun rayon cloths meet stiff competition in the export markets, while capacity has

Natural fibres	Price per lb s. d.	Synthetic fibres	Price per lb s. d.
Silk (raw yarn)	40 6	Terylene (staple fibre) ..	15 0
Wool (tops 46s)	6 10	Nylon (staple fibre)	11 3
Cotton (raw American type)	2 7	Ardil (staple fibre)	4 2
		Rayon (acetate staple) ..	3 5
		Rayon (viscose staple) ..	2 0

been expanded considerably from an average of 10 million pounds a month in 1949 to 17 million pounds in both January and March this year.

Courtaulds, the major producers of rayon staple, may therefore feel under some pressure to widen the market, but the recent announcement that Imperial Chemical Industries intended to double its capacity for producing "terylene" yarn before the first full-scale unit has come into production is a sign of strong confidence in the market for synthetic fibres. ICI has an interest in each of the three newest fibres, nylon, "terylene" and "ardil," to appear on the British market.

The impact of these new fibres on the textile market is not, however, likely to be very dramatic for the present. The combined output of all three plants when the extensions contemplated have been completed will not greatly exceed 70 million pounds of yarn a year, which would represent only a few weeks' output of the long-established textile

fibres. Rayon production is running at an annual rate of about 400 million pounds a year, wool at the rate of about 500 million and cotton at the rate of about 800 million pounds. These are rough figures but they serve to put the role of synthetic fibres in perspective. The comparative prices of the natural and synthetic fibres perhaps explain this difference in the planned volume of output. It is perhaps significant in this connection that the prices of natural fibres fluctuate freely in world markets, while the prices of man-made fibres are governed by comparatively few producers.

Passengers by Helicopter

THE passenger-carrying helicopter service that the Belgian airline Sabena intends to open in August will be the first commercial scheduled operation with such machines. British European Airways started the world's first passenger helicopter service several years ago, but the intention then was to gain experience for the time when bigger machines were available. In the United States, there are a few mail and freight services, but no scheduled service carrying passengers. The nearest approach to one is the flying taxi service now being introduced by an independent company between New York's three airfields. Sabena, which has bought three 7-seater Sikorski helicopters, expects to open a regular passenger service in August, from Brussels to Lille and Rotterdam, extending it later to Cologne and Saarbrücken. The fare will be the same as for a fixed-wing aircraft.

The principal appeal of helicopters is their ability to land passengers at their destination and not at an airfield several miles from town. Sabena starts with the considerable advantage of having obtained permission to take-off and land from the centres of the cities being visited, Antwerp being the only exception. The landing site consists of a 60-foot square of concrete with a small terminal building. British European Airways does not land in city centres because of the risk of flying a single-engined machine over built-up areas. The helicopter rotor acts as a parachute should the engine fail in mid-flight, and its windmilling action brings the machine down without an unreasonably hard drop. But if the engine fails at take-off, the helicopter may not have gained enough height for the rotor to act in this way. BEA will therefore not fly into city centres until it has a twin-engined machine in service, which may not be for some years. Sabena, which has been using the landing site in Brussels for a mail service for nearly three years, overcomes this difficulty by taking off near the canal and following its course for the early part of the flight. Emergency landings that might not be possible on land can be, and have been, made on the water without serious damage.

The most noticeable feature about the Belgian venture is the degree of co-operation that the airline has received from the civil authorities within whose towns its helicopters will land. They have made it possible for the airline to operate its helicopters under conditions that approach the ideal for this form of transport. The mail service has already shown that helicopters need the minimum of ground facilities, and the noise has not brought any com-

plaints—at least to official sources. The civil authorities who have discussed at length and inconclusively the possible site for a helicopter station in London might perhaps learn something from Belgian experience.

Production Makes Good

INDUSTRIAL production in April and May this year seems likely to have been about 4 per cent higher than a year before and at about the same level as in the same months of 1951. The official index gives a provisional figure of 118 for April output in industries, and says the "all industries" figure for May, from information so far received, is expected to be 119-120; comparable figures for 1951 and 1952 are shown in the table. Manufacturing production in March and April was about 4 per cent higher than in 1952, and taking April alone, the increase was more than 5 per cent;

OFFICIAL INDEX OF INDUSTRIAL PRODUCTION

	All industries			Manufacturing		
	1951	1952	1953	1951	1952	1953
January	116	118	117	119	120	118
February	122	120	121	125	123	122
March	116	123	124	118	126	126
April	122	110	118	126	112	118
May	116	117	119-120	121	120	...
June	122	112	...	127	113	...

but again these 1953 figures were hardly changed from the same months in 1951. The recovery in industrial activity, which had become noticeable before the Budget, is obviously continuing; but it is too early yet to detect from the official indices any marked effect from the budgetary measures to encourage output. From outside indications, perhaps the most encouraging sign is of some recovery of demand for engineering products, and not wholly those that are largely dependent upon vehicle output; but the recovery has still to reach various sections of engineering.

Towards a Tin Agreement?

THE working party of the International Tin Study Group ended its Brussels meeting on a note of progress for the discussions brought producers and consumers appreciably closer on methods of stabilising the tin market. These methods envisage the control of exports by governments, the creation of a buffer stock and adjustment of prices from time to time. Prices were not formally discussed; this will be a big enough stumbling block when the time comes. The producing countries seem to have been left with the potential problem of financing the buffer stock, for consumers were more lukewarm about sharing this burden than

... the business interests of this country and the vast Australian continent. Whether you are travelling or selling to Australia you will find facilities available that extend beyond the usual financial ones. You are invited to use our travel, information, commercial introduction and intelligence services—services which business men in particular appreciate.

With over 90 Branches at the leading centres of Industry and Commerce in India, Pakistan, Malaya and Burma, The United Commercial Bank is well equipped to serve Banks, Commercial Institutions and individuals carrying on business with India or intending to open connections with that country.

B. T. THAKUR, General Manager.

The Foreign Clerk

The intricacies of Exchange Control are part of his everyday work, and he is experienced in the handling of the forms which are necessary for foreign trade and travel. You will find that, whether you are planning new business overseas or merely arranging a holiday on the Continent, his understanding of the financial regulations involved can be of great help to you. He is one of a staff of 19,000 whose knowledge, experience and goodwill are at the disposal of all who bank with

BARCLAYS BANK LIMITED

Time for Eastern trade

Ten-fifteen in Singapore and the city office of the Chartered Bank is already a hive of business activity. The Bank's branches in Japan began work an hour and a half ago but seven hours must elapse before the London, Manchester and Liverpool offices will be open for business; but wherever merchants and manufacturers are engaged in the Eastern trade the services of the Bank will be available to them at one point or another of its far flung branch system.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.

West End (London) Branch: 28 Charles II Street, London, S.W.1. Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 28 Derby House, Liverpool, 2. New York Agency: 65 Broadway, New York, 6.

Branches of the Bank, under British management directed from London, are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

about other aspects of an agreement. The attitude of the United States delegation, though non-committal, was noticeably sympathetic, in contrast to their hostility to any form of agreement during the abortive Geneva conference in 1950—a change of heart that probably results more from recognition of the political dangers of low tin prices in South East Asia and elsewhere than from any sudden tenderness for producers as such.

The price of tin, which fell steeply after the Korean boom collapsed from its fantastic peak of £1,615 per ton, has continued to decline in the last eighteen months. The present price of around £660 per ton is still some £50 above the level of the first half of 1950, but a further fall is to be expected when American stockpile buying ceases at the end of this year. High cost tin producers thus have an interest in establishing a floor price above their production costs, while most consumers would welcome an assurance of supplies within a ceiling price. Consumption of tin, unlike that of other metals, has not expanded in the last 15 years. An enormous rise has occurred in world output of tinsplate, but new methods of plating have made possible great economies in the use of tin. In all recent years there has been a surplus of production, which stockpile buying alone has kept off the open market.

Assuming that governments favour the suggestion of the working party that the Geneva conference should be reconvened, this could hardly happen before November. If an agreement followed, it could hardly come into force within a year from now, and it remains extremely doubtful whether Congress would ratify it. Whether it is desirable is still an open question. Tin exports from some high-cost producing countries are so important to their viability that in times of low prices their governments would almost certainly find ways of subsidising them. In Malaya, the Chinese-owned mines also have high costs; most of the European mines there could probably take care of themselves, and the same applies to the larger Nigerian mines. The smaller Nigerian producers would undoubtedly suffer from price competition. The arguments in favour of an agreement are predominantly political, rather than economic.

Forecast for Fats

TOTAL supplies of oils and fats last year were virtually back to the prewar level, after allowing for the growth in world population; consumers could have as much per head as before the war, and use in addition the equivalent of 500,000 tons in the form of synthetic detergents. Current supplies, excluding frozen stocks, are fully adequate to meet current effective demand. Making this forecast in his annual address to the International Association of Seed Crushers this week, Mr J. C. A. Faure, of Unilever, estimated that world production of oils and fats in 1953 might reach 23,660,000 metric tons, about 890,000 tons less than last year and roughly equal to the 1951 output.

This reduction in prospect arises almost entirely from a smaller olive oil crop, although this, plus any carry-over stocks, should be adequate to meet this year's consumption. Smaller outputs of groundnuts, sunflower seed, copra, whale oil, sperm oil and lard are expected, but these should be offset by larger outputs of palm oil, palm kernel oil, linseed

oil, butter and some other items. Mr Faure was anxious that the present outlook of oils and fats should not give a false impression of security; he asserted, indeed, that the current rate of world production would be quite inadequate to meet demand from a growing population in two or three years' time.

World exports this year are forecast at 5,210,000 tons, whereas import requirements are put at 5,020,000 tons. West European consumption should be only fractionally lower this year at 6,350,000 tons; the running down of stocks is estimated at about 300,000 tons, leaving Europe's net import needs practically unchanged at 3,168,000 tons. Despite the significant increase in world output last year, world exports fell from 5,741,000 to 5,159,000 tons, and

Western Europe's net imports from 3,614,000 to 3,156,000 tons. There was no technical need for Europe to buy oils and fats from the United States, but it did so to the extent of 465,000 tons. Dollars were available and prices were attractive. Mr Faure estimated that surplus stocks in producing countries carried over into 1953 totalled 450,000 tons. A further 650,000 tons were held by the US Commodity Credit Corporation, and at least 500,000 tons in strategic reserves, all of which represent in greater or less degree a potential increase to world supplies. In addition, stocks in Western Europe increased by some 500,000 tons, the larger portion of this being olive oil. Of the 1,600,000 tons in stock in producing countries, Mr Faure believes that just over one million tons were built up during the past two years.

Good Year for Wool

THE last of the raw wool sales in Australia this week—auctions have already ended in New Zealand and South Africa—brought to a close a season satisfactory to wool growers and manufacturers alike. According to estimates submitted by the Commonwealth Economic Committee to the recent International Wool Textile Conference in Lisbon, world production of raw wool in the 1952-53 season was 2,435 million lb, some 6 per cent more than for the previous twelve months; but the increased supply was comfortably absorbed at prices which rose steadily and with an absence of the erratic jolts which in the past have been so unsatisfactory to the wool textile industry.

THE ECONOMIST, JULY 4, 1953

Australian wool prices clearly illustrate this tendency through the year. Merino 64s., clean delivered United Kingdom, opened last September at around 128d. per lb and touched 162d. this June, although the price later fell to 152d.; similarly, crossbred 50s. quoted at about 68d. at the opening in September stood at about 77d. in June, and have also suffered a slight weakening since. The long-feared release of Argentine and Uruguayan stocks merely helped to keep crossbred prices steady and in the long run helped markets by removing the uncertainty which their existence created. About a month ago, prices rose a little on unexpected, and possibly over-delayed, Russian buying. The only serious disappointment of the year was the absence of any strong American demand.

Prices were sustained during the year, despite the large new clip and the release of the old South American clip, thanks to the readiness of the recovering textile industry, though cautiously, to rebuild its depleted stocks. At the opening of the season next September, manufacturers' stocks will be higher than a year ago; moreover, textiles made with dearer wool will be reaching the public, and their reaction will be watched with interest tinged with anxiety. Nevertheless, the wool market is healthy and the general expectation is that next September prices will open at around present levels, that is, somewhat below the peak of the past season. On this, perhaps, a final pointer will be provided by the last London wool auctions between July 10th and July 24th when some 66,000 bales, mostly Dominion, will be offered.

Research in America

SEVERAL Commonwealth governments maintain a joint scientific mission in Washington. Its primary purpose is to act as a channel for the exchange of scientific information between the United States and the countries represented on the mission. Each year, for the past five years, an annual review has been prepared showing the amount of money being spent on research in the United States and the principal projects in hand. The decision to publish the latest of these reviews, though it deals with the twelve months that ended in June last year, provides a concise and complete survey of American research expenditure and activity as seen through the eyes of foreign observers. In 1952, the total amount spent on research in the United States was expected to reach nearly \$3,000 million, of which the Federal government was responsible for providing 56 per cent. This vast sum represents nearly one per cent of the gross national product of the United States.

The amount that industry itself was spending on research during 1950 and 1951 represented about 8 per cent of the sum being spent on new plant. But the Federal government was responsible for initiating a good deal of this research expenditure. Ten years previously industry and the universities looked to Washington to finance about 7 per cent of their research; by 1952, it was paying for nearly 40 per cent of all the work done in industrial and university laboratories. The accompanying table summarises research expenditure during the past few years.

A great deal of the money was being spent on military projects; more than 90 per cent of Federal research

expenditure can be accounted for in this way. The atomic energy projects, which are expected to absorb \$4,200 million for new building alone over the next five years, account for only a small proportion of the military total. But military research is not wholly concerned with weapons. Many projects of long-term value to industry have been sponsored in the name of defence. Electronic computers, the production of which is now a minor industry, and many metallurgical developments fall under this heading. To meet military specifications, a great deal of important work is being done on new alloys, and on the bulk production of metals like titanium, molybdenum and vanadium,

US RESEARCH AND DEVELOPMENT EXPENDITURES
(Millions of dollars)

Year	Total	Source of funds		Use of funds by type of institution		
		Federal	Other	Industrial	University	Federal
1941.....	800	240	560	520	80	200
1947.....	1,810	790	1,020	1,120	170	520

their properties and techniques of processing them. Pressure towards national self-sufficiency has led to work on the extraction of low-grade ores, and there are several separate commissions dealing solely with the conservation of materials. This pressure has also been instrumental in the rapid expansion of the chemical industry—more than \$1,500 million is believed to have been spent on new chemical plant in 1952—for chemicals can provide new materials and new ways of producing materials that would otherwise have to be imported. The plan to produce benzene from naphthenes in natural petroleum, instead of the more usual method from coal tar is a typical example; the United States has been an importer of benzene.

Freight Markets Quiet

IN the last few weeks activity among charterers has been too low to test the market adequately, and freight rates generally have tended to weaken. The Chamber of Shipping index of tramp freight rates for May was 97.4 (1948 = 100), and it will not be surprising if the June figure turns out to be much lower. Even so, the general level of rates is still higher than it was in the summer months of 1950, before the Korean war began. Charterers seem to have been withholding from the market, particularly for grain from the St. Lawrence, and are hoping to take advantage of the unsettled state of the China trades and of the chances of employment in Korean and Far Eastern waters, as well as of the piling up of tonnage on this side of the Atlantic and the apparent lack of outward cargoes.

On the other hand, there is some confidence in the possibility of improvement later in the autumn. The ore chartering market continues to be fairly active, and

moderately good rates can still be obtained for vessels on time charter, although generally only for short periods. The resumption of grain shipments from the United States to Pakistan will provide certain employment for a number of vessels, and sooner or later grain must be moved from the St. Lawrence, Australia and the Plate. Once rates start rising, grain charterers will be only too anxious to avoid missing the market, and shipowners will be in a stronger position. Despite the quietness of the present markets, the fall in the prices of secondhand Liberty ships, for example, has not been as steep as many brokers predicted three months ago; and there has been no evidence of a marked increase in ships laid up.

SHORTER NOTES

Interest received on outstanding claims under the War Damage Business Scheme will not be liable for EPL this year; this relief has been assured by allowing the companies concerned to have their claims under this scheme postponed from the beginning of next October to January 1, 1954, the day on which EPL is removed from the Statute book.

July 13th has been set by the Minister of Supply as the appointed day under the Iron and Steel Act, when the nationalised Iron and Steel Corporation goes out of existence and its shareholdings in steel companies are transferred to the Iron and Steel Realisation Agency for "return to private ownership." The Iron and Steel Board, which is to supervise the industry, also takes up its responsibilities on that day. The process of selling the industry back to private owners will then formally begin. In fact, this may at first be confined to negotiations with the former owners of steel

companies that may wish to buy them back; the likelihood of at least one public issue before the holiday season, which appears at one time to have been intended, now seems improbable.

Tinplate prices are normally adjusted quarterly in accordance with the price of tin—the price of a basis box of tinplate alters a penny for each variation of £10 in the average cash price of tin on the London Metal Exchange for the first three of the four preceding months. The fall in tin prices during the spring would in fact have reduced the price of a basis box from 57s. 9d. to 56s. 8d. from the end of June. The Minister of Supply has now raised the controlled price of tinplate by this 1s. 1d. a basis box, so that the price to tinplate consumers will remain unchanged. The grounds given for raising the home price were that this would be justified by increased costs in the industry, pending a study of tinplate prices by the new Steel Board. It has been argued for some time that the home price does not fully cover costs for many works. Until this year, this was offset by the very high export premiums made by works selling tinplate overseas, but with the slump in demand, these windfall profits have now disappeared.

The Government is to introduce legislation to continue the operations of the National Film Finance Corporation for a further three years after August, 1954, when its present term of activity expires. The Corporation, which makes loans to film producers and distributors in order to finance the making of British films, may lend up to £6 million advanced to it by the Treasury. Half of this sum is on loan to one major film producing company, British Lion, which has not as yet repaid any of it; the NFFC is once again discussing with British Lion methods of dealing with this large loan from public funds.

the rise in raw wool, it is at least certain that they have not been distorted completely out of shape—as they were in the years of the boom in wool prices—by illusory windfall profits on stocks. The later profits therefore provide a genuine backing for the dividend and the stock market could without any misgivings mark up the £1 ordinary stock units by 3s. 6d. to 6s. 6d., to offer a yield on the new dividend of 6.6 per cent.

THOMAS DE LA RUE. The preliminary report of Thomas de la Rue (for the year to March 29th) proves conclusively that diversity in a company's activities does not necessarily lead to satisfactory earnings. The company's interests range from the printing of banknotes and security documents and the manufacture of playing cards and fountain pens to the production of a wide range of plastic products and of gas cookers.

In the last financial year, it appears that only from the printing side of its business did Thomas de la Rue make a profit; this profit was completely swamped by the losses made in other operating divisions, and the group as a whole reports a loss of £78,844, compared with a profit of

£659,842 in 1951-52. The provision of £51,835 for British taxation (less a surplus tax provision of £5,000) brings the group's total net loss to £125,679, compared with a net profit of £253,783 the year before. In accounting terms, the loss of £74,844 arose because the group had to charge a series of special provisions against its earnings. These charges included a provision of £50,860 for depreciation (in addition to the normal charge of £225,181); a further sum of £134,932 was provided against the "exceptional depreciation" of stocks, and a sum of £115,283 was set aside for "the depreciation of current stocks."

Shareholders had been prepared for a shock of considerable magnitude by the interim report issued by the directors last November when they decided not to pay an interim ordinary dividend. When they made this report the directors pointed to the collapse of the group's export markets in Australia and New Zealand, following the import restrictions imposed by those countries, to the halving of the production of gas cookers and to short-time working in the company's plastics division.

Very little could have happened before the end of the financial year to brighten this gloomy picture and the decision to pay no final dividend comes as no surprise. How soon, then, can shareholders expect the return of regular 25 per cent dividends on the 5s. ordinary shares, which are now quoted at 6s. 3d.? The prospect clearly depends on a sustained improvement in trade, for the company is decidedly short of liquid resources.

RENOID AND COVENTRY CHAIN. The impressive industrial record of Renold and Coventry Chain—whose part in serving the motor and engineering industries is of great importance—has been tempered by an uninspiring dividend policy. Fortunately,

the preliminary report for the financial year to end-March shows some modest sign of shift from this ultra-conservatism. Admittedly, the equity dividend has in effect been raised only by the merest fraction—from 10½ to 11 per cent, but it has been recommended in the face of a slight decline in net profits from £335,672 to £323,528, the significance of which rests directly on another rise in the provision for taxation—this time from £444,100 to £609,519. The tax collector has obviously gained the most from a year which witnessed an advance in gross profits from £779,772 to £933,047.

As operating and re-equipment costs were probably still rising in 1952-53, this advance in gross profits appears to reflect

Earnings:	Years ending	
	Mar. 30, 1952	Mar. 29, 1953
Profit, before tax	779,772	933,047
Taxation	444,100	609,519
Net profit	335,672	323,528
Ordinary dividends	131,854	144,204
Ordinary dividends (per cent)	12*	11
Re-equipment reserve	186,000	183,000
Added to carry forward ..	25,539	Dr 15,787

£1 ordinary stock at 36s. 3d. x d. yields £6 1s. per cent.

* Interim dividend of 3 per cent paid on £1,131,310 ordinary capital and final dividend of 9 per cent on £2,413,464 ordinary capital after cash issue of 377,105 shares (at 50s. each) and bonus issue of 905,049 shares; the equivalent rate on present capital of £2,413,464 is 10½ per cent.

another definite increase in output and sales by the organisation. The way for such an expansion in the business was prepared by further additions to the company's industrial capacity (financed partly by the rights issue of ordinary shares); and shareholders may well assume from the further appropriations to re-equipment reserves that the end of the programme of expansion is not yet in sight. But one day all these plans will come to fruition; and one day the promise implicit in the latest preliminary report of a bigger reward for shareholders ought also to be fulfilled.

LONDON STOCK EXCHANGE

The London stock market has looked a little brighter this week, though not very much busier, than for some weeks past. Throughout the period to the close on Wednesday industrial equities were firm, but it was not until Tuesday that a rally was staged in the gilt-edged market. On that day and on Wednesday, dealers reported some quite heavy institutional buying, perhaps encouraged by the slightly better political news but also associated with the half-yearly levelling up of accounts. In these two days War Loan rose from 80½ to 81½, Transport stock (1978-88) from 79½ to 80½ and Saving Bonds (1965-75) from 86½ to 86½. The short-dated stocks were also in demand; both the 1955 Exchequer stock and the 1953 Serial Funding stock rose by ½ to 99½ and 99½ respectively. This rally ensured the oversubscription on Thursday morning of the £4 million loan raised by the City of Bristol on a 4 per cent stock (1968-71) at 96½.

A stream of encouraging dividend and profit reports helped to keep the rally in equities alive and in the week to Wednesday's close the *Financial Times* ordinary share index rose steadily from 117.2 to 118.5. A good number of the "bluechips" shared in this advance, but interest in the market tended to focus upon stores shares and textiles. The oil market was slightly more active than the rest of the "House" and prices improved, with Anglo-Iranian making a net gain of ½ to 6½. The market in tea shares was featureless, but rubber shares, after being quietly firm in the last days of the old account, faltered slightly when the new account opened.

In the foreign market both Japanese and German issues lost a little ground on the last days of the old account and then—as usually happens—turned slightly better on the first day of the new account. Most attention in this market on Wednesday and in early dealings on Thursday was concentrated upon the Potash issues, which fluctuated very widely on the news of an offer to settle. Kaffirs turned easier at the end of the old account and then made a few gains on Wednesday.

Company Notes

PATONS AND BALDWIN.

The directors of Patons and Baldwins, the knitting wool manufacturers, have this week published perhaps the most pleasing of all the preliminary reports that have come from either side of the Pennines in the last year or so. Among the first of the textile companies to suffer in the recession, Patons and Baldwins has staged one of the most impressive recoveries. In the year to May 2nd, the group earned a net surplus of £1,628,616, compared with a loss of £482,660 in 1951-52; and the directors have been able to restore the ordinary dividend from 10 per cent (to which it was reduced in the previous year) to its earlier level of 20 per cent.

The actual recovery experienced by the company is even more spectacular than these bare figures would suggest, for the net profit of £1,628,616 is struck after charging £1,209,956 for taxation, in direct contrast to the 1951-52 results when the loss of £482,660 was shown after a net refund of £154,799 from tax provisions. Furthermore, this net profit

is shown after a heavier charge for depreciation, which has been increased from £372,287 to £513,305, and after paying a bonus of £110,359—nothing being paid in the previous year—to employees.

Within the net surplus, however, are included several non-recurring credits, comprising £129,729 on the sale of a trade investment, £3,445 as a profit on the redemption of debentures and £476,795 from taxation provisions no longer required. But similar credits appeared in the 1951-52 accounts (including £184,457 arising from property sales, £69,472 as exchange profits and £25,112 from dominion and foreign tax provisions no longer required); in any case, the directors have used the latest special credits to reinforce the contingencies reserve. As well as recommending a full year's dividend of 20 per cent, the directors have appropriated £1 million to this reserve of which £606,434 has come from these non-recurring profits.

Although the latest year's profits may have benefited to some small extent from

(²) Special trade (excluding in yield). with the exception of Ireland which covers general trade: Belgium includes Luxembourg.

EXCHEQUER RETURNS

For the 10 days to June 30th there was an "above-line" deficit (after allowing for Sinking Funds) of £11,729,000, compared with £26,716,000 in the previous week and £8,145,000 in the corresponding period last year, bringing the cumulative deficit to £156,419,000 (£200,965,000 in 1952-53). Net expenditure "below-line" absorbed £21,888,000, raising the total cumulative deficit to £268,655,000 (£345,803,000 in 1952-53).

Financial Statistics

THE MONEY MARKET

DESPITE the fall of the half-year end in the week covered by Wednesday's Bank return, Lombard Street again enjoyed comfortable conditions. Not only did the market, in contrast to its experience a year ago, avoid borrowings at the Bank on penalty terms, but it did so without the aid of any special purchases by the authorities throughout the week — a rare occurrence indeed. Even on June 30th itself, the heavy "outside" calling was just met by funds from the clearing banks. And on Thursday before the weekend, as well as on Wednesday last, the authorities indulged in considerable reverse selling to mop up the surplus funds.

At last week's Treasury bill tender, the market maintained its bid at £99 8s. 2d. for the £250 million of bills on offer, but total applications dropped by £23 million, and discount houses secured a slightly larger proportion of its tenders—66 per cent, against 63 per cent. Yesterday, £250 million of bills were again on offer and, if fully allotted, will exceed maturities by £20 million, compared with an even balance in the past week.

The Bank return shows an increase in the note circulation by £4.7 million. Government securities held by the banking department rose fractionally; discounts and advances rose by £8.1 million and other securities by £9.1 million. With public accounts up by £6.8 million and other accounts rising by £1.3 million, bankers' deposits rose by £5 million.

COMPANY MEETINGS

GUEST, KEEN AND NETTLEFOLDS, LIMITED

INCREASING COMPETITION IN OVERSEAS MARKETS

MR J. H. JOLLY'S WORLD-WIDE SURVEY

The fifty-third annual general meeting of Guest, Keen and Nettlefolds, Limited, was held on June 25th at Birmingham, Mr J. H. Jolly, the chairman, presiding.

The following are extracts from his statement circulated with the report and accounts for the 53 weeks ended January 3, 1953:

Your board consider the results are very good, especially since they are arrived at after a provision for the excess profits levy amounting to well over £1 million.

TAXATION

Without regard to the heavy and increasing charges for local rates, Government direct taxation at home and abroad on the 1952 profits, and representing over 72 per cent of those profits, calls for £7,031,757, cash receivable by stockholders in dividends is £1,284,953.

Naturally, we welcome the decision of Parliament to terminate the excess profits levy at December 31st next. For a long time taxation has been draining away the resources of industry, which at the same time is striving to achieve the highest efficiency. It is to be hoped that we are nearing the end of this period of frustration, but under the Finance Bill we shoulder the burden for yet another year.

That we are able to produce profits comparable to those of the previous year is a tribute to the wholehearted enthusiasm of management, staff and workpeople.

TRADING RESULTS

As you may imagine, the results of the subsidiaries have not been uniformly better than in the previous year, but where they have fallen short there have been special reasons. The home companies in the aggregate achieved an advance on previous figures, but the experience of subsidiaries abroad was more varied and in the aggregate not as good as in 1951.

With the increased investment in buildings, plant and machinery, the amount required for depreciation naturally increases. We have continued our policy of charging against the profits of the period a total provision which has regard to the reduced purchasing power of money and is made on the basis of the current values instead of the book values of the fixed assets. The charge for 1952 is nearly £3 million—an advance on the previous year of over £400,000.

The profits retained in the group are slightly over £2 million for the year. Your board consider this to be the prudent course to adopt, especially at the present time when the country's economy is adjusting itself to a more normal character from several years of an artificially magnified demand in some directions.

TRADING CONDITIONS

In the latter part of 1952, several sections began to feel the effect of customers' decisions to drastically reduce their stocks in trade. This of course lessened the pressure on us for supplies and in a few cases has resulted in a shorter working week in 1953. It is difficult to forecast the length of the period of this general adjustment of supply

and demand throughout the country, but while it is with us it does bring about that reduction of "volume" of production, which in turn affects profit margins.

Our direct export trade is relatively not great, but a very considerable part of the group's output in this country goes into products which are exported by our customers. It is quite clear that nationally we have entered upon a phase of increasing competition in world markets, accentuated by the intention of many countries inside and outside the Commonwealth to make themselves less dependent on imports. Every effort must therefore be made to lower national costs of production from their present level. In particular we suffer from the largely increased costs of the nationalised services.

In our own works, efforts are being made all the time to bring down costs of production, but it is disappointing that achievements in that direction are partially offset by the steady advance in costs beyond the management's control. For example, taking the year 1939 as 100, the price of coal is now 320 and railway freight rates are 229.

MANUFACTURING SUBSIDIARIES IN GREAT BRITAIN

Our numerous manufacturing companies in this country have continued their energetic course. As well as taking care of production, some have been pressing forward with major alterations and expansion. Several of these have been or are on the point of being completed, such as the:

Reorganisation of the rolling mills at Exors, of James Mills, Limited, Bredbury.

Mechanised finishing mill and ancillary breaking-down mill at Sankey's Manor Works, Bilston.

Assembly shop at Sankey's Hadley Castle Works, near Wellington.

Steel drum and lithographing plant at Bristol, in which we are partners with the Rheem Manufacturing Company, of Richmond, California.

These developments and others throughout the organisation are capable of contributing handsome returns in times of full production, but it would be rash to expect them to accrue fully in the next twelve months, when it is so difficult to forecast the trend of trade over that period.

OVERSEAS INTERESTS AUSTRALIA

Lysaght's Works, Proprietary, Limited, has works at Newcastle and at Port Kembla in New South Wales. Notwithstanding many difficulties the company has increased its trading profits compared with 1951. At the Port Kembla works new constructional work is proceeding at the same time as the normal manufacturing side of the business.

Difficulties arose, however, from the severe inflationary spiral in Australia and the severity of the measures taken by the Australian Government to counter that trend. In the earlier part of 1952 our works suffered at times from a shortage of steel or coal or labour, when customers' buying, in anticipation of higher prices, was at a much higher level than works production. For

some time there had been greatly expanded imports of all goods into Australia until the Government, to protect the general economy, found it necessary to impose restrictions. Towards the latter part of the 1952 year supplies of steel from the Australian makers were increased, coinciding with severely reduced demand for the steel sheets produced by our works there and used by manufacturers of automobile bodies, refrigerators, stoves and general domestic appliances. The year 1953 commenced, therefore, as a period when large imported stocks of all classes of goods had to be digested, affecting some but not all of the company's production. Basically and for the long term, we believe that the normal demand in Australia for the company's products remains sound.

Nettlefolds (Proprietary) Limited, Melbourne.—Trading conditions in Australia militated against good trading results of this company, but we are confident that better results will be forthcoming in 1953. Authority has been given for extension of the works' buildings and for installation of additional plant and machinery for an increase in output and the widening of the range of products.

OTHER COUNTRIES

India—Our principal subsidiary company in India is Guest Keen Williams, Limited, with works at Calcutta. Their results were distinctly below those of recent years.

Pakistan—In this Dominion we are represented at Karachi by our subsidiary company, which is a trading but not a manufacturing unit. Sales turnover in 1952 was a considerable advance on the previous year in spite of the difficulties frequently arising from the Pakistan Government's licensing system restricting imports.

Canada—We decided that a good opportunity for the development of Joseph Sankey and Sons, Limited, presented itself by the purchase of a steel furniture and partition manufacturing company at Smith Falls, Ontario. The capital of that company was acquired on December 31, 1952. We look forward to its being an interesting development and providing also a base for the manufacture in Canada of other Sankey products. A review is now being made and in the near future plant will be sent from England to manufacture laminations for the electrical trade, for which product Sankey's name is already well known in the Canadian market.

Our long-established company at Hamilton, Ontario—Lysaght's Canada, Limited—has had a successful year and is developing the manufacture in Canada of some of our engineering products made in this country by Exors of James Mills, Limited, on its subsidiary company at Bredbury.

IRON AND STEEL

At the time of writing this statement, iron and steel trade to private enterprise almost reached the Statute Book. At the time of writing this statement, iron and steel trade to private enterprise almost reached the Statute Book. At the time of writing this statement, iron and steel trade to private enterprise almost reached the Statute Book.

That is still our purpose providing the conditions which are of paramount importance can be satisfied. We believe that under our management the costs of steel production will be less, and its quality for our manufacturing companies will be better than under a nationalised control.

In the near future we expect to be invited to discuss the possibility of the return to our ownership of the iron and steel works referred to. The matter will be decided in the light of the terms offered to us, and the conditions as they affect the iron and steel trade today.

The report and accounts were adopted.

It was announced that Sir John Morison had resigned from the board on his appointment as chairman of The Iron and Steel Holding and Realisation Agency.

The chairman then said:

That, Ladies and Gentlemen, brings us to the end of the formal business of the

meeting. If you will spare a few minutes more, I would like to take the opportunity of making a personal statement.

This is the last occasion on which I shall have the privilege of addressing you as chairman of the company, since, in a few days' time, I shall reach the end of my tenure of that office.

Our company has an unwritten but sensible rule which ensures that the person who succeeds to this important and onerous position shall do so while he is young enough in mind and body to leave his impress on the conduct of affairs and also, which is equally important, that he lays down his office before advancing years takes too severe a toll of his ability to keep up with the daily stress of the problems of a group of this stature.

If I have one regret it is that, through parliamentary delays beyond our authority, the operative date of the return to our own

control of the steel companies we previously owned will fall outside the period of my chairmanship. I regret it, the more because the subject of free enterprise is one in which I fervently believe, and for which my colleagues and I have consistently fought. So, although I shall not be the one actually to hoist the flag, I shall be one of the team, and that is what matters.

May I, on taking leave of you, express my thanks for the grand way in which you as stockholders of the company have supported the board during my term of office. Also, I would like to remind you how much you owe to a very efficient, loyal and hardworking band of officials and workpeople. Their work, about which you hear once a year, is continuing week in week out and has been a major contributing factor to the position which the GKN Group holds today—a position which is thoroughly sound, was never stronger, and of which you can be proud.

UNION MINIERE DU HAUT-KATANGA

STABILITY OF COMPANY'S GENERAL POSITION

AN EXCEPTIONAL YEAR OF PRODUCTION AND RECEIPTS

The annual general meeting of the Union Minière du Haut-Katanga was held in Brussels on June 25th.

Mr Gaston Blaise was in the chair.

The accounts for the year ended December 31, 1952, were adopted.

The profit and loss account showed a gross profit of Fr. 4,770,953,374. After deduction of the provisions for depreciation and for profit taxation, and of sundry charges, there remained a net profit of Fr. 3,091,074,645. By inclusion of Fr. 77,437,865 brought forward from the previous year, the available balance totalled Fr. 3,168,512,510.

From this balance, Fr. 1,154,553,732 were appropriated to the reserve and the special reserve and contingencies funds, and Fr. 45,030,433 were carried forward. The balance left for distribution amounted to Fr. 1,968,928,345.

The meeting approved a dividend of Fr. 1,250 net per share for the year 1952. Taking into account the interim dividend of Fr. 600 net paid in January, 1953, the final dividend is accordingly Fr. 650 net per share.

MR E. SENGIER'S STATEMENT

In his address to the meeting, Mr Sengier, chairman of the Permanent Committee, said:

I can but confirm the statements I made to you at the June, 1952, meeting of our company. The stability of our social structure, confirmed from year to year, and the realistic forecasts which I made previously quantified more than realised.

quantified results which you have before you types it in exceptional year and records of restriction in with:

of new plant, metric tons of copper, as compared with 1951:

important raw supply. Boitic tons of cobalt, as compared with 1951.

of milk—a s, were made at market prices

new words. ed, as I told you in 1951 and average prices upon which one can

MILK der to estimate probable profits

before as resulted in exceptional receipts

which enable us to increase the dividend and to propose to you the distribution of a net amount of 1,552 million francs, after payment of approximately 2,300 million in taxes and duties, of 177 million in royalties to the Comité Spécial du Katanga, whilst carrying more than one milliard to reserves and 800 million to depreciation. We note, on the other hand, in spite of capital expenditure amounting to 1,540 million, an improvement of approximately 800 million in our liquid assets.

We believe it useful again this year to aggregate the receipts of the eight postwar financial years and their utilisation. The receipts of these eight years amount in round figures to 45,000 million francs which have been utilised as follows:

	per cent (approx.)
Production expenses	44
Taxes and royalties	23
Net dividends	13
Capital expenditure	16
Investments and increase in cash at banks	4

For the financial year 1952, the receipts were 10,550 million, the repatriation of which is as follows:

	million
Production expenses	4,200
Taxes and royalties	2,460
Net dividends	1,550
Capital expenditure	1,540
Increase in liquid assets	800

It will interest you to compare three items of the 1952 expenditure which are counterpart to these receipts:

1. The remuneration of work, that is to say the aggregate of the payments to the members of the European and Congolese personnel, amounts to 1,184 million, i.e., 11.20 per cent of the receipts.

2. The remuneration of capital, that is to say the net dividends to shares subscribed in cash, amounts to 1,223 million, i.e., 11.60 per cent of the receipts.

3. Duties, taxes, dividends on shares issued free as remuneration for the concessions, and royalties to the Comité Spécial du Katanga amount to 2,792 million, i.e., 26.50 per cent of the receipts.

PROSPECTS FOR 1953

Concerning prospects for 1953, Mr Sengier said:

The last financial year and the first months of 1953 constitute a troubled period which renders forecasts for the immediate future impossible: the market has successively shown proof of excessive, optimistic and pessimistic feelings, which appear to me to be worthy of a short commentary.

During this period, the laws of commercial freedom have been transgressed: an exceptional American industrial activity, massive demands for armament purposes and the constitution of governmental stocks raised fears of a shortage of metal which gave rise, on the one hand, to the reinforcement of controls and, on the other, to unjustified speculations.

This appearance of under-production led the market prices of copper to exorbitant figures which have encouraged the development of the production of substitutes which, if maintained, could become detrimental to our industry.

This situation encouraged, on the other hand, the future development of new mines, certain of which are financed by the American Government, with guaranteed prices of 24.50 to 28.50 cents—new mines from which the output is estimated at 500,000 tons, being about 20 per cent of the present world production.

Although the purchases for governmental stocks contribute to falsify the picture of the true consumption of copper, which is not necessarily equal to demand, one nevertheless arrives at the conclusion that, for raw materials which the United States cannot produce in sufficient tonnages to meet their consumption, such stocks could usefully serve as regulators to market prices, the purchases being made during the periods of world over-production and the disposal being made during periods when production is deficient.

COPPER PRICES

Here are a few figures enabling you to judge of the confusion of the market.

During the whole of the year 1952 the

American domestic market price, that is to say the market price of copper produced in the United States, remained officially fixed at 24.50 cents.

During these same twelve months the market prices applied to foreign copper varied between 27.50 and 36.50 cents. The *Engineering and Mining Journal* price for export copper, which fluctuated between 27.50 and 34.70 cents, has been falsified by an arbitrary price imposed by the Chilean Government which at the beginning of 1952 was 27.50 cents and was brought to 36.50 cents as from June of the same year.

In February, 1953, following a reduction of control, the American domestic market price settled at 27.50 cents. At this same date, it was enacted that the imposition of 2 cents on imported foreign copper could only be re-established before June 30, 1954, if the average price of a given month fell below 24 cents.

The height of the confusion revealed itself at the beginning of 1953 with five different prices in the United States, varying from 24.50 to 36.50 cents—plus one price in London—the Union Minière having more-over an independent price which varied, during 1952, from 28.30 to 34.30 cents with an average of 31.60 cents, equivalent to Fr. 35.100 per metric ton for the year.

Since May, 1953, thanks to a greater freedom, the confusion has lessened, and the two principal basic market prices, that is to say the American domestic price and the export price (freed at the end of April from the influence of the Chilean arbitrary market price) drew closer to each other at a level of 30 to 31 cents.

We have pleasure in noting that authorised sources, and in particular the *Financial Times* of London, declared that the competent authorities consider the independent market prices adopted by the Union Minière as being the most representative of the world market.

The market prices in force mid-June are:

Domestic market price	29.97
Export market price	29.85
Market price Union Minière for sales in Belgium based on	29.85
equivalent to Fr. 33,750 per ton, c.i.f. Antwerp.	

This recent fall of market prices and their alignment did not surprise us, and we consider them as a step towards a healthier position.

Nevertheless, during these last months, customers in Europe, in the uncertainty of the future market prices which showed a tendency to fall, have lived on stocks and reduced their purchases to immediate requirements.

STRONG DEMAND IN U.S.A

In the United States, on the other hand, the demand influenced by the orders from the Government which absorb 30 per cent of the domestic production estimated at one million metric tons per year, continued to be strong. The demand appreciably exceeds this production, which must be augmented by a tonnage of imported copper which, for 1952, was in the range of 400,000 tons.

In view of all these new factors, we will abstain from making forecasts as to the future of the markets.

As far as we are concerned, the tonnage of copper sold to date, the profit from which will influence the results of 1953, amounts to 98,119 metric tons at an average market price of 32.28 cents per lb, being Fr. 35,582 per metric ton.

Cobalt has acquired a considerable importance for our company. Our production is increasing and its disposal is assured for several years.

NEED FOR STRONG LIQUID RESOURCES

In conclusion of his statement, Mr Sengier declared:

The experience of the large copper producers proves the necessity of considerable liquid assets, indispensable to face the need for working capital for operations, the financing of capital expenditure and the reserves necessary to cover future eventualities, and, in particular, possible sudden fluctuations in the market prices of metals.

With exception to the Le Marinel power project, the financial years 1953 and 1954 will be marked by the completion of our capital expenditure programme, comprising in the first place the hydro-electric equipment of the waterfalls and the installations necessary to the development of our new mining centres.

Our prudent administration has permitted the realisation of this programme without recourse to new capital.

For the years following 1954, and excepting expenditure for the completion of the Le Marinel power station, for which we are making a provision from our present liquid assets, amounts equal to a normal depreciation should be sufficient to cover current expenditure for equipment and improvement of our exploitations.

In short, thanks to large, well-developed reserves of minerals, to a personnel of high quality, to stocks of metals and other products valued at conservative prices—three elements constituting the principal assets of any mining concern—thanks also to our working costs, which compare favourably with those of our competitors, we are convinced that with copper prices resulting from the rules of supply and demand in a free economy, and in the absence of unforeseeable events, we shall be able to continue to present you with very satisfactory balance sheets.

Further to Mr Sengier's address, the report of the board of directors, which has been circulated with the accounts, mentions that all the company's productions showed a further increase in 1952.

The company has always paid attention to the modernisation of its various installations; its construction programme for 1952 included, in particular, the extension of several plants and the increase of available electric power.

In this respect, the erection of the Delcommune power station on the Lualaba River, has been actively prosecuted. A first turbo-alternator group was started up last December. With this power station in production, the Union Minière will be in a position to generate 1,100 million kWh per average year.

The survey work, relating to the Le Marinel power station, a fourth generating plant necessary to cope with Katanga's future requirements, is in progress. The total capacity of this installation will reach 280,000 kVA.

According to estimates, the commissioning of the first group is due in 1957.

A power transmission line to the Rhodesian Copper Belt is projected. Katanga hydro-electric power will thus participate in a few years to the relief of power shortage in the Copper Belt.

Owing to the constant efforts of the Medical Department, the health situation develops favourably amongst the European and Congolese staff.

Union Minière has continued to expand its programme of social work for the Congolese workers and their families. Emphasis has been laid on the extension of the responsibility granted to the Congolese, in accordance with their social progress, and on the improvement of their qualifications by a better technical education.

HAZELL WATSON AND VINEY, LIMITED

STEADY VOLUME OF WORK

The sixty-ninth annual general meeting of Hazell Watson and Viney, Limited, will be held on July 23rd at 52 Long Acre, London, W.C.

The following is an extract from the statement of the chairman, Col O. V. Viney, circulated with the accounts to March 31, 1953:

Our works continued generally to be busy during 1952. In the early months of this year work in connection with the Coronation increased the volume of orders, and we finished the period with the Aylesbury and Watford factories fully occupied. The reduction in the price of paper and increased supplies were an important contributory factor to the result. Paper prices seem to have stabilised for the present, but are still high in comparison with the cost of commodities generally. This steady flow of work throughout the year, coupled with reduced losses on stocks as compared with 1951-52, resulted in a substantial increase in the profit of the group.

The directors have given careful consideration to the dividend, which has been unchanged since 1947. They feel justified in the circumstances in recommending the payment of a bonus this year and propose a final dividend of 7½ per cent making, with the interim of 2½ per cent, 10 per cent for the year (as 1952), and in addition a bonus of 2½ per cent.

Capital expenditure at £220,981 was much less than the previous year's total of £500,243. The commitments of £208,000 (against £227,000) for capital expenditure, and plans for development now under consideration, will more than absorb the present cash reserves. But in these days of high costs any large development plan must be spread over a fairly long period, and the directors hope that it will be possible to finance the various schemes from our own resources.

COSTS AND EFFICIENCY

Our Aylesbury works had a busy year as also did Sun Printers at Watford. At both these plants we enjoyed record sales. The book side of our business continues to expand and demands more and more floor space for the storage of sheets and bound books. Additional space was provided but this problem is always with us. During the year the cost of living index figure increased by nine points, which entailed an advance to male staff of 6s. per week in July and 3s. in January, with proportionate amounts to women.

Our constant aim is to keep costs down, and I am glad to say that we found it unnecessary to pass on the full cost of the increases to our customers. If our industry is to continue to enjoy full employment, costs must be kept under strict control. This can only be achieved by still greater efficiency, improved techniques, and introduction of most up-to-date plant. This has been continued to be our objective. The results of the year were only slightly better than those of the previous year, with the co-operation of the entire staff, the directors express their thanks to all.

The financial year has started well, the pressure of Coronation work has been recession after June 2nd, but so far no signs of it and our prospects for the few months are good. Unless there is a major change in present trade conditions, there seems every indication that we shall experience another satisfactory year.

LONDON & OVERSEAS FREIGHTERS LIMITED

SATISFACTORY RESULTS DUE TO LONG-TERM CHARTERS

INCREASED OPERATIONAL TANKER TONNAGE

HIGH LEVEL OF SHIPBUILDING COSTS

MR BASIL M. MAVROLEON ON SERIOUS CONSEQUENCES OF POSSIBLE FURTHER WAGE INCREASES

The fifth annual general meeting of London & Overseas Freighters Limited was held on July 1st at The Baltic Exchange, St. Mary Axe, London, EC3, Mr. Basil M. Mavroleon (Chairman and Managing Director) presiding.

The Secretary (Mr Stanley Sedgwick, ACA) read the notice convening the meeting and the report of the auditors.

The following is the review by the Chairman which had been circulated with the report and accounts for the year ended March 31, 1953:

EARNINGS

The trading results of the year under review are satisfactory and, in a period of comparative depression in the shipping markets of the world, reflect the steady influence upon revenue of the long-term charters under which your company's tankers are operating. The figure of £942,614 representing the operating surplus closely accords with your board's estimates and is a natural projection of the results reported in the interim statement for the first half of the year.

The following statement shows the make-up of the operating surplus and illustrates the important part played in the company's prosperity by the growing tanker fleet:

Year ended March 31, 1952 Revenue-earning fleet	Operating surplus		Year ended March 31, 1953 Revenue-earning fleet	Operating surplus	
	£	%		£	%
Dry-cargo ships:			Dry-cargo ships:		
2 throughout the year			2 throughout the year	106,785	11.3
5 for an aggregate trading period of 694 days	269,558	50.6	Tankers:		
			4 (aggregating 66,097 d.w.t.) throughout the year		
			1 15,347 d.w.t. 344½ days	835,829	88.7
			1 18,070 d.w.t. 275 days		
			1 15,330 d.w.t. 255½ days		
			1 24,600 d.w.t. 51 days		
Tankers:					
2 (of 16,325 d.w.t. each) throughout the year					
1 (of 18,100 d.w.t.) for a trading period of 34 days	263,370	49.4			
1 (of 15,347 d.w.t. for a trading period of 29 days)					
	532,928	100.0		942,614	100.0

It will be observed that the tanker tonnage in operation at the end of the year under review totalled 139,444; more than double the figure for the previous year. It is anticipated that this figure will be augmented by 18,070 d.w.t. half way through the current financial year and towards the end of the period by a further 24,600 d.w.t.

INCREASED OPERATING COSTS

Operating costs have continued to increase since the year. It is, of course, always difficult to maintain a high standard of restriction on any fleet, but in the case of your new plant it is especially important, in view of the flexibility of the gross earnings, to keep the periods of inactivity for the fleet as low as possible. I am pleased to be able to say that the company's record in this respect has been excellent so far and that the policy of your board in regard to the highest quality and best personnel both afloat and on shore has been maintained.

be ensured only by experience and the effluxion of time.

INTEREST PAYABLE

The only other item in the profit and loss account which calls for comment is the interest on bank advances amounting to £65,730. This sum is a measure of the increased bank borrowing which has been necessary to meet the cost of additions to the fleet. The financing of the company's building programme is referred to later in this review, but I would emphasise at this stage that the bank overdraft has proved itself to be the most flexible and least costly facility available.

TAXATION

No income tax, excess profits levy or profits tax is payable in respect of the profits of the period under review, but the taxation which would have been payable to date had it not been for the incidence of initial allowances in respect of expenditure on building

new ships approximates £800,000. The sum of £300,000 has, therefore, been added to the £500,000 already standing to the credit of taxation equalisation reserve.

DIVIDEND

The board, adhering to the dividend policy declared at the time the company secured a Stock Exchange quotation, recommends the payment of a dividend of 5 per cent (less tax) for the year ended March 31, 1953, and reaffirms its intention to limit the dividend payment to that rate for the current year.

FLEET

During the year under review your company's fleet has been increased by four new tankers, making eight in all. These vessels are very fine examples of the modern shipbuilders' craft and will considerably augment the company's earning power. It is important, however, that you should know something about the cost of these ships. Two of these tankers were ordered at the end of 1947 and the cost was estimated in the building contracts to be £500,000 each. When the vessels were completed, nine months after the contract date of delivery, the cost of the two proved to be over £1,400,000, which figure included some £90,000 in respect of optional extras. The other two tankers delivered during the year were ordered in March and July, 1950, respectively, and cost together nearly £2 million, including extras of £133,000, as against estimates at the time of placing the order totalling £1,640,000. Thus these four ships cost (including extras) a total of £760,000 more than was anticipated when the orders were placed. This represents an extra cost of the order of 28½ per cent over the original estimates and is indicative of the magnitude of the problem involved in financing the uncompleted part of the company's building programme.

Up to the present time eight vessels have been constructed and are in service. These vessels have cost in all £1,200,000 more than the original estimated prices. There are eight more tankers still to be completed, and it is estimated that these will cost in all £1,880,000 more than the contract prices. This situation is one which has been developing for some time and your board has been alive to its possible effect on the company's plans. It is a very disturbing situation and one which is at the present moment worsening. You will be aware of the recent decision of the Confederation of Shipbuilding and Engineering Unions to put forward a claim for a 15 per cent increase in wages for their members. An increase of this order would mean an overall increase of not less than 10 per cent on the present estimated cost of the uncompleted building programme. In terms of hard cash the figure of £1,880,000 mentioned earlier as being an indication of the probable excess of the final cost of eight ships yet to be built over their aggregate contract prices would be increased to the substantial figure of £2,800,000. A very disturbing outlook indeed. Perhaps I might mention in this connection that Japanese shipbuilders have reduced their prices by not less than £21 10s.

per ton deadweight—25 per cent—in the last twelve months.

IMPORTANCE OF CONTINUED MODERNISATION AND EXPANSION

I am not qualified to express an opinion as to the merits or demerits of this claim for a further increase in wages. I do not know enough about it. What I do know, however, is what your board will do or will not do in certain circumstances, and I think it only right that you should know what is in our minds. In the event of our being faced with the certainty of further increased costs of this magnitude, we will without hesitation seek and secure the cancellation of outstanding building contracts. Arising from this there is a point which I am sure you will agree merits the most serious consideration of all concerned. It is the danger of a complacent frame of mind resulting from the frequent references in the press to the full order books which shipbuilders in this country have been enjoying for some time now. A book full of orders for vessels to be built in two, three, four or five years' time is of itself nothing more than an earnest of the intentions of the contracting parties to do certain things under certain conditions. The inability of either party to execute their intentions through the force of circumstances quite beyond their control might involve them in financial forfeits, but it would not build ships. Order books can be emptied overnight. It happened in 1919 and 1920—it could happen again in 1953. It is crystal clear that the implementation of the contracts is what matters—only by the execution of the orders can ships be built and wages paid. The well-being of the shipyard workers, the shipowners—yourselves—the men who look to the sea for their livelihood and everyone remotely concerned with the survival of the United Kingdom as a maritime power depends upon the continued modernisation and expansion of the merchant fleet. It is my considered opinion that any rise in the cost of producing ships will result in the wholesale cancellation of building contracts, to the detriment of all concerned. I venture to hope that wiser counsels will prevail.

MR DAWSON MILLER

It is with regret that my colleagues and I learnt from Mr Dawson Miller that he would not be able to accept re-election to the board, and I take this opportunity of recording our appreciation of the wealth of experience which he has brought to bear upon the company's affairs during the three years which he has served as a director.

PERSONNEL

I am sure that you would not have me conclude my remarks without reference to the contributions made to the company's progress by members of the staff both afloat and ashore. It is encouraging to find that your board's policy directed towards requiring efficient and loyal service in return for adequate remuneration, generous conditions of employment, unsurpassed accommodation and excellent prospects is resulting in men of the highest calibre vying with each other for appointments in our fleet. The staff ashore have shown themselves equal to the tasks thrust upon its members by the increasing activities of the company. For my part, and on your behalf I am sure, I record my appreciation of the efforts made by all concerned.

The report and accounts were adopted and the dividend of 5 per cent on the ordinary shares was approved.

The retiring director, Mr M. E. Kulukundis, was re-elected and the other formal business having been duly transacted, the proceedings terminated.

JOHN THOMPSON, LIMITED

(Steam Power Plant and General Engineers)

INCREASED OUTPUT

£38 MILLION WORK ON HAND

MR EDWARD W. THOMPSON'S REVIEW

The eighteenth ordinary general meeting of John Thompson, Limited, was held on July 1st, at Ettingshall, Wolverhampton.

Mr Edward W. Thompson, MA, chairman and joint managing director, presided.

The following is an extract from the chairman's statement which had been circulated with the report and accounts for the year ended December 31, 1952:

For the year 1952 the combined profit and loss account shows that the gross trading profits of the group were £1,343,729 which is an increase of £91,738 over the corresponding figure for the year 1951.

The same account shows that our net profits for the year 1952 after paying £709,974 for taxation and providing £197,365 for depreciation are £381,158; this compares with £393,880 for the year 1951.

It will be seen, therefore, that while the gross profits increased by over £90,000, or 7 per cent. over those for the previous year, the net profits were reduced by £12,722, a reduction of 3 per cent. The reduction is entirely due to the increase of almost £110,000 in the taxation provision which includes £85,097 for excess profits levy.

The total output invoiced over the whole group for the year 1952 amounted to £12,901,320 compared with £11,001,945 for the year 1951, and £9,460,336 for the year 1950. The value of the output for the year 1952 was more than three-and-a-half times that for the year 1946, indicating not only the development and progress made by your company since the war but also the direct result of the large total of capital expenditure incurred over the same period.

I am pleased to say that all the group trading companies record profits for the past year with the sole exception of the small accessory company purchased three years ago, to which I referred in my previous statements. The output from this company is showing considerable improvement, and it is hoped that the development losses so far incurred will be converted into profits over the next year or two.

Including 1952, the amount put to reserve or otherwise retained in the business over the past 15 years is £2,107,540, 84 per cent more than the amount of £1,146,751 which we shall have paid in dividends for the same period.

The figures for stock and work-in-progress have increased to £4,787,055, which exceeds the corresponding figure for 1951 by no less than £1,384,400. This large sum of nearly £5 million shows the growth in your company's business but it adds to the difficulties of providing increased capital to finance this expansion.

BURDEN OF TAXATION

I think it would be of interest for shareholders and others to realise the burdens and restrictions on industry caused by taxation, particularly on an expanding business such as ours. Results over the past six years show that while output in money values has increased by £8,242,626 and the gross trading profits by £913,184, the net profit left has been practically stationary and, in fact, has declined over the last three years. Against

this position, with our long-term contracts and expanding output, we are inevitably faced with increased stocks and work-in-progress which have increased from £1,053,616 at the end of 1947 to £4,787,055 at the end of 1952, an increase of £3,733,439. Thus our gross trading balances on which our taxation is based are largely tied up in stocks and work-in-progress and may be termed "paper" profits to the company since the cash is not immediately available.

This is the reason why over these years our liquid cash resources have been gradually reduced to the present position where on the consolidated balance-sheet we owe the bank the net sum of £328,430 in spite of the fact that capital issues have provided £479,458 net over this period.

As compared with our profits our dividend policy over this period has of necessity been a very conservative one, and we have had to plough back so much more than we have paid in dividends not only to finance essential capital expenditure but also to provide the increased working capital necessary for our continually expanding output.

I would have stressed the taxation position more strongly but for the small glimmer of hope afforded by the 1953 budget. It is my sincere hope that the government may be able in their next and subsequent budgets still further to reduce the taxation of industry.

The statement then reviewed the activities of the company's subsidiaries at home and overseas and continues:

We have continued to expand our overseas interests by sending out additional representatives and appointing new agents. Your directors continue to visit overseas territories, and such visits are very essential.

You will see from the figures given with the report that work exported continues to grow in spite of the increased competition we are meeting.

WORK ON HAND AND FUTURE PROSPECTS

The orders secured during 1952 have in general been well maintained, and even after the increased output the total work on hand uninvoiced of all the group companies has reached a new record of nearly £38 million. It should be understood, of course, that a large proportion of this is for boiler contracting work, but even so the manufacturing companies of the group have sufficient work to keep them fully employed for some time ahead. For the first three months of 1953 the total output of our home companies shows an average increase of 15 per cent compared with the same period of 1952.

When I consider the rather difficult position that we were in at this time due to the shortage of materials and consequent delays and restrictions in production it is very pleasing to be able to report satisfactory results in the report. The materials position has eased considerably, although there is still difficulty with the heavier plates, but value can be reasonably optimistic that 2% paid year, 1953, will provide equally satisfactory results.

The report and accounts were

CADBURY BROTHERS, LIMITED

AN EVENTFUL YEAR

INDUSTRY ENCOURAGED BY SUGAR DERATIONING PROSPECTS

REVIEW OF HOME AND OVERSEAS ACTIVITIES

MR L. J. CADBURY ON MILK CHOCOLATE PRODUCTION

The fifty-fourth annual general meeting of Cadbury Brothers, Limited, was held on June 29th at Bournville, Birmingham.

Mr L. J. Cadbury, the chairman, in moving the adoption of the report and accounts, said: The accounts you have in your hands are for the twelve months ended December, 1952, but before dealing with the company's affairs in that year I should first like to mention two very important events which have occurred in our industry during the last few months.

I refer, of course, to the abolition of both rationing and price control of chocolate and sweets on February 4th and the statement by the Chancellor of the Exchequer on Budget Day that sufficient sugar would be available later in the year to meet the country's full requirements.

The Minister's decision to abolish the sweet ration was certainly a brave one. At that time the consumption within the 6-oz ration was about 5½ oz per head per week, and no one knew what the demand would be in a free market. Some authorities said it would be 6 oz, some said 7 and even 8 oz. But, while the industry was in favour of taking the risk, it was clear that a substantial addition to the then rate of sugar allocation, which was 54 per cent of the prewar supply, would be necessary to make derationing safe. Subsequent events have shown that this view was correct, and the Chancellor's statement that sugar would also be derationed came as a great relief. In fact, the consumption in the four months that have elapsed since derationing has been not less than 8 oz, and manufacturers have only been able to maintain output at that level by dipping into their stocks of sugar and "unallocated" raw materials.

WAY OPENED FOR UNRESTRICTED ENTERPRISE

It was, therefore, very gratifying last week to have the Minister of Food's statement that we could look forward to sugar being in free supply next September. Otherwise it might have been necessary to modify production programmes to maintain level employment. It is still uncertain what the eventual take-up will be when sugar and—even more importantly—all sugar-using products are free and the consumer at liberty to exercise his choice. It will be a surprise if, over the year, the present level of consumption is maintained.

Derationing and the promise of free sugar have opened the way from control to unrestricted enterprise. It would be wrong, however, to assume that we have passed straight away into fully competitive conditions. The public may be getting in total quantity the chocolate and confectionery it requires, but not entirely in the brands and types it would like. This is partly because restrictions on building and on the erection of new plant limit productive capacity in certain directions and partly because some important raw materials are still in limited supply. Both these handicaps apply to our firm, especially on the supply side in the case of milk—a subject on which I will now say a few words.

MILK CHOCOLATE PRODUCTION

Before the war we were condensing 26 million gallons of fresh fullcream milk at

our factories in the counties of Stafford, Denbigh, Hereford and Gloucester. Our weekly sale of Dairy Milk Chocolate was over 900 tons. These figures show beyond doubt that the public likes to take a lot of its milk in the form of milk chocolate; also that condensing milk and turning it into milk chocolate is an efficient way of conveying milk from the farm to the consumer in a convenient and non-perishable form, with all its natural properties unimpaired. We bought our milk through the Milk Marketing Board; true, a monopoly, but one which worked on commercial lines and appreciated the advantage before the war of selling milk for chocolate at more profitable prices than, say, milk for cheese.

With the war-time creation of the Ministry of Food, that body took the marketing of milk out of the hands of the MMB. This step was inevitable, in view of the war-time set-up of subsidies and priorities. The net result was that by 1945, though our factories were then collecting 21½ million gallons of milk from 2,600 farms, they were condensing only 2 million gallons for milk chocolate. The rest they were delivering to the liquid market or it was being used for other industrial purposes, chiefly the manufacture of cheese. The figures for 1952 show some improvement, with a total intake of 29½ million gallons and 5½ million gallons for milk chocolate.

We have, fortunately, been able to supplement our supplies of fresh fullcream milk from the factory we have built since the war in County Kerry, Ireland. This, nevertheless, still leaves our production short of pre-war figures and of the public's requirements.

We do not suggest that there should be an immediate scrapping of all the M of F milk subsidies and priorities that were created under war conditions. We do urge, however, that disposal of at least "industrial" milk should conform once more to the demands of the consumer. If he is prepared to pay more for his milk in the form of milk chocolate than he is prepared to pay for it in cheese, then his preference should prevail.

In this connection the remarks of the chairman at the recent annual general meeting of the Milk Marketing Board are of interest. Regretting that freedom to sell cream had not achieved higher sales, he said, "this and other better markets for milk in this country cannot be neglected any longer, otherwise a serious loss to our industry will result." Milk chocolate is, of course, one of the "other better markets."

COCOA PRICES

Turning to our main raw material, cocoa beans, you will recollect that after the Ministry of Food gave up buying on behalf of the industry we had an interim period when we operated an industrial panel. That ceased with the 1951-52 season. 1952 was thus the first year since 1939 when raw cocoa buying became the responsibility of the individual firms. When we were given this increased freedom we realised we had to face two contingencies: much greater fluctuation in price, and much more capital tied up in financing stocks. We have experienced both, but have no regrets. Under Ministry control, the price remained at £190 a ton from December, 1948, to June, 1950. It was then

increased to £208. In November, 1950, the Ministry handed over stocks at £275; by the end of the year the price was £300. Since then it has fluctuated violently between £245 in December, 1951, and £340 in March last year, a variation of nearly £100 a ton.

The average price paid for cocoa during the 1951-52 season was £250 a ton, with a Gold Coast crop of 207,000 tons. The final figure for the 1952-53 main crop is expected to be 244,000 tons, and the average price at which we have bought is £240 a ton.

SWOLLEN SHOOT CONTROL

For some years now I have reported the efforts we have made to stimulate an effective attack on swollen shoot, a disease that has devastated many of the cocoa-growing areas. A remarkable change of public opinion in British West Africa has recently taken place for which the Gold Coast Government is largely responsible. Now more farmers are complaining that their farms have not been treated and trees cut out than there were farmers last year said to be threatening violence if anyone dared to suggest cutting out. Recently 600,000 trees a month have been cut out, bringing the total to over 18 million up to date. It is a far cry from the days of frustration we suffered when we first began our campaign and although we rejoice at the progress made there is still much to be done, not only in swollen shoot control but in the control of other crop-wasting diseases also.

Experiments in the use of systemic insecticides are continuing, but the likelihood of this method being adopted on a large scale appears to be somewhat remote. Doubt has been expressed as to its efficacy, its cost if put into full practice would be many millions and it seems not unlikely it may have some undesirable effect on the beans.

HOME AND OVERSEAS SALES

Our sales in the home market showed a decrease in tonnage of 4 per cent. This was caused by a drop in the ration at the beginning of 1952 from 6½ oz to 6 oz, due in turn to a cut in sugar supplies and a reduction in unallocated raw materials.

Export sales showed a decline, but only a slight one, and remained at about 7,200 tons, near the £2½ million mark. Sales to the US Forces in this country, Germany, the Continent, India, ships' stores and our traditional export markets increased, but those to the United States, Canada and NAAFI showed a decline.

Overseas, our companies in Canada, Australia and Eire achieved record sales figures, while those in New Zealand and South Africa showed little change. Considerable extensions of plant and buildings took place in all of them. At home, our chief development is at Moreton, in the Wirral Peninsula, where a new factory is going up to schedule and where we anticipate production will begin about the end of the summer.

PRICE CONTROL AND RISING COSTS

Three weeks ago the accounts of the company and its parent concern were sent out to shareholders. They came in for some attention by various organs of the press and

comment was made that, though our consolidated sales at home and overseas showed an increase at £52 million, our profits had suffered a substantial drop. This was partly caused by a period of unprofitable trading in Canada and losses in some of our export markets. The chief reason, however, was that

we were not allowed to adjust our prices to rising costs in 1952. A review of prices was undertaken in the spring of 1952 by the official Price Control Committee. They agreed on a general upward revision. In the past their agreed recommendations had gone through almost automatically. On this occa-

sion higher authority intervened, and until price control was lifted this year a number of lines whose goodwill we were anxious not to lose had to be sold at unremunerative prices.

The report and accounts were adopted.

THE TUNNEL PORTLAND CEMENT COMPANY

OUTPUT AGAIN A RECORD

EXCEPTIONAL HOME MARKET DEMAND

CONTINUED PROGRESS OF OVERSEAS INTERESTS

MR N. M. JENSEN ON THE NEED FOR INCREASED CAPACITY

The forty-second annual general meeting of The Tunnel Portland Cement Company, Limited, will be held on July 27th, at 105, Piccadilly, London, W.1.

The following is the review by the chairman and managing director, Mr N. M. Jensen, which has been circulated with the report and accounts: Ladies and gentlemen, The pressure of home demand during the past financial year was so great that export deliveries had to be curtailed slightly. Total deliveries, however, have again broken all records.

ACCOUNTS

With somewhat lower profits in the export market and the slightly lower export tonnage the profit on trading before depreciation is £1,669,104, compared with £1,713,714 for the previous year. On the other hand, there is a considerable increase in income from investments, viz. from £182,538 to £435,643. You may remember that last year we were unable to include any dividend from the Helwan Portland Cement Company because, although declared, it had not been remitted to us at the time the accounts were made up. It was subsequently paid and the 1952 dividend was also received before the close of our financial year. We have, therefore, in the accounts now submitted included two years' dividends from the Helwan Company.

Depreciation has increased from £209,506 to £269,047 and we have again transferred out of profit for the year £200,000 to reserve for replacement of fixed assets, bringing this reserve up to £1,200,000.

Taxation, which includes a transfer from income-tax equalisation reserve of £49,000, absorbs £1,065,345, leaving a balance of profit for the year of £570,355. To this has been added the amount carried forward from the previous year of £469,657, making an available balance of £1,040,012.

A total of £32,660 was required for the dividends on the two classes of preference shares, and the interim dividend of 2½ per cent (less income tax) paid on the "A" ordinary shares and "B" ordinary stock absorbed £32,073.

Your directors propose a final dividend of 15 per cent (less income tax) making a total of 17½ per cent (less income tax) for the year. This would absorb £201,602, leaving a balance to be carried forward of £773,677.

In the company's balance sheet you will find a sum of £549,200, representing new additions to property, plant and equipment. The main items are the new kiln at the West Thurrock works, the balance of the cost of the extension of our Pitstone works and additions to our fleet of lorries.

We have used our tax reserve certificates for income tax and profits tax falling due during the year. Since the change in the

bank rate, we have preferred to keep cash not currently required on deposit with our bankers.

PRODUCTION AND DELIVERIES

During 1952, the consumption of cement in the home market and deliveries in the export market for the industry as a whole came very close to the forecast made, and the industry was able to produce the required quantity. Since the beginning of this year, however, the demand in the home market has exceeded the estimate. At the same time the industry has been under pressure to maintain as far as possible the export trade, particularly to the Commonwealth. Although the industry has increased its productive capacity and there is also some reduction in export, the heavy demand has caused a shortage which is now being met by imported cement.

The erection of the new kiln at the West Thurrock works to replace one of the old kilns proceeded according to schedule and it was put into operation in December, 1952. The extension of the grinding plant at the Clydebank works of our subsidiary, The Clyde Portland Cement Company, Limited, is going ahead, but it is not expected to be completed until the end of this year.

I might mention that during the year 1952 the total deliveries of the Tunnel group of companies were about 50 per cent above the deliveries in 1939, while the corresponding figure for the rest of the industry was about 34 per cent. Since the war we have replaced two of the oldest units at our West Thurrock works and, taking our group as a whole, we have increased our annual capacity at home by some 600,000 tons. The total capital expenditure involved is in the region of £5 million.

The capacity of the paper sack factory at West Thurrock, operated by our subsidiary, Essex Sack Company, Limited, has for some time been inadequate to meet the requirements of our various works. We have, therefore, wanted to build a new sack factory near the Padeswood works, but it is only recently that we have been able to obtain the necessary building licence. It is the intention to produce a new type of sack at this factory which will result in a considerable saving of paper.

FUTURE DEMAND

The present exceptional demand in the home market is, to a large extent, accounted for by defence work which one hopes will not have to continue indefinitely. It is difficult to assess, however, how much the need for defence work has displaced normal requirements of cement. There is a great deal of leeway to be made up in many directions. House building is bound to continue for many years and might be increased if suffi-

cient labour becomes available. More road building is long overdue and must be tackled as soon as labour and the necessary raw materials are available. The same applies to many other civil engineering works. Furthermore, concrete is increasingly replacing other materials, either on merits or because such materials are, and are likely to remain, in short supply.

With regard to export, 82 per cent of the country's export of cement is sold within the British Commonwealth and the remainder outside. The Colonies especially look to this country for cement supplies. At the moment Britain cannot send all they need by way of imports and, in view of the considerable developments that are taking place in many parts of the Commonwealth and elsewhere, I feel confident that the volume of export business is likely to remain there for some time. There will, undoubtedly, be a reduction in export prices, but since our costs are lower than those of most other countries, we shall be able to meet competition from Continental manufacturers without any difficulty.

On a long-term basis, the cement industry has always been a growing one, partly due to the increase in population, improvement of living standards and displacement of other materials. If one compares the annual home consumption of cement with that of other countries, the position is that Great Britain, in 1952, used 403 lbs. per capita as against: Austria, 453; Belgium, 682; Denmark, 449; Finland, 418; Eire, 458; Norway, 506; Sweden, 530; Switzerland, 629; Canada, 517; USA, 594. These figures suggest that we have by no means reached our peak consumption. If the growth continues on the same scale as before the war, the industry will find it difficult to meet the demand. Unfortunately, the building of new works is an expensive matter since the capital cost is about three to four times the prewar cost and this, of course, means much heavier depreciation and a larger capital to be remunerated. Your company has done more than its share of expansion since the war, but we are nevertheless investigating the possibility of extending either the Pitstone or the Padeswood works where we have almost unlimited supplies of raw materials available.

OVERSEAS INTERESTS

All the overseas companies in which we hold an interest have done well during the past year.

The extensions of the two works belonging to Cement Limited of Eire are progressing well and should come into production next year.

The Jamaican works of the Caribbean Cement Company have completed a very successful first year.

The Helwan Portland Cement Company of Egypt, in which we have a substan-

interest, have, in spite of the difficult economic conditions in that country, had quite a good year.

The Sudan Portland Cement Company have been working at full capacity and, I am glad to say, made a reasonable profit last year.

In the USA, the National Portland Cement Company have again had a successful year and further arrears of preference dividends have been paid off. When the US excess profits tax is removed or substituted by other taxation, the company should soon be in a position to pay off all arrears. We still hold about three quarters of a million dollars from the redemption of preferred stock of that company and this sum remains temporarily invested in American securities and bonds.

We have not made the progress I had hoped for with the scheme for a cement works in Cyprus. All financial and other arrangements with Wm. Baird and Company, Limited, who will be partners with us in this venture, have been agreed. Several months ago, agreement was also reached in principle with the Cyprus Government which welcomed the scheme, but some of the terms of the licence to the local company have yet to be agreed. I hope, however, the few outstanding points will soon be cleared up.

Last year, I mentioned we had bought the necessary land for a new works in New Zealand, but so far we have not proceeded further with those plans. The moment conditions become more favourable, it is our intention to follow the scheme up again.

In the early part of this year, I paid a visit to Kenya, where the Governor had invited us to look into a project for a new cement works near Nairobi. During my visit it was decided in principle that The East African Portland Cement Company would go ahead with the building of a complete cement works having a capacity of 100,000 tons per annum. The East African Portland Cement Company is financially controlled by your company and The Associated Portland Cement Manufacturers, Limited, jointly. About 40 per cent of the capital is held by local interests. The raw materials are at present being proved, and as soon as this work has been completed and final arrangements made with the Kenya Government, as well as the Masai Council, it is the intention to go ahead with the construction.

TAXATION

I must again refer to the heavy burden of taxation upon your company. In the year under review, some 58 per cent of your company's profits, after providing for normal depreciation, has been paid or reserved for taxation, 14½ per cent paid in dividends to shareholders and 27½ per cent retained in the business (11 per cent by transfer to replacement reserve and 16½ per cent as increase in carry forward). We all welcome the first steps the Chancellor of the Exchequer has taken to lighten the tax burden upon industry. The abolition of the Excess Profits Levy will remove a tax which bears heavily on all enterprises with an expanding business like ours.

DIRECTORATE

Mr R. J. Hillard, CMG, has been co-opted to the board. He has recently left the Sudan Government after many years of service and spent two of the last five years as the Director of the Department of Economics and Trade and three years as general manager of the Sudan Railways. His experience of the Middle East and Africa, where we have such substantial interests, will be of great value to your company.

May I, once more, record our appreciation of the whole-hearted co-operation of the management, staff and operatives in, our various companies.

VENNER LIMITED

MR ARTHUR A. ROWSE ON CONTINUED PROGRESS

The forty-second annual general meeting of Venner Limited was held on June 30th, at the registered office of the company, Beverley Way, Kingston-By-Pass, New Malden, Surrey.

Mr Arthur A. Rowse, CBE, MIMechE, MICE, MIEE (the chairman), who presided, said:

The report has been circulated, and I trust I may take it as read. (Agreed.) It is again gratifying to report that the output in the year under review constituted a new record, being very considerably in excess of that for 1951, which was then the highest recorded in the history of the company. Unfortunately, the benefit which should have accrued to the shareholders and to the inherent stability of the company in the form of reserves, was seriously reduced by the incidence of the excess profits levy, which absorbed no less than £10,050. This would otherwise have been available for dividend or for plant replacement purposes, and your directors would have recommended the allocation of the amount to reserves for this and other purposes to reinforce the productive capacity of the business. It is a clear example of the bad effect of the tax that the allocation to reserve should this year be reduced by so substantial an amount, and it emphasises the wisdom of the change in policy announced in the budget this year.

PROFIT AND DIVIDEND

The profit for the year, after depreciation, amounted to £73,902. Of this, income tax absorbs £32,515, profits tax £8,635, and excess profits levy already referred to, £10,050, a total tax deduction of £51,200, reducing the available balance to £22,702. To this must be added the amount of £14,102 carried forward from last year and the amount of £7,621, being over-provision for tax in previous years. The amount available for distribution is, therefore, £44,425, which your directors recommend should be allocated as under:

To dividend on 8 per cent cumulative preference shares for the year ended September 30, 1952, less income tax	£1,260
To general reserve	£10,000
To a dividend of 15 per cent on the ordinary stock, absorbing, less income tax	£17,820
Leaving to be carried forward	£15,345

BALANCE SHEET FEATURES

Turning to the balance sheet, it will be observed that the figures all show the effect of the increased turnover. Stock and work-in-progress has risen from £314,275 to £371,764. Debtors have gone up from £100,897 to £185,858 but the creditors show a smaller increase from £72,427 to £92,730. There has been a marked increase in the bank overdraft from £3,130 to £136,304. This is due to the need for financing the stocks and debtor increases noted above, which together add up to £142,450. The earned profits would have corrected the situation materially but for the fact that it was necessary to incur expenditure on new buildings amounting to £40,724 and to purchase substantial amounts of new plant. It will be noted that the fixed assets have gone up from £139,980 to £194,030 after providing for depreciation to date. The current assets have risen from £425,818 to £566,663 and now exceed current liabilities of £298,322 by £268,341 or more than the issued share capital. The picture

would be better were it not for the heavy taxation item of £51,200.

NEW BUILDING EXTENSIONS COMPLETED

The factory, both as regards buildings and plant, is in good condition and under continuous view to keep it up to date, although taxation constitutes a real problem and puts a limit on what can be done.

The new building extensions have been completed since the date of the balance sheet. Constructed on the most modern lines, lighted, heated and with power distribution to the best current standards, they constitute a valuable addition to the resources of the company, adaptable as they are to the most varied types of engineering products. They are fully occupied with very high-grade engineering work of a confidential nature.

DEMAND FOR TIME SWITCHES MAINTAINED

The demand for time switches, which led originally to the establishment of your company, has been well maintained and the company continues to be one of the leaders in this field. An extensive tour was undertaken recently by our sales manager to India and Australia with a view to further investigation of new markets and the consolidation of old. The company's products appear to be well received, and Australia in particular, where import restrictions have now been eased, is a substantial market for Venner specialities.

Shareholders may have noticed the new flashing beacons on zebra crossings and will be interested to learn that the major part of the installations throughout the country are being furnished by the company.

PROGRESS IN ACCUMULATOR FIELD

The accumulator has made considerable progress during the year and despite heavy development charges has made a small contribution to the profit. The company has every reason to be proud of its work in what is now seen to be a major technical development destined in this country, as it already does in the USA, to play an important part in specialised applications where weight and space are important.

Recent applications of standard productions embodying the accumulator are to be found on aircraft of British Overseas Airways and British European Airways. Much prototype development work is being done which should in due course extend the field of application considerably.

ELECTRONIC DEVELOPMENT

In the field of electronic development covered by the wholly owned subsidiary, Venner Electronics Limited, good headway has been made. Electronic aids for the whaling industry have been developed successfully, together with transmitting equipment for safety at sea, and experimental work in the field of remote switching by radio frequency is receiving attention. This work, together with the development of the accumulator, takes your company into entirely new markets, and exemplifies the policy of your board to expand the interests of your company into fields other than time switches.

PARKING METERS

During the year your directors formed the view that sooner or later there would arise a

demand for parking meters in this country. The company was able to conclude an agreement with American interests for the exclusive right to manufacture and sell in this country and the world, excluding the American continent, one of the best known and widely used parking meters in the USA, of which several hundred thousand are in satisfactory service. As and when conditions permit in this country and abroad, your company will be well equipped to enter this field, for which their plant is very suitable and for which they have the appropriate distribution facilities.

BUDGET ENCOURAGEMENT

The recent Budget contains much to encourage the company in further development. The relief in income tax, small as it is, is welcome. The reinstatement of initial allowances on new plant is a distinct help to the provision of new plant to keep the factory up-to-date, and enable low cost production to be achieved. So also is the abandonment at the end of this calendar year of the excess profits levy which bore so hardly on your company, related as it was to years when the company was labouring under governmental restrictions imposed in the critical years of electricity shortage. If present trends continue and there is no recurrence of punitive taxation, the future can be viewed with restrained optimism, though any definite forecast in the world conditions obtaining today would obviously be impossible to make and unwise to attempt.

The shareholders will, I am sure, wish to join the directors in conveying to the staff and employees their appreciation of another year of progress, and their thanks to all who have co-operated.

The report and accounts were adopted.

ODIHAMS PRESS

INCREASED CIRCULATIONS

The thirty-third annual general meeting of Odiham Press, Limited, was held on June 30th in London, Mr A. C. Duncan, FCA (Chairman), presiding.

The following are extracts from his circulated statement:

Our net profit of £1,034,130, after taxation, has increased by £97,000. This, I think, may be accepted as a satisfactory result.

In times of inflationary values, such as have been experienced during recent years, replacement costs have not been covered by depreciation allowances on pre-war capital costs. The wisdom of conserving the company's resources will, therefore, be obvious.

The directors recommend an increase of 5 per cent in the final ordinary dividend.

Your directors have decided that the sum of £1,269,000 out of reserves should be capitalised by converting the existing 4s. units into units of 10s. each in order to bring the issued ordinary share capital of the company more into line with the actual capital employed in the business. I think you will agree that the prudent policy pursued during recent years has been justified and that the reorganisation of our ordinary share capital is now timely and appropriate.

The trading results so far this year have been satisfactory, but many problems are likely to arise in the near future, including that of sponsored television, which will increase the competition in the advertising field.

The report and accounts, together with the special resolution relating to the increase of capital and the capitalisation of reserves were carried unanimously.

THE CLAN LINE STEAMERS LIMITED

POLICY OF PREPAREDNESS

LORD ROTHERWICK ON WAGE COSTS

The sixty-third annual general meeting of The Clan Line Steamers Limited was held on July 1st in London.

The Rt Hon Lord Rotherwick (the chairman) in the course of his speech said: I would like to place on record our appreciation of the services rendered by the inhabitants of Borne when our vessel the *Clan Macquarie* went ashore on the Isle of Lewis, not only for the able assistance they gave in the actual rescue operations, but also for their generous treatment of the captain and crew when they were landed. I am sure you would like me also to express your gratitude to and admiration for the coastguard crew from Stornoway who transported the life-saving equipment eighteen miles across open moorland in sleet and snow lashed by a wind which was recorded as having reached 112 miles per hour. It was found impossible to rig the breeches-buoy during the hours of darkness, but once contact was made the entire crew of sixty-six men were taken off in two hours forty minutes. This record will be hard to beat.

NEW DELIVERIES DELAY

The delivery dates of some of our new ships have been put back by as much as twelve months from the original estimate, due almost entirely to the shortage of steel plates. We are told in the House of Commons that steel allocations to shipyards have been increased by 5 per cent, but unfortunately no mention is made of the fact that deliveries, which after all are what really matter, are anything from 25 per cent to 40 per cent short of the allocation. Not only do we lose the benefit of these ships, but in a period of rising costs the delay adds considerably to the price we have to pay.

TAXATION

I am deeply concerned about the long-term replacement position, for so long as shipbuilding costs continue to rise the excess cost of replacement has to be found out of taxed income. Although initial allowances are a useful immediate contribution, they are no more than an interest-free temporary loan and furthermore, as we have seen, they lack permanency. For this reason I welcome any reduction in taxation, and the present Budget is a step in the right direction.

DIVIDEND AND FUTURE PROSPECTS

This year the proposed dividend has been increased to an equivalent of 20 p. cent on capital of £1,200,000 costing net 30,500. I must make it quite clear to you, however, that future dividends will depend entirely on the profits earned and, if you remember that large sums for replacement have to be provided out of taxed income, you will appreciate that, although your directors hope to maintain the 20 per cent rate, it is not by any means certain that they will be able to do so. In connection with replacement I must add that the question of new construction is under constant consideration and it may well be necessary to modify our plans, particularly if prices continue to rise.

I should like you to know something of the difficulties which we have to face during a period of falling commodity prices. In theory it should enable us to import more material, but this will only happen if the producing countries have a surplus or if they increase production at the risk in some cases

of depleting their natural resources. In practice I very much doubt if this will happen, as we are meeting increased competition from the other exporting countries, particularly Germany and Japan, and as their exports increase so they will be able to obtain a greater share of the available raw material. We do not obtain more materials the producing countries will have less sterling available for the purchase of our manufactured goods and, unless the cost of such goods falls, they must buy less. It is obvious there will be some fall in cost as the lower priced raw materials are used in production, but that is only one element of cost, the other is wages. The natural tendency would be for wage rates to fall as the purchasing power of money increases, but there is no indication of such a trend and, therefore, unless we can obtain an increase in the amount of work for each pound of wages paid there will be a reduction in the volume of our exports and a decline in the amount of shipping space required.

From my remarks it could be inferred that I view with disfavour falling commodity prices. Nothing could be further from the truth. What I fear is that this desirable movement may be unjustified and that we may be forced once again to devalue sterling, thereby increasing commodity prices and restart the inflationary spiral with wage increases always tending to lag behind the increase in the cost of living. Surely it is better to increase our production by giving incentives and abandoning restrictive practices. If we have any surplus labour we can use it so easily to improve our standard of living by creating better conditions in the home, factory and workshop.

High taxation is crippling incentive. I think there is good reason to give an individual more than an equal share if through his efforts he develops a product or an idea which makes a contribution towards the wealth of his country.

My company has always been receptive to new ideas, and I propose during the current year to intensify the work on research. As the members of our own staffs afloat and ashore may well be able to contribute useful ideas, I hope to be able to introduce a scheme whereby some financial reward will be given to the originator of a new idea capable of commercial exploitation and particularly if it can be exploited abroad.

We can improve our trading position materially by promoting greater freedom of trade within the Commonwealth and Empire, and I feel that every effort must be made to obtain the assistance of our partners. At the present time America is dependent on Canada for supplies of certain raw materials. As a result, in trade negotiations, Canada has been able to insist that America should accept partly fabricated goods instead of the simple raw materials. In these circumstances it appears to me that we might, through the agency of our Canadian friends, encourage the Americans to accept more of our manufactured goods. If this result could be achieved I should hope that any additional dollars earned would be used for investment in Canada, for we are lagging far behind in supplying capital for the further development of resources in a country with such potential opportunities.

COMPANY WELL EQUIPPED

I am very sure that I must end with a note of qualified optimism. As mentioned in the d

tors' report, we experienced a slackening in the demand for space during the latter part of the financial year, with a consequent reduction in the rate of profit earned. There are gloomy prophecies of what will happen if the world settles down to a period of peace. Although I appreciate the position, I am not prepared to accept this view, for slumps are created in the main by a sufficient number of people believing that there will be a slump. I prefer to adopt a policy of preparedness; ready to conserve if the need should arise, but always on the look-out for an opportunity to advance. In a world where all could use more goods, it will surely be a terrible condemnation of our economic system if we cannot maintain a high level of employment. If we create the right goods at the right price there will be a demand for our products, and I am satisfied that this company is well equipped to maintain its position, although we must not forget the dangers of subsidised foreign competition.

The report and accounts were adopted.

At the extraordinary general meeting the board's capitalisation and bonus issue proposals were approved.

HIELD BROTHERS LIMITED

COMPANY'S SILVER JUBILEE

SPECIAL BONUS TO SHAREHOLDERS AND EMPLOYEES

The thirty-first annual general meeting of Hield Brothers Limited, was held at Briggella Mills, Bradford, on June 30th, Mr David H. Hield (the chairman) presiding.

The following are extracts from the chairman's circulated statement:

I have pleasure in submitting the accounts of the company for the year ended March 31, 1953, showing a net profit of £126,242 after making full provision for taxation of £218,376.

In spite of adverse conditions our Canadian branch made a profit last year, but I regret to say that trading conditions for any Canadian producing unit remain difficult owing to the devalued £ and low Canadian import duties. I am happy to report that our English mills have run full time throughout the year. We have had the advantage of a rising market for wool from our stocktaking basis at March 31, 1952, when wool touched a very low point. Our policy continues to be to give the best competitive value we can to our customers, and today we have an order book which is as great in volume as it was a year ago.

SURVEY OF PROGRESS

This year we completed 25 years as a public company, and it is interesting to survey the progress made. Our shareholders have provided in all £577,000, including premium on share capital. Today our balance sheet shows net liquid assets of £952,882, apart from the value of fixed assets represented by six fully equipped mills. During this period we have paid out £503,498 (gross) to our preferred shareholders and £795,350 (gross) to our ordinary shareholders. During the same period the Inland Revenue has claimed from us £1,590,120.

The reserves which figure in our accounts are fully employed in the financing of the business. I am hoping the time will come when it will be convenient to capitalise some of these reserves, but for the moment we do not feel such action would be expedient, as values have again risen sharply this year, we may still need to call upon these reserves to meet the consequences of any fall.

ANALYSIS OF EACH £1 OF SALES

In considering the figures which I have put before you, some of which will seem big as compared with our nominal issued capital, I want to emphasise that they should be related to turnover. The margins in this trade can be very narrow at times. For instance, in the financial year to March 31, 1952, we find that each £ of sales represented:

	s.	d.
Materials	12	9
Wages, salaries and pensions	3	2
Services, supplies and expenses	2	1
Outside commission	9	
Depreciation	2	
	18	11
Taxation	8	
Net dividend	3	
Surplus retained in business	2	
	£1	0 0

We feel that twenty-five years of successful progress deserves to be recognised in a practical way to both operative and shareholder, and as it coincides with a profitable year's results the directors have distributed a special bonus based on length of service to every employee of the company, the total amount of which is approximately £25,000, and now recommend a special bonus to ordinary shareholders this year of 25 per cent over and above the dividend of 25 per cent.

Everyone in this business works hard, and we shall continue to do our best in the future to improve on the record of achievement of the last 25 years which I have so briefly set before you.

The report was adopted.

WORTHINGTON-SIMPSON, LIMITED

The sixty-second annual general meeting of Worthington-Simpson, Limited, was held on July 2nd in London, Mr John Southern (managing director), presiding in the absence through indisposition of Sir Samuel R. Beale, KBE (the chairman).

The following is an extract from the chairman's circulated statement for 1952:

I am very pleased to submit to you again a most satisfactory report and statement of accounts in respect of the year under review. The progress of the company has continued and the output for the year 1952 was again higher than that for the previous year. The trading profit at £691,715 shows an increase on the 1951 figure of £97,761, and a net profit on the year of £239,603 is shown against £217,363 for 1951.

In spite of the heavy rate of taxation, including £63,500 for excess profits levy, the account now shows an improved financial position over the previous year.

Our order book at April 30, 1953, is still at a high level and slightly higher than the corresponding period a year ago. Our heavy engineering side is assured of a steady load for the next two or three years. Incoming business for our smaller trade lines of pumps was eased in recent months, largely due to import restrictions abroad. The home demands have kept up reasonably well.

The commitments for capital expenditure amounting to £68,283 are about the same as last year, largely because we have not yet received delivery of the machine tools on order at that time.

It is proposed to distribute a share bonus of one new 10s. ordinary share for every 11 ordinary shares held.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

ANNUAL GENERAL MEETING

The annual general meeting of this company was held on June 30th in London.

Sir Frederick Godber, the chairman, in the course of his speech, said: Viscount Weir of Eastwood is by his own desire retiring from the board of your company, of which he has been a director since January, 1939. I am glad to have this opportunity of expressing the gratitude of my colleagues and myself for the help and advice which he has so readily made available to us and which his long experience in many industrial spheres has made so valuable during both the late war and the difficult years which followed it.

SIR ANDREW AGNEW

It is with pleasure that I record that Sir Andrew Agnew this year completes fifty years of service with your company and its associates. He started handling Shell affairs in Singapore in 1903. In 1922 he was appointed a director of your company and since 1935 has been a managing director. The honour of Knighthood was conferred upon him in 1938. During World War II he was chairman of the Petroleum Board which handled the problem of maintaining petroleum supplies. We all hope that Sir Andrew will continue to give your company the benefit of his long and varied experience for many years to come.

You will be glad to hear that the Hon Peter Samuel, who has been a director of your company since 1937, has recently been elected to the boards of the Shell and Anglo-Saxon Petroleum Companies, in which capacity his wide knowledge of banking and finance will become more closely available to the affairs of our group. Major Samuel served in the Middle East during the war and was awarded the Military Cross for gallantry in action at the Battle of Alamein. He comes from a family with a tradition of service to your company. You will remember that his grandfather, the first Viscount, was not only its founder but was for many years its chairman, whilst his father, the second Viscount Bearsted, was also chairman for many years.

SIR FRANCIS HOPWOOD

There is one other matter that has occurred since the publication of my statement and that is the honour of Knighthood conferred upon one of our managing directors, the Hon Francis Hopwood. I am sure you will desire to add your congratulations to those of the board. It is undoubtedly a well-deserved reward for his leadership with the other managing directors of the group and, as in the case of those of us who have been similarly honoured, we may perhaps also look upon it as a recognition of our group's contribution to the national effort. That it comes in Coronation year is all the more pleasing.

On the proposition of the chairman, seconded by Sir Andrew Agnew, CBE, the report and accounts were unanimously adopted: the retiring directors, the Hon Peter Samuel, MC, TD, the Hon Randal H. Vivian Smith and Sir Kenneth B. Harper, were re-elected and the remuneration of the auditors, Messrs Turquand, Youngs and Company, was fixed.

The Rt Hon Viscount Knollys, KCMG, proposed a vote of thanks to the chairman, directors and staff.

Mr A. E. D. Anderson seconded the vote and it was unanimously accorded, a brief acknowledgment by the chairman concluding the proceedings.

GODFREY PHILLIPS, LIMITED

SALES MAINTAINED

The forty-fourth annual general meeting of Godfrey Phillips, Limited, was held on June 26th in London.

Mr P. A. Godfrey Phillips (chairman and managing director), in the course of his speech, said:

The profit after deducting taxation shown as attributable to the group is £430,844, as against £650,361. Last year I referred to the various difficulties that we should have to face with increased cost of raw materials and wages both here and overseas and with drastic governmental restrictions on our import trade into Australia.

LOWER PROFIT MARGINS

As I forecast, margins of profits have dropped both at home and overseas and fresh markets which have been found to replace other markets where our sales have become restricted have not shown equally good returns. It is some consolation, however, that although we have not been able to maintain the profit shown on our world-wide trading, we were able in 1952, taking all our factories together, to manufacture and sell almost the identical volume of tobacco goods. After the transfer to "capital reserve" of approximately £120,000 and the payment of preference dividends, including £14,767 arrears payable on the "B" preference, and if confirmed by this meeting a totalled ordinary dividend of 15 per cent for the year, the carry forward will be increased from £1,961,000 to £2,025,000.

It is never easy to forecast trading results where we manufacture and sell under so many varying conditions. The cost of our raw leaf shows no tendency to fall and in most of the markets continues to rise. As competition becomes more intense both at home and abroad so increased expense becomes necessary in the presentation and advertising of our products. Although the restrictions on imports into Australia have been slightly relaxed, we shall only be able to import into that market 30 per cent of the cigarettes shipped there in the fiscal year 1950-51; this not only seriously affects our manufacturing profits in England, but also, by reducing the quantity of goods available for distribution in Australia by our Australian company, increases the overhead factor in their cost of distributing their own manufactures.

PROSPECTS FOR 1953

There has been a tendency throughout the world for money to become tighter, and the first to suffer are those who specialise in high-class quality lines. Your group, through its subsidiaries, has always enjoyed a relatively large share of this semi-luxury trade, and it is inevitably suffering as a consequence. In all these circumstances it is, I fear, too much to hope that we shall be able in 1953 to maintain our profits even at the reduced 1952 rate; should these fears be well founded, then the board will have to consider carefully whether they can recommend the maintenance of the ordinary dividend at the present rate.

Your board's policy in extending its activities by the formation of manufacturing companies throughout the Empire has been fully justified and all its overseas companies are happily thriving. I would particularly like to congratulate the Indian board on the great progress they made last year. I am glad to be able to report that the excellent relations that have always existed between the managements and employees in all our factories are still maintained and I should like to send to all our people both at home and overseas the

thanks of this meeting for their continued loyal support.

The report was adopted.

GEORGE WIMPEY & CO., LIMITED

HUGE HOME PROGRAMME EXECUTED

The thirty-fourth annual general meeting of George Wimpey & Co., Limited, was held on July 1st in London.

Sir Godfrey Mitchell (the chairman) presided and, in the course of his speech, said:

Aided by particularly good contracting weather, your company has, once again, made a considerable advance in the volume of work carried out during 1952. Throughout the United Kingdom a huge programme of building, civil and mechanical engineering work of every description has been successfully carried out, while our overseas activities have made a contribution very substantially in excess of any previous year.

Perhaps the major development in our ever-expanding overseas interests was the commencement of the new 5-million ton oil refinery and oil port at Aden for the Anglo-Iranian Oil Company. We are joint contractors for this huge project, estimated to cost about 50 million pounds, with our American friends, Middle East Bechtel Corporation.

After reviewing in detail the progress of the company's other world-wide interests, the statement continues:

At home we have once again been in the forefront of the Housing Programme, having handed over some 10,000 dwellings during the year.

The extension of our "No-Fines" concrete technique to the construction of multi-storey flats has been most successful, and has aroused considerable interest.

We have been very busy throughout the year on our contracts for the oil companies. At Grangemouth, building and civil engineering work continued, and at the Isle of Grain an immense amount of fabrication and installation of refinery plant and equipment has been carried out.

A considerable volume of building, civil and mechanical engineering has been executed at the great new chemical works at Ellesmere Port.

We have maintained our excellent progress in the construction of the Tunnels at Meig and Luichart for the North of Scotland Hydro-Electric Board. Although there was a scarcity of civil engineering projects of magnitude we have, nevertheless, carried out a wide diversity of contracts which, although individually not of great size, have amounted in the aggregate to a substantial proportion of our turnover.

The profits have risen from £540,000 in 1951 to £1,800,000 in 1952. It may be of interest to mention that our net profit before tax of £1,800,000 represents 3.8 per cent on the value of £47 million of work carried out.

It is proposed to pay a dividend of 7½ per cent on our ordinary shares and to issue to ordinary shareholders 50,000 5 per cent redeemable second cumulative preference shares of £1 each as a bonus, on the basis of one preference share for every twenty ordinary shares held.

Looking to the future, we have made a good start on a programme of work which promises to exceed all previous records, and although in this industry it is dangerous to prophesy, I am confident that we may look forward to a year of continued progress.

The report was adopted.

THE ECONOMIST, JULY 4, 1953

GREEN, HEARN & COMPANY

The fifteenth annual general meeting of Green, Hearn & Company, Limited, was held on June 30th in London, Mr Michael Marks (one of the joint managing directors) presiding.

The following are extracts from his circulated statement:

Your company's splendid record in showing a substantial annual increase in sales over the past years was not maintained during the year in consequence of the retarding factors to which your attention was drawn last year. In the circumstances you will doubtless agree that our earnings, which for 1952 amounted to £92,100, bear a satisfactory comparison with those of 1951, at £113,147.

Our current trading results show a comparative increase in turnover and in earnings and it is hoped that, subject only to any recurrence of world-wide trading difficulties, your directors next year will be able to report a resumption of the continued expansion which has been indicated in successive preceding years.

The high reputation for quality and value which Lyndale Coats and Suits have attained ensures that any general rise in public consumption will be accompanied by an increased demand for the company's products.

The report was adopted and a total distribution of 32½ per cent approved.

At a subsequent extraordinary general meeting the board's capitalisation proposals and bonus issue of one new 2s. ordinary share for each three ordinary shares held was approved.

HIGHAMS, LIMITED

TURNOVER FULLY MAINTAINED

The forty-fifth ordinary general meeting of Highams, Limited, was held on July 1st in London, Mr Eli Higham (the chairman) presiding.

The following is an extract from his circulated statement:

It has been a difficult year for textiles generally, almost amounting to a minor slump in the summer of 1952. In spite of this it is most gratifying to have been able to show an increased profit.

The year's result justifies to a large extent the confidence which I expressed last year, a confidence which was based on two main facts, one, that we are a vertical combine, producing household necessities as opposed to luxuries, and secondly, that they did not, in the main, attract purchase tax.

Your board recommend a final dividend of 12½ per cent and a bonus of 5 per cent, thus equalling last year's distribution of 27½ per cent.

The finances of your company are in a healthy state, turnover has been fully maintained and the stock is at the minimum level required for normal trading.

Developments of a far-reaching character have been planned during the year under review, the cost of which will amount to almost £150,000.

I see no reason why I should not be reasonably optimistic about the year in front of us, but one must always bear in mind the effect which a fall in value of raw materials can have on the trading profit; there is no doubt that the tendency of values is in a downward direction.

The report was adopted.

THE ECONOMIST, JULY 11, 1953

WATER - ESSENTIAL FOR CIVILIZATION From the very beginning of civilization, the well-being of all peoples has depended upon the availability of clean, fresh water. Today adequate quantities of drinkable water are of increasing importance for domestic, industrial and agricultural activities. As this basic condition cannot always be met on the spot, the necessity often arises to build water plants at a distance from towns and villages for the provision of a piped supply.

Here again, the unique features of the Mannesmann Steel Tube have opened up new opportunities. That is why extended piping systems made up of Mannesmann steel tubes are being operated in so many areas throughout the world.

Mannesmann design, manufacture and install:

**What is
Quantuplication?**

A problem always confronting national advertisers is . . . *which combination of the leading national daily newspapers will carry my advertising to the largest possible market at the most economic cost.*

The DAILY HERALD now presents advertisers with a guide to media planning—QUANTUPLICATION—a series of tables based on recent surveys which show for 20 commodity groups the total market reached by any combination of the leading national dailies, and what it costs to reach that market.

Quantuplication is something new in advertising economics. The name has been coined to describe the overlap involved at all stages when five daily newspapers are considered—up to and including quintuplication.

If you are in any way concerned with advertising in the national press, Quantuplication must interest you. A copy will be sent on application to:

Landmark in resin development

Resins have long been important raw materials for the manufacture of paints, lacquers and other surface coatings. Originally, only natural gums and resins extracted from trees were available. Then the first synthetic resins were discovered, bringing not only the advantage of increased and steady supply, but many qualitative advantages also. Now comes a further important advance in synthetic resin development—Epikote Resins, the reward for years of research by Shell in this field. Epikote Resins make possible the production of coatings which combine toughness, flexibility and adhesion to give finishes hard-wearing to a degree never before achieved. Their use can confer an extended working life and prolonged good appearance on a vast range of industrial and domestic equipment.

Epikote Resins from Shell Chemicals

The Riddle of Prosperity

WITH the general blessing of both the major parties, the Government has introduced a Bill which will enable the Monopolies Commission to undertake several investigations concurrently and to pursue them with more expedition. It is not, however, proposed significantly to extend the scope of the Commission or to sharpen its teeth. This Bill, and the circumstances of its introduction, accurately reflect the present state of public opinion in this country. Everybody agrees that monopolistic restriction can go too far and that it is a proper subject for investigation. That is something gained since the thirties. What is more, it is accepted both by the managerial community, whose opinions so strongly influence those of the Conservative Party, and by the trade unions, whose opinions dominate those of the Labour Party. That also is something gained.

But it would be a great mistake to overrate the extent of the change in opinion. It would be a wild exaggeration to say that the merits of real competition are yet recognised in any but a few corners of the managerial community or anywhere at all in the trade unions. On the contrary, competition is still a dirty word in these islands, never to be allowed out in public without some guardian epithet to proclaim its disgrace, such as "cut-throat," "harmful," "wasteful" or "destructive." When industrialists talk of "monopoly" and agree to its investigation, and conceivably even to its condemnation, they do not mean anything that enters into the normal practices of British industry, but only something abnormal and exceptional, which can safely be deprecated without in any way disturbing their own established procedures. When trade unionists speak of monopoly they mean only something that wicked capitalists do; they are not prepared to admit (and their refusal is enshrined in the terms of reference of the Monopolies Commission) that it is even imaginable for monopolistic restrictions to exist in the trade union world or in publicly owned corporations.

The prevention of monopoly, in short, has become in the last few years something to which it is good form to pay verbal tribute. One might even go so far as to hack off one or two of monopoly's outlying tentacles. But no impression whatever has been made on the great body of restrictionism in this country. Nor could any such attempt be made, for public opinion would not support it. Monopoly is becoming something that everybody talks about, and nobody does anything effective about.

Much the same can be said, though perhaps a little less sweepingly, about the subject of economic efficiency in general. Under the device of "productivity," there has been a very widespread recognition throughout the country since the war that, if Britain is not to starve in idleness, there must be a great and rapid increase in general economic efficiency. A great deal of most praiseworthy effort has been put into the examination of the subject. The labours of the Anglo-American Productivity Council and its successor have, in

particular, been monumental. Much has been said and much written. Some things have also been done: productivity, at least in some British industries, and so far as it can be measured statistically, has been rising more rapidly since the war than before. And yet it is difficult to believe that the fundamentals have been tackled. Ordinary observation does not suggest that the gap in general economic efficiency between Britain and America has been significantly closed in these years; on the contrary, it seems to be widening. German industry, after lying prostrate for several years, is now moving forward at a speed which finds little reflection here. There are several other countries which, with much less conscious attention to the subject, have yet achieved more.

It begins to look as if we have been dealing with the surface symptoms of poor productivity and that the real causes lie deeper. For a few years after the war, it was possible to ascribe a great deal to the lingering effects of the disorganisation and the exhaustion of the war itself. But that excuse serves no longer. For a time, it was believed that productivity could be increased by exhortation. It had a little effect, but only here and there, and for short periods. Exhortation will work only when it can act as a lever on a firm fulcrum of faith; and in this country, it appears, faith in the merits—one might say in the morality—of economic achievement is dim. Then there was the phase of believing that the trick could be done by more and newer and better machinery. There is something in that too. But as an immediate stimulant to British productivity it suffers from two defects. There is a shortage of savings to pay for the machines. And machines will do little without the will to use them. In the last eighteen months, monetary discipline has been tried, and its effects have been considerable. But no one would claim that monetary policy can change the basic shape and spirit of a nation's economy.

Slowly, therefore, the conviction has been growing that the essential element has been missing. That element is the human will. Unless the ordinary man or woman sees the virtue, or at least the necessity, of producing more, more will not be produced. Even the Communists, who are taught to regard human beings as machines, are beginning to learn this truth. Certainly in a free society, it is basic. And perhaps no set of people more badly need recalling to it than the professional economists. For many years now, the fashionable economics has been almost wholly mechanistic. The phenomena of economic life have been explained by formulae as rigid and as generalised as those of the natural sciences. Men have constructed machines to show how human society works, and "models" to show how it ought to be made to work. And since everything is believed to be mechanical, it follows that everything can be controlled and predicted.

But this has all really been a great mistake. The human being stupidly and stubbornly persists in being human. His consumption function is variable; his propensity to save is subject to the most whimsical

variations. The difference between progress and stagnation does not turn on matters that can be regulated by a planner's decrees; it lies deeper in mass psychology. And if an explanation is sought for the fact that the progress made in improving productivity in Britain since the war has been, not perhaps poor in absolute terms, but so inadequate in relation to the acknowledged need, then it is to be found not so much in economic policies or party programmes but in the everyday attitude of the people as they go about their business. It is not the economist or the politician so much as the sociologist, the psychologist—and perhaps the moralist—who can find the answer. The real question to ask is not why we do not produce more but why we do not want to produce more.

★

Two recently published books, both of which were reviewed in *The Economist* at the time of publication, serve to illustrate this thesis. The first* is the book that Mr Graham Hutton wrote at the request of the British Productivity Council, to sum up the general lessons that can be drawn from the reports of the three score productivity teams which crossed the Atlantic to prospect for the secret of American prosperity. After all has been said that can be said on the direct constituents of American productivity, on the quality of management, on the use of machinery and the organisation of production, on standardisation, on labour relations, it is apparent that only a small part of the answer has been given. The real secret of American productivity is that American society is imbued through and through with the desirability, the rightness, the morality of production. Men serve God in America, in all seriousness and sincerity, through striving for economic efficiency. But in Britain, if any moral feeling at all survives about economic matters, it is usually a vague suspicion that economic success is reprehensible and unworthy. From this difference in attitudes everything else follows.

The second book is of a very different character.† It is an attempt by Professor Walt Rostow of the Massachusetts Institute of Technology to classify some of the psychological elements that underlie economic behaviour. What, he asks, are the basic determinants of the pace at which an economy grows? And he suggests that the answer is to be found in variations, as between one country and another, or between one time and another, in six fundamental functions:

1. The propensity to develop fundamental science (physical and social).
2. The propensity to apply science to economic ends.
3. The propensity to accept innovations.
4. The propensity to desire material advance.
5. The propensity to consume rather than to save.
6. The propensity to have children.

* "We Too Can Prosper." By Graham Hutton. Published by Allen & Unwin. 12s. Reviewed in *The Economist* of May 23, 1953.

† "The Process of Economic Growth." By W. W. Rostow. Published in England by the Oxford University Press. 25s. Reviewed in *The Economist* of May 16, 1953.

Others will no doubt quarrel with this list and prefer one of their own. But Professor Rostow is to be congratulated on a pioneer attempt to take the searchlight of analysis down into the unexplored foundations of economic behaviour. If this is not an exact list of the basic determinants, then it is an illuminating first approximation. It enables one to propound an answer to the question of why one nation prospers and another stagnates. The proximate answer is that a nation will make rapid economic advance so long as all six, or at least four or five, of these propensities are in a conjuncture favourable to productivity. In the United States today, for example, all six are in the right posture. In Britain, of only one, the first, can the same be said with any confidence. Our pure science is good. But we do not apply it; we prefer stability to change; we prefer leisure to wealth; we do not save; and we barely reproduce ourselves. To analyse the matter in this way is not, of course, to arrive at the final answer. It must still be asked why these attitudes prevail, and why they are so different at different times and in different places.

Behind the Curtain

THE recent dramatic events in Eastern Germany must not be allowed to overshadow the remarkable and puzzling news that has been coming from the neighbouring Communist regimes. In Czechoslovakia resistance as staunch—and in Pilsen as bloody—as that of the Berliners, successful protests by trade unions against the party and extensive absenteeism. In Hungary passive resistance by the peasants, discontent in the industrial towns, followed by a drastic reshuffle of the government. In Poland a simmering resentment of the government. In about which few trustworthy details are to be had. In Rumania and Bulgaria rumours—but so far nothing but rumours—of similar events in the making. This picture is in some ways more significant than that presented by the Soviet Zone of Germany, for in these countries well behind the iron curtain there is less organised contact with the West, escape is more difficult, resistance looks more hopeless. Moreover, in Eastern Germany the Russians have a special motive for conniving at, if not approving, the humble apologies of Grotewohl for past errors and the tardy amends now being made to the poor, the oppressed and the over-worked. So long as there is even a possibility of free elections having to be conceded as part of their wider Germany strategy, they must get the East German population out of a mood that would produce too crushing a defeat for those political elements that have co-operated with them.

What are the important features of this unrest among the satellites? Why has it broken to the surface just at this time? What could be the effect in the Soviet Union itself of the knowledge that the end of the Stalin era

But the analysis does serve to direct the inquiries in specific directions. And it also serves to underline the fact that the answers, when they are reached, are more likely to be found in mass psychology than in logic or in physics. It is, in literal truth, faith that moves mountains, even when it employs bulldozers. It is, in essence, this truth that is applied to the problems of economic development in the book by Professor Nurkse reviewed on page 95 of this issue.

How does a nation set about changing its own frame of mind? That it needs to be done will not be denied by anybody who realises what the economic hazards of the future mean for a people situated as we are. That it can be done will hardly be denied by anybody who reflects upon the enormous change in precisely these attitudes that has occurred in the last two generations or so, much of it the direct result of deliberate teaching. How shall we set about restoring some belief in the rightness of effort, the morality of success? How shall we make the British people determined to be prosperous?

has stirred into action the peasants and workers of other Communist states? It will need time to be sure of the answers to these questions and to assess what Moscow's policy in its European empire now is, or is likely to become. But some answers have to be sought now, because the questions force themselves into any consultations between the western allies about their future dealings with the new men in the Kremlin.

Two or three things only are clear beyond dispute. The first is that the causes of trouble are primarily economic. This is not a rising of the dispossessed middle classes and dissident political elements against Communist tyranny; nor is there any evidence that western propaganda and subversive activity have brought about organised and carefully timed coups. The evidence is of spontaneous refusal by workers and peasants to tolerate any longer the conditions of their daily work and living. Ruthless and doctrinaire handling of the villages has cut down food supplies to the towns with their increasing populations. Bewildered peasants have no confidence either in the local regimes or in their currencies; they neither work nor plan for the future. In the factories the raising of production norms, the constant pressure to fulfil impossible plans, and the interference by the party have caused intense resentment; at home the complaint has been against high prices, lack of food and the absence from the shops of consumer goods worth working hard to buy.

Secondly, the sequence of cause and effect over the last five years is clear enough. Communist insistence on industrialisation in the towns and collectivisation in the villages has brought about a reckless kind of

planning. Production and investment policies in each satellite country have been fitted into a general pattern designed to serve the five-year plans of the Soviet Union. The emphasis has been on the growth of heavy industry which will simultaneously create a politically conscious urban proletariat and increase the war potential of the Soviet bloc. The neglect of consumer goods, combined with exaggerated investment programmes and the resistance of the peasants, have caused an inflation beyond the power of the governments to control. Workers able to eat and buy less and less were being urged to work more and more.

★

That this state of affairs was being created has been pointed out more than once in these columns; and the admissions and exhortations of the Communist planners themselves have fully confirmed the diagnosis. It can, indeed, be said that the workers' discontent was causing anxiety in Berlin, Prague, Budapest, Warsaw and Moscow before Stalin's death. Since that event it has come to a head; the Communists everywhere find themselves faced with the deeply disturbing fact that the proletariat is rebelling against the dictatorship of the proletariat. To say, as *Pravda* and General Dibrova in Berlin have said, that western agents and propaganda are responsible for the crisis in Communist affairs is merely to make one factor, and certainly not a major one, into the main cause. When the elder statesmen of European Communism publicly admit that they have been too ruthless, that they have industrialised too fast, and that officials have tyrannised individual citizens—then it is clear that psychological warfare, a much overrated weapon, has done no more than exploit a crisis created by the Communists themselves—if it has done even as much as that. It is also clear that Soviet policy has had to take different measures in different countries. If the peasants and workers are being appeased in Eastern Germany and Hungary, the screw is still being kept tight in Czechoslovakia and Poland. If the industrial plan is being maintained in one country, perhaps only for the time being, it is being modified in another. The monolith of Eastern Europe is showing deep cracks.

Two main questions have therefore to be answered before western policy can decide its attitude to events behind the iron curtain. What will be the effects in the Soviet Union of these developments, and how will Malenkov and his colleagues handle them? One thing is certain. If the changes in economic policy now being promised in the satellite countries are to be carried out, they must have some effect on planning in the Soviet Union itself. What precisely that will be we cannot tell; but it is reasonable to guess that the industrial equipment and war production furnished by Germans, Poles, Czechs, and Hungarians will fall well below expectations; that the production of consumer goods in the Communist bloc will have to be increased; and that the whole pattern of trade between the Soviet Union

and its neighbours will have to be revised. This is, of course, to assume that what has now been started must go on, that the governments cannot revert to pure Stalinism, and that Eastern Europe must work out policies something like the New Economic Policy that Lenin was obliged to introduce five years after the Bolshevik Revolution. The men of Prague, Warsaw and Budapest may be on a slippery slope.

★

The fact that this is so will become known in the Soviet Union and is bound to play some part in the calculations of Malenkov and his colleagues. It is significant that they have already found it necessary to order factory meetings at which it is explained that disorders in the "people's democracies" are entirely due to western intrigue and provocation. But the Russian worker will doubtless notice that these disorders have in fact secured a better deal for those taking part in them. And he may well wonder whether the concessions that he has been receiving since Stalin's death are somehow part of a general movement of ideas and feelings in the Soviet empire. How his rulers will handle the situation it is impossible to tell; but the next few months may throw much more light on the stresses and strains that make themselves felt in the imperial capital of Moscow.

These conclusions, tentative though they must be, strengthen the case for caution and patience in western policy. It would be foolish to disregard the weaknesses that have been revealed in the Russian hand; but it would be just as foolish to seek a quick and dramatic exploitation of them. The importance of the resistance that has been reported from beyond the iron curtain lies in the fact that it is economic rather than political, that it is spontaneous and not organised, that it may be directed—if there is any direction at all—by workers who want freedom to protest and a better standard of life without wanting a return to prewar ways of government. For the West to attempt to give direction and leadership to these movements would be to provide the Russians and their protégés with the justification they need for a return to sheer terrorism and repression. To keep flowing behind the iron curtain the current of news about what is going on, to keep alive the spirit of criticism and discussion, to reflect the strength and sympathy of the free world—all these are possible and vital things for the West to do. For the objective is still that the peoples of Eastern Europe (Eastern Germany is a problem apart) should one day liberate themselves. If the allied consultations that have now been set in train produce the decision that talks with Moscow should be undertaken, then President Eisenhower and his colleagues could use whatever opportunities negotiation might offer to express their interest in Eastern Europe's future. Until then it would be wise to watch and study the Kremlin's effort to cope with problems of imperialism unique in its experience. To interfere is to run the risk of doing the wrong thing in a most complex and fluid situation.

The Pains of Irish Protectionism

ANOTHER crisis in Irish politics was passed last week. Mr de Valera's government had been defeated in two by-elections. Its parliamentary majority, always narrow, had almost disappeared. Mr de Valera put himself to the test of a vote of confidence in the *Dail*, where everything depended on how the Independents divided. They gave the government a majority of two, with one abstention, and Mr de Valera has obviously decided to trust to this majority in the hope that things will improve before he is obliged to go to the country.

This decision settles nothing. At the most, it prolongs a period of unusual instability. Mr de Valera returned to office, just over two years ago, in most unusual circumstances. The general election had seemed to point to a continuance of the coalition of his opponents which had governed the country since 1948. Mr de Valera's party, *Fianna Fail*, had gained very little in the election. Its principal rival, *Fine Gael*, had markedly increased its representation. But the allies of *Fine Gael* in the inter-party government had lost seats, and when the new *Dail* met enough independent deputies were found to put Mr Costello out and Mr de Valera in.

The new government defined its policy as being to restore stability to public finance and the balance of payments, to press on with a programme of capital investment and to introduce further social legislation. The confused politics of the last two years have, indeed, turned on these matters. They have been the more confused since very often differences of opinion run through rather than between the parties. In financial policy, Mr MacEntee's two budgets have borne full witness to his conviction that accounts must be balanced. In 1952, direct and indirect taxes were increased and most of the food subsidies abolished; this year, the budget speech brought no relief to the taxpayer. Such measures required considerable courage; the pity is that they have not produced the orthodox rewards of a balanced budget. Public expenditure has increased commensurately with taxation; indeed, the two sides of the account were only brought into some relation to each other in this year's budget by Mr MacEntee's promise to effect economies in administration and to abstain from increased government activity until the national income has increased. The fulfilment of this promise would entail placing a standstill order on the activities of the Minister for Industry and Commerce, Mr Lemass. He, it is believed, is unimpressed by the anxieties of the Department of Finance.

Mr Lemass has his own worries. Programmes of capital investment are pressed with the same vigour as in the days of Marshall aid, and state borrowing continues, though at markedly higher rates of interest. The

main form of investment is still housing and kindred services. Though there has recently been a seasonal decline, unemployment is running at higher levels. While part of the increase may reflect the extended scope of unemployment relief, the employment situation is now genuinely more difficult than at any time since the end of the war. The remedies applied by Mr Lemass take the traditional protectionist forms of higher tariffs and smaller import quotas. The consequent increase in prices bears heavily on a community that has to provide for higher taxation. It is arguable that

STRENGTH OF THE PARTIES

	1948 Election	1951 Election	Now
Fianna Fail (de Valera) ...	68	69	69
Fine Gael (Costello)	31	40	45
Labour	19	16	15
Clann na Poblachta			
(McBride)	10	2	2
Farmers	7	6	7
Independent	12	14	9

a prime element in the economic situation is that the public cannot afford the level of costs and prices that government policy has helped to create. Ireland perhaps provides an example of how protection and high taxes can price an economy out of its own market. Certainly the most prosperous sector of the economy is that which stands to "gain" least from protection. Agricultural exports have increased; aided by the reaction from stockpiling, this has brought about a notable improvement in the balance of payments. On the other hand, the costs of Irish agriculture are already sufficient to price some of its products out of possible export markets.

★

The government is under a special obligation to sponsor further social legislation. Its majority depends partly on the support of Dr Browne, who resigned from the previous government when he did not receive his colleagues' support for a scheme of maternity treatment that was strongly opposed by the Catholic bishops and by the doctors. For some time past the *Dail* has discussed a new health bill; chiefly in terms of what the opposition thinks of Dr Browne and what he thinks of his medical and political colleagues. There has been little discussion of the bigger issues involved—of how far it is possible to improve health services by simple reorganisation, or of the implications of burdening the budget with the heavy overheads of extensive health services. Behind these matters lies the further question—which in Ireland is not merely unanswered but hardly, as yet, fully phrased—of the proper place of

state services in the community. It has been well remarked that Ireland is at present attempting to combine social ideas resembling those of, say, Portugal, with the legislative framework of a welfare state on British lines.

It is doubtful if the electorate relates the health bill to those fundamental principles. Indeed, the importance of social legislation in Irish politics can be exaggerated. It is often said that while Dr Browne brought down the inter-party government by his resignation it was in fact driven to a general election by a dispute with the dairy farmers about the price of milk, an issue which stirs more electors more deeply than all the maternity services that were ever thought of. Some provisions of the health bill would increase local taxation, and it may be remembered that Irish farmers escape income tax but do pay rates.

All these questions have been sharpened by the succession of government defeats in by-elections, which have made Mr de Valera's position so insecure. His

waiting tactics may succeed. He may ride out the storm. But there is no margin for accidents. And whether or not the government is able eventually to face the electorate in happier circumstances, the problems that have occupied attention for the last two years will remain. It is not obvious that they will in any event be tackled. Some of the economic policies that are needed—such as the freeing of trade and reduction of costs in both the public and private sectors of the economy—will initially be unpopular. A government that tackles these matters will have to be sure of its own mind, and of its supporters. The last is the great difficulty. Divisions of opinion on social policy, state expenditure, tariffs and investment are common to all parties; they exist as much in the opposition as in the government. As in Britain, the balance of power in the last few years has been so delicate that it is peculiarly difficult for either of the major parties to adopt unpopular measures. In Ireland it seems unlikely, all in all, that there will be much change just yet.

Notes of the Week

The Labour Leadership

THE blows that fell on Mr Herbert Morrison in the last months of the Labour government, and continued last year, would have broken many men. Even for him, the road back to power within his party is proving to be very difficult. But at least a road now seems to exist. The trade unions have taken a long time to overcome their doubts about Mr Morrison but, having made up their minds, they cannot be accused of dilatoriness. The National Union of Mineworkers has invited him to stand for the treasurership of the Labour party and the two big general unions are reported to be willing to support his candidature. The union leaders concerned would probably have preferred to lay their plans in private and to persuade Mr Greenwood, who has held the office for ten years, to retire gracefully from the scene. But the trap has apparently been sprung prematurely; a somewhat aggrieved Mr Greenwood has no intention of withdrawing. Mr Morrison has nevertheless decided, after some hesitation, to stand.

It can be assumed that Mr Morrison has no great interest in the treasurership for itself. His goal must remain the leadership of the party in the House of Commons, which alone can gain him entrance to 10 Downing Street. The choice of leader technically rests with the Parliamentary Labour party, but no one would fancy the prospects of a candidate who did not enjoy the backing of several of the big trade unions. At this stage, the unions themselves are

not thinking very much about the party leadership. Mr Attlee may be abdicating the intellectual leadership, and even the control of party strategy, but he remains a respected figure with a good deal of personal authority. What disturbs the leaders of the big unions is the presence on the party's national executive of Mr Bevan and five lively lieutenants, without anyone of similar calibre to oppose him. Nor can they ignore the fact that either this year or next Mr Bevan must, on seniority, become vice-chairman of the party with a view to becoming chairman twelve months later. They have decided that Mr Morrison is the necessary counterweight. It has taken the death of Ernest Bevin and the menace of Aneurin Bevan to put the miners behind Mr Morrison, but if he helps them now by gaining the treasurership they are unlikely to forget him when the leadership falls vacant.

For Mr Morrison, this is the only way back on to the executive. The constituency parties which rejected him last autumn could not be relied upon to take a more kindly view this year. In the election for the treasurership, the union can use their block votes in his favour. That does not make the issue certain, if Mr Greenwood remains determined to fight; 73 years old, ailing and venerated, he will command some sympathy votes apart from having the support of a Bevanite influence. But the three big unions already pledged to Mr Morrison give him up to 2 million votes and he should be able to count on some constituency parties and many smaller unions. His decision to stand must be based on a careful estimate, for to be defeated now would indeed be taken as the final ruin of Mr Morrison's hopes.

Television Befogged

THE two statements on television that the Government has already made this month could hardly have been vaguer. They are intended to quieten controversy until the autumn, and that is all. The report of the Television Advisory Committee—which was published this week and is discussed in a Business Note later in this issue—in effect takes a conservative view of the number of television services that can be started within the next three years or so. The Government appears, so far as the Postmaster-General's statement went, to accept this view. It has also given the BBC permission to make a start with the development programme that the corporation would like to treat as an alternative to commercial television. And at the same time, it has promised to publish in the autumn a White Paper defining the terms on which "competitive" television "might" be permitted to operate.

The only conclusion to draw from all these contrary indications and muffled phrases is that the Government does not know what it is going to do. Ministers have been severely shaken, but as a whole they have not yet been fully converted, by all the high-minded objections to commercial television. Until the autumn, therefore, all the interests—both vested and thrusting—are left to go on exerting their pressures. Politically, it remains very difficult for the Government to withdraw altogether from the policy it declared last May, that "in the expanding field of television some provision should be made to permit some element of competition." A full retreat would delight the Labour party and anger many of the Government's supporters in the House of Commons.

The Government is obviously tempted to move towards a compromise: it could permit competition in theory, but find technical and moral reasons for hedging it round with such restrictions that few or no commercial stations are set up and the BBC retains in practice an overwhelming advantage. But there are two practical objections, as well as those of principle, to such a compromise. It would be insecure, because the technical arguments would change with improvements in television transmission. And it would satisfy only those people who have a vested interest in preventing advertising by television. If they mean what they say, the would-be controllers of public taste will be satisfied with nothing less than an absolute declaration of the BBC's inviolability. If the Government is still willing to assert any other principle—as it should—the practical arguments are for letting the competition be genuine: which does not mean, of course, that it need follow the American model.

Flames Flicker in Soviet Germany

FIRMNESS with the Russians has paid in Berlin. Travel restrictions have been lifted between the eastern and western sectors, although General Dibrova had previously declared that they must be retained until the western commandants called off the "West Berlin agents and fascist provocateurs" who, according to the Russian myth, were

responsible for the recent riots surveyed on p. 106. It is understandable that the raising of the barriers in Berlin has been accompanied by a warning that further disturbances will be severely repressed, for unrest in Berlin and the Zone is far from over. Last Tuesday a deputation of East Berlin workers, after consulting with West Berlin colleagues, declared that mass demonstrations would be avoided, but that strikes would be organised in individual factories until men who were arrested in the recent troubles have been released. Some such strikes have now taken place.

The mood of the workers is one of intense bitterness against the Communists, the *Volkspolizei*, and against the Russians for not having fulfilled the hopes they roused when they first forced repentance on the SED. The men in the factories are loyal to their comrades and intensely resent the brutal way in which thousands of arrests have been made and reprisals carried out on the families of the strikers. The SED has granted concessions, and the leading posts in the government will probably be reshuffled, but it is still in power. Yet no changes in the facade will now satisfy the Germans in the Zone.

By distributing the state reserves of food and clothing the SED hopes to overcome the immediate crisis in supplies. But the shoes to be distributed will amount only to one pair for every eight of the 6½ million workers, and the quantity of textiles to only three-quarters of a yard apiece. And, on the political side, the SED has given no sign of introducing the democratic elections to the trade unions and parties that the workers demand. Mr Semeonov's instructions, it seems, only allow him to do too little and too late.

Towards a French Commonwealth?

DESPITE the urgent economic and political problems demanding attention in France itself, M. Laniel and his new cabinet have turned first to Indo-China. Public opinion is thoroughly aroused over this costly and apparently endless struggle, and M. Mendès-France's hint of direct negotiations with Ho Chi-minh elicited a wide response. The present right-of-centre coalition knows that its days are numbered unless it can present some answer of its own to the general protest from the left that France is being bled white in Indo-China and to no purpose. By dissolving the Ministry for the Associated States, M. Laniel made it clear that he would put the problem directly in the charge of himself and M. Reynaud, his deputy premier. It was known, moreover, that M. Reynaud had it in mind to change the very nature of the French Union so as to make it more like the Commonwealth. Others in the cabinet, however, together with M. Bidault, strongly oppose any loosening of the administrative ties between France and the territories overseas. From this division in M. Laniel's cabinet there has resulted an offer to the Associated States that represents a compromise and a series of verbal generalities rather than a real step forward.

Identical but separate notes have been sent to Laos, Cambodia, and Vietnam, inviting each government to bilateral discussions on whatever political, economic or juridical issue it wishes to raise. The ultimate goal is to

modify the agreements of 1949 and 1950 with the Associated States in order to allow a larger measure of autonomy. This purpose, moreover, is underlined by the appointment as Commissioner General of M. Lejean, a diplomatic rather than a military or administrative figure. But the French note gives no specific indication of how far the French Government is prepared to go. Whereas the Quai d'Orsay insists that nothing more is intended than a series of adjustments in the present situation, M. Reynaud has gone so far as to say that any one of the Associated States will have the right to discuss whether it wishes to remain in the French Union at all.

Analogies with the Commonwealth merely obscure the problem. They cannot be drawn with any accuracy because the Associated States are at present quite incapable of economic or military autonomy, and because the whole conception of the French Union is based on the idea of central administrative organs. Indeed, the present vague offer looks more like a reluctant reaction to a deadlock and to recent troubles in Cambodia than a new French initiative. If France intends to develop further the participation of the Associated States in the Indo-China war and hopes to build up a stock of loyalty for the future, it will have to go more than half way; a formula for autonomy within federal union will have to be found. To find it is difficult but not so difficult as a continuation of the present thankless effort in South-East Asia.

Changes in Hungary

SINCE Moscow has set a new fashion for collective responsibility, it was perhaps unlikely that Mr Rakosi could retain much longer his dominant position in both the Communist party and the government of Hungary. But the changes announced by Mr Imre Nagy, the new Prime Minister, represent such a startling reversal of the economic policies of the regime that they alone provide a sufficient reason for Mr Rakosi's retirement into the wings. He is certain to do a good deal of prompting, and within the party his position remains unrivalled. He is no longer secretary-general, but his two colleagues on the three-man secretariat are very young men who are unlikely to challenge his authority. In Hungary, however, it is not enough to rule the party; to have popular prestige it is necessary to have a seat in the cabinet as well.

It is clear that Moscow's influence may be strengthened rather than weakened. Mr Nagy is a staunch and completely loyal Muscovite; so is his second-in-command, Mr Geroe, who as Minister of the Interior will control the security police. And the new Minister of Defence, General Bata, who comes from the sub-Carpathian Ukraine, is a Russian citizen, whose knowledge of Hungarian is far from perfect. He might, indeed, be called Hungary's Marshal Rokossovsky. The strong passive resistance of the Hungarian workers and peasants has made Moscow offer far-reaching concessions, but it knows that it is taking a calculated risk and is determined to keep it as small as possible.

The changes are clearly in the nature of a controlled experiment; there has not yet been any irrevocable reversal of policy. Nor, it seems, are there to be any scapegoats. Mr Nagy says flatly that the five-year plan is beyond the

country's strength and that there are "no justifiable reasons for exaggerated industrialisation." But Mr Geroe, who was responsible for all this, gets the key post of Minister of the Interior. Again, Mr Nagy complains that collectivisation has been "far too rapid" and that there has been "too much intimidation" of the peasants. But Mr Nagy, himself, when Minister of Agriculture after the war, took a tough line with the peasants; and the new Minister of Agriculture, Mr Hegedus, who is to give the peasants a new deal, must be identified, as Minister of State Farming in the previous ministry, with the old repressive policies. The new Cabinet may have been well shuffled, but there are few new faces in important posts. The Hungarian people must face the future with a good deal of scepticism.

Rewards of Representation

THE Government has not yet hardened its heart against the attempts of some Members of Parliament to get their salaries raised. After a meeting with the Opposition on Wednesday, it is discussing with Conservative members the appointment of a Select Committee. This would be a fact-finding body to investigate their financial problems and compare their £1,000 a year with the salaries and perquisites obtained by members of other legislatures.

Some attempt to do this has already been made by a group of members of all parties, through a new organisation called the Members' Parliamentary Committee. It has found that British MPs are, relatively, not so badly off as they thought, at least compared with their European counterparts. The money figures are far from conclusive, since they do not take account of considerable differences in living costs. But for what they are worth they show that Turkey pays its elected representatives rather better, with a salary equivalent to £1,750 and free travel. The Belgians do a little better, with salaries of £1,285, of which nearly £800 is tax free, and so do the Italians with salaries of only £440 but expense allowances of between £900 and £1,250. But in the Scandinavian countries and Holland the salary does not reach four figures. European representatives, like British MPs, have to pay their own secretaries and usually there is no room for them to work in the parliament buildings. Compared with the American House of Representatives, of course, all European parliaments are like workhouses. The Congressman gets £5,170 with an expense allowance of £890. He is allowed £285 for stationery and £5,170 for clerical help, and he has an office suite close to the House of Representatives.

It is not by such comparisons, however, that the proper salary for an MP can be judged. The real question is whether he is paid enough, or gets enough help in kind, for Parliament to get what is needed from him. The evidence suggests that he is not. In this connection it is most important that the committee should examine the position of junior ministers. They get a total of only £2,000 a year, out of which they must pay the usual secretarial and other expenses, and they are not allowed to supplement this with outside work. Able men are lost to the Government because they cannot afford to let their earnings drop to this level.

Featherbed or Safety Net?

IN the House of Commons last week the Minister of Agriculture proudly showed that farm production continues its upward trend towards the objective of a 60 per cent increase over the prewar level; the provisional index for 1952-53 is 151. But the Minister had little to say on the contentious issues of agricultural policy, and the widely ranging debate displayed considerable confusion on both sides of the House. Like the public at large, members remain unable to make up their minds on the extent to which farming should be treated as an ordinary economic occupation.

What Sir Robert Boothby called "the hideous days of Free Trade" are gone. The simple measuring rod of profit-and-loss cannot be applied without qualification to agriculture. One way or another, an expanded agriculture must prosper. This much is agreed. But it leaves plenty of scope for disagreement not only about methods but also between the two different attitudes that may lie behind subsidies, guaranteed prices, or other pieces of preferential treatment. One school of thought may be defined as that of expansion-at-any-cost; the other of reasonable-value-for-money. The first had the upper hand throughout the debate, but few speakers seemed to be certain whether they were debating an economic or a logistic problem.

The respective merits of various proposals—from the improvement of rural amenities to marketing boards—were consequently discussed more or less in a vacuum. The irrepressible Mr Stanley Evans was almost alone in trying to relate the cost of agricultural privilege to the return in extra food production. No one posed the basic question of how the promise of general stability in prices, which is necessary for confident expansion in agriculture, can be reconciled with flexibility in the prices of particular crops—which is also necessary if supply is to be matched to demand. Mr Nugent, for the Government, expressed confidence that in the "freer" economy prices could be "worked out" and maintained at "the right level in the interests of both producer and consumer." No arrangements that have yet been proposed provide any basis for such confidence. Certainly a genuine flexibility, "worked out" in the market, is compatible with the security of floor prices, or more accurately of "safety net" prices that would protect the farmer against serious losses. But while the expansion-at-all-costs mentality prevails, so realistic a compromise seems unlikely.

The Long-term Unemployed

ON Monday the House of Commons revived a prewar drama, with the Labour party accusing the Conservatives of wanting to subject the unemployed to a means test. On July 5th, Section 62 of the National Insurance Act of 1946 automatically expired. Under this section, the unemployed who had exhausted their right to unemployment benefit could apply to a local tribunal to have their benefit extended, without a means test and at the Exchequer's expense, for six months at a time. The Labour Govern-

ment made this provision in the 1946 Act because it feared postwar dislocation and mass unemployment. If there were mass unemployment, and ordinary unemployment benefit was unlimited in duration—as a minority of the Labour party wanted—the insurance fund might be made bankrupt, as it was in the great depression. On the other hand, if there were no other means of relieving prolonged unemployment, large numbers of workers would have to have recourse to the Assistance Board and be subject to a means test. Extended benefit was intended to get round this dilemma, and because it was intended also to meet a special situation—a postwar slump—it was made a temporary measure.

Should it have been continued? The Government is apparently confident of the continuing success of full employment policy. It has decided that, since the circumstances for which Section 62 was framed have not materialised, other provision for the long-term unemployed ought to be made. It has, therefore, made regulations allowing an unemployed person to draw, subject to a satisfactory record of contributions, ordinary benefit for nineteen months, compared with the previous maximum of one year. This more generous system of benefit will, according to the Minister, pick up many of the 48,000 who are now drawing extended benefit and whose cause the Labour party is championing. Mr Peake went on to say that, so far from the whole 48,000 being driven on to national assistance, many of them are drawing it already to supplement their extended benefit.

Section 62 was intended to affirm the state's duty to maintain full employment and to assume direct financial responsibility, without a means test, for employable people for whom it could not find jobs. In practice, it mainly shielded those whose ability to obtain and hold a job is precarious. In present economic circumstances, therefore, the Government's decision not to re-enact Section 62 is justified. But a prolonged depression might well force whichever government is in power to revive it.

Trojan Horses in Italy

PARLIAMENTARY democracy in Italy is beginning to take on a dangerously French look, in which leaders of intricate and artificial centre coalitions will walk on a tight-rope. Signor De Gasperi has reluctantly agreed to try to form a government, but even if he succeeds in doing so such a government would have no real prospect of stability and only the barest margin of votes with which to carry out its programme. Signor De Gasperi and the Christian Democrats will have to take into the coalition camp a number of dubious allies; the question is to decide which of several Trojan horses is least dangerous. There is still hope that the Social Democrats will co-operate, despite the negative response of their leader, Signor Saragat. Having failed either to woo the fellow-travelling Signor Nenni into a socialist bloc or to persuade Signor De Gasperi to accept him in the government, Signor Saragat is trying to lead his eighteen colleagues into splendid and barren isolation.

If he succeeds, Signor De Gasperi will have to turn towards the Monarchists and Signor Lauro with their forty seats. In fact, however, this would mean not only that the Republicans (five seats) would desert Signor De Gasperi, but also that the more liberal elements in his own party might rebel. For whatever may be the extent of agreement between Christian Democrats and Monarchists on issues of foreign policy, the latter would not stomach land reform and a more liberal economic policy. The Monarchists, moreover, have indicated clearly that they would prefer to join a coalition led by Signor Piccioni, a Christian Democrat to the right of Signor De Gasperi. If, on the other hand, the Social Democrats overrule their leader and decide to enter the government, the latter's centre of gravity would

shift to the left. In that case, Signor De Gasperi might prefer to hand over to Signor Gronchi, on the left of the Christian Democrats.

The obvious winners in this complex and shifting game are the Communists and the left-wing Nenni Socialists. That parliament should become powerless and that the Christian Democrats should be prevented from continuing the task of government is entirely to their advantage.

