

sincerely it may seek a *delente*, to divide the United States from Britain and Europe."

The *New Statesman and Nation* wrote on August 8: "If the Western Powers could fairly be charged with making difficulties in seeking to confine the conference to the almost insoluble problem of Germany, the Soviet Union gives the impression of making her tactical purposes an equally unhelpful *riposte*. With the agenda widened to include the whole world from the Sakhalin Islands to Casablanca, the sort of conference for which the Russians are now asking would give limitless scope for mutual recriminations and reciprocal barrages of propaganda."

The *Observer* writes that the "immediate task of diplomacy today" was restoration of confidence between the Soviet Union and the West. The difficulties of a European settlement, though real and manifold, were not unprecedented and insurmountable. Suggesting a way in which this task might be furthered the paper proposed a meeting of Foreign Ministers provided it preserved "a measure of informality and a still greater measure of privacy and seclusion." The paper lay great stress on the secrecy of the talks and writes that if the Foreign Ministers' Conference could not guarantee that secrecy, the Powers should resume diplomatic contacts and discussions through ambassadors which had the advantage of being less spectacular and arousing fewer public expectations.

Wastage in Industry

While delivering the Acharya P. C. Roy Memorial Lecture on "Development and Utilisation of Scientific Talent in India" held under the auspices of the Indian Chemical Society at Bombay, Dr. J. N. Mukherji said that the country was annually losing about Rs. 100 crores due to the faulty process of recovery of sugar from the cane in the manufacture of *gur* and *khandsari*, reports the *Bombay Chronicle* on August 10.

"Dr. Mukherji stressed the importance of a scientific policy for the State which alone could tackle the problems of poverty and under-development facing the country. Recalling the vital role played by unofficial scientific institutions in promoting science and making available the fruits of science to the industry and the people at large in the Western countries, the lecturer pleaded for greater help to and better recognition of such institutions in the country."

"While welcoming the policy of the Government to accelerate the progress of industrialisation of the country with the help of foreign experts, Dr. Mukherji warned the authorities that there were a number of lines of development where such co-operation might not be available in the absence of common fields of interests if the interests collided."

He said that this dependence of us hope for the was not directed of our resources on outside help was like feel deeply that industrial advancement lopsided and un on Far Eastern productive role." pleaded for building up the scientific, tech, the sponsors logical and engineering potential of the co, announc- expenditure would repay the outlay many - Menon's and quickly. at not to

The Press in Pakistan

Discussing the condition of the Press in place she Star's special correspondent writes that the Pakistan was very weak because the nu, ofoundly readers were restricted on account of high, and because of low incomes from advertis, tened which were only a few, owing to the lack of ind, main development. As a result the newspapers h, scored depend upon foreign firms for advertisements and, a fact, more than half of the entire advertise, revenue earned by newspapers in Pakistan came from establishments owned and run by foreign interests. "And advertisement money is not merely money! It is much more," writes the special correspondent. "Advertisers have been known to wield considerable influence stifling the truth. In our country if this baneful influence is a little more pronounced, it should not be surprising at all."

The other most disturbing element was the influence of politicians on newspapers or newspaper editors. "Most of the newspaper proprietors are running newspapers not as newspapers but as just another instrument to queer the pitch in their favour, be it in the field of politics or in some other field." Then there was too much interference by the proprietors. The journalists had no security of service. They had to say *ditto* to whatever the proprietor asked to write or to quit their services. Dismissals and resignations were frequent.

Such a situation could not fail to tell on the efficiency and ultimately on the financial position of the newspapers. "And from here there are only two ways open to the newspapers: to close down and bury the whole affair or to rake up money somehow to keep the disaster at bay."

"Money obtained 'somehow' is seldom productive of pleasant results. If not earlier, the newspaper finds itself in an alley when there is only one way out—blackmail, which we call irresponsible journalism."

The working journalist had no say in any matter. "The fact is that an average pressman seldom shares the vices of the press and equally seldom his virtues are afforded an opportunity to shine through the printed sheets you read as newspapers in Pakistan." 1

THE LION-HEARTED LEADER

An Intimate Impression of Syama Prasad Mookerjee

By ST. NIHAL SINGH

(Specially written for *The Modern Review*)

The 1st floor chamber in an opulent, adverse eff neighbourhood in Calcutta was lined with Chinks from floor almost to ceiling, save a good ydoors and windows. In the centre near rubber, c farthest from the front, way be'ow which livelihood traffic ceaselessly flowed, was set an out-in 51 peout chair. It was none too big for the Re'heavily moustached occupant. So filled he wilearning, Eastern and Western alike, was he, its Mosh Mookerjee, that his admirers—and plazir number was legion—spoke of him as the pletatara (incarnation) of Sarasvati (the goddess of Wisdom) in this *Kaliyuga* (the iron age).

From him my eyes wandered towards the figure that, following my entry, had noiselessly glided into the Presence and stood with bowed head, ears attuned to some message or mandate. In build and feature the two bore unmistakable similitude. In years they were a generation apart.

This was, I learnt, Syama, the second son of the celebrated jurist, lawyer, linguist, scientist and, above all, educationist—Dr. Asutosh Mookerjee. By virtue of native intelligence and by dint of hard, conscientious work, the moustached Sarasvati had earned the title to append almost half of the alphabet to his name.

Possibly because of his size, the son looked remarkably mature, though he had but entered his twenties. His attitude towards the author of his being impressed and pleased me. Adoration was writ large upon his face. Eyes, ears, hands and feet were all eagerly devoted to the service of that embodiment of erudition he evidently loved more than life.

This was in 1921-23. I was back in India after my second globe-girdling—a decade spent largely in Europe.

An encounter had taken place shortly before between Asutosh and the satrap set up by Dame Britannia to rule in her name over Bengal. Of that set-to, many tales were current. Lord Lytton, whom I had met in my early days of English journalism, and who shared my interest in penology, had inherited Bulwer's brain as well as the title. He had authority at his back, too. Yet he had not have the best of the bout with his Bengali Vice-Chancellor of the Calcutta University, who could brook no interference with his administration of the institution, veiled or open.

I had a job of work in hand that kept me in

Calcutta for weeks, so I had some opportunity of observing the second son of that formidable personage. What under-study was more advantageously placed, I asked myself, or albeit was more capable of benefiting from that opportunity?

Fifteen years had bubbled up from Eternity's cauldron and had been sucked back into it before my gypsy feet were once again treading the Calcutta side-walks. In the meantime Syama had graduated from the University, had gone to Britain (while I was living somewhere else), there had pursued his legal studies, eaten his dinners, been called to the Bar, attended some conferences as the representative of his *alma mater* and returned to his natal city. He had shown no great keenness to practise law but had taken with avidity to educational administration. At three and thirty he had been inducted into the office that had given his father the spring-board for exalting Bengal.

Several letters typed on the Vice-Chancellor's letter-paper with Syama's bold, clear, firm signature, had been winged my way. Familiar with my writings from his school days, when he had devoured them as they appeared in *The Modern Review* and other Indian magazines, the epistles had been couched in terms that warmed the cockles of my heart. They whetted my desire to renew acquaintance with him.

I would fain have gone to meet him in his office or in his home: but he insisted that on the first occasion he must call on me. I appreciated his sentiment and respected his wish.

The difficulty was that just at that moment I had no fixed abode. I was, in fact, occupying what my good lady, in her expressive Americanese, called our "palace on wheels." My railway friends, who in the kindness of their hearts, had placed it at my disposal so that we may travel in comfort, had ordered it to be parked at a platform in the Howrah station, next the street. So airily dismissing her qualms born of propriety, I made an appointment for Syama to call one afternoon.

When railway men happen to be in the right mood they, in the words of the jingle, are

"...very, very good,

And when they are bad they are horrid."

That "O.C." (in their cant "officer's carriage") was "some" carriage indeed. It was, if I remember aright, 69 feet long and ran, I believe, over twelve wheels. There was a huge compartment that served as drawing-cum-dining-room during

the day and bed-room at night, in addition to another large bedroom across the entrance-aisle. The bath, I seem to recall, was seven feet long and four feet wide. The train in motion at anything like top speed set up such a wave action that I, used to a much humbler mode of living, never dared to get into it unless the saloon was parked at a siding. There was, however, another tub elsewhere which was much more like the one that a frequenter of (English and other) landlady's lodging houses was accustomed to. In addition to the two large bedrooms there were rooms for the secretary and staff and next to the lesser bath room a "cabin" for the servants almost as large as a first-class compartment, as was also the luggage room. Beyond it was the kitchen—roomy, light and airy, fitted with a real cook stove. This was my delight, for the recipes that appear in my cookery articles are all evolved by me and tested before they go into print.

Just as the hour set for Syama's coming was striking the floor of the carriage rocked, not too gently. The tea-things clattered.

"Oh, dear!" exclaimed my wife with some petulance, "oh, dear! they are moving the saloon again."

"What difference does it make?" I, no less disturbed, said in a tone calculated to soothe her nerves much jangled by prolonged "rambuncting" (to use her own expressive Americaneese).

"You apparently have forgotten," she almost shrieked at me, "that an important caller is just about due. You told him that he would find this 'palace on wheels' parked alongside the No. 10 platform at the Howrah station. He, therefore, would have no difficulty in finding us."

This was only too true. The saloon was in motion while this colloquy proceeded. By the it was well into the yard. Except for a cabin from which men ever on the look-out manipulated levers that, according to the need of the split-second, shifted points, there was nothing in sight but rails, shining in the westering sun and carriages and waggons on some of them.

Alarmed—genuinely alarmed—Mrs. Singh gloomily predicted: "He will come and, finding no saloon at the spot you named, will go whence he came. Even if some one perchance tells him where this blessed carriage has been shifted to, he will never be able to locate it in this—wilderness—wilderness of rails. So that is that."

"A man who had the wits and the energy to climb into the seat of the Vice-Chancellor of the Calcutta University at an age when many of us have not finished cutting our wisdom teeth," I assured her, "would not be fazed by this little move for which there is doubtless good and ample cause. More than likely the Station Superintend-

ent's eye will pick Syama out of the multitude and he will personally conduct your august visitor to us. I promise you that you will presently see his smiling face beaming at you from that door through which he will be entering."

Sure enough. That was exactly what happened. Hardly were the words out of my mouth when there was a click and the door near which my good lady was sitting swung upon the carefully greased hinges and a man entered. From the size of the head I could recognize it as Syama's.

A bare head it was. Somewhat closely cropped.

A giant he looked as he, upon entering, straightened himself, advanced towards Mrs. Singh, bowed, shook hands and expressed his joy at seeing her. There was nothing of the lackadaisical Oriental in his step, speech or handshake.

As he next greeted me I saw how much he had matured since our last meeting. His manhood was, certainly, in flower.

"Our brother Asutosh has left us," I remarked, "since we were last in Calcutta."

"He died in 1924—on May 25th," he replied.

"The greatest tribute that ever was paid to him," I remarked, "emanated from Lord Lytton. Unconsciously, no doubt. When your father and he had scarcely ceased measuring swords, he, seated in the study in that grand mansion in Calcutta built in imitation of the Curzonian country seat, confided in me:

Lytton: "If the schemes that you have in mind go through, the number of persons who would have passed through the portals of the University would outrun the number of jobs. You would hardly credit the remark he made."

Asutosh: "I shall not mind."

Lytton: "Not mind unemployment among the educated?"

Asutosh: "Precisely."

Lytton: "Why?"

Asutosh: "Don't you say over there that discontent is divine?"

"You see," commented Lytton, "Asutosh Mookerjee wishes to shake the very foundations of *pax Britannica* in the East."

Syama, who had not heard of this passage at arms, was patently impressed with it.

"You must write Father's *Life*," he said, with that downrightness that I had already learnt to associate with him. He seemed to know his mind—to possess the faculty of making up his mind quickly—resolutely.

I thanked him politely.

"No, no," he said, "this is no new brain-wave on my part."

"Indeed, no," interposed Mrs. St. Nihal Singh, "I remember you mentioned it in a letter—or was it in more than one?"

Bubbling with joy at this, he began to outline the book, child of the slow-moving East though he was supposed to be.

"There were four sides to Father," he explained, "at least four, each more or less distinct from the others."

"Firstly, there was the scientist. He had the mathematician's brain. In his B.A. he had worked out a problem that astonished mathematicians abroad. With that foundation he could have become a great physicist had he so willed—or tried to be."

"Secondly, there was his linguistic, literary side. His mastery over English did not so occupy his mind that he did not become proficient in Sanskrit. This was evident from the ease with which he won two degrees in Sanskrit learning. He had taken pains to learn all these as well as Bengali. What I must not fail to add is that he could use to effect all these languages both by word of mouth and by pen. This was indeed remarkable."

"Thirdly, after gaining distinction in his chosen profession, he went from the Bar to the Bench. The questions he put, the points he elucidated, were admired by the most eminent counsel, both in India and in Britain. The judgments he handed down were noteworthy equally for their grasp of law, appreciation of the finest points of law and equity, brevity, lucidity and precision of language."

"Fourthly and perhaps greatest of all, he was an educationist. As syndic of the University during his early years he made a mark. His terms of Vice-Chancellorship enabled him practically to rebuild that institution by developing science and technology, philosophy, culture, art and literature. He gave a new direction to life in Bengal. His keenness for the adoption of the mother-tongue as the vehicle of education was already exercising a profound influence before he passed away."

"Not the least good that he did was to fish out young men of promise and give them the opportunity to develop their gifts. Father installed a young Andhra at the University as head of the philosophic side. By his intellectual gifts and work Sarvapalli Radhakrishnan acquired a worldwide reputation. C. V. Raman was persuaded to leave the Accounts Department, where he had brilliant prospects, and devote himself to science, though to begin with he would be financially worse off. Meghnad Saha, too, he encouraged. You will observe that he did not confine himself to Bengal, but sought his men wherever he could find them."

III

"How about your own work at the University?" I asked. "There you have come into a great inheritance."

Almost everything Syama had to say about the University was associated in one way or another with his illustrious sire. His only thought was to go on consolidating and extending the work Asutosh had inaugurated. Fortunately no one in the wide world knew so well as, through association with him, Syama did of the plans that administrator had in mind when he vacated the Vice-Chancellor's chair. It was all to the good that the son who now occupied the chair relinquished by his sire carried the blue-print in his head.

More than that, he had ideas of his own. Born in the initial year of this century, brought up in an atmosphere of acute unrest—confusion—boy-cott—swadeshi—swaraj—and kindred waves, he had "urges" (as the Americans say). There also was the steadily accelerating tempo of the age. It had begun to go up with the Russo-Japanese war. The jazzed nerves—not only the jazzed music—that subsequently came in the wake of World War I. All this expressed itself in the matter of the time-table to which it seemed to me he had geared himself.

In the programme of what he wished to do that he outlined to me as we sat talking in that railway saloon on a siding at the Howrah station I noted that he was eager to develop the post-graduate teaching side of the University. Much had been done by his father. Much, however, remained to be done to put Calcutta University in the forefront in that domain.

I admired particularly the stress he was placing upon culture and art. He told me of the tour he had been making in Orissa, of the valuable figures and figurines he had been able to acquire. These he had put or was going to put in the University Museum.

The emphasis he placed upon the medium of education pleased me most of all. With the steps he had taken all teaching would soon be done, even in the graduate classes, through the Bengali. He seemed to derive much satisfaction from this achievement.

Had he found his *metier*?

Was he content with educational administration? Or did his heart hanker for . . . ?

We discussed these matters after he had taken leave of us and gone from the saloon long ere then taken back to the No. 10 platform. In discussing the state of Mother India, he had used a phrase more than once. It was "civil liberties." His mind seemed to be dwelling upon it. Of this more in the next article.

(Article Two of this series will appear in the October, 1953 issue of *The Modern Review*.—EDITOR.)

HISTORY AND GROWTH OF CO-OPERATIVE MOVEMENT IN INDIA

By PROF. C. B. MAMORIA, M.A., (Geog.), M.Com.

II

CO-OPERATIVE MOVEMENT DURING POST-WAR PERIOD

The abnormal conditions created by World War II led to some far-reaching developments in the co-operative movement. There has been an over-all improvement. Between 1938-39 and 1945-46, the increase in the number of societies, the number of members and the working capital have been respectively 41 per cent, 70 per cent and 51 per cent. Also the movement touched 6 per cent of the population in 1938-39 but 10 per cent in 1945-46. The war stimulated the growth of Consumers' Stores and Marketing Societies. Many new types of producers' societies like Weavers' Societies, Milk Supply Unions, Motor Transport Societies, Fruit Growers' and Cane Growers' Associations, etc., were formed during the war period. The credit societies extended their functions and the movement manifested its multi-purpose potentialities. Loan repayments were accelerated, turnover was brisk and working capital registered a substantial increase though not in proportion to the war-time inflation which means that a unique opportunity of augmenting working capital by increasing members' deposits was lost. Thus during the war, "with a large turnover, accelerated payments and shrinkage in the overdues the societies gained in strength and vigour." There was a temporary decline in the figures consequent on the partition, but the progress made subsequently has been so appreciable that the figures for 1949-50 have exceeded even the total for undivided India in 1945-46, the number, membership and working capital during 1949-50 having increased by 0.5 per cent, 37 per cent and 42 per cent respectively over 1945-46 figures.

The following table shows the development of the movement since 1909 up to date:

(See TABLE I on page 193)

Before we conclude this history of the co-operative movement in India we may point out its certain characteristic features:

Firstly, the co-operative movement in India has not sprung up from the people. It was initiated by the Government with a view to solve the problem of rural indebtedness; and even today it is based not on the voluntary efforts of the people determined to help themselves but on the Government support, which could not evoke the ready response and services of the young and the ardent, who looked with suspicion upon every movement so started. In the words of Mr. V. L. Mehta:

"Government are so out of touch with public feeling and sentiment that despite their control of the machinery of administration they fail in their efforts to seek an expansion of the movement."

In fact, it is not a spontaneous growth but a Government policy.¹¹ The distinction between co-

operation imposed by the Government and necessarily supervised, regulated, restricted and controlled on the one hand, and co-operation promoted by voluntary initiative and sustained by the co-operative spirit, which insures the loyalty of the members, on the other hand, cannot be over-emphasised.¹²

Secondly, started originally to provide the farmer with cheap credit, it has continued to this day a predominantly credit movement. So that the progress of non-credit co-operation has been slow and agricultural credit societies dominate the picture.

Thirdly, though there are inter-provincial differences, the structure of the co-operative organisation is uniform in almost all the provinces, e.g., in each province at the head of the movement there are three authorities, viz., the Registrar of the Co-operative Societies in charge of control and direction of the movement, Provincial or Apex Bank in charge of finance, and the Provincial Co-operative Institute or Union in charge of education and propaganda.

We close this note by quoting the remarks of the Reserve Bank of India in the following paragraphs:

"Apart from this general expansion, the working of the movement in recent years has been characterised by greater diversity of functions; co-operation has permeated several walks of life, some of which were perhaps no more than touched before. It has played an important part in the attempts to solve two big problems, viz., the rehabilitation of displaced persons and the augmentation of the food production. The rehabilitation of displaced persons through the formation of co-operatives received a great fillip, owing mainly to the aid extended by the Government, in the shape of loans, grants-in-aid, cheap land building materials and similar other concessions. Housing, industrial and forming societies were generally encouraged so that the displaced persons could be settled in colonies and provided with gainful occupations. In the field of food production co-operatives were entrusted with the distribution of manures, chemical fertilisers and agricultural implements. Credit facilities were liberalised for the members of co-operative credit societies by such measures as the relaxation of credit limits, financing at concessional rates, installations of pumping sets and oil engines. Thus by the introduction of modern methods there was sought to be brought about both more intensive and extensive cultivation of land.

"The full-scale development of the multipurpose idea in several States like Madras, Bombay, Mysore, U.P., is another notable trend in the primary credit structure. These societies were entrusted with the distribution of rationed and other essential commodities."

FUTURE TREND OF CO-OPERATIVE MOVEMENT

The Reserve Bank of India has brought out a comprehensive review of the progress made by the Co-operative movement in India in the two years of 1948-50. The publication outlines the future trend of the movement into Multipurpose Co-operative Societies, which should embrace complete economic activity of the agricultural and labouring class within its fold. These, as given out in the said publication, are:

(1) The Organisation of Multipurpose Societies.

(2) Financial accommodation from the Reserve Bank to the Co-operative movement, and

(3) The training and education of staff working in the departments and the co-operative institutions.

THE MULTIPURPOSE IDEA

"Even as early as 1937, the Reserve Bank of India stressed the importance of organising multipurpose co-operative societies in our country where numerous single-purpose societies could not be easily worked on an effective and economic basis; the multipurpose society could embrace the whole life of the agriculturist. It was explained how the credit societies were catering only to one of the needs of the agriculturist, viz., credit, and even then they could meet only a part of the requirements. The agriculturist was, therefore, still largely dependent on the village sowcar for marketing his goods, for supplying him with his necessities of life, viz., consumer goods and numerous other services that he was in need of. The result has been that the idea of effecting an economic regeneration of the Indian peasantry through co-operation has remained

unfulfilled. Co-operators, official and non-official, have become increasingly aware of the limited utility of single-purpose societies and during the past few years, the credit society has been yielding place to the multipurpose society. Several States have drawn up schemes of organising such multipurpose societies afresh or at least have begun to enlarge the functions of the existing credit societies by entrusting them with the work of distribution of essential goods to start with. The multipurpose idea has thus obtained a firm footing.

"It has, however, to be observed, that there has not so far been a clear-cut scheme for defining the scope and activities of all the institutions in the multipurpose hierarchy. While all are agreed that at the bottom the primary society should be multipurpose, dispensing credit, distributing supplies, looking after better sanitation, better living and so on. It has to be examined as to which institutions these primary multipurpose societies should be federated into, at the taluk or district level, and what should be the function of these federal agencies. The trend appears to be in the direction of having a federal organisation at the taluk level. In this connection, it may be observed that there is a tendency to combine banking and trading. No doubt the village multipurpose societies can and must do banking because the volume of transactions under each activity will not be so large as to imperil the interests of any other section to any dangerous extent. Further, it has been found necessary to secure the undivided loyalty of the villager to the Co-operative movement and in the absence of facilities to be loyal to the society. On the other hand, the taluka multi-

purpose society should be a purely trading concern and it would be preferable to exclude banking from it completely for several reasons: Firstly, its business would be sizable and its profits in certain lines or losses in others might be considerable at times. And, the societies may not only trade as agents of the primary societies but on their own also in some types of goods and such business would naturally carry risks. If, therefore, the trading side suffers on account of some speculation or undue risks taken by a society, such a failure may have serious repercussions on its banking side. Secondly, trading calls for special business talents, different from those needed for carrying on banking. An enterprising businessman need not necessarily be an able banker, but on the other hand, might even bring the banking side into a dangerous position. Thirdly, the taluka multipurpose society might not be able to attract deposits of all kinds, and the hope that it would develop into a first class taluk bank might not materialise. So much so the banking section may not be a profitable section and apart from unnecessarily mixing up trading and banking, may not by itself cater for the credit needs of the affiliated societies satisfactorily. And from the Reserve Bank of India's point of view also, it would be doubtful, if the numerous taluka multipurpose societies can run separate credit sections on absolutely banking lines, to be considered fit enough for giving the second good signature under Section 17(2)(b) of the Reserve Bank of India Act.

"This would mean that the primary multipurpose societies would have to affiliate themselves to taluka multipurpose central financing agencies for their credit needs. And at the top, there would be the apex bank on the credit side and an apex society on the non-credit side. In short, the trading structure should be treated separately from the credit structure, and it is up to the Registrars of the States to clearly define the scope and functions of the various institutions, in the trading and credit hierarchy, in order to avoid mixing up of banking and trading."

RESERVE BANK AND THE MOVEMENT

"Another factor that has assumed increasing importance in recent years is the larger demand for funds made on the Reserve Bank of India by the Provincial Banks under Section 17(2)(b), (4)(a) and (4)(c) of the Reserve Bank of India Act. From Rs. 0.91 crores and Rs. 0.68 crores in 1947-48, the amount of loans applied and the amount sanctioned have increased to Rs. 4.82 crores and Rs. 2.14 crores in 1949-50 and still further to Rs. 10.46 crores and Rs. 7.62 crores respectively in 1950-51. The advances have been at concessional rates wherever they were utilised for financing seasonal agricultural operations and marketing of crops referred to in the Act. Recently, a few amendments have been made to the Reserve Bank of India Act with a view to liberalising the Bank's loan policy to the State Co-operative Banks. The amendments are:

(1) Section 17(2)(a) of the Reserve Bank of India Act, which relates to the discounting of bills arising out of bonafide commercial or trade transactions and which was not applicable to provincial co-operative banks before, has now been extended to co-operative banks also.

(2) The period of accommodation from the Reserve Bank specified in Section 17(2)(b) has been extended from 9 months to 15 months. The condition placed by the Bank that all the loans should be repaid by a fixed date irrespective of the maturity of the bills has also been removed.

(3) Another far-reaching step is the extension of the provisions of the Reserve Bank of India Act to the former Indian States which have now been reorganised into more homogeneous States Unions and which have so far been denied the facilities for accommodation available under the Act. To bring about a uniform development of the movement in these new States Unions, the Reserve Bank advocated as a first step, the formation of apex co-operative banks in them and have also conducted preliminary discussions with the authorities in some unions for taking speedy action in that regard. The need for organisation of apex banks is most necessary to enable them to take advantage of the Reserve Bank's accommodation facilities since under the Act, financial accommodation from the Reserve Bank could be made available only through a State Co-operative Bank or in its absence, any central society declared to be a State Co-operative Bank by a State Government for this purpose.

"In this connection, an Informal Conference was convened in 1951 to discuss the role of the Reserve Bank of India in the sphere of Rural Finance. As a result of the deliberations of the conference, an expert Standing Advisory Committee has been formed comprising prominent co-operators and others, both official and non-official. The main function of the body is to advise the Bank on matters pertaining to its Agricultural Credit Department and allied subjects."

CO-OPERATIVE EDUCATION AND TRAINING

"Lastly, the question of imparting training and education to the staff of the Co-operative Departments and the Co-operative Institutions is also of paramount importance. The responsibilities are becoming greater day by day, and it is very necessary that all the higher executives concerned with important co-operative societies should know their job thoroughly. At present, except in advanced States like Bombay and Madras, adequate arrangements do not exist either for imparting initial training or for refresher classes for departmental and non-departmental workers. In Bombay, the Poona Co-operative College is serving as a centre for training the higher staff. It is seen that some of the officers from other States are also being deputed to this college for training. Similarly, the staff of the co-operative institutions in Madras including depart-

mental staff, receive training in the Central Co-operative Training Institute in Madras City. Efforts should, therefore, be made to provide facilities for the satisfactory training of the personnel in the higher ranks like officers of the Co-operative Department, Managers and Secretaries of Banks and Societies in all the States. In the existing circumstances two kinds of training arrangements will have to be made, viz., long-term training in the theory as well as practice of co-operation. Banking inspection and audit and so on, for officers newly recruited and short-term intensive training for those who are already working in the Departments and Co-operative institutions and who must reinforce their knowledge by a refresher course.

"It, therefore, devolves on the departments to make suitable arrangements for such a thorough training. Perhaps they may consider utilising the existing higher training institutions, such as these in Bombay and Madras, to the fullest possible extent, until such time as the necessary steps are taken to set up similar institutions in the States themselves.

"In conclusion, it may be said that in spite of all the difficulties which it has had to face, the Co-operative movement had a fairly successful period of development during the two years under review. The potentialities are very great in view of the importance given to the movement in all nation-building activities in the various States. Guided properly by zealous co-operators and well-trained officials, the movement has every reason to look forward to an increasingly effective and useful role in shaping the future of the country."

CLASSIFICATION OF THE CO-OPERATIVE SOCIETIES

A proper classification of the co-operative societies is essential for three reasons: Firstly, it facilitates the study of the principles that should govern the working of the different kinds of societies. Secondly, it enables an easy study of the progress made by the different types of co-operative societies in different regions through independent and comparative study. Thirdly, it can help the propagation of certain theories and notions.

In regard to the international statistics classification of co-operatives by Dr. C. R. Fay is as follows: (i) Co-operative Banks, (ii) Agricultural Societies, (iii) Workers' Co-operative Societies, (iv) Co-operative Stores.

Dr. Faquet suggests the following classification: (i) Consumers' Co-operative Societies, (ii) Housing Societies, (iii) Occupational Co-operative (excluding agricultural societies but including Urban credit societies), (iv) Agricultural Societies (including the credit societies), (v) Various others.

The International Institute of Agriculture, Rome, has adopted the following classification: (i) Credit, (ii) Production, (iii) Production and Sale, (iv) Purchase, (v) Sale.

The fourth classification may be attempted as: (i) Credit Societies, (ii) Consumers' Societies, (iii) Producers' Societies, (iv) Insurance Societies, (v) Housing Societies and (vi) Others.

The classification given by Dr. Fay does not include the housing societies and the insurance societies; but from the point of view of co-operative development in the world it is essential to study the progress of these societies separately.

In the second classification, greater emphasis is placed on consumers. It does not have a separate group for credit societies. In view of the special importance of finance, it seems incorrect to include the credit co-operatives and producers' societies in one.

The third classification has no place for housing. Also it considers insurance societies as something which can be taken as auxiliary to one of the five forms while purchase societies include both supply societies and consumer's stores, and class production may be merged in "production and sale." Sale group may be included therein; and three groups could be together named, "Producers' Societies." So the third system is also not suitable.

The fourth classification does not distinguish between the Urban and the Rural societies. But the rural societies do not have to follow principles very much different from those that guide the urban co-operatives. It also seems unjust to have one class for agricultural societies and four or five for the non-agricultural societies. If a distinction is made between the urban and rural problems, let there be as many classes for agricultural societies as for the urban societies. If this is not agreed to, it will suffice to have a sub-head for "Urban Credit Societies" under "Credit Societies"; and for "Agricultural Producers' Societies" under "Producers' Societies."

(A) In India, the Reserve Bank has made the following classification: (i) Credit Societies, (ii) Purchase and Purchase and Sale Societies, (iii) Production Societies, (iv) Production and Sale Societies, (v) Others.

(B) Land Mortgage Banks.

(C) Non-Agricultural Societies: (i) Credit Societies, (ii) Purchase and Purchase and Sale Societies, (iii) Production Societies, (iv) Production and Sale Societies, (v) Others.

(D) Insurance Societies: (i) Ordinary and (ii) Cattle.

This grouping may be modified in view of the growing importance of the housing, marketing and multipurpose societies. Hence, the given classes under (A) and (C) group may be remodelled as (i) Credit Societies, (ii) Consumers' Societies, (iii) Production Societies, (iv) Marketing Societies, (v) Housing Societies and (vi) Others.

Under each of these classes, the number of societies which are multi-purpose in nature may be indicated within brackets. This will not only focus our attention

on the necessary aspects of co-operation, but will facilitate compilation of internal statistics for a comparative study.

It is difficult to give an exact classification of the different kinds of co-operative societies but for convenience we can divide them into two main categories, viz., (a) Agricultural and (b) Non-agricultural.

Agricultural societies are those societies in which the majority of the members are agriculturists, i.e., persons whose main occupation is cultivation of land or the rearing of livestock or of which the object is mainly agricultural. Whereas, non-agricultural societies are those which are not agricultural in character.

The diagram given below showing the classification of the co-operative societies will give a clear idea of the complex co-operative structure that has been built up in India:

Co-operative Credit Societies are linked with the Banking Union or the Central Bank and the Central Bank is linked with the Provincial or the Apex Bank.

The primary societies are confined to small villages, the Central Banks to Taluka or District towns, and the Provincial Banks are the headquarters of the Province. If a borrower in a village needs money, he applies to his society. If the society has no fund at its disposal, it applies to the Central Bank, and if the Central Bank is in need of the funds, it applies to the Provincial Bank. That is why it is said that the co-operative movement links the farmer in the remote village with the money markets of the country. The objects of primary agricultural credit societies include the borrowing of funds from members or others to be utilised for loans to members and also for the promo-

CO-OPERATIVE SOCIETIES

(A) AGRICULTURAL SOCIETIES

The Agricultural Societies may be again subdivided into credit and non-credit societies, and similarly non-agricultural societies may also be divided into credit and non-credit societies.

1. *Agricultural Credit Societies:* In the list of Agricultural Societies on credit side we have first the primary societies, the main purpose of which is to provide credit to their members and to encourage the habit of thrift. At the other end of the credit societies are the Provincial Banks which link the rural areas with the money markets of the country, and have their headquarters at the capital towns of the Province or States. Between these two extremes are the Banking Unions and Central Banks. Generally speaking, Primary

tion of thrift. They also act as agent for the joint sale of its members' produce and the joint purchase of their agri-domestic requirements, for the hiring of implements, machinery or animals to members, the dissemination of information about improved farming practices, the encouragement of subsidiary industries and the reform of social practices.

2. *Agricultural Non-Credit Societies:* On the non-credit side, the agricultural societies deal with sale and marketing of goods, consolidation of holdings, better living and better farming, insurance of cattle, supply of seed, cattle breeding, co-operative farming, irrigation, milk and dairy products, ghee, poultry and eggs societies, crop-protection societies, colonisation societies and crop insurance societies, labour contract societies.

THE FIRST CENSUS OF FREE INDIA

197

(B) NON-AGRICULTURAL SOCIETIES

The non-agricultural societies may also be conveniently sub-divided into credit and non-credit societies.

The credit societies are generally called Urban Banks. They provide credit to workers and artisans. They have no separate Provincial or Apex Bank of their own, though they have their own Central or District Banks.

On the non-credit side, the important societies are Employees' Societies, Consumers' Stores, Thrift and Life Insurance, Housing Societies, Artisans' and Weavers' Societies, Milk Societies, Communal Societies, Societies for Factory Workers and Societies for Depressed Classes, Societies for Women, etc.

Of India's co-operative undertakings in this century, credit societies which were launched the earliest still dominate the picture. In all Provinces and States, agricultural societies exceed by far both in number and in membership, though not in working capital, all other types of co-operative organisations put together.

Out of 169.66 thousand primary societies in 1949-50 124.06 thousand were credit societies forming 73.1 per cent of the total agricultural credit societies, their membership and percentage to the total being 116.53 thousand and 68.7 respectively. The number of agricultural credit societies rose from 112,339 in 1948-49 to 116,534 in 1949-50 consisting of 28,126 limited liability societies, 75,953 unlimited liability type and 12,455 grain banks.

The largest number of agricultural credit societies is to be found in U.P., 24,057 in 1949-50 followed by Madras 15,348, Bombay 8,928, West Bengal 9,598 and

Hyderabad 15,899. Madras leads in the number of members of such societies 1,191,027, followed by U. P. 813,726, Hyderabad 771,829, Bombay 611,873 and West Bengal only 220,098 and the Punjab 278,863. Whereas there were only 7.53 thousand non-agricultural societies in 1949-50, there were 48,17,545 and 20,65,990 members of the agricultural and non-agricultural societies respectively, representing 68.7 and 31.3 per cent of the total number. The working capital of the former was 3521.75 lakhs and Rs. 5160.24 lakhs of the latter.

Madras had 1,191 non-agricultural societies in 1949-50 followed by Bombay and West Bengal with 1,496 and 385 and by U.P. 646, Punjab 453 and Mysore 562. The number of members of such societies in Madras was 483,215, Bombay with 721,954 was followed by Bengal with 281,132, U.P. with 79,282, Punjab 25,537 and Mysore 112,970.

The details given below show the numerical position of credit and non-credit societies:

	1948-49		1949-50	
	No.	Percentage to total	No.	Percentage to total
<i>Credit Societies:</i>				
Agricultural	112.34	68.95	116.53	68.68
Non-agricultural	7.03	4.32	7.53	4.44
Total	119.37	73.27	124.06	73.12
<i>Non-credit Societies:</i>				
Agricultural	22.76	13.97	25.86	15.25
Non-agricultural	20.79	12.76	19.74	11.63
Total	43.55	26.73	45.60	26.88
Grand total	162.92	100.00	169.66	100.00

(Concluded)

THE FIRST CENSUS OF FREE INDIA

By ASHISH BOSE, M.com.

THE Census of 1951 was the eighth regular census of India and first census of free India. In the history of census operations in India it stands out as a remarkable census. It secured public co-operation in much more abundant measure than on any previous occasion. And it was probably the least inaccurate and the most scientific census in India.

THE CENSUS OPERATION

The Census was taken in all Part A, B and C States and Part D territories of India with the exception of (1) Jammu and Kashmir and (2) the Part B Tribal Areas of Assam. Sikkim was always included in former censuses and the practice has been retained in this census also. The counting started on the 9th February and the enumeration was completed by the 3rd March, 1951. 5,92,937 enumerators visited six crores and forty-four lakhs of houses. The enumeration records were assembled and checked at 52 Tabulation Offices opened temporarily for this purpose at

various centres in the country. Provisional figures of the total population were published in April 1951 and the final population totals were published in May 1952. A sample verification of the actual count was done before the end of 1951 and the result published in March 1953.

NEW FEATURES OF THE CENSUS

The useless collection of statistics and discussion regarding castes and sub-castes, which was the practice in previous censuses has been abandoned and more attention paid to the economic characteristics of the population. Further, the ambiguous concept of "community" which was introduced in the Census of 1941 has been discarded and statistics of religion collected.

The occupational distribution of population which was abandoned in the Census of 1941 has been introduced again with a more simple and scientific classification. The entire population of the country has been divided into two broad livelihood categories:

(1) Agricultural and (2) Non-agricultural. Each category is divided into four classes. The detailed classification is given in a subsequent table.

The 9 Part A States, 9 Part B States and 10 Part C States in addition to a few Part D Territories have been grouped into six Population Zones. They are: North India, East India, South India, West India, Central India and North-West India.

Independently of the above grouping the country as a whole is divided into five Natural Regions on the basis of physical features. They are: The Himalayan Region, the Northern Plains Region, the Peninsular Hills and Plateau Region, the Western Ghats and Coastal Region and the Eastern Ghats and Coastal Region. These five Regions are in turn divided into 15 Sub-Regions and 52 Divisions (the Bay Islands form the 53rd Division). Thus the study of population changes in relation to geographical and economic factors is made possible.

Another feature of the Census of 1951 is that instead of calculating the percentage variation as was done in past censuses, "the mean decennial growth rate" has been calculated. The latter is based on the average of the population of 1941 and 1951 taken together and not solely on the population of 1941 which is the base in the calculation of the percentage variation.

SAMPLE VERIFICATION OF THE CENSUS COUNT

For the first time in the history of census operations in India, a sample verification of the Census Count was conducted on a random sample basis and a precise estimate of the extent of error in the Count made. The area brought under verification contained 81 per cent of the total population. This verification reveals that the 1951 Census Count contains a net under-enumeration error of 1.1 per cent. As the Census Paper No. 1 of 1953 puts it:

"For every thousand persons included in the Census Count 11 other persons were probably omitted. It is a reasonably safe conclusion that the number of persons omitted (per thousand counted) could not have exceeded 12 or fallen short of 10."

It is encouraging to note that even in U.S.A. a net under-enumeration error of very nearly the same order was revealed by a post-enumeration survey conducted soon after the Census of 1950.

TOTAL POPULATION

The total population of India including the estimated population of Jammu and Kashmir (4.41m) and the Part B Tribal Areas of Assam (0.66m.) on the 1st March, 1951 was 361.8 millions. The total land area was 1.27 million sq. miles. The following figures relate to the territories actually covered by the Census of 1951:

Total population in 1951: 356,829,485
Total population in 1941: 314,766,380
Net increase (1941-51): 42.06 millions
Mean decennial growth: 12.5 per cent

Percentage increase: 13.4 per cent.

On account of the merger of Chandernagore into India the population of India (in 1951) increased to 356,879,394.

THE BIGGEST STATES

The following table gives the population, density and the rate of growth of population in the ten biggest (on the basis of population) States in India:

	Population (in millions)	Density (persons per sq. mile)	Mean decen- nial growth rate (1941-51)
Uttar Pradesh	63.22	557	+11.2
Madras	57.02	446	+13.4
Bihar	40.23	572	+9.6
Bombay	35.96	323	+20.8
West Bengal	24.81	806	+12.7
Madhya Pradesh	21.25	163	+7.9
Hyderabad	18.66	227	+13.3
Rajasthan	15.29	117	+13.9
Orissa	14.65	244	+6.2
Punjab	12.64	338	-0.5

In India, Uttar Pradesh has the biggest population, Madhya Pradesh the largest land area (130,272 sq. miles) and Delhi State the highest density (3,017 persons per sq. mile). Travancore-Cochin has the second highest density (1015). The density is lowest in Andaman and Nicobar Islands (10), Kutch (34) and Manipur (67).

RATE OF GROWTH

Among the six Population Zones, West India (Bombay, Saurashtra and Kutch) shows the highest rate of increase in population (20.1 per cent) and North-West India (Rajasthan, Panjab, Pepsu, etc.) the lowest (9.0 per cent). Likewise among the five Natural Regions, the Western Ghats and Coastal Region shows the highest rate of increase (20.5 per cent) and the Northern Plains Region the lowest (10.8 per cent). Among the individual States, the highest rate of growth is recorded in Delhi (62.1 per cent). Next come Coorg (30.5 per cent), Tripura (21.9 per cent), Mysore and Travancore-Cochin (21.2 per cent each) and Bombay (20.8 per cent). There is an actual decrease in population in Punjab (-0.5 per cent) and Andaman and Nicobar Islands (-8.6 per cent).

SEX-RATIO

Of the total population of 356.83 millions in 1951, 183.31 millions were males and 173.52 millions were females. Thus there were 947 females per 1000 males. There are more males than females in all States except Orissa, Madras, Travancore-Cochin, Manipur and Kutch where the reverse is the case. The sex-ratio is very unstable in Andaman and Nicobar Islands (625 females per 1000 males), Pepsu (844) and Punjab (863). It is worst in cities. In Calcutta, there are only 570 females per 1000 males, in Bombay 596 and in Kanpur 699.

RURAL-URBAN RATIO

The total rural population in 1951 was 295.0 millions or 82.7 per cent of the total population. There were 75 cities with a combined total population of

24.13 millions or 6.8 per cent of the total population. U.P. has the largest number of cities (16) while Bombay (State) has the biggest city population (5.1m.). The biggest cities in India are Bombay (2.8 m.), Calcutta (2.5 m.), Madras (1.4 m.), Hyderabad (1.1 m.) and Old Delhi (915,000). Greater Calcutta, however, has a population of 3.5 millions. Since 1941, 27 new cities have sprung up in the area that is India today. There are 55 cities in the Part A States, 16 in the Part B States, 4 in the Part C States and none in the Part D Territories.

LIVELIHOOD CLASSES

The following table gives the livelihood classes and the percentage of population dependent on each class to the total population:

I.	Class	Percentage of total population
1.	Cultivators of land, wholly or mainly owned and their dependents	46.9
2.	Cultivators of land, wholly or mainly unowned and their dependents	8.9
3.	Cultivating labourers and their dependents	12.5
4.	Non-cultivating owners of land, agricultural rent receivers and their dependents	1.5
	Total agricultural population	69.8
II.	Persons including dependents who derive their principal means of livelihood from:	
5.	Production other than cultivation	10.6
6.	Commerce	6.0
7.	Transport	1.6
8.	Other services and miscellaneous sources	12.0
	Total non-agricultural population	30.2
	Total	100.0

Thus India still remains a predominantly agricultural country. In spite of 50 years of industrialisation and urbanisation 70 per cent of the people depend on agriculture for their livelihood and 83 per cent of the people live in rural areas. But the population has kept on increasing. In 1901, the population of India (excluding the areas of Pakistan and Jammu and Kashmir) was 235.5 millions. In 1951, it was 356.8 millions. Thus in 50 years the population increased by 121.3 millions or by 51 per cent.

RELIGION

In the Census of 1951 the concept of "community" was abandoned and religion was recorded as revealed by the person enumerated. The following table shows the religious composition of the population of India (excluding those living in Jammu and Kashmir and the Part B Tribal Areas of Assam):

	Population (in millions)	Percentage of total population
1. Hindu	303.2	84.99
2. Muslim	35.4	9.93
3. Christian	8.2	2.30
4. Sikh	6.2	1.74
5. Jain	1.6	0.45

6. Buddhist	0.2	0.06
7. Zoroastrian	0.1	0.03
8. Jews (26,781)	...	...
9. Other religions (Tribal)	1.7	0.47
10. Other religions (Non-tribal)	0.1	0.03
	356.7*	100.00

Hindus form an absolute majority in every State of India except in Pepsu (where they are 49 per cent) and in Andaman and Nicobar Islands (where they are 30 per cent). The Muslim population is 22.08 per cent in Assam, 19.85 per cent in West Bengal, 15.4 per cent in Bhopal, 12.48 per cent in U.P., 11.82 per cent in Hyderabad and 11.34 per cent in Bihar. The Christian population was 32 per cent in Travancore-Cochin, 6.47 per cent in Assam and 4.15 per cent in Madras. In the Census of 1951, the great majority of the tribal people returned themselves as following Hinduism. The followers of tribal religions are concentrated in Bihar (52 per cent of the total followers of these religions in India are found in Chota Nagpur Division), West Bengal and Assam. The Jews are concentrated in Bombay State (75 per cent of the Jews in India live in this State). The Parsees are also concentrated in Bombay State (87 per cent of the Parsees in India live in this State). The majority of Jains live in Bombay State. The Buddhists are mostly found in West Bengal. The Sikhs are concentrated in the Punjab, Pepsu, Delhi and U.P. Among the followers of other non-tribal religions the majority are found in Assam, Bombay and Madras.

THE SECOND BIGGEST COUNTRY IN THE WORLD

Next to China India is the biggest country in the world. So far as land area is concerned, she ranks seventh in the world (next to U.S.S.R., China, Canada, Brazil, U.S.A. and Australia). India occupies 2.2 per cent of the total land area of the world and supports 15 per cent of the population of the world. In Asia, next to Japan, Lebanon and Korea, she has the highest density of population. The population of India is more than the combined population of North America and South America, about twice the population of Africa and about 44 times the population of Australia. It is 1.8 times the population of the U.S.S.R., 2.4 times the population of the U.S.A. and 7 times the population of United Kingdom. During a single decade, 1941-51 the population of India has increased by over 42 millions which is the present population of France. Every year a population almost equivalent to that of Denmark is added to the population of India. This will give us an idea of the magnitude of the population problem.†

* This figure does not include the returns of 268,602 persons in the Punjab whose records were destroyed by fire.

† The article gives the gist of all the Census Papers published so far, viz., Paper Nos. 1 and 2 of 1952 and Paper Nos. 1 and 2 of 1953.

EGYPT (1875-1953)

By PROF. SUDHANSU. BIMAL MOOKHERJEE, M.A.

The world is sharply divided today between the two fundamentally opposite philosophies of life, namely, Communism and Capitalism. The world is not one in spite of Wilkie. It should be remembered at the same time that the down-trodden millions of Asia and Africa do not bother half as much about the rival 'isms' as about their own deliverance from the bondage of Western imperialism. Unless the capitalist imperialist nations face the facts, unless they respond to the challenge of the age and agree to liquidate their ill-gotten colonial empires, Communism will naturally appear to the exploited millions of colonies in the role of the liberator. They will do well to bear in mind the note of warning uttered years ago by Sumner Welles, a former Under-Secretary of the U.S.A. Government:

"As the result of this war (World War II) we must assume the sovereign equality of the peoples the world over. Our victory must bring in its train liberation for all peoples. The age of imperialism is ended. The right of people for freedom must be recognised."—A speech on May 30, 1942.

The Anglo-American Allies have won the war. Have they won the peace? No, we fear.

A great unhappiness "fills the feudal regions from Spain to Indo-China and, in addition, much of Africa and Latin America. Everywhere a thin wealthy upper caste shamelessly flaunts its luxury under the eyes of the hungry, diseased peasants and shepherds who are deprived of the education, organisation and political power to improve their lot. Techniques date back to Noah and the population increases faster than production. Industry is puny, the middle class weak, the working class small, and the farm population in feudal servitude. Army, bureaucracy, and police cruelly oppress and consciously delude the poor, and for these services to the rich they are allowed to consume the bulk of the national budget, politics by assassination flourishes and palace revolutions multiply. Leadership goes to the unenlightened nobility or plutocracy who pay or to the trigger-quick military and unscrupulous demagogues who inflame the patriotic passions or religious fanaticism of the mass. Masters come and go, foreigners are ousted, national independence is achieved, but bread, rice, milk, medicines, water, shoes, shelter, schools remain in short supply. Loans from abroad reach the pockets of the haves, the have-nots have only their envy and hate."—*The Life of Joseph Stalin* by Louis Fischer, pp. 287-88.

The description applies almost word for word to Egypt, which forms a part of the vast region indicated above and inhabited by more than a billion people. The happenings in that country during the last one year and more show that the national temper is rising. The Egyptians are in no mood to be tied to the apron strings of their masters—alien or otherwise. They want to be masters in their own house—masters in name as well as in fact.

Egypt came within the orbit of European politics

in the late 19th century. European statesmen and politicians were preoccupied with exclusively European affairs till 1878. It is only after 1878 that they began to take more and more active interest in extra-European affairs. For the generation of Europeans that lived after 1878 there was no European problem demanding immediate solution. Italian unity and nationality had been achieved. So also had the German, Prussia had successfully fought out her struggles with France and Austria. The Eastern Question was no longer explosive. There were besides, positive factors, which drew the attention of Europe to Asia and Africa. The growing population of Europe needed outlets. Her rapidly expanding industries needed fresh sources of raw materials and fresh markets.