Lysenko Dethroned

TROFIM Denisovich Lysenko, whose name has become the symbol of Stalinist narrow-mindedness and intolerance in science, is dethroned. He, whose infallibility was for years beyond question, is now being openly attacked in several Soviet publications. Lysenko is a biologist who is regarded in the West as a brilliant practitioner and a poor theoretician. The controversy which opposed this pupil of Michurin and his group to the followers of Mendel, Weisman or Morgan could have been of interest to scientists only. What raised it, however, to the level of a *cause célèbre*—provoking disgust even among Communist sympathisers outside Russia—was the method by which the "truth" of Lysenko's arguments was "proved" through the party's and Stalin's own backing. At a scientific congress held in 1948 Lysenko forced his opponents into submission and Molotov himself boasted afterwards that:

The scientific debate in the sphere of biology was carried out under the guidance of our Party. The guiding ideas of Comrade Stalin here again played a decisive role opening broad perspectives for scientific and practical work. . . .

By that time, it is true, Stalinism had learnt not to cut off its nose to spite its face, and Lysenko's opponents were only downgraded and not purged as they would have been in the thirties; but the sanctification of Lysenko as the high-priest of the new science and the establishment of "scientific truths" by Party decrees smacked of the Middle Ages.

Lysenko's rise was largely due to practical considerations—his theories on heredity, if true, would have offered vast scope to Soviet agriculture—and so probably is his relative decline. The practical experiments cannot have come up to expectations, since the Academy of Sciences now blames Lysenko's Institute for failing "to make theoretical contributions of practical value." But there is more to it than that. The new line was heralded by attacks in the party theoretical organ, the *Komunist*, on "monopolies" in science. The *Botanichesky Zhurnal* apparently thrust this accusation at Lysenko and also blamed him for trying to solve scientific problems by government decrees. Lysenko may or may not have been disgraced, but he certainly has been toppled from the pedestal of high-priesthood.

Slow Train to Peking

A CRYPTIC reference in a Russian journal to a project for a new railway link between Moscow and Peking seems to have started a train of conjecture fast enough to outstrip the track itself. The project itself is not new

During the war the Nazis, taking the conquest of Russia for granted, dreamed of a railway across central Asia that would make strategic co-operation with Japan easier and promote German trade with the Far East. Indeed, as far back as the 1890s, when the roundabout Trans-Siberian line was being built, various shorter routes to China were discussed but rejected; it was clearly more economic for the railway to pass through the fertile zones of southern Siberia and Manchuria than to cut across the Mongolian deserts. Today, however, new factors have entered the picture. Industries have grown up in Soviet Asia and are planned in China's western borderlands. The governments in Moscow and Peking seek both to tie China's economy into that of the Soviet bloc and to improve their military communications. It would be surprising if they were to rest content with the present 4,500-mile rail journey between the two capitals, which takes a fortnight even by "express."

Since they became masters of China, the Communists have made play with the idea of a line through Sinkiang, whose minerals both they and the Russians regard as invaluable resources. This line might take off from the Turksib railway in Kazakhstan and run by way of Urumchi (Tihwa) and Hami to the Chinese railheads at Lanchow and Paotou on the Yellow River. East of Hami such a railway would have a wide desert to cross, but it would help to open up China's west. The project now contemplated, however, may take only the more modest form of a line across eastern Mongolia. From the Trans-Siberian near Lake Baikal, a

branch line already runs to Ulan Bator, whence it is only a little more than 500 miles across the Gobi to Paotou. A short-cut here would certainly bring Peking nearer to Moscow, but would be of little service to the development of China itself. However, even this advance seems to be some way off as yet; it is only the plans, not the line itself, that are said to be nearing completion.

Mr Nehru on Africa

MR NEHRU'S presence at the Coronation was widely regarded as an indication that he remains sincerely convinced of the value of the Commonwealth association and of a co-ordinated Commonwealth policy. But in London the Prime Minister of India made no secret of his conviction

that the gravest problem facing that association of like-minded states was racial domination, more especially in Africa. Perhaps to offset his concurrence in the Commonwealth communique, which recorded so much agreement on so many other subjects, he has now voiced in the strongest terms not only his detestation of the treatment of Africans in "some parts of" Africa but his country's abiding sympathy with "countries which sought their freedom from colonial authority."

No doubt this outburst was largely for internal consumption. It was made at a meeting of the All-India Congress committee. A rousing lead was needed, both to divert attention from some of the more drab aspects of the Indian government's achievements, and possibly to forestall criticism of Mr Nehru's presence in London. Inter-family criticism may represent the only terms on which Indian leaders can keep their country in the Commonwealth family. But external influences are probably also at work. Mr Nehru's remarks may please the Arab countries with which India works closely in the United Nations. In these circumstances, they are no doubt expected to be taken in good part by those at whom they are directed, as a contribution to the Commonwealth's policy and philosophy by one of its elder statesmen.

But to whom are Mr Nehru's rebukes directed? Is it the Kenya Government or the Union Government that is treating Africans "like wild animals"? Or is Central African Federation at fault? The remarks might even apply to facets of Belgian or French administration. Mr Nehru left everything very vague, but European governments in many parts of Africa will no doubt be fitting on the cap and getting correspondingly angry. The pronouncement will hardly improve relations between Indians and Europeans in Africa, and it will certainly give fresh substance to the bogey of "Indian Imperialism" along the East coast of Africa. It will give passing pleasure to a few African nationalists, but Mr Nehru can hardly believe that it will help in any way to lessen racial tension.

Scientists Nipped in the Bud

ONE person out of every 31, in the age group concerned, now reaches the university, compared with a proportion of about one in 60 before the war. In the opinion of the University Grants Committee, whose report on the

Next week's issue of
The Economist
will include the annual
review of
BRITISH INSURANCE

years 1947 to 1952 was published this week, very few people are being refused places. This is the general position. But within the total there is a need to increase certain university faculties now.

The University Grants Committee has shown signs of uneasiness before about the output of arts graduates. This time its language is slightly stronger:

It is doubtful whether the future demand for arts graduates will be sufficient to absorb the entire output of the universities at their present rate. On the other hand, there are certain fields of vocational training from which a substantially higher output is urgently desirable.

Only a brave man will use the word "vocational" in academic circles. But it is absurd that the nation should be paying for far more arts students than it needs, and not getting the scientists and technologists that it needs desperately. To make science faculties bigger, at the expense of arts, would be costly in building and equipment. But it is even more likely to be hampered by the attitudes of the universities themselves, where academic tradition may be stronger than fears about national solvency. As arts students are still by far the largest group in the universities, they could give way quite a bit without really endangering that "balance" in the universities which is so often pleaded as a reason against any change at all.

In one sense, however, it is to the advantage of the universities that the change should be made; it would slightly raise the quality of the students. The pressure

Then and Now

Now, let us remind our readers of the condition of the country before 1842. In 1841 the general distress provoked almost universal discontent, and the people sought relief at the hands of a new Ministry. The Whigs were turned out, and the Conservatives, with Sir R. Peel at their head, were placed in office. Then the revenue was both deficient and declining, and the resources of the country seemed to have come to an end. New taxation yielded so little, that it was felt and proclaimed to be impossible to extend it with the least advantage. Substituting direct for indirect taxation, abolishing prohibitions, removing duties from the raw materials, and lowering them on the means of subsistence, [Sir R. Peel] began the great work which he and his successors have carried on to the present day, giving us as the result free trade and free navigation. The gist of all the changes then and subsequently made was to remove impediments from trade, to set industry free, and give scope to the exertions and enterprise of individuals. Since this new system came into use, circumstances have subjected it to a severe trial. . . . Through all these calamities . . . England, under the influence of her improved commercial system, has passed without serious injury, and has recovered more speedily than could have been expected. . . . Let any person who has lived through the incendiarism of "Swing" in 1830, the Reform riots of 1832-4, the "plug" riots of 1842, cast back his thoughts on the successive disasters and destruction of property that prevailed continually and immediately before the system of Free Trade came into operation, and he will find abundant reason to rejoice that he has lived to see better days, and to mourn over the prejudices that so long shut us out from the greatest physical and moral improvements that were ever vouchsafed to an old nation.

The Economist
July 9, 1853

for university places is greatest in the medical faculties, which (following the advice of the Goodenough Committee) have undergone a relatively small expansion since the war. The next strongest demand for places is in pure science, and people who would have made useful scientists are being turned away while others, probably of inferior ability, get places in the arts faculties. On the other hand, in spite

of the much-publicised demand for technologists and the good pay that they can command, the number of applicants has fallen slightly and the universities can accommodate them without difficulty. It would seem that in the eyes of teachers and parents pure science still enjoys a mystical prestige over applied science. The best administrative arrangements are helpless against this attitude.

Committee on the Old

THE fifth anniversary of the social security scheme has been marked by the appointment of another committee. Its terms of reference, according to Mr Butler's announcement last week, are

to review the economic and financial problems involved in providing for old age, having regard to the prospective increase in the number of the aged, and to make recommendations.

They are thus wide enough to cover private pension schemes, as well as the statutory old-age pension, and also the crucial question of whether the accepted age for retirement should be postponed.

There are at present four committees concerned with one aspect or another of the social security scheme. The National Insurance Advisory Committee is a statutory body to which the Minister has to submit draft regulations and whose general purpose is to advise him on the whole working of the national insurance scheme. There is also the Minister of Labour's National Advisory Committee on the employment of older workers, whose first report is expected shortly. The third is the Guillebaud Committee on the cost of the health service, which will have to take into consideration the ageing of the population. Now comes the new committee under the chairmanship of Sir Thomas Phillips. In prospect, moreover, is the statutory quinquennial review by the Government actuary of the

PROGRESS IN ELECTRONICS

MANY of the great technical achievements of this age stem from scientific investigations that have led to improvements in the properties of materials. This is especially true of the electronics industry.

The rapid progress in electronics has been marked, for instance, by the development of new and improved magnetic materials. One of the most important of these is an efficient anisotropic or directional permanent magnet. Another is a magnetic ferrite of exceptionally high permeability eminently suitable for the cores of high frequency inductances. A third is a non-metallic permanent magnet which is actually a true ceramic.

All these remarkable materials, which were pioneered in this country by Mullard, have had a considerable influence upon the design of better and more compact electronic components and apparatus. Their successful use is due in no small measure to the work undertaken by the Mullard Applications Advisory Service, which is itself backed by a comprehensive research organisation.

Sand into Shells

A mixture of dry sand and a special heat-hardening BAKELITE Resin is dropped on to a heated metal pattern. A strong, light 'shell' is formed, which makes a very suitable mould for metal castings. It sounds simple, but the process represents a revolutionary advance in foundry practice. It means cleaner, more accurate castings that need little or no machining. The development of a suitable resin is another example of the practical benefits to industry that flow from Bakelite Limited's research. The story of plastics is already a long one, but new pages are being written every day — by the organisation whose pioneering efforts were mainly responsible for the general adoption of these versatile materials.

Please write for booklets describing the Shell Mould process or BAKELITE products generally

Schweppshire Shows the Way

5. RE-INHIBITATING CENTRE

The Story of the Psychological Wing of the Middleschweppes Hospital illustrates Schweppshire's ability to progress beyond progress.

EARLY DAYS. Middleschweppes was the first to prove that Freud was not, in fact, Freud at all, but existent as a buried personality-wish.

FIRST FRUITS. The Middleschweppes psycho-analyst squad perfects its techniques and psycho-analyses more psycho-analytically than any other psycho-analysts anywhere.

COURTING DISASTER. Complete and universal psycho-analysis irons everybody so completely flat that it is impossible to tell the difference between people except by labels.

A CRISIS AVERTED. Boldly progressive once more, the crisis is met by de-psycho-analysis, employing the now familiar methods of re-inhibition, re-packing the subconscious, complexing up, and making

everybody tremendously different again without exactly knowing why. Note, in the *BEFORE* (bottom right of main picture), the absolutely ordinary. *AFTER* (top left) the absolute un-ordinary or different.

Designed by Lewitt-Him, written by Stephen Potter.

financial condition of the insurance fund, as well as the Minister's review of the adequacy of pensions and other benefits.

Mr Butler assured the House of Commons that there will be no overlapping. Perhaps, indeed, the Phillips Committee is to act as a sort of national assistance scheme to the other committees by reviewing every aspect of old age that falls outside their scope. Its appointment does at least make clear the present Government's attitude towards the cost of social security. Labour intends to abolish health service charges and increase benefits and pensions annually to meet any rise in the cost of living. The cautious Conservatives appoint committees.

Peron's Deal with Moscow

HISTORY is both made and unmade by the Soviet-Argentine trade agreement announced this week. For the first time, Russia is offering credits—to the tune of nearly £11 million—to a country outside its own orbit. It has also promised to sell Argentina oil-drilling equipment, an item which Russia itself has lately been seeking from the West, and railway equipment and precision instruments, two categories of goods for which Communist China had likewise been approaching European traders. Argentina, for its part, has offered linseed oil, wool, hides, pork and

mutton; no beef appears to be involved, which is hardly surprising in view of the current lag in deliveries of beef due under the Argentine agreement with Britain. The scale of the trade will be far smaller than was originally forecast; first intimations referred to an exchange of goods totalling \$500 million, but it now appears that the agreement provides only for £26.8 million worth of trade in each direction. This, however, is still a record for Soviet trading with any South American country.

It is irresistibly tempting to ask a number of questions. How is it that Russia is able to offer the Argentines types of equipment which it has not, apparently, been able to find for its allies the Chinese? Why is Argentina now given priority over the Asian countries to which Moscow has been holding out unfulfilled promises of capital equipment? Are the coal and oil listed on the Soviet side of the bargain to come from Russia itself, or from Poland and Rumania through Comecon channels? Will the Soviet credits hold good if Argentina fails to keep its deliveries up to schedule, as it has recently failed in its dealing with several other countries?

Both parties have zealously affirmed that there is no political meaning in the deal. Yet it is difficult to answer some of the above questions except in political terms. Only a few years ago, General Perón's regime was regularly anathematised by all good Marxists as an example of the purest fascism. Today it is treated with restraint and, in Moscow, even with favour. This looks like the totalitarian version of a gentlemen's agreement.

Letters to the Editor

The Reconstruction of Policy

SIR—It is obviously impossible in a letter to do justice to your leading article of June 27th concerning the reconstruction of the foreign policy of the Western Alliance. Two points made in your article, however, can and ought to be clarified for the benefit of a misinformed public opinion. One concerns the reasons for Sir Winston's insistence upon a top-level conference with the Russians, the other has to do with the military integration of Western Germany into the Atlantic Alliance.

There has been much speculation, especially on this side of the Atlantic, on the reasons for Sir Winston's insistence upon a top-level conference with the Soviet Union. All kinds of reasons have been adduced, from senility to party politics, and your article seems to be inclined toward the latter view. The simple truth is that in more than forty speeches made since the beginning of the Cold War, Sir Winston has stated his conviction that the only alternative to a third world war is a negotiated

settlement with the Soviet Union. Sir Winston may well be wrong in this conviction—even though I am inclined to doubt it—but in any case it is contrary to fact to attribute his recent diplomatic moves to failing judgment or domestic politics.

You present the problem of Germany in the form of a simple alternative between a Western Germany "on our side of the fence" with the Iron Curtain at the Elbe, and a Western Germany joining the Soviet Union with the Iron Curtain on the Rhine. It seems to me that, unfortunately, the situation is not quite as simple as that. We should take it as axiomatic that the political and military allegiance of a nation will follow its interests. Western Germany has two national interests overriding all others: unification and recovery of the eastern provinces. The strength of the Russian position lies in the ability, not matched by any similar ability on the western side, to grant the German demands whenever it seems advantageous. It must be the purpose of western diplomacy to weaken that Russian position. The military integra-

tion of Western Germany into the Atlantic Alliance does not serve that purpose; it does the exact opposite. For it postpones the fulfilment of German aspirations to an indefinite future and presents to the Germans the Western Alliance as the main stumbling block to the fulfilment of those demands. A rearmcd Western Germany will then be fully exposed to those "irresistible temptations" of "an unscrupulous Russian diplomacy" to which your article rightly refers, and it would be in an excellent position, regardless of treaty obligations and the preferences of the West, to take full advantage of them. The Russians will then negotiate, not with Great Britain, France and the United States, but with Western Germany and the western powers will then be reduced to pleading with Mr Adenauer, or his successor, as they must today with Mr Syngman Rhee.

The only alternative to such a disaster appears to be an attempt to negotiate the future of Germany with the Russians. Nobody can say that such an undertaking can succeed; yet nobody has a right to say that it is bound to fail as long as it has not been tried. If it succeeds, it will at once remove those "temptations" for Germany to strike a bargain with the Russians; for it already will have achieved one of its main objectives through a bargain between the Western Alliance and the Soviet Union. The fear that such a bargain, or even a bargain between Germany and the Soviet Union, would

necessarily advance the Iron Curtain to the Rhine appears to be bordering on the absurd. For the Russians, in contrast to many western observers, certainly must know that a Communist German Government is about the weakest link for a Russo-German understanding that can be imagined under present conditions. As regards Germany, the Russians are not interested in ideologies, but in the neutrality or friendship of a unified Germany. A remilitarised Western Germany, tenuously aligned with the West, will not frustrate the Russian aspirations. If the remilitarisation of Western Germany is not accompanied by, and subordinated to, diplomatic action, it will make the triumph of those Russian aspirations almost inevitable.

Sir Winston is no doubt older than many of his critics; he may also be wiser than most of them.—Yours faithfully, HANS J. MORGENTHAU
University of Chicago

More Academic than Free

SIR—Even to one who does not wholly share the reasoning implied in the Harvard Corporation's ruling about faculty members who appeal to the Fifth Amendment, your note seems unreasonably critical, and suggests that on this subject there may be a wide divergence of opinion between Englishmen and Americans who ordinarily see matters much alike.

You express disappointment that the Harvard authorities did not use this occasion "to discuss the vital case for allowing Communism to be taught and studied openly." If you mean that Communism as a doctrine and a social system should be given the closest study by fair-minded scholars, Harvard has done much more than discuss the notion; it has put it into practice in a Russian Research Centre whose work has been widely and generously applauded on both sides of the Atlantic, not least by your own reviewers. Or if you mean that Communists should be allowed to speak at Harvard, the answer is that they are. But if you mean that Harvard should permit a Communist propaganda operation by members of the University staff, I can only say that this seems a most astonishing suggestion.

I am also unable to understand your comment on Harvard's disapproval of appeal to the Fifth Amendment. You seem to feel that complete silence does a man less harm on his job and in the community than a qualified answer might do. Is there any evidence for this view, and is there not a good deal to the contrary? And it is surprising to find a journal as clear-headed as *The Economist* making use in this connection of the phrase "to turn informer." It is quite true that many men who once toyed with Communism now feel that they should not tell on others whose activities may have been equally trivial. I respect the honesty of their judgment, although I do not agree with them. But this reticence with regard to those whose activities were trivial is very different

from a general refusal to give relevant information about confirmed and dedicated secret Communists; to "inform" on such people may be unpleasant, but it seems, on balance, far less unpleasant than a refusal to inform.

Lying behind all these matters is the question whether one does or does not believe that a Communist Party member can meet the standards for membership in a free university. Most of us in the United States (though not the annoyingly independent Senator Taft) are persuaded that in the usual case the Party member is under the discipline of an organisation which is committed to deliberate falsehood as a tactic. Thus it seems a sound general rule that Communists are not fit to serve an institution whose motto is *Veritas*, though the rule may have exceptions. Does *The Economist* really disagree? — Yours faithfully, MCGEORGE BUNDY
Harvard University, Cambridge, Mass.

[As long as congressional investigations are conducted as many of them are at present, it seems justifiable for a witness to prefer complete silence to the qualified answer that may lead not only to charges of perjury or contempt of Congress, but also to publicity which mobilises prejudice against him and his family. *The Economist* believes that no one should be dismissed because of his political opinions unless it can be proved that they have led him to speak or act against the spirit of the institution he serves.—EDITOR.]

Revolt in Stalin Allee

SIR—"Berlin, June 17th" has a lasting significance: workers demonstrating against Moscow's protégés dealt a deadly blow at the theory that had associated Communism with the popular masses and anti-Communism with vested interest and privilege. It would be, however, dangerous to go beyond this in evaluating the events and their likely consequences. The Communists have in the past 36 years learned the fencing technique: "step back" when attacked, then "riposte." That was the way they treated in the past decades all the agitations against Soviet power, organised or non-organised, violent or non-violent, inside or outside Russia. Temporary concession was followed by lasting repression: that was the tactic they applied in their fight against the kulaks in Russia, against the Churches in Eastern Europe, and that is what they are likely to apply against their opponents in Eastern Germany.

It is perfectly true that the recent riots in the East German cities have demonstrated that the pro-Communist regime is not popular with the masses. This is, however, not a new revelation: it was clearly expressed some years back, by the decisive defeat of the Socialist Unity Party at the all-Berlin municipal elections. The novelty that has emerged after June 17 is that the Russian Army and the East German *Volkspolizei* are capable of dealing with an actively hostile population and—if at a price—can quell any revolt. And the Germans are inclined to be impressed

by a show of force: Hitler consolidated his power over 70 per cent non-Nazis by ruthlessly crushing his principal enemies in the purge that followed the "Roehm putsch" in 1934. In the past days German Communist leaders may have lost face with their people, yet the Russian armoured cars have certainly gained added prestige.

The West will, of course, make the best of the propaganda material offered by the events in Germany. It should, however, not relax the efforts for increased unity and strength. It would be most dangerous to underestimate the power of the Russians or to exaggerate the weakness of their bargaining position. They are unlikely to offer face-losing concessions on account of an abortive revolution they have easily managed to defeat.—Yours faithfully,

GEORGE A. FLORIS

Hever, Kent

Goodbye to Famine in India

SIR—Mr Nehru's claim that India was on the way to self-sufficiency in food should cause no surprise if one carefully examines the present trends of food production and procurement in the country. In your note of June 13th you have very rightly pointed out that "the major deficiencies in India's food production are in wheat and rice." Of the two, the greater deficiency is in rice. The larger part of India is rice-eating and it is shortage of rice that induces shortage of wheat, as both imported and internally procured wheat has to be diverted to the rice-eating areas. Therefore, the key to India's self-sufficiency in food also lies in increased production of rice. If you examine the latest figures of rice production you will find that there is "concrete evidence" for the Indian Prime Minister's claim of approaching self-sufficiency.

The production of rice, according to the 1952-53 estimates, has increased by 2.68 million tons. The Government's estimated requirement of rice for feeding deficit areas is about 900,000 tons. Internal procurement up to the end of March, 1953, exceeded the potential demand and was 1,200,000 tons. Thus, it would be possible to feed the country entirely out of domestic production of rice.

The over-all food situation in the country is also quite satisfactory. The Government has this year imported 2.1 million tons of foodgrains (not your figure of 2.5 million tons). It has a balance of 1.8 million tons of foodgrains from last year's imports. It thus had a stock of 3.9 million tons, while merchants in this country had also sufficient grain in their stocks. The Government expects that it will have a balance of 2.4 million tons in its stocks at the close of the year. Therefore it would not be necessary to import foodgrains for current consumption if there were not the need for building up stocks.—Yours faithfully, A. J. KIDWAI

Freedom versus Progress?

PROBLEMS OF CAPITAL FORMATION IN UNDERDEVELOPED COUNTRIES.

By Ragnar Nurkse.

Blackwell. 163 pages. 15s.

THIS is a closely-reasoned, topical and disquieting book. The starting-point of Professor Nurkse's argument is common to a great many analysts from the hard-faced to the starry-eyed: the "underdeveloped" countries are poor because they are poor. Malnutrition, ill-health and ignorance keeps productivity down; low productivity yields no margin of resources for that process of capital formation by which happier economies have prospered; lacking that margin, productivity remains low, perpetuating malnutrition, ill-health and ignorance; and so on indefinitely.

The circle, however, is less simple than it appears. Low current productivity may be compatible—on certain conditions—with a potential margin of resources; so far, so much better. But the provision of outside aid, designed to break the circle, may, unless these and other conditions are fulfilled, fail almost entirely of its effect; so far, so much worse. The potential margin for real investment consists in manpower now wasted, in that "concealed unemployment" endemic in underdeveloped economies where ten men scratch a living from land which would yield as much or more to the labours of five. Given the right equipment, the right, well-balanced, well-timed shift of the occupational pattern, this wasted labour can serve the needs of the future without prejudice to those of the present.

The conditions, however, are all important. Capital is not a simple entity; nor is the flow of consumer goods which it produces. It comes in discontinuous and disparate lumps: a rolling mill or a metallised road, a textile factory, a power station, a school. These may be, and often are, interdependent to a degree which makes it necessary to advance on a broad front or not at all. Each may need the big market that an underdeveloped, low-income economy fails to provide; each may need, on the other hand, the support of the others for production and, more generally, the skills, the habits, as it were the economic morals, of a developed economy. This complementary development cannot be imported *holus bolus* from abroad. Foreign aid, in money or in kind, can be applied at key points, but it will largely run to waste unless balanced by a type of capital formation which is necessarily indigenous. This involves willingness both to change occupational patterns and to

save—to acquiesce in standards rising less rapidly than productivity. Neither comes easily to an uninstructed democracy. Professor Nurkse makes, indeed, the novel and important point that the backward peoples' growing awareness of the higher standards enjoyed elsewhere makes this essential deferment of the fruits of progress far harder to accept than it was to the West at a similar stage of development. "It is much easier," he says, "to adopt superior consumption habits than improved production methods."

With the scales thus heavily weighted against thrift, progress or even—given the Malthusian threat—the avoidance of actual disaster may prove incompatible with the individual's freedom to save or spend as he pleases. The indispensable growth of domestic capital may demand compulsion—collective saving through taxation. This is a depressing conclusion for democrats. Professor Nurkse sees no incompatibility between state-enforced saving and private investment, and it is on the growth of the latter and on the "capital consciousness" which it diffuses that he rests his hopes. But if the government enforcing the savings is popularly elected, the overwhelming likelihood is that what it collects will not be saved but collectively spent and overspent; and moreover that the manner of enforcement, according to the canons of equity as understood by the voting masses, will be such as to remove any incentive to the speedy growth of private investment and "capital consciousness." Not only consumers' freedom, but political democracy itself, appears dubiously reconcilable with the progress of underdeveloped areas. The best one can hope for is that paternalism, whether native or metropolitan, may becomingly wear the mask of democracy until such time as democracy becomes economically responsible. Looking much nearer home than the underdeveloped areas, one may judge that time to be remote.

The New Paradise?

DAYBREAK IN CHINA.

By Basil Davidson.

Jonathan Cape. 191 pages. 10s. 6d.

MR DAVIDSON visited China last September, as one of a party of thirty sponsored by the Britain-China Friendship Association. It was an interesting moment to be in China. The Communist military government in Shanghai had just seized all the property of two British firms. Chou En-lai was returning from Moscow without the economic aid he had gone to seek,

leaving several of his ministers to continue the haggling for another six months. Dr Zhukov-Verezhnikov's scientific commission was in Peking to sign the much-publicised report asserting, on the basis of second-hand evidence, that germ warfare had been used in Korea and north China. The "Asian Peace Congress," due to open in Peking on September 26th, was inexplicably delayed. Unemployment was proving a serious problem in many parts of China, and the beginnings of a scheme to register the unemployed were being contemplated. All over the country judges were being purged, and in provincial cities "anti-social elements" were being executed on the spot in batches after trials "conducted" by mobs of thousands of people. The Peking government was issuing orders extending the system of "surveillance correspondents" through which it "supervises the broad masses," and tightening its control over all books and periodicals published in China.

All of this Mr Davidson either chose to ignore, or did not notice. It was all reported by the Chinese Communist press and radio at the time, but, of course, he could no more read the press than he could talk to the Chinese peasants without the aid of the official interpreters who courteously conducted his party as it whisked from Peking to Shanghai and Canton and back. He met nobody inclined to utter the least criticism of the Peking government; he was assured that writers could publish what they pleased; he was happy to record that, although Chinese workers are now forbidden to strike, they do not need to. The spectacle of political prisoners being used to build China's well-advertised dams and reservoirs seemed wholly satisfactory; Mr Davidson contrives a sneer at the phrase "slave labour." Nor was he at all disturbed when, standing below Mao Tse-tung at a Peking parade, he saw on the one hand doves of "peace" and on the other tanks, guns and jet warplanes.

There is a school of thought in this country that at one time would admit no imperfection in Russia, but is now disillusioned. Has China, in turn, become the object of this craving for belief in an earthly paradise? At times, Mr Davidson's faith seems to weaken. He writes: "Real life, the sceptic may object, is different. Real life consists of light and shade, good things and bad things." But this objection is hastily overruled, and the result is a book which contains nothing that the Peking official news agency could not have issued.

Mr Davidson's reports on other countries have contained "good things and bad things," and have therefore been effective. But in China he has failed. Even if considered as propaganda, the book will not do; the careful omissions and silences discredit the passages that are, no doubt, perfectly true. There is clearly much to be said for, as well as against, Communist China; but Mr Davidson has not served his cause well.

Town Planning Revised

MODERN TOWN AND COUNTRY PLANNING.

By James W. R. Adams.
Churchill. 234 pages. 42s.

THIS book, by the County Planning Officer for Kent, is based on an earlier work by the author's father, Mr Thomas Adams, which was published in 1932 under the title "Recent Advances in Town Planning." Unfortunately it is not made clear how much of the present work follows Adams *père* and how much is a new contribution by Adams *filis*. It gives a judicious and eminently fair account of developments in the law and practice of town and country planning since the turn of the century, mainly in Great Britain but with some reference to conditions in the United States and other countries. It is also nicely illustrated.

However, either out of filial piety or else from innate caution, the author has fought shy of much discussion of the important developments in town planning in the last ten years. Recent legislation is briefly noted, but the important examples—for instance, in the chapters on "Regional Plans" and "Advisory Town Plans"—are drawn from an earlier period. The author pleads in his preface that it is too early to judge the relative value of recent developments, but the result is that some chapters seem curiously outdated for a book of this title.

Save yourself...

Almost certainly, you will be able to save yourself a great deal of time and trouble if you apply first to us for books on economics and on the political and social sciences. We make no claim to infallibility. Yet, inevitably, a bookshop reflects the interests of its clients. Our clients include Universities, Government Departments, libraries, banks, learned bodies—and learned men. Their discriminating custom has enabled us to build up a stock, and a service, that we are told is unrivalled in its field.

Mail orders receive the personal attention of the Manager.

The Economists' Bookshop

11-12 Clements Inn Passage,
Aldwych, London, W.C.2.

This is a pity, for a competent evaluation of "modern" town planning is badly needed. Its new and intricate machine, though pushed from without by strong enthusiasts, yet seems to be stuck somewhat in the mud. It is a pity the author has nothing to say about why it got there and how to pull it out.

Communal Living

SOCIAL INSECTS.

By O. W. Richards.
Macdonald. 219 pages. 15s.

FEW people seem to be attracted to insects as individuals, for they lack distinctive personalities; but their behaviour in communities can be fascinating. The scientific study of insect societies is a relatively new branch of natural history and its results are only just beginning to reach a wider public. In his book, Mr Richards describes in detail the day-to-day habits of the four principal groups of insects that live such a communal life: wasps, bees, ants and termites or the white ants of the tropics. In each of these communities, a queen is attended by workers and sometimes also by a separate caste of soldiers. While she lays the eggs that are vital to the continuance of the community, the workers feed her and the freshly hatched young. They build the nest, and when it gets too hot they cool it with their wings and carry in drops of water.

The remarkable feature about these societies is the high degree of co-operation between their inhabitants. A worker bee coming back to the hive can describe, through formal dances, the place where she found food, its distance from the hive and the direction in which it lies. The worker ants are not content merely to forage for food; many of them are farmers. It is quite usual for them to tend herds of aphids for the sticky fluid that the aphids secrete, but certain species of ant grow fungus in specially built chambers in the nest. The soil for these fungus gardens is made up of chewed leaves, and when a young queen flies off to found a nest, she carries a pellet of the fungus away with her to start a fresh garden. Other ants use some of their number as living stores, filling their crops until these "repletes" grow to a remarkable size. In time of scarcity, some of this reserve is given up, drop by drop, as the workers come for it. The blood red ant does no work, but invades the nest of another colony, kills its queen and enslaves its workers. As the workers cannot reproduce, the invaders make sure of successive generations of slaves by occasionally raiding other nests and carrying off grubs and cocoons, which are brought back to the first nest to be reared there as a second generation of slaves. When the worker termites go out on a daylight foray, they are flanked on either side by a special armed caste of termites.

The way in which these insect societies seem to parody certain human institutions makes it difficult to avoid the pitfall of attributing to them instincts and emotions that they cannot possess.

THE ECONOMIST, JULY 11, 1953

Mr Richards's scientific training helps him to preserve an attitude of scrupulous detachment that adds greatly to the satisfaction of reading his book; he does not attribute to the insects any motives that he cannot prove to exist. The picture he builds up is a remarkable one, of highly developed and in many cases long-lived societies in which the welfare of the individual is totally subordinated to that of the group. One of the most extraordinary features of these communities, and one for which a satisfactory explanation has not yet been discovered, is how the apparently identical eggs laid by the queens yet produce clearly defined adult castes—queens, males, workers and soldiers—balanced according to the needs of the community at any one time. The amount of food given to the grubs by the workers is an explanation that does not fit all cases. All the fascination of the flea circus, stemming from the wonder that creatures so small can show so much initiative, is to be found in Mr Richards's study.

Unexciting History

MODERN GERMAN HISTORY.

By Ralph Flenley.
Dent. 394 pages. 30s.

PROFESSOR FLENLEY'S book is both too modest and too ambitious. It is too modest because the approach to German history which he commends, embracing the history of ideas, of economics and society as well as politics, requires a more radical revision than can be satisfactorily developed in a single volume of four hundred pages. It is too ambitious because the author's achievement, even within these limits, is not equal to his design.

It is difficult to make modern German history dull; however unattractive the actors and the theme, the plot is too full of surprises. Yet Mr Flenley rarely escapes the tedium of the text-book. His virtues as an historian are of a workaday order: lucidity, clarity of arrangement, wide reading. What he lacks are those exciting flashes of interpretation which distinguish Mr A. J. P. Taylor's often perverse, yet brilliant "Course of German History."

A more fundamental criticism could apply to most of what has been written about Germany by those trained in the same liberal tradition as Mr Flenley. Preoccupied with bringing out the good as well as the bad in German history, they pay too much attention to that "other" Germany which has been persistently defeated at every turn of events in the past century. They underestimate or blur the alien, hostile character of the assumptions and influences that have determined German development. What is missing from Mr Flenley's placid and well-ordered narrative is precisely that restless, dynamic quality in their history that has made the Germans so unstable as a nation and so disturbing as neighbours. Without that, the logic of a development which culminated in Hitler must escape the historian and German history remain opaque.

THE ECONOMIST, JULY 11, 1953

THIS IS THE SYMBOL

OF THE
BROWN & POLSON
GROUP OF COMPANIES

Makers of 'Patent' Cornflour and
Industrial Starch Products

A CONSULTATIVE SERVICE

The Brown & Polson Industrial Division manufactures 200,000 tons of industrial starch products per year—400 different products bought by more than 80 different industries. In addition to this large-scale, versatile, and dependable supply service the group also offers a consultative service, backed by unrivalled experience and freely available to all who are interested in the industrial uses of starch products.

The Industrial Division of

Brown & Polson

THE HOUSEHOLD NAME OF A SERVICE TO INDUSTRY

WELLINGTON HOUSE, 125/130 STRAND LONDON, W.C.2

THE UNITED
STEEL
COMPANIES LTD

THE LARGEST
STEEL PRODUCERS IN THE
BRITISH COMMONWEALTH

The United Steel company is by no means tied to the fortunes of a single trade. The company's markets are very widely and evenly spread, because of the diverse nature of the products of the group.

This independence of particular markets provides a good insurance when demand varies between products or between industries.

Furthermore, the distribution of the United Steel company's markets shows a sound balance between industries making capital goods and those making consumer goods.

The wide range of products is such that customers find it easy and convenient to deal with the United Steel company for all their requirements.

SOME FIGURES

The total sales during the year ending September 1952 were £67,000,000 supplying these industries:

Railways and Rolling Stock	11.5%
Shipbuilding and Marine Engineering	8.9%
Constructional Engineering and Building	8.6%
Drop Forgings and Laminated Springs	6.8%
Motors, Cycles and Aircraft	4.9%
General Engineering	13.1%
Mining and Quarrying	6.6%
Miscellaneous	10.2%
For further conversion to finished products	19.0%
Direct Export	10.4%

APPLEBY-FRODINGHAM STEEL COMPANY
SAMUEL FOX & CO. LTD.
STEEL PEECH & TOZER
UNITED STRIP & BAR MILLS

YORKSHIRE ENGINE CO. LTD.

THE UNITED STEEL COMPANIES LTD.
SHEFFIELD

NEW BRITISH ENGINEERING TRIUMPH THREEFOLD AID TO NATIONAL ECONOMY

First Automatic Press to produce Timber Board in Continuous Strip

THE PERFECTION OF THE BARTREV PRESS after 14 years' research means that a new industry has been born; for the Bartrev Press turns the unused wood that accumulates in huge quantities throughout the Timber Industry into a vast store of treasure. It makes possible for the first time the continuous production of board at low cost and of uniform quality.

Because of the scope that exists for it in timber-growing areas at home and abroad, the Bartrev Press will

1. Earn dollars and other currencies by sales of the machine itself.
2. Lower costs in building and other industries throughout the world by the supply of this new timber board at a greatly reduced price.
3. Save foreign currencies by the reduction of imports of board. Britain's own production of 'Bartrev' will do much to fill the gap between her requirements and the present production of her home industry.

BIRTH OF A NEW INDUSTRY

With 60% of all felled timber regularly going to waste, Bartrev machines will be in demand in every timber-producing area and wherever building board is required. The process will become

the basis of a new world-wide industry and the speed and economy of continuous automatic production must introduce an entirely new element into the existing board industry.

'Bartrev' emerging in a continuous strip from the press

The Bartrev invention is as revolutionary in the timber industry as was the invention of continuous milling for the steel, paper and aluminium industries.

'BARTREV' OPENS UP REMARKABLE PROSPECTS

The supplies of accessible timber are diminishing; the demand for timber is rapidly increasing. The Bartrev Press meets this demand by converting a hitherto neglected raw material into fine quality timber-board; and this raw material is unique in that it is always accumulating in quantities that preclude any great increase in cost. The owner of a Bartrev Press almost completely avoids the problem of the rising price of raw materials.

The Bartrev Continuous Press

The effective production area required for the Bartrev Press and ancillary plant is only 6,000 square feet. A single Press, producing 1' board at 14 feet a minute, turns out 16,000 tons of 'Bartrev' a year.

USES OF 'BARTREV'

Among the industries to which 'Bartrev' will bring particular benefit are Building, Furniture, Ship Building and Coach and Body Building. To all these industries and to the man in the street, 'Bartrev' means a first class building material at a far lower cost.

FIRST COMMERCIAL BARTREV PRESS IN OPERATION

A full scale commercial Bartrev Plant is in operation in Essex. Orders for the Bartrev Press can now be accepted and delivery arranged from December 1953. Each Press will be delivered as a complete package unit and specifications for all necessary ancillary plant will be provided. Installation will be supervised by Bartrev Engineers and Specialists.

VERE ENGINEERING COMPANY LIMITED
3 Vere Street, London, W.1.

PATENTS. The Bartrev Process and Automatic Press have been covered by Patents and Patent Applications throughout the world.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Going Slow on Taft-Hartley

Washington, D.C.

COMMITTEES of the Senate and the House of Representatives held lengthy hearings this year at which spokesmen for labour and management expressed themselves at length on the subject of possible changes in the Taft-Hartley Act. All that was missing from these hearings was a spokesman for the Administration. Mr Durkin, the Democratic trade unionist who is Mr Eisenhower's Secretary of Labour, did not appear before either committee; reports that he and Mr Weeks, the Secretary of Commerce, were at odds on the issue received implied support from the President himself at a press conference, at which he said that his officials were working hard to arrive at an agreed Administration position on amending the Act. Since then, there have been meetings at the White House in which the chairmen of the two interested congressional committees, Mr Durkin, Mr Weeks and Senator Taft all took part. On July 1st the *New York Times* reported that these talks had "been suspended, at least temporarily," because of failure to reach agreement, and "informed opinion is that the chances of success this year are remote."

Superficially, in the six stormy years of its existence the Act has played a role in the United States not unlike that of the Trade Disputes Act of 1927 in British politics. Both measures followed unusual outbreaks of labour unrest: the General Strike in Britain, and in the United States the embattled year of 1946, which holds the record for the number of man-days lost through strikes. Both were made possible by public reaction to these outbreaks. Both had the incidental effect of involving the trade unions more deeply in politics.

Yet, in the United States, despite the initial outcry over the "slave labour act," and despite the fact that repeal of the law is far and away the most popular theme at trade union gatherings of all kinds and sizes, the Taft-Hartley Act has not been seriously amended, let alone repealed, and American labour is still far less committed to political action than was British labour in 1927. One reason for this is the growing recognition that the Act is a very intricate statute, the full effects of which cannot be measured by the still limited experience which the country has had of it.

This intricacy has made it difficult for labour leaders to carry on a comprehensible and realistic campaign against the law. Because to criticise the various clauses one by one, in all their complex ramifications, would almost amount to an exercise by lawyers for the benefit of lawyers, trade union officials have resorted to the general and hyperbolic condemnations by now so wearily familiar. These seem to have left the rank and file unmoved. Wage-earners have

never been so prosperous, and their unions have not suffered noticeably under the Taft-Hartley Act.

It has been claimed that the organisation of those workers still outside the trade unions has been virtually halted by the Act. Singled out for attack in this connection are the "free speech" provisions, which allow employers to bring their case to their employees "if such expression contains no threat of reprisal or force or promise of benefit." Labour critics say that these safeguards against bribery and intimidation are inadequate. The Taft-Hartley Act's legalisation in injunctions as a means of ending major strikes, and its ban on the closed shop are also blamed for what everyone admits to be the recent stagnation in the growth of union membership. Most important, especially in the light of current Republican desires to give the states more authority in labour matters, is the provision in the Taft-Hartley Act allowing them to write labour legislation that is more restrictive of the unions than the federal statute in such crucial matters as union security. (Where state laws are more lenient, federal law prevails.) Since one of the major areas still vigorously resisting trade union organisation is the South, and since, southern state legislatures tend to be dominated by conservatives, it is easy to see why this worries union leaders.

Another complaint from labour has been that the Taft-Hartley Act's prohibition of the closed shop, and the delays which are imposed upon certification of a union shop (one in which all employees must join the union after being hired), have hurt the unions in industries such as the building trades, where casual labour is prevalent. Often, however, the law is broken by tacit agreement, employers being more willing to put up with the closed shop than to cause an upheaval, costly in days of prosperity, by challenging it.

★

There is very general agreement that the Act has not brought the country any nearer to a solution of the basic problem which was agitating Congress when it was passed—the question of what to do about strikes which "imperil the national health or safety," by paralysing key industries. Republicans claim that this is because the law was administered until last January by its sworn enemies. The favourite piece of evidence for this Republican view is Mr Truman's failure to invoke the Taft-Hartley Act in the big steel strike of last year. But the law was used on ten different occasions under Mr Truman, and the results indicate that its "cooling-off period," during which the parties to a dispute are forbidden to stop work and

are required to try to reach a settlement, often serves only to embitter the trade unions, with their traditional hatred of injunctions. Statistics suggest that the Taft-Hartley Act has not prevented strikes. Some of the years since 1947 have been relatively peaceful, but 1952 was second only to 1946 in the number of man-days lost by strikes.

Recognition that the Act has not succeeded in solving this problem has led representatives of management to argue that it should be amended to prohibit industry-wide or nation-wide collective bargaining, as a means of breaking "the monopolistic power of labour unions." Fear that some such additional restrictions might be enacted by a Congress with so strong a preponderance of Republicans and conservative southern Democrats has led trade union leaders to feel, privately at least, that perhaps amendment of the Act may prove dangerous. Once a Bill to change it, however mild, reaches the floor of either chamber, so the argument goes, the way will be opened for seriously anti-labour amendments.

This argument has its influence upon the Administration. Responsible Republican leaders do not want to allow the party's right wing to pin an anti-labour label on it; particularly not just before the congressional elections of 1954. What they would like to do is to produce a Bill incorporating several relatively non-controversial changes, most of them favourable to labour, or at least neutral. For example, workers on strike would be permitted to vote in elections held to determine which union should be entitled to bargain with the management, even though such workers have been replaced. The non-Communist oath now required of trade union officials would either be applied to employers or, if that smacks too much of *reductio ad absurdum*, be abolished. In that case, some new board might be created to determine when a union has fallen under Communist domination. Some kinds of secondary boycott might also be permitted.

But it is difficult to imagine the success of so delicate a tactical manoeuvre, even if Mr Durkin were to abandon the more substantial revisions in favour of labour for which he is reported to be fighting. Many Republicans in Congress will be very reluctant to accept such self-restraint as this would demand. Labour leaders and Fair Deal Democrats, on the other hand, would be so wary of the Greeks bearing gifts that the political benefits which the manoeuvre was designed to produce might never materialise.

American Notes

Knowland Reverts to Type

SENATOR KNOWLAND, for long one of the most unpromising friends of right-wing nationalism in the Far East, and now acting leader of the Republican party in the Senate, had been expected to be extremely difficult to convince of the necessity for making concessions to the

Communists in order to achieve a truce in Korea. But when, early in June, President Syngman Rhee first displayed the rigidity of his opposition to the armistice terms, Mr Knowland, to everyone's surprise and most people's relief, warned Mr Rhee that anything that endangered the truce would be detrimental to the people of Korea and must not be allowed. Within ten days Mr Rhee had endangered the truce most seriously by his secret release of 27,000 North Korean prisoners, yet last week Mr Knowland was excusing Mr Rhee by blaming not only the Truman Administration but the Eisenhower Administration for not consulting him enough and for having treated him as a "colonial subject" instead of as a "partner" who was a "great patriot." Mr Knowland added that he did not think that Mr Rhee had done anything that would "warrant anyone to say that we can't trust him."

That view is hardly held by the American soldiers fighting in Korea or indeed by many Americans anywhere. Mr Knowland explains his reversion to his former attitude by his revived hope of getting more favourable armistice terms from the Communists, including a united Korea, as a result of the pressures arising from the anti-Soviet stirrings behind the Iron Curtain. Many people share these hopes, but have not sufficient faith in them—or sufficient interest in the future of Korea—to allow the much more concrete prospect of peace to be deferred any longer. Senator Wiley was expressing the opinion of nearly all Americans, and unofficially that of the Administration as well, when he condemned, with unusual sharpness, the "unfortunate extremism, obstinacy and arbitrariness" of Mr Rhee, which was jeopardising the lives of over 300,000 fighting men from the United States and other countries, and warned him that time was running out.

President Eisenhower himself, while hoping that Korea will eventually be reunited by peaceful means, is refusing to discuss the actual status of the negotiations between his special envoy, Mr Robertson, and President Rhee. Mr Eisenhower has, however, already written twice to Mr Rhee deprecating his intransigence. But even if the Administration were prepared to give Mr Rhee what he wants—a guarantee that hostilities would be resumed in 90 days if progress had not been made in the negotiations for a peace treaty uniting Korea—there is no chance that such a guarantee, even if it had Mr Knowland's support, would be given the necessary approval by the Senate. On the other hand, it is almost as difficult to imagine that Congress would approve the extreme alternative, that American troops should force the South Koreans to accept and keep the armistice terms. Mr Robertson's patient determination to find an acceptable compromise is not surprising.

Neither Aid—

THE majority for this year's foreign aid Bill was as bipartisan in the Senate as it had been in the House, but rather more generous, for the Senate has authorised an expenditure of \$5.3 billion, compared with the House's \$4.9 billion. But this was more promise than performance, for there is every expectation that actual appropriations, even in the Senate, will be substantially less. With the American farmer in mind, the Senate proposed a currency

conversion scheme which would enable agricultural surpluses to be exchanged for armaments produced abroad, and paid for with military assistance dollars. The Senate allowed the President to transfer up to 15 per cent, compared with 10 per cent in the House Bill, of the funds from one area or function to another, from military to economic aid, for example, or from the Far East to Europe. The Senate also left it to the President's discretion to decide whether \$1 billion, half of Europe's assistance, should be withheld until the European defence treaties had been ratified, while the House made it mandatory that this should be done.

But on one question, and that a fundamental one, the Senate was more severe than the House. It insisted that the Mutual Security Agency should be closed down by the end of June, 1955, and that all spending for economic aid should finish by June 30, 1956, with long-term military deliveries to be allowed for another year. The House would not close down the agency until 1956, while the Administration had asked for authority to let contracts until 1958 and continue deliveries until 1961. In Senator Taft's view little, if any, money will in fact be provided by Congress for foreign aid even next year, and this is borne out by the fact that the early termination date was proposed not by a Republican die-hard, but by Senator Mansfield, a Democrat who has been an ardent advocate of foreign aid; and Senator George, another internationally-minded Democrat, has said he will never vote for the programme again.

Mr George is also a great believer in economy, and the sharp comparison between the amounts being given away to other countries and taken away from taxpayers in the United States is one reason why, as things stand now, there seems little future for foreign aid unless some radically new approach is tried. Another reason is the sharp disappointment which most Americans, rightly or wrongly, feel at how little there is to show for the billions of dollars they have poured out, and at the lack of desire to do better which they notice, especially in their opinion in Europe, and which explains the congressional pressure for implementation of the European Defence Community.

THE Senate and House conferees should not have any difficulty in reaching a compromise on the foreign aid Bill, but there will almost certainly be trouble over the one renewing the Reciprocal Trade Agreements Act for a year. For as the price of getting Representative Simpson to drop his restrictive amendments to the Act, the President had to agree to the inclusion in the House version of a clause adding a seventh member to the supposedly bipartisan Tariff Commission. It was taken for granted, although not necessarily correctly, that this new member would be not only a Republican, but also a protectionist, and neither party in the Senate was prepared to support a change which would give the impression that the United States did not want to encourage freer trade. Some people may, however, get this impression from another Senate amendment which would allow the President to take immediate action to restrict imports of farm commodities in an emergency situation;

it was the American wool growers whom the sponsors had particularly in mind as needing such help.

It is the Tariff Commission which recommends increases in duties to the President when American businessmen complain that they are being injured by foreign competition as a result of tariff concessions granted under the Trade Agreements Act. And for some time people abroad who wish to prepare for the ending of dollar aid by earning more dollars, by finding, as Senator Mansfield said "a solution that is mutual in reality, not just in name," will probably get most of their indications of what to expect from the Tariff Commission. It is, however, possible that Senator Knowland's efforts to get the Customs Simplification Bill through Congress this month will succeed; this legislation would ease import regulations and facilitate assessments of duty. But it is understood that no fresh negotiations are to be conducted under the renewed Trade Agreements Act, at least until the new Commission on Foreign Economic Policy which the Act sets up has reported, probably not long before the Act itself expires again next year. The commission is to have ten Republican and seven Democratic members, appointed by the President, the Speaker of the House and the President of the Senate.

Choking Off Surpluses

WITH the probable supply of wheat the largest in the nation's history and nearly 50 per cent greater than a hypothetical "normal," Mr Benson, the Secretary of Agriculture, has had no choice, under the law, but to announce that wheat farmers must decide whether they want to restrict their production next year through marketing quotas, or accept a government support price of about \$1.25 a bushel, compared with this year's \$2.21. All except the smallest farmers, who are exempt from restriction, will have a vote. Wheat is politically easier to cut back than

cotton, another candidate for restriction, although the rate at which cotton surpluses are piling up may be slowed as the result of the smaller acreage which has been planted this year. The western states, where cotton planting recently has been growing by leaps and bounds, will fight hard against a formula for restriction which would make the Old South once more the land of cotton.

Wheat farmers, however, are almost certain to accept restriction as the price of continued high government guarantees; whatever sympathy they may once have felt with the Administration's laudable aim of reducing the farmer's dependence on Washington and discouraging overproduction of staple crops by lower support prices has evaporated as market prices continue their two-year fall.

Nor Trade?

An exception, however, is the cottonseed industry which has welcomed a cut in the support price in the hope of regaining part of the market lost to other vegetable oils.

Possibly, if the present drought in six south-western states should spread—Arkansas has just been added to the “disaster states” shown on the map—marketing quotas for wheat might not be necessary and those for other farm products which now seem inevitable might be avoided. But Mr Benson is not likely to be rescued from his embarrassments by calamity, although he has had to come to the help of the cattlemen in the south-west with cheap feed, low-interest government loans, lower freight rates, and an increased purchasing programme for beef. He may, however, be able to point out that the return of Dust Bowl conditions is due, in part, to the over-grazing and the spread of wheat and cotton to marginal land which high support prices have encouraged.

Mr Benson expects to have his proposals for a new farm price law ready for the next session of Congress, though it may tax even his hardihood to propose taking away the farmer's crutch just when he feels he needs it most, and in an election year as well. Meanwhile, the Administration can only nibble at a mountain of surpluses, now valued at over \$3 billion and certain to increase in coming months, by seeing that wheat continues to move abroad under the international wheat agreement, even though this has not yet been ratified formally by the Senate. Congress even seems disinclined to give the President the power he has asked to use some of these surpluses, before they go bad, to relieve famine abroad; this would be, it is argued, too great a grant of power to give even a President who is not likely to abuse it.

The Debt's the Question

THE government has lost no time in staking its claim to the additional \$6 billion which the banks have available for new loans as the result of the Federal Reserve Board's lowering of reserve requirements. On Monday the Treasury put on the market its largest new issue since 1945, \$5.5 billion of eight-month tax anticipation certificates. Unlike the more usual tax anticipation bills, these certificates have a fixed rate of interest, in this case 2½ per cent, which was apparently just to the taste of the market at the moment. Much as the lowering of reserve requirements is an admission by the central bank that credit has been tightened enough, so this new issue is an admission by the Treasury that conditions are not yet suitable for any more of the long-term government borrowing to which the new Administration is also devoted in principle.

The certificates are intended for investors, both corporations and individuals, who are storing up funds against the spring tax-paying season; the certificates mature on March 22nd and can be handed over to the taxation authorities instead of cash. A large proportion will probably be taken up by the banks, acting really as underwriters, with the idea of selling the certificates gradually to clients as they are needed. This issue is big enough to allow the Treasury to give the market a holiday until the end of the summer, but by October the government will be coming back again for at least \$3.5 billion, and perhaps more. For only about 30 per cent of the annual tax receipts come in

during the second half of the calendar year, while government spending goes on as usual. Unless the last fiscal year closed with a substantial surplus (the deficit on this June 30th was \$9.4 billion), there is no alternative to borrowing.

This year there is a further problem, for on June 30th the government debt was only \$9 billion below the legal limit of \$275 billion—and \$9 billion is just about what will have to be borrowed before the end of the year. By dipping into its cash balance of between \$4 and \$5 billion, the Treasury may just manage not to bump its head on the debt ceiling. But it will be a very near thing; how near must be decided in the next few weeks for, if the ceiling

is to be raised, Congress will have to do it before it adjourns in, it is hoped, less than a month's time. Congress will not want to undertake this operation, any more than the Administration will want to ask for it. It is quite embarrassing enough that a party which is pledged to economy and solvency has already had to insist on a tax increase and to budget for a deficit, without it having to confess publicly that it needs permission to incur even more debt.

Good Government in New York

THE reforms which Governor Dewey and his Republican legislature have forced on traditionally Democratic, and traditionally corrupt, New York City are beginning to take shape. Mr Dewey and Governor Driscoll of New Jersey have signed identical Bills to clean up the crime-ridden waterfront which the two states share. Some provisions, such as the replacement of the notoriously abused “shape-up” by state-run employment offices, the registration of pier superintendents, and the banishment of convicted criminals from the docks, do not take effect until December, while a permanent joint commission to supervise the waterfront must await the permission of Congress. But after September 1st the longshoremen's union, which in any case is now ready to place its reform in the hands of an administrator appointed by the American Federation

of Labour, will not be able to collect any dues from its members if its officials include any convicted felons. New York City's budget troubles have been eased by the appointment of the Transit Authority demanded by the Governor; this new body is forbidden to run the city's transport at a deficit and empowered to raise fares to make ends meet, something they have not done for years.

Unfortunately these prospective fare rises, coupled with a 15 per cent increase in rents authorised by the state and with Mr Dewey's dictatorial manner, have not made it easier to secure first-rate candidates for the mayoralty election in the autumn. The Democrats and Liberals, the local third party, regard Republican state domination over the city as a most promising battle-cry; this was one reason the Liberals were reluctant to join the Republicans in the city to nominate Representative Javits, who has sat in Congress as a Liberal-Republican and would make an excellent Mayor. The Liberals also suspected that the Republicans would not throw their full support behind so independent a candidate. Instead they chose to dash all hopes of a Liberal-Republican coalition by picking Mr Halley, who under their banner defeated both the Republican and the Democratic candidate in 1951 for President of the City Council, even though his record in office has been disappointing.

Party labels have come to mean less and less in the city; more than half the voters are estimated to be independents. It is the candidate's popularity that counts, and Mr Halley, an expert television performer, may justify the Liberals' hopes of winning the Mayoralty as a preliminary to the election for Governor next year. At least his selection has driven the Democrats, once the masters of New York City, to consider whether they should form a coalition with the Republicans, at the cost of abandoning their anti-Dewey war-cries, or seek a well-known Liberal who might pull independent voters out of Mr Halley's orbit.

Anti-Trust Up to Date

THE heads of the two government agencies which are responsible for the enforcement of the numerous anti-trust laws—Mr Brownell of the Department of Justice and Mr Howrey of the Federal Trade Commission—have both recently made speeches which together provide the first definite outline of the new Administration's attitude on these matters. As might be expected from an Administration which will inevitably be accused of showing favouritism to big business, it was emphasised that monopoly and unfair competition would be attacked relentlessly. A number of corporations, especially perhaps the DuPont company, must have been disappointed when Mr Brownell added that there would be "no wholesale dismissal of pending suits."

However, Mr Brownell also insisted that the administration of the anti-trust laws should be simplified and that businessmen should be helped to follow the laws. Mr Howrey suggested various ways in which his commission could work towards these ends, mainly through more consultation with businessmen and economic experts. He emphasised that the objective would be to secure compliance with the laws to prevent them being broken, rather than to wait until they had been violated and then prosecute. And Mr Brownell promised that, where court actions had

to be brought, they would, wherever possible, be civil suits, which can usually be settled by agreement, rather than criminal cases.

The conciliatory approach that is now to prevail has already been demonstrated by the FTC's readiness to support legislation, which it had previously opposed, which would allow a firm to practise price discrimination in order to stop a particular customer buying from a competitor. The seller's right to do this under certain circumstances was in fact upheld by the Supreme Court some time ago and at its latest session the Court ruled on another aspect of the Robinson-Patman Act, concerning the responsibility of the buyer who pays a discriminatory price. It is this Act which makes price discrimination illegal, but it is very difficult to interpret satisfactorily or to co-ordinate with other anti-trust legislation. The Robinson-Patman Act is one of the laws to which Mr Brownell has specifically directed the attention of the national committee which he is shortly going to set up. It will be composed of lawyers and economists, and will apparently study all the ramifications of the monopoly question, in order to prepare the way for modernising and strengthening, and, it is to be hoped, simplifying and clarifying, anti-trust legislation.

Willow Doesn't Run

THE Air Force, which tried so hard to convince Congress that its budget should not be reduced, has been acutely embarrassed by the discoveries of a Senate subcommittee examining its contract with the Kaiser Motor Corporation. This contract, until the Air Force hastily cancelled it while the hearings were still going on, was for 159 C119 cargo aircraft, commonly known as flying boxcars, which were to cost \$198 million. What made the subcommittee see red and the Air Force squirm was the revelation that the Fairchild Engine and Aircraft Corporation is supplying for \$260,000 each models for which the Kaisers were charging \$1.2 million apiece.

In fairness to the Air Force and to the automobile com-

pany, it must be remembered that the contract was let in 1950, when additional sources of supply were being urgently sought to broaden the productive capacity for arms; the Fairchild Company could produce only 33 aircraft a month, while the Air Force wanted 135 a month. It was recognised then that the Kaiser Corporation, starting from scratch, would have heavy tooling costs; that it would have to learn to make aircraft at government expense; and that while the Fairchild Corporation was using a government plant, the Kaisers would be using their own vast plant at Willow Run, originally built by Henry Ford to manufacture Liberator bombers. The first cost estimates, received, the subcommittee noted sourly, some months after the work was allotted, put the price of each Kaiser boxcar at about \$467,000. Even the Air Force spokesmen had to admit the "apprehension and regret" of his service as the cost more than doubled and the aircraft proved slow in coming. So far 55 have been delivered.

The cancellation has caused the lay-off, at Willow Run, of nearly 10,000 of its 12,000 workers. It is hard to believe that the Kaisers, with all their ingenuity and audacity—they were the most famous of wartime contractors, ready to turn their hands to anything—can easily find alternative employment for Willow Run. Too many defence contracts allotted to the automobile industry are being pared down in accordance with the new policy of concentrating production to reduce costs. In any case, the Kaiser Motor Corporation, in the first six months of this year, lost almost four times as much money making cars as it earned—if that is the right word—making aircraft for the government.

SHORTER NOTES

Under pressure of the problems that might have arisen had the government's power to control supplies of scarce materials needed for defence production been allowed to lapse, Congress renewed the Defence Production Act at the last minute, for two years, without the controversial section dealing with an agency to help small business. The Senate and House conferences had been unable to agree on a compromise and an attempt will now be made to settle the question by separate legislation.

★

As a result of the increase in steel wages, the leading steel companies have increased their prices by varying amounts, which average about \$4 a ton for carbon steel products. How far users of steel, in particular makers of household appliances and automobiles, will wish to pass these increases on to consumers remains to be seen, as does the effect which the increases will have on the present high demand for steel.

The hot summer season, when carbonated soft drinks are sold by the million, has been chosen as the right time to launch new throw-away containers for the beverages. One of the largest manufacturers of these products is introducing tinned soft drinks; "soda pop" needs a container heavier than does the beer which has long been sold in tins. Now that the problem of tinning carbonated drinks has been solved, both shop and consumer will be spared the trouble of storing and returning bottles.

The East German Revolt

FROM OUR SPECIAL CORRESPONDENT IN BERLIN

TALKS with strike leaders who managed to escape to the West after the astonishing events of June 17th in Soviet-occupied Germany make it possible to get a fairly clear picture of what took place. It seems that although political demands came to the fore in the later stages of the revolt, at first it was mainly directed against intolerable living conditions. There was less food in the Soviet zone than during the war, even for the privileged workers, and prices had been surreptitiously raised time and again. For months past, the Socialist Unity Party (SED) had been ordering the factory managers and trade union leaders to conclude new "norms"; this meant that unless the workers produced at least ten per cent more their wages would be cut; and on May 28th when a decree on "norms" was issued, the men came out in small local strikes here and there. Behind this specific grievance lay a vast accumulation of resentment against the broken promises, the appalling lack of decent housing and clothing, the bullying of SED party functionaries, the spying, and the compulsion to spend one's free time learning Marxism Leninism.

It takes a great deal to make German workers revolt, and they would perhaps not have done so in June if the Communist trade union leaders, who were often at the same time SED party officials, had not become thoroughly discredited as mere tools of the party. Moreover, the SED itself had earned the reputation of being more Communist than the Russians. With German thoroughness, added to subservience and brutality, it had tried to fulfil the tasks assigned to it from the Russian headquarters "one hundred and fifty per cent." Moreover, even the comparative efficiency of the Germans has not made the planning system work: local bottlenecks are frequent, cotton frocks are distributed at Christmas and overcoats in mid-summer.

It would, however, be wrong to suggest that it is only material hardships that have turned the Soviet Zone workers against the Communists. They have also been affected by the system of secret police terrorism run by men who often simply passed from the Gestapo or *Sicherheitsdienst* of the Nazis to the *Staats-Sicherheitsdienst* of the SED. Workmen were ordered to spy on their colleagues and knew that their mates were doing the same to them. They were given special training in an allegedly infallible method of discovering whether a man who made a politically unreliable remark did so because he was merely stupid or because he was a "saboteur." Feeling against this system was vented on June 17th, when prisons were stormed, prisoners released and files thrown out of the windows.

By the beginning of June bitterness against the SED had reached a high pitch. On June 10th the SED proclaimed that it had made serious errors. The party leaders cried "*mea culpa*" but made concessions only to the lower middle class and the peasants. Like wildfire, therefore, the belief spread that the Russians were about to jettison their puppets, and now was the time for the workers to present their grievances. They were further encouraged to do so by the sudden appearance in the press of specific complaints by workers. The Soviet idea was evidently to allow the lid to be raised slightly and to impress on the people that their complaints would henceforth be heard. This is the only truth, it seems, behind the widespread rumour that the Russians or the Minister of the Interior, Zaisser, had engineered the first strike in the Stalin-Allee.

It is certain that the *Volkspolizei* and the Russian managing directors in the Soviet-owned factories were confused and inhibited by the general feeling that a change had taken place in top-level policy. Were they supposed to smile and grant concessions to the strikers, or should they use force against them? This uncertainty accounts for the fact that there was practically no resistance to the demonstrators who marched on June 16th from the Stalin-Allee to the government headquarters in the Wilhelmstrasse. The crowds were in complete control of the situation until the Soviet tanks appeared; and once this happened, the *Volkspolizei* began to take action. Until then, the East Berliners had felt so confident that they had the SED on the run that their demonstrations even assumed elements of a students' "rag"—an aspect of the affair which was increased by some unofficial West Berliners who came to join what one reporter called "the Wild East show." There was, however, no organised intervention or incitement from West Berlin; the allies and West Berlin authorities agreed after some argument that it was much too dangerous to give support to the strikers.

Nevertheless, the western radio played an important part in developments. On June 16th, a deputation of East Berlin strikers came across to the West. They decided in conjunction with westerners to draw up a list of demands, including free all-German elections, which would be presented to the Soviet German authorities by the men's own representatives; if they were not accepted, the strike would be continued with the call to everyone to rally at Strausberg in Berlin on the 17th. Actually, the American-controlled radio station, Rias, broadcasting these demands, gave

the impression that the demonstrations were to go on in any event. Throughout the Soviet zone, therefore, "Strausberg" became the rallying cry for the strikes that broke out on the 17th. In this way, Rias played the role of tocsin once the first blow had been spontaneously struck. Previously, broadcasts from Rias and the North-West German station, as well as various other activities undertaken by West German organisations, had not incited the East Germans to action. They had, however, created a mood of resistance.

On the 17th, strikes began everywhere, without any organisation. Only at the Leuna works was there a real strike committee which took up its headquarters in a hotel and issued orders. In a typical episode at the Soviet-owned Agfa works at Bitterfeld, the leaders presented their demands to the Russian managing director, who played for time until he could get instructions from Berlin. The leaders appealed to the strikers not to damage the factory, and when the Russian managing director asked them to help the works police to keep outside rioters from forcing their way in, he met with some response. But in Bitterfeld and elsewhere, passion soon swept away restraint. Pent-up hatred was vented on the Communist functionaries, who tore their badges off to save their lives. One or two were lynched nevertheless.

Bewildered Russians

It is true that the Russians, with some exceptions, showed restraint. It was evident that the officers were under orders to avoid bloodshed. The reasons are obvious. To fire on the workers would not only ruin the appeasement campaign that had been started with an eye on the West German elections; it would upset the theory that workers revolt against capitalists and Communists help them. June 17th turned this theory upside down, and it is small wonder that the Russians were bewildered. Some reports have declared that the Russians in their tank turrets actually cheered the strikers; but the truth of the matter seems to be that they were only making gestures to the crowd and shouting "Go home." Only when stones were hurled at them like hand grenades did they fire, and so did the German army men who stood with a stiffening of Soviet soldiers behind them. But both the Russian and German soldiers evidently remained uncertain what they were about. One sidelight to this aspect of the affair may be significant. German children who had been taught compulsory Russian at school appealed to the soldiers in their own language. The Soviet authorities must now wonder whether it is advisable to provide this means of contact between their cloistered troops and the Germans.

The initial mildness of the Russians (offset by the later repressions carried out by the German police) did not prevent the Germans from throwing stones at their tanks. Perhaps it encouraged this foolhardiness. The demonstrators were mostly men under 35 and are therefore hardened ex-soldiers who, even unarmed, have no fear of Russians, in tanks or out. Many of them prefer Dr Adenauer's policy of building up West German armed strength to the Socialists' call for "unity first" because they see no way of liberating central Germany except by force. These men are disappointed that the western powers did not invade the Soviet zone. Too much, however, should not be made of this feeling, since it is counter-balanced by the fear of war, and the realism of Soviet Zone citizens.

France and Its Empire

FROM A CORRESPONDENT IN PARIS

FRANCE'S offer of greater independence to Indo-China, and the gradual awakening of the French conscience about conditions in North Africa have put the question of empire in the forefront of the new government's policies. It is increasingly clear that the French Union, as it was conceived after the war in response to the wave of anti-colonialism, has solved neither the problems of Asian and African nationalism nor those of the proper economic relationship between France and its vast territories overseas. As was said some thirty years ago, "France conquered an immense colonial empire without doing it on purpose," and French thinking about the colonies is therefore muddled or outdated.

Although the French empire played a vital part during the war—De Gaulle's road to Paris started at Lake Tchad—the metropolitan Frenchman knows little and often cares less about the French Union. This was confirmed graphically when a poll was taken last year: 53 per cent of those questioned could not define the French Union and 19 per cent could name none of its far-flung territories. This ignorance is partly due to the fact that the French school curriculum tends to pass hastily over colonial history and geography. There is, moreover, no widespread public relations or propaganda organisation to foster general interest in colonial problems and the *Ligue maritime et d'Outremer* is far from active.

Nevertheless, the pressure of events since 1945 is beginning to bring home to the average Frenchman the concerns of empire. The revolt in Madagascar, the mounting conflict between North Africa and the mother country, and above all the bitter war in Indo-China have brought their own education in geography. It is no exaggeration to say that Indo-China is the dominant fact in France's political and economic picture at present and that North Africa may become so in the near future. The division of opinion about the French Union, moreover, is one of the most important divisions in French politics and France's social structure as such. To the Communists, and to many Socialists, the empire is France's open wound and the main cause of its weakness. To the upper bourgeoisie and to a large section of the middle classes, however, the French Union represents France's last real claim to be included among the great powers. Nationalism on this issue has been so vehement, moreover, that even the Communists have thought it wise to speak in muffled tones about colonial aspirations or total independence.

Awakening of Conscience

Whereas France is as yet unprepared to make major concessions in North Africa, it is becoming increasingly clear that a solution will have to be found rapidly in Indo-China. The fact that M. Mendès-France, who hinted definitely at negotiations with Ho Chi minh, should have obtained more than 300 votes in the Assembly and a wide measure of acclaim throughout the country, proves this. Few Frenchmen are willing, as yet, to renounce Indo-China entirely, but an increasing number would like to see the transformation of the French Union into something more like the Commonwealth.

They are beginning to realise that it is at least as

(TELEPHONE: 5727-11, 1100-1)

Yours sincerely,

This warm, friendly personal subscription to our letters to friends conveys also a message of truth and honesty. It is strange that these words are not used more often in business. Yet how appropriate they are, especially in such a relationship as must exist when the Bank is appointed as Executor or Trustee.

Hence it is that more and more use is being made of the Bank's services as Executor and Trustee as realisation is growing that the holder of such offices must combine an intimate and personal approach with experience and continuity.

The Manager of any of our branches will be glad to supply information and to hand you a copy of our Executor and Trustee pamphlet.

EXPORT QUESTIONS NEED EXPERT ANSWERS

Can we tender
for tractors in
Latin America?

WHETHER you are exporting tractors or transformers, electrical gear or jet engines the markets of Latin America pose special questions about currency, import regulations and exchange control. As the only British Bank with branches throughout Latin America, we are particularly well equipped to answer these questions promptly and accurately, and to advise and assist you in many other ways.

Our *Fortnightly Review*, a digest of reports sent in from our 56 branches in South and Central America, is an invaluable summary of economic information for all who trade in these markets. We shall be glad to send you a specimen copy on application to:—

The Research Department (SECTION 34)

BANK OF LONDON & SOUTH AMERICA LIMITED

BRADFORD: 19 SUNBRIDGE ROAD • MANCHESTER: 36 CHARLOTTE STREET

important to improve the material and spiritual standards of the native populations in overseas territories as it is to maintain a strong political, military and economic control over them. They feel that France is responsible for their political education as well as for their economic development, and that peoples overseas may yearn even more for political freedom than for good communications, schools, hospitals, increased production and food supplies. These views are more widely spread at present in the left-wing political parties than in conservative groups, but they are gaining ground, apart from all political belief, in intellectual circles. A number of Roman Catholics, led by François Mauriac, have come out in favour of the North African nationalists after the recent incidents in Casablanca. There is probably more humanitarianism than policy in this evolution, which is part of the progress of liberal trends in French Catholicism. There is, moreover, a growing body of French opinion which feels that the brutalities of French rule in North Africa are a symptom of the homeland's weakness rather than of its strength. Sooner or later these trends should help to give a more flexible course to French rule overseas.

Another important fact is that nearly a hundred-odd representatives of the French overseas territories (not including the North African protectorates nor the Associated States of Indo-China) are now sitting in the National Assembly in Paris. Whatever their colour, most of them have chosen to join the various metropolitan political parties. A dozen have formed a special group: "the overseas independents." In the unhappy search of all French coalition cabinets for a stable majority, the votes of both categories are important. They would remind any French government which was tempted to forget it that France has a future full of problems not only in Europe but also in other parts of the world, especially in Africa.

Burma's Rice Surplus

RICE is not one of those commodities that dominate world trade or disturb international relations, like wheat or rubber; but in South-East Asia it is often crucially important. The exporting countries—Burma, Indo-China, Siam—have not, since the war, had any difficulty in disposing of their export surpluses at remunerative prices. On the contrary, the importing countries—India, Ceylon, Indonesia and Malaya—have been hard put to it to buy what they need. The pressure has been on the exporters to increase their output which, in many countries, still lags behind prewar averages. New sources of exports have also been tapped: China (only a marginal exporter before the war), Egypt and the United States are now net rice exporters. A record world production of 357,000 million pounds, six per cent more than last year, has been forecast.

In Burma, where rice is grown on 90 per cent of the cultivated land, production and the exportable surplus have been climbing back to prewar levels. The Burmese economy is heavily dependent on rice not only as its principal product, and as a source of foreign exchange, but also for public finance. Nearly a fifth of the revenues of the government come from profits of the State Agriculture Marketing Board, which profits by selling Burma's rice exports abroad at a price higher than it pays to the farmers.

Any setback in foreign sales of rice is thus doubly unpleasant to the Union of Burma government.

Recent reports indicate that Burma is facing a difficult problem in disposing of an export surplus of rice estimated to be 1.5 million tons in 1953. So far inter-governmental contracts have been arranged for the sale of 900,000 tons, but no obvious market for the balance is in sight. The government does not want to accept lower prices—which would probably solve the problem of the surplus—primarily because it would be extremely embarrassing to the budget. The Minister of Agriculture, Thakin Kyaw Dun, has appealed to farmers to store their rice until the government is able to straighten out the price question.

Meanwhile, in the search for a convenient whipping-boy for Burma's present misfortune, opinion has hardened against the United States. The Burmese claim that the United States is planning to cut off Burma's rice markets—presumably by itself exporting rice to South-East Asia—with the object of bringing Burma into the American sphere of influence. This explanation flatters the State Department's influence with people such as Mr Nehru and takes no account of the limited capacity of the United States to supply the rice needs of the area. The unpleasant fact is that with a buyers' market emerging, the inherent inflexibility of a government selling cartel is once again being demonstrated.

"Solutions" in South Africa

FROM OUR JOHANNESBURG CORRESPONDENT

AFTER their election victory the Nationalists prophesied that the United Party would rapidly develop those fissiparous tendencies which kept the Nationalists themselves in the wilderness for so many years. Their reading of the crystal ball has not proved wrong.

Mr Blaar Coetzee, a prominent member of the United Party who is also a big publisher of Afrikaans books, cannot now see why the United Party should not get together with the Nationalists over the colour question. "If," he says blandly, "such a solution still demands a two-thirds majority, I think it ought to be given." The Nationalists wanted to take the Cape coloured voters off the common roll without a parliamentary two-thirds majority. The United Party vigorously attacked this as constitutionally unthinkable. Mr Coetzee's "solution" of the problem is simplicity itself: the United Party should give the Nationalists their two-thirds majority.

Against such simplicity, many members of the United Party have not unnaturally revolted. Unfortunately, they still await a clear lead from Mr Strauss, their leader. There is nothing very ambiguous about Mr Coetzee's somewhat cold-blooded proposition, but Mr Strauss is rapidly becoming South Africa's chief political enigma. "We will give the government a fair chance. In Parliament the United Party will not defy the government and will not place obstacles in its way as long as the government works for the welfare of the country." He added mysteriously: "We do not ask for a coalition, and we do not ask for seats in the Cabinet."

Since the Nationalists greatly increased their majority in Parliament in the election, Mr Strauss is not likely to get either, even if he asked; but his statements started rumours

circulating about a possible *toenadering*, the time-honoured method whereby South African politicians in difficulties get together to merge their parties and save the country at the expense of their principles. Unfortunately for the rumours, it is only Mr Strauss who is in difficulties, not the Nationalists. Mr Eric Louw, with his customary incisiveness, declared: "Any compromise proposals from Strauss and Co. will have only one aim, to save their own political skins. We can make our own conditions." Other Nationalists are less inclined to call for unconditional surrender, and more prepared to deal tenderly with "the conservative young men of the United Party", meaning Mr Coetzee. But even they doubt if the conservative young men can "redeem" the United Party, and therefore, like Mr Louw, advise them to support the Nationalists openly.

Mr Strauss's statements afforded plenty of opportunity for disagreement within the United Party itself. Mr Coetzee declared he had merely enunciated "the official United Party policy: to take the non-European question out of politics, and that can only be done by negotiation with the government." On the other hand, the chairman of the executive committee of the United Party on the Witwatersrand, Mr J. D. Cloete, said that Mr Coetzee's "attempt to act as interpreter-in-chief of the meaning of Mr Strauss's proposal to lift the non-European question out of the hurly-burly of party politics is, to say the least, unfortunate."

Mr. Strauss Begs the Question

To not a few United Party supporters, there occurred the thought that Mr Strauss's meanings would hardly have needed any interpreter had they been couched in less ambiguous language. The further thought which logically followed was that the best man to clear up any misunderstandings was Mr Strauss himself. In response to an invitation to do so (by the *Natal Witness*), Mr Strauss replied: "There has been no response to my sincere and friendly offer to Dr Malan to co-operate in finding a settlement of the non-European problem. The offer still stands, but it remains with Dr Malan to take the next step." This was begging the question with a vengeance, since no one even now knows what it is that Mr Strauss means when he talks about "co-operation" with the Nationalists.

Though the United Party's "conservative young men" have promised, rather sulkily, not to "negotiate independently" with the Nationalists—the phrase is astonishingly revealing—it is evident that Mr Strauss's leadership is now seriously in question. Equally significant, and disquieting, is the fact that the rebels within the party are all to the right of Mr Strauss, who has never been regarded by his warmest admirers or severest critics as a Liberal.

Outside the United Party, but also opposed to the Nationalists, the new Union Federal Party, based on Natal and supported by at least one limb of the now dismembered Torch Commando, accuses the whole United Party, including Mr Strauss, of waging only a "sham fight" against the Government. The equally new Liberal Party also criticise the United Party.

So much for the white parties opposing the Nationalists. But, in the new and dangerous South Africa that the Nationalists themselves have done most to create, the African and Indian Congresses (and their white sympathisers) can never be ignored. The Nationalists have made it crystal clear that they propose to get (or stay) "tough"

with the non-Europeans. The incident of June 28th in Johannesburg will serve as an illustration of what this implies. Sophiatown is a non-European suburb of Johannesburg. In this and adjoining areas live some 75,000 non-Europeans who have freehold rights but whom the Government now proposes to uproot and disperse in the name of *apartheid*. Twelve hundred non-Europeans attended a Sunday protest meeting in the Indian-owned Odin cinema in Good Street. They were quiet, well-behaved, well-dressed people: they might be said to represent the African bourgeoisie. These people want to keep their homes, not to be inmates of a squatters' camp. The meeting was addressed by Father Trevor Huddleston, an Anglican missionary who has long served the people of Sophiatown. The Anglican Bishop of Johannesburg, Mr Ambrose Reeves, sent a message of sympathy and support. On the platform there were also leaders of the African and Indian Congresses. The meeting was orderly.

Suddenly twenty white policemen burst into the hall, armed with sten-guns, rifles, bayonets and revolvers. In the street outside about a hundred African policemen debouched from trucks. It looked like a military operation. Some detectives sprang on to the platform, while a policeman stood on guard over the audience with a sten-gun. Father Huddleston and the Indian Congress secretary, Mr Yusuf Cachalia, were hustled out of the hall. Father Huddleston was subsequently released, but Cachalia was arrested and driven off in a police car. The police made no attempt to explain their action. The crowd became incensed, and the Indian and African leaders had to lock them in the cinema until the police had departed.

Thus, while the divided United Party talks vaguely of "taking the non-European problem out of politics," the Nationalists proceed to deal with the "problem" in their own way. It can now hardly be doubted that their solution is one of intimidation, terrorisation, and the ruthless crushing of even verbal protest by making arrests and flourishing sten-guns. While thus resolutely sitting on all the safety-valves, the Nationalists continue to stoke the furnace of the boiler of non-European unrest and resentment. On these lines, an explosion is inevitable, sooner or later. And no white political group is doing anything to stop it, except possibly the Liberal Party which stands by with its cup of water in the rather vain hope of quenching the flames.

The Danish Bases

FROM A CORRESPONDENT IN COPENHAGEN

THE strengthening of Western Europe's northern flank through the establishment of allied air bases in Denmark must now, at least for some time to come, be left out of the calculations of Nato planners. The matter had been under discussion between the Danes and the Americans for twelve months, and in spite of Danish hesitations an agreement was expected before the end of the year. The new attitude now taken up by the Danish Social-Democrats seems to put an end to all such expectations. At their party congress in Copenhagen during the last week of June, their leader, the former prime minister, Hr Hedtoft, said that Denmark should thank the North Atlantic Treaty Organisation for the offer to place allied air forces

on Danish soil in peace time, but should announce that in present circumstances it did not desire to accept it. This decision was unanimously supported by the congress. The minority government of Liberals (*Venstre*) and Conservatives will not now be able to obtain sufficient parliamentary support to enable Nato bases to be established. No foreseeable outcome of the next elections, due in September, can alter this—unless such "present circumstances" as Hr Hedtoft referred to have changed by then.

The Social-Democrats have during the last four years, together with the two governmental parties, formed the four-fifths majority which supports the Atlantic policy of Denmark. Hr Hedtoft himself, as prime minister, brought Denmark into Nato in 1949, swinging his own party away from its traditional predilection for neutrality. Even last week, he was careful to stress that the decision on bases did not affect his party's fundamental adherence to the Atlantic policy. But his party's change of attitude towards the air bases cannot fail to create an impression of a Danish defection from the main road of policy hitherto trodden by the Atlantic allies. This change is certainly not unique in Western Europe.

Political Complications

In announcing his change of mind Hr Hedtoft was undoubtedly, and perhaps mainly, moved by considerations of internal politics. As was explained in *The Economist* of June 13th, the constitutional revision has made this year an intensive electioneering period in Denmark, involving one plebiscite and two general elections, the second of which is still a few months off. In parliament as in the electorate there has for several years been a very delicate balance, a situation which, of course, gives the marginal vote a special importance. The party balance has furthermore put the small Radical party, which still stands for isolationism, in a key position. Facing the possibility of losing votes on a controversial issue like the air bases, Hr Hedtoft may have been tempted to act as a party politician rather than as a statesman. The government was keeping the air bases issue in cold store until after the elections, since it is also disturbing to the supporters of the other Atlantic parties; and the fact that a formal Social-Democratic statement was therefore unnecessary at this time, tends strongly to underline the internal aspect of Hr Hedtoft's move.

The Social-Democrats' decision is, indeed, welcome to many other Danes, who are otherwise supporters of the Atlantic policy. The idea of having thousands of foreign soldiers in the country in time of peace is unwelcome to a people not yet accustomed to a policy of military alliance. A year ago this feeling was probably outweighed by the obvious advantage of having strong friends on the spot in case of danger. The Soviet government on two occasions officially protested against supposed Danish intentions as regards "American bases." When the Danish government, backed by all the democratic parties, firmly rejected the Soviet Notes a few isolationist voices deplored what they called "a provocative policy towards Russia"; but on the whole the Soviet threats rather strengthened the Atlantic line. Since then, however, the Soviet "peace offensive" has affected public opinion very much as in other western countries, and this has allowed those who were doubtful about the air bases to take a more negative attitude. Yet in this respect the Soviet moves have been less influential than

certain trends in American policy. "One does not want to have binding obligations towards McCarthyism." However much such an argument may overlook the reciprocal character of the obligations, it is perhaps the strongest single factor behind the change of mind among the Social-Democrats and some other Danes.

In his recent speech, Hr Hedtoft said that the question of establishing allied air bases in Denmark might arise again if the international situation warranted it. It is perhaps symptomatic of the general tendency in Denmark to regard the establishment of allied bases as a Danish favour towards the United States, that Hr Hedtoft assumed the American offer to stand indefinitely. But on that—wholly unfounded—assumption, and supposing that a new international situation were to develop after the September elections, it may be worth while to discuss the problem as it appeared during the recent American-Danish talks.

When the growing interest in Europe's northern flank produced the Nato plan for the establishment of allied air bases in Denmark, its execution was at once left to the United States, which was—and may still be—alone capable

of delivering the aircraft and the personnel. At their subsequent discussions, the Danes and the Americans arrived at an American offer to place three wings—later reduced to two wings, or about 150 tactical planes with a total personnel of 4,000—on the two Jutland airfields of Tirstrup and Vandel, which the Danes would prepare.

The Danes, however, have sought to combine the question of the air bases with a demand for stronger Nato forces in Schleswig-Holstein. This issue came to the fore some months ago, when Nato asked Denmark to strengthen its brigade in northern Germany to replace the withdrawing Norwegians. The Social-Democrats would support this enlargement of the Danish brigade only on condition that the other Nato forces in this area were increased and as General Ridgway was not in a position to promise this, the Danish Government had to drop it. From a Danish point of view this problem is important. Nato's willingness to reinforce the Jutland frontier is in a way considered a test case, from which it can be seen whether Nato is seriously prepared to defend Danish territory.

Even before the Social-Democrat retreat there were still some other problems that obstructed an agreement. The

Danes had insisted that judicial authority over the allied forces should rest with the Danes and that the command over the allied wings in Denmark should be regulated in the same way as over the Danish defence in general. The Americans did not seem prepared to agree entirely to this. Nevertheless when and if the question of Nato bases in Denmark comes up again, some ground—both political and practical—will have been cleared. The enlargement of the airfields will go on and all sorts of technical preparations are on hand. Moreover, public opinion might be much more sympathetic if the attempts—so far unsuccessful—to make the allied air force to be stationed in Denmark more international in character could be realised.

Satellite Soccer

BY A CORRESPONDENT

THE very English game of football has become extremely popular in Central and Eastern Europe. In Rumania in the 'twenties it had already seriously challenged the national sport, *oina* (a form of rounders), and by the 'thirties it had dethroned it. And today, under the Communist regime, it has not lost its appeal. There are more than 5,000 football clubs in the Rumanian People's Republic and huge crowds regularly pack the stands to overflowing.

It goes without saying that the official explanation for this is "the Party and Government's care for man and his needs"; it is the "fruits of the correct application of the directives of the Politburo of the Central Committee of the Rumanian Workers' Party," aided by "the gigantic experience of the Soviet sport." Presumably, however, there are also other reasons for the popularity of football in Rumania. A diet of Russian plays and Russian films, etc., must begin to pall after a time. Moreover, you can really let yourself go at a football match; and there are no politics, no slogans, and no need to simulate an enthusiasm you are far from feeling. This is a very limited, negative freedom, indeed, but apparently one that a totalitarian regime cannot stomach. For the Party newspaper, *Scanteia*, has recently devoted three full columns to a critical examination of the state of Rumanian football.

Even in the first division "games have in general been played on a low technical level." Why is this? Because the clubs have "not applied the unique training plan laid down," and, even worse, because

remnants of bourgeois sports practices have given rise to unhealthy manifestations which have nothing in common with the new sport, or the healthy spirit of hundreds of thousands of young sportsmen educated by the democratic people's regime.

These "unhealthy manifestations" are not, as one might innocently suppose, just foul play, engaging the referee in fisticuffs or throwing things at him, but—"the low political level . . . in the activities of the players in the social field."

The behaviour of the clubs themselves causes *Scanteia* much grief: for it seems that they are set on winning their matches. At all costs they are determined to exceed the norm; and they therefore seek, by means of all sorts of extravagant promises, to entice the best players away from the opposing teams. Such practices are apparently not in

THE ECONOMIST, JULY 11, 1953

themselves so bad, but, as *Scanteia* points out, the "fluctuations and transfers" take place "on an unprincipled basis," which has given the star players the impression that "for them everything is permissible on the football field." And club managements "in their impetuosity for victory 'at all costs'" rush to the defence of the culprits. Moreover, "Party and State activists with responsible posts" who happen to be on a club board of directors, or who are football fans, "have lost their objectivity and political clarity, and have taken up a partisan and inadmissible attitude in covering up and even encouraging these unsporting practices".

Have they forgotten, asks *Scanteia*, that their duty is "to combat the spirit of competition between teams?" Have they forgotten that they must be "guided by Stalinist teachings concerning Socialist competition?" Furthermore, "the lack of ideological vigilance" of many of the activists on the directing boards of football clubs is so great that they allow themselves to be "influenced by so-called 'sports technicians' and 'stars' soaked in bourgeois ideology, to such a degree that they resort to *unprincipled interventions*" in their favour, and "tolerate the reintroduction of the competitive spirit in the teams," which is "completely contrary to the spirit of collaboration and reciprocal aid that is a specific part of the Party line and spirit in sports matters."

"Provocatory Acts"

The remedies proposed by *Scanteia* are illuminating. The main one appears to be that the Central Commission of the Sports Federation (C.C.F.S.), should "assure a systematic and permanent political education of players." Apparently "a first class player ambitious to represent his country" must not only achieve technical perfection, he must also "possess the well-developed conscience of a patriotic citizen, with a high political and ideological standard." This is all the more important since "the absence of close co-ordination between sports education and political education represents a danger to the work of the Communist education of the great mass of young people."

On the other hand

the CCFS must rely on the thousands and tens of thousands of worker spectators, who are filled with love for the development of the new sport . . . in order to unmask the small number of adverse elements who . . . try to intimidate the referee and indulge in all sorts of provocative acts.

Poor Rumanian football fan. The club managements must also punish the "unhealthy manifestations" of their players without awaiting the CCFS' decision, and "in certain cases, must themselves rectify the sometimes serious errors made by the referee in their favour during a match." *Scanteia* further recommends that after each match the two teams should hold an inquest on it, for the purpose of "criticism and self-criticism of the play." Finally, great "attention must be paid to the professional preparation and to the raising of the political level of the trainers."

If all these instructions are properly carried out, Rumanian football will undoubtedly undergo a remarkable transformation. But first of all a certain amount of cleaning-up will be required, and, since almost all the Government ministers are honorary presidents of one club or another, a number of big figures may have to be declared "offside."

THE BUSINESS WORLD

Commodities since Korea

FOR over two years, world commodity prices have been falling, more or less steadily, from the dizzy heights reached in the first nine months of the Korean war. The reaction from that upsurge, which had no parallel in commodity history, has worked itself out. The Economist price indicator reworked for this article to a base date coinciding with the beginning of the Korean war (i.e., June, 1950=100), shows that after soaring to a peak of 157 in March, 1951, prices by the end of last month had at last dropped back to 99. Other indices tell a similar story though it may be observed that the Volkswirt index returned to the pre-Korean level as early as April of last year. Some commodities, notably rubber, wheat, sugar and jute, have fallen below their pre-Korean levels; a few, principally wool, are still above those levels.

Wool is the major exception to the general trend. The charts for four individual commodities show that Dominion wool prices in London were more than doubled in the first nine months, rising from 140 pence per lb (for 64's) in June, 1950, to 314d. in the following March, and then lost all this ground—and more—in the following six months, touching 112d. in Sep-

tember, 1951. A subsequent recovery was not maintained, but from April last year firm demand has sent prices climbing fairly steadily to 148 pence per lb. American cotton, it will be seen, rose much less steeply than wool, and is now below its level of three years ago. Middling grade rose from 34.47 cents per lb in June, 1950, to 46.06 cents by February, 1951, and held this level for five months. Prices then declined, rose moderately, and declined again to reach 34.05 cents in June this year. Fluctuations in Egyptian and Indian cotton were much more extreme.

Tin prices, which stood at £600 per ton when the Korean war broke out, almost trebled in a mere eight months, fell back as swiftly to £836, and then quickly recovered to £1,000 in October, 1951. A long period of approximate stability ended early this year, since when the price has fallen steadily, and is now only £10 above the pre-Korean level. Rubber prices behaved even more violently. In June, 1950, No. 1 RSS stood at 23d. per lb; by the following February it had been more than trebled, at 71½d., but then dropped violently. The collapse was checked for a time in mid-1951, but the subsequent trend has been almost consistently

The Economist commodity price indicator is based on 17 commodities important in international trade, and has been recast for this chart to the base June, 1950 (=100); it includes six foods, four fibres, four non-ferrous metals and three other raw materials. The index of world-market commodity prices calculated by R. Schulze, and published in *Der Volkswirt*, Frankfurt (here reproduced from the annual report of the Bank for International Settlements), covers a much larger number of items.

downwards—to 19½d. at the end of last month.

Commodities have been under almost constant attack since the spring of 1951, when the boom was punctured by the change in credit policy in the United States and by the favourable turn of events in Korea, which dissolved fears that the West might be cut off from its supply sources in the East. The wild scramble for supplies that had sent prices rocketing stopped abruptly,

and prices collapsed. Industry ran down its swollen stocks and subsequently bought only minimum replacement needs, thereby intensifying the market's weakness. By September of that year, the commodities had on the average lost one half of their previous gains.

The ensuing phase of recovery and stability was cut short at the turn of the year by a combination of factors. In their renewed efforts to combat inflation and struggle out of deficits on their balance of payments, western governments had turned increasingly to credit restrictions and higher money rates. These, together with the worldwide decline in sales of consumer goods, imposed a further check on demand and on stock levels. The United States, Britain and other nations slowed down their strategic purchases for stock. Some price controls were removed and some commodity markets reopened. The rate of increase in world industrial output slowed down, and in some countries in 1952 output actually declined. These negative pressures on the demand side of the price equation were supported by a positive improvement in supplies of many commodities. The decline in prices continued, washing away the premiums hitherto commanded by commodities from non-dollar sources.

A prolonged fall in commodity prices can never be an unmixed blessing to international trade—not even when it follows an obviously extravagant rise. Its severe economic and political consequences for the commodity exporting countries are temporarily accompanied by “favourable” swings in the terms of trade of the manufacturing countries, but these benefits tend to be offset later by a fall in exports and export prices. Britain's experience neatly illustrates this. If Britain, as the world's largest importer, can be considered in

isolation from the sterling area, it may appear superficially to have gained more from the slump in commodity prices than any other country. It has lost little in export prices because the raw material cost of manufactures is only a small part of total production costs. The resulting improvement in Britain's terms of trade is shown in the chart. The extent of this improvement may be gauged from the fact that, if Britain's imports and exports in the year 1952 had been priced at the levels of last May, the visible trade deficit for that year would have been nearly one-third less.

Necessarily, what Britain's terms of trade have gained, the terms of trade of the commodity exporting countries have lost—and more besides. And this loss has its repercussions upon the manufacturing countries. The drastic fall in wool prices, to take the most prominent example, forced Britain's largest market, Australia, to impose swingeing import restrictions, from which British exporters have not yet recovered. Other West European countries have also suffered a fall in exports to the commodity producing countries, which are their largest markets outside Europe.

An even more obvious, and quicker acting, adverse consequence of the deflation in commodities, and one of vital importance to trade between the dollar and non-dollar worlds, is the drop in the overseas sterling area's dollar earnings. Exports of Malayan tin and rubber, Australasian wool, West African cocoa and the rest are the foundation of the dollar income of the whole sterling area. In 1950, the United States purchased from Britain goods worth \$337 million, but its purchases from the rest of the sterling area were almost four times as much, at \$1,266 million; in 1951 its purchases from Britain actually rose faster than those from other sterling countries, but the absolute increase in the latter was by far the more important (\$437 million, to \$1,703 million, compared with \$131 million, to \$468 million). And in 1952, although US imports from Britain continued to

rise (to \$484 million) those from the rest of the sterling area slumped to \$1,379 million. These comparisons clearly indicate the dangers implicit in a further weakening of commodity prices; and there is always in the background the recollection of the unhappy experience

of 1948/49, when the drop in the overseas sterling area's dollar earnings during the slight American recession was one of the reasons why Britain had to devalue the pound.

The crucial question now is whether commodity prices as a whole, which have lately been stagnating rather than falling, will come under further pressure or stabilise at roughly their current levels. The answer must mainly depend upon the trend of business in the United States; and that is still coasting over a high plateau. This article is not the place, nor perhaps is this the moment, to try to weigh the conflicting uncertainties in the American prospect. The indications are that the high level of economic activity will continue at least until the end of this year, but the prospect for 1954, and especially for the latter part of that year, is obscure. Though the peak impact on the markets of the stockpiling programme is long past, it is intended

France Finds Wings

LAST Sunday morning, a pilot dived over the centre of Paris; the shockwaves set up as his aircraft passed the speed of sound cracked windows in the Champs Elysées. That aircraft was the Mystère IV, giving audible proof that French aircraft designers had produced a machine able to stand comparison with any of its class in the world. But the difficulties of the French aircraft industry are not limited to overtaking the immense technical lead that the British and Americans gained during the war and afterwards when the French factories were out of action. Perhaps the main problem is to secure the production of aircraft once they have been designed—in other words, to place production orders in conformity with a coherent defence policy and to pay for them. The limits of what can be produced are set by the size and the organisation of the French aircraft industry; the influence of both these factors can be seen in recent developments in French aircraft design.

The French aircraft factories were nationalised in the late thirties, because of general dissatisfaction with their progress. The factories themselves were merged into regional groups; the companies that had owned them kept their legal identity, although they were reduced to little more than drawing offices. French politics after the war, including the presence of a Communist as Air Minister, ruled out any chance of recasting the form of the industry; to-day there are three groups of nationalised airframe factories, in the North, South-East and South-West regions, and one nationalised engine company. But there were also new stirrings of private enterprise as the original founders of the French aircraft industry began to re-assemble design teams. Among them was Marcel Dassault, familiar before the war as Marcel Bloch, before he

that US defence expenditures shall remain at the present high level for about another year. Moscow's dramatic change of tactics, and the efforts to end the Korean war, have presumably been pretty fully discounted by the markets already, but it would be rash to say that they have been wholly discounted; the feeling that peace may prove less than good for business is still widespread. A year from now, if one may look so far, the outlook will be governed largely by the extent to which the reduction in American demand for armaments is taken up by an expansion in civil demand. By then, of course, western views on the volume of arms required may have changed substantially. The commodity markets may reflect that, having lost their Korean boom, they cannot lose it a second time. But they should also reflect that even a small and shortlived slowing of America's gigantic economic machine can cause large reverberations outside.

adopted a *nom de guerre* used by his brother in the resistance movement.

French designers had little or no chance to work on jet aircraft during the war. Their lack of experience, by comparison with British and American designers, accounts for a certain impatience on their part to avoid spending time and money on the spade work that others had to do in order to evolve to-day's supersonic fighter from the first jet aircraft of 1941. In this vain hope they have dissipated much energy. Many of the proto-

Experimental supersonic fighter built by Société Nationale de Constructions Aéronautiques du Sud-Ouest. Designed to operate from small airfields; powered by rocket motor in the fuselage with two Turbomeca jets on the wing-tips. First flew last March.

types flown in France in recent years seem to have aimed deliberately at novelty in the hope of finding a line that had not already been successfully developed in other countries. Few of these fancies were considered suitable for production; indeed, most of the aircraft built in France have been based on the de Havilland Vampire. Some of the best French designs have come from the design offices of the privately owned companies, and French policy has acknowledged that fact in a truly Gallic way—by giving nationalised factories to those companies so that they can build as well as design aircraft. At the same time, the government is attempting to rationalise production in plants still under its

control. Several of the smaller workshops have been shut down and more will follow. Out of 60,000 workers engaged in the production of airframes and engines, about 25,000 are working for private companies, and the balance in the nationalised factories. Not all of those working in the nationalised factories are working on aircraft, and those that are seem to be employed largely on sub-contracting for the private companies, especially for Dassault.

★

The French aircraft industry is not large, it employs about a third of the numbers working on airframe and engine manufacture in this country. Since its size puts a close limit on the different types of aircraft that it can produce, the greatest efforts are being concentrated on the production of fighter aircraft. A certain amount of work is being put into the design of civil aircraft and troop transports, but none into really big structures like bombers. But when it comes to deciding on the types of fighters of which France stands in most need, new problems arise. France is exposed to the risk of attack by land forces as well as from the air; so strategic considerations dictate two separate needs—for aircraft capable of high-altitude interception and for machines to be used in ground attack. There is much discussion whether absolute performance is a more important objective than securing the greatest number of aircraft and keeping them as easy as possible to operate. On the whole, the French aim at producing aircraft and engines that are simple to turn out in quantity and do not rest on critical materials that might become scarce in an

VAUTOUR
Sonic fighter-bomber built by S. N. du Sud-Ouest. Powered by two Atar jet engines; first flew last October.

emergency. In order to get aircraft in numbers, the French Air Force is prepared to compromise on a higher fuel consumption and a shorter range and combat life than would meet British or American standards.

It remains to be proved whether these ideas are sound. Certainly, engineers in Britain are convinced that a simple, cheaply built jet engine is impossible. They would maintain that the complex design and high-grade materials in a modern British engine give it more than a good fuel consumption; they would claim that these are the essentials of high performance, and that performance will suffer if they are reduced. The argument is important, for an aircraft is only as good as its engines. Most of the jet engines used in France come from Hispano-Suiza, a private company, and are built to

Rolls-Royce designs. The nationalised engine company, Société Nationale d'Etude et de Construction de Moteurs d'Aviation (SNECMA) has evolved the Atar range of jet engines, some of which are coming into service, but there is a difference of opinion about the design, which is planned with simplicity as the first consideration. At the other end of the scale, another private company, Turbomeca has developed a unique

MYSTÈRE IV
Sonic Interceptor fighter built by Avions Marcel Dassault. Powered by a Hispano-Suiza Tay, to be replaced later by an Avon. More than 200 Mystère IVs have been ordered by the Americans for Nato. First flew last September; delivery due to begin next summer.

range of miniature jet engines giving from 300 to 900 pounds thrust. French airframe designers have already found a surprising number of applications for them and the designs have been licensed in a number of other countries.

★

The French industry put its products on show at Paris last week, ending with a flying display during the week-end. The most important French aircraft there was undoubtedly the Mystère IV. This is an interceptor fighter built by Dassault, roughly equal in performance to the British Swift or Hunter. This spring the Americans placed an order for the Mystère IV for Nato forces, worth about \$86 million, which will cover the production of about 200 aircraft. The company has undertaken to deliver the first Mystères by June next year. The first of them will have French-built Rolls-Royce Tay engines giving rather more than 6,000 pounds thrust, but will eventually be fitted, like the Swift and Hunter, with Rolls-Royce Avons which Hispano-Suiza may be able to deliver in two years' time. This change will mean a further improvement in the Mystère's performance.

The Mystère IV has been evolved from a family of several generations of fighters in much the same way as modern British aircraft; the Dassault company has overtaken the technical lead of the British companies not by inspiration but by intensive development. The Mystère IV first flew last September, within eleven months of the time when drawings were first begun. To do this the factory and drawing office worked continuous three shifts, and an exacting schedule is now in force to deliver the aircraft on the dates promised

next June. Development at such pressure is remarkable in the aircraft industries of the world; should Dassault continue at this pace with the same success, it will be a competitor to be reckoned with.

The Mystère is, however, a conventional aircraft in this sense: its power, weight and intricacy differ relatively slightly from those of similar aircraft produced in other countries. In two other military aircraft, an attempt has been made to meet the requirements of simplicity of production and high, if transient, performance. The South-West region factories have produced the Vautour, a sonic* twin-engined fighter bomber for ground attack and also, it is hoped, capable of adaptation into a high-altitude all-weather fighter heavily equipped with radar. Whether it is possible to design one aircraft to fulfil successfully two such different roles, has yet to be demonstrated, for the Vautour first flew only a few months ago. A "pre-series" order has been placed in order to get experience of the Vautour under service conditions. Such orders usually cover the production of 10 to 20 machines.

The second of these aircraft, the Trident, was designed by the same group of factories. It is an experimental aircraft, designed to work even if France should again be invaded and its airfields over-run. Modern jet fighters need long and elaborate runways for take-off and landing, whereas the French air force would in such circumstances need fighters that can fly from the fields. The Trident is powered by a battery of rockets in the fuselage, with two small Turbomeca jets on the wing-tips to bring it back to land. Rocket propulsion in a piloted aircraft is largely untried and presumably dangerous; when the Trident was demonstrated publicly, only the jet engines were used. But the high speeds of well above 1,000 miles an hour of which rocket-powered aircraft are capable and the growing conviction in many quarters that lighter and not heavier high-speed fighters are needed, gives the Trident international significance. The work on ram-jets being done by René Leduc et Fils has much the same object and on a less ambitious scale, the Baroudeur jet fighter designed by the South Eastern region group is intended to use grass airfields.

★

Part of the French pre-occupation with cheapness and ease of construction stems from the difficulty of getting money for military aircraft, as well as from the strategic desirability of dispensing with big runways. The French Air Force budget has rarely been voted without severe cuts, and orders already placed have often been reduced, sometimes drastically. In such an

* The term "sonic" is now applied to aircraft that can reach Mach 1 (the speed of sound at any given altitude). The term "supersonic" is used to describe the future aircraft that may fly consistently at speeds of more than Mach 1.

atmosphere of uncertainty, production becomes impossible to plan, especially for the company faced with the responsibility of placing orders for sub-contracts and for materials. It is not unknown for orders to be reduced by as much as half between the time they were first signed and the date when the aircraft came due for delivery. In addition, because of persistent delays in voting the budget, the Air Ministry rarely knows how much money it will get and when. Orders are often placed in instalments, for the original drawings, for tooling and so on. Since each purchase, from ingot to finished aeroplane, pays a *taxe du transaction* that starts at 1 per cent and increases with the degree of fabrication, French costs tend to be about 20 per cent higher than British, although still well below American, and this reduces the opportunity for exporting aircraft except in special circumstances.

★

American aid has ensured that the Mystère IV will see service with the minimum of delay, but the industry cannot look beyond this machine with any degree of certainty. Yet it would be an international tragedy if, after achieving so much in so short a time, French

HD 31
Civil transport designed for use in North and Central Africa by Société Anonyme des Avions Hurel-Dubois. Intended to carry up to 42 passengers. Its thin wings are unconventional, and are intended to secure remarkably low operating costs. Powered by two Curtiss-Wright Cyclone engines; first flew in January.

aircraft design were to slip back, through lack of financial support, into frittering away unquestioned technical ability on unlikely prototypes. A modern aircraft industry is something of a luxury that not all countries can afford, and the most efficient is bound to be costly. The French aircraft industry, as at present organised makes the worst of the both worlds—neither efficiently nationalised nor capable of giving effective scope to the talents of independent designers and builders. To rationalise this hybrid so that concerns most deserving of support can rely on orders big enough to keep in business will not be easy; it involves politics of the most excitable kind. Yet it may be the only way of ensuring that the Mystère is the first of a new generation and not the single offspring of an immense creative effort.

Towards Safer Railways

ON October 8, 1952, just after eight o'clock in the morning with an autumn fog rapidly clearing, a Perth to Euston express ran through a colour light distant signal at caution and two semaphore signals at danger at the northern approaches to Harrow and Wealdstone station. It collided with the rear of a suburban train standing in the station, and its derailed engine was almost immediately struck by a Euston-Liverpool train travelling north. In this double collision thirteen railway coaches were compressed into a compact heap of wreckage about 45 yards long, 18 yards wide, and 30 feet high—a shambles in which 112 people lost their lives, and 157 people were taken to hospital, many with serious injuries. These are dreadful losses, but it is not their size alone that makes them so; the roads devour life and limb in greater number, but not in the same instantaneous and devastating way. Last year a billion passenger journeys were made on British railways, and 109 passengers lost their lives—with a single exception all at Harrow. A one in ten million chance of survival can hardly be called unreasonably dangerous; but it is no argument for complacency.

Colonel Wilson's report on the Harrow disaster—with the evidence admirably marshalled and the logic of its conclusions tempered with scrupulous fairness to all the railway servants who were involved—confirms the finding that he announced at the end of the inquiry. The driver of the Perth train for some unexplained reason did not obey the indications of the three signals; the signalman had done his work properly and complied with the regulations; and once the first collision had occurred there was no means of stopping the second. So the second most grievous accident on British railways (the first at Gretna in which 227 persons lost their lives in 1915 was caused by the failure of signalmen) was one which might have been prevented by a system of automatic train control—more accurately described as warning control. Since 1912, 640 train accidents have been investigated, in which 1,416 people were killed; 66 of these accidents might have been prevented or mitigated by warning control, and 399 lives might have been saved. Warning control should not be confused with the trainstop equipment which is provided on London Transport and other urban electric railways; it is a system intended for main railway lines. Nor is it the one missing component that would assure complete safety on the railways. It does not by itself reduce the risk of signalmen's errors; it reduces the risk that drivers will run through adverse signals. Yet there is no guarantee that its warning will be properly heeded. In 1940 there was a derailment at Norton Fitzwarren on the former Great Western line in which 27 people were killed; by mistake or miscalculation the driver cancelled the warning (as any main line system must allow him to do) and disregarded the

caution that the warning equipment had conveyed to him.

In the past, there has been some ground for dissatisfaction at the speed with which some of the former railway companies were prepared to move in installing warning control equipment. The Great Western Railway began to develop its system of warning control as early as 1905; it has proved its worth as a simple and robust apparatus, but one that the Railway Executive, not without good technical grounds, held to be capable of improvement. The GWR system operates in conjunction with the "distant" signal—the fishtail signal of boyhood memory which to-day is more likely to be a colour light signal with a focused beam to give a clear indication in brilliant sunshine or thick weather. When the distant signal is at "caution"—the fishtail horizontal or the colour light showing yellow—the driver is warned to reduce speed so that he can stop at the next "home" signal if it is "on." When a Western train approaches a distant signal, its aspect is indicated in the engine cab—by a short bell ring if the signal is clear or by a blast on a hooter if it is at caution. These cab indications are conveyed from a steel ramp fixed between the running rails through which an electric current is passed when the lineside signal is clear. If the lineside signal is at caution (or if the apparatus has failed) the contact shoe on the locomotive is not energised; the hooter sounds and the train brakes are applied. The driver can, however, cancel the brake application by pressing a button and resume full control of the train; it is, indeed, essential for good operating reasons that he should be able to do so.

The former LMS railway experimented on the Tilbury and Southend line with a second system of warning control. This is a magnetic system which unlike the GWR system does not depend on physical contact with a ramp. As the engine approaches a distant signal, it first passes over a permanent magnet between the rails and then over an electromagnet a few yards further on. The first magnet opens a valve which sounds a horn; the second closes the valve if the signal is clear and the horn stops with a short hoot. If the signal is at caution the horn continues to sound and the brakes begin to be applied, though the driver can cancel their automatic application by pressing a vigilance button.

★

Since 1948, the Railway Executive have been engaged in developing a warning control apparatus that would combine the best features of the two systems already in use. Many disconcerting technical troubles were met; it was not, indeed, until nine days after the Harrow disaster that a final prototype was given a first

trial. By March this year, 54 locomotives had been fitted with the apparatus, which is now on large-scale test on the down main line of the Eastern Region between Barnet and Huntingdon. To judge from the chief inspector's report on the Harrow accident, this apparatus promises to answer the need, though the decision to test it for at least twelve months on a high-speed line before adopting it as a future standard equipment for British Railways as a whole is clearly wise. If and when the chief inspecting officer is fully satisfied with the efficiency and reliability of the system, the British Transport Commission will proceed with its installation. The Railway Executive contemplates two plans. The first, to take five years and cost £7½ million, would equip 1,332 miles of route, including the London to Scotland east and west coast routes, Euston to Birmingham, Manchester and Liverpool, Liverpool Street to Norwich, and Waterloo to Exeter, Southampton and Bournemouth. The second part of the scheme would extend the system over another 4,000 route miles, bringing the total cost up to nearly £17½ million. On its completion nearly 35 per cent of the total route mileage of British Railways would be equipped with

warning control, and in effect all the main lines carrying heavy passenger traffic.

Thus, after many years of experiment and urging by the railway inspectorate, automatic train control has been adopted as a standard feature of safety equipment for British Railways as a whole. The figures given above show that it will be costly, and the full scheme will involve annual charges of £2¼ million. It is not a guarantee of absolute safety on the railways. Rather it should be regarded as a special extension of a broad programme of signalling modernisation including the provision of more colour light signals (despite the tragedies at Harrow last year and at Bourne End in 1945 these have proved their great worth in improving safety on the railways) and the extension of electrical track circuiting and block controls to prevent mistakes by signalmen. No one part of this work can merit an absolute priority over the rest; they combine together to provide a modern standard of safety which the railway traveller is entitled to expect. When all elaborate technical provision has been made to safeguard against errors, safety will still rest on the integrity and vigilance of signalmen, signal engineers, and locomotive drivers.

Business Notes

Soft Pedal on Funding

THE symphony of flexible monetary policy, which some people had expected to be massively supported by the deep bass notes of big Treasury funding operations, is being provided after all with only a rather spasmodic *obbligato* in the high register. Twice within the past month the Treasury has shown its unwillingness to provide anything more than a light accompaniment. Early last month, when most people expected it to make a major conversion offer to holders of the £810 million of 2½ per cent War Bonds, 1952-54, that finally mature on March 1st next, and perhaps to push the replacement date beyond the 1960 date chosen for the issue of last spring, it merely repeated the earlier tactics with a modest £100 million offer for cash. The market audience thereupon deduced that the deep sustained notes were being held back for a grand finale in the autumn; and it thereby made a double mistake. This week there came another toot from the high treble. On Tuesday the Treasury announced that, until July 17th, holders of the 1952-54 bonds may convert at par into the 1954-56 War Bonds.

This is admittedly a further instalment in the slow approach to the problem of the coming maturities, which also include the £577 million of 1½ per cent Serial Funding Stock, 1953—due in mid-November, and heavily held by the banks. But it is hardly a "funding" operation. The

descent from a 1960 stock yielding just under 3 per cent to a "money market" stock yielding roughly 2½ per cent for just over three years is not, moreover, particularly alluring to the banking community for which it was presumably made. The discount market, currently enjoying good margins on its bill business, now disdains small margins on bonds. And the banks, some of whom may perhaps be a shade less unresponsive (though not all of them still have holdings of the 1952-54 bonds), are naturally more concerned to know how the Treasury will deal with their much more substantial holdings of the 1953 Serial Funding stock. While the fate of this stock remains uncertain, they cannot be expected to rush enthusiastically into an optional conversion that is not made demonstrably attractive. At Monday's close, the bid price of the 1952-54 bonds (99½) was the same as the offered price of the 1954-56 bonds; on this basis the only sweetener is the interest "turn" represented by the fact that converters will secure their six months interest next year a fortnight earlier, and banks and brokers get 6d. commission.

Harmonising with Reflation

ON present indications, it seems that if the conversions are substantial, they will be mainly those of the "departments," which have of course been following the usual practice of absorbing the nearest maturities. And the

Government broker will soon have another stock with which to supply his "taps" when it appears timely to reopen them. This soft pedalling of genuine funding, the market reasons, argues official confidence in the future of gilt-edged. That may be the explanation. Another one, not necessarily consistent with it, is that the light *obligato* matches better the soothing tones of inflationary budgeting.

Meanwhile, if he listens carefully, the connoisseur may just discern the limited performance assigned to the discount market in this orchestra of flexible money. While the commercial bill rate sounds its monotone (at a pegged 3 per cent, despite the restiveness of some of the performers), the only scope for variation is in the Treasury bill rate. Flexibility here can be discerned in a quiet little dirge encompassed within about three or four semitones. The note actually dropped a full tone at last week's tender (2d. per cent on the market's bid price, and $\frac{1}{2}$ per cent off the discount rate—to an average of £2 6s. 8.48d. per cent, the lowest for more than a year). But such variations are to be construed at present rather as a modest token of flexibility than as a harbinger of dramatic changes in key.

Taking Stock of Television

BOTH supporters and opponents of sponsored television services may draw their own encouragement from the first report of the Television Advisory Committee, published this week after much delay. The committee was asked to report on the number of channels in the ether that would be available for television transmission. Five of the wavebands allotted to Britain under international agreement, each containing a number of channels, are technically suitable, but when the committee came to examine them, it could find only two channels in one of these bands free for immediate use. Within those two channels only three or four high power stations could be operated, which would cover not more than half the population, plus some low power stations in remote parts of the country. The few low-powered stations would be of little interest to commercial television, and might be used to complete the BBC "first programme" television coverage. The higher-powered stations in these channels, and possibly other stations in channels that might be freed in this band, could be allotted to the BBC for a second programme or they could be licensed to commercial stations.

Only recently has the BBC, whose chairman was a member of the Television Advisory Committee, announced any plans for introducing a second programme, and it does not automatically follow that it will be allocated the extra channels that it would need for this purpose. The present BBC television service occupies all the five transmission channels contained in what is known as Band One; each of its five high-powered transmitters uses a different channel, and with the medium and low-powered transmitters already planned its services would make "virtually full" use of available frequency channels in the band. Band Two being too narrow for television transmission, further expansion in the "very high frequency" range now employed calls for the use of Band Three, since Bands Four and Five are in the "ultra-high frequency" range. But business users and navigation services have nibbled into Band Three so as

to leave free only the two of its eight channels. If a third channel on Band Three could be freed for television, then the Committee believed that a second network, of 18 stations, could be set up that would cover as much as 70 per cent of the population. It has recommended that this extra channel should be released as soon as possible; also that the whole of this waveband should eventually be cleared for television purposes, and if possible extended.

How Many Stations?

IF the British radio industry were in a position to provide equipment to transmit and receive pictures using the ultra-high frequencies of Bands Four and Five, television services would no longer have to be limited, as they are at present, to the very high frequencies of Bands One to Three. There is room in these ultra-high frequency wavebands for as many as 50 extra stations. Nor does their use present any special difficulties, for such frequencies are used by many American stations and the seven different services put out in New York use channels from Bands One, Three and Five. But since such frequencies have never been used in this country, the British radio industry has no experience and no facilities for making the necessary components in the quantities needed, and it would probably need three years to provide them.

It is the absence of ultra-high frequency equipment, rather than the somewhat higher cost of transmitting in those frequencies, that limits the number of services that can be licensed. There may, however, be some doubt about whether the BBC is making the most economical use of all its five channels in Band One. The existing arrangement was chosen by the BBC because of its convenience, and need not necessarily be the final answer. This is a point that the Television Advisory Committee may be asked to re-examine.

The most important finding of the report is that there is unquestionably room for two British television networks with the channels immediately available, and for more when the radio industry can produce the necessary equipment. The second network would necessarily be incomplete in coverage, but it would be sufficient to make a start with commercial transmission. Stations on these frequencies could be completed within twelve months of receiving a licence. The BBC may therefore be obliged to commit itself to the introduction of a second programme much earlier than it has so far suggested, if it is to make out a case for the refusal of these frequencies to commercial applicants. Whether its immediate financial prospects would make such a programme possible is another matter.

Australia Eases Import Controls

THE Australian government has decided that, in view of the substantial improvement that has taken place in the balance of payments and in the state of the external reserve, further relaxations can be made in restrictions on

imports into Australia. These concessions, which are already in operation, do not apply to imports from dollar and Japanese sources. Category "A" goods from other sources, which until July 1 last were being licensed for import on the basis of 70 per cent of the value imported in the year 1950-51, are now being licensed on the basis of 80 per cent of that value. This group includes motor chassis, wire netting, chemicals, photographic films and iron and steel goods. Category "B" goods, which include cotton piece goods, tobacco, textiles and household goods, are to have their import licences stepped up from 30 to 40 per cent of imports in the base year. This is the second relaxation made by Australia in the import restrictions that were introduced early in 1952; the effect of those restrictions was to cut down British exports to Australia by nearly two-thirds of what they had been in the previous year. In announcing the relaxations the Acting Prime Minister, Mr Fadden, suggested that a further relaxation might be expected later in the year.

These concessions appear wholly justified by the remarkable improvement that has taken place in Australia's external reserves. The total of these reserves, including Commonwealth Bank balances in London, gold and external working balances of commercial banks, fell to a low point of about £240 million in September, 1952. They are now probably around £400 million. The major factor in this recovery has been the growth of the wool cheque, which for the season just ended amounted to £300 million, the second largest in Australia's history. Wool prices are keeping up remarkably well, which promises favourably for the wool season 1953-54, the first sales for which are due in the early autumn. In view of the considerable improvement that has occurred in its external reserves, Australia may find some difficulty in continuing to justify the discriminatory nature of its import restrictions when the matter is next considered by the signatories of the General Agreement on Tariff and Trade; their representatives meet in Geneva in September. A special plea for less discrimination will certainly be made on behalf of Japan, whose direct trade with Australia now shows a substantial excess of purchases over sales—and this at a time when Japan is embarrassed by a shortage of sterling.

British Investment in Canada

ANOTHER project is announced this week for the participation of British capital in the development of Canada. The London group that is participating in this venture is headed by S. G. Warburg & Co. and Helbert Wagg & Co. and includes Glyn, Mills & Co. on behalf of the "Three Banks" group and a number of institutional investors. There is also a New York group headed by Kuhn Loeb. The company Canadian interests are also participating. The company that has been formed by this triangular international galaxy of bankers is appropriately called the Triarch Corporation, Limited. It has an authorised capital of \$10 million, of which 10 per cent is being issued for the time being. It will have its headquarters in Toronto. The object of the company is "to provide finance and technical experience

for the development of the natural resources and trade and industry of Canada"—a rather wider definition of functions than that given to some of the other recent projects for the participation of British capital in Canadian development. These ventures include United North Atlantic Securities, in which Robert Benson Lonsdale and Rothschilds have taken an interest, the Newfoundland Corporation, in which Rothschilds, Morgan Grenfell, Schröders and Hambros are interested, and the participation taken by Barings and Morgans in the Toronto investment firm of Harris and Partners.

The total of new investment in Canada is beginning to reach appreciable dimensions. The Economic Secretary to the Treasury, Mr Maudling, announced in Parliament recently that some £17½ million worth of dollars had already been sanctioned this year for this purpose. All of this, presumably, will have been provided in dollars at the official rate by the Bank of England. In addition, some dollars for investment in Canada have been made available through a tortuous backdoor route that involves the purchase of blocked Deutschmarks, the sale of these for Swiss francs, and the conversion of the Swiss francs into Canadian dollars. This tangled web of operations can be openly spun with the permission of the Bank of England and at present rates ultimately provides Canadian dollars at a price about 6 per cent dearer than the official parity. The flow of investment into Canada should make even greater progress as the Canadian authorities find it possible to relax the present restrictions on switching Canadian securities in London, restrictions that still require the proceeds of sales of such securities by British residents to be automatically applied to repaying the wartime interest-free loan made by the Canadian to the British Government. The amount of that loan, originally \$1,000 million, has now been reduced to \$200 million and it should not be long before these shackles on London switching of Canadian securities and on new British investment in Canada can be removed.

Coal Prices and Wages

THE Minister of Fuel and Power this week rearranged domestic coal prices to make the duff that many householders have to take at least rather cheaper by comparison with the large coals that they want but cannot get; and the miners went ca'canny over proposals to demand a substantial increase in wages. Neither gift horse should be looked in the mouth. It is tempting, perhaps, to wonder if the Ministry and the National Coal Board still hold that "nobody can be expected to pay what anthracite costs to produce," and to speculate on how much coking coal is being sold at how much loss; but this week's little price change should make the contents of the average coalcellar less expensive if no less depressing. Equally, the National Union of Mineworkers promised to consider a claim for the industry's day wage men and set aside a suggestion from South Wales that investigation of the industry's wage structure should be hastened; but the union executive showed a general moderation and an anxious concern for their industry's internal weaknesses and commercial future that many other unions today do not.

Sir Hubert Houldsworth, addressing the miners, bluntly

Between privation and plenty, between misery and freedom, stands the power barrier. THE BRUSH GROUP bursts through this barrier with all the great resources of modern skill to give the world those vital raw materials which bring life and hope to its peoples. At this very moment Shell are drilling for oil at a depth of nearly two miles beneath the bed of a lake in Venezuela, using a diesel-electric drilling barge—a floating power station, the first of its kind ever built in Britain.

THE BRUSH GROUP is proud to share in this exciting venture. For the main power plant consists of four 12-cylinder diesel engines made by Mirrlees, Bickerton & Day Ltd., a member of the Group.

BRUSH through the Power Barrier

On land, on water (and now even under the water), THE BRUSH GROUP is bursting through the power barrier—exporting the power which assists the march to true civilization.

DUKE'S COURT • DUKE STREET • ST. JAMES'S • LONDON S.W.1 • AND THROUGHOUT THE WORLD

described the fall in the number of shifts worked this year, owing to higher absenteeism, as the "sporadic, unofficial, and unannounced" taking of an extra week's holiday, on top of the two weeks and six public holidays for which the miners are paid in the year. This decline in time worked—equivalent, apart from the Coronation, to two shifts for each man in the industry during the first 24 weeks of this year, or some 1½ million tons of coal—is perhaps the most important factor in the disappointing production so far this year. So far as the five-day week is concerned, the increase in absenteeism is wholly due to higher "involuntary absenteeism," for which a recognised excuse is accepted. In the early months of the year, influenza hit the industry hard. But a more important contributory cause may have been an alteration in the conditions by which men occasionally absent can nevertheless qualify for the attendance bonus in pay.

There is no evidence that absenteeism in mining is higher than in other industries. It happens, however, to be measured in mining; and it happens, in mining, to be directly more important to a larger proportion of the community than absenteeism in other jobs. But that importance to the community—and the arduousness and danger of coalmining—is at present fairly recognised by the position that miners hold at the top of the wage ladder, by their improved holidays, pensions, supplementary injuries assistance, subsidised transport, and concessionary coal. The moral terms in which appeals in the coal industry tend to be couched sometimes sound odd to people in other industries; but they sometimes work, too. Sir Hubert Houldsworth's view of the industry's united objective—"to give real and not transient security to those employed in the industry, and to assist in providing security for the whole community" should commend itself to the miners.

Bank Interim Raised

THE season of half-yearly bank dividends has produced one welcome surprise. The National Provincial Bank, which last January put heart into bank shareholders and heart-searching into rival board-rooms by breaking the long tradition of stability in bank dividends, has gone a step further. That is to say, it has raised its interim to 8½ per cent, or 1 per cent more than was paid twelve months ago, and thereby has maintained the half-year's payment at the increased level paid for the second half of 1952. Last January's move, which raised the full year's distribution by 1 per cent above the 15 per cent that had been paid since 1932, had left the market in doubt whether the improvement would be extended to the interim also. That it had preferred the cautious view was apparent this week, when the shares rose sharply on the announcement.

The heart-searching among the other banks has not yet produced any visible results, for the remaining six of the Big Seven have all maintained their payments at the customary level. But if any results are to be expected (and market hopes have, of course, been revived this week) they were never likely to reveal themselves first in the interim payments—despite the fact that this past half-year has undoubtedly been a favourable one for bank earnings. The average level of bank deposits has been rather higher

than in the corresponding period last year, and although advances have been running appreciably lower, the banks have been enjoying the full benefit of the increases in rates charged to borrowers as well as in service charges—without, however, facing the once apprehended worsening of bad debts experience. Shareholders should not expect, however, that this present trend of earnings will provoke any general move into line with the National Provincial. Some bank chairmen, indeed, made it very plain at the last annual meetings that they had no intention of moving in the early future.

German Debts Unsettled

JUST before last week-end, the German debt settlement dragged its weary length a few inches nearer the final goal of coupon payments. In the United States the Senate Foreign Relations Committee approved the settlement more promptly than had been expected and in Germany, after the hitch over the Franco-German settlement, the debt agreements should be signed by the President before the middle of this month. A resumption of the debt service was finally brought into sight by the formal offer to the holders of the Hamburg State Loan. By prolonging the life of this loan to 1971, by cutting its coupon rate by a quarter (from 6 to 4½ per cent), by waiving one-third of the interest arrears and by funding the remaining arrears, the German authorities observe to the letter the conditions laid down in the general debt settlement.

The prospect of an early resumption of payments on German bonds has, however, been tarnished by procrastination over the Potash loans. The formal offer on the Gold Loan of the Potash Syndicate of Germany does not, in the opinion of the British trustees of this loan, Royal Exchange Assurance, and of the principal British paying agent, J. Henry Schroder and Company, "conform even to the minimum terms laid down" in the general agreement. The German debtors appear to have tried in this offer (the details of which have not been published) to take advantage of the general clause in the settlement that

nothing in this agreement shall prevent any debtor from obtaining, with the consent of his creditors, terms more favourable to the debtor than those specified in this agreement.

With this offer the Potash producers seem to have sent up a trial balloon; they may want, indeed, to proceed by the dreary round of offer and counter-offer, as in the general debt negotiations. The fact that the Potash producers are earning good profits and that one of them recently declared a dividend would make any such prospect of further bargaining particularly distasteful for British creditors.

Mr Snip the Tailor

SINCE Mr Charles Clore's successful bid for the ordinary shares in J. Sears (True-Form) Boot Company, speculators have given even less credence to the value of bricks and mortar as shown in a balance sheet and have

shown an increasingly lively interest in share offers. In the last month or so, most of the rumours have been centred in the shares of some of Britain's leading multiple tailoring concerns. And for once these rumours were based on a firm rock of fact. They were confirmed when the Jacobson family revealed that they had arranged to sell their 51 per cent controlling interest in Jackson the Tailor to Montague Burton and when Sir Henry Price and his family announced that they, too, had arranged to sell their interests in Prices Trust (which through its subsidiaries controls the operations of the Fifty Shilling Tailors) to United Drapery Stores. The 1s. ordinary shares in Jackson the Tailor will be sold at 6s. each (compared with a price of 3s. 6d. only a month ago and, after the rumours had flown about, with 5s. 6d. on the eve of the announcement), but this sale will be completed only when a similar price is offered to other shareholders in Jackson the Tailor and when the holders of at least 90 per cent of the £300,000 equity capital have accepted the offer. Similarly, the sale of Sir Henry Price's one-third interest in the ordinary capital of Prices Trust at 30s. for each 5s. share—a price that is 1s. higher than the current market quotation and as much as 9s. higher than the price quoted two months ago—is made conditional upon the acceptance of the offer by the holders of at least three-quarters of the issued ordinary capital of £776,250 of Prices Trust.

These acquisitions, if carried out in full, would cost Montague Burton about £1,800,000 and United Drapery Stores about £4,657,000—quite large sums to find at a time when the multiple tailors are beginning to recover from the troubles into which they were plunged by the fall in wool prices and a setback in sales. It may be that both Montague Burton and United Drapery Stores may wish to arrange a more rational distribution of their chains of stores across the country once these deals go through. But the directors of neither company can be blind to the point, so clearly demonstrated by Mr Clore, that the real value of freehold and leasehold properties is well in excess of the value put upon such properties in a balance sheet. This is not the only, and perhaps not the main, feature of these two deals. The coincidence of the timing of the two bids is also interesting—even to the point of prompting the question whether one bid was made in answer to the rumours of the other. Neither of the two rivals would presumably care to confront the other except by matching as closely as possible its competitive power.

Vision and the Box-Office

ADMISSIONS to the 410 cinemas owned by the Associated British group were nearly 5½ per cent lower in the year ended March 31st than during the year before; and the group's chairman, Sir Philip Warter, had no hesitation this week in singling out television as the main reason for this loss of business. The number of television licences, Sir Philip points out to the group's shareholders, grew by nearly 50 per cent during the year under review; he adds that "most of the drop" in cinema attendances takes place in the evening performances when most television programmes are broadcast. Sir Philip does not believe that the present total admissions of about 25 million a week

(of which the ABC group accounts for about 3½ million) can be held. Though he is confident that the cinema will continue to retain an important share of entertainment in this country, it is with serious qualifications:

I am sure that during the next few years there will be an inevitable tendency to reduce the existing number of cinemas, either by rationalisation within the industry or by economic necessity.

The group has already equipped a number of its cinemas for three-D and wide-screen processes, though as yet it is not committed to any particular system.

It has sometimes been said that Whitehall would never believe that cinema exhibition was doing badly until ABC passed a dividend. Associated British has furnished no such doleful evidence, even though its group trading profit for the year was some 13 per cent lower at £2,067,776. Net profits for the group were £487,746, against £518,223 in the previous year; and the total dividend is left unchanged at 20 per cent. Sir Philip referred to the continued burden of Entertainments Duty. The minor concessions granted in recent years have mainly benefited the small cinemas, as against the larger cinemas operated by ABC and other major circuits. In fact, Entertainments Duty and the Eady Levy took more from ABC than in the previous year, although its gross box-office takings fell; the final result was that the net takings left to the circuit fell by more than the amount its patrons paid. Associated British has always been less heavily committed to film production than the Rank Organisation, and is continuing to support production on a moderate scale. Accordingly, it receives money from the Eady Levy as a producer while paying it as an exhibitor, but it gains much less on the roundabouts than it loses on the swings.

More Capital for English Electric

HAND in hand with the news of the over-subscription of de Havilland's new issues of preference and ordinary shares came the announcement of another new issue that should prove to be equally successful. English Electric, whose last balance sheet underlined the need for new money by disclosing a bank overdraft of £9.4 million (which has since risen to £12 million) and a rise in the value of stocks by £11½ million to over £46 million, is to raise just over £6½ million from the issue of a debenture stock and of ordinary shares. The debenture issue will consist of a new £2½ million tranche of the 4½ per cent stock (1972-77), of which £3 million was placed privately at par at the beginning of 1952; this stock will be offered to the public at 97½, at which the gross redemption yield to the latest date is just over 4½ per cent. That this stock is expected to command good support from investors is sufficient comment in itself on the decline in coupon rates on industrial debentures that has taken place since the beginning of the year, when Anglo-Iranian made its famous issue at 5 per cent.

The remainder of the new money will be raised by a rights issue of 1,769,365 new £1 ordinary shares; stockholders are offered one new share at 48s. 6d. for every £3 of ordinary stock they now hold. On the assumption that the

Seasonal
Greetings!

Strange things happen
in a British Summer. But
If you really did see Father Christmas
on the pier one day this August you
might well swear off lobster lunches
for ever. Set your mind at rest, though;
this jovial chap is simply our impression
of the business man who has already placed
his order for advertising playing cards
for this Christmas. Have you ever thought
of advertising by playing cards? They
make an admirable gift and are a
very effective way of keeping your name
in mind. Their cost, too, is surprisingly
reasonable. Why not strike a new note
this year? Our designers can incorporate
your name or trademark into an attractive
playing card and the finished product will
have over a hundred years' experience behind it.
But orders must be received by early September
for delivery before Christmas. So please
telephone or write for one of our technical
advisers to call and show
you specimens and answer
all your questions.

TANKERS AND TEXTILES

OIL is the Proteus of minerals—changing its form, shape and very character under the wizardry of petroleum chemists. It kills insects in your garden and pain at your dentist's. It clothes you and colours your clothes, for oil is one of the raw materials of synthetic textiles and of many textile dyes.

To cope with the demand for oil, the British Tanker Company, shipping subsidiary of Anglo-Iranian, is expanding its already great fleet. The s.s. British Sailor, shown here, went into service in time for the recent Coronation Fleet Review. A carrying capacity of 32,000 tons makes her the biggest tanker under the British flag.

Twelve more of these giants are building or on order to bring oil to the BP refineries where it will be processed for use in industry, agriculture, transport and ordinary homes all over the world.

THE BP SHIELD IS THE SYMBOL OF THE WORLD-WIDE ORGANISATION OF

Anglo-Iranian Oil Company
LIMITED

last full year's equity dividend of 15 per cent will be maintained, the new shares are offered on a yield basis of 6½ per cent, and this, together with the turn on the current price on the existing stock units of 55s. 6d., should ensure full subscription lists.

Caution from Courtaulds

THE chairman of Courtaulds, Ltd., Sir John Hanbury-Williams, gave shareholders at the company's annual general meeting a characteristically cautious analysis of the prospects of the rayon industry, in somewhat marked contrast to the prevailing mood of optimism. Rayon production has been running at a rate far higher than that recorded even at the peak of the 1951 boom, reaching nearly 37 million pounds in May. But Sir John is not convinced that this state of affairs is likely to continue for any longer than it takes rayon consumers to build up their stocks. It did not prove too easy to reopen the rayon factories that were closed down last summer, and there was some delay before producers were able to meet orders when trade revived last September. Courtaulds, which continued to produce for stock at the beginning of the textile depression in the hope that the fall in demand was temporary, may be understandably anxious not to over-estimate the market a second time.

The rate of rayon cloth production in Lancashire does support the view that some of today's high rayon staple and yarn output is going into stock. Although cloth production in May was far higher than at that time last year, when the industry was heading for the trough of the depression, it is less than 3 per cent higher than in May, 1951, while the production of rayon staple and yarn is running at a rate more than 14 per cent higher than in May, 1951.

There seems no immediate prospect that rayon exports will rise much above their levels in 1951 and thus absorb some of this extra production. As Sir John pointed out, Japan has recently become the world's leading rayon exporter, in spite of import restrictions on textile imports into the Commonwealth. But the British rayon industry, which exports as much as half its output, would do better to meet this competition commercially than to campaign against the relaxation of restrictions that would follow the admission of Japan to the General Agreement on Tariffs and Trade. The threepence a pound that was taken off the price of Courtauld's rayon staple last week is a stronger and more proper counter to Japanese exports than arguments for the retention of trade restrictions.

Capital Issues Contrasts

WHATEVER definition is put upon the term "capital issues," all the published statistics for new issues in the first six months of this year give the same broad, but misleading, impression. It is that the demand for new capital was much higher than for some years past. In the

table of capital issues published on page 132, for instance, total new borrowings directly from the public and from shareholders in the first six months of the year are shown at £450 million, compared with £244 million and £147 million respectively in the first six months of 1952 and 1951. But this is a reflection seen in a distorting mirror, for the total figures are swamped by the demands that the Government have made upon the market. No less than £345 million of this total of £450 million was borrowed by the Government—largely through the £125 million issue by the British Electricity Authority and by the two £100 million tranches of the 1960 Exchequer stock. The volume of new money absorbed by public companies in the private sector of the economy fell quite sharply. New direct issues made by British companies (at £55 million) were as much as £21 million lower than similar issues in the first half of 1952 (when, as it happened, electrical manufacturers were particularly heavy borrowers) and only £2 million more than those made in the first six months of 1951.

In the private sector, the fall in raw material prices and the slight recession in trade (together with the high costs of loans either from the banks or from the market) forced some companies to revise their fixed capital development programmes and enabled others to reduce their working capital commitments; and the consequent accretion of liquid balances immediately damped down the need for new permanent capital. Indeed, apart from the special case of the Anglo-Iranian issue, which disproportionately swelled the amount of new money raised on debentures in the first months of the year, the only industrial group that knocked firmly on the door of the capital market was the aircraft industry.

What Productivity Costs

IF politicians use the word "productivity" rather vaguely to denote A Good Thing That Industry Ought to Improve, many engineers use it indiscriminately for various relations between output and certain factors of input.

GOLD AND DOLLAR RESERVES
US DOLLARS [MILLION]

Nevertheless, when used in conjunction with costs, it is an excellent index of productive efficiency, and an important if incomplete measure of industrial efficiency. Sir Charles Goodeve, addressing the Institute of Production Engineers recently, proposed as a useful preliminary to the investigation of productivity (and perhaps as a corrective to some comparisons that have been asked to bear too much weight) a standard method of combining the physical and financial yardsticks. This is to set a "resources consumption rate"—that is to say, the amount of materials, hours of labour-time and machine-time, and share of services required to make a given product—besides the prices of those factors, to give a cost analysis.

Such a table—Sir Charles's example for an "average" ton of pig-iron is reproduced—makes it possible to see at once the factors in which economy would yield the greatest return for managerial effort. For example, to produce this ton of pig iron with 10 per cent fewer man-hours, other things remaining equal, might reduce the total cost by about

THE COST OF MAKING A TON OF PIG IRON

Resource	Consumption Rate	Price	Cost Component
Raw materials, iron ore, etc.	1.8 tons	£4.10s. per ton	£ 8 2 0
Limestone	0.2 tons	£1 per ton	4 0
Fuel—coke	0.85 tons	£5 per ton	4 6 0
(net gas credit)	(65 therms)	(2.4d. per therm)	(18 0)
Labour-time	3.2 manhours	4s. 6d. per hour	14 6
Furnace-time including overheads	0.08 hours	£15 per hour	1 4 0
			£13 16 6

1s. 6d., while a similar economy in furnace-time would save about half-a-crown; to use 10 per cent less limestone would save less than 5d. a ton, but an economy of 10 per cent in coke consumption might save more than 7s. a ton of pig iron. When the economy in one factor—for example, man-hours—can only be achieved by an increase in another—say machine-hours or machine price—it will indicate whether such an increase in the productivity of this factor is worth buying.

Thus the prices shown in the table in effect set the limits of a manager's control, and the limits to which broad comparisons also are subject. For example, an important item in the differences between labour productivity in the United States and Britain is the fact that wages in the United States are three times as high. In Britain, Sir Charles pointed out, new industrial plant costs perhaps two-

Next week's issue of
The Economist
will include the annual
review of
BRITISH INSURANCE

thirds as much as in the United States, though wages are a third as high; the cost of plant in relation to labour here is thus twice as high, which must hamper attempts to raise physical productivity to American levels. It arises, he argued, partly because of the obsolescence of equipment in some plant manufacturers' shops; hence these manufacturers deserve priority for re-equipment and closer co-operation from plant users, to encourage standardisation. Both measures may well be desirable. But the disparity between wage levels, affecting different industries differently in accordance with the varying importance of labour costs, applies to all industries and services and will probably continue to impose a difference in the industrial pattern. Truly, as Sir Charles added, "Every step forward is indeed a much harder one to make here than in a country such as the United States."

Protection for "Free" Sugar

AN international marketing scheme for sugar will be considered in London next week. Unlike the schemes for rubber and tin debated earlier this year, the International Sugar Conference is concerned only with the smaller part of the world trade in sugar, the free market. The larger part has long been regulated by preferential arrangements, such as those between the United States, Cuba and the Philippines, and between Britain and the Commonwealth. Exports of "free" sugar amount to some five million tons yearly, compared with total exports of some 12 million tons and a world production of 35 million tons. The United States, the largest importer, does not come into the free market at all, but Britain, the second largest importer, takes well over one million tons of "free" sugar. Cuba, the largest exporter and a low-cost producer, sells roughly half its exports to the United States at a preferential price, and so is able to offer the rest in the free market at a correspondingly lower price. The preferential markets are to a large extent supplied by high-cost producers, the free market by low-cost producers. Sugar has never held in serious regard the economics of the open market.

The draft of the new agreement, like the 1937 agreement (which is now out of date) seeks to stabilise prices and prevent the accumulation of huge surpluses of sugar, to maintain the size of the free market and give those countries that depend on it a share of any expansion in world consumption. The draft agreement departs from the old by proposing a maximum and minimum price zone in the free market; whenever the free price goes above or below the zone for more than thirty consecutive days export quotas would be automatically increased or lowered. The effectiveness of this provision appears to depend on the zone of prices that is initially set, and on whether the appointed authority could agree to modify it if experience of its working demanded any change.

As the effective working of any commodity agreement demands the widest possible measure of support, it seems a pity that China, potentially an expanding importer, and East Germany, an important exporter, have not been invited to attend. Some form of regulation of the free market is almost certainly desirable, and the prospects of reaching agreement appear favourable.

SHORTER NOTES

Led by Esso and Cleveland, the major oil companies raised the prices of most petroleum products in this country this week by from ½d. to ¾d. a gallon "owing to higher world prices of petroleum products." This follows rises in America last month as the result of a rise of about 9 per cent in the price of crude oil—the first major rise for 6½ years. Although nearly all Britain's imports of crude oil come from the Middle East, where crude prices have not yet been raised, the prices of refined petroleum products vary in accordance with a "Gulf-plus" formula based on prices at the United States Gulf.

The British Transport Commission has decided to appeal against the findings of the Ministry of Transport inquiry into the loss of the motor-vessel *Princess Victoria* in the Irish Sea on January 31. Captain J. D. Reed, the registered manager of the ship, is also appealing against the findings of the court, which held that the vessel was unseaworthy, and

that its loss and that of 133 lives were caused or contributed to by the default of its owners, the Commission and its managers.

Unemployment in Great Britain on June 15th was down to 297,700, no more than 1.4 per cent of the estimated number of employees; the number of persons working short-time in one week of May was 62,000, compared with 112,000 in the February quarterly return; and 50,000 more people were in civil employment in May than in April.

Sales of wholesale textiles fell in May by 5 points to 90, a figure only two points above that recorded for May last year (1950=100). The level of stocks has hardly changed at all during the past four months, at 87; it was in May only one point higher than in April and the same level as that recorded in March. This is well below the value of the stocks being carried during the same period last year, when the index for May stood at 113.

Company Notes

COURTAULDS. Though the full accounts of Courtaulds are scarred by the effects of the recession in the rayon industry, they show many signs of the recovery which began last autumn and which, naturally enough, is given a prominent place in Sir John Hanbury-Williams's statement. By the end of last year the group's factories manufacturing rayon staple were back into full production and more recently the production of textile yarn has been running at the level achieved in the middle of 1951. This recovery came too late to make any clear mark on the profit and loss account, which shows a fall in trading profits from £20½ million to £11½ million; but it may well have been the profits earned in the last half of the financial year that removed the earlier threat that the ordinary dividend might have to be reduced from its customary rate of 11½ per cent. In fact, the consolidated balance sheet reveals the foundations on which recovery was built. Here the most reassuring sign is that stocks, in Sir John's words, "have been reduced to more normal operating levels" and that their book value has fallen from £22.2 million to £17.6 million.

By far the most startling change in the balance sheet, however, is the sudden rise in the net book value of fixed assets from £34 million to nearly £52½ million. Although over half of this net increase—£9½ million—is accounted for by adjustments in accumulated depreciation provisions, the remainder is a reflection of heavy capital outlays during the year. Undeterred by the recession, the group

pushed ahead with its programme of capital expansion, especially in Canada and Mobile, Alabama, where a new factory is being built. The building of this factory will enable Courtaulds to keep its foothold in the United States, now that it has sold its remaining 5 per cent shareholding in American Viscose for just over \$11 million. The group appears to have financed these capital developments by

£1 ordinary stock at 40s. yields £5 13s. per cent.

selling part of its holdings of Government securities, for in the consolidated balance sheet their book value is shown to have fallen from £18.6 million to £11.7 million. A pause, if not a halt, in this process of expansion is, however, signalled by the

estimate of outstanding capital commitments at £5½ million, compared with £16 million the year before.

The justification of this programme must be found in Sir John's estimate of future prospects. Here he is reasonably reassuring, though his remarks are qualified by some reservations. He believes that the current rate of deliveries of rayon staple, running at the moment at peak levels, should be maintained this year, but he adds that a small proportion of these deliveries may merely be swelling existing stocks, so that there is a danger that demand may once again fall off. Similarly, the demand for rayon yarn may reflect "over-buying" and Sir John is also obviously worried about the trend in sales in the group's export markets. Perhaps this is why the directors appear to see the future in terms of a factory "on the spot" rather than in terms of exports from this country.

BRITISH PLASTER BOARD.

A few reservations about the future course of trade expressed by Lord Belper in his statement to shareholders of British Plaster Board may explain why the 5s. ordinary stock units (at their current market price of 14s. 3d. xd) still yield 7 per cent. The general improvement in the group's sales appears to have been so strong as to offset the reduction in the prices of building plasters and plaster-board made by the company last autumn, and the group's trading profits have advanced from £1,657,404 to £1,816,559. And, of even greater import for equity shareholders, net profits have risen as well—from £418,883 to £478,428—in spite of further increases in the charges for taxation and depreciation. This advance in profits, together with a reduction in the

book value of stocks (from £1,182,513 to £972,022) and the consequent reinforcement of liquid resources, was immediately and rightly accepted as an opportunity for raising the ordinary dividend from 17½ to 20 per cent.

There are two factors, however, that prevented the market from giving this increase the welcome it might have otherwise provoked. In the first place, there is little sign that the rise in costs (particu-

larly in wages) has been brought to a halt. Secondly, Lord Belper, though he expects sales to be maintained at a high level, points out that "the shortages of other important building materials—particularly of bricks—may possibly arrest the rate of increase in the building of houses and thus tend to curtail the expansion in the sales of building materials, particularly of plasters and plasterboard." If this errs on the side of caution, the company's ordinary stock units should be well worth their present price.

★

E. K. COLE. The impressive industrial and profit record of E. K. Cole, the radio and television manufacturers, remained untarnished in the year to March 31st last. A further advance in the group's trading profits—from £564,025 to

£652,781—was followed by an effective increase in equity dividends. The actual rate of the ordinary dividend was maintained at 25 per cent, but the dividend was paid on a capital of £294,075 as increased by a bonus issue of shares. These figures suggest that the group gained more on the roundabouts of television sales than it lost on the swings of radio sales; the group will have also benefited from defence contracts, which help to swell profits but also to encourage development and research at a low cost to the industry.

There is only one blot on the group's full accounts. It is the incidence of EPL,

which once more penalises progress. In the consolidated profit and loss account the combined provision for profits tax and EPL has risen from £98,000 to £125,000 and this, together with the rise in the income tax provision (from £206,000 to £275,600), has cut so deeply into gross earnings as to reduce net profits from £209,215 to £134,202. As the group possesses quite ample liquid resources—its cash balances having risen from £391,922 to £458,061 in spite of an increase in the book value of stocks from £1,598,693 to £1,782,929—the directors may see in the death of EPL a chance to pay more to their equity shareholders.

LONDON STOCK EXCHANGE

New account begins: July 15th.
Contango Day: July 15th.
Settlement Day: July 21st.

THE steady, if unspectacular, recovery in the stock market was well maintained in the week to Wednesday's close. Gilt-edged stocks, which were given a fillip by a favourable interpretation of the gold and dollar figures and the prompt over-subscription of the Bristol loan, led this advance. This rally received a momentary check on Tuesday, but the earlier recovery had been strong enough to give old Consols a net gain (in the week to Wednesday's close) of ½ to 60½. Many of the other longer dated stocks made similar slight net gains, but War Loan showed a net loss of ½ to 81½ in the same period. Much of the interest in the gilt-edged market, however, was concentrated upon the "shorts," and within this period War Bonds (1954-56) rose from 99½ to 99½ and the 1955 Serial Funding stock from 100½ to 100½. A good part of these gains was made on Wednesday when the terms of the 2½ per cent War Bonds conversion offer were construed as a sign of official confidence in the market.

Following the lead set in gilt-edged, industrial equities continued to gain ground; in the week to Wednesday's close the *Financial Times* ordinary share index rose from 118.5 to 119.9. Before the week-end the demand for industrial equities remained rather selective, mainly focused upon textile and one or two heavy engineering shares. This demand became stronger and broadened out to include many more of the well-known shares after the news of the relaxation of the Australian import restrictions. The higher price for British petrol and news of an increase in production at Kuwait also helped to stimulate the demand for oil shares. Rubber and tea shares remained quietly steady. Kaffir shares received some slight support before the week-end, but then lost these earlier gains in an idle market later in the week. Diamond shares were marked down sharply when the disappointing gem sales figures were announced.

THE MONEY MARKET

CREDIT conditions tightened up considerably in Lombard Street in the week covered by Wednesday's Bank return. Special purchases by the authorities were necessary to save the market from recourse to the Bank at the penalty rate on every day except Wednesday last—when credit was just adequate. On both Friday and Monday funds were especially short, as there were no maturities owing to the fall of the Easter holiday three months ago.

At last week's Treasury bill tender, the Government borrowed on the cheapest terms since April of last year. The competition of outside tenderers in the previous week induced the market to raise its bid by 2d., to £99 8s. 4d. per cent, for the £250 million of bills on offer—and the average rate of discount on all bills allotted fell by 7½d. Total applications rose by nearly £7 million, but the market's "quota" rose to no less than 75 per cent. At yesterday's tender, £260 million of bills were on offer; if all are allotted, the excess of new bills over maturities will fall to £10 million next week.

The Bank return shows an outflow of notes of £11.6 million, clearly attributable to the growing demands of the holiday season. Government securities in the banking department fell by £5.8 million, but as the Treasury special account fell by £11.6 million, involving an automatic cancellation of Government securities of the same magnitude, the week's special purchases are reflected in the return. "Securities" fell by £10.2 million, other accounts by £2.8 million, and bankers' deposits by £15.0 million.

COMPANY MEETINGS

THE AUSTRALIAN ESTATES COMPANY, LIMITED

CONTINUED PROGRESS

SIR DENYS LOWSON'S REVIEW

The annual general meeting of The Australian Estates Company, Limited, will be held on July 20th in London.

In the course of his review, which has been circulated to shareholders, Sir Denys Lowson, the chairman, said:

The consolidated profit and loss account for the year ended December 31, 1952, discloses a gross profit of £1,010,151, compared with a corresponding figure of £1,338,937 for the previous year.

After deducting Australian and United Kingdom tax of £494,101, also depreciation and other charges, there is a net profit left of £253,709, which again represents a satisfactory year's trading.

The board recommends a dividend of 10 per cent and also a special bonus of 5 per cent out of the profits distributed by the joint organisation for the disposal of wartime wool stocks. After providing for this distribution and the appropriations shown in the profit and loss account, the amount to be carried forward to 1953 is £170,854, an increase of £21,229 on the amount brought forward from the previous year.

A second distribution was made in March, 1952, by the Commonwealth Government from the profits from the wartime purchase of Australian wool; the total amount paid to the Australian growers was £25 million, of which this company's share was £84,000.

A third distribution at the rate of 4 per cent, representing £16 million, was paid to the growers in March, 1953, the company's share being £53,000. It is expected that there will be one or two further distributions.

In April, 1953, the High Court of Australia ruled that these distributions were a gift, and therefore not liable to income tax; but the Commonwealth Government have decided to seek leave to appeal to the Privy Council against this decision. In any event, it would seem unlikely that the company will benefit; even if there is a favourable decision, because there will be a corresponding increase in the amount of United Kingdom taxation payable, unless steps are taken to secure that where there are local exemptions from taxation, so as to encourage development and other expenditures, there should be a similar concession from the British tax authorities.

The year 1952 was a satisfactory one for all sections of our business, except our cattle stations; most of the latter experienced one of the worst droughts on record, and, while our losses were not severe, our income from cattle sales fell considerably. The effect on the company might well have been most serious had it not been for the foresight of our general manager, Mr Colman, and the quick action taken by him to move stock to agistment while the long stock routes were still open, and before the drought became too pronounced.

Our agency turnover was high; and, due to a good season on the east coast of Queensland, our sugar mills crushed very heavy tonnages of cane.

Expenses rose, but not to the same extent as in the previous year. There were signs of a more stable condition in the Australian economy; imports fell heavily during 1952 and exports rose; but there was a relatively small rise both in the cost of living and in the weekly basic wage.

The high capital cost of machinery, plant and buildings, needed for the expansion programmes on our mills, stations and branches, and also the high cost of repairs and maintenance, are a cause of concern to the company. As I have previously stated, the depreciation allowed for taxation is in most cases inadequate for replacements; and the high rate of tax makes it difficult to establish the necessary liquid reserves with which we try to meet the cost of essential replacements.

PASTORAL

In Queensland, the season on our sheep properties was satisfactory, with a fairly well spread rainfall during the year, but the cattle country in the North and North-West had a very low rainfall, following a bad year in 1951; the only cattle property where good rains fell was Chatsworth. Pastures in that district were good from April until the end of the year, and enabled the country to be used for agistment for stock transferred from the North. Although our actual mortality was comparatively light—thanks to the general manager's foresight in removing large numbers of cattle from our Northern Stations—we had comparatively few cattle in fit condition for sale. Our Dagonally station, which usually carries 10,000-12,000 cattle, was completely drought stricken, and nearly all stock had to be sent away.

The season in New South Wales was satisfactory throughout the year, and our sheep stations carried their usual numbers.

IMPROVEMENTS

Our policy is to continue to improve all departments of our business. Our sugar mills now compare favourably with any in Queensland and, with the help of our research organisation, are among the most efficient in the State. Considerable money has also been spent on staff houses, amenities, quarters, recreation grounds and other accommodation for mill employees.

On our Agency side, we provide good houses for managers and, where possible, for other members of the staff. New offices have been built at Julia Creek and Miles in Queensland and Corowa in New South Wales, and we hope to build more in other centres in the future; in fact a programme of not less than two or three new offices per year will be essential for several years to come if we are to keep abreast of the necessary requirements in the various areas.

We are giving special attention to the improvement of our pastoral properties, since it is of national importance that Australia should concentrate on increasing primary production; and, by providing more water and subdivisional fencing, we hope to increase the production of both wool and beef.

We are aiming at a target by which cattle shall not have more than four miles to walk to water, and sheep not more than two and a half miles. This will be a striking improvement on the conditions previously ruling in many cases, where parts of the stations were usually ten or twelve miles from any permanent source of water.

Our large cattle properties are situated in semi-tropical areas, where rainfall is not well distributed throughout the year, and seasons may be unreliable. We are giving special attention to the improvement and management of these properties, under the supervision of a trained officer, who has made a special study of the Australian cattle industry, and who will devote his time to problems connected with breeding, carrying capacity, mortality and brandings.

We intend to experiment with the Santa Gertrudis breed of cattle which have recently been introduced into Australia from the King Ranch, Texas, to ascertain whether they are adaptable for some of these difficult areas; and we have already purchased one such bull for use at Millungera, where we feel that the special characteristics of the Santa Gertrudis stock can be used to advantage.

In New South Wales, we are developing Jemalong into a fat-lamb raising property, combined with the growing of mixed pastures, irrigated lucerne, and some wheat and oats.

WOOL.

The Australian wool selling season 1952-53 proved a very satisfactory one, with price fluctuations less marked than in some recent years.

There was an increased Australian production; the demand showed that civilian consumption of wool was growing throughout the world, and the position of wool was better than in 1950-51, when very high prices were ruling.

Except for temporary interruptions, wool values have shown an upward trend since March, 1952, and this is confirmed by a comparison of clean costs on Australian show floors of two qualities, average 64's and 56's, supplied by the Australian Wool Realisation Commission:

	64's	56's
1952		
April	120d.	70d.
June	154d.	92d.
September	150d.	98d.
December	164d.	105d.
1953		
April	178d.	111d.
May	193d.	110d.

That more people throughout the world were using wool and were prepared to pay for it would appear to be the principal reason for the ready absorption of the Australian wool clip.

Under generally keen and widespread competition, Great Britain was the largest buyer, and secured a greater quantity than in the previous year. France occupied second place, closely followed by Japan, but purchases on behalf of the United States of America were much reduced.

During the eleven months ended May 31, 1953, 3,515,764 bales had been sold, which realised £368,510,091 at an average price of 83.15d. per pound. For the same period last year, 3,181,835 bales realised £287,532,743, the average price per pound being 73.23d.

It was estimated by The National Council of Wool Selling Brokers of Australia and The Australian Woolgrowers' Council that 3,640,000 bales would be received into Australian brokers' stores for sale by June 30, 1953.

The figures for the Australian clip for the last four seasons for wool sold in Australia are as follows:

	Bales	Gross Value
1949/50	3,597,940	£286,919,294
1950/51	3,549,998	£636,156,430
1951/52	3,409,312	£307,787,401
1952/53*	3,640,000	£375,000,000

* Estimated.

A new wool Futures market opened for the first time in London at the end of April. Similar markets have been established in New York and on the Continent for many years; but never in Britain, which has the greatest wool textile industry in the world, and where traders have always carried heavy financial commitments, and the Bradford system of forward selling has been satisfactory. A Futures market is designed to afford an insurance against adverse price fluctuations, and the development of the Wool Futures Market in London will be watched with interest.

Publicity has recently been given to the development of new synthetic fibres, which represent a great achievement of the chemical industry, particularly in the United States. It is, however, hoped that the steady increase in world population, together with rising living standards, will continue to absorb all available textile materials. There has been an enormous increase in world production of all fibres in the last 25 years, particularly synthetics and cotton; and cotton is the major fibre, wool representing only about 10 per cent of the world's fibre production. At the present time no synthetic fibre has been developed which takes the place of wool satisfactorily, and there is no indication that it will be possible to dispense completely with its use. Wool still possesses many virtues which artificial fibres have not yet achieved and, in fact, the most successful developments have been with mixtures containing not less than 40 per cent to 50 per cent wool. The cost of the raw materials from which synthetic products are manufactured has continued to rise, and there would appear to be every indication of further increases in the price of those raw materials during years to come. Nevertheless, it may well be that with increasing competition from the various synthetic textiles a lower price level may prevail for wool. It would appear, therefore, that growers would be well advised to take every possible step during the present good period to reduce their costs.

With the object of providing the Australian wool industry with a better equipped organisation, the Commonwealth Government has introduced a Wool Promotion Act, 1953, to replace the present Australian Wool Board with a new authority, to be known as The Wool Bureau, having increased powers and responsibilities. The function of the

bureau will be to promote the use of wool, to assist in improving production, and to encourage scientific, economic and cost research in all branches of the industry. The action of the government is commendable, since the danger which it is desired to overcome is not solely the concern of wool-growers, but of the whole Australian community; Australian wool provides the finance for a large proportion of that country's imports, and contributes to a large measure of employment.

OUTLOOK

Our latest advice from Australia is that the seasonal prospects in the sheep districts of Queensland are reasonably good, but on the cattle properties, where the monsoonal rains ceased in February, we expect to have a difficult period from August until about the end of the year, when early storms can be expected.

The season in New South Wales is fair, being helped by rain in the early part of May, and we do not expect much difficulty in carrying our sheep through the year.

At the sugar mills, the early estimates indicate that again a large quantity of cane will be available for crushing.

VISIT TO AUSTRALIA

During the spring of this year I had the opportunity myself of inspecting, not only the company's head office in Melbourne, but also a number of our properties in Victoria, New South Wales and Queensland; as well as the developments to the sugar mills at Kalamia and Pleystowe in the north. I was much impressed with the enthusiasm for, and loyalty to, the company's service which I saw on every hand; and also at the very substantial improvements which had been made, not only in the living and working conditions of our employees, but also on our various properties.

During the course of this tour I was accompanied by one of my colleagues, General Revell-Smith, who made an extensive visit by light aircraft to all the company's principal cattle properties in the north of Queensland. It was pleasing to be able to observe the success of our endeavours to improve the standard of our station managers' dwelling-houses, together with those of our overseers and other station hands and, in particular, to provide good married living accommodation as well as other amenities for their families.

In the case of all outlying stations we are endeavouring to construct aeroplane landing strips at least long enough to take a Dakota. We feel that this will be of great encouragement to the staff of the various stations in maintaining close contact with the outside world in times of flood, need and sickness; as well as affording facilities to buyers of our stock to come and see for themselves what we have on our properties.

We have given special attention to the need for water conservation which may well be described as the liquid gold of Australia, and on many of our properties we have doubled or trebled the number of existing water tanks since 1945. We have also investigated the possibilities of limited artificial irrigation, so as to provide lucerne and other high-quality crops for our pedigree and stud stock. In this connection we find it is a great hardship that expenditure on such essential improvements which are allowed, in full, for purposes of Australian taxation, are disallowed for purposes of British income tax; thus placing a company registered in England at a serious disadvantage compared with a similar company registered in Australia.

At the same time we are placing great emphasis, firstly, on the improvement of quality in all that we produce, and, secondly, on the increase in quantity.

Our head offices at Melbourne and Brisbane have experienced a considerable increase in business commensurate with the increased number of branches which we now own; and we look for an expansion of our turnover of wool sold at both centres, as well as increased participation in stock and other sales.

Notwithstanding the substantial capital expenditure during the last few years, we envisage that further expenditures will be necessary so as to take the fullest advantage of the pre-eminent position which we occupy both in Victoria and Queensland. On the sugar side, we hope that our expenditures will be largely completed by the end of 1954; subject to any further requirements which may be necessary to comply with the needs of those farmers and owners who are assigned to our various mills. At many of our stations the improvements will also be largely completed. We still have in hand a substantial programme of sub-divisional fencing, holding paddocks and water improvements on a number of Queensland properties; as well as similar projects in connection with some of the stations in New South Wales, where we are endeavouring to utilise to the full the water now being made available through state irrigation channels. Your company continues to receive most helpful assistance from all the shire, provincial and state authorities in dealing with the many problems which arise from day to day.

STAFF

In 1951 the board made certain improvements to the Provident Fund which were designed to provide adequate pensions or bonuses for those employees on retirement who had devoted many long and faithful years to the company's service, and to take account of the increased cost of living in Australia as calculated at the end of 1950. Unfortunately, the continued decline in the purchasing power of the Australian pound means that the adjustments which were made so recently are already out of date, and that what the board then provided is no longer adequate. In these circumstances they have decided to take advantage of the favourable results during the past year to make a substantial allocation to the Staff Provident Fund, which, together with the balance of the old Pension Fund, should restore the position to that previously existing.

The staffs in all sections of our business gave excellent service throughout the year, particularly those who had expansion and improvement programmes to carry out in addition to their routine operations, and the company's results reflect the success of their energies.

We acknowledge the loyalty and work of the whole of our staff and also of our subsidiary organisations, including in Victoria, McNamara's and Trenchards who, under the energetic guidance of Mr Maurice McNamara and Mr Morgan respectively, have continued to develop and expand the outstanding position which they already occupy, and afford many services to all their customers.

Once more we are greatly indebted to our general manager, Mr Colman, who, for twenty-five years, has guided the destinies of the company with such success. To him we owe a great debt of gratitude, not only for the prosperous condition in which we find ourselves, but also for his great vision in ensuring that we had four different spheres of interest—namely, sheep, cattle, agency and sugar—so that we have a diversification of our activities and a spread of risk which is not normally enjoyed by pastoral companies. Our warmest thanks go to him for another splendid year's results, which have helped to entrench the company ever more deeply in the Australian scene.

CURRENT TRADING IMPROVEMENT

MR L. P. O'BRIEN ON THE GROUP'S EXPANSION

The forty-sixth annual general meeting of Laporte Industries, Limited, was held on July 9th, in London, Mr L. P. O'Brien (chairman and managing director) presiding.

The following is an extract from his circulated statement:

When, in October last, we went to our financial advisers to consult them about how to raise £2,500,000 in the most advantageous manner to the company, the moment was distinctly unfavourable.

During the autumn of last year the slackening off in demand which began in the January-March, 1952, quarter continued progressively. By the end of September, 1952, this falling off in demand had cumulatively proved to be so severe that the group trading surplus (after depreciation) for the first half of the financial year was only about £109,000. With these figures before us we were unable to give our financial advisers anything better than a very cautious estimate of what the group surplus for the whole year was likely to be. In the then prevailing circumstances, our estimate was that the group surplus available for meeting bank and debenture interest would be some £375,000—that is to say, less than half what it had been in the previous year.

We decided to raise the additional capital required by the issue of £2,500,000 debenture stock bearing interest at the rate of 5½ per cent and repayable by March 31, 1978. This stock was privately placed at par among institutional investors.

In the months which have elapsed since October, the trading surplus of the company improved considerably. The actual figures for the whole of the twelve months were £472,649, plus the exceptional items amounting to £57,032.

So, as we had to discharge our indebtedness to our bankers by January 31, 1953, and this had grown to £878,980, we committed the company to borrow £2,500,000, as mentioned before. So far we have received £1,838,702, after payment of expenses incurred of £36,298. The balance of £625,000 is due on June 25, 1953.

SALES CONSTITUTE A RECORD

Now, as I write, the volume of our output and the value of sales throughout the group exceeds that of any previous period and, in fact, constitutes a record. In the meantime, wages, costs of fuel, electricity, raw materials, transport and overhead expenses have continued to increase, whereas we have not (except in one or two cases) increased our selling prices; on the contrary we have reduced some of them and so, generally, the margin of profit per unit is somewhat lower.

The indications for the future are satisfactory, as there is reason to believe that there will be a continued expansion of demand for the products of the three British and the one Australian subsidiaries.

The Kingsway works at Luton has been maintained in a good state of repair, and the outputs of some of the plants have been expanded while, at the same time, improvements have been made to manufacturing processes.

The Baronet works for the manufacture of hydrogen peroxide at Warrington is to all present intent and purpose now complete. It is a magnificent all-British job which reflects great credit on everyone concerned with its design, construction and operation. Moreover, it is a commercial success and so far fulfils our expectations in every way.

We continue to widen our range of manufacture of peroxy compounds and of special-duty detergents for industrial purposes.

This company has lost its hydrogen peroxide export business with Brazil—a fast growing market—because the Brazilians have imported a plant from the USA and are now making for themselves under the protection of an import duty. Before that plant was imported, Laporte proposed to join with Spanish chemical manufacturers and Brazilian industrialists to form a company in Brazil to import through your company a Laporte-designed British-made chemical plant for the manufacture of hydrogen peroxide under licence from our company. The value of the British plant to be shipped was more than the share of the capital your company was to subscribe, by £10,000. In addition, your company was to receive shares to the value of £17,000 sterling in exchange for the plant designs and working knowledge.

The Bank of England refused to allow us to make an investment in Brazil, even though the plant sale dependent on the investment would have brought a balance of cash in Britain's favour. So Brazil, who will pay promptly for capital goods, has an American plant; the USA has sold a plant and is no doubt happy with the proceeds, and maybe the prospect of a future flow of dividends and royalties. Your company, through no lack of foresight or action, is the unhappy loser whichever way we look at it—no more sales to Brazil and no royalties or dividends to look forward to over the years to come.

However, we have not lost all export opportunities and it has been interesting to note that during the month of August, when the home business was at the lowest depths, we sold and shipped abroad to 28 countries.

LAPORTE ACIDS, LIMITED

In the case of this subsidiary, the trading history of the year was similar to that of the other subsidiaries, with the exception that the improvement in volume of business transacted commenced in September.

NATIONAL TITANIUM PIGMENTS, LIMITED

The trading experience of this now wholly owned subsidiary was similar to that of the parent company. The new titanium oxide plant at Stallingborough, North Lincolnshire, has been started up and titanium oxide therefrom should be available for sale by the date of the annual general meeting.

The demands for titanium oxide, both from at home and abroad, exceed the capacity of the older plant at Luton. There is every reason to believe that the present volume of sales will be increased significantly in the near future.

The new sulphuric acid plant at Stallingborough is now in operation, and the first load of acid was despatched to a buyer a few days before the close of the financial year. Sales continued throughout April and May.

CRYSTAL-LAPORTE PROPRIETARY, LIMITED

The business affairs of this company are in a healthy state, and the hydrogen peroxide and other plants are operating at full capacity. Further extensions to meet the growing demands of the Australian market will be undertaken in the near future.

The report and accounts were adopted.

THE MERCANTILE AND GENERAL REINSURANCE COMPANY, LIMITED

NET PREMIUM INCOME EXCEEDS £6,500,000

CONTINUED PROGRESS IN FIRE, LIFE AND MARINE DEPARTMENTS

MR H. K. GOSCHEN'S SURVEY

The annual general meeting of The Mercantile and General Reinsurance Company, Limited, will be held on July 28, 1953, at the company's chief office at 25-31, Moorgate, London, E.C.2.

The following is a statement by the chairman, Hugh Kenneth Goschen, which has been circulated with the report and accounts for the year ended December 31, 1952:

I have to record with deep regret the death of Mr Ian W. W. Shepherd, MC, on January 24, 1953. Mr Shepherd was closely associated with my predecessor, Mr Richard S. Guinness, for many years and thus had an intimate knowledge of the company's traditions. We shall miss his valuable advice, particularly on investment matters, his specialised experience in which was always readily at our disposal.

The Companies Act, 1948, requires us to give special notice of a resolution in order to re-elect directors who have passed the age of seventy years. You will accordingly be asked to approve this year a resolution proposing the re-election of Mr E. Hurlimann. Mr Hurlimann has watched over the affairs of the company from its origin as a specialised reinsurance office; his wisdom and unique understanding of the business is of inestimable value.

TRIBUTE TO MANAGEMENT AND STAFF

It is with pleasure that I record once more our appreciation of the good work of our general manager, Mr Calburn, of his team of managers, and of the whole staff. The accounts now before you show that we have had another successful year. Such results could not have been achieved but for the constant and whole-hearted efforts of everyone associated with the company.

Before dealing with the individual accounts, I should like to draw your attention to two major changes in the presentation of the annual figures. You will remember that last year we published for the first time a separate balance sheet for the life department, but the figures for that department continued to be included in the respective items of the company's general balance sheet. This year we are again publishing a separate life balance sheet, but only the totals of the life assets and liabilities are incorporated in the general balance sheet. It will also be noticed that this year for the first time we include the underwriting statement and statement of profit and loss and the balance sheet as at December 31, 1952, of our subsidiary company, The Mercantile and General Reinsurance Company of Canada, Limited. However, you will note that these accounts have not been consolidated with the company's own accounts.

PAID UP CAPITAL

A resolution was passed at an extraordinary general meeting held on October 21, 1952, increasing the paid-up share capital by £50,000, to £250,000, by issuing 43,000 further "A" shares of £1 each, fully paid,

and paying up a further 8d. on the 210,000 partly paid shares, which are now paid up to 3s. 4d. per £1 share.

THE ACCOUNTS

Turning now to the accounts, these show a further increase of business. The net premium income again expanded by about 10 per cent, to reach a total of £6,517,696. I referred last year to a lessening of the extraneous influences which have been largely responsible for the unusually rapid increase of premium income during the post-war years. This trend towards a more normal rate of growth has continued. The competition for business becomes ever more intense. To seek means and opportunities of being of use to an ever-widening circle of friends and of adapting our services to their changing needs continues to be our first and constant objective. Our officials have travelled extensively at home and overseas in order to maintain these indispensable personal contacts. The fruits of our endeavours are encouraging.

FIRE DEPARTMENT

The business of the fire department shows a healthy development. The results have been generally favourable, if slightly less so than in the previous year.

ACCIDENT DEPARTMENT

The weight of the motor, third party and miscellaneous accident business affected the results of the accident department adversely. There was, moreover, a hardening in the claims experience in the Burglary and fidelity guarantee classes, in which a reduction in the rates of premium also contributed towards a fall in the profits. The personal accident business continued to run satisfactorily, but the large amounts covered on air travel, and the consequent accumulations on individual flights, give cause for concern and need careful watching.

MARINE ACCOUNT

The marine account continues to expand. You will notice that this year we have discontinued our practice of providing for taxation in the Revenue Account and this item will in future be dealt with in the profit and loss account. You will also observe that we are transferring an amount of £10,000 from profit and loss in pursuance of our policy of strengthening this growing account. As I said last year, this does not imply an unsatisfactory experience and I am glad to report that the account is profitable. Nevertheless, there are clear indications of less favourable times ahead and we consider it prudent to maintain a strong reserve position. Our marine fund at £502,702, now stands at 127.31 per cent of the premium income, and we consider this as fully adequate for all eventualities.

LIFE BUSINESS

The production of new life business was again highly satisfactory. The net new business figure exceeded £10 million, which is a most noteworthy achievement. The large proportion of transactions on the risk premium basis was maintained. Our risk premium rates are constantly under review, and in the course of the year we were able to effect some notable reductions both at home and overseas. Every avenue is explored for rendering the most comprehensive and efficient service to our ceding offices. In particular we specialise in the underwriting of sub-standard risks, in respect of which prompt decisions are made available, both in the home market and abroad. The sub-standard pool for diabetic lives, although small in volume, has been well supported and we have now introduced a second sub-standard pool for blood pressure cases, which has aroused considerable interest.

INVESTMENTS AND LOANS

The total investments and loans of the company once again show an increase, being approximately £798,000 more than the sum invested at December 31, 1951. The market prices of fixed interest stocks continued to depreciate during the year, but as it has been our general policy for some time to invest in fairly short-dated Government stocks with fixed maturity dates, the effect on our portfolio was less severe in consequence. I am glad to report that the margin between the market value and book cost is greater than it was at the close of the previous year. The opportunity was taken during the year to improve our spread of investments by moving part of our funds out of British Government securities into industrials and into property in which we are interested both directly and by way of mortgages. We have thought it prudent again to make a transfer to the provision against investment and exchange fluctuations.

You will remember that in 1950 we purchased a freehold site, Nos. 48/54, Moorgate, which we hoped soon to be able to rebuild in order to meet our urgent needs for increased accommodation. Unfortunately we have been unable to obtain the necessary licence and have consequently had to seek space elsewhere to deal with the expansion which has taken place in our business. We have accordingly now arranged to lease on a long term a building just off Moorgate known as "Moortfields House," where we shall be able to concentrate the whole of our staff. We expect to move into this building some time before the end of September, 1953. We are retaining Nos. 48/54, Moorgate, against the possibility of still further expansion in the future. Our new building affords adequate space for the most up-to-date and comprehensive machinery, which for the last of introducing into our accounting and statistical systems. We are confident that the considerable expenditure which has been incurred under this heading will be amply repaid, not only in doing away with much of

the drudgery and overtime hitherto associated with the preparation of accounts of a peculiar intricacy and a multiplicity of foreign currencies, but also in improving administrative efficiency to the highest possible degree.

CANADIAN COMPANY

Our Canadian company has made a most satisfactory start. The capital resources of the company were increased during the year to \$1 million capital and surplus. I have just returned from Canada where I was happy to meet many of our friends who place reinsurance business with our Canadian company, and to observe that, thanks to the constant and expert activities of the manager, Mr Barnard, a useful and efficient reinsurance service is being rendered. The premium figure for the first year of operations is slightly misleading, in that it includes the premiums in respect of liabilities still current from the previous year under the new reinsurance contracts assumed. During the initial years, whilst the premium income is building up, we must be prepared for the published accounts to show a deficit, even when the underwriting experience is satisfactory, owing to the strain of adjusting the premium reserve to the very severe standard required by the Canadian authorities.

CONDITIONS AT HOME

At home it is satisfactory to be able to record a considerable improvement in the economic field. The steep inflationary rise has been checked and the pound has strengthened with the rise in the gold and dollar balances and the growing confidence in sterling. There are, however, still many difficulties. Competition not only in the insurance business, but also in the direct export field is becoming fiercer, goods are more difficult to sell and buyers require longer terms of credit. The utmost effort continues to be called for from all sides if we are to keep and expand this export trade, both visible and invisible, which is so vital to our economy. Whilst labour is expected to refrain from pressing inordinate demands for wage increases and so do its share in keeping down the cost of production, manufacturers must instal new methods and new machinery and send their representatives out into the world to seek out and meet the needs of the customer. Above all, Government must make greater progress in effecting the long-promised economies, and so achieve a reduction in the taxation which represents so heavy a load on industry and on our capacity to produce at competitive prices.

PENALISING TAXATION

We, in the "Mercantile and General," are proud of the development of our overseas business; the figures testify to the value of our contribution. The combination, however, of extensive and productive travel with an efficient internal organisation is exacting on all grades of personnel. Those who rise, therefore, to positions of responsibility in such a complex international business should not be discouraged by having their rewards reduced by a system of taxation which leaves their net return little greater than if they had not contributed such valuable endeavours. The economic life of our country, as we know it, is mainly the product of our foreign trade, and to penalise the expansion of our international trading relations, by undermining the pioneering activity of the individual, is merely another step towards a restricted economy, in which the majority of our population will be deprived of the means of subsistence.

BOVRIL, LIMITED

PROGRESS IN SPITE OF DIFFICULTIES

LORD LUKE'S REVIEW

The fifty-sixth annual general meeting of Bovril, Limited, was held in London on July 8th. The Rt Hon Lord Luke (the chairman) said that fixed assets had increased by £146,743. Trade investments had again increased by £82,692. There was a substantial reduction of £110,331 in the charge for taxation, so the Group net profit at £318,762 was down by only £59,185. They recommended a final dividend of 10 per cent, making 12½ per cent for the year, £50,052 would be transferred to reserve for contingencies, making this reserve £300,000, leaving the carry forward on profit and loss account slightly reduced at £209,624.

Sales, although reduced, had been maintained on a satisfactory level in 1952, and their overall position was very sound.

In the year under review there had been a bigger percentage fall in export sales than in the home market, and this was due to import restriction in some of their best markets.

It was not only in times of sickness that Bovril was found so appetising and necessary. In the winter it was always a most stimulating beverage as well as an aid to good cooking, whilst in the summer Bovril sandwiches were found to be ideal, so when Bovril was in the home it was for general use and an insurance against emergencies.

Bovril Brand Weaning Food, first introduced in the North of England, had since been developed nationally, and good progress had been made.

With greater freedom in the supply of cereals, they had recently improved the quality of their Bospur Gravy Powder, and the packaging had been redesigned on modern lines by one of the foremost experts in the country.

RISE IN COST OF RAW MATERIAL

The world position of beef cattle had a direct bearing on the availability of raw materials for Bovril, as had the production of corned beef, of which meat extract was a by-product. In recent years the Ministry of Food had considerably reduced its bulk purchase of corned beef and this had been a contributory cause of the world shortage of meat extract and the consequent increase in price.

The meatworks of their Argentine company had continued to produce a substantial proportion of their raw material requirements, but the costs of cattle and wages had continued to rise, and shipments from the Argentine would have to be at greatly increased prices even when they were permitted—he said this adversely because they were finding it extremely difficult to obtain the necessary import licences.

It was unfortunate that more licences were not available at the time when supplies had been more plentiful and prices considerably lower than they were today. They were, of course, continuing to seek ways and means of economising in the methods of production of Bovril, which would, in some measure, offset the present rising cost of raw materials.

They were still looking forward to the time when they could begin once again importing their Bovril Brand Corned Beef for sale on the home market and there seemed now no valid reason why bulk buying of this commodity should continue.

SALES IN THE USA

In the United States, however, their sales of corned beef from the Argentine had con-

tinued at a very satisfactory level, and there was no doubt that Bovril Corned Beef ranked as one of the finest shipped to that market. Their sales last year would have greatly exceeded their 1951 figures but for the difficulty of obtaining Argentine import permits for tinsplate. Why the Argentine should restrict their supplies, which would greatly increase the Argentine's earnings of dollars, was quite inexplicable, and he could only hope that they would take a more realistic view this year.

Sales of Bovril in the United States had been slow and their rate of expansion had been disappointing. Nevertheless, they had consolidated the limited success achieved and had now put this business on a sound basis.

CONDITIONS IN THE ARGENTINE

Turning to the Argentine Estates of Bovril, Limited, the chairman said that it had had a better year, in fact its profits were the best since 1947. During the four years 1948-51, inclusive, this Company had had to shoulder losses on exchange which totalled 97 per cent of its profits, so it was with considerable relief that he was able to report that in the past year there had been no exchange loss.

During the temporary shortage of meat in Buenos Aires the Company had sent shiploads of cattle from its estancias in the north to assist the situation. The Argentine economy had benefited considerably from good grain harvests following two disastrous years. The Company joined with many others in hoping that the new five-year plan, while fostering the Argentine's industrial aspirations, would give plenty of scope for the expansion of her products from the land so that her natural exports might be on an increasing scale and her imports might include products which the United Kingdom could supply and which would assist her industrial future.

PROGRESS AT NORTHERN IRELAND

Their Creamery in Magheralin in County Down had a satisfactory year; more than 5 million gallons of milk were processed and some 2,600 tons of dairy products were produced, the bulk of which was sold to the Ministry of Food.

COMMONWEALTH SURVEY

Bovril (Eire), Limited, had had a satisfactory year, whilst not attaining the sales of the record year of 1951.

Bovril (Canada), Limited, had had another good year and maintained its profits at the 1951 level.

As he forecast last year, the results of Bovril Australian Estates, Limited, had been unsatisfactory, showing the first loss for some years past. This had been due to the serious drought conditions in the Northern Territory and the losses of cattle had been substantial. However, the stock that remained was still a basis for breeding up once again, and the management of Victoria River Downs and Walgra Stations was in good hands.

BOVRIL FOR EVEREST EXPEDITION

Bovril Pemman had been supplied to various expeditions, such as the one to Spitzbergen, the British North Greenland Expedition and the Swiss and British Everest Expeditions. They offered their congratulations to Col Hunt and the members of his splendid team on their epic achievement.

J. LYONS & COMPANY, LIMITED

SOUND STRUCTURE OF BUSINESS FULLY MAINTAINED

BENEFITS FROM RELAXATION OF CONTROLS

MR M. GLUCKSTEIN ON THE SATISFACTORY RESULTS

The fifty-ninth annual general meeting of J. Lyons and Company, Limited, was held on July 6th, in London, Mr M. Gluckstein, the chairman, presiding.

The following is his circulated statement:

The accounts submitted with this statement are for the fifty-ninth year of the company. You will have seen from the report that the net profit for the year is £689,451, which compares with £615,075 last year. We are recommending the payment of final dividends on the ordinary, "A" ordinary and proportional profit capital at the same rates as last year, which, with the interim dividends paid in December last, will absorb £308,242. Preference and preferred ordinary dividends paid and accrued amount to £261,205, so that there is an undistributed balance of profit for the year of £120,004. The amount brought in from the previous year was £260,042. To this has been added £277,923, representing adjustments of taxation in respect of previous periods, and from the total of those two figures we have transferred £500,000 to capital reserve. Including the undistributed balance of this year's net profit, the amount now carried forward in the profit and loss account is therefore £157,969.

BALANCE SHEET FEATURES

I do not think I need comment on the rest of the accounts item by item, but I will direct your attention to two figures in the balance sheet of the parent company. You will observe that capital reserves, now standing at £7,649,071, show an increase over the previous year of some £780,000. This includes the transfer of £500,000 from unappropriated profits which I have already referred to; the remainder of the increase represents surpluses from sales of fixed assets. Stock-in-trade, etc., at a little over £9 million shows an increase of some £800,000—just under 10 per cent. This is no more than normal having regard to the recent freeing of certain commodities from control and rationing, and the continued upward trend of food prices. Our stocks are, of course, very carefully watched, and their volume is not excessive having regard to the total volume of business.

As to the balance sheet generally, a comparison of the figures of the current year with those of last year shows that the surplus of current assets over current liabilities has increased by something over £1 million. I feel we can regard the year's results as satisfactory and say that the sound structure of the business has been fully maintained.

DIRECTORATE

Before passing on from the report and accounts, I would like to refer to my colleague, Mr G. W. Booth. We are all very glad that his name still appears in the list of directors of the company. But for the first time since the company's incorporation it does not appear as secretary. He gave up that office on August 31, 1952, and the board accepted his decision with the greatest regret. I will not attempt to describe what Mr Booth has been to the company, nor why we look forward to a continuance of his work

and counsel. He was, from 1891, the accountant of the private company which preceded the present public company: when the latter was incorporated on April 10, 1894, he became its secretary. In that office and, from 1898 as a director also, he has played his full part in the development of the company from its quite small beginnings. I am sure you will share our admiration of his achievement and our pleasure that we still have the benefit of his great experience and ability. Mr H. H. G. Bennett, who became secretary in addition to Mr Booth in 1926, retains the appointment.

During the year two additions to the board have been made. In August last Mr Guy M. Gluckstein, a general manager of the company, was appointed an ordinary director. He is a grandson of one of the founders of the company, the late Mr Montague Gluckstein, and after coming down from Cambridge University, began his business career in 1933 by the customary apprenticeship at the Trocadero Restaurant. He is one of the group of younger men to whom I have referred on previous occasions and has had the long training in all the company's activities which was requisite to the full performance of the duties of which he has proved himself so capable. In accordance with the company's articles of association, his appointment will come up for confirmation at the annual general meeting.

In September, Mr C. A. Crosslé was appointed an employee director. Mr Crosslé has been with the company for some 30 years and, for a considerable time past, has been in charge of our tea and coffee departments. To these special qualifications there is added wide experience and adaptability, and we welcome him as a member of the board.

In the New Year Honours List, we were very glad to see that Mr Norman Joseph had been made a Commander of the Order of the British Empire.

TRADING CONDITIONS

It is a pleasure to be able to say that there has been some relaxation of the many controls to which we have for so long been subjected. We hope that the process will be accelerated so that we may again enjoy the benefits that freedom and competition can bring. We aid our customers now have a somewhat freer choice. Our chefs, who for so long have had insufficient and sometimes inappropriate raw materials—and I would like to pay tribute to their efforts during that time—are beginning to get the materials they want in more adequate quantity and of more suitable quality, though there are still shortages, of course, particularly of butter and meat. They managed to maintain through the lean years standards which were remarkable in the circumstances, and it seems that we can look forward to their being able to provide, once again, a cuisine which is as good as any in the world.

Prices, however, continue to give us cause for anxiety. Foodstuffs, which account for the bulk of our purchases, escaped some of the more spectacular increases in price which many commodities suffered, but the rise in them, though more gradual, has not in general come to a halt. This is in contrast

to the experience in other industries, where raw material prices have decreased. We are affected, too, by the cost which is still too high, of many other things—the utensils we use, the fuel we consume, the transport we need and, in consequence, there has been little or no opportunity for retail price reductions. To find new methods to keep down costs to our customers, to give still better service and to bring about reductions in prices, is still our constant aim.

THANKS TO STAFF

We were naturally prepared for heavy calls on us during the great event we have recently celebrated—the Coronation of Her Majesty the Queen. Our teashops and our Corner Houses were able to provide the service which the public confidently expects from them at such a time. To achieve this needs great enthusiasm and hard work on the part of the staff. They always rise to the occasion and they did so again. I am sure you will be with me in expressing our thanks not only to those who made the extra effort called for on this occasion, but also to the whole of our staff for their continuing loyalty and good work throughout the year.

The report and accounts were adopted.

MIDDLE WITWATERSRAND (WESTERN AREAS) LIMITED

FURTHER SATISFACTORY PROGRESS

The twentieth annual general meeting of Middle Witwatersrand (Western Areas) Limited, was held in the board room, Anglovaal House, Johannesburg, on Thursday, June 25, 1953.

In the absence overseas of the chairman of the company, Mr S. G. Menell, Mr B. L. Bernstein presided and in moving the adoption of the report and accounts for the year ended December 31, 1952, said:

Since Mr S. G. Menell's statement was circulated with the annual accounts further satisfactory progress has been achieved by Virginia OFS Gold Mining Company, Limited, Merriespruit (OFS) Gold Mining Company, Limited, and Hartebeestfontein Gold Mining Company, Limited, in which companies your company has considerable holdings.

At the Virginia Mine, the installation of the permanent shaft equipment at No. 1 shaft has been completed and development was recommenced on June 22, 1953.

At the Merriespruit Mine, development was commenced from No. 1 shaft on April 15, 1953, and up till June 22nd, 1,004 ft, all of which 593 ft were on Basal Reef. Of 550 were classed as payable having an average value of 6.65 dwts over a channel width of 46.3 in, equivalent to 308 in-dwts. Development at No. 1 shaft is to be continued, using the existing sinking equipment, until the end of July, 1953, when it will be necessary to suspend these operations in order to install the permanent shaft equipment. It is estimated that development operations will be resumed at an increased scale, early in October, 1953. The drilling of borehole KA.2 is being continued. Recently a further borehole, KA.3, situated on the farm Kaallaagte No. 562, within the company's mining lease area, was commenced approximately 2,500 ft south of borehole KA.2 in order to obtain structural information to assist in future shaft sinking. At the Hartebeestfontein Mine, No. 2 shaft has been sunk and lined to a depth of 100 ft.

Sinking has been suspended temporarily, to permit of the erection of the concrete headgear and the installation of hoisting equipment. The erection of No. 1 shaft headgear is well advanced. Work is proceeding on surface construction, mine buildings, European and native housing and on the provision and distribution of power and compressed air supplies.

The recent results obtained in borehole TL.40, drilled by your company on the Klerksdorp Townlands, where the Vaal Reef was intersected at a depth of 7,065 ft with a value equivalent to 421 inch-dwts, read in conjunction with the results obtained by drilling in the vicinity, indicate that the portion of the Townlands east of the Buffelsdoornult has good prospects of becoming part of a future mine.

The recently published results obtained by New Consolidated, Free State, Exploration Company, Limited, in borehole GS.1 on the farm Gelukspan, the mineral rights on which are owned by your company, taken in conjunction with the results previously obtained in boreholes LR.6 and LR.7 on your company's portions of farm La Riviera 289, give further indication that your company will have a valuable stake in the mining company which will very probably be formed to work what is known as the "Saaiplaas" area under the aegis of New Consolidated Goldfields, Limited.

NEW ACQUISITION

In accordance with the terms of an agreement taken over from American Anglo-Transvaal Investment Corporation, Limited, a company, the Letaba Copper and Zinc Corporation, Limited, has recently been formed and has acquired from the Murchison Copper and Zinc Holdings, Limited, group of companies the base-metal prospect in the Northern Transvaal in which the American Anglo-Transvaal Investment Corporation and its associates were also interested. Your company will hold approximately 52½ per cent of the initial issued capital of £500,000 in the new company as a result of both the amalgamation with American Anglo-Transvaal Investment Corporation and the subsequent acquisition of the interests of certain other parties. Although the prospecting operations carried out to date have revealed the existence of a promising ore deposit, there are various metallurgical and other problems still to be overcome. Your company, in conjunction with Anglo-Transvaal Consolidated Investment Company, Limited, also holds additional mineral and prospecting options over base-metal claims situated in areas adjacent to the Letaba Copper and Zinc prospect.

BOARD'S DEVELOPMENT POLICY

A shareholder, Mr J. L. P. Wyndham, criticised the company's policy of not having paid any dividends for a number of years in view of its large shareholdings and cash balance. In reply the chairman stated that there had been no change during the past six years in the company's policy which was to further the development of new mines and to retain substantial shareholdings therein. Although no dividends had been declared, the company had passed on to its shareholders rights in the Virginia and Merriespruit Mining Companies and had also retained a substantial holding in both those companies and in the Hartebeestfontein Gold Mining Company, all of which mines were still in the development stage and in respect of which it would be some years before dividends were received.

A special resolution was passed providing for the use of mechanical signatures on share and other certificates.

The report and accounts were unanimously adopted.

ALBERT E. REED AND COMPANY, LIMITED

SIR RALPH REED'S STATEMENT

The fiftieth annual general meeting of Albert E. Reed and Company, Limited, Paper Manufacturers and Converters, was held in London on July 6, 1953.

The following is the statement by the Chairman, Sir Ralph Reed, which had been circulated to Shareholders with the Report and Accounts for the year ended March 31, 1953:

Before referring to the financial results disclosed by the Accounts, it may be helpful if I give you a brief outline of the general state of affairs which existed in the Paper Trade during the financial year under review.

As I informed you last year, the extraordinarily high demand for paper and paper products which had obtained until January, 1952, then began to fall off. This recession of demand became more and more pronounced until last August or September, when the production of paper and board in this Country reached the very low figure of approximately 45 per cent of the production for the last quarter of the year 1951. Naturally, the cost of our raw materials was affected very greatly by this falling off in demand and unbleached Chemical Pulps from European sources fell from approximately £120 a ton to around £40 a ton, and Mechanical Pulps from around £50 a ton to £27 a ton, the latter prices in both cases being approximately those ruling at the present time. The falls in pulp prices have been duly reflected, after allowing for further increases in certain items of production costs in other directions, in the greatly reduced market prices of paper, so that we have experienced a year of very severe deflation in striking contrast to the highly inflationary conditions of the previous two years.

An important factor which adversely affected our operations in the year under review was the severe restriction imposed, particularly in Australia, upon our exports of paper in 1952, which contributed in no small degree to the general recession in demand to which I have referred. I am glad to say, however, that these restrictions have been substantially lifted for the year 1953 and our substantial exports to these traditional markets have been revived to a full and very welcome extent.

You will be interested to know whether and to what extent our properties and operations were affected by the disastrous floods which occurred on the night of January 31st last. Much of our land at three of our Paper Mills was flooded for a short time, but there was comparatively little percolation into the Mill buildings. Thanks to the efforts of all concerned, I am glad to say that production was no more than partially held up to a negligible extent and that our losses arising from flood damage were relatively very small.

PROFIT AND LOSS ACCOUNT

The Profit for the year, before charging Taxation, amounts to £2,135,000, and this has been arrived at after utilising the provision of £1,500,000 which in the last Accounts was provided against falls in values of deliveries of Woodpulp under contracts entered into in the previous year, but after charging all other Stock Losses against the Profits for the year. These Stock Losses were unavoidably very heavy by reason of the fact that our raw material consists in such high proportion of Chemical Pulps, where the previous price increases and subse-

quent falls were so outstandingly large. In the case of Kraft Pulp, for example, of which your Company is much the largest consumer in this Country, or indeed in Europe, the rise and fall in prices has been greater than for any other kind of pulp. The Taxation charge amounting to £497,000 is relatively low by reason of the fact that the £1,500,000 provision just referred to was not deductible from the taxable profit for the previous year.

In the circumstances, and having regard to the extraordinarily difficult period through which the Paper Trade has passed in the year under review, we have every reason to be well satisfied with the results presented to you and, in view of these, we recommend the payment of a final dividend of 13 per cent, making 20 per cent for the year, being the same distribution as for the previous year, after appropriating a sum of £1,500,000 to General Reserve.

BALANCE SHEET

You will observe that the Group Balance Sheet discloses a greatly strengthened financial position. The increase in the Fixed Assets from £3,516,000 to £4,216,000 reflects, not only the acquisition of Empire Paper Mills, Limited, but a continuation of our policy of maintaining our plant in a high degree of efficiency. The item of £564,000, being the excess of the cost of shares over the net book value of assets in Subsidiary Companies, compared with £30,000 last year, is almost entirely due to the acquisition of Empire Paper Mills, Limited. This Company, to which I referred in my statement last year, has now been incorporated as an integral member of the Group, which has been much strengthened thereby, and we have every reason to be satisfied with this important acquisition.

The fall in Stocks from £7,308,000 to £4,625,000 is represented mainly by the fall in values of raw materials to which I have previously referred and the fall in Debtors from £4,981,000 to £3,306,000 is consequential upon the lower costs and prices.

You will observe that Tax Reserve Certificates and Cash now amount to £3,955,000, as compared with £2,736,000 last year, but this figure should be considered in relation to the Future Income Tax Reserve, which last year was £2,750,000 and now is £400,000. There is, therefore, a very large increase in the liquid resources of your Company—an increase which will stand us in good stead in our future trading and development.

TAXATION

Although the Taxation charge in these Accounts is relatively low, it should not be allowed to hide the very serious effect of the rates which have had to be borne by this Company and Industry generally, and it is with considerable relief that we receive the Chancellor's recent decrease in the rate of taxation and the abolition as from next January of the Excess Profits Levy. We also welcome very much the reintroduction of the initial allowances on capital expenditure.

PRESENT PROSPECTS

For the moment the pulp market appears to have achieved a stability which we have not seen for several years, and we may hope

that we shall not again experience the violent fluctuations which have characterised those years. However, in our business we have to contend with the very formidable effects on European prices of variations in the demand in the American market, and for this reason alone we are always in a very difficult position to predict the future.

Our production is now running at a reasonably high level denoting a very substantial recovery from the recession of last year and, having regard to the manner in which we have come through probably the most serious and difficult time ever faced by the Paper Industry, and in view of our strengthened financial position, we look forward to the future with considerable confidence. We must be prepared for very competitive trading conditions, but we believe that we are well equipped to meet them.

TRIBUTE TO STAFF

Bearing in mind the very unusual and difficult conditions of the year under review, I am particularly glad to pay tribute to the manner in which our Executives and Staff have risen to the occasion in meeting these difficulties, which, together with the sustained efforts and team work of all those employed in our Organisation, has so effectively contributed to the results which we are now able to put before you.

THE ORION INSURANCE COMPANY

EXTENSION OF ACTIVITIES

INCREASE OF ISSUED CAPITAL

SIR STRATI RALLI'S STATEMENT

The twenty-third annual general meeting of The Orion Insurance Company, Limited, will be held on July 16th in London.

The following is an extract from the circulated statement of the chairman, Sir Strati Ralli, Bart, MC.

I take this opportunity of extending a very cordial welcome to our two new directors, Mr W. A. Osborne and Mr A. P. B. Guinness, whose re-election to the board you will be asked to approve at the coming annual general meeting.

I am also glad to inform you that, with effect from April 28, 1953, Mr Dudley Rybot Scholey has been appointed deputy chairman of the board and of the company.

In October, 1952, your company agreed to act as aviation underwriters in the United Kingdom for The Victoria Insurance Company, Limited, of Melbourne, and, with effect from January 1, 1953, to act in the same capacity for the New India Assurance Company, Limited, of Bombay.

Earlier this year your company, in conjunction with certain insurance friends and associated concerns, participated in the formation of a new insurance company under the name of the "Sphere Insurance Company Limited." Your company has a substantial, although not a controlling, interest in the "Sphere" and has agreed to act as marine and aviation underwriters for that company.

MARINE DEPARTMENT

In the marine department the net premium income for 1952 amounted to £1,265,009, compared with £1,215,517 for 1951.

The sum of £40,000 has been transferred

to profit and loss account out of the 1950 closed underwriting account.

The marine fund now stands at £1,375,474 (108.7 per cent).

Conditions in the marine market remain difficult and settlements at the end of the second year of our 1951 underwriting account indicate that this will prove a lean one.

The 1952 account, to date, shows some improvement in settlements, although the account may not yet have borne the full burden of its share of the unfortunate and costly series of marine casualties which were sustained in the winter of 1952-53 and of the severe losses which arose from the disastrous floods experienced in February this year.

FIRE, ACCIDENT AND MISCELLANEOUS DEPARTMENT

The net premium income in this account for 1952 amounted to £866,057, compared with £827,080 for 1951.

This account generally has had a more favourable experience than last year and after maintaining the unexpired risks reserve on our usual conservative basis of 50 per cent, which has involved a financing charge of £19,488, has yielded a modest profit of £28,268.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

After bringing in gross interest and dividends of £116,410 (£109,377) and the transfers from revenue accounts of £68,268 (£87,465), and after deducting directors' fees £1,933 (£2,000), other expenses and audit fee £29,101 (£27,671), overseas taxation £3,853 (£2,590) and providing the sum of £110,000 (£145,000) for United Kingdom taxation, the net balance for the year amounts to £39,791 (£19,581). To this has been added the sum of £87,691 brought forward from 1951, making a balance of £127,482 available for distribution.

Your directors recommend the payment of a dividend of 10 per cent, less income tax, for the year 1952 (same), which requires a net sum of £22,000 and, after transferring £2,000 to provision for staff contingencies, there remains a balance of £103,482 to be carried forward.

The total of invested funds as shown in the balance sheet is £3,031,093, of which a large proportion is held in short-dated Government securities.

Despite a further fall in security prices in 1952 the market value or, where there is no quotation, the estimated value, of our investments at December 31, 1952, was in excess of their balance sheet value.

The total assets of the company now stand at £4,860,569, compared with £4,342,722 last year.

GENERAL REMARKS

The company's business has undergone considerable expansion over the past five years in every direction, and your directors are of the opinion that the time has again come when the issued capital of the company should be further increased. It is proposed, therefore, immediately following the annual general meeting, to invite shareholders to subscribe for a further 50,000 ordinary shares of £1 each at par in the ratio of one new ordinary share for every eight ordinary shares held. The new shares will not rank for any part of the dividend recommended for the year 1952, but, otherwise, will rank *pari passu* with the existing ordinary shares. The effect of this will be to increase the issued and paid-up capital of the company to £450,000.

SMITH'S POTATO CRISPS LIMITED

RECORD PRODUCTION AND SALES

The twenty-fourth ordinary general meeting of Smith's Potato Crisps Limited was held on July 7th in London.

Mr Fermian Le Neve-Foster, the chairman, in the course of his speech, said:

The net profit, before taxation, of the parent company for the year shows a remarkable increase to the sum of £271,859 as compared with £184,330 in the previous year.

The most satisfactory feature is the substantial increase in the profits of the Parent Manufacturing Company. This has been achieved in spite of some increases in the costs of materials and transport and in labour rates. It is attributable mainly to the considerably greater volume of production and sales. These constitute an all-time record in the history of the company.

The directors recommend a final dividend of 20 per cent, plus a cash bonus of 5 per cent, both less income tax, on the enlarged capital resulting from the one in ten free share bonus issue distributed to shareholders during the year.

STRONG FINANCIAL POSITION

The consolidated balance sheet shows an exceedingly strong position. Fixed assets show a small increase, but the additions to plant, etc., have, within £1,500, been looked after by the amounts which we have written off for depreciation. With British Government securities, tax reserve certificates and cash standing at a total of £460,955, we have an exceptionally strong liquid position.

With falling prices of commodities, most companies have today problems arising from depreciation of stock values, but in our case, I am glad to say that this question does not carry the same risks and problems. Shareholders may congratulate themselves on this aspect of our business.

POPULARITY OF CRISPS

I have in the past referred to the reasons for the popularity of crisps. They will be found in the shops of grocers and caterers, in snack and cocktail bars, and in licensed houses, as well as in the homes. They are universally popular at picnics. The demand for Smith's crisps continues unabated and now that we have been able to supply greater quantities we find evidence on all hands that our claim that "there are no crisps like Smith's" is truly well-founded.

Undoubtedly we have the friendship of all sections of the trade, retail and wholesale, as well as that of the licensed victuallers. The supplies which we have been able to give them this year have been welcomed very heartily and, like *Oliver Twist*, they still ask for more. We shall do our best to supply them.

In this great Coronation year I may be forgiven for reminding you of that great figure of the last Elizabethan reign, Sir Walter Raleigh, who introduced the potato to this country. In the recent celebrations Smith's crisps have played their part in feeding the enthusiastic crowds and large quantities of our crisps have been sold among them, in the parks and elsewhere.

The results of the first two months of the current year are most encouraging and if they are maintained I have every hope that at our next meeting I shall be able to place before you results which are as good or perhaps even better, than those which we are now considering.

The report and accounts were adopted.

HEAD, WRIGHTSON AND CO., LIMITED

RECORD TRADING PROFITS

ORDER BOOK GREATER THAN EVER

MR RICHARD MILES'S SPEECH

The sixty-third annual general meeting of Head, Wrightson and Company, Limited, Engineers, etc., was held on July 8th at the Registered Office, Teesdale Iron Works, Thornaby-on-Tees.

Mr Richard Miles, the chairman and managing director, who presided, said:

At the opening of this, our sixty-third, annual general meeting, I should like to start with an expression of thanks to our staff and workmen, without whose support our continually improving results would not have been possible.

LABOUR AND WELFARE

There have been three events during the past year which may prove landmarks in the history of our old-established company. The first and most important is the inauguration of a pension scheme for our workmen. This is a forward step, but it is not unattended by risks in increasingly competitive markets, especially overseas. The second is the fact that during the year we presented mementos to our long-service employees. We had nearly one hundred and fifty, with fifty and forty years' service. Some of these men have worked through three wars, four if we include the Korean war. It should create a feeling of confidence that our industrial production should endure despite world upheavals. The third is the beginning of a scholarship scheme for a university degree course for selected apprentices, a corollary to our apprentice school, which still maintains its popularity and pre-eminence. Despite the increased public expenditure on social services and education, we are still not seeing a corresponding improvement in the extent of technical staff. We have therefore decided to assist ourselves. The high overheads for social services must be recouped by the high quality of our designs and products. With few natural resources except coal and brains, this country cannot maintain its standard of living unless we maintain our lead technically.

In referring to personnel, I should mention that Mr J. E. Mercer, the works director of our steel foundries, well known in the iron and steel foundry industry, has retired after being with us for over thirty years. He remains on the subsidiary company board concerned.

ACTIVITIES

Today our order book is greater than at any time in the history of the company. Our trading profits, despite the inclusion of only nine months' trading by the parent company, are again higher than before. All our subsidiaries have made a contribution.

It cannot be expected that every one of our activities has not experienced difficulties. Australia, due to economic factors, has not yet recovered from last year's recession. We have formed Head, Wrightson Australia (Pty.) Limited, a company designed to supplement our operations with our Australian associates. Our South African company had a very successful year, but is not having an easy time at the moment. We are starting a branch office in Canada and we hope that our efforts there will make a due contribution to our returns. At home the requirements of the automobile and transport industries have been occasionally variable. We are, however, finding that the heavy industries, iron and steel,

coal, oil, are still expanding their needs for the capital equipment in which we specialise, both at home and overseas. A highlight lately has been our large order to build an ore-handling and blast-furnace plant for Spain, which will take us three and a half years to complete. In February the largest blast furnace outside the USA, which we built for Messrs John Summers and Sons, Limited, was successfully started, and officially opened by HRH The Duke of Edinburgh on April 29th, and a duplicate plant is now being built. Important installations in other directions in the iron and steel trade, in the mining, and in the oil and chemical industries, at home and abroad, were completed during the year. Special mention might be made of an oil refinery approaching completion in Belgium. Our outputs of steel castings and drop forgings were the highest recorded, despite inadequate supplies of raw materials. Our business in aluminium alloy structures has improved.

During the year visits overseas to examine prospective markets were made by directors of the parent and subsidiary companies, and a special review has been made of India.

Our long-term capital expenditure programme continues to be carried out to plan. The lightening of the burden of taxation, though small, is a timely help. Initial allowances assist the immediate cash position, and they are accordingly welcome.

ANNUAL ACCOUNTS

You will have noted from the annual accounts that, as foreshadowed last year, having brought the year-ends of all our wholly owned subsidiaries into line, we have now been able to bring the year-end of the parent company into line also. This is not only required by the 1948 Companies Act, but is obviously a convenience in many ways. It has entailed taking a trading period of nine months instead of twelve months for the parent company, but you will observe, nevertheless, that we increased our trading profit.

The final results are substantially better, because several factors connected with taxation have operated favourably in the same direction. There is in the first place the very welcome, even if small, reduction in the standard rate of income tax. We have had a small refund of Excess Profits Tax on our South African subsidiary. The rearrangement of the parent company's year-end alters the assessment somewhat, again to our advantage but not to any great extent. The main difference is due to the fact that our final accounting date for the twelve preceding months, April 30, 1952, falls inside the same fiscal year as our new final accounting date, January 31, 1953. We had reserved the taxation for this fiscal year in the last accounts. This amount, though allowed for, is now released. It makes no difference in the long run, but has an important bearing on the present figures.

All these effects, some of them technical and complicated, we have tried to show as clearly as possible in the accounts, and have provided notes where we thought further clarification helpful.

BALANCE SHEET FURTHER STRENGTHENED

Our balance sheet is thus further strengthened, and it may be interesting also

to note the increasing volume of work-in-progress, the profits upon which will be reflected in the accounts in due course.

The policy of your board includes the continual ploughing back of a large proportion of our earnings into the company, for improvement to buildings and machinery, and for working capital, so that we shall be in the best possible position to maintain full employment; but in fairness to you who have had confidence in us, and patience under restrictions, we now feel we can recommend an improvement in your return. As you will see from the annual report, your directors are recommending a final dividend of 12½ per cent on the ordinary shares, making 17½ per cent for the period.

He would be a bold man who would confidently foretell the future of any industry, when still unsettled political factors play such a dominant part, but my statement to you today ends on a note of optimism.

The report and accounts were adopted.

HOUSE OF FRASER LIMITED

TOTAL TURNOVER AGAIN A RECORD

MR HUGH FRASER ON NEW ACQUISITIONS

The twelfth annual general meeting of House of Fraser Limited was held on July 7th at the Merchants' Hall, 30, George Square, Glasgow, C.2, Mr Hugh Fraser, DL, JP (chairman and managing director), presiding.

The following is an extract from his circulated statement:

During the financial year the company purchased the whole issued capital of Wood and Selby, Limited, Duncap's Limited, and Scottish Drapery Corporation, Limited, at a total cost of £3,223,352, and on the winding up of Scottish Drapery Corporation, Limited, and fourteen other subsidiary companies, the net assets, including cash transferred, were sufficient not only to recoup the cost of acquisition, but also to create the substantial surplus disclosed in the capital reserve account.

TRADING RESULTS

The profit and loss account of the principal company shows an increase in trading profit at £361,183, and the profit before taxation arising from retail trading alone has increased by £86,433. The profit from trading is stated after charging the new lease rents from May, 1952, and the additional revenue from subsidiary companies arises directly from the investment of the capital released by the sale of properties to which reference was made in my last statement.

The group trading results are shown in the consolidated accounts and the preacquisition profits of subsidiary companies have been calculated on a time basis notwithstanding that the major part of these profits accrued under your company's control. The reduction in interest charges follows from the repayment of loans secured over heritable properties and having regard to the continued rise in operating costs, particularly in wages and to the very considerable maintenance expenditure charged to revenue, the increase in net profit from £124,488 to £270,097 is extremely satisfactory.

BALANCE SHEET FEATURES

It will be seen from the balance sheet of the group that the total assets after deducting bonds and debentures secured over heritable properties now exceed £5 million, and

that the value of the interests of stockholders amounts to £3,790,265, of which £1,453,374 is represented by the surplus of current assets over current liabilities. In dealing with the assets of subsidiary companies, the warehouse premises retained in the group ownership have been valued professionally on the same basis as those recently realised, and the remaining assets have been taken at existing book values. No account has been taken of the company's interest in leasehold properties, but at the date of the balance sheet this has been certified to show a capital value of £600,000.

The separate items of current assets do not call for detailed comment, and the available cash balances and liquid assets are adequate for all company purposes in the foreseeable future.

BONUS ISSUE

The appropriations recommended in the directors' report include a final ordinary dividend in respect of the last financial year, at the rate of 60 per cent actual. Ordinary stockholders will also be asked to consider the proposal already announced, to apply part of the capital reserve account in payment for an issue of ordinary shares to ordinary stockholders in the proportion, as nearly as may be, of one ordinary 5s. share for every 20 ordinary stock units held at the close of business on June 26, 1953.

It is intended to recommend similar bonus issues at regular intervals so long as conditions permit, and having regard to the earnings and dividend prospects of the company, the directors are of opinion that these distributions will prove beneficial to all ordinary stockholders.

The directors have also under consideration some further adjustment of the share capital which would not affect the proposals already outlined, but would bring the issued ordinary capital more nearly in line with the capital employed, and this matter will be fully reviewed in the light of developments in the current year.

BINNS ACQUISITION

Since the end of the financial year, the company has extended its trading by acquiring the ordinary capital of Binns, Limited, Sunderland. Transfers for approximately 98 per cent of the ordinary capital have now been settled. The remaining ordinary shares will be acquired and at the offered price the total purchase consideration amounts to £2,900,000. This outlay can be met out of the existing resources of the group, and there is no doubt that the new acquisition will greatly enhance the earnings of your company.

BRIGHT PROSPECTS

The day-to-day trading conditions throughout last year showed some irregularity in progress among the individual stores, but the total turnover was again a record. In the early part of the current year, there was a temporary falling off in certain sections of the trade, which has now been recovered. The total turnover has been fully maintained to date, and your directors are confident that there is still considerable scope for development within the group, apart from the increased trade being contributed by the Binns Stores.

It is my intention to consolidate and develop the trading group as it now exists, and I take this opportunity to assure members that recent press reports associating the name of the company with various undertakings in London are entirely without foundation.

The report and accounts were adopted.

At a subsequent extraordinary general meeting the proposed capitalisation and bonus issue proposals were sanctioned.

BRITISH GLUES & CHEMICALS, LIMITED

CURRENT TRADING IMPROVEMENT

SIR ROGER DUNCALFE'S REVIEW

The directors' report and accounts for the period ended March 31st were issued to the stockholders on July 7th. The following are extracts from the review by the chairman, Sir Roger Duncalfe:

The directors having decided to change the ending date of your company's year from April 30th to March 31st, the accounts now presented are for eleven months instead of the normal period of twelve months.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

Consolidated profit for eleven months is £243,424 (last year £821,618 for twelve months) after all charges other than United Kingdom tax. Included in Consolidated profit is a credit for £25,000, transferred from a provision made in a previous year against fall in value of raw materials purchased under forward contracts. After deduction of United Kingdom tax amounting to £137,000 the net profit is £106,424 (last year £348,618) and after adding £1,049 reduction of surplus of subsidiary companies, the profit dealt with in the accounts of British Glues & Chemicals Limited is £107,473 (last year £311,808).

TAX

As a result of the change of accounting date, certain adjustments to the taxation liabilities are required, and a substantial part of our provision for tax becomes surplus to requirements. We can safely credit appropriation account with £300,000, arising from the accumulated over-provision for past years (including EPT years) to which I referred two years ago, as well as the estimated reserve set free by the change in accounting date and the reduction in standard rate of income tax for 1953-54.

APPROPRIATIONS

The £107,473 profit, the £300,000 tax credit just referred to, and £52,169 balance of profit brought forward from the previous year, total £459,642 (last year £353,044), which is the amount available for appropriation. Our first appropriation is £250,000 to general reserve, bringing it to £550,000, a figure which, incidentally, is the same as for our issued ordinary stock, and which is more than twice covered by the excess of our current assets over our current liabilities. Our second appropriation is £80,000 to replacement reserve, bringing it to £320,000.

DIVIDENDS

Subject to acceptance of the proposed necessary alterations to our Articles of Association consequent upon the change of our year-end we recommend final dividends of 4 per cent cumulative and 2 per cent participating on preference stock and 12½ per cent on ordinary stock, so that the total dividends for the eleven months' period on both preference and ordinary stock will be the same as for the preceding twelve months—viz., preference 10 per cent actual, ordinary 15 per cent actual, both less tax.

Following the above appropriations and dividends, we carry forward £56,260 in the balance sheet of British Glues & Chemicals Limited against £52,169 brought in.

CONSOLIDATED BALANCE SHEET

There is little change in our fixed assets at £1,061,608. Depreciation was about

£11,000 more than capital expenditure, which amounted to £98,326. At March 31st, 1953, orders placed by the group on capital account amounted to £30,000, and additional schemes in hand at that date will involve £40,000 further expenditure. Current assets at £1,968,172 are nearly £500,000 less than last year, mainly by reason of heavy tax payments, but our current liabilities are correspondingly reduced. Current assets exceed current liabilities by about £1,400,000, which surplus is largely represented by our stocks and debtors, whilst our cash, money on short-term loan and tax reserve certificates more than cover our total liabilities.

On the left-hand side of the balance sheet there is no change in our issued capital, but our reserves and surplus have increased by approximately £330,000. General reserve is £550,000 (last year £300,000), replacement reserve £320,000 (last year £240,000), contingency reserve £100,000 (last year the same). Carry forward at £56,260 is slightly increased. Surplus of subsidiary companies at £91,677 is £1,049 less than last year. With the change in the year-end the need to reserve for 1954-55 income tax has gone.

THE FUTURE

The improved trading conditions we experienced during the later months of last year have continued up to date and we start the new year on a rather better basis than a year ago. I must, however, warn you that the difficult period of adjustment which I mentioned in my last review still persists; there has been some reduction in gelatine and glue prices, and tallow and grease prices have fallen heavily; up to the present, however, our raw material prices have not responded fully to these lower product prices.

TIMOTHY WHITES & TAYLORS

PREVIOUS HIGH SALES RECORD SURPASSED

The twenty-fourth ordinary general meeting of Timothy Whites & Taylors Limited was held on July 2nd in London, Mr Louis Nicholas, JP, FCA (the chairman), presiding.

The following is an extract from his circulated statement:

The total sales of the company and its retail subsidiaries for the year surpassed the high record of 1951.

The trading profit and sundry income of the group for the year amounted to £1,239,172, as against £1,169,143 for the previous year. The provision for taxation amounts to £572,973. This taxation takes over 57 per cent of the profits. The directors recommend a total dividend for the year of 35 per cent, less tax, as compared with 32½ per cent last year.

Whilst from the point of view of the general public the recent reduction in purchase tax is to be welcomed, I would again mention the position of retail traders in respect of the serious losses which they will sustain in the event of the repeal or reduction of purchase tax without provision being made for the return of the tax paid by the trader upon the goods unsold at the time of the alteration.

The company's policy of expansion and development is continuing.

Subject to nothing unforeseen taking place, I look to the future with reasonable confidence.

The report was adopted and the board's capitalisation proposals and bonus issue were approved.

SIAMESE TIN SYNDICATE

CAPITAL INCREASED

The forty-sixth annual general meeting of the Siamese Tin Syndicate, Limited, was held on July 9th in London, Mr Kenneth O. Hunter (the chairman) presiding.

The following is an extract from his circulated statement:

Total production from dredging operations, including those of our wholly owned subsidiary, amounted to 1,833 tons of ore. In addition, a further 28 tons were produced from the re-treatment of tin shed tailings, giving a total of 1,861 tons, which is in excess of any year's production since the war. The total output of 8,872,100 cubic yards was also a postwar record.

The consolidated profit before taxation amounts to £525,814, an increase of £36,479 over 1951. This is largely due to a successful ten-month working period by the subsidiary company which made a profit of £64,479. The directors recommend a final dividend of 85 per cent (making 150 per cent).

Our reserves stood at December 31, 1952, at 132,872,750 cu yds, averaging 0.506 lb tin ore per cu yd. Of this total 25,227,500 cu yds averaging 0.486 lb per cu yd lie in expired leases for which application for renewal has been made.

The report was adopted and at a subsequent extraordinary general meeting resolutions were passed approving: (1) an increase in the authorised capital to £550,000, of which up to £250,000 would be available for the proposed offer to Bangrin stockholders; (2) the capitalisation of £150,000 of the reserves and its distribution as one ordinary share of 5s. each for each stock unit of 5s.; and (3) a cash distribution of 2s. 6d. per 5s. stock unit.

BANGRIN TIN DREDGING

A DIFFICULT YEAR

The thirty-third annual general meeting of Bangrin Tin Dredging Company, Limited, was held on July 9th, in London, Mr Kenneth O. Hunter (the chairman) presiding.

The following is an extract from his circulated statement:

We have in 1952 faced a difficult year. Not only has the value of our product fallen from its previous peak but for five months our operations were reduced to one working dredge, where three were working before. Production fell by 147 tons to 687 tons of ore. Of the total output of 2,245,000 cubic yards, 2,225,000 came from ore reserves.

Stockholders will have noted a reduction of profit from the figure of £405,633 in 1951 to £217,943 for the year under review. The directors recommend the payment of a final dividend of 20 per cent. The gross dividend of 35 per cent on the nominal capital represents 17 per cent on the net assets at December 31, 1952.

Our total ore reserves amounted to 35,400,000 cubic yards averaging 0.56 lb. tin ore per cubic yard at the end of 1952. Of this total some 4,700,000 cubic yards, averaging 0.72 lb, lie in isolated blocks or are gravel pumping areas. The remaining 30,700,000 cubic yards, averaging 0.53 lb per cubic yard, comprise the present dredging area.

Owing to the necessity of docking both dredges on a single area of hard ground above high tide because of working in tidal waters, the dredge courses have been dictated by circumstances to have lain during the past two years in ground of higher value than the average.

The report and accounts were adopted.

SAN FRANCISCO MINES OF MEXICO

MR C. E. TEMPERLEY'S SPEECH

The fortieth annual general meeting of San Francisco Mines of Mexico Limited was held on July 7th in London.

Mr C. E. Temperley, OBE, MC, the chairman, in the course of his speech said: The gross value of products sold was £9,386,000. The net profit was £970,000 against £1,022,000. The directors have appropriated £100,000 to exploration and development reserve which brings the reserve to £500,000. We have also appropriated £100,000 for contingencies reserve. The directors recommend the payment of a dividend of 6s. per unit.

Turning to the prospects ahead of us, you may be sure that the mines, the mill and the finances of your company are in the best trim we can put them into to meet either fair weather or foul. Development of the complex orebodies continues to be favourable. There are substantial reserves of good grade ore. Your company is well endowed with cash. Internally all is well. Unfortunately, as I have pointed out, our prosperity depends more on outside factors over which we have no control than on factors within our control. The most important of these is the price at which we can sell the metals we produce. At the present level of prices the operating profit of your company is very far below the level achieved in the past year and profits will continue low for so long as these prices persist. I am not a pessimist and I think there are some grounds to hope for an improvement—provided no major world recession intervenes.

The report was adopted.

BAH LIAS RUBBER ESTATES

SIR ERIC MILLER'S VIEWS

The forty-second annual general meeting of the Bah Lias Rubber Estates, Limited, was held on July 3rd in London.

Sir Eric Miller (the chairman), in the course of his speech, said: The Bah Lias Company's financial position is so strong that some shareholders, I observe, are canvassing the idea that we should now distribute a large part of the resources which we have prudently accumulated over the years for the specific purpose of financing the gradual replacement of our oldest planted areas as they become uneconomic, which we would have tackled ere now had not the situation in Sumatra been too unsettled. Some may even have acquired a holding in the company with an eye to a killing. I think it therefore timely to indicate the principles which govern the actions of the board of this company, which was established in 1911 to take over concession lands, on which a modest amount of tobacco was being grown, with the express object of expanding the cultivation of rubber and coconuts. Some time later the tobacco venture was sold to advantage and the coconuts were gradually replaced by rubber. We made an excellent move in 1933 when we took an interest in Kulai Rubber Estate Limited, registered in Malaya. Our stake in that company was substantially increased when we absorbed the Wampoe and Bila Companies by amalgamation in 1938, for they were also shareholders—and, as our report tells you—our interest in Kulai is the equivalent of some 2,400 acres of first-class modern rubber.

People who go in for rubber-growing, which is a long-term proposition, have to be tenacious by nature. Having been responsible for opening up a large acreage during the past 40 to 50 years, thus creating some of the best estates in South-East Asia, Harrison and Crossfield are not going to throw in their hand just because conditions happen to be trying and difficult at the present time. This modern world of ours cannot get along without adequate supplies of natural rubber and South-East Asia cannot afford to see this source of wealth return to jungle conditions. All responsible people have a vital interest in preventing economic disaster in that area, which is so close to Communist China. It was therefore encouraging that at the recent Study Group meeting in Copenhagen the American rubber manufacturers volunteered and recorded publicly their collective understanding of the part they should play in preventing any catastrophic slump in the price of natural rubber by themselves being willing buyers at a price competitive with the synthetic product. The disastrous effect on the economy of this country if there were wholesale spoliation of the liquid resources built up by productive enterprises for the purpose of expanding or modernising their equipment to enable them to hold their own in a competitive world, should be obvious to all right-thinking people and any such moves should be strongly deprecated and resisted in the national interest.

The report and accounts were adopted.

THE BURMAH OIL COMPANY LIMITED

INCREASED VOLUME OF TRADE

SIR KENNETH B. HARPER'S REVIEW

The fifty-first annual general meeting was held on Friday, July 3rd, in the Merchants' Hall, Glasgow, Sir Kenneth B. Harper presiding.

In moving the adoption of the directors' report and accounts the chairman referred to his statement dealing with the group companies' activities during the past year. The substantial fall in the trading profits—from £7,500,000 in 1951 to £5,500,000 in 1952—did not signify any weakening of the fundamental strength of the companies' trading position. On the contrary, the volume of the group's trade had increased by 2 per cent, an increase sufficient to maintain their share of the market, though not enough to offset a narrowing of profit margins. He hesitated to forecast the future, so much depending on factors outside the group's control, but he could say that in the current year to date sales were showing a satisfactory increase over the same period last year.

PROSPECTING

Over past years about £10 million had been spent in prospecting, with negligible results in terms of new oil fields, but there was now some ground for optimism in regard to at least two areas. Expert advisers were of the opinion that the gas field at Sui in Baluchistan promised more than enough gas to provide fuel for many years for all West Pakistan's industrial requirements, while the results just received of testing the lowest and possibly not the best of the four oil sands drilled through at Nahorkatiya in Assam suggested that the sand was capable of yielding moderate production. Evidence from this well was being applied immediately to the search for further oil in the large area

of the Assam Valley, over which the Assam Oil Company held the exclusive priority right to apply for concessions.

demands and doing great damage to industrial relations.

LABOUR COSTS

Labour costs were 300-400 per cent pre-war and for every £6 wages and allowances £1 was spent in housing, schools, hospitals and other forms of welfare. The group believed in improving the working conditions of their employees, but their efforts were in danger of being upset by the way the system of compulsory adjudication in industrial disputes was applied. However high the pay in relation to other comparable employment, arbitrary awards of two, three or four months wages were being made, thereby encouraging the unions to make further

RELATIONS WITH ANGLO-IRANIAN

Referring to the recent issue of debenture stock by the Anglo-Iranian Oil Company Limited, the chairman recalled the historic relationship between the two companies. Burmah Oil Company money and enterprise had first proved the existence in Persia of oil in commercial quantities. When the Anglo-Persian Oil Company was formed in 1909 the Burmah Oil Company subscribed 95 per cent of the ordinary capital and guaranteed the preference stock. In 1914 the ordinary capital was increased by £2 million, all of which was subscribed by His Majesty's Government. Today the Burmah Oil Company held about 26½ per cent of the

ordinary stock. The Anglo-Iranian Oil Company's important share in the Iraq Petroleum Company also derived from Mr W. K. D'Arcy's interest in Iraq acquired by the Burmah Oil Company along with his Persian concessions.

The report and accounts were unanimously adopted.

The final dividend of 2s. 6d. per £1 unit on the ordinary stock, less income tax at 9s. in the £, recommended by the directors, was approved and declared payable on July 17th, and the balance of £596,047 was carried forward.

Lord Bilsland and Sir William Fraser, the directors retiring by rotation, were unanimously re-elected and the proceedings terminated with a vote of thanks to the chairman.

THE ALEXANDRIA WATER COMPANY, LIMITED, ALEXANDRIA—EGYPT

PAYMENT OF DIVIDEND

At the Annual General Meeting of the Company held on June 24, 1953, the dividend of Fourteen Shillings and Three Pence per £5 share proposed by the Directors was duly declared in respect of the year ended December 31, 1952, but it was decided that Ten Shillings only of this amount should be paid as from July 1, 1953, leaving payment of the balance in suspense. Notice is hereby given that a dividend of Ten Shillings per £5 share on Coupon No. 126, less Egyptian Government and Alexandria Municipal taxes amounting to 1s. 11.67d., will be paid on and after July 1, 1953, at the National Bank of Egypt in Alexandria at Rue Toussoun, or in London at 6 King William Street, E.C.4.

United Kingdom Tax at the standard rate will also be deducted from dividends paid in London except when coupons are accompanied by an affidavit of non-residence in the United Kingdom.

Net Profit for the year ended December 31, 1952, £155,400 (last year £168,000).

Coupons referring to share warrants to bearer of the series 120,001-168,000 must be listed separately on special forms. These forms, which also contain instructions regarding the issue of new coupon sheets for this series, are now obtainable on application, from the National Bank of Egypt.

Dated, Alexandria, Egypt, June 24, 1953.

By Order of the Board,

ROBERT WALTON,

Managing Director.

R.C.A.48

OTTOMAN BANK

(INCORPORATED IN TURKEY WITH LIMITED LIABILITY). Notice is hereby given that, in accordance with Article 29 of the Statutes, the ANNUAL GENERAL MEETING of SHAREHOLDERS will be held on Wednesday, August 5, 1953, at Winchester House, Old Broad Street, London, E.C.2, at 12.30 p.m.: to receive a Report from the Committee with the Accounts for the year ending December 31, 1952; to propose a dividend; to replace the retiring members of the General Committee; to be informed concerning ratification of the new Agreement reached with the Turkish Government; to prolong the existence of the Bank for a period of 99 years as from July 3, 1953; to agree modification of the Statutes as proposed by the Committee, following on the new Agreement with the Turkish Government; and to fix the remuneration of the Members of the Committee in accordance with Article 18 of the Statutes.

By the 27th Article of the Statutes the General Meeting is composed of Shareholders possessing at least thirty Shares, who, to be entitled to form part of the Meeting, must deposit their Shares at the chief office of the Company, Istanbul, or at any of the several branches or agencies abroad (in London at 20-22, Abchurch Lane, E.C.4, and in Paris at 7, rue Meyerbeer, 9me) ten days at least before the day fixed for the Meeting.

Copies of the proposed modified Statutes will be available to Shareholders when depositing their Shares.

J. VASSALL ADAMS, Secretary to the Committee.

July 10, 1953.

BARRISTER (31), returned from four years' practice in Middle East, would welcome interesting employment, not necessarily legal.—Box 286.

ASSISTANT ACCOUNTANT, aged 28-35, is required by a West Middlesex Manufacturing Company. Applicant must be fully qualified in financial and cost accounting. Experience in budgetary control and standard costing essential. Post is superannuated and offers excellent opportunity.—Write, stating age, experience and salary required, to Box 287.

MERCHANT BANKERS require recently qualified Chartered Accountant.—Applications, giving age and qualifications, to Box 254, Dorland Advertising, 18-20, Regent Street, London, S.W.1. **MY BRAIN** is all I have to offer, trained legally and academically to First Class Honours standard. Is there an employer who will turn it to practical account offering in return a worth-while future?—Box 294.

ABLE Chartered and Incorporated Accountants required for installation of Management Accounting Schemes. Age 28-40. Industrial experience since qualifying essential. Four-figure progressive salary.—Write, stating age, experience and salaries, to Robson, Morrow and Co., Box 005, 59 New Cavendish Street, London, W.1.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 14 New Bridge Street, E.C.4.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History, and Social Sciences, you may wish to sell (periodicals excluded).

EXPORT SALES.—Dane (31), with broad experience in foreign trade and shipping, seeks interesting position in export sales field. Energetic, cultured, fluent knowledge of Scandinavian languages, English, German, Spanish, Portuguese. Travelled. Resident several years in Spain and South America. Europe-Western Hemisphere preferred.—Box 233.

THE UNIVERSITY OF SHEFFIELD

Applications are invited from graduates of any University for a Douglas Knoop Research Fellowship. The Fellow will be required to undertake research in Economics in the University of Sheffield.

The Fellowship will be of the value of £425 a year, and will normally be tenable for three years.

Applications (three copies), indicating the line of research proposed by the applicant, and including the names and addresses of three referees and, if desired, copies of testimonials, should reach the Registrar, The University of Sheffield (from whom further particulars may be obtained), by September 7, 1953.

Official application forms are not provided.

A.W. CHAPMAN, Registrar.

WOOLWICH POLYTECHNIC, LONDON, S.E.18

Principal: J. S. TAIT, Ph.D., B.Sc., A.R.T.C., M.I.E.E., A.M.I.Mech.E. DEPARTMENT OF COMMERCE AND MANAGEMENT STUDIES

The Governing Body invite applications for the appointment of two Grade B Assistants—(i) to teach Shorthand (Pitman's), Typewriting, Private Secretarial Practice and general commercial subjects up to advanced R.S.A. Standard. Applicants should have teaching and commercial experience and a practical knowledge of modern office machines and up-to-date business methods; (ii) to teach English, History and/or Geography up to G.C.E. Advanced Level. Applicants must be Graduates and should have teaching experience.

Salary according to the Burnham Technical Scale for Teachers in Establishments of Further Education: Man—£490-£25-£765, Women—£437-£20-£597-£15-£612 per annum, plus London Allowance of £36-£48, and the following where applicable: (i) Graduate allowance £60 (men), £48 (women); (ii) training allowance £18 (men), £15 (women), for each year up to three for full-time study or training beyond 2 years; (iii) increments for industrial experience up to 12 years; (iv) increments for full-time teaching experience.

Full particulars of the post and application forms may be obtained from the Clerk to the Governors, to whom they should be returned not later than July 18, 1953.

TEXTILE RESEARCH

ENGLISH SEWING COTTON CO., LIMITED, invites applications from young men who are capable of undertaking and supervising Research work into Synthetic yarns.

Applicants must be Graduates with the appropriate scientific training and ability to give practical expression to results. Two or three years' industrial experience an advantage.

The position is a permanent one with Superannuation and a salary commensurate with qualifications, which provides an excellent opportunity for a young man who wishes to initiate new developments in a practical sphere.

Applications, giving age and full details of qualifications and experience, should be addressed to The Personnel Manager, English Sewing Cotton Co., Ltd., Arkwright House, Manchester, 3.

PERSONNEL OFFICER.—Applications are invited for a Personnel Officer vacancy in the Consumer Research Department of a large food manufacturing company in the Home Counties. This is a pioneer position, which offers scope for individual initiative and responsibility in the introduction of modern personnel practice into a new field, and the duties will include the formulation and development of selection procedures, the development of training method, the assessment of performance and the review of wage policies as they affect the employment of a country-wide staff of field interviewers. Initial salary will be not less than £550 per annum, plus non-contributory pension and other benefits. Women aged 25 to 30 years, who have had not less than three years in personnel work and who are prepared to travel within the United Kingdom, should write in confidence, giving full details of career to date, to Box 280.

REQUIRED by important firm of Commodity Brokers and Merchants in City with world-wide connections. Market Representative aged up to 35 years. Fluent French and German or bi-lingua standard in either with working knowledge of the other. Some experience international marketing very desirable. Essential qualifications initiative, energy and drive and good presence. First-class prospects for suitable man.—Write, stating age, experience and salary ideas, to Box 277. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

ECONOMISTS 1943/44, 1946/53 inclusive (unbound) for sale. Many odd copies. Offers.—Box 290.

SALES REPRESENTATIVES, salaried, aged about 35, are required by a Public Company of Leading Food Manufacturers who are engaged in an expansion programme. The areas are: South Western England, South Wales, West Riding of Yorkshire and the Glasgow/Edinburgh areas.

Selling experience, though not necessarily in food, is essential. Applicants must have their own car. Salary £850 per annum plus expenses and participation in a contributory Superannuation Scheme. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952. Box 0200, Lee & Nightingale, Liverpool.

First Item Germany

THE results of the meeting of foreign ministers in Washington are better than had been expected, and it seems unlikely that President Eisenhower, Sir Winston Churchill and their French colleague will find it necessary to meet, whether in Bermuda or elsewhere, for some time to come. Western solidarity seems to have been restored, at any rate for the purposes that lie immediately ahead; and the log jam in diplomacy has been broken not by using a charge of dynamite but by patient pushing and hauling. The results are not dramatic, perhaps not all that Sir Winston Churchill may have desired; but they are reassuring, and perhaps something more than President Eisenhower at one time believed possible. The communiques—which are directed at Moscow and Peking as much as at public opinion in the Atlantic alliance—are courteous, calm and confident. No unfamiliar conditions are laid down to rile the Russians; the emphasis is placed more strongly than ever before on the peaceful purpose of the Atlantic alliance and of the European community that is in the making. The latter "is to be looked upon as necessary in itself and not linked with existing international tensions." Above all, the gates are flung open to renewed negotiation on Germany and Austria. To the question whether a general settlement can be negotiated with Malenkov and his colleagues the answer is given "Wait and see"; but to the question whether an atmosphere of confidence for such negotiation can be created by agreement on limited questions the answer is given "We will try to find out—in Germany."

The time-table of western policy has now been made clear. In the Far East there must first be a truce in Korea, then a political conference on the problems of the peninsula's future; only when that much has been achieved does a broader approach to settlement become practicable. At that stage, if it were reached in reasonable time, it might be possible to link Far Eastern with European matters in the general bargaining. But first the piecemeal approach has to prove itself in Europe, and there the vital thing, as the western foreign ministers insist, is to get "German unity re-established in freedom." That can be done only by a series of agreed decisions which would show that confidence is being restored and tension relaxed. To achieve such results, let it be emphasised, will take time—years rather than months; and the obstacles to progress may prove to be factors that are at present quite unpredictable. The lesson of 1953 so far is that a fluid international situation is full of surprises that may or may not make peaceful negotiation easier. Nowhere is the possibility of surprises greater than in Russia itself, where the adherents of Stalin may or may not be making a come-back, and in Eastern Europe, where unrest and uncertainty have shown themselves all along the lines of communication between Moscow and the Russian army in Europe.

To some the progress contemplated will seem too slow. It will be said that nothing but good could come from the broadest talks with the highest authority in Russia; they would make it possible for the

President and the Prime Minister to measure their man and to sense the motives that lie behind the conciliatory gestures of the last three months. That argument was in fact being used after Sir Winston's famous speech on May 11th; would anyone use it with the same confidence since the disgrace of the deputy premier of the Soviet Union? It will be said that public opinion expects a greater and faster effort to meet the Russians half way; but public opinion in the United States is in a much more cautious mood than public opinion in France, and ways of reassuring the Russians which might be approved in this country would certainly not be approved in Germany. There is no such thing as a united western opinion, save when the Russians are clearly and persistently aggressive. When they improve their public relations, western opinion divides along party and national lines; and the response of western statesmen can be made only by acts and statements which represent a compromise between their governments' views. The alternative is for one statesman to "go it alone"—there was some reckless talk of Sir Winston doing this—thus making it impossible for the West to bring its whole united bargaining power, and perhaps wrecking the chances of bringing together the main protagonists—the United States and the Soviet Union. This possibility has only to be mentioned to be dismissed. But there is all the difference between the bold and dramatic offensives along the cold war front that might occur in another Yalta conference and the local sallies and penetrations that are possible on a limited sector. The former promise nothing but difficulty; the latter might well bring success.

★

Such a sally has in fact begun as a result of the Washington talks. The western governments are proposing to the Russians a meeting of foreign ministers two months hence to discuss the establishment of a free all-German government and conclusion of an Austrian treaty. This is not a new proposal and it is not a new method, but it is the first initiative towards the Kremlin taken since Stalin's death. It may or may not be welcomed, but it can and should be pressed home. The western allies are now committed as never before to securing German unity, and they have to show proofs of good faith both to the Russians and the Germans. The way to do it is to ask at the earliest possible moment for a meeting of the four High Commissioners, who would discuss the measures that must be taken in advance if free elections throughout Germany are to be possible. The Adenauer government, and its Social-Democrat opponents, have made it clear what those measures are; the removal of barriers between the zones, free movement of Germans across all zonal frontiers, and the elimination of the No Man's Land created on the Soviet side of the zonal frontier last summer. To present these proposals to the new Soviet High Commissioner, Semenov, would be to test the intentions of the Malenkov regime in a manner that might appear to it to be at once tempting, perplex-

ing and fair. It would be tempting, because the Russians have consistently asked for a revival of the machinery of Potsdam which enabled the four occupying powers to discuss Germany as a whole; it would be perplexing because it would be difficult for the Russians to restore all restrictions on movement once they had been lifted generally; it would be fair because no arrangements for German unification through free elections would be possible unless the Russians were ready to open up their zone.

It can be objected that to ask for such concessions so soon after the events of June 17th in Berlin is unreasonable; in fact, however, it offers the Russians a way of saving face, and a way suggested by themselves. To them it offers the one possibility of detaching the western allies from the Bonn Conventions and the projects of integrating Germany with Western Europe, the one way of working out a four-power policy for Germany instead of a compromise between an Eisenhower-Adenauer policy and a Malenkov-Grotewohl policy. For this possibility they would probably pay a high price. Dr Adenauer himself, like his political opponents, is well aware of this Russian calculation; but he appears to be willing to accept the risks involved for him in a return to four-power consultation. Now that the western allies have decided to take the initiative, it is important that they should maintain it by probing at once into the delicate sector of Eastern Germany.

This, for the moment, would be enough to go on with. Convulsions may shake the Kremlin between now and mid-September, but the people of the West will take their holiday. So, too, will their political leaders. The forces of Nato will, as the Washington communique emphasised, remain on guard; if the Kremlin's attitude stiffens again, as it may in face of what has happened in and around Russia, nothing of substance in the policy of containment has been abandoned, dim though the prospects of the European Defence Community now look. But if the Russians seize the chance of serious negotiation about Germany's future, then the western foreign ministers must expect to find any major concessions that Malenkov may proffer accompanied—as Sir Winston Churchill has indicated—by a demand for guarantees of Russia's security against Germany. If they have not considered during their Washington talks what this would require of the West they should begin doing so at once.

More Lances against Monopoly

THE Monopolies Bill has stimulated little controversy in the House of Commons. It could hardly be otherwise. No one who thinks that restrictive practices in industry should be investigated at all can be satisfied with the existing pace of the investigation. The Monopolies Commission required three and a half years to complete the first six enquiries with which it was charged in March, 1949. It is true that the attack on monopoly was not intended to be, in the early stages at least, more than gradual. But what has in fact happened is not gradualism; it is almost inaction.

It is true that the investigations must, if they are to command confidence, be painstaking. It is equally important that they should be extensive. No one supposes that restrictive practices, in the broad sense, are confined to a few exceptional corners of the British economy. They are widespread. The object of studying particular cases is to trace exactly how the practices work and what their effects are. But if the conclusions are to carry any weight, whether in criticism of monopoly or in its justification, the examination must extend over a reasonably wide front. If it is worth doing at all, it is worth doing faster than has proved possible for the existing commission.

The parties' agreement on the present Bill is, therefore, simply a logical consequence of previous legislation. The Bill's main proposal is to increase the size of the commission—from ten to twenty-five members—and to empower it to work in groups of five. This will enable many more industries to be investigated concurrently. At the same time, the position of the commission's chairman and his two deputies is, very rightly, enhanced. Provided that the legislation is backed by an anxiety at the Board of Trade to give the commission all the fact-finding staff it requires, in numbers and quality, the result should be considerably to accelerate the investigation of monopoly practices.

That is important, but is an improvement in machinery, not an advance in principle. It brings the actual practice into line with the attitude towards monopoly that both parties adopted in 1949, when the existing legislation was passed. But have not opinions in the meantime moved a little forward? This is not, admittedly, an easy thing to measure. Both Labour and Tory views on the virtues of competition are still confused; most criticism of restrictive practices remains tentative. But there has been a shift. Something of the general reaction against postwar rigidities—against nationalisation, state controls and the over-valuation of security—has been passed on, intellectually at least, to other practices. The proposition that private enterprise must justify itself by being enterprising is a little less a piety and a little more a precept. This is true as yet only of individual attitudes; it has not penetrated the offices of trade associations, still less of trade unions.

But the views expressed both in industry and by politicians do indicate, even within the past two or three years, some small change. No doubt even the most determined government could take only a step or two in advance of public opinion. Nobody, perhaps, was expected to take too literally the brave declaration in the programme on which the Conservatives won the last election:

We believe in the necessity for reducing to the minimum possible all restrictive practices on both sides of industry, and we shall rely on a greatly strengthened Monopolies Commission to seek, and enable Parliament to correct, any operations in restraint of trade, including of course in the nationalised industries.

But the present Bill hardly comes up to the spirit even of these vague phrases. It is as if the Government had talked of abolishing slavery but then introduced a measure under which the worst cases of cruelty to slaves might be investigated.

★

Restrictive practices on the trade union side of industry are now conveniently ignored. In another respect, the failure to carry out the election promise can be excused. A Select Committee is considering the relationship between Parliament and the nationalised industries. Until it has reported, the question whether these industries should be brought within the purview of the same commission as private monopoly can properly be postponed. The President of the Board of Trade, however, has attempted to use a similar argument to justify delay in the sphere of private monopoly. The commission is now for the first time examining how a general type of trade practice—exclusive dealing and the collective boycott—affects the public interest, not in one industry but in all industries. Mr Thorneycroft seemed to think that no change in the method of attacking monopoly should be made until this inquiry was complete. There are two objections to such a view. It involves an unconscionable delay. The commission's report on exclusive dealing cannot be expected before the end of next year. On this basis, new action against monopoly practices cannot be prepared until 1955. Politically, the Government would be unwise to put off so long one of the very few measures for which it has the sanction of the electorate. And in terms of economic policy, how—if the Tories meant what their programme said—can such a delay be justified?

Moreover, the argument rests, unless it is a deliberate evasion, on a complete confusion of thought. There are two stages in any attack on monopoly. The first is to formulate some conception of what the public interest requires. The second is to build up a body of case law on how restrictive practices are related to this public

interest. The second is a gradual process whatever the form of anti-monopoly legislation—even where, as in the United States, it starts from a clear condemnation of all restraints on trade. The restrictive practices that are actually illegal still depend on a series of judicial decisions, decisions whose nature is fairly constantly shifting. That, in this country, is the business of the Monopolies Commission. It remains the business of the politicians to establish the concept of the public interest that the commission uses as a standard. To leave it to the commission is either a pretence or a means of ensuring that the commission is ineffective.

The present state of opinion has been usefully illuminated by the debates on the new Bill. There are two main elements. The public interest in cheap goods is obvious, and almost everyone recognises that unrestricted competition, whatever else it may do, almost always makes for cheapness. Secondly, there is a public interest, less easily defined but quite genuine, in the stability and continuity of industries and services. This is the root of most serious defences of restrictive practices; continuity is a public interest that competition may sometimes injure—though probably less often than is commonly supposed.

These two elements were widely recognised, with varying emphasis, in Parliament. They would be sufficient in a world without science, where industrial techniques never changed. In the real world, there should be a third and most important element in the attitude to monopoly. That is the public interest in

economic progress, in the inventiveness, enterprise and risk-taking of firms developing new products, adopting more efficient methods, seeking new markets. This dynamic interest is not always identifiable with competition. In some industries, it may be only the very large firm—leaving no room for direct competitors—that can have the resources for research and innovation which modern technology requires. This is a reason for tempering, sometimes, the attack on monopoly or near-monopoly. It is hardly ever a reason for tenderness towards restrictive practices in the wider sense—towards agreements restraining competition among many small firms. In general, competition is unquestionably the most reliable spur to industrial innovation. Besides this, the uncomfortable changes and uncertainties that it brings are of very small account.

In these matters, the ministers of a free-enterprise government should be leading opinion. They may still doubt whether any satisfactory concept of the public interest in competition can be formulated precisely enough to be written into new legislation. But, at least, if all the elements in that interest were more clearly recognised, there is little doubt that the commission would quickly become more effective. It could stop assuming that restrictions on competition are all right until they are elaborately proved to be bad in particular cases; and the Government would then begin to fulfil the promise of its election propaganda. There are few respects in which so important an achievement is open to it.

The Legal Engine Overhauled

THE committee appointed in April, 1947, with the Master of the Rolls, Sir Raymond Evershed, as its chairman, to inquire into the practice and procedure of the Supreme Court has this week published its final report [Cmd. 8878]. The report gives a detailed account of ways in which the efficiency of the courts could be improved and, in particular, the cost of litigation could be reduced. How the report is to be implemented is another matter.

The subjects covered by the report can be divided, roughly, into six groups. Its main body deals with the methods by which civil actions are conducted; after all, the bulk of the cost of litigation is in fact the cost of employing a lawyer, or more than one lawyer, to carry out the detailed steps by which an action travels from start to finish. The second subject is that of appeals; the third deals with the assessment of the costs of an action when it is over; and the fourth with counsel's fees. There is a section on litigation at the public expense and a final one on the distribution of business among the divisions of the High Court, with some comments on commercial arbitrations. In general, the committee has been in the position of a garage mechanic overhauling the engine of a car to find out how it

could be made more efficient in its running. It was not a motor designer planning a new and ideal piece of mechanism.

What is said about the methods of conducting High Court litigation is, inevitably, a mass of detail. Little purpose would be served by attempting to follow the committee down every bye-path it was compelled to explore. In outline, the stages in a High Court action are three. The plaintiff launches his claim and the defendant files his defence. The action then comes under the jurisdiction of a Master, an officer of the court, who controls what are known as the interlocutory proceedings. These decide where and how the action shall be tried, and make arrangements about documents, expert witnesses, plans, models and the like; in short, the purpose of the interlocutory proceedings is to weed out the inessentials, and to make the trial itself, as far as possible, a clear-cut contest on certain defined issues of fact, or law, or both. The third stage is the trial itself.

Interlocutory proceedings may themselves waste money. Still more, if the Masters are not expert and determined, they may fail to eliminate what is really irrelevant and so permit of wasted time, and money, at the trial. Two litigants who desire the point at issue

between them to be decided as soon as possible, and who employ competent lawyers who are neither under nor over worked, do not need altered rules to keep down the costs. The Master, and the rules, have also to deal both with the litigant who wants every delay he can get and with the lawyer in whose mind the saving of costs is not at the forefront. The committee makes many practical suggestions, both on how the powers of the Masters can be strengthened and on how the Masters can save costs in an action. One of the weak points of the present machinery of the courts is that too little thought seems to have been given to the role of the Master. If necessary, the committee thinks, the appointment of more Masters will save time and money; they will sift further the work falling to the judge. In view of the importance of their work—at least, of the importance of what their work might be—the status of the High Court Master today is probably too low.

★

On the question of appeals, the committee does its best within the limitations of its terms of reference. The original Judicature Act of 1873 was suddenly amended, before it came into operation, and the House of Lords as an appellate tribunal was spared from destruction, although a separate Court of Appeal had been created. Since then litigants, and probably justice, have suffered from the fact that there are two courts of appeal in civil actions. Such a system is indefensible in logic and has not worked well in practice, for the House of Lords and the Court of Appeal certainly do not always see the law in the same way. The best the committee can do in these circumstances is to suggest that certain kinds of appeal may be “leap-frogged” over the Court of Appeal, from the court of first instance direct to the House of Lords. Since there is little prospect of Parliament taking its courage in both hands and dispensing with either the House of Lords or the Court of Appeal as an appellate tribunal, this suggestion has at least the merit of practicability.

The third and fourth subjects of the report are the assessment of costs and the question of counsel's fees. The present practice is that the bill of costs of the solicitor for the successful party is submitted to an official of the court for “taxing,” or assessment, and the loser must pay what the official finally allows. Most of the individual items in the bill are fixed by statutory order, but some are discretionary, particularly counsel's fees. In the United States, the successful litigant recovers virtually no costs from the loser; in Canada, no more than a portion. The committee does not recommend a complete change to such a system here. It does, however, suggest that in the end the recoverable costs of the successful party may have to be limited to some set standard.

On the question of counsel's fees, the principal argument has long been over the custom of the Bar by which a junior counsel is entitled, on his brief for the trial of an action, to a fee equal to two-thirds of that paid to

his leader, regardless of the part he plays, or is expected to play, in the conduct of the trial itself. This custom produces the curious result that, since the more experienced leaders command the higher fees, junior counsel may be paid a very high fee for a brief that imposes virtually no responsibility on him. The defence of the system is that the fees payable to junior counsel for work done in the interlocutory stages before the case comes into court (which is his particular province since, by custom, a Queen's Counsel is debarred from such work) are so low that the two-thirds rule is no more than a means of giving him proper pay for the total of his effort. The committee goes no further than to suggest a relaxing of the strict rule where the leader's fee exceeds fifty guineas. Four members of the committee, in an addendum, argue that the proportionate custom itself—and, indeed, also the rule that a QC must always be accompanied by a junior—should be abolished. They further think that the fee a barrister charges to his own client (as distinct from what can be recovered from the other side in the event of success) should be decided by an independent tribunal if it is not freely agreed.

Finally, there is a useful proposal from the committee on litigation at the public expense. Occasionally—and not only in Revenue matters—a case involves an undecided or doubtful point of law of wide application. The committee proposes that, if the Attorney-General certifies that the clarification of this point would be in the public interest, the costs of prosecuting the action should be borne from public funds, regardless of the means of the parties. This assistance would probably be limited in normal cases to the costs of an appeal from the Court of Appeal to the House of Lords, but assistance should be permitted at any stage after the issue of the writ.

★

There remain two other points, one raised in the addendum by the four members, the other by the report as a whole. The first is the fusion of the two branches of the legal profession, barristers and solicitors. The addendum recognises that this does not come within the terms of reference of the committee, but argues that it is important enough to justify the appointment of a separate committee of inquiry. The medical and the accountancy professions, while they are not exact parallels, provide two contrasting examples. There is a division of function between the general practitioner and the specialist which corresponds in some ways to that between the solicitor and the barrister. The accountancy profession, on the other hand, has not thrown up any general order of independent specialists. The accountant, particularly the accountancy partnership, carries out all the work that falls to the profession, including if need be the argument of points of law with the Inland Revenue, without recourse outside the individual office organisation. In the case of the law, one thing is clear; arguments have gone on long enough

to show that the legal profession itself will not originate any proposal for fusion. If that is to come, it can come only when public opinion is positively in favour of it, and the public is entitled to the evidence that such a committee could collect and sift.

The remaining point is the future of this report. With the best will in the world, the Lord Chancellor's department, the Rules Committee of the Supreme Court, the General Council of the Bar and the Council of the Law Society cannot hope to bring the various changes suggested by the committee into operation at the drop of a hat. Indeed, it is not simply a matter of altering some rules and leaving it at that. For some of the reforms

suggested, legislation would be necessary. Nor would even that by itself be enough. The committee emphasises that what is needed is a new approach by the courts, their officials and the legal profession, and that little will happen without such co-operation. Many forms of litigation have declined in recent years, and the commercial world increasingly tends to settle its disputes by other means. This is silent but eloquent testimony to the fact that the courts have not in recent years been serving the public as well as they might. Unless all branches of the legal profession are prepared to accept the service of the public as their only final justification, no purely formal changes will accomplish very much.

Dr Malan's Roll Call

IN the recent South African election campaign the leader of the Opposition, Mr Strauss, produced the idea that the colour question ought to be "taken out of politics." At the time, this was widely regarded as no more than a veil for the United Party's lack of any clear policy as regards racial problems. Certainly Mr Strauss did not expect his seemingly harmless phrase to rebound on his party. Yet this was precisely what happened. Dr Malan promptly convened for this week a joint session of both houses of the South African parliament to consider a bill that would remove the "Coloured" (which does not mean black) voters in Cape Province from the common electoral roll. If a two-thirds majority of both houses sitting together were to be mustered behind this bill, Dr Malan hoped to attain, by strictly constitutional means, the objective that the courts denied him last year. The Nationalists, despite their victory in the April elections, do not command a two-thirds majority; but the Prime Minister chose to take Mr Strauss's slogan at the letter, and has invited the United Party to allow a free vote.

Only a baker's dozen of Opposition members needed to have crossed the floor to give the Nationalists their triumph, and, as was mentioned in *The Economist* last week, signs of some wavering in the United Party's ranks were not wholly lacking. The government has done its best to encourage this tendency. It has played down the question of a South African republic, and it now specifically proposes that the equal status of the English language alongside Afrikaans should remain "entrenched" in the Constitution under the protection of the courts—which, under the new Bill, were to be stripped of the right to test the validity of laws on any other subject. To quite a number of United Party members the fate of the Cape Coloured electorate, once divorced from the broader constitutional question, does not seem of vital importance.

Yet it is the unity of the Opposition that is now the Nationalists' chief quarry. Although Dr Malan was bound by his election pledges to proceed at once for the political segregation of the Cape Coloured voters, failure

to gain this objective would hardly be a mortal blow to him. But, whichever way the voting at the joint session goes, the Nationalists are confident that their tactics will succeed in revealing new rifts within the Opposition. By conforming, however belatedly, to constitutional procedures, they have robbed the United Party of its clearest rallying-cry—the defence of the constitution. Since the elections they have seen Mr Strauss's following disintegrating at both its conservative and its liberal extremes, and scarred right across by the emergence of the Natal-based "federalist" group, a heterogeneous party united only in its desire to maintain the British connection. Indeed, on present form, Dr Malan has good reason to believe that for some time to come he can keep the parliamentary opposition on the run—in several different directions. Another general election at an early date is an obvious possibility.

The permanent cohesion of the Nationalist Party itself cannot, of course, be taken altogether for granted. While the Prime Minister's personal position is still unchallenged, his political life must now be drawing near to its end. The April elections, which demonstrated the swiftly growing strength of the Transvaal Nationalists, made it even more probable than before that their leader, Mr Strydom, would inherit Dr Malan's mantle: and Mr Strydom is a somewhat controversial figure within the party. The party itself now that it seems able to count on five years of power with a comfortable majority in parliament, may not be able to retain the tautness that has marked it since 1948. As last week's parliamentary debate showed, the twin issues of republicanism and Commonwealth relations are particularly difficult ones for a government which has to deal with hotheads on its own benches.

Indeed, it is arguable that the Nationalists would have cause for regret if they should succeed in navigating quickly past such problems as that of the Cape Coloured vote. Issues of this kind provide good campaigning

slogans—"the sovereignty of parliament" has served the Nationalists as well as, perhaps even better than, "defence of the Constitution" served the Opposition—and their practical implementation raises no insoluble problems. As yet the Nationalists have scarcely begun to think seriously about the final consequences of a full-blooded policy of *apartheid*. During the election campaign, the constitutional issue and the immediate counter-measures taken against the non-Europeans' passive resistance movement served them as a shield to deflect awkward questions about the economic future of South Africa. At the present moment the embarrassments of the Opposition still protect the government from any such disquieting confrontations with the future.

★

Hard facts cannot, however, indefinitely be blinked. Behind the apparent triumphs which the Nationalists have recorded (and may yet record) lies the grave reality of a country whose bitter divisions are being rapidly and deliberately deepened, and whose urgent economic problems are still set aside. While soil erosion quietly carries off South Africa's fertile topsoils, the racial policies of Dr Malan's government are cutting jagged gullies through its human foundations. The supreme political problem in the Union, as elsewhere in the continent, is to foster among the Africans a public opinion interested in co-operation with the Europeans,

and to encourage a reciprocal attitude on the European side. The Nationalists have not merely failed to tackle this problem; they have not even been content to ignore it; they have exacerbated it. As yet there is no sign that they have any policy, other than repression, with which to meet the Africans' growing political consciousness. They have been lavish enough already with their repressive measures, and there are doubtless more rods in pickle; but the sterility of these methods has now been amply demonstrated. The discipline and restraint shown by the non-Europeans in their passive resistance campaign were a revelation, as was also the unity which that campaign showed to exist between Bantu and Indian groups. The political awakening of at least a broad segment of the non-European population of the Union is now a fact beyond dispute.

The real task before South Africa is, therefore, much less to find ways of taking the non-European problem "out of politics," than to find ways of bringing the non-Europeans into politics in a manner suited to their present stage of development. It is South Africa's problem, and it is inevitably somewhat invidious for any country to have to listen to home truths from abroad; but opinion in Britain and elsewhere in the Commonwealth cannot be expected to remain silent on the matter, for it is one of common and deep concern. What happens in South Africa cannot but cause repercussions in other parts of the continent, and especially in those areas for which Britain has direct responsibility.

Notes of the Week

Front in the Far East

FOR far too long the idea has been generally accepted that the East is East and the West is so hopelessly divided on the subject of the East that never shall the views of the Big Three meet. The communique on Far Eastern matters issued after the foreign ministers' talks in Washington should do a good deal to redress this impression. The gap between American and British attitudes to Communist China has never in reality been an unbridgeable one, and the ministers appear at least to have established this fact authoritatively for the first time. They have agreed to maintain their "common policies" towards China for the time being—and, by implication, to refrain from biting each other's backs as regards those aspects of their relationship with China on which they have taken different stands in the past. This is surely as satisfactory an agreement as can possibly be reached as long as Mao Tse-tung's armies continue not merely to bear arms against the United

Nations, but also to press repeated and savage attacks on the Korean front.

President Rhee's intransigence has been another factor inhibiting any attempt to shape a comprehensive policy on Korea. But here again, the foreign ministers have found and set forth an important common factor—which happens also to be an essential principle. They announce, in very carefully chosen words, that

if the Communists should renew their aggression in Korea after an armistice and again threaten the principles defended by the United Nations, their governments would, as members of the United Nations, again support the restoration of peace and security.

Attempts will no doubt be made, by those whose chief aim is to divide the United States from its allies, to represent this pledge as a Franco-British surrender to American pressure. Such attempts would be extremely disingenuous. The foreign ministers' statement represents, in reality, no more than a reaffirmation of an undertaking by which all three nations have long been bound. Resistance to aggression in Korea is a plough from which the hand can hardly

be removed in mid-furrow without the loss of both honour and material advantage. At the same time, the foreign ministers have been careful to avoid giving Mr Rhee the least encouragement to believe that any adventurous moves on his part would automatically obtain the armed support of the countries that have fought so long in his defence.

The Big Three have also shown once more that they are fully aware of the danger that a truce in Korea might actually increase the Communist pressure on South-East Asia. There is nothing new in the communiqué's explicit recognition of the vital nature of the struggle in Indo-China, but this is a point which still needs to be made again and again to a largely uninterested public opinion in Britain and America. The final section of the communiqué on the Far East, on the other hand, is addressed primarily to France; Mr Dulles and Lord Salisbury have taken advantage of the French government's latest proposals to Vietnam, Laos and Cambodia to establish the fact that yet another gap has come to assume more manageable proportions. To some readers, and perhaps not least to M. Bidault, the phrases used by his two colleagues with regard to the nature of the French Union may not seem as precise as the facts warrant. But, however much the past record of French relations with the three Associated States may justify continued scepticism, it must surely be common ground that France's recent initiative has opened up encouraging new possibilities for those relations, and that the essential task at Washington was to encourage, rather than to warn, those concerned.

Summer Storm in Egypt

UP till last week-end all was quiet in the Canal Zone while General Neguib and his team turned to their immense task of handling Egypt's internal problems. They had begun acclimatising an unstable people to the thought that they must work out their own salvation, expect slow progress and accept austerity. Their budget, and the accompanying speeches in which General Neguib explained why he could not make ends meet by soaking the rich and why he must tax bread and sugar, were masterpieces of sobriety.

Suddenly a leading aircraftman of the R.A.F. was abducted in Ismailia. He was last seen in company which led the British military authorities to suppose that known persons could explain his disappearance. They asked for Egyptian help in tracing him but, when they did not immediately receive this, made the psychological mistake of making in writing a threat of reprisals. This, as might have been foreseen, helped the Egyptians to vault back on to their high horse; they at once made it public. Since the threat turned out to be nothing more than the familiar reimposition of road-blocks and the searching of vehicles, it contributed nothing to the discovery of the missing aircraftman. Perhaps, fortunately for the British Commander-in-Chief, Major Saleh Salem, Minister of National Guidance, also made a psychological mistake by grossly overstating Egypt's intentions of counter-reprisals. The two errors cancel out, and the sudden storm has abated; but the unsuitability of the British method of handling it is apparent if one asks one question: How long are the road-blocks to be retained, keeping British and Egyptian tempers simmering, if the aircraftman remains missing?

Germans as Allies

THE long and fervid controversy over the European Defence Community, both in Europe and outside, has now a new fact to reckon with. The western foreign ministers in Washington have agreed, in spite of American reluctance, to give talks on German unity with the Russians priority over the ratification of the EDC treaty by France and others. This may be read as a concession to the French insistence that the Assembly will not look at the treaty until it is clear that the Russians will not budge; as a rebuff to Dr Adenauer who pressed for ratification first; as an acknowledgment of the treaty's present unpopularity in Europe (which is described in an article on page 183); and as an admission that the Russians could not be expected to agree that an all-German government should be free to choose its allies if Western Germany were already formally integrated into a European community, and a defence community at that.

The last point is the most important, and it is to be hoped that the Russians take it. Lest they should overlook it, the Washington communiqué stresses that the EDC is part of a general plan for European integration and not merely a scheme for rearming the Germans in a way acceptable to Germany's weaker neighbours. How strong that European community becomes and what the German contribution to it will be depends in large measure on what can be achieved in negotiation with the Russians.

The Americans—especially Congress—tend to make too much of the EDC's function of making German rearmament possible, thereby causing the French to have fears about their own relative strength in the community. The French—and the British—make too little of the contribution that the EDC would make towards protecting the civil power in Germany against resurgent military interests. What most people overlook is the value of the project as a card in exchanges with Moscow. For the first time in the Washington communiqués it has been played with real skill.

The Election Prospect

WITH both Sir Winston Churchill and Mr Eden on the couch of convalescence, the prospects of an early general election are having to be re-assessed. If the state of the Opposition were the only test, the arguments of those who want the Government to appeal to the country in the autumn would have been strengthened. The Abingdon by-election has confirmed the Government's popularity, and any chance the Labour party might have of reversing the position in the immediate future seems likely to be lost at the Margate conference. On the other hand, the Conservative party cannot take lightly the ill-health of its leader and deputy leader. Labour would certainly label its opponents in an election campaign as a government of invalids and peers. It could also accuse the Tories of cashing in on the Coronation. Above all, the Government is afraid of appearing to be making a convenience of the electorate. The voter is supposed to like some clear-cut issue on which to decide and it is by no means clear that

These considerations do not, however, quite settle the issue. That Sir Winston must at some point within the next few weeks make a clear choice has been tacitly admitted more than once. This week Mr Lennox-Boyd, not the least sensitive of politicians, told his constituents that a general election "might become inevitable." Sir Winston himself has made no contribution to the discussion since his Edinburgh speech in the spring, when he denied any intention of holding an election unless the tactics of the Opposition forced his hand. At the time this seemed to allow him plenty of room for manoeuvre, but he could scarcely have imagined that the Opposition would remain so supine during the summer. It has of late wholly failed to provide him with anything remotely resembling a *casus belli*.

Sir Winston, however, is not the man to be unduly fettered by a formula, and he has probably long since realised that the one he laid down at Edinburgh was inadequate. He should also realise that the illness of himself and his lieutenant is irrelevant to his problem. Ill-health is an overwhelming reason for reorganising the Cabinet, but it is not a good excuse for putting off an election if Sir Winston would otherwise decide on one. His choice is between seeking an immediate mandate for a new four-year programme and starting this autumn on a two- to three-year programme designed to carry this Parliament through its full term. The strain which the latter would impose is not to be underrated, but there is no third choice. To think of an election next spring, as some politicians are suggesting, is to toy with the worst of both worlds. If Sir Winston is now unlikely to appeal to the country in October, he should be preparing a Queen's Speech which shows to Parliament and the country a firm intention to continue in office with a constructive purpose.

Challenge to Labour

THERE is no longer any doubt that the Labour party's recent policy statement has failed to provide the intended compromise that both the right and the left wings of the party might accept with fairly good grace. From the left, that was always too much to expect. But open opposition from the right wing, which in public at least is usually more cautious, is another matter. Yet while the Bevanites demand that the statement should be bolder, and should include definite plans to nationalise rented land and industrial assurance, Mr Deakin has now been equally critical; he has made quite plain his doubts about the limited and diluted nationalisation that "Challenge to Britain" does propose.

Mr Deakin has this week been laying about him with great vigour in his counter-attacks against the Left. On policy, he not merely urged the conference of his union, the Transport and General Workers', to reject various resolutions advocating more nationalisation than the Labour party proposes. He accepted even those proposals only with serious reservations. The TUC was known to have doubts about nationalisation in the chemical industry, but Mr Deakin went further and voiced his doubts about the extension of public ownership to parts of the aircraft and machine tool industries. It was impossible, he said, to tell

where nationalisation would begin and end, or how it would affect firms' interests abroad; care must be taken, he argued, not to upset the delicate balance of industries on which others depended. Mr Deakin inevitably spoke in favour of renationalising the road haulage industry; but he called public ownership a "worthwhile experiment," implying that it had gone quite far enough for the present. There were differences of opinion about the best form of administration, and there was no general approval for it among those whose support had to be sought. In the coal, gas and electricity and transport industries there was a feeling that the position of the workers had been improved at the expense of the consumer.

These remarks must be infuriating to those who have striven to find a formula by which the Labour party can still appear to stand for socialism without doing much about it. They are reassuring to those who see in the party's proposals a blank cheque that could be made out for a large or small amount according to the whim of the drawer.

Rationing Struggles On

THE new problem of plenty last week brought the whole system of meat distribution to the verge of collapse. At a meeting on Monday, however, the butchers' representatives decided to accept "under protest" their allocation of imported mutton, provided that retailers in particular areas have the right to refuse meat that would be unsaleable. (As one delegate said, South Wales miners will eat only the best.) The butchers had withdrawn their earlier decision to refuse inferior mutton because the Minister of Food had announced that its price, and that of pork also, would be reduced from July 19th. But they doubted whether the reductions went far enough; they regretted the compensatory increase in the price of beef; they protested against having to take all the allocation or none of it; and they urged that the Ministry should revise its contracts with the Dominions to choke off the inexorable flow of carcasses.

In spite of these protests and provisos the row over ewe mutton seems to be at an end. The offending meat amounts to only 3½ per cent of the total allocation, and at the new prices there should be no difficulty in selling it. Even at the old prices, it seems to have sold fairly well last week-end. It is more doubtful whether the price reduction for pork is great enough. Supplies will reach a new peak in about three weeks' time, and another peak in August and September, by which time beef supplies will also be improving. It seems likely, however, that meat distribution will struggle along under the present bogus rationing system until the return of comparative scarcity in November mercifully ends the anomaly.

The Ministry has been criticised for not building more cold storage space to spread supplies over the year. But this would be an expensive way of doing it. Under private trade an even flow was secured by seasonal variations in the prices paid to suppliers and cold storage was largely their responsibility. It would be wasteful to build cold stores now, when all that is really holding up the return to private trade is the failure to decide how to implement, permanently, the guarantees to farmers.

Tasks for the Supreme Soviet

THE Soviet parliament, or Supreme Soviet, has been summoned to meet on July 28th. It is a bulky body of some 1,400 deputies divided into two chambers: the Soviet of Nationalities representing the various republics and the Soviet of the Union elected throughout the Soviet Union on the basis of one deputy per 300,000 inhabitants. It is not, however, its bulk that prevents the Supreme Soviet from fulfilling its parliamentary functions. Supreme in theory, in practice it is but a puppet, whose real function is to approve unanimously decisions taken by the government and the Party. Nevertheless its rubber stamp is necessary to make many changes legally valid. Thus, a meeting of the Supreme Soviet was convened shortly after Stalin's death to give the sanction of law to the governmental reorganisation and to approve the change of chairman of its own Presidium, the Soviet President. This time it will have to record Beria's dismissal, the appointment of his successor and any consequent changes.

The agenda need not, however, end there. The Supreme Soviet can hold as many special sessions as it wishes, but legally it is bound to have at least two meetings a year. One of these is the budgetary session normally held in the first half of the year, usually in March. Up to now, however, the budget has not been revealed, nor has the current Five Year Plan received parliamentary approval. The national accounts are of particular interest this year, since they might show whether Stalin's successors have made any important changes in economic policy, and also how they intend to fulfil their promises to increase the supply of consumer goods.

The drafting of a new legal code is another item which ought to appear on the agenda. When the amnesty was proclaimed in March, it included a special recommendation to the Ministry of Justice to prepare within a month a new legal code for submission to the Supreme Soviet. Four months have passed and no mention of a new code has been made yet. Will it now appear at all?

Backpedalling in Budapest

MR RAKOSI has not lost much time in stepping back into the centre of the Hungarian stage. Last week-end he gave to a meeting of party activists in Budapest his own interpretation of the new policies recently announced by the prime minister, Mr Nagy; it cannot have been a popular interpretation. He poured cold water on those who thought that good times were only just round the corner and that hard work was no longer the order of the day. He stated in—as he himself put it—"the most clear and unambiguous terms" that there was no change of policy towards the collectives, which must continue to be supported "with the same energy as in the past." He also made it clear that the five-year plan had not been thrown overboard. He maintained that the plan was not (as Mr Nagy had categorically stated) beyond the country's strength; it was, however, necessary to re-allocate some investments so that the standard of living could be more

quickly raised, and he added the significant warning that any changes in the plan would take a long time to work out.

Mr Rakosi's backpedalling does not necessarily mean that the new policies are to be summarily abandoned. On the contrary, he appeared to give them the stamp of his approval; but, at the same time, he tried to minimise their long-term importance. Mr Rakosi, in fact, seems to have been forced by the unexpectedly strong popular and party reactions to Mr Nagy's concessions, to step forward into the limelight again and to show more of his hand than he had at first intended. For it appears that, after Mr Nagy's announcement, many workers immediately decided that plans and norms could be relegated to the dustbin, and many peasants decided to walk out of the collectives at once instead of waiting until the harvest had been gathered in. Many party members, moreover, were deeply disturbed by the turn of events and were wondering where they themselves now stood. Mr Rakosi obviously felt it necessary to reassure these people as well as to demonstrate both that the new government had the support of the Party, and that the Party still had the last word. He assured the party activists that all those who had lost their places in both the Politburo and the Cabinet had "without exception" been given suitable positions elsewhere. In other words, there had been and would be no purge.

Panic Among the Bosses

RAKOSI is not the only Communist leader to be worried about morale within the party. Last Sunday the official newspaper of the East German Communists complained bitterly that some members had wallowed so wholeheartedly in "pessimism and atonement" that they had ended up by thinking that the Communist party had committed nothing but mistakes. According to the *Neues Deutschland*, the party had in fact committed only a few limited mistakes, and there was no doubt at all about the "absolute correctness" of its basic line.

This may seem a doubtful conclusion to draw from the abject apologies made by party leaders both before and after June 17th. But it is likely that these dubious glosses are necessary, in Eastern Germany as in Hungary. Party members are used to "criticism and self-criticism" about failures to carry out the party line correctly; but they are not used to being told, as Grotewohl and Nagy to all intents and purposes told them, that the policy itself is mistaken. How can the minor party bosses now uphold their shaky authority over the factory workers and the peasants? How, indeed, can they maintain their position at all if they are abandoned by those above them and flouted and derided by those below? It is plain that Moscow, if it intends for the time being to pursue conciliatory policies in Eastern Europe, cannot ignore the reactions of its own adherents, who have acquired a vital interest in preserving things as they are.

There is, however, no clear sign that the example of Hungary and Eastern Germany is to be followed elsewhere. In Poland, radio commentators have been very busy mocking at western reports of popular disturbances in Polish towns; but otherwise, to the outside observer, the country seems curiously unaffected by

what is going on around it. In Rumania, the sudden—and apparently successful—effort to increase food supplies by digging into state reserves, is most probably due to the need to impress the thousands of visitors expected for the meeting of the World Federation of Democratic Youth in Bucharest next month. Only in Czechoslovakia has the government given way to popular pressure in a way that would have been unthinkable a few months ago. A repressive decree designed to combat absenteeism which was introduced, according to *Rude Pravo*, "in response to the overwhelming demand of the majority of our workers" was completely withdrawn, after representations by the trade unions, barely a week later.

Towards Gold Coast Independence

THE Gold Coast Assembly on Wednesday passed Dr Nkrumah's motion on constitutional reform. His speeches have been notably conciliatory and statesmanlike. In calling for early independence, he declared his confidence that the United Kingdom Government would accede to the demand. "There is no conflict that I can see between our claims and the professed policy of all parties" in Britain. He emphasised that the final transfer of power should be made in a way that would preserve friendly relations between Britain and the Gold Coast, both of them united by a common allegiance to the Crown and by free association within the Commonwealth.

On these terms, full dominion status for the Gold Coast is probably close at hand. Dr Nkrumah has not yet pledged himself to an exact date, as have the Nigerian politicians with their "Self-government by 1956" motion; but circumstances—particularly the tactics of his political opponents—may force him to do so before long.

His statement on the Gold Coast Government's attitude to expatriate officials, also made to the Assembly last week, is thus sensible and opportune. The Africanisation of the civil service has for long been a plaything of Gold Coast politics. Dr Nkrumah now admits that for some years to come the Gold Coast will need the services of overseas officers to maintain an efficient administrative machine.

In the Gold Coast political advance has outstripped the Africanisation of the public service, and we find ourselves on the threshold of independence, having to rely far more on the services of overseas officers than was the case in India, Pakistan or Ceylon.

To allay any feeling of uncertainty among these overseas servants he therefore guaranteed them pensions and terms of service no less favourable than their present ones, and in addition a compensation scheme for those retiring before their time. This scheme, if approved by the Gold Coast Assembly, is to form part of any new constitutional settlement reached between the United Kingdom and Gold Coast Governments. Dr Nkrumah's readiness to continue using the services of Europeans is one of the more encouraging signs that the Gold Coast may prosper with independence.

Theory of the Welfare State

DISCUSSION of the social services—especially discussion of the proper limits to their cost—more often befalls than clarifies the issue for lack of clear agreement on what the social services are intended to do. It is confusedly assumed that they are intended to alleviate want, sickness and incapacity, to deal social justice, to raise the unfortunate above the poverty line or to prevent them falling below "a minimum." But there is no definition of any of these question-begging phrases, and politicians of different creeds consciously or unconsciously define them differently. Because their assumptions about ends diverge, their arguments about means are otiose. Mr Walter Hagenbuch, in the current issue of *Lloyds Bank Review*, has made an acute contribution to the theory of the welfare state by dissecting the various purposes which modern social services may be used to promote.

It will not do to assume that social services are intended to abolish poverty, for what was sufficiency when Mr Rowntree made his first survey of York is rank destitution today. Many nineteenth-century economists believed that poverty would shrivel away as the result of technological progress, so that social services—which they conceived as temporary expedients—would shrivel with it. Only if poverty is defined in absolute terms, as malnutrition, is that so. The poverty line has proved to be something that rises with the standard of living. Indeed, once the conception that the poor are the substandard is introduced, "substandard" can mean anything below the exact average. Nor is poverty a mere passive failure to achieve the conventional necessities of life. It is something that can be self-inflicted, or worse, can be inflicted on a man's helpless dependants, by wilful choice of luxuries (whether television or works of art) against necessities (which may include anything from approved housing to approved schools). The existence of such "secondary poverty" has made it possible to argue for the indefinite extension of state control over personal spending.

If this principle is pushed far enough, social services become the instrument of redistribution of income. There is no limit to the amounts that might desirably be spent on education or health, and the actual limit is only reached when the state controls all personal spending and takes from the citizen's purse the appropriate sums as well as all freedom of choice. The Conservative conception of "need"

and of a means test is roughly handled in Mr Hagenbuch's analysis, and still more complete is his exposure of the Socialist theory of social security as a method of realising "the principle that everything must be free and equal except the progressive taxation out of which it is all financed."