Asia and Africa offered the best opening to an expanding Europe in the years after 1878 and international rivalries were transferred to these two continents. It was during this era that Egypt, a vassal State of the Ottoman Empire, came to be tied to the chariot wheel of Western imperialism. Turkish overlordship over Egypt, it should be remembered, had long ceased to be effective.

Khedive Ismail, who ascended the throne of Egypt in 1863, has been rightly described as a man "with an immense capacity for wasting money." Egypt's national debt rose from three million pounds to one hundred million during his reign. The burden of taxation literally broke the back of the people. The hapless Egyptian fellaheen groaned under it. The country suffered from three C's—COURBASH (a whip of hippopotamus skin with a tapering end used as a whip), CORVEE (forced labour) and CORRUPTION. Wholesale bribery and sale of concessions were openly practised and connived at. The Egyptian peasantry under Khedive Ismail was perhaps the most wretched people on earth. European intervention in the affairs of Egypt and the whole of her later history are in a very real sense the outcome of the "carnival of extravagance and oppression" of Khedive Ismail. Ismail sold his shares in the Suez Canal Company in 1875. Prime Minister Disraeli of England purchased them for four million pounds on behalf of Her Britannic Majesty's Government. The transaction was the proverbial thin end of the wedge—the first step towards the establishment of England's stranglehold over Egypt. The Khedive repudiated the national debt of Egypt in 1876. English and French creditors of the Khedive were alarmed. Mr. Goshen and M. Joubart were sent out by them to Egypt to look after their interests and the immediate result was the establishment of the *Caisse de la Delta* (May 2, 1876). The Anglo-French Commission was originally empowered "to receive the revenue set apart for the service of the debt and to sanction or veto

fresh loans." These functions were enlarged before long to include the entire financial administration of the country. Ismail abdicated in 1879 and was followed by his son Tewfik on the throne of Egypt. The country was placed under an Anglo-French condominium in the same year. The financial supervision was vested in two controllers—one English and one French. The administrative control of the country soon passed into the hands of the Controllers. This dual control was not destined to last long, however.

The revolt of Arabi Bey in 1881 is a very significant episode in the history of modern Egypt. Nobody denies that it was in part military. But it was anti-foreign at the same time. It was directed against Turkish sovereignty on the one hand and against European intervention on the other. It was Arabi Pasha who raised the slogan "Egypt for Egyptians" (*Masli-Mastrijin*) for the first time. In a sense he may, therefore, be regarded as the father of modern Egyptian nationalism. Arabi secured the dismissal of some 1,200 foreign officials employed under the Anglo-French Condominium. He seized Alexandria in June, 1882, and set up his headquarters there. He had already forced the Khedive to promise that he (the Khedive) would dismiss two of the leading members of the Cabinet and accept a responsible ministry. He had further agreed to summon an Assembly of Notables before the end of 1881 and to limit the functions of the Condominium to the service of the debt.

The developments in Egypt frightened Europe. The Great powers met at Constantinople to formulate an agreed Egyptian policy. The conference decided nothing. Great Britain, particularly anxious for the Suez, her vital life-line, resolved to restore order by force. Admiral Sir Beauchamp Seymour bombarded Alexandria. Arabi withdrew after having burned the city. He was finally defeated at Tel-el-Kebir by Sir Garnet Wolsley, captured and deported to Ceylon. The Khedive's (!) power was restored and some British troops were left in the country, ostensibly to maintain peace and order. The Liberal British Foreign Secretary, Lord Granville solemnly assured the House of Lords: "We shall not keep our troops in Egypt any longer than is necessary." The promise has yet to be fulfilled as so many of Britain's promises to weaker peoples.

The failure of Arabi's rebellion was followed by the abolition of the Anglo-French Condominium (November, 1882) leaving the English sole masters of the Egyptian scene. Major Evelyn Baring (later Lord Cromer) was appointed the British Consul General in Egypt. The Khedive and his Ministers were responsible for the Government and carried on the administration of the country. But the British army was the real security for peace and the British treasury the real security for financial stability of Egypt. Baring was the Khedive *de facto* till his retirement in 1907.

When Arabi Pasha struck in Egypt proper in 1881,

Sudan, a dependency of Egypt, too, rose in revolt against the authority of the Khedive. A Sudanese proclaimed himself to be Mahdi, the Messiah. The rebellion, which assumed formidable proportions, was finally put down in 1898 when British troops under Kitchener crushed the rebels in the battle of Omdurman. As during Arabi's revolt, so also during the Mahdi's, British bayonets came to the rescue of the Khedive. England, of course, had her pound of flesh and Sudan was placed under joint Anglo-Egyptian rule in 1899.

The opening years of the 20th century were marked by a steadily mounting anti-British sentiment in all strata of Egyptian society. Discontent grew. National temper rose. Clear signs of unrest were discernible. Then came the Great War (1914-18) and Egypt, still a vassal of Turkey, was declared a British protectorate in December, 1914. The pro-Turkish Khedive Abbas was deposed. When the war came to an end in 1918, Zaghlul Pasha (Saa'd Zaghlul), the leader of the extreme nationalist party, presented a demand for complete independence of Egypt. Zaghlul's proposal was turned down. Prime Minister Rushdi Pasha next sought permission to go to England to confer with the British Government. The permission being refused, Rushdi Pasha resigned (1919). His resignation was the signal for riots and strikes all over the country. Even Government employees stayed away from work. Riots and strikes brought about a complete deadlock. The British Government sent out the Milner Commission to study the Egyptian problem at first hand and to suggest how peace and order was to be restored in Egypt. The Nationalist Party boycotted the Commission. Zaghlul Pasha, however, offered his co-operation and the Milner-Zaghlul Agreement recommended a treaty of alliance recognising the independence of Egypt as a constitutional monarchy with responsible institutions. Egypt was to recognise Britain's right to safeguard her special interests in Egypt, not to enter into any relations with a foreign power prejudicial to the interest of England and to permit England to maintain troops in Egypt. The Agreement was followed by a recrudescence of widespread riots. Zaghlul Pasha was deported. Egypt seethed with discontent.

England recognised the independence of Egypt in 1922. Certain questions were reserved for settlement later on. Zaghlul Pasha was allowed to return to Egypt. Supported by the Wafd (Nationalist) Party, he became the Prime Minister. The English Commander-in-Chief of the Egyptian forces was murdered in 1924. Anglo-Egyptian relations steadily deteriorated and Zaghlul Pasha was driven out of office.

The treaty of 1922 was revised in 1936. England agreed to remove her troops from Cairo and Alexandria, but not to evacuate Egypt. British troops were to remain in Egypt within prescribed limits.

Questions left for future consideration in 1922 were also settled. The expenses involved in the withdrawal of British troops from Cairo and Alexandria were borne by the Egyptian Government. Barracks and aerodromes for the British army were constructed in the Canal Zone at Egypt's cost. Britain was guaranteed the unfettered right of use of all Egyptian ports, railways and aerodromes. Needless to say, the terms did not satisfy the progressive section of the population.

World War II which has intensified the urge for independence everywhere in the world, may be rightly regarded as an important land-mark in the history of human emancipation. The repercussions of that War were felt in Egypt too. As a matter of fact, she had never reconciled herself to the idea of Britain's tutelage. The years 1945-52 were marked by persistent anti-British agitation and frequent conflicts all over Egypt. Britain's Labour Premier, Mr. Attlee, declared in 1946 that all British troops would be withdrawn from Egypt and that the Anglo-Egyptian treaty of 1936 would be replaced by an Anglo-American treaty to safeguard the security and independence of Egypt. We are not sure if Mr. Attlee really meant what he said. Britain's record in Egypt—one strewn with fragments of broken pledges—makes us dubious. The 1946 declaration was however well-timed and served a very useful purpose. It went a long way to pacify the impatient Egyptian progressive.

British imperialism was passing an anxious time in 1946. Britain and the U.S.A. held sharply divergent views over the future of India, Burma, Palestine and Malaya. Iran too was giving a headache. It would be unwise to antagonise Egypt at such a time. By 1947, the crisis had been tided over however and the Attlee declaration of the previous year was shelved. Egypt was disappointed. The national temper reached the boiling point. Egypt was convinced, if she had not been convinced earlier, that Britain would not quit Egypt unless forced to do so at the point of the bayonet.

Disappointed and disillusioned Egyptian public opinion forced the Wafdist Government of Nahas Pasha to abrogate the Anglo-Egyptian treaty (1936) in October, 1951. The Government declared at the same time that Egypt does not recognise British control over Sudan under the Anglo-Egyptian agreement of 1899. Students, labourers, peasants and the middle classes next launched a nationwide campaign against the occupation of the Suez Zone by British troops. Egyptian labourers in the Canal Zone organised a strike. Resistance groups sprang into existence in Cairo, Alexandria, Ismailia and other towns. Women did not lag behind their menfolk. For the first time in the long centuries of Egypt's chequered history women took an active part in politics. An anti-imperialist women's organisation came into existence. A nursing corps for those

wounded in mass demonstration was organised for the first time. In not a few places Egyptian police and military refused to deal sternly with the demonstrators. 35,000 Egyptian labourers in the Canal Zone refused to work. The Egyptian crew of British vessels refused to work for the British army. The country throbbled with a new life.

Egypt was a boiling cauldron during the three months from October to December, 1951. The Cairo correspondent of the United States News and World Report wrote at the time that Egypt's poverty-stricken masses were awake and described the awakening as resentful. It was at this critical juncture—at the crossroads of history—that the accredited leaders of the people failed them. The Wafd, which had been the spearhead of all Egypt's anti-British, anti-imperialist movements for a long time, took fright. They would not or could not keep pace with the awakened demos. The Wafdist Cabinet of Nahas Pasha was between the devil and the deep sea. It lacked the courage to condemn the mass struggle outright. Nor could it displease Britain. It nevertheless took stern steps to restore law and order in Britain's interest. The double-faced policy brought about the downfall of the Wafd. It forfeited the respect and confidence of the people on the one hand. On the other, Britain held it responsible for the growing mass militancy and accused it of conniving at anti-British demonstrations. A policy of vacillation and hesitance, an outcome of muddled thinking, makes enemies of all and friends of none. The dismissal of the Nahas Government was demanded by Britain. King Farouk meekly said, 'yes.' The excuse was not long in coming. About the middle of January, 1952, British troops in the Tel-el-Kebir area had minor skirmishes with the local Egyptians. Evidence from all sources shows that these were provoked by the former. British troops cordoned the palace of the Egyptian Governor and the police headquarters at Ismailia on January 25, 1952. Next day on January 26, the British Commander sent an ultimatum demanding the surrender of arms by the Egyptian police. The Governor ignored the ultimatum. An all-out assault was thereupon launched on the small Egyptian police force at Ismailia by British tanks, artillery and air-force. Fifty Egyptian policemen lost their lives. Many more were wounded. There were riots and demonstrations all over the country in protest against the atrocities at Ismailia. This was exactly the opportunity Britain had been looking for—an opportunity of crushing the mass movement and of installing a government in Egypt that would faithfully carry out the dictates from the White Hall. She warned the Egyptian Government that unless it could bring the situation under control General Erskine, the Commander of British troops in Egypt, would place Cairo under military occupation. The American Ambassador at Cairo threw a hint to King Farouk on Janu-

ary 24 that the Nahas Cabinet must be dismissed. The Government acting on the advice of the King, proclaimed Martial Law in Cairo. More than 1,000 were arrested. Drastic as the measure was, it did not satisfy Great Britain. The Government was dismissed by the King immediately after the promulgation of the Martial Law. Aly Maher Pasha was asked to form a Cabinet. The Wafd, which had an absolute majority in the Parliament, once again betrayed the nation by meekly accepting the order of dismissal, by not raising its voice of protest against the unconstitutional act of the King. Reaction was triumphant.

There are very good reasons to believe that foreign powers had a hand in the fall of the Wafd. It came out in the press and over the radio of various European countries that King Farouk was forced to offer the Premiership to Aly Maher under pressure of foreign powers. General Robertson, Commander-in-Chief of the British troops in the Middle East, declared on December 31, 1951, that British troops would by no means be withdrawn from the Canal Zone and that other powers—the U.S.A., no doubt, among others—were behind this decision of Great Britain. Prime Minister Winston Churchill requested the Truman Government at the same time to send some American troops to Egypt. Some American papers gave out that a 6000 strong token army was actually being despatched to Egypt.

Ali Maher Pasha was soon dismissed. Hilaly Pasha succeeded him. Hilaly's first act was the suspension of the Parliament. A vigorous campaign of calumny against the Wafdist leaders sought to dis-

credit them in the eye of the people. In the meanwhile, the situation was steadily deteriorating, the martial law notwithstanding. Anti-foreign, progressive mass movement reached the climax.

The army had in the meanwhile lost its confidence in the monarchy. It had been thoroughly discredited and its leaders humiliated in the Palestine War. King Farouk and his relations and favourites had been responsible for the scandal in connection with the purchase of arms and ammunition for that war. Leaders of the army had begun to unite against the King and the political parties. At last on July 23, 1952, a successful *coup d'etat* made General Neguib the arbiter of the destinies of Egypt. King Farouk abdicated on July 26 and made an inglorious exit from the Egyptian scene "unwept, unhonoured and unsung." His infant son was declared King of Egypt as Fuad II. Monarchy has since been abolished (June 18, 1953) in Egypt, which is now a Republic with General Neguib as the provisional President and Prime Minister.

The fate of Egypt rests on the knees of the gods. In the meanwhile, the rise of Neguib has been interpreted by many as a victory of re-action over progress—a successful Anglo-American device to crush Egyptian nationalism. Others again there are who hail Neguib as Egypt's Man of Destiny, as the saviour of his country and of his people. The problems of Egypt are however no nearer solution today than they were at the time of Neguib's rise to power.

The time is not yet perhaps to pronounce a verdict. Let us wait and watch.

MOISM AND AHIMSA

By CHOU HSIANG-KUANG, M.A.

Lecturer in History, University of Delhi

FROM the 6th century (Confucius was born in 551 and died in 479 B.C.) to the time of Emperor Wu-ti of the Han Dynasty, who canonized the Classics of the Confucian School, it was about six hundred years. During this period, the Confucian School was only one of many schools of thought which ran parallel to one another. Besides the Confucian School there were the following schools: (1) Taoism, (2) Moism, (3) The Sophists, and (4) The Legalists.

Moism was founded by Motze who is one of most important figures in Chinese history, a man whose name was constantly linked with that of Confucius. Motze was born in 468 B.C. and died in 376 B.C. He seems to have been a great officer in the State of Sung.

He was skilful in maintaining military defence, and taught economy of use. Huai Nan Tze states:

"Confucius and Motze practised the arts of the ancient Sages and were learned in all the discourses on the Six Disciplines."

But there are many places in Motze's writings where he stands opposed to the Confucian School, the thought of which differed from his own. Confucius "tried to be correct in righteousness, without calculating profit; tried to be pure in principles, without considering whether this would bring material return." They were working tirelessly to rescue the world from its ills.

Anything must be of profit to the country and the people before it can possess value, and it is the wealth and

populousness of a country, Motze believed, which constitute its greatest profit. Although luxury and adornment are of no benefit to the country and the people, yet at the same time they are not its greatest harm. Harm lies rather in the incessant fighting of the people and states among themselves, caused, so Motze held, by the fact that men do not love one another. Motze, therefore, was preaching the doctrine of love. The practice of universal love not only benefits the one who is loved, but the one who loves, on the principle of reciprocity. Motze says :

"Heaven wishes people to love and benefit one another, and does not want people to hate and hurt one another. Why, Because He loves all and benefits all."

"How to follow the will and wish of Heaven? It is to love all people and Heaven."

Motze thought that the great benefits to the world come from men practising universal love, and its major calamities come from them fighting with one another. Thus he says :

"How were chaos and calamities caused? They were caused by people not loving each other. A thief loves his own house and does not love the other's house, he therefore steals from the other's house for the benefit of his own house. A murderer loves his own body and does not love the other's body, he therefore murders the other's body for the benefit of his own body.....Every officer loves his own family and does not love the other's family, he therefore exploits others' families for the benefit of his own family. A king loves his own country and does not love others' countries, he therefore attacks others' countries for the benefit of his country.....If a man looks upon another's house as his own house, who will steal? If a man looks upon another's body as his own body who will murder? If a man looks upon another's family as his own family who will exploit? If all look upon others' countries as their own country, who will attack? . . . Therefore, when all love one another, there will be peace; and when all hate one another there will be chaos and calamity."

Again :

"To kill one man is wrongful and must receive one death punishment. Accordingly, to kill ten men is ten times wrongful and must receive ten death punishments. And to kill hundred men is hundred times wrongful and must receive hundred death punishments . . . Now the greatest wrong is to attack a country but he who attacks receives no punishment....Is this right?"

Again :

"Which are the greater ones among the evils of the world? They are those actions of the big countries attacking the small countries, of the big families disturbing the small families; and those deeds of the strong robbing the weak, of the group of the many oppressing the group of the few, of the clever deceiving the dull, of the high class scorning the low. These are the greatest evils of the world."

Therefore, Motze thought that we should condemn warfare. He says :

"When the army sets out, the bamboos, arrows, plumed standards, house tents, armours, shields and sword-hilts will break and rot in innumerable quantities and never come back. . . . Innumerable horses and oxen will start out fat and come back lean, or will die and never come back at all...Why, then does the government deprive the people of their opportunities and benefits to such a great extent? It has been answered : I covet the fame of the victor and the possession obtainable through conquest, and therefore I do it. But when we consider the victory as such, there is nothing useful about it. When we consider the possession obtained through it, it does not even make up for what has been lost."

Philosopher Bentham held that the purpose of morality and law is to procure the greatest happiness for the greatest number, a doctrine shared by Motze.

Although Motze held that the doctrine of universal love is the only way to save the world, he did not believe that men through their original nature can love one another. Because man's nature is like pure silk, and its goodness or evil is dependent entirely upon what it is 'dyed' with. We must strive to 'dye' others with the doctrine of universal love. But since the mass of people is short-sighted, it is difficult to make them see the benefit of universal love. Therefore, Motze laid stress on religious sanctions. He held that there is a God who rewards people, who practise universal love and punishes the perverse. He says :

"The ancient Sage-kings of the Three Dynasties, Yu, Tang, Wen and Wu, were those who obeyed the Will of Heaven and obtained reward. And the wicked kings of the Three Dynasties, Chieh, Chou, Yu and Li, were those who opposed the Will of Heaven and incurred punishment."

Motze loved all people without discrimination. Mencius described him by saying :

"If by grinding his whole body from the crown to the heel could have benefited the world, Motze would have done it."

Motze's idea of universal love is very similar to that of Ahimsa. Ahimsa is a word negative in form with a positive sense. We Chinese people prefer to use the positive form rather than the negative used by Indians. The philosophy of love of Motze and the Ahimsa of Hindu philosophy are the same gospel expressed in a slightly different way.

I have no better words to express my feelings about Motze's philosophy than the words which the Mahabharata uses : "Ahimsa is the Supreme Religion." Swami Sivanandaji says in the *Voice of the Himalayas* :

"There is only one religion : the religion of love."

Prime Minister Jawaharlal Nehru, accompanied by Sm. Vijayalakshmi Pandit, arrived in Karachi on July 25. He was received at the Amuripur Airport by Mr. Mohammed Ali, Prime Minister of Pakistan.

Rajkumari Amrit Kaur gave a luncheon party in New Delhi on August 18, in honour of Mr. Mohammed Ali, Prime Minister of Pakistan and Begum Mohammed Ali. (Front row): Mr. Mohammed Ali, Rajkumari Amrit Kaur, Begum Mohammed Ali and Sir M. Zafrulla Khan, Foreign Minister of Pakistan. (Back row): Dr. M. S. Mehta, High Commissioner for India in Pakistan and Mr. Ghaznafar Ali Khan, High Commissioner for Pakistan in India.

THE OUTBREAK AT BENARES IN 1799

By DR. S. B. CHAUDHURI, M.A., Ph.D.,

Presidency College, Calcutta

THE materials for the history of this episode have been taken from a nice little monograph, *Vizier Ali Khan or The Massacre at Benares: A Chapter in British Indian History*, written by Sir J. F. Davis, son of Mr. Samuel Davis, the brave Judge of Benares, who kept the insurgents at bay for a long time when they attacked his house. At the time of the incident, Davis, the son of the judge, was a child, but for this work he obtained, besides papers, the personal information and assistance of the Hon. Mount Stuart Elphinstone who was appointed on his first arrival in India as assistant to Mr. Davis, the Judge and Magistrate of Benares in 1799. By publishing this little volume of one hundred pages, Sir J. F. Davis has not only "done honour to his father's memory," but has laid the students of British Indian history under a deep obligation. Few narratives, indeed, can have "higher claims to implicit credit."

When Shuja-ud-daula, the Nawab-Vizier of Oudh died in 1775, he was succeeded by Asaf-ud-daula, who ceded to the Company the province of Benares, including "all the districts dependent on the Raja Chait Singh." The province was allowed to remain in charge of the Raja, subject to the control of a Resident at Benares. During the rule of Raja Mahip Narayan Singh, who was installed as successor to Chait Singh, an independent Magistrate was appointed for the city of Benares, the first to hold this post being Ali Ibrahim Khan. In 1794, Mahip Narayan was removed from the Government, as he was found incompetent to run it, and British officers were placed in charge of the administration. Benares remained quiet for a few years, but soon after the death of Asaf-ud-daula (1797) an insurrection broke out, the first of its kind during the British rule in India, which in many ways anticipated the political ideals of the Revolt of 1857.

The Company became the 'arbiters of the disposal of a kingdom,' as Lord Teignmouth wrote, 'by an extraordinary concurrence of circumstances.' The claim to succession lay between Vizier Ali, the son of the deceased Nawab and Saadat Ali Khan, the eldest surviving son of Shuja-ud-daula. Though the

former was installed by the British Resident at Lucknow, he was shortly afterwards deposed on account of his proved illegitimacy. By nature fearless and sanguinary, the young Nawab of seventeen, seems to have been conscious of his insecure position and even before his bonafides were doubted, the British Resident at Lucknow got the impression that Vizier Ali was entertaining hostile designs towards the English. The appearance of Lucknow is said to have been alarming on the day of Sir John Shore's intended visit to the city and Mr. Davis is of opinion that the assassination of the Governor-General was even planned by the Nawab's people.² But the Nawab was deserted by his friends including Almas Ali Khan, a powerful noble who denounced him before the Governor-General as spurious and profligate. The mother of the late sovereign, the Begam, also made similar complaints of the defective title of Vizier Ali, as a result of which he was deposed in favour of Saadat Ali Khan, and was removed to Benares where he was given as a residence the house known as Madho Das' garden with a pension of a lakh and a half annually. Saadat Ali was proclaimed Nawab-Vizier on 21st January, 1798.

The removal of Vizier Ali to Benares, on the frontier of his former domain, and the shadow of power sustained by the numerous retinue he was allowed to maintain, were by no means calculated to diminish the risks of future trouble and with a Mysore war in the offing and Tipu Sultan trafficking with the French, and Zaman Shah, the king of the Afghans, firmly entrenched at Lahore with a powerful army, the time indeed seemed ripe for a revolt of the Muslim princes of India.

The two chief civil authorities at Benares were: Mr. Samuel Davis, Judge and Magistrate of the district, and Mr. G. F. Cherry, the Resident at Benares, who, as Chief Judge of the Court of Appeal, was the channel of communication with the foreigners of rank at that city. By virtue of his position Mr. Cherry had some personal intercourse and interchange of visits with Vizier Ali, but he did not 'entertain any suspicions of sinister designs on the part of his charge' though Mr. Davis as well as the supreme government at Calcutta had repeatedly warned him to become 'cognizant of the suspicious conduct and disposition of Vizier Ali' and even suggested the removal of the

1. The book was published in 1811, but the impression having been exhausted, the second edition appeared in a limited number of copies meant chiefly for circulation among friends and relatives. The copy used by the writer of this article in the National Library at 'Belvedere,' bears an interesting notice—"purchased from the Hon'ble C. P. Ilbert, Date 26th October, 1886."

2. Davis: *Op. cit.*, p. 7.

Muhammadans of influence from the district, as they might be induced 'to throw their weight into the scale of insurrection.'³

Vizier Ali at Benares lived in right royal style with all the external marks of high rank which helped him to cherish views of independence in himself and at the same time offered an inducement to other disaffected chiefs to strengthen his cause. Davis quotes Lord Valentia and other authorities to show that the massacre at Benares was not a mere 'ebullition of rage' in Vizier Ali when he was ordered to live in Calcutta, but that the plan of the insurrection was arranged long before the arrival of that order.⁴ In fact, Vizier Ali looked forward to an invasion of India by the Afghans under Zaman Shah to whom he had sent an envoy, and depended much on the expected operations of the Afghan invader for the ultimate execution of his plan. He had also engaged some of the principal people of Benares to join him in an insurrection through a chain of conspiracy carried out by two of his accomplices Izzat Ali and Waris Ali, and was also in correspondence with other disaffected Musalman princes of Bengal devoted to his interest.⁵ Lord Mornington, on

being acquainted with the situation issued instructions to Mr. Cherry to remove the dangerous dethroned man from Benares to Calcutta. To Vizier Ali, it was a death-blow to all chances of success of his plan to overthrow the British rule, and so he was 'hurried into the execution of a desperate plot,' though he seemingly acquiesced in and gave out that he should proceed to Calcutta on the 15th or 16th of January (1799).

Mr. Cherry was too little inclined to suspect treachery on the part of the ex-Nawab, but the native Superintendent of Police reported to Mr. Davis on the 13th of January that Vizier Ali was engaging a number of armed men in his service, and seemed to make no preparations for his departure to Calcutta. On the night of the 13th Vizier Ali sent an information to Mr. Cherry that he would visit him on the following morning. Accordingly, on the morning of the 14th January 1799, he paid a State visit to Mr. Cherry, arriving at his house with a retinue of some 200 men fully armed. Unsuspectingly Mr. Cherry welcomed the party, and took Vizier Ali, Izzat Ali, Waris Ali and another attendant into the breakfast room who were accompanied by four armed followers. When tea was served to Vizier Ali he did not touch it, and began to complain in a loud voice, of the treatment he had received from Sir John Shore who promised him six lakhs of rupees per annum, but reduced it to a much smaller amount.

"On his departure," continued Vizier Ali confronting Mr. Cherry face to face, "Sir John Shore told me that you would take care of my interests and attend to my representations; but this you have never done. On the contrary, at the suggestion of Siadat Ali Khan you now wish me to go to Calcutta. . . . Saadat Ali Khan wishes for my death and the English are in league with him. . . ."⁶

While he was thus speaking, Waris Ali drew himself near Mr. Cherry, and at a signal from Vizier Ali held him by the back, while Vizier Ali himself seized his victim by the collar and struck at him with his drawn sword. The Resident endeavoured to escape through the verandah but they followed him and cut him down to pieces. Mr. R. Evans, a young private secretary, and Captain Conway, who were living with Mr. Cherry, were also killed in the Residency. The assassins now swelling into a murderous gang then made for the house of Mr. Davis, the Judge of the district, and killed on the way Mr. Robert Graham, a young civilian, and Mr. Hill, a shopkeeper of Benares. Mr. Davis, just returning from his morning ride found the *catal* in his home who reported that he apprehended some mischief from Vizier Ali's visit to Mr. Cherry. Presently, they found the insurgents running up against the house. Without delay, Mr. Davis sent

Feringhee. Vizier Ali had intrigued with Zaman Shah, and would not only have welcomed, but have subsidised also an Afghan force in his own dominions (Kaye: *Sepoy War*, I, pp. 115-16).

6. Davis: *Op. cit.*, p. 30.

his wife with her two children, of which the writer of the book *Vizier Ali* was one, to the flat roof of his house. He saved himself and his family only by his presence of mind and a narrow winding staircase which he defended with wonderful tact and pluck. With a spear and none to help him, he disabled his assailants singly every time they wanted to reach the roof. For the space of an hour and a half, he converted this narrow winding staircase into a sort of 'Domestic Thermopylae' as Lord Valentia described it,⁷ till troops came to his rescue. In the meantime Vizier Ali and his desperadoes went to plunder and murder other English houses in Sikraul, but when Major-General Erskine, encamped within a short march of the city of Benares, arrived at the scene with his troops, Vizier Ali retired to his house at Madhu Das' garden and prepared for defence.

The force under Erskine while marching through one of the suburbs of Benares suffered by the fire from the houses and the narrow lanes on each side, but on reaching Madhu Das' garden, the Nawab's palace, the gateway was broken in, and the stronghold was captured just as the sun set. It is believed that if the contest had lasted until dark, a frightful massacre would have been committed and the city of Benares pillaged by numerous bandits and adventurers who were thronging round.⁸

But though the garden house was assailed, Vizier Ali could not be captured as he had already fled by the way of Azamgarh towards Betail accompanied by most of his horsemen and a number of his armed foot followed during the night. The next day, the 15th of January 1799, the Raja of Benares, the Delhi princes from the Shivala, and many of the principal inhabitants of the city waited on Mr. Davis to prove their steadfast adherence to the British rule, which, of course, was not doubted, though it is certain as it turned out to be, that Jagat Singh of Saranath fame, a kinsman of the Raja, had been one of the emissaries in Vizier Ali's conspiracy.⁹ Early in his flight, Vizier halted to

7. *Ibid.*, p. 96. There is also a succinct statement in Thornton's *History of the British Empire in India*.

8. Meanwhile, the European residents assembled at the house of Mr. Davis, and it was freely acknowledged that they would have been discovered and massacred if the attention of the insurgents had not been occupied by his defence (Davis, *op. cit.*, pp. 40-41). Lord Wellesley, who was absent for a time on a visit to Madras at the period of the Benares insurrection subsequently expressed his appreciation of the arduous trial of prudence, activity and resolution of Mr. Davis and sent to his wife this autograph inscription: 'To Mrs. Davis, as a testimony of sincere respect and regard, and also a memorial of attachment founded upon long intimacy, to the honourable and virtuous memory of her deceased husband, from her faithful friend and servant, Wellesley.' (*Ibid.*, pp. 75-76).

9. The principal testimony was given by a Brahmin who was an astrologer to Vizier Ali. The Brahmin was sent by him to Jagat Singh, four months previous to the insurrection, to ascertain if he was well-disposed and if he would be a privy to his design of making war against the English. Jagat Singh in reply stated that he was a slave to the Nawab and that he would extend his dominions

address a letter to the Raja of Benares urging him to rise against the English which was miscarried into the hands of Mr. Davis,¹⁰ who, of course, found no reason to doubt the loyalty of the Raja and wrote back to him to calm his apprehensions as follows:

"Do not you be alarmed on this account, for though the Nawab wrote a letter to you, it is clear that you had no communication or correspondence with him, and I am well assured that you are a friend to the Company."¹¹

By the 18th of January public tranquillity seemed re-established but in the course of the enquiries, instituted by Mr. Davis and other servants of the Company, it was very clearly proved that not only a good number of Muhammadan chiefs, but also a considerable number of 'Hindu Babus' or nobles had promised assistance to Vizier Ali. These Hindu Chiefs were obviously waiting the result of the massacre, but their non-participation was not a proof of their innocence as definite evidence was found, that the Zamindar, Bhavani Sankar, and his son Sheo Deo Singh went to the fort of Pindra about 14 miles from Benares, on the Jaunapur road with two hundred men armed with guns and swords on the evening of Sunday, the 13th January where at nightfall they were joined by Nawab Vizier Ali. In the consultation that followed it was agreed that the Hindu Chiefs should prevent any force coming while the Nawab was fighting the English and that they should engage the troops from Beetabur.¹² After the flight of Vizier Ali, next day, Bhavani Sankar disappeared with the intention, it was supposed, of joining his master and Sheo Deo took up his residence in a small house in the city where he remained entrenched

as far as Calcutta. He is also reported to have said, "Let me assemble troops and raise money from the bankers to defray the expense of massacring the English." Vizier Ali being delighted sent a 'Kehlau' to Jagat Singh who reciprocated by declaring that he had prepared a list of sixty of his friends, who would take an oath of fidelity to the cause. A secret interview took place one night between Jagat Singh and the ex-Nawab, when the latter seemed to have signed some promise or contract in the event of their plot, succeeding. But the Brahmin, later on, wanted to disclose the plot to Mr. Cherry and actually approached him for that reason, but the Resident declined to give him any audience. Jagat Singh, Davis says, had a great taste for Persian culture and refinement: his Persian Library and his compositions earned for him the title of the 'Nightingale of India' from a former Nawab. This might explain why he was so staunchly loyal to Muhammadan rule. (*Ibid.*, pp. 47-49).

10. The letter runs as follows: 'From Vizier Ali Khan to Rajah Udwunt Narain Singh.' "By the grace and bounty of God, the life of the worthless Cherry, who disturbed and oppressed you, the hereditary servant of my family, has been terminated by the warriors of the army of Islam. You, who are my hereditary servant and ancient well-wisher, whose ancestry were always ready with heart and soul for the service of my family, must consider these joyful tidings, as the cause of your prosperity. Be ready with your people for my service, and guard well the roads about the city of Benares. Enjoin your people to permit no individual of the British or other European nations to pass the boundaries of Benares. . . ." (*Ibid.*, pp. 44-45).

11. *Ibid.*, p. 46.

12. *Ibid.*, pp. 88-99.

3. Davis: *Op. cit.*, p. 23.
4. *Ibid.*, p. 94.
5. Among the letters of Vizier Ali seized after his flight, there is a letter from the brother of the Nawab of Dacca (perhaps a brother of Seyed Ali Khan Nasrit Jung, Nawab of Dacca) (*Hamilton Gazetteer*, I, p. 478) to Zaman Shah which gives us a glimpse of the working of the Muslim mind and the desperate nature of their attitude to British rule. After the customary eulogy, the letter proceeds: ". . . considering your majesty as the support and champion of the true faith, I am happy to offer my services in the most zealous manner and rank myself among the propagators of our holy religion. . . . However great were the obstacles to my submitting myself to your majesty's protection I have at length fortunately surmounted them, and, trusting to Providence have despatched this letter to your majesty's court by Sheik Att, or Amli, who will explain fully all circumstances relating to this country. I beg leave to observe that owing to the imbecility of the house of Timour, and the contempt into which it has fallen of late years, the powerful have been weakened and the weak become powerful. Worthless unbelievers and ambitious villains have started up at every corner, boldly conquered all these countries, and established themselves here. For these reasons, religion which should be so highly prized, is here lost, nothing of Islamism remains but that bare name. They have so stripped and reduced the principal Mussulmans that they have no resource, and are obliged implicitly to obey their orders. The Mussulmans have become vile and wretched, the honour of the great men is gone. Christians seize and keep by force, the daughters of Syeds and Mussulmans. Under these circumstances, when we can no longer act openly, it behoves us to exert ourselves secretly in the cause of religion. If your majesty's victorious standard shall be directed towards these parts for the establishment of religion and destruction of its enemies, by God's assistance your majesty will in a short time, and without any difficulty, conquer this country and annihilate your enemies." (Davis, *op. cit.*, pp. 96-98). These sentiments which Vizier Ali undoubtedly shared, made feasible the formation of a Mussulman league with Zaman Shah at its head to free India from the British. Kaye writes that Zaman Shah of Kabul had kept the British power in India in a chronic state of unrest. 'There was the fact,' he continues, 'of a minacious Muhammadan power beyond the frontier, not only meditating invasion, but stirring up the Muhammadan Princes of India to continue in a religious war against the usurping

surrounded by a body of guards known as 'Bankas'.¹³ "It is well known," wrote Mr. Davis to General Erskine, "that this city abounds with armed adventurers who are ever ready to enter into any service at a moment's notice. There are in the district persons of rank who live and maintain their own guards without any limitation from government."¹⁴ The danger resulting from the existence of these mercenary elements was apparent in the use made of them by Vizier Ali.

It was further ascertained that a nephew of Jagat Singh had come up from Saran to Benares and agreed to join him in the conspiracy engaging to raise 20,000 men in Chapra. It was also established that a chief named Culb Ali Beg, otherwise known as Mogul Beg, had attended Vizier Ali during the insurrection.¹⁵ The extent and organisation of the conspiracy is also indicated by the evidence of a European inhabitant, McLean by name who was going to be despoiled on the evening of that day far off from Benares. A number of papers discovered after the flight of Vizier Ali contained lists of forces he was able to pull—about four thousand eight hundred foot and a hundred horse who would join Vizier Ali at once, and some eighty thousand who would subsequently espouse his cause on the day of massacre. But it has been estimated that not more than two or three thousand actually composed Vizier Ali's forces on that day, but the huge levy would certainly have been brought into action on a favourable opportunity had he been allowed to stay in Benares and develop his plans.

So the plot failed, but Vizier Ali, however, was still at large and the implicated 'chieftains' were not yet apprehended. The supreme government of Calcutta had sent instructions to secure the persons of those nobles who were privy to the conspiracy but it was difficult to execute the order as these refractory chiefs lived in houses that were fortified like castles and in particular in the stronghold of Pindra. Further, Sandat Ali, whose help was needed in the pursuit of Vizier Ali and his partisans, implored to be excused upon the ground that he could not trust his own soldiers; and all that he did was to issue orders that Vizier Ali should be seized.

The Honourable Mountstuart Elphinstone, then a very young man and assistant to the Judge and Magistrate of Benares, was deputed to capture Pindra. On the 18th of March he was furnished with four companies of infantry and twenty-four troopers. The

place was taken without resistance as the occupants had fled, but a seizure was made of fifty matchlocks, forty swords, and some powder and ball. On the same day Mr. Sealey and another officer of the civil service, surprised the residence of Jagat Singh and forced him to surrender. Sheo Deo, who occupied a strong house in the city of Benares, offered a gallant resistance to his friends who came to capture him. He held out a whole day and night without food and water and 'though every means was adopted to persuade him to surrender' and every assurance offered that no personal disgrace should be inflicted, he remained shut up in his impregnable position. At length he rushed out and furiously attacked the soldiers. In the desperate conflict that now ensued, Sheo Deo was slain, but not before he and his 'Bankas' had killed or wounded a number of the besieging party. The arrest of other leaders could not be made as many fled, only Bhavani Sankar and Jagat Singh were brought to trial and condemned to death. Of the two, Bhavani was executed, but the sentence of Jagat Singh was committed to transportation, but he committed suicide on his journey down the Ganges when he approached the sea, with a view to escaping the degradation of the loss of caste.

Subsequently, other measures were taken to break up this dangerous band of feudal retainers and to clear the country of the Bankas. In the meanwhile, Vizier Ali was ravaging Gorakhpur when he was joined by free-booters and adventurers of all kinds and with these lawless bands amounting to some thousands of men, he brought the eastern districts of Oude into a state of chaos and disorder, but chased by British force he moved from place to place and was eventually compelled to fly to Rajputana where he took refuge with the Raja of Jaipur. When pressure was brought to bear upon the Raja, he delivered him up to the English, but due to his 'scruples for the laws of hospitality' he stipulated for the life of Vizier Ali and also made it a condition that he should not be confined by fetters. Vizier Ali was taken to Benares, by a singular coincidence, on the anniversary of his rebellion and thence to Calcutta. Subsequently, after a long captivity in Fort William, he was transferred in the palace built for Tipu Sultan's family in the fort of Vellore, where the females of his family joined him.

Such was the outbreak at Benares in 1799. Considered from the aspect of affairs on the side of Mysore, brought about by the war with Tipu Sultan in February 1799, Vizier Ali's insurrection at Benares may not appear to be just a flutter on the political surface of India, and had it not been put down speedily, the spread of revolt at such a critical period might have taxed the resources of the government to the utmost. But the genesis of the insurrection calls for some remark. It was undoubtedly a political movement with definite political objectives, probably the earliest on record during British rule,—the Muslims and Hindu chiefs, joining in a conspiracy to overthrow the

government. The highhandedness of Warren Hastings, in the affairs of Chait Singh of Benares, left a back-wash of bitterness and resentment in the minds of the Hindus of Benares, who were unfortunately duped to join in a cause which was not worthy enough of their participation. The reckless ambition of a dastardly boy of nineteen of ignoble origin could not evoke much sympathy, and far less any widespread national sentiment, and the assassination of a half a dozen

Europeans, though an unprecedented event in the 90's of the eighteenth century, did not help the movement to gain any elevation. Even then, the insurrection served to generate a spirit of tension against British rule in India, and in spite of the pan-Islamic predilections of this young visionary to unfurl the green flag with the help of Zaman Shah, it furnished a precedent to the disaffected political elements to combine in a revolt to overthrow the rule of a foreign power.

—:O:—

TOWARDS ECONOMIC FREEDOM

By S. N. AGARWAL

THE Agra Session of the All-India Congress Committee devoted its attention mainly to the serious economic issues facing the country. We attach the greatest significance to the two resolutions on Unemployment and the Social and Economic programme passed by the A.-I. C. C. after careful consideration of all aspects of the problem. It will be wrong to regard these resolutions as mere "pious hopes and platitudes"; they embody the will and determination of the Congress to bring about a social and economic revolution in the country after the achievement of political freedom. We have, indeed, been able to achieve substantial results in various spheres of national development during the last few years. Thanks to the able guidance and wisdom of our great leaders, it has been possible for us to consolidate and stabilise our newly-won political independence. Besides, the country has made impressive progress in different fields of economic activity. But we are ourselves not satisfied with the pace of progress in the social and economic domains. The resolution, therefore, rightly points out that "the pace of progress must be quickened more specially in regard to land reform and industrial growth." The A.-I. C. C. "attaches the greatest importance to the introduction of far-reaching land reforms in India" in order to make "the actual tillers of the soil the owners of the land." The State Governments have been asked to "take immediate steps in regard to the collection of the requisite land data and the fixation of ceilings on land holdings" with a view to "redistribute the land, as far as possible, among the landless workers." Every effort is to be made "to add to the volume of investment for developmental purposes" through voluntary and, wherever possible, even compulsory savings. The machinery of administration and in particular the Services have also to be "reorganised with a view to deal effectively with the problems connected with the establishment of a Welfare State." The legal system which is "expensive and dilatory" should be revised

and made "simpler, less costly and more expeditious." The Planning Commission has been asked to "re-examine" the Five-Year Plan with a view to "its expansion in such directions as would lead to an increase in the volume of employment." The State has been enjoined to "assume a larger degree of responsibility in regard to cottage and small-scale industries" in order to provide fuller opportunities for the proper utilisation of country's man-power. The A.-I. C. C. has also stressed the need for the reorganisation of our educational system so that it may adapt itself better to the present requirements.

It is now necessary to follow up these important resolutions with definite lines of action, and we are confident that the Government of India as well as the State Governments will take early steps to secure for the country a true type of social and economic freedom for the common good of all citizens irrespective of any distinctions. It is essential to tackle our economic problems with a sense of urgency and in a crusading spirit. Time is of the essence in a fast-moving world of today; we cannot afford to follow a policy of over-caution and "gradualness." There is, of course, great risk in moving too fast; but the risk in not moving fast enough is no less. All of us have to realise that the quintessence of economic freedom is *economic equality* and reduction of glaring economic disparities in our present-day society. With a yawning gulf between the rich and the poor, all talk of economic freedom appears to be futile and meaningless. In order to establish real economic justice in society, it is necessary to fix ceilings on incomes either from land or from other kinds of property. The A.-I. C. C. has called upon the State Governments to take early steps to fix ceilings on land-holdings for redistributing land among the landless. We also welcome the Estate Duty Bill as a measure of achieving greater economic equality among the urban population. It will, however, be desirable to re-orient our taxation policy with a view to bridging

13. This set of braves called 'Bankas' were leagued together as a sect. They were men of all castes they affected a peculiar way of dressing, 'half bully and half dandy': strutted in the streets and were always ready to be hired for a crime. The term 'Banka' is derived from the peculiar movement of their swords which are proficiently exercised and so they were mostly maintained by the wealthy as their armed followers. (*Ibid.*, pp. 68-72).

14. *Ibid.*, p. 65.

15. It is interesting to note that one Mustopha Beg gave the signal for revolt to the people at Vellore in 1806. (*Kaye: Sepoy War in India*, I, p. 227, f.n.).

the existing gulf between the haves and have-nots.

In regard to land reforms, we would draw the attention of all the enthusiasts for large-scale farming in this country to the fate of collectivization in Eastern European countries like Yugoslavia, Poland and Hungary. In Tito's Yugoslavia, collective farms have not only "set peasant against peasant, but also peasant against the State." In Hungary, collectivization has recently been "slowed down," because it has "impoverished and antagonised the population and brought the country to the verge of economic collapse." (Vide *London Times*, July 6). In China, there is a movement for allowing more "liberty for the peasant" by making collectivization voluntary and doing nothing "to neglect or roughly hamper the peasant's activity as an individual economic unit." The history of collectivization in the U.S.S.R. also clearly indicates the need for great caution in trying similar experiments in India. As in Japan and several countries of Western Europe, small-scale farming with co-operative endeavour in different processes of agriculture is best suited to Indian conditions. Instead of trying to pool land on the basis of highly mechanized farming, we should try to persuade the individual small-scale peasants to pool their resources of production like cattle, irrigation, manuring, etc., as also processes of agriculture like sowing, weeding and harvesting on a co-operative or mutual-aid basis. That is why we have welcomed Acharya Vinoba Bhave's Bhoodan Yagna as a novel way of redistributing land to the landless on the basis of small-scale and intensive farming.

The problem of unemployment is, indeed, a serious problem which requires to be tackled on many fronts. We have expressed our views on this question on previous occasions also and have regarded unemployment as Enemy Number One in India. In order to liquidate it effectively, it is essential to provide the fullest scope for the development of small-scale and cottage industries. Unless our pattern of production becomes labour-absorbing rather than labour-saving, it would not be possible to solve the problem of unemployment or partial-employment in this country. This is not sentiment or a Gandhian "fad"; it is pure and simple arithmetic. Of course, the technique of cottage production has to be made as efficient as possible with the help of technical or scientific knowledge. The public has also to pay its own part in patronising the goods of cottage and small-scale industries as compared with those articles produced by big mills and

factories. The Government of India must re-orient its import policy with a view to protecting the interests of small-scale and decentralised production in India. The import of consumer goods which can be easily and efficiently produced in our own country through cottage and village industries must be rigidly curtailed and even completely stopped. Our educational system requires radical changes in order to impart to our youngmen the capacity to work hard physically for earning their living. The present schools and colleges have become veritable factories for quickly turning out armies of the educated unemployed who are proving to be a source of potential danger to the stability of our democratic traditions.

We welcome the reference to the Reorganisation of Services in the resolution of the A.I.C.C. at Agra. We earnestly hope that the Government of India and the State Governments will now try to implement the recommendations of the Planning Commission in this regard with a strong will. Prof. Appleby's suggestions also deserve to be considered seriously for making our administrative machinery more flexible and less rigid. So far as the desirability of Legal Reforms is concerned, we suggest that the Government of India should soon appoint a High Powered Commission to go into this complicated question thoroughly and submit its definite recommendations within a year. Various schemes for tapping the idle capital resources, particularly in the rural areas, should be prepared by the Planning Commission in consultation with the Ministries of Finance and Communications. In such schemes, special facilities should be provided for earmarking funds for specific local projects in different areas.

It is also gratifying to know that the A.I.C.C. has accepted most of the amendments to the Congress Constitution as proposed by the Working Committee. These amendments are meant to revitalise the Congress organisation with a view to making it a sharper and more efficient instrument for effecting an economic revolution in India. We feel confident that with the reorganisation of the Congress, the land and the industrial systems, the administrative services, the educational system, the commercial policy and the legal procedure, we shall be able to achieve economic freedom for our great country within the next few years. Our first fight for political liberty began in 1857; we achieved independence in 1947; let our fight for economic freedom bear ample fruit before the beginning of 1957.

INDUSTRIAL DEVELOPMENT IN RAJASTHAN

By Prof. K. B. SAKSENA, M.COM.

It looks quite satirical on the very face of it that a big State of India, viz., Rajasthan, to which goes the credit of being the birth-place of the leading business magnates and industrialists, is itself to be categorized as a backward area both agriculturally and industrially. The State with a widespread area of about 1.28 lakh square miles is inhabited by approximately 1.53 crores of a sturdy class of males and females. Is it not a matter of deep thinking and concern that this region of the country with much less a density of population, as compared to other States in India—India as a whole and other developed parts of the world, is not in a position to provide a decent living standard to the existing population? To consider any scheme for the general economic development of the State would be unjust within the limited space. An attempt is therefore made here to study the industrial problems and prospects of an industrial development in the State.

HISTORICAL BACKGROUND

Before coming to any conclusion regarding the subject and suggesting proposals for the industrial development, it seems quite essential to look through the mirror the historical background for the present undeveloped condition of the State. Scanning the annals of the history of this State (though not in the form of present political configuration) we find that since the time we have got traces of its history, the land of Rajputs popularly known as Rajputana, had been a constant arena for political feuds among the various rulers of small States who were more anxious for establishing their political supremacy rather than aiming at a consolidated economic, political and social unity. This was one of the reasons for the fall of the brave people and the governments of this State before the Moghul and then the Britishers. The courage of the people can be well judged by the views of the learned authority Todd as expressed in the *Annals and Antiquities of Rajasthan*:

"Rajasthan exhibits the sole example in history of mankind of people withstanding every outrage barbarity can inflict or human nature sustain and bent to the earth, yet rising buoyant from the pressure and making calamity a whetstone to courage."