Scotland and Wales

SINCE the Coronation, Scotland, Northern Ireland and Wales have drawn the limelight of the press in turn as the Queen has visited them. This week Scotland and Wales have also been under discussion for their economic problems. Those problems have at least one thing in common; for both countries the Government is asked for more money.

When Scottish trade and industry was debated in the House of Commons, Labour members showed concern at what they regard as an incipient slump. They expected the government to do something about it by guiding industry or at least orders to Scotland. It is true that Scottish industry has lagged behind industry south of the border. Between 1948 and 1951 manufacturing output in Scotland increased by only 16 per cent compared with 21 per cent in the United Kingdom as a whole; mining and quarrying

The Dispute with Russia

The honour and reputation of England is pledged, that on her part at least there shall be no step backward. She owes this to Turkey, which has acted by her advice—to France, which relies upon her steadiness and fidelity—to herself, for she has much at stake upon the issue of the crisis. She is now fairly face to face with a powerful antagonist, in a quarrel not of her own seeking. She has sent her fleet to the Dardanelles on a special mission, and she cannot recall it till that mission is accomplished. If she now recedes before Russia, her prestige both in Europe and Asia will be shaken to its foundation. Whatever it may cost, she must now make good her ground. It is well known that the Emperor of Russia has been emboldened to his aggressive course of action by three deliberate calculations:—that England could not act cordially with France under her present Government in any cause whatever; that she would not be able effectively to man her navy; and that the Peace-at-any-price and the Economy-at-any-cost School were powerful enough to prevent her engaging in a war for any European purpose. How far the language of our Press and of the party alluded to in Parliament may have justified him in these calculations, we will not here discuss. But it is the more important that we should show him now, by our words, by our attitude, by our resolute behaviour, by our ready acceptance of all risks, that he has mistaken our position, misconceived our temper, underestimated our strength, and presumed far too much on our forbearance; and that no voice will be raised to oppose, and no subsidies refused to support, our Government in the management of a struggle at once righteous in its origin, important in its objects, indubitable in its issue, and necessary to the vindication of our honour and the security of our position.

The Economist

July 16, 1853

output was unchanged while that of the United Kingdom increased by 8 per cent. Things have been better lately, however. Final figures for 1952 are not yet published, but it is estimated that production in Scotland fell less sharply than in England; and although unemployment is higher in Scotland than in the country as a whole, it has fallen of late and is only 2.7 per cent of the insured workers. The Government is therefore right in discounting the talk of slump and in its refusing to extend development area policy. At the same time it has made two useful decisions. A peat-burning power station is to be built in Caithness and £1 million is to be spent on roads in the Highlands.

It is not for the industrial, but for the rural sector of the economy that help is asked in Wales. The new report of the Council for Wales and Monmouth includes a pilot survey of three counties; on the basis of this the council recommends that the Exchequer should contribute £60 millions over a period of 12 years to rehabilitate the Welsh countryside, where water supplies, sewerage, communications, electricity supply and so forth are well below the standard for rural areas in the country as a whole. A public corporation would be responsible, and the council hopes that the depopulation of the countryside would be checked, greater output be obtained from Welsh agriculture and greater stability be secured for it. It is true that in many parts of England, where rural amenities have been improved in recent years, migration to the towns has been checked. The same would not necessarily be true in Wales, where the improvement required is so much greater. But the poorest areas certainly have some claim on central generosity.

M Laniel and the Budget

AT the very moment when the Senate Appropriations Committee in Washington is being told that France is "constitutionally incapable" of balancing its budget and putting order in its fiscal house, there are indications that the French economy may turn in a new direction. By giving the Laniel government special powers to govern by decree between now and October 1st, the Assembly has created an essential tool of reform; by supporting M. Laniel's proposals to obtain additional revenue by increased taxation on petrol, by a consumption tax on alcohol and by a special surtax on spirits and wines, it has acknowledged that the job must be done. Anyone who has followed the tortuous course of French politics over the past years and who knows how fundamental this question of home-distilled spirits has been, will realise that the recent crisis has done more than any previous one to create in the Assembly a sense of urgency.

Unfortunately, however, M. Laniel inherits an extremely grave situation from preceding governments, none of which had been given the full power to deal with it, and many of which have been unwilling to use what powers they had. The budgetary deficit at present stands at some 733,000 million francs and M. Laniel's government, in order to enable the Treasury to meet its obligations, is asking the Bank of France for a new loan of 110,000 million francs. This has brought the total advances from the Bank to the state to some 440,000 million francs. The Laniel programme calls for a redemption, over the next months,

of the extraordinary advance of 240,000 million francs made since the beginning of 1953, and the additional taxation is designed to raise the relatively small amount of 60,000 million francs in a full year.

France's payments position is also critical. Although, owing to new restrictions, imports have been generally falling throughout the spring, and although exports rose in June to a record for the year of some 80,000 million francs, France had a deficit in June with EPU of \$56.8 million—a peak for 1953. The probable explanation is that this increased deficit is due to speculative influences resulting from a lack of faith in the franc by French exporters who are failing to repatriate their proceeds and continue to place hidden assets abroad. With simultaneous inflation and under-employment, it is difficult to see how M. Laniel and M. Faure, his finance minister, will reconcile the conflicting needs of drastic cuts in government expenditure and of an expanding investment programme. One of the solutions that is being increasingly urged is that a much larger measure of investment should go into a radical modernisation of French agriculture, whose inefficiency has left under-exploited one of the essential sources of France's national wealth.

Jerusalem

IS any importance to be attached to the Israel government's decision to move its foreign office from Tel Aviv to Jerusalem, or is it merely the last nail in the already sealed coffin of United Nations hopes? Less than four years ago, 38 nations voted for the creation of an international Jerusalem. They are now challenged to put an end to their pretence that they will do what they said they would do; for they will have to decide whether they, too, will for convenience's sake move their embassies and legations, or whether they will remain indefinitely at fifty miles distance from what has *de facto* become the capital. From Israel's standpoint, the move has practical advantages; the Knesset and all other important ministries had gone to Jerusalem long ago and to maintain a foreign office so far removed from them was inconvenient. From the standpoint of its foreign relations, it has ignored the wishes of foreign governments which were pressing it not to face them with an awkward decision, and it has furnished the Arabs with further proof that the United Nations is useless and that nothing short of force will make Israel do anything it does not wish to do.

By tacit consent of the Powers the idea of an international Jerusalem is therefore a dead letter. The city remains indefinitely divided by the great scar of ruined houses, weeds and rusty barbed wire that runs through its centre. On either side two sets of Jerusalemites, living without inter-communication, can see one another moving up and down the streets. Up to date, few cross the line, or want to, except UN officials and members of Christian missions. It is time that more third parties started bridging the gap. Foreign diplomatists, by moving more freely to and fro, could help to counter the untrue tales which each side believes of the other. Yet many of them, most of all the British, are absurdly shy of making a trip which they could turn into an everyday occurrence. Scholars, journalists and

others who move around could do the same. Those who take the plunge find people on either side keen to know hard facts about the other, and it is time to stop behaving as if they were for ever to be divided.

Britain for Holidays

IN 1952 Britain's travel account showed a net receipt for the first time in recorded history. The gross receipts from foreign tourists were as high as those of any country in Europe. As in 1951, more dollars were earned from American visitors to this country than from any single group of exports to the United States; the runners-up were whisky and motor cars. The British Travel and Holidays Association, whose annual report was published last week, notes some of the improvements that have helped to lead to this result. There are more hotel rooms, and building licences have been freely available to the hotel and catering industry. Tourist air services, London floodlighting, and the opening to the public of historic houses added to Britain's attractions. The report also says that "there has been a marked improvement in standards of service

throughout the hotel and catering trade."

As the chart shows, the profit on travel account was made chiefly because British visitors to foreign countries spent less per head than foreign visitors spent here; last year the travel allowance was only £25. But even at the present level of £40, a net earning of foreign exchange may still, in the association's opinion, be made. The chance is very good if the earnings of British transport bringing the visitors are included. The total number of visitors will be higher this year because of the Coronation. No doubt the visitors who arrived in May—nearly 100,000—included many who would have come to Britain in any case, but put forward their holiday to take in June 2nd. Even so, the total for the year is expected to rise to 800,000, compared with 720,000 in 1952.

The report points out that the growth of the tourist trade has by no means reached its limit. This depends, however, on more hotel building than will, at current building costs, take place. To right the balance of payments by making Britain the pleasure resort of the world remains a dream; but it is remarkable how much has been achieved in spite of such disadvantages as climate, licensing laws, the Catering Wages Act and ewe mutton.

The Houseworkers Survive

THIS year's annual report of the National Houseworkers' Institute is of particular interest as an example of the impact of government economies on a minor but useful social experiment. The institute started with a single centre, which had only nineteen applicants for training. In five years it expanded to nine centres, with a waiting list. Of these only two now survive. Economic stringency has also cut back the programme of training for institutional domestic work, notably for hospitals; it has halted the expansion of the daily houseworkers' service; and it has halved the institute's headquarters staff.

The institute is showing, however, an admirable capacity to adapt itself and to operate, ingeniously and indirectly, on a shoestring. The disappearance of most of the training centres has prompted appreciative local authorities to fill the gap in various ways. They may provide, in secondary modern schools or elsewhere, courses of training leading up to the institute's diploma; they may collaborate with voluntary bodies, or give direct financial help to the institute's own establishments. The hospital workers' training scheme has been replaced, for the time being, by advisory co-operation in the hospitals' own training arrangements. Together with the National Council of Social Service, the institute is expanding its experimental courses in home management for young housewives. And the less cut-and-dried but equally important psychological objective—to raise the status of housework—is being pursued through public relations, conferences, and joint committees representing employers and houseworkers. The grants that launched and maintained the institute are in fact justifying themselves even after their partial withdrawal; they have evidently set off a developing sequence. On the experimental fringes of the social services, this semi-accidental pattern of events might well serve as a model to be deliberately followed.

Furnishing Confusions

ANOTHER complication has now been added to the rent restriction complex by a recent judgment in the House of Lords. The point at issue in the case—*Preston and Area Rent Tribunal v. the Queen*—was as follows: Is there a time limit within which the tenant of a furnished letting must apply if he wishes a rent tribunal to give him the right to remain in possession? Or can the tribunal provide protection even if more than three months have elapsed since it dealt with the rent of the letting? The House of Lords agreed to the second proposition.

It has taken over eighteen months for a final decision to be reached on this case, and it is also notable for the considerable disagreement of judicial opinion on the meaning of the statutes concerned—the Acts of 1946 and 1949, which set up tribunals to deal with the rents of furnished lettings. The House of Lords decided the issue by a majority, and its judgment was contrary to the views both of a divisional court and of a majority of the Court of Appeal. Moreover, the latest decision reverses a practice which has been in operation for the last fifteen months or so, on the authority of the

earlier decisions, and creates as many anomalies for the future as existed during this earlier period. Until last month, there was a time limit within which a tenant of a furnished letting might apply for the right to remain in possession, despite the desire of his landlord to get rid of him, and there is a good deal to be said for some time limit in those circumstances. Now, as Lord Reid said in his judgment, a tenant whose application for a reduction in rent is refused may still have a chance of an extension of tenancy at any time if he pleads his case well enough. But, in Lord Porter's view, since anomalies result whichever way the Acts are interpreted, they rule each other out as factors in deciding what Parliament intended the Acts to mean.

Parliament and the Courts between them have in fact created a pretty cat's cradle out of Acts originally intended to give lay tribunals clear directions about what they could and could not do for the tenants of furnished apartments. There is nothing really surprising about that. Parliament and the Courts have, for a much longer period, done precisely the same thing with the Acts that control the letting of unfurnished apartments. But the decision of the House of Lords is another reminder, if any be needed, that the duty of recasting all the Rent Acts, from 1920 onwards, is one which this Parliament, like its predecessors, has so far avoided facing.

The Evans Inquiry

THE official inquiry into the Evans case has removed public misgivings that there might have been a miscarriage of justice when he was hanged in 1950 for the murder of his child. That is the important result of the thorough report made so promptly by Mr Scott Henderson. He finds that the case for the prosecution as presented to the jury was overwhelming; he is satisfied that Evans killed not only his child—the crime for which he was sentenced—but his wife as well; he shows, convincingly, that Christie's confession to her murder was untrue.

These findings ought not, however, to check the questioning of capital punishment that the Evans and Christie cases have stimulated. The whole truth was not known when Evans was convicted and hanged. It is true, in this particular case, that he would have been convicted if the jury had had all the relevant facts before them, and it may well be that the Home Secretary would still not have granted a reprieve. But it is also certain that if all the facts had been known the trial and all the proceedings in the case would have been very different. It remains deeply disturbing that a man can be condemned without it being known that the chief witness at his trial was himself a murderer and that the place where the bodies were found already hid two other bodies also. It is possible to imagine that in another case circumstances might later have come to light which, if they did not alter the verdict, might at least have influenced the decision on whether or not to exercise the prerogative of mercy. It is this possibility that strengthens the arguments against the death penalty. It is confidence in British justice—in the rightness of the verdicts of the courts—that can remain unshaken, not confidence in the administration of an irrevocable punishment.

For the sheer joy of driving

it must be a ZEPHYR

WINNER OF THE 1953 MONTE CARLO RALLY.

— — — — — or — — — — —

a CONSUL

The 6-cylinder Zephyr is powered by a brilliant o.n.v. 'over-square' engine. Yet it reaches high speeds so smoothly and has roadholding qualities so unusual that it is certainly one of the *safest* cars on the road. The Consul is a 4-cylinder version of the Zephyr, with the most remarkable performance of any saloon car in this price range. Your Ford Dealer will gladly give you details of each of these '5-Star' cars—and of the finance facilities for both. Which is your choice?

ZEPHYR-6 £532 Plus P.T. £222.15.10
CONSUL £470 Plus P.T. £196.19.2

Visitors to Britain requiring cars for export may order them for early delivery without payment of Purchase Tax from any Ford Main Dealer or from Export Department at our Showrooms, 88 Regent Street, London, W.1. (Regent 7272).

THE CASE OF THE TRAFFORD TILE

Asbestos-cement tiles like this were used to roof a whole group of factories (a Burroughs one included) near Glasgow. If the stock control system in a Manchester office had failed, some components might not have been at the right place at the right time...

The factory roof had to be assembled in the office!

SOME TIME AGO, Turners Asbestos Cement Co. Ltd., a member of the Turner & Newall Organization, found itself with a pressing stock-record problem. The company's six factories turn out all manner of asbestos cement products, large and small, and, at the central office in Manchester, the management was finding it increasingly difficult to handle a rising volume of stores transactions. In operations that needed most accurate co-ordination (as in the distribution of supplies of roofing in Scotland) day-to-day knowledge of the exact stock position and location became imperative. Were all the components on the spot? Were there hook-bolts enough to secure the tiles?

It was at this point that the collaboration of the machine-accounting specialists of Burroughs Adding Machine Limited was invited to assist in solving the problem.

After investigation Burroughs suggested the installation of their latest Multiplying-Accounting Machines at

the Trafford Park Works of Turners Asbestos Cement Co. Ltd. By use of these machines, Purchasing Orders, the Stores Ledger and its Journal Audit proof sheet could all be calculated, extended and posted automatically—stock balances for all the six factories appearing at a glance on one card.

Result: The Stores Accounts system now gives a continuing picture of the exact position in all the factories. The Chief Stock Controller can tell at a glance the value of total stock and the stock balance at any plant. This system, with its absolute proof of accuracy, makes ordering and controlling possible far in advance of requirements.

What about you? If your business could benefit from faster and more accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and

Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service guarantees its efficiency in operation.

Call Burroughs today. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service offices in principal cities round the world.

At work on the Stores Ledger for Turners Asbestos Cement Co. Ltd., is Miss Lilian M. Hopson. She is using one of the Burroughs Multiplying-Accounting Machines that helped to solve the Case of the Trafford Tile.

Letters to the Editor

Trading with Mao and Malenkov

SIR—My attention has recently been called to the following comment on page 797 of the June 20th issue of *The Economist*: "Even the United States bought \$28 million worth of goods from Communist China in 1952."

I should like to point out that this comment, as formulated, misrepresents to a considerable degree the status of US trade with China last year. The figure cited is the officially reported total of US imports in 1952 of goods of Chinese origin (i.e., of goods originally grown, mined, or manufactured in China, regardless of where they were purchased), and does not purport to measure the value of goods actually bought from Communist China in 1952. Although statistics on the latter basis are not available, it is known that the total would be materially smaller than that compiled in terms of origin, since a substantial proportion of the \$28 million worth of goods in question was purchased from countries other than China after having been held in inventory outside China for an extended period. For some of this merchandise, in fact, absence of any Chinese interest subsequent to December 17, 1950, was a necessary condition, under the US Treasury's Foreign Assets Control Regulations, for importation into the United States.—Yours faithfully,

CARL P. BLACKWELL

Department of Commerce,
Washington D.C.

Opportunity for Adenauer

SIR—Mr Kenneth Younger holds that the contentious question has always been whether the incorporation of Western Germany in a western military alliance should be pushed ahead, or whether it should be held up, "lest it should make Four Power agreement on German unity impossible." That was the official Labour argument last summer in opposing United Kingdom ratification of the Bonn Convention interlocking with EDC. In effect it was an argument for indefinite postponement, though Mr Attlee declared there must be ratification "sometime." But when? As the past year has shown, the difficulties in concluding the EDC Treaty have increased with each month of postponement. To whose interest? Certainly not that of the Western Powers in Nato; while relations between Germany and her continental neighbours are clearly less healthy today than a year ago.

A neutralised Germany with an

independent army was the Soviet formula in approaching the Western Powers last year. In essence, that demands the withdrawal of a German defence contribution to EDC or Nato. Mr Younger implies, however, that Four Power agreement on German unity is prejudiced not by such demands, but by the Western policy of a German defence contribution to which his government subscribed, and to which the present government adheres. If that policy is held up to the point of failure, both European and Atlantic unity, as well as German unity, will have been penetrated and the primary Soviet aim fulfilled.—Yours faithfully,

URSULA BRANSTON

London, W.1

The New Paradise?

SIR—One point, if I may, about the highly coloured review of my small book, "Daybreak In China," which you published last week. Your reviewer, with the omniscience of someone who has not been there, comforts his rooted prejudice by asserting that in provincial cities, while I was in China, "anti-social elements" were being executed on the spot in batches after trials 'conducted' by mobs of thousands of people"; and he adds, for good measure, that I "either chose to ignore, or did not notice" this.

Now, far from observing "careful silences and omissions," I discussed this side of things a good deal in my book. I made it clear that I saw no signs of terror, and I explained why I thought that none exists in China now. That your reviewer should have the impertinence to suggest that executions occurred which I either ignored—or "did not notice," save the mark!—merely suggests that he wanted to blacken my book at all costs. But perhaps your reviewer does not know what executions look like: there I have the advantage of him, for it was a sad part of my experience during the war to live for three years in countries under a real and daily terror. In German-occupied Europe there were some of us who became through grim experience quite expert in detecting signs of terror. I can assure you, sir—for it is apparently no use to assure your reviewer—that there is not the most remote similarity between a country living under terror and the China of today. China is not a new paradise—the insinuation that I said it was is your reviewer's, not mine—but it is a country, for reasons given in my book, where hope and happiness and a healthy belief in the future are strongly present. Little gibes may well please little minds: important to us all remains

the solid fact that China is changing fast, and is changing towards good, not evil.
—Yours faithfully, BASIL DAVIDSON
Braintree

[Our reviewer writes: Could we not keep to the facts? "Terror" is Mr Davidson's word; it was not used in the review. It was the Communist authorities who announced during his stay in China that summary executions were taking place after mob trials—for instance, at Anshan on September 21st and at Kunming on September 22nd. These executions were only one out of nine interesting and major developments which the same authorities revealed to be occurring in China while Mr Davidson was there, but which his book does not mention. Since he did not deliberately overlook them, the only alternative explanation is that his hosts kept them from him during his brief stay. In that case his indignation should surely be directed against them, not against the review.]

The Riddle of Prosperity

SIR—Your article of July 11th suggests that the Englishman is more anxious to have leisure than money, while the American prefers money to leisure. If this is so, and I have little doubt that it is, the reason must be sought in past generations.

It is the natural ambition of parents to hope that their children will have a better life than they have had, and in deciding what this better life is they look to those who, in the society in which they live, are regarded as the leaders.

In England in the nineteenth century these leaders were what were known as the "leisured classes." In spite of the fact that many of them worked hard in politics or in their own counties the rest of the country connected them mainly with Cowes, Ascot and grouse shooting, with balls, garden parties and German Spas. Without being consciously aware of it, parents brought up their children with the idea that leisure was the most prized possession, with the results on production that we are seeing today.

In the United States, on the other hand, the leaders of society were the Vanderbilts, the Rockefellers and the Carnegies. In spite of immense wealth and lavish spending, such people still devoted their main energies to making more money. The main outward difference between the boss and the worker was that the former arrived at the office or the mill in a carriage and pair, wearing a silk hat and smoking a cigar, while the latter arrived on foot, dressed in overalls and smoking a pipe. That is why the ambition of the American worker today is not for leisure, but rather for a Cadillac in place of a Chevrolet and whisky rather than beer.

It follows from this that the incentive to production by means of higher profits or wages will fail in this country. What is needed instead is to make leisure cost more, or to make people work harder in order to achieve it. Logically, therefore, we need higher taxes—a complete reversal of Mr Butler's policy.—Yours faithfully,
H. D. WALSTON
Newton, Cambridge

Books & Publications

Russia Modernised

RUSSIA AFTER STALIN.

By Isaac Deutscher.
Hamish Hamilton. 174 pages. 10s. 6d.

MR DEUTSCHER has had the fortune that favours the brave. He began to write this book a few days after Stalin's death in March; it now appears in the very week that minds are seething with speculation about Beria's downfall, and at a moment when the future of western policy depends in some measure on the estimates made of Malenkov's position and of the stability of the Communist empire. If Mr Deutscher's advice is taken the West will try hard and quickly to let the new regime in Moscow negotiate peace with honour; for otherwise there is a grave risk of a Stalinist come-back or even of a Bonapartist phase in Russian policy. "You have been warned," says Mr Deutscher, and there will be the keenest argument not about his credentials as a scholar but about the accuracy of his judgment.

In his favour there is this to be said: that he prophesied a break with the worst features of Stalinism when the leader died—and the break came; that he foresaw trouble with the political police when Beria, with a reputation for intelligent moderation, was put in charge of them—and the trouble has happened; that his analysis of the crisis in the Soviet Union is firmly based on his study of the transition from Leninism to Stalinism and on parallels from the earlier history of Russia. There is also no question that he has done American and English readers a great service by calling them sharply away from obsession with Communism to examination of the realities of a developing society. He brings to the study of contemporary history a calm temper, a searching imagination and a gift for the schematic ordering of events which is at once absorbing and disturbing to the English reader. Here is a liberal mind straining the facts through a Marxist mesh; it is a stimulating spectacle.

But there are difficulties. The results are too neat and symmetrical. If the democratic regeneration of Soviet Russia is frustrated it will be, on Mr Deutscher's showing, the West's fault. If Stalin built up Communist regimes in Eastern Europe (did the process really not begin until the summer of 1947?), it was the fault of the "tempest of the times." The man who is portrayed as following a subtle and consistent policy of "self-containment" for Russia is also credited with creating an empire over a vast area in fits of absence of mind—just

like the British. The politician who was immunised against the western elements of Marxism by his humble Georgian origins and his theological training was none the less a fanatical believer in western technology and planning. Here and there one has the impression that Mr Deutscher prefers paradox to simplicity, and it is curious that the biographer of Stalin and Trotsky should give so little importance to the personal rivalries that show themselves at the death of a dictator.

Yet his basic thesis is completely convincing. Stalinism destroyed, by the industrialisation of Russia and the education of its men and women, "the very prerequisite of self-perpetuation." To modernise Russia he—or someone else—had to be ruthless: barbarism must be driven out, as it was in Peter the Great's day, by barbarism. Lenin had tried to strike a balance between the autocracy that this task required and the democracy for which so many in the party yearned. Stalin cut off both party and nation from the West, and so the Asian characteristics of the peoples of the Soviet Union came to the fore. The Stalinist era became characterised by "the mutual interpenetration of modern technology and Marxist socialism with Russian barbarism." Bolshevism descended in its handling of the people "to the level of primitive magic." This, Mr Deutscher argues, could not go on indefinitely. Sooner or later the tremendous mobilised energies of the new society must burst the bonds of a system that had become obsolescent. The death of the leader "acted as a catalyst" in latent processes of change that had been operating for some time.

Malenkov therefore emerges as the modern type, the "rationaliser striving to put in order the Stalinist legacy and to disentangle its great assets from its heavy liabilities." He can only "sneak away from Stalinism"—a brilliant phrase—but he is not, like the master he served so long, a slave of the past. And if, as Mr Deutscher admits, it is hard to believe that Stalin's picked colleague, his "arch-devotee," is going to liquidate the master's era, it may be that the urge of the Russian people to start afresh is too strong to be resisted.

The only possible comment on such a judgment is "Well, we shall see"; and it is fair to warn the general reader that the author does not make it clear how limited are the materials and sources on which the student of contemporary Russia has to draw. If his main conclusions turn out to be correct, then it

will appear that the art of political intelligence—which is a combination of shrewd guesswork with scrupulous scholarship—can rise to greater heights of unwishful thinking than had been thought possible.

Communism and McCarthyism

WITNESS.

By Whittaker Chambers.
Andre Deutsch. 629 pages. 21s.
McCARTHY.

By J. Anderson and R. W. May.
Gollancz. 431 pages. 18s.

MR WHITTAKER CHAMBERS is the man who sent Mr Alger Hiss to jail convicted officially of perjury and unofficially, to many people at least, of treason. Senator McCarthy is the man who exploited, for personal and political ends, the shocked perplexity which then permeated the United States, because a respected, able and high-minded public servant had apparently put loyalty to a Communist Party controlled from the Soviet Union before loyalty to his own country. The perplexity was deep enough and sustained enough for Mr McCarthy to be able to exploit it chiefly, of course, because the Soviet Union is now generally understood to be a threat to the security of the United States. But there is also a second reason. It is that Mr Chambers achieved what he set out to do; he has made ordinary Americans realise the personal issue involved; he has made them see that Communism threatens them as individuals—that it is, or was, infiltrating at home.

Whether or not Mr Chambers exaggerates the danger, there can be no doubt, after reading his book, that he believes sincerely that it exists and that it was his mission to expose it. It is almost impossible to think now that his attack on Mr Hiss was a private vendetta; it was a crusade against Communism started and continued, with the greatest reluctance, because Mr Chambers felt that his new-found faith in God and his duty to mankind left him with no alternative. "Witness" is a very long and frequently embarrassing self-revelation, an autobiography which ought perhaps to be reviewed by a psychologist, but which nevertheless could hardly fail to fascinate even a reader who had never heard of the Hiss case. It is a detailed, sometimes too detailed, account of Mr Chambers's family background; of why he joined and why he left the Communist Party; of what he did there, both above ground on the staff of the *Daily Worker*, and underground organising a spy ring in Washington government offices; and of his life since he left the Party, as an editor of *Time* and as a witness before a congressional committee and a grand jury. He does not deal with the actual court proceedings against Mr Hiss, which have after all been fully described by other authors.

The skill with which Mr Chambers

writes he owes presumably to *Time*, where he found his post-Communist feet, rather than to the *Daily Worker*. His book has all the elements of the mystery story, clues, aliases, secret agents, escapes, conspiracies, murders, even love interest, combined with a highly personal disquisition of how one man reacted to the basic political problem of the day. His reaction makes the story a tragedy—he calls it "a tragedy of history"—even though it ends in the triumph of good over evil. For at the finish Mr Chambers has given up the struggle, has escaped exhausted to his farm, apparently for the rest of his life, leaving others to follow up the bolt which he shot so successfully.

Mr Chambers therefore gives no indication of his views on the man who did follow it up with remarkable energy; he seems unlikely to write that study of Mr McCarthy which might well be as fascinating as his own autobiography. It would be particularly interesting to know whether in this case Mr Chambers is prepared, as he was in that of the Un-American Activities Committee before which he brought about Mr Hiss's downfall, to excuse the unpleasant publicity involved in congressional hearings on the ground that only by this method could Communist sympathisers in the government be prevented from frustrating the legal processes which are the real remedy for disloyalty. But that excuse is no longer valid and, according to Mr Anderson and Mr May, the publicity with which Mr McCarthy surrounds the proceedings of his committees is explained only by his lust for personal power.

Their biography of Mr McCarthy can be presumed to be factually true; otherwise, experienced newspapermen would never have dared to make such allegations of financial and other irregularities, allegations which have since appeared also in the report of a Senate investigating committee. This biography, too, makes easy reading. It is full of facts but it is nevertheless superficial. Mr Anderson and Mr May do not provide any real explanation of what McCarthyism is or of where it is going. Luckily signs are now appearing that the American people are at last beginning to understand that it must not be allowed to go much further. What is certain is that, if it was indeed a crusade that Mr Chambers started, Senator McCarthy is the best answer to it that the Communists could have found.

Studying Man

THE TOOLS OF SOCIAL SCIENCE.

By John Madge.
Longmans. 308 pages. 25s.

THE study of matter has advanced far more rapidly than the study of man. The failure of the social sciences to achieve even a fraction of the success of the physical sciences has long caused disappointment. In this book Mr John Madge seeks to explain how far that

disappointment is inherent in the subject and how far the methods now developed should enable a more substantial advance to take place. He does not break new ground, but he provides a useful survey of the present state of sociological research. With reasonable scepticism, and drawing on a wide variety of sources, he describes the philosophical dilemmas inherent in the quest for scientifically certain conclusions about human behaviour. He goes on to expound the technical difficulties involved in using the various kinds of data available to students of social conduct—documents, interviews, systematic observation, and, most deceptive of all, experiment. He comes to the conclusion that the biggest obstruction to an advance in understanding social behaviour is reluctance to admit the inevitable personal involvement of the sociologist in the problems he is studying. Mr Madge pleads for a frank recognition of the impossibility of achieving in the social sciences anything equivalent to the objectivity demanded in the physical sciences.

In Britain, sociology has a low academic status. Its critics point to the failure of all the money and energy poured into it to produce any commensurate results and to the jargon-wrapped platitudes in which its devotees all too often conceal the barrenness of their conclusions. Is it possible to force the study of man's social activity, in all its infinite diversity, into a unified scholarly discipline?

Mr Madge will not altogether disarm such critics. Nevertheless, he meets many of their objections; and he is especially to be congratulated for his emphasis on practical research, for his relative freedom from jargon and from pretentious conclusions and, above all, for his repudiation of those who so eschew testing their ideas in practice that they turn sociological theory into a species of metaphysics.

Perhaps the most unsatisfactory feature of the book lies in the uncertainty of its aim. If Mr Madge is writing for the expert he is, at times, too elementary; if for the intelligent outsider, he is too cursory. He gives hasty descriptions of specific research techniques and isolated experiments, jumping abruptly from one to the next, often with summary and questionable verdicts on their value (his brief disquisition on public opinion polls is especially unsatisfactory). Moreover, as he moves from one example to the next, the reader cannot escape the feeling that many of the lessons about sociological field-work in factories and communities are no more than applied commonsense and hardly justify such laborious documentation.

Yet behind it all there remain some sound methodological conclusions and a valuable sketch of the kinds of research that have been undertaken. The outsider may still await an introduction to the methods of social science and the expert a more advanced compendium. But in the meantime Mr Madge must

be congratulated on a study that is far more workmanlike than so much that has been written about this subject—a subject which, despite all that its advocates have done to discredit it, has undoubtedly much to offer.

British Institutions

BRITISH GOVERNMENT.

By Hiram Miller Stout.
Oxford University Press, New York.
(London: Geoffrey Cumberlege). 433 pages.
42s.

BRITISH institutions have been fortunate in their American academic exposition. The tradition established by President Lowell in his "Government of England" and maintained by Professor Ogg in his "English Government and Politics" is a notable one. Thanks to it, generations of American university students have obtained their knowledge of British politics from sources which not only satisfied exacting standards of scholarship but also reflected an intimate understanding of the *ethos* of our institutions.

Professor Stout's "British Government" is in this tradition. Somewhat briefer than its two distinguished predecessors, it has to employ a greater economy in its exposition; there are fewer of the richly studded footnotes of Ogg, less of the personal touch that one encounters in Lowell. Yet by a taut style and a very orderly presentation Mr Stout has managed to cover almost as much ground as his elders and at the same time to do justice to the numerous developments which have occurred since they wrote.

The most important of these developments, in Mr Stout's opinion, are those which follow on the expansion of the welfare state in Britain, on the changes in the structure of the Commonwealth and on the strengthening grip of the party system. On all these aspects of his story he shows himself well abreast of recent research and generously disposed to give our institutional novelties the benefit of every doubt. The Republican sophomore who has been brought up to view postwar Britain as the graveyard of liberty will find little nourishment for his cherished disillusion in these pages. At a time when so much effort on each side of the Atlantic goes into the picking of holes in each other's institutions it is a pleasure to find a book that lays its emphasis on the positive achievements, rather than the incidental shortcomings, of our popular government.

Professor Stout's treatment begins with an outline sketch of "the country and its people," and proceeds to a discussion of "the constitution." This addresses itself to the expectations of readers who, brought up on the American document of that name, seek anxiously for comparable title-deeds for the government of the United Kingdom. The mysteries of the monarchy are sensibly expounded, though perhaps a

little more might have been said about its social role in the mid-twentieth century. Then follow familiar expositions of cabinet and parliament, good chapters on parties and elections, and clear descriptions in enthusiastic tones of the judiciary and local government. The final quarter of the book is devoted to the functioning of the executive branch and the relations, internal and external, of the Commonwealth and Empire. The whole is workmanlike and comprehensive; addressed to Americans it might none the less be read with profit by many an English student.

Managers in Person

MANAGEMENT UNDER NATIONALISATION.

By T. E. Chester and J. H. Smith.
Acton Society Trust. 79 pages. 7s. 6d.

THIS little book is always interesting, sometimes irritating, occasionally stimulating. Its main idea—to present the day-to-day problems that beset "operational management" through the device of single "composite representative" managers in certain nationalised industries—was a good one. The pictures here given of the working experiences of an area general manager in the coal industry, a power station superintendent, and a British Road Services district manager are an effective and enlightening means of presentation. They suggest that an area general manager in coal has far more power and responsibility than most people realise (more than half the industry's total investment in 1948 was on the authority of area managers); the power station superintendent less, largely owing to the pattern of grid operation; and that the road services' organisation, between 1949 and 1952, was still half-baked if not chaotic.

This method, obviously, has its dangers. The "action pictures" gain verisimilitude by the assembly of selected "individual detail"; but this detail, too, may make their representativeness questionable. To quote an opinion of this imaginary area general manager, but then to add that "many of his fellows" would disagree, may render the device ineffective. Similarly, to describe a BRS manager who used to own his own firm, and in a footnote imply that such managers may be the exception, vitiates the effect. Either these notional managers should be representative, or they should be more fully sketched as individuals.

The study abandons this effective method—and its critical attitude—in an intriguing but inadequate account of a form of organisation adopted by one of the Gas Boards. It goes on courageously to attempt a few comparisons between the chains of command in three large private enterprises, the GPO, the Metropolitan Water Board, and the newly nationalised fuel industries. These are most interesting, though on occasion seemingly muddled—the operating division board employed in ICI,

for example, is described first as an "interposed board between the operational unit and top management" and seven pages later as "the focus of operational management." The discussion of the pros and cons of decentralisation, in this context of operational management, is sensible and penetrating, though the Acton Society has no new specifics to prescribe. This is, in short, the kind of book that provokes marginalia and leaves anyone interested in the subject looking for somebody to argue with.

Victorian Iconoclast

SAMUEL BUTLER: *The Incarnate Bachelor*.

By Philip Henderson.
Cohen & West. 242 pages. 18s.

"I HAVE never been able to understand it," Butler notes of his detested father, "but the servants were genuinely fond of him." One may suspect that Canon Butler was fond of the servants, and not (as Butler goes on to aver) only of the cat. And in this the rebellious son was cut to the paternal pattern. He got on well with his own employees, was most at ease with cronies when he had turned them into dependants, and among cats best liked to patronise strays. Butler was a man of property. A slum landlord who disliked the author of "Widowers' Houses," he was to murmur as the Canon died peacefully in his arms, "How gently do they that have riches enter into the kingdom of Heaven"; and there is the complexity of all good ironic writing in his "Narcissus"—that mock pastoral in which the shepherds and shepherdesses come to London and speculate wildly on the Stock Exchange, only to be admonished:

How blest the prudent man, the maiden pure,
Whose income is both ample and secure,
Arising from Consolidated Three
Per Cent Annuities, paid quarterly.

Butler's pertinacious iconoclasm was achieved from behind the shelter of this conviction, and to the accompaniment of a personal bearing eminently respectable and correct. He wondered how "a man who considered himself to be a gentleman should have chosen to be bothered with writing" *Mrs Warren's Profession*; yet he himself was a gentleman who for twenty years visited the same prostitute (who came of respectable parents and owned a cat called Marquis) on Wednesday afternoons, sending along his pensioner and future biographer Jones on Tuesdays, and his servant Alfred to pay a retaining fee while he was on holiday. It is evident that there clung about Butler himself something of that Victorian world which his greatest work did so much to render monstrous to posterity. "The Way of All Flesh" owes its power to the ambivalence of its author before the whole Pontifex order.

Mr Henderson's able study throws fresh light on Canon Butler, who emerges as more bewildered than bale-

ful. Yet the shadow of this "human Sunday" was over Samuel Butler to the end, draining his intellectual energy into unprofitable heresies and devastating his affections. When at fifty-two Butler gleefully records meeting "a charming young man who hates his sister," or in the last year of his life skilfully anatomises the pettiness of his own sisters in the matter of cups of coffee and slivers of toast, the reader is made sharply aware of his limitations. He is the man who inserted a letter from his mother, written as she believed on her deathbed, with telling effect into a satirical novel. Yet this deeply unfortunate man remains among the most fascinating grandfathers of the present age. Mr Henderson's book will admirably introduce him to many great-grandchildren.

Picture of Prinny

PORTRAIT OF THE PRINCE REGENT.

By Dorothy Margaret Stuart.
Methuen. 240 pages. 18s.

MISS STUART has been concerned to present the personality of the Prince Regent and "to let the great events of the period provide the background of the portrait." She aims at rescuing the Regent from his Whig detractors and at correcting the picture of the libertine which Thackeray drew. She sees him as a "man of envious warmth and copious amiability," highly intelligent, sensitive and amusing. With the exception of George III, whose mental collapse has been attributed by an eminent historian partly to his "resolute fidelity to a hideous queen," the domestic life of the Hanoverians overflows with scandals and quarrels, exacerbated by the use which politicians made of them. The Regent's matrimonial troubles and his quarrels with his daughter are fully explored by Miss Stuart, who emphasises that he was not entirely to blame.

Miss Stuart enjoys the flamboyant opulence of the Regent's court and considers him the right man for the times, since he possessed panache, which was precisely what was then required. Yet his ministers were less appreciative of his panache than critical of his unmanliness and irritated by his tears and tantrums. And although posterity has benefited from his splendid building, his contemporary unpopularity was to a considerable extent due to it. Not only factious Whigs criticised the Regent. In the bleak years after the Napoleonic Wars the Regent's oriental magnificence, lavish generosity and spectacular building were generally resented. It was the Tory ministers, Liverpool and Castlereagh, who told the Regent that he must avoid even the appearance of spending more on his Baiae at Brighton. The Regent was a collector of pictures and the patron of John Nash, but this does not compensate for his failure to show a sense of public duty or responsibility.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

McCarthy's False Step

Washington, D.C.

SENATOR MCCARTHY, like all demagogues, prefers vulnerable victims. They need not be guilty of the charges he brings against them, of course, but it is desirable that they should have weaknesses not necessarily related to Communism or disloyalty, which will reduce their power to fight back, and will disconcert their friends and potential defenders.

It is this instinct for vulnerability that has led the Senator to spend so much time harassing the foreign information programme run by the International Information Administration, including the Voice of America and the overseas libraries. Their vulnerability lies, not in any demonstrated propensity to be infected with subversion, but in the fact that they are relatively new activities, with a short history behind them, and that a history full of uncertainty and confusion. As Senator Hickenlooper's subcommittee of the Senate Foreign Affairs Committee—an investigating body lacking Mr McCarthy's fine contempt for constructive achievement—has pointed out in its report, issued last month:

In the postwar years, appropriations for the overseas information programme have fluctuated sharply, drastic cuts caused in the main by dissatisfaction with its operations alternating with precipitate increases. Simultaneously, there have been rapid changes in the organisation of the programme and in its administrators. There have been some five major reorganisations and five administrators in the last five years.

Perhaps the most serious weakness of these programmes has been what this same report sums up as the "lack of a common understanding of the objectives of the information programme on the part of the Administration, Congress, and [the] American people." In the minds of many Americans, the information services were one part of a general mechanism of "psychological warfare" which was to do the job of defeating the Soviet peril, freeing the satellites, and restoring peace to the weary world, all without the loss of a single American life or the necessity for any of that subtle and exasperating activity called "diplomacy." It is not unfair to say that such ideas were encouraged by the Republican campaign last year, although the President's own comprehension of the limitations of a psychological blitzkrieg must have saved him from sharing so naïve a view.

As for the confusion about the objectives of the programmes in the minds of those responsible for them, there is evidence enough in the unbelievably chaotic series of

events concerning the alleged presence of 30,000 books "by Communist authors" in the State Department's overseas libraries. (The allegation was Senator McCarthy's.) Acting in precipitate haste, through fear of the Senator's wrath, the unfortunate department eventually issued some eleven different directives between mid-February and this month concerning what was to be done about such volumes, and so managed to strike an almost perfect balance of futility between the two possible policies of refusing to say anything about the matter to the press or making a full disclosure of it. The President, meanwhile, in his speech against "the book-burners" at Dartmouth College in mid-June and in several subsequent press conferences, compounded the confusion to the point where no one could be sure whether the issue was the general principle of censorship or the specific question of the criteria for selecting materials to be used in the overseas information service. Finally there came the resignation, for "reasons of health," of the unhappy Administrator of the International Information Administration, Dr Robert L. Johnson, who had tried to co-operate with Mr McCarthy, even to the point of accepting the dubious assistance of his young sleuth and globe-trotter, Mr David Schine, in choosing new personnel for his organisation. In the four months of Dr Johnson's leadership, as the *Washington Post* put it, "IIA progressed from demoralisation to complete disintegration."

★

Having announced his impending departure, Dr Johnson made one more effort, on July 8th, to end the book-burning controversy, by issuing yet another statement of policy. This appeared to represent a complete return to the original directive of February 3rd, the one which had first aroused Senator McCarthy's ire and thus brought the whole controversy about. The new statement reaffirmed the principle of judging the suitability of books on the basis of content rather than authorship, a principle which had been hastily scuttled in the directive of February 19th banning books by "Communists, fellow travellers, etcetera." Furthermore, the new directive returned to the primary point at issue by maintaining:

It is conceivable that the special purpose character of our libraries may require, in special cases, the inclusion of books by Communists or Communist sympathisers, if such authors may have written something which affirmatively serves the ends of democracy.

This was greeted by the Senator with cries of "ridiculous"

and he prepared to summon Dr Johnson to explain his action (which had been approved by the Secretary of State).

The apparent return to sanity of the IIA on the book-burning issue is only one of the recent indications that the Administration is beginning to rearrange its views, not only on the McCarthy phenomenon, but perhaps on the whole subject of the struggle for men's minds all over the world. Mr Eisenhower seized the opportunity to deliver a heavy blow to Senator McCarthy by vigorously supporting the widespread indignation against the engaging, as an official of his committee, of Mr J. B. Matthews, author of an article in which it was asserted that "the largest single group supporting the Communist apparatus in the United States today is composed of Protestant clergymen." The Senator was forced to retreat, and to accept Mr Matthews's resignation. In the subsequent fracas over the right of Mr McCarthy as chairman of the subcommittee to hire and dismiss its staff without reference to the other members, the three Democrats on the subcommittee dramatically resigned. The degree to which the conservative and strongly Protestant Southern Democrats had been alienated by the Matthews affair was reflected in Senator Byrd's demand that Mr Matthews "give names and facts to sustain his charge or stand convicted as a cheap demagogue."

An abortive attempt by Senator McCarthy to divert attention by bringing up a new sensational "case," this time against Mr William Bundy, a high official of the Central Intelligence Agency and the son-in-law of Mr Acheson, failed to remove the impression that the Senator was at last beginning to prove a bit vulnerable himself.

No More TVA's?

FROM A SPECIAL CORRESPONDENT

ONE of the most dramatic of the activities of the federal government since the nineteen thirties has been the construction of gigantic hydro-electric installations with picturesque names—Mud Mountain, Hungry Horse, or the greatest of all, Grand Coulee. Most are what are known as multi-purpose projects; electric power is often a less prominent objective than development of all the resources of a region through irrigation, or flood control.

The most famous and most complete expression of this idea is the tremendous enterprise run by the Tennessee Valley Authority, which is the sole supplier of electric power in an area including all or part of seven south-eastern states. Before the TVA was created, only 3 per cent of the farms in the area were supplied with electricity; now, 85 per cent have it. The average use of electricity in homes has increased, since 1933, from 600 to 3,900 kilowatt-hours annually; the national average is only 2,070. New industries have blossomed and farmers have benefited both from material advantages and from the educational activities and the experimental research carried on by the TVA.

For twenty years Democratic Administrations in Washington have pressed forward the development of these federal projects. Most Republican members of Congress, however, have been critical; it would cause no stir were they to cite the TVA as an example of what they meant by "creeping Socialism." But when the President of the United States does so, as Mr Eisenhower did at a recent press conference, the excitement is considerable. Angry leaders

appeared in newspapers in the TVA region which had supported the General in the election campaign. Letters of protest appeared in the *New York Times*. Senator Morse professed to see in the President's remark the preface to an attempt to sell the TVA installations to private power interests and local authorities, as ex-President Hoover has suggested.

The excitement may be premature. Responsible men such as the Secretary of the Interior, Mr McKay, and his Assistant Secretary for Water and Power, Mr Aandahl, have been wary of aligning themselves with the private electricity companies although they make no secret of their theoretical agreement with Mr Hoover's proposal. Mr Aandahl, with what sounded like a public sigh of regret, has rejected the idea:

There is a sizeable element who feel that when the government produces low-cost hydro-electric power, that power should be made available to the people, and I think we are all agreed in that premise. And no matter what the facts might be about efficiency in distribution, and about American standards of private enterprise, if this Administration, or any other Administration, should turn that federally produced power over to big business, there would be an adverse reaction among the people. In order that our people may retain confidence in government, we should not do it.

It is clear that such political sensitivity will keep the new Administration from some of the more obvious reversals of policy in favour of free enterprise. The fact that the cost of many multi-purpose projects is beyond the resources available to private companies or to the states has been freely admitted on all sides, and projects on this scale will continue to be undertaken by the federal government. Funds requested for the Bureau of Reclamation for 1954 were cut by almost 25 per cent below the figures in Mr Truman's budget, and most of the reduction was in money allocated to construction. But this is in keeping with the general policy of reducing expenditures, and even under the Truman Administration there was an order, issued at the outbreak of the Korean war, against initiating new projects, although it was only loosely enforced.

★

However, some kinds of federal construction are in greater disfavour with the new Administration than others. The building of steam plants to supplement hydro-electric power is being discouraged, and so is the construction of transmission lines to carry federally produced power to local customers. The crux of the dispute over transmission lines is the operation of the preference clause. This has been a feature of federal power legislation since it was introduced under Theodore Roosevelt, a Republican; it requires that in the sale of electricity generated at federal installations priority be given to the demands of the local public power authorities—municipalities and the like—and the co-operatives, as against privately owned companies.

Mr McKay has shown considerable sympathy for the claim that the federal government has used this clause as an excuse for empire-building in electricity, extending transmission lines so as to reach preference customers although this meant entering areas served by private companies as a competitor. If this has been the policy, it has not been markedly successful. The percentage of consumers of electricity who are served by beneficiaries of the prefer-

ence clause has risen since 1922, from 12.6 per cent to 18.4 per cent, because of the growth of rural electrical co-operatives. But private companies still serve the remaining 81.6 per cent.

There is no doubt that some proponents of public power in the federal government have been openly hostile to the needs of the privately-owned utilities. But the advocates of government transmission lines argue that the private companies would be able to squeeze the small, local public agencies out of the market for federal power if the government, after having produced the power, left transmission in the hands of private enterprise.

As for the construction of steam plants, such as the \$30 million one in the TVA area recently eliminated from the list of projects to be undertaken, it is argued that whoever is supplying the basic power in a given development ought to be allowed to supplement this power by adding steam generating plants to the system; otherwise there will be the anomaly of the federal government's hydro-electric facilities being dependent upon some private source for the supplemental steam-generated kilowatts necessary to "firm up" the power supply, that is, to fill in the gaps that are left from time to time by the erratic behaviour of rivers.

★

There are two major pieces of evidence about the electric power policy of the new Administration. One is a proposed new contract for the distribution of electricity by the Bonneville Power Administration, the federal agency in the Pacific Northwest. This would restrict the freedom of preference agencies to serve new large-scale customers, or to expand their operations generally. Advocates of public power assert that this amounts to undermining the preference clause, and certainly it makes more suspicious than ever Mr McKay's attempt to evade questions about the clause when he was testifying to congressional committees before his confirmation.

Secondly, there is the withdrawal by the Interior Department of its petition to the Federal Power Commission, filed in Mr Truman's time, against granting a licence to a private company to build three small dams in place of the one high dam which the Department has long planned for Hell's Canyon, on the Snake River where it forms the border between Oregon and Idaho. A controversy is raging over the technical questions involved, but it is clear that the government scheme for Hell's Canyon would produce somewhat more power—one engineering report estimates over 70 per cent more—as well as very much greater subsidiary benefits, such as flood control.

Mr McKay argues that this project has never been authorised by Congress and that there is no chance of getting appropriations for it in the near future; and that to oppose the Idaho Power Company's scheme is these circumstances would be "playing the reprehensible part of a dog in the manger." But the decision to leave the government project undefended before the Federal Power Commission must seem to represent a retreat, on the part of the Interior Department, from the militant defence of the public interest. If the three little dams are built, the extra kilowatts that Hell's Canyon might have provided will have disappeared for ever. The question is whether Mr Aandahl's fear of an "adverse reaction among the people"—Hell's Canyon might, for example, re-elect the exasperating crusader, Senator Morse—can yet turn the Administration from its chosen path.

American Notes

Eisenhower's First Victories

IT is significant that once the President decided to make the extension of the excess profits tax a test of his own authority and prestige the opposition of all but the most obdurate right wing Republicans melted away. Though all the Republican members of the Ways and Means Committee originally opposed the continuance of the tax, three-quarters of them voted, in the end, to sustain the President and override their chairman, Mr Reed. The vote in the House, at 325 to 77, was better than the Administration forces had dared to hope, though it owed something, no doubt, to the legislators' awareness that it would be unpopular to lighten the load on corporations six months before individual taxpayers were to be relieved from the Korean levies. The Senate probably will follow suit this week. The six months extension to the end of the year is expected to bring in \$800 million.

The committee so far, however, has turned a deaf ear to the Administration's argument that tax relief for individuals in December can be reconciled with a balanced budget in 1954-55 only if the reductions in excise and corporation

ON YOUR TRIP TO
NEW YORK
YOU CAN FLY TO

Bermuda

AT NO EXTRA COST!

Something extra special lies ahead of you on your flight to New York. Your first-class fare, via any international airline, can include a trip to Bermuda—and at no extra cost.

When business is over, refresh yourself with a delightful week-end in Bermuda. Stay longer, if you wish, for Bermuda is in the sterling area. Bermuda's less than three hours from New York, and there are frequent daily flights.

And there's nothing like Bermuda for sunning on pink sandy beaches . . . for leisurely living far from bustling routine . . . for rest and utter contentment.

taxes scheduled for next spring are postponed. Unless Congress acts, there is a drop of \$8 billion in revenue ahead. Instead, the committee showed a tendency to take away with one hand at least part of what it had given with the other. It has passed, and the House is expected to approve, a Bill abolishing the 20 per cent federal tax on cinema admissions. The exhibitors, whose campaign is very well organised, argue that only if this money goes into their own pockets can they keep their doors open despite the inroads of television. The Bill might cost the Treasury as much as \$200 million in a full year, though the Senate is said to favour giving the industry only half a loaf.

Other victories have followed the President's reluctant recognition that he must fight for what he wants. After Mr Eisenhower had taken on himself the responsibility for the cuts in the defence budget, the House Republicans overrode Democratic opposition and accepted them. The Senate and House have compromised their differences over the authorisation for foreign aid at \$5.157 billion, only slightly below the \$5.4 billion the President requested. It is true that the Administration failed to budge the House from its determination to earmark \$1 billion of Europe's military aid for the European Defence Community, but the House relented to the extent of allowing long-term contracts for military equipment to be placed. The real threat to the mutual security programme lies, of course, in the appropriation Bill which will have to follow this authorisation; cuts of as much as \$1 billion are being discussed, but here, too, the President is bringing pressure to bear on the

committees concerned. And it is noticeable that Mr Dulles, who is usually so conciliatory to Congress, has been fired by the President's example. His replies to members of the Senate Appropriations Committee who complained of "giveaways" were extremely sharp.

Reprieve for the Boom

PROFESSOR ARTHUR BURNS, the President's economic adviser, is too cautious to be drawn by Congressmen into any prophecies. But among businessmen the feeling is that the boom, which it was once felt would be on its last legs by midsummer, is likely to go on for another six months. Industrial production ceased its rise in March, but the total output of goods and services, the gross national product, was running in the second quarter at an annual rate higher than ever before, \$368 billion, compared with \$361 billion in the first quarter, and \$342 billion a year ago. Prices have changed relatively little in this period. Gross private domestic investment was higher in the first six months than it was in the same months a year ago, although larger inventories accounted for most of the increase between the first and second quarters.

Consumers have not only been enjoying record incomes, but also, according to the Federal Reserve Board's spring survey of consumer finances, feel that 1953 is a better year

Two-Way Banking Service for Two-Way Trade

It's a two-way banking service provided by Chase in London—service to British business interests dealing with the United States and service to American exporters in British markets as well as American importers buying British products.

to buy durable goods than 1952 was. The reason given is that prices are levelling off or coming down. In fact, the price level has changed little; people are simply becoming used to it. This attitude is reflected in retail sales, which have been running at an annual rate of \$170 billion compared with sales of \$164 billion in 1952. Department store sales in June and May were higher than they have been since the post-Korean buying spree.

Anxiety about the effects of a truce in Korea has been moderated, rightly or wrongly, by the conviction that the drop in defence spending will be very small compared with the reduction which a much smaller economy had to absorb in 1946. Some alarm is expressed, however, about the total of consumer debt, which is now larger, in relation to incomes after taxes, than it has ever been, and about the

record \$78 billion accumulated in inventories. These have been swollen in the last two or three months by a piling up of television sets, washing machines, and other durable goods. The President, though he declares no significance should be attached to the date, has asked his economic advisers to have ready by the autumn plans to deal with the onset of a recession.

Psychological Misconceptions

LAST week another step was taken towards clearing up some of the confusion about the meaning of psychological warfare and some of the inefficiencies in its execution which have given Senator McCarthy so many opportunities. The report of the President's Committee on International Information Activities was completed and part of its recommendations were made public; the rest were too secret. This group, headed by Mr William H. Jackson, former deputy director of the Central Intelligence Agency, contained representatives of that element in the Administration which is most closely identified with the "psychological warfare" approach to foreign policy. It is, therefore, particularly striking to find in its report such remarks as these:

... the existing Psychological Strategy Board... is founded upon the misconception that "psychological strategy" somehow exists apart from official policies and actions and can be dealt with independently by experts in this field...

Except for propaganda, there are no "psychological warfare" instruments distinct from traditional instruments of policy...

"Cold war" and "psychological warfare" are unfortunate terms. They do not describe the efforts of our nation and our allies to build a world of peace and freedom.

The committee by no means abandons psychological weapons, however, but stresses instead that "there is a 'psychological' aspect or implication to every diplomatic, economic or military policy and action," and asks for both a more widespread and a more intelligent recognition of this fact. In this connection, the committee emphasises the "danger in formulating foreign policies beyond the capabilities of the United States to carry out. This has been a prevalent error in the past." The applicability of this comment to the Administration's own "liberation" policy has not escaped attention in Washington, at a time when the Soviet world is in ferment and the United States has performed remained a more or less passive spectator.

What the fate of the Jackson Committee's recommendations will be is uncertain; some changes in organisation will probably be made, in pursuit of better co-ordination of the government's multifarious propaganda activities abroad. The recommendations on general policy may, however, prove to have ranged so widely as to have lost effectiveness. The overseas information programmes are already in the process of being consolidated and divorced from the State Department, but they are in danger of having their funds cut devastatingly by Congress. And the morale and efficiency of the staff have been shattered beyond immediate repair by attacks from the irresponsible, and well-founded criticism from the rest. There is now ground for hope, however, that the Administration and some of its friends in Congress are beginning to pay more attention to this sad state of affairs, and to its causes.

Beef Stew

BY signing the Bill which authorises special loans to livestock owners and other farmers in drought-ridden areas, President Eisenhower has kept his promise, made last week at the emergency conference of Governors of south-western states, that the federal government would do what it could to help. Now it remains for Congress to keep its promise by providing the Department of Agriculture with funds to cover the loans; it is estimated that at least \$100 million may be needed, to help farmers who have neither water nor feed for their animals. Meanwhile immediate aid has come from the President's relief fund; feeding stuffs are being supplied cheaply from Commodity Credit Corporation stocks and transported at half price by the railways. The Department of Agriculture has also offered to buy up to 10 million pounds of beef a week for its low-cost food programmes.

This help and the expectation of more to come has checked, for the moment at least, the fall in cattle prices which has frightened even farmers who are unaffected by the drought into rushing their steers to market. The Secretary of Agriculture is concerned not only at the loss to farmers, which has already given rise to demands for gov-

ernment price supports for beef, but also at the danger that herds may be so depleted that next year there will once more be a beef shortage. At the moment consumption of beef is running higher than ever before and over the whole year may break the record—73 pounds a head—which has stood since 1909. Cattle prices have fallen by one-third or more in the last year and it has been suggested that if the government were to undertake to support the price of beef it would own every steer in the country within twenty-four hours.

Provided, however, that it does not go too deep this reduction in the cattle population will bring more stability to the beef market than had been expected, for herds have been expanding excessively under the stimulus of the high meat prices of recent years. As a result, the ranges in the south-west, in Texas, New Mexico, Arizona, Colorado and Oklahoma, have been over-grazed and were in no state to stand the four years' drought which has dried up the Rio Grande and brought water rationing to many towns. So far there are dustbowl conditions, with the top soil blowing away and roads blocked by dust drifts, in only a few

districts, but if the rains do not come before the October gales these conditions may spread rapidly. It will take a year's normal rainfall to put things right.

But even if the situation is saved by steady rain, and even if over-grazing can be avoided in future, Texas for one will have to think whether its development is not outstripping its water supplies. For the demands of the state's new industrial plants and of its growing population have in some places lowered the underground water table to a degree that is ominous in an area where droughts seem to be a regular cyclical occurrence, coming roughly every twenty years.

Oil in Hot Water

THE spokesmen for four major oil companies have failed to convince the House Interstate Commerce Committee that they were justified in raising the buying price for crude oil by about 25 cents a barrel in June and in charging more for refined products. The committee remains disagreeably impressed with the speed with which other companies followed the lead of the Phillips Petroleum Company, and the chairman has threatened to ask the Department of Justice to determine whether there was any collusion. One of its members even has up his sleeve a Bill for federal regulation, though the possibilities of its passage are too remote to have much effect.

In some respects the market has borne out the committee's contention that prices should not rise when stocks of refined products are at peak levels and refining, according to the head of the Texas regulatory authority, is running 400,000 barrels a day ahead of demand. Half the price increases in heating and diesel oils and kerosene have had to be withdrawn; stocks of fuel oil are particularly large after the mild winter. The rise of 2 cents a gallon in petrol prices, however, is better timed; it will not be rigorously tested until vacation motoring is over.

Petrol prices have not been raised since 1950, and those for crude oil not since 1947, while costs have gone up by 50 per cent, in the estimate of one company. Earnings this year are expected to be 5 to 10 per cent below those of last year. The committee showed a good deal of scepticism about the argument that higher prices are necessary if the industry is to press its costly search for new wells; drilling has been proceeding at a record pace in recent years, and the 27½ per cent tax allowance for oil depletion is only justified as a means of encouraging new exploration.

There is more merit in the contention that the industry must recoup from the oil it sells the cost of keeping in being a reserve capacity of a million barrels a day for defence. This falls heavily on the small independent producers, who feel they must either have higher prices for crude or a larger share of the domestic market through restriction of imports, if they are to continue to finance new developments out of earnings. One of the announced aims of the committee is to discover whether the higher price for crude oil is designed to placate the domestic producers who otherwise would demand a reduction in imports from American-owned fields abroad.

The World Overseas

Outpost on the Adriatic

BY A CORRESPONDENT

LAST week, the foreign ministers of Greece, Turkey and Yugoslavia virtually declared that if Albania succeeded in detaching itself from the Soviet bloc they would respect its independence. The Soviet satellite to which the Balkan Treaty partners made this gesture is the one in which the iron curtain is most effective. There have been no British or American missions since 1946, and the French and Italian Legations, which still exist in Tirana, are so closely watched and circumscribed that they can have little contact with Albanian life. The information available in the West is based partly on the statements of the official Albanian news agency and the stereotyped articles in the Cominformist press, and partly on the report of refugees.

Albania's geographical position makes it a minor nuisance to the free world, and a minor asset to the Soviet bloc. Albania faces the "heel" of Italy at the Adriatic's narrowest point. It is possible that the naval installations made by the Italians on the island of Saseno during their 25 years' rule have been improved by Soviet naval experts, although it is premature to talk, as some West European newspapers have done, of a "Soviet submarine base." Such facilities as exist could be of use to the Soviet Union only if it had already forced the Black Sea Straits and overwhelmed the main forces of Turkey and Greece. But Albania can be a nuisance to both Yugoslavia and Greece. The existence of Italian armies in Albania in 1941 prevented contact between the Greek and Yugoslav armies at that time. Today the situation is more favourable to the West, as Italy is on the Western side. Yet the Albanian army could tie down Greek and Yugoslav forces, and so appreciably reduce the resources of both countries in the face of attack from the Danubian satellites.

The Albanian regime is basically very weak. At the time of its liberation from the Germans, it was at least a generation behind even the Balkan states. This predominantly Moslem country, with a society part tribal, part feudal, might indeed be compared with Russian Central Asia in 1917. The Albanian Communists hoped to modernise their country as the Russian Bolsheviks modernised Uzbekistan, and by similar means. New industries were to rise, and railways were to be built, giving Russia access, from the

Black Sea coast across Macedonia and Albania, to the Adriatic. The achievement of this old design of Russian imperialism was prevented by the defection of Yugoslavia. The expulsion of the Yugoslav engineers and advisers who had helped Albania's reconstruction after 1944 was also a loss. Their place was taken by Soviet experts, more costly and more exacting; and geographical isolation from the Soviet bloc has created enormous supply problems. Polish and Soviet ships bring a few essential goods, enough to keep the Albanian economy from collapse, but not enough to realise vast plans of industrialisation. The Albanian leaders still talk of these plans. At the second congress of the Communist Party, held in April, 1952, Mehmet Shehu spoke of an oil refinery which is to produce 150,000 tons

annually from Albania's oilfields, and of large textile factories and a sugar refinery—all in the future.

But the Hoxha regime has to be taken seriously. In the economic field it has some achievements to its credit. Agricultural output is more than twice prewar. Progress has been made with electric power schemes. Education is crude, and is perverted by Communist indoctrination: even so, thousands of children of illiterate peasants have been taught to read and write. A few of them have chances of careers that were never open to their parents' generation. The information of both refugees and foreign missions suggests that material conditions are very harsh, and that the regime is hated. It

also shows, however, that the regime is obeyed throughout the country. And this is no mean achievement. Under King Zog and under the Italian administration, government was a compromise between the central authorities and the chieftains or landowning beys. The Communist regime is the first in Albania's history that has established the complete supremacy of the central government over every village. The system is the same as in the Danubian satellites: the Communist Party controls everything through its own hierarchy and its command both of the armed forces and police and of the "mass organisations."

The striking thing is that in a country so intractable as Albania, this system should really work. The stories of guerrilla warfare against the regime are little more than wishful thinking. There are probably a few bands of a

few dozen outlaws in remote mountains: their effect on the regime is negligible. And the system is the work of Albanians. The Soviet advisers in central ministries and in military and police headquarters no doubt play an important part; but in the last months it seems that they have been partly replaced by Bulgarians. Russia, however, remains the main source of economic assistance. A Soviet-Albanian trade agreement, signed in Moscow on April 8th, undertook to exchange wheat, equipment for the oil industry, agricultural machinery and fertilisers for Albanian crude oil, copper, crude leather, wool and tobacco. But the country is ruled, not by Russian or Bulgarian personnel, but by Albanians. The maintenance of the regime depends largely on the unity of the Albanian Communist Party itself. Here there are some signs of weakness in reports of rivalry between the Premier, Enver Hoxha, and the Minister of Interior, Mehmet Shehu. But it would be unwise to attach too much importance to this.

The strength of the regime is perhaps still more due to the international situation. This makes Albania poor and vulnerable, but also makes a change very difficult. It remains to be seen whether the Balkan powers' declaration will soothe the Albanian fears of Yugoslav, Greek and Italian designs which Enver Hoxha has been able to exploit to his own advantage. Yugoslavia has 700,000 Albanian subjects; about two-thirds as many as live in the Albanian state. Many Albanians who are far from communist none the less dislike Yugoslavia, hope to see the Kosovo-Metohija province united with Albania, and fear that Yugoslavia intends to subject the whole of Albania. They also fear Greek designs on what they call southern Albania, and the Greeks call northern Epirus.

Albania's Neighbours

Marshal Papagos has stated that Greece maintains its claim to northern Epirus, but will not use aggressive means to enforce it. He hopes that, when a European settlement comes, Greece will receive this territory, but he also insists that Greece wishes to have an independent Albania on its border. Yugoslavia has no territorial aims in Albania, and has expressed no view on Greek claims. In the spring of 1951 a League of Albanian Political Emigrants was formed in Yugoslavia. Its headquarters are in Pristina, and it is led by a former schoolteacher from Korca, in southern Albania, named Apostol Tenefti. The Italian government, and those Albanian exiles in Italy who enjoy its sympathy, attribute sinister intentions to Tenefti and to the Yugoslav government. They believe that though Yugoslavia has no territorial claims on Albania, its aim is to bring the whole country, while nominally independent, under Yugoslav control. The Italian view of Yugoslav policy towards Albania is, of course, coloured by the Italian attitude to Yugoslavia over the Trieste question. About their own aims the Italians preserve silence. They are, in any case, in no position to assert themselves on the eastern shore of the Adriatic. But they have a long-term interest in Albania, and in the course of time their policy will almost certainly be more active and more ambitious. Meanwhile, Italian spokesmen prefer things as they are. Italian diplomatic circles make no secret of their view that the Hoxha regime is better than anything that is likely to take its place. Thus the Soviet outpost on the Adriatic, which forms a substantial though not a disastrous threat to the Balkan members of Nato and to their Yugoslav associate, is preserved by the hostility between Yugoslavia and Italy.

The Fall of Beria

THE future historian may be able to retrace step by step the first drama of the post-Stalinist era, the decline and fall of Lavrenti Pavlovich Beria, deputy premier of the Soviet Union. For the moment, since so much of it has been played behind the closed doors of the Kremlin, there is still vast scope for guesswork and speculation. Yet it already seems reasonable to put forward this seemingly paradoxical conclusion: that the blow apparently aimed at the policeman-in-chief was really directed at the whole policy of reform and concessions that has been followed since Stalin's death. During the first hundred days or so after that event, Soviet policy presented a coherent picture. The new regime was beginning to eliminate the worse features of Stalinism at home and was taking at the same time a more conciliatory line towards the West. The stage seemed to be dominated by reformers and conciliators; the partisans of toughness seemed lost and bewildered. After the Berlin rising the latter raised their heads again. Now they are enjoying their first open victory.

The questions that now present themselves are: How complete is this victory? How much of what has been done can no longer be undone? To what extent will it be possible to check aspirations towards freedom, peace and plenty that have been aroused during the first hopeful days? To answer these questions with any confidence is impossible and the future cannot be foretold. But here, at least, is the evidence to support the view that the Stalinists have made a come-back.

Return to Stalinism

First, it is evident that the form taken by the campaign against Beria marks a return to Stalinism at its worst. When a man who had served the Soviet regime for the whole of his adult life is described as a "bourgeois renegade," a "hireling of foreign imperialism," and an "enemy of the people"; and when mass vituperation against him is staged throughout Russia, the world is hearing the echoes of the notorious thirties. This is not the tone of liberal reform.

Secondly, it is significant that throughout the indictment of Beria reference is made to intensified infiltration by foreign agents, and to the need for vigilance. This was the main refrain of the campaign that was going on before Stalin's death, and reached its climax with the "doctors' plot." It suddenly ceased on the morrow of Stalin's death, when Beria took direct control of home affairs and internal security. The line of policy was reversed. During Beria's hundred days the grip of the police—and this is the crucial point—was not tightened but relaxed. An amnesty was proclaimed and the constitutional rights of the citizen were emphasised. The "criminal" Jewish doctors were freed. Their accusers from the security services were arrested for having extracted information by "unconstitutional means." The self-confidence of the totalitarian policemen was being sapped.

The sequel to this development was played out first in Beria's native Georgia and then in all the other republics. The "tough" directors of the purge, recently appointed men who had been thriving on the vigilance campaign, were dismissed. Their victims were rehabilitated and charges of "nationalism" against them were exploded. In the process

the whole Moscow policy of russification was discredited and some of its exponents eliminated. This is now described by his accusers as Beria's attempt to excite "bourgeois nationalist" elements as a prelude to a restoration of capitalism.

The charge of "capitulation" to foreign imperialism is indirectly a condemnation not only of the internal policy followed in recent months, but also of the new approach towards the West and of reforms within the Soviet sphere as well. There is evidence that the Berlin and East German revolts played an important part in discrediting the policy of conciliation. It was only after Berlin (June 17th) that the first signs could be seen of a come-back of the Stalinist die-hards. The cult of the dead leader was partly revived and the very reporting of the Berlin events, with its emphasis on the part played by "foreign agents" smacked of Stalinism. This was to be expected: the partisans of "toughness" could argue for the first time that a switch from the iron hand of a General Chuikov to the velvet glove of a Mr Semeonov would lead to the disruption of the Soviet third of the world, without any compensating gains.

Will Malenkov Retreat?

The Beria affair does not necessarily mean that a reversal in foreign policy is to be expected soon nor even a sharp change in the treatment of Eastern Europe. There has always been a time-lag between the moves at the centre and consequences at the periphery. Besides, the Berlin troubles and their repercussions were not the only causes of the setback of the conciliators. The accusation now made against Beria reveals that economic difficulties in Russia itself have also played their part. The new regime had promised a more plentiful supply of consumer goods, hoping to obtain it partly through cuts in the production of other things and partly through higher productivity. Apparently, however, liberalisation at home resulted in smaller supplies of foodstuffs and a relaxation of factory discipline. Since the hopes of the consumers cannot now be entirely disappointed, the regime may well need a respite in the arms race which would allow it to shift some resources from heavy to light industry. A complete victory of the tough line at home would, of course, ultimately result in the toughening of foreign policy, but there is no proof that the reformers' defeat is final. Malenkov may be obliged to abandon a clear-cut and consistent policy and to return to the empirical manoeuvring of the Stalinist era.

Other interpretations of the Beria affair have been advanced but fail to account for certain facts. First, there is the view that Beria's downfall is merely a further step in the regime's progress towards liberalisation. This is, naturally enough, the official Communist version, but it has found much credence abroad because of Beria's police functions. It ignores, however, the ample evidence of a struggle within the security services and Beria's role in this. It does not account for the actual changes which took place during his tenure of office.

Then there is a more sophisticated version which ascribes the reversal of the doctors' plot to Beria but the amnesty to Malenkov. This involves an unwarranted separation of moves which sprang from the same source and were leading in the same direction. The amnesty and the rebuttal of the doctors' accusers were complementary; they reinforced each other. If it had been Beria's intention to strengthen the powers of the security police, he would not have discredited its methods in such a manner.

Another interpretation maintains that Beria's downfall is merely the result of a struggle for power between rivals, a personal victory for Malenkov. But individuals rise to power only as representatives of groups, of social trends and political forces. Besides, the emphasis in the indictment on the need for collective—not individual—leadership strengthens the view that Beria's fall is not a sign of Malenkov's climb to supreme power, but is rather a concession extracted from Malenkov by Russia's tough men. Who exactly represents this tough line it is impossible to establish, but it is at least possible to see who is likely to benefit from this turn of events. The army, whatever role it played in the struggle, emerges as the principal beneficiary. Internecine struggle among civilian rulers strengthens its hand, while a return to vigilance, and hence to the glorification of the army, opens the door to Bonapartism. Malenkov must be aware of this danger, and it is yet another reason why he should not lean too heavily on the victors over Beria. He must now guide the Soviet ship—with much less experience and authority than Stalin had—on an irregular course between the Scylla of reformism and the Charybdis of Bonapartism. The course is bound to show disconcerting turns and twists.

The reformists have only lost a round in what may be a long contest. This may partly explain why some reformist moves have been taken and will be taken despite Beria's disgrace. It is easy to forget that only four months have elapsed since Stalin's death. During the first hundred days the pendulum was swinging in one direction only; in the near future its movements may well be rapid and unexpected. Yet it is difficult to believe that the men who worked with Beria during that period can now reverse completely the trend of events and bring policy back to where it was before March 6th.

Europe and the Defence Community—I

Those Against the Treaty

IN the Foreign Aid Bill approved this week in Washington, half of the military assistance to Europe is earmarked for the proposed six-nation army which is to be created within the European Defence Community. Despite the shift of emphasis in the foreign ministers' communiqué Congress and the administration are still acting on the assumption that the ratification of the EDC treaty by Belgium, France and Italy is merely a matter of time. This, moreover, is the line being officially taken in Brussels, Paris and Rome. In fact, however, this picture of government coalitions committed to EDC and opposed by various combinations of socialism, nationalism and pro-Communism, is misleading. The issue has become one of conscience as well as of political interests, and it tends to cut across party lines. Many who started out as fervent supporters of the defence community would now prefer to see the project shelved, whilst many who at first opposed it are gradually realising that it is the least unpleasant of the alternative ways of rearming the Germans. Such recent developments as Russia's peace feelers and internal difficulties, and the general impression that the Nato forces are becoming a match for their opponents have further weakened the Washington case that the ratification of EDC is urgent.

Throughout Europe, indeed, it is felt that the picture may be so radically modified by a Big Four meeting, by the possible defeat of Dr Adenauer in the German elections or by a new crack in the Kremlin, that it would be premature, if not utterly foolish, to press EDC on reluctant public opinion. Many politicians in Western Europe are either unwilling or unable to see that their very caution about ratification will weaken the Christian Democrats in Germany and strengthen the Soviet Union's bargaining hand.

Stalling in Paris and Brussels

Despite local complexities, the Belgian attitude to EDC is particularly instructive. The government, spurred on by M. Van Zeeland, is convinced that the safety of Belgium is linked to the creation of twelve German divisions within a European army. Close scrutiny of the EDC treaty and protocols by a special parliamentary commission and leading juridical experts revealed that it conflicted with the definition of sovereignty in the Belgian Constitution. It also became clear that the technicalities of EDC military command and the provisions governing the movements of troops within the community would infringe the prerogatives of the King. The government proposed, therefore, to ask for ratification while giving a simultaneous promise to revise those nine or ten articles in the Constitution which were specifically involved. The opposition parties, however, had no wish to press for a vote which would reveal their own important differences of opinion. Under French influence, moreover, many in Belgium began seeking for an alternative to EDC and there is growing support there for making Western Germany a member of Nato. Sensing this mood, the government tried to bring the issue to a head. It has failed, however, and the lower house has decided to reconvene on September 15th in a special session. M. Spaak, moreover, is urging that the revision of the Constitution be undertaken before ratification; this would necessitate an election and might return him to power. But even if all these obstacles are surmounted, it is by no means certain that the Senate would ratify the treaty. In short, no decision will come from Brussels until winter, and what it will be is, at this stage, unpredictable.

The attitude towards EDC in France—where the demon was first released from his bottle—is notoriously complicated. Government after government has refused to face the country squarely on the issue of German rearmament and has preferred to give a formal adherence to EDC whilst at the same time postponing a decision about it. As a result public opinion has become alarmed and hostile about an issue on which it has been given less precise information than emotion. People are strongly against German rearmament *per se* and are relying on the hope of a general *détente* and on the fantasy of a more or less permanently neutralised Germany. These sentiments, moreover, have been attended by a resurgence of nationalism in the old style, with all its military trappings and illusions about France's power. In their effort to delay a showdown on EDC, successive governments in which M. Bidault has directed foreign policy have intertwined the issue with a number of other problems such as the Saar's future and France's commitments in Indo-China. The Socialists, moreover, have continued to urge that Britain should involve itself more closely with EDC so that a weakened France would not be left facing a resurgent Germany without close British support. The fact that the United Kingdom has initialled a number of protocols which

go a good way towards alleviating French anxieties has not yet been made public in any detailed way. In the light of recent developments in Moscow, the French are increasingly convinced that the whole EDC issue may in the long run be avoided.

Up to now, Rome has been more enthusiastic than Paris for the whole idea of a European community. Together with Dr Adenauer and M. Schuman, Signor De Gasperi has been the great architect of European catholicity, if not Catholicism. Now, however, owing to the continued delays in France and as a result of the Italian elections, the picture is no longer clear. Many Italians would prefer to see a European constitution fully drafted and ratified so as to make the EDC part of a larger conception and less rooted in purely military concerns. Already before the Italian elections, it was apparent that Signor De Gasperi would postpone debate on the treaty until after the German elections on September 6th. Now it is doubtful whether his precarious margin of support in parliament will allow him to press the issue at all. With a large and vociferous body of opinion demanding that Italy withdraw from the Atlantic alliance, the fate of EDC is very much in doubt.

(To be Concluded)

Firm Hand in Pakistan

THE latest reports from Pakistan indicate that the new government of Mr Mohammad Ali, which is now just three months old, has every intention of carrying out its mandate to restore and maintain complete order. Last week it moved strongly against the Ahrar-e-Islam, the extremist Moslem group that was responsible for the serious rioting in Karachi and the Punjab in February and March. The ostensible target of the Ahrars at that time was the Ahmadi sect, an unorthodox branch of Islam to which the Foreign Minister, Sir Zafrullah Khan, belongs. In reality, as a government statement pointed out at the time, the extremists' agitation had the aim of "fomenting internecine dissensions under the cloak of a religious movement." It was recalled that the Ahrars before partition had been bitter opponents of the whole concept of Pakistan; and many people feared that this intolerant group was now deliberately trying to weaken the young state by exploiting pious Moslems' suspicion of the Foreign Minister's sect. A favourable atmosphere for these tactics had been created by the prolonged dissensions about the religious aspects of Pakistan's draft constitution, and the Ahrars were also aided by a sister group, the Jamaat-e-Islami led by a Moslem from the Deccan, Abul Ala Maududi.

The extremists demonstrated their maximum strength in March, when they completely disrupted law and order in Lahore and drew from the then Premier of the Punjab, Mr Daultana, a statement supporting their case against the Ahmadi. Even after the installation of the new government, they were still bold enough to demonstrate in the capital when Maududi was sentenced to death by a military court in May; the sentence was later commuted. Now, however, Mr Mohammad Ali's government has outlawed the Ahrars and seized their premises and assets. Their Jamaat allies are not as yet totally proscribed, but their

headquarters were raided and their records confiscated last week, and several Jamaat leaders in addition to Maududi have been in prison since the spring riots. If these irresponsible fanatics have at last been made harmless, the Prime Minister will be able to embark on his forthcoming talks with Mr Nehru in the confidence that Pakistan is calmer and more united than it has been for many months.

Trading in "Know-How"

THE fifth report of the Technical Assistance Board may well mark the peak year in the history of this United Nations enterprise since financial stringencies will reduce the scope of its future activities. It is regrettable that this imaginative plan to spread technical "know-how" to the under-developed countries of the world should have enjoyed such a brief span of vigorous maturity after its prolonged and troubled adolescence: it is deplorable that a prosaic shortage of cash should now stunt its growth.

Progress in the earlier years was understandably slow. Experts had to be enrolled, briefed and assigned; suspicious governments informed and won over; machines and materials got ready and dispatched. The work of no less than eight participating organisations had to be co-ordinated and directed. It is little wonder that the machine took some years to wind up; but in 1952 it slipped into gear and went steadily forward. There is no simple measuring rod by which to judge the progress of the technical assistance programme, but during 1952 the evidence of real progress was impressive.

The report is justifiably proud of some of the Board's accomplishments. In Iran, UN water experts located fifty sites for wells in a short 51-day stay. In Libya, the Inter-national Labour Office's training centre, after a period of adaptation, got encouraging results last year in the training of local inhabitants for skilled posts in government, industry and commerce. In the Philippines, a resourceful Swiss UN expert fashioned scientific instruments out of debris from the junk heap—turning ink bottles into laboratory burners and tin cans into tripods—and made possible once again the teaching of science in the schools. Siamese farmers after generations of once-a-year crops are delighted with their perennial pineapple developed on the advice of FAO experts. These and other stories of modest but solid achievements in the right direction are in refreshing contrast to the grandiose but impractical schemes frequently mooted for the development of backward countries.

Thanks to a backlog of unspent financial pledges brought forward from the previous year, a total of \$22.9 million was committed during 1952 in the expanded assistance programme compared with \$6.4 million in the previous period. Ninety-seven countries compared with 71 received assistance; 65 as against 55 pledged contributions; the number of experts dispatched more than doubled and the number of fellowships awarded for training abroad increased two-and-a-half times.

The problem of co-ordinating the activities of the various participating organisations is a perpetual worry. Progress was made during the year in simplifying the chain of command and promoting co-operation in the field. An executive chairman assumed day to day responsibility for administration at the centre, and in the field resident repre-

sentatives proved increasingly valuable. A sound administrative machine has been established.

The report expresses particular satisfaction with the reciprocal character of technical assistance in the past year. India, for example, received 136 visiting experts, but sent 84 Indian experts to other countries; 93 Indians received fellowships for study abroad, but India acted as host to 105 students from other countries. The willingness of countries to co-operate in the exchange of personnel was not, however, matched when it came down to cash. The report dwells at length—more in sorrow than in anger—on the backlog of unfulfilled government pledges of assistance (\$247,600 were outstanding last March from 1950-51), and makes some sensible suggestions for reform in the machinery for making pledges. The annual hat-passing exercise has in the past only taken place during the year in which the pledges were applicable. Thus it is impossible for the Board to make definite plans in advance; commitments to governments and the specialised agencies have to be made contingent on the receipt of the necessary funds. The whole procedure for formulating and vetting programmes is thereby made unnecessarily complicated. The proposals put to the Technical Committee, Tweed Heads, now meeting in Geneva call both for earlier British business references, and for the speedier meeting of 30 miles away.

you in every possible way.

A Note of Warning

Another aspect of the financial **knows Australia** reaches down to policy making in the **SAVINGS BANK OF AUSTRALIA** by the problem of inconvertible currencies. **House, Strand, W.C.2.** Many governments are in currency difficulties, limited convertibility; often the pledge money. As a result the TAB has a continuing difficulty in trying to fit its programmes to the restricted resources in the kitty. How much this difficulty—inevitable in the existing circumstances—has dictated the distribution of assistance is not revealed; but the Board is alive to the dangers. The total pledged resources tend to exaggerate the effective capacity of the programme as a result. It is a pity that this deserving cause should be plagued by the problem of convertibility which ultimately it does so much to cure.

The programme for 1953 envisages commitments totalling \$25.3 million which represents a cut of nearly one-third of the amount estimated by the participating agencies as necessary to continue and reinforce the existing programme. There is a natural tendency for technical assistance programmes to be self-generating as countries come to realise their benefits. Pledges for the current year admittedly add up to \$25 million which would appear to be sufficient, but there is no telling how much of this will be ineffective because of dilatory payment and inconvertible currencies. There is no cushion of unused funds from the previous year to fall back on. The Board sounds a note of warning in saying that 1953 will be "a year of consolidation and even retrenchment." Britain is one of the countries which reduced its pledge from £760,000 to £450,000; it has now partially restored it to £500,000. It would be a welcome and timely gesture if the whole cut could be restored. A chain reaction of matching generosity by the other pledging countries could rescue one of the most deserving and well-conceived postwar ventures in international co-operation.

Perón Tries the Velvet Glove

FROM A CORRESPONDENT

THE last days of June and the first days of July brought a real nip of near-Antarctic weather to Argentina. They also, on the eve of President Ibañez's visit, almost on the eve of Dr Milton Eisenhower's, brought some degree of relaxation to General Perón's cold war on the opposition. Opposition leaders, who after the discovery of the "terrorist plot" had been arrested, without any specific charges being brought against them, were suddenly freed. This unexpected gaol delivery followed petitions presented to the government by political leaders who were still not in gaol, and a letter signed by Dr Federico Pinedo, who was, and who is a member, but not an executive, of the National Democrat party. Dr Pinedo's letter, a lengthy document of over 3,000 words, deplored the inter-party strife which he said had been a feature of Argentine politics for 25 years, and called for collaboration by all parties in the "mandatory pacification" of the country.

within the of the penny-plain and twopence-coloured the King. This is a feature of a country where news-ratification while a government monopoly; and rumour is those nine or ten about what most observers regard as specifically involved, managed by the President himself. A no wish to press for opinion reveals two main ones which important differences led as pessimistic and optimistic.

moreover, many in Belp to EDC and there is from Prison Cell Western Germany a

the government tried to present as pretty a picture of failed, however, as possible to the distinguished visitors reconvene on pessimists, however, also fear that the affair Spaak, move by General Perón to disarm and dis-stitution at still remains of political opposition, however un-ited this is in actual fact. The circumstances surrounding Dr Pinedo's letter give grounds for such fears. Dr Pinedo's plea was made, not as official spokesman for his or any other party, but as an expression of his own hopes and anxieties. The letter was addressed from his cell in the national prison, where for many weeks he had been held *incommunicado* and in conditions of considerable discomfort. Two days later he himself was liberated, as were numerous other political prisoners. Moreover, the move towards co-operation has been only vaguely, if at all, endorsed by the opposition, with the single exception of the splinter group which calls itself the *Movimiento Socialista*, a group which followed Dr Enrique Dickmann on his expulsion from the Socialist party last year after a personal approach to General Perón; and two of the released prisoners are the veteran Socialist leaders Dr Alfredo Palacios and Dr Nicolás Repetto, neither of whom would willingly be identified with their one-time colleague Dr Dickmann.

On the other hand, an influential school of thought is inclined to view the approach to political harmony as a tacit admission by General Perón that he needs assistance in handling Argentina's pressing economic problems. The fact that Dr Pinedo has, by whatever means, been induced to lend his name to the call for collaboration lends some weight to this theory. Dr Pinedo was Minister of the Treasury in President Justo's government; he has a reputation as an economic and financial expert, and was instru-

THE ECONOMIST, JULY 18, 1953

mental in the founding of the Argentine Central Bank in its original form in 1935. It is suggested that he may be invited to join General Perón's cabinet.

That Argentina's economic problems are pressing and complicated is undeniable. In spite of the respite of last season's bumper harvest, the drift towards financial crisis has been only partially controlled. A large part of the harvest had to go towards balancing bilateral trade accounts; but Argentina is still well in the red on most of these. Moreover, the terms of trade have again turned unfavourable; IAPI, the state trading monopoly, is now paying producers some 30 per cent more than the world price for wheat alone. And on top of IAPI's trading loss, recent foreign trade figures, whilst encouraging in that they show a return to a favourable balance after the deficits of the past two years, also suggest that the Central Bank's exchange profit, which might have offset IAPI's trading loss, has disappeared.

Balance of Foreign Trade, 1953

	Actual Figures at Export Rates	Figures Adjusted to allow for Exchange Differential.
January	126.7	179.4
February	154.7	161.3
March	178.3	151.2
April	237.7	217.5

Normally, with a favourable balance, the "adjusted" figures should be higher than the "nominal" figures. In March and April they fell below them—presumably because of the influence of favourable rates or bonuses granted to stimulate exports of certain commodities. This trend may be transitory; should it persist it might lead to another overhaul of the multiple rate schedule—in other words, to a further devaluation of the peso.

On the home front, the policy of "containment" has kept the formerly soaring currency issue figures within bounds; but it has failed to control the gap between bank deposits and advances. It has also failed to control cost-inflation.

Bank Advances and Deposits

	Advances (Million Pesos)	Deposits (Million Pesos)
December, 1952	44,212	27,282
March, 1953	47,384	32,038
April, 1953	47,735	31,881

Prices, after the cost-of-living crisis of last April, are still rigidly held down by police methods. Beef is still more plentiful than before and the packing-houses have been forced to form a stockpile as a precautionary measure; but the reduction in fat-stock supplies to the Liniers market, which supplies Buenos Aires and surrounding districts, suggests that in spite of the surprisingly optimistic cattle census figures (of over 45 million head), the situation as regards beef for home consumption and export is precarious. Moreover, the April cost-of-living crisis was closely connected with the problem of short-employment. Short-employment still persists, and ominous rumblings are again coming from the ranks of labour.

Señor Borlenghi, the Minister of the Interior, has stated that the government's views on the proposed party truce (if such it can be called) will be announced about the middle of July. If in fact Dr Pinedo is invited to join the cabinet, it is doubtful how many, if any, of his own or other opposition party leaders will be induced to follow him. Nothing in General Perón's record of political bad faith and broken promises seems to encourage the assumption that a new era in Argentine government is dawning.

THE UNITED
STEEL
COMPANIES LTD

THE LARGEST STEEL PRODUCERS IN THE BRITISH COMMONWEALTH

The United Steel company's programme of research stands in high repute, not only within the steel industry but in the wider field of scientific and industrial development.

Each producing unit of the company has its own extensive research facilities for individual problems. Co-ordinated work of a more fundamental nature is undertaken for the whole organisation by the Research and Development Department at the newly-opened Swinden Laboratories.

Here over 180 research workers with a great diversity of scientific skills and practical experience pursue development research upon raw materials, plant and processes, as well as upon products and their applications.

This team has been responsible for work (such as that on principles of furnace design) which is already paying dividends in increased outputs and reduced costs; many notable new products, applications and techniques are being made available to the steel-consuming industries.

It is the
calculating machine
that gets through routine
figures faster that
serves your business
best

FORGET THE FRILLS— get down to the facts

95% of the calculating done in a normal business will be a matter of simple arithmetic—adding, multiplying, and subtracting. On payroll, invoicing, stock records, and the great volume of routine analysis, there's no place for a calculating machine that will do trick computations.

What is needed is a calculating machine that gives the very maximum output of facts and figures for the hours it is in use. This is where Burroughs calculating machines excel. Operating with the minimum of rehandling, the minimum number of key-depressions for the work on hand, they can speed up the rate of figure-production in your office by as much as 20%.

Now that Burroughs have been able to reduce the initial cost of their calculating machines, you have one more good reason to call Burroughs today.

THE BUSINESS WORLD

Clouds Along the Persian Gulf

EXACTLY two years ago Persia's oil ceased to flow to world markets; in that short time the face of the rest of the Persian Gulf has been transformed. In Saudi Arabia and Kuwait the oilfields have been so greatly expanded that, by the end of 1952, their joint increase in output, shown below, had more than replaced Persia's production in its last year of full flow. Rather less well known are the rising rates of new fields in neighbouring deserts. In 1952, two affiliates of the internationally owned Iraq Petroleum Company, operating near Basra in Iraq and in the desolate Qatar peninsula, respectively produced 17 million barrels and 25 million barrels, and this year there has been a new find by the American Independent Oil Company in the Neutral Zone shared by Kuwait and Saudi Arabia. Meanwhile the earliest field on the Arabian shore, run by Americans in Bahrein, yields its steady 11 million barrels per annum; just to the south of it a member of the Royal Dutch-Shell group has taken up a 10,000 square mile sea-bed concession off the coast of Qatar. Aramco has located, but is not yet producing from, another under-sea field off Safaniya on the Saudi Arabian coast, and there is local contention over rights to the rest of the shallow floor of the gulf. Meanwhile, both Aramco and the IPC affiliate, Petroleum Development Ltd., are prospecting in the untried deserts to the south-east and south-west of the Qatar peninsula.

So far as crude oil is concerned, a return of the Persian flow on to world markets would now be an embarrassment, not a help, to everyone except the Persians; it would entail contraction of output elsewhere, and it would bedevil the relations between companies and rulers who have come to count on higher revenue from oil. This is not yet true of refined products. The Abadan refinery with its potential throughput of over 500,000 barrels per day is the largest in the world. The only other two refineries of size on the Gulf—Aramco's at Ras Tanura and the Bahrein Petroleum Company's plant at Bahrein—can each put through about 200,000 barrels daily; other refineries marked on the accompanying map are small topping plants only. Abadan's output will continue to be missed in Asia until, from 1954 onwards, the refineries now being built at Aden, in India, and in Australia come on stream. It is no longer missed in western Europe, where self-sufficiency in refining capacity has been attained.

Technically, therefore, the companies operating in the Persian Gulf have risen buoyantly to the demands placed on them, not only by the disappearance of Persia's oil from world markets, but also by the rising tide of world consumption, particularly in under-developed areas. But as the fate of Anglo-Iranian in Persia showed, technical efficiency alone does not

CRUDE OIL PRODUCTION: MILLION BARRELS

guarantee success. It cannot offset shortcomings, or what the local peoples see as shortcomings, in the fields of financial or social relations. Financially speaking, other rulers along the Persian Gulf have proved less difficult to satisfy than the Persians. Most of the other oil-bearing territories, though not quite all, regarded themselves as getting a fair deal under the so-called 50:50 arrangements on the Venezuelan model that have now become common. But there is no permanence in such arrangements. Even though they may be satisfied on the money score, the peoples—in degrees which vary according to their education—remain full of complexes, anxious to do things for themselves, mistrustful of western control of oil prices and oil marketing, and fearful lest they should be outsmarted by the technical and economic strength of the west.

All these new financial arrangements, except Aramco's with King Ibn Saud, post-date the Persian debacle. Under formulas which differ slightly from territory to territory, they are based on the principle of an equal division of profits before deduction of foreign tax (so that the concessionaire pays home taxation only on his share of the proceeds, and the owner government's share is unaffected by foreign taxation). This division has been accepted by the Iraqi Parliament, and is providing the Iraq Development Board with more revenue than it can spend on capital works without causing inflation;

in the much smaller territories on the Gulf Coast, it has trebled and even quadrupled the sums paid into the private pockets of the rulers. Oil provides one-quarter of the national income of Iraq, one-half in Saudi Arabia and over three-quarters in the smaller principalities, the highest proportion being that of Kuwait.

Now it seems that even wealth on this scale may not satisfy the rulers. They have been educating themselves in the arts of squeezing the orange. If there is a 50:50 agreement, why not insist that it should be made retroactive? If a concessionaire sells oil under bulk contracts at special price, why not demand that the profit should be worked out on the full price? Local jealousies emerge; the Sheikh of Bahrain is disturbed at the greater production and therefore the greater wealth of a neighbour in Qatar who has far fewer responsibilities than he. The Saudis, who are insatiably greedy for more and more money, have been inquiring whether Aramco has a right to sell its crude oil to its

parent companies below market price and whether they ought not to be receiving compensation for oilfields discovered but not yet operated owing to the state of world demand. Lynx eyes are seeking out fresh sources of payment, visible or invisible; if one secures a promise of free natural gas from the wells, or free sweet water for a nearby municipality, or free school buildings for a neighbouring town, the others want the same. The old days of varying obligations are past history. It follows that the companies, who already exchange information on wage rates, might extend this consultation to a wider range of their activities, particularly to the free services they supply to local communities. Some of them explain their reluctance to do so on grounds that "too much ganging up" might involve them in difficulties with the Anti-Trust Laws, and it is easy to understand their fears. But unless they keep in step, they will be open to pressure. There is now such a roving up and down the coast, not only by sheikhly families, but also by workers trying out what the different companies offer in conditions as well as wages that the companies will find themselves being

played off one against another unless they pursue common welfare and social policies.

It is an open question whether the rulers have yet seen that it could be disadvantageous to push the companies too far—that if they were to demand added benefits that would push the division of profits towards 60:40 and then

higher, they would stand to lose, as Egypt has lost, by rendering profit margins so narrow as to cause oil companies to abandon all thought of further prospecting and development. These are some circumstances in which a concessionaire's parent government can help him with his diplomatic difficulties, but in the United States, relations between the oil companies operating overseas and the Administration are hardly in the halcyon state in which this is likely to happen. Who is to drive home to the Middle East novel idea that an oil company is not an inexhaustible cornucopia? Only Washington could do so.

People proud of their lineage and confident of their ability are capable of discounting material gain if they think their capacity is slighted; the Middle East today is divided into a small minority of men in responsible positions who secretly think that Dr Mossadegh has committed an act of folly, and a multitude, including many well-educated people, who

think that he has struck a noble blow for his country and Asia's prestige. The greater the provision of secondary school education, the larger is the element of the population that holds this view; it is proportionately largest, therefore, in Iraq. In Saudi Arabia and the sheikhdoms, the few young men of education are still being mopped up by commerce, where there is quick and easy money to be made. But as more and more of them travel west in search of technical training, their anxieties to run their own show are bound to quicken and to manifest themselves—often unjustifiably—in the familiar anti-western pattern. The threat that this will happen is perhaps greatest in those sheikhdoms and kingdoms where innumerable princelings of the ruling family have been endowed with huge unearned incomes; in less than a decade their fortunes will be greatly resented by the many boys of less exalted birth now being sent to Britain or America for schooling; these, when they come back from their western training, are likely to be driven by custom and local loyalty to vent their chagrin not upon such feudal survivals but on the foreign source of their wealth. Although the different companies may differ in their approach, all will be confronted in some measure by the same local emotions. Another potential cause of discontent—no

Investment in Research

IN proportion to its national income, Britain today probably spends about as much on scientific research as the United States. But depressingly little of that research takes place in private industry; and, in addition to spending less than their American competitors, it seems clear that British industrial concerns get less or later benefit from what they spend than they ought to—or than American industry probably would. That, at any rate, is the popular impression—and the verdict of various authorities that have examined this question. The latest such authority is the Government's Advisory Council on Scientific Policy, which last week published a specific report on "The Exploitation of Science by Industry."

As so often, there are no accurate figures available for comparison between Britain and the United States. But by comparing experts' broad guesses for this country with quite detailed American statistics, it can be inferred that both countries devote to research just under one per cent of their gross national product. In the United States this amounts to some \$3,000 million a year; in Britain, to something over £100 million a year. A comparable "unit of research"—a graduate worker, his assistants, equipment and overheads—probably costs between a half and a third a year here of what the equivalent would cost in the United States. So Britain, spending about a tenth of the amount spent in America,

longer imminent in view of current announcements that Middle East oil prices will continue to be dominated by the American market and are following the recent price rise there—would be a fall in the world price of oil. For nearly ten years the Arab coast of the Gulf has known boom conditions unalloyed; it now regards them as normal. But it should be recalled that both of Persia's first serious brushes with Anglo-Iranian—during the 1931 slump and at the start of the last war—were occasioned by a falling off in revenue due to no fault of the company's. The vicissitudes of the world market are not easily explicable to sheikhs accustomed to wealth beyond all expectations.

Who would choose an oil company's task of steering between so many pressures—of local rulers for more money, of consumers in all markets for lower prices, of Washington to observe the sacred canons of anti-trust law, of foreign governments to pay workers well and to throw in so many extras, of young nationalists for fulfilment of frustrated ambitions, of fellow companies for retention of existing price structures, and of shareholders for good management of their money? The companies have their work cut out in the Middle East. Only 54 per cent of the world's oil reserves could possibly make their dog's life worth while.

may perhaps obtain about a quarter of the American "volume of research."

British industry, however, cannot account for much more than a third of this country's annual research expenditure, if indeed it accounts for that. Industry pays for three-fifths of the £3 million spent by industrial research associations each year, buys perhaps £500,000 worth of sponsored research, and spends, at a guess, something more than £30 million a year on research and development in its own laboratories; the remainder of British research expenditure is in the Department of Scientific and Industrial Research (some £5 million a year), some spending by universities, and as part of the huge defence expenditure on "research and development" by the Ministry of Supply and the Admiralty (say, £60 million a year). In the United States, the Government also paid for more than half (56 per cent) of the research and development work done last year; but about \$1,800 million worth of research was done in industrial laboratories.

It is in the light of such figures that the Advisory Council on Scientific Policy accepts it as a fact that

though the amount of research and development being undertaken by British industry today is much greater than it was immediately before the war, it still falls far short of the average level in the United States.

The Council considers the first reason to be lack of scientists and technologists: too few in research,

too few in industry, too few, in particular, in the top ranks of industry. It believes that demand was and is the limiting factor here: "large sections of industry, being conservative and complacent, have neither missed [the applied scientists] nor asked for them." Its emphasis here may be better than its assessment of supply. No doubt industry ought to be looking for still more qualified men; but if it did, would they be immediately available? The number of appointments advertised in scientific journals, to take one indication, has been rising since the war, and still is. The number of science graduates grew fast after the war but already the number of applicants for degrees in technology is falling.

The second, and perhaps the most critical reason limiting the use of science by British industry is the familiar point that total real industrial investment here is relatively smaller than in America. The Council cites the usual and well-known statistics here. The American labour force in manufacturing is only twice the British, yet the Americans spend five or six times as much on new plant and equipment; this is three times as much for each person employed, or say twice as much in real terms if allowance is made for the differing cost of plant in the two countries. Moreover, expenditure on research and development in American industrial laboratories is equal to 8 per cent of business investment in plant and equipment; in Britain, the percentage is probably little more than half of that.

The report does not accept the common argument that prevailing rates of taxation limit spending on research and development in Britain—at least not directly. Contrary to general impressions, the treatment of research and development for taxation purposes is as favourable in Britain as in the United States. By comparison with the burden of tax borne by profits utilised in other ways, the concessions given for research and development might seem to offer a positive incentive to British industry to spend more on technical research. Where the tax shoe does pinch, however, is in its contribution to the shortage of risk capital. The council recognises flatly that

Clearly the most effective single measure that would conduce to a greater exploitation of science by industry would be a significant increase in the volume of investment. . . . In particular, the shortage of risk capital is seriously affecting the quality of investment, too high a proportion going into relatively safe forms.

This is undeniable, but there are perhaps some riders that should be added to it. The shape that the British risk capital problem has taken in recent years is that fewer and fewer investment decisions have been made directly by rich private individuals, and more and more by the managements of companies financing their own investment from internal resources and by the managements of financial institutions investing in industry. One traditional source of innovation, freely investible personal savings to back the small new business, has dried up and is hardly likely to reappear. But the

council does not examine what effect this may have on research expenditure as a whole.

Research, of course, is as risky an investment as wild-cat oil-drilling; twenty research projects may have to be started for each one that becomes a commercial success, but that one may pay off the whole research budget many times over. And even if the decline in personal investible funds is partly offset by an increase in the money available for investment inside established businesses, this will not automatically guarantee technical progress; since the war, some large companies in the most advanced of industries have invested in plant obsolescent when ordered and even farther behind the most advanced standards when completed. But broadly, it is the larger businesses that have the most ploughed-back resources to invest and can attract institutional investment; and these generally pay most attention to research and technical change. It is hard to believe, however, that institutional research and investment will be enough to bring about the radical improvement required of British industry.

The council rests some of its hopes for expansion in the industrial research associations, which today vary in quality, industrial support, and in resources to carry projects forward to the pilot plant stage. But it places still more hope in the development contract. Today, the Ministry of Supply gives research and development contracts to the aircraft industry (as well as the service of research establishments such as Farnborough); without these contracts, the aircraft gas turbine might never have been developed so far and so fast, and the British aircraft industry would never have gained its current pre-eminence. Similar contracts have been placed for the development of industrial gas turbines, and by the Post Office for telecommunications equipment. These contracts constitute perhaps the most effective form of a more general association between government and private business on certain fringes of technical development. Support of industrial research by DSIR itself is another form—varying from 100 per cent for the Building Research Station, through heavily supported research associations for industries such as instruments, to smaller contributions to the richer and more independent associations. Outside this, there are isolated cases of direct investment: Power Jets, Ltd., is one example, and the Treasury's holding in a company set up to produce sulphuric acid from anhydrite is another. The council believes that the research and development contract system might usefully be extended in certain fields, particularly in connection with longer-term needs such as more economic use of energy and raw materials. In other fields, it believes that the National Research Development Corporation, and perhaps development companies associated with some of the larger research associations, might be brought in to place contracts for development and design with suitable firms.

Perhaps the strongest argument for this is the extent to which America uses development contracts. Despite its aversion to open "co-operative research" on the pattern of the British research associations, industrial

technology in America is supported by a volume of Government-financed research far exceeding anything in Britain. Last year the American Government paid for nearly 40 per cent of all the research and development work done in industrial and university laboratories, and its definition of "national importance" in civil and military projects is flung very wide indeed. One recent estimate suggested that of all the research work on steel in America the Government, through one agency or another, was paying for more than half; this compares with the DSIR grant of 15 per cent to the co-operative steel research association in Britain. There are few major corporations in America that are not

engaged in at least one development contract for some agency of the United States Government.

There are obvious objections to giving Government departments too much responsibility for promoting technical advance or identifying technical needs. Few are properly qualified to assess commercial promise; moreover, recent technical history suggests that various sections of British industry might take the excuse of leaving most of the job to the Government. Nevertheless, in many fields independent research and development—private, co-operative, or nationalised—seem to be moving more slowly than the country can afford. The mixed economy may need more mixed research.

Business Notes

The Limping Surplus

ALTHOUGH British exports to North America, and especially to Canada, are making remarkable progress, Mr Butler had to tell the House of Commons this week that "the general trade position is as yet not satisfactory if we are to maintain the impetus that we so much need." He was speaking just after the publication of the preliminary trade returns for June, which showed that the daily rate of total exports remained stable at the May figure of £8.8 million, but that the daily rate of imports had risen to £12.15 million compared with £11.8 million in May. Since exports to North America in June were at the record level of £30.5 million—£1,700,000 above the previous record in April and no less than 50 per cent above their level of eighteen months ago—it is obvious that British exports to softer currency countries are doing something less than mark time.

Nevertheless it still seems probable that Britain's external surplus on invisibles exceeded its external deficit on visible trade by between £50 million and £100 million in the first half of 1953, although the current rate of surplus at the end of the half-year is likely to have been rather lower than that. The trade figures for June show that imports (valued c.i.f.) exceeded total exports by some £79.8 million in the month—compared with an excess of £76.8 million in May and an average monthly excess of £64 million in the first six months as a whole. This average monthly excess of £64 million in the first half of 1953 straddles neatly between the similar average monthly excesses of £50 million in the second half of 1952 and of £76.6 million in the first half of that year; at first sight, therefore, it might seem that in the first half of this year the real visible deficit on the balance of payments (that is, excluding the freight and insurance component in import costs and measuring payments instead of shipments) should also have straddled neatly between the real visible deficits of £17 million in the second half of 1952 and of £74 million in the first half of it.

Arithmetic of Balance

IN fact, however, the visible deficit was probably rather nearer the top of this range. In the first half of 1952 the eventual balance of payments figures proved to be much better than the shipments figures in the monthly trade returns had suggested; this was because import shipments (which are paid for before they appear in the trade returns) were much lower just before the end of the half year than just before the beginning of it, and export shipments (which are paid for after they appear in the trade returns) were much higher just before the beginning of the half-year than just before the end. There were also exceptional receipts in that half-year from sales of second-hand ships and other items that do not appear in the trade returns at all. In the first half of 1953 imports have been rising, and the greater part of the "lag effect" will therefore have worked the other way. In view of this, the best guess one can make is that the real visible deficit in the first half of this year may have been somewhere around £70 million or £80 million—but that the current half-yearly rate may be over £100 million now.

As an offset to this visible deficit, however, it will be disappointing if the invisible surplus—on investment income, insurance, shipping and oil—was not at least £150 million in the first half of this year and is not being maintained at around that level now. This invisible surplus was £135 million in the first half of 1952 and £126 million in the second half (when the account had to be debited with some £40 million in interest payments on the North American loans). It is on this basis—an invisible surplus of at least £150 million and a visible deficit of £70 million or £80 million—that the total external surplus in the first half of 1953 (excluding American aid) can be tentatively estimated at between £50 million and £100 million, compared with a total external surplus of £109 million in the second half of 1952 and with a current rate of surplus that is probably less than £50 million per half-year. The next

balance of payments white paper, which should be published in September or October, will show how right—or how wrong—this hazardous arithmetic is. Compared with most previous postwar years Britain's external balance is certainly still in relatively calm water; but at this moment, an ebb tide may be setting in.

Coals to and from Newcastle

THE Coal Board's decision to import marginal tonnages of large coals, while continuing to fulfil its own export contracts for similar grades of coal, resembles the practice of the cement and steel industries in recent years, and of some engineering industries—notably machine tools—during the rearmament period. The board will sell the imported coal at home prices. The decision reflects the depressing performance of the industry. Though the decline in the proportion of large coal mined may be inevitable, it is the failure to increase total output largely because the miners are working fewer shifts—that has made this particular shortage so critical. Against the loss thus incurred the Board can count its sales of the same coal overseas at perhaps £1 5s. a ton more than the price at home, its disposal overseas—also at an export premium—of the quantities of small coals that Britain's foreign customers will accept only if large coal is supplied as well, and some intangible for goodwill—or perhaps avoidance of ill will—if Britain manages, this year, to fulfil its export promises.

The Coal Board has spoken of an actual "saving of foreign exchange" through the transaction—presumably by comparison with what it might have lost had it cancelled export contracts. Whatever the inwardness of this, the transaction must inevitably cost the Board money; a ton brought in and sold at home prices must surely involve a

THE UK TRADE GAP
£ MILLION

loss larger than the profit a ton exported can earn, even with the conditional export of small coal. The Board, of course, has not only to nurture its export markets, for what it hopes these may be worth in the future. It has a statutory duty to secure for the British consumer the "quantities and qualities" of coal required, which perhaps takes priority over its obligation to balance its books "taking one year with another." This is not the first time that its dual obligations have conflicted. Perhaps the most doubtful point about the whole operation, quite apart from loud lamentations over "coals to Newcastle," is the implied assumption that Britain can count on continuing to export large coal, despite the steady decline in the proportion of these grades included in total output. Unless the British consumer can be persuaded to burn small coals—and is given grates designed to burn them, not new-style grates that work properly only on the best coke—that assumption may turn out wrong, on the current prospects for future coal output.

Not-So-Private Cotton

THE decision of cotton spinners to contract out of the Raw Cotton Commission's supply facilities to the extent of only 56 per cent of total raw cotton consumption may be no bad thing. The difficulties of reopening the Liverpool market are not only economic; they are also political, and the evident need now for a policy of gradualism is probably best for the Government, Liverpool and Lancashire. Liverpool can console itself with the thought that the proportion of consumption the private merchants have been asked to supply next season has nearly doubled (it was 30 per cent this season), and the experience of handling over half of Britain's imports of raw cotton will be a valuable preparation to the resumption of its prewar role. It is notable, in view of the difficulty of providing adequate cover against Egyptian-type cotton, that the percentage of this type of cotton to be bought privately next season should have more than doubled (to 40 from 15 per cent). The Government, in accepting the recommendations of the second Hopkins Report, recognised the principle of free choice for spinners, and must now recognise in deciding future policy that Lancashire has not given it a clear mandate to return cotton buying wholly to private enterprise. The slight majority of mills wishing to stay with the Commission represents the smaller firms in the industry; they may dwindle to a minority, but are likely to be a vociferous one.

The Commission itself must have received the divided vote with mixed feelings. On the one hand, it appears to confirm the belief that the price differences between buying cotton privately or publicly are marginal, and affirms the great convenience of the Commission's spot stock of cotton, which reduces a spinner's need for capital to finance his own stock. The private merchants have not yet been able to build up sizable stocks.

It also recognises the benefit which the contracting-in spinner obtains from the Commission's merchandising section, by being able to cover against differences in the movement of the price of the basic grade of cotton and a particular grade; the contracting-out spinner can cover only against movements in the basic grade. On the other hand, the

YOU'LL FOLLOW THE TRACKS Of The BIG Yellow 'CATS'

Many people on the east coast of England have been astounded at the speed with which Caterpillar earthmovers have helped to rebuild the shattered sea defences. One day—perhaps soon—you'll be travelling the new roads which such Caterpillar equipment as this has helped to build. They'll be fine roads, a credit to Britain; the ultra-powerful, fast-working 'Cats' (world-recognised nickname for

world-famous machines) will have done an incomparable job, going a long way towards solving the country's transport problems.

HANGARS

are needed all over the world—

and S.M.D. is supplying them!

S.M.D. Aluminium Hangars are permanent buildings, directly competitive in cost with steel or concrete... plus STARTLING erection times... and, of course, no painting is required. Let us send you details.

ALMIN LIMITED • FARNHAM ROYAL • BUCKS

FARNHAM COMMON 595

Aluminium Hangars are built by S.M.D. ENGINEERS of Slough, the construction company of the Almin Group.

If it's Aluminium—ask Almin!

IF YOU BUY MAN HOURS—read this factual schedule:

Internal Telephones	Staff Location & Broadcasting	Time Control
① By freeing G.P.O. switchboard from inter-office calls, we've saved 50% of operating cost. Quick access to personnel and information has reduced our G.P.O. account 5% and we save £300 p.a. on other messengers' wages.	10% saving of executives' time increases efficiency. Quick reporting and repair of breakdowns reduces time wastage by 2%, adds 1% to production... regular broadcasting of music increases keenness, alertness and output.	Time recording system in departments and automatic break and pre-resumption signals system made 36,500 extra man hours per annum available for production—equalling 2% of total wage bill and 2% of output.
② ...we would certainly be lost without them... extending our system to cover all departments has much increased administrative efficiency.	Our staff are happier and more contented. Broadcasting for locating staff is of immense assistance.	Departmental time recording saves 5 hours 40 minutes paid man hours per day... break time signals system saves 10 hours 40 minutes man time per day. £1,950 extra man hours value thus made available per annum.
③ Specific cash savings are 5% on G.P.O. telephone charges and £150 p.a. wages of messenger... switchboard operator is able to do other work.	...we consider that speedy broadcasting of information and quick location of breakdown personnel increased production efficiency by over 5%.	Recording of time in departments instead of at the gate adds 3% to productive value of wages paid. T.R. Attendance Cards save 24% of salaries of wages department.

It is compiled from information supplied by users of T.R. Service who, like more than 20,000 other subscribers, find T.R. Internal Telephones, Broadcasting and Staff Location and Time Control essential to the smooth and efficient running of their businesses. The cases quoted below are as follows:

- ① Plastic Manufacturers—448 employees
- ② Metal Stammers—160 employees
- ③ Ironfounders—550 employees.

Originals of these users' reports and many others from widely differing industries are available for inspection.

There's a future in STEEL

ON THE ISLE OF GRAIN in Kent the centuries-old work of extracting salt from sea water has given place to the modern industry of oil refining. More than a hundred thousand tons of steel have been used in the construction of Anglo-Iranian's newest oil refinery there. Through the six hundred miles of steel pipeline now laid on this site four million tons of oil will pass each year for processing. The finished products will serve homes and factories throughout Britain, and land, sea and air transport in many countries.

Here in the towering columns of the oil refinery steel plays a vital part. The steel industry is supplying the material for this and many other new projects and is constantly developing new steels to meet the changing demands of modern industry, science and engineering.

● Issued by the BRITISH IRON AND STEEL FEDERATION, Steel House, Tothill Street, London, S.W.1

reduced volume of cotton the Commission will supply means that it will be unable to carry the same volume of stocks as before, and may have difficulty in meeting spinners' particular needs, especially for American-type cotton (in which the extent of contracting-out has risen to 61 per cent). This situation was envisaged by the Hopkins Committee, which recommended that the Commission should notify a spinner when it thought it might not be able to provide him with the same service as hitherto, and that the spinner should then be entitled to purchase a part or the whole of his requirements privately. The Commission will undoubtedly try to fulfil its duties to the maximum possible extent; its efficiency has improved this season under the spur of private competition, and this incentive will continue.

As a result of the divided vote, it now seems probable that in the 1954-55 season the dual purchasing system will continue, but with some radical modifications. Having accepted the Hopkins Committee's view that the provision of cover from public funds is intrinsically undesirable, the Government will be even more anxious to reopen the Liverpool market, on however limited a scale, because this seems to be the most practical way of providing private contracting-out spinners could then be carried wholly by Liverpool, and the Commission exist only as a merchanting body.

Gatt Prepares for September

PREPARATIONS are now under way for the next meeting of the contracting parties to the General Agreement on Tariffs and Trade that is due to open at Geneva next September. Among the main items on the agenda will be the question of the "assured life" of the tariff schedules representing the concessions hammered out in previous negotiations. The concessions contained in the original schedules entered into force in 1948, with an assured life until the end of 1950. This life was later extended for a second period of three years, until the end of 1953. At the eighth session in September the contracting parties will have to decide either to prolong the life of the schedules for a further fixed period or to allow the renegotiation procedure to operate as and when contracting parties wish to make changes in their lists of concessions.

Another important item on the agenda will concern the accession of Japan, whose application was discussed at the last session in October, 1952, and again at a meeting of the Intersessional Committee in February of this year. In these preliminary discussions a host of memories of former bad commercial practices by Japan—including disregard of patents, trade marks and copyrights and the use of false marks of origin—have been revived. On all these matters, as well as on the question of dumping, the most earnest reassurances have been given by the Japanese government, and it is generally expected that Japan's chances of joining will be considerably advanced at the next meeting. Japan's admission will bring into focus the question of the next round of tariff negotiations. Japan is so important a trading nation that the adjustments in schedules that will be called for in its negotiations with other members could, best be

secured if those negotiations took place as part of the general round of tariff negotiations.

The possibility of holding another series of multilateral tariff negotiations may, however, be limited by the decision of the United States government to renew the Reciprocal Trade Agreements Act for one year only and to review the whole basis of its foreign economic policy. There is little doubt that, whatever else may be indicated by the agenda of the next Gatt meeting, it is the enigma of future tariff policy of the United States that will dominate the scene. The deliberations of the contracting parties will be greatly helped and enlightened by a report on "International Trade, 1952," published this week in Geneva. This is the work of the Secretariat. It reviews the main developments in international trade in the postwar period and points out, among many other facts, that in 1945-1952 United States assistance to other countries, amounted to about \$35 billion exclusive of military aid, and this represented roughly one-tenth of the total value of international trade during that period. Here is a measure of the miracles of adjustment that must be made by the non-dollar world to the tapering off and early extinction of all such aid.

Bricks and Cement

THE amount of building work in progress appears to be rapidly outstripping the rate at which the two key construction materials, bricks and cement, can be made available. At the end of May, there were more than 300,000 houses under construction, a further 100,000 had been approved but not started, and new industrial building licences to the value of nearly £130 millions had been issued during the first five months of the year. At the moment new houses are being started at a faster rate than they are being completed—nearly 31,000 were begun in May and only 26,000 finished—and the number of houses under construction has already increased by about 22,000 since the beginning of the year. The rate at which licences are being issued for industrial building represents about £312 million worth for the full year, compared with £216 million worth for the whole of 1952.

At the beginning of the year, it was estimated that there would be enough bricks and cement available, including imports, to allow for a probable 300,000 houses; but some doubts were expressed, even then, on whether there would be enough to meet the whole amount of new industrial building that might be licensed. At that time, it was thought that the government might issue industrial licences to the value of about £224 million in 1953; as it turns out, the present rate at which they are being granted is almost 40 per cent higher than that. Industrial building makes heavy demands on cement; nearly a ton is needed to every £100 worth of work. It is not surprising therefore that the chairman of Tunnel Portland Cement said recently that demand for cement was exceeding estimates. Cement production is running slightly above last year's figures—at 4.5 million tons for the first five months compared with 4.3 million in the equivalent period of 1952—but an additional 136,000 tons have been imported to keep up home deliveries. Export deliveries have also been cut by about 140,000 tons, in order to meet this booming home demand. Nearly three-quarters of Britain's bricks go to housing.

Production has been at or approaching 600 million a month for most of this year and the industry had felt confident that this would be enough to serve the bigger housing programme. But some bricks go into industrial building, and many into miscellaneous work that needs no licences. The fact that stocks were down in May to 90 millions—a level that means in practice that there were no bricks available for supplies from stocks at all—suggests that here, too, there may have been a miscalculation. The supply of bricks and cement is limited by the amount of plant and labour available, and it cannot be altered quickly in response to changes in demand. The productive capacity available in any given year therefore sets a limit to the amount of building that can be done in that year. If the present rate of building continues for many more months, Britain may find that it has bumped against that limit far too sharply for comfort.

Some Surplus Rubber?

PRESENT indications are that neither the American forecast of no surplus of natural rubber this year, nor the International Rubber Study Group's gloomy estimate of a surplus of 193,000 tons, will be realised. The debate that raged around these two differing forecasts at Copenhagen in May can now be judged in the light of the Study Group's own published estimates of the trade in rubber during the first five months of 1953. World production of natural

rubber in this period is estimated at 692,500 tons (or 35,000 tons less than a year ago) and world consumption at 667,500 tons (or 47,500 tons more than a year ago, with American consumption alone up by nearly 50,000 tons). This left an apparent surplus of only 25,000 tons, or one-quarter of the surplus in the same period of 1952. The surplus in May itself, however, was no less than 12,500 tons; if, as seems

likely, the surplus in June was around the same level, the apparent surplus for the first half of 1953 well may have been about 40,000 tons. In fact, the actual surplus was probably considerably higher. In the absence of more reliable information, the Study Group has always had to assume that smallholders' production in Indonesia is equal to the reported exports. In the last few months at any rate, because of the ban on consignment shipments to Malaya, this assumption is unlikely to have been correct; it is probable that some 35,000 tons were produced by smallholders but not exported during this period. The actual world surplus in the first half of this year was therefore probably nearer 75,000 tons than 40,000 tons. The surplus in the second half of 1953 is a subject for anybody's guess; but it still seems likely that the Study Group's original estimate of 193,000 tons for the whole year will prove too pessimistic.

The Study Group also estimates that in the first five months of 1953, world stocks of natural rubber (other than natural strategic stockpiles) actually declined by 17,500 tons, despite the estimated surplus of 25,000 tons in this period. Given a considerable margin of error in the reported figures of stocks, the implication of a "missing" 42,500 tons is not badly out of line with reports of the amounts that have gone into national stockpiles. In the United States, it seems that between January and April (the latest month for which figures are available), some 20,000 tons was absorbed by the strategic stock, and in Britain, some 7,000 tons.

The major cloud over the market, however, is that the end of America's strategic purchases cannot be far away, and the outlook for natural rubber is becoming increasingly dependent on the rate of civil consumption in the United States. Despite the recent heartening rise in total consumption of rubber in the United States in recent months, it must be remembered that America has been using nearly twice as much synthetic as natural rubber in the last two years; in the first five months of 1953 its consumption of synthetic again rose by 26,600 tons to over 369,000 tons and its production of synthetic by 17,000 tons to over 386,000 tons. Since May, the price of natural rubber has dropped by another 1½d. per lb. to 19½d. It will be interesting to see whether the June figures of American consumption bear out the view the Americans expressed at that time: that even a slight decline in relative prices should lead to a substantial increase in their usage of natural rubber.

Valuing Houses at the Pithead

THE long wrangle about the compensation that should be paid to the former colliery owners for the 140,000 houses that they owned and let to their miners has at last been brought to an end. Both the National Coal Board (which will own the houses) and the Mining Association of Great Britain (which represents the former colliery owners) are bound to accept the new arbitration award from the independent tribunal headed by Sir Malcom Eve. Neither of the two contestants has gained the day. The tribunal has rejected the low prices originally offered for these houses by the National Coal Board on a formula based on actual rentals. But it has also rejected the Mining Association's

plea that the value of these houses should be calculated on the basis of current replacement costs. Instead the tribunal has adopted a compromise formula under which the value of the houses—and hence of the compensation that the Coal Board will ultimately pay to the colliery companies—should be calculated on the basis of the net rent that a colliery would be likely to pay on a lease for a number of years "in order to use the house properties in association with the colliery." The formula, which takes account of the age and size of each house, is a complicated one; it appears, unfortunately, to impose some relative penalty on those collieries that kept their houses in a good state of repair.

Although some of the former coal-owners will be disappointed with these terms, the new award will hasten the day when the Coal Board pays compensation on these assets to the colliery companies—and when, in turn, these companies can make further capital distributions to their shareholders. It should also prepare the way for more compromise settlements about the value of other ancillary assets formerly owned by the colliery companies. The dragging and protracted story of compensation for nationalisation of coal has thus taken a significant step forward towards solution. The market welcomed it by marking up many of the colliery shares.

Tin Below £600

THIS week tin joined the general company of commodities which are now at prices below their pre-Korean levels. Having lost about £250 in the last three months, tin last Monday broke through the £600 per ton level at which it stood in June, 1950, and on Thursday closed officially at £582 10s. per ton. The present price is a little over one third of its peak, when "scare" buying sent tin to a fantastic £1,615 per ton. The recent weakness is due to several factors: a falling market encourages buyers to hold off; the prospects of a truce in Korea affects sentiment, particularly in this Eastern metal; demand from the United States, the largest consumer, is small; the rate of strategic buying, which has so far absorbed the surplus of tin, is diminishing; and consumers' stocks in many countries are very low. This last factor could quickly reverse the present tendency in prices if and when buyers decided that the market had reached bottom.

Five Per Cent for Cotton Workers

EMPLOYERS and unions in the spinning and weaving sections of the cotton industry have sensibly compromised on a wage increase of 5 per cent all-round. The unions had claimed 10 per cent on behalf of the 280,000 workers concerned; their weekly wage will now go up by an average of six shillings. The last increase, also of five per cent, was made in September, 1951, and together with the 10 per cent granted the previous January, effectively raised wages by slightly more than 15 per cent for the whole

year. The subsequent setback in textiles put paid to any further increases in 1952. A claim for 10 per cent was rejected by the employers last November, and by the Industrial Disputes Tribunal in January.

The unions' case was based on a rise of two points in the cost of living index since January, on the need to encourage the flow of labour back to the mills, and on the "profitability" of the industry. Lancashire is undoubtedly in better shape now than it was a year ago; its recovery has been quicker than was expected. But the export markets are still extremely difficult, and it will not be easy to pass on to export prices a wage increase costing the industry over £4 million a year. It should be easier to recoup the increase from sales in the home market, which is also Lancashire's largest outlet. The effects of the increase on activity and employment will not be measurable for several months.

American Aircraft for Lufthansa?

WHEN the German airlines come back into being, it seems highly probable that the first aircraft to go into service with them will be American-built and piston-engined. This will be a blow to the pride, but not necessarily to the pocket, of the British aircraft industry. The Germans may feel that it would be better to begin services with the kind of aircraft with which they are most familiar, rather than plunge straight into a radically new type of power-plant involving special operating techniques. They have not yet placed orders, but they have obtained written undertakings from two American manufacturers, Lockheed and Consolidated Vultee, that they could deliver aircraft in time for the newly formed Lufthansa to start services with them. The numbers involved are much smaller than those that the Germans originally intended to buy; probably half-a-dozen Super-Constellations will be bought for long-distance work and the same number of Convair 340s for medium ranges. This would leave Lufthansa free to build up its fleet with more modern gas-turbine aircraft once the difficult stage of re-establishing services had been passed.

The Super-Constellation, with the Douglas DC-6, is the last and the finest of the great piston-engined airliners; it is an essentially modern aircraft that is only just coming into service. By starting long range services with these aircraft, probably in 1955, the Lufthansa would be as well equipped as the majority of its competitors; and since the only immediate alternative is the Comet, the decision to use Super-Constellations is probably an irrevocable and possibly a wise one. But the Germans may be less settled in their reported decision to base their medium run services on the Convair 340, an aircraft that has been in service for some years; they may yet decide to operate these services with the Vickers Viscount instead. The Viscount, as a turbo-prop aircraft, does not call for the same precise schedules as the pure-jet Comet, and its costs compare favourably with those of the Convair. A deciding factor may be the ability of the British companies to offer the same credit terms as the Americans; the numbers of civil aircraft on the American industry's order books have been running down rapidly and manufacturers are likely to offer particularly favourable terms. Since airlines do not like changing their suppliers because of the difficulties that it creates over spare parts

and servicing, the familiar and vexed problem of long-term credits for British exports seems to be raising its head in a field where the *prima facie* case appears better founded than in many others.

Spate of New Issues

THE queue of applicants for new money during this summer holiday season is bigger and has appeared more suddenly than the capital market had expected. The steady accumulation of liquid balances in British industry (associated with the decline in stocks) had led most investors to believe that applications for new money would have been at least deferred until later in the year. In fact, however, there has been a sudden spate of moderately attractive mixed ordinary-cum-debenture issues, most of them by companies associated with the capital goods industries in this country or by those interested in developments in the Commonwealth.

Heading the list comes English Electric, whose decision to raise £2,500,000 on a 4½ per cent debenture stock (1972-77) at 97½ and whose rights issue of 1,769,365 new £1 ordinary shares at 48s. 6d. were discussed in these columns last week. The lists for the debenture stock were promptly closed on Thursday when a heavy over-subscription was announced. Also within the orbit of the capital goods industry in this country are the offers by Marley Tile (one of the leading companies manufacturing concrete roof tiles) of £750,000 of 5 per cent debenture stock (1959-77) at 99, and by Berry Wiggins and Company, the petroleum refining and bitumen making concern of 1,500,000 new 5s. ordinary shares at 5s. 6d. each; on the basis of a dividend of 10 per cent these shares would yield a little more than 9 per cent on their issue price.

Two other major new issues are to be made by companies closely concerned with the development of Commonwealth resources. Wankie Colliery (now domiciled in Rhodesia) is to raise about £4,500,000 by an issue of shares and debentures; the actual details of the offer have not yet been announced, but the new money will be used to provide further equipment for the company's two collieries, for the establishment of a third one, and for extensions to coking and other by-product plants. A similar combined offer of equities and debentures is to be made by Taylor Woodrow, the well-known civil engineering company that has many interests overseas. This offer, which comprises a £500,000 issue of a 5½ per cent debenture stock (1960-68) at par coupled with an issue of ten new 5s. ordinary shares at 7s. 6d. each for every £100 of the loan stock taken up, is the first to be sponsored by the recently formed Locana Corporation. This corporation, founded under the auspices of Hambros Bank, Harrisons and Crosfield and a number of investment trusts, was formed with the object of helping British companies to establish themselves in Canada. It is in Canada that the bulk of the new money to be raised by Taylor Woodrow will be used. Since Taylor Woodrow's existing ordinary shares are currently quoted at around 14s. 6d., the option for subscribers to the new loan stock to subscribe for the company's equity shares at 7s. 6d. each seems to be a carefully calculated and attractive bait.

Two Warnings from Selection Trust

TWO very plain warnings were issued at last week's annual general meeting of Selection Trust Ltd., which controls the Roan Antelope and Mufilira copper companies through Rhodesia Selection Trust and which has other considerable investments in the diamond, gold and oil industries. The chairman, Mr Chester Beatty, addressed his first warning directly to the company's shareholders. Without mincing any words Mr Beatty told them that they can expect lower dividends in the near future, as the dividends that Selection Trust itself will receive from its investments are almost sure to drop after the recent fall in metal prices. The group is, however, taking the opportunity to extend its exploration programme, particularly in Canada and Southern Rhodesia; concessions can now often be obtained on more favourable terms than may be possible in the future.

Mr Beatty's second warning was directed at the British Treasury. He believes that very few of the mineral deposits that Selection Trust has helped to develop in the past would be worth equipping today by a company resident in this country, because at the present rate of British taxation "the net return from such a company would not justify the expenditure involved." It is therefore the practice of Selection Trust, when sponsoring new companies for the development of a new mining venture, to have its subsidiary companies registered and domiciled abroad. Broadening his argument, Mr Beatty added that he thought that

it will only be a matter of comparatively short time before only very few of the world's minerals are controlled from the United Kingdom, unless quite substantial relief from taxation is given by the Chancellor of the Exchequer in respect of overseas mining business administered from this country.

The migration of mining companies from this country has already proved Mr Beatty's point, and it should not be dismissed by the Treasury merely as a piece of familiar and special pleading by one of the interests involved.

Greeting the Stockholder

FAR too often stockholders in British industry are the odd men out. Any reform, however small, that identifies the stockholder more closely with his company is therefore to be welcomed without reservation. Just such a reform has been initiated by Unilever Ltd, which, in forging those intangible links between the board-room, the workshop and the stockholders' meeting, has already to its credit a series of informative and unusually well-presented accounts. Adopting a practice that is very common in the United States, but that is almost unknown in this country, the directors of Unilever have decided to send a letter of welcome to every new stockholder. In this unpretentious letter, stockholders are told something about the financial and industrial organisation of the Unilever group, about the products it sells, about the date of dividend payments and how to secure the receipt of these payments through a banking

In the Seaports of the East...

from the Arabian Sea to the Pacific Ocean the branches of the Chartered Bank perform a wide range of banking services connected with overseas trade and local industry. Merchants and manufacturers in the United Kingdom who trade into the East are invited to consult the Bank's managers in London, Manchester and Liverpool.

THE CHARTERED BANK OF INDIA, AUSTRALIA & CHINA

(Incorporated by Royal Charter, 1853)

Head Office : 38 Bishopsgate, London, E.C.2.
West End (London) Branch : 28 Charles II Street, London, S.W.1.
Manchester Branch : 52 Mosley St., Manchester, 2.
Liverpool Branch : 28 Derby House, Liverpool, 2.
New York Agency : 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

THE ORGANISATION OF

HENRY GARDNER & CO. LTD.

(CAPITAL AND RESERVES, £2,000,000)

is associated with

The British Metal Corporation (Pakistan) Ltd.,
Drew, Brown Ltd. (Canada), Sandilands Buttery & Co. Ltd. (Malaya),
and C. Tennant Sons & Co., of New York, as well as with
the associates of The British Metal Corporation Ltd., London,
Australia, Canada, India, South Africa and Central Africa.

The Group provides manufacturers and producers of finished articles and raw commodities with an economical method of marketing their products

throughout the world. Expert knowledge in distribution and salesmanship is available through the various units of the Group.

THE PURPOSE AND RESULT OF SENSIMATIC CONTROL

Here's the secret of the Sensimatic's astonishing versatility. Each panel (or sense-plate) like this guides the machine through any four different accounting jobs in any combination. There is no limit to the number of panels you can use.

From one accounting machine — countless applications

NOW THERE ARE FIVE VERSIONS of the Burroughs Sensimatic Accounting Machine, giving you the registers or combinations of registers you need for the jobs you have on hand. All are based on the completely new principle of Sensimatic Control, which directs the machine automatically through every mathematical function and carriage movement during a posting operation. Just as there is no practical limit to the number of different accounting applications the Sensimatic will handle—switching instantaneously from one to another at a turn of the selector knob—so there is no limit to the economies in time and labour which its use will effect in your office.

Call Burroughs about the Sensimatic today. You'll be surprised at the low cost of this multi-purpose accounting machine.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service offices in principal cities.

Burroughs  **Sensimatic**

account. Letters such as these cannot perhaps do much to remedy the atrophy of savings and risk capital in this country, or to re-establish the vital principle that the stockholder should not occupy a subordinate place in the hierarchy of directors, managers, workers and stockholders. But they can do something, and there should be many more of them.

SHORTER NOTES

Traffic on the cross-channel car ferry operated by Silver City Airways has expanded to a point where the company is contemplating building its own airfield in the Romney Marsh area. In the five years during which the ferry has been in existence, the number of vehicles carried has risen from 170 in the first year to 11,000 in 1952; in the first six months of this year, more than 10,000 have been flown across and at least that number will be ferried in the single month of July.

In their report on Hudson Bay Marine Insurance Rates for 1953 the Commonwealth Shipping Committee state that a record number of 27 ships sailed from Port Churchill in 1952, compared with 21 ships in 1951. Various improvements to aids to navigation are outlined in the report, and as a result the insurance market has amended the

additional premiums for the Hudson Bay on vessels fitted with gyro compasses from 7s. 6d. to 6s. 8d. per cent.

Retail sales rose sharply from 118 in April (1950=100) to 126 in May. This is ten points higher than a year ago, and if food sales are excluded the difference is even more striking. Sales of goods other than food by the big retailers rose from 103 to 120 between April and May, and those of the independent, smaller shops from 96 to 112. Much of the increase took place in household goods, sales of which rose 20 per cent, no doubt as a result of the budget reductions in purchase tax.

The sale of the ordinary shares in Prices Trust—whose affairs (and existing excess of property values over balance sheet values) were discussed in these columns a week ago—was given a fresh twist this week. The Anglo-Federal Banking Corporation made an unconditional offer last Monday of 31s. a share for 51 per cent of the ordinary capital of Prices Trust. This price is 1s. more than the offer that was made by United Drapery Stores and that was accepted by Sir Harry Price for his one third interest in Prices Trust's ordinary capital; it follows a conditional bid at the same price made on July 2nd—that is before the offer by United Drapery Stores was made public—for 75 per cent of the ordinary capital.

Company Notes

ENGLISH SEWING COTTON.

The decision by the directors of English Sewing Cotton to maintain the ordinary dividend at 12½ per cent is obviously a reflection of their confidence in the future rather than of their satisfaction with the trading results in 1952. For last year, as was reported in these columns on June 20th, trading profits collapsed from £1,370,438 to £40,611. In his statement accompanying the full accounts, the chairman, Mr Leslie Shaw, amply demonstrates that this pitifully small level of profitability is not a fair guide to current prospects. As with almost all the other textile companies either side of the Pennines, English Sewing Cotton had to withstand a sharp fall in prices and a loss in sales in the first months of 1952—and then began to enjoy a notable revival in trade in the months that followed. This recovery could not be expected to go far enough in 1952 to wipe the black marks out of the accounts—especially as higher unit costs were inevitably associated with the decline in output. But at the moment, although a few of the company's departments are still under-employed, Mr Shaw reports that the mills are running "at a fairly high level of activity."

Mr Shaw's confidence in the future is based on the change in working capital commitments as well as upon the present course of trade. He explains in some detail that in the first half of 1952 the company kept its mills running at a high

level of activity and continued to build up its stocks of finished goods. When trade improved about halfway through the financial year, however, the company did not immediately step up production but began to sell off its accumulated stocks; by the end of 1952, therefore, the volume of stocks was about the same as had been held at the end of 1951. The fall in the book value of stocks (from £4,221,590

to £3,611,709) was therefore due almost entirely to the decline in prices. Since the beginning of 1953 the company has

been reducing its stocks of finished goods at "a fairly rapid rate" and it has also reduced its stocks of raw materials. The reinforcement of the company's liquid resources that will have followed this reduction in inventories, together with the higher level of current profits, suggests that a dividend of 12½ per cent may be paid again this year—and with much greater comfort.

AMALGAMATED METAL.

Together with most other dealers in non-ferrous metals, rubber and other commodities, Amalgamated Metal had to suffer some hard blows last year. But these blows were not quite as severe as a first reading of the company's full accounts, which show trading profits to have slumped from £1,919,439 to £892,049, might suggest—for earnings in 1951 were unduly swollen by certain exceptional receipts and profits. Indeed the most dismal feature of the latest profit and loss account is not the decline in profits but the fact that taxation (at £715,596, including £86,000 for EPL) is only £350,000 lower than the year before, and thus absorbs an even higher proportion of gross profits than in 1951. Net profits have slumped even more alarmingly than gross earnings, from £1,008,867 to £330,111. But the directors, who were not led astray by the exceptional profits in 1951 and who have the comfortable assurance that EPL will not disfigure the accounts for long, have been able to maintain the ordinary dividend at 8 per cent without any real difficulty.

The balance sheet provides a further

justification for this maintained dividend. The value of the group's stocks has fallen from £2,918,910 to £1,920,297, and this has been followed by the customary reinforcement of liquid balances. Last year the group reduced its bank overdraft from £1,610,924 to £1,066,980, increased its

balances from £1,082,147 to 80, and increased its holdings of five certificates from £63,025 to £100,000. There are still plenty of shares at a price of copper when free to begin in this metal in August. In the short term consideration that the company has associated itself with the new companies formed to promote and exploit development projects in Canada and Newfoundland. The £1 ordinary stock units currently stand at par, to yield 8 per cent.

PINCHIN JOHNSON. Shareholders in Pinchin Johnson, the paint

manufacturers, have not been as fortunate as those in Amalgamated Metal and English Sewing Cotton. Their ordinary dividend has been cut from 25 to 20 per cent. As had been expected, in view of the worldwide trading recession, the company's preliminary report shows that both gross trading profits and net profits have fallen—from £1,958,819 to £1,476,076 and from £520,893 to £422,496 respectively. These declines, however, are not as violent as those reported by many other companies that have been willing to maintain their dividend payments; in advance of the publication of the full accounts, it must therefore be assumed that neither towards the end of Pinchin Johnson's financial year (on March 31st last) nor since then have there been any very hopeful signs of recovery in the paint trade. But last year's issue of an unsecured loan stock and the more recent acquisition of the Fishburn Printing Ink Company show that the group, come

10s. ordinary stock at 30s. xd. yields £6 13s. per cent. wind or rough weather, is not afraid of adding to its interests either in this country or overseas. In itself this is a sign of long term confidence, but it does not make up for the short term gloom spread by the dividend reduction.

LONDON STOCK EXCHANGE

Next Settlement Day: July 21st.
Next account begins: August 5th.
Next Contango Day: August 5th.

BUSINESS was again at a low ebb this week and prices tended to drift slightly lower as the old account drew towards its end. A little ground, however, was gained in most markets at the beginning of the new three weeks' account. In the gilt-edged market prices were again marked up slightly before the weekend; but, as the market faltered on Wednesday, the net gains in prices in the week to Wednesday's close were very small indeed. Old Consols and Daltons, for example, made gains of only 1/4 to the common price of 60 1/4, while many of the other stocks showed no net changes at all on the week's trading. In the foreign market Greek bonds received some support but the advance was checked when profits were taken on the first day of the new account. German and Japanese bonds—as is customary—were marked down at the end of the old account; next day, however, German issues were again in demand on the news that the debt settlement had been ratified in the United States. Some speculative support was also given to Hungarian issues.

In the industrial market interest tended to be concentrated upon the lesser known issues, rather than upon "blue-chips." Textile and tobacco shares received some support but the rally in prices received a sharp check on the last day of the old account. Colliery shares were marked up after the news of the valuation award on colliery houses. At the beginning of the new account a much brighter tone prevailed in the market, although the volume of business remained small. Oil shares were also particularly firm at the opening of the new account. Kaffirs were dull at the end of the old account; but then took a decided turn for the better when the new account opened, following the cheerful quarterly report of the Union Corporation and the news of Daggafontein's uranium profits. Copper shares were weak at first after the warnings from the chairman of Selection Trust, and tin shares were marked down in line with the sharp fall in the price of the metal.

Financial Statistics

EXCHEQUER RETURNS

For the week ended July 11th there was an "above-line" deficit (after allowing for Sinking Funds) of £4,903,000, compared with a surplus of £6,110,000 in the previous four days and a deficit of £17,337,000 in the corresponding period last year, bringing the cumulative deficit to £155,213,000 (£213,074,000 in 1952-53). Net expenditure "below-line" absorbed £7,334,000 raising the total cumulative deficit to £280,836,000 (£392,138,000 in 1952-53).

THE MONEY MARKET

CREDIT remained short in Lombard Street in the week covered by Wednesday's Bank return. On each day except Wednesday moderate official help was needed to save the discount market from recourse to the Bank. It was given readily—indirectly through purchases from the banks on each day from Thursday before the week-end to Monday, and then directly on Tuesday to individual houses that were especially short of funds. On Wednesday, the influence of the final call (of £314 million) on the BEA loan made credit short at first; but as these funds flowed back to the banks conditions eased later, and normal credit supplies proved just adequate for the first time in the week.

At last week's Treasury bill tender, the market restored its bid to £99 8s. 2d. for the £260 million of bills on offer; this drop of 2d. on the previous week's bid was to be expected in view of the difficult credit conditions that had ensued. At yesterday's tender, £250 million of bills were on offer; with a full allotment, the excess of new bills over maturities will rise to £20 million next week.

The Bank return shows an outflow of notes of £10.4 million. The Treasury special account rose by £5.8 million, but as holdings of Government securities in the banking department were up by fully £23.3 million, the influence of the week's special purchases are clearly discernible. With discounts and advances falling by £3 million, public accounts by £8.2 million and other items virtually unchanged, bankers' deposits rose by £12.2 million despite the note efflux.

London Money Rates

Bank rate (from 2 1/2% 11/3/52)	%	Discount rates	%
Bank bills: 60 days	3	3 months	3 1/2
Deposit rates (max)		4 months	3 1/2

NOTICES

UNIVERSITY OF MALAYA, SINGAPORE

Applications are invited for appointment to the post of Research Secretary of the newly established Social Research Unit of the University.

The person appointed will be Secretary of the Social Research Committee and will be required to organise group research projects. He will have the status of Senior Lecturer or Lecturer.

Salary on scale £1,330 x £70 to £1,610 p.a., or £854 x £42 to £1,400 p.a. Status and point of entry according to qualifications and experience. Expatriation allowance for persons recruited from overseas £210 to £280 p.a., according to salary. Cost-of-living allowance £294 to £637 p.a., according to salary and personal circumstances. All paid in Malayan currency.

Free passages for appointee, wife and children under 12 years of age. Housing allowance.

Applications (six copies), with the names of three referees and full details of qualifications and experience, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date July 31, 1953.

UNIVERSITY OF MALAYA, SINGAPORE

Applications are invited for appointment to two Research Fellowships in the Social Research Unit of the University.

Salary on scale £854 x £42 to £1,400 p.a., or £735 p.a. (fixed) according to qualifications and experience. Expatriation allowance for persons recruited from overseas £210 to £252 p.a., according to salary. Cost-of-living allowance £294 to £637 p.a., according to salary and personal circumstances. All paid in Malayan currency. Free passages for appointee, wife and children under 12 years of age. Housing allowance.

Applications (six copies), with the names of three referees and full details of qualifications and experience, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date August 31, 1953.

AUCKLAND UNIVERSITY COLLEGE

NEW ZEALAND. Applications are invited for a LECTURESHIP IN GEOGRAPHY. The position calls for qualifications in physical geography (preferably geomorphology and biogeography), with ability to teach cartography and field survey.

Salary will be £800 per annum, rising to £950 per annum by annual increments of £50. Allowance is made for travelling expenses. Further particulars and information as to the method of application should be obtained from The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

Closing date for the receipt of applications in London and New Zealand is August 31, 1953.

AUCKLAND UNIVERSITY COLLEGE

(UNIVERSITY OF NEW ZEALAND). Applications are invited for a LECTURESHIP IN ECONOMICS. Salary will be at the rate of £850 per annum, rising to £950 per annum by annual increments of £50. Allowance is made for travelling expenses.

Further particulars and information as to the method of application should be obtained from The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications is September 15, 1953.

EXPANDING GROUP OF COMPANIES in Midlands, with international reputation, employing 5,000 to 6,000 on manufacture of wide range of products in motor, aircraft and industrial fields and having acknowledged leadership in production and personnel techniques, is about to appoint, at a very substantial salary, an executive capable of advancing ultimately to the most senior position on their production management staff. Applications are invited from men 25 to 45 years of age who possess the essential minima, and those experience, which are regarded as the essential minima, and those without them will not be considered.

1. Technical training—H.N.C. or B.Sc.(Eng.).
2. Long practical experience (preferably with apprenticeship) in light precision engineering.
3. Many years of progressive supervisory experience in the same field.

4. Present position of high managerial responsibility. All applications received will be regarded as strictly confidential and will be considered at the highest level. The details required include age, training and qualifications, particulars of positions held, in date order, and an indication of the salary expected.—Box 285.

PUBLIC COMPANY, requires General Sales Manager. Textile of women's clothing, but appointment demands outstanding experience not essential, but appointment demands outstanding ability and experience in the control and direction of a national sales force. Commencing salary £3,500-£4,000 per annum, dependent upon experience, with prospect of directorship. Applications will be regarded as strictly confidential and will be opened only by the Managing Director.—Box 302.

FINANCIAL EDITORIAL ASSISTANT REQUIRED FOR LONDON FINANCING NEWSPAPER. Applicants, who must be of good personality and not over 40, should: (1) Be familiar with the financial and economic aspects of the metaliferous mining industry, with respect both to individual mining companies and to the share and metal markets; (2) Be able to compile and interpret simple statistics; (3) Be able to write constructively, concisely and quickly and preferably—have had previous experience of early promotion. The appointment offers the opportunity of early promotion. The appointment offers the opportunity of early promotion. The appointment offers the opportunity of early promotion.

depend on the extent to which the above requirements are initially fulfilled.—Particulars of qualifications and previous experience to Box 305.

I SHOULD LIKE to become a SURTAX payer (in due course). I am 33, have a thorough practical knowledge of export, personal selling experience at home and abroad, an Honours degree in Economics and a fair knowledge of three foreign languages.—Box 298.

LARGE British Company with world-wide distributive organisation and trace-mark and own production facilities in light engineering, factory seeks new products. Ample finance available for production, selling and advertising. Write Box 296.

YOUNG EXECUTIVE, exp. sales gen. management, seeks position. A.M.Amer.I.E.E., age 32, foreign languages, background light elec. industry, but any field considered where ability to use imagination is required. Excellent record in consistently progressive career.—Box 297.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS IN ECONOMIC & SOCIAL STUDIES. Applications are invited for the above studentships, renewable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £250 or £300 per annum. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University. Applications should be sent not later than August 15th, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for research posts in ECONOMICS, ECONOMIC STATISTICS, GOVERNMENT, SOCIAL ADMINISTRATION, and SOCIAL ANTHROPOLOGY. There are two grades: Grade II—salary not less than £450 per annum; Grade III—£350-£400 per annum. Applications should be sent not later than August 15, 1953, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF SOUTHAMPTON

Applications are invited for the post of Research Assistant in the Department of Economics, for research into productivity of certain industrial firms. Salary £400-£450, duties to commence September 14th or as soon thereafter as possible. Applications (three copies), together with names of three referees, should be sent by August 4th, to the Professor of Economics, University of Southampton, from whom further particulars may be obtained.

THE AUSTRALIAN NATIONAL UNIVERSITY, CANBERRA

SCHOLARSHIPS. Applications are invited from postgraduate students with research experience for Scholarships in Anthropology and Sociology, Demography, Economics, including Economic History and Economic Statistics, Far Eastern History, Geography, International Relations, Law, Pacific History, Political Science, including Public Administration, Social Philosophy, Statistics, including Mathematical Statistics. The Scholarship tenure is for a period of two to three years.

The present value of a Scholarship is £A624.10s. p.a. Married scholars with dependent children may be granted additional allowances and the University will make a contribution not exceeding £87.75 towards a scholar's fares to and from Canberra.

Application forms and further information may be obtained from the Secretary, The Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1. Applications should be submitted to the Registrar, The Australian National University, by August 31, 1953.

R. A. HOHNEN, Registrar.

NORTH WESTERN INDUSTRIAL ESTATES, LIMITED

APPOINTMENT OF GENERAL MANAGER. Applications are invited from suitably qualified candidates for the post of General Manager of the North Western Industrial Estates Limited. The Company acts for the Board of Trade and is responsible in the Merseyside, South Lancashire, and North-East Lancashire Development Areas for the construction and management of factory premises and industrial estates financed by the Government under the Distribution of Industry Acts 1945 and 1950.

The initial salary will be within the range of £1,500-£1,750, dependent on the qualifications and experience of the successful candidate. The successful candidate, on taking up the appointment, will be required to join the Company's Staff Pension and Life Assurance Scheme.

Applications, stating age, education, present appointment and salary, and giving full particulars of qualifications, experience, etc., together with the names of two referees, should be forwarded to: The Chairman, North Western Industrial Estates Limited, Derby House, Exchange Buildings, Chapel Street, Liverpool 3, so as to reach him not later than August 21, 1953.

Envelopes should be endorsed "General Manager." This vacancy has been notified in accordance with the Notification of Vacancies Order 1952.

THE Renold and Coventry Chain Company Limited require an individual for the Economic Survey and Central Statistics Department. Candidates should be 28/35 years of age with good University degree in Economics and/or Statistics, and experience in industry of the practical application of economic and statistical techniques.

Commencing salary £730/780 per annum, depending on qualifications and experience. The post includes participation in the company's pension and profit-sharing schemes.

Applications, stating age, full details of qualifications and experience, should be addressed to the Employment Manager, Renold Works, Didbury, Manchester 20 and quote the Reference A5.

OXFORD GRADUATE, 25, single, bilingual French, fluent Spanish, ambitious, hardworking, and intelligent, two years' P.A. experience with large British export concern in very competitive Near Eastern market, seeks responsibility and quick progress with firm London or Madrid.—Box 286.

THE Executive Director of a manufacturing company in the West Midlands requires an Assistant with experience in Organisation and Methods, Work Study, Staff Management, and some knowledge of Management Accountancy. Age 30 to 35. Commencing salary £800, with good prospects of promotion.—Box 301.

RESEARCH GRADUATE (29),

COMPANY MEETINGS

LONDON AND MANCHESTER ASSURANCE
COMPANY, LIMITED

INCREASED PREMIUM INCOME IN ALL DEPARTMENTS

ANOTHER SUCCESSFUL YEAR

LORD GRANTCHESTER'S REVIEW

The eighty-fourth annual general meeting of the London and Manchester Assurance Company, Limited, was held on July 15, 1953, at the Chief Office, Finsbury Square, London, E.C.2.

The chairman, Lord Grantchester, OBE, in moving the adoption of the report and accounts, said:

I know that I shall be echoing the feelings of everyone engaged in our enterprise if I commence my remarks by paying a tribute to our former chairman, Mr A. H. Dawes, who made so noteworthy a contribution to its growth and prestige. His career won him distinction—not only in this company—but in the service of Industrial Life Assurance as a whole. His chairmanship of the Industrial Life Offices' Association during the crucial period when a large sector of the insurance industry was first openly threatened with damaging state interference thrust upon his shoulders heavy responsibilities. He discharged these duties with steadfastness—always keeping before him a national rather than a parochial view of his responsibilities.

BOARD CHANGES

There have been several important changes in the constitution of the board during the past few months.

We welcome three new directors:

Mr Harold L. Rouse is a distinguished member of the distinguished board of the Midland Bank, with which he has been associated all his life, attaining the high office of chief general manager before he joined the board of the bank.

Mr Lewis G. Whyte is well known for his knowledge and experience of the problems of investment.

I consider the company is particularly fortunate, in times like the present, to have the benefit of the advice of two men of such calibre and wide experience.

The third addition to the board is Mr Wilson, who joined the company in 1922, and upon whom, as the company's actuary, the board is dependent for the assessment of the company's liabilities.

Mr Wilson was appointed actuary in succession to Mr A. H. Mann, who, in May last, was appointed managing director.

Mr Arrowsmith is leaving us after 52 years' service with the company, of which 25 years were spent as general superintendent and six years as a director.

ACCOUNTS

The accounts for the year ended March 24, 1953, and the directors' report have been in your hands for some weeks, and I assume you would wish me to take them as read. Now that the comparative figures for the previous year are published in the accounts, there is very little that it is necessary for me to say on them without wearying you with the repetition of figures which you will have already studied. Suffice it for me, therefore, to draw your attention to the fact that the

premium income from all branches advanced by £180,000 and exceeded £6 million, showing the continuing progress of the company.

The gross rate of interest earned on the Ordinary Branch Life Fund was £4 13s. per cent and on the Industrial Branch Life Fund £4 12s. 11d. per cent, which in each case is 3s. 4d. per cent better than last year (part of which increase is, however, due to the effect of last year's large transfers to Investments Reserve Fund). The net rate earned was £3 11s. 1d. per cent compared with £3 9s. per cent last year in the Ordinary Branch and £4 4s. 6d. per cent compared with £3 19s. 10d. per cent last year in the Industrial Branch.

Including the transfer to the Staffs' Pension Fund as an expense, the expense ratio in the Ordinary Branch was 13.9 per cent, showing a small decrease on last year's figure, whereas the Industrial Branch expense-ratio, similarly calculated, remained unchanged at 30.8 per cent.

INVESTMENTS

Last year, as you know, it was necessary to make substantial transfers to Investments Reserve Fund to meet the depreciation suffered mainly on the company's holding of Government securities. I am happy to be able to tell you that the position as regards depreciation was materially better on March 24, 1953, as compared with the position a year earlier.

Nevertheless, as the Chancellor indicated in his Budget speech, the future is by no means yet "set fair," and your directors, while resuming the policy of declaring a reversionary bonus to policyholders in both branches for the past year, have deemed it desirable to exercise caution against the possibility of renewed deterioration which might follow upon another deterioration in the nation's balance of payments, for the Chancellor has made it clear that in such an event he "would not hesitate to use the monetary weapon," which might include the raising of the Bank Rate.

LABOUR PARTY PROPOSALS

It is unfortunately necessary for me to refer, briefly, to the new proposals of the Labour Party published a few weeks ago in so far as they appear to affect our business. No more reactionary and undemocratic plea has been advanced than that the nation's economy (which means what is to be produced and sold) should be determined in peace-time by regulation and imposed upon free citizens. The answer is very plain: no one has the right to decide such a matter except the people themselves in their day-to-day activities, and it is an impertinence for anyone or any Party to indulge in pretensions of superior knowledge of such a complex subject covering so vast a field. In a free market economy what governs production is the vote, often cast several times a day, by the breadwinner or by the housewife when they exercise their choice in selecting a purchase in a shop or in an insurance office. If any manufacturer, or for that matter any insurance company, is intelligent enough to anticipate a sufficient demand from the public for what they are to

offer for sale, thereby proving that they are meeting a need, they will be fortunate enough to make a profit. If they do not do so they will soon be out of business. The concept of profit is therefore a function of primary importance indicating as it does how far the public is being served as it wishes. Expectation of profit is the incentive which calls for service and the realisation of profit the criterion by which investors must judge.

Any other criterion, however it is designated or whatever good intentions may inspire it, is fraught with grave risk of loss to those who, by restricting their immediate consumption, have performed a most useful social function by their saving through the medium of insurance or other channels. It is of special interest to us, because of the importance of our business in its relation to national saving, to know that the exhaustive Report of the Bank of International Settlements published last month states that experience has shown that it is an illusion to count on overall budget surpluses for any permanent contribution to meet the requirements of industries and that what is necessary is a revival of personal saving made possible by reductions in taxation.

Taxation is too high in this country to permit of the necessary flow of savings into creative enterprises but every member of our staff when he sells a policy is helping to realise the hopes of the Chancellor that the gap in his Capital Balance Sheet will be bridged through personal saving.

The collection of so many small premiums has for many years provided, and continues to provide, a very important contribution to national savings.

The Labour Party's proposal to prescribe by statute on the distribution or ploughing back of profits is a further attempt to relieve directors of their responsibilities and to decide "ex cathedra" by a tribunal less conversant with the relevant considerations vital to the business than those upon whom the responsibility now rests.

The salutary influence of a body of shareholders upon their board ensures generally among other beneficial effects that a balance is held between conservation and distribution. Fair distribution is important for its bearing upon a policy of conservation, for the most conservative conservation usually needs reinforcement at some time by further investment which cannot be expected to be made in a company which does not deal equitably with its existing shareholders.

The London and Manchester is a Company which is out quite unashamedly to make a profit because the making of a profit is evidence that we are meeting a wide need with due economy in administration and are pleasing large numbers of the public. When we have demonstrated that fact we share that profit with those through whom it has been won, to whom we pay back a far larger proportion of profit than to anyone else. To policyholders in the Industrial Branch who have no contractual right to participate in profits we have allocated, out of profits, no less than three million pounds since we started this practice in 1928. We do this, not

because we are philanthropists, but because we think it good business to do so, for we hope thereby to attract a still wider circle of friends and policy-holders with whom we shall continue this process of profit-sharing.

As a final word on the new Labour Party proposals may I say that, in our opinion, the general body of policy-holders would not welcome the creation of a "Juggernaut" of an amalgamation to take the place of many rivals and competitors, large and small. After all, the service which an insurance agent renders in the home of the policy-holder is a very personal one and the preservation of a choice of the individual calling is very important. Monopolies are anathema to the consumer. The cost of administration might well rise rather than fall under a "publicly

organised service." Perhaps it is even more important that the caller at the home should not be the representative, direct or indirect, of the State or any other compelling Authority. So might be forged an instrument of coercive suggestion which could be used to undermine independent thought and prevent the formation of any independent public opinion.

STAFF

In concluding I should like to express once again our appreciation of the assistance and courtesy of the directors, officials and staff of the County Fire Office who so readily place their experience of Fire and Accident business at the disposal of our staff and policy-holders; and to pay a tribute to the

officials and staff of the London and Manchester who have contributed to the results before you. It is the aim of all concerned in the management that responsibility should be shared by every member of the staff, and that in a position of responsibility, whatever the degree, each should have the opportunity to work with dignity as a person of importance because he renders important service. In no business is the integrity, intelligence, keenness and personality of the representative more important than in an insurance office such as ours. To all members of the staff for their work during the past year we say "Thank you." Our wish is that all of them may derive enjoyment as well as profit from their work in the service of the Company during the current year.

ASSOCIATED WEAVERS LIMITED
(Manufacturers of Carpets and Upholstery Fabrics, Dyers and Spinners)

RECORD PRODUCTION AND PROFITS

LIQUID POSITION FURTHER STRENGTHENED

REVIVAL IN OVERSEAS TRADE EXPECTED

SIR FRANK NEWNES' STATEMENT

The seventeenth annual general meeting of Associated Weavers Limited was held on July 16th at the Savoy Hotel, London, W.C., Sir Frank H. Newnes, Bt, chairman of the company, presiding.

The secretary (Mr William Sunderland) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to March 31, 1953:

It is always a pleasant task for a chairman to report that, for the year under review, production and profits constitute a new high record, despite a very slow start in the early part of the year. Such, however, is the flexibility of the productive capacity of your company, coupled with the close team work necessary, that we were quickly able to take the opportunity offered by the increasing sales of our new products to raise output to record levels.

The consolidated net profit after all expenses, but before deducting taxation was £475,185 against £300,538 for the previous year, a truly excellent result.

Of this figure, taxation takes £335,227 or approximately 70 per cent leaving £139,958 or approximately 30 per cent for disposal. The latter is an increase of only £2,762, although the rise in profits amounted to £174,647.

THE DIVIDEND

The Directors have already paid an interim ordinary dividend of 10 per cent actual on a capital of £305,200 requiring £16,023 net, and now recommend a final ordinary dividend of 20 per cent actual on a capital of £348,800 (as increased by the free share bonus of 1 in 7 distributed last January) requiring £38,368 net and making a total of 30 per cent for the year.

Your Directors expect to be able to maintain in future this rate of distribution on the present ordinary capital of £348,800. The net sum required to pay this dividend and the preference dividends is less than half of last year's profits after deducting all taxation.

Your Directors have transferred from the balance on profit and loss account to general reserve the sum of £259,700, thereby raising it to £316,100. If we add thereto the share

premium account and the EPT post war refund, we get a total of £350,000 or slightly more than our issued ordinary capital. This will still leave us a balance of £9,556 on profit and loss account to be carried forward to next year.

BALANCE SHEET FIGURES

If you will turn to the consolidated balance sheet you will notice an increase in our plant and machinery account and this is due to the completion of the re-equipment of our carpet mill. The estimated balance of liabilities for capital expenditure within the group has been reduced as a result from £105,000 a year ago to £28,500 at March 31, 1953.

We have deemed it wise during a good year to write down to site value only, some cottage property we own which adjoins our Dudley Hill factory. We have also written down to £1, all our fixtures and fittings and motor vehicles.

The liquid position of the group has continued to strengthen. At March 31, 1953, our current assets exceeded our current liabilities by £892,152. Our current assets included £477,792 cash at bank and in hand, and on deposit with building societies.

END OF EPL WELCOMED

Although our basic profits figure is reasonably high by virtue of the satisfactory profits earned during the standard years as increased by subsequent accumulations of undistributed profits, nevertheless, the excess profits levy takes a heavy toll of this year's very much higher figures, which is such an extremely disheartening climax to the efforts which made those most excellent results possible. Fortunately, however, for a progressive company such as ours, the Chancellor said in his Budget speech that this tax will end in January, 1954, and it is worth noting that even the previous Chancellor, Mr Gaitskill, has gone on record as having stated that he, too, is opposed to this tax. If no alternative tax is imposed in its place, then your company should benefit very much indeed under normal conditions.

Last year I spoke about the volume in most markets being much smaller. Whilst the home trade demand has risen greatly, exports of the parent company are still restricted by the import controls exercised in our principal overseas markets. We are, however, now in-

formed that the saturation phase existing in some overseas markets has passed, and we are looking forward to a revival as soon as our main markets reopen fully. This should help to protect us should the present keen home trade demand for our products tend to slacken in the future.

I also mentioned the introduction at the latter part of the year of a new twin pile moquette, and I feel that I must add that the sales of this fabric have far exceeded our most optimistic hopes.

TWO INTERESTING EVENTS

Since March 31, 1953, there have been two interesting events. One, the reduction of purchase tax on carpets—most certainly a step in the right direction—and the other, the completion of the re-equipment of our carpet division.

Progress in our research and quality control departments continues well. They are now mainly equipped with the latest type of machinery suitable to their needs. Several photographs based on these departments are shown in this report.

During the year under review, Directors and representatives of our sales organisation and that of our subsidiary, Armordite, Limited, have visited the principal countries of the world in the interests of sales and close observation of trends.

FURNISHING TRENDS

At the present time in the furnishing industry, as well as in architecture, there is a definite leaning towards what is known as "contemporary" into which controversial sphere I do not propose to enter; but I would like to say that our competent designing staff have had no difficulty in producing for this field successful designs (which have been acclaimed by our customers catering for this difficult but definite market) as well as, of course, producing our traditional types of designs. Our production and sales so far this year are highly satisfactory in every division.

I think it is worth repeating that all our moquettes and carpets are branded with the trade mark "Weavercraft," and our customers know that we proudly stand behind this.

This year, as I write my speech, the international situation appears to be more relaxed

than at any time since the end of the war, and it is devoutly to be hoped that we shall really have "peace in our time." With the strengthening of the sinews of peace, more houses, more refurnishing, etc., etc., your company will have an increasingly important part to play in catering for an ever-widening demand not only at home, but in many markets abroad.

SUCCESS OF ARMORIDE, LIMITED

Contrary to the trend in the leathercloth and plastic industries, our subsidiary, Armoride, Limited, has again increased its profits to an all-time record, and we regard this as a great tribute to its efficiency and to the originality and sales appeal of its products. The policy of maintaining an excellent standard of quality and service to their customers reaps its own reward.

Its new upholstery covering "Florestin" continued in its popularity, and is now established, and is fast becoming a household name.

This year in particular I cannot conclude without saying how very much I and my co-Directors thank our executive and productive staffs, employees, and especially our sales organisations and their agents throughout the world, for the excellent efforts they have put in during the whole of the year, which have enabled us to achieve such magnificent results.

The report and accounts were unanimously adopted; the proposed dividend was approved, and the retiring Director, Mr Basil M. Lindsay Fynn, BComm, FCA, was re-elected.

Resolutions were also passed ratifying the pension arrangements made on behalf of the Managing Director by the board, and approving an agreement extending his service agreement.

AMALGAMATED METAL CORPORATION

MR W. GARDNER'S STATEMENT

The following are extracts from the statement of the chairman issued with the report and accounts.

In 1952 the contraction in world trade in consequence of restrictions imposed by many countries and the recession in commodity prices had their effects on the operations of our group, which comprise not only the principal non-ferrous metals and ores and rubber, but also many other commodities, such as timber, chrome, asbestos, jute, vegetable oils, etc., as well as general merchandise. Profits are consequently lower. Nevertheless, your board has deemed it right to maintain the dividend at the same level as last year.

LEAD AND ZINC

The lead market was reopened on the London Metal Exchange on October 1, 1952, and the zinc market on January 2, 1953. All arrangements have been carried out smoothly, thus enabling the London Metal Exchange to resume its normal functions of registering world prices and enabling producers and consumers to hedge against their commitments.

The reopening of these markets took place during a period of inevitable reaction from the world-wide buying scramble of 1951 and early 1952. Also, whereas during the last six to twelve months under bulk purchase the Government had, in effect, been taking substantial tonnages off the market, under private trading the full current output had either to be sold to consumers or hedged on the Exchange. The falling trend of prices thus continued.

The price of lead had dropped from £180

a ton at the beginning of 1952 to £110, when the London market reopened. It rapidly fell to £80 on October 22nd, but recovered to £105 a ton at the end of the year. In 1953 a new low point of around £72 was touched on April 23rd, from which there has been a recovery to the present level of around £89 a ton. Zinc was as high as £250 a ton (and refined zinc over £300) at the beginning of 1952, and had fallen to under £90 at the end. During 1953 it fell to £64 a ton (April 23rd) and is at the present time (June 30th) around £71 a ton.

The drastic correction of the excesses of the Korean boom appears to have come to an end in April and from now on we can reasonably hope for a much more stable trend of lead and zinc prices.

The postwar expansion of output continued in 1952. World production of lead last year amounted in long tons to approximately 1,750,000 tons and of zinc to 2,250,000 tons. The USA continued to provide a huge post-war market for "foreign" metal and its imports of lead and zinc last year amounted to 550,000 tons and 450,000 tons respectively.

The copper market on the London Metal Exchange will be reopened on August 5th.

RUBBER

From a high of 41d. per pound early in 1952, the price of rubber declined steadily to a low for the year of 22d. in October. An improvement took place in November and December, the price reaching 28d.

This improvement was speedily counteracted by the reopening of the alcohol synthetic plants by the US government and the price recommenced its downward movement, touching the low point of 19½d. in April. The cost of production of alcohol based synthetic is believed to be around 36d. per pound, while it is being sold by the US government at under 20d.

It is hoped that the synthetic plants in the USA will be disposed of to private industry within 12 months, and it should then be possible to ascertain the true commercial cost of production of synthetic.

World production of natural rubber exceeded consumption by about 300,000 tons in 1952—all of which was absorbed into Government stockpiles. For 1953 the Rubber Study Group estimate a surplus of 190,000 tons. The Study Group at Copenhagen postponed further consideration of a buffer stock and had to remain content with a declaration by the RMA of America that they would absorb or consume any potential surplus of natural rubber during 1953 at or around the present price level of 21d.

NEW INTERESTS

Two years ago I mentioned that the British Metal Corporation, in conjunction with a well-known mining concern, had exercised an option for the purchase of an asbestos property in Southern Rhodesia. The scope of this enterprise has been widened and our subsidiary's associates now include the Johns-Manville Corporation of USA, and Anglo-Huronian, Limited. A company named "Rhodesian Asbestos Limited" has been formed, in which the British Metal Corporation are considerable shareholders.

In common with a substantial number of important concerns, the British Metal Corporation is a participant in a syndicate known as British Newfoundland Corporation, Limited. This has been formed with the active support of the Newfoundland government, and its objective is to prospect on a substantial scale the natural resources of various parts of Newfoundland.

The British Metal Corporation has taken an investment in the Commonwealth Development Finance Corporation, the company recently formed under the aegis of the Bank of England.

WHITBREAD AND COMPANY

RESULTS AGAIN SATISFACTORY

The annual general meeting of Whitbread and Company, Limited, was held on July 10th in London, Mr W. H. Whitbread (chairman and managing director) presiding.

The following is an extract from the circulated statement by the chairman for 1952:

You will have seen a preliminary announcement of the profit made by the Company during the year 1952, and of the increased dividend recommended. From this you will probably have considered that the results are again satisfactory.

IMPROVED FIGURES

The profit of the Parent Company for the year, after providing for taxation, amounts to £653,624, an increase of £61,258 over the previous year. The consolidated accounts also show an improvement; the profit for the year after providing for taxation is £723,862—an increase of £66,598. Profit on trading, plus dividends and interest receivable, has increased by some £113,000. This increase has, however, been offset by the extra charges for Debenture Interest payable of £64,500 and depreciation of £59,600. The charge for taxation is decreased by £59,000.

From the consolidated balance sheet it will be noted that current assets amounting to £8,739,221 exceed current liabilities by £4,472,709; free reserves and undistributed profits amount to £5,048,603, compared with £4,663,786 for last year, and exceed the issued ordinary capital of the Company by nearly £2 million.

There is no doubt that, during the last year, there has been a great change in industry.

First, we may be in the process of moving over from an inflationary to a deflationary climate. Secondly the Brewing Industry, which rather doubtfully enjoyed a sellers' market during and immediately after the war years, met the full force of a buyers' market about two years ago. This needs a thorough readjustment of outlook. Thirdly, the most recent change is the easing of controls.

TAXATION OF BEER

The tendency towards deflation means that our customers have less money to spend, and I do not see how the national revenue from beer can be maintained under the new conditions unless the price of beer is reduced by a lowering of the rate of Duty. If Beer Duty is not Purchase Tax, it is a special tax levied on the industry; I have always understood it to be a tax paid by the consumer, but levied at the most convenient place in the process of manufacture and distribution for collection by the Treasury. The fact remains that Purchase Tax on beer is levied at the rate of well over 150 per cent, whereas hardly any other article, however much of a luxury, now bears more than 75 per cent.

Your Company still makes good progress in its export trade to markets all over the world, especially in hard currency areas. It is now four years since we were able to get back into full swing in Belgium, where we have traded for over 50 years; during the last four years we have not only greatly increased this outlet for the Company's products, but have also secured for the country over 1½ million pounds of this hard currency. This year has broken all previous records.

Now, well on into another year's trading, in spite of difficulties and increased competition, we look forward with confidence in the future of the Company.

The report and accounts were adopted.

ROLLS-ROYCE LIMITED

RECORD OF ACHIEVEMENT

POLICY OF PRE-EMINENCE IN ALL DIVISIONS

LORD HIVES ON THE MANIFOLD ACTIVITIES

The forty-sixth annual general meeting of Rolls-Royce Limited was held on July 14th at the Midland Hotel, Derby, The Rt Hon. Lord Hives, CH, MBE, LLD, DSc (the chairman), presiding.

The following is an extract from his circulated statement:

Once again I am able to report another successful year's trading. The turnover in 1952 was a record for your company. The amount paid out in taxation was also a record, and the profits reached the highest level recorded in our history. This rising trend of profits reflects active employment of a rapidly increasing amount of capital which has taken place as a result of new issues of capital and retention of profits.

It is gratifying to report that all departments of our business contributed to the increased turnover.

You will see that we have spent further substantial sums on buildings and equipment. The ever-increasing complexity of plant and the necessity for your company to have resources to meet the demands which are made upon it cannot rule out the possibility of further permanent capital being required. Whilst no immediate action is contemplated, it is considered advisable to increase the authorised capital of the company, and a special meeting will be held for this purpose.

AERO DIVISION

In the military field there is still a preponderance of Rolls-Royce engines in service with the RAF.

The Avon has established itself as an outstanding engine for reliability and low cost of maintenance.

As new types of aircraft come into use in the RAF, so the number of Rolls-Royce engines in service increases. The Hunter, Swift and Valiant aircraft which are at present in production are all fitted with Avon engines.

In connection with the Nato off-shore purchases by the USA, your company is fortunate in that the aircraft that have been chosen for manufacture, both in this country and on the continent, are fitted with our engines.

Our engineers, designers and technicians are continuously working on improved and new designs in order that we can maintain the world-wide pre-eminent position we now enjoy. It is inevitable that competition will increase in the world markets and we must be prepared to meet it.

We have built up a considerable reputation and goodwill in Civil Aviation.

The Vickers Viscount is an outstanding aircraft and a number are now operating on BEA scheduled services. Although it is too early to make any claims for this operation, it is interesting to note that the aircraft went into service on the exact date laid down a long time ago.

Deliveries of Viscounts have started for Air France, and several other countries have placed orders. We are particularly pleased with the order that Vickers-Armstrongs Limited have obtained from Trans-Canada Air Lines. It is an outstanding achievement

for a completely British-designed aircraft and engines to be purchased for passenger service on the North American Continent.

The first Comet II has been flying for over a year on proving tests, and it is anticipated that the de Havilland Aircraft Company will deliver Comet IIs to the schedule as laid down.

It is your company's policy to establish our products as pre-eminent in civil aviation. It is the type of business where quality, reliability and efficiency are readily appreciated.

MOTOR CAR DIVISION

Our output of Rolls-Royce and Bentley cars has been well maintained. In common with other manufacturers, however, we have had to contend with the uncertainty in the home market caused by the expectation that a reduction in purchase tax was imminent.

We have continued to study the needs of all export markets which are open to us and particularly the European and American Continents. The introduction of the Continental Bentley has been welcomed by many Bentley owners of long standing, both at home and abroad.

We have also introduced a fully automatic gearbox. We are the first British manufacturer to achieve this, but we consider this an essential feature for countries where American cars are available. We are very gratified by the response with which it has met.

The "B" range of petrol engines has been brought into production both in our own works and in those of the Austin Motor Company, Limited.

The oil engine division did well to get under way with its production programme. The bulk of the engines at present being produced are absorbed by Vickers-Armstrongs Limited for use in their VR.180 Tractor. A number of engines were also made available to other customers for use in prototype and production installations. We look forward to developing many more of these as soon as circumstances permit.

OVERSEAS ACTIVITIES

Our products—aero engines, motor cars and oil engines—are in use in most countries throughout the world. We take particular pride in ensuring that our customers receive all the technical help and service they need in maintaining these products. We have technical and service engineers living in many countries.

After dealing with the progress of the associated companies the statement continues: The demand which your company is experiencing for its products both Military and Civil, at home and overseas, can only be attributed to the emphasis which has always been placed on the importance of design and development and the equal importance of moving forward in clearly defined steps, each step being based on sound knowledge and experience.

The report and accounts were adopted.

At a subsequent extraordinary general meeting a resolution increasing the authorised capital to £6 million by the creation of 2 million new £1 ordinary shares was approved.

THE METAL BOX COMPANY, LIMITED

SIR ROBERT BARLOW'S REVIEW

The thirty-second annual general meeting of The Metal Box Company, Limited, was held on July 17th at the Mayfair Hotel, London, W.

Sir Robert Barlow, the chairman, presided.

The following is an extract from the directors' report and from Sir Robert's review, which have been circulated together with the statement of accounts for the year ending March 31, 1953:

Our sales and income from investments have again risen to a record total for the year of £40,165,000, of which £29,161,000 was earned at home and £11,004,000 overseas.

Group profits (after depreciation and taxation) were £1,302,905, against £1,515,063. This year's figure represents 3¼ per cent on sales.

The consolidated balance sheet shows capital reserves and revenue reserves totalling £8,259,862, an increase on the year of £1,693,027, made up of £872,018 share premiums and £821,009 profits retained.

Additions to fixed assets were £2,072,992 and depreciation was £728,091. Group current assets exceed current liabilities by approximately £9,500,000. The ordinary dividend was maintained at 15 per cent on the capital as increased during the year.

The year has been one of fluctuating demand, rising costs and increased competition.

Since so many of the company's products are used as containers for foodstuffs, our policy has been to expand production and to accept a lower margin of profit as being some contribution to restricting further increases in the cost of living and to encourage exports.

TINPLATE

The opening of the new cold reduction mill at Trostre during the year coincided with a recession in demand at home and overseas. This brought about the temporary closing of a number of hand mills, with the probable loss of many skilled men to the industry.

As a consequence, production today in South Wales is less than it was a year ago, while consumption is greater and will increase. The fall in overseas orders was mainly due to a world-wide reduction in stocks and it is probable that as demand picks up tinplate will again be in short supply, until the new cold reduction mills at Velindre and Ebbw Vale come into operation towards the end of 1955.

PRODUCTION

A new factory for the production of food cans is in course of erection in Wisbech, all the productive machinery for which is being built in our own shops. With Wisbech, we shall have seven highly specialised plants, the potential annual output of which will be over 2,000 million cans, as compared with 65 million 21 years ago.

MACHINERY BUILDING

The purchase of an engineering plant at Crawley referred to last year has proved a valuable addition to our facilities. Our production this year exceeded £1,200,000, of which over 30 per cent was exported.

SALES

Our sales position is very much stronger than it was when Trostre opened last summer. Export markets have begun to open

up again for our customers. The home trade demand is strong. It is satisfactory to report that many of the industries most affected by last year's recession are now pressing for delivery to the limit of our capacity to produce.

We have felt the effects of competition both from within our own industry and from competing packaging materials. We meet

that competition, we believe successfully, by the keenness of our prices and the quality of our products.

VISITS

During the year I have visited our Associates in New York and Western Europe; our subsidiary company in India at Bombay,

THE ECONOMIST, JULY 18, 1953

Calcutta, and Madras; our subsidiary in Singapore; our Associates in Australia at Sydney, Melbourne and Adelaide; and our Associates in Auckland, New Zealand.

The report and accounts were adopted.

Complete copies are available from the Secretary, The Metal Box Company Limited, The Langham, Portland Place, London, W.1.

WIGGINS, TEAPE & COMPANY (1919), LIMITED

DIFFICULT TRADING CONDITIONS

EFFECT OF DIMINUTION IN STOCK VALUES

The thirty-fourth annual general meeting of Wiggins, Teape & Company (1919), Limited, was held on Thursday, July 9, 1953, in London, Mr L. W. Farrow, CBE, the chairman, presiding.

The following is an extract from the statement by the chairman, circulated with the report.

In my statement last year, I referred to the serious recession in the demand for paper and paper products which had taken place. Your directors had felt that such a recession would occur sooner or later. With this in mind, stocks of paper had been allowed to run down to a low level. As a result of this, it was possible to keep our mills running when the volume of incoming orders was lower than the productive capacity of our mills by building up stocks. We fixed a ceiling tonnage of stocks, however, below the tonnage we were accustomed to hold in pre-war days. Though all our mills at some time or other ran short-time, it was not necessary to close down any mill during 1952. No real improvement in the order position occurred until early in 1953.

Our principal raw materials, namely, woodpulp, esparto and cotton linters, come from overseas and it is essential to hold considerable stocks to meet the current requirements of our mills and our customers.

FACTORS AFFECTING TRADING

The year 1952, therefore, was one of great difficulty with every factor working adversely against profitable operations. These adverse factors can be summarised as follows:—(a) Losses arising from successive reductions in values of our stocks of raw materials. (b) Losses arising from successive reductions in values of stocks of our own manufacture and paper which we merchant. (c) Higher production costs due to short-time working in addition to which there were increases in the rates of wages and cost of coal and transport. (d) Increased handling and selling costs per unit of sales as a result of the reduced volume of trade.

Our subsidiary company, Pirie Appleton and Company, Limited, and its group of companies overseas, which manufacture envelopes and stationery, were affected in a similar manner and for the same reasons as was the paper trade.

I informed you last year that your directors had decided to establish a mill in Australia. I am glad to state that the old-established firm of papermakers, William Nash, Limited, of St. Paul's Cray, Kent, is joining us in this proposed enterprise. A site on the Shoalhaven River near Nowra in the State of New South Wales has been acquired and plans are now being prepared for the erection of a two-machine paper mill thereon. In the first instance, it is not proposed to build a pulp mill, but the site is suitable for that further development when

it should be considered advisable. Stockholders will be informed as soon as the financial and other plans are finalised.

The South African Pulp and Paper Industries, Limited, in which your company has a substantial interest, again had a record year of trading profit for 1952. The fourth paper machine at the SAPPi mills at Enstra, to which I made reference last year, is now working and the erection of the new mill at the site on the Tugela River, South Africa, is making satisfactory progress. Our relations with the management of SAPPi continue to be most cordial.

RESEARCH AND DEVELOPMENT EXPANSION

We have continued to expand our research and development work both as regards our scientific staff and the equipment of our laboratories. Further, we have a big variety of papermaking machinery on which to make full-scale trials or production when the laboratory work has been completed. At all our mills we have technologists qualified and experienced to control specifications of the papers once established, and to aid this we are continuing to add to and improve our recording instruments. We are, therefore, in a unique position, not only to develop any speciality papers that may be required, but to give even closer attention to the maintenance and improvement in the quality of our standard papers.

The following shows the amounts for which the fixed assets, excluding freehold land and motor vehicles, are insured, compared with the values appearing in the consolidated balance sheet:

Insured values	£
Buildings	6,456,236
Plant, machinery, etc.	8,963,445
	£15,419,681
Balance-sheet values, including freehold land and motor vehicles	
Total as per balance sheet	9,451,069
Less provisions for obsolescence and renewals	2,064,166
	£7,386,903

THE YEAR'S RESULTS

Upon turning to the consolidated profit and loss account, it will be seen that the trading profits of the group for 1952 amounted to £2,183,935, before making the adjustments enumerated, compared with £7,291,985. Your directors have explained in their report that they have added an amount of £1,656,574 to the trading profits for the diminutions in stock values and an amount of £825,941 to taxation for the tax thereon. This is in order that the profit and loss account should show

the results of trading without taking into account the effects of the diminutions in stock values brought about by reductions in prices of raw materials over which the directors had no control and for which special provision had been made in past years. We consider that the circumstances which caused these exceptional diminutions are non-recurring.

After deducting expenses and provisions, taxation, dividends to outside shareholders of and profits retained in subsidiary companies and adding investment income and interest received, the profit, including the net transfer from stock reserves (£830,633), amounts to £1,133,010. The sum of £647,000 has been transferred to general reserve and I would draw your attention to the fact that the amount of £709,845 standing to the credit of reserves for contingencies has also been transferred to general reserves, as your directors consider it no longer necessary to maintain these reserves separately.

Your directors in recommending a final dividend on the ordinary stock of 10 per cent, less income tax, have reverted to the declaration of dividends as a percentage less income tax. The final dividend, together with the interim dividend of 1½ per cent, free of income tax, makes the total dividend for the year 1952 on the ordinary stock an equivalent of 12.381 per cent, less income tax, being at the same equivalent rate as the total dividend for 1951. Of course stockholders receive a slightly higher net final dividend by reason of the reduction in the standard rate of income tax from 9s. 6d. in the £ to 9s. in the £. After making these appropriations, the balances on the profit and loss accounts of the group are increased from £208,616 to £251,433.

CURRENT YEAR'S PROSPECTS

With regard to the current year, though there has been some improvement, the demand for paper throughout the world is still less than productive capacity. There is evidence that stockists and consumers are still carrying more stock than they require, and only order more paper to make up what they need for current demands.

The outlook for your group is more promising. For some weeks all our mills have been working full time, and in fact in some cases overtime has been and is being worked. On the merchanting side of our business, however, trade both at home and overseas, as might be expected, is following the general trend of the paper trade to which I have referred. Satisfactory profits have been earned by the group since the close of last year, and if there is no deterioration in trading conditions, we should be in a position to present a satisfactory balance sheet for 1953.

It is my pleasant duty to refer to all our employees, both at home and overseas, and

THE ECONOMIST, JULY 18, 1953

to express to them our sincere thanks for their loyal work during what has proved to be a most difficult trading year.

The report and accounts were adopted.

WALSALL CONDUITS

CHANGED TRADING CONDITIONS

MR A. E. READ ON RISING COSTS

The seventeenth annual general meeting of Walsall Conduits, Limited, was held on July 13th in Birmingham, Mr A. E. Read (the chairman) presiding.

The following is an extract from his circulated statement:

The group final net profit for the year ended December 31, 1952, after making all provisions, including taxation, amounted to £159,192, compared with £209,434 for the previous year.

The net profit of the parent company, after making all provisions, including taxation, amounted to £174,211, compared with £178,637 for 1951, while the subsidiary company, after providing for taxation, has incurred a loss of £15,200, compared with a profit of £30,797 for the preceding year. Although the trading profit of the parent company has declined by approximately £38,000, this has been offset by the reduced provision required for taxation, and the final net result is a reduction of only £4,400, which may be considered satisfactory having regard to the trading conditions prevailing during the latter half of the year.

There has, however, been a further improvement in the liquid position of the group at December 31, 1952, the excess of current assets over current liabilities, including provision for the final dividend and bonus, amounted to £933,554, compared with £905,727 a year ago.

SUBSIDIARY'S ACTIVITIES

Our subsidiary company, A. G. Hackney and Company, Limited, at Hanley, is mainly concerned with the manufacture of electrical porcelain, and during the second half of the year under review there was a substantial reduction in demand for their products. As I indicated in my statement last year, there were many cancellations of export orders in consequence of import restrictions imposed by certain countries in which we were developing an expanding and profitable business. Another factor which has contributed to the adverse trading result is the continual rise in manufacturing costs which it has not been possible to recover in selling prices.

TRADING CONDITIONS

With regard to the parent company the turnover for 1952 was satisfactory and exceeded that of the previous year, but during the second half of the financial year trading conditions changed considerably, from a sellers' to what may be termed a consumers' resistance market. Without making any increase in the selling prices of our products during the past year we have had to meet additional costs have been met from increased output made possible following reorganisation and re-equipment carried out over the past few years. However, under increasingly competitive conditions it is now becoming more necessary than ever that the prices of all basic materials such as coal, coke, iron, steel, zinc, etc., and power should be substantially reduced. When circumstances improve we shall be in a position to take immediate advantage with our modern and up-to-date equipment and sales organisation.

The report was adopted.

GOODLASS WALL AND LEAD INDUSTRIES

RESULTS REFLECT MORE NORMAL CONDITIONS

NEED FOR INTENSIFICATION OF EFFORT

MR J. L. McCONNELL ON FINANCIAL POLICY

The twenty-second annual general meeting of Goodlass Wall and Lead Industries Limited was held on July 15th in London, Mr J. L. McConnell, the chairman, presiding.

The following is an extract from his circulated statement:

Before reviewing the operations of the company for 1952, I think it is desirable for me to refer once again to the effect of taxation on our base stocks. It is our practice in preparing our trading accounts to value the base stocks at constant prices so that the trading results are not affected by any fluctuations in market price. For taxation purposes, however, these market fluctuations have to be taken into account. In 1950 and 1951, owing to the rise in the price of metals, substantial tax liabilities arose, which were not reflected in our trading results, and we therefore, as you will remember, added to the stock values shown in the balance sheet the equivalent of the tax liability arising from such appreciation. In 1952 conditions were reversed and the book value of the base stocks was reduced by the amount of the tax relief obtained.

In addition, it was found advisable during the year to make a reduction in the quantity of our base stock of lead: as a result of a policy of concentration of production over a considerable period, it had proved to be in excess of requirements. From this realisation of base stock, which was effected at an opportune time, a profit of over £200,000 has arisen. This has been transferred direct to reserve.

The group balance sheet remains a strong one and shows a marked improvement in our liquid position.

GENERAL

This time last year I stated that we were feeling the effects of a recession in trade, and that, in the absence of a material improvement in conditions, we were bound to experience some reduction in our earnings in 1952. This has taken place and the group profits of £1,481,286 compare with a figure of £3,380,991 for 1951. This fall in profits to what must be looked upon as a more normal level is a reflection of general trading conditions throughout the world.

The year 1952 will possibly be regarded in many industries as of some significance in that it may have marked a change-over from the somewhat abnormal postwar period of rising prices and general inflation to one of falling prices and less inflationary conditions in which trading may well be considerably harder. The results of our home companies for some years now have, as previously stated, been in excess of what we consider to be their normal earning capacity, and a repetition of these results is not to be expected. In many ways conditions in 1952 were for us almost the reverse of those prevailing in 1951. A substantial fall took place in metal prices (lead £175 per ton to £106 per ton and antimony £365 per ton to £225 per ton), while pigments were in ample supply throughout the whole of the year and a complete return to a buyer's market took place. Our smelting and refining department and the Fry's Metal Foundries group had a successful year, although they experienced a steady increase in competitive conditions throughout the period. The value is now more fully being

felt of the heavy capital expenditure incurred since the war in the modernisation of our smelting and refining plants. Export trade generally showed some diminution following the universal panic buying which took place in 1951; deliveries were well spread and included a useful tonnage to hard currency markets.

Goodlass, Wall & Company, Limited, Liverpool, although maintaining their turnover, suffered, in common with most paint companies, some decline in earnings, but in the circumstances their results can be considered satisfactory. They have enjoyed a steadily increasing share of the retail market with their "Valspar" range of products. Our smaller paint interests felt the recession more keenly.

Trading conditions in India were difficult and our lead and zinc companies in Calcutta suffered a reduction in tonnage. We are pleased with the progress made by our Durban company, but here again losses on lead stocks were sustained.

The year 1952 was not an easy one for the paint industry abroad. The results of our Bombay company were again affected by the official policy in regard to labour and by the same general recession in trade as was experienced by our lead companies in Calcutta. The figures for the Argentine company, which are again good, continue to be omitted from our accounts. I am glad to report that nearer home Harringtons & Goodlass Wall Limited, Cork, maintained their position well.

British Titan Products Company, Limited, though not unaffected by the conditions prevailing in 1952, continues to prosper and is once again enlarging its capacity. The results of our associated Company in Johannesburg, Enthoven Fry Limited, show an improvement over those for 1951, itself a good year; a new works at Port Elizabeth has just been established.

The business in zirconium compounds is a complicated and highly technical one, in which much fresh ground has to be broken and the period for establishment of this division is proving more lengthy than anticipated. Our research laboratories at Perivale and Kirby have had an active and useful year.

RAW MATERIAL SUPPLIES

Lead has been in free supply throughout the period. The disparity between the Continental price and the UK official price for most of the time created difficult conditions for our export department, but on October 1, 1952, the Government relinquished control of lead and dealings on the London Metal Exchange opened for the first time since the war. The market has not yet fully settled down but the substantial fall in price which has taken place may be helpful in strengthening in some directions the competitive position of lead. The Ministry of Materials is to be congratulated upon reopening the lead market and as a further measure of freedom from Government control we welcome the announcement that dealings in copper are to be resumed on the London Metal Exchange in August of this year.

The financial position of the Group has received the close attention of your board. At the end of 1951, a net cash balance of £627,276 was available to meet current tax-

tion of £1,806,223, a deficit of £1,178,947. After providing for current taxation of £1,641,299 we have, on this occasion, a cash surplus of £648,004; this substantial change arises in the main from a reduction in both the volume and value of stocks. Since the end of the year, our cash position has shown further improvement. The effect of the present penal rates of taxation on a company such as ours is severe, and I am glad that the present Government appreciates the absolute necessity of reducing the existing burden. In particular, I specially welcome the encouragement given to industry in the recent Budget, and I hope it will be found possible before long to modify or abandon profits tax, the whole of which so unjustly falls upon the holders of equity capital.

Your directors are recommending a final dividend of 8½ per cent, less tax, on the ordinary stock, making a total for the year of 12 per cent, less tax. This is the same total distribution as for 1951, when a dividend of 10 per cent and a bonus of 2 per cent were paid.

RICHARD COSTAIN, LIMITED

CONSIDERABLY IMPROVED LIQUID RESOURCES

MR R. R. COSTAIN ON THE WIDESPREAD ACTIVITIES

The twentieth annual general meeting of Richard Costain, Limited, was held on July 14th at Rodney House, Chichester Street, Dolphin Square, S.W.1, Mr. R. R. Costain, CBE (chairman and joint managing director), presiding.

The secretary (Mr L. Richards, ASAA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:

The consolidated profit and loss account for 1952 shows a small decrease in trading profits compared with the previous year; after provision for taxation and outside shareholders' interests the net balance of profit available to the parent company shows little variation from 1951. In addition, substantial capital profits have been realised during the year and transferred to capital reserve; your board has considered it prudent to appropriate £50,000 of these capital profits to reduce the book value of certain of the group properties. After making this appropriation, the capital reserves are increased during the year by £135,117.

The board has recommended the payment of a dividend of 10 per cent, less tax, on the ordinary share capital, and after transferring £50,000 to general reserve and £9,477 to capital redemption reserve, the balance carried forward on profit and loss account is virtually unchanged.

Shareholders will, I hope, be pleased with the new form in which the accounts are presented. This conforms with modern practice and I hope gives you a clearer indication of the financial strength of the organisation. It will be seen that there is a considerable improvement in the liquid resources of the company over the past 12 months. Nevertheless the magnitude of the group's operations require considerable working facilities and in these circumstances the directors have considered it wise to retain the level of distribution to shareholders established in recent years.

AT HOME

The large hydro-electric scheme at Garry in Northern Scotland is now well under way

It is also recommended that the general reserve of the company be increased by £300,000 to £1,150,000 and that the sum of £524,200 be carried forward to 1953.

PROSPECTS

For the first five months of this year the volume of our business has been running at about the same level as for the previous year, and so far as I can judge at this early stage, this level should be maintained. I expect improved results from some sections of our business offset by less satisfactory results from others, but over all we shall have done well if we are able to repeat the trading figures for last year. I feel that all responsible businessmen should welcome a return to steadier and less sensational conditions even although competition may be keener and profits lower. We are very much alive to the fact that the right response to this change of atmosphere is an intensification of effort to obtain greater all-round efficiency.

The report and accounts were adopted.

and progress is considered to be very satisfactory. The reservoirs at Usk and Weir Wood are nearing completion. Your company is actively engaged on flood remedial work on the East Coast.

Development is taking place with the Costain Wilson block, a form of pre-cast concrete construction to be used mainly in the erection of houses, two of which were presented last year to the Lynmouth Urban District Council as a contribution to their Flood Disaster Fund and which, with the collaboration of the Lynmouth Council, were erected and occupied in two months.

Building Activities.—The company are engaged on several advance forms of new tradition housing, and a considerable contribution has been made to the housing of coal miners by the use of Schindler housing. The company has again received public appreciation for completing the British European Airways Terminal contract ahead of contract time.

Opportunities are being sought to expand these sides of the contracting business in an economically satisfactory way, but I think shareholders should know that the volume of work being obtained at the present moment is not as high as one would have hoped.

The factories owned by your parent company, run by Costain Concrete, continue to expand and to lead the field in the development of pre-stressed concrete, and the Stahlton floor, which is the most modern form of fire-resisting construction and is rapidly gaining the appreciation of the industry.

I find it impossible to conclude the remarks on work in this country without referring once again to the property side of your company, which owing to rent restriction control is, as before, showing quite inadequate returns compatible with your investment, and I can only say as each year goes on this situation deteriorates owing to the continuous increased cost of repairs.

WORK ABROAD

East Africa.—It has been found uneconomic to continue in this area and we are in the process at the moment of closing down your company's activities here. The losses which must be faced in such a situation have

been provided for in the 1952 accounts.

Rhodesias.—In partnership with Clifford Harris and Partners, South Africa, the Hunyani Dam (which encloses an area of water as big as Windermere) was completed during the year and work in Southern Rhodesia has been considerably restricted owing to the financial stringencies in this country. It is hoped that developments will expand again when federation takes place. Your company has just completed the Ridge-way Hotel in Lusaka, Northern Rhodesia, possibly the most up-to-date and modern hotel on the African Continent.

West Africa.—The £4 million extension to the Apapa Wharf, and the Ijora Power Station contract, are making good progress and the Costain West Africa Company is making steady headway, in spite of political uncertainties.

Kuwait.—We have, in company with Abdulla Mullah Saleh, just completed the water distillation plant, and are actively engaged in other works including the erection of the new power station, for HH the Ruler of Kuwait.

Costain-John Brown, Limited.—Before dealing with the report of the above company, I would like to record the board's sympathy with the severe loss sustained by Costain-John Brown, Limited, through the death of the late Lord Aberconway.

Costain-John Brown, Limited, in partnership with American and British firms, is carrying out the £20 million refinery for the Anglo-Iranian Oil Company near Perth, Australia. This is the fifth refinery on which this company has been engaged. It also continues to expand in other fields of operation.

FUTURE PROSPECTS

In an organisation such as yours it is naturally impossible to be definite about future prospects, particularly in this modern age when situations are so easily affected by possible political disturbances. I can only repeat, as I have said in previous years, that your board is continuing to make every endeavour to keep abreast of current trends both at home and abroad, and to express their warm appreciation of the work of the staff during the past year.

The report and accounts were adopted and the dividend of 10 per cent, less tax, was approved.

The retiring directors—Mr J. W. Whiter, OBE, and Mr R. B. Minto—were re-elected and the remuneration of the joint auditors—Messrs James Worley and Sons and Messrs Peat, Marwick, Mitchell and Company—having been fixed, the proceedings terminated.

KILLINGHALL TIN, LIMITED

DIVIDEND 25 PER CENT

The twenty-third annual general meeting of Killinghall Tin, Limited, was held on July 10th in London, Mr Jack Addinsell, the chairman, presiding.

The following are extracts from his circulated statement for the year ended September 30, 1952:

Last year the general managers anticipated that prospects for the year under review would be favourable, and this has been borne out by the increase in tonnage of tin ore recovered by the dredge during the year from 465 tons to 621 tons. The profit, after allowing for depreciation, head office expenses, etc., amounted to £178,230.

An interim dividend of 15 per cent, was paid in February of this year and your direc-

BRITISH INSURANCE

This Survey of the British Insurance industry differs from those of recent years in that it is entirely accommodated within the pages of The Economist itself. The statistical analyses that formerly appeared in Records and Statistics have been slightly changed in form, but not in scope; they provide with the articles a comprehensive study of every branch of the British insurance business.

Is Life Assurance Lagging?

LIFE Assurance offices provide one of the most important channels through which personal savings reach the Stock Exchange—indeed, together with the privately administered pension funds they are virtually the only channel of importance. Although the life and annuity funds (including industrial life funds) need all their present rate of growth of about £160 million a year merely to offset the annual drain on personal savings to pay death duties, this in no way detracts from their importance. But there is some evidence that insurance is no longer expanding as fast as in recent years—and not so fast as the need for savings requires.

Maintenance of the rate of growth of life office funds depends upon the flow of both life and annuity new business. The new business statistics that normally attract most attention relate to net new sums assured. For last year, they showed a further expansion, but of no more than 3½ per cent compared with increases of 19 per cent in 1951 and 10 per cent in 1950. But this is not necessarily the best test of expansion. The number of new policies issued gives a better idea of the volume of individual new policies taken out, as distinct from those issued under staff schemes, and the new annual premium income is the only satisfactory measure of new savings. On these two different criteria, there

are grounds for fearing that new ordinary life assurance business actually turned downwards in 1952. Moreover, the incomplete statistics so far available suggest that last year brought in lower new annual premiums for deferred annuity policies, and a considerable fall in consideration money for new immediate annuities.

These grounds for thinking that the postwar expansion of new life assurance is slackening call for reconsideration of the views that life assurance enjoys a natural expansion. One might ask, indeed, if its progress in recent years has really been as satisfactory as at first sight appears. Some American comparisons are instructive here. The Institute of Life Insurance (of New York) has calculated that the volume of life assurance in force at the end of 1950 was 110 per cent of one year's national income in Canada, 98 per cent in the United States and about 50 per cent in each of the United Kingdom, Holland and Switzerland; in other countries the proportion was lower. The discrepancy between the extent of life assurance cover in this country and in North America is, indeed, rather less glaring than these figures suggest, for endowment assurances are overwhelmingly the most popular form of contract here, whereas in America and Canada other types of policy that secure a

materially larger sum assured for a given premium constitute the bulk of the business. But it is, nevertheless, clear that by North American standards, people in this country are much under-insured. Nor is there much consolation in the fact that the volume of life assurance in force in this country is roughly in line with that in other leading Western European countries for they have had sickening experiences of the fate of money contracts that Britain has not experienced. Last year's new business, despite its large record amount, makes a poor comparison with the volume secured before the war, if allowance is made for the intervening fall in the purchasing power of money. Total new sums assured in the United Kingdom in industrial and ordinary life assurance together were last year probably of the order of £900 million, compared with £463 million in 1938. But in those fourteen years the national income has more than doubled from £5,000 million to £13,500 million. There has been little expansion in industrial new sums assured during the same years, and if ordinary life assurance figures alone are compared and adjusted for the movement of prices last year's total of ordinary new business can be put at £200 million in terms of 1938 £'s, compared with £243 million worth of new business secured in 1938.

This lack of buoyancy in last year's new business is the more surprising because it occurred in a year of widespread improvements in the terms of non-participating life assurance policies and bigger benefits from with-profit contracts. These advantages for proposers and policy holders owed much to the active competition between some eighty British and Commonwealth offices transacting new business in this country; as soon as it became clear that the rise in interest rates was not a passing phase, a great part of the improvement in the average yield on newly invested money was passed on to the public in bigger benefits or lower premiums for new life policies and for annuities. As a rule, premium rates for with-profit policies were not changed, since improved earnings on participating funds are reflected in higher bonuses to the holders of existing policies. But the question remains: Why, when the life offices were able to put before the public the most attractive terms since 1939, was life assurance more difficult to sell last year than at any time since the end of the war?

There may be an answer—and it is not a very consoling one—in the fact that business was most sluggish earlier in the year, and picked up in the autumn, when economic recovery had already gone some way. The fact is that new business in ordinary life assurance falls into three broad categories: individual policies for quite modest amounts; large policies taken out with the object of minimising the impact of surtax or estate duties; and the life assurance part of staff schemes, usually taking the form of group life assurance. The first category forms the hard core of new business, and the amount taken up each year is probably fairly constant; such evidence as there is gives no indication that individual

policies are expanding to any material extent. New business under the other two headings, which accounts for a considerable and increasing proportion of the whole, seems to depend on the buoyancy of business and industrial profits; that seems to be a fair deduction from the boom in such insurances since the war, and from the check that they experienced last year. It may well be that industrialists feel less inclined to enter into long term commitments when their paper profits are falling. If so, last year's slowing down in new life assurance business may have some direct connection with the slowing down of inflation.

To those who have come to regard insurance as one of the few bulwarks of private saving that still survives to check inflation, the signs that insurance business itself is fed by its very forces will be disconcerting. The increase in popularity of staff pension schemes effected with life offices—and also those administered by private trustees—evidently owes much to postwar inflation and the high taxation that has accompanied it. And last year's fall in new premiums for deferred annuities, which are largely connected with new staff pension schemes, may well have been a symptom of a contrary disinflationary cause. A substantial volume of pension scheme new business was, indeed, transacted last year. But there can be little doubt that the commitments of employees to pay annual contributions under pension schemes (and the cheap life assurance cover that is often associated with them) has already made a sizeable dent in the market for individual new life assurance. Members of such schemes enjoying quite high gross incomes often have little to spare for individual assurance after they have made in addition repayments under house purchase mortgages. The market for new individual assurance seems destined to grow steadily smaller and the offices have made their dispositions to meet a fall, for nearly all of them now transact scheme business, though comparatively few did so as recently as 1945. The scope for starting new staff pension and life assurance schemes is still considerable, but much business has been undertaken in a mere five years and new schemes will in future need increasingly to attract employers who for various reasons are not over ready to commit themselves to long term contractual liabilities.

All these considerations suggest that the life assurance business is likely to become more competitive as the offices go out to maintain—and increase, if they can—the volume of assurance and annuities that they have sold in recent years. They are hoping that Mr Millard Tucker's second report will open up a new field where self-employed people and controlling directors of companies, who now have to make what provision they can for their retirement out of taxed income, will have extended to them the substantial tax advantages that are at present available only to employees. If the report recommends such changes—and if they are implemented—the life offices might expect a valuable source of new business.

Insurance Investment Policy

LAST year provided a full crop of problems for insurance investment managers. Most of the considerable amount of ground lost in the market in the first six months had been regained by the year-end, but investments held in this country (these comprise the bulk of the assets held by the life funds and about a third of the general funds) can hardly have escaped further depreciation. On the distribution of assets at the end of 1951, shown in Table I overleaf, the net depreciation last year suggested by the movements of the Actuaries' Investment Index might have been of the order of 2 per cent of the total. Two and a half per cent Consols fell during 1952 by 4.8 per cent, 3 per cent Savings Bonds 1960-70 by 1.3 per cent, debentures by 2.1 per cent, preference shares by 2.2 per cent and ordinary shares by 4.2 per cent.

Last year's depreciation came on top of five lean years; since the bursting of the Daltonian bubble only in 1950 was any measure of appreciation recorded in British security values. Few life offices can still retain appreciable investment reserves, either hidden or disclosed. This situation might at first blush seem a little disturbing. But in fact when an increase in the market rate of interest is firmly established, life offices can with complete propriety similarly raise the rate of interest assured in their actuarial valuations. This has the effect of calling for smaller reserves thus releasing funds which can be used to make good any deficiency on investments. In making such transfers, they are limited by certain restrictions—for example, the distribution of the maturity dates of the assets should approximately match the incidence of the future liabilities and any investment deficiency between market and book values (less existing reserves) to be covered by transfers from actuarial reserves that are released must proceed from a change in interest rates and not from any deterioration in the intrinsic value of the assets.

No such convenient adjustment is possible in the amount of the liabilities under non-life insurance business. Perhaps 70 per cent of the whole of the general business is transacted overseas or in London on foreign account. Because of unstable currencies and the statutory requirements of many foreign countries, overseas liabilities are normally adequately covered by assets in each individual country. In the most important market of all, North America, local requirements are so stringent that the reserves against unexpired risks and unsettled claims have by law to be materially larger than past experience or British practice would demand. In effect, the offices have had to maintain surplus dollar assets, and they have enjoyed an uncovenanted appreciation on them, expressed in terms of sterling, from the devaluation of the pound. This factor has helped the companies to give the statutory certificate required by the Assurance Companies Act, 1909, that in the aggregate the assets are fully of the value stated in

terms of sterling. Nevertheless, the fall in the market value of high-grade dollar bonds since the end of 1950 has been so considerable—US 2½ per cent Treasury Bonds 1962/67, for example, fell by 4.5 per cent in 1951, by 0.3 per cent in 1952 and by a further 3.3 per cent during the first half of this year—that sterling investment reserves in the non-life funds must have experienced a severe pruning. There is, however, no reason to think that they are exhausted, and in any case, the offices have ample free reserves. Home investments held by non-life funds can hardly have escaped considerable depreciation in the last few years, but a substantial proportion is invested in relatively short-dated fixed interest stocks; on these the current effects of higher interest rates will be less severe.

Life office reports for 1952 showed less signs of strain from investment depreciation than did those for 1951. Some further adjustments were, however, made to the bases adopted for actuarial valuations. Of these, the most important (because of the magnitude of the figures involved, rather than the degree of the change) was that of the Prudential, which released £9½ millions from the ordinary life branch actuarial reserves and £9½ million from those of the industrial branch. These amounts were written off assets totalling £684.1 million, leaving branch contingency funds of £7 million and £12 million, respectively, intact at the end of the year. So far this year, a modest appreciation in the market value of insurance holdings in this country has been offset by a decline in the prices of American and Canadian bonds and shares.

★

It has been suggested in several quarters that the insurance companies are too cautious in their approach to investment in industrial risk capital. The Life Offices' Association, the Associated Scottish Life Offices and the Industrial Life Offices recently published a statement that emphasises, very properly, that the first duty of the life offices is towards their policyholders. They are in the position of trustees and it is not their business to take an equity stake in speculative or untried enterprises. Some of the criticisms, however, seem to ignore the fact that they invest large sums in British industrial equities and also in loans of various kinds (including the purchase of freehold properties that are subsequently leased to the original owner for a long term). In particular, the life offices are staunch supporters of sound new issues.

Table I shows that the composition of insurance portfolios underwent further changes in 1952. Although the actual amount invested in British Government securities was virtually unchanged, the proportion of total assets in gilt-edged again fell sharply, from 32.4 per cent to 30.6 per cent. Mortgages rose by £51.4 million

From the ashes...

On the night of the 2nd September, 1666, a small fire started in Pudding Lane. In three days it devastated all but 75 of London's 373 acres, destroyed 13,200 houses, 89 parish churches and old St. Paul's Cathedral.

But despite the tragic loss of life and property, the fire was a blessing to London. It destroyed a vermin-infested, plague-ridden, unsanitary and badly planned city and allowed Christopher Wren to replan its streets and rebuild its churches.

As a result of this and similar fires the Sun Fire Office was established in 1710—laying the foundation of the great reputation which the "SUN" holds to-day for insurance service of all kinds.

The Centuries-old Sign of Public Service

Head Office: 63, Threadneedle Street, E.C.2
Branches and Agencies throughout the World

Insurance Service

By placing all your insurances through one organisation you can save yourself much time, trouble and inconvenience.

The Pearl Assurance Company's Life, Fire and Accident Branches are at your service.

Funds held for the protection of policyholders exceed one hundred and ninety-five million pounds.

and debentures by £32.2 million; together they accounted for nearly half of last year's increase in total assets. The popularity of mortgages has been the most prominent feature of insurance investment policy in recent years. Preference shares remained friendless. Ordinary shares rose by £39.5 million to £377.7 million (11.5 per cent of total assets) and property by £26.7 million (to 7.1 per cent of total assets). Out of total assets of £3,289.3 million, perhaps £400 million was invested abroad, mainly in Government stocks and other bonds, or held in cash or its equivalent to cover foreign fire, accident and marine liabilities and perhaps £200 million to cover overseas life assurance and annuity liabilities. The distribution of the assets between the various categories shown in the table had in earlier years been distorted by different margins that existed between the book and market values; but such differences must have largely disappeared by the end of last year.

Separate analyses have again been made of the life and annuity assets of the leading offices and of their non-life assets. In the latter, the substantial overseas fire, accident and marine business is reflected in the investment of 31.1 per cent of non-life assets (see Table III) in overseas Government and home and overseas near gilt-edged stocks. This group, together with British Government securities, cash and debit balances accounted last year for no less than 71.5 per cent of the non-life assets, compared with 48.6 per cent of the life department assets.

Life Assurance Trends

NET new ordinary sums assured in 1952 at home and overseas by offices established in the United Kingdom and in this country by the dozen or so Commonwealth offices that transact business here, were of the order of £750 million—about 3½ per cent above the previous record set up in 1951. Overseas new business (including that transacted in Eire), accounted for 13 per cent of the total new business of the British offices in 1950 (the latest year for which comprehensive statistics are available); it continues to expand faster than home business. It would seem that both the number of new ordinary life assurance policies issued last year and the new annual premiums that they produce were lower than in 1951; an ever-larger proportion of the new sums assured takes the form of group life policies, each of which covers a number—sometimes a considerable number—of lives at low rates of premium. The new annual premium income under deferred annuity contracts (which are associated largely with the pension scheme business transacted by the life offices) was also lower last year than in 1951. Taken together, these results suggest that 1952 witnessed a check to the rapid postwar expansion of new life business. The progress of life and annuity business is, however, more realistically measured by the increase of the life and annuity funds; this increase amounted to £101.8 million in 1950; it was probably rather higher in 1951, and about £125 million last year—after taking account of transfers to investment reserves in each of the last two years.

Statistics published by the Life Offices' Association and the Associated Scottish Life Offices, which are thought to cover 98 per cent of the total life and annuity business,

The yield calculations in Table IV have been expanded this year to include gross as well as net earnings on the life assets of a large sample of the leading offices. The gross and net yield for each office may be considered together; the gross yield can be taken as the more direct indicator of the rate of return on the invested funds, but the net yield is important as the measure of the annual rate at which interest income is actually accruing. The effective rate of taxation borne by the different offices varies widely, according to the composition of the business. Broadly, interest income from home life assurance reserves is taxed at 7s. 6d. in the £, that from annuity reserves escapes income tax (although annuity profits are taxed) and overseas life funds (for some offices these form a significant proportion of their total assets) are normally exempt from British income tax.

Considerable variations are apparent in these investment yields, net and gross. The mutual and proprietary life offices show a range from 6.36 to 4.22 per cent gross and from 4.93 to 3.42 per cent net. The ranges for the industrial and composite companies were from 5.00 to 4.09 per cent gross and from 4.08 to 2.95 per cent net. Exceptionally high gross yields would suggest a fairly marked departure from the more conventional investment policy, with the largest scope for such departure presumably in ordinary shares. A comparison between Tables II and IV suggests such examples.

show that premiums attributable to "scheme" life assurance and pension contracts in 1951 totalled £71.4 million, representing 31.5 per cent of annual premiums of £226.7 million. Demand for ordinary immediate annuities and for split annuities fell off last year, although virtually all the offices offered more attractive terms to purchasers; the leading offices received £17.8 million purchase money compared with £23.0 in 1951 and £18.4 in 1950. As will be seen from Table IV on page 220, the net yield on the life and annuity funds of the leading offices last year was 3.80 per cent, compared with 3.68 per cent in 1951 and 3.49 per cent in 1950. New money is now being invested on somewhat less favourable terms than last year and further substantial transfers from life and annuity funds to investment reserves (these have the effect of increasing the indicated yield on the funds) seem less likely than in either 1952 or 1951; there will however probably be a modest further rise in yields this year. Last year's average yield of 3.80 per cent compares with an average rate of interest underlying the 1952 valuations of the offices included in Table V of about 2½ per cent (approximately the same as in 1951); a margin of 1 to 1½ per cent between the assumed and earned rate of interest is normal in valuations on the net premium basis—that is the basis adopted by most of the offices—as an implicit foundation for future bonuses on with-profit policies. Expenses of management were held in check last year; the average adjusted expense ratio of 14 per cent for the leading offices was virtually the same as in the two previous years.

The most important factor in life office valuations is the assumed future net rate of interest on the invested reserves;

* Valuation basis changed 1951. † Valuation basis changed 1952. (a) Including an unspecified sum released from actuarial reserves. (b) In addition £9½ million in the ordinary branch and £9½ million in the industrial branch were released from actuarial reserves and transferred to investment reserves. (c) In addition £289,000 in the ordinary branch and £1,173,000 in the industrial branch were released from actuarial reserves and transferred to investment reserves. (d) In addition £128,000 was released from actuarial reserves and transferred to investment reserves. (e) Including £25,000 in 1951 and £30,000 in 1952 outdoor staff bonus. (f) Including £230,000 released from actuarial reserves. (1) In an alternative class bonuses take the form of reductions in premiums. (2) On United Kingdom policies; different rates apply overseas. (3) Rate applicable to endowment assurances; a higher rate of bonus is paid on whole life assurances. (4) Minimum rate; bonuses are on a sliding scale. Additional bonuses at the rate of 18s. % and 24s. % of existing bonuses were allotted in 1949 and 1952 respectively. (5) Current series only; for policies issued prior to 1940 bonuses are on a sliding scale. (6) The 1947 bonus distribution included a non-recurring contribution from the exceptionally large carry forward during the war. s=simple bonus, calculated with reference to the sum assured only. c=compound bonus, calculated upon the sum assured and existing bonuses.

the other major assumptions are the future rates of mortality (the continuing lightening of which favours the offices in life assurance business and works against them in annuity business) and expenses of management. In order to deal with depreciation in the market value of the assets, the bases of the actuarial valuations of the offices marked * or † in the table were modified in 1951 or 1952 respectively by assuming a higher rate of interest than at the previous valuation. Amounts released from actuarial reserves in this way are almost invariably transferred to other reserve accounts. Because a substantial proportion of life office assets is invested in dated stocks that need not be realised whilst the funds are expanding and will in due course be paid off at par, a large part of the substantial sums written off in the last two years will in due course be recovered.

Wherewithal for Higher Dividends

LAST year the rate of expansion of the premium income of the British insurance offices slowed down. Aggregate fire, accident and marine premiums of twenty leading offices included in Table VI rose by 10.5 per cent from £399.4 million to £441.4 million; in 1951 the rate of increase was 15.0 per cent and in 1950 14.8 per cent. The life and annuity premium income also rose by rather less than in 1951. But total premium income in 1952, including ordinary and industrial life assurance, of all United Kingdom registered offices and of Lloyd's underwriters, must have considerably exceeded the landmark of £1,000 million passed in the previous year.

Net fire, accident and marine profits—that is to say, the underwriting profits of these twenty offices—amounted to £5.5 million, a result appreciably better than in 1951, when underwriting profits dipped to £3.0 million, representing no more than 0.7 per cent of premiums. These underwriting results are struck after overhead expenses, contributions to staff pension funds and taxation, but transfers to investment and other reserve funds are treated as allocations of profit. These profits for 1951 and 1952 can be compared with an average during 1934-38 of £3.2 million, which represented 2.9 per cent of an average premium income of rather less than a quarter of the income of 1951. Transfers of surplus from life, annuity and capital redemption business again contributed usefully to total trading profits in 1952.

Insurance dividends are traditionally paid out of the interest earnings on the non-life reserves and capital. Tables VI and VII demonstrate the effects of applying this principle. Accounting practices in treating profits tax and EPL vary between different offices and net interest incomes are not necessarily comparable. Certain offices that consistently earn good underwriting profits and distribute a large proportion of, or even more than, their net interest income in dividends, may be following just as cautious a policy as other offices that maintain a substantial margin between their dividend disbursements and their interest income, but show less favourable underwriting profits.

If allowance is made for additional distributed profits tax and for the fact that substantial assets are held in countries where the interest and the underwriting profits may have to be retained either to finance an expanding business or because of exchange control, the scope for the payment of higher dividends proves to be less than column (8) of Table VII might at first sight suggest. On the other hand appreciable liability to EPL has been incurred by some of the offices, from which they will be relieved from the end of this year. Broadly speaking, further material increases in the dividends paid by the composite insurance companies would

Once the initial adjustment has been made to the book values of their assets, life offices normally benefit on balance from a rise in the rate of interest.

Rates of bonus on participating ordinary life policies declared at the end of last year by each office are shown in the table, together with those declared at the previous valuation. Interim bonuses for 1953 are being paid at the full rates by the offices that declared bonuses last year; some other offices (whose valuations, and hence bonus declarations, are made at intervals of up to 5 years) increased the rate of interim bonus. Last year's substantially increased bonuses clearly demonstrate the advantage of with-profit contracts, by which policyholders participate in the whole of the profits of the mutual societies and in a large proportion of those of the proprietary offices.

seem to depend on larger trading profits and/or interest income.

With the exception of the Norwich Union Fire—which is a special case since it is the wholly owned subsidiary of the Norwich Union Life Office—all the offices included in Table VII increased their net ordinary dividends last year. Despite the increase of £814,000 (12.5 per cent) in the aggregate net amount distributed to ordinary shareholders, £9.5 million was ploughed back last year by these 20 offices whose results are summarised in Table VI, compared with £7.0 million in 1951, £11.2 million in 1950 and £10.9 million in 1949.

Column (9) in the detailed Table VII must be interpreted with caution. The ratios of aggregate departmental reserves, free reserves and share capital to non-life premium income give no more than a broad indication of the relative reserve strength of the different offices. Reserves for unexpired risks and additional reserves retained in a given underwriting account cannot be used for any other class of business; only the capital and unencumbered reserves—disclosed or hidden—are generally available. The size of free reserves is influenced by the character of the different classes of business; in fire insurance with its lurking catastrophe hazard, additional reserves are desirable on a scale that would be unnecessarily conservative in accident or even marine insurance.

Experience over many years has shown that the total amount that will be paid out in claims under current contracts is unlikely appreciably to exceed one half of the year's premium income. The fact that these offices command resources approaching 100 per cent of their non-life premium income can thus be taken as an indication of the impressive strength of British insurance.

TABLE VI. PREMIUMS, PROFITS, INTEREST AND DIVIDENDS—20 OFFICES

* Excluding life, annuity and capital redemption business.

ATLAS ASSURANCE

COMPANY LIMITED

ESTABLISHED 1808.

INSURANCE BUSINESS OF
EVERY KIND TRANSACTED

THE COMPANY ALSO ACTS
AS EXECUTOR & TRUSTEE

R "Let Atlas carry the burden"

HEAD OFFICE:

Salisbury 92 • CHEAPSIDE • LONDON • E.C.2.

GUARDIAN ASSURANCE COMPANY LIMITED

ESTABLISHED 1821

Head Office:

68 King William Street, London, E.C.4

BRANCH OFFICES IN LONDON:

LAW COURTS: 21 Fleet Street, E.C.4

LIME STREET: 3 & 4 Lime Street, E.C.3

WEST END: 4 Cavendish Place, W.1

The Company transacts all the principal
classes of INSURANCE BUSINESS
and acts as Trustee or Executor

Total Income: £16,191,000
Total Funds: £42,793,000

The STANDARD LIFE ASSURANCE COMPANY PROGRESS

New Life Assurances effected during the three
years ending 15 November, 1952 (including Group
Life Assurances)

1950	1951	1952
£23,384,000	£28,850,000	£34,049,000

Head Office: 3 George St Edinburgh

Branches throughout the United Kingdom, Ireland, Canada,
the West Indies and Uruguay

"Our Policy— and Yours"

You are invited to apply for a copy of
this attractive illustrated Supplement
issued with the Annual Report and
Accounts of the

UNITED KINGDOM PROVIDENT

It takes you "behind the scenes" of a
great Mutual Life Office and helps to
show why the insurance business is so
important to the Nation and Common-
wealth at the present time.

Please write to:

The Secretary and Actuary

UNITED KINGDOM PROVIDENT INSTITUTION

33, Gracechurch Street, London, E.C.3

Mansion House 6543 (6 lines)

Fire and Accident Experience

THE fire, accident and miscellaneous underwriting accounts of 25 leading British insurance companies that account for about 90 per cent of the total business in each department are summarised in Table VII and shown in greater detail in Table IX. Aggregate fire premium of these offices expanded last year by 5.8 per cent from £174.4 million to £184.6 million; this was a slower rate of expansion, comparing with 13 per cent in 1951 and 15 per cent in 1950. Overseas premiums, both for fire and accident, have been converted into sterling at current rates of exchange, with the important exception of the Royal-Liverpool and London and Globe group which still uses \$4.86=£1 for its substantial North American business, and thus understates the results. Aggregate fire underwriting profits of the 25 offices, however, reached a record figure of £18.7 million income, compared with £17.7 million in the previous year and £16.0 million in 1950. Last year was free from major catastrophes from fire or the "extra perils" (of which the most important is windstorm damage) that are covered by the fire department. Fire insurance is, and is likely to remain, the most stable and profitable of the various classes of non-life insurance business. It has produced an underwriting profit for these companies as a whole exceeding 10 per cent of the premiums in the last four years; Table IX shows, however, considerable variation in the results of individual offices.

Estimated fire wastage in the United Kingdom last year totalled £24.2 million, compared with £23.1 million in

1951 and £19.6 million in 1950. These estimates do not make any allowance for the serious consequential losses (which are separately insured) that invariably result from fires in business premises. United States fire losses for 1952 have been estimated by the National Board of Fire Underwriters at \$785.0 million compared with \$731.4 million in the previous year and \$688.4 million in 1950. Estimated Canadian fire losses in 1952 were \$65.2 million, compared with \$59.8 million in 1951 and \$68.0 million in 1950. Many of the British offices transact an important proportion of their total fire insurance business in North America and the trend of losses there is, therefore, at least as important to them as in the United Kingdom.

The proportion of the year's fire premium income reserved by individual offices for unexpired risks varies from 40 per cent (which is conventional where policies are all renewable annually and the business is evenly spread over the year) to 50 per cent, which is appropriate where, as is common in North America, premiums for up to 5 years are paid in advance. Where no more than 40 per cent is reserved by companies that transact a considerable North American business, additional reserves are generally maintained. In this survey the basis adopted by each office has been followed.

Accident and miscellaneous insurance premium income continued to expand rapidly last year; the aggregate premium income of these twenty-five offices rose by 15.8 per cent from £198.9 million to £230.4 million compared with

TRUST . . . as enduring as the hills

The main precept upon which The Scottish Mutual is founded is a changeless one. That precept is *trust* . . . a trust as secure in its foundation as the mountains themselves. Since 1883, the Society has enjoyed the confidence of a discriminating public. As a policy holder, broker or agent, you too can have every confidence in assuring with or recommending—

A FREELY MARKETABLE INVESTMENT IN A
TRUST SPREAD OVER THE SHARES OF THE
LEADING 30 BRITISH INSURANCE COMPANIES

INSURANCE UNITS

AT THE PRESENT TIME these Trust Units are particularly suitable for investors who seek a stable income combined with good prospects of capital appreciation.

Long Term Attractions

The insurance companies, whose shares constitute "Insurance-Units," have a common policy of maintaining a wide margin between what they pay out in dividends and what they earn. In the case of virtually all companies (with the exception of the Life companies, where other considerations apply), dividends are covered, often by a handsome margin, by income from investments. Other profits are added to the invested funds, thus increasing the income from which dividends are paid.

Dividend Prospects

Many of the insurance companies whose shares are included in the Trust Fund have during the past two years declared increased dividends, and there are good prospects that these payments should be at least maintained.

Purchase of Units

The price of the Units is within the reach of the small investor, who is freed from any personal liability for calls on partly-paid shares included in the Trust Fund. Ask any Stockbroker or Bank for full details.

Offer price 15th July, 23/3 x.d. Yield calculated in accordance with Board of Trade requirements, £4/4/5%.

n increase of 15 per cent in 1951 and 18 per cent in 1950. Last year's increase in accident premiums followed an adjustment of motor premiums overseas and of home and overseas rates for employers' liability insurance; there was also a larger volume of business, particularly in the motor department. The cost of claims has continued to soar all over the world; the exiguous profit in the accident department in recent years has in particular reflected the rapidly mounting cost of third party claims under motor and employers' liability insurance. Even relatively minor damage to motor cars of modern design bears heavily on the motor account. There have been signs in recent months, however, that motor insurance in the United States is at last 'in the black'; and it may be just breaking even at home. It is a general complaint that employers' liability business in the United Kingdom is still unprofitable in spite of last year's rate increases, and higher rates are being charged this year.

Industrial Life Assurance

Prudential, whose industrial branch policyholders enjoy contractual rights to share in the surplus of their branch, bonuses upon industrial branch

policies are usually *ex gratia*. Last year industrial life bonuses were allotted at somewhat higher rates than in 1951 by each of the offices making a valuation.

Marine Insurance

TOTAL marine premium income of twenty leading insurance companies was £46.2 million last year compared with £44.4 million in 1951 and £36.1 million in 1950. The latest comprehensive statistics relate to 1950, when the total marine premiums of all insurance companies were £58.4 million and of Lloyds' underwriters £84.2 million. Hull insurance premiums were well maintained in 1952 because of the commissioning of many new ships at high insured values and also because a full year's premiums carried the 10 per cent surcharge imposed in February, 1951. Cargo insurance premium income, which varies with the level of world commodity prices and with the volume of international trade, increased last year by a much smaller amount than in 1951. Competition for cargo business remains keen and there is a tendency to use war risk premiums to meet ordinary claims instead of retaining them as a contingency reserve. It remains doubtful if cargo insurance at present rates of premium is yielding any appreciable profit to the underwriters.

Marine insurance accounts are closed at the end of the second year following that in which the premium is received. Last year's profit transfers from marine accounts thus related to the outcome of insurances initiated in 1950; they give no necessary indication of current profits in this branch of insurance. For the twenty leading companies, such transfers totalled £3.8 million last year compared with £4.4 million in 1951 and £3.6 million in 1950. Profits transferred from marine accounts during the next few years seem unlikely to be as large as those that have been earned from the accounts of recent years.

Despite a run of serious casualties during December, fewer ships became total losses last year than in 1951 and

their aggregate tonnage was smaller; 87 vessels of 254,600 tons were lost in 1952 compared with 103 vessels of 304,500 tons in 1951. The number of "partial losses" at 7,689 was almost exactly the same last year as in 1951. Whilst total loss, particularly of important vessels, involves underwriters in substantial payments, repairable damage to ships accounts for the major part of each year's claims outgo. Claims experience this year has so far been bad; the total loss by fire of the *Empress of Canada* in January, at a cost to the marine insurance market of £1,300,000, was almost immediately followed by the sinking of other valuable ships, and the month closed with the disastrous floods on the East Coast and in the Low Countries which were very costly to marine underwriters.

The continued upward trend of ship repair costs together with the run of major total losses explain why premium rates on all subsequent hull insurance renewals were raised last March by a further 10 per cent. The higher premium rates will affect the 1954 account more directly than the 1953 account; but they may be at least partially offset by some reduction on the next renewal of insured values on certain classes of vessels.

Marine fund reserves of the twenty offices at the end of last year stood at 145 per cent of the year's premiums, as at the end of 1951. Reserves of such magnitude are substantially greater than all foreseeable claims under existing insurances. A monument to the capacity of the British marine insurance market was set up last year, when the cover on each of the two "Queen" liners was increased by £2 million to £10½ million; part of the original risk undertaken by the insurance companies and by Lloyds' underwriters was reinsured abroad under reciprocal treaties.

'ENGLISH ELECTRIC'

Electric arc welding has brought about great changes in British shipbuilding. More and more ships are being built by welding together large sections on the slipways. Much of the arc welding and other equipment used in Britain's shipyards is manufactured by 'ENGLISH ELECTRIC'.

bringing you

Today, British shipbuilders face more foreign competition than ever before. 'ENGLISH ELECTRIC' is providing our shipyards with the most modern equipment to enable ships to be built at competitive prices, thus helping Britain to supply the world with its finest ships. In this, as in so many other ways, 'ENGLISH ELECTRIC' contributes to the better living of millions.

On Not Missing the Bus

THE unmistakable tenor of the Opposition speeches in this week's parliamentary debate was a lament over an opportunity missed. Sir Winston Churchill's speech of May 11th had opened the way to peace, by way of a top level meeting, but the obduracy of the Americans and the incompetence of Sir Winston's own colleagues had thrown the chance away. The momentum had been lost, the bus had been missed. Lord Salisbury, said Mr Mikardo, had "muted down the reverberating chord struck by the Prime Minister into the pathetic peep-peep of a penny whistle."

It is, of course, the Opposition's job to oppose. But on this occasion the Labour speakers were only exaggerating a widespread public feeling of anti-climax. Soberly considered, the differences between what the Prime Minister proposed in May and what the Foreign Ministers agreed to in July do not seem to be very great. Instead of the heads of governments, it is to be the seconds in command. Instead of an unlimited agenda, it is suggested that the essential central problem, on which all else depends, should be tackled first. These are, indeed, differences, but hardly such as to justify the transition from exaltation to despair.

Those who attach so much importance to the difference between Prime Ministers and Foreign Ministers, and between an undefined and a concentrated agenda, must presumably have some reason for supposing that the one method would produce results that the other will not. But why? There is no ground for supposing that the Russians, if they really want to do business with the West, will insist on having the Prime Minister and the President to do it with. Of course, a difference having arisen in the West, they may now try to exploit it; but if that proves anything at all, it is that they are not really in a mood to respond very fruitfully to concessionary gestures from the West.

Nor is it as easy as the Labour speakers assumed to wave aside the known objections of President Eisenhower and his advisers. Even if the American view were palpably silly, it would still have to be taken into account. (Those who are most insistent on the need for independence in British policy tend to be those who would dictate most dogmatically what American policy should be.) And the American view is very far from being palpably silly. It is not the view of the wild men, but of the sober and experienced professionals of the State Department. They might well ask Mr Attlee how, if he believes (as he said on Tuesday) that the changes in Russian policy "are due to the fact that we have built up the strength of the Atlantic community," he can also complain of "too much emphasis on positions already taken up." This comes very close to saying that because the policy of firmness is working it should be abandoned. American policy is at least consistent; and if there is to be any meeting at all with the Russians, the Americans have to be there.

It is equally difficult to see why there is objection to taking the

question of Germany first. Mr Attlee thinks that "to suggest that a talk at high level on that crucial question is likely to be fruitful seems an entire illusion." But Mr Attlee cannot suppose that anything else of any importance—except perhaps the Far East, where progress towards a conference is once more being made—could be settled without bringing in the central problem of Germany. If he is so pessimistic about the prospects of one set of doctors examining the heart of the matter, how can he be so hopeful about another set of doctors talking generalities about the limbs?

★

With so much confusion in the public mind, it is as well to argue the matter in the simplest terms. The dominant fact is that nobody in the West knows what has happened, or is happening, in Moscow. One supposition is that there is a real struggle going on between those who want peace with the West and those who want an eternity of cold war. Another supposition is that the only differences are over the tactics to be pursued in an agreed programme of conquest. If the former view is right, it will be dangerous for the West not to show a willingness to meet the Russians half-way, for a failure to do so may lead to a victory of the war party in Moscow. But if the latter view is right, any weakness or appearance of weakness, and particularly any initiative that undermines the resolve of the western peoples or disturbs their unity, would be highly dangerous.

The conclusions that follow from the two hypotheses could hardly be more opposed to each other. To adopt the wrong one could be disastrous. But nobody knows which one is correct. It follows that the only safe

policy to pursue is one of feeling the way. The Foreign Ministers offered to talk with the Russians, but tried to remove any illusions that a willingness to talk was a sign of weakness. And as the best available test of good will, they proposed the central issue of Germany. It is a crucial issue; it is a complex issue (as an article on another page illustrates); and it is one where there is room for a certain amount of give and take on both sides. If there is a real possibility of doing business with the new rulers of Russia, a conference on Germany will reveal it; if all goes well it can lead on to further conferences on the highest level and on a wider agenda. But if there has been no real change in Soviet policy, little or no harm will have been done. It is really very difficult indeed to see what other practical proposals could have been made.

If it seems disappointing, that is a measure, not of the incompetence of the statesmen, but of the emotionalism of the public. What makes the present period the most dangerous since the end of the war is the growing evidence that the public—or large sections of it—after a long period of seeing things clearly, is sinking into one of those bouts of wishful emotionalism that were so familiar in the thirties. There is a widespread determination to make the most favourable possible assumptions about a potential enemy, not because they correspond to any known facts, but simply because they are the most comforting. Last time, this habit of mind led to the humiliations of 1938 and the horrors of 1940. If it is not to have comparable results this time, reason must remain in command. Judged by the tests of fact and logic, the decisions taken at Washington, unexciting though they may be, were unquestionably the right ones.

An Autumn Election?

THE parliamentary holiday begins next week and the second session of this Parliament, though it is due to be resumed for a few days in October, is for all practical purposes concluded. The adjournment will find the Conservatives in a state of self-confidence that could hardly have been expected a year ago. So convinced are they that they are riding the tide of public opinion that the minds of some of them have been turning, at intervals during the summer, to the thought of a general election in the autumn. At the moment, these speculations are muted, and the general opinion at Westminster is that there will be no dissolution in 1953, or perhaps even in 1954. But this is not because the Tories do not think they would win an election. Prophecy on this subject is notoriously hazardous; and there are Jonahs who point out that only twice in a hundred years past has a Government increased its

majority at a general election (and on one of those two occasions—the "khaki election" of 1900—by only three seats). But unless all the usual indications are liars, the country would return more Tories at the present moment than in October, 1951, when Sir Winston Churchill could still be attacked as a warmonger, when the Labour Party still had some appearance of cohesion and coherence, and when it was still believed that any tampering with economic controls would lead to massive unemployment.

If Conservative opinion is turning against an autumn election it is not therefore because of any revision of their calculations. Other reasons, indeed, are not far to seek. The very quietness of the Opposition (except in its internal quarrels) has enabled the Government to manage the House of Commons with ease, in spite of its narrow majority. The prolonged uncertainty over

the truce in Korea and over the prospect of talks with Russia has made foreign affairs, from the party manager's point of view, an unusually incalculable element. More important than either of these, as a practical consideration, there is the illness of both the Prime Minister and the deputy Prime Minister.

In these circumstances, it is perfectly clear that any decision to dissolve Parliament cannot be made until the autumn. It would be very surprising if there were as yet even a presumption forming in the Prime Minister's mind. He will have to wait and see, and so will the rest of us. When the time comes, the determining consideration will doubtless be the party advantage of the Conservatives. That is inherent in the British system, and there is nothing in the least improper about it—particularly since no party likes to face the charge of flouting the public interest. But, lest it go by default in these politicians' calculations, there is another argument that is worth restating. This is the argument that the public interest is not merely something that negatively should not be harmed by a party decision; the public interest positively requires a dissolution, if there is a chance of its producing a firmer basis for decisive government.

★

After its first lamentable nine months, the Government for the past twelve months has done well. The boat has turned out to be serviceable even if some of the crew are ailing. But ministers would be very unwise if they assumed that this justified them in simply paddling quietly on, with the vague idea that it may be time to set a new course in the spring of 1954, or 1955, or 1956. The Conservatives have done—with some assistance from good fortune—the rescue job for which they were elected. If surer foundations to the country's prosperity and safety are now to be laid, what is required is not a rescue but a widely ranging programme of radical reform. From the recasting of the taxation system to the structure and finance of local government, from the elimination of subsidies to the attack on restrictive practices, from tidying up the social services to working out a new international economic policy, from Africa to agriculture—over all this field new measures and new methods are needed.

Clearly an election could not by itself guarantee such a transformation. The prior conditions are that the party should know its mind and that it should have leaders able and determined to execute such a policy. But on the showing of the past twelve months one should not perhaps entirely despair of the Conservative party's ability to rise to the opportunity, especially if some of the younger men are to be given their chance. And if the willingness and ability were there, they would certainly need a new Parliament to be effective. There would be need of the refreshed confidence that comes from the positive renewal of a specific mandate. Moreover, if there is to be a programme of reform, there will have to be a long list of legislation, which is impos-

sible with the present exiguous majority. Nor must it be forgotten that if politicians are to do their proper job properly they must be relieved of the heavy physical strain that an evenly divided House imposes on them.

The period of political deadlock—or of what differs from deadlock only by a degree or two—has now lasted for nearly three and a half years. There is a real risk that the country will get used to it, and that it will become the general assumption that nothing much can ever be accomplished under the British parliamentary system. But if ever there was a country that needed a government capable of taking decisions it is this crowded island, with its precariously balanced position in the world. Surely the national interest requires that no opportunity of securing an effective, purposeful government should be neglected. It is no departure from *The Economist's* custom of neutrality, but a simple recognition of obvious fact, to say that the only chance of such a government for some years to come is for the Tories to get a working majority. If, in the autumn, the Prime Minister thinks an election would have that result, it will be his duty to advise a dissolution before the unpredictable march of events removes the opportunity.

The Demand for Meat

At the rate meat is at present being consumed there is every reason to anticipate prices still higher than those now ruling, which are considerably above anything obtained for meat for several years past. This is entirely due to the great prosperity of the working classes in this country. We have often in these columns stated that one of the first things to which a working man would apply a considerable part of increased wages would be in the purchase of more meat for himself and his family; and this, we urged, would be the certain result of a moderate price of corn. The present state of the meat and corn markets completely justify these views. No farmer can now doubt the wisdom of keeping a good quantity of stock, or the necessity of exerting himself to maintain as much breeding stock as possible. There is now no question as to the profits of stock-keeping. Sheep and bullocks now pay their own way; they are no longer to be deemed merely manure-making machines. The grand consideration now is how to maintain the largest amount of live stock; with that good corn crops come as of course. No longer is the farmer alarmed at importations of live stock, for greatly increased importations have had no effect in keeping down meat prices.

In 1852, for the five months, the imports of bacon were 35,940 cwts., which had risen in 1853 for the corresponding five months to 53,907. So of pork, 47,643 cwts. in 1852 had increased in 1853 to 84,353. The imports of beef (salted) had increased still more, for in 1853, 130,932 cwts. were imported, against 56,505 in 1852. Here we have an immense increase of fat meat brought from other countries, and at the same time the price of prime beef in Smithfield market reaches 4s. 4d. and 4s. 6d. per 8 lbs. Prime Down mutton is 4s. 8d., 4s. 10d., and even 5s. per 8 lbs., and other kinds in proportion. . . . Here, then, is a state of things in which good farming cannot fail to be profitable, provided the farmer takes care to have on his farm sufficient accommodation for keeping an extensive stock.

The Economist

July 23, 1853

Locarno on the Oder-Neisse

WHEN Sir Winston Churchill spoke in the House of Commons on May 11th of the need to find a way of "reconciling the security of Russia with the freedom and safety of Western Europe" he threw out a hint that some arrangement might be possible on the lines of the Locarno Treaty of 1925. The significance of his remark lay in the fact that this was the first occasion for a long time that a leading statesman had referred to the smouldering question of the Oder-Neisse line. To all interested parties this frontier between Germany and Poland, only provisionally accepted by the three western governments at the Potsdam conference of 1945, is a source of embarrassment as well as anxiety. The Russians seldom mention it because they do not wish to remind the Germans that this grievance was largely created by Russian action. The Americans and British seldom mention it because they can see no solution to the problems it raises. The French kept quiet about it because they have in the Saar their own territorial difficulty with the Germans. The Communist-dominated government of the Soviet zone of Germany has formally accepted the line as a "frontier of peace," because it had no choice in the matter. Now the silence has been broken. Sir Winston Churchill's suggestion of a Locarno was ill-timed but, having been made, it cannot be ignored.

To consider what could or should be the frontier between Germany and Poland is to go to the root of the difficulties between the Russians and the West. And to propose that this frontier, whether in its present or in a revised form, should be guaranteed by a new Locarno treaty is to raise a question of burning interest to all Germans. At the moment their leaders say little about it in public; their interest is concentrated on ways of bringing about the liberation of the Soviet zone and its reunion with Germany. But once that liberation is achieved the Oder-Neisse line, if left as it is, is bound to become the subject of bitter controversy and fervid pleading. The question at the back of all minds wrestling with Germany's future is therefore this: can the problem of the German-Polish frontier and the former German territories beyond it be shelved until unification has been achieved, or must it come up immediately—and the Locarno idea with it—if the Russians and the West are to bargain seriously about free elections and an all-German government?

First let it be made clear that the Locarno Treaty of 1925 guaranteed against change by force not Germany's eastern but its western frontier. Secondly, it has to be realised that any similar guarantee today of the eastern frontier would have to be underwritten by the Americans if it were to have any significance to the Russians, or indeed to the Germans. For if western aims were attained, and a united Germany joined either the European Defence Community or Nato, then the Oder-Neisse line would have become the

frontier between the Atlantic alliance and the Communist bloc, two heavily armed and closely organised power groups.

To propose a Locarno treaty between Germany and Poland is, therefore, to propose that Russia and the three western powers should guarantee the frontier between them against any attempt to change it by force. That is in itself an acceptable idea. No one in the West, except a handful of German extremists, wants a war about the eastern frontier of Germany and the aim of western policy is to avert such a disaster. But the frontier, as now drawn, is a focus of fears, regrets and ambitions that range far beyond Germany and Poland. Any suggestion that it could be peacefully revised and then guaranteed by the Great Powers in the present atmosphere of tension and suspicion is quite unrealistic. Peaceful revision would be possible, if at all, only when confidence had been so far restored between the Soviet Union and the United States that neither would regard concessions to the fears of the other as incurring either loss of face or military danger.

If, then, revision of the frontier is out of the question in the immediate future, a guarantee of the Locarno type, if given now, would have to cover the Oder-Neisse line as it is. That is to say, the western powers would have to accept a frontier that they have refused to recognise *de jure* but have respected *de facto* since 1945. Such an action would be regarded by the world as conceding Russia's right to all that it has gained in Europe since the war. It would consolidate the Communist hold on Eastern Europe and, perhaps, kill the spirit of resistance that has been showing itself since Stalin's death. There is no concession likely to be made by Moscow that would justify the West in guaranteeing this bad frontier.

That is, roughly speaking, the position between the Great Powers; but the picture leaves out the crucial factor—the attitude of 65 million Germans. The Russians would doubtless be ready to ignore them if they thought they could conclude a good bargain with the West over the heads of Dr Adenauer and Herr Grotewohl. They have urged often enough that a peace treaty, defining Germany's frontiers, should be drawn up before—not after—free elections had produced an all-German government to sign it. And they have never given any sign that they would compromise on the Oder-Neisse line. The western allies, on the other hand, have always taken—and still take—the attitude that free elections and unification must come first, because the unity of Germany was broken by the Russians and must be restored by them unconditionally. Only when that has been done are they willing to discuss the frontier question, and then only with the new

German government participating. They cannot and will not do a deal at the expense of the Federal Republic and Dr Adenauer.

It seems to follow that the western powers could agree to the Oder-Neisse line as a provisional frontier only if it could be accepted and honoured by an all-German government. Until that government exists it is impossible to judge what would and would not be acceptable. For any West German statesman who said publicly between now and September 6th that he would accept the Oder-Neisse line would be inviting disaster to himself and his party. And any West German statesman who said he would not in any circumstances accept the line would be accused of extreme nationalism and of endangering the prospects of peace and unity. It is possible that after September 6th a German leader may think it wise—it would certainly be brave—to say what Sir Austen Chamberlain was able to say on behalf of Stresemann's Germany to the House of Commons in March 1925:

She is prepared to say that she renounces the idea of recourse to war to change the frontiers in the East. She is not prepared to say, in regard to the frontiers in the East, that she renounces the hope some day to modify some of their provisions by friendly negotiation, by diplomatic procedure, or it may be, for aught I know, by recourse to the good offices of the League of Nations.

For if the Russians refuse to talk in September, or talk without making any concessions, the many Germans will ask themselves this question. Is it worth their giving a pledge that revision of the frontier will

be sought only by peaceful means, if the Russians would in return agree to elections that would liberate their zone and reunite the country?

It is a question that is not easily or quickly answered. If it were answered in the wrong way and at the wrong time, and if it were thought that western pressure had been brought to bear, the consequences might be disastrous. The demand for the return of the lost territories could become overnight a burning political issue, cutting right across the party lines drawn up by the followers of Dr Adenauer and their Social-Democrat rivals. The refugees from the Oder-Neisse territories, who make up nearly a quarter of the West German voters, would cry out against betrayal and there would be politicians to lead them. Those who distrust the policy of alliance with the West would be listened to as never before, and German nationalism would be back in the race for power as an anti-western political force. Only the Russians could profit from such an outcome, by holding out the prospect of a revision of the frontier on their terms. The consequences of a German statesman's reply to Sir Winston Churchill's hint might, of course, not be so serious. But the western powers would have to think very hard before they jeopardised all chances of winning the Germans into the western camp by guaranteeing a frontier settlement which was opposed by a majority or a large minority of Germans.

This is the point of the argument at which the Russians' view must be examined, so far as it is known. Clearly their calculation runs something like this. If

we agree to free elections and the formation of an all-German government free to make any alliances it wishes, then the following will happen: The Communist regime in Eastern Germany will collapse, the West will claim a great diplomatic victory, the new German government will be led into the Atlantic alliance (or the European Defence Community, which is just as bad) by its western members, and in a matter of two or three years Germany will be a power again. Then it will seek to use the western alliance to force a revision of the Polish frontier, even at risk of war. Nato divisions, some of them German, will be within striking distance of vulnerable regimes in Poland and Czechoslovakia. So, probably, runs the Kremlin's appreciation. The deduction from it is clear: the West must accept the Oder-Neisse line before we (the Russians) will take the first steps towards unification. We will not ask for that acceptance, because that would make us appear as the saboteurs of German unity; but we will raise every kind of difficulty about negotiation until our fears are recognised.

If that is indeed the Russian attitude—and the history of past negotiations suggests that it is—then the West has to consider the possibility that only some declaration of intention about the frontier question will get negotiations on Germany moving. To give a Locarno guarantee of the present frontier now is out of the question: but revision also, on present evidence,

seems impossible. The only alternative, therefore, seems to be that the West, with German consent, should express its willingness to guarantee the frontier against any attempt to change it by force, provided that the Russians admit the possibility of change by negotiation between the Germans and the Poles and provided that German unification and German and Austrian peace treaties are achieved within a reasonable time.

There is no reason at all to believe that either Sir Winston Churchill or allied experts have worked out the details and implications of his Locarno hint. Yet so long as it remains only a hint, capable of all kinds of interpretations both friendly and hostile, it can do as much damage as good. There is no good reason why it should not be examined provided that two conditions are borne in mind. The first is that any such gesture to Russian suspicions should be made with the full support of a strong West German government, which could not be later accused of weakness under dictation. The second and more important is that a new Locarno would be offered as the climax, and not the first stage, of detailed negotiation between the Russians and the West. There would have to be an interval between the offer and its execution, during which the confidence needed to make a guarantee effective would have to be created by the "piecemeal solutions of individual problems" for which Sir Winston asked on May 11th

The Architect's Dilemma

MORE architects are practising their profession than ever before in Britain, and the output of qualified young men and women was never higher. The profession is increasing at a rate of over 6 per cent a year and nearly everybody—at the moment—is getting a job. The proportion of building work that is being planned or directed by architects is increasing encouragingly. It was only 5 per cent of all building operations before the war, and now it may be 15 or 20 per cent. Architects are working on types of building from which they were previously almost excluded, such as local authority housing and schools. Yet the profession senses an undertone of public criticism of its conduct; it is far from happy about its present fortunes and is uneasy about its future. Controversy invades architectural journals and conferences; a radical wing even questions whether the professional status, built up so laboriously by the Royal Institute of British Architects, makes any sense at all in the postwar world.

The social changes which have taken place since 1939 have upset the traditional order of things for the architectural as well as for the medical profession; moreover, architects are struggling to come to terms with the technological revolution that is slowly overtaking building, despite the opposition of builders. Before the war,

architecture—the design of traditional kinds of building with traditional materials—was still mainly in the hands of the private practitioner (so far as it went to architects at all). He made anything from a just tolerable middle-class living to a fair-sized fortune out of it. Only those products of the schools or articulated training who had neither capital nor talent for private practice took the salaried posts that local authorities had begun to offer in growing numbers. Since the war the balance has changed spectacularly. It is the salaried architect who is getting the interesting work, the private architect who is doing the chores.

The reasons are obvious, though few foresaw them. Before the war public bodies and private concern put out their work to private architects; and so did the well-off and wealthy, who were still building houses, no longer mansions. But, since the war, building controls and priorities for council housing and schools have put most building into the hands of local authorities who have expanded their own architectural departments. So have nationalised industries; so have regional hospital boards; so have many large firms. The salaried architect, however underpaid and frustrated, has handled most of this work—and has kept control of even that part of it which has been "put out." The private

architect has had to be content with this overflow from public offices, together with such priority factory or commercial building as has come his way, plus conversions, war damage repairs, exhibitions and suchlike, to fill the gaps.

Meanwhile, the costs of running a private office have soared along with the taxation levied on the profits, if any. To be able to handle a remunerative commission, offices must be reasonably staffed. To carry the overheads between remunerative commissions, all sorts of odd jobs must be accepted. Even so, a private office often proves undermanned to deal with a big job—and any consequent mistakes or delays will draw criticism upon the profession. Big commissions tend to be concentrated upon a minority of large and experienced firms. This is especially true of factories, generally the most remunerative work. It is said that two or three firms have handled all the sizeable factories put out to architects in Scotland since the war. It has become almost impossible to start a new practice, and survive.

Of the 18,000 registered architects in Britain over half are already in salaried employment. They have in many cases found themselves taking instruction from seniors who were hardly regarded as the cream of the profession when they first went into local government service. Their prospects rarely exceed a top salary of £1,800 and a pension. But they have done most of the worthwhile architecture since 1946. Their efforts, not surprisingly, have encountered a lot of criticism—not least from builders, some of whom have the hardihood to declare that whether or not postwar houses are better designed than their forerunners, they are not designed to minimise cost or site delays. Nor has extravagance been confined to houses, as anyone who visits a new power station soon realises.

But the disgruntled private architect is in no position to point the finger of scorn. In his small office he often lacks the resources to tackle large programmes of work or to experiment with new techniques and materials: so much so that group practice has been proposed. He must face the fact that the most remarkable postwar architectural achievement has come from salaried architects. Thus the Hertfordshire County Council first showed in its school building what could be done by pre-planning, modern technology and cost-planning; and from its pioneer work has sprung the schools building programme now organised by a team of architects, engineers and administrators in the Ministry of Education. They have not only reduced the cost per school place by 45 per cent since 1949, despite a continuous rise in building costs, but have demonstrated a variety of non-traditional methods and materials—and even invented some—within a genre of architectural comeliness which has brought foreign architects flocking to these shores. A bitter pill this for the old school, whose efforts in the interwar years hardly raised a flicker of interest among their questing overseas colleagues, who

turned rather to America or Sweden for work of note.

It is clear to almost all architects that the prewar market for their services has disappeared with the last remnants of Galsworthy's England. Even the system of competitive tenders and contracts which the architect supervises is becoming obsolete. Tendering becomes too costly when three-quarters of the bill of quantities is for specialised materials at fixed prices; it imposes a rigidity of design which keeps costs high. The idea of the architect as standing between the owner and the builder is of doubtful relevance to the needs of a new age—which are for economical, standardised, efficiently-designed shelters for families, staff, production-lines or what else. This may be vulgar; it may not leave much scope for what the old school calls architecture; but it does leave scope for a tremendous technological development which the younger school views with undoubted relish.

★

Circumscribed by the RIBA code of professional practice—a development of little more than sixty or seventy years—the private architect has tended to hold aloof, concerned at least as much with art as technology, sometimes taking refuge from technology in art; all too often disinterested in close costing and good administration. In theory the leader and grand co-ordinator of the building team (which includes the quantity surveyor, the surveyor, the structural engineer, the contractor, the builder and other specialists), the architect has, in the opinion of the radical school, all too often been lost in the ensuing babel; and the specialists sometimes have to rescue him from the consequences of his own ignorance. To reassert his leadership, it is held, the architect must again become the master-builder, a man with a technical training adequate to make him practical and at home in modern technical developments.

Immediately after the war, indeed, the RIBA set up a special committee to advise upon the overhaul of architectural education, and a second—the Architectural Educational Joint Committee—is now working over the problem again. For there is little agreement on how the architect is to be trained for his commanding position. Over a third of young architects still receive their training outside the schools—usually by training in private offices where they make insufficient contact with modern building conditions. Even in the schools, the teachers are often men who were trained in prewar conditions and have not adjusted their teaching to modern needs, though some schools are radically overhauling their methods. There is a growing feeling that architecture must be integrated with technology in general; it is even suggested that properly remodelled courses in architecture and in engineering—civil, mechanical or electrical—would share the same first-year syllabus. Students themselves seem to demand more technology and less art.

Educational reconstruction, however, would not alone solve the professional dilemma. It might provide better

technicians for the public offices, where their talents would be used or abused, according to the quality of the senior architect. It should improve every architect's power to deal with builders and specialists. But it would leave the future of undercapitalised and underequipped private practices still in doubt. Many architects hope that easier times and the private client will return, that local authorities and regional boards will disgorge commissions, and that the architect will be restored to his proper place—that of the specialist consultant who in a fiduciary capacity stands between his client and the builder, earning his fees because of his disinterested professional status.

★

Others see a different future for the private architect. The way in which he can become again the master-builder is, according to this school of thought, to be a part of a firm of contractors or builders—an honest and knowledgeable business man in the best modern professional sense. He should be neither employee nor consultant, but preferably a director. Again, he ought to be fully involved in the many firms who are making building components or developing prefabricated systems. If, it is argued, the architect is not the designer of new materials and methods, he will miss the crucial development in modern building. He will risk becoming

ing the prisoner of other men's design and architecture.

To accept such an argument means, in terms of the RIBA code, that the architect would change sides. He would become a salesman rather than the guardian of his client's interest. The institute sticks to the view that if the architect is to lead the building team, and even effectively to influence design "at the production end," he must hold fast to his fiduciary status *vis-à-vis* the client—even if the "client" is a committee of architects and technologists. The radical school thinks this argument unreal. It foresees that more and more work will be done by departments of qualified salaried officials, or by tough "business architects," while private practice shrinks to the hard core of big consulting firms, which, in numbers and organisation, will approximate to the firms of consulting engineers, who form so important, but numerically so small, a part of the engineering profession.

It is not, for those who appreciate the aesthetic values in architecture, a very comforting prospect; and, indeed, the radicals probably underestimate the strength of the small provincial practice matching the small provincial builder. But if private practice is to be kept alive as a vital, independent and experimental force—and art—amid an increasingly official architecture, the profession must certainly adapt itself, and quickly, for its survival in a changed world.

Notes of the Week

The Regency

THE Government's decision to amend the Regency Act is the outcome of decisions that began more than a year ago. Since the intention had already been discussed in the Press, there was no point in delaying the official announcement. Mr Butler on Wednesday did his best to prevent the legal change from being falsely linked in the public mind with all the recent, ill-mannered speculation about Princess Margaret's private affairs. Presumably for this reason, he did not specify the precise changes that are to be made. It is clear, however, that the amending Bill will have two objects. It will name the Duke of Edinburgh as the person who would be Regent if his son should succeed to the throne before he is 18, and it will make the Queen Mother one of the Councillors of State who act for the Queen if she is too ill to carry out her duties or if she is out of the country. The Government intends to get the Bill on the statute book before the Queen and the Duke of Edinburgh leave for their Commonwealth tour at the end of

November, since during their absence a Council of State will have to act. Mr Butler emphasised that the terms of the Bill will be agreeable to all members of the Royal Family; Mr Attlee is said to have promised the support of the Opposition; and the Commonwealth Prime Ministers, consulted while they were in London for the Coronation, are reported to be unanimously approving.

It could hardly be otherwise, for the Government's decision is plainly right. The proposed changes do not, however, merely modify the 1937 Regency Act; they suspend its basic principle. Before 1937 it had been customary to make the arrangements for Regency *ad hoc*, but the Government of that time thought it desirable and possible to make a more permanent provision. They sought to do this by laying down the principle that, with one exception, both the Regency and the composition of the Council of State should be determined by the succession to the throne. The exception was the inclusion of the consort in the Council of State. In practice, this means that at the moment Princess Margaret would be Regent and that the Council of State would consist of the Duke of Edinburgh (should he not also be out of the country with the Queen), Princess Margaret,

the Duke of Gloucester, the Princess Royal and the Earl of Harewood. The Queen Mother would not be a member because the 1937 Act specifically excludes anyone "incapable of inheriting, possessing and enjoying the Crown" from being Regent or, with the exception of the consort, from being a Councillor of State.

The need for amendment reflects simply the foolishness of trying in 1937 to lay down a general principle that could not be appropriate to every circumstance. The practical and emotional reasons for making the Duke of Edinburgh the Regent for his son, and for bringing the Queen Mother into the Council of State, are obvious and sound. They have nothing to do with the rumours about Princess Margaret's matrimonial wishes, and the amendment of the Regency Act will leave the Princess third in line to the throne and second in line for the Regency.

Mr Attlee and Mr Butler

FOR the past two months Labour MPs have been depressed by the knowledge that Sir Winston Churchill's speech of May 11th gave not only the diplomatic initiative to his country but also the political initiative to his party. The experience of wallowing in the wake of a Churchillian "peacemongering" campaign was made none the more palatable by memories of Labour's "warmongering" charges at the last election. But the worst of the Opposition's discomfort has proved to be short-lived. This week's foreign affairs debate in the House of Commons has enabled the Labour leaders to make at least a little of the running again.

On the evidence of the Washington communiqué and of Mr Butler's speech opening the debate, the Opposition argued insistently that, with Sir Winston off the scene, the approach he foreshadowed on May 11th had been discarded by his colleagues. Lord Salisbury and Mr Butler had betrayed Sir Winston, so Mr Attlee and Mr Morrison were glad to rush to his defence; Mr Morrison, all thoughts of warmongering forgotten, hailed "the spirit of May 11th" with the fervour of some latter-day St Paul. Much of this was just political manoeuvring. The later Government spokesmen were able to demonstrate fairly convincingly that there was no great difference, when it came to practical proposals, between the official policies of the two sides—granted, of course, that the Government was sincere in its protestations that the proposed meeting of foreign ministers could be a prelude to a meeting "at the highest level." But Sir Winston's proposals were really of secondary importance compared with the general temper of his speech; it was in this that the Opposition saw the real difference between him and his Chancellor.

Mr Butler had an extraordinarily difficult task, and in the result his speech did not match either the level of the event or the speculation about his capacity as a future Prime Minister. That, however, should be regarded as misfortune, and the damage to his reputation is unlikely to prove very lasting. For the moment, the pendulum which carried the Conservatives to disappointment swung Mr Attlee to some revival of his authority. At a time when his leadership is being criticised by the right wing of his party almost as much as by the left, he was fortunate to be able to make a politically effective speech on such advantageous ground.

Clamour from the Constituencies

WITH more brisk rhetoric from Sir William Lawther and more barbs from the left-wing journals, the conflict over Labour party policy is weekly becoming more ill-tempered, if not deeper. A glance at the resolutions put forward for the annual conference, and published this week, would nevertheless suggest that the conflict is wasted words: the Left looks to be plainly on top. But that is a misleading impression. Although the conference is certain to be stormy, the rebellion against official policy will not be anything like as strong as these resolutions suggest. They have first to come before committees whose task is to weed out the frankly lunatic and to boil down each group of similar resolutions into composite amendments. When that is done the clamour of the highly vocal constituency parties will seem less powerful.

The constituencies, indeed, have put forward all but 15 out of nearly 400 resolutions, and most of these have a strong Bevanite flavour. Many press for more nationalisation than is proposed in the policy statement "Challenge to Britain." A few cling to the old faith in nationalisation of all the basic industries. Others mention specifically chemicals, insurance, engineering, shipbuilding, shipping, building materials, machine tools, aircraft, textile and mining machinery, the joint stock banks and the wholesale meat trade. Thirteen resolutions demand nationalisation of the land. This used to be an integral part of Labour policy but has long since been quietly dropped—quietly at least until Sir Hartley Shawcross last weekend declared that it was impracticable. Even *Tribune*, somewhat illogically, is now pressing for nationalisation of rented land only.

The kind of opinion that the conference resolutions embody is not typical of opinion in the rank and file of the Labour party as a whole. It is rank and file opinion as distilled through the filter of the constituency party organisations, where the most active members tend to be left-wing socialist theorists. Rank and file opinion is also distilled through the local branches of the unions, whence it often emerges relatively cautious and practical. The body of opinion that is opposed to nationalisation for its own sake is hardly represented in the resolutions for the party conference, but it is expressed in the support for Mr Deakin when he urged the Transport and General Workers' Union to demand no more than the limited nationalisation of "Challenge to Britain"—and to accept that only with reservations.

The Outrageous Mr Rhee

THE President of South Korea has again sent a shock of indignation through the free world. By his statement yesterday, Mr Syngman Rhee has shown that he is impenitent and unchanged in his refusal to accept an armistice in Korea along the lines at present proposed. Thus one man continues to hold the United Nations to ransom. It is difficult not to regard these tactics as gangster politics, adopted, it is true, from motives of what in other circumstances might be praiseworthy nationalism, but the crudest

form of politics nevertheless. The result may well be a further postponement of the truce and the death of thousands more men. And to what purpose? There is not the remotest possibility of uniting Korea by force in the foreseeable future. If Mr Rhee believes so strongly it must be attempted, let him go into the trenches himself.

The latest divergence of policy between the South Korean and American governments is reflected in different interpretations of the agreement recently reached between Mr Rhee and President Eisenhower's special envoy, Mr Robertson. Mr John Foster Dulles has stated publicly that, after their meetings, Mr Rhee wrote a personal letter to President Eisenhower saying that "he would not obstruct in any manner the implementation of the armistice terms," and that he wrote a further letter to the Secretary of State saying that "while he questions the wisdom of the truce he has yielded his convictions to United States policies." Now Mr Rhee comes out with definite qualifications to this attitude which have never previously been made plain, at any rate in public. He and his Foreign Minister, Mr Pyun Yung-tai, assert that his promise not to obstruct a truce was entirely dependent on the imposition of a time limit of ninety days after the armistice, during which a political conference would be expected to achieve Korean unity by negotiation. This is virtually impossible. Failing agreement on unity, the South Koreans reserve the right to renew the fighting. General Harrison, the chief UN negotiator, has rightly given an undertaking to the Communists that the rest of the UN forces will not assist.

Puzzle in Indo-China

MLANIEL'S government is caught between the danger of a renewed offensive in Indo-China by the Viet-minh when the rains end and the likelihood of a political crisis in Paris in the autumn. The methods by which the former threat has to be met are certain to precipitate the latter. On the one hand General Navarre, the new commander in Indo-China, has asked for more men and has pulled off two spectacular, if limited, operations by paratroopers and commandos. On the other hand, the financial programme outlined by M. Laniel and the current of French public opinion are both opposed to any intensification of the military effort in the Far East.

As a further complication, there is the ambiguous attitude of the Associated States towards the recent overtures from Paris. Although Cambodia, Laos and Vietnam are prepared to enter on bilateral talks with France about greater political and economic autonomy, it is clear that they consider the French offer as no more than a preliminary move towards real independence. In Paris, however, the government is rather sharply divided about the length to which France should be prepared to go when confronted with the increasing nationalism in the Associated States. In the present conception of the French Union, moreover, neither national armies under independent command nor an economy really detached from central administrative institutions could find a place. This poses the question whether or not a French government would allow the Associated States to make a decision about staying in the French Union.

A number of conflicting solutions are being put forward. There are those who wish to continue, and even intensify, the war until France can negotiate from strength. This would mean a substantial increase in American help of which there is no sign. A second school of thought favours the greatest possible independence for the Associated States provided that they take a more active part in the war. The latter would then develop into a civil war between Asians, and probably end in a compromise peace. Those who are in favour of this solution, which has much to recommend it, are inclined to forget what a compromise might produce. It would mean either an ultra-nationalist coalition of the three states which might break with the French Union, or an eventual Communist regime under Ho Chi-minh, brought about by Communist members of a coalition government undermining and liquidating their colleagues. It is this lack of a clear and predictable solution that makes the war in Indo-China so tragic and makes so many Frenchmen feel that a way must be found to get an armistice before too long.

Bread and Shackles in East Germany

THE rulers in the Kremlin are having to fight for the existence of the Socialist Unity (Communist) Party in East Germany. Following Beria's fall, a new policy of bread and shackles—the Soviet version of carrot and stick—has been inaugurated in the Soviet Zone. A new bout of political terrorism is accompanied by continued promises of economic concessions. There is no mistaking the meaning of the dismissal of the Minister of Justice, Herr Fechner, a former Social-Democrat who went over to the Socialist Unity party in 1946. His crime is that he admitted that the right to strike is embodied in the constitution of the "German Democratic Republic." He has been arrested and replaced by Hilde Benjamin, a veteran Communist lawyer, who has earned a reputation for savage sentences based on political prejudice. With the advent of "Red Hilde" or "Long-haired Freisler" (a reference to Hitler's hanging judge), it is clear that the brief period is over in which it seemed that Herr Ulbricht would try to appease the Social-Democrat leaders in the Federal Republic. Now a hunt is on foot to unearth all workers who have retained their allegiance to their old party principles. There are many of them and most will be too courageous and loyal to denounce their comrades.

The dismissal of other leading members of the Socialist Unity Party for having shown weakness during the revolt of June 17th is only one of the signs that a desperate effort is being made to reform the disrupted party ranks. German party members are hearing the same imperative orders as are being issued from Moscow to the Communists in the Soviet Union—to leave their office seats and go among "the masses." They must argue, it is said, "honestly and convincingly" with the workers about their grievances and "mistakes." Russian officials are themselves questioning German workers. But Herr Ulbricht, whose blood the workers want, has preferred to make his latest address to a picked audience and relay it through loudspeakers to the rest of the factory.

The German Communist leaders are still talking about

supplying more consumer goods, but they are again insisting in orthodox terms that the workers must increase production if the promised better times are to materialise. Raw materials and food, it seems, have still to be paid for by exports. Some Soviet food is being hastily sent, allegedly on credit, to counter the American offer of free supplies to the East Zone, but there is no sign that the Soviet government after turning down the American food, will itself go so far as to make any presents to the Germans. Under these circumstances, the East German Communist leaders have been in a very weak position to make their latest appeal to Bonn for a conference on unity. Since the events of June 17th there is not a single West German leader who would treat with the men whom the East Germans have so violently repudiated.

Wages, Prices and Exports

THE Chancellor of the Exchequer has acted none too soon in his renewed warning about the effect of higher wages on exports. On Wednesday he said bluntly that Britain's competitive position in engineering products had deteriorated over the past two years, and competition in foreign markets was now becoming intense. A general rise of 10 per cent in wages would, other things being equal, force export prices up by 4½ per cent, and that would "cause a serious fall in the volume of our exports."

With the engineering unions now officially pressing their claim for a 15 per cent rise, and a host of other demands under discussion, the Chancellor has no alternative but to stress this danger. It would be a pity, however, if the words he addresses to industry were misunderstood by its overseas customers. Some wages have already gone up, others will no doubt follow, some prices will accordingly rise, and other unions will take this as strengthening their claim for higher wages also. But all this is by no means as simple and automatic as Mr Butler's illustrative figures. The foreign buyer who reads reports of wage increases in Britain does not have to assume at once that he will very soon be asked to pay more.

Even the relation between increases in the cost of living and wage claims by the trade unions is very far from being direct and unchanging. From June, 1952, to June this year the index of retail prices has risen by three points only,

compared with thirteen points in the previous twelve months, but the volume of wage claims shows no corresponding reduction. The current *Economic Journal* contains an interesting study of the lag between price and wage movements over the years 1948 to 1951. If there were no lag at all, if price increases were immediately reflected in wage increases and these again, via costs, in further price increases, the currency would swiftly collapse. The longer the average lag, the more powerful the brake on inflation and the greater the chance that increasing productivity or mere good fortune may right matters before serious damage is done. The "average lag" is in fact a complex of delays—between price increases and their impact on the cost of living index, between the rise in the index and the presentation of claims, between the beginning of negotiations and the report of higher wages.

During the period 1948 to 1951 the total lag was, on the average, six to seven months. But this average masks a wide difference between the periods before and after the ending of the wage freeze. By the second half of 1951 it had fallen by nearly a half. Since 1951 it has—as the authors of the study admit—become unsafe to assume that claims "are induced only by actual, realised price changes and not by expectations of price changes." The lag may have become, in some instances, almost a negative quantity: wages are increased in part because prices are expected to rise, not solely because they have risen. If this is true, only the fall in raw material prices has of late averted a critical inflation. The outlook certainly embraces the dangers to which Mr Butler drew industry's attention.

School-building Defended

IT was not to be expected that the Ministry of Education would lie down under the strictures of the schools made by the Select Committee on Estimates. Its reply, published last week, rebuts the criticisms and rejects most of the recommendations.

The committee had blamed the Ministry for underestimating the number of new places needed and for not having precise information about obsolete schools. It recommended that the estimate should be made by "less haphazard methods" and that a national survey of the older schools should be carried out. To this the Ministry replies that the estimate was determined by Government policy (the Labour Government's) not *vice versa*. That policy rested on a deliberate decision to endure, during the next few years, large classes, makeshift accommodation, long bus-rides for some children and the use of obsolete buildings. After 1960 the school population will fall steeply, and it would be a waste of public money to build enough places to house everybody comfortably meanwhile. To do so would, indeed, be to provide extra places twice over, for the children now crowding out the primary schools will in five years' time need places in the secondary schools.

The committee also urged that the school building programme should be reorganised on a three-year basis instead of an annual one, so that larger orders can lead to lower costs and school building can keep better pace with house-building. It is certainly not the fault of the Ministry of Education if housebuilding forges ahead; that again has

been a matter of government policy. The committee might well have criticised this general over-emphasis on housing, but its criticisms were actually directed at particular cases where housing estates had been completed without schools to serve them. As the Ministry points out, it takes longer to build a school. That fact, however, lends support to the committee's proposal for a three-year school-building programme; while the Ministry could not approve such a programme in full, in advance of the annual estimates, it could effectively sanction a considerable part of it. As for the recommendation that local authorities should be urged to adopt prefabricated methods—which are not only cheaper but also quicker than ordinary buildings—the Ministry can justly claim that it has been asking them to do so for years past. It has indeed played an important part in their design and development. Perhaps it could redouble its persuasion. On the whole, however, the Minister's defence carries conviction. Most of the select committee's criticism appears to have been unfair and much of its advice superfluous.

Capital, Colonies and Conscience

POVERTY in the colonies—indeed throughout and beyond the Commonwealth—lies increasingly heavily on the conscience of the Labour party, to judge from the increased spending on development and welfare demanded by successive Labour speakers in the debate last week. Mr Shinwell and others demanded to know what the Government was doing and spending in greater detail, and criticised it in advance and in retrospect as inadequate. They not only urged that the Colonial Development Corporation and the Colonial Development and Welfare Fund should spend more, but that narrow considerations of profitability and return on capital should be waived; they urged the colonial marketing boards to disgorge their reserves; they called for greater British contributions to the Colombo Plan, to the United Nations Programme of Technical Assistance, to the FAO and other United Nations agencies; they demanded that the Commonwealth Development Corporation and private enterprise generally should get on with the job; they called for contributions from Canada, South Africa, New Zealand and Australia and advocated the transference of a few colonies to the last two as a means of loosening their purse-strings; they called for more loans from the world bank, and more dollars and colonial investments by the United States.

To these impassioned pleas to get into the shooting war against poverty and malnutrition, Mr Lyttelton and Mr Nutting, for the Colonial Office and Foreign Office respectively, gave an effective answer: that it is impossible to invest a deficit. In the year in which the Government took office, the total deficit on overseas account was £600 million; to be able to meet all the desirable projects and worthy causes championed by the Labour party, the country would need a regular annual surplus of comparable size. To some extent, the British people must choose between social services at home and welfare and development abroad. There can be little doubt which alternative politicians would prefer to put to the electorate. Nevertheless, large sums have been invested, successfully as well as unsuccessfully, in the colonial territories; the problem has

more often been shortage of equipment or skilled labour than of finance. The rate of capital formation in the colonies has been rising impressively, from £190 million in 1948 to £400 million in 1952. The development plans of the colonial governments involve the expenditure of £500 million in the next ten years, and most of it will have to come from the British taxpayer. One may sympathise with those members who urged that some effort should be made to bring home to citizens of the colonies the extent to which the British taxpayer is now carrying the burden of developments that would otherwise have to be met by forced savings—taxes—in the colonies themselves.

Malenkov's Dangerous Ally

IT was clear from the outset that the Russian Army was bound to benefit from Beria's downfall and the dissension among Soviet civilian leaders. The prominence given to military figures in the campaign against Beria indicates that it took an active part in the struggle. From the Caucasus Beria's fall was greeted by the army chief, General Antonov. At a meeting held in Kiev local military commanders were among the most vehement in denouncing Beria. To crown it all, great publicity was given to a meeting of the Party caucus in the Ministry of Defence in Moscow at which the elimination of the "traitor" was commended. Since all superior officers must be members of the Party, the meeting was attended by almost all the prominent army leaders, including the Minister of Defence, the political Marshal Nikolay Bulganin; his first deputy, the conqueror of Berlin, Marshal Zhukov, and the Chief of Staff, Marshal V. D. Sokolovsky.

Since almost all the elite were present absences were conspicuous. Notable among them were those of the other first deputy, Marshal A. M. Vassilevsky; of the head of the land forces, the conqueror of Vienna, Marshal I. S. Koniev, and of the former Chief of Staff, General S. M. Shtemenko. All three had at the time of the doctors' plot been described as the intended victims of the Jewish doctors. On the other hand, another intended "victim"—Marshal Govorov—took part in the meeting. Once, however, one enters into the domain of speculation, numerous reasons can be found for the absence. Thus, for example, if a deal were struck between Malenkov and Zhukov—as the leader of the fighting generals—either could have asked, to it. Zhukov could have asked for the downgrading of military competitors (and the stars of Zhukov and his friends have always been in rivalry), while Malenkov could not, tried to push into the background those directly involved in the "doctors' plot."

This is all merely guesswork, but two things are becoming clearer. First, that Beria's victors must get things properly under control, or at least must decide on the policy now to be followed. This would necessitate postponement for a week of the meeting of Soviet originally summoned for July 28th. Malenkov must have come to an understanding with the Army. Did he choose this path freely or was it imposed on him? In many quarters Malenkov has been praised for the cleverness of his move. Yet Malenkov has freely chosen such a strong ally, must have forgotten

Sand into Shells

A mixture of dry sand and a special heat-hardening BAKELITE Resin is dropped on to a heated metal pattern. A strong, light 'shell' is formed, which makes a very suitable mould for metal castings. It sounds simple, but the process represents a revolutionary advance in foundry practice. It means cleaner, more accurate castings that need little or no machining. The development of a suitable resin is another example of the practical benefits to industry that flow from Bakelite Limited's research. The story of plastics is already a long one, but new pages are being written every day — by the organisation whose pioneering efforts were mainly responsible for the general adoption of these versatile materials.

Please write for booklets describing the Shell Mould process or BAKELITE products generally

Simple steps to higher mileage

FREE

Get this valuable book

IT CAN SAVE YOU POUNDS EVERY YEAR

Do you know that with identical cars one driver may get, say, 7,000 miles and another driver 35,000 miles from tyres of the same make? Just think of that. One buys 25 tyres while the other buys 5. What is the secret? This book will tell you. Read how to get thousands more miles from your tyres. It is free from 'padding' and is free to you. Post the Coupon NOW (1d. stamp in unsealed envelope). Issued in the interests of motorists by The Avon India Rubber Co. Ltd., Melksham, Wiltshire.

THE COST OF DRYING THINGS

Millions of tons of fuel are used in Britain every year in drying processes, many of which are inefficient and wasteful.

When coal was cheap no one worried unduly, but today the cost of fuel used in drying is a serious expense item which tends to get buried in general overhead without receiving the close control given to economy of raw materials. Furthermore, many drying processes are as ineffective as they are extravagant.

Eight years ago, we started a specialised service to the Metal Goods Industries by providing Gas Infra-Red Tunnels for drying paints and varnishes. Today our techniques have wide application as varied as those employed in fish curing and textiles.