Despite the absence of warfare in this region during the British regime, the laissez-faire policy of the government could not do much for the industrialization of the country as a whole, nothing to talk of Rajasthan. Of course, the limited stimulus that was given to handicrafts and fine arts in the various States was due to the fascination of the rulers for decorating their capitals. It could be hoped that the liberation of the country and the

unification of small and big units into a compact group under one government, would be much helpful for *inter alia* the development of industries in the State. The State and the country as a whole immediately after the independence have confronted a great many political and economic difficulties plus the rehabilitation problems created after the partition of the country. The diversion of activities has been responsible now for the lack of due consideration for the problem under review. However, I do not stand to depreciate the steps taken by the Rajasthan Government in this connection, but the proposals for industrial development are not however sufficient.

REASONS FOR LACK OF INDUSTRIAL PROGRESS

Political reasons only do not account for the chequered growth of industries in the State; but there are many other reasons that can be attributed to this slackness. The position of raw-material and the financial problems are also to be considered in this connection. There has always been lack of co-operation and initiative in the State and the industrialists of today. The industrialists who have their origin in the State were never very anxious to develop industries in their birth-place, rather they invested a major portion of their stupendous earnings outside the State. The system of customs duty and the lack of facilities for the import of raw material and movement of goods to and from the State along with the lack of facilities for the maintenance of industrial units, were obstacles in the way. Seth Ganshyamdas Birla once opined that the industrial development in the State could not be possible in the absence of facilities for transport and communication, industrial power and the taming of the water resources for industrial purposes. One of the most serious curses to this State is the incredibly low percentage of literacy which accounts for approximately 90 per cent of illiterates.

PLAN FOR DEVELOPMENT

Whenever we consider any plan for the industrialisation, the first question that comes up is the form which should be given to it. Not only Rajasthan, but the country as a whole is standing at the threshold of industrialisation and we have got an option between the Gandhian system wherein there is limited scope for the big industrial units run by huge machines and there is a major consideration for the cottage industries which would give employment to the 80% of the rural population who is out of work for about eight months in the year and the method suggested on the American lines which leads to surrender of man-power to the supremacy of the machines. Up to this time the State has

not advanced much towards the American method and the Gandhian economy has not yet been applied on satisfactory lines. Here, however, we should not ignore the methods adopted in the communist countries, particularly in U.S.S.R. which is a symbol of planning not only industrial but agricultural, fiscal, commercial, educational, credit and monetary as well.

The industrial policy for the State should be so construed as to lead an all-round development of our life and to respond closely to the needs of the society in a manner so as not to centralize the benefits within a small group or a particular class of the people, but it should be on an equitable basis.

A CASE FOR COTTAGE INDUSTRIES

Here it looks quite essential to look into the possibilities of developing cottage industries in Rajasthan. For such undeveloped areas it is always useful to stimulate cottage industries. These will provide work for the majority of persons at a lower cost and will prepare a background for industrial outlook. The success of cottage industries in Japan and Switzerland are amazing examples which are quite fascinating and alluring for the people of Rajasthan. A survey of the position of meagre cottage industries in the State has been made by the Rajasthan Government which does not reveal a desirable progress in this direction. The important cottage industries mainly consist of weaving and spinning, ivory goods, engraving, oil pressing, dyeing, Bidi-making and wood work.

Keeping in view the development of cottage industries it should not be missed that the development of such industries is to be stimulated which will provide the people with articles of domestic use and not with those which lead the cultivator to immoral habits, e.g., Bidis and local liquor which, though they may give employment to a number of persons, are like the noxious vermins which would infect society with evil germs. The Rajasthan Government has contemplated to spend an amount of Rs. 38.50 lakhs over a period of five years (1951-56 for the development of the cottage industries in the State of Rajasthan. This amount is not commensurate with the size of the population and the area of Rajasthan. As compared to other Part 'B' States of Mysore and Madhyabharat which provide for an expenditure of Rs. 135.38 lakhs and Rs. 50 lakhs respectively this amount seems to be too meagre. It is quite ridiculous that this meagre amount has been provided only for cottage industries when no amount has been provided for other major industries in the State. For the purpose of financing these cottage industries, the help of co-operative credit societies in the villages should

be obtained and every possible step should be taken to develop credit co-operation in the State.

MAJOR INDUSTRIES

The absence of any provision in the Five-Year plan for this State for the major industries should not be considered as to mean that there is no scope for the development of major industrial units. Rather this indifference of the State should be taken up by the private sector. Now in the democratic country, the big industrial units should flourish side by side with the cottage industries not with a view to competing with each other which will cause the ruin of cottage industries and massacre of the economic development of the State. It should, however, be aimed at that these two types of industries should work with fullest possible co-operation.

The working of the large industrial units creates problems regarding finance and labour. As far as the financial side is concerned, there are at present about four leading banks of Rajasthan origin and approximately an equal number of those who have been registered outside Rajasthan. These joint-stock banks can easily finance the requirements of the working capital. As far as the fixed capital is required for the establishment of new units or the expansion of the existing one, the facilities granted by the Industrial Finance Corporation can be availed of. The formation of a provincial corporation in Rajasthan does not look feasible or economically advantageous.

It should, however, not be lost sight of that the industrialists now should come forward with a generous motive for the welfare of the State and the people, and not with the only consideration of making profits. The problems of labour and capital relationship have become quite considerable these days and although the government is in constant effort to create amiable relations, individual effort from both the parties is quite indispensable. The capitalists should take lesson from the growing tendency towards socialisation and nationalisation of industrial units over vast regions of the world. The symbol of capitalism in U.S.A. and U.K. may not remain so forceful as it is today and even today the benefactors of capitalism and bureaucracy in the two countries are always on their guard to keep off socialism and communism at an arm's length. It is at this stage very essential for our capitalistic class to show goodwill towards the interests of the general masses and not to keep aloof for fear of nationalization of the industries in the future which is not in the offing as yet. Here they have got ample opportunity to save their skin from criticism by the public.

THE COLLEGE OF YOGA AT LONAVLA

By Dr. S. C. BHATTACHARYA, M.A., T.D., Ph.D.

To wander for nearly twenty years in the mountains and jungles of the sacred land of Bharat from Kedarnath in the Himalayas to Cape Comorin and from Girnar in Saurashtra to Tarakeshwar in Bengal in search of Yogis to get an inkling into the mysteries of Yoga and ultimately to be blessed by the

to dispel darkness from the 'terra incognita' of Yoga and

"to propagate Yoga in all its aspects—physical, mental and spiritual—by co-ordinating it with modern sciences and orienting it in such a way as to make it useful in everyday life."

To give effect to his mission in life Swamiji made a small start in the year 1924 with an Ashram *The Kaivalyadhama* at Lonavla which is nearly 80 miles from Bombay, en route to Poona, and is on an elevation of 2,000 ft. approximately. Later on, the research side of the Kaivalyadhama was separated and organised as a well-constituted Samiti and was registered under the Societies Registration Act 21 of 1860 under the name of Swami Kuvalayananda's Guru, His Holiness Paramhansa Shree Madhavadasa Maharaj of Malsar (near Baroda). Kuvalayanandaji's selfless devotion to the cause of Yoga gave rise to two important off-shoots of the Kaivalyadhama of Lonavla—one at Bombay and the other at Rajkot in Saurashtra. The Bombay off-shoot is known as the Kaivalyadhama Ishwardas Chunitlal Yogic Health Centre where on an average about a thousand people

The view of the 'Valvan Lake' behind the 'College of Yoga'

teachings of a Yogi in the very heart of a modern metropolis of no less importance than Bombay, is indeed one of the greatest wonders as well as an irony of fate in a man's life. Such was destined for the present writer who, in the year 1949, came into contact at Bombay with Swami Kuvalayanandaji, the founder-Yogi of the 'Kaivalyadhama' at Lonavla, Bombay, etc. The love and kindness with which Swamiji accepted the neophyte, in spite of certain handicaps, could only be explained by a reference to some relation existing between us in the previous births. It was the occasion when Kuvalayanandaji was selecting the first batch of thirteen students, who should satisfy certain conditions, for his College of Yoga that had its beginning in Bombay before being shifted to Lonavla, I was selected by Swamiji, not because I could satisfy the required conditions, but mainly on account of my genuine interest in the subject of Yoga. Yet, what a perverted idea one possesses about Yoga before one receives true light and what a heavy price one has to pay for his sad mistakes! To some it is a hoax, to others it is a cure-all.

The subject of Yoga has an attraction or repulsion (both on false grounds) to a modern mind either due to the fantastic claims attributed to it or on account of the absence of a code suitable for the modern scientific mind. The present writer was no less a victim to the fog and mist in the domain of Yoga until he came to be guided by Kuvalayanandaji who has been fighting alone for the last thirty years

The 'College of Yoga'—Front view

(both men and women) undergo Yogic exercises every year. The Rajkot off-shoot maintains a hostel for college students and also carries on cultural work for the general public. The former institute gets an annual grant of Rs. 1200 from the Bombay Government and the latter Rs. 1,000 from the Saurashtra Government. The Kaivalyadhama has also deve-

veloped an exclusive spiritual centre at Kanakeshwar-Bhuvaneshwar in the Kolaba district (off the Bombay coast). This centre is the *tapovana* of the Kaivalyadhama. Here Swami Kuvalayanandaji's Guru performed *tapas* for twelve years more than seven decades ago.

The first 'Ashrama of Kaivalyadhama' at Lonavla

But besides the afore-mentioned institutions Swamiji's mind all the time gazed at the temple which would be built up some day to enshrine the highest achievements of Yoga—both practical and theoretical. His dreams have, at last, been fulfilled by the starting of a full-fledged College of Yoga in 1950 at Lonavla ('The Gordhandas Seksaria College of Yoga and Cultural Synthesis') through the magnificent gift of Seth Makhanlal Seksaria of Bombay. Yet, how far it is from what it aspires to be and what immense potentialities are stored in it! The present assets of the College are only a few lakhs whereas it requires at least half a crore of rupees and there is no reason why it should not be possible for it to revive the ancient secrets of our hoary land reflecting through the prisms of modern science.

The College of Yoga at Lonavla being situated by the side of the first Ashrama of Kaivalyadhama over an extensive plot of land in the solitude of hills and lakes is a unique institute not only in our country but also in the whole world in the sense that the age-old Yogic lore of our motherland, is being investigated by the application of ultra-modern scientific instruments to the young men with bright university careers taken under training to serve as 'subjects'. In a short article as the present one it is not possible to give the details of the scientific experiments that are being carried on in the College of Yoga at Lonavla under the supervision of a Doctor of Science on the 'subjects' practising *pranayama*, *kapalabhati*, meditation, etc., to record and verify the truth of higher life experienced and described by our ancient sages. To use the words of Swami Kuvalayanandaji:

The aim of his College of Yoga is "to develop a philosophy and a culture based on the co-ordination of Yogic experiences and modern sciences that would lead to the establishment of human brotherhood. The principal science which will be used for this purpose is biology, although physics, chemistry, physiology, psychology, sociology, etc., will be fully taken advantage of . . . Life is trying to express itself in higher and still higher forms and endeavouring to obtain experiences of higher and still higher values. The science of biology which deals with life has stopped short with the study of the normal and abnormal man. That science will always remain truncated unless and until it extends its studies to the mystic. The effort of Dr. Julian Huxley and others to develop evolutionary ethics and scientific humanism will never have a sure foundation unless the mystic is scientifically taken into account. Cultures based upon an incomplete study of man will never eliminate conflict and war. If a man is to be happy, he must be studied in his entirety. . . . The experimental psychology that is developed in the West, however, has been concerning itself mainly with normal and abnormal or pathological psychology. The higher experiences of man have not yet been properly touched . . . Luckily for humanity the Indian Yoga taken in its most comprehensive sense, trains a man, stage by stage, from what may look to be merely physical exercises to the highest mystical experiences. Hence, the students trained in Yoga afford the best material for scientific investigation in Yoga."

A hostel for the students of the 'College of Yoga'

In this connection one may think of the Duke University of the U.S.A. where Dr. Rhine is engaged in scientific experiments with the facts of extra-sensory perception—now better known as parapsychology. But even Dr. Rhine is handicapped to reveal the inner side of Yoga as he is not interested in or qualified for the facts and experiences narrated by Patanjali and other Sanskrit writers on Yoga. I, therefore, again assert that the position of the College of Yoga at Lonavla is unrivalled—specially as it is situated in the motherland of Yoga and is being directed by an adept in the subject.

Nearly ten students are selected from all over India without any distinction of caste or creed every

year in June-July for the monthly scholarships of Rs. 60 offered by the College of Yoga at Lonavla which is a residential college and their courses of studies extend over two years. They are given lessons in practical

The view of another hostel

Yoga, Eastern and Western Philosophy, Indology, Comparative Religion, Anatomy and Physiology with reference to practical and scientific Yoga, experimental work on Yoga, etc. The professors consist of the Doctors of Indian as well as foreign Universities and well-versed Sanskrit scholars. Apart from the scientific study of Yoga, the College also encourages and gives facilities for research work in philosophy and literature. Several scholars of India and at least one from America (Mr. Behanan of the Yale University) have been awarded Doctorate Degrees by the different Universities for their research work done under the roof of the College of Yoga at Lonavla. The present writer is also one of them.

The 'Kaivalyadhama Yogic Health Centre' at Bombay

Excluding the two authentic books on *Asanas* and *Pranayama* by Swami Kuvalayananda, research work done by Om 'Kaivalyadhama' in the field of Yogic literature consists of the publication of a journal on Yoga called the *Yoga Mimamsa*, a critical edition of

the *Hathapradipika*, a critical edition of the *Brihad-Yogi-Yajnavalkya Smriti*, an *Index of Yogic Literature*, a *Concordance of the Yoga*, etc. In appreciation of the work put in by the College of Yoga at Lonavla the Central Government of the Indian Union and the Provincial Government of the Bombay State have allotted grants of Rs. 30,000 and Rs. 3,000 respectively to the institute so far. The College has also attracted no less world-famous visitors than Dr. J. B. S. Haldane and Prof. McBain from among the Western scientists, besides the Indian ones. The personality of Swami Kuvalayananda is a rare thing to come across even in the antiquated land of Yoga such as India. His vast erudition in the field of Yogic literature coupled with an equal amount of knowledge

The writer

of its practical side and a thorough grasp of the modern physiological investigations have made him well-known not only to the students of Yoga in India, but also in the Western countries which he has not yet visited. Though the main cause of his turning towards Yoga and the manner of his initiation at the hand of a greater Yogi, namely, the late Paramahansa Shree Madhavadasa Maharaj, will remain shrouded in mystery to us, yet we know this much that Swami Kuvalayananda was none but the principal Guru at Amalner more than a quarter of a century ago. His is a personality about whom the greatest living philosopher of India, Dr. S. Radhakrishnan, has said:

"I am impressed by the work which you have been doing all these years . . . I know that the lessons of Yoga in its different aspects are needed today, not only in our country but in the world outside. And you have the capacity and the training for undertaking this noble task. . . ."

Mr. Roswell P. Angier, Chairman, Department of Psychology, Yale University, New Haven, U.S.A., writes:

Some students of Yoga in the lap of Nature

"I wish on behalf of the Department and of the Yale University to express our sincerest appreciation of the facilities that were given him (Mr. Behanan) in his study of Yogic practices. Mr. Behanan has a very deep affection for you and is full of gratitude for the untiring attention and help that you gave to him. This sense of gratitude is also felt by the Department of Psychology at Yale University."

To quote the words of my revered Guruji:

"Yoga has a complete message for humanity. It has a message for the human body, it has a message for the human mind, and it has also a message for the human spirit."

But the world, as it is constituted, requires material help even for spiritual progress. Let the benefactors of humanity and wealthy philanthropists in our country as well as abroad not forget this fact and allow the College of Yoga at Lonavla to close half-way for want of financial help that is urgently needed by it. The responsibility of our National Government is also by no means less towards the maintenance of this Institute, which has grown up independently to the credit of its founder-Yogi, for the revival of our cultural heritage.*

RAJESWAR DAS GUPTA

The Pioneer Agriculturist of India

By INDU BHUSAN CHATTERJEE, MSc., LAc.,
Ex-Assistant Agricultural Commissioner with the Government of India

INDIA is an agricultural country and agriculture here is the most vital industry. In these days of widespread food shortage when huge quantities of foodstuff are being imported from abroad at enormous cost to the country, agriculture assumes even greater importance than ever. It has to be remembered, as once Sir Maurice Hallett remarked, that

"Whoever can make two ears of corn or two blades of grass to grow upon a spot of ground where only one grew before, deserves better of mankind and does more essential service to his country than the whole race of politicians put together."

In this connection the name of the late Rai Bahadur Rajeswar Das Gupta comes first to our mind. Realising the importance of agriculture he was one of the first to advocate research and improvement in our agricultural systems and their application to the field. Fittingly he has been called a pioneer in agricultural research in this province if not in India.

The late Rai Bahadur hailed from a distinguished Vaidya family of Vikrampur (Dacca). Undeterred by the loss of both the parents even at a very early age, he proceeded perseveringly with his studies and passed the F.A. Examination from the Dacca College. From

the very beginning he had a leaning for agricultural studies and this manifested itself in his taking admission in the Sibpur Engineering College with agriculture as a special subject. After passing the Final Examination he entered his service career. He was appointed Agricultural Inspector under the Government of Bengal in 1904. Later, after working for 2 years as the Superintendent of Agriculture, under the short-lived Eastern Bengal and Assam Government, he was promoted to the rank of Provincial Agricultural Superintendent. He conducted the cattle and jute census and prepared a *Year Book of Agriculture* which was of immense help to Indian Agriculturists. Mr. E. S. Miligan, the then Director of Agriculture, who was the first Agricultural expert to come out to India, was so much impressed by his work that he promoted him to the rank of Deputy Director of Agriculture.

Rajeswar Das Gupta officiated in the post of Deputy Director of Agriculture for two years and was then confirmed in the same post in the year 1919 and remained there till his death which, however, came too early in 1926 due to heavy extra departmental work which told on his health. He was made a Rai Bahadur in the year 1920. If he had lived a few years more, he was sure

to have been the first Indian Director of Agriculture in Bengal in those days of British bureaucracy. He lived only for 48 years, but in this short span of life his work is varied and voluminous. Regarding his success in service he was the first Indian I.A.S. in Bengal. He was not, however, merely a high Government official pinned

Rajeswar Das Gupta

to his official files. He was a practical farmer and carried his message to the door of the farmers and agriculturists. In this country the most difficult task before an agricultural officer is to bridge the wide gap between the agricultural experiment station and the vast mass of peasants who really form the backbone of Indian Agriculture. In the words of Sir John Russell:

"It is not so much new science as fuller use of existing science that is needed."

Rajeswar realised this and spared no efforts for the application of laboratory results and improvements in the field. When the Royal Commission on Agriculture came to India in 1926 he acted as Liaison Officer on behalf of the Government of Bengal. He was the recipient of many medals and prizes in agricultural shows and exhibitions.

Amidst his many and varied activities Rajeswar could find time to write down his experiences in agricultural science in the form of manuscripts which he obviously desired to publish in book-form. His untimely death, however, prevented him from doing this and he left this responsible task to his eldest son the late Romes Chandra Das Gupta. But for the latter, these valuable works would have been lost to us. Romes Chandra spared no pains to get the manuscripts of his father arranged in the form of books and get them published. This over-strain told on his already failing

health and he died very prematurely at the age of 42. The Rai Bahadur's work are now being published by the Calcutta University in three volumes covering, in general, almost all the aspects of agriculture including livestock farming which in the main relates to cattle-breeding and dairy farming. The *Krishi-Bijnan* (Volume I) of which a second edition has come out deals with the fundamentals of agricultural science in lucid Bengali so that it can be read and the contents utilised by all those interested in agriculture in the two Bengals. It is not merely a theoretical book compiled from different journals and text-books. It is a practical guide to the cultivators. It traces the development of agriculture in India from time immemorial, deals with the nature of soil, its origin and broad classification particularly in this country, then goes on to describe the mechanism of

Rajeswar plough

plant life. The author devotes a chapter on plant mechanism of plant life, a chapter on plant nutrients, soil micro-organisms, manures and fertilisers, etc., What the author intends is to bridge the gap between the student of Agricultural College or School and the cultivator. The school purpose and the farm purpose, though inter-allied, should be considered as separate and the author's aim is to serve both. It is only natural to expect that with the progress of civilisation and in years to come a more organised system of education will be introduced and the treatment of land will be more and more "thoughtful" to provide a decent living to those engaged. In the cultivation of the soil lies the wealth of the country. This can be achieved only by applying scientific knowledge, sound practice and reliable theory. As a text-book for examination it is more suggestive than exhaustive and it is sure to open the mind of the student to the many problems involved in practice.

Rajeswar Das Gupta was very thorough in his methods and in his *Krishi-Bijnan* he introduced for the first time very appropriate Bengali equivalents of Botanical terms which shows his profound knowledge of Sanskrit. He believed that cattle improvement in Bengal would only be possible if an indigenous Bengal Breed could be stabilised with fixed characters and he really started selection work on these lines at the Rangpur Cattle Farm. But unfortunately, his policy was not continued.

Great credit is due to Rai Bahadur Rajeswar Das Gupta for the design and execution of a new type of plough which has been named "Rajeswar Plough" after him. It is an improvement on the plough used in Bengal which is antiquated and out of date. The adoption of the new plough would not only save time and labour but also increase production. The book should find a place in the curriculum of the Agricultural teachings and syllabus of our University as well as the State Government. The Directorate of Agriculture, West Bengal, should also encourage wider circulation of this

book written by one of the ablest officers of the Department. He was admired by one and all for his unflinching devotion to work, and his generous heart.

Rajeswar Das Gupta is no more with us. The best way to commemorate his work and memory is to push ahead with our plans for an all-round improvement in our agricultural system and carry the message of laboratory research and experiments to the very door of the farmer and help him to apply more systematic and scientific methods for crop production. Then and then only we shall breathe "the air promise-crammed."

—:O:—

TAMING THE TURBULENT TAPI

A new era of prosperity will dawn for the Surat farmer tomorrow when Shri Gulzarilal Nanda, Minister of Planning and Irrigation and Power, Government of India, will formally open the Kakrapar Weir and Canal Project on the Tapi River, and release the first irrigation waters into the Chalthan Branch of the Left Bank Main Canal system. No longer will the farmer have to gaze towards the sky for merciful showers at the end of the monsoon season to save his crops. On several occasions failure of rains at the most crucial period has been a frequent phenomenon in this region. Henceforth water from the project which, incidentally, is the first in the Five-Year Plan to be constructed and put into operation by the Central Water and Power Commission, will be available in plenty when needed most.

Kakrapar, a tiny village 50 miles from Surat on the lower reaches of the Tapi river, has given its name to the project. It was once famous for *kankar* used for making roads, and because investigations on the Tapi first started here, this village became associated with the project.

Rising in the dense forests of Madhya Pradesh, the Tapi courses through Betul, Amraoti and Nimar districts for about 260 miles and enters the Bombay State a little beyond Burhanpur. Collecting the waters of numerous tributaries, it meanders another 250 miles through the Khandesh and Surat districts of Bombay State before emptying itself into the Gulf of Cambay. In the region of Kakrapar, the Tapi has dug for itself a deep channel with high banks. On both sides stretch miles of cotton and *jowar* fields and banana orchards.

RICH SOIL

As one travels from Surat to Kakrapar over a country track encountering jerks and jolts, and clouds of dust, one is sustained by the thought that the new road now under construction nearby will soon be ready. The black soil on either side of the road is rich and good for cotton, but its fertility cannot be fully exploited due to unreliable monsoons. The waters from the weir will now help overcome Nature's whims.

The Tapi's catchment area is 26,000 sq. miles with an average rainfall of 29 inches, nearly all of which

occurs during the monsoon, yielding a mean annual run off of 16 million acre feet. A small part of this water is today being utilised for irrigation.

Similarly, the basin's abundant timber wealth which can be converted into paper, rayon and plywood, besides being used in construction, is lying unexploited for want of power. Navigation too has suffered from neglect, being possible only up to Surat, a distance of 12 miles from the sea.

C.W. & P.C. INVESTIGATIONS

The Central Water and Power Commission took up the investigation into the scientific and planned utilisation of the waters of the Tapi in 1946. It was found that the basin could be conveniently divided into three parts, each of which could be developed independently without prejudicing an integrated scheme for the entire valley.

The lower portion of the basin possessed attractive possibilities and its development was given priority. The work has been divided into three stages. The first stage is further sub-divided into two parts. The first part provides for a Weir at Kakrapar and canal systems on both sides; the second which is under investigation by experts, includes the building of a storage dam to a partial height and canals to irrigate an additional area of 4,79,000 acres. Its completion will permit considerable perennial irrigation. The second stage involves the raising of the storage dam to its full height, and installation of hydro-electric power and transmission lines. The third stage envisages the construction of a 16-mile long power canal from the Kakrapar Weir to the river edge opposite Piparia village to take advantage of a 107-foot drop for generating more electricity.

THE PROJECT

On a massive rocky outcrop stretching across the river from bank to bank, the Kakrapar Weir is 2,038 feet long and the height above the deepest point in the river bed is 45 feet. The Left and Right Bank Main Canal regulators tower over the weir to a height of 53 feet. The length of the weir originally was 2,500, but it was reduced to enable a better off-take of the Right Bank Canal which is an important component of the project,

The noise and din of machinery mingled with the voices of some 2,000 workers echoed and re-echoed in the valley for wellnigh over a year in order to complete the Kakrapur Weir within the time set. It was a race against the clock and everyone—workmen, officers, staff and contractors—worked with martial regularity and unison.

Draglines at work on the Left Bank Main Canal. Machines are here seen excavating the bed and shovelling the earth for bank formation

The weir will command a gross area of 8,00,000 acres, of which 6,51,000 acres will be irrigated annually. The scheme is an economical one as the cost of development per acre is about Rs. 100/-. The increase in the yield of foodgrains will be about 1.6 lakh tons and of cotton 16,000 tons per year.

CANAL SYSTEM

The irrigation system fans out from two main canals taking off from the regulators on both ends of the weir.

Of the total length of 850 miles of canals, branches, distributaries and minors, 600 miles have been dug and the entire system is expected to be completed by June 1955.

The progress of the Left Bank Main Canal has been behind schedule because a layer of hard morrum and rock underground was encountered. It was drilled with holes and dynamited. In other parts of the canal system bull-dozers, draglines and tractors are busy in the work of excavation. Afflux bunds have been constructed on either side to form a reservoir.

The waters of the Left Bank Main Canal will be let

into the Moticher Khari which will serve as a canal for some distance. About half a mile above the Khari's confluence with the Tapi river, the Moticher Weir, a masonry structure across the Khari, has been built. This weir is 260 feet long and 48 feet high tapering from a base width of 299 feet to 24 feet at the top.

The country to be served by the canal system is traversed by several large rivers, necessitating construction of a number of huge and expensive aqueducts. Two major structures already constructed in the uppermost reach of Left Bank Main Canal are the Moticher Weir with spillway and an earthen dam at Ratania Khari. The number of masonry works on the canal system will exceed a thousand.

15,000 WORKERS EMPLOYED

Most of the work on the project was done by manual labour, but where the load, lift and operation by manpower was uneconomical, machinery consisting of dragline excavators, shovels, scrapers, etc., was used for economy and speed.

During 1951-52 the number of workers employed on canal digging reached a peak of 15,000. This helped considerably in giving employ-

Kakrapar Weir under construction

ment to a large number of persons from areas affected by scarcity and famine.

A large part of the equipment and stores was acquired from Disposals. All expensive and perishable stores were kept in godowns, while heavy material, like girders, plates and fencing, was stocked in an open yard.

Most of these will now be available for use on other projects.

Before work on the project started, a comprehensive soil survey of the commanded area was undertaken to determine the suitability of the soils for irrigation. This was done in the Project Laboratory at Kakrapar, which also tested concrete, mortar and engineering properties of soils.

The completion of the Weir at Kakrapar and the

supply of irrigation water to the areas on the Chalthan Branch marks the commencement of the systematic development of this part of the valley. By the middle of next year another large tract between the Mindhola and the Purna rivers will be provided with irrigation facilities and by June 1955 channels will be ready to serve the rest of the areas on this project. So the first step in taming the wild and turbulent Tapi in the service of man has been successfully taken.—*PIB*

—:—

PAPER : FOOD FOR THOUGHT

By A. G. MEZERIK

THE universal hunger for knowledge today has created a new need, a need for greater supplies of the raw materials for paper-making, since the printed word still is man's best means of communication.

In Sweden logs are towed to pulp mills in great rafts enclosed by a boom, as shown here

The oldest known bit of writing in the world, the Presse Papyrus, is in the municipal museum at Istanbul. It dates from about 6,000 years ago and the first sentence reads: "Alas, times are not what they used to be. Everyone wants to write a book and children are no longer obedient to their parents."

A long time has passed since then but the situation seems to be just the same—excepting that more people want to write books. There is another exception too. Papyrus leaves are no longer the basic ingredient for the manufacture of writing materials. Along with papyrus leaves the world has used—at one time or another—bones, stones and wood, slabs of clay and metal, fabrics, palm leaves, and finally sheepskin.

Now the world has turned to wood pulp, and

green forests are as essential to the printer as is movable type. And not only to the printer, for whether for ideas or confetti, for a poem or wrapping paper, or for postage stamps or wallpaper—paper winds itself about our lives from birth certificates through death certificates. The need for more paper—and more sources for paper—grows almost by the hour.

Governments and international organizations are committed to fighting literacy. The United Nations Educational, Scientific and Cultural Organization and other United Nations organizations are introducing new forms of education. Governments are exchanging knowledge and information. Every such action calls for books, newspapers and periodicals. Radio and television are newer forms of communication. They well may be in the long run most important, but now it remains true that more men, women and children in the world depend upon words and images printed on paper for their information and know-

ledge than on any other means of mass communication.

As education removes the cobwebs of ignorance, a new kind of hunger is spreading across the globe. That hunger is for newsprint—for paper. The new famine is robbing millions of people of their mental nourishment. World organizations are mobilizing to relieve this famine. A newsprint shortage has been obvious for some time but the general boom in raw materials which took place in 1951, accentuated by stock-piling demands, created an acute crisis. It was then Unesco became alarmed. Inadequate supplies of printing paper available prejudiced the success of its basic educational program. Unesco approached the Food and Agricultural Organization and initiated a campaign to meet the emergency.

The FAO assumed the major responsibility for high quality were made in Java wholly from rice straw. On the basis of the technical improvement in the straw-pulping process, rice straw could be used to a much greater extent as a raw material in those tropical countries where there is an insufficient supply of pulpwood. But the fly in the ointment is that rice-growing areas rapidly are mechanizing their farming operations. Harvesting by machines such as combines will cause the farmer to switch to short straw varieties of rice which will reduce the supplies of rice straw before the pulping business gets started.

This team of man and elephant is taking one of the first steps in moving the raw material for paper-making from the forest to the pulping mill

for printing. The quest has reached back into time—once again touching the very papyrus from which we started. Egypt, as the year 1952 ended, announced it would again try to produce paper from the plant from which paper got its name—the papyrus, on which the Pharaonic Egyptians wrote. The search covers the land. It ranges all through agriculture, although to be sure, it does not now encompass the prospect of reintroducing sheepskin. The record of 300 sheepskins required by Gutenberg to print his Bible on parchment is in no danger of being challenged.

Other ancient agricultural sources for paper-making are not so immune. Wheat straw was employed in making pulp before wood began to be used. Methods were primitive and the product reflected it—being cardboards, corrugating papers and low-grade wrapping papers. However, the art of making pulp from wheat straw has lasted through the centuries with many small straw pulp factories still in operation. Rice straw is also a source for the making of paper—and of much better than is possible from wheat straw.

Before World War II white papers of a very

Bagasse, the residue of sugarcane, today is receiving the most widespread and intensive consideration as a source of pulp. The world's potential supply of bagasse—more than 33,000,000 tons—could do much to alleviate the newsprint shortage. Bagasse makes a good pulp, suitable for various kinds of paper, including newsprint, provided it is produced by modern methods and mixed with groundwood. However, it too

From Canada, newsprint is shipped to many other countries. This picture shows great rolls being loaded for export

has drawbacks. Supplies will be limited as long as most of the world's bagasse is used as fuel to fire sugar processing and refining. Bagasse also has a relatively high pith content which must be removed before

actual processing.

It already is clear that, in spite of these and other difficulties, bagasse is going to be a useful supplement to wood pulp in those parts of the world which are in or near sugar-processing areas. Supplement is the word, however, because compared to the total pulp demand, its possibilities are limited to a ceiling estimated by experts to be about 10 per cent of the world's present pulp output. Today's production of bagasse pulp amounts to less than one per cent.

The same areas which produce bagasse grow bamboo, which already is the chief raw material for making pulp and paper in India. Of India's total pulp production of 128,000 tons, 60 per cent was made from bamboo in 1951. Bamboo has good fibre dimensions; it grows rapidly, and it produces a good quality of paper. In Burma, Pakistan, Indo-China and the Philippines, commercial plantations growing bamboo bring high financial returns.

Bamboo is a grass, as is esparto, which grows abundantly in northern Africa and in Spain. Esparto is shipped mostly to England and France for processing. Sabai is another grass. With two crops per year and a yield of about 3200 pounds per acre, sabai today contributes about 22 per cent of the raw material for pulp production in India. Esparto and sabai are important locally—but that is about all. Along with the grasses, straw, bagasse and bamboo all can make a contribution. None can meet the ever-growing need for paper.

The world demand for pulp will continue to rise in the coming years at a rate of about five per cent a year. By 1960, the demand will reach—and it may exceed—54,000,000 tons, an increase of 20,000,000 tons over 1950. To satisfy this need it will take trees and forests. FAO has been looking at all kinds of trees in all kinds of places, seeking new forest sources for pulp.

One of the most promising future sources of pulp-wood from tropical regions is from pine plantations. Australians, New Zealanders and South Africans have demonstrated the practicability of obtaining very rapid growth and high volume yields from planted exotic pines. The world's largest man-made forest—Kaingaroa, in New Zealand—will shortly supply newsprint under a \$30,000,000 project.

In the green region of selva sweeping back from the eastern slopes of the Andes Mountains, Peru sees a solution for its chronic shortage of newsprint in the wood of the cecico, a native tree which grows in weed-like profusion along the banks of the Amazon, the Marañon and the Ucayali Rivers. In his *Woods of Northern Peru*, Llewellyn Williams says that the cecico (genus *cecropia*), although designated a hardwood, is really soft and not very heavy. It is one of the fastest growing pulp trees, growing more than 30 feet in three years. The trunk is 10 to 12 inches in diameter.

Palms, of which there are hundreds of species, also are being explored. Palm woods vary from soft and spongy to extremely hard and heavy, sometimes with a density greater than that of water. It is possible that certain species of palms can be grown for their wood just as others are grown for oil, dates and coconuts.

Hardwoods are not being ignored. Australia's pulp production of 136,000 tons is based almost 80 per cent on hardwoods, while in the world as a whole only 8 per cent of wood pulp is made from hardwoods. Certainly there are possibilities. Eighty years ago, a raw material shortage forced the paper industry to discover and develop new resources, to use softwoods instead of rags as the chief source of pulp for paper. Today the search goes on to meet the ever-increasing pressure of world demand on the raw materials currently being used to produce pulp for paper. Plants, cotton linters, roots, reeds, grasses and many other agricultural products are being tested.

In the United States, at Savannah, Georgia, and at Lufkin, Texas, are factories which work for American, African, Indian, Finnish, Mexican and New Zealand manufacturers. They are searching for raw material sources—and included in their studies are palmetto, sugarcane, fibre, straw, bamboo, African bango and cotton stalks.

Around the world the search goes on—prodded always by the insistent need. When FAO, not long ago, offered to survey cellulose resources and help establish factories for pulping, 25 countries in the Far East and Mediterranean Europe replied, asking for missions to survey their potential capacities for producing paper and newsprint. FAO, as its work develops, gets to know more about the possibilities. They are not pessimistic. The world's forests, they say, are capable of supplying sufficient raw materials. It should be technically possible to achieve the necessary increase in production to meet prospective pulp and paper needs.

The traditional raw material for pulping is, of course, spruce wood which is concentrated in North America and Europe. These two main producing regions had an output of 8,000,000 tons in 1913; by 1950 their joint output had risen to just under 31,000,000 tons.

A long time has passed since the French scientist Rene Antoine Ferchault de Reaumur observed that wasps made their nests from wood filaments which resembled paper. His associates were skeptical when he suggested that man, too, could make paper from wood. When Friedrich Gottlob Keller, a weaver from Saxony, discovered wood pulp in 1844, he proved Reaumur right. By 1854, collars, cuffs and shirt fronts made of paper were on sale in New York City. Ten years later, aprons, hats, carpets, casks and floorings were being made of it. It was used to make

MILE-STONES TO OUR FREEDOM STRUGGLE

223

coffins (but the Persians had thought of that idea long ago), houses, and at least two churches, one in Oslo, the other in London.

Now there are 14,000 uses and with every child who learns to read, a new consumer for paper enters the market. It will indeed take every kind of conservation, ingenuity and inventive resource to keep abreast of this demand. R. F. Taylor, a forester in charge of the Alaska Forestry Research Center, suggested recently that Iceland's forests, practically non-existent after thousands of years of grazing and erosion, might be regrown with conifer seeds collected in Alaska. Alaska thinks that could be done and Iceland wants it done. Who knows; one day a child in Basutoland in Africa may use a book, the seed of which was truly borne near Juneau, though the author lived in Paris.—From *American Forests*.

MILE-STONES TO OUR FREEDOM STRUGGLE Patriotic Movements and Associations of the Early Nineteenth Century

By JOGESH C. BAGAL

INTRODUCTION: RAJA RAMMOHUN ROY

In the history of India's freedom struggle, the patriotic movements and associations of the early nineteenth century should form a distinct and important chapter. It is a fact that the English established factories in Western and Southern India earlier than in Bengal. But from the cultural point of view, the people in Bengal came into close contact with the English earlier than others. Western thought, culture and education laid a strong impress on the minds of the Bengalis so much so that they began to think and act for our national progress on the pattern of the West. The signs of such development were palpable even before the systematic inculcation of English education to the generality of the people. Raja Rammohun Roy, Dwarkanath Tagore, Radhakanta Deb, to name only a few, imbibed Western mode of thought and culture in the first decade of the century.

Rammohun Roy headed the progressive school of thought. His religious and social activities through the meetings of the "Atmiya Sabha," publication of religious books, issuing of pamphlets on social subjects, such as *Suttee*, and writings in the Press, had already made an impress on the minds of his co-religionists and the foreigners, mostly Christians. He assimilated the Western way of approach and reasoning so closely that at times he was hailed as a valuable addition to Christianity. But the Christians had to be disillusioned soon. Though he was a relentless critic of the religious and social habits of his countrymen, still at heart he was a staunch nationalist and ardent lover of his country and countrymen. Standing on this plane he came into conflict with the missionaries and challenged them to meet his arguments against the nefarious activities of the latter. Spread of Christianity amongst a dependent people by vilification of their social and religious customs could not be deemed as an act of chivalry. Rammohun asked them why they would not prove themselves zealous in propagating Christianity in independent countries like Turkey, Persia, etc., and follow the example of the founders of Christianity.¹ He

envisaged the gravity of the problem even in the twenties of the nineteenth century. Since then more than a century had passed, the country had also attained independence, but the missionary activities have

Raja Rammohun Roy

still remained a problem in the land. It may be safely said that our national movements and associations started, and very often received momentum, with our attempt to counteract this missionary menace.

1. *English Works of Rajah Rammohun Roy*, Panini Edition, p. 145.

Rammohun was a pioneer in other directions also. The Hindu College had only been started in 1817. Systematic English education necessarily could not make much headway. In his political work he depended more or less on his colleagues who were mostly privately educated and acquainted themselves with the Western thought beforehand. Rammohun utilised the Press, then in the nascent stage, to propagate his progressive views on subjects which required to be tackled for the rapid improvement of his countrymen. He found in James Silk Buckingham, editor of *The Calcutta Journal*, a true well-wisher of India. Rammohun's Bengali and Persian writings in the two respective papers, *Sambad*

James Buckingham

Comrade and *Mirat-ul-Akhbar*, were Englished for the journal and published in it almost regularly. The governmental activities in the early twenties were severely criticised in Buckingham's *Journal* as well as in the Indian papers. Minutes on the English and the Vernacular Press—one on English by J. Adam and the other on Vernacular by W. W. Bayley—reveal broadly the critical attitude of the Press, especially of *The Calcutta Journal* and the vernacular papers towards the various ugly measures and actions of the Government. Instead of mending their ways in the light of these criticisms the Government of the day thought it prudent to pass the Press Regulation of 1823, which sought to prevent the free expression of opinion by the Press.

The Damocles' sword had already fallen on James Silk Buckingham. His licence was cancelled; he was banished from the country by April 1823. Rammohun also did not sit idle. Along with his associates, such as Dwarkanath Tagore, Prasanna Kumar Tagore and others, he sent a petition

to the Supreme Court against this measure. This proving ineffective, he sent an address to the King in Council in England, in which he dwelt on the virtues of a free Press. This address was likened to the *Arcopagetica* of Milton for its lucidity of style, force of argument and for the defence of the freedom of the Press. Rammohun took a step forward. As a protest against the Regulation, he stopped publication of his Persian paper *Mirat-ul-Akhbar*, after bringing out its last issue on 4th April, 1823. In giving reasons for the stoppage, he quoted two Persian couplets, the purport of one of which is:

"The respect which is purchased with a hundred drops of blood
Do not thou, in the hope of a favor,
commit to mercy of a porter."²

A great votary of the Bengali language, Rammohun desired its rapid improvement. He thought that the universal use of Bengali was urgently needed for political reasons also. In a paper, "On the possibility, practicability, and expediency of substituting the Bengali language for the English," Rammohun pleaded, for 'the reading of the vernacular languages of India by the English,' for, that 'would give us a better chance of obtaining justice than we have ever had yet.' Some cogent reasons were advanced in support of his proposition. He wrote in conclusion:

"... Surely it is much easier for two or three thousand of them (Englishmen) to adopt our language and character, than to expect sixty millions of Natives ... to give up that which have been used for centuries, and accept a new one."³

In a dependent country, to hold and propagate such a radical view bespeaks of the vigour and foresight of the man that Rammohun was.

GAURIYA SOMAJ

Though most of his countrymen could not subscribe to his radical views regarding religious and social matters as also could not appreciate the far-sightedness of his political views, they, however, formed themselves into an association early in 1823 to devise ways and means for the rapid development of the Bengali language and literature and for the neutralisation of the missionary activities. Both the followers of Rammohun and those belonging to the orthodox section of the Hindu community joined the association in large number. The former included Dwarkanath Tagore, Prasanna Kumar Tagore and Tarachand Chakravarty and the latter the renowned Sanskrit scholars, such as, Ramjay Tarkalankar, Kashinath Tarkapanchanan and Raghuram Siromani, as well as such other litterateurs and prominent Bengalis as Bhawani Charan Banerjee, Radhakanta Deb, Ram Comul Sen, Ramdulal De (Sarkar), Rasamay Datta and Kashinath Mallik.

2. "Rammohun Roy as a Journalist"—Brajendra Nath Banerjee, *The Modern Review* for August, 1931, p. 138.

3. *The Modern Review* for December, 1928, p. 636.

The Gauriya Somaj, rightly described at the time as "The Native Literary Society," issued a prospectus⁴ in Bengali in which its objects were explained in detail. The principal object of the society was the encouragement and diffusion of knowledge amongst our countrymen in their mother tongue. With this view the Society resolved that 'translations of works from other languages into Bengali shall be prepared and published at the Society's expense.' The prospectus proposes the following practical means for the fulfilment of this object in the following lines:

"We therefore beg to suggest, that the wise and well-informed men of this country should combine, and, as far as their respective abilities admit, or by the employment of pundits, and translators, the

twenty years, the English missionaries have treated the natives of Bengal.' The prospectus continues:

"What man of any observation is there who does not perceive its injurious operation on our existing laws, and who is uninformed of the lamentable condition of those who, deserting their own faith, have become native Christians? The missionary teachers, imperfectly informed of the principle of our Shastras, our *devtas*, and our institutes, have translated, as descriptive of them, detached passages; they have printed pamphlets against us, replete with most intemperate and abusing terms, and distributed these to the world ..."

The attitude of the English officials towards the Hindus and their religion was also deplorable. 'Influenced by their disposition to consider us as followers

Dwarkanath Tagore

of a false religion, they withhold all countenance from our pursuits, and feel little or no interest in our welfare.' The Hindus therefore could not look for any considerable encouragement and aid from this quarter. They must rely on their own strength to counteract the menace. They proposed in the prospectus:

"It thus appears that the Hindu, who has always been submissive, humble and inoffensive, is now exposed to unprovoked attacks, and is injured in his reputation, and consequently even in the means of subsistence, by persons who profess to seek his good. As yet this cruelty and calumny have been little heeded, and scarcely an effort to repel them been attempted; had such conduct been offered to the Mussalmans, they would instantly have combined to resent it; and in like manner it is now incumbent on the opulent and respectable Hindus, who delight not in the abuse of their Shastras and practices, and who wish to cherish and preserve them, to consider well these circum-

4. Published in English translation in *The Asiatic Journal*, December, 1823.

Ram Comul Sen

stances, and upon full deliberation, to unite to publish replies to the charge made against us, or to represent our grievances to the government, by whose wisdom no doubt a remedy will be devised."

The Somaj was inaugurated on 16th February 1823, in the Hindu College Hall, with Ram Comul Sen in the chair. The prospectus was read and discussed. Ram-comul Sen and Prasanna Kumar Tagore were appointed secretaries. In the second meeting of the Somaj, a committee of management was formed with Ladly Mohun Tagore, Radhamadhub Banerjee, Kasikanta Ghosal, Chandra Kumar Tagore, Dwarkanath Tagore, Pandit Ramjay Tarkadankar, Radhakanta Deb, Tarini Charan Mitra and Kasinath Mallik. From the contemporary newspapers we get the record of only four

Prasanna Kumar Tagore

meetings of this Somaj, which were held in a rotating manner. The Somaj succeeded in focussing the attention of many influential and opulent persons, and it was hoped that the objects of the institution would be more than fulfilled. Though nothing of the Society was heard beyond the middle of June, 1821, still the impetus that it gave to the propagation of knowledge through the publication of Bengali translations or compilations from foreign authors as well as of the Hindu Sastras, such as the Ramayana, the Mahabharata and the Puranas; English and Bengali newspapers, periodicals, books on polite literature and poetry, grammars, dictionaries and even maps. The members of the Gauriya Somaj are found to engage in this work of

public good in their individual capacity. The Somaj could not continue for obvious reasons. But the objects for which it was founded, remained uppermost in the minds of our leading and enlightened countrymen who were its members. Very many associations were started later for literary or cultural pursuits. But the Gauriya Somaj may be rightly called the precursor of them all. Late in the twenties, associations of a newer and more radical nature grew up, due to the spread of the new education. Henceforward the people were more and more conscious of the evil consequences of the mischievous missionary propaganda in the country.

THE NEW EDUCATION: THE ACADEMIC ASSOCIATION AND OTHER COGNATE BODIES

During the first decade (1817-27) the Hindu College mostly imparted only rudimentary instruction in English. The appointment of Henry Louis Vivian Derozio, the young Eurasian poet, as teacher of History and English Literature in the Hindu College in 1826, signalled a new era in the teaching of these subjects. His instruction made it possible for the Indian youths to be acquainted with the currents of modern European thought and culture. The students no longer took things as they were. They applied reason to consider *pros and cons* of every subject and tried to arrive at an independent conclusion. They became habituated to stand for reason as against prejudice. The spirit of enquiry was abroad. To Derozio's pupils were gradually unravelled the secrets of European superiority over the rest of the world in every sphere of life. They began to preach and practise things which were disliked by their elders. They started debating societies at which they freely discussed social, moral, religious and political subjects. This transformation in the outlook of the Bengali youth was brought about within four or five years of Derozio's joining the Hindu College. Peary Chand Mitra, a student-disciple of Derozio, gave the credit for this historic transformation to the inspiring instruction of Derozio in and outside the Hindu College. He writes:

"Of all the teachers, Mr. H. L. V. Derozio gave the greatest impetus to free discussion on all subjects, social, moral and religious. He was himself a free-thinker, and possessed affable manners. He encouraged students to come and open their minds to him. The advanced students of the Hindu College frequently sought for his company during tiffin time, after school hours and at his house. He encouraged everyone to speak out. This led to free exchange of thought and reading of books which otherwise would not have been read." "The impetus to enquiry and promotion of thought given by Derozio manifested itself in debating clubs, which were encouraged by Hare."

The first and foremost of these debating clubs was the Academic Association started by the advanced students of the Hindu College in 1828, and over which

5. *A Biographical Sketch of David Hare*: By Peary Chand Mitra, p. 15.

6. *Ibid*, p. 16.