We are ever looking for new drying problems to solve. Nearly every industry has one. Send yours to:

The Quality Cigarette

[3P 111]

Machiavelli's warning "that a prince ought to take care never to make an alliance with one more powerful than himself for the purpose of attacking others, unless necessity compels him . . . because if he conquers you are at his discretion, and princes ought to avoid . . . being at the discretion of anyone."

France Gets Russian Trade

A SIGNIFICANT, if minor, development in the cold war was the signing last week of a Franco-Russian trade agreement. It is to run for three years and the volume of trade each way is fixed for the first year at 12,000 million francs (some £12 million). While the volume is small in relation to total French trade, it is much larger than in the past and, what is more, the exchanges that did take place in recent years left France with a deficit which had to be paid in gold or dollars. If the present agreement works according to plan, French imports from Russia will be twice those of last year and the Soviet Union will take six times as much from France. Commercially there can be little doubt that it is a very good bargain for France.

France will receive from the Soviet Union such strategically important commodities as chrome, manganese and oil and also such dollar savers as maize. In return France will deliver a number of consumer goods—citrus fruits, wool and rayon yarn and cocoa; but it will also get some commodities that Congressional watchdogs in Washington would like to regard as strategic, though they do not appear on the embargo list. These include boilers, cranes and cargo ships up to 5,000 tons. In fact, there seems to have been little attempt by the Russians to embarrass the French by insisting on strategic goods; for example, they did not hold out for tankers, one of their favourite demands. The agreement has the additional merit, in French eyes, that it comes at a time when French exports are selling with considerable difficulty and the trade deficit is mounting steadily.

France has been eager for some years to conclude a trade agreement with Russia, but not until recently has the Soviet Union shown reciprocal enthusiasm. It is fairly plain that its new co-operativeness springs more from diplomatic considerations than from economic motives. For one thing, the propagandists for east-west trade have now been provided with a showpiece which will be used incessantly to obscure the fact that fundamentally Russia is not a reliable market for western consumer goods nor a cornucopia of food and raw materials. Its economic aim remains self-sufficiency for a great land bloc. Its political aim is to create internal dissension, by just such measures as this, among the western powers.

Moreover, it requires only a second's thought to appreciate that Russia could have obtained precisely the same commodities from Italy or a number of other western countries. Yet, in recent trade talks with Italy, Soviet negotiators have maintained an inflexible demand for strategic commodities. Forbearance towards the Italians would not yield the same political dividends as with one of the Big Three.

A Windfall of Roubles

THE Russian offer of four million roubles for Uno's technical assistance programme, followed almost immediately by a similar offer from the Polish delegate, took the meeting of the Economic and Social Council in Geneva by surprise. The offers were sandwiched between speeches critical, to the point of abuse, of American motives in providing help to under-developed countries, but they mark a complete reversal of Communist policy towards this aspect of Uno's activities. Previously Moscow's line has been to denounce its work on technical aid as an imperialist intrigue against backward countries. Although the first contribution by the Soviet Union (and Poland) is modest, considerably smaller than Britain's and only a fraction of that of the United States, it is surely to be welcomed as one of the more solid gestures that post-Stalinist Russia has made. The reaction of the American delegate in welcoming the new move without qualifications is clearly right.

The motives underlying the *volte face* at this juncture are obscure; but it is not unlikely that the Russians have become aware of the prestige and propaganda value of extending material assistance to certain countries. Technical assistance in the UN manner is, however, a two-way trade: experts and research fellows move both into and out of each participating country. It would be a most interesting development if the Kremlin showed itself confident enough to let Russian technicians and students go forth into the free world to take an active part in the technical aid programme.

The prospect of a Russian technical expert advising on nutritional problems in India or of Ukrainian researchers at Oxford is fascinating enough; but imagination boggles at the prospect of an American national accounts expert giving advice at the Gosplan headquarters. It will be interesting to see whether the Russians propose to subscribe to this two-way exchange of experts and facilities encouraged by the Technical Assistance Board. No doubt some kind of restraint on the political activities of visiting experts will be required and guarantees will have to be given against the corruption of visiting students by their hosts. A more generous exchange rate for the rouble will be required if fellowships tenable at Moscow's scientific institutes are to be at all attractive.

Uphill Fight for Fish

THE second annual report of the White Fish Authority was discussed in Parliament last week. If not precisely disillusioning, the picture of the authority's activities can hardly be called cheerful. Its primary job is to encourage and facilitate self-help within the fishing industry. It can grant loans for building new ships—an astonishingly high proportion of the fishing fleet dates back thirty years and more—and can also spend money on research, training and publicity; but its chief aim is to further co-operation within the industry, and notably to rationalise the Aberdeen fleet into more economical units, to establish a joint marketing organisation, to develop co-operative freezing facilities, and

to work out an agreed scheme of freight equalisation for consideration by the Transport Commission. The subsidies granted in 1951, and supplemented later by building grants, were meant merely to keep the industry going until these longer-term schemes should bear fruit.

But the authority reports almost uniform failure to win a response from its constituents. Its loans found no takers, costs of construction being too high in relation to earnings; the Aberdonians remain aloof; "insufficient support" was forthcoming either for the authority's scheme of voluntary price stabilisation or for the freezing plan, on which negotiations continue; Fleetwood and Grimsby objected to the freight equalisation plan favoured by the more distant ports. The subsidy—on strategic arguments more justifiable than most—continues at a higher rate; the reforms for which it was supposed to give breathing-space are still to seek.

The industry has, of course, had some bad luck to contend with. On the one hand it has suffered from the Iceland dispute, forcing the deep-sea trawlers further afield, and from general increases in operating costs; on the other, it has had to face the competition of more plentiful meat and eggs. These factors—which between them lowered the last twelvemonth's landings by 5 per cent in volume and 10 per cent in value—would have been operative whatever the Authority's success. Moreover, it has not despaired of seeing persuasion bear fruit. Meanwhile it is, on its own initiative, conducting experiments in the technique of quick-freezing at sea; this, if successful, should both reduce wastage and bring a better product to the fishmonger's. Such an improvement in quality opens the best chance of recapturing the consumer's favour.

Charitable Trusts

THE House of Lords returned this week to a subject raised just over four years ago. On that occasion its motion arose out of Lord Beveridge's report on "Voluntary Action," which discussed the place of voluntary effort in the welfare state and the future of the many charities whose purposes the state has largely superseded. As a result of the debate, the Labour Government set up a committee to survey the law and practice relating to charitable trusts. The recommendations of this committee (discussed in *The Economist* of January 10, 1953) formed the main subject matter of this week's debate. It is regrettable that the present Government's attitude to the report appears to be lukewarm. Even the promised Bill on imperfect trust instruments has not been forthcoming, and the Lord Chancellor showed little enthusiasm for the committee's other proposals.

One of these was that all trusts should be registered with the Charity Commissioners or the Ministry of Education. At present, public information on the number and size of trusts is scanty. But a good idea of their enormous range and variety is provided by "Trusts and Foundations," which has been opportunely published* this week. This guide covers only a tiny proportion of the trusts and foundations that are known to exist in the United Kingdom and the rest of the Commonwealth—and there are probably many more whose existence is unknown to the Charity Com-

* "Trusts and Foundations." Compiled by Guy W. Keeling. Bowes & Bowes. 194 pages. £2 2s.

missioners—but it gives an excellent cross-section. Thus cheek by jowl (the guide is arranged alphabetically) with the seventeenth century Morden College at Blackheath for the reception of old widowers or bachelors, which has a capital of well over half a million pounds and an annual income of £66,000, is the Mullaghmore School Trust Fund, founded in 1920 for the benefit of children attending the local primary school, with a capital of £60, of which only the income is available.

Other startling contrasts can be found on almost every page of the guide. It is intended, however, to do more than give a list of charities large and small for interest and entertainment. Through its classified index, which will enable social workers and potential beneficiaries to see what funds are available, it will do much to make charity more effective—besides itself providing a fruitful example of "voluntary action."

Mr Markezinis' Visit

MR MARKEZINIS has gone back empty-handed after his visit to London last week, but that is not necessarily a reason to judge his visit a failure. He came primarily to explain and to explore, and this he has done, both in Whitehall and in the City. He himself is reported to be well-satisfied with his talks; his optimism will be justified if in the months ahead Greece is in fact able to increase its trade with this country and if British investors do indeed decide to invest in Greek development projects.

Greece is not particularly attractive to the foreign investor, nor is its record as an international debtor encouraging. (No progress towards a settlement of Greece's prewar debts seems to have been reached last week.) On the other hand, for the first time since the war, Greece is being governed by men who are clearly making a real effort to put their country's economic house in order. They have cut down on government expenditure and are gradually reducing the overblown civil service to its 1940 level. In an effort to stimulate exports, they have carried out a long overdue devaluation of the drachma, and the other week they lifted almost all import restrictions. These measures have not been without their ill-effects; both the cost of living and unemployment have risen. The rise in the cost of living—7.8 per cent since last March—is not as bad as the Government feared it might be, but the increase in unemployment is causing a good deal of anxiety.

Field Marshal Papagos's government is pinning its hopes for Greece's long-term recovery on its five-year development plan. The plan is reasonable enough in theory; the trouble is to find the money to put it into effect—and this at a time when American aid has been drastically cut. The total cost of the plan is estimated at \$235 million, of which \$131 million is in foreign exchange. About half of this should be provided by unused balances of American aid funds, the current year's allocation of aid (a mere \$20 million) and EPU funds. If the government's efforts to persuade Greek shipowners to repatriate their earnings were to be successful, this would provide a substantial contribution towards the remainder. But as things are, if its plan is to be carried out the government will have to depend on the International Bank or foreign investors.

Letters to the Editor

Theory of the Welfare State

SIR—You say in your issue of July 18th that "the Conservative conception of need" and a means test is roughly handled in Mr Hagenbuch's analysis" in the current number of *Lloyds Bank Review*. It may be so; but Mr Hagenbuch himself made remarkably little headway on the subject.

"May it not be," he concluded, "that the solution lies not in a hotch-potch of different types of means test, discriminatory charges and the like, but simply in an extension of the principle of insurance?" He instances insurance "for the more costly" health services, but does not suggest how the same principle could be extended to education or, say, subsidised housing.

The Conservative party's conception of the social services does, of course, include and strongly support the insurance principle for the whole range of social security payments. But it is a corollary of the insurance principle that those not insured can only be relieved after satisfying the very test of need which Mr Hagenbuch rejects. He wishes to abandon universal free education and universal free treatment in sickness; but he does not say on what principle the amounts which are to be paid by different persons for these services would be decided, nor how, for example, the rents of subsidised houses are to be fixed.

Where insurance is impracticable, either the subsistence means test must be imposed throughout, or we must fall back on that "hotch-potch of different types of means test, discriminatory charges and the like" which Mr Hagenbuch so contemptuously dismissed. Perhaps after all this empirical approach of the Conservative party to each of the social services individually has something to be said for it.—Yours faithfully,

J. ENOCH POWELL

House of Commons, S.W.1

More Academic than Free

SIR—Mr McGeorge Bundy's letter gives a wholly inadequate impression of American opinion about Communists and alleged Communists in higher education. Mr Bundy says that "most of us in the United States" believe that as a general rule Communists are not fit to serve in universities. The only exception he mentions is Senator Taft, whom he describes as "annoyingly independent." ("Annoyingly" seems an odd word for an American to couple with "independent.")

The American Association of University Professors, the only national organisation of teachers in higher institutions, which for forty years has been chiefly concerned with the defence of academic freedom, has repeatedly reaffirmed its adherence to the position that Senator Taft has now taken. The faculty of Political Science of Columbia University takes the same position. So do Alexander Meikeljohn and Robert S. Lynd, to mention only two of many whose names spring to mind. Albert Einstein has gone further and demanded a campaign of civil disobedience against the investigating committees.

I should have said that most of us in the United States who are seriously concerned about the integrity of our institutions applaud Senator Taft's statement as an expression of sanity and common sense.—Yours faithfully,

ROBERT M. HUTCHINS

San Marino, California

★

SIR—On the "Letters" page of your July 11th issue you state: "*The Economist* believes that no one should be dismissed because of his political opinions unless it can be proved that they have led him to speak or act against the spirit of the institution he serves." That principle seems to be entirely in accord with the policy of barring members of the Communist Party from university faculties. It is well known that membership in the Communist Party entails much more than holding certain political opinions which can be given concrete expression through established democratic processes. Such membership requires that the individual be prepared to surrender his duty of independent criticism and even his conscience to the direction of the party, a direction he is powerless to control.

As you have stated, it is one of the primary functions of a free education to present alternative views. A teacher who joins the Communist Party establishes a presumption that he is not, or at least may not be the custodian of his own judgment. Is he then to be considered still competent to present alternative views in objective fashion, or to sustain further that spirit of free and impartial inquiry which distinguishes a university from a trade school? Does not his acceptance of membership in itself constitute an act which clearly violates the spirit of the institution he serves?—Yours faithfully,

CHARLES O. COOK, JR.

Washington, D.C.

The Riddle of Prosperity

SIR—The first article in your issue dated July 11th ends with the sentence "how shall we make the British people determined to be prosperous?" Although there was a time when I thought that the "carrot" was the answer, I think now that perhaps that was an oversimplification. I am reminded of a story told about the reactions of Mr Ernest Bevin when he saw the wealth of finished commodities owned by many American workers. Mr Bevin is said to have exclaimed "in Britain there is a poverty of desire." By some curious thinking, there is a powerful body of opinion in this country which believes that a desire for material wealth is something evil whereas, of course, in a competitive world as we have it and which must be accepted, the great danger which faces Britain is a fantastic indifference to inefficiency.—Yours faithfully,

W. McMILLAN

Alderley Edge, Cheshire

Farm Rents

SIR—It appears to me that farm rentals fixed by arbitration are substantially below the rentals which market yields would dictate. The actual figures for two farms are:

	Farm "A"	Farm "B"
Acreage	61	103
Rental at date of probate	£99	£135
Probate value at August, 1951, as agreed in autumn, 1952	£3,000	£4,700
New Rental: Statutory arbitration, June, 1953	£140	—
Voluntary arbitration, Dec., 1952	—	£214
Gross Yield (before charging repairs, insurance and management expenses) ...	4.67%	4.55%

The foregoing may be compared with the Agricultural Mortgage Corporation's current rate of interest of 5½ per cent. Further, it should be noted that under the Agricultural Holdings Act farm tenants are protected and consequently a tenant-occupied farm is worth less than one with vacant possession. In theory, therefore, the capital values employed for the above farms are understated.

Whilst appreciating that interest rates have changed between August, 1951, and now, I feel that this can hardly account for the substantial discrepancy. There would appear to be two main reasons for fictitiously low rentals: (a) The failure of landlords, for various reasons, to raise their rents; (b) The lack of a free market in farms to let.—Yours faithfully,

London, S.W.1

The Acheson Years

SURVEY OF INTERNATIONAL AFFAIRS, 1949-50.
By Peter Calvocoressi.
Oxford University Press. 590 pages. 52s. 6d.

DOCUMENTS ON INTERNATIONAL AFFAIRS, 1949-50.
Selected and edited by Margaret Carlyle.
Oxford University Press. 796 pages. 63s. net.

THESE two tremendous volumes cover two tremendous years, the time when the Acheson-Bevin policy was at its firmest and clearest in Europe, though still fumbling in Asia. The North Atlantic Treaty was being signed and executed, Western Germany was being built up, Western Europe was struggling by devious ways towards a first pattern of unity; in the East the Communist republic in Germany was being set up, Tito was breaking away towards the western camp, the grip on Eastern Europe was being consolidated. In Asia the Korean war started, China joined in, and the United Nations found itself formally engaged in a war for its principles. What a period for a historian to tackle, what a mass of events in which to find the true pattern, and what a medley of emotions to be detected and overcome in the evidence and in the planning of its use.

In a short introduction Professor Arnold Toynbee takes a telescope and sees a pattern of rivalry between two great powers in two areas. But the brunt is borne by Mr Peter Calvocoressi, who marshals evidence admirably and here and there produces badly needed sections of analytical discussion. This volume is far more readable than his last and he is gaining in skill and confidence as his work catches up with events. The successor to this volume, which deals with two years, will deal—as is the Chatham House tradition—only with one. It is something to look forward to.

There are two major criticisms to be made. Firstly, the emphasis is too much on the strategic pattern. Admittedly, much that happened in those two years was the result of fear of war and an effort to take up better positions in case it came. But even in the United States and Russia, the dominant rivals, one must doubt whether strategy was as dominant in policy as would appear from Mr Calvocoressi's view. Recovery from the war was still incomplete; policies were deeply affected by economic difficulties and the political disruption caused by the return to peace. It is, of

course, extremely difficult to say where international affairs begin and national affairs end. But it is a matter to be thought about in the preparation of future volumes. Likewise, more attention should be given to the part played in these rivalries by conflict of ideas, or rather by fear of ideas backed by the resources of powerful governments. There is a quotation from Ranke on the title page which rouses unjustified hopes.

Secondly, the treatment of economic affairs is dull and thin, although that appears not to be Mr Calvocoressi's direct responsibility. Russian policy and the American reaction to it created new economic patterns both in and beyond Europe; rearmament and the restriction of trade with the Communists had their impact on domestic economies and deeply affected governments' attitudes to the United States. The institutions that Professor Hawtrey studies are less important than the events they were set up to control.

The documents are quite invaluable both for regular use and for the study of the survey. By getting them out of the way the historian is able to provide excellent footnotes and to furnish a running sequence of cross-references. But how much bigger and how much dearer are these valuable books to become? One can only ask the question, not answer it.

Steadily and Whole

RETURN PASSAGE.
By Violet Markham.
Oxford University Press. 260 pages. 21s.

TO have opened an alert and observant eye on the world of the 1870s and to remain alert and observant in the 1950s is almost in itself a sufficient qualification for an autobiographer. When the greater part of the interior has been filled with a devoted, distinguished and richly varied career of public service the autobiography becomes something of a historical document as well as a personal record. Miss Markham has a further and rarer qualification, harder to define than length and richness of experience or a gift of straightforward, unemphatic but often entertaining narrative. It is a capacity to move, in a very special sense, with the times; neither clinging nostalgically to Victorian security or Edwardian elegances nor repudiating, in the name of the brave new world, the standards and values of earlier days, but seeing the whole long perspective steadily and whole through a wise

but essentially contemporary eye. It is a capacity deriving from courage, charity, strong principle and an open, ever-receptive mind.

These qualities shine through narrative, digression, anecdote, personal assessments and appreciations, political and social judgments, whether Miss Markham is describing a happy childhood as the youngest member of a large prosperous Victorian clan, discussing the party politics of the 1900s, telling of travels and encounters in Egypt, South Africa, Canada and the Far East, recalling the trials and disappointments of the National Service Department in the first world war or the humours of the women's services, pondering the hard lessons of the National Assistance Board, weighing the gains and losses of the welfare state—or talking about dogs. The more personal side of the story—friendships, tastes, brief happy marriage—is neither suppressed nor obtruded. The final chapter is, typically, a testament of religious faith.

"Return Passage" is a footnote to political and social history and an unfailingly interesting story; it is equally significantly a study, no less valuable because entirely unselfconscious, of the forging and moulding of a character.

Economics and "Realism"

THE LOGIC OF BRITISH AND AMERICAN INDUSTRY.
By P. Sargent Florence.
Routledge and Kegan Paul. 368 pages. 28s.

NEARLY three years ago, Professor Sargent Florence complained of the lack of what he called "realistic economics—resting on actual observations of economic life"—in this country, observing of some of his colleagues

I have been careful not to say that the pure economist is valueless but, if I may borrow one of his own conceptions, his marginal utility is low.

He has now supplied, in this book, an impressive essay in the economic technique that he favours; and it does not lack some piquant examples of his own characteristic prejudices.

In form, this is a much enlarged revision of Professor Sargent Florence's classic "Logic of Industrial Organisation," published some twenty years ago. In content, the mass of data on British industry that has become available has enabled him to fill out with evidence many of the generalisations he made in the thirties; to widen his discussion of the structure of industry, in size and location; and to illustrate his discussion of the efficiency of different patterns of control in industrial organisation. Comparison with the earlier volume reveals how seldom the author has felt it necessary to discard or seriously revise a judgment; but this revision has added much more elaborate documentation to a textbook still almost alone in class and approach. This book, it should perhaps be added, is more than a textbook; it is an original work of economics that a businessman may be able to read with advantage and without exasperation.

FIRE! PRODUCTION LOST BUT FOR NU-SWIFT!

Are your sales on the up grade yet?

I wish they were. We've given our sales staff pep talks. And spend a mint of money on advertising.

But are you using the right media? I've never seen your ads. in the Daily Mirror, for example.

I don't happen to like the Daily Mirror.

Maybe not, but 4½ million other people do. And do you know why? Because it has the guts to say what it thinks with no beating about the bush. It hates cant and hypocrisy, and it claims to be, and IS the paper that dares. Personally, although I don't always agree with its opinions, I like the Mirror very much.

Oh, it has a big sale, I know that.

BUSINESS FINANCE

By

F. W. Paish, M.C., M.A. (Cantab.)

Professor of Economics (with special reference to Business Finance) in the University of London.

The problem of providing the necessary finance for the improvement and extension of the equipment of British private industry is one of the most urgent confronting the country today.

This book, based on lectures delivered to London University undergraduate students of economics, deals with the subject from the economic rather than from the legal or accounting aspects. It explains some of the more elementary principles and practices of business finance in Britain, and discusses the nature of finance and the methods by which business undertakings acquire the finance they need. An invaluable book for university students. 12/6 net.

PITMAN

PARKER STREET · KINGSWAY · LONDON, W.C.2

The biggest daily net sale in the world, to be precise. And if you're so prejudiced as to ignore 4½ million potential customers because you and they read different newspapers, you're not the shrewd business man I've always taken you for. By the way, I might mention that space in the Daily Mirror costs less per square inch per thousand than in any other national daily.

Daily Mirror

THE BIGGEST DAILY SALE ON EARTH

In particular, the censuses of production in 1935 and 1948 have not led Professor Sargent Florence to modify his firm belief that "large-scale production, especially when conducted in large-size firms and plants, tends to result in maximum efficiency." He does not accept the view of other economists that large-scale organisations necessarily weaken the effective control that management can exercise; he holds that this is essentially a problem in political science, to be solved by (and in practice often already solved by) good "line and staff" organisation. He finds, incidentally, that in Britain and America it is the same industries that tend towards large-scale organisation (and indeed towards monopolistic control). But he also believes that many large concerns—particularly horizontal combines—do not in fact reap the potential advantages of large scale; and though he notes the latest arguments that large organisations tend to promote technical progress, he attaches some importance to the possibility of "defensive research," to defend established positions, by these large groups.

This careful empiricism, of which a particularly interesting example is a dispassionate but powerfully solvent examination of the "managerial revolution" thesis, does not preclude the author from venturing some broad personal conclusions where as yet little evidence can be available. His own strong views colour an interesting and unorthodox critique of the role of the Stock Exchange in gathering savings into capital; and also a provocative "scoreboard" comparing the degree to which different kinds of leader in business—the traditional entrepreneur, the family businessman, the financier, the promoted executive, and the trained administrator—can be expected to possess the qualities industry needs for progress. But the author is well aware that there are simply not enough facts on these matters for him to back his every hypothesis with statistics; and the book would be much less attractive without its lacing of uncompromising views—even if some are not altogether "realistic" as defined.

Poet in Exile

UGO FOSCOLO: *An Italian in Regency England.*

By E. R. Vincent.
Cambridge University Press. 255 pages. 25s.

UGO FOSCOLO reached his English exile in 1816 and died here eleven years later at the age of forty-nine. His reputation reached London before him: he had written a novel of unhappy love; his poetry was profound; living in occupied Italy, he had bearded a Napoleonic government and been dismissed from a professorship. His manners turned out abrupt, it was true, and his temper short; but he was a poet, a hero, and a foreigner, and the angular face set in a blaze of red hair appeared at many of the dinner tables of London where tyranny was hated

most, and where for lack of belief in other deities men and women worshipped the memory of Charles James Fox. Foscolo was befriended by the leaders of Whig society, men who held to their friends once they had made them; and even though he terrified Wordsworth at a party of Haydon's, he was still asked to dine at Holland House and Lord John Russell came to call when he was ill. No one can recapture the brilliant conversation which enthralled his English hearers; yet in this charmingly written (and finely printed) book Professor Vincent has shown with sympathetic understanding why the Whigs were glad to receive this wayward and bizarre Ionian-Italian, and how their tactful generosity supported him financially.

With two things in England Foscolo never managed to come to terms: the manners of the women, who found him less irresistible than had his many Italian mistresses, and the outlook of the tradesmen, who insisted that their bills be paid. After a restrained treatment of various attempts of Foscolo's, all failures, to secure himself in the affections of some English girl of good upbringing, Professor Vincent embarks on the sordid tale of his fall. Its cause seems to have been an entire inability to spend within the limits of an income of which the poet's incorrigible optimism always exaggerated the likely size; this inability led him to a short spell of prison and to long spells, intolerable to a man of poetic temperament and capacities, hiding in the noisome slums of expanding London.

Unhappily, the author has packed all his scholarly apparatus into notes at the back, has scorned biographical footnotes and overloaded his text with their content, and sometimes writes too much in a "shown to the children" tone. Yet this is an engaging book, and should certainly stimulate interest in the fascinating though often repellent character of its hero.

How Congress Works

CONGRESS AT WORK.

By Stephen K. Bailey and Howard D. Samuel.

Douglas Saunders with MacGibbon and Kee. 502 pages. 30s.

THE LEGISLATIVE STRUGGLE.

By Bertram M. Gross.

McGraw Hill. 472 pages. 52s.

BRITISH readers are often flattered to find in the works of American professors of political science that the United States can never be saved without something like the parliamentary system. The writers of these two books do not indulge in this form of flattery, which is really a kind of escape from the much more exhausting tasks of assessing the real role that Congress plays in American life and suggesting workable reforms.

The need to know how Congress works is not confined to the citizens of the United States, and Messrs. Bailey and Samuel have provided the most

painless method so far devised of initiating the reader into the private language of this strangely casual yet ritualistic world. The authors give a series of case studies, which illustrate, for instance, what actually happens when a committee chairman decides to block a measure, when a senator exercises his right of patronage, when pressure groups start lobbying, when a committee investigates, when an unpopular tax law has to be pushed through, when a treaty is ratified and when a President vetoes a bill. In addition the election campaigns of one senator and two representatives are analysed and a typical working day in their offices described. There is a chapter on the way Congress organises itself in the first week of a session and one on what happens when it adjourns.

The advantages of this method are very apparent: it makes for a detailed yet lively and atmospheric book that deserves to be widely read on both sides of the Atlantic. There are some corresponding disadvantages, which make the book less than its subtitle suggests: "A Complete Guide to the American Government Machine." Because, in the attempt to cover the whole ground, there are so many case histories, loose ends are often left trailing; and, while the course that was actually followed in each event is explained, not much idea is given of the range of choice open to the participants.

This gap, however, is filled by "The Legislative Struggle." Mr Bertram Gross is a congressional technician; he has worked as staff adviser to various Senate committees and later as a White House official concerned with congressional relations. Now he has written a guide for legislators, for those who are being legislated for and those who are being legislated against.

Unfortunately, he has also had the additional ambition of "developing a theoretical structure, a systematic method of thinking about legislation." This has made for the kind of heavy, graceless writing that too many people, and sociologists in particular, present as a certificate of scholarship. Mr Gross's main thesis is that all legislation must be thought of in terms of a group struggle, the prize being a transfer of a greater or lesser degree of wealth and power. All politics are special-interest politics, though some interests are more special than others.

Mr Gross's book comes alive when he calls on his practical experience in helping to promote legislation. Then, from beneath the sociological gloss there emerges a fascinating account by an old hand of the ploys and counter-ploys required if the legislative battle is to be fought and won. It is clear that as much earnest study has gone into the tactics of Congress as into the tactics of bridge or the practice of lifemanship; the author reprints, as evidence of the useful field work that has already been done, a memorandum of do's and don'ts for witnesses issued by the National Association of Manufacturers and a list of 15 rules on "How to Beat a Filibuster Without Cloture."

WORKERS IN THE TEAM

Number 3 in a series

This thoughtful, sensitive face belongs to a craftsman. Walter Turner is a man for whom only first class work is good enough.

He started work with the Company in 1925 after serving his apprenticeship as a joiner. Today he is general foreman in charge of important work: and everyone knows that under Walter's eye even the smallest details will be attended to thoroughly.

He has shares in the Company—a privilege reserved for those who set an outstanding example. But his chief reward comes when a fine job has been done and its

quality is noticed: then, his face lights up.

He takes great pleasure in the Company's annual outings because there he meets old fellow-workers and they talk of past jobs tackled together. For all his work is shared. This is the real secret of the satisfaction he gets from life: good work done by a team of which he is one.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Gamble in Washington

Washington, D.C.

THE meeting in Washington of the Foreign Ministers of Britain, France and the United States was held at a moment of such supreme awkwardness for the members of the Administration that if Mr Dulles and his colleagues—the representatives of the strongest power—looked like hunted men beside the unruffled calm of Lord Salisbury and the insouciance of M. Bidault it was not to be wondered at. The meeting coincided with the last three weeks of the congressional session, a time when the strongest official of the Administration tears his hair and wishes that he had quietly stuck to making motor cars or practising law.

When the Ministers met, the Administration had on its hands five fights with Congress which directly or indirectly affected the questions to be discussed. The Mutual Security Act was just entering the torture chambers of the Senate and House Appropriations Committees with a poor chance of emerging unscathed; the Bricker amendment, which would limit the treaty-making power, was being debated; and the Nato protocols, designed to commit the ultimate treachery of permitting American troops in other Nato countries to be tried in foreign courts for off-duty offences, were being passed over vocal opposition. Moreover, the Senate and the House were about to go into conference to decide what strings should be attached to the renewal of the Reciprocal Trade Agreements Act; and Senator McCarran was sharpening his axe for the Bill which would permit the entry of a quarter of a million extra immigrants.

Each one of these measures demanded the personal pleading and testimony of senior officials of the Administration. Such a witness cannot, in the nature of things, tell his congressional masters that he is preserving an open mind, or that the policy which he is asking them to endorse or support with cash may be changed in the immediate future. He must be as apocalyptic as an Old Testament prophet and as immutable as Moses, otherwise his advice will be ignored. On July 9th Mr Dulles, speaking before the Senate Appropriations Committee in support of the Mutual Security Bill, testified that nothing had changed in the Soviet attitude to the free world and that the European Defence Community was still one of the primary objectives of Western policy. That was the day before he sat down with his British and French colleagues to discuss whether either of these propositions was still true.

On another front, the White House was engaging in its first real trial of strength with Senator McCarthy, from which it emerged, despite the Senator's renewed blast at British trade with China, with a reasonable amount of success. On yet another, the Administration was vainly

trying to make some sense out of the courtly exchanges in Seoul between Mr Walter Robertson, the Assistant Secretary of State for Far Eastern Affairs, and President Syngman Rhee. And to cap the confusion, the news of Beria's arrest arrived almost simultaneously with Lord Salisbury.

In the light of the situation prevailing in Washington it is remarkable that the meeting of Foreign Ministers produced as much as it did and that the American representatives were able to preserve as much flexibility—however little it may seem to the countrymen of Castlereagh and Talleyrand—as they displayed. The results might have been more impressive still if the meeting had been held outside Washington, as was first proposed, or had been postponed for a month. In a fortnight or so the first Republican Administration in twenty years will thankfully see its first Congress return to its collective grassroots and the legislative boiling pot will be taken off the fire.

The tenor of American editorial opinion on the communiqué was that the agreement to propose a four-power meeting of Foreign Ministers represented a compromise between the British insistence on the necessity of talks with the Russians and the American aversion to such an idea. It is probable that this is an over-simplification, for the decision was really taken in deference to the one Western national leader who was not present, Dr Konrad Adenauer. The cable traffic between Washington and Bonn increased almost to sizzling point while the conference progressed, and the shadow of the uninvited—and at this stage unavoidable—guest grew larger and larger. It was not Lord Salisbury's brilliant and cogent presentation of Sir Winston's argument for a meeting with the Russians which eventually persuaded Mr Dulles, although one cannot doubt its effect. It was the messages from Dr Adenauer about the state of West German opinion.

Nothing was more striking during the conference than the revelation of the extent to which American policy towards Europe, which for so long has been directed at finding some method of forcing or enabling France to ratify the European Defence Community Treaty, is now governed by the desire to ensure that Dr Adenauer does not lose his general election on September 6th. With M. Schuman out of office, Dr Adenauer is, for the Administration as well as for the American public, the towering figure of Europe—a fact that became very obvious during the almost overlapping visits of the French and the West German Prime Ministers late last spring.

Even if a complex series of strategic and political motives had not tended to enhance Dr Adenauer's importance in American eyes, his own qualities would be sufficient to ensure his success with a public which has always tended to attach its foreign enthusiasms—as in England—to personalities, from Lafayette to Jan Masaryk and, unfortunately, General Chiang Kai-shek. Paradoxically, it was not the American Secretary of State whom M. Bidault had to persuade that the French ratification of the EDC should not be made a prior condition of the meeting with Mr Molotov; Dr Adenauer had convinced Mr Dulles on different grounds of the urgency of the meeting. It was Lord Salisbury and the British delegation who showed an insistence on the vital necessity of the EDC which took the breath out of M. Bidault's plump frame and convinced him of the continuing perfidy of Albion.

★

As the first Republican Congress adjourns, American foreign policy is launched upon what may be an uncharted sea and into a range of ideas which is described neither by "liberation" nor by "containment." Mr Dulles is frankly taking a gamble with the American support for a strong European policy, which has been built up with so much effort around the idea of an integrated Western Europe, in order to explore the possibilities of creating a united Germany before its allegiance to the West is embodied in a functioning Defence Community. Possibly not since the decision to send aid to Greece and Turkey in 1947 has such a gamble been taken with American public opinion.

If an illustration were needed of the extent to which events and decisions on European questions and on the future of American relations with Russia have outstripped public opinion, it can be found in the fact that there was virtually no congressional comment on the decision to seek a four-power conference with the Russians on the future of Germany. Congressmen and Senators normally like to make their views plain on every subject they understand or think their constituents understand, from birth control to President Rhee. The majority of the American press, however, has supported the decision to hold the Foreign Ministers' Conference. Although the *New York Daily News* calls it "a weasel plan which may contain diplomatic disaster for the allies," the exactly opposite opinion is expressed by the *Minneapolis Tribune*, which says that it is "a sensible compromise of divergent views"; the *Baltimore Sun* commented that "a Big Four meeting of heads of states would offer many risks for the west against very little hope of tangible results." On the whole, the tone of editorial comment was most cautious, reflecting presumably perplexity about the future.

The North Atlantic Treaty is something that is understood and very generally accepted. European integration is a policy that is supported from varying motives of idealism or self-interest. American opinion over the past few years has settled down into the two camps of "containment" and the long haul on the one hand, or "liberation," "go it alone" and "use the bomb" on the other. The possibility that both these sets of ideas may be discarded, in Europe at least, and replaced by a period of intense diplomatic activity, to which simple slogans do not apply, creates a hush which is not wholly accounted for by the annual exodus to summer beaches and holiday camps.

Stevenson's Funnybone

FROM A CORRESPONDENT IN WASHINGTON, D.C.

(Mr Stevenson's campaign speeches are to be published in *Great Britain* on July 27th*.)

MR ADLAI STEVENSON is arriving in London a year almost to the day since he accepted the Democratic nomination for the Presidency of the United States. Already he is being pressed, by the liberals in his party, to say whether he would be prepared to do the same thing again in three years' time. His world tour made it easy for him to avoid criticising the new Republican Administration while it was still finding its feet, but once he returns home he will hardly be able to keep silent unless he wishes to retire from the political world altogether. In that case the political world would be the loser, for he brought to it an inspiration and a gaiety that gained him the amused admiration not only of his party and of many of his opponents, but also of the politically conscious in other countries.

It was Mr Stevenson's humour that won him the most immediate sympathy, but since topical humour, particularly in its political form, withers fast, a return to his campaign speeches, nearly a year after they were delivered, might be expected to prove disappointing. It is a pleasure to report, therefore, that his humour, the gentle part of it as well as the robust, is still funny, and that the character that emerges from it is still an engaging one. What made millions of listeners and television viewers give way to laughter in the autumn of 1952 still provokes laughter in the summer of 1953. About the only change is that some of the barbs have become even more apposite since the Republicans took office.

Humour came to Governor Stevenson naturally, easily and, indeed, inevitably. Ghost writers may have supplied some of the *bon mots*, but from the beginning it was clear that he could not possibly make an entirely solemn speech. At the very start, in his address of acceptance at the Chicago Convention in July, the new candidate began to poke fun at two of the issues. One, a Republican theme, was that unless the Republicans won the election in 1952, after twenty years of Democratic rule, the two-party concept would be destroyed. The other, a Democratic talking point, was the severe split in the opposition party, between the supporters of President Eisenhower and those of Senator Taft, demonstrated a few days before in the frenzy of the Republican Convention. "Nor am I afraid that the two-party system is in danger," said Mr Stevenson. "Certainly the Republican Party looked brutally alive here a couple of weeks ago, and I mean both Republican parties." Then, in a valiant but, as it turned out, vain attempt to knock down the one principal argument which ultimately beat him, he went on:

Is it the part of wisdom to change for the sake of change to a party with a split personality; to a leader whom we all respect, but who has been called upon to minister to a hopeless case of political schizophrenia?

American political campaigns are traditionally stodgy, solemn and utterly humourless affairs—at least they have been for about a century. With his gaiety, Mr Stevenson seemed almost to be breaking one of the Ten Commandments. Already inclined to be stuffy, the Republicans were never stuffer than when they started to complain, as they did at once, about their rival's unseemly levity. General

* SPEECHES by Adlai E. Stevenson. *Andre Deutsch, Ltd.* 25s. 6d.

Eisenhower and his running-mate, Senator Nixon, spoke in stern criticism. The nation was in a serious state, they noted, and avowed that they, at least, would not jest with the grave issues facing America.

This was hitting below the belt, because Governor Stevenson, for all his humour, had never spoken lightly of weighty issues; his wit had been confined to things about which anyone was entitled to be gay. The silly attack provided the Democratic candidate with two more happy jests:

You remember a while back our Republican friends were trying to make a campaign issue out of humour, and, needless to say, they were against it. . . . I think what they ought to worry about is their backbone instead of my funnybone.

And, on another occasion, he observed that in deference to the objections raised by the opposition, he would obey, "as far as I can, what is coming to be known as the new Republican Law of Gravity."

★

Mr Stevenson's humour took on a sharper edge when he used it as a weapon against the aspect of his opposition that, it was obvious, infuriated him the most: General Eisenhower's refusal to be specific and concrete on the real issues of the campaign, and his "all things to all men" speeches, stuffed with pious phrases, relatively void of hard commitments.

I would like to suggest to the Republicans that it is time for a change—from the General to the specific. . . . The General of the Army has not spoken out on many of the great issues before the American people. Perhaps, as a General, he thinks he should confine his remarks to generalities. Well, I can tell you that, as a civilian, I have no intention of confining my remarks to civilities. . . . I like Ike, but what does Ike like?

The Democratic candidate enjoyed the sight of General Eisenhower adopting the Democratic farm platform, and of the Republicans' disingenuous endorsement of plank after plank in the Democratic record and programme. It was no wonder they did, Governor Stevenson said, for with respect to their own platform, "nobody can stand on a bushel of eels." He himself, he added, had a hard time standing on the Democratic platform: "There are so many Republicans on it they are pushing me off."

Sometimes Mr Stevenson made a smart crack for the sheer fun of it, and without bearing on any political issue: "I have heard it said by some people that Harvard University humanises the scientist and simonises the humanist." Sometimes it was the quickest way of stating a case: "I thought I would make a proposition to our Republican friends: That if they would quit telling lies about us we would quit telling the truth about them." Sometimes it was because the event could not be described except by sarcasm:

There is something badly wrong with the perspective of men who call the last ten years the "dismal decade." And there is something odd, too, in a point of view which endorses the nation's foreign policies and promises to save you at the same time from such enlightened bungling.

Mr Stevenson constantly mocked himself for presuming to speak and his audience for being foolish enough to listen to him. Including himself as one of the breed, he defined a politician as "a man who approaches every question with

an open mouth." Acknowledging a warm reception, he observed:

I suppose a little flattery is all right if you don't inhale too much. . . . Man does not live by words alone, despite the fact that sometimes he has to eat them. . . . I sometimes marvel at the extraordinary docility with which Americans submit to speeches.

A great proportion of his humour was, to be honest and a little snobbish, of the sort enjoyed principally by the best educated elements of society. It depended on rather sophisticated use of words, on a certain elegance of phrase, on sarcasm and refined satire, and on a great deal of deftly-handled self-deprecation. Was all this—the humour and the fine serious phrases, too, the attempt to "talk sense to the American people"—above the comprehension of the electorate? Did Governor Stevenson, as Republicans charged and many Democrats feared, talk over the heads of the voters? There is, of course, no way to tell. One energetic research worker, however, has recently come up with a surprising fact: by the currently popular mechanical tests of "readability" and "human interest," the Governor's campaign oratory was more readily comprehensible than the General's.

Easy to read or hard to read, over the heads of the voters or not, Governor Stevenson's campaign speeches made superb listening when they were delivered and still make superb reading for people who like to read. Unique in the annals of American political history, they have been published in book form even before age could endow them with significance as items for scholarly research or transmute them into venerable precepts. In the first three weeks after the book was published in the United States, it jumped to fourth place on the non-fiction best seller list. Mr Stevenson's humour remained as ebullient and engaging in defeat as it was in the days of high hope. At a speech delivered just a few weeks after election, the badly trounced candidate began with a paraphrase of the opening remark of every music hall comedian who ever stepped out on the stage. Said he, "A funny thing happened to me on my way to the White House."

American Notes

Soldiers of Nato

THE constitutional jitters with which Senator Bricker has infected Congress made it necessary for the President to send a personal message to the Senate before the Republican leaders there could be sure of getting the necessary two-thirds majority for ratification of the Status of Forces Treaty, one of the North Atlantic Treaty protocols which were agreed over two years ago. In the end the vote was a handsome 72 to 15, but Senator Knowland, the Republican spokesman, acknowledged that it could not have been obtained without Democratic support by publicly thanking Senator Johnson, the Democratic leader, for his help. Thus official recognition was given to the fact that, with a Senate membership that is almost equally divided

between the two parties, the Republican internationalists are dependent on the Democrats for the passage of any legislation which is opposed by the right-wing nationalists of their own party. That is the wing toward which Senator Knowland himself has leaned; it was interesting to see him, now that he has taken over the responsibilities of Republican leadership from Senator Taft, putting up a sustained and vigorous fight, on behalf of the Administration, for legislation about which, only three months ago, he was expressing doubts.

The purpose of this legislation is to make it possible for American troops, serving abroad in North Atlantic Treaty countries, to be tried in foreign civil courts, with certain safeguards, instead of in American military ones, for violations of the laws of the country concerned committed when the soldiers are off duty. Senator Bricker considered that this procedure would endanger their constitutional rights; they might, for instance, find themselves being tried without a jury or, in France, being regarded as guilty until proved innocent. But this suggestion, that the judicial systems of other countries are less satisfactory than that of the United States just because they are different, was, as the defenders of the treaty pointed out, an insult to the members of the North Atlantic Treaty Organisation. Furthermore, it was argued that, since American troops serving abroad are part of a common defence effort and are there for the good of the United States, there is no reason why they should have special privileges.

If Senator Bricker had prevailed, the Senate would, in effect, have declared its lack of confidence in its country's allies, and thus have undermined the basis of Nato. It was this, and the implicit admission that United States soldiers are abroad to stay indefinitely and in large numbers, and that permanent provisions governing them are therefore needed, that gave significance to a piece of legislation that was of little importance in itself, and that has aroused the interest of the general public hardly at all.

Blockade for Refugees

ALTHOUGH Senator McCarran, the formidable old Democrat from Nevada, is no longer the chairman of the Senate Judiciary Committee, he has been making use of every resource open to him to block any legislation that might allow more immigrants to enter the United States. He and his opposite number in the House, Representative Walter, a Democrat from Pennsylvania, are fighting to keep inviolate the restrictive immigration legislation which is their own handiwork and which was passed last year over President Truman's veto.

The present Bill, which is being pressed with unusual vigour by the White House, is not intended to redeem the President's election promise to eliminate the race discrimination in the immigration laws. It is only an interim measure to alleviate some of the more damaging effects of present legislation on American foreign policy by admitting an extra 240,000 people over the next two years. This would allow America to offer asylum to a picked 125,000, the bulk of them Germans, out of the multitude of refugees from behind the Iron Curtain, and also to lessen the present harsh discrimination against immigrants from three North Atlantic Treaty countries—Italy, Greece and the

Netherlands. For instance, 20,000 Greeks would be given a chance to come to the United States while at the moment only 308 are allowed in each year.

Despite Senator McCarran's stratagems and vituperation and after the Bill's sponsor, Senator Watkins, a Republican from Utah, had "undergone the most frustrating experience" of his life, a measure recommended by the Under Secretary of State as a vitally important factor in deciding the June election in Italy was finally forced out of the committee by a 6 to 4 vote on July 17th. By then it had become a Bill to admit 220,000 (including 9,000 who for one reason or another are already in the United States) in three years, instead of 240,000 in two. But even this number, according to Mr McCarran, cannot be screened adequately under the security arrangements of his own Act, particularly when refugees are coming from countries where their credentials cannot be checked.

Now the Bill faces the Senator's delaying tactics all over again, this time on the floor of the Senate, where it has to compete for time within a crowded agenda which Congress is trying to complete by August 1st. The Senator was confident that this competition would be lost, but he was perhaps counting too much on the President's earlier desire to be rid of Congress as quickly as possible. Mr Eisenhower is now insisting that this session shall not end until the refugee Bill, as well as a few other urgent measures, have gone through. If the President means business, Congress may have Mr McCarran to thank for the loss of several weeks of its vacation.

Saving McCarthy's Face

SENATOR MCCARTHY'S attempt to distract attention from his first defeats—over book-burning and the appointment of Mr J. B. Matthews to the staff of his investigating sub-committee—by launching an attack on Mr William Bundy of the Central Intelligence Agency has brought an even sharper rebuff from the Administration. Mr Bundy is deputy to Mr Allen Dulles, head of the intelligence agency. Senator McCarthy was prepared to subpoena him to answer for two offences: that of being Mr Acheson's son-in-law and of having contributed to the defence fund of Mr Alger Hiss. The National Security Council, of which the President is chairman, decided that Mr Bundy was to ignore any such summons. His appearance before the congressional investigators would set a disastrous precedent. An intelligence agency can hardly operate if its secrets are to be spread out before Congress and its employees, many of whom, by necessity, are far less respectable and far more vulnerable than Mr Bundy, are to be hired and fired at Senator McCarthy's whim.

The Senator has been allowed to save his face. The power of congressional committees to inquire into the CIA is not directly challenged, and vague promises have been made about a formula to permit employees of the agency to testify without endangering national security. But the subpoena for Mr Bundy is not to be sent; instead, whatever information Senator McCarthy may have is to be turned over for evaluation to the CIA, which cleared Mr Bundy of the same charges long ago.

The episode has not encouraged the Democratic members of the subcommittee, who walked out, to return, even though

It is hinted that they were offered, as an inducement, the head of Mr Cohn, the brash young investigator whose European buffooneries stuck in the craw of many Senators. This leaves the Republicans in an exposed and uncomfortable position of responsibility; those serving on the subcommittee are finding that other commitments prevent their attendance. No one rose to contest the forceful argument of Mr Monroney, a Democrat, when he declared that the time had now come for the Senate to reassert control over its investigating panels.

Yet no one should underestimate Senator McCarthy's resilience. He concluded a fortnight of retreat by producing a report documented in an uncharacteristically thorough manner, on allied trade with China. Most of the charges are old ones. But there is enough disagreement about the line between strategic and non-strategic goods, and enough misunderstanding of the usefulness of the civilian trade with China, to make the report seem one that must be taken seriously.

Dewey's Power Failure?

To preserve the full beauty of Niagara Falls, America's traditional honeymoon resort, the flow of water which is wearing the rock away is to be reduced after dark, by agreement between the United States and Canada. A more important agreement, for the electricity-starved industries of New York State at least, is that providing for fuller utilisation of the power potentialities of Niagara, which was reached in 1950. But Congress has to approve the practical details of developing the additional 1.3 million kilowatts of hydro-electric capacity allotted to the United States. As a result Washington is having the unusual experience of seeing the Republican Governor Dewey, hand-in-hand with the state's leading Democrats, Senator Lehman and Representa-

tive Roosevelt, protesting against surrendering New York's "great natural resources for private exploitation."

For, inspired by the Republican Administration's doubts about public power developments, the House of Representatives has passed, and the Senate is considering, a Bill which would permit five private companies to build and operate the Niagara plants. The companies maintain that, since

this is purely a question of generating electricity, not of a great multi-purpose scheme including flood control, soil conservation and so on, it is nothing to do with the federal government. The alternative, however, is not development by the federal government, but by the New York State Power Authority, under an arrangement strongly favoured by the progressive, but Republican, Governor Dewey. The state would only provide the electricity, which would be distributed over private facilities. This would seem a perfect example of that co-operation between government and private interests when dealing with natural resources which has been recommended by President Eisenhower. It is therefore difficult to understand why he has not come to

"Sorry, Tom — Honeymoon, You Know"

Herblock in the Washington Post

Governor Dewey's rescue, by condemning the Niagara Bill, especially since Mr Dewey has been one of his most faithful and active supporters in the Republican party.

It is being suggested that, if Congress hands over the Niagara power development to private interests, then there may be pressure for a similar change in the agreement with the Province of Ontario, under which the New York Power Authority is to be responsible for the American share, nearly 1 million kilowatts, of the hydro-electric capacity to be developed at the International Rapids, near Massena, as part of the St Lawrence Seaway project. This arrangement, also dear to Governor Dewey, has now been approved by the Federal Power Commission, but is still held up because a New Jersey power company is appealing to the courts for permission to build the plant. Once this is settled, Canada should finally be able to go full steam ahead on the St Lawrence. But, in spite of Senator Wiley's last minute efforts, Congress is unlikely, at least this year, to allow the United States to participate.

Chipping at the CIO

At long last the five vacant offices at the top of the Department of Labour are being filled; only one Assistant Secretary remains to be nominated, and he is expected to be a businessman. The other appointments have gone to men with experience in labour relations, but where they come from trade unions, it is either from independent organisations or from the American Federation of Labour, to which the Secretary himself belongs. The long delay is explained by the fact that the man chosen by the Congress of Industrial Organisations, to fill the Assistant Secretaryship that is traditionally reserved for it, was unacceptable to the White House. The CIO refused to nominate anyone else, and thus cut itself off from the government with which, in the days of Democratic Administrations, it was so closely linked.

It is perhaps partly because they feel that they would be better received in Republican Washington as members of the AFL that several of the CIO's smaller unions are considering joining their larger AFL opposite numbers. But it is probably more because they see a real prospect that the AFL and CIO are going to merge and think that they can get better terms by anticipating the general reunion. For the main obstacle in the way of unity has always been the problem of what to do with officials where each trade union federation has a member covering the same industry or trade—the AFL meat cutters and the CIO packing house workers, the AFL electrical workers and the CIO utility workers, for example. In each of these cases the rivals are already trying to get together, but in the breweries, where unity had almost been achieved, the top has blown off the negotiations in a way which illustrates exactly why these mergers are so difficult to arrange. The AFL teamsters were not prepared to guarantee the head of the CIO brewery workers the job which he wanted in the new organisation.

But a number of the local CIO brewery branches have nevertheless deserted to the AFL union and this has given Mr Reuther, the president of the CIO, a chance to speak some of his mind about these attempts to chip off the CIO's membership. For it is already a good deal smaller than the AFL and Mr Reuther cannot afford any further weakening of his bargaining power in the merger negotiations. If the steel workers, next to his own automobile workers the largest union in the CIO, were to leave him, it would be a disaster. For this reason the recent much publicised call made by Mr McDonald, head of the steel workers, on Mr Lewis, of the independent mine workers, must have made Mr Reuther's blood run cold—as was probably intended.

For Mr McDonald is not at all happy about the aggressive, and progressive, political path along which Mr Reuther is inclined to lead the CIO. Mr Lewis shares Mr McDonald's conservative outlook, his belief that trade unions should stick to their labour concerns. The eventual outcome of Mr McDonald's meeting with Mr Lewis, if it has any outcome at all, is more likely to be an attempt to bring the coal miners back to the CIO, to counter Mr Reuther's influence there, than an attempt to unite the steelworkers and the coal miners in an independent association. And Mr Lewis would also like to have a finger in the organisation of any united labour movement.

SHORTER NOTES

The first American Ambassador to Switzerland will also be the first woman career diplomat appointed to such a high rank by the American government. Miss Frances E. Willis, who has been in the Foreign Service since 1927, has been approved for a post which was recently raised from legation to embassy status. The other women who have in the past been appointed Ambassadors were all chosen for their political connections; Mrs Clare Luce, the new Ambassador to Italy, is the most recent example.

With such alarming articles as "Death Stalks the New Deal" and "Block that Depression!" the Democratic party has launched an innovation in American journalism, the *Democratic Digest*, a 25-cent monthly magazine that will compete at the news stands with less political journals such as "True Romance" and "Popular Mechanics." The editors hope to counter the effects of a press which is predominantly owned by Republican interests. The 112 pages in the first, August, issue of the new magazine concentrate their fire on Republican policies for defence, agriculture, tidelands oil—and, of course, Senator McCarthy.

A special non-fattening 470-calory dinner is now being served on one of the major railway lines, so that diners can streamline their figures as the railway companies have their dining-cars.

Dr Mossadegh Sees it Through

DR MOSSADEGH grows daily more like the demolition expert who, high above a gaping crowd, hacks at one after another of the stones supporting his pinnacle, but always shifts his stance before the one on which he is standing gives way. A year ago this week, the streets of Teheran were strewn with casualties during the violent demonstrations that accompanied the Shah's fruitless attempt to replace him and his triumphant counter-coup. Since then, Dr Mossadegh has won rounds fought with the Senate, the Shah and Mullah Kashani. During the winter, despite the opposition expressed by many deputies, he more than once obtained from the Majlis overwhelming votes of confidence together with grants of plenary powers. Recently, their opposition to his megalomaniac ways has increased, and he is at the moment apparently working on a device to get rid of the Majlis altogether. Never at a loss, he will no doubt win a fresh round of applause if, as he hints that he is about to do, he calls for a nation-wide referendum on his policy.

The following story of recent events is oversimplified, for no mere western pen could do justice to its ramifications. His latest round with the Shah began in February when, with considerable support from fellow-landowners who disliked the royal foible of distributing land to peasants, he sought the transfer of most crown lands to the state; he also sought to tax royal estates hitherto untaxed. At the end of February the Shah countered these claims with an announcement that he was leaving the country. (Who proclaims such a move in advance if he really means to go?) This announcement caused a calculated demonstration of public emotion; tearful crowds besought the Shah to stay. The demonstrators even invaded Dr Mossadegh's home and caused him to run for cover, first to the friendly shelter of the Point IV offices and later to his old lair in the Majlis building. His anger that the army did not respond to a call for help on this occasion was boundless; some wag, it is said, sent word that it could not move, as it was out of petrol. Dr Mossadegh therefore extended the range of his campaign against the Shah, and demanded that the government and not the throne should hold the supreme authority over the army. This struggle, which has become the most acute of the issues between the two men, has lasted for months and is not yet patched up; it is the only one that Dr Mossadegh has not won outright. During May, he triumphed on other counts, for he caused the Shah to change his Minister of Court, and to transfer large tracts of the royal estates to the government.

His open struggle with Mullah Kashani also dates from the turn of the year when the Mullah became a violent critic of his assumption of dictatorial powers; in its early stages, he replaced a chief of police who was said to be over-friendly with the Mullah and appointed a close associate of his own, General Afshartoos. In March, his self-confidence seemed to suffer a slight tremor; he offered to abandon his plenary powers in all matters save finance and the settlement of the oil dispute, provided that full control of the army were vested in him. When this offer fell on deaf ears his position looked shaky. In April, however, it was completely restored thanks to an extraordinary bungle by some opponent, or opponents. General Afshartoos disappeared in mysterious circumstances. Days later, his body was discovered; he had been murdered in a peculiarly cruel and beastly way. Persians are civilised people, and were revolted by the affair. The wave of their anger gave new impetus to Dr Mossadegh, who was therefore able to indict as implicated in the murder not only some hostile army officers, but also political opponents who include General Zahedi—perhaps his only rival for the succession—and the one-time socialist ally who is now his main enemy, Dr Baghai. The two latter are deputies and therefore enjoy a parliamentary immunity which Dr Mossadegh's clique of supporters wish to waive, though it has not so far succeeded in doing so. In June Dr Mossadegh's position in the Majlis was still sufficiently strong to enable him to secure the replacement of Mullah Kashani as its president by the election of one of his own trustees, Dr Moazemi.

Meantime, however, his numerous but unco-ordinated opponents inside the Majlis have rather more frequently tended to coalesce, and he has been thwarted there as seldom before. To get rid of them, he has allowed, or maybe caused, the whole of his own party to resign, which leaves the house without a quorum. A number of the rest have thought to serve some end by following suit, so that there are now only 27 deputies left in a house which is supposed to number 128, but has always been over 50 short on account of queer practices at the last elections. Business is therefore at a standstill.

Naturally, this wanton creation of enemies diminishes the strength of his position. Yet no one should venture to call this weak. He can still muster a murmur of approval, even from the Majlis, when he sends it word (as he did this month) that he refuses to attend it "because his life is in danger." To western eyes, it would seem that he must have lost ground as a result of President Eisenhower's

realistic letter of June 29th, in which (in reply to Dr Mossadegh's demand for money aid as opposed to technical aid) the President said that it would not be fair to the American taxpayer "for the US Government to finance Persia while Persia did nothing to help itself by coming to a reasonable agreement leading to world marketing of its oil." In almost any country but Persia, such a comment would upset a Prime Minister's claim to be able to save his country from ruin thanks to his high reputation in the United States. But in Persia reactions are not thus straightforward, and anyone who knows Teheran will realise how stout the patriotic response that will be evoked by the themes now being propagated by Teheran radio—that the letter is "the outcome of US subservience to Britain" and that "Persia's material and intellectual resources are so strong that it can manage, even without foreign help."

Slightly more disturbing to Dr Mossadegh's position is the increasing volume of evidence, in the first quarter of the financial year that began in March, that the foreign exchange and Treasury position are both worsening. In the first year (1951-2) in which the Persians felt the loss of their foreign exchange assets derived from the Anglo-Iranian Oil Company, they balanced their international payments by the sale of £14 million which was part of the currency cover, by securing a loan of \$8.7 million from the International Monetary Fund and by incurring short-term liabilities amounting to 2,472 million rials. The foreign assets held by the Treasury and the National Bank combined fell from \$113 million in 1950 to \$58 million in December, 1951 and \$42 million in September, 1952. Their balance of payments figures for 1952-3 are not yet available, but, by great efforts to reduce imports and thanks to a bumper rice harvest, they were able to show, unprecedentedly, a favourable trade balance in that year.

Evading Spectre of Ruin

Reduction of imports continues; by a decree published on June 30th there are to be none at all for two months, and none except for a short list of essentials for the two months to follow. So long as harvests are good, however, only the white collar and upper classes are affected by the consequent shortages; the peasant majority lives its usual needy life. But the reduction in total trade deals a severe blow to the Treasury which is accustomed to draw a respectable proportion of its revenue from customs dues. The value of the rial in relation to the dollar dropped by 45 per cent in the first quarter of the new financial year.

The spectre of ruin is not yet overwhelming and Dr Mossadegh is still able to wave it away with news of oil sales abroad (although he has only sold 62,000 tons in two years) and with rumours of barter deals, and of Russian intentions to pay back the 11 tons of Persian gold which Moscow has held since the war. The principal factors which account for his survival would seem to be the total lack of agreement among his opponents upon any leader who could take his place, the propensity of the Shah to evade constructive decisions of any kind, and the nationwide repute that he enjoys as the man who got rid of foreigners who had long cheated Persia. On New Year's Day, 1953, he told a group of his admirers that "only death or a vote of no confidence can alter my decision to continue in office." Since the Majlis is no longer there to vote him out and the populace certainly will not do so, it looks as if his opponents will have to wait for the Great Reaper.

Purges in the Soviet Republics

IT is still too early to see how big a change in Soviet policy will follow Beria's fall, but in one respect a reversal is foreshadowed in the near future. The Stalinist policy towards national minorities was discarded by the new regime and there have been signs of liberalisation in the treatment of minorities. Now everything seems to be prepared for a return to the Stalinist pattern. During the last period before Stalin's death, and indeed for most of the time since the mid-thirties, a policy of russification was followed in the outlying republics and regional nationalism was persecuted. In its own fashion and in a new context, Stalinism was resurrecting certain features of Great Russian chauvinism from Czarist times. Stalin's successors seemed to think that the Soviet Union could be cemented better by a more conciliatory method. During the hundred days of their apparently united rule the russifiers were in disgrace and the "nationalist culprits" of Georgia, Ukraine or the Baltic states rehabilitated. The "blame" for this departure from the Stalinist line is now being put on Beria, who is being accused of "having tried to sow discord among the people of the USSR and to foster the bourgeois nationalist elements in the republics."

After Beria's fall his thousands of followers and protégés in the republics had to be eliminated whether there was a change in national policy or not. After Stalin's death 12 out of 15 non-Russian republics received new ministers of internal affairs. Important party and government officials were also sacked, including the first secretary of the Ukrainian Party L. G. Melnikov. Since this reshuffle took place while Beria was still in power and many of the new men were clearly his appointees, they must now be purged in turn. In the Ukraine, for example, the minister of the interior P. Y. Meshnik, nominated scarcely a month ago, is now sacked and replaced by his predecessor as security boss. In Georgia, V. Dekanozov, a former vice-commissar for foreign affairs, has also been eliminated after a few weeks' tenure of office. Those who rose on the tide, while Beria was Malenkov's partner, are now being swept away. Sometimes the purge takes the form of a sheer struggle for power. Thus, Azerbaijan's prime minister M. D. Baynov has now been dismissed without any accusation of "bourgeois nationalist deviation." On the whole, however, there seems to be one radical difference between the purge which swept through the Soviet republics after Stalin's death and the current one. Then the charges were of toughness, intolerance and russification; now of "bourgeois nationalism" and of "trying to wreck good relations with Russia."

Rewriting History

The reversal of the doctors' plot provided a key to further developments. Undoubtedly by denouncing the methods of the doctors' accusers Beria was also eliminating his opponents from the security services, but simultaneously he was disavowing, among other things, the whole attack on nationalism, Jewish or otherwise. The purge of the tough policemen and their allies throughout the Soviet Union was coupled with the denunciation of the policy of national oppression. Only a month ago the theoretical organ of the Party—*Komunist*—joined in the denunciation of abuses. It was interesting that the Party pulpit was offered to a heretic. The article on the national question was written by P. Fedossyeyev who only a few months before Stalin's death

was most violently attacked as an admirer of Voznessensky, Russia's former economic boss whose fate is unknown. The article was cautious and interspersed with quotations from Stalin, but it no longer warned of the danger of regional nationalism alone. It also warned against Great Power nationalism (i.e. Russian chauvinism).

This was a clear break with the past. From about 1936 the attacks on Czardom were toned down and the glorification of Russia's past began. Russian patriotism was fostered and Czarist conquerors made a curious entrance into the Communist pantheon. Interrupted briefly after the war, the patriotic cult flourished again in the climate of cold war. Sooner or later the nationalist germs were bound to spread to the non-Russian republics. Yet what was praiseworthy at the centre became anathema at the periphery. National heroes in the Ukraine or the Caucasus usually owed their fame to their struggle against Czarist oppression and their glorification was therefore distasteful to centralist and nationalist Moscow. Their example could have a dangerous influence. Hence books on the history of Azerbaijan, Tadzhikistan or Uzbekistan had to be rewritten. The *Komunist* article seemed to promise that it would be possible once again to show these national figures in proper perspective but the new reversal of policy has scarcely allowed any time for rewriting.

The problem of minorities is a vital one for the Soviet Union, where roughly half the total population is non-Russian. The economic development of the country, which necessarily brought about a growth of non-Russian *intelligentsia*, has rendered the nationalist question still more acute. There must have been conflicting opinions in the Kremlin on the best method of tackling it. For a short period Stalin's successors seem to have opted for the carrot as the best means for keeping the outlying provinces quiet, but before there was time to put the new line really into practice, it has been discarded.

Propaganda Shifts

It would be idle to associate Beria with the mild policy towards the nationalities, merely because he is a Georgian. His fellow-Georgian Stalin had been the architect of russification. A milder policy towards the minorities was advocated by Stalin's successors as part and parcel of a general campaign of relaxation. Soviet propaganda always shifts between the two poles of "co-existence with capitalism" and "imperialist encirclement." The possibility of the former and the risk of the latter are never completely dismissed but either one or the other are being played up at different times. When "co-existence" dominates the stage there is room for relaxation, concessions and reform; when stress is laid on "encirclement" appeals are made to vigilance and toughness, particularly in the vulnerable outposts. Before Stalin's death warnings against "encirclement" became louder than propaganda about "co-existence." During the following hundred days the line was reversed. Now it is again revived. Last week *Pravda* warned its readers in Stalin's words:

• To think that the capitalist world can look with equanimity upon our economic successes, successes which infect the working class of the whole world with the spirit of revolution is to indulge in illusions. . . .

In such a climate there is little hope that the Ukrainians' or Georgians' dreams of a more liberal national policy will be fulfilled.

Europe and the Defence Community—II

Those in Favour

THE negative attitude towards EDC in Brussels, Paris and Rome is the darker side of the picture. Luxembourg is strongly in favour of EDC, for essentially economic reasons, and it is expected that in Holland the Second Chamber will ratify the treaty before the summer recess. The Dutch position is both realistic and farsighted. Although the Dutch would prefer to see a far greater measure of economic integration in Europe and have initiated schemes for a European customs union and agricultural pool, they are willing to consider the EDC as a first step. They have few illusions, moreover, about strategy or the absolute need for German military assistance if Western Europe is to be defended successfully, and if Holland, in particular, is to be held. Moreover, rather than see Germany left out, the Dutch seem ready to entertain the thought of Germany's entry into Nato if the Defence Community treaty should not be ratified. Like the Belgians, however, the Dutch have failed to consider that this would profoundly modify the defensive character of Nato and that it would not replace the system of checks and balances on German military strength provided by the EDC treaty.

Where does EDC stand in Germany? The Federal German parliament has ratified the treaty but President Heuss has not yet signed the instrument of ratification pending a decision of the Constitutional Court. In the meantime, the revolt in Eastern Germany has brought the possibility of achieving German unity to the fore. In order to retain his position in the country, Dr Adenauer has had to take the lead in demanding four-power talks on German unity. He cannot face the elections as a lukewarm advocate of German national aspirations and to a certain extent, therefore, has had to shift his ground on EDC. Although he continues to be its champion, he is placing increasing stress on the idea of political federation based on the already existing coal-steel community.

Dr Adenauer's Tactical Error

Speaking to a Catholic gathering recently, Dr Adenauer indicated that America threatened to withdraw aid from Germany and Europe if the EDC did not materialise. In this way he has labelled himself as the "American" candidate in the elections and has laid himself open to telling rejoinders from the Social-Democrats. American pressure is not helping to popularise the Defence Community or Dr Adenauer, and the German public is increasingly resentful of anything resembling the now outdated occupation regime or dependence in foreign policy. On the other hand, former members of the General Staff and officer corps (including extreme nationalists) favour association with America either directly or through the EDC. The great number of volunteers who have applied to the shadow Ministry of Defence for posts in the German contingent of the proposed European army, indicates that popular opinion is swinging towards rearmament.

Opposed to these views is the conception that Germany, in order to achieve agreement with Russia and thereby regain unity, should stay out of any Western alliance and maintain its neutrality with a national army. This idea has the support of many of the refugees from the territories

east of the Oder-Neisse and the Soviet Zone. The refugees form no less than twenty-five per cent of the total electorate and have reduced the proportion of Catholics to just below fifty per cent of the Federal German population. This means an increase in the vote of those actively demanding priority for German unity and a reduction in the support for the Christian-Democrats and EDC. In Germany therefore, the question is whether or not German unity will prove a stronger magnet than European unity.

The seemingly interminable dissensions about the ratification of EDC, the continuous postponement of a showdown in the countries most vitally concerned, has tended to obscure the positive contributions of the EDC project. In the long run, and even if it is not ratified in its present form, the EDC treaty will have prepared the way towards closer European integration. It has not only helped to clarify the great issues of national sovereignty, but has also served as a starting point for further conceptions such as customs unions, military integration and the possible creation of common pools for agriculture and raw materials. When the time comes for talks with the Russians about Germany, moreover, the EDC treaty may prove to be an invaluable card in the hand of the Western powers. In Germany itself, the debates about EDC will have helped to draw attention to the need of ensuring that German rearmament is kept under the strict control of the civil power and parliament.

(Concluded)

Negotiating at Panmunjom—I

FROM A SPECIAL CORRESPONDENT

PANMUNJOM is diplomacy at its most bizarre, even in a world where statesmen have discovered that if they tell everyone what they are thinking and doing—and especially the big news agencies—other governments that might be interested are bound to hear, too. It is diplomacy through the medium of public relations officers and journalists.

But there is a certain idiotic logic about the place and the way its machinery has worked. By the summer of 1951 both the United Nations and Communists could see that there was no prospect of quick or cheap victory in Korea for either side, and neither wanted to seem responsible for keeping the war going. The front line then, and since, was near the 38th parallel, which was a convenient place for it to be. And whether or not either side then wanted a truce, they certainly needed some place from which they could publish to the world their case in the Korean affair.

It has kept this dual purpose of meeting ground and platform for the past two years—serving mainly as the latter, except when there was something practical to be done, such as arranging the exchange of sick and wounded prisoners this spring. Then, propaganda was hushed, the atmosphere became genial, and some progress was made. But for most of these years neither side was anywhere near defeat or in need of peace: and this remained so until President Eisenhower was helped to victory by his promise to wind up the war, and the Communists for their part seemed to decide that a truce would give impetus to their new diplomatic offensive.

Since these were armistice talks between undefeated

enemies, the meeting-place had to be acceptable to both. First it was Kaesong, then Panmunjom. The only virtue of Panmunjom is that it lies south of the 38th parallel—and so technically in South Korea—and at the same time is in Communist territory. It is a couple of miles behind the Communist front line. Thus, both sides had some claim to it, and it was fairly accessible to both, since it lies on Korea's main north to south road. Throughout the talks little has remained of the village but a row of four derelict cottages, part of which has recently been demolished. One of these roughly-thatched, clay-and-timber huts is less ruined than the rest, and serves as a guard room for Communist security troops. This is the only amenity Panmunjom has to offer.

All the rest is artificial, imported for the talks. There is the conference building, an oriental bungalow with long windows and walls panelled on the outside with bright rice-straw matting. Flanking it on either side are the tents of the delegations, fitted with telephones and lead respectively to Tokyo and Pyongyang, and beyond these to Washington and Peking. Without telephone lines Panmunjom's system of negotiation by remote control would be impossible. There is a pair of meaningless sentry boxes for each side. All this, with a couple of other tents, including one for the United Nations journalists, makes up the conference site. Around it lies a bleak and desolate landscape, bounded by a rim of jagged hills. At their end the Communists have planted trees and shrubs; at one time there was a United Nations garden too, but it withered away.

Diplomacy by Generals

That, inevitably, is Panmunjom. And just as inevitably, since it is an armistice that has to be discussed, its brand of diplomacy has to be conducted by generals. Not that the heads of the two delegations are typical soldiers. The North Korean, Nam Il, is a politician who has put on his uniform, with its aggressively-cut shoulders, mainly as a passport to the conference building. The United Nations senior delegate, General William K. Harrison, has a reputation as a Nonconformist preacher, and according to one of his aides reads the Bible in his tent during breaks in the sessions. General Harrison seems by nature a modest and amiable man. He is aware that his way of handling the talks has been criticised, particularly in Britain. He was once asked by a correspondent what he felt about the proposal that the United Nations should be represented at Panmunjom by professional diplomats. His reply was, for want of a better word, disarming. He said there were probably many men who could do the job better than he was doing it. But the distinction between soldiers and civilians was irrelevant, because in the talks there were certain issues that had to be resolved, and the approach to them was determined not by his delegation but by the governments concerned. And, in any case, soldiers had plenty of experience in negotiating.

That was General Harrison's opinion, and it was hard not to agree and sympathise with him. Not only, as he implied, is he briefed in detail on what he is to say in the conference hut and to the correspondents at Panmunjom, but there have been times when it seemed that he had even been told what his demeanour ought to be. He is also in the most exposed of positions. A chance word, or a phrase misquoted and amplified to the world, could raise misdirected howls against him in half-a-dozen countries.

philosophy of life. The Roman Catholic faith, almost universally accepted, much as in Britain the Monarchy is taken for granted, leaves room for everyone to display their own personal inherited or acquired philosophy; this may, indeed, consist in an accentuated Catholicism, but it may also consist in a rationalistic humanitarianism or in something regarded officially by the Church as a heresy. The immense majority even of Communists get their children baptised and their dead buried by the Church. The parties are purveyors of doctrines and uplift. Because the parties hark back to "metapolitical" teachers like Mazzini they survive dictatorships but muff their chances of getting any practical changes into effect when there is liberty.

Perhaps because Signor De Gasperi, though of Italian race, was born an Austrian subject and came to Italy from outside, he has been able to survey the Italian party scene with a good deal of detachment. He has often stressed that for him the Liberal and the Social Democratic ideals have their right place in the nation and ought always to have, just like Christian Democracy, their spokesmen. He is very much averse to that tendency in his own party which, nestling under the Catholic Action wing, takes the existence of party contrasts to be no better than a necessary evil, since in a better state all men would think alike as the Church tells them. He has had to stand a good deal above party. He may be able to see more consciously than other Italian leaders the frequent disconnection between the function of a party as an ideological church and its function as an executor of real policies. This helps him to cope with Nenni, understanding both Nenni's strength as a prophet and his danger as a practical politician dominated by the undreaming Communist chiefs. Now Signor De Gasperi heads a "one-colour" government, but his is not a one-colour mind, and he will doubtless be bent upon trying to spare Italy another costly eclipse of the parliamentary system.

Battle Over Danish Bacon

FROM A CORRESPONDENT IN COPENHAGEN

THE second half of the annual tug-of-war between Britain and Denmark about the price of bacon will soon begin in London. The first round was held in Copenhagen at the beginning of June; it lasted only two days. Until October, the price is £252 10s. per ton f.o.b. under a two years' agreement, concluded last September. This agreement has a clause which permits a 10 per cent fluctuation either way. The British officials from the Ministry of Food demanded a 10 per cent price cut, the Danish negotiators from the private export bacon factories wanted a 10 per cent increase.

These Anglo-Danish battles over the price of Danish agricultural products, principally bacon, butter and eggs, are annual events under the present long-term contracts, which run from two to five years, and usually they end in some sort of compromise. This time the negotiations about bacon may be rather more difficult. The British negotiators support their case by pointing to the general trends on the world market, where grain prices are falling, and to the possibility of the abolition of bacon rationing in Britain, which would presumably lead to increased demands for imported supplies. The Danes, on the other

hand, base their demands for higher prices on the belief that if restrictions on consumption are in fact abolished a shortage on the world's bacon market will set in. They have, furthermore, seen that New Zealand has recently secured from Britain a higher price for its bacon, so that it is now getting more than the Danes. In other countries including the Soviet Union, Denmark is itself getting much higher prices than in Britain.

Danish farmers now ask why they should go on with an arrangement under which they are actually subsidising the British farmers. By paying less for imported goods than for British products, the British Government is helping the British agricultural economy which is not able to compete on the free market. Is this any better than building a tariff wall to protect the British farmers? Any improvement in Britain's economic position is welcomed in Denmark, not least by the farmers. But it is noted that the improvement in the British balance of payments seems to owe a good deal to the Government's food policy, which is to further agricultural production at home, and at prices which do not invite greater consumption.

Months in Cold Store

Moreover, the Danes feel that the present system, under which the British Government is the sole purchaser of Danish foodstuffs and controls the whole of their distribution, does not provide a good advertisement for Danish goods; in order to make sure that they are evenly distributed, Danish butter, bacon and eggs are kept in cold store, and by the time they reach the retailers' shops they may be months old. Danish agricultural produce originally became famous because of its excellent quality. Today there has been neither time nor opportunity to recover this reputation for quality which was lost when all dairy produce in Britain, both home and foreign, was pooled and sold as "National butter," etc. Nowadays most British housewives probably neither know nor care what they are buying: they take what is cheapest. Some Danish farmers say that in that case, why not sacrifice quality for quantity? But responsible spokesmen for the farmers, such as the President of the Agricultural Council, Hr Hans Pinstrup, urge that it is necessary to go on improving quality.

As things are today, Danish farmers have probably lost interest in concluding any more long-term agreements with Britain. Immediately after the war it was to the advantage of both parties to plan for five years ahead. The guaranteed market encouraged the Danish farmers to increase their livestock, which had dwindled during the war; and Britain, for its part, had a guarantee that it would get a certain percentage—up to 90 per cent—of the agricultural produce which Denmark exported. To help its old customer (and to improve its own precarious economic position) Denmark even maintained the rationing of butter and bacon for several years.

Denmark is now gradually shifting its export policy. First and foremost the farmers will try to expand their traditional exports to as many countries as possible; but they will also try to increase the range of their exports. The belief, which governed prewar trade policy, that agricultural exports should be restricted to refined animal products, is no longer valid. There are now many other products that can be profitably exported, such as malt barley, pedigree seed, sugar, and even pedigree cattle.

a vital industry

The Thames Board Mills' story is one of vision and enterprise. Here is an organization known wherever British-made "cardboard" is used; proud to be the largest of its kind in the British Empire. Here, modern craftsmen, with their mammoth machines, transform tiny fibres into thousands of tons of "THAMES BOARD" a week. Large reels, small reels, sheets of many sizes, white, brown, grey and coloured—vital board to pack millions of pounds-worth of British goods or to bind books and to make ceilings and walls in buildings of all kinds. Food, soap, clothing, footwear, medical supplies, hardware, electrical apparatus—all manner of goods—need the protection of cartons made from "THAMES BOARD," plus (of course) "FIBERITE" PACKING CASES, to get them safely to market.

"Yes, it's time I had some limelight"

"WONDER DRUGS!" I'll give 'em wonder drugs. How about some publicity for us basic chemicals? Maybe Hexamine does not sound very exciting but you couldn't manage without me. Not if you wanted plastic bottle caps or light switches or covers for telephone receivers you couldn't. I'm one of the important ingredients in plastic manufacture. Got other uses, too. I kept the Olympic Torch alight all the way from Athens to London in 1948 and I provide the heat in the Army 'Tommy Cookers'. Proud? Of course I am. I come from Brotherton, one of the largest independent British manufacturers of Hexamine and other basic chemicals.

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.
Brotherton & Company Ltd., City Chambers, Leeds 1. Also at Manchester, Glasgow, Wakefield, Birmingham and Blackburn.

THE UNITED
STEEL
COMPANIES LTD

THE LARGEST
STEEL PRODUCERS IN THE
BRITISH COMMONWEALTH

The United Steel company employs some 30,000 people in its various undertakings. In such an organisation there are many opportunities for those who have the necessary ability and the willingness to assume positions of responsibility. The provision of sufficient men of the right quality to fill senior positions is of vital importance for the future.

The company has been a pioneer in the development of a training policy for all grades of employee from juveniles to managerial staff. This policy has been extended to embrace a long term plan of staff replacement, which relates future requirements for executive staff to present recruitment, and provides comprehensive training for recruits selected by rigorous standards for their potentialities as future executives.

The company thus offers a career in which character, ability and skill will be rewarded by rapid advancement, and has a staffing policy which should ensure that its future management will be in the hands of men competent by training and quality to fill the positions they hold.

THE BUSINESS WORLD

The Market in Oil

AN article in last week's issue of *The Economist* surveyed the relations, with all their intricacies and growing difficulties, between the major oil companies and the states and sheikhdoms along the Persian Gulf. When the 50:50 agreements were made between the companies and the rulers, they were taken to symbolise an equal partnership in the trading results of producing and marketing the oil. It has now become pertinent to ask 50 per cent of what? As the rulers grow in experience and wealth, they are seizing opportunities to re-interpret the "what," so that their original 50 per cent is in effect being stretched out to 50 plus. In their insistence on getting the most out of the agreements, they are increasingly unwilling to accept a level of Middle East oil prices that does not fully match prices in other markets.

This factor has been somewhat overlooked in comments on the higher crude oil and petroleum prices announced during the past month. The trigger setting off these increases was pressed on June 15th, when the Phillips Petroleum Company posted an increase of 25 cents in the price of crude oil from \$2.74 to \$2.99 a barrel. This company (which on balance is a buyer of crude oil) attempted the same manoeuvre in 1948, but then the major companies refused to follow; on this occasion they have all followed. For the first time in six years, the price of American crude has been increased and the prices of refined products in the United States have been quickly adjusted to the new level. For two or three weeks, however, there was real doubt whether these increases, in the American phrase, would "stick." Whether higher prices on the American continent were justified or not, the awkward fact remained that Middle East oil was knocking hard on the door of the American market. It had knocked hard in 1949, and much to the displeasure of the independent

oil producers in Texas, who were quick to denounce the "dumping" of low-cost Middle East crude on the Eastern Seaboard of the United States. Indeed, in 1949 the base price of crude oil for the Persian Gulf was reduced to \$1.75 a barrel which with the freight rates of that time approximately equalised its price at New York with other competitive crudes. But after the recent increases in American prices, there was no mistaking their vulnerability to Middle East competition for, as in 1949, but to a much greater extent, tanker freight rates had fallen so far as to upset this equalisation. For the most part, the major companies move oil in their own tankers or long-term chartered tonnage. But if spot tanker rates dip sharply, as they have this year, any system of equal delivered prices instantly becomes vulnerable. Recently spot tanker freights have been down to one-half of the rates fixed by the United States Maritime Commission soon after the war for the large fleet it then controlled. The table overleaf compares the delivered price, New York, of crude oil of 36 degrees gravity from various sources, assuming freight rates equivalent to USMC minus 50 per cent. Before Persian Gulf prices were raised at the end of last week, Middle East crude oil could be laid down at New York for \$2.71 a barrel, almost 50 cents a barrel cheaper than West Texas and Venezuelan crudes. Ignoring any differences in quality (which can be significant), there is still a margin of nearly 25 cents for any shipper who can obtain tonnage at USMC rates minus 50 per cent. Such low rates will not be permanent, for they apply only to the margin of free tonnage; if they improved to USMC minus 25 per cent a different competitive picture would emerge, with Arabian crude costing \$3.385 at New York, against Venezuelan and West Texas crudes at about \$3.27. It must, however, be remembered that a large part of the bulk international

movement of crude oil is carried in the oil companies' own fleets at the "London Award" rates fixed twice a year by a panel of brokers; this currently corresponds to USMC minus 19 per cent and if it applied to transatlantic movements, it would give a delivered price in New York for Middle East crude of nearly \$3½.

But the point that will strike those who had doubts about the reality of a "world market" in oil is this: the major companies who have raised the prices of Middle East crude are following the principle of the equal delivered price for oil from the two major production areas with exportable surpluses—namely the Middle East and Venezuela. Prices for Middle East crude of some producers thus remain linked to prices for crude oil at United States Gulf ports, though the major companies have differing ideas about the levels of prices at which equalisation is achieved. This is a system which has been much under fire by the Economic

Co-operation Administration and its successor, the Mutual Security Administration; it is of the very stuff of anti-trust charges.

The decision to raise Middle East crude prices is the outcome, in fact, of a series of embarrassing pressures and counter-pressures. If Middle East oil were to flood into the Western hemisphere markets, who would gain? There would be a political rumpus in Washington from American domestic producers by comparison with which the 1949 criticisms of "dumping" would be mere murmurs. There would be severe repercussions on Venezuelan oil output and, in the limit, upon Venezuela's never too stable politics. There would be a howl along the Persian Gulf from rulers asserting that the oil companies were not crediting them with a fair price for Middle East crude. All these points can be granted. If Middle East crude threatened to flood into the American market, the likely reaction would be

some form of import restriction and a tariff higher than 10½ cents a barrel. The American market is prepared to absorb a reasonable amount of foreign crude "to supplement but not supplant" its own domestic supplies; but it would certainly not accept the idea of full and free competition from the Middle East.

But what is true of the American market, which is disposed to accept a limited amount of foreign oil, does not necessarily follow for the European market where Middle Eastern crudes have swept out crudes from the Western hemisphere. To take Britain alone, of last year's crude imports, 93 per cent came from the Middle East and less than 7 per cent from Venezuela and the United States. This fact—which can be broadly matched in other European countries—prompts some questioning about the actual mechanics by which crude prices are established. The British consumer has been told that these increases follow from "a rise on the world market," and it is a legitimate inference from this and earlier statements from the oil companies that they have taken full account of their own changes in costs. Now it may be argued, as a proposition holding in the long term, that the prices until recently obtained for American domestic crude were not sufficient to ensure continued prospecting and drilling there. On that ground, the increase in crude prices at the Gulf as signalled in last month's addition of 25 cents a barrel, may be fully justified. But it is not easy to apply the same argument to the prices of Middle East crude where direct costs of production are distinctly low and have not been rising to a major degree—though proper allowance must be made for indirect costs in such an insecure region.

It might be said, however, that Britain's dependence upon Western hemisphere refined products is still large enough to justify the fixing of product prices in this market by reference to the American market; of all refined product imports, the Western hemisphere provides about two-thirds by value. But the main deficiencies are in lubricating oil, kerosene and aviation spirit, and not in motor spirit and fuel oil which can be largely supplied from home refineries. To sustain this argument, it is necessary to look a little more closely at the actual machinery by which prices are established on the Gulf seaboard for refined products. They are, in fact, gathered by Platt's market reporting organisation at the major supply and consumption centres. The report entitled "The International Petroleum Cartel" published in Washington nearly a year ago criticised Platt's quotations unfairly. They measure accurately and honestly the market that exists and even if it is in some respect a thin market, it is better than no market at all. Despite the spread of oil production and refining over the world, no other market has come into being. But if the Gulf prices used to have meaning when that was the region from which shipments of petroleum flowed all over the world, they must obviously have less meaning when the United States has ceased to be a major exporter of bull

petroleum products, and when the pattern of American consumption is so different from that of Europe. The United States protects its production of gasoline by clapping on a duty of 52½ cents a barrel—a hurdle that no importer can jump. Considerable quantities of fuel and gas diesel oils come in over a 5¼ cents tariff, particularly from Venezuela. And since Venezuelan and Caribbean products compete in European markets, there are links, tenuous though they may be, between oil markets in the two hemispheres. But it seems fair to conclude that the prices of petroleum products in the United States have less relevance than they did to the prices that ought to obtain in other and distant markets, served by their domestic refineries using crude oil from other sources.

There is not—and perhaps there cannot be—any market mechanism by which prices of Middle East crude and the prices of products from European (and Eastern) refineries can be realistically determined. But conceptually, at any rate, this has become a distinct market from the American market—one in which the major companies, though closely linked together, as they have to be to do their job, will be expected by the consumer to behave as if propelled by the forces of competition among themselves. The idea that an Eastern hemisphere price structure might emerge from the play of market forces is incompatible with the

Taking a Risk in Wheat

ON August 1st Britain enters a new era in wheat trading: it will buy in the "free" markets of the world, through the private grain trade in Liverpool and London. Fourteen years of bulk purchase by a single buyer, the Ministry of Food, mostly under long-term contracts and international marketing arrangements, will come to an end. The import of wheat and coarse grains has already been returned to private enterprise, and the Government is not a party to the new International Wheat Agreement that starts on August 1st. The two decisions were made independently, but together they represent an attempt to reduce the cost of imported wheat. The freeing of the grain trade is in fact the most important measure of decontrol in the commodities since the war; grain is Britain's most costly import.

In refusing to join the new wheat agreement, the Government is taking a calculated risk—gamble, perhaps, is the appropriate word. It believes that wheat prices are more likely to fall than to rise, and that over the three years of the new agreement it will be able to buy wheat in the free market at less than the maximum price of \$2.05 for IWA wheat. The Government is pitting Britain's bargaining position, as the world's largest importer of wheat, against that of the United States, the largest exporter. Specifically, the Government is wagering that the American price sup-

structure of the companies in the Middle East and in Europe, and would only make their relations with the rulers along the Persian Gulf more difficult. But an automatic adjustment of the prices of Middle East crude and European refinery products to the higher costs of American production does not fit the facts of oil in the modern world.

The Cartel Report last year argued that the effect of the Gulf-plus system had been to keep the price of Middle East oil higher than it ought to have been. A year ago, that was a view that had no sharp sting for the European consumer, although he might have felt some uneasiness at the pricing methods that the industry employs. But after the recent increases he will need more convincing. Increases that may cost the European consumer \$130 million in local currencies, and \$50 million out of dollar reserves are not lightly to be dismissed by reference to "a rise on the world market." In his own *oikos*, he perceived no increase, until the companies staged one. The industry's technical achievements since the war have been remarkable. Its relations with Middle East countries are not proof against shock. But while the consumer will give full credit and allowance for these facts, he will also need to be convinced that the prices he pays are reasonable. In particular, he will not take it as an axiom of the modern oil world that when America turns, all must turn.

port policy will sooner or later have to be brought into line with the world supply and demand for wheat.

Since the war the wheat importing countries have been heavily dependent on two major suppliers, the United States and Canada. The prices charged by these two countries and by the other world exporters, Argentina and Australia, hinge on the support price for American wheat. This price is fixed at a level that Britain and other importers consider unreasonably high; its effective level in the major marketing centres this year is roughly \$2.40 a bushel. By lending and purchasing operations, the US Commodity Credit Corporation boosts the "free" price in the United States as close as possible to the support price; and naturally this acts as a magnet to wheat prices outside America. The Canadian Wheat Board, the sole seller of Canadian wheat, disposes of its Class II (non-IWA) wheat in world markets simply by quoting a price a few cents a bushel lower than the Americans. The Canadian board also sets the price of wheat sold under the wheat agreement from whatever source, and this also follows the American price. During the four years of the wheat agreement that expires on July 31st, the free price has virtually always stood well above the IWA maximum and the IWA maximum was therefore held firmly effective. It is an oddity of the price mechanism of the IWA that though there are over 40 governments buying,

the price is adjusted by one seller acting on behalf of all four exporters. Sales by Australia and Argentina, which is not a member of the agreement, are also made by single authorities that follow the American price.

Faced with such highly controlled selling operations, it is tempting to put Britain, the importer, in the role of David. A glance at the tabled estimates of the wheat position in these four main exporting countries helps to explain why the Government has dared to challenge Goliath. These figures suggest that for the next year or so wheat supplies should be more than ample to meet world demand; and the largest potential surplus seems likely to be in the United States. In the crop year 1953-54, which has just begun, opening stocks are estimated at the record figure of 1,300 million bushels, twice the previous year's total of 650 million. The United States has stocks of 580 million bushels, more than double the previous stock of 260 million. Canada's stock is rather less than double—about 430 million bushels against 270 million a year ago. In Western Europe, the largest importing region, stocks of wheat are considered adequate this year. At the end of the 1953-54 crop year the estimates for the carry-over run higher still; they are put at no less than 1,400 million bushels, of which the United States' stocks will be nearly 200 million higher, at 770 million bushels.

Forecasts of this nature, however, are often unreliable, and in wheat they can be notoriously so. The critical crops of spring wheat in Canada and the United States have yet to be harvested. If the American maize crop were to be poor—which does not at present seem likely—a lot of wheat might be taken off the market there for feed. The European harvest should be as good as, if not better than, last year's; but this remains to be seen, and much can happen before the Argentine and Australian crops are harvested late this year. The British Government is, however, taking a view of prospective wheat supplies for three years, not for one year alone. Some major uncertainties cloud this longer view. Will Argentina overcome its transport problems and become a more aggressive seller of wheat? Will Russia offer some wheat in the free market? Will international relations and international trade improve?

Failing some major shifts in the balance of market forces, it will certainly be difficult for the American

authorities to maintain the price of wheat close to the high support level during 1953-54. The price has in fact dropped by roughly 25 cents in the last three months, though this may have no more than seasonal significance. The expansion of production and the decline in exports has left the Commodity Credit Corporation with a huge wheat stock of some 350 million bushels—almost one-third of the whole harvest. The gift of 36 million bushels to needy Pakistan was only a drop from this brimming bucket. The Administration is aware of the threat to the support programme. To keep exports moving it began to subsidise sales under the new wheat agreement weeks before this had been effectively ratified. The wheat acreage for the 1954 crop has been cut to 62 million from 77 million acres, and marketing quotas may be imposed to penalise farmers if they plant more than their allotted acreage. The cut in acreage may not have much effect on the harvest, because the land taken out of use is usually marginal.

Storage regulations for wheat qualifying for loans have been eased, and \$22 million is being spent on additional storage capacity for 90 million bushels of grain. Schemes are being urgently studied in Washington to move the surpluses of all farm products "not into storage but into (foreign) stomachs," through the long

purse of the US Treasury.

The British Government however, may not be relying entirely on the broad indications of ample wheat supplies in the next few years. It probably hopes that, as the largest importer, its absence from the new agreement may of itself tend to bring down prices. It almost certainly thought that to participate in the new agreement would have helped to make the effective price for wheat the top price in the IWA range, as happened before. Britain's normal import requirements are some 5 million tons a year, of which it bought 4,800,000 tons under the expiring agreement. With Britain absent, and allowing for increases in the import quotas of old members and the addition of new members, the net movement of wheat possible under the new agreement will be reduced to some 12 million tons a year from 15.8 million tons previously. Trade in wheat in the free market will be increased to some 12.5 million tons a

Export prices of American wheat are not published. A rough guide to the price of Chicago futures; a better one is the Class II (non-IWA) price of the best Canadian wheat, No. 1 Northern Manitoba. In the second year of the IWA, a 6 cents storage charge was added to the price of IWA wheat, raising the effective maximum to \$1.36 for the remaining period of the agreement.

year by Britain's transfer, making this market more important than hitherto.

Unless the free price falls below the new IWA minimum of \$1.55, which is unlikely, there is no obvious advantage in trading solely in the free market. Should the free price fall below the new IWA maximum of

\$2.05, the maximum will not be effective and buyers will obtain wheat at the same price as the free price. Members of the agreement still enjoy the right to buy and sell in the free market; their only obligations are that exporters must sell the whole of their quotas at not more than the maximum price, if the importers call on them to do so, and that importers must similarly buy their quotas at not less than the minimum price if called upon. An importing member might, in theory, be inhibited from buying freely in the free market by the fear of being called on to take up his quota at \$1.55. There is, incidentally, no evidence that the British Government expects the free price to go below \$1.55, or that it would consider such an event to be desirable, having regard to its widespread economic implications. But with Britain outside the agreement, the private trade will have a completely free hand to buy where and when it pleases.

Britain did not quibble, during the long haggling in Washington, at the raising of the minimum price under the agreement to \$1.55, although this was 35 cents above the minimum in the last year of the old agreement. It held the existing maximum of \$1.80 to be a fair price in present conditions, but in order to preserve an international agreement that had worked, it was nevertheless prepared to go up 20 cents to \$2.00 for the new maximum. Unfortunately, other delegations in Wash-

ington refused to believe that \$2.00 and no more was the British limit; when all other members agreed to \$2.05 Britain stuck to its guns and departed. (The United States had held out for \$2.05 in order to reduce the cost of its subsidy on IWA wheat, thus transferring some of its domestic subsidy costs on to the backs of the foreign consumer.) Britain's refusal to join hardly seems to have been based upon any argument that membership would be incompatible with the return of the grain trade to private hands; it will have a somewhat similar problem to solve in the decontrol of sugar.

If the current forecasts about wheat prove to be justified, and the American price support operations are weakened, the free market price will probably move closer to the IWA maximum, and may periodically be below it, in which case the two prices would run along together in the higher part of the IWA range. It so happens that for several days recently the Class II price and the IWA price, for orders under the new agreement, were identical, at levels a few cents below the IWA maximum. At the moment they are apart again, with the IWA price a shade below the maximum at \$2.03 and the Class II price three cents higher. It would be unwise to draw any conclusions from the recent movements. The free price tends to be seasonally low in June and July, when the new crops are beginning to press on the market, and this pressure may already be passing its peak.

If the free price does tend to move within the IWA maximum and minimum price range, the wheat agreement will at last be fulfilling its original intentions, with members enjoying an assured market between a ceiling price that protects the importer, and a floor price that protects the exporter from the violent fluctuations which characterised the prewar period. But the outcome of Britain's decision depends not on the temporary success of a bear raid, but on whether North American wheat

WORLD EXPORTS OF WHEAT AND FLOUR
('000 long tons, wheat equivalent)

	Total world	Actual exports under IWA	Export quota in IWA	Free market exports
1949-50.....	20,500	11,500	14,100	9,000
1950-51.....	24,500	14,200	15,100	10,300
1951-52.....	25,300	15,300	15,600	10,000
1952-53.....	22,700	15,000	15,600	7,700
1953-54.....	22,500	...	12,000	12,500

The figures have been rounded; exports for 1952-53 are estimates, and the export quota in the IWA in 1953-54 is provisional.

policies can be brought nearer to reality. The political popularity of these policies is unlikely to diminish. But it is conceivable that the cost of supporting prices at the present level may induce Congress to modify the whole programme when it comes up for review next year. And in that event Britain's policy will deserve as much praise here as it will incur criticism there.

Business Notes

The Conversion Result

THE Government's latest conversion operation seems to have evoked a somewhat better response than was first expected. It was announced on Monday that, when the offer closed last Friday week, holders of about £397 million of the 2½ per cent National War Bonds, 1952-54, had accepted the invitation to convert at par into the corresponding issue that is redeemable in 1954-56. This means that 49 per cent of the impending maturities have been deferred for a further period of not more than two years, leaving an unconverted portion of £413 million still to be repaid, or induced into yet another exchange, on or before March 1st next. Correspondingly, the total of the 1954-56 stock will be raised from £426 million to around £823 million. In a context such as this, "success" is a relative term, and cannot be defined unless it is known how much of the 1952-54 issue was held in official hands and what proportion of that holding was converted. The general impression in the market is that the "departments" held rather less than the most extravagant guesses had suggested, but still held a great deal—probably not less than one-quarter of the whole; and it is further surmised that all, or nearly all, of this large share has been exchanged.

If this is so, the amount converted by non-official holders would represent rather less than one-third of their total holdings—certainly not a very impressive ratio, but still a better one than the City had envisaged. It was clear from the outset, as a note in these columns recorded a fortnight ago, that the discount market was almost completely indifferent, and it seems to have made only a tiny "token" response. The attitude of most of the big banks was similar, but there may have been some second thoughts, and in the event the domestic banks as a whole appear to have taken up a moderate amount—though probably not more than £100 million. Foreign holders, who had valued the 1952-54 issue because the coupon is paid to them without deduction of tax—a privilege that does not extend to the 1954-56 issue—have certainly stood aloof. It seems evident, therefore, that a perceptible flow of conversions has come from the general body of private and institutional investors, the extent of whose holdings of these wartime issues and whose response to such an offer as this are always equally incalculable. The very nature of the operation showed that the authorities were not pitching their aims high, and it is arguable that a massive response would have made the 1954-56 issue embarrassingly large. If their expectations were moderate, they are probably now reasonably well satisfied. A substantial refinancing task still lies immediately ahead, for in addition to the £413 million of unconverted bonds that mature next March there is the £577 million of Serial Funding stock that matures in mid-November.

But the general drift of monetary policy recently implies that the authorities do not see any need for haste. They may be right; but it certainly cannot be taken for granted that conditions will be equally propitious in the autumn.

Terms of Trade to the Rescue

BRITAIN'S terms of trade, which improved by 7 per cent between 1951 and 1952 and in so doing aided the balance of payments and real incomes in this country by some £330 million, are now already 9 per cent better than the average for 1952; although neat arithmetical deductions do not always work out as they should in this field (because of complications arising from time lags in payments), there must therefore be a real hope that Britain is on the way to another sizeable windfall gain of over £300 million this year. This prospect, which emerges from the detailed overseas trade returns for June, is considerably better than Mr Butler seemed to expect when he drew up his budget.

From January to June of this year, the Board of Trade's index of all import prices has fallen by six points to 87 (the 1952 average equals 100), and the index of all export prices has lost only two points to 96. In the same period the terms of trade, that is the ratio of import to export prices, have moved four points in Britain's favour, to 91 per cent of the 1952 average. In June itself the improvement was arrested, perhaps temporarily, and both export and import prices fell by one point. Among the separate components of import prices, the index of imported food, drink and tobacco prices fell one point to 97 in June, the index of raw material prices fell two points to 80, and that of manufactured goods remained stable at 85; among exports, the index of wholly or partly manufactured goods (at 97) and of metals and engineering products (at 100) were both unchanged, but textiles gained one point to 92 and other manufactures, which include non-ferrous metals and chemicals, lost one point to 92.

The favourable movement of the terms of trade in the last six months has, however, been badly needed; for in the first half of this year the volume of imports has been about 2 per cent higher than in the first half of 1952 and the volume of exports about 5 per cent lower. The latest returns confirm, however, that exports have recovered compared with the second half of 1952—by £6 million a month in value terms. The main increases have been in exports of cars, iron and steel manufactures, textiles (especially woollen goods), and refined petroleum. The rise in imports compared with the second half of 1952 has been almost entirely in imports of sterling area raw materials; the

THE ECONOMIST, JULY 25, 1953

weight of wool imported indeed, has been greater than in any half-year since the war. Imports of manufactures, particularly metals and cotton piece-goods, have continued to drop, and have been about £8 million a month less than in the second half of 1952.

IMF Exchange Restrictions

A SUBSTANTIAL part of the work of the International Monetary Fund during the past year has been associated with the first series of consultations under Article XIV of the Fund agreement, which provides that "five years after the date on which the Fund begins operations and in each year thereafter, any member still retaining any restrictions inconsistent with Article VIII shall consult the Fund as to their further retention." The results of these consultations are discreetly described in the fourth annual report on exchange restrictions recently published by the Fund in Washington. No confidences are betrayed in this bulky document, but it is evident that one of the main points of attack of the Fund in these consultations has been directed at exchange subsidies and other forms of export subsidies, including dollar retention schemes.

The point stressed by the Fund was to suggest to countries that were experiencing difficulties in exporting that the fault might lie in the inappropriateness of their exchange rates. The references to this subject in the latest report suggest that the IMF would not be averse to a further revision of parities. In the course of the consultations, Sweden, Finland and Norway informed the Fund that they were removing their retention quota practices, and Belgium and Luxembourg agreed to remove or reduce the intensity of a number of discriminatory practices. In its general comment on developments of the past year, the report states that "while noting the extent to which member countries have made progress in overcoming inflationary pressure and thus moving towards a situation in which restrictions could be removed, the consultations made it apparent that there is much more to be done before general convertibility of currencies and the removal of other restrictions can be attained."

Deposits' Mid-Year Peak

THE period covered by the half-year-end statements of the clearing banks, all of which are now available, was marked by a continued trend towards credit expansion. The net change in the level of bank deposits during the first half of each year is, of course, always strongly influenced by the heavy tax collections and consequent running down of deposits during the first quarter; but in this latest half-year a large part of this seasonal influence has been obliterated. Net deposits have dropped by only £131 million, the smallest fall in any similar period since 1949, and one that contrasts with a fall of £218 million last year, when the banking system was feeling the first effects of the credit squeeze. In consequence, on June 30th

last aggregate net deposits reached their highest point ever touched at the mid-year, at £6,023 million. A significant part of this expansion occurred in the last six weeks of the period; after the "make-up" for May, net deposits rose by no less than £158 million, actually by £38 million more than the large increase experienced in the similar weeks last year. In consequence, the seasonally adjusted index compiled by Lloyds Bank jumped by 1½ points to a peak of 105.5, compared with the low point of 101.0 reached in May, 1952, and 102.9 at the time of the first increase in Bank rate.

The upward trend has been less steep, however, in this past half-year than in the previous half-year, and its causes have been very different. The expansionary force in the second half of 1952 was the extremely heavy borrowing by the Government, whereas in this past half-year it has been the reviving demands of the private sector. Bank advances, which dropped by £72 million in the first half of 1952 and by £111 million in the second half, have in this latest period risen by £14 million. Similarly, the clearing banks' portfolios of commercial bills, which shrank by £97½ million in the corresponding period last year, have this year dropped by less than £6 million. The apparent contraction of investment portfolios has likewise been smaller this year—but part of last year's movement must have reflected writing-down. Since changes in these three categories of assets provide the best available measure of fluctuations in the credit needs of the private sector of the economy (including, however, the nationalised industries), the conclusion to be drawn is that in this past half-year these needs have on balance been little altered, whereas in the first half of 1952 they declined by rather more than £200 million.

Rising Trend of Advances

THIS contrast, which is much more than sufficient to explain the reversal of the basic trend of deposits, has, moreover, become more pronounced recently. During the last six weeks of the half-year, although the £37½ million

call on this year's BEA market loan was only £10 million smaller than that on last year's loan, total bank advances dropped by only £9 million, whereas last year they dropped by £30 million. The implication is that advances to borrowers other than the BEA rose by almost twice as much in these latest six weeks as they did last year.

In this same period, despite the issue of a further £100 million of Exchequer stock "for cash," the central Government was borrowing heavily from the banking system—apparently to the extent of some £160 million—though not quite so heavily as it did at the same time last year. Over the half-year, however, it reduced its indebtedness on balance by roughly £125 million, whereas in the first half of 1952 it hardly achieved any net reduction at all. This improvement is in line with that shown in the Exchequer accounts—including items both "above" and "below" the line—and is, indeed, rather less than might have been expected when changes in national savings, tax certificates and the note circulation are brought into the reckoning.

Brazil Tries It On

THE Anglo-Brazilian commercial and financial negotiations, which have been proceeding in Rio de Janeiro since May 20th, seem to be going from bad to worse. It will be recalled that one of the main issues involved is the debt of £63 million that Brazil owes to British exporters for goods sent to that country in recent years. The British delegation suggested that an initial repayment of £20 million should be made by Brazil—possibly by purchasing the requisite sterling from the International Monetary Fund—and that the balance of the debt should be cleared by earmarking £10 million a year from Brazil's earnings of sterling. Brazil has now countered this proposal by an offer that can only be described as derisory. According to this offer, the outstanding debt of £63 million would be cleared over a period of twenty years, and at best there would be only "the smallest symbolic initial payment" through the agency of the Monetary Fund. Moreover, even this offer would be made conditional upon a British guarantee to maintain imports from Brazil at not less than a certain prescribed minimum.

The tenor of this proposal suggests that Brazil understands neither the rudimentary principles of commercial honesty nor the policy that the British Government is endeavouring to pursue in its commercial relations with the rest of the world. The proposed treatment of the commercial debts is, unhappily, fully in keeping with the long and tawdry record of Brazil as an international debtor. The demand for guaranteed markets in Britain shows that Brazil cannot or will not understand that trade in Britain and over the greater part of the sterling area is handled by free markets and private merchants, for whose activities no "guarantees" can be given. It is unfortunate that in its attempt to depart from the noxious principles of commercial bilateralism, the British Government should, in this particular instance, find the ground cut beneath its feet by the action of the great upholders of multilateralism, the United

States Administration, whose recent financial assistance to Brazil is an unhappy example of the condoning of commercial dishonesty.

Coal Profits Again

FOR the last six weeks of the first quarter of 1953 the National Coal Board had to pay its day wage men at increased rates, equivalent to about 6d. a ton extra in the labour costs of coal; and from March 2nd onwards it was getting an average of 5s. 6d. a ton more for the coal it sold at home. It ended the quarter with a profit on its colliery operations of £5,523,133, or rather over 2s. a ton; this compares with a loss on colliery operations in the last quarter of 1952 of £1,247,628, and a much higher colliery loss in the quarter before that. The increases in costs and proceeds, for varying periods during the quarter, were not the only major elements in this access of financial fortune; the board benefited from a considerable fall in the cost of its "roof supports, general stores and repairs." Even without the higher proceeds that arose from the eventual increase in coal prices, the collieries would probably have been breaking about even on the quarter.

To meet the board's commitments, of course, the collieries have to break a good deal better than even; from their profits, and the profits it can earn from ancillary operations and opencast coal production, it has to make provision for taxation and pay interest—now amounting to nearly £16½ million a year. In the first quarter, the board in fact showed much reduced profits on ancillaries—£740,000 against the estimate of £1,075,000 for ancillary profits in the first quarter of 1952. The board was still showing a loss on opencast coal—£12,000 for the quarter, against £993,050 for the last nine months of 1952. This reflects the continued high costs of carrying large opencast stocks—when the board has to stock any coal on its own account, opencast stocking is convenient, if expensive. On all its operations, the board showed profits of £6,251,133 on the quarter; after providing for taxation (£1,500,000) and other charges, and setting aside £4,050,000 for interest, it showed a final surplus of £541,133.

In the second quarter of the year it was of course paying higher wages and receiving higher prices for the whole thirteen weeks. Its price increase did cause a small increase in the price of steel, of which the board is a heavy buyer directly and indirectly; but it has calculated that by the time a 5s. 6d. a ton increase in coal prices works back to the board through the price of steel and steel products, it amounts to no more than a halfpenny a ton in materials costs. The trend in other materials prices has been downward, so that its colliery costs on this account seem unlikely to rise; even with a probable increase of about 3d. a ton in labour costs (from paying the higher day wages over the whole three months), total costs do not appear likely to have increased much. Colliery proceeds, however, should gain the benefit of the full 5s. 6d. a ton increase, compared with the increase of 2s. a ton in the first quarter and export premiums on British coal may not have fallen much. So in the second quarter of this year the NCB collieries should perhaps have been running at a healthy profit. They needed to: for in the third quarter now begun the industry has to pay for the cost of the miners' second week's holiday—in operating costs as well as in output.

Who Owns Shares?

THE greatest gap in British financial information today is that nobody knows which classes of the community have liquid funds that could be invested on the stock exchange or which classes do invest there when they have the chance. Apart from the Domesday Book, which is out of date even by British statistical standards, and the mournful inquisitiveness of the Inland Revenue's assessors of death duties, who do not publish their information in a very exhaustive form, there has been no detailed survey of personal assets in this country. In April and May of last year a group of intrepid researchers from Oxford set out to remedy part of this deficiency by questioning 2,600 "income units" in 69 districts of the country about their savings habits. An income unit can consist either of a single adult aged over 18 or of a married couple (with the children dependent on them); the 50 million people in Britain are thus divided into some 22 million "income units," of which 37 per cent consist of only one person and 27 per cent of two. An article in the current issue of the *Bulletin* of the Oxford Institute of Statistics by Mr H. F. Lydall has now set out some of the survey's intriguing findings about holdings of stock exchange securities.

The limitations of the statistics unfortunately make it impossible to deduce how much of the £25,000 million of stock exchange securities outstanding at that time was

OWNERSHIP OF STOCKS AND SHARES

held by persons rather than by corporate investors; nor yet to check up on the crucial estimate, deducible from Inland Revenue figures, that over 50 per cent of industrial securities seem to be held in the rapidly diminishing class of estates of £50,000 or more. The survey's general finding, however, is that at least 5½ per cent of income units own some stocks or shares; this suggests that some 1¼ million of the 22 million income units in the country have some stake in the stock exchange, although (since, for example, the wives of some investors hold securities in their own right), the number of individual stockholders must obviously be greater. About half of these investors owned £500 worth or less, and the figures actually suggest that there are some 190,000 shareholders with gross incomes below £200 a year

(comprising 3.7 per cent of income units in this poorest group). As was to be expected, however, and as the accompanying table shows, only 2 to 3 per cent of those with annual incomes between £200 and £600 invested on the stock exchange, compared with over 50 per cent of those earning more than £1,500 a year; similarly 1.5 per cent of skilled manual workers and 0.5 per cent of unskilled manual workers were stock exchange investors against 22.3 per cent of those among the managerial classes.

Old Ladies in Throgmorton Street?

THE survey contained, however, some odder food for thought for the stock exchange than this. First, less than half of the investors traced—and only 2.1 per cent of all the people questioned—had bought or sold securities last year; and, quite fantastically, 42 per cent of those who had bought or sold (presumably sold) in the year said that they had no stock exchange securities left now. Secondly, the 5½ per cent of the community who held stocks or shares included 9.6 per cent of those aged over 65 and 10.3 per cent of those classified as "retired"; moreover, 5.9 per cent of the income units headed by females owned stocks or shares against 5.3 per cent of those headed by males.

If all this is taken at its face value, it suggests that more than half of all personal investors consist of a torpid mass that do not normally switch their portfolios at all in any one year, and that nearly half of those that do now come down to Throgmorton Street come there to liquidate their holdings altogether; while a sizeable proportion of the private portfolios that remain are in the hands of elderly people (including an undue proportion of elderly females) whose holdings are presumably drawing nearer and nearer to the death duties' axe. This cannot be an entirely accurate picture of the stock exchange's customers. But it is probably nearer to the truth than anybody who believes that this country's future depends largely on intelligent provision of personal risk capital can ever like to think.

Slighting the Ring Fence

MEDIAEVAL armies used to "slight" the fortifications put up by their opponents, by knocking small but important pieces off them, once they were inside a citadel. The Conservative Government seems to be willing to do the same thing to Mr Gaitskell's ring fence round the domicile of British companies. Within the broader context of his speech in the parliamentary debate on colonial development last week, Mr Oliver Lyttelton dropped a mild hint that the Treasury may now be more willing to allow British companies to migrate to the colonies. After suggesting that it is "something of an anachronism" that the affairs of a company operating exclusively in a British colony should be directed by a board in London, Mr Lyttelton advanced the two familiar arguments—the need for local control and for lower taxes (allowing more to be ploughed back into

the business for development)—in favour of the colonial domicile of such companies. In considering any applications for a transfer in control Mr Lyttelton emphasised that "the great importance of colonial development will be kept well to the fore." But made it clear that this did not imply "a blanket authority" from the Government that any company wishing to migrate will automatically be permitted to do so. Even a half-promise such as this, however, is a considerable advance over the recent dilatory tactics of the Treasury in holding up the emigration to Rhodesia of the Rhodesian Selection Trust group of copper companies.

High taxation has been the predominant influence upon the recent scale of registration of companies in this country, as well as upon their desire to secure registration in the colonies. The 1952 report of the Board of Trade "on matters within the Companies Act," published this week, shows that last year the number of private companies on the register rose from 244,166 to 250,927 companies (with a paid-up share capital of £2,330 million), while the number of public companies fell from 11,778, to 11,587 companies (with a paid-up share capital of £3,970 million). The number of private companies has grown steadily since the end of the war, though at a slackening rate. This does not mean, however, that there has been a welcome upsurge in the number of new productive businesses; it simply means that, under present tax law and in view of the shortage of private capital, many former partnerships or individual businesses—some of a most peculiar sort, such as the attempt at professional sports stars to capitalise their names for advertisement purposes and individuals' "investment companies" formed to minimise death duties—have found it convenient to secure registration.

Ore for the Furnaces

At the beginning of this year it was estimated that pig iron output in Britain might rise this year by about a million tons above the 10½ million tons produced in 1952. Production of iron in the first half of this year was about 5,551,000 tons, so that output has still some way to rise in the second half if this forecast is to be fulfilled. But this year's output so far—an annual rate of more than 11 million tons—has only to be compared with the level of about 9½ million tons in 1949-50 to show the sharp increase in the last few years. Almost all the increased supplies of pig iron have gone into steelmaking, bringing about the planned decline in the "scrap ratio" of British steelmaking—actually from 63 per cent in 1950 to about 55 per cent at the end of last year. This increase in iron production has called for a correspondingly greater increase in the volume of iron ore used in the country's blast furnaces; last year some 16 million tons of home ore and 8½ million tons of imported ore were consumed.

The variety of ores now used in British blast furnaces, and the widening range of physical properties, has thrown more and more emphasis on the processes of ore preparation—particularly on sintering. This is a method of burning ironstone and low-grade fuel such as coke breeze in a down-draught grate; it produces a charge that both chemically and physically is better suited for the furnace than unprepared ores, and can be smelted into iron faster and with

much lower consumption of expensive metallurgical coke. The British Iron and Steel Research Association, working mainly at member steelworks, has recently been devising improved methods of this and other methods of ore preparation, such as the pelletising of the very finely divided concentrate from which some of the richest foreign ores are received. Any research group has to explore different ways of achieving the same ends: BISRA, in this field of ore preparation, has found that the improved output and quality it has achieved through work on sinter plants (mainly at Dorman Long's Redcar works) have for the present outweighed the economies offered by its improved methods of pelletising. With the growth of pig iron production envisaged in the steel industry's current steel development plan—to some 15 million tons a year by 1956—the amounts of ore to be dealt with will become even vaster; and the need for ore preparation capacity will rise perhaps most of all. Since 1948, the production of sinter in Britain has risen from 2.9 million tons to 4.4 million; by the end of the second development plant in 1957-58, it may well have nearly doubled again.

London Fares Increase

INCREASED fares come into operation in the London Transport Area on August 16th. Single fares of 3d. and 8d. will be increased by ½d.; fares of 6d. and 9d. or over will be increased by 1d. No change will be made in 2d. and 5d. fares. Concurrent increases in early morning fares and season ticket rates have also been authorised by the Transport Tribunal. The awards give broad effect to a charges scheme submitted to the Tribunal on January 5th this year; they will provide £5.6 million of additional revenue a year towards a deficit estimated by the Tribunal, in the light of evidence from the British Transport Commission and from objectors, at £4.8-£4.9 million.

The Tribunal rejected suggestions that consideration of the scheme should be deferred until a "comprehensive inquiry into the financial structure and operating policy" of the Commission had been undertaken, and that the deficit could be remedied by the introduction of cheap fares during off-peak periods. Such ideas were dismissed as "unworthy of serious consideration," on the ground that the first necessity was to ensure that the London services must pay their way. The Tribunal claims, with justification, that the increases in fares now authorised cannot cause any general hardship. After this Tribunal's meticulous examination of evidence and witnesses over twenty-three days, no objector can assert that the proceedings have been other than deliberative and entirely fair. But it is perhaps a matter for some relief that the new Transport Act provides an opportunity for shortening in future the period that has in the past elapsed between the fact of increased costs and the granting of authority to increase fares to meet them.

Stagnation in Rubber

RUBBER is still a stagnant market, and he would be a bold observer who would read it in present conditions. The news that the high-cost synthetic rubber plants in the

THE OX WAGON: It is only fitting that the ox wagon should be displayed on the South African coat of arms. For without this apparently primitive but wonderfully effective method of crossing difficult country the development of the Union might well have been immeasurably handicapped. Serving both as beef cattle and draught animals, oxen were the mainstay of the early South African economy—and even in the Union of to-day they play a large part in transport and agriculture. The original trek wagons were surprisingly small when compared with those in use to-day, measuring only some twelve feet in length, about the same size as an English farm wagon which they greatly resemble.

Our branches in the Union of South Africa are particularly well placed to answer questions on trading conditions and local markets.

Please address your initial enquiries to our Intelligence Department, 54 Lombard Street, London, E.C.3.

BARCLAYS BANK,
(DOMINION, COLONIAL AND OVERSEAS)

Strange things happen
in a British Summer. But
if you really did see Father Christmas
on the pier one day this August you
might well swear off lobster lunches
for ever. Set your mind at rest, though;
this jovial chap is simply our impression
of the business man who has already placed
his order for advertising playing cards
for this Christmas. Have you ever thought
of advertising by playing cards? They
make an admirable gift and are a
very effective way of keeping your name
in mind. Their cost, too, is surprisingly
reasonable. Why not strike a new note
this year? Our designers can incorporate
your name or trademark into an attractive
playing card and the finished product will
have over a hundred years' experience behind it.
But orders must be received by early September
for delivery before Christmas. So please
telephone or write for one of our technical
advisers to call and show
you specimens and answer
all your questions.

INDUSTRIAL AND COMMERCIAL FINANCE CORPORATION LIMITED

Subscribers:

The English and Scottish Banks

I.C.F.C. is ready to consider the requirements of any industrial or commercial enterprise which is established in Great Britain.

The Corporation entertains proposals for additional capital—either for the purchase of additional buildings, plant and machinery, or for financing the expansion of business and carrying increased stocks and debtors. It is also prepared to consider more general schemes of expansion, including the financing of new ventures which are soundly sponsored and backed.

It provides capital both in the form of share capital and medium or long term loans—generally in amounts ranging between £5,000 and £200,000.

United States are to be closed down on August 1st instead of in September may have accounted for a fractional advance in distant positions in London early this week; but the normal switching into these positions may equally have been responsible. The advance was subsequently lost; cash rubber was unchanged and closed officially on Thursday at 19½d. per lb. The later news that American consumption of natural rubber in June rose by 2,100 tons to 48,900 tons failed to move prices and had apparently been discounted. The market's response to these two developments in America, the largest consumer of both natural and synthetic rubber, illustrates its present apathy.

The closure of the high-cost plants will reduce capacity for making general purpose synthetic, natural rubber's competitor, from about 700,000 to 600,000 tons, though the remaining capacity seems quite sufficient for American needs. The rise in American consumption of natural rubber in June was accompanied by a slight fall of 800 tons to 71,500 tons in consumption of synthetic, so that consumption of natural rose by 1.3 per cent to 40.6 per cent, the largest monthly increase since the recovery began. But the absolute rise in the usage of natural is disappointingly small. At the International Rubber Study Group's meeting in May, the Americans forecast that even a relatively small decline in the price of natural rubber should lead to a substantial increase in US consumption. Between May and June the price has dropped by just over 1½d. per lb. Given the current surplus of rubber, and the adequate stocks in consumers' hands, it would probably take a really big increase in American consumption to strengthen the price. At the moment the market is just holding, but it is vulnerable to technical weakness and could certainly go lower still.

The hopes that are pinned on an increase in the price of American synthetic rubber, following the transfer of the plants to private hands, may prove groundless; there is at least as much possibility that private firms may be able to cut the price. The point is becoming of somewhat academic importance. The US Senate has just inserted an amendment to the disposal bill which may postpone the transfer date to January, 1955.

The Cost of Development

IMMEDIATELY before it began to debate a report that advocated some extension of Government research and development contracts in industry, the House of Commons this week heard that the costliest development contract placed since the war was finally to be abandoned. The Minister of Supply told members that the Brabazon I aircraft and the uncompleted Brabazon II, on which together some £6½ million had been spent, were to be dismantled, while the assembly building and enlarged runway at Filton, which cost another £6 million, were already being used for other purposes. This development contract was placed with the Bristol Aeroplane Company to fulfil one of the airliner suggestions made by the Brabazon Committee; the Ministry financed the design and construction of prototype. This system, supported by the basic aircraft research done at Farnborough, is the most usual method of research and development in the aircraft industry, though some private development—for example the Comet airframe—is financed

entirely by individual companies. The Brabazon development admittedly supplied some technical data on large airframe design and on power controls. But broadly, it was a costly failure; partly because the original conception was not justified by the subsequent trend of aircraft design and operating economics, and partly because those responsible for the grandiose concept did not see early enough when to stop. Neither of these dangers can be guaranteed against when public money is being risked on research (always a gamble) and upon its application (often not much less so). But in the aircraft industry, at least, the development contract system has produced other much happier results during and since the war.

It was not wholly clear from the debate that followed whether the Government proposes to extend this system in civil industry to the limited extent suggested recently by its Advisory Council on Scientific Policy. Mr Molsom, for the Government, "approved the principle," pointed with pride to the contracts that already exist for industrial gas turbines and heat pumps, and encouraged the co-operative research associations to finance design and development, as distinct from research. He added that "we contribute, and intend to continue to contribute, grants to these research associations." In form, this might well be preferable to the backing of likely developments by government departments, however well advised; in scale, it may or may not be adequate. Britain's present place in the race for technical advance suggests that it needs to devote to hastening the application of research not only as much effort as the United States (where development contracts are placed by the Government with industry more widely than here), but perhaps more. It is always harder to catch up.

Cheaper Steel Exports

FOR the second time this year, some reductions have been announced in the export prices quoted for some steel products. These apply to merchant bars, small sections, hoop and strip; the reductions, which in some cases amount to about 12½ per cent, bring the British export prices closer to the Continental quotations for similar steel, though still slightly higher.

One effect of the cuts in export quotations has been that certain steel products now cost more than others on the export market and less on the home market. Given the insulation of the two markets by the official limits on the amount of steel the industry is allowed to export, such a disproportion is not unlikely; though in the softening world market for steel, the influence of this control must be declining. These cuts in export prices, and the shaving of the windfall prices that the industry has enjoyed through export premiums, may tend to reduce further the margins that steelmakers can earn on certain products of which home prices are relatively low. But the industry as a whole is benefiting from further cuts in the levies made upon British steel production to finance the import of steel and raw materials at world prices and their sale at the lower British prices; the quantities imported are falling and the prices paid, too, for steel and steelmaking products, at any rate, are lower. Nevertheless, a general review of the whole price structure in steel is probably overdue; and the new Iron and

Steel Board, now building up its organisation, presumably has this high on the agenda.

The Iron and Steel Consumers' Council that operated under steel nationalisation, in its closing report to the Minister last week, raised one issue of pricing policy for the new Board. It had received complaints from consumers in London and certain South-Western areas about the increased scale of "zone extras" imposed this year for some steel products. For consumers in these regions the extras on certain products were roughly doubled, causing the anomalies inevitable in any "zone-delivered" price system. For example, steel consumers in Bath, Chippenham, Devizes, Trowbridge and Frome can buy heavy steel at 7s. 6d. a ton cheaper than those in Bristol, Dursley, Gloucester and Stroud, though the former towns are farther from the works of the heavy steelmakers. The Council considered that these increases in zone extras did bear harshly on some users near zone boundaries; however, it was unable to agree on alternative pricing methods, such as a single delivered price for the whole country or "ex-works" prices with transport charges to be paid by the consumer. Prices at the works, plus actual transport charges, would theoretically accord best with the economic location of industry—both for the producers and for the consumers of a product. But a number of British industries now use "delivered" or "zone-delivered prices"; and indeed the nationalised coal industry, which uses them for domestic coal, has for some time been proposing to extend the system to prices for industrial consumers. The new Iron and Steel Board is not short of economic sophistication or knowledge of pricing; it will be interesting to see its considered opinion on this point and on other major issues of steel price policy.

India's Sterling Balances

INDIA still has a larger sterling balance than any other country, and the financial agreement signed by United Kingdom representatives in New Delhi this week—although it does no more than tidy up the agreements made in 1947 and 1951—has brought into clearer focus the provisions that have been made for its gradual unblocking since the war. The arrangements negotiated in 1951 provided in the first place for the transfer of the Indian currency backing of £310 million from India's blocked No. 2 account to its free No. 1 account—although with a gentleman's agreement that the dominion did not expect to have to draw down this sterling. The remaining sum of about £210 million was left in the blocked No. 2 account; but it was agreed that this should be released in six yearly instalments of £35 million, these releases dovetailing into the financial provisions of the Colombo Plan. Two of these annual releases have now been made, leaving about £140 million in the No. 2 account, which will be finally exhausted by 1957 after the release of four more instalments of £35 million. In May of this year the foreign exchange reserves of the Reserve Bank (blocked and unblocked) amounted to £533 million, an increase of some £20 million over the preceding twelve months. In addition, the Reserve Bank held £88 million of gold, while the government and the commercial banks held dollar working balances equivalent to about £30 million. On the evidence of these figures the Indian balance of payments would appear to be running at a modest surplus.

Thirty-Shilling Tailors

THE short, sharp skirmish over the ownership of Prices Trust is over. As the holders of over 50 per cent of the 5s. ordinary shares in Prices Trust have accepted the offer of 30s. for each share made by United Drapery Stores, the attempt by the Anglo-Federal Banking Corporation to acquire a 51 per cent interest in Prices Trust by bidding 31s. for each share falls to the ground. United Drapery Stores had effectively won the victory before the contest was joined, as Sir Henry Price (with his control over 1,045,529 ordinary shares) and his fellow directors had already accepted its offer. Their decision to accept the lower rather than the higher bid has surprised some people, particularly as the Anglo-Federal Banking Corporation had stated that it intended that the business should be carried on and that all existing agreements should be duly respected. But Sir Henry Price and his fellow directors point out in a circular to shareholders that United Drapery Stores is well qualified "to preserve the continuity of the company's business" and that they did not know whether the Anglo-Federal Banking Corporation were acting as principals or as agents. Complete and assured continuity is obviously in the interests of employees; it may also be in the best long term interests of shareholders, even in these days when the book value of so many company's assets is so far below their real value.

The real issue that emerges from this episode is therefore the familiar one—but by some boards ignored—of the need for very full publicity. Obviously the first negotiations about a share offer must be conducted behind closed doors, but once a definite bid has been made shareholders should be told all the facts. More particularly, if there is more than one bid and the directors prefer one to the other, the reasons for their choice should be explained in detail. The directors fight the battle, but unless shareholders are told how they have fought it there will always be some barracking of the result.

WE'RE INVITING INVESTMENTS and this is why!

More houses are going up. More purchasers are asking building societies for advances to pay for them.

In the past six months this Society has agreed to lend £3,804,000 for the purchase of 2,582 houses newly built or in course of erection.

Money saved and invested with the Society is thus being used to good purpose.

Still more savings can be used. The interest offered is 2½% with income tax paid by the Society—equal to more than 4½% where the investor is liable for tax at the full standard rate.

If you would like particulars please write to the

SHORTER NOTES

By declaring an interim ordinary dividend of 8½ per cent on a capital of £60,100,880, the directors of Imperial Tobacco have recommended a rate that is for all practical purposes equivalent to last year's interim dividend of 13½ per cent, which was paid on the original capital of £37,563,049 before the 60 per cent free issue of shares. It seems reasonable to assume therefore that, unless trading conditions change very suddenly, the company is likely at least to maintain a full year's dividend of 20 per cent—a rate exactly equivalent to the one paid for the last financial year.

★

The slump in General Electric's gross profits from £6,603,957 to £4,230,234 in the year to March 31st last came as something of a shock to the market, and the £1 ordinary stock units (which had been marked up on the eve of the company's preliminary report) were immediately marked down 3s. to 40s. The decline in profits, which can probably be attributed to a drop in the sales of the company's consumer goods, was not however great enough to put the ordinary dividend in danger. By recommending a final dividend of 7½ per cent, the directors have fixed the full year's distribution at 11½ per cent; this is exactly equivalent to the rate of 22½ per cent paid in the two previous financial years on the ordinary capital of £5,877,720 before the 100 per cent scrip issue made last September.

Company Notes

DISTILLERS. Like so many of the other mammoths of British industry, Distillers have had to report a sharp slump in trading profits in the year to March 31st last—from £21,265,450 to £13,205,539 after writing down stocks by £1,970,016—but its directors have been able to recommend an unchanged dividend of 22½ per cent without any apparent difficulty. After this announcement, the 4s. ordinary stock units were marked down only marginally—by 3d. to 16s. 4½d. Stockholders had been prepared for a report of this character by the chairman's warning last year that the industrial and plastics divisions of the group's business were then experiencing "a heavy recession." The directors now reveal that all the group's trading divisions shared in the fall in profits, but that it was the chemicals division that "felt most keenly the severe economic changes experienced by industry generally in the past year."

A fall in the provision for taxation (from £11,816,737 to £6,641,394) has helped to protect stockholders from the direct effects of the recession in trade and profits. Even so, net profits have dropped from £7,466,839 to £4,101,072—partly because of higher charges for depreciation on new plant and equipment and for debenture and loan interest (following the issue of the new loan stock). The group, therefore, has not been able to plough as much back into the business as it did in 1951-52. But even here there is a sunnier side to the picture, for the decision to

write back £754,207 from stock contingencies reserves and to make a fresh appropriation of only £329,455 to these reserves (compared with £1,561,274 in 1951-52) shows that the directors are now

far less concerned with the problem of replacing stocks than they were in the years of soaring prices. Similarly, as profits in 1952-53 cannot have been distorted to any degree by windfall gains on stocks sold in a rising market, stockholders can look upon the cover given by net earnings to the ordinary dividend (which absorbs just under £2,800,000) with much more confidence. Certainly there is no reason to fear anything worse than a repetition of a 22½ per cent dividend for the current year, for the directors report that "a general improvement in the chemicals section both as regards output and profit margins" has taken place since the end of last March.

At a house-warming held last week by Thomas Hedley Limited, for its newly completed administrative headquarters outside Newcastle, the Minister of Food said that synthetic detergents now made up 25 per cent of the market and that he "understood" Hedleys to be the largest suppliers of them. Thomas Hedley, owned by the American company, Procter & Gamble, and Unilever are the two main contenders in this market, with Colgate-Palmolive-Peet, also American-owned, a possible runner-up. Some experts would doubt whether synthetics yet account for more than 20 per cent of the market; but the probable combined output of soap and synthetics should easily reach 500,000 tons this year, so the stakes in the market for detergents—one of the most bitterly contested among all consumer goods—are quite considerable.

★

The provisional offer by the Bavarian Mortgage and Exchange Bank to the holders of its 6½ per cent gold mortgage bonds follows the lines set out in the German debt settlement—as did the formal offer to the holders of the City of Hamburg loan. One-third of the interest arrears on the gold mortgage bonds is to be waived, the remaining two-thirds of the arrears are to be funded, the date of repayment is to be postponed to 1968, and the coupon rate is to be reduced from 6½ to 4½ per cent. There is still, however, some uncertainty about the rights of German holders, and final settlement of this debt may therefore be delayed.

UNITED DOMINIONS TRUST.

For the fifth successive year since the war the United Dominions Trust group established fresh records in the volume of its business and in its profits in the financial year to June 30th last. This success can be attributed in part to the wide ranging interests of this commercial banking house; they include the provision of credit to manufacturers and merchants selling goods under hire purchase contracts, the granting of loans to businesses wishing to renovate their buildings or to re-equip their factories, the provision of credit for engineering concerns and the ownership of the London Produce Clearing House and of Ryders Discount Company. They also include the ownership of subsidiaries granting credit facilities to borrowers in the Commonwealth. With ambitious—indeed some would say grandiloquent—official schemes for Commonwealth development in the air, these Commonwealth subsidiaries may become of even greater import to the group in the future; an indication of these expanding horizons can be found in Mr Gibson Jarvie's visit to Canada "to make preliminary investigation into the possibility of [the group] commencing operations there."

The growth of the group's business last year is reflected in an increase in the balance sheet total from £22,505,794 to £26,235,884. All the group's earning assets—including loans against security, advances to customers, amounts receivable under customers' agreements and bills receivable—show satisfactory increases, though this, of course, has been accompanied by an increase in loans and acceptances from £13,282,680 to £16,898,141. The dearer money policy of

the last two years does not seem to have significantly damped down demand for the type of finance that the Trust provides. Indeed the increase in the volume of business, together with the higher rates of interest, has led directly to the advance in profits from £766,202 to £850,200. And, although

taxation has again cut deeply into earnings, the directors have been able not only to stick to their policy of building up the group's reserves but also to raise the ordinary dividend from 20 to 22½ per cent. In the next three years it will be surprising if any lending institution manages to keep as free from bad debts experience as it has since the war; but the bias towards capital goods in the Trust's activities and its progressive dividend policy seem amply to justify the current price of 74s. 6d. for the £1 ordinary stock.

★

W. H. SMITH AND SON (HOLDINGS). More newspapers and books were sold from the familiar bookstalls of W. H. Smith and Son in the year to March 28th last than in the previous year; indeed the increase in the value of sales, which owed little or nothing to a rise in prices, came as something

of a surprise to the directors of the company. Unfortunately, however, wages and carriage charges increased even faster; and the group's trading profits, therefore, declined fractionally from £2,154,674 to £2,152,038. This tiny reduction, however, was accompanied by a much bigger fall in the provision for taxation—from £1,185,622 to £1,069,421—and net profits advanced from £570,837 to £732,678. The directors, therefore, had no difficulty in repeating the ordinary dividend of 12 per cent, and they have also been able to increase the appropriation to the general reserve from £290,000 to £400,000.

Perhaps, however, the most cheering feature of the group's accounts is that in spite of the increase in sales, stocks

remained practically unchanged; in fact, the value of stocks as recorded in the balance sheet declined slightly from £2,167,252 to £2,129,663. Much of the new money ploughed back into the business, therefore, could be held as a liquid asset, and during the year the group purchased £513,975 of short-term Government securities. Although costs are still going up, the directors expect that the group will enjoy yet "another satisfactory year."

LONDON STOCK EXCHANGE

Next account begins: August 5th.
Next Contango Day: August 5th.
Next Settlement Day: August 11th.

THE biggest gains both in the Funds and industrial equities in the week to Wednesday's close, were made before the week-end; this advance petered out on the first two days of this week, but prices held the ground that had been gained. In the gilt-edged market interest at first was concentrated upon the "shorts" and the medium dated issues; but on Wednesday dealers reported that there was a tendency for investors to switch out of the "shorts" into the longer dated issues. In the week to Wednesday's close War Bonds (1952-54) improved by ½ to 80½; Savings Bonds (1965-75) by ¼ to 85½; and Transport (1978-88) by ¼ to 80½; the most sustained improvement of all was made by Savings Bonds (1955-65) which rose from 95½ to 95½. Home Corporation issues attracted some support and bank and insurance shares improved on a broad front. The steadiness in the gilt-edged market set the stage for a promising debut by the new 4½ per cent debenture stock issued by English Electric at 97½; after active dealings on Tuesday it closed at 2½ premium. In the foreign market the final stages of the ratification of the German debt settlement touched off a little extra demand for German issues before the week-end; later on attention switched to Japanese bonds, which had previously been dull.

Before the week-end many of the better known "blue-chips" received some support, though most attention was focused upon textile and colliery shares. Immediately after the week-end there was a slackening of interest and although little of the ground originally gained was lost the most active section of the market was that dealing in "take-over" shares. On Wednesday, however, interest again broadened to include textile, tobacco, building, motor and stores issues. Oil, rubber and tea shares remained quite firm. Kaffir shares tended to drift lower in advance of the South African budget but turned slightly better once it was known that the gold mines were not to suffer from fresh taxation. Lead-zinc shares were steady, but tin shares drooped a little further.

BOARD OF DIRECTORS
Hollenberg Klein

I have examined the books and records of the Company and, having obtained all the information and explanations necessary for my audit from the directors, I find the books, the balance sheet, and the yearly survey where it explains the balance sheet, to be in accordance with legal requirements.
Münster (Westf.), May, 1953.

Dr. Schumacher,
Chartered Accountant.

SUPERVISORY BOARD: Dr.-Ing. Willy van Delden, Ahaus i.W., Chairman; Otto Werthmann, Lühringsen bei Soest, Deputy Chairman; Dr.-Ing. E.H. Heinrich Kost, Kapellen, Kr. Moers; Carl Ludwig Kümpers, Rheine i.W.; Dr. jur. Carl Moskopp, Dortmund; Dr.-Ing. E.H. Günther Quandt, Frankfurt a.M.; Fritz Ridderbusch, Essen.

COMPANY MEETINGS

PATONS AND BALDWIN'S, LIMITED

The annual general meeting of Patons and Baldwins, Limited, will be held on August 25th at Darlington.

The following is the statement by the chairman, Mr Philip A. Wright, which has been circulated with the report and accounts:

It was announced in the latter part of April that Mr Alexander Forrester-Paton had resigned from the board of directors of your company owing to ill-health. Mr Forrester-Paton joined John Paton Son and Company in 1899 and was appointed a director of Patons and Baldwins, Limited, upon formation in 1920, became vice-chairman in 1933 and was chairman of directors from 1938 to 1951. Mr John Forrester-Paton who, like his brother, has a record of a lifetime of service with John Paton Son and Company and with your company, attained the age of seventy years earlier this year and does not offer himself for re-election to the board. I wish to place on record the great services to the company of these two gentlemen. During the year the board appointed Mr J. S. Bullimore as vice-chairman of directors.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The surplus on trading brought into Section I of the consolidated profit and loss account is £3,185,940 compared with a deficit of £293,492 for last year. The corresponding surplus two years ago was £3,834,696 and these figures emphasise how greatly your company has recovered from the doldrums to which trade had drifted in the autumn and winter of 1951-52.

During the year the company liquidated its holding in an associated company in the United States and has since made alternative and very satisfactory agency arrangements for the sale of the Beehive range of yarns in that country. The cost of the investment in the American company was £187,916 and its realisation has yielded a surplus of £129,729 which is shown in the trading account. A substantial part of this represents an exchange profit since the original investment was made partly in the days of a \$5 exchange and partly at \$4 whereas it has been liquidated upon a basis of \$2.80=£1.

The charges shown in Section I of the trading account follow the standard lines. Depreciation shows a substantial increase from £372,287 to £513,305 largely due to non-recurring adjustments necessary on receiving the final analysis of capital expenditure for the construction of the Darlington factory and to a re-assessment of the expected life of some of the company's newer continuous spinning machinery. The directors are glad that the results of the group once again warrant the payment of a bonus to employees both at home and abroad and £110,359 has been charged for this purpose. The balance carried from Section I to Section II of the profit and loss account is £2,474,710 compared with a deficit of £634,794 last year.

TAXATION

In Section II are shown the charges for United Kingdom and Dominion taxation based on the income of the year. The charge for Dominion income tax largely arises in respect of the profits of the Australian subsidiary which, together with the profits of other subsidiaries, are included in the con-

solidated statement. The amount of £838,336 covers the charge for British income tax and profits tax leviable on the income of the year less, in the case of income tax, arrears of capital allowances which could not be granted last year, and in the case of profits tax less the loss incurred last year. But for these deductions the charge for taxation would have been some £280,000 higher. The charge of £147,226 for profits tax on distributions to stockholders covers tax on the dividends on the company's 6½ per cent and 4 per cent preference stocks as well as on the total ordinary distribution of 20 per cent which the board recommends. During the year negotiations have been concluded with the income tax authorities consequent upon the formation of Patons & Baldwins (Far East) Limited and the taking over of the company's business in Australia by Patons & Baldwins (Australia) Limited. These negotiations result in provisions made in earlier years for United Kingdom and Dominion taxation to the extent of £476,705 not being required and being free, therefore, to bring back to the credit of profit and loss account.

After elimination of the interest of outside stockholders in the profits of the Australian subsidiary amounting to £112,843 the net surplus for the year carried from Section II to the appropriation account is £1,628,616 compared with a deficit last year of £482,660.

APPROPRIATION ACCOUNT

Patons & Baldwins (Australia) Limited has, like the home company, had a very satisfactory trading year and as well as declaring a dividend at the rate of 6 per cent on its issue of ordinary stock, of which Australian investors hold one-third, has taken a substantial sum to reserve. The parent company's proportion of this amount, namely, £106,242, is shown in Section III of the profit and loss account.

Under the trust deed securing the company's issue of 4 per cent first mortgage debenture stock 1960-75 there is an obligation to set aside, in addition to interest on outstanding stock, a sum equal to the difference between that interest and £165,000 for the purpose of redemption of outstanding stock. In lieu of paying to the trustees the sum mentioned, the company may surrender stock purchased in the open market. Stock Exchange conditions during the year made it possible for the company to purchase the debenture stock required at prices below par and, in fact, a profit on purchase amounting to £3,445 was made on the total of stock redeemed by purchase having a nominal value of £48,448. The board consider it prudent to transfer from profits an amount equal to the nominal value of stock redeemed and this sum appears as a capital reserve in the balance sheet.

After deducting the two sums mentioned and bringing in the unabsorbed balance on profit and loss account from last year amounting to £428,530 there is available a total of £1,902,456. The dividends on the company's issues of preference stocks and the interim dividend of 4 per cent paid on the ordinary stock require £167,411 and there is, therefore, a balance of £1,735,045 to be appropriated. In considering this substantial figure regard must be had to the fact that the surplus for the year contains non-recurring credits amounting to £606,434 from the realisation of trade investment and taxation provisions not required and that the

charge for taxation has been reduced by some £280,000 by reason of last year's loss. In addition, it will be recalled that it was necessary to bring back from contingencies reserve last year a sum of £700,000 in order to pay preference dividends and a total of 10 per cent on the ordinary stock. Accordingly, the directors recommend that the sum of £1,735,045 be appropriated in the following manner:

£	232,217	in payment of a final dividend of 11 per cent and a bonus of 5 per cent on the ordinary stock.
1,000,000		to contingencies reserve.
502,828		to be carried forward to next year.
1,735,045		

CONTINGENCIES RESERVE

In recommending an appropriation to contingencies reserve of £1 million, of which £606,434 is looked upon as coming from non-recurring sources and £393,566 from the trading surplus, the board have in mind the need to conserve the liquid resources of the company in view of the substantial bank borrowing which is necessary even at today's level of wool prices and the need for the company to maintain an adequate reserve against contingencies. Since the heavy fall in wool values which took place so suddenly after the peak of March, 1951, there has been a steady rise in prices and while falls of equal severity are unlikely there are bound to be fluctuations and if stability is to be looked for at all in the future the company must have available a substantial reserve built up out of profits. In 1939 the market price of 64's Tops was in the neighbourhood of 25½d. per lb and a variation in price of 10 per cent, that is 2½d. per lb, would have caused some consternation. At our stocktaking in 1953 the market price of 64's Tops was 167d. and a variation of 10 per cent, that is over 1s. 4½d. per lb, is not considered out of the ordinary. None the less, these price variations in our raw material when evaluated over the company's necessarily large stocks of wool, tops and yarns represent latent risks which will always be liable to cause fluctuations in earnings and against which prudence dictates that some balancing reserves be made.

Looking at the group balance sheet it will be seen that apart from just under £2½ million in capital reserve the group's revenue reserves, including proposed appropriations total £5,819,070. This indicates the strength of the group but it should be borne in mind that all these reserves are entirely locked up in the working capital.

CONSOLIDATED BALANCE SHEET OF THE COMPANY AND ITS SUBSIDIARIES

Taking the group as a whole, net assets, after deducting the interest of outside stockholders, have risen from £14,080,059 to £15,316,797—an increase of £1,236,738. The net value of fixed assets has fallen over the year from £8,532,444 to £8,420,303 due chiefly to adjustments in depreciation already mentioned. Our expenditure on capital account now shows a welcome sign of steadying down to a normal level compared with that of recent years during which the Darlington factory, of which we are justly proud, has been constructed. You will observe that consequent upon the final analysis of expenditure at Darlington

certain expenditure originally classified as land and buildings has been transferred to the motive plant, plant and machinery category and this fact accounts for the changed figures compared with last year.

Total current assets at £15,419,318 show an increase compared with last year of £2,533,641, of which £2,392,636 is accounted for by the increase in value of stocks of raw materials and finished yarn. The weights of wool, tops and yarns held at stocktaking this year show, as would be expected in view of the increased business done, a substantial increase compared with last year.

Total current liabilities have increased from £3,322,776 to £3,772,724. Heavier raw wool purchases, necessitated by the upswing in trade, have resulted in greater use of temporary bank facilities and bank overdrafts show an increase of nearly £1 million compared with last year's figure. Current taxation liabilities are considerably lower than last year due to the incidence of the trading loss of 1951-52. The provision for bonus to employees and the increased ordinary dividend account for the balance of the increase in current liabilities compared with last year. Last year no provision for future taxation was necessary owing to the trading loss; this year, £715,239 has been provided to cover estimated income tax on the assessable profits of the year.

EXPORTS

During the year under review we have, in spite of import restrictions and financial limitations, been able to maintain a very satisfactory export turnover. I am happy to report that trading restrictions in many parts of the world are becoming easier. You may rest assured that no opportunity is being missed for increased turnover.

PERSONNEL

The successful recovery which the group has made in its trading since 1951-52 has been achieved by strenuous effort on the part of all our workers, management, productive and selling. Long hours have been worked at the factories in England and Scotland and to meet the demands of our customers we have reopened Rutland Mills, Wakefield, in order to increase production. The directors are glad to be able to resume the practice of awarding a bonus to employees and thus sharing revived prosperity with those who helped to make it possible.

PROSPECTS FOR THE FUTURE

Last year I expressed the hope that 1952-53 would see the commencement of a recovery in the wool textile trade. This has indeed taken place but much more rapidly than the most optimistic of us hoped a year ago. Indeed, during the year under review your company's sales of hand-knitting yarns in the home market have in weight been an all-time record. The demand, too, for manufacturing yarns has been great and your factories are booked to capacity for months to come.

Statistically, the raw wool market appears sound in that world stocks are very moderate. The production of wool in the primary markets compared with prewar has not increased to any great extent while the big rise in living standards throughout the world should certainly make for increased consumption. Furthermore, stocks of finished goods in traders' hands are in a healthier condition than for some years past. Against these bull factors must be set a possible sympathetic recession in price, probably temporary, should easing world tension result in a break in world commodity prices generally.

Since September last the price of wool has advanced some 25 per cent, necessitating a continual advance in selling prices. While

the immediate outlook is satisfactory, I must point out that the present level of the price of raw wool has not yet reached the public and any continued rise may result in a level beyond the public's capacity to pay, with a consequent restriction in demand.

These are, however, the hazards of trade and with our factories equipped as they are I am confident that unless circumstances beyond our control arise we have no room for pessimism.

DE WENDEL & CIE., S.A. (PARIS) (Iron and Steel)

INCREASED PRODUCTION AND TURNOVER

The annual general meeting of de Wendel & Cie., S.A., was held on June 24th in Paris, under the chairmanship of Count Emmanuel de Mitry.

Analysing de Wendel's position for the year 1952, within the wider framework of the activity of the French iron and steel industry, in which the company occupies a predominant place, thanks to its grouping of metallurgical and mining interests in the Fensch and Orne valleys in Lorraine, and its important participation in the new "Sollac" continuous strip mills, the chairman stated in his report: The year 1952 has been marked, for our company, as for the other iron and steel enterprises, by a progressive change in the trade position. On the French home market, the slowing down of demand, already noticeable during the first half of the year, became seriously aggravated during the second half, affecting all types of products, with the exception of heavy iron and steel sheets and railway permanent-way materials. On the export market, signs of weakness became apparent from the beginning of the year, but during the second half, and owing to the continued shrinkage of the French market, important quantities were sold abroad. In spite of the reverse in the trading position in 1952, the considerable volume of orders on the books of the French iron and steel industry allowed of a notable increase in output.

The de Wendel plants' production of steel, which was 1,326,000 tons in 1951, attained 1,483,000 tons in 1952. The company's turnover rose from Frs. 40,606 million in 1951 to Frs. 47,460 million in 1952.

PROGRESS OF MODERNISATION

After the completion of war-damage reconstruction, begun immediately after the liberation, a programme of new construction in the mines and plants was actively pushed ahead in 1952.

Investments in 1952 amounted to Frs. 5,187 million, and allowed, notably, of the modernisation of the Fensch Valley plants, the mechanisation of the iron mines, the erection of two powerful blast-furnaces to be completed during the first quarter of 1953, the construction of a new coking plant, and the installation of a continuous wire-rolling mill scheduled for completion in 1954, and, lastly, the development of a housing estate for the workers necessitated by the increase of industrial activity in Lorraine.

The balance sheet at December 31, 1952, totals Frs. 46,476,248,287, and profits, after deduction of Frs. 4,687,272,783 for amortisation, amount to Frs. 445,155,993 on the capital of Frs. 5,000 million, of which Frs. 1,300 million is unpaid. The net dividend, after deduction of taxes, has been fixed at Frs. 410 per old Frs. 5,000 share and Frs. 205 per new Frs. 5,000 share of which half is paid.

BRITISH SUGAR CORPORATION, LIMITED FIFTH HIGHEST CROP

The seventeenth annual ordinary general meeting of this corporation was held on July 21st in London, Sir Alan Saunders, OBB (the chairman), presiding.

The following is an extract from his circulated address for the year ended March 31, 1953:

The season under review produced the fifth highest crop in the history of the industry, both in regard to the tonnage of beet delivered and the average yield per acre. This is noteworthy, for the six heaviest crops to date have all been produced in the postwar period.

I pointed out last year that the season, favourable or otherwise, played a significant part in all farming operations and that for that reason it was not practicable to judge farming results on the basis of a single year. But it must be agreed, I think, that the sequence to which I have just referred is indicative of real progress.

The total tonnage of sugar beet received at the factories was 4,235,908 tons, compared with 4,533,512 tons in the previous season and a ten-year average of 4,064,324 tons. The average yield per acre was 10.73 tons, or half a ton more than the ten-year average of 10.12 tons.

The crop was grown by 39,568 growers on 394,728 acres, an average of practically ten acres per grower. This figure has only once been exceeded, in 1946-47, and then only by a small margin. This is an interesting point, for it suggests that, despite the ever-shrinking labour force on the land, sugar-beet growers are fully confident of their ability not merely to handle but to increase their acreage of sugar beet. This is certainly the result of the application of modern farming techniques.

These desirable results were attained in a season when favourable weather during the growing period allowed farmers to secure the maximum advantages of improved methods of cultivation now available to them, but the weather broke up rapidly almost as soon as lifting began and the 1952 harvesting period was one of the most difficult on record.

Productive efficiency remains at a high level and the installation of new plant is giving improved results. Our labour productivity was increased by 7 per cent; 329,737 tons of white sugar and 260,823 tons of raw were produced from the beet crop, a total of 590,560 tons, the third highest in the history of the corporation.

We are justly proud in our industry of the high quality of the sugar we produce, and factory staffs are to be congratulated upon the way in which they have maintained their very high standards in this respect.

Our production of sugar beet pulp, an attractive carbohydrate food for stock, was 278,082 tons. We also produced 184,060 tons of molasses.

Turning to the accounts, the actual results of the year have been satisfactory as, by improvement in our own efficiency helped to some extent by the processing of beets of a quality rather better than average, our share of economies under the new arrangement with Government, showed an increase of £156,000—over 20 per cent better than last year.

In addition, the system of price fixation controlled by Government has again produced a surplus in which the corporation has a share in the form of a provision against future deficiencies.

The report was adopted and a dividend of 4½ per cent was approved.

GOSSARD LIMITED

(Manufacturers and Distributors of Corsets, Brassieres, &c.)

CONTINUED INCREASE IN CORSETRY SALES

IMPROVED LIQUID POSITION

MR B. M. LINDSAY FYNN'S SPEECH

The eighteenth ordinary general meeting of Gossard Limited, will be held on July 30th at the Café Royal, Regent Street, London, W.

The following is the speech of the chairman (Mr B. M. Lindsay Fynn, FCA), which has been circulated with the report and accounts for the year ended December 31, 1952:

Last year was the sixth year in succession for which the corsetry sales of Gossard Limited, increased. I warned you a year ago that orders had fallen off badly in the early autumn of 1951 and that difficult conditions had continued into 1952. In fact, they continued until the summer, since when our factories have been under heavy pressure to deliver. Therefore, unlike 1951, when our factories worked at full production until the autumn and then orders fell off, in 1952 sales were difficult until the summer, since when our problem has been production. That is still the position at the present moment, and it is impossible to forecast just how long this condition will continue or when there will be another change as abrupt as the last.

INCREASED DEMAND FOR SILKSKIN AND TRU BALANCE

The demand for and production of Silk-skin continue to expand and Tru Balance, despite fabric problems, has come to be recognised as the finest corset in Britain for the woman who needs a little help. We believe that the increase in demand for these two products has still a long way to go.

During the year, we marketed three more corset developments—namely, Stridese, the Gossard Basque and the Cami-Bra. We have certain further developments which we hope to market as soon as our increasing production capacity permits. Your group factories are currently producing about six times as many foundation garments as in 1938-39.

At the end of 1951, on account of the decline in our sales, the group stocks were at a peak because production was only gradually being throttled back and the surplus over demand had gone into stock. During 1952 this surplus was successfully marketed and at the end of 1952 our finished stocks were very low. The release of funds tied up in stock had an immediate and material effect on our liquid position and you will see that at the end of 1952 we showed £60,060 cash at bankers, less £50,032 overdrafts, against £154,157 net overdrafts twelve months earlier. This was an improvement in total of £164,185.

SOUTH AFRICAN FACTORY

Changes in demand, similar to those in this country, were encountered by South African Gossard (Pty), Limited, with the result that while its turnover and profits for the year were still satisfactory they suffered a setback as compared with the wonderful results of the previous year. Since September, 1952, the position has again been rapidly improving in South Africa, and the problem has been to increase output. Production and sales and profits all reached record levels in

the first few months of 1953. As the South African factory is still comparatively young, and has been operating for only four years, the range of merchandise which it manufactures has been steadily widening. Last year, and again early this year, further ranges of new models (including Tru Balance)—not hitherto manufactured in South Africa—have been successfully introduced and have met with considerable success. I visited last autumn some fifty of our principal Rhodesian and South African customers, and was able to spend some weeks at our fine Cape Town factory discussing policy and products.

Our Swiss subsidiary continues to make headway, and has again increased its sales and profits. Immediate outlook is satisfactory.

OVERSEAS TRADE

Of our sales of foundation garments 30 per cent were export or overseas, and we estimate that one-third of the group profit was earned from such overseas trade.

Our children's outer-wear subsidiary, Harris and Parkin, Ltd., suffered from the heavy fall in the value of woollen piece-goods, and, as a result of stock depreciation, failed to make a profit. Its substantial dollar export trade again increased, and from orders so far received it appears that in 1953 this should be maintained. Our laundries made progress in a difficult year, sales of fully finished work in particular rising in recent months to the utmost limits of our capacity.

CONSOLIDATED ACCOUNTS

Turning to the group consolidated balance sheet, our current assets at £772,802 exceed our current liabilities at £291,189 by £481,613. We issued a further £50,000 Notes during the year at 84 and redeemed £6,500 at 81, a net increase of £43,500.

The consolidated profit and loss account

	1949	1950	1951	1952
	£	£	£	£
Issued ordinary capital	156,250	156,250	156,250	156,250
Trading profit (excluding minority interest)	97,503	179,089	197,101	153,419
Less:				
Depreciation	25,012	29,101	30,159	35,890
Unsecured note interest	6,797	6,698	8,775	10,602
Taxation	39,658	79,793	95,199	77,169
	71,467	115,592	134,133	123,661
Net profit available for dividends	26,035	63,497	62,968	29,758
Less:				
Preference dividend and redemption	5,950	5,862	5,640	5,578
	20,085	57,635	57,328	24,180
Percentage earned on Ord. shares	23.37	67.06	69.88	28.14
Percentage paid on Ord. shares	18.00	18.00	18.00	18.00

indicates that our trading profit declined by 25 per cent, but our net profit after deducting 25 per cent, but our net profit after deducting taxation (including a reserve of £8,000 for Excess Profits Levy) declined by 40 per cent.

Excess Profits Levy alone amounted to 5 per cent net on our ordinary capital.

We have recently completed negotiations for the acquisition of a majority interest in a German corsetry factory, and this, subject to the necessary consents of the British and German Governments, should enable us to enter successfully the important German market. We believe, as a result of the success already achieved by our exports to Germany, that there is a considerable future for our products there, and in particular for Silkskin and Tru Balance.

CALLS ON CASH RESOURCES

Although our group cash position is at present quite satisfactory, considerable calls are likely to be made on our resources over the next year or two. They include:

(1) At present we have virtually no finished stock and all orders are accepted for delivery in four to thirteen weeks according to model. We know that such a position cannot last and we must expect to have to carry at least a modicum of finished stock.

(2) We are steadily increasing our output capacity, and that involves finance for plant, machinery, raw materials and work in progress.

(3) We have certain new lines which we wish to launch at the earliest opportunity.

(4) Our German development, which we estimate may require £35,000 over the next year or 18 months.

The sales and profits of the group for the first four or five months of 1953 have been excellent and your directors hope, therefore, to be able in a year's time to present satisfactory results.

TABLE OF PROFITS

Last year I set out a table of our profits since 1948. Here it is brought up to date.

I cannot close without thanking my colleagues for their good work during the year and asking you to join with me in appreciation of the efforts of our executives and staff.

ALLIED IRONFOUNDERS LIMITED

CHANGED COMPLEXION OF TRADING

The twenty-fourth annual general meeting of Allied Ironfounders Limited, was held on July 23rd in London, Mr James Shaw (chairman and managing director) presiding.

The following is an extract from his circulated statement:

The group trading profit amounted to £1,484,338 (last year £2,077,989), and net profits before tax £1,364,495 (last year £1,801,377). Taxation absorbs £731,523 (last year £1,078,618), leaving available for reserves and dividends £632,972 (last year £722,759).

Your directors have placed £250,000 to the reserve for replacement of fixed assets. The dividends for the year require £267,505, leaving the balance of the year's profits, £115,467, to be added to the carry forward, which now becomes £668,569. Our capital and revenue reserves, including profit and loss balance, now exceed £6,800,000. Our current assets total nearly £5,600,000 against current liabilities of £1,105,856 and income tax due on January 1st next amounting to £614,642. Our financial position, which was already a strong one, has thus been further fortified during the year.

REVIEW OF THE YEAR

In my statement to you last year, and also in the notice announcing the interim dividend, I referred to the less favourable outlook our market was assuming. In the home trade materials and labour became more freely available, increased production made good depleted merchant stocks and orders declined to lower—and no doubt reflected more normal—trading levels. Restrictions on important export markets were reimposed and made a sudden gap in the production programme of some of our most efficient plants.

While good progress has been made in additions and improvements to plant, such increased efficiency could not wholly compensate for the recession in trade. Selling prices tended to decline, and we absorbed increases in wages and materials in sympathy with the national policy to check the upward trend of consumer prices.

I can assure you that this change in the complexion of our trading was not wholly unexpected, and much has been achieved in the course of the year in the efficient employment of all the assets of your company, promising steady progress in line with its past records.

After a brief review of the company's sectional activities, including rainwater and soil goods, baths, cooking and heating appliances, heavy cooking equipment and agricultural products, the statement continues:

Export: The problem of world markets is one to which we have given special attention in the course of the year. Officials of the company have visited many countries and secured useful business in dollar countries. We have established responsible contacts in other parts of the world which still hold promise as a market for our products.

As our interests are closely bound up with the homes of the people and the housing policy of the Government, we associate ourselves with any movement which suggests a change or development in the form of our products or which promises to open up fresh fields of demand. In this connection we have initiated what is now known as the "Stockton Test," which we suggest may make a useful contribution towards easing, if not solving, the national housing problem.

I am happy to say that the recession last year, which I have perhaps unduly stressed,

did not persist, and there was an improvement in the later months. This has been maintained in the first quarter of the present trading year, and apart from any unforeseen circumstances, we expect the resources of the company to be fully and profitably employed.

The report was adopted.

GOPENG CONSOLIDATED

MR DONALD W. THOMAS'S REVIEW

The fortieth annual general meeting of Gopeng Consolidated, Limited, was held on July 15th at the registered office, Redruth.

Mr Donald W. Thomas (chairman) presided.

The reports and accounts for the year ended September 30, 1952, having been circulated for the prescribed time, were taken as read, as was also the chairman's statement circulated with the reports and accounts, which was as follows:

Stockholders will note from a perusal of the directors' report that there have been changes in the directorate during the year under review and since. I must add a personal word of appreciation of the services rendered to this company by the late Mr Harry Rich with whom I had been associated on this board and in other spheres for many years—we do indeed miss his valuable contribution to our deliberations over the affairs of this company. In his place we welcome Major W. E. Hosking of whose worth we have had experience on the boards of other companies of this group.

I must also refer to the retirement of Mr Stanley Wickett from the chairmanship of the board. I greatly appreciate the honour my co-directors have done me in electing me to fill his place and am thankful that I shall have the benefit of his long experience and sound judgment to assist me in discharging the duties of my new office.

The gross profit for the year under review is £408,328 which is £66,577 less than the previous year.

NO RELIEF IN TAXATION

There was no relief in taxation during the year and it will be observed that British and Malayan taxation amounted to £258,808, in addition to which government royalty on ore sales was £92,367, a total of £351,175 to be provided before distribution of profits could be considered.

Some little relief will be given in the current year owing to the reduction in the standard rate of British income tax but the additional relief given by the abolition of excess profits levy will not be felt until the succeeding year.

Four dividends totalling £103,889 (net) were paid; general reserve has been increased, and the balance remaining on profit and loss appropriation account has been slightly increased to £52,779, which the directors propose to carry forward.

Since the close of the financial year under review the outputs of tin ore were:

October-December, 1952

3,130 piculs = 186½ tons.

January-March, 1953

2,520 piculs = 150 tons.

We are glad to be able to report that an award has been made for rehabilitation expenses of the mine and it is hoped shortly that awards will be made for the rubber estates in which this company has an interest. In any event considerably over £50,000 of expenditure on rehabilitation will have to be borne by the company.

We hope that next year's accounts will be the last in which these various entries will appear.

The attention of stockholders is drawn to the report of the general managers, Messrs Osborne and Chappel, particularly the comparative table of results of mining during the year.

The profit from Moynalpy and Sanglop Rubber Estates was about only one-fifth of that of the previous year, due to a substantial fall in the price of the commodity.

BETTER POSITION IN MALAYA

The 'security position in Malaya is certainly better than when the last report was issued but stockholders will remember that Sir Gerald Templer, the High Commissioner, not long since warned us against complacency either here or in Malaya.

Despite frequent reports to the contrary, I wish to draw particular attention to the amount of health and welfare services provided by this company and many others in the Colonies by private enterprise. Large sums are expended annually under such headings as Asian staff provident fund, insurance of Asian staff, pensioners, medical, security measures, and emergency regrouping.

We fully appreciate the loyal service of our general managers, their staff at the mine, and on the estates, and admire the courageous and efficient manner in which they carry out their duties in face of the dangers and difficulties they have to meet. We are happy again to have voted substantial special gratuities to them and we feel sure that the stockholders will heartily endorse this action.

The statement of accounts and balance sheet, together with the directors' report, were received and adopted.

THE TRUSTEES CORPORATION, LIMITED

The sixty-fifth annual general meeting of The Trustees Corporation, Limited, was held on July 22nd in London.

Mr L. A. Stride, the chairman, in the course of his speech, said:

The forecast I made last year that the revenue for the following year would remain buoyant has proved correct, and once again we are able to produce satisfactory results.

Our total revenue for the year at £438,534 shows an increase of £20,272 over last year.

There are signs already of increasing competition from Germany and Japan which industry in this country will have to meet, and it is indeed unfortunate that the trade unions should choose this time for putting forward claims for increased wages without at the same time promising any increase in productivity. It is to be hoped that sane counsels will prevail in these wage deliberations as increased costs may price us out of world markets, and this can only lead to a lowering of the standard of living in this country.

We recommend a final dividend of 13 per cent with a bonus of 2 per cent, both less income tax, on the ordinary stock (making a total of 22 per cent for the year) which takes £72,188.

If, as I earnestly hope, there is an improvement in international relations, I would expect a return of confidence and a resultant increase in world trade.

All in all, I find it extremely difficult to forecast what lies ahead during the coming year, but I hope that the results will not prove unsatisfactory.

The report was adopted.

THE BRITISH BANK OF THE MIDDLE EAST

BUSINESS WELL MAINTAINED

The sixty-fourth ordinary general meeting of The British Bank of the Middle East was held on July 21st in London, Mr R. V. Buxton, DSO, chairman, presiding.

The following are extracts from his statement:

Our financial year ended this year on March 31st instead of the customary March 20th. The reason for the selection of the latter date had been that it coincided with the end of the Persian financial year. Now that we have ceased business in Iran, it seemed more suitable to make the end of the bank's financial year coincide with the end of the month according to the Gregorian calendar.

At another meeting to follow this, you will be asked to approve certain changes in the capital structure of the bank to conform to the conditions of today. It has been a pleasure for your board to recommend that the final dividend be increased to 7 per cent, making 10 per cent per annum for the year instead of the 9 per cent which you have received for so many years.

STRONG POSITION

Our accounts continue to show a strong position. Cash and money at call at £17 million compare with £29 million a year ago, but investments, almost wholly in dated British Government securities, £10,700,000 compare with £6 million the previous year. Our deposits at £35 million show a decline on the figure of £45 million, but you will recall that in the chairman's statement last year, he forecast that the disappearance of our Iranian accounts would cause some reductions under this heading and this is what has come to pass, although other fortuitous circumstances not related to Iranian business, account for part of the reduction also.

Bills discounted, loans and advances at £9,900,000 show an increase of £700,000, and credits and guarantees on behalf of customers at £8,500,000, an increase of £1,200,000, both a sign that our volume of business is being well maintained. Fixed assets at £100,000 remain unchanged. The winding up of our business in Iran has continued throughout the year, and we now maintain only a few members of our Iranian staff in Teheran to conclude our affairs. All our properties in Iran have been sold.

DIFFICULT TRADING CONDITIONS

The headquarters of the overseas management of the bank, together with the chief inspector and his staff, have been transferred to London from Teheran where they were formerly stationed, and this change has now been in force for the past year. Modern facilities for travel by air make control from London, the head office of the bank, not only practicable, but even more efficient than control from a centre overseas. All our 19 branches can be reached within 24 hours' travel from London, most of them within half that time.

Trading conditions in all areas where we operate were more difficult last year than in the previous year. Markets in most commodities were falling and had the Middle East as a whole not been in receipt of increasing revenues from oil to offset the fall in prices of most agricultural products, the result might have been less satisfactory.

You will have observed that, for the first time since the bank was founded in 1889, Iran has not been mentioned. We withdrew the last member of our British staff in

December last. It is a matter of regret to us that our long period of co-operation in the development of that country should have come to an end.

CAPITAL REORGANISATION

At a subsequent extraordinary general meeting resolutions were unanimously passed to the effect that the consent of HM Treasury having been received, the reserve liability attached to the existing shares be cancelled, any future issues to be free of reserve liability. Furthermore, it was decided that the existing fully paid £10 shares be divided into ten shares of £1 each fully paid. By capitalisation of reserves 500,000 new shares of £1 each fully paid were created for distribution to shareholders in the ratio of five new £1 shares for each £10 share held on July 20, 1953, the capital of the bank thus being raised to £1,500,000.

The proceedings terminated with a vote of thanks to the chairman, directors and staff at home and abroad.

The report and accounts were adopted.

F. H. LLOYD & CO.

SATISFACTORY PROGRESS

DENATIONALISATION OF IRON AND STEEL

MR F. N. LLOYD'S VIEWS

The sixty-sixth annual general meeting of F. H. Lloyd & Company, Limited, was held on July 17th at the registered office of the company, James Bridge Steel Works, near Wednesbury, Mr F. N. Lloyd, chairman and managing director, presiding.

The secretary (Mr E. Allison) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended March 31, 1953:

Ladies and gentlemen,—Although a lower net profit is shown by these accounts, I think that, on the whole, we can report that the company has made satisfactory progress.

After providing for depreciation, £104,504, and taxation, £541,469, the net profit for the year, as shown in the consolidated profit and loss account, is £260,489, to which is added £3,270 adjustments relating to the previous year. An appropriation of £25,000 has been made as a provision for doubtful debts on debtors now totalling over £1 million.

ALLOCATIONS

During the year, interim dividends were paid of 2½ per cent, less tax, on the 5 per cent cumulative preference shares and 5 per cent, less tax, on the ordinary shares. We are now recommending an increase in the fixed assets replacement reserve of £74,500, making the total reserve £400,000 and an allocation of £67,000 to general reserve, which will then stand at £550,000.

We also recommend the payment of final dividends on the share capital of 2½ per cent, less tax, on the cumulative preference shares, and 12½ per cent, less tax, on the ordinary shares, which, in total, will absorb £44,825. The balance on the consolidated appropriation account to be carried forward to next year is increased to £98,730, compared with £65,851.

LARGER OUTPUT AND PROFIT

The increase in our trading profit from £717,318 to £803,127 is a result of an increased volume of output, as selling prices

have remained constant, in spite of increases in labour and material costs outside our control. Unfortunately, by the end of the year, the cumulative effect of these increases was so great as to make an adjustment in selling prices essential.

That we had, until then, been able to stabilise our prices without detrimental effects on trading profits has been due to the beneficial effect of the improvements to our plant effected in recent years. Unfortunately, this year we have felt for the first time the full effect of the excess profits levy, which has more than nullified our achievement.

The amount of tax which your company has to pay on its earnings this year makes it virtually impossible to retain sufficient profit to finance essential development and pay a reasonable dividend to shareholders. Your board therefore decided to raise additional capital, and the issue of new ordinary shares was successfully completed after the end of the financial year.

PLANT MODERNISATION

Continued expenditure on plant modernisation must be incurred if we are to make our contribution to the increase in production of engineering goods, which is rightly demanded of industry by the present Government.

We have had to effect considerable reorganisation of production programmes, owing to modifications to defence requirements, and difficulties of firms supplying export markets which use our products. It is a measure of the flexibility of our organisation that it has, to a large extent, managed to take these changes in its stride. Moreover, we serve such a wide variety of trades that, so far, we have been able to keep our plant working at full capacity. The policy of diversifying our production has enabled us to maintain a stable level of operation, which is so essential for efficiency, and we can be thankful that we have been able to avoid excessive specialisation, with its accompanying dangers of erratic fluctuations in demand.

DENATIONALISATION DANGERS

You will doubtless have noticed that the Government, in bringing in its legislation for the denationalisation of the iron and steel industry, has also brought the iron and steel foundries under the general supervision of the board which it has set up to control and supervise the denationalised industry. While no reasonable person would wish to quarrel with the general objectives and principles with which the board is charged, there nevertheless remains a danger that we, along with other firms in the steel foundry industry, may begin to suffer some of the evils of centralised control, as a result of the general responsibility for the supervision of our industry with which the Iron and Steel Board is charged. We believe that, with good will on all sides, these dangers can be avoided, and your company certainly intends to do its best to see that the Government's bold attempt to enlist the full co-operation of all parties meets with the success which it undoubtedly deserves.

Before concluding, I must, once more, record a tribute to the work done by all our employees, who have continued to do everything in their power to further the company's progress, and would like particularly to mention those who work long hours to keep essential processes operating day and night throughout the year.

The report and accounts were adopted; the proposed dividends were approved; the retiring director, Mr H. P. R. Scott, was re-elected, and the directors having been authorised to fix the remuneration of the auditors, Messrs Agar Bates Neal and Company, the proceedings terminated.

THE BRITISH EMPIRE TRUST COMPANY

(Trustees, Registrars, Secretaries,
Transfer Agents, Industrial Financing)

LARGER PROFIT

The fifty-first annual general meeting of The British Empire Trust Company Limited, was held on July 20th in London, Mr E. Ronald Crammond, the chairman, presiding.

The chairman, in the course of his speech, said: The market or estimated value of the investments held by the group at April 30, 1953, namely, £1,877,426, exceeded their book value by £255,693. This shows some improvement on the appreciation of £220,860 at the close of the previous year and may be considered satisfactory, bearing in mind that during the year net profits of £19,801 were also realised on investments sold.

A NEW CANADIAN COMPANY

We intend to form an associated company in Canada. For many years, prior to his death in 1947, Mr A. J. Mitchell, a director of your company, represented us through his company in Toronto as agent. Owing to the virtual impossibility of expanding financing business in Canada at that time, the appointment of another resident representative did not seem justified.

The very welcome progressive easing of restrictions under the present Government enables us to take a much more hopeful view of doing an increasing business in Canada, and we accordingly made an application to the Bank of England—which they recently granted, authorising us to convert our funds up to the extent of \$1 million (Canadian) for the purpose of forming an associated company in Canada. This matter is being pursued and a further announcement will be made.

The profit and loss account shows an increase in every item of revenue and some increase in expenses. The amount received under double taxation relief during the year has been shown as an addition to our income from investments. This procedure has been adopted to include our income from investments abroad on the same basis as income from the United Kingdom, which is shown before deduction of United Kingdom taxation.

The net profit for the year, after expenses but before taxation, amounted to £138,316, being £33,183 more than the corresponding figure for the previous year.

Your directors recommend that the available sum, after deducting the dividend on the 5 per cent Preference stock, should be appropriated in transferring £7,500 to provision for staff pensions and paying dividends at the rate of 12 per cent on the Employees' stock, 9 per cent on the Preferred Ordinary stock and 13.05 per cent on the Deferred Ordinary stock.

SERVICE TO PUBLIC COMPANIES

We recently had the pleasure of acting as agents for the Crown Zellerbach Corporation in making a share exchange offer to the United Kingdom shareholders of the Canadian Western Lumber Company, Limited. A very satisfactory response was secured; the offer has been consummated and we look forward to an extension of our relations with the Crown Zellerbach Corporation as transfer agents in London.

We are making every effort to extend our activities as transfer agents and also in undertaking other useful services in London for Canadian companies. I am sure that we

can perform a valuable function for such Canadian companies who are not already represented here.

I would like to remind you as stockholders of the Trust that we are in business to serve you and your friends in every way, especially in carrying out any of our special services which are shown at the head of the print of my remarks. I would particularly ask those who are directors of public companies to consider carefully the advantages of entrusting their share registers and transfer work to us as professional registrars. We have the facilities and long experience for carrying out this work.

The first year of the second half-century of the Trust has ended with satisfactory results and, while we naturally hope to improve on this as time goes on, it must not be forgotten that the world is beset at the present time with many political uncertainties. The development of a new Canadian organisation cannot be expected to produce immediate results. However, in spite of these factors I hope that we shall be able to put before you a satisfactory report in respect of the year to April 30, 1954.

The report and accounts were adopted.

HENRY HOPE AND SONS, LIMITED

INCREASED DIVIDEND

The fifty-fifth annual general meeting of Henry Hope and Sons, Limited, was held on July 22nd at Smethwick, Mr Michael Hope, chairman and joint managing director, presiding.

The following are extracts from his statement circulated with the report and accounts for the year to March 28, 1953, after he had paid a tribute to the late chairman, Mr H. Donald Hope.

Revaluation.—The fixed assets of the parent company are now shown in our balance sheet at the 1951 valuation, less depreciation.

Dividend Policy.—We believe that the interests of the ordinary shareholders are better served by putting back a generous proportion of the profits into fixed assets than by lavish dividends and bonuses. At the same time we realise that the value of money is far less now than it was before the war.

Wages and salaries are about two and a half times what they were in 1938, while our principal raw material—rolled steel—is over three times. The selling price of standard metal windows is still barely twice the prewar price, while our shareholders have had to be content with the same old 10 per cent dividend, or when prospects seemed a little brighter, an increase of a quarter, making 12½ per cent in all. This year your directors feel justified in recommending a dividend of 17½ per cent and a special Coronation year bonus of 5 per cent on the ordinary stock. This represents only 1.06 per cent on the total capital employed in your business.

Hot-Dip Galvanised Windows.—We have maintained the policy of galvanising the whole of our steel window output, and we believe that this has contributed to strengthen the position of your company in the trade.

Export.—We continue to cultivate the export trade in all parts of the world. Your principal subsidiary in the United States—Hope's Windows Inc.—has had another successful year and has contributed a substantial proportion of the net profits by its dividend which, of course, is paid in dollars.

Hope's Heating and Engineering Limited.—Hope's Heating and Engineering have also had a satisfactory year.

The report and accounts were adopted.

ARTHUR BALFOUR AND COMPANY

LORD RIVERDALE ON TRADING CONDITIONS

The fifty-fourth annual general meeting of Arthur Balfour and Company, Limited, was held on July 15th in Sheffield, The Hon Robert Arthur Balfour, JP (managing director), presiding in the absence, owing to indisposition, of the chairman, The Rt Hon The Lord Riverdale of Sheffield, GBE, LLD.

The following are extracts from the chairman's circulated statement:

There is a marked difference in the figures presented this year compared with those of the record year 1951. That year, you will recollect, was exceptional, not only in the high level of trading actually reached but also in the fact that substantial windfall profits were earned due to the rise in prices. We are now returning to more normal conditions and while there has been a severe reduction on the previous year, the profits of the group, before taxation, of £436,536, cannot be considered as unsatisfactory.

A fall in values of alloys in particular was accompanied by some slackening of demand in this country, quite apart from many difficulties in export trade, due to currency regulations and import restrictions in overseas markets.

I referred last year to the burden which it was anticipated would be placed upon the company's resources by the level of taxation. In the overall result over 50 per cent of our net profit is absorbed by taxes.

The cash position having improved recently, the board, after careful consideration, feel justified in spite of the fall in profits, in recommending the same total distribution as last year, namely 20 per cent, made up as follows: interim dividend 6 per cent (already paid); final dividend 10 per cent; bonus dividend 4 per cent. We propose to place to general reserve the sum of £75,000 and £50,000 to stock and contingencies reserve. The carry forward then becomes £140,722, which compares with £137,613 in 1951.

The main subsidiary company at home has contributed satisfactorily at a higher rate than last year. Subsidiary companies overseas, feeling the effect of restrictions and more difficult trading conditions, have earned considerably less profit than in the previous year.

I cannot stress too highly the serious consequences to our earning power and our competitive position in the world's markets if the new and substantial wage claims recently advanced were to become effective.

CURRENT YEAR

Turning now to the current year: in the early months some departments were producing well under capacity, and this has continued to some extent. The present general level of activity is considered reasonably satisfactory in the circumstances. Improvements have been felt in some sections recently.

There have been encouraging results and a useful contribution from energetic exploration of other markets and some of the restrictions on exports have eased.

Looking forward, it must be appreciated that competition is becoming tougher both at home and overseas. We do, however, hope for more stability in the price of raw materials and an improvement in the general level of activity: with this there is quiet confidence that not only shall we obtain our share of available trade, but that we shall be able to maintain a scale of performance which can show a satisfactory result.

The report and accounts were adopted.

SALTS (SALTAIRE) LIMITED (Worsted Spinners and Manufacturers)

CENTENARY DISTRIBUTION OF CAPITAL PROFIT

The thirtieth annual general meeting of Salts (Saltaire) Limited, was held on July 22nd, at the registered office of the company, Saltaire, Yorkshire.

Sir Frank B. Sanderson, Bart (the chairman), in the course of his speech said: This year we meet in very happy and quite exceptional circumstances, for the Coronation of our gracious Queen Elizabeth II has taken place during the year of our centenary.

The accounts show that the year under review has seen a welcome recovery from the conditions prevailing at March 31, 1952, when wool values and machinery activities throughout the industry were at their lowest level.

TRADING RESULTS

Profit on trading of the group, after charging depreciation of fixed assets £84,753, auditors' remuneration £2,315 and completing forward purchase contracts outstanding at March 31, 1952, amounts to £756,697 compared with £422,676 for the previous year.

The net profit is £340,889, and the board recommend a final dividend of 3½ per cent on the 7 per cent non-cumulative preference shares, which will make 7 per cent for the year, a dividend on the preferred ordinary shares of 1s. 3d. per share, and a dividend on the ordinary shares of 6d. per share.

Deducting the appropriations and dividends from the profit available for distribution, there remains a balance of £231,496, which it is proposed to carry forward.

At March 31, 1952, there was a surplus on disposal of fixed assets amounting to £17,738, which has been increased during the year by £44,961, making a total of £62,699.

I have already made reference to the fact that 1953 is the hundredth anniversary of Saltaire, and the board recommends a centenary distribution of capital profit for the year to March 31, 1953, of 2d. per share on the preferred ordinary shares and 2d. per share on the ordinary shares, which is equivalent to 16½ per cent. This distribution amounts to £58,333 and leaves a surplus on disposal of fixed assets at March 31, 1953, of £4,366.

It is gratifying to note a growing appreciation of the heavy burden of taxation which industry is called upon to bear, which has serious financial reactions not always immediately apparent.

The steps taken by the Government should be regarded as only a beginning—there is a considerable leeway, in the reduction of taxation, to be made up, and it is hoped that successive Budgets will lighten what is an intolerable burden.

The board are fully aware of the urgent necessity for the expansion of our country's exports and the vital contribution this industry must make. Your directors and senior executives personally visit many of our overseas markets and notwithstanding the restrictions which apply in many foreign countries our efforts have resulted in a gratifying increase in our export trade.

FUTURE PROSPECTS

Since June of last year there has been a marked improvement in the demand for our goods, and this improvement has continued, enabling a return to normal running of our machinery. The flow of orders continues which I am happy to state will ensure continuity of production for many months.

The report and accounts were adopted.

WALKER CAIN LIMITED A SUCCESSFUL YEAR'S TRADING

The thirty-first ordinary annual general meeting of Walker Cain Limited was held on July 16th in London.

The Rt Hon Lord Brocket (the chairman), in the course of his speech, said: It is again gratifying for your board to be in a position to submit accounts which I am sure you will consider very satisfactory. They reflect a year of successful trading during which time our output has been well maintained. The increased cost of malt which I mentioned last year was operative for the greater part of the year covered by the accounts. Moreover, the latter part of our financial year was slightly less propitious by reason of a mild recession which, quite naturally, followed the general trend of industry in the areas we cover. It is, however, encouraging to note that a more optimistic feeling now prevails in the textile trade as a whole and I am hoping that the energetic steps being taken by those engaged in this important Lancashire industry will help to restore its share of the world's markets.

Our net profit at £563,534 shows an increase of £25,503, and we have an available balance of £1,132,750. After payment of dividends and allocation to reserves the balance forward to next year is £562,870. We have a very strong financial position with net current assets of upwards of £3,500,000 and when suitable opportunities occur we shall use these funds to extend our field of operations. Your directors recommend a final dividend of 15 per cent, which with the interim of 5 per cent, gives a total of 20 per cent for the year.

The report was adopted.

HENDERSON'S TRANSVAAL ESTATES

The forty-first annual general meeting of Henderson's Transvaal Estates, Limited, was held on July 15th in London.

Sir Joseph Ball, KBE (chairman and managing director), presided and, in the course of his speech, said: With the net profit, after taxation, up by some £2,000 at £46,704, your directors recommend, for the seventh successive year, the payment of a dividend at the rate of 15 per cent, which leaves the carry forward at £57,246.

The company's South African coal interests are held through its subsidiary—Tweefontein United Collieries Limited. The accounts of that company show a profit on coal amounting to £168,000, as compared with £129,000. This substantial increase in profit was attributable partly to increased sales arising from improved transport facilities during the latter half of 1952, and partly to an increase in the inland price of coal which became effective as from June 27, 1952. While the total net profit for the year, before taxation, was up by some £42,000, a substantial proportion of this increased revenue was absorbed by increased taxation. Dividends on the ordinary shares for the year amounted to 10 per cent, as compared with 15 per cent, the reduction in dividend being considered desirable for the purpose of conserving the company's cash resources in order to provide the necessary finance for the development of the reserves now being undertaken.

White's South African Portland Cement Company Limited enjoyed another successful year. We have every reason to be satisfied with our substantial holding of its shares.

The report was adopted.

TELEPHONE MANUFACTURING COMPANY

The twenty-third annual general meeting of Telephone Manufacturing Company Limited was held on July 20th in London, Mr Fred. T. Jackson, OBE, Comptree (chairman and managing director), presiding.

The following are extracts from his circulated statement:

Turnover for 1952 reached a high level, although the proportion represented by direct exports dropped to 26 per cent from 31 per cent for 1951.

We are maintaining our efforts in the export markets and we hope it will now not be long before the Australian Post Office will be free to place orders in this country again. We find shortage of currency and fierce competition by foreign manufacturers our greatest difficulties overseas.

Our Canadian branch is making progress and has been invited by the Canadian Department of Defence Production to tender on two projects of some magnitude.

The continued restrictions imposed by the Treasury on the expansion of the telephone service in this country is causing us increasing concern. As competition in the export markets becomes keener, so it becomes even more important that the activities of the industry overseas should be soundly based on a satisfactory home market.

As to the prospects for the current year, output should be maintained at its present high level for the greater part of the year, but I should like to see more orders for delivery during the last three months.

The report was adopted and the dividend of 10 per cent was approved.

WILLIAM HANCOCK AND COMPANY

The sixty-sixth annual general meeting of William Hancock and Company Limited was held on July 23rd in Cardiff, Col J. Gerald Gaskell, CB, TD, DL (chairman and managing director), presiding.

The following is an extract from his circulated statement: The net profit for this year has increased from last year's figure of £79,774 to £87,799, and the directors recommend an increase in the dividend of 1 per cent up to a figure of 15 per cent.

The improvement in profit has been derived from all departments. Sales of beer for the year show a slight increase over the previous year and this can be considered satisfactory in the light of competition as the previous year also showed an increase over the year before. For the year in question there was a considerable increase in the cost of malt and that has affected the accounts for most of the period. The wine and spirit department and mineral water department each show a satisfactory increase, the latter you may think of particular importance in the light of the trend amongst some of the larger brewery companies to encourage the sale of non-alcoholic American and Canadian drinks. Our company fortunately has been interested in the mineral water side of our business for a very long time and we can say now that that department is firmly established. I think that the increase in the trading profit from £314,000 to £329,404 can be regarded as satisfactory.

During the postwar years we have spent large sums on improvements to licensed premises to bring them up to modern requirements. I think our licensed houses set a very high standard.

The report was adopted.

LONSDALE INVESTMENT TRUST

DIVIDEND RAISED TO 11 PER CENT

The sixth annual general meeting of the Lonsdale Investment Trust, Limited, was held on July 22nd at 22, Old Broad Street, London, E.C.4., Mr T. L. McC. Lonsdale, chairman of the company, presiding.

The following is the chairman's statement circulated with the report and accounts for the year to February 28, 1953:

The revenue received by the Trust from its general investments in its first year, five years ago, was sufficient, after deduction of all management expenses and of the preference dividend on the present basis, to pay slightly under 6 per cent on the ordinary stock. Since then the comparable income from the Trust's general investment has substantially increased and in the year now under review was sufficient to pay slightly over 8 per cent on the ordinary stock.

The balance required to meet the proposed ordinary dividend has been obtained from the dividend payable to the Trust by its wholly-owned subsidiary, Robert Benson, Lonsdale & Company, Limited. Five years ago the combined net earnings after tax of the Trust and Robert Benson, Lonsdale & Company, Limited, applicable to the ordinary stock, were £80,450. Last year the equivalent earnings of the group were £132,624.

ACCUMULATED REVENUE

Since the amalgamation with Robert Benson, Lonsdale & Company, Limited, in 1947, the undistributed revenue of the Trust has accumulated to £85,225, while revenue retained in Robert Benson, Lonsdale & Company, Limited, during the same period amounted to £157,885.

In view of the more variable nature of the business of Robert Benson, Lonsdale & Company, Limited, the dividend from that company has, since 1947, been restricted to 7½ per cent in order to strengthen its reserves. As a result of this conservative policy, the board of that company have now felt justified in increasing the dividend to 10 per cent and the Trust's net revenue available for the ordinary stock is therefore some £12,700 larger at £94,523. In view of this, your directors have recommended an increase in the final dividend of 1 per cent, making a total of 11 per cent for the year, taking £69,615.

Turning to the balance sheet of the Trust, we have been advised that as the result of a recent legal decision, the capital reserves of the Trust should be divided by the transfer to a share premium account of part of the premium which arose on the issue of

shares in 1947. This amounted to £677,353, and the transfer has been given effect to in the balance sheet. Certain subsequent deductions from the accounts as set up are stated in full on this occasion so as to regularise the position with a record in detail.

A CANADIAN COMPANY FORMED

In the current year the activities of Robert Benson, Lonsdale & Company, Limited, have been well maintained. In March an opportunity arose of re-establishing the close financial relationship with Canada which the company had enjoyed for many years before the war. Permission was obtained from the Treasury to sponsor the formation of a company whose object is to take part in the medium and long-term development of Canada both in connection with established Canadian companies and with established companies in this country who may require finance with a view to opening up in Canada.

The company, United North Atlantic Securities, Limited, has an issued share capital of \$2,500,000, of which \$1 million was subscribed by ourselves. Messrs N. M. Rothschild & Sons, Limited, and a number of investment trust companies, most of the balance being subscribed by Canadian and American friends.

Your directors feel that the connection we have re-established is a valuable one as Canada is undoubtedly a country of immense resources and one which should have an assured future.

The report and accounts were unanimously adopted.

DENNISTOWN RUBBER ESTATES, LIMITED

MR J. L. MILNE'S REVIEW

The twentieth annual general meeting of Dennistown Rubber Estates, Limited, was held on July 14th in London, Mr J. L. Milne (the chairman) presiding.

The following is an extract from his circulated review for the year 1952:

The average Spot London Price for first quality sheet rubber last year was just over 2s. 4½d. per lb, whereas in the previous twelve months it was almost 4s. 3d. per lb. This fall seriously affected our sale proceeds and was mainly responsible for the reduction in our profit, before taxation, from £130,470 to £43,457.

Taxation required an allocation of £26,750 and out of the sum remaining a dividend of 10 per cent was paid on May 7th last. No further payment will be made in respect of

the year ended December 31, 1952.

The sum of £1,777, being a part of the amount paid to the Malayan Government as replanting cess, has been refunded and credited to replanting account. This account now stands at £30,374. Much of this sum will be required to bring our replanted and new planted areas to maturity.

Crops have been very disappointing, particularly on Kim Seng Estate. As from the beginning of 1953 a lighter system of tapping has been introduced and this, in time, should have beneficial results.

Estimates for 1953 have been compiled on the assumption that some 1,390,000 lb will be harvested. The crop obtained for the five months to May amounts to 450,000 lb.

The report and accounts were adopted.

ELLAMS DUPLICATOR

The annual general meeting of this company was held on July 16th in London, Mr Frederick Ellam, chairman, presiding.

The following is an extract from his circulated statement:

The report and accounts for the year ending December 31, 1952, show a sharp fall in profit. The causes are those which your board foresaw at that time, namely, the difficulties in exporting to our important overseas markets, a general falling off in trade, and a fall in the cost of raw materials.

As far as import restrictions are concerned there has been little your board could do, but in the markets available the most strenuous efforts of the sales organisation have succeeded to some extent in softening the blow. With regard to the fall in the cost of raw materials, here we have suffered a very considerable depreciation in the value of materials in stock and on order.

Last year the general and stock reserves were increased by £25,000 each, and in spite of the difficulties it has not been necessary to encroach upon these reserves, it has been considered advisable to increase both whilst maintaining the dividend.

In the opinion of your board the year ended 1951 was an exceptional trading period, and the results for 1950 are really more indicative of the steady expansion that is their aim, and the endeavour during the current year is directed to equalling or exceeding those figures, but whether this target will be reached it is not possible to forecast at the present time, for although there are slight signs of improvement, trading conditions are still very difficult.

The report was adopted and the proposed final dividend of 2½d. net per share on the ordinary shares, making 4d. per share (33½ per cent) for the year, was approved.

AUSTRALIA AND NEW ZEALAND

Improved business prospects—
get there first in
a Pan American Clipper!

With the prospect of improved trading with Australia and New Zealand, now is the time to get out there quickly to present your proposition.

Your time is valuable—so you'll be interested in Pan American's 3½-day 'clipper' service—the fastest there is.

You fly via the U.S.A. This PAA way there are fewer documentation and health requirements, and there are liberal stopover facilities. So if you also have business in an American city en route, kill two birds with one stone. Or, if you can spare the time, spend a day or two beside the surf on a Pacific Island!

Meals, cigarettes and bar service are complimentary on Pan American first-class flights. Berths and Sleepette* service with fully reclining seats are available over the Atlantic, free over the Pacific. Services to both Australia and New Zealand.

Consult your Travel Agent, or Pan American, 193/4 Piccadilly, London, W.1 (Telephone REGent 7292) and at Prestwick Airport, Ayrshire (Telephone Prestwick 7272 ext. 402).

Tan-Sad
on every floor

A tall story? No. It is a fact that well known organisations are equipping their premises—literally from basement to roof—with Tan-Sad chairs. They realise gains in health and efficiency through correct posture. Let us show these benefits to your organisation. Write or phone for full details to:—

THE TAN-SAD CHAIR CO. (1931) LIMITED
AVERY HOUSE, CLERKENWELL GREEN, E.C.1
TELEPHONE: CLERKENWELL 3192/3

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS; PATENT EXAMINER AND PATENT OFFICER CLASSES. The Civil Service Commissioners invite applications for permanent and pensionable appointments to be filled by competitive interview during 1953. Interviews will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1953, may eventually be announced. The Scientific posts are in various Government Departments and cover a wide range of scientific research and development in most of the major fields of fundamental and applied science; in Biology the number of vacancies is small. The Patent posts are in the Patent Office (Board of Trade), Admiralty and Ministry of Supply. Candidates must have obtained a university degree with first or second-class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification; or for Scientific posts, possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer and Patent posts taking their degrees in 1953 may be admitted to compete before the result of their degree examination is known. Age Limits: Senior Scientific Officers, between 26 and 31; for Scientific Officers and Patent Classes, between 21 and 28 during 1953 (up to 31 for permanent members of the Experimental Officer class competing as Scientific Officers). London Salary Scales: Senior Scientific Officers—(men) £812-£1,022; (women) £681-£917; Scientific

Officers—(men) £440-£707; (women) £440-£576; Patent Examiner and Patent Officer Classes—(men) £440-£655; (women) £440-£576. Somewhat lower rates in the provinces. Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. S.53/53 for Senior Scientific Officers and S.52/53, S.128/53 for the other posts. **BRITISH ELECTRICITY AUTHORITY** wish to appoint a **PRINCIPAL ASSISTANT** in the **FINANCE BRANCH** at their Headquarters in London. Applicants should preferably possess a recognised accountancy qualification or a degree in economics or commerce and should have had a wide experience of electricity supply finance and accounts. In particular the post calls for knowledge of budgetary control and ability to prepare concise and lucid reports on financial matters. Salary (N.J.C. Grade 8) £905-£1,010 inclusive. Letters of application, stating age, present salary, qualifications and experience, to D. Moffat, Director of Establishments, Winsley Street, London, W.1. Closing date August 4, 1953. Please quote AE/396. **THE WORKING MEN'S COLLEGE**, which provides evening classes in adult education, requires a non-resident male Assistant Secretary. Starting salary £450 to £600, according to qualifications. Candidates must have experience of office routine and be prepared to take part in the general life of the College. Particulars and application forms may be obtained from the Secretary, Working Men's College, Crowndale Road, London, N.W.1.

THE BANK THAT CONDUCTS THE LARGEST BANKING BUSINESS IN NEW ZEALAND

Since its establishment nearly 100 years ago, the Bank of New Zealand has kept pace with the country's development. Information supplied by over 300 Branches and Agencies provides current data on all aspects of commerce and industry, which is freely available to all with present or protected interests in the Dominion.

You are invited to contact the London Office or the Head Office.

Your
electric shave
luxury...

An electric shave is a dry shave, so use Imperial Leather After Shave Lotion before instead of after shaving. Your shave will be cleaner than you ever thought possible.

Large size 3/2, Junior 1/10. From all good shops.

Imperial Leather toilet luxuries also include Shaving Sticks, After Shave Talc, solid and liquid Brilliantines and the famous toilet soap.

Cussons IMPERIAL LEATHER Toilet Luxuries

The Power Barrier? It stands between death and life. On one side, dry water courses, starvation, the sad, gaunt bones of the desert; on the other, irrigation, miles of waving green crops, food... happiness, and hope. It is *power* that brings life to a land and its people. At this very moment in India, *power*—diesel and electrical power—is bringing life-giving water from a thousand wells to the dry acres of the great Ganges Plain. Diesel generating sets made by THE BRUSH GROUP are power stations in miniature, and operate sixty electrical pumps. Each pump draws water through a steel well from hundreds of feet below the parched Indian soil.

BRUSH through the Power Barrier

Throughout the world THE BRUSH GROUP exports the engines and the plant that burst through the power barrier—bringing green lands in place of yellow sands, plenty in place of hunger...

THE BRUSH GROUP

Manufacturers of diesel engines and electrical equipment for agricultural, traction, industrial and marine purposes.

End of a War

NO jubilation was reported from any capital of the world when the truce was finally signed in Korea. There was only a dull and wary relief that at last one of history's most unpleasant and most futile wars had come to a halt; and perhaps to an end. To say that it was futile does not, of course, mean that it should not have been fought. Wars never do good; but they sometimes prevent greater harm being done; and for all its sordid indecisiveness the war in Korea clearly meets that test. The harm that would have been done if the aggression on a member of the United Nations had not been resisted is beyond calculation, and though complete victory would have shed a greater lustre on the sacrifices that have been made, those who made them can still be sure that they were not made in vain. The pass was not sold.

As the armies rest, the diplomats confront a task of equal difficulty. Any illusions there may have been that the political conference which is to follow upon the truce would be an easy one must have been removed by Mr Dulles's press conference on Tuesday. The Secretary of State, announcing that he would fly to Korea on Sunday to discuss future policies with President Syngman Rhee, strongly rejected suggestions that there should be any substantial concessions by the United Nations. Least of all would America barter Korean unity for Communist China's membership of the United Nations. The statement has indeed been made, without denial, that Washington has promised Mr Rhee to walk out of the political conference if it does not make satisfactory progress in ninety days from its start.

Those who are already denouncing this attitude on Mr Dulles's part should first stop to reflect on the position in which he finds himself. In his own country, he is attacked from an angle exactly opposite to that of his critics in Europe. As a despatch from Washington points out on another page, the Truman Administration could not possibly have concluded an armistice on these terms, and though a Republican Secretary of State has a little more freedom to manoeuvre, he cannot wholly ignore the views of so many members of his party. Even if this were not so, he would be very silly to put all his cards on the table. After all, the fact that a truce has been secured at all is a vindication of the patient firmness that the Americans have shown (under both Administrations), and a continuance of the same attitude provides the best hope of a successful—or at least an acceptable—outcome to the political conference. To judge by the speeches that have been made in Parliament this week, the Labour party thinks that the right way to approach a bargaining match with oriental Communists is to tell them in advance that their main demand will be conceded. Whether this attitude derives from a carefully thought out new policy as yet unrevealed, or from the usual muddle-headed emotionalism, or merely from a desire to do the Government down at any cost to the public interest, no one can say. The one certain thing is that it could not possibly suit the Kremlin's book better.

Neither the composition nor the agenda of the proposed conference is in the least clear. Those who want to see it achieve results will want to keep it as restricted as possible in both respects. But this will hardly be possible, at least so far as composition is concerned. The truce negotiations were, formally, a two-party affair, between North Korea and the United States, representing the United Nations. But on the Communist side, a conference will have little reality unless the Russians are directly represented, and none at all unless the Chinese Communists are there. And on the side of the United Nations, it is highly unlikely that the nations will be content to leave the Americans in sole control. Every country that contributed a contingent to the fighting will want to be present, and could hardly be excluded. Neither Australia nor Canada will be content to leave the representation of the Commonwealth to the United Kingdom. India, as custodian of the prisoners, will have to be there. Nor can Japan, in reason, be denied a place, though any suggestion to send an invitation to Tokyo is likely to meet with strong opposition from the other side. But if all these attend the conference as plenipotentiaries, progress can hardly be expected to be either smooth or rapid. This puzzle will presumably have to be solved by the General Assembly of the United Nations, which meets on August 17th.

★

Besides the composition of the conference, the agenda is still quite uncertain. Will it or will it not range beyond the shores of Korea? Will it include the problems of Communist China's seat at the United Nations, the status of Chiang Kai-shek's regime on Formosa, and even the war in Indo-China? Is it to be a discussion confined to the specific issues of Korea or an attempt to use the truce atmosphere for bringing about a general Far Eastern settlement? No one seems to be willing to say in public what he thinks. Mr Dulles, when asked the other day, replied refreshingly: I don't know. But surely the facts are compelling. The first and only object of the present conference must be to deal with Korea. Put at its simplest, nations such as Turkey or Colombia which have a right, and will assert their claim, to be consulted about a Korean political settlement, by no means necessarily all have the same right to be heard on such subjects as Formosa and Indo-China. They may have fought in Korea as members of the United Nations' team, but they will not have to bear the same consequences as the major powers for decisions taken about other parts of the Far East. The composition of a conference to deal with the latter should be quite different from one to deal with the former. If negotiations over Korea go well, they should be followed up by another conference with a wider agenda. If they do not, it is a waste of breath to suggest talking about the Far East as a whole.

The truth of this proposition was generally recognised both in the Commonwealth and in the United States when the truce talks first opened at Kaesong two

years ago. But events have since blurred its outline, just as they have sown fresh uncertainty into the question of what to do about Korea itself. The United Nations have been fighting in theory for the conception of a united Korea; no one, at any rate outside the Communist capitals, intended in 1945 that Korea should be permanently divided. With the recent implacable Communist opposition in the north, however, it had come to be thought that some form of partition was the only workable solution—until Mr Syngman Rhee made it clear during the past few weeks that, whatever the north might want or do, the south itself would not accept a permanent division. Hence, if the allies are going to discuss the future of Korea, it is now clear, as Mr Dulles has recognised, that they must go into the conference committed to unity. Yet this in itself presents a problem. For it implies that, since the actual union of north and south does not at present look like being feasible, some formula may have to be found which, while accepting union in principle, still does not make peace dependent on its being put into practice immediately—whatever Mr Syngman Rhee may say.

Thus the first item on the agenda provides infinite opportunity for stonewalling, if that is what the Communists want to do. But do they? Is it entirely unreasonable to suppose that, having decided to give up the attempt to conquer South Korea by force, they will want to complete the political side of that decision on satisfactory terms? The armistice arrangements represent the filing down of a great mass of disagreement into the smooth and polished pages of the present compromise. Study of their contents shows that the negotiations protracted though they were, did accomplish a great deal: both sides moved from their original incompatible positions towards a genuine compromise. It would be wrong, in spite of the reservations that so readily suggest themselves, to assume in advance that the same process cannot be applied to the political negotiations. But if, in the end, it is to produce the same result, two conditions are inescapable. The first is that the negotiators for the United Nations will have to possess great patience; the second is that they will have to show united firmness. If the first admonition is chiefly addressed to American public opinion, it is the second that should be taken to heart in Britain.

Canada's Time to Change?

ON August 10th a new Federal Parliament will be elected in Canada. This election occurs at a time when the free world must expect to take an increasing interest in Canadian politics; that is one of the surest consequences of Canada's economic expansion and of its growing importance in diplomacy. But if this pleases the pride of Canadians, it will also expose them to some irritating misconceptions. The outside world too readily regards Canadian politics as a mixture of British and American. They show, for example, some of the regional differentiations of the United States, with Quebec providing a parallel to the "solid south." On the other hand, parallels with Britain are as easy to find—although, in a struggle in which Liberals and Conservatives are the major parties and Socialists little more than a splinter group, the parallels may sometimes seem to be with nineteenth century Britain.

That, however, should show the inadequacy of such comparisons for a country that belongs so distinctively to the twentieth century, not only in technology but also in thought, as does postwar Canada. Most of the parallels, with Britain or with the United States, are more dangerous than helpful. If French Canada is quite as loyally Liberal as the southern States are Democrat, that is the incidental result of racial and religious complications which are utterly different as causes. Nor are Liberals and Conservatives in Canada closely identifiable with their British namesakes at any stage in history. Least of all does the Social Credit party in Canada stand in the place in the political firmament that its inflationary monetary theory would suggest; in all other respects it is a party of the extreme Right.

But while the drawing of parallels is dangerous, one is, in 1953, irresistible. In Canada, as in the United States, the more conservative party was in office when the world of the twenties was dashed to pieces by the Great Depression. At the next election it was, naturally, thrown out—the Republicans in the United States in 1932, the Canadian Conservatives in 1935—and its opponents gained the opportunity to rule through two decades of recovery, victorious war and unprecedented postwar prosperity. The Canadian Liberals, like the American Democrats, acquired with this experience a changed political philosophy. They became more internationalist in outlook, they embraced many social security measures, they turned to Keynesianism in economic policy; in short they became, more clearly than before, the party of the Left—the Left, that is, in North American terms, which still allows its adherents to look askance at the socialism they claim to find in the British Conservative party. And as they moved to the Left, and the boom went on, the Liberals became more and more the popular party, until in 1949 they scored one of the most resounding victories in the history of parliamentary politics, giving them nearly three-quarters of the seats in the House of Commons. But that was in 1949, when electors were still sur-

prised and grateful to have a job and to live in an expanding economy. The past four years have brought higher prices and taxes heavy enough for resentment. The Canadian Conservatives are certainly not without hope. The Liberals have done badly at by-elections and have suffered heavy defeats in provincial general elections, stretching across the country from New Brunswick to British Columbia. But the indications are not all one way—the Liberal Government of Manitoba won a general election comfortably last month—and they are in any event of doubtful account. In a provincial election Canadians are deciding different issues; there is, probably, even less relation between the voting in provincial and federal elections than there is between county council and parliamentary elections in Britain.

★

In stating the case for a change the Canadian Conservatives suffer, compared with the Republicans south of the border, from three disadvantages. First, their leader, Mr Drew, is a somewhat lesser figure than Mr Eisenhower. Secondly, their previous experience of office is effectively more remote than was that of the Republicans. The unfortunate administration of 1930-35 was the only substantial interlude in the ascendancy that Mackenzie King established by refashioning the Liberal party after the first world war. It is hardly an exaggeration to say that modern government, in the age since 1918, has as yet meant in Canada only Liberal government. The Canadian Conservatives have more ground to make up, in experience as well as in seats, than often falls to the lot of a major party.

Their third handicap, compared with the Republicans in the United States, is that the Liberals are a harder target than the Democrats. The impression of good government that Canada gives to the outside world is not exactly reflected inside, where the standards of what is practicable may be higher. Some cases of extravagance and maladministration can be demonstrated, and one at least has done the Government appreciable political damage. But there can be no gainsaying the fact that the great expansion in the machinery of Federal government during the past fifteen years has been achieved in Canada without the confusion and corruption that in the United States became a charge against the Democrats. It may be, of course, that this reflects the vigilance of the parliamentary Opposition in Ottawa as much as the honesty and competence of the Government. But whether fairly or unfairly, the result is that the Conservatives are unable in this election to make much headway with charges of maladministration.

The Conservatives are therefore fighting chiefly on the field of taxation, which they promise to reduce by \$500 million—more than a tenth of the total federal revenue. The means of doing so are open, to say the

least, to argument. At the same time, the Conservatives propose to institute national health insurance and to embark on increased expenditure in various directions. Their programme, indeed, reflects the inevitable difficulties of opposition in a country where one party has managed to establish itself so broadly across the centre of politics. Despite, for example, their leftward movement in welfare legislation, the Liberals have firmly maintained disinflationary financial policies that in Britain would be dubbed reactionary. The Conservatives have accordingly found at times little room for manoeuvre on the right of the Liberals and have stepped out of character to advocate policies—notably an extensive use of physical controls during the 1951 inflation of prices—that might have been expected to come from the left wing. Partly for this reason, business opinion is far less closely linked with the Conservatives than it is with the Republicans in the United States. Indeed, in an expanding economy the Canadian Government's liberal policies for foreign trade have been widely welcomed not only on the Prairies but also in the traditionally protectionist industrial areas of Ontario.

★

The battle between Liberals and Conservatives is being fought from Newfoundland to Manitoba. In the three western provinces, the Liberals may well lose some seats, but the gainers are likely to be the two minor parties. The CCF (Co-operative Commonwealth Federation) is a socialist party, doctrinally close to the British Labour Party, which gained power in 1944 in Saskatchewan—the centre of agrarian distress in the thirties—but remains unlikely, in this election at least, to win over the industrial proletariat. The most interesting plank in the CCF election platform is provided by its extreme position on one of the more emotional issues of Canadian politics—how far to lean towards either the British or the American connection. The CCF would cut down Canada's need for American dollars by discriminatory import restrictions and would expand trade with Britain by accepting sterling in payment. Not even Mr Coldwell, the party's very able leader, can make this a policy that will appeal to many Canadians, except those who export wheat.

Social Credit is also a party of agrarian discontent, but it came to provincial office in Alberta as long ago as 1935, had no power to practise its monetary theories, soon found a boom on its hands, and settled down to sound administration with a strongly free-enterprise, anti-socialist bent. Its Bible-class revivalism is linked with an authoritarian tone in political philosophy and its monetary heresies, in so far as they survive even in theory, find expression in a certain anti-semitic emotion rather than in any other common political doctrine. Social Credit recently captured the provincial government of British Columbia, and may now win some federal seats there, but it was checked in Manitoba and its hopes of becoming a national party are in suspense.

Its immediate importance is that, if the Liberals and Conservatives were to come back to Ottawa in approximately equal numbers, the Social Credit group would probably choose to ally itself with the Conservatives.

Such a result depends on the Conservatives' ability to win back the seats in their traditional stronghold of Ontario that fell to the Liberals in 1949. In Quebec they may gain some seats, but against them is not only the provinces' traditional Liberalism but also the popularity of the French-speaking Prime Minister, Mr St Laurent, who combines great abilities with a capacity for inspiring affectionate confidence that makes the nickname "Uncle Louis" far more than a publicist's brainwave. In Manitoba and the Maritime provinces, also, various historical and local circumstances set close limits to the likely Conservative gains. It is only in Ontario, and perhaps only in the south-west of that province, that the Conservatives can look with any confidence for the landslide of 1949 in reverse. The Liberals, indeed, will be entitled to feel some surprise if the time for a change, which the electors in the United States decreed after twenty years, comes in Canada after eighteen.

Free Trade in Cabs

A fortnight ago we hinted our misgivings of the New Cab Law, though we did not like to run full tilt against the public voice, and denounce an Act which met almost universal approbation. Our misgivings have been realised. London was astonished on Wednesday to find itself totally deprived of the convenience of cabs. The cab-owners struck; they refused to carry on their trade under the new regulations; and gentlemen hastening to keep appointments—parties coming from or going to railways—a great number of the softer sex and of children—were exposed to vexatious delays and cruel disappointment. . . . It is not very often that we find ourselves agreeing in opinion with Sir Robert Inglis, but when he said on Wednesday that by this Bill . . . a rate of price has been affixed to a given scale of goods, and that this is contrary to all the principles of political economy, we cordially echo his opinion. We will add that it is contrary to justice, and that, if persevered in, it is likely to be about as dangerous a measure as ever the Legislature sets its hand to. Let the Act be disguised as it may . . . it was passed exclusively in the interest and on the representations of the hirers of cabs, and at their request it fixes a maximum on the charge at which they may command the services of others. They are to ride in cabs, not for a fair and reasonable remuneration, only to be determined, like all other bargains, by the higgling of the market, or the mutual contracts of buyer and seller, but for a sum settled at their instance, without hearing the cabmen, by the Legislature. . . . It is true that such a principle is not now acted on for the first time in relation to hackney carriages. But this is the first time it has been acted on since the Corn Laws were abolished, and since unrestricted competition, the higgling of the market, has been declared throughout the land to be the only principle on which buying and selling can be fairly carried on.

Guardians of the Straits

THE Turks are evidently determined not to be led astray by the air of studied courtesy and moderation that pervaded the Soviet note to Ankara of May 30th. In their reply, delivered two weeks ago, they are equally polite, moderate and reasonable; but the rebuff to the Russian advances is plain enough. They note "with satisfaction" that Russia has renounced all territorial claims to Turkey; and to the Soviet Government's declaration that, after reconsidering the matter, it now considers that the Straits question could be settled on conditions acceptable to both Turkey and Russia, they return a pointed reminder that the control of the Straits is regulated by the Montreux Convention. The gratuitous Soviet complaint about this week's visits of American and British naval forces to Istanbul, must make the Turks feel that their frigidly correct attitude was right; for the Montreux Convention specifically permits courtesy visits and places no limitation on the size of the visiting forces.

It would, however, have been surprising if the Turks had not been included in the present widespread distribution of Soviet attentions. Turkey controls the entrance to, and exit from, the Black Sea on which lie Russia's only warm-water ports; quite apart, therefore, from considerations of cold war, the Soviet Government is bound to watch developments in Turkey with the closest attention. In the last five years, it has seen the Turks throw their former cautious isolation to the winds and become active members of the North Atlantic Treaty Organisation. Turkey has received about \$1,000 million in American aid for military and economic development; Nato air fields are being built on Turkish soil within easy reach of the Donbas; and its relations with Greece and Yugoslavia have been improved to such an extent that a full-scale military alliance may not be far off. In the nineteenth century, the Russians were deeply disturbed lest the weakness and disintegration of the Ottoman empire should cause the Straits to fall into the hands of one of the Great Powers. Now, in the mid-twentieth century, the Turks are indisputably masters in their own house, and vigilant guardians of the Straits. But from the Russian point of view they have made too many undesirable friends; the developments of the last few years must arouse in the rulers of Russia much the same sort of suspicions as were felt by their Czarist predecessors.

The Russians may now regret their hectoring and hostile attitude towards the Turks in the immediate

postwar years; it can only have helped to push the Turks into the western camp. In particular they may now regret the decision in 1946 to revive the claims of Georgia and Armenia to the Turkish provinces of Kars, Artvin and Ardahan. Lenin had renounced Soviet claims to these predominantly Moslem districts, in return for a Turkish withdrawal from Batumi, in the Treaty of Moscow in March, 1921. Armenian and Georgian claims were revived in 1946 on the grounds that Russia had negotiated this treaty more or less under duress, and also on highly dubious ethnic and historical grounds. Now, the two Soviet republics have unconditionally abandoned their claims. To the last the fiction is maintained that Georgia and Armenia have minds and wills of their own; but it is a useful fiction since it allows Moscow to pose as the benevolent go-between between Turkey and the two republics and

to retrieve a tactical error with the minimum loss of face. But to the Turks, who have never acknowledged the revived Georgian and Armenian claims, the Russians have merely stopped something which they should never have begun in the first place.

If the Russian statement on the Straits' question means that they have given up their claim of 1946 to have fortified bases along the Dardanelles, then here too the Turks will say that

they are merely abandoning claims that they should never have made in the first place. But it is not even plain that the Russians have gone as far as this; all that emerges clearly is that they are dissatisfied with the present arrangements for controlling the Straits. Yet when the final draft of the Montreux Convention was signed in July, 1936, it contained some important concessions to the Russian point of view. No limitations were placed on the number and tonnage of the warships that a Black Sea power could send through the Straits into the Mediterranean; the only limit was on the number and tonnage of warships passing through the Straits at any one time. Thus the Montreux Convention places no limit on the size or nature of the fleet that Russia could, if it wished, build up in the Mediterranean in time of peace. On the other hand, there is a strict limitation on the naval forces that non-Black Sea powers can send into the Black Sea in peacetime. From this restriction it follows that Turkey's membership of Nato does not mean that Admiral Mountbatten can send as many Nato warships as he likes into the Black Sea and there hold large-scale naval manoeuvres.

This is the position in time of peace, and from a Soviet point of view it clearly could be much worse. But to the Russians the regulations governing the passage of warships in time of war must leave much to be desired. If Turkey is neutral, the peacetime regulations apply, except in the case of belligerent warships which, save in certain special circumstances, are not allowed to sail through the Straits. But if Turkey is a belligerent, the passage of warships is left, under Article 20 of the Convention, "entirely to the discretion of the Turkish Government." And under Article 21, Turkey is given the right to put Article 20 into effect, if it believes itself to be "threatened with imminent danger of war." In 1936, when Turkey was likely to be neutral, or at any rate not actively hostile to Russia, in any future war, this may have seemed satisfactory enough to the Russians. But in 1953, it is quite a different matter. Even if Turkey should not be actively engaged in any east-west conflict, it can still allow an unlimited number of Nato warships to sail through into the Black Sea, on the grounds that it feels itself to be seriously threatened.

This is the contingency which must seriously worry

the Russians. Yet Malenkov and Molotov must surely realise that in the present international temper they are unlikely to get any revision of the Montreux Convention more favourable to themselves. The extremely conciliatory offers of revision made by the western powers in 1946—and then churlishly rejected by Moscow—can hardly stand today. But the Russians have not yet made any specific request for a revision of the Convention. Their principal aim, it seems, has been to draw the Turks out of the western camp by suggesting to them that it might be to their profit to do a deal with Moscow over the Straits. The Turks, however, have made it clear that they have no intention of getting involved in a *tête-à-tête* with their big neighbour. Whether, after this rebuff, the Russians will think it worthwhile to pursue the matter to the extent of asking for a revision of the Convention, remains to be seen. If they do, and if they are prepared, as the Turks insist, to admit the Americans to the conference table, then the West can be fairly certain that their aim will be not so much to score a point in the diplomatic game as to draw attention to what they consider to be their vital interests.

Guide Books

BY A CORRESPONDENT

TRAVEL literature is as old as the art of writing; but guide books—the utilitarian species within the genus—go back only a couple of centuries or so. The frontier of the species is not perhaps quite self-evident; but for the present purposes it can be drawn to include only books you actually take with you on your holiday and to leave out the ones that you read at home in the course of making up your mind where to go or give as Christmas presents to your relatives after you have returned in the hope of exciting their envy. To be a guide book, a book must take you literally by the hand.

The great classical figure in the guide-book world is, of course, Karl Baedeker, closely followed for the English-speaking world by the Muirhead family. Both designed their guides on the same general plan. They take the traveller on a succession of itineraries or routes (which, in the old days used to follow the railways, though the postwar "Blue Guides" have switched to the roads). Everything—be it hotels, post offices, restaurants, cab fares, excursions, historical notes, beauty spots, museums or galleries—comes in its exact geographical position. And the detail is inexorable (the new "Blue Guide" to Northern Italy has, to take a single example at random, a list seven pages long of the treasures of the Uffizi).

The labour and the care that are put into the classical guide book are both astonishing. But is it what the tourist of today wants? In the nineteenth century, the traveller may have had infinite leisure and the determination to leave nothing unseen or untried. Very few

of his kind survive today. The typical tourist now travels by car (which is difficult to park in towns); he is always short of time (because he always attempts too much) and usually short of money. He wants his information pre-digested and he wants it in a hurry. He can use the classical guide-book only as a quarry, and for this (in spite of the attention paid to indexes) it is not well designed. It is at its best when carried through a gallery with a finger keeping the place, at its worst when the need is to discover, before the traffic light changes, whether to turn left or right. But the other extreme, the directory type of book, which is a mere list of hotels and garages with a street plan, equally has its limitations. It can tell you where to mend a tyre, but not where to refresh the spirit; and it is the latter that is the more important for a good holiday.

Between these two extremes, any number of people have struggled for years to find the ideal formula for the new-style motor tourist. Let us take the case of Spain and illustrate it in the light of a selection of the recent publications alone. As it happens, there is not an up-to-date Baedeker or Blue Guide for Spain, whose recent rise in popularity as a tourist resort may perhaps have been too rapid for the necessarily lengthy process of compilation of such detailed guides. Their place is partly taken by a local publication, "The Tourist Guide Book of Spain," but it tends to suffer from their fault of indigestibility without the saving grace of their admirable organisation. Moreover, it breaks what ought to be the Golden Rule for all guide-book compilers:

THE ECONOMIST, AUGUST 1, 1953

Never accept hotel advertisements if you want your readers to trust your recommendations. At the other extreme is Mr Cedric Salter's "Introducing Spain." Indeed, it would be outside the category of guide books altogether, for most of it is a subjective, personal travelogue, if it were not for six preliminary chapters with headings such as "Language, Clothes and General Behaviour," "Hotels" and "Spanish Food and Wine." These contain more helpful information than can readily be memorised or copied out; the book would probably find its way into the suitcase. Then there is the Spanish volume of the series (of Dutch origin) that calls itself "Fodor's Modern Guides," and has obviously made an effort to deserve the title. This volume contains eight chapters of practical information, followed by two-score descriptive chapters by different authors, which naturally differ in style, in thoroughness and (a partial sampling would suggest) in reliability. But on the whole one has to conclude that this gallant attempt to provide a "modern guide" falls between two stools. For descriptive writing one would turn to the many travelogues (and leave them at home) and for reliable detailed information to the admirable new Michelin guide.

★

The name of Michelin leads to what, in the present writer's opinion, is the only completely satisfactory solution of the motor tourist's problem. This is the "Service de Tourisme," provided by the Michelin tyre firm for its native country. The lucky traveller in France has, firstly, the series of Michelin road maps, very cheap, beautifully printed and crammed with information (the only addition one can suggest is contour colouring). Then secondly there is the famous red "Guide Michelin" revised each year. Basically, this is a list of hotels and restaurants—but compiled with such scrupulous discrimination as to raise it into an entirely different class. One of Michelin's famous stars is an unfailing indication of a good meal, three stars of a gourmet's paradise. Moreover, Michelin gives lists of quiet hotels, of particularly well situated hotels and the like. And there are hundreds of town plans of admirable clarity. Then, thirdly, there are the slim, green regional guides, which tell the tourist where to go and what to see—again with the help of scores and scores of maps, large and small. The secrets of Michelin's success would seem to be the ingenuity that has been devoted to all matters of lay-out and printing; the separation of descriptive from reference matter (so that the latter can be up to date and complete without encumbering the former); and, above all, the courage to express discriminating opinions and state orders of merit, whether it be of natural beauties or of the delights of the table.

It is this element of discrimination that is so woefully lacking in the usual guide books. In Germany, a re-birth of the Baedeker firm is beginning

to put out, in conjunction with the German Shell company, a series of regional guides obviously based on the Michelin regional volumes. But in other countries, and particularly in Britain, if the tourist wants similarly discriminating assistance, he will have difficulty in finding it. The gap waiting to be filled by some ambitious publisher is not very difficult to define. Suppose you have an American friend coming to this country, who wants to hire a car and see within two weeks some of the best British scenery. You want to be able to put a book into his hands that will tell him which districts are really worth seeing and which are not worth bothering about, and that will lay his journey out for him in a practical way. It is not enough to assume that he already knows where he wants to go and then give him information impartially about Wigan and Windermere—nor should it be assumed that everybody has the same amount of time to spend. If such a book exists, it has not found its way into the hands of this correspondent.

Secondly, you will want to give your visitor some means of distinguishing the hotel that is pleasant to stay in from the one that is a licensed robbery. The motor associations long ago gave up the struggle to discriminate, and their system of stars nowadays indicates nothing beyond relative size and expensiveness (though it is only fair to say that some hotels are dropped from the list completely—the fourth largest city in Scotland is a total blank in the current issue). There are two volumes, reprinted annually, which attempt to list only the better hotels, Mr W. G. McMinnies's "Signpost" and Mr Ashley Courtenay's "Let's Halt Awhile." These are useful books. But they suffer from the difficulty that, if they were restricted to really excellent hotels, they would be slim volumes indeed and, therefore, though they list no poor houses, a certain skill in reading between the lines is necessary to distinguish the good from the merely fair.

The official tourist agency, the British Travel and Holiday Association, would get into the most dreadful hot water if it attempted to say that one village is prettier than another, one hotel more comfortable than its neighbour, one restaurant less addicted to baked beans than its competitor. Being official, it has to be impartial. But is there no private organisation that would like to reap in Britain some of the goodwill that scores of thousands of travellers in France gratefully attach to the name of Michelin?

Notes of the Week

Lord Salisbury's Refutation

IN the House of Lords on Wednesday the Acting Foreign Secretary was able to quote his absent Prime Minister as saying of the recent Washington conference that "in the circumstances we had got the best results possible." That is to say, the American attitude excluded a meeting with Malenkov but not talks on Germany with Molotov. Lord Salisbury was, if anything, too modest in defending his achievement at Washington; for it is the impression of others who were there that Sir Winston would have secured from President Eisenhower fewer concessions to the British point of view than Lord Salisbury secured from Mr Dulles. It is a fact of life, not to be disregarded in the conduct of British policy, that the tremendous respect in which the Prime Minister is held by political leaders in the United States and Western Europe is not unmixed with a certain suspicion of his diplomatic intuition.

Lord Salisbury also addressed to some of his critics in the House of Commons a well-deserved rebuke. "It really is no use," he said, "people in Parliament or outside behaving as if we had no allies or at any rate no need to pay the slightest attention to them." People are taking time to grasp that the first task of diplomacy at the moment is not so much to reach agreement with the Russians as to keep together the Atlantic alliance so that it can negotiate from a firm and common base. Characteristically the Bevanites in this country (and some Boothbyites) and the neutralists in France work with the China Lobby in the United States to make the alliance creak and groan.

Three Voices on Germany

FIRST Dr Adenauer in a letter to Mr Dulles, then President Eisenhower in a letter to the German Chancellor, and finally M. Bidault in a report to the foreign affairs committee of the French Assembly, have all thrown out new hints on the future of Germany in relation to the Soviet world. Nobody has mentioned by name the problems of the Oder-Neisse line (discussed in last week's issue of *The Economist*), but they lurk between the lines of the German and French pronouncements. Nobody has specifically said that the European Defence Community might become first and foremost a political and economic federation, with the rearmament of Germany only an element in it. But this idea, too, seems to be in the minds of Dr Adenauer and M. Bidault; and it will be pursued

at the meeting of the foreign ministers of the six countries in the coal-steel community to be held at Baden-Baden in the middle of this month.

Dr Adenauer's letter to Mr Dulles, written at the time of the Washington conference, has doubtless been made public at this moment because Christian-Democrat chances of winning the forthcoming elections are improved if he is regarded as a man who exerts pressure on America—not the other way about. In his letter Dr Adenauer threw out the vague suggestion that the whole EDC should be the point of departure for a security system which would meet the requirements of all European peoples, including the Russians. Speaking on the same subject at Dortmund last Sunday, the Chancellor suggested that the EDC should remove Russian fears of revived German militarism because of the safeguards it provides.

M. Bidault told the foreign affairs committee of the Assembly that no peace treaty would be imposed on the Germans; the treaty would be made with Germany, not against it. This sound doctrine is not welcome in France. It implies that the Germans will not be forced to recognise the Oder-Neisse frontier—or the Saar either—though they might, for the sake of regaining the Soviet Zone, agree under protest to the continued existence *de facto* of their present borders. M. Bidault seems to have had this possibility in mind when he said that it remained to be seen whether a reunited Germany that did not recognise its frontiers could be incorporated in the EDC. M. Bidault did not regard it as impossible that this might happen, and even that the Soviet Union might agree.

President Eisenhower, on the other hand, envisaged total victory after the establishment of the EDC. He forecast that the

growing contrast between west and eastern Germany, the latter with its bankrupt regime and impoverished economy, will in the long run create conditions which must make possible the liquidation of the present Communist dictatorship and Soviet occupation.

He also said he was sure that united Germany would not choose to disarm. It is a pity that President Eisenhower's advisers, having agreed that there should be talks with the Russians, should be so frightened of appeasement that they cannot use the language of reasonable negotiation. The result is a perpetual discord between Europe's tones and America's.

The Samovar Spirit

IT has been interesting to observe how many newspapers and how many politicians writing for them have been trying to persuade their readers that normality in inter-

national relations is just around the corner. Indeed, in the last few weeks a kind of samovar spirit has been created, an impression that a nice cup of tea and a game of poker between Sir Winston Churchill and the appropriate representative of the Kremlin would put most things right. It is possible, but unlikely that it would; but what is disturbing is that the samovar school of thinking should be ready to give up so many cards before the tea party and the game have even been arranged. One says that there is a new spirit abroad in Europe; another that all is fluid and that we must therefore review all our policies; another that the European Defence Community is dead as mutton; another that the Americans will pull out of Europe anyhow and should leave its inhabitants to go their own way.

So far as these statements have any truth at all they represent not freshness of thought or boldness of vision but a drifting back to familiar and normal things. The really new spirit in Europe is the one that is trying to form a new society of nations there, which would include the EDC and the coal-steel pool. The so-called fluidity is the fidgeting of uneasy Europeans in postures of alertness and determination that they want to give up before they can be certain that it is safe to do so. There has never been a majority opinion in Western Europe favouring either these projects or these postures: the creative spirit and the determination to prevent war shown in them have been the work of a few men backed by a minority of voters.

Those who now claim that plans for European institutions and an Atlantic community must be dropped from American and British foreign policy because Europe does not want them, are using an argument they might have used at any time in the last three years. It would be braver and more honest to say that they want to appease the Russians by ceasing to do the things that they want us not to do and by letting Europe drop back into apathy. But that would not read so well in the columns of the Sunday newspapers.

Welsh Mountains out of Molehills

MR BEVAN did his best last week to concoct a real party issue out of two minor aspects of unemployment benefit. Since the lapse of extended benefit was debated in the House of Commons on July 6th, the report of the National Insurance Advisory Committee on "the availability question" has been published [Cmd. 8894]. In this report the committee discusses the grant of unemployment benefit to persons who place abnormal restrictions on the type of work they will accept; and it recommends that benefit should be withheld from anyone who imposes such restrictions that he has no reasonable prospect of employment. This recommendation—made not by the Government but by an advisory committee—and the lapse of extended benefit were described by Mr Bevan as part of an organised attack on working-class standards of life and an inroad into the welfare state.

The hollowness of his argument and of that of the other Labour speakers in the debate is apparent from the history of the present scheme. In his report Lord Beveridge did, it is true, propose that unemployment benefit should be unlimited in duration—which is what Mr Bevan is now

apparently demanding. But Lord Beveridge coupled his proposal with much stricter conditions of attendance at a work centre or for training in a new employment than Mr Bevan would dare to accept on behalf of his constituents. In any case, both the Labour party and the Conservatives rejected the proposal and deliberately chose the present system. Under this a man's right to unemployment benefit depends on his registering himself as available for work, and the duration of his right is limited to seven months in the first instance—though if he has a good record of employment and therefore a good record of contributions his standard benefit can be increased by "added days." (The present Government has now increased the maximum number of "added days" so that the ordinary benefit period may be as long as nineteen months.) "Extended benefit" was a temporary measure of the Labour Government to protect those who, because of post-war industrial dislocation, might be unemployed long enough to exhaust their ordinary benefit, including any added days they might have earned.

Labour speakers last week and in the earlier debate justified their indignation at the end of extended benefit largely because of its effect on Welsh miners suffering from pneumoconiosis who cannot go back to the mines and who cannot find suitable alternative employment in their districts. But if the country is to make extra provision for these men—who, under the industrial injuries scheme, are already far more generously provided for than comparable sufferers from tuberculosis—a permanent *ad hoc* scheme should be drawn up. Hitherto the Labour party has never, officially and openly, suggested that unemployment benefit should be used to supplement provision for the disabled or to freeze a person in a particular job in a particular locality. Yet, under the leadership of Mr Bevan, that is the impression Labour speakers gave last week—with the tacit support of Mr Griffiths, architect of the 1946 scheme. Or was the party determined, for once and at all costs, to show a united front?

Federation Achieved

THE last debates on the scheme for the federation of Central Africa have now taken place. The draft order-in-council embodying the scheme was passed in both Houses of Parliament this week; the order-in-council itself will be made shortly; and the appointment of Lord Llewellyn as the first Governor-General will then be officially announced. Thus the interim administration will probably be in force by the beginning of September, and the permanent provisions of the constitution at a date to be announced by proclamation of the Governor-General. The first federal elections and the meeting of the first federal assembly are expected to take place in the new year.

That is the timetable. But the speeches in the last debates were concerned with far more important things. Mr Lyttelton, in a thoughtful and persuasive speech, dealt at length with what Mr Griffiths has called the Africans' four fears: fears of losing their protectorate status; fears of the eventual amalgamation of the three territories; fears that their political advancement in the northern territories would be halted; and fears for their land. On all these

matters Mr Lyttelton pointed to constitutional safeguards. In the matter of political advancement, indeed, reassurance has already been provided by the appointment of another African to Nyasaland's legislative council, and talks on Northern Rhodesia's constitution, to allow additional African representation in that territory's legislature, are to begin in September. In the economic sphere, too, negotiations have begun between one group of copper mining companies and the European trade union on the difficult but far-reaching question of industrial advancement for the African.

Neither the conciliatory and moderate speeches made by the leaders of both parties in both Houses during these last debates, nor the tentative beginnings of partnership that are discernible, can be relied on to turn the Africans' opposition to federation into willingness to give it a fair trial. The scheme—as Lord Altrincham remarked, one of the most interesting constitutional experiments the Commonwealth has yet seen—is being launched against the same background of sullen African hostility that has overshadowed all the two-year discussions. The initiative has now passed from Westminster to Salisbury and Lusaka—and to the European leaders in the two capitals. It is squarely on their shoulders that the responsibility now lies for establishing the new federation in an atmosphere of mutual tolerance.

Traffic and Safety

THE debate on road policy in the House of Commons on Tuesday served to emphasise what is often ignored: the extent to which the apparently identical problems of traffic congestion and traffic accidents are in fact separate—and amenable to different treatment. The easing of the traffic congestion which is, in Mr Callaghan's words, "strangling" London, Manchester and other large cities in a knot drawn tighter every year, ideally demands an ambitious replanning of traffic arteries. It also involves, therefore, a disturbance of local amenities of which the protests aroused by the Great West Road scheme two years ago give an ominous forecast. And its cost, once the raising of road standards over the whole country is taken into account, will be comparable with that of last century's railway development. The time may not be nearly as far off as it seems when a beginning can be made with such a programme. Certainly everything should be got into readiness for it.

It is, however, clear that the attack on accident rates can be mounted—and indeed ought to be mounted—from quite a different direction. The experience of America and of Germany, both of which have spent far more lavishly on their roads than has this country and neither of which has to contend with a comparable traffic density, shows that whatever else *autobahnen* and turnpikes may accomplish they do not prevent traffic accidents. The upward trend in both countries is the same as it is here, and the rate per vehicle mile is considerably worse. This is not to deny that money must be spent on the roads in order to save lives. But for that purpose the need is for traffic lights, roundabouts, guard rails and cats' eyes, for doing away with proven dangerous blind spots, for the construction of

occasional local by-passes, and the like, rather than for major construction.

Analysis of the causes of accidents needs to be taken a good deal further, but the House of Commons recognised that many of them lie quite outside the scope of road improvements. They lie in the behaviour of road users and the state of their vehicles. Probably the biggest single step which could be taken towards the improvement of both would be to bring the police force up to strength. The mere sight of a uniform has a wonderfully sobering effect on the reckless, the mannerless, and the merely casual; and the power to carry out on-the-spot checks of brakes, steering and roadworthiness generally would, if widely used, eliminate many wheeled menaces which no road improvement would make innocuous.

Reforming the French Parliament

IF it is true, as some observers assert, that Frenchmen are constitutionally incapable of having a stable government, part of the blame has lain with the present Constitution. This left the Fourth Republic with a weak executive and a cabinet system operating by the grace of a disunited and often irresponsible National Assembly. The system of checks and balances has been carried to such a point that governments, instead of finding equilibrium, have had to choose between demise and immobility. Nearly everyone has been calling for reform, but the contrivers of the Constitution put countless obstacles in the way of amendment. A parliamentary study of various proposals began early in 1951; last week the National Assembly adopted, by an impressive margin, on a first reading, a Constitutional Reform Bill designed to strengthen the position of the prime minister and cabinet.

Its most important provision would do away with the system of "double investiture," allowing a premier-designate to form his cabinet and then face the Assembly in a single trial of strength instead of having to present himself and his cabinet on separate occasions. Secondly, the Bill reverts to the practice of the Third Republic in stating that a majority

of the deputies voting, and not of the total number of deputies, is sufficient to elect a Prime Minister. This would help make life less easy for those deputies who have toppled governments over by merely abstaining. Unfortunately, the Bill fails to provide for the same method of counting votes in the case of votes of confidence or votes of censure. This means that the interregna between cabinets would be shorter, but it does not mean that cabinets could be overthrown any less frequently.

The Bill also seeks to strengthen the position of the Senate by providing that a bill, within a hundred days of being sent to the upper house for the first time by the Assembly, may be referred back an unlimited number of times instead of only once. This gives the Senate far less than its pre-war veto, but it means that its amendments will get a more careful hearing. The new Bill also fires two shots at the Communists: it abandons the system whereby vice-presidents and other officers of the National Assembly must be chosen by proportional representation, and thereby weakens the position of the Communists on key commissions. Secondly, parliamentary immunity of deputies will now be limited to the period in which parliament is actually in session.

This Bill is essentially a weak compromise arrived at by the National Assembly in the face of mounting public criticism. It proposes the method of dissolving an ungovernable parliament, so that successive cabinets will remain at the mercy of political whims and cabals, with deputies more intent on keeping their jobs than on risking a decision by the electorate.

Release of Naumann

THE release of Naumann and Bornemann by the Karlsruhe constitutional court this week cannot be criticised on the grounds of pure justice. The two men have been in detention for many months, pending examination of the evidence, without sufficient reasons having been found for bringing a charge against them. This is in accordance with German law, which provides for "examination arrest"; but even in Germany there is a limit to the time that detained men should stay in prison. From the point of view of British justice, the affair has been confused and dubious from the start, as the dispute over Naumann's right to apply for a writ of *habeas corpus* showed. Even after the British washed their hands of the Naumann group by handing them over to the Germans, the affair continued to be full of complications. Its legal aspect again became doubtful when much of the material, including Naumann's diary, leaked out to the press a few months ago. The British papers did not touch it, as they considered the case *sub judice*, and in Germany itself, only the very boldly anti-Nazi *Frankfurter Rundschau* and the trade union organs gave extensive publicity to it. As Naumann may still, in theory, be charged it seems as if the restraint of the British press may have to be observed indefinitely. Some valuable evidence about German nationalism will therefore remain buried.

It cannot be said that the effect on German political parties of the original British arrests has come up to

expectations. The first shock woke up the leaders to the danger of infiltration, but the desire to win the votes of former Nazis in the coming elections and fears of party splits have prevented any effective reforms. Indeed, the groups that were most exposed to the influence of Naumann and his friends have remained unscathed and are putting up candidates in important seats.

The value of the British move has, therefore, largely been lost. It is to be hoped that other means will be found to show up the essential fact about the danger from former Nazis: this is not that they are wild men who want to overthrow the present regime and set up a replica of the Hitlerite state, but that they are unrepentant nationalists who will try to use rearmament and American aid for reviving Germany's might.

Decision on Gatwick

LIKE sewage farms, gasworks, asylums, and other necessities of civilisation, airports are understandably unpopular neighbours; but like these they have to be sited somewhere, and their choice of site is very narrowly circumscribed by terrain and local climate. The Government's White Paper on London's airports, published last week, gives convincing reasons why the inhabitants of Gatwick and of the new town of Crawley, rather than anyone else, should endure the afflictions made necessary by the growth of London's air traffic.

Over the five years from 1947 to 1952 that traffic increased by nearly 60 per cent, and it seems likely to double its volume within the next decade. For the safe and efficient service on which London's status as an air centre depends—and with it, in the air age, an essential ingredient of national prosperity—reorganisation of the airport system is imperative. At present 90 per cent of London's air traffic passes through London Airport and Northolt. These are too close together to handle more traffic safely at peak periods; moreover when visibility is bad at London Airport it is bad at Northolt too. The first essential for an alternative is that its weather should be different from that of the main airport, so that the periods when both are crippled should be cut to a minimum. Other requirements are that it should have convenient and rapid access to London; that it should be near the main air routes converging on the capital (this means, effectively, a site to the south of London); that it should not complicate the air traffic control problems either of the main airport or of the RAF; and that it should disturb amenities and property as little as possible.

When all the possibilities within fifty miles of London had been examined Gatwick emerged as an unmistakable winner under all heads except, possibly, the last. Modifications of the original plan have reduced the disturbances, particularly the diversion of the main London-Brighton road; and, as the White Paper consolingly remarks, the very fact that Gatwick is an essential alternate or reserve ensures that it "will not be used intensively all the year round." The heavy initial cost (£6 million for the first stage of development) will be partly offset by the sale of Croydon and by an annual saving of some £450,000 on operating costs elsewhere; it will earn a certain amount in rents from

independent airline operators; and by cutting the costs of the air corporations and furthering the expansion of their traffic it will benefit the taxpayer, who now bears their deficits. The price of progress may be high, but it genuinely seems, in this instance, to have been kept as low as possible.

Workers in 1952

THE Ministry of Labour's annual report for 1952, published last week, sets out facts that are by now familiar. The working population in 1952 fell by 22,000 to 23,292,000. An increase in the number of male workers was more than offset by a fall in the number of women, mainly because some 27,000 left the textile industry during the recession.

Apart from an increase in the mining labour force of about 3½ per cent, the movement of workers did not follow the course that national priorities dictated. It was in accordance with the policy of disinflation that there should be a fall in consumer industries such as china and glass, paper and printing, and rubber. It was also a firmly stated intention that there should be reduction in the number employed by the central government. But it was not intended that there should be a fall also in transport and communications, or agriculture and fishing. And in spite of the defence programme, the labour force in the metals, engineering and vehicles group of industries remained about the same. Within that group there were, however, great differences. The aircraft and other defence industries gained workers. They did not gain as many as had been expected, in part because the defence programme was slowed down and in part because of the shortage of materials. At the same time, as both home and export markets became more difficult, employment fell and there was a good deal of short time in such industries as motor vehicles, textile machinery, tools and cutlery, hollow-ware, and certain electrical goods.

One sidelight brought out by the report is the difficulty of formal joint consultation, on which the present Minister of Labour has set great hopes of better human relations in industry and so of higher productivity. The report says that many committees were apparently functioning in a somewhat desultory fashion and some had ceased to function altogether. It adds, however, that this did not indicate a lack of progress because "more people in industry were talking about the value of informal consultation." There are examples of successful formal committees. But it has too often happened that the management has been unwilling (and not always for the wrong reasons) to discuss any real problems of policy with the workers and discussions have mainly been confined to minor questions of welfare. It often happens too that these are the questions that the workers' representatives are most ready and most competent to discuss. In industries where there is no tradition of joint consultation it may be better to encourage it informally on the shop floor between workers and their supervisors, rather than prematurely to set up a single formal committee which, by time-wasting discussion, may discredit a worthwhile attempt.

Mr Nehru in Karachi

IT is difficult not to be disappointed with what little has been allowed to leak out about the talks in Karachi last week-end between the Prime Ministers of Pakistan and India. This was the first time for several years that Mr Nehru had been to Karachi, the first formal and direct negotiation between him and the new Prime Minister of Pakistan, Mr Mahomed Ali, and the first occasion that Indo-Pakistani problems had been discussed on the spot at such a level since the critical days of the Bengal troubles in 1950. The setting was more favourable than anyone can remember at any previous meeting. There was no sense of crisis and no dominant problem demanding urgent solution; Mr Mahomed Ali's advent to power had changed the climate of official opinion in Pakistan; and both Prime Ministers had lately made cordial contact in London during the Coronation. And, as Mr Nehru said, the extraordinary friendliness shown by the people of Karachi towards himself had moved him deeply. Yet it appears that almost nothing tangible has come of the meeting; indeed, Mr Mahomed Ali has been unable to conceal his disappointment.

It is true that the Prime Ministers have parted on excellent terms and that they are expected to resume their discussions in Delhi in September. But the range of their talks and the inclusion of every important point of dispute outstanding between the two countries, from Kashmir to the enclave of Cooch Bihar, should have produced something better than the anodyne communiqué issued at the end of the conference. Unfortunately, no complete solution is possible for any of the other problems without a settlement in Kashmir. However much the general atmosphere may change for the better, the fundamental grounds for suspicion remain. Progress on individual matters, such as the removal of barriers to movement between India and West Pakistan, helps to improve understanding, but a deep old sore like Kashmir will need a long course of healing. Nevertheless, the fact that India and Pakistan are now further from the possibility of war than they have ever been is a great gain to the security of southern Asia and the stability of the free world.

The Harvest in Eastern Europe

THROUGHOUT Eastern Europe the harvest is in full swing and reports everywhere speak of a bumper crop. The Communist authorities always make a great song and dance at this time, but this year they seem even more zealous than usual. Nature's bounty must seem a providential opportunity to allay discontent in the towns by restocking the food shops; but the party is clearly worried lest the discontented and unco-operative peasants should prevent the crops from being safely and completely gathered in. Why else should the Czechs, for example, repeatedly insist that party members must not try to make out that there was no time for political work during the harvest period? On the contrary, it is said, mass political and propaganda work among the farmers is essential to convince them of the vital need to complete harvesting and delivery plans.

The authorities have also been taking more concrete measures to sweeten the peasants' temper. A number of minor concessions have been introduced throughout the Soviet bloc. In Hungary, for instance, all fines for failure to fulfil delivery quotas have been cancelled, and all those farmers who fulfil their current obligations promptly will have most of their arrears cancelled. In Rumania individual farmers are being allowed to keep a certain basic minimum of grain for domestic use before beginning their compulsory deliveries. In Czechoslovakia rewards are offered to farmers who deliver milk in excess of their compulsory quotas.

This compelling necessity to improve food supplies is leading the Communist leaders to woo the private farmers. Bierut in Poland has repeated Rakosi's emphatic statement that the individual farmer must be provided with fertilisers, machinery and every other incentive to produce more. This is a shift in emphasis, but it is not new and it does not imply any change in the long-term policy of collectivisation. According to Bierut, the collectives are to receive "more marked and more comprehensive help"; and throughout Eastern Europe the advantages of collectives continue to be extolled. From Hungary, where the regime has apparently gone furthest to meet the peasants' abiding hatred of collectivisation, have come the most categorical denials that the policy is to be abandoned. And it is likely that the Hungarian peasant will be heavily discouraged from exercising his new right to leave his collective farm; a recent decree which reduced the delivery obligations of collectives by 10 per cent, specifically excluded those members who were planning to go back to private farming. In short, the Communists are trying by some concessions to overcome their present difficulties without abandoning their long-term policy in the countryside.

Oil on the Sea

THE committee inquiring into the pollution of the sea by oil, whose report was issued recently, makes far-reaching recommendations. Many of them require, to achieve their full effect, a degree of international agreement that has not hitherto been forthcoming in this matter. To keep British coasts reasonably unpolluted, it will be necessary to prevent ships, both dry cargo and tankers, from discharging "persistent oils" within a zone which in order to take account of ocean currents, will project some 1,200 miles into mid-Atlantic as far as the fortieth parallel of longitude. Yet even this is only a palliative; for the oily residues discharged from tanks appear to last almost indefinitely, and to keep the seas and coasts clean it will be necessary to devise disposal facilities at ports and chemical methods for use in ships. At present this prospect is remote; it would involve heavy expense and loading and unloading delays, while separators are as yet fitted in relatively few ships and are not always adequate.

Yet the problem is an urgent one. It was first tackled by the Oil in Navigable Waters Act, 1922, and by a series of international agreements, leading to a draft convention prepared in 1935 but never ratified. The cure has always lagged behind the disease as the cargoes of oil and the proportion of oil-fired ships on the high seas and in coastal waters have grown. Since the war, oil imports into Britain

and continental countries have rapidly increased and pollution with them. The result has been not only the spoiling of beaches but also a deplorable destruction of bird life; the committee did not enquire into its possible ecological effects. In addition, fishing vessels and fisheries, especially shellfish beds, have begun to suffer heavily.

Some losses of these kinds are the inevitable price of using and transporting oil; wrecks, for example, can hardly be prevented from emitting oil as their tanks corrode under

the action of sea-water. But the main evil is both serious and preventable, if a stringent code of behaviour can be enforced by an international body with jurisdiction far beyond the range of territorial waters for which national authorities can legislate. Unfortunately, not all countries which operate tankers possess a public interest in seaside holidays, which is the principle sanction of Government action. But it can well be argued that ships caught offending against a proper code of behaviour should be denied a share in the carrying trade to countries that suffer from their incontinence. Meanwhile, the need for research into chemical methods of dispersing persistent oily wastes is urgent.

Evasive Public Corporations

LORD JUSTICE DENNING had some sharp words to say this week about the liability of public corporations for damages for negligence, and on the shorter time limit within which they may be sued as compared to the time within which other concerns may be sued. Three years ago this week a man named Littlewood, an employee of British Overseas Airways Corporation, was injured in an accident while at work at London Airport. He claimed damages from the contractors, Messrs Wimpey and Company, Limited, and they in their turn claimed that BOAC was jointly liable with them. The trial judge held that both organisations were to blame, and assessed the liability of BOAC at one third of the total. But the proceedings launched by Mr Littlewood had not been begun until nearly two years after the accident itself, and BOAC raised the additional defence that, as a public corporation, they must be sued within one year of the accident or not at all. They relied, in short, on

the fact that the period of limitation, as it is called, although six years for a private concern, is only one year for a public authority. They cannot be blamed for raising the defence; it would be the duty of any auditor to criticise a public body which did not take full advantage of a provision in the law enabling it to resist a claim against it. But, as Lord Justice Denning pointed out, it is now four years since a committee of which Lord Justice Tucker was chairman found that this distinction between public and private corporations had lost its original validity, imposed injustice upon claimants, and ought to be amended.

The losers in this case are Messrs Wimpey. They could do nothing to formulate a claim against BOAC within the twelve months period because no proceedings against them were in existence. When the claim was made they brought BOAC into the action at the first available moment. They are now left with a court ruling that BOAC should pay one third of the total due to Mr Littlewood, but no means of enforcing that award. Yet BOAC would be the last to claim, in other circumstances, that it is anything but a trading corporation, striving as hard as it can to make a profit on its operations.

The anomaly arises from a provision of statute law and the courts can do nothing to remedy it. The stock parliamentary defence for not dealing with such situations is that the congestion of business is so great that no promise can be given to introduce an amending Bill. Yet it is not hard to think of several bills presented to Parliament in the last four years which have had less merit than a bill that would have amended the Limitation Acts. The implication seems to be that injustice has to grow to a certain size before Parliament can take any notice of it.

Benelux Rides Another Storm

At the darkest moment of Benelux's history the spirit of a sensible compromise, without which international agreements are useless, has steered it clear of the shoals; but the vessel is not yet set fair to the wind. Ministerial delegations, which met at The Hague on July 24th, have agreed on temporary measures to meet the present difficulties occasioned by intensive Dutch competition in Belgian markets. So far the detailed measures have not been finally agreed, but the broad principles are known. When production in one industry of a member country drops by a certain percentage, as a result of competition by the industry of another member country, a "crisis situation" exists and one or more of a battery of safeguarding measures come into play. These are known to include quotas, minimum price agreements, credits from a special fund still to be instituted, and finally, reimposition of import duties.

Whereas the crisis situation is defined by a formula that works automatically, the measures to be applied have to be agreed on; there is also provision for arbitration. An inter-parliamentary council, composed of fifteen members each from Holland and Belgium and five from Luxembourg, will, if the agreement is ratified by the three parliaments, constitute the final authority. On the Dutch insistence the measures are clearly defined as temporary and specific, and are subject to review after six months by the inter-

parliamentary council. Thus the conflict between the Dutch view, which blames the high costs of Belgium's industry, and the Belgian view, which blames low Dutch wages, has been resolved in an honourable draw. The agreement makes no mention of means to raise Dutch wages; nor, except for a pious suggestion of a joint productivity council, is there any pressure on recalcitrant Belgian industries to modernise themselves.

In practice the new agreement might work out rather better than the terms suggest, for the difficulties of Benelux have never been on a national scale; they have tended to be exaggerated by the sectional interests concerned. If each complaint is treated separately on its merits and corrective action is adapted to each need, the spirit of Benelux may be saved from blind condemnation by public emotion whipped up by interested parties. Public opinion polls still show that there is widespread enthusiasm in all three countries for the idea of a Low Countries union. If that is to be realised, permanent machinery must be set up to deal with the fundamental difficulties of bringing their economic policies and fiscal measures into line.

Jugoslavia's Troubled Borders

JUGOSLAVIA continues to receive conciliatory gestures from its Cominform neighbours. Rumanian and Yugoslav representatives arranged to meet last Sunday to discuss the formation of a joint commission to investigate and settle frontier disputes; it is just over four years since the first abortive attempt to set up this commission was made. Earlier this month Bulgaria agreed to set up a similar mixed commission; and shortly afterwards Hungary followed suit. The Yugoslavs are accepting these gestures for what they are worth. But they have no illusions that they represent a radical change in the Cominform's attitude towards them. To halt the war along Yugoslavia's frontiers would be as much to the satellites' advantage as to Yugoslavia's, even though it might to some extent facilitate the flight of refugees into Yugoslavia. Nevertheless, the Yugoslavs evidently feel that no opportunity should be lost to test and measure the reality of the apparent changes in Soviet policy.

Of Yugoslavia's Cominform neighbours, Albania alone now continues to maintain its former uncompromising attitude; indeed, in recent weeks the situation along the Albanian-Yugoslav frontier seems to have been even more strained than usual. It is possible, however, that the Communist regime in Tirana will now fall into line with Moscow's latest policies. It may be significant that last week it underwent a reshuffle which appears to have been designed to make it accord more closely with Moscow's present ideas of "collective leadership." One of the two chief Albanian Communist bosses, Enver Hoxha, has retained the premiership, but lost the portfolios of defence and foreign affairs; while the other, Mehmet Shehu, has kept the ministry of the interior, but ceases to be secretary of the Central Committee of the party. On the other hand, the recent Yugoslav-Greek-Turkish declaration guaranteeing the independence of a non-Communist Albania, may make the Albanian Communists feel obliged to foster the feeling that the country is surrounded by implacable enemies.

Leave Britain to the raincoaters,
the snowbooters, the sneezers.
Spend this winter in sunshine on tropic seas.
Gain a month of pure delight, comfort,
full freedom from care. See Casablanca,
Teneriffe, Rio, Madeira and Lisbon.
Join the beautiful Empress of Scotland and
journey round the South Atlantic.

From Liverpool 15th December. From Southampton 17th December
and calling at Cherbourg. Returning to Southampton 18th January 1954.

Letters to the Editor

Trading with Mao and Malenkov

SIR—A letter from Mr Carl P. Blackwell of Washington, DC, in your issue of July 18th challenges the accuracy of *The Economist's* statement that the United States bought \$28 million worth of goods from Communist China in 1952. A substantial portion of this merchandise, Mr Blackwell says, although of Chinese origin was purchased from other countries after being held in inventory outside China for an extended period.

No such refined distinctions are made by the US Department of Commerce, of which Mr Blackwell is an employee. The Department's Business Information Service for March, 1953, published a series of trade statistics under the title, "United States Trade with European and Asiatic Countries in the Soviet Bloc." In the column showing US imports for 1952 we find the item: "China, including Manchuria . . . \$27,806,000." In fact *The Economist's* use of this figure is in complete accord with the "country of origin" classification traditionally used by the Department of Commerce.

Mr Blackwell's letter omits a couple of relevant facts. The purpose of the US Treasury's Foreign Assets Control Regulations of December 17, 1950, was to prevent American economic relations with Communist China. Those regulations prohibit import of Chinese goods except under licence by the US Treasury. Yet the Treasury in 1952 granted one exemption after another from this ban because certain Chinese products were wanted for American stockpiling.

Mr Blackwell may find it inconvenient to have attention drawn to these facts. They seem to make it inappropriate for Senator Joseph McCarthy and others to become quite so apoplectic about the restricted commerce which a number of non-communist countries continue to conduct with China.—Yours faithfully,
Washington, DC

FREDERICK KUH

The Market in Oil

SIR—The article "The Market in Oil" in your issue of July 25th raises the pertinent question to what extent the prices for crude oil and finished products in the Eastern Hemisphere are—or should be—dependent upon developments in the USA. By looking at two specific problems involved one can perhaps carry these considerations one step further.

During the last few years the idea became generally accepted that for Middle

East trade the US was the marginal market which would tend to determine the price for the crude. This means that Middle East crude would sell to any destination at a price higher than was its laid-down value in New York less transportation. The collapse of the tanker freight to half the "standard" USMC level, combined with the recent increase in American crude oil prices, raised this "netback" at the Persian Gulf, and it is worth considering what repercussions this might have on the bulk of the exports from that area. In 1952, of a total of 85 million tons exported from the Middle East only just over 7½ million tons went to the USA; the balance—except for small quantities shipped to South America—remained in the Eastern Hemisphere. In a freely competitive market would the prices for the Eastern Hemisphere supplies now continue to reflect the netback from sales to the USA? This would certainly be the case if the volume of sales to America could be expanded at will, because then it would be left to the seller to determine whether he wants to place his crude in the Western or Eastern Hemisphere. However, since the scope for sales in the USA is limited to a certain maximum, even in the absence of an official quota system, the competitive position in the Eastern Hemisphere would make itself felt independently. At a time of ample supplies the several sellers will endeavour to get as much business as they can, and it is quite conceivable that the netback from sales to Europe or to the East might for some time become lower than that theoretically obtainable for the limited sales to the USA. This is one more reason why the concept of a unified world market price has become less tenable of late.

Another relevant point is the development of finished product prices in Europe. The recent price adjustments in the UK and some other countries were still based on the idea that any change in the USA, as expressed in Platt's Oilgram "Low" quotations, was immediately applicable elsewhere. It has since been pointed out that the pattern of consumption in Europe is different from that of the USA and that—with the local refineries' capacity now equal to demand—the relative prices of the three main product categories may reasonably be determined by the conditions of the markets which these refineries serve. It has been suggested that in these circumstances regular motor spirit would become cheaper and gas oil, which is short, may go up.

But during the last few days gas oil prices have fallen in the States (losing

almost all the increase which followed the crude oil rise) whereas those of motor spirit are unchanged. This is the result of seasonal and local surpluses in America of gas oil and related products which have nothing whatsoever to do with the European trend, which goes in the opposite direction.

Both these aspects show that most of the principles on which the oil companies have hitherto based their price systems are now subject to revision and that a new orientation cannot be delayed much longer.—Yours faithfully,
London, W.1

P. H. FRANKEL

Jerusalem

SIR—In the note of the week in your edition of July 18th, you suggest that scholars, journalists, and others who move around could turn trips from Israel to Transjordan and *vice versa* into an everyday occurrence and could thus help to counter the untrue tales which each side believes of the other.

This is all right in theory. But whilst the Israel authorities are willing to allow tourists and travellers to pass to and from Israel reasonably freely, the Hashemite authorities in Jordan are alone among the Arab states in allowing travellers, unless they are of Jewish origin, to cross the frontier with Israel, or more accurately to pass through the barbed wire fence at the Mandelbaum Gate into the Old City of Jerusalem. Even they, however, will not allow travellers except exceptionally (I was an exception) to enter Jordan and return again to Israel, and they must normally leave Jordan by another route. All the other Arab states are totally intransigent.

Anyone on a Middle East tour wishing to visit Israel and the Arab states must either leave Israel through the Mandelbaum Gate in Jerusalem or return to Cyprus before continuing his journey.—Yours faithfully,
London, S.W.7

V. C. B.

Uphill Fight for Fish

SIR,—I welcome your Note of the Week in the issue of July 25th. Its tenor accords with that of the recent Cairncross Report which, though rejected by the Government, is designed, *inter alia*, to arrest the decline of fishing and other communities; to conserve natural resources that are in danger of being wasted; to prevent the waste of material and social assets; to make fuller and more economical use of man-power; and to accelerate the growth of new industrial communities in Scotland.

A freight equalisation plan is essential to preserve the more distant British ports. The services of Scottish fishermen are highly valued in time of war but their communities are penalised almost to extinction by high freight charges in time of peace. For reasons of strategy as well as justice, the North of Scotland should be treated as continuously part of the United Kingdom.—Yours faithfully,
House of Commons, S.W.1

Books & Publications

The Ethics of Organisation

THE ORGANISATIONAL REVOLUTION.

By Kenneth E. Boulding.

Harpers (Hamish Hamilton). 286 pages. 25s.

THIS book, which forms part of the Federal Council of Churches' series on Ethics and Economic Life, also falls into place among a sequence of works—Thurman Arnold's "Mythology of Capitalism," James Burns's "Managerial Revolution," Peter Drucker's "Big Business," and "The New Society"—all concerned with the internal and external politics of large economic units and all coming from America. The "organisational revolution" is a much more striking phenomenon in the supremely individualistic United States than in an "Old World" historically familiar with guilds, monopolies, chartered companies and corporations; and the logic of its development, though equally valid elsewhere, is correspondingly clearer to an American observer.

Unlike most explorers of the borderlands of social disciplines, Professor Boulding is a highly qualified economic theorist. There is little overt theory in "The Organisational Revolution," but the economist's-eye view of the social and technical changes involved, whether as cause or as effect, has certain advantages over that of the impatient sociologist or historian rebelling against the abstractions of marginal analysis. Concentrating on the human relationships, the divisions of loyalty, the particular and general responsibilities, and the consequent ethical problems, arising from the growth in the number, size and power of organisations, Professor Boulding never loses sight of the economic forces which have contributed to shape or limit that growth and which it has in turn generated or modified. His book consequently has a solidity and realism often lacking in political and ethical discussion.

Politically he is a pluralist, welcoming both the dispersal of powers by the market and the balance of powers provided by a multiplicity of organisations. Indeed, he prefers the constant push and pull of special interests, within and without representative government, to the confrontation of homogeneous political parties. When each party is the monolithic embodiment of a coherent set of principles, "conversation among the parties ceases, or degenerates into mutual shouting or speechmaking . . . once the train of thought has reached a terminus, everyone might as well get off." The essence

of democracy is discussion. "Dictators arise because men get tired of the wearisome process of discussion, and want a quick answer . . . the dictator himself becomes insulated from discussion." That is his weakness; for "he sits in a dark room watching the world through what he thinks is a television set, but is actually an old movie made out of his preconceptions"—and so has no means of correcting his mistakes. The problem of organisation, whether in the large group or the small, is the problem of mutual communication. "Love," says Professor Boulding tersely, "is no substitute for organisation and does not itself constitute an answer to the problems which organisation tries to solve"—though he adds a little later that organisation, the Letter, is no substitute for love, the Spirit.

General discussion of the ethics, the politics and (briefly) the economics of the organisational revolution is followed by a number of percipient "case studies" (the labour movement, the farm organisation movement, and others); and a final summary leaves the reader with some salutary but disquieting thoughts about the fruits of a morally neutral social science. Then follows an unusual feature: a substantial though sympathetic critique by Professor Niebuhr, against whom Professor Boulding in turn defends himself with firmness and courtesy, and a selection of other, more technical comments and rejoinders. "The discussion," Professor Boulding concludes, "is now launched." Some measure of his book's power to stimulate is provided by the intensity with which one wishes for contributions to that discussion, not only from Professor Niebuhr, but from, say, Lord Russell, Professor Röpke, Mr Aldous Huxley, Mr Aneurin Bevan, Mr Adlai Stevenson, and Mr Nehru.

Locke's Journal

LOCKE'S TRAVELS IN FRANCE, 1675-9.

Edited by John Lough.

Cambridge University Press. 309 pages. 40s.

IN the winter of 1675 John Locke went to France for the benefit of his health. He was soon expressing delight at his escape from the English climate, remarking of Montpellier, where he stayed for more than a year, that "Winter makes but little excursions into the vale of this country, and if I were to draw his picture, he should not be crowned with turnips and carrots,

but with violets and jasmine studded with olives." From Montpellier he made extensive tours of Provence and explored parts of the Mediterranean coast. His stay in France was prolonged for a further two years, for he became tutor to the son of a London merchant, and spent a year in Paris before setting out on a final tour which took him down the favourite travel route of the Loire.

Throughout these years Locke kept elaborate journals or notebooks, in which he entered not only details of his travels but also philosophical dissertations, notes for a Utopia, and much material relating to meteorology, medicine, the Bible, currency, weights and measures. Professor Lough, who has mastered Locke's difficult shorthand, now presents a scholarly edition of the travel entries of the journal. As he says, "our text is not the work of a mediocrity or nonentity; it is the Journal of Locke"; and it is to be regretted that the timorousness of publishers has denied us the opportunity of seeing the full journal as Locke wrote it, his powers of observation and intelligence playing over the whole field of politics, religion, technology and speculation.

Locke never intended his journal for publication, and what we are given here is necessarily uneven in interest. Many entries are only laconic jottings of travel expenses or rough notes on industrial processes. He had little gift for the description of places or the visual arts, but was keenly interested in the political and social structure of France, then subject to such rapid changes. In a letter to a friend, Locke once expressed his distrust of general theories, saying, "it is more easy to build castles of our own in the air than to survey well those that are on the ground." Just how literally he meant this it is now possible to see, for Locke was ceaselessly pacing out the dimensions of every building and garden he visited. His cool, empirical temper of mind, his passion for exact measurement and his concern for the welfare of the individual admirably fitted him to observe and record the progress of the French state towards totalitarianism. He notes an edict forbidding the teaching of Cartesian philosophy, remarks upon the docility of the local estates, and shows a constant concern for the fate of the Huguenot minority. He criticised historians for concentrating on wars and conquerors, and himself took pains to investigate the condition of the French peasantry. He was aware too of the new power of the French state; and he attended army reviews, inspected Colbert's new industries and paid special visits to the new naval ports and the great arsenals.

But even in these notes there is more than the dry record of social statistics, architectural measurements and accounts of industrial processes. Of Louis XIV's fountains at Versailles he remarked, "He may well be made merry with this water since it hath cost him dearer than so much wine, for they say it costs him

3s. every pint"; in Avignon he saw "a plain old chair wherein the Pope was infallible," and adds, "I sat too little a while in it to get that privilege." His modern outlook, his wide curiosity and his meticulous accuracy of statement make these excerpts a most valuable study of the France of Louis XIV and an even more valuable record of the mind and personality of a great figure in European thought.

Living Together

SOCIAL PSYCHOLOGY AND INDIVIDUAL VALUES.

By D. W. Harding.

Hutchinson's University Library. 184 pages. Price 8s. 6d.

A BOOK of this kind must be difficult to write. People, after all, are more or less expert practitioners in the art of living together, and social psychologists cannot yet tell them much that they do not know already. Many books on social psychology either try to conceal this fact by translating ordinary experience into rather pompous jargon or else they appear trite. Professor Harding escapes both of these pitfalls. He escapes the first by providing not a systematic treatise, but a series of loosely connected essays on social psychological topics; and he escapes the second by being always sensible and often penetrating. In order to say something worth while in such short space he has to make some demands of his readers, and a few technical terms slip in, most of them derived from the clinical field. But many such terms have been passing into current use during the past twenty years or so, and the ordinary man is probably wrong in supposing that it is still possible to express all we know about human behaviour in the language of ordinary conversation.

To be adequate to his theme Professor Harding must find a way of treating value and fact neither as a Utopian with a programme nor as a disinterested intelligence surveying the human scene from a safe distance. He may tend towards the latter, as becomes a scientist, but he remains concerned in the outcome of the processes he describes. The values he expresses, generally by implication, are those for which the word "democratic" was once appropriate. For "progress" the phrase "possibilities for growth and change" might be better, and for "freedom" we might read "opportunities for individual development and expression"; but his values are the values underlying our society and none the worse for that. A point he makes clear is that they are closely interwoven and that one cannot exist without the other. His account in chapters 10-13 of the dynamics of social change brings this out clearly.

Some people may, perhaps, make one criticism. Professor Harding, himself so reasonable, tends to think of others as perhaps more reasonable than in fact they are. He gives, it is true, some weight to the findings of psychoanalysis, but his human beings seem more in

command of their destiny than the clinician, or indeed the anthropologists, would allow. His point of view here is at least refreshing, though it may not be fashionable.

All in all, this is a stimulating little book which any thoughtful person will find both worthwhile and possible to read.

A Young Profession

SOCIAL SERVICE AND MENTAL HEALTH: An essay on Psychiatric Social Workers.

By Margaret Ashdown and S. Clement Brown.

Routledge and Kegan Paul. 260 pages. 16s.

THIS description of the psychiatric social worker's selection, training and career should go far to dispel the misconceptions that still surround this emergent profession. Such a clear-headed and dignified account allays any suspicion that this type of social work is concerned with woolly-minded theories or potted psychiatry, clothed in tiresome jargon.

The book describes the growth of the profession during the last thirty years, showing how it emerged from the stern test of the war changed but broadened in outlook and firmly established in the world of medicine and social work. The method of selecting candidates is fully dealt with, and emphasis is laid on the type of personality most likely to give and to find satisfaction in the work. This is followed by a critical discussion of training in the light of information gathered from a group of workers who were trained between 1935 and 1939. The authors have studied the worker's progress from her selection as a student throughout her career and have devoted a chapter to personal difficulties. These may sometimes make the training an anxious experience, but with the help of the right supervisor such difficulties may themselves be turned into valuable assets for the worker.

A psychiatric social worker should have "the ability to imagine truthfully the experiences of other people, even though they may be very different from her own, and the readiness to accept these differences." Given this realisation of the range of possible experience, the authors are of the opinion that "there is no end to the possibilities of developing her sensibility." Such an attitude enables the worker in child guidance to win the confidence of a mother in order to guide her through her own and her child's difficulties while the latter is being treated by a psychiatrist. Again, in the mental hospital it enables her to give support and understanding to anxious relatives or perhaps to the disturbed out-patient himself.

The authors also discuss the relationship between psychiatrist and psychiatric social worker. If certain charges of arrogance, or of attempting treatment beyond her scope, have been rightly levelled at her, these have been counterbalanced by a tendency on the part of some psychiatrists to consider her little

more than a dogsbody for making social investigations and adjustments that are strictly practical. Such an attitude sets limits to her work which her specialised training has not taught her to expect.

Every profession which aims at helping to alleviate human suffering or to meet human needs works towards its own extinction.

But this could only happen when general social work becomes permeated with the principles underlying psychiatric social work. Even then the authors suggest that this would not mean the end of the profession as a specialist service.

Gifted European

THE STORY OF AXEL MUNTHE.

By Gustaf Munthe and Gudrun Uexküll. John Murray. 216 pages. 18s.

AXEL MUNTHE was a Swedish citizen; he wrote in English, sought British nationality and established his family in England, and he and his sons served with the British forces in two world wars. He qualified and practised with renown as a doctor in France, but chose Italy as his land of heart's desire where he finally created his island fastnesses of San Michele and Matera. This gifted European was a connoisseur of art and music and a devotee of the art of living; a servant of the unfortunate; the protector of exploited birds or beasts; and, above all, master of an inner kingdom of fantasy which absorbed him more and more as his increasing blindness precipitated his withdrawal from the world.

Most people cherish a conception of their possibilities which they blunderingly try to impose on their fellow men; but very few achieve this human desire with a charm of wit and gallant audacity that gains instant sympathy in every part of the world. This is what Axel Munthe did with his "Story of San Michele"; and with "The Story of Axel Munthe" two well meaning but disparate biographers, who knew him when he was old and failing and querulous, give us a peep behind the scenes after the curtain had fallen on his unique career.

Their collection of random reminiscences will doubtless be welcomed by the countless readers in many countries who constitute a Munthe cult; but discriminating admirers will find little to enhance and much to obscure the brightness of the original picture. Gustaf Munthe, a distant cousin, treats his subject with detached commonsense and slightly wary sympathy. This is an astringent antidote to the saccharine adulation of Gudrun Uexküll, whose gossip revelations remind one of the chatter of initiates at a much visited shrine or the embarrassing exuberance of a fond mamma showing off her ewe lamb in the drawing room. Perhaps the most interesting part of the book is the flashlight on the unusual aspect of Munthe as a family man, given by his son, Malcolm, in an introduction that is a model of brevity, tact and clarity.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Eisenhower's Armistice

Washington, D.C.

IF the armistice in Korea had been put through by Mr Truman and Mr Acheson there would have been calls for their impeachment throughout the country, said Senator Paul Douglas, the liberal Democrat from Illinois, last Sunday. Although the Senator was using this statement as evidence that the truce may prove to be disastrous, he was perfectly correct. Nothing has been more striking in the weeks that President Syngman Rhee has been playing cat and mouse with the United States, the United Nations command and the peace of the Far East than the remarkable shift in the attitude of American opinion, not only towards the Korean war, but to South Korea as well. The Americans, so like the nineteenth-century British in this respect, have in this century acquired a passionate respect for nationalism in small nations which do not threaten America's own security. Thomas Masaryk obtained his strongest backing in the United States, and General Chiang Kai-shek became a much more important figure, personally, when he commanded nothing more than a beleaguered Formosa than when he ruled the whole of China; in a different sense Pandit Nehru was more of an American hero when he was struggling to assert the independence of India than after he became the ruler of two-thirds of a subcontinent.

President Syngman Rhee has been a close student of American politics and manners. He is a graduate of two of the great universities and lived in Washington for many years between the wars. He probably knows the American official and political mind as well as any non-American. In the first two and a half years of the Korean war he had as magnificent a build-up in the American press, as a patriotic and brave old man struggling doggedly for the freedom of his country, as his most assiduous lobbyists could possibly have desired. In one sense or another various influential Americans, Generals MacArthur and Van Fleet, Senator Knowland, and several mass circulation newspapers have supported his position that anything less than a unified Korea would be disastrous, and that the compromise on which the armistice is constructed represents a defeat for the free world. President Rhee thus had all the makings of an American hero and yet he has not become one.

The only explanation that is readily available for this is that, in the problem of South Korea and its future, the United States has been confronted for the first time with a situation—as perhaps the British were, in their support of Turkey, by the hardships of the Crimean war—in which national aspiration and autonomy can no longer be cheered

on from the sidelines, but must be either subjected to higher ends or sustained by a continuing drain of American blood accompanied by the constant prospect of world conflict. The American people seem to have come round to the view of the outgoing chairman of their Joint Chiefs of Staff, the wise and gentle General Bradley, that the full-scale war in the Far East, which would be the logical consequence of adopting Mr Syngman Rhee's position, would be "the wrong war, at the wrong time, in the wrong place." It is clear that the mail which Congressmen and Senators have been receiving has contributed powerfully to their reticence on this subject and even Senator Knowland has only intermittently raised his voice to espouse the cause of President Rhee.

★

Yet it would be wrong to suppose that the United States has concluded an armistice in Korea and refused to support the full fantasy of South Korean demands simply because it is tired of the shooting war, or in deference to the clamour of its "pusillanimous allies." Even General Wedemeyer, once the advocate of a tough policy in Korea, said last Saturday that the United Nations should sign a truce in Korea now

and then get out and stay out. Apparently competent authorities have decided that going on and winning the war in the American tradition would be prohibitive.

Only the Hearst and Scripps-Howard papers, coupled with the columnist Mr David Lawrence, the Colonel Blimp of contemporary American journalism, have seriously suggested that the United States should have sided with Mr Syngman Rhee. The truth seems to be that, if American opinion as a whole ever did believe in General Wedemeyer's "tradition" of total victory as the only solution to any international problem, then it seems to have changed its mind.

Nothing contributed more to General Eisenhower's victory in the election of last November than his assurance that he would end the Korean war, and no better piece of work has been done by President Eisenhower since he assumed office than his repeated insistence, both publicly and privately, that a diplomatic solution is more desirable than a military solution for any international problem. Among all the other disappointments and failures of the first six months of the new Administration, great credit must be given to both Mr Eisenhower and Mr Dulles for the way in which they have driven the Korean *troika* of Mr Syngman Rhee, the American Congress and the Com-

munists—and, if a four-horse sleigh is conceivable, of the allies too—while throwing only minor titbits to the wolves. As Senator Douglas said, such an attempt would have led to the impeachment of the previous regime. The Republicans, just because they are the supposed exponents of a tough American attitude towards international affairs, can resort to diplomacy more readily than their predecessors, who had always to prove that they were not the heirs of Yalta and Teheran.

When the news of the cease fire reached the United States last Sunday there was no Mafeking night, no wild throwing of caps in air, despite the fact that American casualties in Korea had been unusually heavy in the weeks preceding the signing of the armistice. If there is any disposition towards an attitude of "get the boys back home," there is virtually no indication of it in the mail of those responsible for analysing such matters at the State Department and the Pentagon. Mr Wilson, the Secretary of Defence, at his press conference last week, indicated that an end to the Korean war might mean a lowering in conscription calls of as much as two-thirds within ninety days of the Korean cease fire. But this is taken by officials with the grain of salt that they habitually apply to all Mr Wilson's statements of fact; such a reorganisation will depend on the withdrawal of at least two American divisions to Japan, which in turn may not be ordered for many months, or until the outcome of the political conference is known.

Mr Wilson's statement was in fact unnecessary if his aim was political popularity, for it is clear that once the actual fighting ends American popular opinion will support the occupation role of the American forces in Korea with as little fuss as it does those in Germany. The couplet that Professor Denis Brogan attributes to an American friend of his, that

American boys are not like any others;
Only American boys have mothers,

may or may not be true, but certainly those mothers will feel very differently about their sons being posted to a Korean occupation force than about their being sent to active combat there.

★

There are immense pitfalls ahead. There has been only the haziest thinking in the State Department about the position which the United States will take at the forthcoming political conference on the future of Korea, whether it should really aim at a general settlement of the Far East, whether the United States will really make a *démarche* on the political unification of Korea, whether an attempt will be made to settle the Indo-Chinese and Malayan questions at the same time. The haziness is due to the fact that the senior members of the Administration have been fully occupied with the day-to-day problems of achieving the truce itself in the intervals of attending to the requests of one congressional committee after another. All that can be said is that, with Congress about to depart to tap its grassroots, and with the immense relaxation in the tension of American life that will follow from the cease fire, the Administration will for the first time since it took office have the opportunity—if it takes it—to do a little fundamental thinking about the relation of the United States to a Far East which is no longer within the jurisdiction of the New England missionary or the San Francisco merchant.

Summer Students

FROM OUR SPECIAL CORRESPONDENT

THE range and variety which characterise higher education in the United States flower to their fullest extent in the summer schools. Held by regular colleges and universities, these sessions attract Americans of all ages, from the tired elderly professor to the two-year-old whose manner of making mud pies provides the subject of a thesis for the seeker after a degree in education. Summer courses satisfy that aspiration for learning which has been noted by so many observers of the American scene; they also lead to better jobs. Their subject matter ranges from archaeology and butter-making, through military science and music to a closer acquaintance with Xantippe, running the whole gamut of American cultural and professional ambitions.

A great many people go to summer sessions who do not regularly attend colleges and universities, but perhaps for that very reason the available statistics are few. The federal Office of Education recognises 2851 institutions carrying on what it calls higher education, which have a resident student population of more than two and a half million men and women. Some of these institutions offer four regular terms a year, but most of them follow the older system of leaving the summer free as a supposed compensation for low professorial pay. Into this summer holiday, however, many colleges now interpolate an extra term, or even two, if, like the University of Chicago, they can draw a large and ambitious population. At these the underpaid professor may give up leisure in order to teach and earn more money.