Derozio presided. This Association met once a fortnight for literary discussion in the garden-house of Sreekrishna Singh at Maniktala, where later on the Wards' Institution was situated. The subjects discussed at the meetings included free will, fate, faith, the sacredness of truth, the high duty of cultivating virtue, the narrowness of vice, the nobility of patriotism, the attribute of god, the hollowness of idolatry and the shams of priesthood. In these discussions Krishna Mohun Banerjee, Rasik Krishna Mallik, Dakshinaranjan Mukherjee, Ramgopal Ghose, Ramtanoo Lahiri, Radhanath Sikdar, Gobinda Chandra Bysak, Peary Chand Mitra as well as many others took an active part. David Hare, the main projector of the Hindu College and a true friend and advocate of Indian advancement, was a regular visitor to the meetings of the Association and encouraged the deliberations of the young men on the above subjects. Sir Edward Rayan, Justice of the Supreme Court of Calcutta, and Colonel Benson, Private Secretary to Lord William Bentinck, used to visit the meetings occasionally. The example set by the students of the Hindu College was followed by those of the other seminaries also. We learn from a contemporary account⁷ that

"Seven associations of this kind are now in existence, the proceedings of which are conducted exclusively in the English language. Most of them meet once a week, and some at longer intervals, for discussing questions in literature and science; and sometimes in politics; the number of members belonging to each varies from 17 to 50. At some of the societies written essays are produced, which become the subjects of discussion; at one of them lectures on intellectual philosophy are delivered in rotation by members, and at another by the president, an East Indian gentleman of great talents. . . ."

The last one evidently refers to the Academic Association, and its President Derozio. According to this account, Derozio was connected with most of the others as a member. It further says:

"In short, he lends a very able and active hand in raising the intellectual character of the native youth; and many of the young men who have enjoyed the advantage of his instructions have distinguished themselves by their proficiency."

We learn also that

"The example thus set in English has been imitated in Bengalee literature, and two or three Associations have been formed principally of persons not connected with the schools above-mentioned, for writing upon and verbally discussing various subjects exclusively in the Bengalee language."

Students headed by Debendra Nath Tagore (later, Maharshi) and Ramaprasad Roy actually started an association in December, 1832, for the cultivation of the Bengali language.

7. "An Indian Correspondent on the Native Improvement" in *John Bull*, December 11, 1830.

This free discussion by the advanced students and young men soon led to activities that gave rise to a commotion in the Hindu society. Eating forbidden food, decriing idolatry, denouncing the social customs—constituted some of their chief planks of action to which the elders took serious exception. The latter made Derozio responsible for all this, and succeeded in inducing the Hindu College authorities to dispense with his services. The young men were subjected to various kinds of torture and humiliation by their guardians. But they were undaunted. They remained votaries of their cherished opinions all their life. They fought against social evils and religious bigotry with youthful exuberance. Eager to diffuse the new educa-

David Hare

tion amongst their countrymen, these youths started free schools in and around Calcutta. Some of them took to journalism, literature, teaching or trade as their profession while others accepted posts in various departments of the Government. Whenever they went, they instilled the spirit of honesty and truth into the body politic. This paved the way for the removal of long-drawn abuses prevalent in the public offices and in private life. These young men, better known as "Young Bengal", later on, became the leaders of the community in politics and social activities. The lessons of association or combination, imbibed in their youthful days, stood them in good stead in after life. Guided by the noble motives of patriotism, they established religious, social, cultural and political associations for the all-round improvement of their countrymen.

The educated Bengali youths soon spread into the mofussil districts of Bengal, and gradually all over

Northern and Central India as well as Assam as the emissaries of new light, education and culture. They also took lead in the progressive movements of these regions.

THE ACTIVITIES OF THE ELDERS

Since the establishment of the Gauriya Somaj, the elders of the community took upon themselves the task of safeguarding our national interests in politics. They soon had an occasion to protest against the

Henry Louis Vivian Derozio

governmental action. The jury system was first introduced in our law courts in 1826. Here was made an invidious distinction by the powers-that-be between the Christians and the non-Christians. It was stipulated in the law that 'the Grand Jury in all cases, and all jurors for the trial of persons professing the Christian Religion, shall consist wholly of persons professing the Christian Religion.'⁸ Rammohun Roy, the most progressive leader of the period, protested strongly against this measure. While in England, he even brought the matter pertinently to the notice of the Parliamentary Joint Committee set up for the consideration of the Indian affairs in 1832. Here the public mind was so

much agitated over this unjust measure that both the Hindus and Mussalmans joined hands with one another for the first time for seeking redress of this political grievance and sent a petition to the Government here as well as in England either for rectification or for withdrawal of this ignoble measure. One Mr. John Crawford acted as agent of the Indians in England and presented a petition on the matter before the Parliament on their behalf. It was due to the continued agitation in India and abroad that the Jury Act was so amended as to remove the invidious distinction from the Statute Book in July, 1832.

Next in importance was the colonisation question mooted in late twenties by the non-official Europeans. The Europeans had to live in this country on sufferance, licences being issued to them for residence here. They were liable to be banished from the land even on suspicion by the Government. They, therefore, could not be permanent residents and have any stake in the land. For the removal of these disabilities, the colonisation movement was started. In the public meeting held for this purpose in the Calcutta Town Hall on 15th December, 1829, Rammohun Roy and Dwarkanath Tagore lent their cordial support to the cause. Dwarkanath even moved a resolution for abolishing the restrictions on the residence of Europeans in India. Rammohun supported this resolution. In their speeches they both emphasised the necessity of the Europeans living permanently in this country, as partners of the Indians in weal and woe. From personal experience, Rammohun said on the importance of European colonisation as follows:

"I am impressed with the conviction that the greater our intercourse with European gentlemen the greater will be our improvement in literary, social and political affairs; a fact which can be easily proved by comparing the condition of those of my countrymen who have enjoyed this advantage with that of those who unfortunately have not had that opportunity; and a fact which I could, to the best of my belief, declare on solemn oath before any assembly."

Rammohun believed in his heart of hearts that European capital and enterprise, not to speak of Western education and culture only, would be fruitfully employed for the development of the country's resources, whereby the Indians would be largely benefited. But the Charter Act of 1833 and the invention of the steam engine conjured up together to belie these expectations of Rammohun and his friends. There was a party of elders, headed by Radhakanta Deb, who denounced the colonisation question; and the unforeseen circumstances that followed, proved their contention to be right.

Some sort of political consciousness was already in evidence in the newly educated in Bengal. Both the elders and the young men felt that their dependence on

others must end before they could rise to their full stature. And the process had already set in. In his "An Address to My Countrymen,"¹⁰ in 1831, Prasanna Kumar Tagore declared that

"The influence of liberty and truth was spread and is spreading far and wide, and nothing can check its course. There was a time when the natives of this country were looked upon as a race of unprincipled and ignorant people. . . . But look at the contrast now. Is it possible that at the present day an impeachment of such a dark character will be allowed to bear the slightest colour of truth?"

On the social plane the conservative Hindus came into serious conflict with the progressive school of reformers headed by Rammohun. The *Suttee* question was solved once for all by Lord William Bentinck, the then Governor-General by the passage of the Anti-Suttee Act on 4th December 1829. The progressive leaders welcomed this measure and gave him an address of felicitation in the following January. The orthodox section also approached the Governor-General with a prayer to get the Act repealed, but failed to elicit a favourable reply. They, however, founded *Dharma Sabha* on 17th January, 1830, to conduct an agitation in India and England against the Anti-Suttee Act. They even appealed to the Privy Council for redress. But here also they could not succeed. At times the conflict between the Brahmo-Sabha, the religio-social body of Rammohun, and the *Dharma Sabha* of the orthodox Hindus grew serious. But the political grievances which both had to suffer equally, bridged the gulf of differences and they were united in no time to fight for the common cause.

THE CHARTER ACT OF 1833 AND AFTER

The 'reformist' and progressive activities of the Indians here and especially of Raja Rammohun Roy in England had their repercussions on the discussion over the renewal of Charter in the Select Parliamentary Committee there. The Charter Act was passed by the Parliament in 1833, and came into force early next year. By this Act the East India Company lost all its trading rights except those on salt, and the Indian Civil Service, a close preserve for the relations of the directors and influential share-holder of the Company, was opened theoretically to all, irrespective of caste, creed or colour. But, practically speaking, only the Britons could take advantage of this innovation for a long time. The most important change introduced by the Act, was, however, the centralisation of legislative power for all India in the Council of the

Governor-General, who now came to be designated as the Governor-General of India instead of the 'Governor-General of Fort William in Bengal.' This important change neutralised the fissiparous tendencies of the Governments of Madras and Bombay, who had hitherto acted practically independently of the Central Government at Calcutta. The spirit of governmental independence percolated to the rank and file of the newly educated there. Decades had to pass before this separatist tendency could be removed from their minds and a national outlook evolved. Being centralised, the Government became 'national' before our new nationalism could take a concrete shape. A fourth member was added to the Governor-General's Council as 'Legal Member.'

The colonisation movement succeeded so far as the removal of the licence-system was concerned. After the passage of the Charter Act, the Europeans were eligible to be an Indian citizen *par excellence*. They could settle here permanently, acquire property rights, engage in agriculture and carry on trade in the country. But the greatest anomaly remained, and they could move here like "free" Britons, by which they boasted to call themselves. Their privilege of being tried by the Supreme Court of Calcutta both in civil and criminal cases, was kept intact. This led to serious racial antagonism between the Indians and the Europeans afterwards. Even when in 1836, Macaulay, the first Legal Member, sought to remove this legal anomaly and racial discrimination partially by extending the jurisdiction of the Company's civil courts in the mofussil to try cases in which the Indians and Europeans were involved, the non-official Europeans in Calcutta held public meetings to denounce the measure and even then they nicknamed it as the 'Black Law.' This name persisted each time any attempt for the removal of this legal discrimination was made.

But the leaders of both the communities still acted together for the preservation of their common interests. The beneficent rule of Lord William Bentinck and his temporary successor Sir Charles Theophilus Metcalfe induced the Indians to unite and work for the good of their common Motherland. They did not hesitate to unite and protest against the administrative measures. The Press was set free in September, 1835. This gave no less impetus to free discussion of the State-measures.

Political associations soon cropped up to give vent to public feelings. Newspapers devoted themselves more and more to political discussion. Criticism of the public acts and measures as well as suggestions for the country's improvement became the order of the day.

HOW AMERICANS MISREPRESENT INDIA

Some Samples

By PREM NARAIN AGRAWAL

"AMERICAN editors like to publish articles, etc., about India by their own editors, writers, journalists and observers, etc., who are visiting India off and on rather than by Indians," said an important man of the U.S. Embassy in India. I agreed because it is perfectly natural to rely more on their own countrymen and their writings will have a greater appeal to American readers. They also write in a suitable style giving those very facts most needed by them and in a manner which attracts their imagination at once.

But it is risky too, particularly in these days when earnest efforts are being made by U.S. at tremendous cost to win Indian friendship and goodwill. Misrepresentations, wrong facts, or exaggerations in their writings tend to create ill-will among Indians, and the critical section in India, not favouring increasing Indo-American friendship, make a capital out of even small things innocently written. They are likely to confirm all kinds of suspicions of Indians about American intentions. Naturally therefore, it is essential for American editors to be extra-careful in not publishing wrong things about Indian affairs injuring their sentiments, thus cutting the root of growing friendship between the people of the two great democracies of the world.

An impartial analysis of these references to Indian affairs is very revealing and sometimes it appears as if a deliberate attempt is made to misrepresent India even by most eminent and responsible men. Sometimes such instances are more harmful and we have to guard against them.

In this article I propose to give some concrete instances to give you an idea how and what misrepresentations are being made.

Even so responsible a man like the former U. S. Ambassador in India who was always believed to be correct and who was expected to be more familiar with facts being on the spot often made grievously wrong statements.

In his article appearing in the *New York Times*, dated March 23, 1952, under "Asia Challenges U. S. through India," the former democrat U.S. Ambassador in India Mr. Chester Bowles wrote:

"Following the general pattern set in the point four pilot study at Etawah each project will lay heavy stress on increasing agricultural production."

Participating in a Columbia Broadcasting system programme "Capitol Clockroom" broadcast on January 18, 1952, Mr. Bowles again said:

"The U. S. is trying to help them help themselves. Horace Holmes (point four expert) went out there to help them . . ."

The pilot project work, Etawah, of which I am a resident, is not a point four work. Point four aid

implies financial as well as technical help but here there was more. In fact, on June 5, 1950, the President of the U.S.A. approved the act of international co-operation, authorising the point four programme. On September 6, 1950, the first annual appropriation of \$34,500,000 for the fiscal year 1951 became available on September 8, 1950. The point four programme became the responsibility of the Department of State by executive order.

Etawah pilot project work had been started in September, 1948.

It will thus be abundantly clear that point four came into existence after two years of Etawah work had started and nothing has yet been done by point four in any shape or form to take the credit.

Mrs. Eleanor Roosevelt, who visited India early in 1952 as a guest of India Government, paid a visit to Etawah and wrote about its work in her world-wide syndicated column "My Day" appearing under Allahabad (India), March 19, 1952 date-line in this way:

"When our point four people first arrived the farmers thought only of digging a big canal for irrigation purposes, which would have been an expensive project, but it was quite evident that no money was forthcoming for this, so Mr. Holmes started by inducing them to try better seeds in small sections of their fields. Then gradually tube-wells were put down and more irrigation was possible . . ."

In the same column in the concluding paragraph she wrote:

"Altogether I was so interested by Etawah that I wanted to tell the whole world about what Mr. Holmes of the U.S.A. working for the point four programme has started."

It implied that when work was started here there was no proper scheme of work, people entertained wild ideas or hopes, enough money was not arranged for and it was Mr. Holmes who gave the lead in driving away the confusion and that he was point four man.

All of these are however wrong. Before the work started experts had a definite well-thought-out scheme and ample funds at their disposal for executing it. People never thought of digging a canal and wanted to know what they would do as a big canal with so many tributaries already existed there, tube-wells were put down to supply more water and at will. There was no room for confusion of any kind and experts started the work according to pre-arranged plan. The biggest mistake, bordering on mischief, is the suggestion that it was started by or under point four. As explained above point four had nothing to do with it and Mr. Holmes who is now working in India with point four was then an employee of U.P. State and was imported into

India to work here as an assistant and later joined point four.

The last paragraph where she says it was started by him is again wrong. Mr. Albert Mayer, an American town planner, who conceived it, planned it and put it into work and who still continues to work for it, started it.

When I brought to the notice of Mrs. Roosevelt all these facts she corrected her previous writings by writing the following under "Hyde Park," July 10, 1952 headline:

"I have a letter from a gentleman in India who points out that I was incorrect, rather left an incorrect impression when I wrote a column on Etawah, India. I am sorry to have been inadequate and I hereby correct it immediately, but I also wish to say that in short column it is very difficult many times to tell the whole story about anything."

"The project of Etawah was started by the Indian Government. Albert Mayer, an American architect, who is building the new capital of upper Punjab, was responsible for the early recommendations on which was to be done and has continued to watch over it with interest. The Government had engaged Horace Holmes, an American extension agent, and he worked in India for two years before our point four programme came into the picture at all. Later Mr. Holmes was kept on under the point four arrangement."

"This information was kindly sent me by Prem Narain Agrawal, M.A., who is an author and journalist of Ajitmal, Etawah, India. I am very grateful to him that he corrected the impression that I had created. I have mentioned Mr. Mayer on several occasions. He has been interested in and guided much on the building in this area and in other Indian areas."

Such mis-statements and half-hearted corrections by such eminent persons like Mrs. Roosevelt create a lot of misunderstanding and confirm various suspicions already existing in India. She corrected her previous writing but not all the facts and that too not in clear language.

When she visited Etawah she was in the company of the U. P. Governor and this fact she mentions in the same column from whom she could have easily ascertained these facts. But she relied on her own countrymen which put her in such an awkward position and did a lot of harm not only to her prestige in India but to Indo-American friendship and good relations. In her Allahabad, March 18, 1952 date-line column she gave the source of her information which she later had to correct in this way:

"The evening before on the train Mr. Holmes, who is the point four man, who started this work and whose training was given at Cornell University, came in to talk with me about what they were doing, so I had a little background to help me observe."

Evidently she was misled deliberately by Holmes with some intentions.

Her previous column appeared in Indian papers

but not her corrections. She did not appear to have made any effort so far to enlighten the Indian people about her corrections, leaving them free to form any opinion about her intentions, those of the Americans whom she represented. But Mr. Chester Bowles, the former U.S. Ambassador in India, did not deem it fit to correct his statements referred to above, despite my rather lengthy correspondence with him, and the verbal admission of the mistakes by his assistant, probably because of the official position he held at the time.

Though unusual for Ambassadors he wrote several articles about India and might have committed equally serious and damaging statements. In another article captioned "New India" appearing in the *American Quarterly Review Foreign Affairs* in October 1952, which came to my notice recently, he wrote:

"In addition there were 584 princely States. Of those only Kashmir, Hyderabad and Mysore were of significant size, while 202 had areas of less than ten square miles."

While the number of States is not exactly the same his statement that Kashmir, Hyderabad and Mysore only were of significant size, is misleading. There were several other States of significant size like Baroda, Gwalior, Indore, Jaipur, Jodhpur, etc.

At another place in the same article he writes:

"The answer lies largely in making more consumers goods available in the village bazaars at reasonable prices. There are tens of millions of Indians who have never owned a pair of shoes or a change of clothing. The market for new cooking equipment and simple comfort is almost unlimited."

It gives an incorrect picture. There is plenty of consumers goods now in the market, barring a few things, but Indians have no money to buy them. Indians could not own a pair of shoes not because there was a dearth of shoes but they never had money to spare for them. Now with slump coming in there is a general complaint everywhere in India that consumers goods are lying in shops and stores, and there are no buyers. It is true that the market for cooking equipment and simple comfort is almost unlimited but they have no money to buy it.

It may be argued that neither Mrs. Roosevelt nor Mr. Bowles are professional writers and such mistakes are possible. But the truth is that their views and observations carry far greater weight than that of an ordinary writer, hence, they should have been more careful in their writings.

But professional and experienced editors have done no better.

Another very important man of the same embassy very proudly gave me a copy of Mr. Ralph McGill's report on India containing all the columns written by him during his stay in the interior of India, which had also appeared in the American daily *The Atlanta Constitution*, of which he was the editor, challenging me to point out wrong facts and wrong impressions as

he was sure it cannot contain such things. He gave it to me when I was discussing wrong facts, misrepresentations, exaggerations, etc., in American and Indian press about Etawah project in which the U.S. embassy had an hand.

Since he was in Etawah district for the most part of his stay and wrote about it, myself being in between Ayana and Mahewa, the two areas where he stayed and wrote about, I can give the correct factual picture.

Writing of Pandit Jawaharlal Nehru, under New York City date-line appearing in *The Atlanta Constitution*, dated November 21, 1951, he says, "He sold his beautiful, spacious house and gardens." Evidently he refers to Pandit Nehru's famous Anand Bhawan afterwards called Swaraj Bhawan, which was the headquarters of the All-India Congress Committee for a number of years. It was not sold but given free of all costs to the Congress to house its head office. There is plenty of difference in selling and giving free.

Writing of Mahatma Gandhi under Karachi date-line appearing in his paper on December 1, 1951, he says, "He (Gandhi) was shot on Sunday, January 25, 1948."

Gandhiji was shot on January 30, 1948 and it was Friday and not on the date and day he mentions.

Under Ayana, district Etawah, U.P., headline appearing in *The Atlanta Constitution* on December 10, 1951, he writes thus:

"So great is the shortage of fuel that cowdung is made into cakes and dried so that it resembles and burns like the peat of Ireland."

Cowdung cake is not used because of fuel shortage but because of the quality of fire it produces. Its fire is more suitable for good cooking. It is so cheap and convenient to make and use during monsoon when woods get moist, giving more smoke.

Writing about Etawah pilot project work, which he came to see in particular to shout about, under New York City date-line appearing in his paper, dated November 21, 1951, he writes, "There our agricultural aid has brought many changes."

Again he makes reference to this work under Ayana head-line appearing on December 10, 1951, in the following words:

"... Who is in charge of the farm project being conducted here by the Indian Government. With point four assistance ..."

He emphasises American aid in this area again under Ayana date-line appearing on December 11, 1951, in this way:

"Here thanks to ... and his associates, Indian and American. The administration of American aid has been sound and productive."

But the fact is that there was no American aid either technical or financial in the Etawah pilot project area. Etawah work had been started in Sept. 1, 1948, two years before point four was formed in the U.S.A. and much before it came to India. Some Americans who

worked in this area were employed and paid fully by the U. P. State.

Under Etawah headline appearing on December 12, 1951, he says, "Etawah which is the smallest of 48 districts in the State called the United Province," and goes on describing the annual livestock fair of the Etawah district as "the largest fair in all India." He called it the United Province though its name was changed to Uttar Pradesh in 1949 under the new Constitution.

Etawah is not the smallest district of this State nor the annual cattle fair 'the largest fair in all India.' It is not the largest fair even in our State of U.P.

Appearing on December 13, 1951, under Ayana headline he mentions, "There are in India 48 such other States." He would have been correct if he had said there are 48 such districts in U.P. There are only in all, big or small, 28 States, like Uttar Pradesh in the whole of India.

At places we also find confusion of thought. Under Ayana headline appearing on December 13, 1951, he writes:

"There is an area which is semi-desert. Irrigation necessary. There are two canals flowing more than 300 miles through the areas, deriving from Ganga (Ganges) the river."

Under Mahewa headline appearing on December 17, 1951, writing about another village Andawa a few miles from Ayana, he says:

"The land in this area, which is the vast Ganges river valley, is very fertile, but arid. Aside from the monsoon which brings rain in the late June and into late August, there is almost literally no rain at all."

In the first paragraph if he describes Ayana area it is wrong since there is only one canal and the land is not at all semi-desert. If he means the whole of Etawah district, which has two canals, the land again is not semi-desert.

The second paragraph makes the confusion and description more evident. The whole of Etawah district, not village Andawa alone, including Ayana village, lies in the vast Ganges river valley and the land is very fertile. I should rather say the land lying between the two famous rivers Ganges and Jamuna, called *doab* land is the most fertile land in the whole of India and Etawah is situated in this area. It looks ridiculously inspired to describe it as 'semi-desert.' Rainfall continues from late June to late August and also in September. In December and January, again there are showers of rain and often more than necessary for canal-irrigated land.

Under Ayana headline appearing on December 18, 1951, he writes:

"There were letters to mail and so we drove along bullock cart ruts to the canal bank, which flows from the Ganges 300 miles through this parched land and along it to the Post Office at Auraiya 11 miles away."

"It has a bank, with a policeman on guard in a uniform like a soldier's and armed with a rifle."

The first paragraph is a sad and incorrect reflection on the postal system of India. It implies he had to go to Auraiya 11 miles away just to post his letters as if there was no Post Office capable of carrying his mail nearby. There is a Post Office in the village of Ayana itself and another five miles away, as quick in carrying mails as Auraiya Post Office. It is wholly incorrect to say he had to go there for the sake of posting his mails. It would have been reasonable to say that he went to see what it was like.

It is equally wrong to say that Auraiya had one bank only as described above with a policeman. Auraiya has more than one bank and the man whom he described as policeman was not a policeman but a *sentry* of the bank, employed to guard it. He seems to invent and develop a funny idea to boast American aid to impress his American readers. Under Mahewa headline appearing on December 20, 1951, he writes:

"The Indian masses were never given schools. ... Now they are being given schools and assistance in learning. The U.S.A. is playing a part in it, though always with and under the Indian Government as is proper."

There were schools not only in this region but all over India even during the British days and in some villages compulsory primary education existed. Their number was constantly increasing and reaching larger number of villages even in the remotest corners.

I do not know what part he thinks U.S.A. is playing in it. I have already stated in the Etawah project the U.S.A. has not contributed a single pice. There is no justification to say so when there was no such aid in any form.

While writing about the Prime Minister, with whom he lunched he shows the same ignorance. Under Mahewa headline appearing on December 22, 1951, he writes, "Even Nehru's daughters attained, etc."

Pandit Nehru has only one daughter, Mrs. Indira Gandhi. He should have written sisters, to be correct who are two.

Describing his lunch with Pandit Nehru under New Delhi headline appearing on January 6, 1952, he says:

"So we talked, and his gracious sister, Madame Pandit Nehru, and his charming and attractive daughter chatted briefly."

He did not even know that his gracious sister, who has been Indian Ambassador in his country, should have been mentioned as Madame Pandit only.

While writing on general conditions of India, under Mahewa headline appearing on December 29, 1951, he writes:

"A good half of the population does not drink milk, because it comes from an animal."

It is true that a large number of our people do not drink milk; they do not drink, not because it comes from animal but because they cannot afford to do it or

they do not get it. It is funny to think in this way, because the cow is called mother from time immemorial for the simple reason that it gives sweet healthy milk. It has become a sacred animal to Hindus mainly for this reason and they have been drinking her milk for centuries.

Even a casual glance on the railway ticket from Etawah to Delhi, would have caught his eye that the distance between these two places is only 185 miles, not 296 miles as he mentions in his column appearing on January 1, 1952, under New Delhi headline.

These are some of the major and most glaring lapses which I have discussed here from the writings of a very keen and sincere observer editor of U.S.A., about whose facts the U.S. Embassy man in India was so sure. Others may be committing larger and more serious mistakes, depending on their preconceived notions, objectives and places of visit. Fed on such stuff by their own countrymen, neglecting the other side by the Indian writers, what the American public will think of the Indian can be very well imagined. When such material is distributed widely in India and the U.S.A. by responsible official American sources, it only indicates their complicity with anti-Indian propaganda, uprooting the feelings of Indo-American friendship and goodwill.

The effect of such irresponsible writings is that the general press in America begin to believe in so many things which are not correct, forming an altogether wrong idea of what India is today. This is the time when we need better information about each other so that we may understand them with greater sympathies and be more friendly. But such an impression among them, while it misleads the American citizens, creates ill-will amongst Indians when they know of such erroneous views of those, whom they try to befriend. It can be easily explained by Communists or others as anti-Indian propaganda to lower their prestige in the U.S.A.

The impressions the Americans are forming as a result of such writings can be best illustrated reading the following paragraphs from *New Orleans*, an U.S.A. paper, printed on December 30, 1951, under the headline "Point Four in Miniature—A Country Agent at Work in India":

"And by adopting modern agricultural equipment and knowledge to local conditions and religious laws, he turned the barren valley of Etawah into a bountiful garden."

Another paragraph runs as follows:

"It will kill the plants before they have matured and that would be taking life which we are forbidden to do"—they explained—"when Holmes wanted to introduce use of the soil-enriching legumes."

As explained elsewhere in this article Etawah is not a barren valley, it is the most fertile and best irrigated land in the whole of India nor the American experts have succeeded in turning it into a 'bountiful

garden.' In fact, these experts have caused more harm to Indian farmers than good owing to their unfamiliarity with Indian soil and conditions of agriculture.

It is equally wrong to suggest that Indians never knew of green soil-enriching crops or religion stood in their way. They have been using Sanai, Indigo, etc., as such for decades and no religious ideas came in their way.

In fact, in everything I read about India by American writers or journalists, I find some such information which may very well be described as 'intentionally or deliberately done' and the reasons for it may be differently interpreted by different parties. Even their own correspondents in India have been reporting incorrect and damaging facts.

In an article entitled "Point Four Props Farmers in India" in the *Christian Science Monitor* by its special correspondent, Mr. Gordon Graham, appearing on 20.8.51, it appears:

"For example, sometime ago it was suggested to the Etawah farmers that they should try green manuring with Sanai (sunherp). But the farmers would not plough the green crop in, as this would

require, because, as Hindus, they considered it sinful to destroy anything living before maturity."

So many are the misrepresentations in the writings of these few persons, and numerous persons and papers in the U.S.A. have written about Etawah! We can well imagine the number and extent of such samples. And all this is about Etawah. There may be many more places like Etawah and the cumulative result is just shocking to our imagination.

Hereculean efforts on the one hand by the American government and such misrepresentations based on completely wrong facts, inventions and distortions on the other hand, are going together and I wonder if the result would be satisfactory to the liking either of the American people or their government or the Indian people, who now deserve better consideration, particularly after a lot of such misrepresentations indulged in by the then British rulers to prove India's incapacity for Swaraj before the Americans for decades. Instead of counteracting this, such things continue only to undermine the future pleasant relations of the peoples of the two great democracies of the world. There is still time to think and be careful.

—:—

THE CONCEPT OF JUSTICE IN OUR CONSTITUTION

By KUMARI SUSHILA RUDRA, M.A.

In our country for centuries, has the common man hankered and hungered for Justice. The one virtue which he admires most is "Insaf." The poets and bards of our ancient land have sung its praises, while legends tell us that the kings who have been revered and respected most were those who were imbued with a sense of justice. And now we find, according to the Preamble of the Constitution, that this much-sought-after virtue is almost within our grasp. For the Preamble of the Constitution states boldly:

"... to secure to all its citizens
Justice—Social, Economic and Political ..."

Social justice is secured in our Constitution according to Article 17. "Untouchability is abolished and its practice in any form is forbidden. The enforcement of any disability arising out of 'Untouchability' shall be an offence punishable in accordance with law." Thus we see one of the greatest ideals of the Father of the Nation is realised by this Article. By the removal of this social injustice nearly 50 million people are assured of their dignity as individuals.

Social justice is also attained by Article 23 as traffic in human beings and *begar* and other forms of forced labour are prohibited and punishable by law. Justice—social—is specially taken into account for the weaker people, in particular the Scheduled Castes and Scheduled Tribes. According to Article 46, the State shall promote with special care their educational and economic interests and shall protect them from social injustice and all forms of exploitation.

Economic justice has not been fully realised. For economic justice is not to be found in Part III of our Constitution, namely, the Fundamental Rights, which are enforceable in a court of law if violated in any way. Justice—economic—is embodied in Part IV of the Constitution in the chapter dealing with the Directive Principles of State Policy. The articles therein are mere directives and principles which are to be followed and to be put into practice by each State. But no law-suits can be filed against the Union or State Governments if they are entirely indifferent or negligent regarding these Directives.

According to Article 38, the State is to secure a social order for the promotion and welfare of the people. The Directive Principles lay down certain specific measures which are to be carried out in order to promote economic justice. There we find especially in Article 39 of the Constitution as follows: "The State shall, in particular, direct its policy towards securing—

- (a) That the citizens, men and women equally, have the right to an adequate means of livelihood;
- (b) that the ownership and control of the material resources of the community are so distributed as best to subserve the common good;
- (c) that the operation of the economic system does not result in the concentration of wealth and means of production to the common detriment;

(d) that there is equal pay for equal work for both men and women;

(e) that the health and strength of workers, men and women, and the tender age of children are not abused and that citizens are not forced by economic necessity to enter avocations unsuited to their age or strength."

The Constitution also secures economic justice in the case of unemployment, old age, sickness and disablement (Article 41). For women too special consideration is given and humane conditions of work secured and maternity relief. Economic justice is secured for children as well according to Article 24, and Article 39 (f) states that "childhood and youth are protected against exploitation and against moral and material abandonment."

Article 43 seems to be almost a Utopia in itself. It sets out to achieve through suitable legislation or economic organisation or in any other way "to all workers, agricultural, industrial or otherwise, work, a living wage, conditions of work ensuring a decent standard of life and full enjoyment of leisure and social and cultural opportunities and, in particular, the State shall endeavour to promote cottage industries on an individual or co-operative basis in rural areas."

Political justice is secured for the individual in the form of one of the most important Rights, Article 14: "The State shall not deny to any person equality before law or the equal protection of the laws within the territory of India." Thus every individual is justly treated as equal.

As regards employment in the State too, we find that justice is meted. Article 16 states according to Clause 1: "There shall be equality of opportunity for all citizens in matters relating to employment or appointment to any office under the State." This is indeed a great step forward since employment in government is no longer on a narrow communal basis as it was before independence, but is dependent on ability to be judged by a system of examination to be held by the Public Service Commission. Thus ability is the criterion for employment in the secular State.

According to the Directive Principle of State Policy, Article 44, "The State shall endeavour to secure for the citizens a uniform civil code throughout the territory of India." But true political justice can only be achieved

in our country when Article 50 of the Constitution is put into practice: "The State shall take steps to separate the judiciary from the executive in the public services of the State." For a certain amount of separation of powers is very essential for the success of a newly formed Democratic State like ours.

Social justice has been guaranteed by the State fully. But here we find the State striding and marching ahead, and a somewhat baffled and ignorant people slowly waking up to find, that overnight their traditions and customs and entire set of values have been changed by the State. But justice—social—must be preserved for the good of the nation. Thus it is for the individual to undergo a process of mental revolution and adjustment, while it is for the State to give every aid through a right system of education, to be able to make him realize the full implication and significance of the tremendous social change.

Economic justice is something which the individual cannot achieve by himself. The Directive Principles are like shining stars studded in the Constitution which the common man dare not even dream to touch. The gulf between the ideal and the reality is pathetic. It leaves the individual helpless and frustrated. It is here that the State must needs don the "Seven-League Boots" in order to meet the daily common needs of the individuals. It is in the matter of economic justice that the State should stride even farther ahead of the people than it has done in regard to social justice. For though social justice was the cry of the great reformers in our land in the nineteenth and till the first half of the twentieth century, yet within these few years since Independence they are looked upon as mere superficial reforms. Thus the cry of the hour in our country as in all other parts of the world is that of economic justice, and the State must realise this justice. But we must recall to mind the old dictum which tells us that State and Society are made up of individuals. Thus it should be indeed a matter of great enthusiasm and adventure for the State and Individual to tackle together this almost insurmountable Everest in Article 43.

Justice—political—has been guaranteed and a great deal has been achieved, but not enough, while there is a grave danger that these articles might tend to become mere dead letters, if selfish interest of individuals or party power-politics is allowed to get the upper hand.

—:—

COMMENT AND CRITICISM "Quit English?"

I have read with great interest the article under the above title by Prof. Kamal Krishna Ghosh appearing in the June, 1952 issue of *The Modern Review*. I quite agree with him that even in free India, the former position of English should be retained and it should be begun soon, after a child begins his vernacular. He has sounded a note of warning against growing deterioration among our

students particularly with regard to English. My experience from a long career as a teacher in Bihar is that though after Independence, the pass mark in English was reduced to 30 p.c. from 37½ p.c., the percentage of failure in English has shot up and the greater number of failure in the Matriculation Examination of the last few years was entirely due to English. If this is the fate

of the boys who had been studying English in school for eight years, what will happen to those going up for the Secondary School Examination (formerly, Matriculation) in 1954, who will have read it only for four years?

With whatever end in view, we had been so long learning and teaching English—being our rulers' language or for Government jobs—we did not fail to perceive that it had been and would remain of great benefit for us, because :

(1) English is one of the richest literary languages of the modern age.

(2) It is an international language, understood almost everywhere in the world—in the Eastern and Western Hemispheres as well as in the Northern and Southern Hemispheres, and hence is most useful in world trade and world politics.

(3) It gives a wider outlook than Classics or Vernacular, and in it have been translated the best books of the world.

(4) In order to keep in touch with modern currents of thoughts, students all over the world, should in addition to their vernacular, study the language of one modern progressive European nation. French or German can serve this purpose, but Indians have the best advantage to study English.

To-day independent countries are also doing this. Japan has made great progress through English education, Turkey has replaced Arabic by French. In Thailand (Siam), students have to learn both English and French, because it had been surrounded by British and French Indo-China. Multilingualism is a necessity for the day. But the common Indian student need not go beyond English for they have also to learn the Vernacular, the State Language and the Classical Language. As we cannot forget that we are Indians and hence must study the language or languages forming our cultural background, so we cannot afford to forget that we belong to the modern age and must not lag behind the modern progressive nations.

Now if our matriculates read English only for four years, from 11 to 15 years, what will they do with this meagre knowledge? They will not be able to read and understand a most simple book or a newspaper in English nor able to taste a bit of its literature nor talk with a foreigner. This would be a sheer waste of energy.

Let me say one word on the medium of instruction—a question Prof. Ghosh has evaded in his article. There will be no two opinions on the fact that in the school stage the vernacular should always be the medium. Many reformers are in favour of retaining the vernacular in the colleges too. But we already agreed to learn English as an international language. Why do we labour for it unless to get access to its rich storehouse?

Translation of any and every English book should not be allowed even if it is possible with the vast number of terms, for that is a discouragement to study the original works. It would not be proper to translate Darwin's *Origin of Species* into Hindi for our students' obtaining diploma in Biology. In the Osmania University where Urdu was the only medium, students could not follow the lectures of foreign visiting professors. Many of our students will seek higher education in foreign universities, hence education should not be too much vernacularised. Even English proves insufficient for some higher courses of the universities of England in which original French or German books have to be studied. Western thought loses much of its charm if translated into Indian languages and *vice versa*. For the same reason Sankhya, Jyotish, Ayurveda, etc., should be studied in original Sanskrit in the higher courses.

My views on the subject are quite singular. I say that neither Vernacular nor Classics nor English nor any language in particular should be the medium in the university stage. Whatever books serve best to teach the particular subject should be used, whether written in English, Vernacular or Sanskrit since the student is supposed to know all these languages. For them no particular "text-books" should be written nor any translated. The subject-matter is to be taught and not the language and the students should gather their knowledge from their professors' lecture-notes and books in any language approved by them. The individual professor's advantage to use a particular language out of the above three approved ones, is also to be looked into. If in any subject most of the books available be in English, the candidates may find it convenient to answer in English too. But it does not mean that they cannot answer in vernacular if they so like. In all non-language subjects, the candidate should previously fill in the form stating in what language he wants to answer the paper.

If we are to follow the ideal of Mahatma Gandhi, we cannot base our State on hatred, not even for the English people, far less for their language or literature. The Government of Bharat have not yet abolished English measures in space (yards, feet, inches) and weight (tons, pounds, ounces), nor have employed any clock-maker to construct clocks showing *danda*, *pala* and *vipala*, although they are not less scientific than the English system. We are still following the Christian Calendar, though Christians are a very small minority here. Perhaps every one wants to retain them for ever, for all-India matters. What harm is there in the English language, in the international numerals and the Roman Script which are at least easier to write than Devanagari?

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.

EDITOR, *The Modern Review*.

ENGLISH

SHRI K. M. MUNSHI DIAMOND JUBILEE VOLUME—Part I, *Bharatiya Vidya*, Volume IX, 1948: Published by *Bharatiya Vidya Bhavan, Bombay*, 1949. Pp. 377. Price Rs. 15.

In this first part (all received by us up to now) of the Festschrift presented to the well-known President of the *Bharatiya Vidya Bhavan* by his friends and admirers on the happy occasion of his completing his sixtieth year, the editors have selected, for publication in the alphabetical orders of the authors' names, thirty papers bearing on different branches of Indian history and culture. The papers are of unequal merit. We propose to take up first the best papers which may be arranged under the head 'Indian Literature.' In the branch of Vedic exegesis Dr. V. M. Apte offers a new explanation of the symbolism of the goddess Diti, while Dr. H. R. Karnik gives similarly a learned interpretation of the Brahmana legend of the Aptya-devatas. Mention may also be made of the paper of Dr. Enrico Gerardo Carpani listing with his running comments twenty-one texts from the *Chandogya* and *Brihadaranyaka* Upanishads which illustrate the psychology of dream-phenomena in Vedic philosophy. In the field of classical Sanskrit literature, Dr. S. K. De (*The Curtain in Ancient Indian Theatre*) makes the ingenious suggestion that the variant *yamanika* signifying 'a covering' or 'a curtain' was the original form which was afterwards lost and replaced by the two familiar forms *yavanika* and *javanika*, of which the former has often been wrongly taken to be a proof of Greek influence on the Sanskrit drama. In another paper Dr. R. G. Harshe presents the text of two interesting, but fragmentary manuscripts on dreams together with a list of their book-illustrations numbering 113 in all. The former is a Jaina work not later than the fourteenth or fifteenth century, while the latter belongs to the seventeenth century. In another interesting paper, Shri S. V. Iyer introduces us to a Sanskrit play of the rare *vithi* type written by a Kerala poet shortly before 1750 A.D. More controversial is the paper of Shri S. L. Katre in which the author rejecting the sixth or seventh century date given for Harisvamin (the renowned commentator of the *Satapatha Brahmana*) by previous scholars, assigns his work to c. 54 B.C. in the time of Vikramaditya, the so-called founder of the Vikrama Era. This interpretation, the author claims, gives another support to the historicity of Vikramaditya of the first century B.C., while it fits into "the grand Age of Vedic culture" under Pushyamiitra Sunga. In the branch of medieval literature Prof. H. C. Bhayani introduces us to a striking *apabhramsa* work of the class of *Samdesakavyas* belonging to the twelfth or the thirteenth century. This

is the *Samdesarasaka* of Abdala Rahamana of Multan (?), which, according to the author, is the first known Muslim contribution to the Indian literature and influenced the well-known work of Malik Muhammad Jayasi called *Padumavati*. Of more general interest is the paper of Dr. A. K. Coomaraswamy, in which the late lamented scholar gives a short list of parallel texts from Eastern and Western literatures under different heads. In these passages "identical doctrines have been enunciated as nearly as possible in the same terms and often indeed in the same idioms," thus suggesting their cognate origin. As regards other branches of Indian culture, social history is represented by a paper of Dr. B. C. Law on *Slavery as known to early Buddhists*, while science is represented by a contribution of Mm. P. V. Kane (*The Problem of the Introduction of Rasis in Indian Astronomy and Astrology*) and one of Dr. G. P. Majumdar (*The Genesis of the Science of Medicine in Ancient India*).

In contrast with the above the papers bearing on political history are devoid of any interest. Reference may also be made to a long and insipid paper on *Jainism in Gujarat* which is nothing but an undigested compilation of anecdotes, tales and authentic history with a distinctly chauvinistic bias and is unworthy of inclusion in the present volume.

U. N. GHOSHAL

IMAGES OF THE BUDDHA: By Luang Boribol Buriband. Translated by P. S. Sastri and A. B. Griswold. Published by the Chatra Press, 77 Rama V. Road, Bangkok, 1952. Twenty-five illustrations. Pp. 21. Price not stated.

This is an excellent little hand-book illustrated with 25 specimens of images, dealing very ably with the vexed question of the origin of the image of the Buddha. The author starts with the *chronicle* of the sandalwood image, attributed to Prasenajit, and very reasonably doubts if the tradition could have been current during the time of Asoka, though *prima facie* it is a legend coming into existence during the life-time of the Buddha. The author very frankly accepts the position that archaeologists agree that the first Buddha images were made shortly after the beginning of the Christian era, either in Gandhara or at Mathura and that the images of Mathura and of Gandhara began to influence each other, and "there is a merging of Greek plasticity with Indian ideals." Later schools adopt the same formula and gradually standardize them. With these preliminary discussions the author proceeds to examine the evolution of the various types of the Siamese schools: the Dvaravati style, the Srivijaya style, the Lopburi style, Early and Late Chiengsaen style, Sukhothaya style, the U-thong style and the Ayudhya style, demonstrated with appropriate illustrations. Altogether,

this little booklet comprises within a short compass a brilliant exposition of the evolution of the Buddha image which will be useful to scholars and students alike.

RENNELL'S MAPS: 1. Bahar—(Behar) North, 2. Bahar—South, 3. Conquered Provinces South of Bahar—containing Ramgur, Palamow and Chuta-Nagpur, 4. Bengal and Bahar—in Warren Hastings' time, 5. Bengal with the Bhootan, Morung and Assam Frontiers in 1779, 6. Delta of the Ganges with adjacent countries on the East: *Printed between June and December, 1779. Photogravure reprints in Six Folio Sheets by The Book Company Ltd., College Square, Calcutta 12. Price: the set Rs. 12-8.*

The Book Company has done well to reproduce in Folio-sheets by photo-litho process the original Maps by Rennell which have become very rare. The Maps are not only invaluable to research-workers and students of history but also as records for the delineation of boundaries.

K. N. C.

LECTURES ON THE RAMAYANA: By the Rt. Hon. V. S. Srinivasa Sastri. Published on behalf of the Madras Sanskrit Academy by S. Viswanathan. Price Rs. 10 (\$4, sh. 16).

Srinivasa Sastri was well-known as an astute politician and a great statesman. But that he was a Sanskritist and an enthusiastic admirer of Indian culture and especially of the Ramayana is not known as much and as widely. The volume under review—unfortunately a posthumous one—is a testimony to this latter aspect of the character of Sastri. The volume consists of thirty lectures delivered under the auspices of the Madras Sanskrit Academy. We have here critical and analytic studies of the different characters found in the Ramayana. Though full of reverence for Rama, the learned lecturer looked on the hero as an ideal human being occasionally manifesting the frailties that are inherent in a man. He does not, like the old commentators, seek to explain away these frailties with far-fetched interpretations and he has clearly stated the reasons of his disagreement with the commentators. The lectures which are of absorbing interest contain copious quotations from the text of the Ramayana and numerous references to the commentaries with discussions thereon. It appears that the lectures were delivered extempore and the Madras Sanskrit Academy did a very good thing in making special arrangements for taking shorthand reports of the lectures, publishing them in book-form and thereby making them accessible to the reading public who will be highly benefited to go through them. One who reads the book will come to like the Ramayana and appreciate its value and importance. Books of this type and not merely dry scholarly studies are necessary for attracting the sympathetic attention of the people to Sanskrit literature as well as to the greatness of Indian culture.

CHINTAHARAN CHAKRAVARTI

BUBBLES: By Satis Chandra Sinha. With two articles of Sir Jadunath Sarkar. S. C. Sarkar and Sons Ltd., 1-C, College Square, Calcutta 12. Price Rs. 5.

The book contains forty short articles or essays. The subjects dealt with in these essays range between social, legal, political and cultural. The author's views on these matters have been couched in easy and forceful but at times in a very caustic style. These essays have been written between June 30, 1948 and August

15, 1952 and necessarily cover the various problems that had raised their head during this period. India has attained independence. But the country has been divided. This has given rise to many unforeseen problems. Mass-scale transfer of population has been a problem very difficult to tackle. Other problems have also cropped up. One, most vital and important from our national standpoint, was the fixing of Hindi as *rashtra bhasha* or State language, which would take effect in the early sixties. Problems confronting the Hindu social frame also demand solution. Women's position in modern Hindu society is yet to be determined. Such varied subjects as 'private endowments,' 'Debottar property' and 'censorship' also deserve to be thrashed out. The author has written on these as well as on many other topics. Some of them may seem trivial to the man in the street, but each one of them has some particular importance in our body politic. It appears from the book that the author is especially interested in matters cultural and those concerning the social position of women in the Hindu society. He has given the story of the Imperial Library, now called National Library, in a nutshell. His views on the Hindu code and other Bills and Acts affecting Hindu women, should be carefully considered by our reformers. The article on "Swayambar" is full of humour, and serves as a pointer to the problem of the marriage of modern educated Hindu girls. The two very thoughtful articles on "Compulsory Hindi" by Dr. Jadunath Sarkar, given in the Appendix, weigh the gain and loss that we have got to incur in our onward march to progress. It is regrettable that the balance is heavily on the side of loss. Our leaders should ponder hundred times before the use of Hindi is made compulsory in the affairs of the State, and it is made the medium in the higher studies in our Universities. The book deserves repeated perusal.

JOGESH C. BAGAL

THE LIFE OF JOSEPH STALIN: By Louis Fischer. Published by the Associated Advertisers and Printers, Ltd., Bombay. Price Rs. 2-4.

The volume under review is an apt commentary on the universally held belief that truth is the first casualty of war—cold and otherwise. In a biography of Joseph Stalin running to more than 300 pages the author has not a single good word about the hero of his work. He has painted Stalin in the darkest hue. Yet it is a fact that the transformation of Czarist Russia from medieval backwardness to her present position during the comparatively brief span of a little over 25 years is due in the main to Joseph Vissarionovitch Stalin. The man who began with many odds against him, not the least damaging being Lenin's verdict that the former "is too rude" and his (Lenin's) proposal that he (Stalin) be removed from the General Secretaryship of the Communist Party, succeeded in capturing power after Lenin's death in 1924 and in retaining it for more than a quarter of a century, proves conclusively that he was quite a few cuts above the ordinary. Mr. Fischer would, however, have his readers believe that the success was due to intrigues, unscrupulousness, ruthlessness, treachery and the like. "Stalin's four simple rules of success," says the biographer, were—"any method is justified if it helps achieve the desired end; men must be discarded when no longer useful; alliances are made to be broken; ideas have no existence unless chained to the chariot of power" (p. 18). Few, if any, impartial observers, will agree with him.

Mr. Fischer has, however, done a very great service to the intellectual not tied to any 'ism' by revealing many facts about Soviet Russia which are blocked out or glossed over by the champions and spokesmen of the Soviet system. His analysis of Soviet foreign policy in the thirties (Ch. XIX) is interesting, pleasant and substantially correct.

Mr. Fischer points out and rightly at that, "From the Iberian peninsula, around the Mediterranean littoral, through the entire Moslem world except Turkey . . . and Israel, on to Southeast Asia, the defenses against Communism and other forms of totalitarianism are weak. It is in this mammoth region, inhabited by more than a billion persons living in the 19th, 18th, 17th and 16th centuries, that the rivalry between Russia and the West will rage with special fury for years" (p. 287). He proceeds, "Unhappiness fills the feudal regions from Spain to Indo-China and, in addition, much of Africa and Latin America. Everywhere a thin wealthy upper caste shamelessly flaunts its luxury under the eyes of the hungry, diseased peasants and shepherds who are deprived of the education, organisation, and political power to improve their lot. . . . Masters come and go, foreigners are ousted, national independence is achieved, but bread, rice, milk, medicines, water, shoes, shelter, schools remain in short supply. Loans from abroad reach the pockets of the haves; the have-nots have only their envy and hate" (pp. 287-88). Mr. Fischer points out that the only way to save this vast area for democracy is revolutionisation from below and guiding it into the 20th century. "Stalin's fate," he concludes, "is in the hands of the non-Stalinists. They can write history's verdict on him. They will determine whether his life was a success or failure" (p. 307). We agree and know what that verdict will be.

SUDHANSU BIMAL MOOKHERJEE

SHOULD FATHERHOOD BEGIN AT FORTY?: By E. Orson Brower. Published by the author, 1952. U. S. A.

It should not begin earlier that seems to be the opinion of the author. Citing the cases of many famous men the author has shown that their parents were all above forty when they were born. He subscribes to the view of M. L. Steckel that "the younger the parents the less favourable is the prognosis for the intelligence of the offspring" (p. 6). In the techniques of the measurement of intelligence he has suggested a new factor 't' by which he means "ability to find the important meanings in the commonplace" (p. 23). He also attempts to find biological justification in support of his theory that the later the parenthood begins the better it is in all respects for the offspring.

The book is written in a highly emotional tone and controversial spirit throughout. It seems as if the author is standing with a club in his hand ready to smash down anyone who dares differ from him. In spite of his many quotations and references to authorities the reviewer is of opinion that he has not been able to establish his thesis and the question that he has posed (the title of the book) still remains an open one. Though the facts presented in the book are of considerable interest to all, the style adopted by the author is neither pleasant nor commendable. The book, however, is a thought-provoking one and would have aroused greater interest amongst professional psychologists and biologists had the author chosen to present his views in a more sober and dispassionate way.

S. C. MITRA

BENGALI

MANO-BALJANIK: By Satyen Sinha. Published by Das Gupta and Co. Ltd., 54/3 College Street, Calcutta 12. Price Re. 1-8.

A modern drama deftly depicting certain psychological complexities. The author has been able to arouse and sustain the curiosity of the reader from the start to the finish. For a new writer—this is his first published work—it is no mean achievement.

RAUDRA-JYOTSNA: By Sushil Kumar Gupta. Published by Writers' Corner, 104/14 Gopal Lal Thakur Road, Calcutta 36. Price Re. 1.

A collection of thirty-two poems, most of which were published in periodicals. The poet is neither an escapist nor a propagandist. Conscious of the incongruities of the existing social order, he dreams of a brighter day and resolves to march ahead towards it with faith and conviction. His emotion is genuine and hence comes this directness of expression. Nowhere does he struggle to pose his 'modernism' with a queer jumble of words and halting rhythm.

D. N. MOOKERJEE

HINDI

MARUKUNJA: By Mathurdas Tricumji. Published by Navajivana Prakashan Mandir, Ahmedabad. Pp. 154. Price Re. 1-4.

The author suffered for a long time from the fell disease of tuberculosis. He has, therefore, turned wisely his experience and knowledge, gained additionally from books as well on the subject, into a practical handbook on how to prevent the incidence of the said wasting ailment, and if one has succumbed unfortunately to it, then how to co-operate with Nature and the doctor, together with those best of doctors, Doctor Diet and Doctor Quiet, in overcoming it.

G. M.

MARATHI

KAMALAN: By Arvind Gokhale. Published by Popular Book Depot, Bombay 7. Pp. 138. Price Rs. 3.

Shri Arvind Gokhale has made his mark in Marathi fiction and this book maintains his high reputation. Here the reader will find a well-got-up collection of twelve short stories, most of which have already appeared in popular magazines. Against the background of the social life of Maharashtra middle class, the writer depicts uncommon moods of common persons. It is through revealing the hidden links of emotional urges, rather than weaving novelty of situation that he succeeds in holding the interest of his readers. Unlike some, who overdo this psychological technique, he maintains a sound balance between plot and motive. This as well as keen observation, rich imagination and warm sympathies appear to be the secret of his craftsmanship. The book is sure to be hailed as a rich addition to Marathi short stories.

P. J. JAGJEDAR

GUJARATI

RASHTRA BHASHANO SAWAL: By Jawaharlal Nehru. Translated into Gujarati by Nagindas Parekh and published by the Navjivan Prakashan Mandir, Ahmedabad, 1949. Paper cover. Pp. 43. Price seven annas.

Panditji's views on our having a National Language are well-known. He has viewed the question fairly and impartially as well as practically and comprehensively. His thoughts are reproduced here faithfully.

K. M. J.

JIVATA TEHEVARO: By Dattatreya Balakrishna Kalelkar. Printed by the Navjivan Prakashan Mandir, Ahmedabad. 1949. Paper cover. Pp. 30. Price Rs. 2.

This delightful and instructive book has undergone a fourth edition. "Living Holidays" were noticed in its earlier editions. Kaka Kalelkar has added fresh material to this—the latest edition—and added new Holidays like Rashtriya Saptah and Azadi Din. Jayantis of several saints are also set out, along with their significance and the precepts they have left behind them.

(1) **AMINA** (4th Edition), (2) **ZANDEVAN-DAN:** By "Shayda" (Harji Louji Damni). Printed at the R. H. Printing Press, Bombay-8, and Be Ghadi Printing Press, Bombay-1. 1950. Thick card-board. Pp. 455: 412. Price Rs. 6 and Rs. 5 respectively.

Mr. Shayda has a long-established reputation for writing popular stories on various subjects. Amina, which has passed through four editions between 1923 and 1950, is a story of social life amongst Muslims which approximates, if not fully resembles, Hindu social life, paints the picture of a new bride going to her husband's house, sandwiched in between her sister-in-law and mother-in-law and acquitting herself creditably in winning them over and in doing so complying with her mother's parting advice—not to spoil her good name—advice which she had made to sink in her, while suckling her at her breast. There are various incidents such as of singers and others portrayed also. The second book, *Salutation to the Flag*, is written as an appeal to the Indian Nation, not to open only their temples, built of brick and mortar, to the Harijans but to open the temples of their Heart, and give them free access and equality in all pursuits of life. It emphasises the creed of Mahatma Gandhi in no uncertain terms. It is found to prove as popular as his other stories.

(1) **RAJAJI**, (2) **RAJENDRAPRASAD:** By Ambelal N. Joshi, B.A., LL.B., Advocate, High Court, Bombay. Published by the Brihad Gujarat Prakashan Mandir, Bombay-7. 1949. Thick card-board. Illustrated jacket with blocks. Pp. 239, 274. Price Rs. 4-8 each.

Shriji Ambelal Joshi is an enthusiastic student and writer in addition to being an Advocate. He has planned a Greater Gujarat series of Books—Granthavali—in which he desires to publish the Biographies of all eminent men and women of India. Pioneer work he has already done, and the two volumes under notice testify to the fact that he has successfully passed that pioneer stage and entered on that of a practised writer. Rajaji and Dr. Rajendraprasad needed original biographies in Gujarati and Mr. Joshi has supplied that need. Almost all incidents in their lives have been set out here, with a sense of proportion and a terseness which are exemplary. He has not omitted to give due prominence to Rajen Babu's pleading for Hindi and has devoted a whole Appendix to it. We welcome his work and are looking forward to other works on similar lines.

MAHAN BANO: By Chandra Shankar Pranshankar Shukla. Published by Vora and Co., Bombay-2. 1948. Thick card-board. Illustrated jacket. Pp. 140. Price Rs. 2.

The title of the book means "Be Great," and in support of that advice Mr. Shukla has given, in simple Gujarati, outlines of the lives of twenty-five men and women, European and American, basing

them on D. Carnegie's three volumes on the subject. The object is to put before a rising generation a picture of those who have acquired a name for themselves so that it may furnish guidance and inspiration to all who care to profit by it.

GURJAR MAHILAO, Parts I and II: By A. R. Bhimani. Printed at the Unity Printing Press, Bombay 1. 1949, 1950. Illustrated jacket. Cloth-bound. Pp. 200 each. Price Rs. 20 each.

Women of Gujarat, (45+48=93 in all) young and old, of the old and the new generation figure in this work, with their photographs, an attractive feature of it. The good that they have been able to do, in their own families and in public, Hindu, Muslim, Parsi, is deservedly set-out in the sketches of their lives below their photographs. The number 93 is too small and Shri Bhimani is planning further parts of the compilation. We wish success to him and his enterprise.

1. **MAHABHARAT:** By K. K. Shastri.
2. **NAMAVALI OF PERSIAN MANUSCRIPTS IN THE LIBRARY OF THE FORBES GUJARATI SABHA, BOMBAY:** By Janab Mohammed Umar Kokil.

Both published by the Forbes Gujarati Sabha, Bombay 4. 1950. Paper cover. Pp. 86, 90. Prices Re. 1-8, Rs. 2.

The Mahabharat has been rendered into Gujarati verse by more than one poet of old Gujarat. In the first of the books under notice, the verses of poets Nakar and Vishnudas, comprising four *parvas*, Shalya, Gada, Sauptik, and Stri are edited by Mr. Shastri, a noted student of old Gujarati. The Sabha possesses a valuable collection of old Persian MSS. Mr. Kokil, a trusted and experienced hand at this sort of work, has catalogued them with short, informative notes. It is sure to prove of great use to research students.

GANDHI DARSHAN: By Bhanubhai Pandya. Published by Fulwadi Prakashan, Khambhaba. 1948. Paper cover. Pp. 7. Price four annas.

A Gandhi drama in verse played by the school children of St. Xavier's High School, Bombay. It contains prophetic verses put into the mouth of Gandhiji, when they were written (26-27 January), viz., "Take me as sacrifice" and within three days Mahatmaji was murdered. The *Darshan* offered is real and picturesque.

K. M. J.

A Monumental Work INDIAN ARCHITECTURE

Vol. I: Hindu and Buddhist Period
Vol. II: Islamic Period

By Percy Brown (former Principal, Government School of Arts, Calcutta). Both volumes profusely illustrated. Vol. I, Rs. 22: Vol. II, Rs. 19-12.

This masterly review extends to every development of architecture in India from the earliest times and the sources from which they were derived. The volumes are beautifully illustrated by numerous photographs and specially prepared drawings and diagrams of the most important examples of Indian Architecture.

INDIAN PERIODICALS

Trading Links of Old World Empires

Long before our days of swift transit and telecommunication the caravans were threading their slow and sometimes dangerous way across the deserts; and the mariners of different regions were braving the terrors of the seas. Edmund Roberts writes in *The Aryan Path*:

The history of civilization might be written around the story of trade routes between Europe and the East. During the course of centuries they have seen the camel and the packhorse followed by the age of sails; itself only to be superseded by the era of the steamship, and today the aeroplane has shortened the time of conveyance to days, as compared with the months during which goods were in transit in mediaeval days. Giant planes now cross in a few hours the very desert painfully trodden by the camel for centuries, such crossings in former days often lengthening into months.

The importance of these ancient trade routes in the story of human endeavour cannot be exaggerated, and historians and archaeologists are paying increasing attention to them.

Shortly before the last war, British archaeologists working in Lower Burma were concentrating on a study of one of the oldest of such routes, that between India and the Far East.

The route crossed peninsular Siam at the only latitude which provided sheltered anchorages on both coasts, which were at the same time connected by what were formerly deep rivers running from the narrow watershed, affording a nearly unbroken waterway across the peninsula. The ancient route begins at Takoapa (or Taikala), believed to be the site of the old mart of Takola, mentioned in the second century by Claudius Ptolemy, the famous Alexandrian geographer. The supposed site of the ancient port is an open sandy space, locally known as the "Plain of Monuments," on an island near the mouth of the Takoapa River. Several mounds were excavated, and the foundations of an extensive early Indian temple have been brought to light. Pottery and beads have also been found, proofs of habitation at some period or other.

After completing excavations in the neighbourhood of Takoapa, the expedition crossed to the east coast, following the old trade route leading to the Bay of Bandon. When this route was in use the crossing was comparatively easy, but the 20th century explorers found the task slow and difficult because of the low state of the rivers, which have silted up in the course of centuries. There were many rapids and shallows, all of which had to be negotiated with heavily laden boats. The villages along the route were reported still deeply impressed with Indian folklore and the tradition of an ancient Indian migration eastward.

South of the Bay of Bandon lies a remote city called Vieng Sva. It is enveloped by a dense thorn jungle and the archaeologists had to hack their way through this before they could reach a moated enclosure with a ruined

central shrine. There a beautiful statue of Buddha was brought to light, and it seems that in the remote past Vieng Sva was populated from India. The next city en route was Chaiya, which thrived about a thousand years ago and where thousands of bowls, made of porcelain, have been unearthed.

Two other trade routes of lesser importance, subsidiary to this great highway from the Far East to India, have also been investigated.

Near the western terminus of one of these, ancient stone baths carved out of the living rock, and still overflowing with hot salt water from underlying springs, were found deep in the jungle. The existence of this thermal establishment would appear to indicate the former existence of a highly developed civilization in the neighbourhood.

The few facts mentioned above show what riches remain to be revealed to us of the history and development of the ancient trade routes of the world. Up to the present, only the surface of the ground has been scratched, so to speak. There is certainly no more fascinating study than that of the growth of these ancient trade routes, along which flowed riches of gold, silver, precious stones, linen, silks, incense and spices. Trade was one of the earliest growths of civilization, and the lines of intercommunication in Europe between the Baltic and the Mediterranean, which were in existence as long ago as the Stone Age, are clearly visible.

The trade routes of the ancient world frequently afforded to explorers the only practicable routes along which to travel. This was so in the case of Marco Polo, who traversed those of Asia. During recent years explorers have been paying considerable attention to these old highways, and among those who have traced certain of them are Dr. Sven Hedin, the eminent Swedish explorer; Sir Aurel Stein; and M. Haardt.

Actually how far back in the mists of antiquity these trade routes began cannot be definitely discovered. Sir Halford Mackinder, who made a study of their evolution, suggested that some of them began as "raid routes," and in several cases the evidence seems to bear out this theory. The Norse pirates of Northern Europe, for example, sailed out every spring in search of spoil, and came back in the autumn laden with the fruits of their forays. In Africa, again, the routes followed by early European explorers were those originally marked out by the Arab slave traders on their nefarious business. Testimony given by such men as Livingstone relates to the terrible evidences of this trade that were found strewn the routes.

Long before the Christian era primitive commercial highways were in existence.

The Stone Age routes of Europe were touched upon in a previous paragraph. They came into being because the amber of the Baltic was in great demand. This led to the establishment of two well-trodden routes from that sea to the Mediterranean. Sir Flinders Petrie has proved that, further south, Gaza in Southern Palestine, mentioned in many places in the Bible, was a great mart

in ancient times, trading routes leading to it from the north and the south.

Early trade of this type was not confined to a small area, and it is astonishing to learn how widely scattered the products of the Old World countries became, undoubtedly by means of repeated exchanges. As a proof of this, what is believed to have been Irish gold has been found on the site of Troy, which was flourishing a thousand years B.C. In those days Ireland was one of the most important sources of gold in the world.

The two most powerful of the Old World empires to establish trading routes early in the history of civilization were Egypt and Babylonia.

In their cases it is possible that raids and forays marked the commencement of the interchange of goods. The fact that each had merchandise of value to the other may have been an accidental discovery resulting from the spoils of war but as time went on, it seems, the people discovered that peaceful trading was more profitable than constant fighting. Palestine lay between the two, and a great amount of merchandise passed through it, and whoever controlled that country had command of the routes leading to the east and the north, and then west to Europe. Thus for centuries there was extreme rivalry over the possession of it, which explains why the Israelites were always struggling for their freedom.

The earliest trade routes, therefore, were established, as it were, as a result of accidental discovery of the value of goods. Gradually, with the passage of time, these routes were extended further east, north and west, until both Europe and the Far East were contributing their quotas of wealth. Men became more venturesome, and the Phoenicians established the first great sea routes in the history of the world, sailing, we believe, as far west

as Britain. Overland another route traversed Asia Minor, East was brought to India, partly by the ancient route and linked up Europe. Pointing towards the East yet another route led to Persia, and the wealth of the Far East was brought to India, partly by the ancient route the British archaeologists have been exploring and then up the Persian Gulf and overland westwards.

The rise of the Greek Empire, which subdued Persia, led to changes and further developments in the routes, although their main directions were unaltered.

It was along the ancient trade routes between East and West that the riches of the world continued to flow in increasing volume. One of the routes led up the Red Sea, which was dotted with important commercial stations, and overland to Alexandria; and an alternative route from the Indian ports led to the head of the Persian Gulf, as mentioned above, from whence the goods were taken overland by desert caravan. It is believed that nearly 2,000 years ago the Greeks were aware of the sea route to China via India, for their venturesome pilots thought nothing of the crossing from the Red Sea to India, accomplishing it regularly.

These two main sea routes were supplemented by the great overland route through Asia and China, which it is believed established contact with Western civilization early in the Christian era. In times of peace this route was far more convenient and quicker for the goods of Northern India and China than the ocean routes. The cost of travelling by land was greater, but the expense was more than counterbalanced by the high value of the goods carried, which were generally light and of small bulk.

PRABUDDHA BHARATA

OR AWAKENED INDIA

(Started by SWAMI VIVEKANANDA in 1896)

Now in its 58th Year

The premier English monthly, conducted by the Monks of the Ramakrishna Mission, devoted to universal religion and philosophy, culture, education, and art and other topics of national and international interest. It keeps its readers in intimate touch with the cultural side of Indian national life, both ancient and modern.

The journal is popular and is widely circulated all over the world and is esteemed highly as the following opinions will show:

RABINDRANATH TAGORE: "Admire its writings as contributions to pure Indian culture."

DR. S. RADHAKRISHNAN: I have been a regular reader of *Prabuddha Bharata* and can say that its sanity in dealing with religious doctrine and discipline has been its most impressive characteristic."

COUNT HERMANN KEYSERLING: I think *Prabuddha Bharata* is one of the most interesting and important magazines that one can find today in any country."

SUBSCRIBERS ARE ENROLLED FROM JANUARY OR JULY

Annual Subscription: India, Burma and Ceylon, Rs. 5; Foreign 14 sh.; U.S.A. \$ 4.00

ADVAITA ASHRAMA, 4, Wellington Lane, CALCUTTA 13

Three notable routes stretched westwards from China overland, and they converged on the important markets of Samarkand and Bokhara.

These towns were great junctions, for there the caravans from China, traversing the silk route, met those coming from India; and there, too, the termini of the routes from the West were met. These ancient trade routes linking East and West maintained their supreme importance until the 15th century, when the discovery of the New World and the Cape route to India and the East completely altered the course of world trade and for a period the sea became predominant.

The Cape Route to the East played an increasingly important part in the commerce of Europe, and for practically three centuries it was unassailed. Not until the cutting of the Suez Canal was transport once more diverted through the Mediterranean. With the discovery and settlement of the New World came the establishment of what was destined to become the busiest world sea route, that to North America, and a little later that to South America was established. Then, towards the end of the 18th century came the settlement of Australia; and this was followed in the last century by the Australasian route. Today, strangely enough, along the routes linking East and West, traffic is being diverted back once more overland, via the air, and at the present time aeroplanes are regularly travelling over the track of the ancient trade route between Egypt and Babylonia, one of the very earliest to be established.

A First Glimpse of South Africa

Henry P. Van Dusen, President of Union Theological Seminary, New York, writes in *The National Christian Council Review*:

On this rapid round-the-world flight, I did not intend to visit South Africa. Indeed, if the whole truth be told, I did not very much want to visit South Africa. And for at least two reasons. On the one hand, while recognizing that it is never possible really to understand a situation or people without personal contact, I felt that, through *Cry, The Beloved Country* and countless first-hand accounts, one had a reasonably clear and reliable picture of South Africa which observation could only confirm. On the other hand, what could a visit to South Africa possibly lead to? What can any of us do about it?

THE PRESENT STATE OF THE NATIVE AFRICANS

I have spent many hours visiting residence-areas of every type inhabited by 'non-Europeans'—the mining company compounds into which native labourers recruited from up-country virtually on an indenture basis are herded for nine-month terms and then shipped back home; the unnumbered communities of one-family homes, many of them quite new, some sponsored by government, others privately owned and operated, which seem to ring Johannesburg; some of the worst of the 'shanty towns' pictured in Alan Paton's book and film; the independent towns owned and operated wholly by Africans outside the municipal limits.

In any ideal community, the 'company compounds' and the system of labour-employment which creates them should not exist. Their worst feature is not the living conditions provided but the uprooting of young men from their communal existence in the rural 'reserves' and their transplantation into the demoralizations and dissipations of a great metropolis. Even this is not without its parallels in the life of migrant labour in the United States. The most hopeful feature of this thoroughly bad system is not the provisions for health, recreation and education by some of the more enlightened mining companies, but the fact that here, as elsewhere throughout Africa, increasing family migration is replacing individual indenture and that the increasing provision of family dwellings is making this possible. In Northern Rhodesia, I was told that close to fifty per cent of the migration from native communities to industrial centres is now by families.

Some of the communities of one-family homes for native Africans are among the most attractive 'garden villages' which I have seen anywhere in the world—well-built two or three-room dwellings with plenty of open space between and acres of open ground about, many of them with well-cultivated flower and truck gardens, adequately supplied with school and recreation facilities. By comparison, the sweltering tenements of our large cities are festering incubators of physical and moral disease. Even the 'shanty towns' struck me as far less unhealthy and undesirable living places than the tumble-down Negro shacks on the outskirts of almost any city in our own deep South.

By all odds, the most disturbing type of residence situation is the independent communities outside the metropolitan boundaries which are entirely owned, operated, governed and policed by the Africans themselves. Not primarily because of crowded and unsanitary living conditions, but because of the absence of minimal structures of law and order. These must be the principal breeding grounds of lawlessness and immorality.

CONSULT YOUR DOCTOR ABOUT IT

UNION DRUG

CALCUTTA

Scattered through the native residence areas are schools, playgrounds, and community centres, very largely church-sponsored, which, while far less plentiful and well-equipped than the ideal are less inadequate than corresponding facilities in many American cities. Even this present government with its futile cry of *apartheid* and vicious doctrine of race superiority is doing vastly more for its native population by way of health, educational and recreational facilities than I would have supposed; vastly more, be it confessed, than all too many American communities with congested Negro districts.

THE PRESENT POLITICAL SITUATION

In the States, we hear almost altogether of Dr. Malan and his Nationalist advocates of *apartheid*. Their grip upon South Africa today is far less secure than often supposed; their dominance over South Africa tomorrow is almost certainly doomed.

No one will venture a confident prediction of the outcome of the forthcoming general election, scheduled for April. Many believe the Nationalists will be crowded out by the Union Party (moderates) by a small margin. One of the leaders of the latter was quoted to me as saying he hoped his party would *not* come to power; their margin of control might be too slim to permit effective reversal of present policies.

The severest and most unqualified indictments of the Nationalists and *apartheid* are not being framed in Europe or America but in South Africa. Johannesburg is a centre of British rather than Afrikaaners influence. I have been reading every word of its two excellent daily papers. Their condemnation of Malan and all his works make Pittsburg's hatred of Truman and the New-Fair Deal seem, by comparison, mild approbation.

In any event, two facts about the future appear beyond challenge. First, the extremists *within* the Nationalist Party are gaining control of it. Whether they win or lose the next election, Malan will shortly retire and be replaced by a far more violent and irrational leader. Therefore, a Nationalist victory portends worse days for South Africa and the world in the immediate future. But, second, in the long run and probably not too long, the Nationalist extremism is doomed. Not only is the determined opposition of more moderate counsels and policies strong and steadily gaining strength. Extreme Nationalism is pitting itself against inexorable forces which in the very nature of the situation can be temporarily retarded but which cannot ultimately be halted. These forces are economic as well as political and humanitarian. Economic power lies largely with the non-Afrikaan elements of the population, indissolubly linked by tradition and by self-interest with foreign capital and overseas trade. Through these channels, the judgment and conscience of the world may make its influence most effectively felt within South Africa. The extremists, in the familiar Dutch figure, are desperate men, sticking their fingers into the ever more numerous and ever enlarging holes in the dyke. Many believe that, at least subconsciously, they sense this inevitability of history. The 'wave of the future' bears the cause not of Nationalism but of moderation.

Indeed, in the longer view, the most ominous current development on the African continent may be, not the temporary triumph of reaction in South Africa, but the pending Federation in Central Africa, which may impose on Northern Rhodesia and Tanganyika the scheme of white supremacy dominant in Southern Rhodesia, which is itself a projection of South African attitudes and policies northward.

Even the Afrikaaners' leadership is by no means without its elements of light and vision. Certainly the most exciting and possibly the most promising conference I have had was with the Commission on the Socio-Economic Development of the Native Areas within the Union of South Africa. The Commission was appointed by the present Government. Its nine members are all, or almost all, Afrikaaners. But they are scholars of competence and wide knowledge, several of whom have studied at first hand the race problem in the United States and elsewhere. They are engaged in a three-year inquiry, and expect to present their findings and recommendations by the end of 1953. Their assignment is to develop a comprehensive, long-range, and inclusive policy for the 'reserved areas,' the vast and potentially rich tracts of land mostly along the east coast which are reserved exclusively for native residence and use where five-eighths of the native Africans still live.

I have seldom met a more competent or enlightened group of highly trained and informed social scientists. They have taken as the base-line, determinative of all their recommendations, 'the human factor,' that is, the welfare of the peoples concerned. And their guiding principle is that all proposals must hold in view and be devised to further the total advance of the population, not merely economic progress but economic, educational, social, cultural and spiritual factors in their organic unity (perhaps an echo of General Smuts' 'Holism'?). The fact that the focus of their attention is upon the 'native areas' and presupposes the continuing residence of a majority of the Africans within these 'reserved' territories opens their proposals to the suspicion of being 'enlightened apartheidism.' This they fully recognize and emphatically disavow. Their workrooms are crowded with maps, charts and data on every aspect of the African people, their potentialities and their problems. For example, they have detailed evidence of the well-nigh limitless economic potential of the 'reserved areas.' And recommendations they will sponsor supply great and soundly conceived plans for the progressive transformation of these areas. We know only too well the long step between formulation by experts and implementation by politicians. Nevertheless, this Commission is a heartening evidence that some Afrikaaners are seeking to conceive a worthy future for the Africans, and it may hold promise that, once the curse of white superiority dogma is surrendered, the best elements of Dutch and British ancestry might join hands in constructive measures. In any event, the forthcoming report of the Commission is worth watching for.

The Test of Democracy

Asian Opinion writes editorially :

The test of democracy lies in the quality of the citizens it produces. There can never be a strong government over a weak people. Therefore, the Parliament and the subsidiary legislative bodies will have to take into account the day-to-day difficulties of the people which create greater friction than decisions which concern only a section of some class. Thus the supply of good quality of wheat and rice is more important than the establishment of a car-manufacturing industry. The courtesy of a constable is more important than the well ordered and methodic speech of a minister. The words of an inspector from the enforcement branch mean more to the people than a debate in Parliament. For one law that the Parliament passes for the people, there should be ten laws to guide the officers who are to enforce it. This can be the only way to preserve the freedom of the people. Once it is said an old woman came to Delhi and complained that her property had been looted by some officers of the State in an outlying province of the empire. The emperor replied that that was a far-off place and he could not manage the affairs so well as he could in Delhi. "Then my lord" the woman replied, "you should relinquish your hold on that province and permit it to be transferred to some other state." The emperor thought over her remarks and sent a large body of troops to restore order in that province.

The conditions as they are today show that minor irritations are taking the form of *dark and arid mountains*. Nothing can grow on them and the soil is fast ceasing to be fertile for further progress. The ministers are also responsible for the prevalence of these conditions. They have been mentally receding from the society as it exists in the villages and cities and are living in the air-castles of their own. Casual visits and inspections mean nothing to the people. They should walk through the streets like ordinary citizens making their own sundry purchases, mixing with the people, exchanging views with them. It is these small gestures that work for greater popularity. They should personally purchase their requirements from Chandni Chowk, Kalva Debi and Harrison Road. Grandiose schemes mean little to the people till they feel their effects after a generation or so.

Mahatma Ji delivering a speech in Mayavaram in 1915 said :

"I am in a position to say that I am to be at war with my leaders. Whatever they do or whatever they say does not somehow or other appeal to me. The major part of whatever they say does not seem to be appealing to me."

In another speech he said :

"I do not want to be dragged in the carriage. There is a meaning in that. Let us not spoil our public men by dragging them. A charge is brought against us that we as a nation are too demonstrative and lack business-

like methods. We plead guilty to the charge. I give you a message: Establish Ram Rajya in Mysore and have your minister a Vashishta who will command obedience."

And then Mahatma Ji said in Bangalore, May 1951: "God is with those whose garments are dusty and tattered. The dream of every Indian who loves his country should be not to glorify in language but to spiritualize the political life of the country and the political institutions of the country. I think the *political life must be an echo of the private life* and there cannot be any divorce between the two."

These are some of the important words of our Master. The laws must not divide the members of the Parliament and the people. Mahatma Ji and now Vinoba Ji have shown that greater changes can be wrought by mass contact than through laws. There is no compulsion and friction in direct contact. *There is the essence of democracy in the direct ministerial approach to the people, common citizens who love those who remain by their side.* The impression of Parliament that laws will bring about the necessary changes must go root and branch the sooner the better. The maxim of Mahatma Ji that the best government is that which governs least is all important and must be adhered to.

Atharva Veda (7.12) ushers the following prayer, "May the Samiti and the Sabha, the two daughters of Prajapati, concurrently aid me. May he whom I meet co-operate with me, May I O Ye Fathers, speak agreeably to those assembled." The Vadas described Samiti and Sabha as the two daughters of Prajapati, eternal councils, and gave them the name of Narishta 'mirth' or "most favourable to men." They gave the name Gramani to the leareds who attended and called them "Sayata Manva" those who wandered about, suggesting that the duty of Gramani was to wander from place to place to study the conditions of the people. Thus the members of our Parliament should learn a lesson from this. They should be wanderers like Vinoba Ji rather than the guardians of the people. They hold India in trust.

Chaim Weizmann

The passing of Chaim Weizmann, first President of Israel, removed from our midst a phenomenal personality unequalled in our generation. He was not a theoretician of the Zionist movement. He was too educated, too wise, and perhaps also too skeptical to believe that it was possible to compress a national movement that was rooted in many centuries of suffering, struggle and hope into the constricting framework of a theory or an ideology. But all those who came in contact with him sensed that he was the bearer of historical forces, the repository of memories of a great past, sensitive to the sorrows of the present and conscious of the glory of the future. Having spent most of his life in western Europe, Weizmann never lost intimate contact with the milieu of east European Jewry from which he sprang and with which he maintained a tender and profound communion.

There already exists an extensive literature on Chaim Weizmann. Now, while all Jews, and important parts of the non-Jewish world mourn his passing, is not the time to evaluate his achievements and the debt which Jewry and the Zionist movement owe him. There had been times when parts of the Zionist movement disagreed with his political orientation. There were times when Weizmann disagreed with his own orientation. He was never a dogmatist in politics. He believed in adapting political policies to existing conditions. He was not a maximalist, in the sense of believing that the major part of the ideal must become reality in his own lifetime. Indeed he was aware of the threat to existing social values in the maximalist movements of our epoch—Bolshevism, extreme nationalism, fascism. It was in this sense that he often declared during the last years of his life that "I am not of the twentieth century. I am more nearly a man of the nineteenth century. I am perhaps one of the last of the liberals still wandering about in the world." It is possible that moods like these sometimes made him misunderstand certain activities and plans of the labor leadership in Eretz Israel, though, as a general rule, he gladly co-operated with the labor movement in the country in economic matters, in the preservation of the popular character of Zionism and in the defense of democratic principles.

Weizmann's non-maximalism in political matters should not be misunderstood. He was not a compromiser. His non-maximalism implied a preference for gradualism when he believed that more radical attempts to attain the goal might endanger the *Yishuv* in Eretz Israel or Jews elsewhere. He may have erred in his estimate of specific political situations, but in that case his error was motivated by a profound humanism and a deep concern for the welfare, the future and the good conscience of his people.

It was the above qualities that gave Weizmann his stature and that accounted for the fact that when the State of Israel came into being he was the sole undisputed candidate for the office of first president of Israel.

For many generations to come Weizmann's memory will live in Israel and in the Jewish people. It will be

a living inspiration and a goad to higher achievements. —*Jewish Frontier*, December, 1952.

The Values of Mankind

Excerpts from the address of Dr. Chaim Weizmann, the first President of Israel, at the opening of first *Knesset Israel* are reproduced from the *Jewish Frontier*, December, 1952 :

It is with a feeling of deep reverence and consecration that I rise to open the Constituent Assembly of the State of Israel, the first *Knesset Israel* of our time, in this Eternal City of Jerusalem.

Today we stand on the threshold of a new era. We leave the dawn-light of provisional authority and enter the full sunshine of orderly democratic rule. This Assembly was elected by the whole body of citizens of Israel. In this election the will of the entire people was fully and freely expressed. Thus at the outset we are building on fair and solid foundations, foundations of freedom and equality, collective responsibility and national self-discipline. It was no longer an isolated band of pioneers, subject to foreign rule, who elected this Assembly, but an independent nation dwelling in its own free country.

This nation is to be conceived as the ingathering of the exiles, for there is not a Jewish community in the world whose members have not their portion in the State of Israel. In these very days, to our heart's joy, thousands and tens of thousands of our brethren from countries near and far are entering the gates of our country that stand wide open to receive them. It is our hope and prayer that this gathering in of the exiles will go on increasing and will embrace ever larger multitudes of our people, who will strike roots here and will work side by side with us all in building up our state and making our desolate places fruitful again. We shall make this our goal before all else and devote to it our best powers of thought and action.

Heavy indeed is the responsibility laid on us here in this Assembly. What we began this same day nine months ago we are bringing to completion this evening: the restoration of the realm of Israel. If we are using state forms that have been moulded by the experience of the enlightened nations of the modern world, we know truly that these forms contain a treasured essence of the heritage of Israel.

In the ancient world this tiny country of ours raised the standard of spiritual revolt against the reign of tyranny and brute force. The Law of Israel and the vision of her prophets founded a new ethic of the relations of man to man and led to a new ordering of human society. The authority of the King in Israel was limited by the law and by tradition. The prophets of Israel did not fear to utter rebuke and reproof to kings and princes, and with their inspired word for weapon they defended the poor and the oppressed, the stranger and the slave, the orphan and the widow.

The very principle of the institution of kingship was hateful to the spiritual leaders of the people. "I shall not rule over you, nor shall my son rule over you. the Lord shall rule over you," declares the Judge to the assembled people. The warnings of the prophet against the dangers of tyranny thunder from on high in the ears of the people to the last generation. In Israel, this rising up against the authority of one man derived from the noble conception that the people, naturally free and freely accepting the rule of law and just judgement needs no compulsion from above to live as an ordered society. The root principle of the constitution of that novel State was the limit set to the authority of the King, and it is in this sense that the ancient Hebrew policy was the mother of constitutional government in the modern age.

And now it has fallen to our generation to weld anew the links of that life of freedom that were snapped by a tyrant's force nearly nineteen hundred years ago. I know not why it is precisely our generation that has been privileged to bring about what all the generations before us longed for and cleaved to in the darkness of Exile, unless it be that we have earned it by all the hardship and weariness, the sorrow and tribulation that have been our portion for the last seventy years—years when our body was stricken limb by limb until finally one-third of the entire nation was annihilated. We have suffered torture and affliction such as befell no other nation in the world until at long last the prophecy has been fulfilled. "The remnant shall return." But because we are the remnant, no more than a remnant, a double and treble responsibility is laid upon us to fill the terrible void in our national life that has been created by slaughter of the best sons of our people, the guardians of her spirit and the bearers of her culture.

It is our people that once gave the whole world a spiritual message fundamental to civilization. The world is watching us now to see what we shall choose for ourselves in ordering our lives, in what shape we shall fashion our State. The world is listening to hear whether a new message will go forth from Zion and what that message will be.

A new message is not born without some travail of the creative spirit. It does not see the light without much toil and weariness, difficulty and pain.

Having taken part in the great battles of the human spirit, having shed our blood and given our lives for the liberation of many peoples, we have at length won the right to toil and labor in order to give expression to our distinct national identity and make our contribution as a free people among other free peoples to the spiritual treasure of the world.

First of all let us strive to strengthen our constructive resources by enhancing the position of science and research in the life of Israel. Science and research are the basis of human achievement. All the scientific capacity that we have displayed in every country in the world must now be mobilized to help build up our motherland. Yet, for all the decisive importance of science, not by science alone shall we win through. We have to build a new bridge between science and the spirit of man. "Where there is no vision, the people perish," and we see what scientific progress leads to when it is not inspired by moral vision—to the atomic bomb that threatens to destroy the entire planet.

All my life I have labored to make science and research the basis of our national endeavour. But I have always known full well that there are values higher than science, the only values that offer healing for the ills of humanity, the supreme values of justice and righteousness, peace and love.

This day is a great day in our lives. Let us not be thought too arrogant if we say that it is a great day in the history of the world. At this hour a message of hope and good cheer goes forth from this place, from this sacred city to all those throughout the world who are persecuted and oppressed and who are struggling for freedom and equality. A just struggle is indeed of avail. If we, the people of sorrows and affliction have been vouchsafed this event of today, then truly there is hope at the end for all who long for justice.

From this place we send our fraternal blessing to all our people dispersed in exile in the four corners of the earth. We stretch out the hand of peace to neighboring countries, the hand of friendship to all the peace-loving peoples of the world. Our greetings go to all the States, great and small, that have recognized Israel, and a cordial welcome to the representatives of foreign States and to the religious dignitaries who have honoured this event by their presence.

Members of this Assembly! May your first gathering be blessed. Be mindful that the eyes of the entire Jewish people are lifted up toward you, and that the longings and prayers of past generations attend your steps. May it be given to all of us to be equal to our heavy charge.

The Growth of Labor Unions in the U.S.A.

Organized labor unions in the United States claimed a membership of between 14 and 16 million workers in 1952. Although it is difficult to obtain exact membership figures, probably about one out of every three employees in non-agricultural establishments today is a trade union

member. In 1913, by contrast, there were nearly 2 3/4 million union members, which meant 1 out of every 15 such workers was a union member.

One hundred years ago there were few unions and they were small. The first national union was formed by the cord-wainers in 1836. Within the next few years other national unions were formed by the printers, the comb-makers, the carpenters, and the hand-loom weavers. The only one that still exists as a national union was founded by the printers in 1852.

Several times the various unions tried to get together in an over-all national association, but with no more than temporary success, until the American Federation of Labor (AFL) was formed in 1881. At that time there were only 138,000 union members. By the end of the century there were more than half a million. But the importance of labor in World War I raised membership to about 5 million by 1920, of whom 4 out of 5 were in AFL unions and the rest in independent unions.

The growth of unions resulted in clashes between organized labor seeking to help the worker through united action, and some of the employers in big industries. Nevertheless, by 1920 the unions had succeeded in raising wages and limiting the hours of work.

For example, in 1909 average hourly earnings of workers in manufacturing were 19 cents, but in 1923, after the recovery from the depression of 1920-21, they were 52 cents. Allowing for price increases, the rise was still very significant. In 1909 the work-week was more than 51 hours, but in 1923, it was 46 hours.

In spite of these gains, the 'twenties were worrisome years for organized labor, and the depression of the 'thirties increased their difficulties. Some employers set up their own company unions. The membership of trade unions dropped to less than 3 million in 1933.

The government that came in at about that time passed laws guaranteeing workers the right to organize. The unions organized workers in some big industries where there had been little or no organization before. By 1935 some of the older unions had increased to as much as four times their 1930 memberships, and new organizations were formed.

During the years 1935 and 1936 certain unions broke away from the AFL and joined with some of the independents to form a separate national body now known as the Congress of Industrial Organization (CIO). The unions in this organization put their effort into signing up members by industry instead of occupation, while the old-line unions emphasized membership according to trade.

As a matter of fact the AFL and the CIO worked on both industrial and craft bases, but the one put more effort into craft unionism and the other put more into industrial unionism, at least at the start. Today this distinction is not so clear.

At first some thought that having two national federations in competition would destroy them both. Instead there was a great increase in the membership of both. Just before the United States entered World War II, in December 1941, total union membership had risen to over 10 million, more than double what it had been in 1936.

This vigorous growth of unions led to a great increase in strikes. Many of these were for the purpose of obtaining recognition of the union or strengthening its position, rather than for the union's customary objectives of higher wages, fewer hours of work and better working conditions.

Under war conditions labor agreed to limit wage demands and to refrain from striking. Most unions followed their leaders and there were few strikes.

Competition between the CIO and the AFL died down. Organized labor took an active part, together with employers and the government, in strengthening the war effort. Labor officials took important government posts for that purpose. Labor-management committees worked together at all levels, including the top defense agencies of government.

And with employment increasing in defense industries, union membership also increased. In some industries, such as shipbuilding and aircraft manufacture, membership doubled or tripled.

Going back from wartime to peacetime living did not generally result in the loss of union members, as had happened after World War I. Business remained good, trying to catch up with peacetime demands. But the number of strikes increased.

The objective of these strikes was to get higher wages, partly to make up for the loss of overtime pay, of which there had been a great deal during the war period.

After the early postwar disputes in 1945-46, both management and labor were looking for ways in which they could agree. In some industries they agreed that wages would go up or down with the cost of living as measured frequently and regularly by the United States Department of Labor. Many union agreements also provided for special old age pensions and other methods of protecting the health and welfare of the workers.

Today organized labor in the United States is stronger than it has ever been, even though many workers are still not organized.

WHAT LABOR UNIONS DO FOR THEIR MEMBERS

When a labor union is young it can do little more than fight for higher wages and shorter hours of work for its members, and spends much of its time and effort in increasing its membership. When it has more experience it is able to extend its activities. Most labor unions today are able to give their members much more in the way of service than they were able to give them ten, twenty, forty years ago.

Many labor unions publish their own newspapers and magazines to keep their members up to date on what is going on in the world both inside and outside the labor movement. Part of the newspaper or magazine is given to items of interest to the worker's family, such as marketing, cooking and fashions, and comics for the children. They report new developments in their own field of work and in their industry in general.

In many cases the labor newspaper tells its readers about what is going on in politics and labor, and explains what the developments mean to the worker. They discuss what is happening in the cities and States where the workers live so that they will be well informed.

The publications of the **SHIROMANI GURDWARA PARBANDHAK COMMITTEE**, Amritsar in Punjabi, Hindi and English are sold almost at their cost prices. The first editions of the Holy Guru Granth Sahib in Punjabi and Hindi are out and Bheta fixed is Rs. 40, and Rs. 16, respectively. Printing of Gurbani in Punjabi is done through Photo Blocks. "Muslim League Attack on Sikhs and Hindus in 1947" 20" x 26/8" size, antique paper with pages 453 is sold for Rs. 8 only.

For further information and free copy of the catalogue, please write to the Secretary.

They discuss the problems of workers in other countries and the joint efforts of the international workingmen's federations in the free world. They thus arouse their readers' interest in the community and the Nation and urge them to register and vote.

The union holds meetings at which problems are discussed. At those meetings it might be decided to make a special membership drive in a certain plant, or to help support workers who are on strike in some other place so they can exist until the strike is settled. Relations with other unions or union locals are discussed, and officials of State and Federal labour departments are asked to visit and explain what the government is doing to help solve the workers' problems. Experienced union members make studies of living and working conditions in various parts of the city, or of how workers should be trained in new kinds of jobs. In this connection the major unions of the country have done an outstanding job of co-operation in the retraining and rehabilitation of union members returning as veterans from World War II.

Trade union leaders together with representatives of industry and the public have worked on price and rationing committees. As individuals many of them have served on committees for the selection of men and women for the armed services, and on committees for getting money for the war effort. Many labor union members today take a direct part in State and city governments.

Unions also have life insurance, health, and pensions programs. Many union-sponsored health insurance plans provide maternity benefits for women employees and for the wives of men employees. Some unions maintain homes for their retired members. Many own their co-operative stores. They finance improved housing projects for workers. They arrange radio programs and recreational activities for their members. They run summer camps for members and their families. They also conduct charitable drives, to provide expensive hospital equipment or facilities for the treatment of major diseases.

In fact the modern labour union goes into nearly every field of living in which its members are interested, and frequently into related fields which help people who are not members of the union.

UNION TIES WITH WORKERS IN OTHER COUNTRIES

The interests of American labor unions go beyond the limits of the United States. They co-operate with workers in other countries, helping them to gain strength and develop into organized groups.

Shortly after World War II trade unions in many countries set up an organization known as the World Federation of Trade Unions. After a few years, however, it became clear that the Iron Curtain countries had taken over control of the organization and were using it to further Russian political objectives.

Thereupon in 1949 the free trade unions of the world which had been members quit the WFTU and set up the International Confederation of Free Trade Unions (ICFTU), to support "the rights of all peoples to full national freedom and self-government" and to combat totalitarianism. This Confederation now embraces more than 50 million workers in about 70 different countries. It includes the largest labor union groups in the United States—the AFL, the CIO, and the UMW—whose leaders have been active in the organization since its inception. Members of the Confederation advise each other how to keep their unions free, and give aid, including goods and money, to help those who are not free to overcome their oppressors. They advise their governments on how to deal with other governments in labor

matters, and often take active part in advising their governments in international affairs. And they send their own representatives to foreign countries to help fight oppression.

Altogether in the past forty years organized labor in the United States has grown from childhood into manhood. It is now a powerful influence, not only in the affairs of the Nation but of the whole world.

PUBLIC ATTITUDES ABOUT LABOR UNIONS

One of the most important developments during the past forty years has been the way in which people have changed in the way they feel about organized labor. Throughout American history until about the time of the depression in the 'thirties the general feeling, as shown in both the law-making and the law-interpreting branches of government, was that labor unions interfered with the freedom and rights of employers. But these feelings slowly changed as people came to see that workers need unions, and that it is possible for labor and management to agree on their mutual problems.

Looking into the mirror

THE 46th ANNUAL REPORT
of the Hindusthan for 1952 once again reflects the soundness, integrity and strength as also the continued public confidence which have always attended its career.

a human institution to meet human needs

HINDUSTHAN CO-OPERATIVE
INSURANCE SOCIETY, LIMITED.

Hindusthan Buildings, 4, Chittaranjan Avenue, Calcutta -13

During the past twenty years or so Congress has passed laws setting forth certain limits to what employers and their workers may or may not do in their dealings with each other. It has tried to write into law what might be considered fair or unfair labor practices, and how management and labor should go about arriving at agreement about them.

These laws have had results. They are showing the way in which organized labor and employers have responsibilities to each other and the public, and how they may in time work peaceably together for the good of everybody.

Some of the present laws will probably have to be changed to meet changing conditions, but there is no question that during the past twenty years or so they have served a useful purpose. The relations between employers and employees have greatly improved, and organized labor unions today are one of the most important forces in American industry. They are a part of our national life.—*The American Labor Review*.

"Progressive" Taxes Based on Ability to Pay

When an American made a million dollars in 1900 he had just that much money to spend. Today he may earn a million dollars but he can keep only 16 per cent or about \$160,000 for himself. It is still a lot of money but no longer can he "live like a king" as his millionaire predecessors did.

Where does the remaining money go? It goes back to the Government in the form of taxes. The shift in the position of the rich in the U.S. has been striking, and the income tax is in great measure responsible for this levelling up of real purchasing power of people with varied incomes. The shift downward of the rich is socially significant. It indicates a consistent trend toward the middle, with lower income groups rising, top brackets coming down, and both groups shifting gradually into an expanding middle class. Economists the world over claim that the middle class is the mainstay of any country's economy.

The income tax—first introduced in the U.S. in 1913—at first assessed only one per cent of net incomes up to \$20,000, with a modest surtax for larger incomes. It was initially designed solely to raise revenue for the Government. Little did the Government then realize the steam-rolling potentialities of the income tax as a leveller of inequalities in the distribution of incomes. It was this realization, coupled with the idea that an individual should "pay" according to his "ability," which gave birth to the "progression" in the present American income tax system.

ABILITY TO PAY

The average citizen's "ability to pay" takes into account the number of dependants upon him, his public contributions, and expenses he incurs in procuring his income. The system is based on a sliding scale and puts the heaviest tax on those with the highest income. This is in essence the progression in the income tax structure.

To maintain a basic standard of living which is considered an absolute minimum for economic efficiency, a certain portion of the income is exempt from taxation. This exemption limit has been put at \$600 per person. For incomes above this level, a single individual has to pay taxes.

This ensure that the poorest, who is least able to pay, pays nothing. If his income is \$800, he pays only about \$40. If, his net income is \$280. The tax payment increases progressively as the income keeps mounting. Thus, a man with a net income of \$10,000 pays \$2,347; if his income is \$25,000, he pays \$9,362; with income of \$100,000, he pays \$63,541; and so on. A 1953 millionaire will pay about \$840,147 tax on an income of \$1 million.

One important feature of the American income tax law is that it takes cognizance of expenses which a family head to meet in supporting family.

DEDUCTIONS ALLOWED

This is reflected in the deductions that are allowed to such a person in the compilation of his tax return.

A family head may deduct \$600 from his income report for every dependent member. For instance, a married man with a wife but no children does not pay any income tax if his income is below \$1,200. On an income of \$2,000 he pays only about \$160.

The deductions are even higher if the married couple has any children or other dependants. For instance, a married couple with two children and with an income of less than \$2,675 does not pay any income tax. Such a family on an income of \$3,000 pays only \$133. As they go up in the income scale their tax payments increase at a progressive rate but the rate is still considerably lower than those for single individuals in the same income group. For example, a married couple with two dependants and with an income \$25,000 pays only \$7,004, compared with \$9,362 which is paid by a single person. Or a four-member family with an income of \$100,000 pays \$56,032, compared with \$63,541 which is paid by a single person having the same income.

These deductions are based on the principle of ability to pay. It is obvious that married people, and those having dependants, have lesser payment ability than those who have no encumbrances.

The U.S. Government relies on each person to keep his own income records and to see that the full accounting is received by the tax department. Every year more than about 50 million Americans must figure out how much tax on their incomes they must give to the Government, and they must mail their returns by the midnight of March 15.

The actual payment of taxes is less painful to the individual American, since for the last ten years the Government has been using a "pay as you go" scheme similar to that applied by the Indian Government. Under this scheme a fixed portion of the tax is deducted from each employee's weekly wage by his employer, who turns it over to the Government. Those who are self-employed or are in business must pay their tax dues in quarterly instalments.

CORPORATION TAX

Just as the individuals pay income taxes, so do companies and corporations. If the net income of a business exceeds \$50,000, the corporation must pay a flat tax of 52 percent of its net profit. Lower tax rates apply to smaller companies. This has the effect of encouraging the growth of small, privately owned businesses in America, which, in turn, leads to the creation of more jobs, more employment, and, therefore, a greater share of the national income in the form of wages.

In the years since the first income tax was introduced in the U.S. more and more Americans have been made subject to the tax. Only one person in about 275 was required to pay under the first income tax law. Today, more than one person in three pays a share, large or small.

At the same time, the proportion of government revenue derived from the income tax has increased and the portion derived from indirect taxes, which usually ignore a person's ability to pay, has decreased. For instance, in the fiscal year 1953 (July 1, 1952, to June 30, 1953) personal and corporation income taxes yielded about 69 percent of all U.S. Federal revenues.

America's tax structure as a whole still needs simplification, equalization, and revision, but it has come a long way toward mitigating the inequitable distribution of national income, and toward a more equitable distribution of the cost of a free democratic government.—*American Reporter*.

OUTSTANDING PRODUCTS OF HERING & KENT

ROYAL OONIM: Super vitalising Tonic for MEN and WOMEN. Restores youthful vigour and vitality at any age. Rs. 50 for 3 weeks course; Rs. 200 for complete course of 12 weeks.
OONIM: General all-round tonic for men & women. Rs. 7-8 for one week; Rs. 22-8 for 3 weeks; Rs. 90 for 12 weeks complete course.

BIOSTIL HORMONE CREAM: Genuine hormone treatment for restoring the freshness and firmness of youth to the aged, wrinkled skin. Women of 60 regain complexion like women of 20. Indicated for wrinkles, lines, bagginess, bad colour, disfigurement, blemishes and skin disorders (acne, pimples, etc.) Rs. 5-8 per tube.

SIMBOOGI HAIR LOTION: An unfailing hair-grower. Positively grows new hair and stops falling hair, dandruff, itching scalp, etc. Rs. 3-8 per bottle. **SIMBOOGI HAIR OIL:** A delightful ideal hair-dressing and tonic for correction of various hair, scalp and brain troubles. Rs. 3-8 per bottle.

LUNEGON: The most effective nerve and brain sedative tonic, indicated for mental and nervous disorders. Immediately calms and soothes high mental and nervous tension. Contains no injurious, depressing or habit-forming drugs. Rs. 4 per packet of 50; Rs. 70 per packet of 1000 tablets. (Hospital packing).

DIBNIL: The most effective oral remedy indicated in the treatment of Diabetes Mellitus. Rs. 15 per packet.

SILVITA: For acidity, heart-burn, sour stomach, dyspepsia, wind and fullness after meals, etc. Rs. 4

NOVUM: The most potent and effective "period regulator" for females, indicated in the treatment of Amenorrhoea. (Periodic Disorders). Restores the female periodic cycle surely, quickly, safely. **NOVUM SIMPLEX**, Rs. 12-8. **NOVUM FORTE**, Rs. 50; **NOVUM SUPER CONCENTRATED**, indicated only for menopausal trouble and oestrogenic hormone deficiency. Rs. 21. **CIVITA:** MUST BE TAKEN tonic with NOVUM to prevent side reactions and hasten results. Rs. 19 per packet of 100; Rs. 4-12 per packet of 25; Also available:

INDULABO PASTE INJECTION TREATMENT for registered and Qualified Physicians only. Full particulars sent on request to physicians only.

PREGNO: An ideal, non-greasy and delicately perfumed preparation for FAMILY LIMITATION. Ideally suited for the most fastidious woman. Rs. 9-8 for complete outfit; Rs. 7-8 for "Refill".

EXPERT MEDICAL ADVICE: We have opened a "Clinical Dept." under the direct supervision of qualified and experienced physicians and surgeons. Expert, sincere and genuine advice and treatment given for all your SEX and FAMILY LIMITATION problems. Consult personally or write your case in detail (enclosing a stamped, self-addressed envelope) for reply.

New Horizons in Antibiotics

New York (MPIB)—Better understanding of the antibiotic drugs, and clues toward developing even more effective antibiotics, are expected to emerge from new knowledge of their highly complex make-up, outlined at a recent conference of experts here. At a meeting of the New York Academy of Sciences, three scientists, Drs. P. P. Regna, W. W. Umbreit and D. W. Wooley, described the chemical structure of terramycin, streptomycin, and chloromycetin, and analyzed the ways in which they act against disease.

The structure of terramycin, an earth-mold drug effective against more than 80 diseases, was worked out after two years of study by a team of eight scientists. These were Dr. K. J. Brunings and associates of Chas. Pfizer & Co., Inc., U. S. firm which discovered the antibiotic, and Dr. R. B. Woodward of Harvard University who pioneered in the synthesis of quinine and cortisone.

In "blueprinting" the structure of the terramycin molecule, the scientists found it to be unique among the antibiotics, and one of the most complex found in nature. Because of its complexity, terramycin cannot be synthesized commercially and will probably always be produced by fermentation, according to the team of chemists.

Determination of the structure of terramycin will help chemists to make minor changes in the molecule, some of which were described by Dr. Regna at the New York meeting, in the hope of producing new drugs with new medicinal possibilities. It also helps to show why

it is that terramycin goes to work in the body so rapidly and safely.

Pfizer scientists also are attempting to find out how so simple an organism as a mold can build so complex a substance as terramycin, and what raw materials it uses as building-blocks. If some of these raw materials can be supplied to the mold in already "prefabricated" form, terramycin production efficiency might be increased.

Ernest Hemingway Wins Pulitzer Prize

Ernest Hemingway won the Pulitzer Prize for his book *The Old Man and The Sea* in the 36th annual Pulitzer awards, announced on 6th May by Columbia University.

The prizes were established by the late publisher Joseph Pulitzer in a bequest to Columbia University for merit in the field of journalism and letters.

Hemingway's Pulitzer Prize was his first, although his reputation as one of America's greatest writers extends more than 25 years through recent history.

The Old Man and The Sea, in length no more than a good-sized short story, was an immediate best seller. It dealt with an aged fisherman whose efforts to land the prize catch paralleled the fight of man himself against the imponderable.

President Rajendra Prasad inspecting a guard of honour, provided by the passing out trainees at the I.N.S. Circars during his recent visit to the naval base, Visakhapatnam

General Mohamed Naguib with Lt. Commander Inder Singh and Commander Kohli. During their Goodwill visits three ships of the Indian Navy, (I. N. S.) *Ganga*, *Godavari* and *Gomati*, visited Alexandria recently, where President Naguib was among those who visited I.N.S. *Godavari*

THE 'MODERN REVIEW'

VOL. LXXXIV, No. 4

WHOLE No. 562

NOTES

Unemployment

The Government of India has at last awakened to the fact that one of the major causes of the unrest and discontentment in the country is unemployment on a titanic scale. After the realisation, which has caused quite a stir, attempts are being made to ascertain its magnitude and to devise remedies for the malady. We have no doubt that figures would be forthcoming, of very doubtful accuracy as usual, and that various schemes and plans would be set on foot to waste vast sums in order to obtain minor reliefs. If the ailing party, that is the general public, takes an interest in the matter and attempts to face the problem, then that would be another matter altogether. For in the assessment of both the quantum and the causative factors, public help is essential. And without that assessment, no real remedy can be prescribed. That over-rated panacea, the Five-Year Plan, would be a mere quack nostrum. Therefore, the first step would be to arouse public opinion, overcoming its lassitude.

In most States, a sense of frustration is general, which in its turn is generating resentment against and lack of faith in the Congress Government. This sense of frustration is real, and is the reaction to nepotism, favouritism and corruption that is rampant in the administration, both at the Centre and in the States. Party and parochial considerations and personal influence, to say nothing of graft, has become the main factor in almost all appointments and contracts, without exception. A man may possess the highest qualifications or be highly efficient in business, but he stands no chance against the inferior person who has the capacity or opportunity to pull strings behind the scenes. This is the root cause of all frustration.

As a result of this frustration and resentment very large numbers of the unemployed are becoming unemployable. What is more, this is affecting the Employed person as well, lowering his efficiency by warping his sense of duty and integrity. The

Employees' efficiency being lowered the business, industry or institution is affected adversely and that in its turn effectively stops expansion. Indeed in most cases the drop in efficiency is so great that the concern or institution is obliged to retrench, instead of expanding and thereby providing further employment.

There are other factors too, some of them vital, affecting smaller concerns and institutions which are by far the largest sources of employment in the country. These have to be looked into with a real interest by a better type of official than the common stiff, wooden bureaucrat who owes his office to his—or his father's—oily tongue. Today the big fish are swallowing the little fish, centralizing the concerns and institutions into restricted areas, with considerable reduction in staff and personnel. Wide areas are thus being laid bare of the sources of employment and large-scale unemployment is the inevitable result.

Then again there is the question of the *unemployable*. Prolonged idleness and loafing converts the most efficient person into a lack-a-daisical lout. And if there be no sense of discipline and a total lack of a sense of duty to start with, then such a person becomes a menace to any concern or institution in which he might be employed. Unfortunately our schools and colleges are turning out today masses of such young men. Mere provision of jobs or doles would be worse than no remedy in such cases, unless there is a rectification of their sense of propriety and responsibility.

In some States, particularly in West Bengal, there are vast numbers of uprooted humanity, with almost all moral values destroyed, leaving only resentment and greed. This human flotsam is being utilized for the basest of motives by treacherous politicians and vile human sharks for the furthering of their own designs. Thus the entire mass of refugees in West Bengal are fast becoming unemployables. Even amongst those who have been given jobs, a large majority are

SAKUNTALA WATERING THE MADHABI PLANT

Prabasi Press, Calcutta

By Satindranath Baha

becoming more and more inefficient and unfit for employment, due to their warped ideas on duty and integrity, and are corrupting the efficiency of such of their colleagues who are still useful. Here again stern remedial measures are called for, to prevent total corruption of a very large section of the population.

A school or a college, or any public utility concern or institution, can only produce more unemployables if the staff possesses no sense of responsibility or if there be some members of the staff who are either active disruptionists or have a degraded sense of moral values. In giving jobs to the unemployed, special care should be taken in the appointment of teachers, supervisors, superintendents and others who are likely to come into contact with or to control large numbers of people with immature or undeveloped minds. Else in giving a job to one unemployed the Government will be sowing the seeds for a tenfold production of unemployables. Now let us turn to the official reactions. First of all there is the A.I.C.C. directive as given in the news below:

New Delhi, Sept. 21.—Following the adoption of the resolution on unemployment at the Agra session, the AICC has sought the help of State Congress Committees and individual Congressmen in collecting accurate data on the subject.

The data will supplement the sample surveys which the Planning Commission has decided to carry out in certain parts of India.

Congressmen have been asked to take a personal interest in the problem and collect reliable data regarding the extent of unemployment or under-employment in their constituencies or areas.

The AICC has advised them to pay special attention in the course of their inquiry to the working of village and cottage industries which are faced with a slump and to recommend new industries which might be started in their areas to provide fuller employment.

The information collected from State Congress Committees will form the basis of schemes which the AICC hopes to prepare to solve the unemployment problem.

Needless to say the directive will be futile, the Congress being what it is today. The few, very few, Congressmen who can still rise above selfish and party interests will cry in the wilderness, unless they can rouse public interest.

Then let us see what plans the Government envisages to combat unemployment. On the same day as the above news, there appeared in the daily press the following report:

The Government requires 10 years to solve the unemployment problem in India.

Mr. Deshmukh, the Finance Minister, gave this reply in the Council of States to a question from Mr. Sundarayya, leader of the Communist Party, during a debate on unemployment which covered much the

same ground as a similar debate in the House of the People some days ago.

In Mr. Deshmukh's long written reply to the debate, notable for its academic analysis of the economic trends of the last few years, only two specific remedies to the acute problem found brief, passing mention.

One related to minor irrigation schemes upon which much emphasis has already been laid in the Plan. Their scope will now be further enlarged. The second was educating the rural masses by employing a large number of educated persons.

Mr. Deshmukh was not puzzled by the phenomenon of rising unemployment when the Plan was being executed. He explained it by the fact that, during the first two years, expenditure had been 30 per cent of the total against the 40 per cent envisaged in the Plan.

He relied on the hope that the full impact of the Plan would be felt soon. During the current year, for instance, expenditure was stepped up by 8 per cent as compared with last year. It will amount to Rs. 400 crores. During next year, it will probably be about Rs. 500 crores, even if the proposed modifications were not taken into consideration.

The Finance Minister was satisfied that, having overcome inflationary trends, Indian economy was now better equipped for intensive overall development. Conditions were favourable for increasing investment to a greater scale than contemplated in the Plan.

Earlier, members asked for a courageous approach of the unemployment problem which, according to Mr. Reddy, was approaching staggering proportions.

Replying to the debate, Mr. Sundarayya said that the Finance Minister had categorically refused the demand for relief to the unemployed. "It is not for me but for the hundreds of millions of the unemployed of this country to get angry with this Government and storm the bastion of reaction."

The way the Ministers had spoken on the problem, he added, proved the Government's complacency. How many decades did the Government want to solve the problem?

When Mr. Deshmukh replied: "Ten years."

It is useless to remind Mr. Deshmukh about the old saw regarding "Hope deferred." If things do not improve much sooner than the date put by Mr. Deshmukh for the millenium, then Mr. Deshmukh and all others of that ilk, excepting a few agile turncoats, will have to fly the country or else face liquidation. The main bulwark between Order and Chaos in the country, the educated middle-class man is facing an imminent collapse.

Urban Middle-classes and Moneylenders

The *Clarion* draws attention to the sad plight of the urban middle-class. No statistics of urban indebted-

ness had even been attempted but it would not be surprising at all if over 75% of India's middle-classes were found to be in debt, the paper writes.

Rising cost of living and unemployment drove people to borrowing. And the "ignorance of the law, the sense of shame and the urgency of the situation makes many a borrower an easy prey to exploitation by unscrupulous moneylenders. The debtors often sign a bond for very much more than is borrowed." The paper then refers to a case where a man signed a bond for Rs. 1700 for a loan of Rs. 100 only. Illegally, high rates of interest—sometimes to the extent of 25% per month—were charged. And the moneylender with his knowledge of the law knew how to evade it. He generally did not give receipts for the interest he claimed. The paper writes that cases were common where capital had been more than doubled or trebled by interest payments within a year.

As a way-out the paper suggests the Government "to assist with loans, something on the principle of taccavi loans made to agriculturists. The security offered by the debtors would be their jobs, as arrangements for direct payments could easily, we think, be made by Government. Chances of non-payment would be reduced. In this way Government would be assisting the hard-hit middle-classes, adding perhaps a little to its revenue, and ensuring that debtors pay an interest which is reasonable and fair."

We are not in love with loans, having had long experience of Refugee and Rehabilitation schemes. Loans mean bribes and degradation. It would be better to devise a modified New Deal type scheme, to expand scope for work and profit. Co-operatives might be tried on a large scale.

The Five-Year Plan

Now let us turn to the universal panacea, the Five-Year Plan. Some time back there appeared in the *Asian Review* of London in its July issue, an interesting analysis of the Plan by Sir George Schuster. Sir George's long experience of India and his very deep knowledge of Indian economies makes the short analysis highly interesting. We give the following extracts:

"The main features as I see them are :

(a) India is an essentially agricultural country—(about three-quarters of its people dependent on agriculture)—and yet at present it is not producing enough food to feed its own people even at their present very low standards.

(b) The population is increasing at the rate of four and a quarter millions every year.

(c) On a long view there is no room to absorb great numbers of additional workers in agricultural production. Indeed if Indian agricultural industry is to make its best contribution to the Indian economy a reduction in the numbers on the land would be desirable.

(d) Therefore the great bulk of the working part of the 4½ millions added every year to the

population must be placed in industry or tertiary employment.

(e) Accordingly India needs a vast expansion of manufacturing industry if only as a means for providing bread-winning employment for her increasing population. (That is not the only reason for such an expansion. A greater proportion of industrial employment is necessary if there is to be any improvement in the general standard of living).

(f) But such an industrial expansion can have no sure foundation unless there can be first achieved a vast increase in agricultural production. This is necessary for a double reason. Unless more food can be produced it will be impossible to feed the increasing numbers employed in industry. Unless the purchasing power of the agricultural producer is greatly improved Indian industry will not be able to find markets for its products. (This is not to deny the possibility that Indian industry will be able to find export markets for some of its products. But this can only be a very small proportion of the total production if there is to be an expansion of industry on the scale which the national needs demand).

It is therefore necessary to concentrate first on the development of agricultural production.

It is because such a concentration is the main characteristic of the Five-Year Plan that I regard its broad lines as right. But the first five years must be regarded as no more than the first chapter of a much longer story of development—the first act of a much longer drama.

The essential purpose of this "first act" must accordingly be seen as two-fold: 1st: to achieve the maximum possible immediate increase in agricultural production. 2nd: to be a period of preparation for a great industrial expansion. Therefore, the practical questions to be asked are:

(i) What steps can be taken to aid the most rapid and effective development of agricultural production?

(ii) What can be done to "set the stage" for the great industrial expansion which should follow in the later acts of the Indian drama?

In the case of *agricultural development*, the Plan falls broadly under two heads, first, schemes for capital expenditure on works for irrigation and communications, and secondly, schemes for achieving a general uplift of production and life in the rural areas through measures such as the Community Development Projects."

Regarding the role of private enterprise in the field of economics, Sir George says:

"Private enterprise cannot hope to survive in modern conditions and in an educated democracy unless it can convince public opinion that it is serving the public interest in the sense that it is carrying out the necessary function of production more efficiently than any possible alternative system. I speak as one who believes that it can fulfil this condition, but only if it handles all its operations with this need constantly in mind. I must express the further belief that the Government of India is right in deciding to leave a great part of the task to private enterprise. There are powerful critics in India who

argue that the Plan falls neatly between two stools and that planned economic development can only succeed if the Government has complete control of all the resources for investment, and they point to the examples of Russia and China. But India is a country in which the ruthless methods of Russia could never be accepted or work successfully. Nevertheless, the fact that such opinions are held and that the Congress Party is essentially a left-wing party makes it all the more necessary that leaders of private enterprise should accept a high conception of their role and recognize that if they adopt practices which lay them open to legitimate public criticism they may create intolerable difficulties for Ministers of the present Government who are trying to pursue policies of moderation and leave scope for free enterprise.

There is no simple answer to my question, "What can private enterprise do to earn the confidence of the Government and public opinion?" But a combination of a number of steps might gradually have considerable effect. They include a high standard of managerial efficiency in all grades; educative publicity about financial results and a fair basis of distribution; action by big industry in the public interest in such matters as encouraging the development of small industries; a proper interpretation of the functions of industrial associations; and finally encouragement for the building up of responsible Trade Unions.

It is a commonplace to say that there can be no satisfactory industrial development unless human relations in industry are satisfactory, unless there is a general will to work and a readiness on the part of employers to recognize their obligation to pay adequate wages and, on the part of the workers, to realize that the level of wages must be related to the work effort and to the productivity of labour. One of the greatest needs in India to-day is the growth of a responsible Trade Union movement. There is a long way to go before this is achieved; but, on the other hand, I saw signs which justify me in expressing the view that a hopeful start has been made. Here is a field in which there is room for much helpful collaboration between this country and India. The value of this is recognized by the Trade Union movement in both countries and I can only express the hope that the British T.U.C. will do its utmost to develop effective collaboration."

Village Industries and Indian Government

In reply to a question in Parliament on August 6, the Minister for Commerce and Industries, Sri T. T. Krishnamachari had said that the Government was considering the recommendation of the Planning Commission for the adoption of a policy of developing the production of edible oils through the village industry and the production of non-edible oils through the oil mills. In this connection another recommendation of the Planning Commission for the imposition of a small cess on mill oil for the benefit of the village

oil industry was also under the consideration of the Government, the Minister had said.

In reply to another question on the same day Sardar Swaran Singh, Minister of Works, Housing and Supply, had said that it had been decided that hand-made paper should be purchased for all demi-official correspondence of the Government of India. Of a total value of Rs. 4½ crores of paper purchased by the Government of India in 1951-52, hand-made paper had accounted for Rs. 90,000. No hand-made paper had been purchased in 1952-53 as Government had sufficient stock from the previous year's closing balance. The total value of paper purchased in that year was Rs. 5 crores approximately.

In an article in the *Harijan* on September 12, Sri Maganbhai P. Desai writes that these questions and their answers "tell eloquently well how lightly the Central Ministry take their responsibility to encourage and promote village industries. Apart from the patent indifference that is apparent from the answers, the more serious matter is where Sri T. T. Krishnamachari says that the recommendations of the Planning Commission are still not considered by the Government. . . . The indifference and delay revealed by the answers explain to an extent why unemployment is there in spite of the Plan." Pointing to the fact that the Five Year Plan had been put forward by the Government as their chief plank for the recovery of the national economy he urges upon the Government to hasten the implementation of their accepted policies laid down in the Plan.

We refrain from further comment. New brooms are indicated everywhere.

Community Project in West Bengal

Sometime back we had occasion to ask a high—and highly paid—official of the Project as to how the plans were developing. He said that he himself did not have anything much in the way of expectations where the Community Project was concerned, and so he would say that the results were not very disappointing so far. Needless to say we put no more questions. We append *infra* an extract from a recent issue of the *Vigil* more about the project. Unless a recasting of the plans and procedure is done while there is time, this experiment is going to be a howling failure in most States.

Sri B. K. Guha, Ex-Project Executive Officer, subjects the Community Projects administration in West Bengal to a close examination and his examination reveals some very instructive facts.

The writer notes that the early popular hopes and enthusiasm about the Community Projects had died down. The people had nearly lost all faith in the administration of the Community Development Projects.

Referring to the administration of the Projects of which he had personal experience, Sri Guha writes that

the duties of a Project Officer included everything except executing things. He was to work as a liaison between the Project and the normal state departments to which all allocations of money went. "The Project Officer," he writes, "is there to see that these monies are spent according to priorities determined by various departments in consultation with the Project Officer." The Project Officer had no control over those departments, which "do their utmost to have things in their own traditional way." Though responsible for everything relating to the Projects the Project Officer "can be frowned upon by any District Officer or Sub-divisional Officer." All his complaints were never seriously taken.

Another "important function" of the Project Officer was to act as a tourist's guide to visitors, mostly American "experts," who were "at best nothing more than salesmen of American machinery."

Sri Guha writes: "The various departments by their callous indifference do their best to ignore the very existence of the Project Administration." The District Magistrate was the District Development Officer, but "if he has got not the time or shows no inclinations to co-ordinate the different departments he cannot be blamed. Meanwhile the Project Officer becomes a spectator of departmental inefficiency, lethargy and heartlessness. . . . As long as the reports are sent in time with expert window-dressing nobody bothers about anything."

He cites various instances of departmental inefficiency and official bungling. An artificial insemination centre had been started with four bulls which had proved to be immature and meanwhile ten bulls giving natural servicing had been withdrawn. Illustrating the way the Departments moved Sri Guha writes: "When the Project officer asked the opinion of the Livestock officer about the bulls, the latter was clearly instructed by the Animal Husbandry Department not to give any reply. The Superintendent of Agriculture took a month and a half just to reply that he had nothing to do with the bulls."

The Agricultural Department did nothing more than pushing up "sales of manures on behalf of certain agencies and distributing seeds which very often do not go to the fields. Agricultural loans are given when the season is nearly over and that also to a fortunate few. Small irrigation schemes are undertaken under conditions that the beneficiaries would contribute one-third, now raised to half of the total cost. Contracts are deliberately made at an inflated rate and actual work is done at a much lower rate, the balance being shown as a book-entry for local contributions."

In another case a mobile medical unit had been started with the money of the Community Development Project. Doctors and assistants had been posted in a village without any medicine being provided. On enquiry it had been revealed that the Health Directorate "had not even drawn up any plans for work. So for full one month there was the doctor minus his medicine and the people getting bitter to the core." What was more

revealing was the fact that "when the doctor does get his stock of medicine and popularises himself to the village people he is transferred on some silly pretext."

Two primary schools have been completed but they could not be given recognition "because the district quota was already filled up." Nobody knew when the next quota was to come.

In view of all these Sri Guha says that the Government might as well abolish the establishment of the Project Executive officer. It would save a recurring expenditure of nearly Rs. 3000 per month.

Estate Duty Bill

The Estate Duty bill has now taken final shape. We were the first to point out the defects in the bill as originally framed, particularly with regard to the unjust burden on estates ruled by Dayabhaga laws. Those defects have been mostly removed.

New Delhi, Sept. 22.—The Council of States today passed the Estate Duty Bill as passed by the House of the People and adjourned till tomorrow.

The Finance Minister indicated yesterday that he would have to take the earliest opportunity to amend the provisions relating to exemptions in order to prevent evasion.

Under the clause as it stands, exemptions from Estate Duty is allowable in respect of an insurance policy on the life of the deceased for a sum not exceeding Rs. 50,000 for the purpose of paying Estate Duty. Another sub-clause provides that exemption will be granted in respect of amounts, not exceeding Rs. 50,000, deposited with the Government for purposes of meeting the duty on the estate of the deceased.

The second sub-clause had been introduced to meet the cases of persons who could not insure themselves due to over-age or other factors but would like to make a provision for payment of Estate Duty during their life time.

Mr. Deshmukh said there seemed to be a possibility of these two provisions being utilized cumulatively by an individual to escape Estate Duty up to the value of Rs. 1,00,000.

"I will have to take the earliest opportunity of bringing an amendment to this measure," he told the Council, though he would not say if he would bring forward an amending Bill in the next session.

Travancore-Cochin Assembly

The Travancore Cochin Ministry failed to obtain a majority in the confidence vote, in the State Assembly, on the 23rd of September as given in the news below:

Mr. A. J. John, Chief Minister of Travancore-Cochin, today failed to win a confidence vote in the State Assembly.

The Rajpramukh later issued a notification dissolving the Travancore-Cochin Assembly with effect from tomorrow.

The news of the fall of the John Cabinet came as no surprise in New Delhi. According to informed quarters, Mr. John is expected to advise the Rajpramukh to order fresh general elections.

Pending this, the Ministry is expected to continue in office though it will not initiate any new policies. It will be in the nature of a caretaker Ministry till fresh elections are held.

The 47 Congress members and four Independents today backed the confidence motion. The 32 members of the United Front of Leftists, the nine TTNC members, the 10 Socialists and five Independents voted against it. One Independent abstained.

Mr. John's Ministry assumed office on March 12, 1952, though the general election did not give the Congress a majority in the 109-member Assembly.

The Congress, however, emerged from the elections as the largest single party in the Assembly with 46 members. They managed to get last year's budget passed with the support of Independents.

Now, after the fall, Congress has to try for a working majority at the elections, which have to be completed by March, 1954.

Law and Order in Calcutta

Following the deliberate defiance of law and order on the political front, serious outbreaks of lawlessness have happened in certain parts of the city, in which the ringleaders are professional criminals. Kidnapping, extortion of money by threats of violence, sometimes at the point of daggers or pistols, rape and theft have become more frequent than usual. In one case, the criminals raped the kidnapped eight-year old girl before abandoning her in a severely collapsed condition.

In a very suspicious case, a prominent upcountry businessman was found dead in a "Massage Clinic" of doubtful status. The newspaper reports said that the deceased went there in an inebriated condition and collapsed and died before medical aid could reach him. The relatives and friends were astounded at the news of the death and the circumstances under which the demise was alleged to have taken place. They, therefore, demanded that a *post-mortem* examination be made, as the deceased was not only a man of repute, but was known to his friends to be of steady and refined habits. It is said that on the examination no traces of alcohol or any other intoxicant could be found.

It has been stated in a public meeting of prominent businessmen that the deceased had expressed some apprehensions about imminent and serious troubles to his friends a few days before his untimely death. He did not state what he was afraid of nor did they attach any importance to his fears at the time.

The place of his death is said to be an ill-reputed house, and it is firmly stated by his friends that they cannot imagine his going there of his own volition. They say that the mysterious circumstances under which the death took place clearly point to a conspiracy and violence and ask for a thorough enquiry by the police in the matter.

"Coat, Necktie and Collar"

Pandit Nehru has at last removed his rose-tinted glasses and begun to see things in their proper light as the following news-item indicates:

New Delhi, Sept. 24.—Mr. Nehru today warned Ministers and officials against approaching the problems of the common worker and peasant with a "coat, necktie and collar mind."

Mr. Nehru, who was addressing a conference of State Ministers of Agriculture and Co-operation in Parliament Hall, said that mere conferences would not help if the workers and peasants remained untouched by such activity.

"I am sometimes amazed about the way official work is done," he added. "There are several institutes of agricultural and forest research doing good work. But whatever work is done there is confined to the officers concerned and the four walls of the institute. It does not reach the common peasant."

He had come to attend the conference out of just formality and to wish it success, he said. The Ministers of Agriculture and others participating knew more about the problems of agriculture than he did. It was unnecessary for him to say that the question of agriculture was a basic and necessary one for the country. It was, however, clear that the country could not develop, however advanced agriculturally it might be, unless it was industrially advanced also.

Posing the question how progress in India should be measured, Mr. Nehru said: "In our Statistics Department people make charts and blueprints. They should do more of this kind of work. It gives us some picture of our country. But, ultimately, the only yardstick of measuring the country's progress is by examining the general appearance of the Indian peasant, the clothes he wears, the food he eats and the house he lives in. We have also to see how the children of the Indian peasant are brought up, what arrangements exist for giving them education and safeguarding their health. The country's progress can never be measured by policy statements of Ministers or officials."

In the not so very distant past, the I.C.S. man touring in State through the countryside, used to receive petitions and dictate terms and directives. He used to consider himself omniscient and omnipotent—unless a superior was in the offing. He set the example for all his underlings, and hence came the tradition of the "coat, collar and necktie." This system, which was one of the root causes of the ruin of the common man, in the streets and in the fields, has persisted though the British Raj has departed. The Ivory-Tower tradition dies hard, be it garbed in Coat and Necktie or Gandhi cap and Khaddar.

Sugar Policy Muddle

Vivek writes in the *Bombay Chronicle* that the extent of the "folly and rashness" of the sugar policy of the Government of India would be made clear even

to the uninitiated when one considered the Government's latest declaration of policy.

The Government had presented a supplementary demand for 7.25 crores of rupees for importing a lakh of tons of sugar which was necessary to hold sugar prices and maintain continuity of supplies. In this regard the Government had also announced the reduction of the import duty on sugar to a little less than half.

At the same time Government had urged the Parliament to agree to Rs. 2.06 crores for compensation to factory owners because the Government had undertaken that the sugar factories would get the previous seasons' price for the quantities they held, though a reduction of price was called for on the basis of the stock position.

Still another demand was for Rs. 3½ lakhs for payment as compensation to private exporters because 6300 tons of sugar had been exported at a loss in 1952-53.

Vivek writes: "... a government which went out of its way to spend two hundred and six lakhs to prevent prices from falling because of a large carry-over, finds itself within a few months allocating large sums of foreign exchange in order to reduce prices slightly and to hold them at the lower level! Truly a remarkable debacle, that does little credit either to Government's prescience or its ability to manage."

The policy of the Government helped the speculators. Sugar prices were not likely to remain stable by Government releases and direct sales. The import of a lakh of tons was not likely to lead to comparatively low prices and would, in any case, affect only sales in a few ports.

"In the next season, moreover," Vivek continues, "the production of sugar will probably not be high, for the cultivator is not likely to be encouraged when the price for the cane he sells is settled, while he sees the price of the article manufactured from it free, and the factory owner and the trader making even handsome profits than before."

Here, in West Bengal there is an attempt made by the Government to bring down the retail price of sugar all over the State. It is as yet too early to gauge the results of the plan, which is to persuade the normal trade-channels to accept the measure. Private feuds, cupidity of some traders, and the obvious lethargy of the consumer, are hurdles on the path. But prices are coming down.

British Goat Farm

A 180-acre goat farm in Britain which produces 10,000 gallons of milk each year from a herd of 100 goats is attracting the attention of doctors and agriculturists from all over the world, including the Far East.

Milk from the farm—situated at Stretton-on-Dunsmore, near Rugby—is sent all over England. The

farm also sends regular supplies of yoghurt bacteria base by air for manufacture in British Guiana.

Medical men visit the farm to study the potentialities of goat's milk for the treatment of tuberculosis and eczema and agriculturists are particularly interested in the way Mr. Gilbert Harris, owner of the farm, has used derelict land for milk production, which he hopes to treble in the next few years.

The idea for starting the farm came to Mr. Harris, a former R.A.F. signals officer, when he was stationed in Southern Arabia during the war. He suffered from malnutrition and was cured by goat's milk. After demobilisation he began keeping only a few goats, but following a local doctor's appeal for goat's milk for a sick child he turned over exclusively to goat milk production in 1950.

There are many tracts in India where a similar experiment might be successful.

South Africa Through American Eyes

Emmett Murphy, a young professor of anthropology who took the place of the well-known Professor Z. K. Matthews while the latter was teaching in the United States, had a year in South Africa at the University College of Fort Hare. Because he insisted upon treating white and Africans as equals, he and his wife were ordered to leave the country 44 days before their permit to stay expired.

In reviewing his experience, Emmett Murphy has given a balanced appraisal of the difficulties in South Africa, and the racial situation there. Pointing out that even in the College there was tension between black students and white faculty members, and recounting his friendship with the students, Professor Murphy declares: "There is no area now left in the U.S. where Negroes receive treatment as stern and unfair as in South Africa."

"As the Nationalist Party and most whites in South Africa grow more extreme and harsh in their attempts to keep the blacks down," says Professor Murphy, "so the various African political organizations and most blacks get more extreme in their ambitions to remove the chains which have bound them and to assume control of their own destinies and their land. White liberals are being progressively squeezed out of power by the extremists on both sides, as are African and Indian moderates. Unless a new element enters the picture, we feel, a violent clash between the two forces is inevitable. The only thing that will be effective will be a quick granting of fundamental rights to non-Europeans and embarkation upon a huge program of social and economic progress for all the people. It is our opinion that at least 75 per cent of the Europeans are unswervingly opposed to this much."

U. S. and World-Policy

After the Korean armistice there has been a great deal of wrangling about the policy of the U.S. The following extract gives a good summary:

"Europeans are not always right, but are they wrong in believing the U.S. is too unbending? Largely for this reason, American stock is low, even among the most ardent anti-Communists. Europeans feel that Americans are unrealistic in their insistence on arming Europe, willy-nilly, before attempting to settle the cold war, or before being sure that a decent peace cannot now be pried out of the Russians. Secretary Dulles made one statement in a recent radio speech that particularly bothered Europe. He declared that even if the Russians ceased being aggressive, the European Defense Community would be just as necessary as ever. They would agree that unity ought to be pushed, but they see no reason for permanent costly armament if the Soviet Union could be brought to terms.

In Asia, the political conference to follow the truce will try to halt Communist aggression in the narrowest sense; or will undertake to find a basis for enduring peace through a solution of various questions. If Mr. Dulles means what he has been saying, the U.S. will attempt to limit the conference to issues Washington wants to settle precisely in its own way. This isn't likely to work, however, for some of the best friends of the United States will be just as eager to broaden the discussions as are the Communists. Japan is eager to renew its trade with Red China in order to bolster its shaky economy, and nations fearing Japanese imports will help it. There will be pressure to admit China to the United Nations at the expense of Formosa, not because other countries are pro-Communist, but because they believe peace will be more secure with the Chinese inside than outside. Few countries think that recognition of Red China means approval, any more than Washington thinks so in the case of Latin American dictatorships. Fourteen lands now recognize Red China: Afghanistan, Britain, Burma, Ceylon, Denmark, Finland, India, Indonesia, Israel, Norway, Pakistan, Sweden, Switzerland and Yugoslavia. If the U.S. wins by economic threats, it will suffer.

Many countries are determined not to follow what they feel is U.S. rigidity. They reason somewhat along these lines. Suppose Red China can be persuaded to withdraw troops from Korea on the assurance that South Korea will not renew the war; that a narrow buffer zone be created at the Yalu; and that a United Korea be demilitarized, under international guarantees. Suppose then that China comes into the U.N. after a cooling-off period of six months or a year, and is thus responsible, on the inside, for the maintenance of peace. This could, by taking the heat off Indo-China, give the French the opportunity they increasingly desire, of ending the war there. Japan, safe from invasion through Korea, could avoid the rearmament its people do not want, while the fear of Japan would no longer worry Asian peoples.

You may not agree with any of this, but such ideas are seething in many minds, and if Washington has something better, that policy must be polished up

and brought out soon. The U.N. Assembly is going to get into the act, and through its sessions, along with those of the post-armistice conference, American spokesmen are likely to find that mere inflexibility will not suffice. U.S. prestige has already suffered badly through its abandonment of the International Children's Emergency Fund, and its threatened scuttling of the U.N. technical assistance program."—*Workover Press*

Concessions to Oil Refineries

Mr. K. C. Reddy, Minister for Production, placed before the Parliament on August 23, the terms of the agreements entered into by the Government of India with the three foreign oil Companies, two American and one British, for the establishment of three oil refineries in India. The terms of agreement in the three cases were more or less similar.

The concessions granted included "a no-nationalisation guarantee for 25 years from the commencement of operation of the refineries, import concessions, foreign exchanges facilities and an additional duty protection to the products of the companies," reports the UPI. A guarantee exempting the refineries from the purview of the Indian Industries (Development and Regulation) Act for 25 years had also been given, if the Indian companies applied for such exemption.

The refineries would be owned and operated by what would be known as "Indian Company" sponsored by the foreign firms. Though the Indian investors would be given an opportunity to subscribe to the share capital of the Indian Company, the foreign firms would have the controlling voice.

Under the terms of the agreement the foreign companies had been assumed of fair and reasonable compensation should the Government decide to acquire the refineries after the expiry of the specified period of 25 years.

Assurance had also been given to exempt transfers of petroleum products from the "Indian Companies" to their foreign principals from sales tax, turnover tax or other tax of similar nature.

There will be no tax discrimination between these Companies and other Indian firms for ten years from the commencement of operations of the refineries or until December 31, 1965, whichever was earlier. For the same period an additional duty protection would be accorded to the products of the refineries by maintaining an import duty on motor gasoline at least annas two per imperial gallon higher than the excise on locally manufactured motor gasoline. No import duty would be imposed on crude oil and import duty imposed on any materials required for the refineries would not exceed 5½ per cent *ad valorem*. The refineries would be free to fix the prices of the products at any level higher than the landed cost and that tankers, regardless of flag, importing crude oil or products for the refineries or for marketing operations in India would be permitted to

lift products from the refinery for delivery to other ports in India.

The main object of establishing these refineries is stated to be the conservation of foreign exchange, and we have no doubt that a considerable saving will be effected thereby. But the price of petrol (gasoline) and allied petroleum products is climbing up to a prohibitive degree. We should like to be assured that a price reduction may be expected, so that the ultimate consumer, the general public, may become a beneficiary. Foreign exchange saved thus, would be spent otherwise, we have no doubt, by the spendthrifts in the Central Government.

State Managed Co-operative in Assam

The *Chronicle*, September 4, reports that textile goods worth Rs. 22687 had been stolen over a number of years from the Silchar Central Trading Co-operative Ltd., with the connivance of higher authorities. The report adds: "The Society came into being in 1948 with D. C. [Deputy Commissioner] Cachar as its Chairman. In 1949 goods stolen to the extent of Rs. 2761 was detected. In early 1950 same thing to the extent of another amount of Rs. 7300-10-2 was again detected. Finally, in the latter part of 1950 the total amount, i.e., value of the stolen, controlled textile goods was detected to be at Rs. 22687-14-1. Audit, enquiry and inspection, etc., have duly been held and persons responsible have also been found out. But strangely enough no action for recovery of the money or punishing the responsible persons has yet been taken."

Assam Approves Financial Corporation

The *Chronicle*, September 11, reports that the Assam Assembly had approved the constitution of a Financial Corporation for Assam with an authorised capital of two crores of rupees. The Corporation would have a paid-up capital of one crore of rupees to be raised in the following manner: Assam Government—25 lakhs; Reserve Bank—20 lakhs; Scheduled Banks, Insurance Companies, Investment Trusts, Co-operative Banks or other financial institutions—30 lakhs; and other parties—25 lakhs.

The Finance Minister, Sri Motiram Bora, explained that the Corporation would afford facilities for financing medium and small-sized industrial undertakings of Assam with potentialities of further development.

Linguistic Provinces

A further step forward has been recorded at the All-India Linguistic States Conference, as is indicated in the news below. We are glad that at last Bengal's case has been given some recognition.

Vallabha Vidyarnagar, Sept. 27. The All India Linguistic States Conference unanimously demanded here this evening that the Government of India should proceed to redistribute the country on the linguistic basis after six months from the date of appointment of the Boundary Commission.

The two-day Conference concluded to-day. Dr. Lanka Sundaram presided. The Conference said by a resolution that there was "no question" of appointing a high-power Commission to decide about the feasibility of the linguistic States.

"The principle of the formation of linguistic States for the country as a whole is now finally settled and is no longer open to any further examination or discussions. The only question which now remains is its implementation without any further delay," the resolution said.

REPORT WITHIN 6 MONTHS

The resolution called upon the Government to appoint the Boundary Commission "forthwith" and said that the report of the Boundary Commission should be made available within six months from the date of its appointment and that the Government should immediately proceed to the redistribution of the country on a linguistic basis having regard to such factors as common economic life and geographical contiguity.

Temple Entry at Deoghar

After the assault on Acharya Vinoba Bhave's party at the gates of the Baidyanath Temple, by some fanatic *pandas*, the question of the basic right of temple-entry by the Harijans came very much to the fore. We are glad that here some firmness was displayed by the Bihar Government in the solution of the problem as the following news indicates:

Deoghar, Sept. 27.—Dr. Sri Krishna Sinha, Chief Minister of Bihar, formally threw open the gates of the Baidyanath Temple for the Harijans today at 11-30 a.m.

Dressed in milk-white khadi with flowers and chandan (sandal paste) in hand, Dr. Sinha accompanied by Sri Mahesh Prasad Sinha, Information Minister, Pandit Binodananda Jha, former Minister of Local Self-Government and Sri Gourishankar Dalmia M.L.C. (Congress) and about 800 Harijans, including some members of the State legislature, entered the temple from the main northern gate.

A number of high State officials, including Sri K. Raman, Commissioner of Bhagalpur Division, Sri Mithileshwar Prasad Sinha, Inspector-General of Police, Sri Sarda Prasad Verma D.I.G., C.I.D., Sri U. K. Ghose, Deputy Commissioner, Santhal Parganas accompanied Dr. Sinha to the temple. Several thousand citizens turned out at the temple gates despite inclement weather and drizzling rain to witness the solemn ceremony when Dr. Sinha entered the inner precincts of the temple with Harijans and offered puja to the deity. The whole ceremony was conducted in a peaceful atmosphere. Elaborate police arrangements had however been made as a precautionary measure.

The issue of temple entry came to the forefront with the assault on Acharya Vinoba Bhave on September 19 when he went with a large number of Harijans to the Baidyanath Temple which had for long been the citadel of Hindu orthodoxy.

Dr. Sri Krishna Sinha took it as a challenge not only to humanity but also to the Indian Constitution and announced his decision to enter the temple with Harijans.

Since early morning batches of Harijans paraded the streets of Deogarh today shouting the slogans "Mahatma Gandhi-ki-jai," "Sant Vinoba-ki-jai" and "Behar Kesari (Dr. Sri Krishna Sinha) -ki-jai."

Pak Cinemas Close Down

PTI reports from Karachi on September 19 that all Karachi cinema houses screening Urdu films would be closed indefinitely from September 21 on account of shortage of Indian films, according to an announcement by the Karachi Cine Exhibitors' Association.

Pakistan producers were not in a position to produce enough pictures to feed the Pakistani Cinemas. West Pakistan had 250 cinema houses which needed at least 100 films every year. But Pakistan could hardly produce 10 pictures a year. Therefore, she needed to import about 90 films from India but the Government of Pakistan did not allow the import of Indian films since over a year now. Hence this crisis.

U.S.-South Korea Treaty

On August 8, U.S. Secretary of State, Dulles, and the South Korean Prime Minister had signed a Mutual Security Treaty between their two countries. *Reuter* reports: "The treaty which must be ratified by the Senate in Washington and the South Korean Parliament, declared that an armed attack in the Pacific area on either of the signatories would be regarded as dangerous to the peace and safety of the other and both 'would act to meet the common danger.'" The U.S.A. would have the right to station troops in South Korea.

The South Korean Foreign Minister had predicted on August 7 that the U.S. Senate which was the only legislative voice on such treaties would pass the pact "without difficulty."

In a Press Conference held after the signing of the Treaty, Mr. Dulles said that no agreed plan for the reunification of Korea had been decided upon but he had his own private views on the matter. He was reported to have told that if the Communists had sought to turn the 90-day limit to the conference into "fruitless propaganda," the U.S.A. and South Korea might withdraw before the 90 days were up.

Commenting on the treaty Y. Pavlov writes: "Under this agreement, the U.S.A. is to continue the occupation of South Korea with its land, air and naval forces. And the agreement says plainly that the U.S.A. assumes (1) the right to maintain its armed forces in or in proximity to South Korea. The agreement does not concretize the meaning of 'in proximity.'"

"This tendency of U.S. ruling circles to maintain military bases not only in Korea's territories but also 'in proximity' to Korea is symptomatic. It lays added

emphasis on the fact that the American military circles harbour far-reaching plans for conquests in the Pacific."

Speaking at Seoul on August 14, Dr. Syng Man Rhee said that it was South Korea's "wish and determination to march north at the earliest possible time."

In a declaration published on August 7 in New York the 16 nations with troops in Korea (the U.S.A., Britain, France, South Africa, New Zealand, Australia, Canada, Thailand, Turkey, Greece, Ethiopia, Belgium, The Netherlands, Colombia, The Philippines and Luxembourg) had warned the Communists that they would resist any new attack on South Korea and said that in that event, they probably could not "confine hostilities within the frontiers of Korea." PTI reports that though no names were mentioned the declaration "was regarded an obvious threat of action against the Chinese mainland."

Britain, however, made it clear that her signature to the declaration did not commit her automatically to war against China if the Communists broke the armistice.

In order to meet the criticism against Britain's association with the declaration, a statement was issued from No. 10, Downing Street on August 14 which stated that the terms of the declaration had been agreed upon in 1951 at the instance of the U.S.A. The declaration was concerned solely with what might be termed an 'unprovoked' breach of the armistice by the Communists. "If there were any breach of faith by anyone on our side, the Government would be entitled to reopen the whole question," it added.

Goondalism in French Indian Settlements

The *Bombay Chronicle* of September 8, reports: "Mr. Ramkrishnan, brother of Mr. R. Rama Srinivasan, President of the Karikal Youth Congress, which stands for the merger of the French India settlements with the Indian Union was bodily carried away into the French limits of Karikal on the evening of September 2 by a group of adherents of the Socialist Party, which is in power in French India."

The report adds that the family of Mr. Rama Srinivasan had migrated to India having been unable to bear the persecution by the pro-French elements. Mr. Ramakrishnan who had somehow succeeded in escaping told Pressmen that French goondas had been commissioned to carry the whole family into Karikal. He had lodged a complaint with the District Magistrate of Tanjore about the trespass of the goondas into the Indian Union.

This is by no means an isolated incident. We are beginning to wonder why this sort of thing is allowed to continue.

Anglo-Egyptian Talks

The latest news throws a more hopeful light on the Anglo-Egyptian tangle, as the following news

indicates. We hope the British authorities would show an understanding of the Egyptian Government's problem which is more a question of psychology than real-politics.

Cairo, Sept. 28.—An authoritative Egyptian source said today that Egypt had accepted all British proposals for a settlement of the Suez Canal base problem except that British technicians remaining behind should wear uniform.

The source added that Egypt had agreed on the evacuation of combatant troops in a period of 18 months, that 4,000 British technicians should help maintain the base for a period of three years and on allied re-entry to the base in the event of aggression against a member of the Arab League.

"But we cannot accept Britain's proposal that the technicians who stay should wear uniform," the source added.

"The talks which have so far been most successful may founder on this point, for we shall never be able to convince the Egyptian people that the withdrawal of British troops from the Canal Zone is complete."

The Politics of Suez Canal

Of all the great roadways of the world, the sea-road to India through the Isthmus of Suez is perhaps the most important, for it joins East and West, Asia and Europe, the two most thickly populated continents. Since its opening in 1869, its importance in enlarging the intercontinental route has been great. It facilitates access to raw materials from the uttermost parts of the earth and the opening of new markets for manufactured goods. If the Canal is blocked or efficiency impaired the whole western world is affected. Renan perhaps voiced the truth when he said in his welcoming speech to Ferdinand de Lesseps upon the latter's admission to the French Academy:

"The great sentence, 'I came not to bring peace, but a sword,' must have come often into your mind. Once the Isthmus was cut, it inevitably became a passageway, that is, a field of battle. So far, one Bosphorus had made for quite enough trouble in the world, but you have created a second which overshadows it in importance, for it connects not merely two landlocked seas but all the great oceans. In the event of a naval war, this is the point which the contending powers would struggle most urgently to occupy. You have set your seal on one of the great battlegrounds of the future."

In ancient Roman eyes, Asia was a fabulous source of riches and luxury. Trade on a truly international scale developed between the three important centres of civilization: the Mediterranean, the Hellenistic Middle East and the Far East proper (India and China). Rome imported from India perfumes, cloth, precious stones, spices and circus animals, but had little to offer in exchange. She paid in gold for an unfavourable trade balance, and eventually all the gold of the West found its way to Byzantium and India. In the Middle Ages,

the trade balance remained approximately the same. Egypt was the great meeting place where merchants from Genoa, Venice, and Catalonia met their Arab counterparts from all parts of Africa and Asia. The Turkish capture of Constantinople in 1453 cut off the ancient routes to Asia, until 1498 when Vasco da Gama opened a new sea route, around the Cape of Good Hope, to India. As a result, the Mediterranean was changed for three centuries from a passageway to a blind alley and the world centre of gravity gravitated towards the shores of the Atlantic and the Great Powers which bordered upon it.

The relationship between Europe and Asia underwent a radical change when the industrial revolution came into full force and steam navigation swept the sailing ship from the seas. Industrialised 19th century Europe was no longer content with Eastern spices and other luxury goods. It required raw materials for its factories, and foodstuffs in wholesale quantities for an expanding population which it could no longer support. Its exports were transformed to mass production goods, tools and machinery which had a great appeal to an East roused by its new contact with the western economy.

The East now appeared in quite a different light—not as the legendary and marvellous region of the past but as a no less precious reservoir of cheap raw materials, and at the same time a market for the West's growing industrial production. A new system of exchanges developed: Europe imported goods in the raw and sent them back manufactured.

The passage from England to India by the middle of the nineteenth century required, via the Cape of Good Hope, 140 days by sail and 90 days by steam, and the necessity of a direct route was increasingly being felt. The problem of the Suez Canal as Lesseps saw it in 1854, when he obtained permission to construct it from Mohammed Said, Viceroy of Egypt, was not so complicated. This was the age of liberalism with free trade and enterprise, lower tariffs and with unlimited possibilities of capital, credit and competition. Lesseps was able to count on financing his project through a private company to which savings from all over the world would contribute. In those days of peace and limited wars he felt that in case hostilities broke out the underlying economic agreements would be maintained. He thought that the Canal should not be looked upon as the property of any single Power, but as an undertaking shared by all mankind. Although Mohammed Said, and Ismail after him, preferred the Canal to belong to Egypt rather than Egypt to the Canal, they however maintained a strictly neutral attitude toward the Company charged with constructing it. They offered to nationalistic arguments to interfere with the work of the engineers and administrators. Lesseps never dreamed of asking for the establishment of a "Canal Zone," or a special body of police under his control. He had no fear

that the Egyptian authorities would violate his contract with them. And indeed his only administrative vexation which arose over the issue of employing *fellah* labour, came not from the Egyptians, but from a jealous Britain. It is only in the present century that violently anti-western Egyptian nationalism appears. Before 1869 the Isthmus was a stretch of desert, detached from the main body of Egyptian territory, even though Egypt's political frontier was 150 miles to the east.

Under the circumstances, Lesseps and Mohammed Said had little difficulty in reaching agreement upon the fundamental idea of the enterprise. Its main features are (just as they exist today) written into the original concession, signed on November 30, 1854. The concession was a personal arrangement with "our friend, M. Ferdinand de Lesseps," to whom was given full power to set up and direct a "universal" company for the piercing of the Isthmus and the exploitation of a canal between the two seas. The epithet "universal" indicates that the Company was free from any national bias. Rates were to be the same for all countries, with no chance for any one of them to obtain a special favour. The concession was made for a period of 99 years from the opening of the Canal, that is, it will terminate in 1963 when the Egyptian Government is to replace the Company, paying a sum, to be fixed by arbitration, for the installations and equipments.

Lesseps' real difficulties were neither technical nor financial—but political. Notwithstanding the solemn declaration of the founders that the undertaking was international in character, Britain was profoundly mistrustful and was afraid that under the cover of the slogan of international neutrality, France was trying to obtain a monopoly of communications between Europe and Asia. Lesseps sought to raise his capital of 200,000,000 francs by public subscription. English hostility, instigated by Lord Palmerston, continued to the very end. The principles of availability to all and complete neutrality were not enough to satisfy the British Prime Minister, and Lesseps' attempt to obtain an international guarantee of neutrality was unsuccessful. Evidently, Britain wanted a privileged position, asserted by reason of the fact that English traffic would be the Canal's mainstay.

One year after the opening of the Canal, when Lesseps received a great reception in London, *The Times* wrote: "M. de Lesseps has come to a country which did nothing for the Suez Canal, but which, since the opening, has sent more traffic through it than all the other nations of the globe combined. This country supplies most of the money which will be paid in dividends to the shareholders. May this be a compensation for whatever errors we may have made at the start."

During the years 1870-80, 76 per cent of the total tonnage that passed through the Canal was under the British flag, and France which came next, had only 8.3 per cent, while the USA was insignificantly represented.

Having been outstripped by France in the creation of the Canal, England proceeded to make up for the lost time, first, by buying out the 177,000 shares held by the Khedive Ismail, and thus entering the Company's administration. Secondly, by effecting a military occupation of Egypt in 1882, Britain secured an effective rule over the country including the Isthmus.

The purchase of Ismail's shares however did not give Britain control of the Company, which had 400,000 shares outstanding. But with Lesseps' consent Britain achieved minority representation on the Board of Directors on a basis of friendly and loyal co-operation. The British occupation of Egypt seriously modified the Company's position, because the Khedive no longer held the reins. Although temporarily at least Britain accepted a status of neutrality, she intended at the same time to take advantage of the privileges gained by military occupation. Under these conditions, France all the more strongly desired an international covenant of some kind, and one was eventually adopted under the name of the 1888 or "Constantinople" Convention.

The principles of the Convention were largely based on the presupposition of neutrality or "free use." The Canal was to be kept open, in war as in peace, to warships and traders alike; no fortifications were to be built and no blockade allowed. The Khedive's Government, with the support of the Ottoman Government, to which it owed allegiance, was to insure the observance of these rulings. The validity of the Convention was not limited to the duration of the concession, but was indefinite. But by virtue of the military occupation Britain became obviously the actual guarantor.

Until 1920 this system functioned and it was Britain's chief interest to keep the waterway to India open. During the Franco-Prussian war of 1870, the freedom of the Canal was respected even by the belligerents, and also during the Italo-Turkish war of 1911. Although the Canal at that time was an Ottoman territory, Turkey did not oppose the passage of 12,400 Italian soldiers and three warships.

In recent years the political complexion of the Suez has undergone change. Since the second world war, the political map of Asia has greatly altered. An independent India has emerged, while Communist China has abandoned the West entirely. In the days of British domination, India's tariff policy was determined in London and that of China through the International Customs Union, headed by the Englishman, Sir Robert Hart. More than 50 crores of people are thus removed from the economic domain of the West. Middle-Eastern oil is a new and important factor in trade along the Suez. The character of north-to-south traffic has not altered for it is still composed of manufactured or semi-manufactured goods, mostly machines, railway equipment and tools, all directed to countries in the process of industrialisation. Although traffic from north to south has considerably increased in volume, it still consists mainly of raw materials. In 1913, raw materials came to 45 per

cent and foodstuffs to 31 per cent, with 5 per cent of manufactured and semi-manufactured goods and 19 per cent miscellaneous. In 1952, manufactured goods represented 7 per cent, foodstuffs fell to 5 per cent and raw materials came to 86 per cent; but oil made up 83 per cent of the raw materials and 74 per cent of the total. The large decline in volume and degree of foodstuffs are due to the population crisis of an Asia which cannot feed itself, and the increase in oil is of course, a result of the sensational development of the Middle-Eastern Oil fields. Oil is now the main commodity of trade along the Canal and the construction of pipelines leading directly to the Mediterranean may partially improve the position. Oil is the main commodity in south-to-north trade. In view of the decisive role played by oil products in both peace and war today, the freedom and security of communications through the Canal is becoming more and more important for Europe and for the USA.

The largest part of the tonnage is under the British flag—33.3 per cent of the total in 1952. Even so this represents a great decline from the figures of 51.4 per cent in 1939 and 76.1 per cent between 1870-80. Britain still uses the Canal a great deal more than any other nation, and is therefore the Power most directly interested, from both a political and a commercial point of view, in its efficient functioning. Until 1939, hardly any traffic went under the American flag—only 0.15 per cent of the total. The second world war brought a considerable increase, however, and in 1952, 7.3 per cent of the tonnage travelled under the American flag. American imports through the Canal were 6,156,000 tons in 1952 largely oil and manganese; exports amounting to 4,079,000 tons were mostly grain on the way to the famine-stricken India. The USA is present now in the Near East with an accumulation of economic and political interests. The Suez Canal therefore cannot now be solved without the co-operation of the USA.

There are two sides to the military problem of the Suez Canal—the question of the defence of the Canal, and of the maintenance of free passage through the other seas and straits along the route. At present the Mediterranean background is not what it was at the end of the nineteenth and the beginning of the twentieth century. Although Britain still has nominal control of the Isthmus and the road to India, her position is precarious and the whole system calls for revision.

Although the principles of the Constantinople Convention still hold good, it has undergone important modifications. According to the text of 1888, the Ottoman Government, which then held sovereignty over Egypt, was supposed to enforce the Convention. But Britain, by virtue of military occupation, was in actual control and has been ever since, under a different title. Article 152 of the Versailles Treaty transferred to Britain the powers given to the Sultan by the Convention. And it is on the basis of an Anglo-Egyptian Treaty of 1936 that Britain occupies the Isthmus. After passing in 1914 from the status of a vassal to that of a British protectorate, Egypt

in 1922 acquired self-government and has been intolerant of foreign military occupation ever since. In October 1951, Egypt abrogated the 1936 Treaty, but Britain still occupies the Isthmus and will not consent to withdraw until the present makeshift arrangement is replaced by a permanent one guaranteeing the safety of a route which is indispensable to her status as World Power. For the Canal is still a vital link in Britain's system of communications.

The two world wars have taught England that the hostility or the hostile neutrality of a single one of the Mediterranean Powers can endanger the safety of the Canal. Any enemy that has a foothold on this narrow, winding body of water, so admirably suited for ambush and intrigue, can close it. For this purpose, control of the military installations is not necessary. Twice in the course of the last war, England revived Vasco da Gama's abandoned route around the Cape of Good Hope. It is longer and more expensive, but safer, at least comparatively, from attack by airplanes and submarines. Some Britons say that Palmerston was right in opposing the construction of the Suez Canal. In 1926 Sir John Marriott said in the House of Commons: "Looking back after a considerable lapse of time, I am not sure that the British statesmen who opposed the Suez Canal from the point of view of both diplomacy and power were not right. . . . If the Canal had never been pierced we might find ourselves in a stronger position today. And if this is true, how necessary it is for us to keep the route around the Cape and to see that the African coast, to both East and West, is free of foreign domination."

Up to the second world war, the completely free movement of traffic through the Canal was never questioned. The first Article of the Convention of 1888 established "free use of the Canal in time of war as in time of peace," and the Company assured it. But during the recent war in Palestine, the Egyptian Government has claimed a right to stop tankers on their way to Israel. This is a violation both of the original 1854 concession and the Convention of Constantinople, which is still valid. Egypt justifies her action by Article 10 of the 1888 Convention, which states that other provisions of the Treaty "shall in no case occasion any obstacle to the measures which the Imperial Ottoman (read Egyptian) Government may think it necessary to take in order to insure by its own forces the defence of its other possessions situated on the eastern coast of the Red Sea." It was under pretext of self-defence and the preservation of law and order that the Egyptian declarations of May 15 and 18, 1948, introduced the inspection of ships in Egyptian ports and the confiscation of goods destined to an enemy. The Egyptian plea is that she respects the idea "free use" and that she objects, not to the passage of ships, but to cargoes containing contraband goods sent to a hostile Power. But the free passage of a ship has no meaning unless it includes the passage of its cargo as well. Neither the Turkish Government, in the course of the Italo-Turkish war, nor the Allies in 1914

and 1940, raised any such arguments in order to twist to their advantage the text of an agreement truly international in spirit.

The problem of the Canal is thus a complex one, and the military occupation of the Isthmus is no solution. Although the Canal passes through Egyptian territory it has an essentially international character and cannot be run in any other way than an international spirit. In any future arrangement regarding the Canal, India should have a voice as she is now vitally interested in view of her increasing tonnage along the Canal.

World Bank Completes Six Years

It is only six years now since the International Bank for Reconstruction and Development started its operations. The Bank has achieved a fair measure of success in discharging its functions laid down by its founders, and has proved itself as an effective institution of international co-operation. The functions of the Bank are the mobilisation of world savings for making capital available at reasonable rates of interest over long periods for projects calculated to raise the productivity of the borrowing country; expansion of investment to provide capital for both reconstruction and development of the war-devastated countries, and also to organise mobilisation of economic resources in underdeveloped countries for raising the standard of living of the masses.

The Bank's Annual Report for the year ended 30th June states that with the admission of Germany, Japan and Jordan during the year, the membership of the Bank rose to 54, and along with it, the total subscribed capital to \$9,036 million. The table below indicates the trend of lending by the Bank during each of the last three years:

	1952-53	1951-52	1950-51
No. of loans	10	19	21
No. of countries	9	16	11
(In million dollars)			
Loans sanctioned during the year	178.6	298.6	297.1
Progressive total of loan sanctioned	1,591.0	1,412	1,114
Disbursement during the year	226.8	184.8	77.6
Total disbursements to date	1,103	876.5	691.7

During the year under review, the World Bank made only 10 loans to 9 countries, whereas, in the previous year, 19 loans were granted to 16 countries. Similarly, in line with the number of loans, the value of the loans also shows a decrease, from \$298.6 million to \$178.6 million. This brings the total of the Bank's loans to \$1,591 million shared by 29 countries, in the preceding year. Two of the ten loans issued during the year under review were made in support of a broad range of economic projects. Agriculture, basic industries and transport benefited from a loan to Australia. In Yugoslavia, the Bank supported a group of projects calculated to improve the country's balance of payments.

The Bank gave loans to specific key industries, such as iron and steel in India, wood products industries in Finland and for a fertiliser plant in Iceland.

The share of Asia and the Middle East is only \$187 million, representing only 17.5 per cent of the total of \$1,063 million granted to all the five regions, namely, (a) Asia and Middle East, (b) Africa, (c) Australia, (d) Europe and Western Hemisphere. A year ago, the share of this region was even less at 14.6 per cent of the total. Nevertheless, the assistance given by the Bank to this still constitutes only a fraction of its needs.

During 1952-53, the total disbursements amounted to a sum equivalent of \$226.8 million. This sum, which covers new and existing loans, was the highest reached since the Bank commenced its lending operations for development. Total disbursements to-date amounts to \$1,103 million, of which \$1,014.5 million is repayable in US dollars. Due to an improvement in the supply position of goods outside the U.S., particularly in Europe, the Bank is now encouraging the purchase of materials and equipment from whatever source available at the terms most favourable to the borrower. The geographical distribution of loan expenditure on cumulative total basis reveals that to-date the USA has got the 69.8 per cent of the total expenditure made by borrower countries, Canada 6.5 per cent, Europe 17.5 per cent, Latin America 5.5 per cent, Africa 0.4 per cent, Near East 0.2 per cent and Far East 0.1 per cent.

The Bank sold new bond issues worth \$71.6 million. In October 1952, the Bank issued 19 year 3½ per cent bonds worth \$60 million at 98. Nearly \$20 million of this was subscribed by investors outside the U.S. In November 1952, the Bank floated in Switzerland 3½ per cent ten year Bank Bonds at 98½. The bonds amounted to 50 million Swiss francs or approximately \$11.6 million. The Bank further increased its resources by selling \$13.6 million of securities from its portfolio. The Bank's resources of non-dollar funds were increased by further releases of the capital subscriptions paid in by members in their own currencies, and equivalent amount of releases is \$26.6 million.

India has now become one of the chief beneficiaries of the World Bank. It has so far received loans aggregating \$109.8 million. The Bank gave three loans to India in 1949-50, amounting to in all \$62.5 million which was finally reduced to \$58.8 million at India's own request. In 1952-53, India received two more loans—one for a sum of \$31.5 million granted to the Indian Iron and Steel Co., Ltd., Calcutta, and the other of \$19.5 million for further developments of the Damodar River Valley.

F. A. O. Report

In a review of the latest report of the Food and Agricultural Organization, the *Times* writes that the report showed that, taken as a whole world food supplies had caught up with the growing populations. World food supplies and world population were both 17

per cent higher in 1952-53 than in 1939. But "this can be a misleading generalization," the paper says, "Production had expanded rapidly in the most advanced countries—most remarkably in North America—but in the less developed regions progress was slow.

The more developed regions had more to export and had accumulated stocks while the less developed regions—notably the Far East—had in many instances lower consumption than before the war. In North-west Europe, agricultural production had gone up by 16 per cent compared to pre-war and in North America by 45 per cent. Inevitably, North America now provided a much larger proportion of the world's food exports.

In the U. K., production of grains and potatoes had increased more than in other countries of Northern or Western Europe in general, but, her meat and egg production was less. The increase in her milk output also was larger but in certain countries, the average yield of milk from each cow had risen faster since before the war and that yield was higher in Sweden, Switzerland, Denmark, Belgium and the Netherlands.

The *Yorkshire Post* writes that the report had emphasized that the undeveloped countries themselves must try to improve their position. A large part of available public funds in the Asian countries was already devoted to agriculture. But domestic capital was quite inadequate for the purpose and private and public capital from abroad must come to their help. The paper notes that such help had not been sufficient and probably less than 40 per cent of the necessary extra capital was being provided.

The paper writes: "Somehow the difference has to be made up, possibly by a special U.N. fund for economic development. If the new report does nothing else, at least it draws attention to the size of the problem and the need for swift action."

Politics in France

France has been in the throes of unstable party politics ever since the return of peace. The Communist Party in France has been trying to bring chaos by all means in its power. The latest have been country-wide strikes, that paralysed the nation's work and transport. The strikes failed without attaining the objective. Thus writes the *Newsweek* of New York on September 7:

"France came up for air last week. The strikes that had all but smothered the country in stalled trains, stranded vacationers, undelivered mail, and uncollected garbage, collapsed as even members of Communist unions defied their leaders and followed non-Communists back to work. The Moroccan crisis that had threatened to bring civil war to the strategic French protectorate in North Africa blew itself out. The United States promised to support France in voting against bringing the issue before the United Nations, and

Foreign Minister Georges Bidault presented the Cabinet with a long-delayed program of political reforms for Morocco.

"Who won the strikes? Premier Joseph Laniel failed in his effort to impose some needed economies, and, in fact, half promised some additional inflationary wage increases. The strikers failed in their effort to overthrow the government. They got only 207 of the 209 petitions from members that would have forced the recall of the National Assembly from summer recess. The French people lost a bit more of their faith in everything. One Parisian, returning by airplane from a trip abroad, summed up the situation cynically: France had suffered, he said, 'just a little catastrophe.'"

War in Indo-China

Arnaud de Borchgrave, *Newsweek* correspondent who had toured Indo-China early this year, describes the situation in Indo-China thus: "Actually, the delta, with its 10,000 villages and 6,000,000 inhabitants (with 1,500 people crowded into each square mile), is a condominium. The French rule by day and the Reds by night.

"Almost all roads into the delta are sown every night with mines, which currently cause 60 per cent of the casualties in the north. A notable exception: the main road from Hanoi to Haiphong, over which 1800 civilian trucks ply daily—many of them with Communist shopping baskets. Gaps between the scores of concrete pill boxes along the delta's outer defense perimeter are so many holes in a sieve at night. A year ago, the Reds had about 15,000 men in the delta. Today they have more than 40,000." (*Newsweek*, April 20, 1953).

"When the French approach, the Vietminh vanish below ground only to pop up again half an hour after the French have pulled out. A French intelligence report on the village Le-Loi showed that the Reds have 400 feet of tunnels and 109 individual secret hideouts. All of these are 200 yards of the village, and mostly run under the flooded paddy fields. To find them is like looking for a needle in a stack of rice straw . . .

"The war, with 490,000 French Union and Viet-Namense troops pitted against 400,000 Vietminh, has already cost plenty in men and money. France has the equivalent of twelve divisions tied down to Indo-China. It has lost 36,000 killed, including 1,500 officers, and more than 100,000 wounded, missing and prisoners. Tied up in Indo-China are 30 per cent of the French Army's officer corps and 43 per cent of its noncoms.

"In proportion to its strength, France's effort in Indo-China is far greater than that of the United States in Korea. So far, the war has cost about \$6,000,000,000—twice as much as the total aid received by France under the Marshal Plan. The drain is continuing at the rate of \$1,250,000,000 yearly for France. It amounts to 43 per cent of France's defense

budget. The United States pitches in to the tune of \$525,000,000.

"The Vietminh strategy is to bleed the French white, to avoid an all-out test of strength, and to run whenever outnumbered, or outgunned. Time and again, the French army chiefs believe a decisive battle is in the offing but it never materializes."

Mr. de Borchgrave writes that since 1949 the official French policy had been to create a strong nationalist government, friendly to France. "But small time functionaries have done their best to sabotage progress. In Saigon, our representatives have fallen into the all too tempting game of power and intrigue," said a recent top-secret report to the government, drafted by four French parliamentarians after a trip to Indo-China." (*Newsweek*, July 27).

Lack of leaders was a reason. Nobody had the dynamic political prestige of Dr. Ho Che Minh. Bao Dai's prestige "ranges from bad to indifferent." And to make it worse Bao Dai was always at loggerheads with his Prime Minister, Nguyen Van Tam.

Speaking at a round table discussion at the annual conference of State Governors at Seattle on August 5, President Eisenhower "mentioned particularly Indonesia and India as areas which would be endangered if the Communists were able to complete the conquest of the Indo-Chinese States." (*Reuter*)

The Congress had voted 400 million dollars towards fight against Communism in Indo-China.

In an editorial on Eisenhower's statement, the *Leader* comments: "We are unable to understand how the perpetuation of French colonialism will conduce to India's security."

In an article headed "Why there is no Cease-fire in Indo-China," A. Kurov writes: "Edgar Faure, Minister of Finance and Economy, declared publicly in April of this year that 'France is not fighting for her own interests in Indo-China,' that on the contrary, France is 'greatly interested in having the war ended.'"

"The Indo-China war—and the French Ministers no longer attempt to hide the fact—is ruining France and making her increasingly dependent on the United States. Washington is taking advantage of this dependence, especially on supplies of American arms, to exert pressure on the French Government. It is not only insisting that France continue the war against the people of Indo-China, but is demanding supreme direction of the operations."

According to the writer, the American Government had also used the recent Washington talks of the three Western Foreign Ministers to obtain further French concessions on the Indo-China question. He writes: "*Le Monde* stated on July 21 that Bidault had consented to the so-called 'internationalization' of the Indo-China conflict, that is, to direct U. S. interference in the war. By this arrangement,

Le Monde pointed out, 'America is to assume the chief responsibility in the war and we will have to agree to her negotiating directly with Bao Dai.'"

It was on the insistence of the U. S. Secretary of State, Dulles, that the Navarre plan of operations in Indo-China was adopted. Mr. Kurov quotes *Paris Combat* which wrote: "The danger is so evident that one asks how a Government and an Assembly which had been alerted by alarmed public opinion can resign themselves to persisting in a venture of which we are no longer the masters. This absurd war is more and more coming to resemble a fool's venture."

The three-day conference of the Bureau of Asian Socialists during the second week of August demanded in a resolution, "cessation of fighting in Indo China and the holding of free elections under international supervision for a constituent assembly to determine with outside interference the constitution of a free and independent Indo-China and the form of its future relationship with France and other countries." (*Hindu*, August 15, 1953).

Deposition of the Sultan of Morocco

The French Government deposed the Sultan of Morocco, Mohammed V, on August 20, for his nationalist stand and refusal to toe the French line and banished him to Corsica with his two sons. On August 15, he was deprived of his title of "Protector of the Faith" by the pro-French Pasha of Manakesh and tribal chiefs. The Sultan was accused by the French of leaning heavily on the side of the extreme nationalist movement, Istiqlal and secretly angling for American support against France. Talks of deposing the Sultan, first arose about a year ago when Marshal Juin had been the Resident.

Reuter reports that when the banishment order had been served on the Sultan, French tanks and armoured cars took up positions around the high-walled palace, blocking all roads leading to the area.

"Mass arrests were reported on the night of August 20, in various parts of Morocco including the detention of the Pasha of Meknes, a supporter of Istiqlal movement and Ben Jelloum, Secretary-General of the Democratic Independence Party, affiliated to Istiqlal.

"Some 300 people were reported arrested in Oujda scene of bloody rioting over the weekend after the proclamation of a new 'Commander of the Faithful' by 350 anti-Sultan chieftains."

The Sultan's cousin, Sidi Mohammed Ben Arafa, was proclaimed spiritual and temporal ruler of Morocco. How far he is a mere stooge of the French will be evident from *Reuter's* report from Rabat quoting French comments on the new situation in Morocco. The report, dated August 23, said that "relations between the Sultanate were said to be closer than at any time in recent years. Gen.

Guillaume, the French Resident General mentioned at yesterday's Palace reception, the word 'protectorate' which had for some time disappeared from Imperial pronouncements in Morocco."

Sixteen Arab-Asian nations had approached the Security Council for a discussion on the recent coup in Morocco but on the persistent opposition of the colonial power, U. K. and France and the U.S.A., the matter failed to be included in the agenda.

The Trieste Question

Lately the Trieste question has been very much in the news. After the conclusion of the Second World War, Trieste had been divided into two zones. Zone A, including the city itself, had been placed under Anglo-U.S. military occupation and Zone B under the Yugoslavs. It was a temporary arrangement and the whole question was to have been settled by the U.N., but so far no agreement has been possible.

The recent happenings there have not been quite clear. Fearing Yugoslav announcement of the annexation of Zone B with Yugoslavia, Italian armoured troops had moved up to the frontier at Gorizia and Italian naval movements had also been reported.

On September 6, President Tito had called on Italy to cease military operations along the border and indicated his willingness to discuss the question at a round table conference. He had declared that Trieste should be internationalized and all its surroundings given to Yugoslavia. Rejecting the Italian accusation that Yugoslavia had intended to annex Zone B he had declared that that was "unnecessary as Yugoslavia was already in Zone B." He had clearly warned the Italians that Yugoslavia would not allow Italian troops to occupy Zone A.

Commenting on President Tito's speech, the *Times* writes that the Italian Government was not likely to look upon the solution put forward by him with any favour. However, speech had dispelled fears about Yugoslavia "plotting any forcible change there." The paper says that when hard words were left on one side the substance of what Marshal Tito had said "was calculated to be reassuring." The President had proposed a conference to discuss the issue though, true enough, the terms offered made it difficult for the Italian Government to attend such a conference.

The *Times* continues: "If there is to be a permanent international regime at Trieste, as the peace treaty envisaged, it will need to control a workable territorial unit and not merely the part that Marshal Tito's troops failed to seize in 1945 (that is, Zone A—Ed., *M.R.*). If the Yugoslavs refuse to give up an inch of ground then they are, in effect, insisting upon territorial division and it will follow that the Italians in the end will get the city and the port. But though Marshal Tito put his price high yesterday, he might bring it down in negotiation. His proposal of a conference needs to be taken seriously.

British Press on W. German Elections

The *Times*, in an editorial on Dr. Adenauer's victory writes that the result of the elections indicated that the Federal Republic was a success. The newspaper considered that the result pointed to the failure of Nazi influence and suggested that the general trend was not a drift to the Right but a shift to the middle. The results provided the "assurance of a stable and moderate government in West Germany."

The *Manchester Guardian*, while welcoming the results, cautiously remarks that "the victory has perhaps, been too much personal. Its individuality may raise an echo of that old cry 'Ein Volk, Ein Reich, Ein Fuhrer'." Though the newspaper was sure that Dr. Adenauer had no wish to follow in the footsteps of Hitler, the same could not be said of the millions who voted for Dr. Adenauer. They did so because he was a strong man, a leader, and the one most likely to thrust Germany back to resounding greatness in the world. The victory might sound ominous to the French, the paper writes, but the French might "find consolation in Dr. Adenauer's persistent efforts to keep on good terms with them."

The growing economic prosperity and the prospect of a secure and efficient government would induce the United States to look on Western Germany as good investment.

The *Daily Telegraph* writes that the election added "one more element to the strength which the West can now bring to any negotiations with the Soviet Union; and on the other side, Russian attitude may be a stiffened realisation that the Federal Republic is firmly committed to the West."

The *Financial Times* calls the result "a tremendous personal victory for Dr. Adenauer" but adds that it was also a victory for the doctrine of free enterprise. In that regard the paper gives much credit to Dr. Erhard, Minister for Economic Affairs of Western Germany. The paper writes: "The Christian Democrat's gains have indeed been largely at the expense of the extreme Right, which in Germany has not been notably associated in the past with the support of genuinely free enterprise. It is, therefore, not fanciful to see the German election results as not only a vote of confidence in the government but also to some extent as the triumph of a doctrine."

Chou En-Lai on U.N. Resolution

In reply to the communication sent by Mr. Dag Hammarskjöld transmitting the resolutions of the United Nations on the Korean Political Conference, Mr. Chou En-Lai, the Chinese Foreign Minister, said that in the view of the Chinese Government, the question of composition of the Political Conference had an important bearing on the consummation or failure of the task of the Political Conference, and it

should not be decided by one side unilaterally, but could only be settled through joint negotiations by the United Nations and the Governments of the People's Republic of China and the Democratic People's Republic of Korea.

The Political Conference, Mr. Chou En-lai said, would be concerned with a much wider task than the armistice negotiations. The Political Conference would "negotiate the withdrawal of foreign forces from Korea and the peaceful settlement of the Korean question." Its outcome would be significant not only for Korea but in promoting peace in the Far East and throughout the world. Therefore, the conference should not be restricted to the belligerent nations but should include neutrals. The U.N. resolution on the composition of the conference had "made an injurious distortion to Paragraph 60 of the Korean Armistice Agreement." The General Assembly in adopting that resolution had "allowed itself to be dominated by the United States," and had deprived three-fourths of the members of U.N. an opportunity to play their part in the peaceful solution of the problem.

Mr. Chou En-lai particularly regretted the exclusion of India from the conference, because India would "definitely play a positive part in the achievement of the withdrawal of all foreign forces from Korea and the peaceful settlement of the Korean question."

In view of all these considerations the Chinese Government was "not in a position to give full agreement to the resolutions on the composition of the Political Conference" and instead proposed that

"(a) Participating members of the Political Conference should be all nations on the two belligerent sides in Korea, including Democratic People's Republic of Korea and South Korea, and the following invited neutral nations concerned: The Soviet Union, India, Indonesia, Pakistan and Burma.

"(b) The Political Conference should take the form of a round table conference. However, any decisions of the Political Conference must obtain the unanimous agreement of both belligerent sides in Korea.

"(c) The representatives of the Governments of China and North Korea be invited to be present at the General Assembly of the U.N. to conduct joint negotiations.

"(d) After the composition of the conference had been agreed upon, the two belligerent sides in Korea should hold consultation and make arrangements concerning the place and time of the conference."

The *Hindu* in an editorial comment on the U.N. Assembly resolution writes that "the present composition of the Assembly is such that no resolution unacceptable to the United States has much chance of success. If the Communists want the conference at all, they will have to accept the nominees of the United States."

Resurgence of Islamic Fanaticism

Mr. Avroo Manhattan writes in the *Free Economic Review* that while following the collapse of the Ottoman empire in the First World War, "Islam was made to tumble like an exhausted colossus," the second World War "provoked its sudden revival."

Following the first World War, Turkey the seat of the Caliphate, had initiated summary reforms banning almost all ancient Islamic traditions. These had been followed by many of the other Islamic countries. "The Mullahs were stripped of their influence to such an extent that Islamic clericalism, it was optimistically predicted, would disappear within the foreseeable future."

But that optimism had been belied. The conclusion of the second World War beheld the reappearance of the power of the Mullahs in an astonishingly brief period. The power of the Mullahs was no longer confined to the religious sphere. They were also now dominating the political field—a fact that portended an ominous future.

This power of the Mullahs was, in many instances, exercised for reactionary ends. To quote Mr. Manhattan, "In the domestic field, for instance, they can obstruct and often undo the work of progressive forces by cunning use of half-authoritative injunctions, e.g., by semi-officially condemning women's emancipation. This was done by a *fatwa* of the committee of the Al Azhar University, Cairo, which in June 1952, pronounced against women's right to vote."

Religious fanaticism was used by the Mullahs to enforce a veritable reign of legal and illegal terrorism. Often Mullahs having influence in the government of a country was able to mollify the opposition by the use of his religious influence, apparelled in political garb, as demonstrated by Syed Kashani in Persia at whose instance thirty-five Persian Senators had been refused admission to Parliament in November, 1952.

"Often the Mullahs resort to open terrorism. Movements controlled by them black-list people, condemn them to death, and often execute them. Thus in Turkey Muslim religious fanatics have death-lists of editors whom they condemned for 'organizing beauty queen contests' which are contrary to Islamic law. Turkish editors were actually shot. In Persia, the fanatical Fadayal Islam (crusaders of Islam) published in the Press list of public figures scheduled for assassination." Officials, Prime Ministers had been assassinated at clerical instigation. Khali Tahmassebi who had killed Premier Ali Razmara of Iran in 1950, was released by Syed Kashani, who embraced him with the greeting, "You are a brave son of Islam."

In Hyderabad, the President and eight other leading figures of the fanatical Muslim organization, Ittehad-ul-Muslimeen had been officially charged with 1,200 murders, 4,000 dacoities and 3,600 acts of arson,

in a conspiracy to establish an autonomous Muslim entity in Hyderabad.

Significance of the Developments in Iran

The American journal *Newsweek* wrote after the failure of the first royalist coup in Iran on August 16: "Someone, somewhere, somehow had bungled. A revolt that might have placed Iran securely in the Western camp, misfired or was anticipated and short circuited by its intended victim, Premier Mohammed Mossadeq."

The paper wrote, "Behind the coup lay a tangle of intrigue with Mossadeq and the Shah at the Centre. The basic facts were simple. The West saw Mossadeq, although personally anti-Communist, driven by economic pressure and domestic opposition into an uneasy and dangerous alliance with the Tudeh Party." The paper refers to certain incidents preceding the happenings as significant. In early July President Eisenhower had told Dr. Mossadeq that no more American aid would be given Iran unless she had settled the oil dispute with Britain. On July 25 Princess Ashraf, the Shah's twin sister, who had been exiled from Iran, had arrived in Teheran incognito. Though she had again been ordered out of the country she had succeeded in contacting her many friends in the court and in the army. On August 1, Brig.-Gen. H. Norman Schwartzkof, former American military adviser to the Iranian Government, arrived in Teheran to meet the Shah. (The Communists had charged him with complicity in the revolt of August 16). And on August 4, President Eisenhower had referred ominously to the danger of Iran going Communist.

On the other hand, Malenkov had referred to Iran, in very kind terms, in his speech on August 8 before the Supreme Soviet. Moscow was willing to realise 11 tons of Iranian gold and 8 million dollars held since the war.

The immediate background of the revolt on August 16 was the refusal of the Shah to sign a decree dissolving the Parliament. On the contrary, he had secretly signed three decrees dismissing Dr. Mossadeq, appointing Gen. Fazolollah Zahedi in his place and naming Gen. Nader Batmanghelitch, Chief of staff, in place of Gen. Taghi Riahi, and had gone to Caspian coast with his half-German wife, Soraya, presumably to be "safely out of range," should anything go wrong.

But the coup failed and the Shah had to move out of Iran. Pro-Mossadeq moles swept through Teheran. But when royal statues were toppled from their pedestals, Mossadeq took fright and ordered Gen. Riahi to intervene. "But there was no ammunition. By a previous order of Mossadeq the Teheran garrison had been issued only blank cartridges.

"The army and police laid into the anti-Shah crowds with such vigor that the royalists took cheer. . . ."

And the royalists struck again and this time they

succeeded. Gen. Zahedi came out of his hiding and proclaimed himself as the Prime Minister.

The Shah received the news of the success of the second coup from Hotel Excelsior in Rome. Mr. Allen Dulles, Director of the U. S. Central Intelligence Agency, arrived at the Excelsior to greet the Shah. And from Switzerland came Princess Ashraf, the Shah's twin sister.

These sensational developments in Iran had in turn engendered a good deal of speculation if a second Korea was going to be enacted there. Iran had been the object of power-politics for long. So long the struggle for domination over Iran had been confined to Britain and the Soviet Union. Now a new power, the United States of America, had appeared in the scene. This partly sprang from the assumption by the U.S. of some of Britain's strategic responsibilities. "More important," *Newsweek* writes, "it proceeds from American development of the vast oil resources of the Arab States. . . . Thus Iran is now not only a buffer in the sense of military strategy. It is also a buffer in that it lies between areas containing oil reserves that are vital both to the Russians and the West."

According to the paper, the West was sure to intervene if Iran seemed to be going Communist. The Russians, on the other hand, could not be expected to accept gracefully an anti-Communist Government there. Still many forces militated against Iran becoming a battle-ground. "Russians, Americans, and British alike realize," the paper writes, "that the chips really would be down in the event of armed conflict in Iran. The stakes would be much higher than in Korea and the danger of a local struggle erupting into a world war proportionately greater."

Thus far the American view of the picture. Now let us turn to the other viewpoint. The *People's* diplomatic correspondent in New Delhi writes that it was no longer doubted in New Delhi that the Shah's return had been primarily due to Anglo-American machinations and to the "American-bribed army, which has executed the anti-Mossadeq coup." The U.S. Ambassador to Iran, Mr. Loy Henderson, played a significant part in this affair. The correspondent writes: "Breaking every known international law, the U.S. Ambassador told Mossadeq shortly before the aged Premier was thrown out, that he could no longer be considered Iran's Premier by the United States, as the Shah had dismissed him." Undoubtedly this intervention had affected Dr. Mossadeq's position adversely. The U. S. Consulate in Teheran was being guarded by the police and Americans dared not venture out because of the popular anti-American sentiment.

The people were growing sceptical about the Americans with the realization that the millions of dollars being given by America were not really

DEFINITION OF ECONOMICS

Whether Economics is to us a subject of thrilling interest or a dismal pseudo-science depends upon ourselves. If we come to it with liberal minds, seeing what has been definitely accomplished, we find the discussions dull and the conclusions dubious. But if we come to think of man's long struggle to master his own fate, then the effort to solve economic problems, seems a vital episode in human history. And the future of economics, the question whether man will ever succeed in establishing a serviceable science of economic behaviour, becomes one of the crucial issues on which hangs the doubtful fate of human kind.³

Gandhiji regarded economics as indivisible from political, legal, social and other such aspects of life. For all these aspects of life are not really separate from one another. A man is not merely an economic machine or a political animal or a legal unit; nor is he any one of these at single point or time. He is all these things at one and the same time and all the time. Economics, in his opinion, could not be considered in isolation from the multi-sided facets of the prism of life since all these aspects have something without which life is incomplete and the conclusions are unreliable.

"I must confess," he declares, "that I do not draw a sharp or any distinction between economics and ethics. Economics that hurts the moral wellbeing of an individual or a nation is immoral and therefore sinful. Thus the economics that permits one country to prey upon another is immoral. It is sinful to buy and use articles made by sweated labour."⁴

In this he is in that long line of philosophers right from Jesus Christ and Shri Krishna in ancient times up to Carlyle and Ruskin in recent times, who have preferred welfare to price and morals to money.

His definition of economics is unique and characteristic. For him economics is neither "a study of mankind in the ordinary business of life" (Marshall); nor "the science which studies human behaviour as a relationship between ends and scarce means which have alternative uses" (Robbins). He differs from Prof. Cannan's aim of Economics as "the explanation of the general causes on which the material welfare of human beings depends." He considers Prof. Pigou's economic courtyard consisting of "that part of social welfare that can be brought directly or indirectly into relation with the measuring rod of money," too qualified and too small. For him the best political economy is care and culture of man—a combination (both horizontal and vertical) of individualism, socialism and idealism—one that will admonish its own mischief.

THE OBJECT OF ECONOMICS

Here we are confronted with the fundamental question of the object of political economy. Right from Adam Smith up to Robbins, the classical economists have

held that Economics is the pure science of money and hence it is to be divorced from all other sciences. In their zeal to maintain the purity of their science the classicists have ardently fought against any attempt of co-ordination of economics with equally important sciences of religion, sociology, law and ethics. Perhaps Senior best stated their viewpoint defining political economy as "the science which treats of the Nature, the Production and the Distribution of Wealth;"⁵ wealth being defined as scarce material goods, having the power of satisfying wants. But it made no difference whether the goods were beneficial or harmful. The science of economics was to be perfectly neutral. Rigidly carried out this concept requires the economist to be entirely indifferent to the ethical quality of a given demand. Thus Cairnes holds that "the science is neutral, as between social schemes in this important sense. It pronounces no judgement on the worthiness or the desirability of the ends aimed at in such systems."⁶ With characteristic frankness, H. J. Davenport reveals that

"Peruna, Hop Bitters, obscene literature, indecent paintings, picture hats and corsets are wealth, irrespective of any ethical or conventional test, to which they may or may not conform. Being marketable, price-bearing, they are wealth. So likewise of service, in no sense is economic productivity a matter of piety or of merit or of social deserving."⁷

After being told authoritatively by Prof. Davenport that obscene literature and indecent painting also constitute wealth, no wonder that the perplexed layman turns over the pages of the dictionary to brush up his knowledge of English, only to find to his dismay that the word wealth has been derived from the root 'weal'—meaning prosperity and wellbeing!

HUMANITARIAN ECONOMICS

The first broadside against the classical economists was fired by Sismondi, the father of the Critical School, who declared that the real object of the science should be man or at least the physical wellbeing of man. To consider wealth in itself and to forget man was a sure way of making a false start.⁸ Then followed the Romanticists, Thomas Carlyle, John Ruskin and J. A. Hobson in England and H. D. Thoreau in America. "Both in definition of the elements of wealth, and in the statement of the laws which govern its distribution, modern political economy has been absolutely incompetent or absolutely false"—declares Ruskin in the Preface to *Munera Pulveris*. Thoreau, the American philosopher, summed up his idea of social good in restricting material wants to the simple things in life—simple food, simple clothing and simple shelter plus plenty of leisure to philosophise. Instead of

this idea America was building up a false set of social standards:

"We worship not the graces—but Fashion," cries Thoreau. "the head-monkey in Paris puts on a traveller's cap and all the monkeys in America do the same."⁹

In Ruskin's Essay "Ad Valorem" one comes across the magnificent Peroration: "I desire to leave this one fact clearly stated. There is no wealth but life; Life, including its powers of love, of joy and of admiration. That country is richest which nourishes the greatest number of happy human beings; that man is richest, who having perfected the functions of his own life to the utmost, has also the widest helpful influence, both personal and by means of possessions over the life of others."¹⁰

Gandhiji's viewpoint regarding economics is very akin to the above. For him life is more than money and hence "that economics which disregards the moral and sentimental considerations, is like wax-works that being life-like, still lacks the life of the living flesh."¹¹ He thinks that

"That Economics is untrue which ignores and disregards moral values. The extension of the law of non-violence in the domain of economics means nothing less than the introduction of moral values as a factor to be considered in regulating international trade."¹²

It may be pointed out here that the concept of such 'human economics' is not an out-dated romanticist fad. Pigou and Marshall, though essentially classicists and revelling in abstractions, had to treat economics from the point of view of human welfare. The most ultra-modern American Institutionalists following the lead given by Auguste Comte, started, what is popularly known as the 'Positivist' movement in Economics. They are welfare economists and hold that economics and ethics cannot be separated into two independent fields. As Albert B. Wolfe writes:

"Economics as the science of production, distribution and use of opportunity or of wealth and services, is essentially a science of means and ends. But ethics is also fundamentally, perhaps we should say, the science of means and ends; of their relative value and significance and their mutual functional relations. If there is a disagreement between economics and ethical valuations, one or the other is at fault. The economist's avowed reluctance to consider ethical or social value is an error of judgment, for human attitudes and human activity, the narrowly economic included, involve the adaptation of means to aims, ends and purposes."¹³

Similarly Gandhiji discussing the relation of ethics and economics clearly indicates this 'Positivist' spirit:

"The religious principle requires that the debit and credit side of one's balance sheet should be perfectly square. That is also the truest economics and

therefore true religion. Whenever there is any discrepancy between these, it spells bad economics, and makes for unrighteousness . . . But the majority of mankind do not understand this use of economics to subserve religion; they want it only for amassing 'profits' for themselves. Humanitarian economics, on the other hand, for which I stand," Gandhiji declares, "rules out profits altogether."¹⁴

The inclusion of human values in his scheme of things is one of the characteristics not only of Gandhiji's economics but of his whole philosophy. An economics based on human values is a sure and effective challenge to this world where money and profit are the sole considerations. Callous exploitation, tragic unemployment and 'sweated labour' are common occurrences in the reign of the almighty dollar. The West has tended to emphasise the ideal of material progress above everything else. The value of an individual is often judged in terms of bank balances, in terms of what he has rather than what he is. Human values are thus commercialised. Everyone talks of his rights than his duties. Honesty is only the best policy. As Prof. Kumarappa bitterly points out:

"The factory workers might be made into minced meat, but the machinery of meat-packers of Chicago could not be stopped to save the life of a labourer."¹⁵

To counteract such callous and immoral disregard of humanity, the ideal of human economics, Gandhiji declares thus:

"Khaddar economics is wholly different from the ordinary. The latter takes no note of human factors. The former concerns itself with the human."¹⁶

It would indeed be a happy day for the world at large when we subserve economic behaviour to ethical considerations. We must admit the truth of the contention of the Archbishop of Canterbury that "Industry and Economic activity are not ends in themselves to be pursued without reference to the main ends of human society or by methods inconsistent with it."¹⁷ We must realise that the satisfaction of man's material needs which is the function of industry, ought to be ennobled by the spiritual purpose to which it contributes. Mere materialism would not pay. In spiritualism lies the fate of this dismal globe, where too much of materialism has led us to our never-ending conflicts. The principles of simplicity and non-violence as applied to economic life seem to be quixotic to an ultra-modern-mercenary world of today which intoxicated by its own genius is heading towards the path of destruction and ruin. Historian Toynbee has stated that twenty-one human civilizations known to history have gone down and if we do not turn our back to the precipice by adopting Gandhian principles ours will be the twenty-second. There is basic material for sober reflection by the destiny-holders of the world because his prescription is based upon eternal values which were the same yesterday, today and for ever.

BASIC EDUCATION AND CHILD WELFARE

By MARJORIE SYKES,

The Hindustani Talimi Sangh, Sevagram, Wardha

THE members of an international conference in our times come literally from all over the world. The so-called "advanced" countries are represented side by side with the so-called "backward" countries, "rich" countries alongside "poor" countries. The delegates, both in their personal and in their representative capacities visualise the subjects under discussion in widely different settings—social, economic, cultural and religious. It is likely that almost every individual member of this child welfare conference has a different picture at the back of his mind of the actual children whose welfare he seeks. The children of Manchester and of Madras, of a farmstead in Canada and a village in Kenya, differ in many ways much more fundamentally than their costume and their physical features and colour. Yet if there were no common bond at all, no interests shared, an international conference of this nature would have no meaning. One of its main tasks is surely to define common concerns and to see how the experience of workers in a number of different local settings can be pooled to enrich the whole.

DEVELOPMENT OF BASIC EDUCATION IN INDIA

Public discussion of a national education policy for India was stimulated by the Congress Party's acceptance of ministerial office in the Provincial Governments in 1937. The educational conference, on whose initiative the objectives, principles, and methods of Basic Education were first tentatively defined, met to confer with Gandhiji at Wardha in October, 1937. The report of the Zakir Hussain Committee which was then set up was endorsed by the Haripura session of the Congress in February, 1938, and the Hindustani Talimi Sangh was brought into being in order to implement it. I quote from the resolutions of the Conference:

1. That in the opinion of this Conference free and compulsory education be provided for seven years on a nation-wide scale.

2. That the medium of instruction be the mother-tongue.

3. That the Conference endorses the proposal made by Mahatma Gandhi that the process of education throughout this period should centre around some form of manual and productive work, and that all other abilities to be developed or training to be given should, as far as possible, be integrally related to the central handicraft chosen with due regard to the environment of the child.

4. That the Conference expects that this system of education will be gradually able to cover the remuneration of the teachers.

Briefly outlined the development of the work has been as follows: During the years 1938-40 work began

in basic schools planned for the age group 7-14, in Sevagram village and also in a number of Provinces under Government and private auspices. During the political crisis of 1940-42 however almost all these experiments came to an end with the exception of the group of Government schools in Bihar and the Sevagram School, which carried on with difficulty in very disturbed conditions until the end of 1944, when a new phase began with Gandhiji's release from jail.

In January 1945, after an interval of nearly four years, an All-India Basic Education Conference met at Sevagram. Its work and findings were inspired by the new vision and conviction which Gandhiji had reached after long thought during his imprisonment. The title chosen for the conference report, *Samagra Nai Talim*, is an indication of the nature and scope of this vision. Already in 1937, the Zakir Hussain Committee had made it clear that it recognised the importance in education of the first seven years of life, but that its specific plans were limited to what might be immediately possible. In 1945, the thought of the conference was focussed on two main issues:

1. That the principles which were proving their worth in the education of school children must and should be widened and applied to an educational programme covering the whole span of human life in all its aspects. It must be education for, through and throughout life.

2. That this *Nai Talim* (new education), as Gandhiji preferred to call his plan, was bound up with a new conception of the way in which society should develop; it was seen as the means to the establishment in India of a new and juster social order within whose framework a richer individual and community life would be brought within the reach of every citizen.

Neither of these issues was new to the workers; they had been raised and included in the report of the 1937 Conference. But from 1945 onwards they were embodied in new experimental work. Adult education was taken up, also the education of the pre-school child; plans were made for the adolescent period of life and in 1947-48, the first "Post-Basic" classes were started in Sevagram and Bihar. As a result of these experiences working syllabuses and plans of work have been drawn up for covering the education of parents in the home and of children of all ages from birth to eighteen. 1952 has seen the first beginnings of experimental work on *Nai Talim* principles at the University level.

FUNDAMENTAL PRINCIPLES

The whole of this programme of education is based on a conviction that it is possible, in Gandhiji's

words, to give "a true education, which draws out and stimulates the spiritual, intellectual, and physical faculties of the children" by means of work in a productive craft for the satisfaction of one or more of the primary needs of human life. The work must be productive and useful, or it will not be fully satisfying to the child's emotional and social nature; it must be a social undertaking done in co-operation with others, or it cannot be done properly at all; and it must be thorough, honest, and intelligently planned, if it is to stimulate the intellectual faculties and train the character.

The crafts which have been used most successfully as the centre of the work programme are gardening leading to agriculture, card-board work leading to carpentry and metal work and, most of all, the entire process of cotton manufacture from the growing of cotton to the weaving and dyeing of the finished cloth. Side by side with this major centre of education schools stress the importance of a similar intelligent practice of life activities, such as programmes of sanitation, health, and the planning and the preparation of food. The co-operative life of the school also expresses itself naturally in the observance of the social, national, seasonal and religious festivals by means of which the child's imagination and social understanding is strengthened and deepened.

The development of this type of education in India has been governed at every point by considerations of the primary needs of the Indian nation. The picture in Gandhiji's mind and in the minds of his co-workers has been that of the Indian villages with their under-nourished, poverty-stricken populations, whose local crafts and social traditions are being slowly crushed out of existence by the impact of an alien civilisation and of political and economic policies, which take no account of the welfare of the primary producer. Gandhiji's social and economic teaching cannot be understood, his educational teaching cannot be understood, unless they are both seen as the outcome of his concern for the oppressed and his search for a way of truth and non-violence in social life, which would restore to them the possibility of self-respect and of true welfare. He found this message in the gospel of work and self-reliance, and he applied these principles to the teaching of children side by side with the training of adults.

AIMS AND METHODS

Let us translate this ideal into concrete terms. Child welfare in *Nai Talim* must begin with Adult Education. "All the time and money spent on child education is liable to be completely wasted if the parents of the children do not understand their responsibility for the welfare of their offspring. It is the parents who must provide the child with a happy home, meet his daily needs, look after his health and comfort and guide his moral and spiritual develop-

ment. All parents are educators whether they are conscious of it or not. Their all-pervading influence determines the direction of the child's development in the all-important years of early childhood. The education of the parents is therefore the first step in the education of the child." Adult education in *Nai Talim* does not mean first and foremost the removal of illiteracy; it means the training of village adults to enable them to provide better food, cleaner and more hygienic houses, healthy and more sufficient clothing for themselves and their children. It also means the inculcation of habits of personal cleanliness which will then be passed on to their children, and habits of social co-operation in the village community by which the children's social outlook will be moulded for good. The means of this adult education are the actual work of the villager and his daily needs and problems, his water supply, his drainage, his panchayat, his quarrels and his social and religious customs. For the village woman, education must begin with the daily round of work in her own home and show how for the sake of her children every item of it can be improved.

It follows from this that the education of a pre-school child in *Nai Talim* begins at home and centres throughout the child's home. In early childhood the child is inseparable from his home and surroundings. The school building is less important than the teacher's contact with children in their families and at their games in the village streets. The pre-basic school is less a school than a community centre for parents and children where the older children for a few hours each day work and play under the guidance of the teacher, learn how to help each other, acquire standards of personal cleanliness and self-reliance in meeting their daily needs, and then with the teacher's help carry this knowledge back to their homes. The equipment tools and playthings of a pre-basic school are in harmony with the life of the village of which the school is a part. They consist of things that can be made in the village by the villagers with local materials, and their educational value depends not upon their costliness but upon the intelligent way in which they are planned and used. The children's delight in imitation of the real work of its parents, digging, sweeping, vegetable cutting, cooking, watering the garden, is given full play as it is in the Montessori system of child education. The ideal is that the village schools should be such as the village community could build and equip for its own children out of its own resources, thus carrying out in this field also the principle of self-reliance and self-respect. Expensive material equipment such as is sometimes provided in city "Montessori" schools is out of place in our villages, where such training must and can be given by simpler and more natural means. The principles of self-reliance,

and of harmonious interaction between the development of the school and the development of the whole village community, are of greater educational importance than an abundance of material equipment.

The syllabuses of pre-basic, basic and post-basic education are built step by step, upon these foundations. It is not necessary to go into detail here; they are all centred in the provision of urgently needed goods and services, and directed to the building up of self-sufficient co-operative communities of work in which the personal talents of every individual will be developed and used. They are integrated programmes covering every aspect of rural community living, and they are based on the premise that education is for the good of all alike, not for the personal aggrandisement of a few. This in itself justifies the name "New Education" (*Nai Talim*) for the spirit of the conventional education which India has so far undergone is a spirit of personal privilege. Education for village boys has nearly always meant an escape from the problems of the village into a privileged individual position. The goal of *Nai Talim* (New Education) is identification with the life of the community for the development and enrichment of the whole.

THE INTERNATIONAL VALUE OF NAI TALIM

Basic Education was designed as education for a nation of village communities, and planned in detail for Indian village children. It is obvious that many of its detailed programmes are not for export. One is bound to ask, however, whether it has anything to contribute to the discussion of child welfare on an international level. I believe that the answer is "Yes."

In saying this I am not thinking specially of the emphasis placed upon co-operative, useful work in the educational programme. This is happily a feature of modern methods of child education throughout the world, and the nursery schools, the Montessori schools and kindergartens, and activity schools of many different kinds, are in this way recognizing and catering for a fundamental need of child nature as such. The great importance of approaching the child not as an isolated individual but as a member of a family group, a living social organism, is now also widely recognized. The distinctive contribution of *Nai Talim* lies elsewhere—it lies in the content we give to the word "welfare."

The philosophy of Basic Education is a vigorous protest against the assumption that "welfare" must be synonymous with national abundance. Perhaps more than any other system, it gives a major place to work for the supply of material needs, believes that such work is potentially the most powerful educational instrument in the world, and yet at the same time it believes with equal conviction that "man does not live by bread alone" and that "a man's life consisteth not in the abundance of things that he possesses."

This is not a contradiction, it is a natural consequence of the motivation of work not by personal greed but by the service of the whole group. Neither child nor man can ever find true welfare or lasting satisfaction if he measures his wants and his achievements by materialist standards alone. Welfare surely must be measured by the power to achieve personal happiness and serenity, and for these things social and emotional satisfaction are of far greater importance than material abundance. The highest intellectual, artistic and spiritual development of man is possible in great simplicity of material possession; it may well be that it can be strangled by excess as surely as it can be stunted by privation. Delight in simple things, a glad acceptance of a very moderate standard of material living, is an essential of true welfare. If we are really concerned with the welfare of the whole world family of children, this is the only practicable as well as the only right way to attain it. Let us beware of the glib phrase "raise the standard of living," and ask ourselves what it really implies.

The second contribution that Basic Education has to make is closely related to this. It is of little use to adopt in the schools the methods and ideas which have been described, unless one is striving at one and the same time to refashion society on lines consistent with these ideals. A distinguished American educator on a visit to Sevagram somewhat ruefully commented that American schools all too often labour to develop the co-operative spirit, and at the same time to qualify the children to "make good" in a competitive "go-getting" society outside. Those who are concerned with the welfare of children cannot escape the responsibility to think out the implications of their concern for society as a whole, to take their decision and to act on it. It is calculated that something like 6 million children, destitute, uprooted, torn from the security of the family group, deprived of affection and robbed of any chance of stable growth, are today the victims of our national greeds, suspicions, hatreds and wars. They are the most tragic and horrifying casualty of all. This is what we do to the helpless and innocent by our failure to take seriously the greed and injustice of our common ways of living. *Nai Talim* declares that a just and peaceful society is possible and attainable by the ways that Gandhiji and his followers have described and worked for. Instead of dismissing them as "escapist attempts to put the clock back," our situation demands that we give them the most serious consideration. In *Nai Talim* education and social work are not separable: the social consequences cannot be ignored. Child welfare is a part of the welfare of the whole human race, and the one cannot be achieved on a world scale without the other.*

* Paper presented to the International Study Conference on Child Welfare, Bombay, 5-12 December, 1952.

EMPLOYMENT, MORE EMPLOYMENT!

By PROF. S. N. AGARWAL

It is but proper that the problem of employment is now being given the foremost place in all our schemes of national planning. It is one of the main directive principles of our Constitution that "the citizens have the right to an adequate means of livelihood." It is, therefore, a constitutional obligation on the part of the Government to provide gainful employment to every able-bodied citizen of India. We are glad to notice that the Government of India and the Planning Commission have recognised the urgency of the problem and have placed before the public certain schemes for finding more avenues of employment in the country. Instead of always talking of unemployment in negative terms, we prefer to discuss various points relating to the positive aspect of providing more employment to the wholly unemployed or partially employed people of India. We also deprecate the tendency on behalf of certain political parties in the country to exploit even a common problem of this nature for political or party purposes. The programme to observe the Independence Anniversary as "Anti-Unemployment Day" was, to say the least, unbecoming of any political party. Although we ourselves have been critical of the achievements of the Government and desire that the pace of progress in the economic sphere should be quickened a great deal, we are convinced that it is unpatriotic to under-rate our successes and observe the Anniversary of our Freedom as a Black Day. Our achievements in various fields of national progress compare favourably with those of any country in the world. But we do not desire to rest on our oars; the Congress and the Governments are fully alive to the economic problems and are determined to do their best to solve them to the best of their ability.

The Planning Commission have circulated to the State Governments an Eleven-Point Programme for combating Unemployment in the country. This programme includes the provision of adequate assistance to the establishment of small industries and businesses, the training of technical personnel, development of road transport, slum clearance schemes and the construction of houses for the low-income groups in urban areas, and the setting-up of work and training camps for re-orienting the outlook of the educated classes. This programme is meant to be a short-term measure and should, therefore, be judged as such. It can provide certain "first-aid" steps to save the unemployment situation from worsening further. In

order to plan for full employment, as a long-term measure, the Government will have to think of certain radical changes in its educational, industrial and commercial policies. Merely trimming the leaves and pruning the branches will not serve as a lasting remedy to the deep-seated malady of an under-developed country like India. We will have to adopt and execute a bold policy of industrial decentralisation throughout the countryside in order to absorb the idle labour-power in the rural as well as urban areas. We are not against large-scale industries as such; our basic or key enterprises will have to be on a big scale. But the consumer goods industries like textiles, oil-extraction, paper-making, flour-grinding, rice-husking, gur-making, etc., will have to be organised on a small-scale or cottage basis so that every citizen of the country may be able to find fruitful avenues of productive work and employment. All further expansion of large-scale consumer goods industries, therefore, must stop: processes of excessive mechanisation or rationalization should also be rigidly controlled by the State in order to save the people from being thrown out of employment still further. The Government must also demarcate categories of commodities to be produced by the large-scale, small-scale, and cottage industries respectively. In these days of national planning it would be short-sighted and even suicidal to allow the large-scale and small-scale enterprises to enter into unfair competition with each other for the survival of the fittest. This old doctrine of laissez faire is now dead as dodo and the Government of India must provide the fullest scope for the speedy development of small business and industry in India with courage and conviction. To try to solve the problem of fuller employment by expanding big business is like ploughing the sands. At present all the large-scale establishments in the country employ only about 3 million people with a total investment of approximately 1,200 crores of rupees. Where is the money for further investment in the large-scale sector in order to absorb a substantial portion of surplus labour in India? And even if we are able to find the money where are the markets to purchase these mill-made goods? Conquering markets in foreign countries through Imperialist methods is out of the question, and purchasing power within the country could be increased only by organising fuller employment to millions of people through decentralised industrialisation. The Government has,

of course, accepted this policy in the Five-Year Plan. But we are not yet in a position to say that there are any visible signs of the implementation of this policy.

The Commercial policy of imports and exports also needs further examination from the standpoint of providing fuller employment to the masses through the development of new industries in India. It is not an inspiring sight to see most of the New Delhi shops full of foreign articles at a time when we are seriously planning to build up the economic structure of our country by undertaking ambitious schemes of industrialisation. It is true that the people should imbibe the spirit of Swadeshi and patronise home-made goods. It is also true that the Indian manufacturers should take special care to improve the quality of their products and should not try to misuse the spirit of Swadeshi among the poor consumers. It is, however, equally necessary that the Government of India should once again scrutinise the long list of articles which are still allowed to be imported from foreign lands. It is argued that a few consumer goods are allowed to be imported so that the quality of goods may not go down. It is an argument which fails to carry conviction. If the Indian producers are given a wider scope of selling their goods, more manufacturers will enter into production in accordance with the well-known economic laws and mutual competition would tend to push up the quality of products. We see absolutely no reason why consumer goods like second-hand clothes, bottled and canned fruits and vegetables, crockery, biscuits and cakes and confectionary, artificial silk fabrics, handloom and book-binding cloth, hosiery and toilet goods, etc., are still being imported by us. We have also allowed a number of foreign firms to run consumer goods industries within the country with the result that our own industries with wholly Indian capital have suffered a serious set-back. In this connection, the Government should review the working of foreign-owned units in the manufacture of soaps, chocolates, fountain-pen inks, tooth-brushes and pastes; cold drinks like Coca-cola, etc. The Store Purchase Policy of the Union and State Governments also requires radical changes with a view to patronising Indian-made and specially cottage-made products even though they may be costlier in the beginning.

Above all, our educational policy must undergo

far-reaching changes. We welcome the scheme of the Ministry of Education to open a large number of one-teacher schools in the rural areas to absorb thousands of the educated unemployed youngmen in India. But is this enough? What about the ever-growing number of matriculates and graduates that still continue to be manufactured every year by the existing type of schools and colleges. The number of passes in the Matriculation, Intermediate and B.A. and B.Sc. examinations during 1949-50 was 2,78,400. In 1951-52, the figure had swollen to 3,74,900. In Uttar Pradesh alone the number of students passing the Matriculation and Intermediate examinations was 1,50,000 in 1952; in 1953, it had increased to 2,59,000. What is the Ministry of Education doing to stop this rising flood of educated boys and girls in our country? The present type of schools and colleges imparting the so-called liberal education have had their day: they must now cease to be. It is almost a crime against society to permit their expansion further. Our new educational institutions should be in the nature of occupational institutes or Polytechnics which prepare our boys and girls for specific vocations in life. There should be the closest co-ordination and integration between our educational and industrial programmes. The Government or the Planning Commission must indicate from time to time the types of courses for which there is likely to be a growing demand for the fulfilment of the Five-Year Plan. Admissions to various technical courses will then be adjusted and regulated accordingly by the educational institutions and the guardians. Although education is a State subject under the present Constitution, the Ministry of Education can do a lot to revolutionize the existing system of education which is wholly unsuited to the vital needs of the nation. It is, of course, risky to try to move too fast; but the risk in not moving fast enough is also a potential danger to the new type of democracy in this ancient land of ours.

Gandhiji had told us that to a poor and hungry man God could appear only in the form of bread or a bowl of rice. To millions of our unemployed countrymen, the National Plan can have some meaning only if it gives them work and bread. Instead of asking for "Light, more Light," they want us to provide them with Employment, more Employment.

YUGOSLAVIA SHAPES HER DESTINY Welcome to Her "Good Will Mission"

By AJIT KUMAR BOSE

New Yugoslavia has been successful in drawing world's attention towards her. The reception that was accorded to the recent Yugoslav "Good Will Mission" clearly indicates India's lively interest in her.

Yugoslavia is the land of the South (Yug) Slavs. It consists of six Republics of Slovenia, Croatia, Bosnia-Herzegovina, Serbia, Montenegro and Macedonia and is the largest country in the Balkans having 16 million population covering one lakh square miles. There are four main languages—Croatian, Serbian, Slovenian and Macedonian—which, though similar to each other, have distinctive qualities.

Yugoslavia is surrounded by Austria and three Soviet countries from the north up to the east—Hungary, Rumania and Bulgaria, by Greece and Albania on the south, by Adriatic Sea from south up to the west and by Trieste on the west. She is rich in natural resources and beauties—rivers, forests, mountains, oil, minerals, ores, etc.—sufficient for her developments in industry and agriculture.

The ancestors of the Yugoslavs were inhabitants of the Carpathian Mountains situated in the north. They began to settle in the Balkans in the 6th century. Since the 8th century there developed the Slav civilization which reached its peak in the 13th century.

But subsequent centuries were the days of decline and darkness. The riches of the lands allured foreigners to invade. The Turks invaded Serbia, one of the strongest States. Of course, Serbians resisted fiercely, but they were ultimately defeated and their country fell in the hands of the invaders in 1389. Their invasion continued for long 500 years and the patriotic Slavs did nowhere yield without fighting. As a result, the Turks took a century to conquer Bosnia (in 1463) and Herzegovina (in 1483) and no further they could advance. During the rest of their long domination the Turks could not rule peacefully; they had to face resistance in various forms within their conquered territory even. Thus, of course, the Turks could be prevented from penetrating further ahead, permitting the rest of Europe to develop. Besides, Yugoslavia was invaded from the north by the Austrians and the Hungarians, who also occupied some parts. Italy had also an eye on the Dalmatian Coast always.

In spite of these the South Slavs retained their individuality and cultural identity, and the Montenegrins, who could never be conquered, were a constant source of inspiration for patriotism. While powerful movement for the unity of the Slavs was growing

stronger, various forms of resistance, including guerilla fighting, developed in the 16th century. Since the early part of the 19th century and onward, fight for independence had been gathering momentum. In 1804, Serbia revolted successfully. But it was only after World War I that Yugoslavia became completely independent of the Turks and of the Austro-Hungarian imperialism as well.

But political independence brought no change in the day-to-day life of the people; for the most part their lives remained hard. Despite her great natural resources Yugoslavia remained one of the poorest nations in Europe. Illiteracy was high, average span of life was very low and want of employment was widespread. Yugoslavia was mainly a source of raw materials at cheaper rates for the foreigners. On the other hand, of the total capital invested in industries, whatever Yugoslavia had, foreign shares were 92 per cent in cotton mills, 100 per cent in matches, copper, lead and bauxite, 70 per cent in merchant shipping, 76 per cent in sugar and 55 per cent in coal. Workers' conditions were far below human level. The Monarchy in the country, subservient to the greedy foreign investors, was impotent to solve the basic problems.

Three-fourths of Yugoslavia was agricultural, cultivation being carried on old methods by impoverished peasants. The rich peasants and the big land-owners, who made up only 5 per cent of the population, held majority of the lands. Almost half a million were landless workers and the share-croppers were also of a equal number.

Consequently, during the period between the two World Wars, a strong movement to transform the Government of the country and its economic structure for the benefit of the people developed. The Yugoslav Communist Party affiliated to the then Comintern, took the leading part under the Moscow-trained leaders like Marshal Tito. Other radical political parties and individuals, students, trade unionists, etc., joined them and formed the People's Front ultimately to fight the fascist invaders.

In the meantime, after the Moscow-Berlin non-aggression pact of alliance, Nazi-Fascist Governments began to trample one country after another till the whole of the West Europe and Balkans, excepting Yugoslavia, went under the heels of Germany and Italy within a very short period. Despondency overtook the world. The war was then on the point of taking a turn.

As stated, Hitler planned to attack Russia on

May 15th. As a prelude to that attack, on March 25, 1941, the Royal Government of Yugoslavia signed a pact of alliance with the fascist powers in Vienna and thus surrendered the country's independence. But, on 27th March, the people rose in protest; they wanted no truck with the fascists. Belgrade's streets rang with the cries: "Better war than Pact," "Better death than Slavery!" The Royal Government was overthrown and the pact was repudiated, though, of course, U.S.S.R. and the Comintern were then acting as faithful allies of the fascist aggressors.

On April 16th, 300 German bombers swooped down on Belgrade, the Capital of Yugoslavia, leaving behind them more than 25,000 dead and a ruined city. The war against Yugoslavia began on a full scale with invading armies attacking not only from Germany and Italy, but from their satellites Hungary and Bulgaria as well. Thus attack on Russia was delayed, preventing Hitler's army from reaching the gates of Moscow before winter set in. Undoubtedly it was of tremendous help to Russia.

Yugoslav people continued to fight, guerilla resistance spread everywhere. Before the end of 1941, there were 41,000 partisans, fighting at first with farm implements and such arms as they could capture from the enemies. Their number had increased to 400,000 by 1944 and by 1945 the guerillas were transformed into the regular Army of National Liberation with 800,000 partisans. As a result, Germany was forced to keep more than a million men to fight the Yugoslavs. Thus the fighters against fascists in other fronts, including Russian, were amply helped. By 1944, the Yugoslav National Army liberated three-fourths of their country mainly with their own efforts.

No help was given to Marshal Tito and his forces at the first instance. Instead, the disguised collaborators of the Germans like Mehailovick were given assistance. At last however, the Liberation Army was recognised. After suffering and sacrifice the fighters for Yugoslav freedom came out successful.

But unfortunately, Marshal Tito and his forces were cursed by the U.S.S.R. and its satellites as collaborators and "agents" of Anglo-American powers, though subsequently, by the force of events, they also fell in line with the allied powers and dissolved the Comintern at the dictates of the same Anglo-American powers.

The South Slavs are now united under one banner, the banner of the Federal Peoples' Republic of Yugoslavia. A new social order has been established on a new economic and political structure. But the foundation of this republic was laid in the midst of the war. The new state was created step by step as village after village and city after city were liberated, by electing Peoples' Committees. Thus the basis of the Peoples' Government was formed, with powers to administrate and manage the entire

economic, social and cultural affairs of the respective locality. Late in 1942, the representatives of these Peoples' Committee met and formed the Anti-Fascist Council of the National Liberation Movement of Yugoslavia, the AVNOJ, which again met on 29th November, 1942, in the Bosnian Mountains. In this meeting a Provisional Government was formed—the National Committee for the Liberation of Yugoslavia—and a programme was adopted calling for broad social reforms and a government organised on federative principles.

On November 11th, 1945, after liberation, a Constituent Assembly was elected by secret ballot. On the 29th, this body proclaimed the Federal Peoples' Republic of Yugoslavia. After two months' discussion, on 31st January, 1946, the Constitution of Yugoslavia was adopted and the Constituent Assembly became the first regular National Assembly, which would be elected by popular votes every four years. The second Assembly was elected on March 26th, 1950.

The National Assembly, the supreme body of State authority in Yugoslavia is composed of two houses, the Federal Council and the Council of Nationalities, having a Presidium and the administrative agent. Each of the constituent republics has its own Assembly and Presidium. The Executive branch of the government is headed by the Prime Minister. Both are appointed and recalled by the respective Assembly.

As provided, at the meetings of the Peoples' Committee reports on current progress are made and plans for the future formulated. Local citizens are allowed to attend such meetings. They may discuss and criticise the members of the Committee openly in the public and have the right to demand explanations and pass judgments on the Committee's works. Unsatisfactory members may be removed by the people at any time. In 1949, there were 8104 village committees with a total membership of 119,804. They are helped by hundreds of thousands of members of different councils. Thus the common people of Yugoslavia participate in the political life and day-to-day social activities of the country.

Apart from trade unions, which are free to look into the interests of the workers, workers' councils are elected to participate in the management of industries. At least three-fourths of their members must be workers. In 1950, these councils were given more powers. Thus the Federal Government, in direct contrast to the Soviet bureaucratic centralism and State directorate, is divesting itself of the direct control of the major share of the country's economy and industry.

Yugoslavia adheres closely to the Charter of the United Nations and firmly believes that its principles are the only guide to enduring peace. She stands to fight for equal relations between all countries and

rejects the unjust policy of dividing the world into "spheres of influence" by the big powers. For this reason she refuses to join any contending power blocks and condemns the Soviet-sponsored idea of "five-power peace pact" which is nothing but recognition of the big powers' right to dominate over the weak and under-developed countries.

In addition to the miserable conditions and backwardness that persisted through centuries, the effect of the war on Yugoslavia was thoroughly devastating. According to the statistics of the Paris Reparation Conference, Yugoslavia had 1,706,000 casualties in the war, or about one-third of the total losses of the 18 major allied countries and the damages amount to 9.1 milliard dollars, or 17 per cent of the total damages suffered by those countries. In fact, every ninth person was killed and every three of the rest were physically invalidated and about 3.5 millions rendered homeless. Moreover, 24 per cent of orchards, 38 per cent of vineyards, 67 per cent of horses, 55 per cent of cattle, 63 per cent of sheep, 58 per cent of hogs, 50 per cent of railway trackage, 289,000 farms and most of the mines, factories and electric plants were damaged.

But parallel with the progress of the liberation struggle, the Liberation Army, with the Peoples' Committees, by the close of 1941, began to rebuild the areas freed from occupation. Since the close of 1944, full attention was directed towards reconstruction. Peasants got lands and powers through their committees and worked with the fullest enthusiasm, while the workers vigorously devoted themselves to production and various economic rehabilitations of the country. Due to their untiring efforts and sacrifice production soon attained the pre-war level, alleviating the effects of the havoc wrought by the invaders. The Constitution provides for national ownership, or control whenever necessary, of industry, banking, communications, foreign trade, etc.

In 1947, the first Five-Year Plan sets, *inter alia*, the following main tasks: The national income was to be raised from 132 milliards in 1939 to 235 milliards in 1951, *viz.*, an increase of 193 per cent and the value of industrial production was to be raised from 203 milliards in 1939 to 336 milliards in 1951, *viz.*, an increase of 180 per cent.

Trade Unions and Workers' Councils played a very significant part in executing the Plan. Want of workers, technicians, engineers, etc., was not insurmountable to the determination of the people. New hands were trained and efficiency developed. Results were remarkable. Here are some instances in the main branches of industry:

	1939	1947	1949	1950
	Index.	Per cent of production		
Coal	100	157	342	265
Lead and Zinc	100	181	330	479
Iron and Steel	100	167	260	290
lol.	100	...	6260	...

In other industries of Electric powers, Chemicals, Building materials, Timber, Paper, Textiles, Leather and Foot-wear, Rubber, Food, Tobacco, Film, etc., production increased on an average from 26.6 in 1946 to 46.1, 70.8 and 82.6 in 1947, 1948 and 1949 respectively. Moreover, motors, tractors, electrical machineries, generators, etc., are also being manufactured. Various important items that were never produced in Yugoslavia before war emerged from her new factories. In the spheres of Railways and trackage, Roads, Communication, Transport, etc., progress has been equally rapid. Side by side, new buildings and cities are being constructed.

In the sector of public welfare, provisions have been made for social insurance, pensions and medical aids including medicines and sanitariums, protection to mothers and children, conquering diseases and illiteracy, etc., which is, in reality, being enjoyed by the nation as a whole. The Constitution makes the State responsible for the protection and nurture of children and provides for free and compulsory elementary education for seven years. About 80 per cent of the students in higher education receive monetary aids from the Government. The expectant mothers receive increased facilities in every respect before and after child-birth. She also receives extra money from the Government when the baby is born.

Unemployment has been eliminated. In fact, Yugoslavia's problem is shortage of workers and not want of work or unemployment.

In respect of agriculture, arrangements have been made for training the peasants and guiding them through the State farms elaborately. Co-operative farming is encouraged. It is voluntary and co-operators remain owners of their lands. The co-operative movement in Yugoslavia was started in 1945 with only 31 societies; by April 1950, the number had grown to about 7,000, involving over 350,000 families and covering, together with the State farms, about 26 per cent of the country's arable lands. Arrangements have been made to manufacture agricultural machineries for which factories are working. Construction of dams for hydro-electric power and irrigation have been taken up.

In short, Yugoslavia's progress, within only seven years, is all-round and unparalleled in history.

On the contrary, in the case of the U.S.S.R., the entire first post-revolution decade was a decade of failure and intense suffering, famine, starvation and deaths for the people. Production in industry declined, while in agriculture, it came down to 50 million tons in 1920 as compared to pre-war years when the average harvest was of 80 million tons. As measures against such all-round deterioration and discontent, USSR had to fall back and take up "New Economic Policy," encouraging private enterprise. Foreign helps were accepted including American help and the foreign policy was so formulated as to encourage

foreign helps. On the other hand, machineries of repression and suppression were let loose; terror, mass-scale murder and concentration in slave labour camps in the name of "socialism" and "revolution" became the order of the day.

But still the brave leaders of Yugoslavia are condemned by the Soviet Bloc as "traitors to the people," as "agents of Anglo-America." Like "Trotskyism," "Titoism" has become a word for abuse in the Soviet vocabulary.

In June, 1948, the Cominform expelled the Yugoslav Communist Party which was its member since its inception. The Cominform called upon the Communist Parties all over the world and the Communists of Yugoslavia in particular to unite and overthrow the Tito Government.

In essence, the whole issue boiled down to a Soviet attempt to stop the industrialisation of Yugoslavia, in particular the Five-Year Plan, which began to gather momentum. Moscow had planned for agrarian satellites whose varied and extensive resources would make cheap sources of raw materials for Soviet factories.

Because of the importance of trade to the success of the Plan, the Cominform instituted its *economic blockade*, which was the Soviet answer to Yugoslavia's determination to maintain her independence and develop her economy on her own way. Prior to that 60 per cent of Yugoslavia's trade was carried on with the Cominform countries.

But the Communist Party of Yugoslavia and her government refused to be intimidated, as she refused during the war. In spite of continued political pressure, diplomatic incidents, border provocations, unceasing propaganda and economic blockade, the people of Yugoslavia have remained unshaken and stepped up the tempo.

Recently very bold steps have been taken towards further democratisation and decentralisation of power, both political and economic. From base to the national level the formation of councils of workers has been provided in the country's constitution. Only the workers directly engaged in the process of production are entitled to be elected in these councils. In the levels of legislation they constitute the third House of Representatives and no budget can be effective unless it is passed by this House. And in the production level at the base the entire authority of the management of the factories—authority of employment and dismissal and drawing up of plans and budgets, etc.—has been transferred to the respec-

tive councils. Thus the authority of disbursement of surplus values, the only measure-stick of Socialism, is now in the hands of the actual workers. Whereas, in the Soviet Union and countries within its grip, it is entirely in the hands of the all-powerful Soviet Government of the Communist Party, membership of which is strictly restricted and scrutinised by the ruling group.

As regards the party structure in the popular level, the Communist Party of Yugoslavia is no longer a political party; it has now been transformed into a cultural organisation so to say. It will not run any candidate in the country's elections. It will only preach the basic principle of Socialism. A broad-based Socialist platform has been created to facilitate proper and open discussions on political and various other national issues to determine the course of action. The people of Yugoslavia, having faith in the independence and sovereignty of their motherland and Socialism, irrespective of their various shades of opinion, may unite under this political organisation—the 'Yugoslav Socialist League.' Members are free to differ and discuss openly to build up public opinion. Undoubtedly, it is a step forward towards the establishment of democratic rights of the people—steps new, bold and encouraging enough as against the systems prevailing in the rest of the world, including U.S.S.R., America, etc.

Evidently, therefore, new Yugoslavia is a source of newer inspiration for the suppressed nations in their struggle for emancipation, while for the newly independent under-developed countries she indicates a definite line of action for progress, prosperity and strength.

But it should not be forgotten after all that alike in Soviet Russia, there is no right of association in Yugoslavia. Excepting under the Socialist League of Yugoslavia, the Constitution of the country provides no right for the people to organise, or to be organised under, any political party. It is one of the few fundamental questions relating to the basic rights of man. On it depends the ultimate security of the individual and of the nation as well, nay, of the whole human society. At present, of course, there are great differences with Russia in the nature of Yugoslavia's working out her plans, which helps the people, as reported, to develop initiative and free judgment. Let us hope that Yugoslavia will ultimately be able to lead the suppressed people of the world in their fight for collective well-being and individual freedom as well.

SAGA OF NAPOLEON BONAPARTE

By PROF. DIP CHAND VERMA, M.A.

I

THE career of Napoleon Bonaparte has been a fascinating subject for biographers. Historians have dealt with it from diverse angles. But even today the name of Napoleon not only arouses interest but grips the imagination. Goethe typically summed up the reactions on the minds of most readers when he said:

"The story of Napoleon produces on me an impression like that produced by the Revelation of Saint John the Divine. We all feel there must be something more in it, but we do not know what."

It is likely that for all time to come the genius of Napoleon will remain controversial, hard to define, provoking but delusive, beyond real grasp. Napoleon was not only the representative man of his age—his life was a running commentary on the great revolutionary period of which he was the product—but succeeding generations have been left bewildered at his truly amazing career. The dilemma however remains unresolved, the dilemma of his miraculous success and no less disastrous failure. Both in the magnitude of his success and the tragedy of his fall, Napoleon remains to date an enigmatic figure, defying the meticulous labours of historians and research scholars to solve the riddle.

II

The broad facts of Napoleon's life are easily told. He was born as second son to Charles Bonaparte in the town of Ajaccio in the small island of Corsica, on the 15th August, 1769. His father at one time adjutant to the Corsican hero Paoli, though of a noble descent, was of a flippant disposition. Napoleon seems to have inherited all his great qualities from his mother who was a very remarkable woman. Madame Letizia gave birth to eight children, five sons and three daughters. They are known to history by the simple incidence of their being related as brothers and sisters to the colossus that in his day shook the world. More through accident than design Napoleon got admitted at the military school at Brienne and after a year's training at the Paris Cadets School, he became a lieutenant at 16. His first attempts were to capture power in his own homeland Corsica, alternatively by joining hands with Paoli against the French and later by siding with the French Government against Paoli. Both attempts were unsuccessful and nearly ruined the Bonaparte family. Napoleon's own position was rendered most precarious and he was driven to such straits as pawning his watch and at one time actually thought of suicide.

He got associated with the Jacobins which was the rising faction but the death through guillotine of the elder Robespierre sent the young Napoleon also to jail for a short period but was saved as the charges were not substantiated.

Napoleon steps into history by his part in the siege of Toulon. This is Napoleon's first victory although he is not the official commander. The real opportunity comes when he is offered the command of the army of Italy which puts him on the world-stage as it were to play the great part. For a score of years from this day onward, he rises higher and higher reaching a pinnacle with few historical precedents, suggesting comparisons to celebrated names like Alexander the Great and Julius Caesar, almost within reach of world-power and then suddenly the meteoric career is snapp'd. Napoleon is devoured by the forces he himself produced. He awakened to the danger when it was too late.

What are the landmarks in his great career? He engaged during his short and busy life in nearly sixty pitched engagements. Some of his battles mark him out as the greatest strategist and captain of all time. His military genius remains to date unrivalled and unsurpassed. Napoleon not only conquered nearly the whole of Europe and ruled a larger part of it for a dozen years but was actually on way to world conquest and just missed it.

Marengo, Lodi, Arcola, Austerlitz, Wagram, Jena and a dozen other places scattered over Europe and Asia reaching the far-flung steppes of Russia and the far-off deserts of Egypt—these are a testimony if a testimony is needed to the military genius of Napoleon.

Original and in a way incomparable as Napoleon appears as commander, his real greatness consists in the imagination with which he remoulded the age, rightly called the 'Napoleonic Era.' As consul and Emperor, administrator, diplomat, reformer and law-giver, Napoleon looms large in world-history. Code-Napoleon continues not only to be the basis of the judicial system and social institutions of France but has influenced the growth of law and government in all lands that came directly or indirectly under his rule.

Napoleon's career was possible mainly because of the age in which he lived. He was the son of the Revolution. He created order out of the chaos in which France was thrown by the revolution of 1789.

As first Consul his record is not only unblemished but admirable. He brings about important changes in the internal administration of France, modernizes her agricultural and industrial systems, directs the revolution to constructive channels and above all makes repeated attempts to give peace to Europe. Napoleon is so far fighting defensive wars. The revolutionary ideas which the First Consul symbolises in his person are a standing dread to the world of Legitimacy and the European rulers spurn all his approaches. Partly to stabilize his own position and partly to appease and disarm the hereditary kings of Europe, Napoleon himself dons the crown and becomes Emperor. No body is deceived. He is still regarded symbolizing the dreaded revolution. He attempts to dominate Europe by raising his own brothers, relatives and marshals to thrones carved out of conquered territories. His first thoughts had been to follow in the footsteps of Alexander the Great and establish an Empire in the East, in India and had conquered Egypt as a half-way house. This was frustrated by the destruction of the fleet at Aboukir-bay. His next thought was to restore the Western Empire with himself as the chief potentate. He succeeded to a great extent but the destruction of the grand army in the Russian campaign gave the first mortal blow from which Napoleon never recovered. The campaigns of 1813 and 1814 were again fought in the old style and there were several opportunities for honourable compromise but till the last Napoleon thought that he could undo the reverse and regain the lost position. After the Dresden defeat, he could have retained France for himself with 1793 frontiers but he thought it more honourable to step down from the Imperial throne rather than give up his conquests. After a brief stay at Elba to which place he was confined by the allies Napoleon returned to France once again to rule for another 100 days. This return from Elba is a most astounding performance even for Napoleon whose whole career runs like a ballad. So great is the awe inspired by his very name that the Bourbons who had come in the baggage of the foreign rulers, escape once again across the channel and the romantic hero occupies Paris amidst the ovations of the people to play the final part in the great saga. Immediately on assumption of the Imperial office once again he liberalized the constitution giving it a democratic and parliamentary form and issued appeals to his enemies to leave him in peace so that he might complete his life-work interrupted by his defeat in 1814. So great is the distrust and fear amongst the allies that almost in a panic they outlaw him and prepare for his final overthrow. His own father-in-law, the Emperor of Austria and his wife Marie Louise—who had already sullied herself by her scandalous conduct—are a party to his outlawry. Napoleon wants to repeat his performances of twenty years ago when he took the world by storm by his brilliant campaigns in Italy

and once again plans in his masterly style to defeat each enemy separately before they have time to prepare. His first strokes are successful. He defeats and annihilates Blücher but is overcome and finally crushed at Waterloo because he is not able to attack Wellington in time, his orders are not given in his usual crystal-clear style, leaving so much to his subordinates in which they bungle and finally he calls the National Guard too late, when his main army has already been routed. Discouraged but not wholly disheartened he rushes back to Paris and appeals to the French people whom he has loved so much to rally to him once again and help in driving away the enemy. His brothers and some of his devoted friends rally round him but the enemies he had left behind in Foch and Talleyrand, his erstwhile employees, have already undermined his position and they subtly work for his downfall. He is still popular with the masses; the soldiers are as devoted to him at this hour of defeat as they were at moments of his most glorious victories but his generals and marshals on whom he showered so many favours are unwilling to risk their positions and some of them actually betray him. Marmont, one of his earliest comrades, who rose with the Emperor, proves to be the greatest traitor and is responsible for the final rejection by the allies of Napoleon or his successors to the French throne. His cause ruined beyond redemption, Napoleon attempts to escape to America. Having wasted too much time he is surrounded by the British navy to which he voluntarily surrenders making an eloquent appeal to Prince Regent for a treatment and asylum worthy of a great and generous foe. While his fate is being decided his ship is anchored in the Plymouth harbour, a great surge of people crowd the coast and when Napoleon appears on the deck spontaneously all heads are uncovered as a mark of reverence. The crowd offer flowers to the defeated hero. This was the great tribute of the British Nation, the general masses, the ordinary people who knew no politics but were instinctively drawn by the true greatness which Napoleon represented. The allies decided on the cruel and hard punishment of exile to the rocky island of St. Helena. Napoleon protested strongly for he was not a prisoner of war and had surrendered voluntarily. For the remaining 6 years of his life which he spent as a prisoner on this forsaken unhealthy place Napoleon busied himself in preparing a record of his great career as he had promised the National Guard while taking leave of them at the time of departure for Elba. The accounts left by the companions who had followed the exiled emperor have helped greatly in reconstructing the great events of his age. Within a few years of the Eagle's death the whole Europe was talking of him and so strong was the revival of the Napoleonic cult in France that the July Monarchy was forced by public opinion to bring back the remains of the Emperor from St. Helena

and over them a grateful people have constructed a noble mausoleum, becoming the hero.

III

What sort of man was Napoleon? What was it that brought him to supreme power? Having achieved this power how did he use it? What was it that he really achieved and left for posterity? Why did his supremacy last for so brief a period? Finally why did he fall? What is the great lesson of his miraculous career?

To these questions we must now turn to size up the man and his work. Physically he was short-statured, with a prominent forehead, bright blue eyes whose glare few could stand and in whose great depths one could have a glimpse of his whole life, a breast soft and padded almost like a woman, thin fine handsome hands impeccably neat, somewhat short legs, and during later years, a tendency towards obesity so that he appeared somewhat fattish. Inside this human dynamo was a will that no human power could bend, a determination that could overcome any obstacles, a mind that worked mathematically like a clock but could soar to great heights; he was a poet and mathematician, a realist and idealist, a man of figures and one whose imagination could penetrate to greatest depths and survey the highest altitudes. Skilled administrator, subtle diplomat, clever negotiator, he was equally at home both on the battlefield and his study. His mind is original and sharp like the edge of the sword, so comprehensive and quick that in a trite he can grasp a situation in its entirety and take final sweeping decisions, essentially constructive and productive. Rightly remarks Goethe:

"So divine an illumination is always linked with youth and productivity, and in very truth, Napoleon was one of the most productive men that ever lived."

His chief traits were imagination, self-confidence and energy, this last almost inexhaustible and super-human. This combination explains his success first in the battlefield and later in politics and diplomacy. He was remarkably modern, rational, just and fair-minded but also had belief amounting to superstition in his own lucky star, his fate and destiny. About Sydney Smith who checked him during the Turkish campaign, he said, "That man made me miss my destiny." At the fall of Moreau, his one time rival and later banished by him to America, who returned to take part in the campaigns of 1813, when Napoleon is meeting with reverses, he exclaimed, "My Star." About his own end, he said, "St. Helena was written in the book of destiny." He confessed that it was luck that brought him to supreme power. His self-confidence helps him to face enemies outnumbering him by 2 to 3 and yet by impromptu combinations he can beat them. When during the Russian disaster he

was asked, who in spite of all would defend him in France, he replied: "My name."

Napoleon's achievements were unique, unparalleled before or since. Just within twenty years, rising from obscure origins under most trying and difficult circumstances, he rose to supreme power in France, conquered nearly the whole of Europe or effectively controlled it, engaged in 60 pitched battles most of which he won against great odds by sheer supremacy of tactics, reformed France out of recognition and left abiding influence over the whole of Europe. In point of military genius the only comparable names are those of Alexander the Great, Hannibal and Julius Caesar but Napoleon's place is his own, without rivals. He was the greatest man of action ever born. Even in the matter of thought his grasp was amazing. While voyaging enroute to Egypt he was carrying with him the most noted scholars and scientists, a sort of travelling University with him. He held regular debates and meetings and the savants are astounded, for the commander-in-chief interrogates them minutely about their own subjects and seems to know everything. While on board on the "Bellérophon" in custody of the British after defeat the ship captain is greatly surprised by the technical knowledge shown by Bonaparte on naval affairs.

Napoleon was fond of power but not grossly ambitious. He was ambitious because he wanted to do great things and achieve results on a grand scale. "My age has produced nothing great. Let me set an example," he at one time exclaimed. His first aim, after he was set on the path of military glory, was to found an Empire in the East, in India, on the model of Alexander the Great. This was foiled by defeat on the sea but he never completely gave up the idea; till his final break with Alexander, Tsar of Russia, he continued hobnobbing with the plan for the conquest of the East. While invading Russia he was thinking of establishing a common system of Government and institutions thus forestalling all later ideas about the United States of Europe. He was in fact, the forerunner of President Wilson of America as he actually thought of founding the League of Nations. His ideals were good but he attempted to realize them through gross means. He himself admitted the supremacy of these spiritual powers over the physical forces but it was too late to reverse the course of history. Napoleon once said that he would live to be ninety for his work could not be completed in lesser time. But he failed to curb his impatience and craze for speed and ended his active life when he was hardly 45. Napoleon's age lasted very short, but in that brief period he has left behind a blaze of glory and immortality that will last till humanity. Untold generations will read the story of his great deeds and marvel how all that could be achieved by one man single-handed. He was so much ahead of his age and his ideas were so

original and inspired that a careful study of his career will help in tackling the problems presented by the 20th century. Napoleon belongs to the 19th century the main events of which he could foresee but he was so modern that he seems to belong to us, to this age. William M. Sloane, an American historian, remarks in his *Life of Napoleon Bonaparte*, Vol. II:

"The creative ideas of the revolutionary era with which Napoleon's name is so closely connected are no longer called in question; his own career was now verging to its decline but in his fall the fundamental conceptions of the epoch were firmly established."

Napoleon fought against the system of Legitimacy and his greatest mistake seems to be, to have attempted to appease it or compromise with it. The establishment of the hereditary empire was also a mistake for by these attempts he moved away from the principles of the Revolution of 1789 which made his very career possible. He was careful throughout his life to promote his soldiers and marshals on merit and merit alone but he made exception in the case of his brothers and sisters whom he raised to thrones, which they never deserved. He admitted that this was a mistake and contributed to his downfall. The treaty of Vienna which had imprisoned the son of the Revolution and restored the world of Legitimacy which Bonaparte had torn to shreds, was repudiated by the major developments of the 19th century. Nationalism and Democracy were the dominating forces of the 19th century and strangely speaking they fed on inspiration received from the Napoleonic era.

IV

"To every man, be he whom he may
There comes a last happiness and a last day."

So wrote Goethe on Napoleon's fall, whom he had shortly before declared invincible. Nothing lasts for ever in this transient world and at last even a Napoleon is defeated. He could have easily saved the throne for himself by accommodating with the allies in time, he could possibly have saved the Empire itself if he had followed Carnot's advice and declared himself dictator for the emergency and disbanded the legislative bodies which he himself had founded and entrusted with constitutional powers. He refused to do either because the first compromised his honour and the second would have given him a bad name in history. So punctilious was Napoleon about his sense of honour and so sensitive was he about his position in the eyes of posterity that he decided to end his career rather than besmear his name.

Napoleon's end was tragic and the fact that such greatness should have perished under such dismal and

pathetic circumstances is a sad reminder of the vicissitudes of life. Talking to Las Cases, one of his companions at St. Helena, the Emperor reflected:

"Adversity, too, has its heroism and its fame. Had I died on the throne, surrounded by all the emblems of power, I should have remained a riddle to many. Today the wrappings have been stripped from me; thanks to my misfortunes, every one can judge me in my nakedness."

When he hears of plans of his return to France he coldly analyses the situation and comments:

"But what can they hope from my return? That I should again conduct wars? I am too old. That I should seek for fresh glories? I am sated with them. . . . It will be much better for my son that I should stay here. If Christ had not died upon the cross, he would not have become the Son of God. My martyrdom will give the crown to my son, if he lives."

Subsequently he says:

"Misfortune has its good side: it teaches us truths. . . . For the first time, I am able to contemplate history as a philosopher."

Finally he confesses:

"No one but myself can be blamed for my fall. I have been my own greatest enemy, the cause of my own disastrous fate."

And, "I wanted too much. . . . I strung the bow too tightly, and trusted too much in my good fortune."

Reviewing his whole career in a flash as it were he explained to Las Cases:

"Every future historian will have to allow me my share. . . . Facts speak for themselves. I closed up the chasm of anarchy, and put an end to chaos. I cleansed the revolution from the filth it had accumulated, I ennobled the peoples, I stabilised the thrones. I encouraged all those who had talents, rewarded every merit, and widened the boundaries of fame and glory. . . . Could not historians protect me against many grave charges? If I am accused of despotism, they can claim that dictatorship was necessary in the circumstances. Is it freedom I attacked? They can answer that anarchy was still threatening on our very threshold. Love of War? I was never the aggressor. Striving for world domination? This arose accidentally, because of the conditions of the time. Too ambitious? Yes, true indeed. But my ambition was of the sublimest: to found the kingdom of reason, with full development and unrestricted enjoyment of all the human faculties. The historian may deplore that such ambition could not wholly attain its goal." "There, my dear fellow," he concludes, "in a few words, you have my entire story."

So the mighty Napoleon passes into legend and the saga of his great deeds would continue to be narrated in countless ways to the ends of the world and when credits and debits have been balanced on the immortal ledger of history, all would marvel that such a one as this ever existed