Of the two and a half million students enrolled in colleges and universities, a scant third (943,212 in 1949) go to summer sessions. These seek either to make up past deficiencies or to shorten the time spent at college by working all year instead of only three-quarters of it. The ordinary college course leading to a bachelor of arts degree, or its equivalent in other fields, takes four years. By steady attendance at summer school six months or even a year may be cut from that schedule.

These regular students make up only a fraction of the summer seekers after light. The next great group comprises school teachers who go to refresh their minds, to catch up on the latest teaching theory, or to move one more inch along the road leading to a higher degree. Courses in education form the greatest common denominator in these summer sessions; they are popularly supposed to be attended primarily by spinster school teachers secretly hunting husbands. All that the observant doubter can say with certainty is that, if this be true, the spinster school teacher is better looking than she used to be.

Finally, there is a great number who cannot be classified, who go to seek culture, amusement with an intellectual aura, advancement in professional skills, or romantic opportunity. They may study book-keeping, Chinese art or naval logistics, they may lead madrigal singers or jump off high diving boards. Any of these studies seems justifiable at summer school. As a teacher of business methods put it in urging a two-weeks course on intensive operation of business machines,

there you meet your own kind of folks, you have a marvellous vacation, you learn solutions to your problems, you may find a husband, you may get a better salary.

You may, in other words, follow and gild the American dream.

Just how the colleges arrange their various six-week versions of the best of all possible worlds can be seen in their catalogues. Harvard University, for example, has offered summer courses in the arts, sciences and education ever since 1871, with the exception of four years during the last war when only the Graduate School was open during the summer. Harvard serves students working toward a degree, students not working for a degree and auditors, commonly known as "culture hounds," who merely want to listen. Even this staid university admits that in addition to learning there are concerts, motion pictures, Observatory tours, and other forms of recreation to be found in hot weather.

Two thousand miles to the west, the University of Colorado offers learning on a more flexible (or less formidable) "workshop" plan. Thus a Workshop on Economic Education ran from June 23rd to July 11th "to stimulate and improve the quality of economic education in the public schools"; an Athletic Coaching Clinic has just ended; a Writers' Conference is being held. A Dance Workshop, a Mathematics Workshop, and the facilities of a Language House where one learns while talking are also available.

Regional interests are visible in these announcements. Thus the Central College of Missouri offers planned tours (presumably by bus) of the home state as a substitute for regular courses in Missouri's history and government. The University of Rhode Island, in the insurance city of Providence, conducts a month's summer course on all the forms of insurance, liability and workmen's compensation. On the other hand, Cornell University in upper New York State, which is famous for its researches into agriculture, has joined with Yale University to rise above sectional interests and offer a ten weeks' course in Oriental languages, including Indonesian, Russian and Chinese. And the Massachusetts Institute of Technology, ever attentive to industry's needs, offers professional summer programmes, including courses on the strength of materials, thermodynamics and automatic control of aircraft.

Obviously the college budget benefits if the expensive college plant can be used eleven or twelve months of each year instead of nine, though the need for supplementary teaching salaries does cut the profit. But the kind of educational summer fare which is in demand is changing as summer holidays become a more universal institution, and the summer session competes with mountain or beach for the attention of wider audiences than exist among people with previous academic training.

The element of popular education is important in these sessions, and growing more so as the lower-income groups improve their status. So also is their value as a means of acquainting one group with another. One of the continuing needs of a country as big as the United States is for institutions that will mix people up, keep them from souring into smug isolation in their own country clubs or trade unions, and get them to other parts of the country, not merely as tourists carrying their own atmosphere with them, but in such a fashion that they must live among the pressures and opinions common to another region. This need the summer sessions serve as Californians go to study in New York, New Mexicans drive to Wisconsin, and Connecticut men travel to Arizona, often accompanied by their wives.

American Notes

Congress in a Hurry

WHEN last week the irresistible force of Congress's desire to adjourn by the end of July met the supposedly immovable object of the President's final minimum of essential legislation, it was the immovable object that gave way. The Bill to increase postal charges, to counter the Post Office's perennial deficit, had only to appear on the President's "must" list to be tacitly relegated to the next session of Congress. And on the refugee Bill, the other piece of legislation which had threatened to delay the adjournment, the Administration is ready to settle on Senator McCarran's terms—209,000 immigrants to be admitted over three years, instead of 240,000 over two.

"Remember, Now—Don't Grow Any Bigger"

Herblock in the Washington Post

But it is possible that in the end Congress itself may insist on being a little more generous. The Administration even offered a compromise, admittedly very much to its own taste, to Senator Bricker, over his constitutional amendment that would limit the President's treaty-making powers. But Mr Bricker rejected the offer, and Republican leaders in the Senate have therefore been unable to find time for a debate on his proposals.

At the time of writing the double deadlock on tariff

policy remains unbroken. The Administration won a substantial victory, with Democratic help, over the protectionists in the House by the defeat of the second version of the restrictive Simpson Bill. But the House conferees have so far refused to withdraw in the controversy over the size of the Tariff Commission which has held up the renewal of the Trade Agreements Act for weeks. On the other hand it is in the Senate that protectionist sympathies have prevailed on the Customs Simplification Bill, also now in conference. The Senate Bill is much less satisfactory, from the point of view of foreign traders, than that approved by the House, particularly as regards methods of assessing the dutiable value of imports.

The various appropriation Bills, nearly all passed by the House some time ago, are speeding through the Senate, into the conference room, out on to the floor again, and on to the White House. Once a special plea to the House of Representatives had failed to prevent it from cutting \$1.1 billion from foreign aid funds, the President evidently decided that on this, too, he must give way, at least to the extent of accepting the smaller cut which had been approved by the Senate Appropriations Committee. The final sum recommended there was \$4.5 billion, as compared with the figure of \$5.2 billion in the authorisation Act.

For the solution of another financial problem, the Administration is, it seems, trusting to luck rather than to Congress. If revenue comes in well, if the Korean armistice enables economies to be made and if, perhaps, the government's working balances and trust funds can be manipulated a little, then the national debt may not go through its ceiling of \$275 billion before Congress meets again in January. With only about \$2.5 billion in hand at the moment, it will be a near thing, but the Treasury, although it may still change its mind, apparently does not risk an almost certain rebuff by asking Congress to raise the ceiling now.

After Korea—Universal Service?

PRESIDENT EISENHOWER'S revival of the issue of universal military service, which was shelved by Congress last year, is of greater importance, in the long run, than the dispute between the Secretary of Defence and the Director of Selective Service over the possibility of reducing the call-up for military service now that a truce has been achieved in Korea. At present there are 3,556,000 Americans under arms, more than twice the 1,460,000 in uniform before the war in Korea began. Now that the fighting has ceased, the number is expected to level off, and shrink slightly to 3,300,000 by next June. But unless voluntary enlistments hold up unexpectedly well, or the new Joint Chiefs, in their reassessment of American defence needs, decide that the size of the forces can be cut even further, any drop in the number of men called up is likely to be both small and temporary.

As he appointed Dr Karl Compton and two others to the three vacancies on the National Security Training Commission, the body responsible to Congress for drawing up a plan for universal military service, the President asked the commission to report, by December 1st, on the practicability of instituting UMT while conscription was still necessary. In the past it has been assumed, even by Mr Eisen-

hower, that the number of men in the right age-groups was too small to meet both the demands of the services for serving soldiers and those of a training scheme. The President's interest has evidently been revived by the disproportionate burden which is at present placed on conscripts. After doing their two years' service, they are then supposed to spend six years in the reserves; men who have enlisted voluntarily must spend four. Meanwhile, those who are deferred, either because they are needed on farms or in industry, or because they have dependants, escape any military obligation at all. One loophole, which has caused great resentment, was blocked when the President ruled that men who become fathers after August 25th will no longer be immune to conscription. But there remains a group of over a million men with dependants—more than a ninth of all the men between the ages of 18½ and 26—who for the moment at least are untouchable.

The commission will look into the possibility that a military training scheme might help to build up a strong and ready reserve. The reorganisation of the reserves, adopted by Congress last year, has notoriously failed to do so because, by a strange oversight, Congress did not provide any penalties for those who, when they leave the forces, refuse to take their reserve obligations seriously. Without a reserve sufficiently trained to permit the regular forces to expand rapidly from a peacetime to a wartime strength, there can be little hope of reducing the size of the armed forces and the money that is spent to maintain them.

Stretching Rubber's Deadline

AGREEMENT has been reached between the Senate and House conferees on the Bill authorising the sale of the government's 28 synthetic rubber plants to private firms. The Republicans are anxious to reduce the extent of government competition with private enterprise and this Bill may set a pattern for the disposal of other federal businesses. The House has approved the compromise, but despite the concession made to Democratic opinion, Senator Douglas is expected to lead a last-ditch stand on the Bill in the Senate, on the ground that it does not contain adequate safeguards against the creation of a private monopoly.

In principle, the sale is not a partisan issue, for it was President Truman who originally proposed that the plants, which were built during the war when America was cut off from its natural rubber supplies, should be disposed of. The present Bill empowers the President to appoint a three-man commission to negotiate the sales. To protect the national interest, the purchasers must promise to produce annually 500,000 long tons of general purpose synthetic rubber and 43,000 of butyl, about two-thirds of the present capacity. Any plants not sold, including, presumably, the high cost alcohol butadiene plants to be shut down in August, will be kept in standby condition in case of another emergency.

The chief concession made to the Democrats is that the commission will have until January, 1955, instead of June, 1954, to submit its disposal plan to Congress. The Democrats argued that it would not be able to strike a good bargain if it was negotiating against time. The plants' original cost was over \$500 million, and Senator Capehart,

the Republican chairman of the Senate Banking Committee, thinks most of this should be recovered, although much of it has been written off and the industry thinks \$300 million would be a fair price. The Republicans, after their experience with tidelands oil, are not anxious to incur another charge of giving away a national asset.

The Senate, though not the House, attached equal importance to the question of a rubber monopoly. Small fabricators are assured that any increase in price when the transfer is made will probably be only temporary, but they still fear that their supplies will be endangered if the plants are acquired by the big rubber and petroleum companies which have been running them. The extension of the deadline is partly to enable other firms to get in their bids. The House, however, turned down the Senate's proposal that Congress should be allowed to veto individual sales. It will have to accept or reject the scheme as a whole, but at least the commission is instructed to seek the advice of the Attorney-General on how to create a free competitive industry out of a government monopoly.

Hoover Recommissioned

WHEN, for the second time, ex-President Hoover takes the chair of a commission to overhaul the structure of the government he will find the terms of reference even more to his liking than on the earlier occasion. His first commission, which sent its final report to Congress in 1949, was limited to suggesting ways of performing existing functions more efficiently, while the inquiry now set up by the Ferguson-Brown Act can consider whether the government ought to perform some of these functions at all. There are to be twelve members, appointed in equal proportions by the President, the Vice-President (as presiding officer of the Senate) and the Speaker of the House. The interim reports, and the final report which has to be ready by June, 1955, should give Mr Hoover and those who think like him a chance of showing exactly where "creeping socialism" is to be turned back. At the same time another commission, of 25 members, will be drawing up, by March, 1954, a report on federal-state relations, with an eye to seeing whether much that is at present undertaken or partly financed by the government in Washington could not better be left to state and local authorities.

Meanwhile, during this session of Congress, President Eisenhower has put forward ten more schemes arising from the original Hoover proposals, or recommended by the three man Rockefeller commission that he set up in advance of his inauguration. Six of the ten are now in effect and, unless unforeseen resistance develops in the last days of the session, the remainder will come safely through on August 1st. But, even though the full implementation of the Hoover Report had a prominent place on the Republican party platform, the Administration has not yet faced all the more politically sensitive sections.

Most of this year's reforms have been non-controversial. Those affecting the Department of Agriculture and the establishment of a full dress Department of Health, Education and Welfare were controversial when submitted by Mr Truman mainly because Congress distrusted the political personalities that were then involved, not because

they stepped on the toes of established interests. Of the remainder, the most important are those affecting the Department of Defence and the Department of State. Mr Eisenhower's military prestige was enough to gain sanction for changes which enhanced the status of the civilian Secretary and the chairman of the Joint Chiefs of Staff.

Finally, unless this is reversed at the last minute by Congress, there will be set up a Foreign Operations Agency to supervise all economic, military and technical aid, and a United States Information Agency to run the Voice of America and other information services. This anticipates the complete overhaul of the existing patchwork of legislation providing for the conduct of American foreign policy, which the President has promised for next year; in theory at least the State Department is left to concentrate on policy-making, with the wan hope that it will now be out of the direct line of political fire.

Hollywood Goes to Washington

HOLLYWOOD has given more experienced pressure groups a lesson in how to manage Congress. A minor triumph for the moving picture trade unions is the inclusion, in a technical and non-controversial tax Bill, of a repeal of the income tax exemption granted to Americans who stay abroad 17 out of 18 consecutive months. This was adopted in 1951 to encourage technicians to take jobs on Point Four projects and US military bases abroad, but the real beneficiaries have proved to be moving picture stars and businessmen. The exemption tempted them to make pictures abroad which the trade unions consider might otherwise have been made in the United States.

The industry's triumph, however, is much more impressive. Cinema owners, like many other businessmen, pay federal excise taxes, and they ascribe their present woes as much to the tax as to the inroads of television. Unlike the others, however, they have succeeded in obtaining relief and this from a Congress which has just reluctantly recognised the necessity of extending the excess profits tax for six months. It took only a fortnight for both the House and Senate to pass a Bill exempting cinema owners from the 20 per cent admission tax.

This was the reward of a long and carefully planned campaign. Ever since Congress assembled, delegations of exhibitors have descended upon the Congressmen and Senators from their states, with lists of the cinemas which have had to close and gloomy prophecies about the number about to shut. A film was even made, for Congressmen only, illustrating the exhibitors' plight. Other distressed industries with claims no less justified, the legitimate theatre, for example, were kept firmly out in the cold lest the cost to the Treasury become so great that the President would have no choice but to veto the Bill. As it is, to rescue the movies will reduce revenue by about \$100 million a year, an eighth of the receipts that the President saved by his long and bitter fight to retain the profits tax. Cinema goers will not benefit. The exhibitors say quite candidly that they do not mean to cut their prices. The President's problem is whether he should make his first veto one of a measure which has so much congressional support. But if he signs, it will be hard next year to resist the demands of a score of other claimants.

The World Overseas

A Year of Neguib

A SPECTATOR at the military parade which marked a year of President Neguib's rule in Egypt likened the scene in Liberation Square to the state of the nation today. Hardly had the President arrived and begun his speech than the crowd broke ranks and, raining blessings upon him, poured into the space destined for the military parade. Police vainly pushed and shoved it back; only the faces of the more aristocratic spectators remained unmoved. Yet, in the midst of the milling multitude, a square of the troops waiting to parade stood firm as a rock. There was the national scene in miniature: the ordinary Egyptian displaying his liking for being told what to do, yet his liability to sudden bursts of uncontrollable emotion; the upper class critical of an adulation for Neguib in which it does not join; the army steady, and capable of keeping order so long as it wants to do so.

How much support have the President and his *junta* earned by their deeds during this first difficult year? Judging by their anniversary speeches, their own assessment of their work gives first place to the inauguration of land reform. Distribution of title deeds to a first batch of peasants was one of the many engagements kept by the President during the crowded days of celebration. But the successful redistribution of large estates is a complicated process of which the actual allocation of land is only a trifling part; this must be complemented by assistance with tools, production and marketing, and other facilities that landlords used to provide. Since the modern forms of this assistance are hardly organised as yet, many observers would award first place to some other of the regime's activities.

Its most remarkable feature is its morale; a band of young officers—few of them over 40—continues to give the impression that its members are austere, selfless and at pains to learn a difficult job. Even their enemies are in no position to make the familiar accusation of corruption. It is these young men who, by agreements which they reach in conference, take all executive decisions; yet they have retained in their service several civilians of high quality—notably their excellent Minister of Finance, Abdel Gelil el Emary—because on most matters they remain sufficiently aware of their limitations to know when to take professional advice. Of their practical achievements, the most important in the political field was their decision to abandon the Wafd's conceit that the Sudan issue and that of the Canal Zone were linked matters, and to be ready to settle them separately. The Sudan agreement of last February was the result. In the economic and financial sphere they were left with such a dreadful legacy by their predecessors that spectacular results have been impossible; this legacy included a budget

deficit of £E38 million for the year ending June 30, 1952; an account with the National Bank which had been £E75 million in credit in January, 1950, but went into the red in August, 1952; huge stocks of unsold cotton carried over from previous seasons on account of the Wafd's habit of juggling with prices in order to line the pockets of its friends; and a consequent serious shortage of sterling which caused drawings to the limit on Egypt's blocked account in London, and the balance in its free account to drop to an all-time low figure of £200,000 in December of last year.

There is no quick way out of such straits. Yet last week's Liberation Day speeches were able to report that the government's price policy for cotton had got the surplus moving to an extent that brings the season's sales to date to 1,800,000 cantars more than last year (1 cantar=99 lb); the only fly in the ointment is the money cost to the Treasury of an operation which involved it, having bought when cotton was dear, into selling at a loss of almost £E1½ per cantar. As a result of these sales and of an import restriction policy, speakers were also able to report that the balance in Egypt's free sterling account had risen to £19 million by the end of June. Advances to the government from the National Bank had also been liquidated; at the cost of taking over £E11.8 million which had been held as a reserve in the Bank's Issue Department it was £E5.6 million in credit.

Courageous Budget Policy

These are actual feats performed. Equally meritorious are the plans for next year as framed in the budget for 1953-4. For the first time, an Egyptian cabinet has summoned the courage to proclaim the need for hardship and sacrifice in order to attain financial stability and a higher level of welfare. Abdel Gelil el Emary anticipates a drop in revenue of £E15 million and a rise in expenditure of £E13 million as compared with the figures for the year just ended. He proposes to close the resultant gap by imposing additional customs duties of £E6 million on imports which compete with Egyptian products; duties on imports which increase local production will, by contrast, be lowered.

The balance of £E22 million he intends to raise by reducing the cost of living bonus payable to all government servants and by halving their regular increments. This attack upon an overblown civil service is a real display of courage, for it incurs the wrath of a large and vocal sector of the population. Another economy is to be effected by reducing the subsidies on flour and sugar—that is, by raising the price of two essential foodstuffs. The budget is therefore not

altogether what the *junta's* left-wing supporters would have it to be—a soak-the-rich affair. It hits the poor hard; but there is no other way back into balance, for Egypt possesses virtually no mechanism for collecting direct taxation, and to create it in a year of struggle with odds would have been impossible.

Changes of such dimensions nowhere occur without creating enemies for those who initiate them. The *junta* has made many. It is disliked by most of the politician class whom it ousted, by the big landowners who see it as disrupting their principal source of wealth, and by the underworked but underpaid civil servant who finds his pay-packet smaller and his bread dearer. Lastly, it has some adversaries within the forces; the army officer is drawn principally from the classes that own real property; it has dismissed a large number of senior men in this category, and its recent promotion to commander-in-chief of Abd al Hakim Amir—till lately only a major—has not endeared it to officers in the higher ranks. Yet it survives because it is firm of purpose, and has clean hands, and is so obviously bent, ultimately, on doing its best by all who earn, and increase productivity.

The existence of these critics and adversaries offers an explanation of an anomaly that puzzles many British onlookers. They know that President Nguib admits to the need for a base not just in the Canal Zone but “in all Egypt”—in a word, for a base achieved by consent. They know that he therefore admits, contrary to the opinion of some of his less intelligent countrymen, that, for a country in Egypt's key location, there is no such course as neutrality. How is it, then that in one breath he calls Britain Egypt's “natural friend” and in another reviles it as an enemy whom “we can drive out when we wish”? How is it that he admits a need for technicians over a period, but cannot hear of technicians who shall be responsible not to Cairo but to London? The answer is that he must from time to time throw a sop to his critics, some of whom are in the army, and steal the anti-British phrases from their lips. If he were to endow them with the excuse to proclaim that, by admitting military technicians responsible to London, he had indefinitely prolonged “occupation,” the army might cease to be the factor for order that it is today—and that would be Nguib's end.

Moderation in Africa

FROM A CORRESPONDENT IN ACCRA

THREE years ago, the first popularly elected government in West Africa came to office in the Gold Coast under the star of disorder. The Prime Minister, Dr Nkrumah, had to be released from prison where he was serving a sentence for sedition. The crowds who filled the streets shouted the slogans of anti-imperialism and “immediate freedom from the capitalist yoke,” the speeches of their leaders in the Convention Peoples' Party seemed to draw most of their inspiration from Tom Paine and Karl Marx, and one of the first decisions was to boycott all social contacts with the British.

The distance that has been travelled since those dubious beginnings can best be measured by the statesmanship and moderation displayed by these same leaders in the Gold Coast Assembly's recent debate upon the next stage in

constitutional advance towards self-government. For two and a half years they have worked within the framework of the Coussey Constitution of 1950. Two of its essential features were the presence in the Cabinet of three *ex-officio* British ministers—the Minister for Defence and External Affairs, the Finance Minister and the Attorney General—and the election to the Assembly by indirect voting procedures of a number of territorial members, many of them tribal chiefs or representatives of the chiefs. The new proposals—which the Assembly has now all but unanimously adopted—call for a modification of this hybrid constitution “as a matter of urgency,” replacing the *ex-officio* members by African ministers and introducing direct election by secret ballot for all members of the Assembly. These measures are envisaged as an immediate and essential stage in the advance towards complete independence within the Commonwealth, which “as soon as the necessary constitutional and administrative arrangements for independence are made,” Her Majesty's Government is requested formally to promulgate.

These procedures are, in themselves, far removed in spirit from the slogan of “self-government now” which echoed through Accra three years ago and the reasons for the more cautious approach were made very clear in the course of the debates. The opposition, a small group of half a dozen members led by a veteran of Gold Coast politics, Dr Danquah, is normally well to the right of the government. But he tried to embarrass the government by proposing an amendment to its constitutional proposals, demanding, as the Nigerian extremists had done, a definite date for independence and setting the date for March 6, 1954. In the event, the amendment, far from proving an embarrassment, gave Dr Nkrumah and his Ministers the opportunity of explaining the solid reasons for their prudent approach and of demonstrating the experience, steadiness and judgment they have acquired.

Allaying Northern Fears

Some of the grounds for the government's moderation lie in the Gold Coast's own internal situation. The Northern territories are neither so wealthy in resources nor so relatively advanced in education as the Ashanti or the Coastal regions. The leaders in the North share some of the Nigerian distrust of the men from the South and given an immediate choice between administration by British Colonial officers whom they know and Southern officials who are an unknown quantity, they would prefer the former. Dr Nkrumah has gone out of his way to counter these fears. The constitutional proposals were discussed with the Northern leaders and the Prime Minister recently accompanied the Governor, Sir Charles Arden-Clarke on a formal visit to the Northern capital, Tamale, to reassure local opinion. In the debate itself, an able minister representing the Northern territories, Mr Braimah, was chosen to second the constitutional motion and said bluntly that the men of the North supported the proposals because they believed the transitional period could be used to increase the education and develop the resources of the North sufficiently to bring it into an independent Gold Coast as an equal partner.

The chiefs, too, would have none of the opposition's demand for immediate independence. Their desire is to work out with the government means by which the office of chieftain can be combined with the new elective system

of local government introduced in the last year. In Gold Coast tradition, the chief has been in any case something less than a hereditary autocrat, acting with the advice of his elders and liable to be deposed by an exasperated people. The old tradition and the new democracy could, the chiefs feel, be combined, provided the final constitution of the Gold Coast is not forced through at break-neck speed. Many chiefs believe, too, that a second chamber or senate might be the right national forum for their influence. Here, too, earlier tendencies towards extremism among some supporters of the Convention People's Party has given place to a juster appreciation of the place of the chief in moral society and the dangers inherent in sudden detribalisation.

Tribute to British Officials

The chief cause of the responsibility displayed by the Gold Coast leaders is their direct experience of government. It is a sign of considerable maturity and self-confidence that they are perfectly prepared to admit what has been learnt and how much they have owed, in the process of learning, to the good will and understanding of the Governor and the three *ex-officio* members. Dr Nkrumah's tribute of thanks to these men was almost as warmly applauded in the Assembly as the demand for independence itself. The Gold Coast's leaders have wrestled for two and a half years with the practical problems of administration and if they ask now for a further transitional period, the delay is due not to any slackening in the determination to achieve self government but to the desire to secure it with the least possible loss of efficiency.

Efficiency still means help from Britain, help and advice at the highest level—hence the proposal that the African Minister of Finance shall have an economic adviser, that the Attorney General will remain as an official beside the new Minister of Justice and that the Governor shall remain responsible for defence and foreign affairs and share responsibility for internal security and the public services with an African Minister. Efficiency still means retaining British officials in the Civil Service and a few days before the constitutional debate, the Prime Minister issued a constructive statement, which while reaffirming the principle of Africanisation of the Civil Service, promised security of tenure and promotion by merit to any British official who would serve in the Gold Coast Civil Service after the transfer of power; it also proposed compensation agreements to those who preferred to leave.

New Spirit of Partnership

Above all efficiency means sensitive co-operation with outside interests in the economic development of the country. The largest experiment of this kind in Africa, the aluminium and power project on the Volta River, involves a partnership between the British and Gold Coast government and a private firm, Aluminium Ltd. of Canada (British Aluminium may also participate at some stage). The project is still only in its exploratory stage but the Gold Coast government has already had a first opportunity to demonstrate its desire for a new spirit of partnership. The traditional distrust of foreign capital was reinforced earlier in the year by the fear whispered abroad by extremists, that the Volta was simply a plan to perpetuate by economic means Britain's ostensibly abandoned political

control. In a stormy debate in February, the Assembly demanded that two Gold Coast representatives should sit on the Preparatory Commissions as watchdogs for the people. But a week before the constitutional debate, the Prime Minister persuaded the Assembly to stand by the agreement which had been reached and to substitute for two Commissioners a National Committee representing government and opposition. His statement was remarkable not only for its insistence on the need for trust between the partners but also for his plea that so vast a scheme should be considered as a national and not a partisan issue.

The great question before the Gold Coast now is how the very real striving of its youthful leaders (men between 22 and 35) to fulfil their responsibilities with judgment and good will can be matched by good will and imagination in the United Kingdom. It is not simply a question of granting independence gracefully. It is not even a question of Commonwealth membership for a nation of African stock. That issue will inevitably be raised in the not too distant future by the British West Indies whatever the speed of development in the Gold Coast. It is above all the question whether new methods can be devised to make partnership between equals within the Commonwealth something more than a pious sentiment for Empire Day. The issue does not arise only in relation to West Africa. But the Gold Coast, in which so much good will has been created and where the willingness for partnership is so marked, could well be an invaluable proving ground of the new relationship upon which the continuance of the Commonwealth undoubtedly depends.

South Africa's Budget

SOUTH AFRICA'S Minister of Finance, Mr Havenga, was described as “grave and unsmiling” after presenting his delayed budget to parliament on July 22nd: his mood was well suited to the cheerless news he had given. In all, additional taxes to the tune of £11,400,000 are proposed for the new financial year; but this is not the whole burden, for as a direct result of the new budget the price of bread is to go up by twopence a loaf, and rail rates by an average of 13.6 per cent. The severity of the new tax measures (discussed on page 341) has rudely shocked those South Africans who were hopefully anticipating some modest reductions. No less unexpected was the depressing picture of the Union's present economic difficulties revealed in the budget speech; up to now this has been eclipsed by the constitutional crisis.

Mr Havenga's task was not easy. He was faced with several intractable problems. The Union's economy, after the massive surge forward in industrial development after the war, needs now a period of consolidation and digestion. The economic structure has become unbalanced, the basic industries, like gold-mining, have steadily been losing ground in relation to the rapidly expanding secondary and service industries. For example, mining used to contribute 19.5 per cent to the gross national product in 1938, compared with 17.5 per cent for manufacturing industry. The respective percentages in 1952 were 12.9 per cent and 23.6 per cent. With little prospect of a higher world price for gold, it is to the credit of the government that it has at last

taken the bull by the horns and deliberately planned to redress the economic unbalance which inflation and import restrictions have jointly precipitated since the war.

Another legacy of the tremendous growth of industry since the war is the backlog of public works and services. Up to now, this has been the main limiting factor in further industrial advancement. There have been shortages of electric power and some load-shedding; over-loading of the transport system to the point of near collapse; and in all a strain on facilities which could not go on. The budget is planned to remedy this shortcoming; but the character of the problem has changed. Now finance, or more precisely, the shortage of savings, is the limiting factor and the government has been forced into an extreme measure—a compulsory savings levy—in order to finance its loan account for urgent capital works.

Cost of Apartheid

This situation has arisen because of three inter-related but distinct factors: the postwar inflation; the financing of the new industries out of domestic private savings; and the poor credit standing of the Union government, and indeed of anything connected with South Africa, in the world capital markets. There is now no sizeable fund of genuine savings in South Africa which could be siphoned off by government loan operations for the financing of public works. The budget gives implicit recognition to this fact. Most galling of all to the Malan government is the low credit rating which South Africa has abroad. No amount of bluster and recrimination can alter the plain fact that investors the world over shy away from anything to do with South Africa for fear of the effect that Malan's policies may have on social unrest and economic disorder in the Union.

Mr Havenga also had before him the estimates of government expenditure which, at £223 million, is higher by £10 million than in the previous year. Much of this increase is due to the normal expansion of public services alongside the development of the country and to defence expenditure; but a very large portion (which is quite impossible to estimate) must be set aside for the government's "apartheid" programme; this calls for separate facilities, re-settlement, compensation payments, national registration, and last but not least, the additional costs of providing for internal security.

Flight of Capital

Finally, Mr Havenga must have been much influenced by the rapid depletion of South Africa's reserves in the past half year. Since January gold and foreign exchange reserves have declined by £26 million. The most rapid decline coincided with the return to power of Dr Malan in April. As South Africa's trade balance in the half year has been less unfavourable than in the comparable period in 1952, and there is no evidence of any unusual invisible transactions, the inference is that there has been some movement of capital out of the Union. South Africa's balance of payments is extremely sensitive to movements of capital; unless the capital flight can be halted or brought under control, the alternative will be a further intensification of import restrictions to preserve a minimum reserve of gold and foreign exchange. By excluding gold-mining from the new savings levy; by its attack on the lop-sided economic

structure; by its drive to get rid of inflation; and by its general tone of austerity, the budget is an attempt to get down to fundamentals and thus to influence outside opinion whilst not compromising one whit on the government's broad social and economic policies.

In many respects this is a brave budget because it seeks to arrest even at this late stage the spirit of boundless optimism which is so characteristic of the South African business and commercial community. It is fundamental, because it seeks to redress the unbalanced economic structure which has arisen in the postwar years. It is unpopular because it imposes new taxes when nearly everywhere else reduced taxation is the order of the day. But it is inadequate and basically unfair because it does not go far enough in reducing the discriminatory taxes on gold-mining and because once again the very lowest end of the income scale—the non-Europeans most of all—is most seriously prejudiced, by the increased price of bread, and by the higher rail fares. Finally it is a contradictory budget because it is disinflationary by virtue of the savings levy; but inflationary in setting off a new spiral of cost inflation with the tax on petrol, the higher bread price and the increased railway rates.

Politically it is not an easy budget to defend. If the United Party opposition can mend their ranks there is ample grist for their mill. After all, the cost of living was intended as the opposition's main plank at the recent election. It remains to be seen whether Dr Malan can deflect attention once again from the basically unsound economic condition of South Africa.

Germany Cuts Steel Prices

WEST GERMAN steel producers have reluctantly agreed to make a small cut in prices, much below the amount desired by German consumers; and the duty on German imports of steel from outside the European Coal-Steel Community will probably also be reduced. This is the result of an important conference held recently in Bad Kissingen between the German iron and steel producers, the main industrial users of these products, and the Federal Ministry of Economics led by Dr Erhard.

German steel prices have been a bone of contention inside the community for some months. The German producers, very naturally, have wanted to charge high prices in order to give themselves a generous margin for investment. This policy has brought them into conflict not only with the High Authority, which aims at lower prices, but also with their own consumers. German engineering firms have been complaining loudly that high steel prices put their exports in overseas markets at a competitive disadvantage with those of such foreign rivals as Britain. Now they have won a partial victory with the producers' offer of a five per cent rebate on some types of steel, although even with this reduction, the German engineering industry claims that it must pay more than comparable British firms.

The case for price cuts in Germany was strengthened by the distinct threat of competition in the German home market from French steel based on Thionville. The general level of German steel prices, even after the reductions made in May, when the common market opened, was among the highest in the community. As a result, French semi-

manufactured steel, for example, was fully competitive everywhere in Germany, except Cologne and Hanover. Because the Treaty forbids it, the Germans could not shut out this competition by imposing import restrictions.

The new German cut puts the remaining producers of the community in a dilemma. From selling at the highest prices, after the Italian, many types of West German steel will now sell at the lowest prices in the common market. This means that other producers will probably be compelled to cut their prices too. It was also agreed at the Bad Kissingen conference that the community as a whole had too high and rigid a price level. Dr Erhard and M. Monnet are said to hold the same opinion on this score. It seems that Article 60 of the Treaty provides only that a given producer may align his prices with the lowest quoted at any basing point within the community. The Article does not make allowance for a producer who may wish to cut his prices still further or to cut them for certain orders only. This price structure is too inflexible and proposals for loosening it have been made to the High Authority.

Lower Tariffs Next

At the conference, Dr Erhard stoutly maintained his reputation as a free trader. He refused to agree to a special export incentive for steel, and reminded the meeting that he has, indeed, just given the International Monetary Fund an undertaking to work for the abolition of all such measures. Dr Erhard also pressed his liberal views on tariffs at Bad Kissingen. It was agreed that duties on steel imported into Germany from countries outside the community should be reduced, if possible in conjunction with the French, and German-French conversations are taking place in Luxemburg on this topic. A move of this kind is in keeping with the avowed aim of the Treaty—to reduce tariffs to a point where the whole community has a common tariff barrier as low as the one that now protects the Benelux countries.

The Birth of the Bolsheviks

FIFTY years ago a group of Russian social democrat delegates held a congress in Brussels. After a few days police interference compelled them to move across the Channel. Thus it was in London that the memorable assizes which gave birth to the Bolsheviks ended. Londoners, like the rest of the world, were not aware that history was being made just around the corner. Even if they had bothered to watch the quarrels of this small emigré group, they would have found their dispute unimportant and pedantic. The delegates agreed on a programme and split merely on the wording of one paragraph in the statute. One group, of which Lenin was soon to be the undisputed leader, argued that membership must be restricted to persons "participating in one or other organisation" of the party. The other group advocated a looser formula admitting all those who would accept the programme and support it materially or otherwise.

Even the actors in the drama were not aware of the importance of the cleavage. Lenin alone possibly visualised that, if the revolution was to be successful in Russia, the

party must provide a general staff and disciplined cadres. The partisans of a broader, less disciplined party won the day at first and only after the departure of several delegates from the Congress did the group to which Lenin belonged gain the majority. They were, therefore, called Bolsheviks or majority men while their opponents were named Mensheviks or men of the minority. Many of the protagonists were soon to change sides, yet despite many efforts the gap was never bridged. Fourteen years later Lenin's Bolshevik general staff was to play a decisive role in the October revolution.

Revolutionary leaders have gone. Lenin died in 1924 and Stalin eliminated the others. History had to be rewritten in order to deny the role of Trotsky and the Bolshevik old guard and to make it all the work of Stalin and Lenin. Even the nominal link was broken last year when the Soviet Communist party ceased to be called Bolshevik. The reality of today may be far away from the dream of 50 years ago, yet the bastard children or grandchildren who now sit in the Kremlin do not deny the heritage. Indeed, the lengthy article issued by the propaganda section of the Central Committee and published this week throughout the Soviet press is above all a tribute to Lenin. History is still distorted since no mention can be made of the part played by all the "traitors." The time has not yet come for rehabilitation, but at least Stalin's shadow no longer dominates the whole picture.

Troubles of Middle Age

Obviously such an important document published by the Central Committee does not limit itself to a review of the past. It also surveys the present and the future. In this it says little new, but rather restates things which have already been said before. On the political front it emphasises the need for collective leadership and attacks the "cult of the individual." On the economic side it stresses the need to satisfy consumer demand and argues that Russia has all the basic resources necessary to carry out this task. Yet, there is a seamy side to this picture: "... entire branches of industry lag behind the Plan; collective farms and whole agricultural regions lie neglected." Coupled with recent accusations against Beria this could imply that there are difficulties in obtaining food supplies for the towns and that the collective farm system is facing some sort of a crisis.

Reviewing the international situation, the article again weaves a course between hopes of peaceful co-existence and the need to be always ready for everything. This time the emphasis is on "prolonged co-existence and pacific competition," but the need to insure the defence of the Soviet Union should not be forgotten since "the imperialist camp is full of contradictions, its economy is unstable and its leaders frightened of peace."

On reading the Soviet press nowadays one has the impression that the articles are the result of a compromise or that the editors have not been told definitely what line to adopt. From day to day there are changes in shade, in emphasis. Does this mean that the "collective leaders" are struggling over policy? Fifty years ago it was impossible to foresee that some emigré politicians arguing over a party statute were laying the foundations of the October revolution, that the Bolsheviks would rise to power in Russia. Now it seems impossible to foretell what use their successors will make of this power.

Negotiating at Panmunjom—II

FROM A SPECIAL CORRESPONDENT

FOR much of its history journalists seemed almost as essential to the proceedings at Panmunjom as the armistice delegations. They publicised what was said there, and the place had its own apparatus for helping them to do so. In the last stages this was changed, and the talks were held in secret. Whether progress was made because of this new-found discretion, or whether the delegations chose to work in silence because at last a truce had to be reached, it is perhaps too early to say. The latter seems the more likely. But the bickering that had previously gone on month after month at Panmunjom had at any rate been fostered by the daily publicity it was given. It was practically impossible for either side to make a concession without seeming to admit defeat. The routine at Panmunjom magnified differences that often had little to do with the supposed purpose of the negotiations.

Although almost every word said was repeated to the Press later, the proceedings were not public in the way that, say, those in Parliament are. For one thing, the frail-looking conference building would not have been large enough to hold even a quarter of the correspondents who went to Panmunjom on what promised to be critical days. There might be more than a hundred reporters, photographers, newsreel and television cameramen and radio commentators from the United Nations side alone.

The proceedings they went there to report were in a form that seemed almost ideal for expressing disagreement. They were more like a medieval disputation than talks, except that the delegations were arguing from completely different philosophies. One side would make a statement, of varying length, and the other would follow—and so on, with pauses for translation. Three languages were used in the negotiations—Korean, English and Chinese. It was not a suitable medium for the flexible exchange of ideas, and it was made even more unbending by the style the speakers used. General Nam Il was often pedantic and repetitive in the dullest legal way, and General Harrison was given to rhetoric.

During and after each session a transcript of the speeches was read out, usually verbatim, to the United Nations correspondents waiting around the conference building. This was done by information officers of the American forces who, unlike the journalists, were allowed to go into the meetings. They were questioned about how delegates had looked while they were speaking, and about what their reactions had seemed to be. Much of what was written about the atmosphere of the negotiations came from these information officers. General Harrison's comments and manner were yet another guide to how matters were going. By these means the United Nations made known their point of view, and incidentally, that of the Communists, who had their own retinue of correspondents. Once *Pravda* sent a correspondent who, unlike anyone else, had his own private car. These apparent trivialities meant a great deal.

There was one thing missing from the official apparatus of the place as far as the United Nations' correspondents were concerned—a Communist spokesman who would comment on the proceedings much as General Harrison did. Clearly this could not be done by an officer in North Korean or Chinese uniform, because anybody seen speaking to him

would have been looked on as a most suspicious character. So matters were arranged informally. Among the most regular attenders at Panmunjom were two British journalists writing for Communist newspapers in Western Europe—Alan Winnington, of London, and Wilfred Burchett, an Australian. They were as approachable as a good public relations officer. Every day, even before the delegates arrived, they would be surrounded by a dozen or more United Nations men anxious to know what General Nam Il's line would be and what the Communist view of future prospects was. They provided in advance texts of Nam Il's more important statements, and they were well informed. They seemed to be supplied with much of the correspondence of the main news agencies. On one occasion, for instance, they were able to give British journalists a full account of an important speech by Sir Winston Churchill that had been rather neglected by the American Army radio stations and newspapers. Winnington and Burchett were also factually accurate as far as the negotiations were concerned; and their facts and opinions were widely quoted by United Nations correspondents and credited to "a Communist spokesman," "North Korean sources" and so on. At one time the American authorities tried to ban these informal press conferences, but they failed.

Parish Pump Trivialities

In brief, Panmunjom was managed in such a way that it could be reported with a minuteness of detail that would have been practically impossible elsewhere. It was bedevilled by parish pump trivialities; everything seemed important.

But for anyone at Panmunjom the motives behind the negotiations were by no means as clear as the day-to-day details. The background was one of secrecy, conjecture and half-understood pressures. At times it was hard to say whether either side wanted a truce on terms that could conceivably be accepted by the other. With the Communists, this doubt was understandable, although last spring their policy often seemed the more consistent. Then, they were retreating with much-emphasised concessions towards the terms of the Indian proposal accepted by the UN General Assembly late last year. The aims of the United Nations did not seem as consistent. For instance, on May 13th its delegation put forward a new plan by which Korean prisoners refusing to go home would be set free as soon as an armistice was signed. This had not been part of its earlier proposals, and was rejected by the Communists, as it was bound to be. At the time there was no obvious explanation of why it had been made at all. It seems clear now that it was to meet the wishes of the South Korean government. But eventually it had to be withdrawn in the interests of reaching a truce, and its final result was to foster Communist suspicions that, when Mr Syngman Rhee released many of these prisoners, he did so with the blessing of the United Nations.

Such confusions were perhaps inevitable in the Panmunjom method of diplomacy, especially on the United Nations side, where the effects of negotiating by remote control were most felt, and where there were many different interests to be satisfied. It may turn out eventually, however, that Panmunjom at least helped to keep the war within the confines of Korea. But the lesson of discretion learnt during the past few weeks might be worth remembering when the political conference on Korea convenes.

(Concluded)

WEIGHT AND HEAT

OIL-BEARING ROCKS do not always release a flow when penetrated by the drill. In such instances the rock at the bottom of the borehole must be opened up by other methods. Early in 1949 this problem arose at an oilfield in Pakistan when drilling had reached a depth of 1½ miles! Deciding that explosives would have to be used, the oil company asked the I.C.I. organisation in Pakistan for assistance. Conditions in the borehole were such that the explosive, packed in a container 5 inches in diameter, would have to withstand temperatures close to the boiling point of water and a pressure of 4 tons per square inch. I.C.I. Nobel Division in Glasgow were given the facts and special explosives and blasting equipment were developed and sent out to Pakistan. These were assembled and placed in the borehole, under the supervision of an I.C.I. technical service mining engineer. The charge was fired and a column of crude oil, under immense pressure, shot 140 feet into the air.

HANGARS

are needed all over the world—

and S.M.D. is supplying them!

S.M.D. Aluminium Hangars are permanent buildings, directly competitive in cost with steel or concrete... plus STARTLING erection times... and, of course, no painting is required. Let us send you details.

ALMIN LIMITED - FARNHAM ROYAL - BUCKS
FARNHAM COMMON 595

Aluminium Hangars are built by S.M.D. ENGINEERS of Slough, the construction company of the Almin Group.

If it's Aluminium—ask Almin!

Another phase of AUSTRALIAN DEVELOPMENT

By 1953, it is planned, Australia will be refining approximately 7 million tons of crude oil a year.

THE BUSINESS WORLD

Industry's Fuller Purse

IN the early summer, copies of annual company reports plump with monotonous regularity through the letter-boxes of investors. In the quarter to June 30th, 941 of these reports, the largest number yet analysed in any one quarter, were received in this office. Their composite results and balance sheets, set down in detail on pages 351 and 352 of this issue, in the statistical section, are heavily weighted by the inclusion of the results of a dozen or so of particular giants—Shell, Anglo-Iranian, Unilever, Imperial Chemical and Dunlop among them—whose tentacles of trade reach out across the world. But the profit trends reported by these great cosmopolitans are not out of line with those reported by smaller companies at home; for the most part, these 941 reports, which broadly cover trading periods ending last December, fairly portray the trading and financial experience of British industry in the calendar year 1952.

Their analysis provides some odd contrasts, but no real paradoxes. Some people may claim to see a paradox in the first statistic of all: namely, that although the trading profits earned by these 941 public companies fell by just over 10 per cent (by £82 million to £728½ million), the equity dividends they paid after deduction of tax rose by nearly 11 per cent (by £7.9 million to £80 million). But this contrast is adequately explained by two facts. First, when directors decided on their dividend recommendations earlier this summer, they had some justification for looking back on the worst of the recession as a thing of the past. Secondly, even in the first half of 1952—the bleakest period—the fall in profits had been almost as much apparent as real; much of it had been due to the cessation in the rise of stock values, and it was accompanied by a notable strengthening of industry's liquidity.

Half-way through last year many of these companies,

especially those in close touch with the consumer clearly felt, like Shakespeare's Macbeth, cabin'd, cribb'd, confin'd, bound in to saucy doubts and fears. Many company chairmen reporting twelve months ago revealed openly just how cribbed they were. For many companies trade was slack, if not at a standstill; profits were small, if not yet turned into losses; and some companies, after having allowed stocks to pile up unsold for longer than they should, were having to reduce output for the first time since the war. Then, somewhere between Midsummer Day and Hallowe'en, as the inflationary impact of the budget deficit made itself felt, the pendulum began quietly to swing back again. By the end of the year trade was recovering; profit margins were widening; accumulated stocks were being sold off; and the fall in prices (particularly of raw materials) was being openly recognised as a blessing as well as a curse. In the profit and loss accounts of these companies the earlier recession (and the initial losses on stocks when prices began to fall) made a dark stain that the later recovery could not entirely wipe out; it was for this reason only that in almost all cases trading profits showed a fall.

A scrutiny of their balance sheets, however, shows that the fall in prices (and, to a lesser extent, a slowing down in the tempo of production) reduced the working capital commitments of these companies. This reduction in the book value of inventories, combined in some cases with decisions to postpone capital development programmes until cheaper money returned, enabled many of these companies to reduce their short-term debts and to strengthen their liquid balances. In many cases, too, money ploughed back into general reserves went straight into banking accounts, in direct contrast to the decision typical of 1951 of ploughing

back the money into stock replacement reserves, which meant its quick absorption in higher inventory investment. At the same time the high cost (or the positive difficulty) of borrowing from the banks prevented some companies from loosening their tight rein on their working capital commitments, and a higher rate of return on quoted investments and deposit accounts reinforced the desire for greater liquidity.

In all, therefore, the net "quick" assets of these 941 companies—that is, the total of their cash balances, tax reserve certificates, gilt-edged and other quoted investments less bank overdrafts and short-term loans—increased by nearly 11 per cent (by £75½ million to nearly £767 million). Across the wide range of British industry, Macbeth's saucy doubts and fears had given way to Othello's advice to put money in thy purse, and a mite more—though certainly still less than a farthing more out of every pound's worth of gross sales—into the pockets of shareholders.

The wheel of fortune did not come full circle nor did it swing at the same rate for all British companies—indeed, it would have been a poor reflection on the health of the British economy if it had. Table I shows the changes in trading profits, stocks, liquid assets and bank overdrafts and loans for the various industrial groups. Nine out of the twenty-three groups resisted the falling trend and reported higher profits last year. Six of them benefited directly or indirectly from the continued high demand for capital goods throughout most of the year. Among these were the building industry (with profits rising by nearly 19 per cent), the engineering industry (whose profits rose by

2 per cent), and the iron and steel companies (by 4½ per cent); among the rest were the electrical manufacturers (whose profits rose by 4½ per cent), the motor and aircraft companies (by over 3½ per cent), the shipping companies (by 13 per cent) and a small number of the public service companies (whose profits, shown under the heading "other companies," rose by 10½ per cent). In most cases, these advances in profits were associated with an increase in the tempo of production and were, therefore, accompanied by a rise in the book value of stocks and a decline in liquidity. Among the engineering companies, for instance, the value of stocks rose by 13½ per cent, but net "quick" assets dropped by 30 per cent. Similarly, the stocks held by the motor and aircraft industries rose by 25 per cent and their net "quick" assets fell by 21 per cent.

There are, however, two surprises in the table. First, it shows that the department stores (whose financial years ended for the most part on January 31st last) have been able not only to reduce their commitments in stocks and to reinforce considerably their liquid assets, but also to increase their profits by 7 per cent. This suggests that the really heavy losses on stocks occurred further back in the chain of production and distribution. Secondly, and this seems the oddest feature of all these statistics, the wool companies, whose stocks have been reduced and whose liquid assets have been strengthened, have scored the biggest percentage increase in profits. For the 20 wool companies reporting last quarter profits rose by no less than 56½ per cent; a year ago 16 wool companies reporting in the June quarter showed a fall in profits of 41 per cent. This

textile manufacturers by 38 per cent. Although declines in profits were reported by other companies in the consumption trades, the only groups that have fared as badly as this were the newspaper, paper and printing trades (whose profits fell by 37 per cent), rubber plantation companies (whose profits fell by 52 per cent) and tea companies (whose profits fell by 56 per cent). In

fact, the decline in profits has been the greatest where the fall in raw material prices has been the most severe. This, however, has brought its natural corollary of a fall in stock values and, in the case of the textile companies, of an improvement in liquidity. Only the plantation companies have reported a fall both in stock values and in liquid assets, and these are the only companies that have been forced to reduce their equity dividends at all sharply. A few of the companies in the consumption goods industries, more particularly those manufacturing textiles, have had to reduce their dividends; but 18 of the 23 groups have reported higher dividends, though some only on a higher capital and by a negligible amount.

★

How far does this mean that the freeze on equity distributions—occasioned partly by official requests and partly by the strain on industrial liquidity—is over? The Treasury—whatever its economic judgment—will obviously still continue to plead the case for restraint, on political grounds alone, for some time to come. But in an admirable and overdue official broadsheet* entitled "Taking Profits to Pieces," the Treasury has this week split down the sales revenue of a "typical manufacturing company" into the £951,375 that it reckons goes into meeting the wage bill, the tax bill and other costs against £26,625 that goes into reserves and against £22,000 that goes into gross dividends. The report boldly recognises that undistributed profits "help to make British industry more efficient and better able to meet foreign competition." It is notable that there are no similar kind words about dividends, but they do not come in for any dirty ones either. On more direct economic grounds, many company chairmen reporting in the last three months have not failed to warn shareholders that British industry is now building up its stocks again and that this must in time reduce its liquid balances. But so long as prices remain reasonably stable, the replacement of stocks should present no real difficulty; and if profits can regain their rightful place as a real test of industrial efficiency, the way will be cleared for equity dividends to act as the rightful arbiter of capital investment.

* "Broadsheets on Britain No. 30." Written by the Information Bureau of the Treasury.

QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

Tankers Galore

NEW tankers are being delivered this year from the world's shipyards at the rate—unprecedented in peacetime—of more than $3\frac{1}{2}$ million tons deadweight per annum even allowing for performance much short of plan. This influx of new vessels was planned, but it is arriving at a time when tanker freight rates are at a low ebb and there exists a definite surplus of tanker tonnage. Moreover, more than 60 per cent of the tonnage still under construction and on order in the world's shipyards consists of tankers. The question is obvious. What will happen if the slackening demand now being experienced for the sea transport of oil continues for any length of time? There is already about a million tons deadweight of tankers laid up or idle. Will there eventually be a wholesale scrapping of over-age tonnage together with cancellations of tanker building contracts, leaving the shipyards practically bare? Or will demand for oil absorb the existing surplus of tankers and eventually overtake the potential supply of tonnage?

Fluctuations from shortage of carrying capacity to surplus occur more frequently and more widely in the sea transport of oil than in dry cargo, largely because the tanker is the specialised ship *par excellence*. Crude oil and most refined products cannot economically be shipped in anything but tankers, and conversely, tankers are in general unemployable for anything but the transport of petroleum (though a few experiments have been made to build tankers that can be used for other cargoes, notably the building by Sweden of tanker/ore carriers). Hence transport costs by tankers, which can seldom get a return cargo, are higher than those in dry-cargo ships; more important, when tonnage is short, marginal oil cargoes can be moved only at very high rates or not at all, and when tankers are plentiful, owners must take rockbottom freights or lay up their tonnage. In the short-term, therefore, free "voyage rates" for tankers—which affect only a small proportion of the oil moved by sea—can fluctuate more widely than dry-cargo freights. In the long-term, given the time that is required to build tankers to relieve a shortage, there is an inherent possibility of alternate periods of shortage and surplus in the size of the world's tanker fleet.

When only tankers of 2,000 tons d.w. and over are taken into reckoning, the world fleet today adds up to about 34 million tons d.w. This is just over double the deadweight capacity of the world tanker fleet at the outbreak of war in 1939 and about $2\frac{1}{2}$ times as much in carrying capacity. Table I shows the distribution of tonnage by flags in the year when war broke out, the year after the war and at the end of last year. The main features of the changes that have taken place, apart from

the general expansion of tonnage, are the wartime growth and postwar decline of tankers registered in the United States, and the increase since the end of the war in tonnage registered under the flags of such countries as Panama, Liberia and Honduras. Although the British, American and Norwegian fleets are now much bigger than they were in 1939, they account for only 60 per cent of the total, compared with 72 per cent of the world tonnage of tankers in 1939.

The commercial tanker fleet is owned either by the oil companies themselves, by governments, or by independent companies that depend for their prosperity mainly on chartering their vessels to the oil companies. Before the war, the oil companies themselves owned approximately half of the total tonnage, but since the war the proportion of independently owned tankers has considerably increased. Table II analyses the ownership of tankers under various flags as at December 31, 1952. The figures comprise tankers of 2,000 tons d.w. and over, and the table excludes tankers owned by governments, which at that date totalled about 3,400,000 tons d.w., of which about 1,700,000 tons were owned by the US Government, 500,000 tons by the United Kingdom, 350,000 tons by Argentina, 200,000 tons by Spain and 184,000 tons each by Mexico and the USSR.

Of the total of 13,266,000 tons owned by the oil companies, about $7\frac{1}{4}$ million tons belong to United States oil companies; of this $7\frac{1}{4}$ million tons $1\frac{1}{4}$ million tons was under the flag of Panama, a million tons in British Empire registry, 167,000 tons registered in the

Netherlands and 216,000 tons in Liberia. American oil companies also own 124,000 tons registered in France and 100,000 tons in Venezuela. The American oil companies, therefore, appear to be in direct control of about 58 per cent of the total tanker tonnage owned by oil companies. The latest available figure for the fleets owned by the British Tanker Co. Ltd., the tanker operating subsidiary of the Anglo-Iranian Oil Co., Ltd., is 1,903,000 tons d.w. (on February 19, 1953); and by the Shell and Royal Dutch group, whose fleets operate mainly under the British and Netherlands flags, 2,533,000 tons d.w. (on December 31, 1952).

★

The proportion of tanker tonnage owned independently has thus greatly increased since the war. The greater part of it is owned by European companies, particularly in Norway and the United Kingdom, which operate nearly 40 per cent of the world's total tonnage of independent tankers. Since the end of the war a large block of privately-owned independent tonnage has grown up under various flags such as those of Panama and Liberia, operated mainly by Greek nationals, who also operate tonnage under various other flags. This trend is continuing, if the appearance of the tanker building order book is anything to go by. Of the 15 million tons d.w. of tankers still under construction or on order at the beginning of this year, it is estimated that no fewer than 11 million tons d.w. were destined for independent owners—of which nearly $3\frac{1}{2}$ million tons were for operation by Greek and other independent owners under various flags. Too much reliance cannot, however, be placed on the composition of the order book, since contracts for tankers can be bought and sold, and also cancelled. Since the beginning of the year, for example, several contracts for tankers have been cancelled by independent owners. The striking feature of the tanker building programmes since the war, however, is that construction for independent ownership has been proceeding at roughly twice the rate of construction for the oil companies. The independent tankers are now owned mainly by a large number of companies operating small fleets of tankers, often single tankers, but many dry-cargo tramp owners are adding tankers to their fleets, and certain independent owners are building up large groups of tankers, often under a number of different flags.

The general practice of most oil companies is to provide for their sea transport requirements in three ways—by building and operating their own tankers; by taking independently owned tankers on charter for comparatively long periods; and by the "spot" or voyage chartering of independent tankers to cover marginal requirements or immediate shortages. For example, it may sometimes be more economical for an oil company to charter an "outside" tanker for a particular voyage than to divert one of its owned or chartered vessels. Moreover, it may be more profitable

for the company to hire out one of its own tankers than is particularly well placed to suit the immediate requirements of a competitor. When an oil company finds its own tonnage more than sufficient for its own present requirements, it will itself put tankers on the market.

Under long-term charters, tankers may be chartered for periods of up to 10 years or more, though the more usual fixtures are of 5-7 years' duration. The ship-owners benefit, for these long-term charters at reasonable rates, often fixed before a vessel is built, have assisted them to build up their fleets and finance their expansion. For several years this method has provided a considerable incentive towards profitable investment in tanker tonnage on the part of shipowners and an attraction to the business for private and institutional investors. It has had obvious advantages for both parties—the oil companies and the independent ship-owners. For the oil companies, it has helped to spread the capital investment and the capital risk, and has not committed them to potential losses for more than a few years, should the world demand for oil products not live

up to reasonable expectations. For the tanker owners, it has helped to secure financial cover for the initial outlay on building tankers by reducing, or in many cases eliminating, the possibility of loss on the deal.

The fluctuations of supply and demand in the tanker market, however, have never proved predictable for any length of time; and these fluctuations can occur far faster than the supply of tonnage can be adjusted, since, on the one hand, tankers take a comparatively long time to build and, on the other, even distant prospects of profitable employment tend to prolong the life of older vessels that are becoming uneconomic. The world tanker market has now arrived at a period of a market maladjustment between actual demand and potential supply, and it may be on the threshold of another important change in the planning of oil transport by sea.

Business Notes

Truce and After

RARELY has an event of the importance of the cease-fire in Korea been so long in preparation; and few decisions of such potential consequence have left so many questions still to be answered. What happens now in the political discussions? Does the truce itself hold out any tangible hope of a general settlement? These will be the deciding factors governing trade and investment decisions for many uncertain months to come. Obviously the truce adds a minor depressing influence to the many that now afflict basic commodities; but their fantastic boom two years or more ago was not a direct consequence of the Korean war so much as a feverish response to the possibility—as it then appeared—of war on wider fronts. The correction in commodities has been proceeding even longer than the truce negotiations, and if guesses had to be hazarded they would suggest that industry throughout the world was now carrying a cautious load of stocks.

On this argument, and given the continuing signs of high demand and tender monetary policies in many parts of the western world, no painful disturbance of commodity prices was to be expected from the signing of the truce itself. It is true that rubber becomes more depressed, and has lost three farthings this week to touch 18½d. a pound. But the net reaction in tin, now £575 a ton, has been limited to £7 compared with last Friday's price. Lead and zinc have been firmer; cotton and wheat are holding their recent prices and jute is higher. And on the eve of the reopening of the copper market, all the signs suggest that sellers will not throw copper on the market at bargain prices.

Security prices have shown little response to the truce. Not until mid-week was any perceptible improvement apparent in the gilt-edged market. Industrial equities, again, were this week looking to America and to economic and monetary conditions at home, rather than to the far distant East. They have reached the conditional conclusion to "stay put," and they may not be wrong. Truce in Korea can hardly affect defence policy and spending; it may bring further demands for exports to aid in reconstruction, of which the £500,000 order received by the Austin Motor Company is an early example. Perhaps the basic fact for investors is that the emotional hopes of world "peace" of a few months ago have considerably waned. They can concentrate their attention on events nearer home, and on recent indications they will find at least some grounds for cautious satisfaction.

Ayr Asks Too Much

THE first county authority to take advantage of the new freedom given to local authorities to borrow in the open market instead of from the Public Works Loan Board has been given a chilly reception by the Stock Exchange.

The subscription lists for the new £3 million loan by the Ayr County Council remained open throughout banking hours on Wednesday, and 60 per cent of the issue was left in the hands of the underwriters. The Ayr County Council clearly had hoped to take advantage of the rise in gilt-edged prices that had taken place since the Bristol issue of a 4 per cent stock (1968-71) at 96½ was made and they offered the new stock at the same coupon rate with a slightly longer life and at a smaller discount. Their new 4 per cent stock is dated 1970-72 and was offered at 97½, to give a gross redemption yield to the latest date of £4 3s. 10d. per cent. Moreover, the discount for payment in full—a point to which trustee and pension fund investors attach some importance—was lower than that offered on the other recent local authority loans. The terms of this loan, then, did not offer any inducement to subscribers unless a strong advance in gilt-edged prices occurred. The Ayr County Council cannot be blamed for thinking in Scottish terms, but neither can it complain at the discount of ½ in the opening dealings on Thursday.

The Production Record

IN the first six months of this year, industrial output in Britain appears to have been about 4 per cent higher than in the first half of 1952, and no less than 7 per cent up on output in the second half of last year. Comparison of the second quarters of the two years also puts this year

about 7 per cent ahead, on the basis of provisional figures for May and "information so far received" for June. The comparison with 1951 is not so impressive, but still favourable; on the first six months, production this year is between one and two per cent higher, and for the second quarter it is nearly one per cent higher. The chart shows

the "all industries" index over the two and a half years, taking two months at a time, which partly smooths out the effects of holidays. But it is worth noting in comparing the second quarters of each year that this quarter contained one public holiday in 1951, two public holidays in 1952, and three—including the Coronation—this year.

Output in the manufacturing industries as a group from January to May was about 2 per cent higher than in the first five months of 1952, if not quite as high as in the same months of 1951, and though May included a public holiday this year and did not last year, the month's manufacturing output was 5 per cent up. No component indices are yet available to show the industries in which production was increasing most; estimates of numbers employed suggest that these might be textiles, plus perhaps certain other consumer goods industries that have been given a fillip by reflation.

It is difficult to trace employment figures over more than about 18 months at any time, owing to the method of annual revision employed by the Ministry of Labour; but six-monthly averages of the employment in industries covered by the production index, continuing an official series published some time ago, would suggest that the number of people employed in these industries taken together has remained remarkably steady over the last 2½ years, despite the temporary growth of unemployment last year. It is only fair to add that this index, when set beside six-monthly averages for total industrial output, would suggest that "gross industrial productivity," which fell a little between the first and second halves of 1951 and rather more sharply between the first and second halves of 1952, has since recovered sharply. The rise may reflect the degree of under-employment in industry late last year, and the extent to which slack taken up as industrial plant is used to fuller capacity can bring about a comparatively "painless" increase in productivity.

Trends in Bank Deposits

DESPITE outward appearance to the contrary, there is no reason to believe that the upward trend of bank finance to industry and trade is being checked. The London clearing banks' statement for the first fortnight of July does show an unseasonal fall in net deposits by nearly £10 million (to £6,013.7 million); and, for the third month in succession, a drop in advances—this time of fully £33 million. But these figures give a wholly misleading impression of the actual trends in the supply of finance to the "private sector." The apparent fall in the advances item in this period is in part an illusion since at the end-June make up date an extra large amount of cheques-in-transit (from branch to branch of the same bank) always swells the advances figures at the half-year. To judge from the experience of Lloyds Bank—this is the only bank that show advances "clean" of transit items—the true fall in bank advances in the first half of July may not have been more than about half of the apparent fall of £33 million. Moreover, a true fall of, say, £16 million or so would still not be an accurate reflection of the credit demands of private industry, since the advances figures were influenced by the

final call (of £31¼ million) on the BEA loan on July 15th. As in May and June, this operation inverted what was probably an actual rise in private credit demands into an apparent fall. All in all, with commercial bill portfolios and investments fractionally higher, the steady increase in the credit demands of the private sector appears to be continuing.

The sphere in which credit restraint is now being exercised is the public sector. The Government's borrowing from the banks (broadly reflected in the movement of cash, call money and Treasury Bills) rose by only £23 million in the first half of last month—so that net deposits fell for the first time at this season since 1948—whereas in the corresponding period of last year "public sector assets" rose by £72 million. This improvement presumably reflects the more favourable position of the Budget accounts, small savings and tax reserve certificate repayments, but it is difficult to assess its precise significance. Should it prove to be due to "technical" factors which might be expected to reverse themselves later in the financial year, the expansion of "private" bank credit will necessarily call for all the closer scrutiny.

New Taxes for South Africa

THE main feature of the budget presented to the South African parliament last week is new taxation designed to yield £11,400,000 in the current year. This new money is required to finance record "loan" account estimates of £92 million in respect of essential capital works that have accumulated since the war. Mr Havenga proposes to transfer a prospective ordinary surplus of £18 million in the new financial year to the loan account, together with the surplus of £14,800,000 from last year. But adding in the Treasury's resources in the hands of the Public Debt Commissioners, some £26,600,000 will still have to be found from public loans, and of this no more than £8 million at the outside can be expected from external sources. The Finance Minister's reservations about his budget arithmetic are well expressed in his remark that "the Treasury will make an earnest endeavour to find this amount in a way which will not cause inflation." The balance seems to be precarious.

Mr Havenga's problem (discussed in detail on page 329) is the more difficult because he must meet an increase of £10 million in ordinary expenditure compared with last year. More than £4 million of this represents additional subsidies to the provincial governments and additional defence expenditure; but there has also been a general rise in administrative costs. The Government intends to hold food subsidies at their present level and has permitted the price of bread to rise by 2d. per loaf.

The new taxes include a compulsory savings levy which takes three forms: a flat rate of £6 per head on incomes above specified levels; an increase in surcharge rates from 20 to 30 per cent; and an increase in company tax on all companies except gold mines of 6d. in the £. The levy is repayable after five years and carries interest at four per cent, payable at the end of the period; certificates will be issued but will not be transferable. There are new excise duties on motor-cars assembled in the Union of 6d. per lb, and on motor tyres of 3d. per lb, and the petrol duty is

increased by 3d. per gallon. Import duties on equivalent imported goods are to be increased accordingly. Transfer duties are to be raised from 3 to 4 per cent.

The budget is designed to be disinflationary, but its success will depend not on resort to a compulsory savings levy, but upon the eventual degree to which "loan" account expenditures are eventually covered. Furthermore the increases in excise duties, the price of bread and rail rates (of 13.63 per cent) will cause an immediate rise in the price level and may encourage an inflation of wage costs. In consultation with the Treasury and the Reserve Bank, it has been decided to leave untouched the existing pattern of money rates. But if things do not work out according to Mr Havenga's hopes, the only recourse will be to the monetary weapon.

Loan to Pakistan

PAKISTAN'S dire shortage of sterling is to be eased by a United Kingdom Government credit of £10 million, bearing interest at 4 per cent and repayable over a period of 10 years. The money is to be made available under Export Credits Guarantee Department procedure—the department providing 100 per cent guarantee of the amount in question. The loan is intended to provide finance for the purchase of a defined list of capital goods, and aims at fostering greater agricultural production and not encouraging uneconomic secondary industries. The balance of payments plight in which Pakistan now finds itself is in part due to circumstances outside Pakistan's control—a succession of poor harvests and the severe fall in the prices of jute and cotton. But part of its troubles is due to some ineptitude in domestic economic policy, of which the outstanding symbols have been an unbalanced budget, reliance on central bank credit to cover this deficit, and excessive development of inessential industries such as the construction of jute mills to by-pass Indian mills in the making-up of Pakistan jute. Pakistan's policy, as illustrated by these examples, has created a considerable inflationary pressure that must take a considerable share of the blame for the balance of payments difficulties alongside the share that can be fairly attributed to external factors over which Pakistan had no control. With the help of the British credit and of the gift of one million tons of wheat by the United States, Pakistan is being given time and an opportunity to put sounder policies into effect.

Logic on Trust Issues

THE Chancellor's letter to the chairman of the Capital Issues Committee relaxing the controls on new issues by investment and unit trusts throws the reins over the horse's head; it can now walk forward but it can be prevented from galloping away. For some time after the war new issues by the trusts were banned completely on the totally illogical ground that to raise new capital for mere "finance" would draw off resources needed for recon-

struction. Then the trusts were allowed to hobble forward by extending to them the freedom to issue any amount of new capital up to £50,000 in any one year. But in the end, truth and common sense prevail. The Chancellor now argues that

the time has come when some departure from the rigid application of this policy is desirable, having in mind the part played by the investment trusts in the supply of risk-bearing capital for industry and the need to encourage savings at the present time.

The Capital Issues Committee has, therefore, been given the power to authorise "in appropriate cases" any issues of over £50,000 by investment and unit trusts.

This wording still leaves considerable discretion with the Capital Issues Committee and it is to be hoped that irksome distinctions between applications, based on the purpose of the issue, will be avoided. The timing of this direction has suggested to some in the City that the new freedom will enable the trusts to take part in any new issues arising from the denationalisation of the steel industry and the road haulage services. But the role that the investment trusts are likely to play in the unscrambling process may only be a minor one. It is much more important that the Government has removed a senseless handicap to risk investment, and has opened to those savers whose needs are well suited by investment trust or unit trust securities an appropriate way towards new ventures.

What Price Copper?

ON Wednesday morning "Copper, gentlemen, copper" will be called across the ring in the London Metal Exchange. Then, for what are certain to be five hectic minutes, members will deal in copper for the first time in fourteen years, the news of "London copper" will again be flashed round the world, and the last of the leading non-ferrous metals will have been restored to the exchange (tin was freed in 1949, lead in October last year and zinc on January 1st this year.). What the actual price will be is anyone's guess, but it appears unlikely that it will go much below £235 per ton, compared with the Ministry of Materials' existing price of £252. There is a steady demand in Europe and the United States on the basis of £240 per ton (30 US cents per lb) for prompt delivery, and a London price below £235 would probably encourage producers to offer in the American and other world markets.

Consumers' stocks in Britain, at about 11,000 tons, are low, and cash copper should be in fairly brisk demand. The forward quotation for three months' metal is likely to be at a discount of about £20 per ton, which would roughly correspond to the forward position in New York. It is believed that producers will not have much copper available when the London market reopens, and though the Ministry has an obligation to supply the market and industry until the pipeline is full, it will not press its stocks on the market at any price. The Ministry has announced that it expects to release some 60,000 tons, but not all of this will be offered to the market; it is understood that a good deal has already been sold direct to industry at prices that will be based on the market price in the appropriate month.

The Peoples of the East

Branches of The Chartered Bank of India, Australia and China, under British management directed from London, are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East and the Bank's clientele is drawn from all the peoples of the East who engage in commerce and industry. The offices in London, Manchester and Liverpool are linked directly to the Bank's overseas organisation and they are fully equipped to provide the banking facilities and information services required by merchants and manufacturers in the United Kingdom who trade as exporters or importers with:—

Borneo	Hong Kong	Japan	Sarawak
Burma	Colony	Malayan Federation	Siam
Ceylon	India	Pakistan	Singapore Colony
China	Indonesia	Philippine Republic	Viet Nam

London, E.C.2, England

THE FINEST SERVICE FOR ALL
CLASSES OF INSURANCE

The "Alliance" has representatives throughout the United Kingdom, British Commonwealth and elsewhere abroad.

Canteen Kitchen showing 4-oven 701 range, G3 grill on stand, 803 roasting ovens and elevated general-purpose ovens.

*For Gas, Electricity, Oil,
Steam or Solid Fuel,
Falkirk Heavy Duty cooking equipment*

EVERYTHING YOU REQUIRE is included in the Falkirk Range of Equipment — be it a complete kitchen installation for a luxury hotel or merely a replacement item for a small canteen. There are Falkirk cooking appliances for use with every known type of fuel: gas, steam, electricity, solid fuel and oil.

Strongly constructed from really tough cast-iron, all Falkirk Equipment will stand up to the heaviest wear. It is labour saving and extremely economical in space.

Ask the Falkirk people for a quotation. You will be pleasantly surprised at their competitive prices.

WE'RE INVITING INVESTMENTS and this is why!

More houses are going up. More purchasers are asking building societies for advances to pay for them.

In the past six months this Society has agreed to lend £3,804,000 for the purchase of 2,582 houses newly built or in course of erection.

Money saved and invested with the Society is thus being used to good purpose.

Still more savings can be used. The interest offered is 2½% with income tax paid by the Society—equal to more than 4½% where the investor is liable for tax at the full standard rate.

If you would like particulars please write to the

It will be interesting to see how the New York metal trade, which was critical of the London prices of lead and zinc until these recovered, will respond to the London movements in copper. A lower price here should hasten a reduction in the Chilean price, which is still held well above all other world levels at £284 per ton (35.50 cents per lb). The Chilean Government is finding it difficult to export the metal at this price. Some 60,000 tons have had to go into stock, and the American Kennecott company has cut production by 30 per cent at its El Teniente mine in Chile. The Chilean Government's reported offer to sell copper at a price "in accordance with its true value" to any country including, it is believed, East European countries, may foreshadow a weakening in its pricing policy.

New Bases for Middle East Crude Oil

RECENT confusion in the prices of Middle East crude oil now seems to be settling down and fairly uniform prices are emerging. At times since July 10th, when Gulf raised the price of its Kuwait 31 deg. gravity crude by 25 cents to \$1.75 a barrel, there have been four different prices. Now, it would seem, the general level for Kuwait crude is emerging at \$1.72, with Socony-Vacuum (which did not raise its price until last week-end) standing at this moment a few cents higher. Prices of Arabian crudes of 36 deg. gravity are similarly settling at \$1.97, fob Persian Gulf ports. Of the difference, 10 cents is immediately accounted for by the 5 degree difference in gravities and the rest is in the nature of a quality premium. The following table traces recent changes in Kuwait crude, and also those in Iraq or Arabian crude at Eastern Mediterranean outlets:

MIDDLE EAST CRUDE OIL PRICES				
Company	Kuwait 31° f.o.b. Persian Gulf		Iraq-Saudi Arabian 36° f.o.b. East. Mediterranean	
	Effective	\$ per bbl.	Effective	\$ per bbl.
Anglo-Iranian	15.7.53 16.7.53 16.7.53*	1.50 1.75 1.72	15.7.53 16.7.53 16.7.53* 16.7.53*	2.29 2.54 2.44 2.39
Socony-Vacuum ...	23.7.53 24.7.53	1.50 1.75	23.7.53 24.7.53	2.29 2.39
Shell	16.7.53 17.7.53 20.7.53	1.50 1.75 1.72	19.7.53 20.7.53 20.7.53*	2.29 2.44 2.39

* Effective from date shown though announced later.

In the Eastern Mediterranean prices of 36 deg. gravity crudes from Iraq or Saudi-Arabia have settled down on an apparently firm basis of \$2.39 a barrel. It took Anglo-Iranian three changes to reach this figure, after first raising its price by 25 cents and then dropping it by 10 cents and 5 cents. No doubt the deciding influence was that of Socony-Vacuum which waited for more than a week after the first moves and then posted a 10 cents increase. As a result of the jockeying of the last fortnight, therefore, Persian Gulf crudes are up by 22 cents and Eastern Medi-

terranean crudes by 10 cents, the differential for 36 deg. crude from the two sources being 42 cents a barrel. It seems doubtful if, in the long run, this is a sufficiently big margin. Perhaps the first attempts to obtain a 25 cents increase for Eastern Mediterranean cargoes (which would have given a differential of 57 cents) were based on the prospect—more reasonable now than it seemed a fortnight ago—of a firmer trend in spot tanker freights. At spot tanker rates of, say, USMC minus 20 per cent, compared with recent rates equivalent to USMC minus 50 per cent, the differential would have to widen—though it could do so in a number of different ways.

Sterling in World Trade

AMONG the few nuggets of virgin gold to be found in the annual report of the Bank of England are the statistics referring to the transferability of sterling. The information on the use of sterling in international trade outside the sterling area is given in greater detail than usual in the latest report. There was some reduction in 1952 from the previous year's high level of transfers of sterling between countries outside the sterling area both under the automatic facilities and under the administrative facilities made available by the Bank of England. The amounts transferred, which exclude all transfers to and from American accounts and between countries in the same monetary area were:

STERLING TRANSFERS (£ MILLION)				
	1949	1950	1951	1952
Automatic facilities	144	143	241	209
Administrative facilities ..	125	155	222	170
	269	298	463	379

The report points out that Egypt, the Netherlands, the Italian monetary area and the Scandinavian countries again made considerable use of transferability. Transfers of sterling to and from countries participating in the OEEC are shown below:

TRANSFERS INVOLVING OEEC COUNTRIES (£ MILLION)				
	1949	1950	1951	1952
Between OEEC countries .	48	78	112	78
By OEEC countries to other countries outside the Sterling Area	48	59	82	63
By other countries outside the Sterling Area to OEEC countries	101	99	179	168

The downward drift in these figures can in part be attributed to the fall in commodity prices. In 1952, however, there was a further increase to £151 million, as compared with £125 million for 1951, in the total of United Kingdom merchanting transactions conducted on a sterling

basis between non-sterling area countries. This is a reassuring token of the rebirth of third-party operations made possible by the reopening of free commodity markets in the United Kingdom. The transactions under various "commodity schemes" (by which term the exchange control arrangements in the London commodity markets are known) were down last year, but this was largely a result of the short-lived restoration of commodity arbitrage in August, 1952. The larger part of the total purchases made under this arbitrage venture, which amounted to some £60 million, is excluded from the figures of sterling commodity operations because it was effected by British merchants in dollars. The report points out that while sterling transactions between non-sterling area countries under the coffee scheme were down from £21 million in 1951 to £17 million in 1952 this reduction was more than accounted for by the smaller business in Brazilian coffee. Under other commodity schemes, transactions in sterling between non-sterling area countries remained at approximately the same level as in 1951, despite falls in rubber and tin prices.

Jubilee Quotation for Aluminium Ltd.

FITTINGLY enough, Aluminium Limited has chosen to secure an official quotation for its nine million no par value shares on the London Stock Exchange in the year of its silver jubilee. But the reason for this application by the world's largest producer of aluminium transcends any desire to celebrate the passing of one milestone in its history—a history that is illuminated in a publication, "Aluminium Panorama" recently sent out to shareholders. Nor is this application—the first to be made by a Canadian company since the war—to be construed merely as a symbol of the company's ambition to encourage the ownership of its shares in every country where its subsidiary companies are located or its principal markets are found.

So far the shares of Aluminium Limited have been dealt in on the London Stock Exchange under Rule 163 (which permits dealings in securities already listed in stock exchanges overseas) and shareholders in this country have been able to subscribe new money for the company only by the roundabout and not inexpensive route of buying

D-marks, against which dollars for the new investment could finally be purchased. To raise new money directly in this country Aluminium Limited therefore needed both an official quotation on the London Stock Exchange and the approval of the Treasury. Both these objects the company will now secure. Up to £2 million may now be raised by an issue of shares in Aluminium Limited in this country; the proceeds of the issue, which will rank as an "approved dollar investment," will be advanced to the British subsidiary, Aluminium Union Limited. This new money may well be needed to finance the company's bigger working capital commitments now that trading in aluminium has been surrendered by the Government to private concerns. The Treasury's nod of assent to such an issue is a logical outcome of its desire to make the road to private trading easy; it has already been exemplified by its acceptance of a 4 per cent note, worth £4,918,540 and not redeemable until the end of 1955, against the purchase of stocks of aluminium ingots by Aluminium Union from the Government.

More Red Matches

THE agreement by which imports of Russian matches up to a value of £500,000 in the next twelve months may be exchanged for exports of woollen and worsted textiles to Russia did not arise from the President of the Board of Trade's announced intention to "explore without delay the possibility of removing some of the obstacles to competition in the match industry"; but it may well conform with that intention. In fact, the agreement originated when a British trading organisation approached the department for assistance in importing the matches and the British match importers and textile exporters concerned are dealing directly with the Soviet trading organisation, given a blessing and promised the import licences by the Board of Trade.

At current landed prices, £500,000 would buy perhaps 2½ million "short standards" of Russian matches, which is about as many as Britain imported from all sources in the first six months of this year (a "short standard" for purposes of duty is 7,200 matches, roughly corresponding to a gross boxes of matches). The country lights about 18 million gross boxes of matches a year, about 12 million being produced here and about 6 million imported; the recent Monopoly Commission report on this industry stated that the British Match group accounted for about 87 per cent of home production and 89 per cent of imports in 1949-50, but in the twelve months ended March 31st last BMC accounted for only about 82 per cent of the matches imported. "Competitive imports," from sources or through importers not associated with the British Match or Swedish Match combines, have recently increased; even so, in 1952 they totalled only just over a million gross boxes. The imports envisaged from Russia alone would be more than double this figure; if the whole quantity is brought in, it will be more than ten times as many matches as Britain imported from Russia in 1952. Together with the substantial imports from other countries, it might also imply a potential surplus of matches on the British market. With duty taking more than a penny a box on matches made here and not much less than 1½d. a box on imported matches, the chances of the ordinary box of safety matches costing less than 2d. apiece are remote; but some price competition has already developed in the sale of packets of a dozen boxes.

In June, the wholesale prices of matches made by or imported by the British Match group ranged between 18s. 6d. a gross (for Italian matches) and 20s. 1d. a gross; Russian matches were being offered at 18s. 6d.; but Austria, Holland and Hongkong were offering "competitive" matches cheaper than this, though some of the boxes they supplied contained only 43 matches against the normal average of 47 matches in a box.

Employers Stay Apart

THE idea of merging the Federation of British Industries and the British Employers' Confederation arose in discussions during the war, and was accepted in principle by both organisations in December, 1946. The confederation had already moved its offices to the FBI headquarters in Tothill Street, Westminster, and a joint committee was set up to "prepare a complete scheme for fusion." Last week the committee finally reported that the whole idea of amalgamating the two organisations should be abandoned, though the two organisations will work in close co-operation; accordingly, the British Employers' Confederation is to find new offices.

The main interests of the two organisations have always been quite distinct. The confederation has been concerned primarily with labour negotiations on wage problems and the like; its membership is composed, in fact, of the employers' organisations that negotiate with trade unions for their different industries. The federation, which has individual companies as members as well as trade associations, is not concerned with wage negotiations, though it has a good deal of contact with trade unions and the TUC on general economic and commercial questions affecting industry as a whole. The two bodies have grown up in different ways, which create difficulties in merging them. The joint committee reported last week that these difficulties could have been overcome, given a general feeling that the benefit of fusion outweighed the disadvantages of altering the organisations' structures; but "there is much less certainty on this point than existed six years ago among the members of the two organisations."

Is Sulphur Still Scarce?

THOUGH sulphur in the form of sulphuric acid is vital to a wide range of industries, periodical statistics about its consumption, production and development throughout the world have never been published regularly. Much valuable information has come in the past two years from the International Materials Conference in Washington, but this source ceased when the Conference ended the allocation of sulphur last March. The Sulphur Exploration Syndicate, formed in Britain in 1951 by nine leading consumers of this chemical, is therefore to be congratulated for making available to all the information it collects for its own members, in a quarterly bulletin. In the first issue, published last week, the Syndicate cautiously estimates that in 1953 world production of sulphur in all forms will rise by 500,000 tons to 12.7 million tons, and that consumption will rise by 1.1 million tons to 12.5 million tons. This would leave a surplus of 200,000 tons compared with

800,000 tons in 1952, when the recession in textiles and other industries reduced the demand for sulphur.

During 1954 and 1955, production and consumption of sulphur are both expected to increase at the rate of 4½ to 5½ per cent per annum, given no violent fluctuations in trade. The present level of exports from the United States may diminish. Increased requirements elsewhere will be met primarily by additional production of acid from pyrites, augmented by the expansion of sulphur recovery—which is being developed notably in oil refining. Supply and demand are therefore expected to be in precarious balance up to 1955. Since there is general agreement that supplies of low-cost sulphur from America will decline, the development of alternative sources is essential for European countries, particularly Britain. Failing significant new discoveries, the Syndicate considers that the present alternatives lie between obtaining more elemental sulphur from other known deposits, or expanding supplies from recovery and by-product sources. It considers certain other forecasts of sulphur supply and demand, such as those made recently by a committee of OEEC and by Mr Langbourne-Williams of the Freeport Sulphur Company, too optimistic; and itself holds that sulphur recovery offers the most economic alternative.

Cocoa Boomlet

OLD crop cocoa is enjoying a little boom. Demand continues to be strong and with the season almost over, little of the old crop is still to be had. There will be no carry-over of cocoa from the 1952/53 crop year; this has been true of virtually all postwar years. The shipment price of Accra cocoa has recovered from 230s. per 50 kilos c.i.f. Continent last February to about 305s. this week mainly on account of two developments that began at that time. In Britain, the Government announced the end of rationing and price control of confectionery. Consumption of sweets responded quickly, and manufacturers have substantially increased their purchases of cocoa beans and butter. In Brazil, the Government introduced a free currency market, which made Brazilian cocoa products very competitive in world markets, and exports have increased. This in turn stimulated the demand for Brazilian beans. In the past few weeks world cocoa prices have strengthened further as some Continental countries, particularly Germany, and the United States sought to cover their requirements.

The market in new crop cocoa, shipment of which does not begin from West Africa until October, has in consequence been more active than usual at this time. The West African marketing boards are well sold forward, and now appear to be unwilling to add to their commitments for the moment. At the end of June the price of Accra new crop cocoa opened officially at 260s. per 50 kilos c.i.f. for October/December shipment, and has now advanced to 270s. There has also been considerable activity by dealers, which has raised the price on the London market to about 272s. A firm outlook for the new crop is not necessarily indicated by recent developments. Much will depend on the crop estimates published by the Gold Coast and Nigerian Governments at the end of September, since output from these two Colonies accounts for over half the world's supply.

Source: "Basic Statistics of Industrial Production, 1913-1952." (OEEC Statistical Bulletin.) Base of index numbers changed to 1900 as 100.

SHORTER NOTES

During the next four months, Ford Motors proposes to ship about \$3 million worth of its new diesel tractors to the United States, and preliminary estimates for next year suggest that American sales of the tractor may earn about six times that amount of dollars. The tractor will eventually be handled by 2,700 Ford dealers throughout the United States; shipments will go direct from the Ford wharf at Dagenham to Houston in Texas, to New Orleans and later through the Great Lakes to the wheat belt. Even with these freight charges, the company believes it will be able to offer these tractors to American farmers at prices below those of a similar machine produced in the United States; its initial shipments, indeed, are already on the way to Birmingham, Michigan—only about 10 miles from Detroit.

If weather this winter becomes no more severe than what the British Electricity Authority calls "average cold spell" temperatures, there should be no need for load-

shedding from the power system, though voltage reductions will still be necessary to close the gap of some 1,400,000 kW between the plant capacity available and the potential total demand for electricity at the winter peak. Weather of extreme severity, which would raise the possible gap to 2,100,000 kW, would mean that some 400,000 kW would have to be shed by disconnection of supplies. In these circumstances, no national "target" of load-spreading is being formulated this year; regional boards have been given discretion to make such arrangements as seem necessary with industry in their area.

As a result of Turkey's present balance of payments difficulties, the Export Credits Guarantee Department has limited the cover for new exports to Turkey and has raised its premium rates. To reduce the prolonged delays in payments, Turkey is restricting its imports from OEEC countries and is examining future import arrangements in conjunction with OEEC.

Company Notes

GENERAL ELECTRIC. The sombre story outlined in the full accounts of General Electric for the year to March 31st last suggests that the company has lost some ground in the race for supremacy with the other giants of the electrical manufacturing industry. Sir Harry Railing is careful to explain why the group's trading profits slumped from £8,617,275 to £6,519,615 in spite of "a considerable improvement" in turnover, but his explanations seem to provide less than a complete answer to the question why GEC appears to have fallen behind its rivals. Sir Harry attributes the reduction in profits to "the steep fall in sales of consumer goods both at home and abroad . . . and to a lower rate of gross profit." As the output of capital goods continued to rise, it seems that the GEC group may also have accepted lower

margins of profit on these goods as well as upon consumer goods.

The fall in net profits (from £2,091,114 to £1,266,054) did not, however, have any immediate effect in itself either on the fortunes of the equity stockholder or on the financial strength of the group. By paying 11½ per cent the directors effectively maintained the equity dividend rate. They were also able to appropriate rather more to reserves than was possible in 1951-53, but only through the writing back of the substantial sum of £2,710,979 from taxation provisions no longer required. By far the biggest slice of this sum—£2,420,172 to be exact—arose from the settlement of the group's liability for Excess Profits Tax. Stockholders will be among the first to recognise the once and for all nature of this credit in the profit and loss account.

In the balance sheet, the increase in the production of capital goods, on the one hand, has meant that more money has had to be locked away in financing work in progress and the decline in orders for consumer goods, on the other hand, has led to increased stocks of finished goods in the group's warehouses. For these two contrary reasons, therefore, the book value of the group's stocks and work in progress has risen from £33,541,257 to £38,102,111. This increase, together with an increase in debtors from £14,383,851 to £16,269,059, has denuded the group's liquid balances. Its cash balance has been reduced from £5,256,095 to £1,547,369 and its bank overdraft has jumped from £29,320 to £4,349,966.

The chairman records that "orders for consumer goods show slight signs of improvement and there are indications that the deterioration experienced during the last financial year has stopped." But any hopes that may be raised by this

statement are qualified by the remark that "the order book for capital goods at the end of the financial year was satisfactory, but since then the outlook has tended to become less favourable on account of the shortage of finance the world over and the increased competition in all markets."

PATONS AND BALDWIN. Everywhere in the full accounts of Patons and Baldwins for the year to May 2nd last can be seen the signs of a remarkable recovery—a recovery that took even the most sanguine of the wool manufacturers by surprise. A gross trading profit of £3,185,940 has replaced a loss of £293,492 and a net loss of £482,660 has given way to a net profit of £1,628,616; and the directors have restored the ordinary dividend to its former rate of 20 per cent. Indeed, the recovery has been so sustained that the group sold in weight more knitting wools in the home market than ever

before; the demand for manufacturing yarns has also been running at a high level and the group's factories are booked to capacity for months to come.

As more and more of the company's industrial capacity came into full production so the value of its stocks and work in progress began to climb. By the end of the financial year the book value of stocks had risen by £2,392,636 to £12,303,625 and the weight of wool, tops and yarn showed "a substantial increase" above the previous stocktaking figure. But as stocks increased the group had to look more and more for short term finance from the banks and in the last financial year its bank overdraft was run up from £845,123 to £1,821,838. The company's directors themselves are the first to recognise the need to conserve liquid resources and it was with this need in mind that an appropriation of £1 million (including £606,434 that effectively came from non-recurring credits) was made to a contingencies reserve.

All these tokens of prosperity, however, cannot gloss over the unstable course of trade and of profits in the wool industry and the chairman, Mr Philip A. Wright, takes occasion to emphasise how vulnerable the group's fortunes are to sudden changes in prices or in demand. In commenting upon the sharp swings in the price of wool, for instance, he comments that "price variations in raw material when evaluated over the company's necessarily large stocks of wool, tops and yarn represent latent risks which will always be liable to cause fluctuations in earnings and against which prudence dictates that some balancing reserves be made."

In pointing to the 25 per cent increase in the price of wool that has taken place since September—which has led to an increase in selling prices and which may have helped both to push up profits and the value of stocks—Mr Wright pertinently suggests that "the present level of the price of raw wool has not yet reached the public and any continued rise may result in a level beyond the public's capacity to pay with a consequent restric-

tion in demand." But to be set against this cautious warning are the facts that the price of wool is not likely in the foreseeable future to plunge as steeply as it did in the spring of 1951, that the world's stocks of raw wool are "very moderate" and that "stocks of finished goods in trader's hands are in a healthier condition than for some years past."

★ GREAT UNIVERSAL STORES.

The directors of Great Universal Stores, led by Mr Isaac Wolfson, seem to have the habit of confounding the pessimists (who have sometimes wondered if the rapid growth in the stature of this adolescent giant had led to any weakness in its muscles and sinews) and of surprising even the most hardened optimists. The surprise packet for the year to March 31st last is not so much the advance in trading profits (from £9,954,976 to £11,388,271) as the decision to pay a final dividend of 37½ per cent. This payment, bringing the full year's distribution to 50 per cent, effectively doubled the payments made in 1951-52. Such a liberal dividend can hardly be a mere reflection of the increase in net profits from £2,993,676 to £3,183,385; it may be that recent suggestions that GUS has been building up its cash balances have something in them.

As nothing appears to arrest the progress of the group, investors may already be looking for an even bigger dividend in the next few years. They have some grounds for this hope, for out of a total tax bill of £6,746,550 EPL has taken £1,546,936, or more than double the net equity payments of £732,982. To some extent the latest increase in dividends had been anticipated in the stock markets. Even so, immediately after the publication of the group's preliminary report the 5s. ordinary shares were marked up 1s. 3d. to 30s. 6d., to offer a yield of just under 8.2 per cent. The determined bulls of GUS will argue from the group's recent record that this yield does not discount all future possibilities.

LONDON STOCK EXCHANGE

Next Account begins: August 5th
Next Contango Day: August 5th.
Next Settlement Day: August 11th.

THE probability of a truce in Korea had been discounted for so long in the stock markets that the actual signing of the truce caused hardly a ripple of disturbance in the markets this week. There were very few alterations in gilt-edged prices at first, and then on Wednesday a very moderate increase in business helped to lift the prices of some of the medium-dated and nationalisation issues by about ¼ of a point. The new home corporation issues remained firm, although on Wednesday the subscription lists for the Ayr loan remained open throughout banking hours. In the foreign market the news of the truce immediately gave Chinese bonds a fillip, but these gains were soon lost when profits were taken. Japanese issues, particularly the dollar stocks, improved in the belief that Japanese trade would benefit from the rehabilitation programme for Korea. German Government issues also made some slight gains, but the Potash loans were marked slightly lower on the adverse report on the latest debt settlement offer.

Very slight and irregular movements in prices characterised the industrial market after the week-end. Electrical equipment lost a little ground after the rather discouraging statement from the chairman of GEC and then later on recovered these earlier losses. A minor rally in tobacco shares was staged on Tuesday, but it soon died away, and on Wednesday prices again tended to drift lower. Elsewhere the leading industrials remained quite firm. A little extra demand helped to lift prices in the oil market. In spite of the fall in the price of the commodity after the news of the truce, rubber shares were generally firmer. Base-metal shares were marked down at first in line with the fall in commodity prices, but these losses were reduced to a few pence or wiped out completely in the rally that followed. Widespread gains were reported in the Kaffir market when Continental demand (which was also partly responsible for a firmer tone in copper shares) was renewed.

COMPANY MEETINGS

THE BRITISH PLASTER BOARD, LIMITED

GROUP'S OVERALL TREND OF STEADY IMPROVEMENT

EFFORTS TO ARREST RISING PRICES

LORD BELPER ON SHAREHOLDER'S VITALLY IMPORTANT ROLE

The thirty-sixth annual general meeting of The British Plaster Board, Limited, was held on July 29th at 20, St. James's Square, London, S.W.1, The Rt Hon Lord Belper, DL (the chairman), presiding.

The following is the chairman's statement which had been circulated with the report and accounts for the year ended March 31, 1953:

BOARD OF DIRECTORS

Mr L. A. Elgood, who since November, 1944, has been one of our senior colleagues on the board of directors, has found it necessary to reduce his many important industrial commitments and, as a result, has tendered his resignation as a director of this company. It was with great regret that Mr Elgood's resignation was accepted and I take this opportunity of recording our sincere appreciation of the most valuable service and advice which he has rendered.

You will be asked to confirm the appointment of two directors who recently joined our board: Captain The Rt Hon Charles Waterhouse, MP, and Mr George F. Ashford.

Captain Waterhouse is known for his outstanding Parliamentary career, embracing ministerial rank. He has also had wide experience in industry and agriculture both at home and abroad. Mr Ashford is an important executive in the Distillers' group of companies. Apart from his industrial experience, he has a legal background which will be of considerable benefit to our board.

CONSOLIDATED BALANCE SHEET

Little comment appears necessary on the consolidated balance sheet. The slight increase in the total of £6,336,644 of fixed assets reflects the addition of some £358,000 capital expenditure during the year, less depreciation written off.

A year ago I referred to the interest we are taking in developments in the Rhodesias, and the investment we have now made in a new company—Allied Rhodesian Manufacturers (Private), Limited—accounts for the increase of £45,000 in the shareholdings in associated companies.

Your particular attention is drawn to the useful improvement in the group liquid position.

TRADING ACTIVITIES IN GREAT BRITAIN

The overall trend in this group of companies has been one of steady improvement. I should, however, mention one or two important digressions. In the plasterboard section, the recession in demand which occurred in the latter part of the previous financial year continued during the early part of the period now under review, but sales have increased substantially since August last and are still running at a high level. Our felt companies also experienced some lessening in turnover during the year. The stampings, drop forgings and valve-making companies have suffered some diminution in trade throughout the year, and this situation unfortunately still obtains. However, as I have already remarked, the trend has been one of

definite improvement for our group as a whole.

Looking to the immediate future, there are indications that this general trend will continue, except that there is now some fear that shortages of other important building materials—particularly of bricks—may possibly arrest the rate of increase in the building of houses and thus tend to curtail the expansion in our sales of building materials, particularly of plasters and plasterboard.

ASSOCIATED COMPANIES ABROAD

Our associate company in France Placoplatre, showed a considerably improved profit position by the close of their last financial year to the end of December, 1952, and I am glad to say that they have now been able to bring the depreciation reserve up to an adequate figure and to write off all preliminary and other starting-up expenses. If, as I have reason to hope following my last visit when I observed for myself how the organisation is being strengthened, the progress of that company continues as in the immediate past, it should soon be able to commence paying dividends.

The Irish company in which we are interested continues to do well.

I was able to take the opportunity earlier this year, to visit our associated companies in South Africa and the Rhodesias.

In spite of the somewhat unsettled times through which South African industry has been passing recently, our associate company there has fully maintained its turnover and trading results, and we have benefited during the year under review by an increase in the dividend received. I was much impressed with the whole organisation.

In the Rhodesias, the main activity at present is the building of a paper liner factory at Umtali, which will be of a size fully adequate to the requirements of the Rhodesian and nearby markets. It is hoped that this unit will be brought into production in or about August of this year. Here too, I considered the organisation to be on sound lines.

C. DAVIDSON AND SONS, LIMITED

As members are aware from the meeting which was held on May 29th, the recent amalgamation with C. Davidson and Sons, Limited, has now been completed and their assets and trading results will, of course, be included in our accounts for the year to March 31, 1954. Information as to the numbers of preference shares and stock units to be exchanged has already been circulated and appropriate announcements have been made in the press.

While this linking up of C. Davidson and Sons, Limited, with the British Plaster Board group leaves ample opportunity for us to continue to buy paper products elsewhere and thus to maintain our excellent relationships with other suppliers, there are already marked indications of the benefits we anticipated from this fusion of interests, in addition to those secured through the normal and excellent prospects of the Davidson organisation as a separate entity.

As members will know, setbacks common to many, if not all, in the paper industry have been experienced for some time past, but it would seem that demand is once more substantially on the upgrade.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The group trading profit for the year at £1,398,641 shows an increase over the previous year of £138,898, after writing off depreciation amounting to £320,507 in comparison with £299,769 for the previous year, and, in spite of the need to provide for profits tax, income tax and excess profits levy totalling not far short of £1 million, the balance of profit for appropriation—£478,428—shows a useful increase of £59,545 over the previous year. We are, therefore, in some measure reaping the benefit of the large capital expenditures which we have incurred since the war. We have also been greatly helped by the increased freedom of action accorded to us, and others, by the removal of many government restrictions.

In achieving this larger profit, increases in wages and salaries have been paid to the group's personnel and in an endeavour to play our part in arresting the upward trend in prices we found ourselves able to make a number of reductions in the prices of our products, notably in the prices of our building plasters and plasterboard, which were reduced in the autumn of last year.

Since prewar days there has been no real change in the rate of dividend paid to our members, beyond the small adjustment in the dividend last year from 16½ per cent to 17½ per cent.

Bearing in mind that our stockholders number over 17,000 it will be appreciated that the average holding per member is less than £200 of issued capital. The majority of the stockholders of this group is undoubtedly drawn from those of the modest income groups, the last part of whose income is thus subjected currently to tax at the rate of 9s. in the £. This means that, after allowing for the substantial fall in the purchasing power of sterling since prewar days, and for the large increase in the standard rate of income tax, the real return to the average stockholder is now only between one-third and one-quarter of that received prewar.

SHAREHOLDER'S VITAL IMPORTANCE

In some quarters, a shareholder is regarded—temporarily, I hope—in a most unfavourable light. On the other hand, all recognised leaders of public opinion wax most eloquent on the need to save. It does not seem to be generally appreciated that the shareholder and the saver are one and the same person, but failure to realise this fact—whether intentional or inadvertent—is, to my mind, senseless and encourages the development of policies injurious to the national economy. We all realise that it is necessary that savings be put into the hands of those in government circles by various means, including the great National Savings movement, but no one will deny that in the long run, it is essential

that savings be first put into industrial and agricultural production. Few public leaders in this country seek to deny that at any rate a very substantial portion of British industrial and agricultural effort must be left in the hands of individuals as distinct from government-controlled organisations. It is high time that the shareholder or saver, call him which you will, is once more recognised as a vitally important and, may I add, completely reputable member of our society, with every right to rewards by way of dividends for the risks taken.

Thus, so far as this company is concerned, let us not forget that it is the shareholder who has provided the capital which has enabled our group to be built up and that it is on this capital that rests the prosperity of all our employees and, of course, the provision of a number of vital commodities. The re-establishment of appropriate rewards for thrift is, in my view, essential if the national economy is to recover its health, and your directors are very glad indeed that the net profits of the year under review are such as will enable them to make up, in some small measure, to the shareholders for the loss they have suffered in real earning power, by recommending an increase of 2½ per cent in the final dividend making 20 per cent in all for the year. They have also appropriated £100,000 to general reserve, leaving £48,472 to be added to the carry forward in the parent company.

PERSONNEL

I am sure it is not forgotten that it is by the combined efforts, at all levels, of management, staff and operatives, that the satisfactory results now set before you have been attained, and I am happy to place this on record so that it may be fully recognised.

A contributing factor to the smooth running of our organisation is the continuance of a frank and open relationship with the national and local trade unions representing so many of our employees.

The report and accounts were adopted and the final dividend of 12½ per cent, making 20 per cent for the year, was approved.

The retiring directors were re-elected and the remuneration of the auditors having been fixed, the proceedings terminated.

At a subsequent extraordinary general meeting the alteration to the articles of association was approved.

THE LONDON COUNTY FREEHOLD & LEASEHOLD PROPERTIES

The forty-third annual general meeting was held on July 27th in London.

Mr Thomas J. Cullen (chairman and managing director) in the course of his speech said: The rent actually receivable for the year was £2,217,247, being £118,164 more than last year. The gross rent roll representing the total rents actually in force at March 31, 1952, was at the rate of £2,172,494 per annum and at March 31st last at the rate of £2,043,268 per annum, an increase of £129,226 per annum. There is a total available balance of £614,347.

A sum of £50,000 has been transferred to general reserve and £30,000 to repairs, redecorations and renewals provision in addition to the annual provision. A provision to meet the average cost of all repairs over a period of years is made each year as a charge to revenue. This charge is calculated with great care so that money is always available for the proper maintenance of all properties.

The cost of services included in the rents continues to rise. It is unthinkable that the

Government will delay beyond the next Parliamentary session an amendment to the Rent Restrictions Acts giving landlords the right to recover from their tenants the added cost of services provided in addition to such increase of rent as may be considered reasonable.

We hope you will feel that our results are not disappointing bearing in mind the large proportion of rent controlled flats. All our properties continue to be well maintained.

More than 3 per cent of our dividend is derived from the investments made since 1939 and, therefore, the stockholders are receiving from the prewar investments some 3 per cent per annum less dividend than was paid for a number of years before the war.

The report was adopted and the total dividend of 1s. 1½d. per 10s. unit of ordinary stock was approved.

HICK, HARGREAVES AND COMPANY LIMITED

CONTINUED PROGRESS

MR W. D'ARCY MADDEN'S SPEECH

The sixty-second annual ordinary general meeting of Hick, Hargreaves and Company Limited was held on July 29th, at Bolton.

Mr W. D'Arcy Madden, chairman and managing director, who presided, said: The balance sheet this year shows the change in the share capital of the company since the last report. At the extraordinary general meeting of the shareholders held on March 6th last, the authorised share capital was increased to £800,000 by the creation of 512,000 new shares of £1 each, and following this your directors offered 48,000 of the new shares to the holders of the existing shares at the price of 52s. 6d. per share. This offer was heavily over-subscribed and as a result the issued share capital is now £336,000. The capital reserves are now increased by £70,240 from the share premium account, thereby bringing the capital reserves to a total of £167,753.

LARGER NET PROFIT

The trading results for the year to March 31, 1953, reflect the continued progress made by the company. The net profit of £401,141 before taxation compares with £305,796 in the preceding year and £284,871 in the year before that. Out of the past year's profits, taxation amounts to no less than £233,076, which is 58 per cent of the profit earned. The balance available with £23,010 brought forward from the previous year amounts to £191,075.

Of this sum your directors, following their well-established practice, have ploughed back through adding to the reserves the important sum of £90,000. The revenue reserves, apart from the amounts set aside for Income Tax and Supplementary Pensions, now amount to £611,355. This includes £150,000 set aside for plant extensions and replacements, making a very necessary addition to the small amount allowed for depreciation. Also included is the reserve to meet depreciation of stock, namely £30,000. This should be a sufficient provision since the stocks carried are not large, and the turnover period is fairly short. The general reserve has been increased to a total of £400,000 and the carry-forward to next year's accounts is rather more than last year, namely, £31,355.

DIVIDEND AGAIN 20 PER CENT

The final dividend recommended is 15 per cent, making again 20 per cent for the year.

The dividend policy of this company has over many years been moderate but reasonable, avoiding fluctuation. The ploughing back of profits has unquestionably been the means of putting the company into the sound and strong position in which it stands today. These reserves have now, however, reached a point where a further distribution of a scrip bonus can well be considered, and this is under the careful consideration of your board of directors.

This year, as you see from the accounts, £18,000 has been set aside for a bonus to our staff and workpeople, and £15,000 to augment the pension supplementary reserve which was formed last year and to which I referred at the last general meeting. Our success as a company has been obtained through the team work of all concerned, and I am sure that our continued policy of giving a share in the profits to those whose efforts have brought them about will meet with your approval.

CONTRACTS EXCEED £5 MILLION

The works have been in full production throughout the year and the turnover was increased by over 20 per cent on the previous year. The contracts on our books exceed £5 million sterling and include condensing plant and feed heating contracts for the British Electricity Authority for commissioning up to the end of 1958. Good progress has been made with the extensions to the works, to which I referred a year ago, and we hope to have our new erecting shop in production before the end of 1954.

I have already referred to our staff and workpeople, and I again thank them and my colleagues on the board for their good work and loyal co-operation.

The report and accounts were adopted.

THOMAS BROWN & SONS

The fifty-sixth annual general meeting of Thomas Brown & Sons, Limited (general merchants, manufacturers and warehousemen), was held on July 24th in London, Mr John M. Lawrence (the chairman) presiding.

The following is an extract from his circulated statement:

Traders generally in the early part of 1952 held stocks which were considerably in excess of their immediate requirements, and this factor, which culminated in the import restrictions imposed by the Australian Government in March of that year, gave rise to a substantial reduction in the company's turnover during the early part of the year under review. Trading conditions generally, however, improved during the latter part of the year, and the turnover for the twelve months was only some few thousand pounds less than the previous year, which had constituted a record since the company commenced trading.

The net profit after taxation amounted to £64,598, compared with £113,470 in the previous year, and £84,652 in 1950-51, and cannot in the circumstances be considered unsatisfactory. Your directors recommend a total dividend of 4s. per ordinary stock unit (or 20 per cent) for the year.

During the last few months some relaxation in the import restrictions has been made and it is hoped that the restrictions will soon be entirely removed.

Sales during the first few months of the current year show some increase, and we look forward to the year's trading with confidence, although we cannot expect trading conditions generally to be so favourable as those prevailing in our record year, 1951-52.

The report was adopted.

THE STANDARD BANK OF SOUTH AFRICA

ADDITIONAL RESOURCES FOR EXPANSION

ISSUE OF 2 MILLION IN £1 SHARES

SIR FREDERICK LEITH-ROSS ON TRADING CONDITIONS

The one hundred and fortieth ordinary meeting (being the annual general meeting for the year 1953) of The Standard Bank of South Africa, Limited, was held on July 29th in London, Sir Frederick Leith-Ross, GCMG, KCB (the chairman), presiding.

The following is an extract from his circulated statement: If you will turn to the balance sheet you will observe that the position shown is one of greater liquidity than last year. This arises from a period of relative stabilisation in Southern Africa.

The items cash in hand and cash at call and short notice are up by £12 million, bills discounted (which largely represents Union Government and United Kingdom Government Treasury Bills) are up by £17 million, and remittances in transit up by £8 million, so that there is an increase of £37 million in our most liquid assets. On the other hand, the items bills of exchange and advances to customers are together £15 million less than they were a year ago, and the item investments is down by £5 million, while there is an increase of £17 million under the heading current and deposit accounts, which represents, of course, an equivalent addition to our cash resources.

The reserve fund now stands at £6 million as against £5 million at this time last year. The issued capital, amounting to £5 million, remains unchanged, but there was posted to you on June 27th a circular letter advising you that the board have decided to issue and offer to shareholders 2 million new £1 shares which will be fully paid up and which will increase the capital from £5 million to £7 million. The premium on the shares will be placed to share premium account and the reserve fund further increased accordingly.

From the profit and loss account you will see that after providing for taxation, after making a transfer to the credit of reserve for contingencies and after making an allocation to the officers' pension fund, the profit amounted to £594,762.

To balance of profit £594,762 we add the balance brought forward from last year, £220,372, and thus have a total of £815,134 for disposal. An interim dividend of 9d. per share was paid on January 31st last which, after deducting income tax, amounted to £98,437, and there is therefore a balance now available of £716,697. From this has been appropriated to bank premises the same amount as was allocated last year, that is, £200,000—leaving £516,697. It is recommended that a dividend of 1s. per share, plus a bonus of 6d. per share, be paid, leaving a balance of £310,447 to be carried forward to next year's accounts. Together with the interim dividend, this final dividend and bonus makes a total distribution of 2s. 3d. per share or 11½ per cent, and represents an increase of 1½ per cent in the distribution.

FINANCE AND DEVELOPMENT CORPORATION

Together with the balance sheet there will be found the accounts of our wholly owned subsidiary, the Standard Bank Finance and Development Corporation, Limited. The corporation has continued to expand the assistance which it has rendered to customers of the bank in connection with suitable development projects and this will be seen

from the fact that loans and interest accrued thereon has increased from £730,636 at March 31, 1952, to £1,309,418 at the date of these accounts. To do this the corporation has had to raise an overdraft of £757,288 from the bank, which is unduly high in relation to its capital. Accordingly, we are proposing that the capital of the corporation should be increased by £500,000, that shares to that value should be taken up by the bank and that the proceeds should be applied in reducing the corporation's overdraft. The bank's investment in the corporation will thereafter amount to £1 million. The profit of the corporation for the year, after making provision for taxation, etc., amounted to £13,056 and this, added to the balance of profit brought forward, amounts to £40,261, which is carried forward to the next accounts. Despite the disturbed conditions in Kenya, where many of the corporation's loans have been made, the corporation's trading experience is satisfactory and we are indebted to the local directors in East Africa for the sound advice and assistance they afford in connection with the affairs of the corporation.

The remainder of my statement gives a brief summary of economic and trading conditions in the territories in which the bank operates, but before I come to that I would like to remind you that this year Southern Rhodesia is celebrating the Rhodes Centenary and in connection with these celebrations an important exhibition, representative of all the activities not only of Rhodesia but of Central Africa generally, is being held at Bulawayo. This bank opened an office in Rhodesia in the year 1893 at the direct request of Mr Cecil Rhodes and was the first banking institution to operate in that country, so that we are very directly interested in this anniversary.

UNION OF SOUTH AFRICA

In the Union of South Africa, business activity in 1952, while maintained at a high level, showed a comparative stability, in terms of money, at least, as contrasted with the rapid expansion of the previous post-war years.

Two new features of great importance to the Union's future trade balance, and to its economy generally, made their appearance during the year. These were the first output of gold from the Free State mines and the steps taken to establish the production of uranium.

That there would be a slackening in the momentum of commercial and industrial activity was not unexpected. The selective policy which the financial institutions were asked to adopt was undoubtedly a contributory factor towards the levelling out of business expansion and acted as a steadying influence on those who, under the influence of the buoyant post-war years, were tempted to over-trade.

SOUTH-WEST AFRICA

In all parts of South-West Africa trading turnovers reached satisfactory totals, notwithstanding the contraction in income in certain branches of farming caused by drought. In many instances sales figures exceeded the results for earlier years by substantial margins,

particularly in those centres where trade is being stimulated by the rapid progress of the fishing industry. Trading has benefited also as a result of the expansion that is taking place in the mining industry. The territory continues to achieve a substantial favourable external balance of payments.

SOUTHERN RHODESIA

Trading turnovers reached fairly satisfactory totals, although merchants generally regarded their sales during the year as disappointing. Spending by consumers was careful; staple goods were in constant and expanding demand, but the market for less essential and luxury lines was difficult. Additional rolling stock received during the year has increased the capacity of the railway system, but it is still much overloaded, and a programme of capital expenditure amounting to £27 million has been planned over the next three years.

Manufacturing activities correspond generally with the availability of local resources of raw materials, notably iron ore, asbestos and limestone and of agricultural products, principally tobacco and cotton; but the development of secondary industries has in recent years attracted much overseas capital, and technical skill and their range and capacity have been greatly broadened.

NORTHERN RHODESIA

Trade benefited last year by the sustained prosperity and expansion of the mining industry, principally as a result of which there were further increases in the population of the territory and in levels of employment and earnings.

NYASALAND

In some respects trading conditions were difficult during the past year notwithstanding that both imports and exports rose in value to new record levels. Demand in the African trade was adversely affected by a contraction in income resulting from the smaller tobacco crop which was affected by the excessive rainfall. Current reports indicate the prospect of satisfactory turnovers as the outlook for crops is more favourable than last year. The principal exports are tobacco, tea, cotton, maize and groundnuts.

CHAIRMAN'S TOUR

The statement then reviews the economic and trading conditions in the territories in which the Bank operates and continues: Of general conditions in Southern and Central Africa, where I recently made an extensive though rapid tour, I should say this. Although undoubtedly there are some serious political and social problems in each area, there seemed general confidence that these would not be allowed to impair economic progress. Wherever I went I was impressed by the widespread development that was noticeable. In the Union, quite apart from the opening up of new gold mines, there was intense activity in general building and industrial construction in all the larger centres. I was told that during the past few years, industry had been expanding at the rate of 25 per cent

per annum, and that the value of industrial output now exceeds £1,000 million a year—five times what it was in 1939. This expansion is still going on, and it is perhaps just as well that the tighter conditions prevailing in the capital markets may necessitate some slackening of the pace. Similar conditions prevail in the Rhodesias, although in Southern Rhodesia tobacco growing and in Northern Rhodesia mineral production still remain, of course, the most important economic activities. Even in East Africa, despite the present difficulties, active development goes on, as evidenced by the proposals coming before our Development Corporation, and in Uganda there are a number of important projects on foot, under the auspices of the Government Corporation. In this refreshing climate of vigorous and for the most part healthy expansion, your Bank must continue to play its part, and the additional resources arising from the proposed issue of new shares should assist towards this objective.

The report and accounts were adopted.

FOY, MORGAN AND COMPANY, LIMITED

MR PETER MORGAN'S STATEMENT

The eighteenth Annual General Meeting of Foy, Morgan and Company, Limited, was held on July 28th at the offices of the company, 16, Eastcheap, London, E.C.3, Mr Peter Morgan (the chairman) presiding.

The following is his circulated statement:

Before dealing with the result of the company's trading for the year ended December 31, 1952, I must refer to the great loss we have suffered in the sudden death of our late chairman, Sir Gerald Lenanton. The whole timber trade will greatly miss his wise counsel and dynamic energy.

As Sir Gerald mentioned in his statement last year, the 1951 results were exceptional, and unlikely to recur in the near future, and you will observe that the accounts now before you show a decline in the profit earned, as compared with that year. Nevertheless, after payment of dividends on the preference and ordinary share capital, and provision for transfer to the pensions account, the balance carried forward to profit and loss account has been increased by approximately £37,500.

In fulfilment of the authority given at the last Annual General Meeting, the second preference share capital has been converted and increased, so that the total paid-up capital of the company is now £557,610.

Mr I. R. Lundborg, who was in charge of our Swedish softwood business, retired from the board on December 31, 1952, after nearly 50 years of loyal and devoted service to the company. We still retain the benefit of his long experience in the trade, in an advisory capacity.

You will be invited to confirm the appointment of Mr J. G. Wright as a director. Mr Wright is the grandson of the late Mr D. B. Gellibrand, who was a partner in the firm until his death in 1923.

A further measure of freedom in softwood has been obtained for 1953, but the trade is still confronted with restrictions such as the continuation of consumer licences for softwood, the reintroduction of a temporary ban on the importation of hardwood, with certain exceptions, the present import licensing system for plywood, and the limitation of foreign currency allowed for wallboard. Your company is, however, in your directors' view, obtaining its proper share of 1953 business.

The report and accounts were adopted.

THOMAS DE LA RUE AND COMPANY LIMITED

FACTORS AFFECTING RESULTS

MR B. C. WESTALL ON CURRENT IMPROVEMENT

The fifty-sixth annual general meeting of Thomas De La Rue and Company Limited was held on July 29th in London.

Mr Bernard Clement Westall, CBE (the chairman), in the course of his speech said: In the accounts this year there is one figure that dominates the picture, that is the conversion of a profit last year of £659,000 into a loss of £71,000 before taking taxation into account. In the circular letter that I wrote to stockholders last November I intimated then that there had been a sharp recession of trade on the industrial side of the business and that whereas the security side continued to make a satisfactory profit, most of it had been offset by these losses.

The primary reason for the sharp deterioration in the trading figures of the industrial side was due, on the plastics side, to the collapse of the Australasian market for "Formica" owing to import restrictions. These restrictions equally affected the stationery side. On the gas side, the fall in sales was due to the necessity for the gas boards to reduce their stocks of gas cookers and other appliances in accordance with the policy of the Chancellor of the Exchequer.

The action which has been taken to clean up the stock position puts the industrial side in a more promising condition. While it must not be expected that there is going to be a rapid recovery on the industrial side, yet the very big economies that have been carried out in the course of the last 15 months are now bearing fruit. The sales of "Formica" are increasing slowly but surely, although these, together with the sales of "Delaron," have yet to reach a stage to warrant full-time resumption of work at Tynemouth. I am hopeful that by this time next year, providing there is no marked deterioration in trading conditions, I shall be able to inform stockholders that the Plastics Division has been again on a profit-earning basis.

The stationers, like the plastics, business was badly affected by the curtailment of Australian imports, for this Dominion was one of our best customers for "Onoto" pens.

SECURITY PRINTING EXPANSION

On the security side of the business our profits were well maintained, and this year, again, there is a satisfactory amount of orders in hand. Since the disappearance of China as a customer, and the decision of Pakistan to make—with our co-operation—their own security documents in Karachi, the effort made to extend our business in other fields has proved very successful. Since the war nineteen countries have become customers for bank or currency notes in addition to those who were already purchasing their supplies from the company. This broadening of the basis of the company's security printing business will, I consider, be a reliable source of strength for many years to come.

The balance sheet position, as a whole, is a strong one, and with a steady improvement on the industrial side I think stockholders may be confident in the company's ultimate recovery, but, as I said in my circular letter, this must inevitably be gradual. The results of the first quarter, though they cannot be taken as a firm and reliable forecast for the whole year, are substantially better than they were a year ago.

The report and accounts were adopted.

OHLSSON'S CAPE BREWERIES

The sixty-fourth annual general meeting of Ohlsson's Cape Breweries, Limited, was held on July 29th in London.

Mr Geoffrey Dent (the chairman) presided and in the course of his speech said: During the year under review conditions have not been very favourable to our trade. The spending power of the public has been low, and there has been a good deal of political uncertainty which has naturally affected business. On the whole, however, sales have been well maintained and show an increase over last year.

Our trade at the Cape has been fairly well maintained, but in the Transvaal there has been a decline. Natal and Rhodesia show very satisfactory increases.

In spite of the increase in our sales profit margins have continued to fall, owing to the continued rise in expenses.

The profit on trading and rentals of the company and its subsidiaries for the year after charging all working and management expenses but before providing for depreciation amounted to £569,078.

The directors recommend a final dividend on the ordinary shares of 17½ per cent, making a total distribution of 22½ per cent for the year.

With regard to the future, I can only say that owing to the incidence of the General Election, and rather poor weather, sales as a whole to date this year show a small decrease on last year, although some areas continue to show increases. I can see no reason why, with more stable conditions, they should not now improve.

The report was adopted.

MILLARS' TIMBER AND TRADING COMPANY, LIMITED

The annual general meeting of this company was held on July 24th, in London.

Colonel Clive E. Temperley, OBE, MC, BSc, who presided, in the course of his speech, said: During 1952 the sellers' market, which had lasted for so long in many trades, including the timber trade, turned to a buyers' market and, as a consequence, prices dropped. This largely accounts for the fall in the trading profits of the group from £562,000 in 1951 to £472,000 in 1952. Owing to the incidence of taxation, however, the net profits increased from £135,000 to £150,000, which are record net profits for the company. The directors recommend that the dividend on the ordinary shares should be 25 per cent, an increase of 5 per cent.

Owing to the great demand both in Australia and throughout the world for our Jarrah and Karri, we feel confident that our production, whatever it may be, will be sold.

As you are aware, we have selling branches not only throughout Australia but also in South Africa, India, the United Kingdom and a number of other places in the world. Originally these branches were established largely for the sale of our Western Australian timbers but during the last 15 years we have gradually increased our business in merchandising all kinds of hardwoods and softwoods produced by other people.

Millars' Machinery Company, a wholly-owned subsidiary, has had another successful year. Taking the group as a whole, our turnover for 1952 was more than £6,500,000—over six times the issued capital.

TRUST HOUSES LIMITED

NOTABLE CONTRIBUTION TO TOURIST INDUSTRY

CAPT A. R. S. NUTTING ON THE CONTINUED PROGRESS

The fiftieth annual general meeting of Trust Houses Limited, was held on July 24th, in London.

Captain A. R. S. Nutting, OBE, MC, the chairman, in the course of his speech, said:

It will be of interest to our shareholders to know that our total expenditure on repairs, renewals, and improvements for the last three years reached the very large figure of £1,762,000.

I am glad to be able to report an increase in our trading profit of roughly £57,000 after providing for maintenance. I think we can view this with considerable satisfaction.

Some few months back I had a statement taken out which I think might be of interest. In the last 15 years our net assets have increased 65 per cent, our turnover has more than trebled; the number of meals served has increased by 70 per cent, and the number of sleepers by 90 per cent.

These facts are I think full justification for the board's policy of conservative finance. A substantial part of our profits must be spent in keeping the company's houses up to date, and this has not only paid in reputation and goodwill, but has enabled us to maintain our earnings, which we certainly should not have done had we been content to stand still and not kept our properties abreast of increasing competition.

I have often told you that we run our business on very small profit margins, but we endeavour to keep our standards high, and at the same time to maintain a price which our customers can afford, and I think the fact that our turnover is the highest on record encourages one to believe that our policy and effort is meeting with success.

As regards the future, you would not wish me, and I should be very unwise to try, to prophesy, but your company has a reputation for a reliable standard at reasonable prices, whether in two rooms or two hundred room establishments and it is our policy and intention to maintain and enhance that reputation.

CAPTAIN K. C. McCALLUM: MANAGING DIRECTOR'S REMARKS

I should like to say a word about a subject which has been commented on recently; that is the part played by British hotels in the furtherance of what is described as tourism. The annual report of the British Travel and Holidays Association names seven industries in order of their contribution to the country's earning of United States dollars. These are topped by tourism with £31,560,000 worth of dollars to its credit. But the report goes on to say, and the statement has been widely quoted in the press that "the majority of hotels seem unaware of the necessity to increase overseas business." That certainly does not apply to the hotels of your company.

I venture to say that Trust Houses has done more than any other organisation to improve the standard of hotels throughout Great Britain. Part of our policy has been to take over derelict hotels, modernise and refurnish and re-equip them, thereby bringing into dollar-earning, hotels which would otherwise have played no part in the tourist industry.

Another part of our policy has been to build on extensive additional accommodation in the places to which most tourists go.

The report and accounts were unanimously adopted.

EX-LANDS NIGERIA

The forty-first annual general meeting of Ex-Lands Nigeria, Limited, was held on July 28th in London.

Major General W. W. Richards, CB, CBE, MC, the chairman, in the course of his speech, said: Dealing with the mining side, 620 tons of tin concentrates were recovered assaying approximately 74 per cent metal—this is 10 tons more than the 1951 figure. The output was obtained from some 1,669,060 cu yd mined and the average value of the ground (excluding tribute) was 0.70 lb. per cu. yd.

The ore reserves at December 31, 1952, were 4,614 tons tin concentrates. This is an increase of 5 tons on last year after allowing for the 620 tons produced; that is, a net increase of 625 tons during the year. The reserves are contained in 11,320,000 cu yd equal to an average of 0.91 lb per cu yd.

The profit available for distribution is £69,123, compared with £59,527 for the previous year. The directors recommend a final dividend for the year of 7.2 pence per unit of stock (30 per cent) making a total distribution for the year of 1s. per unit of stock.

The output for the first half of the current year was 303 tons tin concentrates. This compares with 290 tons for the corresponding period of last year.

Producers are seriously concerned at the current price of tin and every effort will be made to represent this factor to the authorities concerned with a hope of obtaining some concession to producers. Our costs compare very favourably with other Nigerian producers and we have every reason to believe that the prosperity of our company will continue.

The report and accounts were adopted.

BREMANG GOLD DREDGING COMPANY

The sixteenth annual general meeting of Bremang Gold Dredging Company, Limited, was held on July 28th in London.

Major General W. W. Richards, CB, CBE, MC, the chairman, in the course of his speech, said:

Bullion revenue at £465,262 showed a decrease of £48,701 compared with the previous year. 34,969 fine ounces of gold were produced against 40,861 and the average price we received was £13 5s. 6d. per ounce against £12 11s. 7,034,100 cu yds were treated for an operating expenditure of £290,627.

The profits for the year before the reserve allocation was £64,767, slightly higher than last year. The directors are happy to recommend again the payment of a dividend of 7½ per cent for the year.

Turning now to dredging operations, the aggregate throughput was lower than the previous year. This was due to the fact that No. 2 dredge, having worked through its ground on the Ankobra River, ceased operating in July, 1952, and has since been dismantled and transported to the Bremang Extended Areas (Offin) and is now in process of being re-erected.

The returns for the first half of the current year show that 3,547,300 cubic yards have been treated for a recovery of 16,911 ounces of gold and an operating profit of £84,093. These figures, compared with the corresponding period of last year, show a reduction of just under 200,000 cubic yards treated, 2,000 ounces of gold less recovered and £16,000 less profit, but it must be remembered that we had four dredges operating last year whereas only three were working during the current year.

The report and accounts were adopted.

ASSOCIATED BRITISH PICTURE CORPORATION

20 PER CENT DIVIDEND MAINTAINED

The twenty-sixth annual general meeting of Associated British Picture Corporation Limited was held on July 30th in London, Sir Philip Warter (the chairman), presiding.

The following is an extract from his circulated statement:

The group trading profit shows a decline of £272,999 from £2,340,775 to £2,067,776. The net group profit, after tax, is £498,077, which is £31,264 less than the corresponding figure of £529,341 for the previous year.

After referring to the decline in attendances at the group's cinemas the chairman continued: Year after year I have told you of the heavy burden of entertainments duty and have appealed to successive Chancellors for an overall reduction, together with a drastic revision of the scale of tax, as between varying seat prices.

The Chancellor, in giving small concessions, has placed emphasis on the small cinema at lower seat prices with the result that the modern, well-equipped theatres, which comprise the greater part of our circuit, are handicapped in comparison and, indeed, suffer an actual increase in the burden.

A reduction in entertainments duty is the simple remedy which, if applied in time and on a scale far greater than hitherto contemplated, would provide a real tonic to the whole industry at a critical moment in its history. In the meantime a situation is rapidly developing which will have a disastrous effect on employment unless help is quickly forthcoming.

I hope that at the last hour it may still be possible to persuade the Government to abandon their ill-judged plan for permitting commercial television in this country. I must warn you that the competition of commercial television would have very serious consequences for every section of the film industry.

PRODUCTION

Our plans in regard to film production must be influenced to a great extent by the Government's decision on the future of entertainments duty and the Eady plan.

I can only emphasise that, without some reduction in entertainments duty, the continuance of the Eady plan alone provides insufficient help to maintain British film production. As I mentioned last year, the sum collected through our cinemas and paid over to the Eady Fund is greatly in excess of any benefits we have received, or can hope to receive, on the films we have produced ourselves.

Apart from the rebuilding and re-equipping of the studios at a cost of one and a quarter million pounds, the corporation has provided very substantial sums towards the cost of production of British films. It would be nothing short of a tragedy if, through lack of Government support at this critical juncture, all the good work which has been done by ourselves and others in the national interest should come to an end and result in the closing down of our Elstree Studios, with all the consequences involved.

Addressing the meeting, Sir Philip, as promised in his circulated Statement to the Shareholders, stated that, taking the Group as a whole, the indications are that the business is being maintained on a basis comparable with the corresponding period of last year.

The report was adopted and a final dividend of 12½ per cent, making 20 per cent for the year, was approved.

BURBERRYS LIMITED

IMPROVED RESULTS

The thirty-fourth annual general meeting of Burberrys Limited was held on July 29th in London.

Mr Geoffrey Bostock, FCA, the chairman, said: Ladies and gentlemen.—My statement on the accounts for the year to March 31, 1953, is printed with the report and accounts, and although it was completed a month ago I do not wish to make any addition to it except in regard to the concluding section which relates to the year 1953-54.

The freehold and leasehold premises which the Company owns are today worth considerably more than their book value, which at March 31, 1953, was £627,878.

The board has under consideration a scheme to realise these properties (with the exception of the Paris premises) and to take leases of those premises which we are now occupying, and out of the proceeds to pay off a substantial part of the preference stock as part of a capital reorganisation.

In view of the delicacy of the negotiations, I am sure stockholders will not expect me to make any further statement on this matter.

The following is an extract from the chairman's statement, which had been circulated with the report and accounts:

At the last annual meeting I said that if the indications of the improvement in sales shown in August and September last continued, I would expect a moderate profit for the year to March 31, 1953. The results shown by the accounts are better than I expected.

The prices of cotton and wool, which showed such wide fluctuations in the previous year, have not moved so violently in the past year, in which cotton prices have come down by approximately 25 per cent and wool prices have gone up about the same percentage. Owing to the hardening of wool prices our suppliers are now quoting up to nine months for delivery, whereas twelve months ago they were accepting orders for delivery in three to four months.

As I promised at the last annual meeting, the board has made a careful review of the company's organisation, and has instituted changes which have already shown some benefit, although only put into effect in the last few weeks of the financial year.

RESULT OF YEAR'S OPERATIONS

The profit on trading before charging directors' remuneration and depreciation was £159,377. At March, 1952, the corresponding figure was £72,844, but as this was after providing £253,849 for writing down stocks and covering forward contracts, I prefer to compare the 1953 figure with £326,693, the profit before writing down stocks. Bearing in mind that selling conditions in the first six months of the year to March 31, 1952, were favourable, and in the corresponding period in 1953 were the reverse, I consider that the 1953 profit on trading does show partial recovery towards the higher profit the business should earn.

The net profit for the year is £50,490, and there is a disposable surplus of £92,318, out of which the directors recommend the payment of the fixed preference dividend for the two years to March 31, 1953, leaving £9,818 to be carried forward.

Our foreign trade (inclusive of sales to overseas visitors at the Haymarket) was 49 per cent of total turnover.

I am hopeful that the year 1953-54 will show an improvement in profit.

The report and accounts were adopted.

PARKLAND MANUFACTURING COMPANY

DISTRIBUTION OF CAPITAL PROFITS MARKS GOLDEN JUBILEE

The fiftieth annual general meeting of Parkland Manufacturing Company, Limited, was held on July 27th in Bradford, Mr George F. Hanson, the chairman, presiding.

The following are extracts from his circulated statement:

This is the fiftieth annual general meeting of the company, and your directors are very pleased that the accounts for the year of the company's Golden Jubilee and the distributions they are recommending will mark this important occasion in a tangible and satisfactory manner.

We delivered in the full year to February 28, 1953, a greater yardage of cloth than ever before in the history of the company. This improved output was reflected in our profits which, for Parkland Manufacturing Company, Limited, amounted, after charging all expenses and full provision for taxation, to £130,532, against £48,992 for the previous year. For the group the profits, after taxation, amounted to £252,911, against £99,302.

The consolidated balance sheet gives the best picture of the position of the group as a whole.

The current assets of over £2 million are almost four times the current liabilities of just over £500,000 and the liquid surplus is £1,536,791.

The total capital reserves and revenue reserves, exclusive of the provision for future taxation, amount to £887,887, which is substantially more than three times the amount of the issued ordinary capital of the parent company. We hope to be able to arrange for a capitalisation of some part of the reserves before the publication of the next accounts.

Out of the increased profits your directors have transferred the sum of £45,154 to general reserve to bring it up to a total of £264,000, which is exactly equal to the nominal amount of the issued ordinary share capital, and a further £15,000 to staff benevolent fund to bring that account up to £25,000.

A final dividend on the ordinary shares is recommended at the rate of 25 per cent, less income tax, which will make 32½ per cent for the year compared with 25 per cent.

DISTRIBUTION OF REALISED CAPITAL PROFITS

It has long been our policy to re-equip our mills with the finest and most efficient machinery obtainable, as well as to modernise existing plant throughout all our businesses. This has resulted from time to time in the sale of some of our buildings and plant which were no longer required. The disposal of these assets has given rise over the years to capital profits in the various businesses and your directors have decided that it would be a fitting way of marking our Golden Jubilee, which by a happy coincidence falls in Coronation year, by distributing these capital profits to the shareholders.

Accordingly it is proposed that, at the same time as the payment of the final dividend, the shareholders should receive a capital distribution at the rate of 33½ per cent free of income tax upon the issued ordinary capital.

OUTLOOK

Since the end of the financial year our sales and production have been well maintained. Our plant has been working to capacity without being able to cope with all the orders offered to us. As a result we have, with regret, had to restrict our sales to maintain reasonable delivery dates.

In the absence of any serious fall in the price of wool with a resulting loss of confidence and reduced demand, I see no reason to be anything but optimistic about the prospects for the current year, but the wool textile industry is one in which the situation and outlook have, in the past, been liable to change very quickly, and this is a factor which can never be overlooked. I believe, however, that we shall obtain a good share of the available business having regard to the conditions which prevail from time to time.

The report and accounts were adopted.

BANCO DE LONDRES Y MEXICO, S.A.

INCREASED DEPOSITS

SUMMARY OF REPORT BY THE BOARD ON THE BANK'S ACTIVITIES DURING THE FISCAL YEAR 1952

Regardless of the fact that during the last fiscal year life in this country was affected by serious national and international events and by unfavourable agricultural and livestock situations, the bank's deposits increased in the amount of \$48,242,143.56, totalling \$282,819,520.70, of which \$250,050,276.45 represent sight deposits, \$4,436,305.78 time deposits, and \$26,332,938.47 savings accounts; the credit balances of banks and correspondents amounted to \$32,597,849.71 showing an increase, as compared with the previous year, of \$6,041,600.49.

The liquidity of the institution is maintained high with: cash on hand, deposits in Banco de México, S.A., and transit items up to \$149,785,058.35. Furthermore the bank maintains securities as a part of the legal reserve and of immediate sale, totalling \$56,063,384.52.

Due to the unfavourable circumstances mentioned above and to the usual conservative policy of the bank, the portfolio figures were not increased but maintained similar to those of the previous year.

In compliance with the request of Banco de México, S.A., it was endeavoured to prefer production investments and to avoid the financing of business that might contribute to emphasise an inflation process. The bank's portfolio is formed by: \$67,492,000.00 production credits and \$55,350,000.00 others, totalling \$122,842,000.00.

RESERVES STRENGTHENED

The bank efficiently intervened, with satisfactory results, in the financing of imports and exports of prime materials, easily marketable, and also in the sale to the public, within the country, of industrial mortgage bonds, issued by first-class industrial enterprises. The activity of the security and trust departments has been specially important, having constantly increased the number of clients using the services and counsel, the safekeeping of securities and the technical co-operation in trust transactions.

The bank's capital and reserves were considerably strengthened during the last fiscal year; the former increased \$3 million, that is, the present paid up capital is of \$18 million; and the latter \$750,000.00, totalling \$6,705,414.86.

The report also states that, while the profit of \$2,673,928.66 during the last fiscal year was smaller than in the previous one, it was due mainly to the policy of not extending in investments of the bank and to the increase of sundry expenses, specially salaries.

E. K. COLE. LIMITED

NEW OVERALL TURNOVER RECORD

MR E. K. COLE ON ONEROUS TAXATION

The annual general meeting of E. K. Cole, Limited, was held on July 28th at the Queen's Hotel, Westcliff-on-Sea.

Mr E. K. Cole, chairman and managing director, in the course of his speech, said:

I think it will be agreed the accounts disclose that we have had another satisfactory year.

The consolidated figures of the company and its subsidiaries show that the trading profit for the 12 months amounts to £624,224 and the net profit, after providing for all expenses, including depreciation, but before deducting taxation, is £534,802. Compared with the previous 12 months this represents an increase of £71,587. I am pleased to be able to state once more that we achieved a new record in turnover.

Radio Division. Trading conditions in the industry during the year were good and we were able to take advantage of the opportunity afforded thereby. Once again I would like to thank our dealers for their loyal support and ready co-operation and I am sure that the year's activity has further strengthened our relations with them. The combined efforts of our sales and publicity departments, backed by commendable production and engineering achievements, resulted in a new record in turnover for the division.

Electronics Division. During the year this division continued to expand and the production of radar, communications, and nucleonic equipment for Government services and commercial use increased.

Trading conditions in the plastics industry proved to be difficult during 1952, but an improvement occurred during the first three months of 1953, and is still maintained.

Heating Division. The restrictions and high rate of purchase tax imposed on the products of this division continued during the year under review. Fortunately, a slight easing of the position has recently taken place, and this, together with the fact that we are launching redesigned space heaters, will, we anticipate, lead to an increase in turnover and a more favourable trading result.

Export. I am pleased to report that we have, once again, achieved a new record turnover with overseas countries. We shall spare no effort to maintain and expand the position already achieved by pursuing a flexible policy designed to meet the conditions of each individual territory.

TAXATION

Your company is, like many others, suffering from the effects of the onerous burden placed upon industry by the excessive rates of taxation now levied. It needs no words of mine to bring home the seriousness of the position when out of the trading profit of £624,224, before charging depreciation and loan interest, £400,600 has to be set aside to meet the taxation liability which includes the provision for a full year's Excess Profits Levy of £87,000. It is the constant worry of all industrial concerns in the country to-day to find the necessary finance for the replacement of capital assets, and unless this situation is eased, the future outlook will be grim indeed. It cannot be emphasised too often that unless industry has the tools for the job we cannot, as a country, hope to maintain our position as a great industrial and trading nation.

The report and accounts were adopted, and the final dividend of 15 per cent, less income tax, on the ordinary stock, making 25 per cent for the year, was approved.

G.R.A. TRUST

MR F. S. GENTLE WANTS EQUITY IN TAXATION

Mr F. S. Gentle, chairman and managing director, presiding at the twenty-fifth annual meeting, reported a reduction in profits mainly due to the 10 per cent Pool Betting Duty levied on greyhound totalisators only.

There was no tax on betting on horse racing or with "off the course" bookmakers.

Taxes last year totalled £1,830,000 and left nothing for ordinary stockholders, the recommended 10 per cent dividend coming wholly out of profits of previous years.

Settlement of taxation and rating arrears had liberated provisions from previous years totalling £732,000, of which £178,000 had been applied in writing down the book value of trade investments and the Group's current assets now exceeded current liabilities by £1,183,000.

Special resolutions for the repayment of the £200,000 7 per cent Cumulative First Preference Stock were adopted. This would benefit the 8 per cent Cumulative Second Preference and Ordinary Stockholders and would still leave a very strong liquid position.

The company had led in building up the cleanest, squarest form of betting sport in the world and would continue in the lead.

Television, with "free admission" and an unlimited attendance not subject to Entertainment Duty, was a tremendous competitor, but the inequity of the taxation discrimination against greyhound racecourses was becoming more widely recognised and with fair treatment greyhound racing would hold its own. All that Mr Gentle asked for was equity and common justice for greyhound racing.

W. & J. GLOSSOP, LIMITED

OUTPUT FULLY MAINTAINED

The eighteenth annual general meeting of W. & J. Glossop, Limited, was held on July 28th in London.

Mr Henry Stephenson, the chairman, in the course of his speech, said:
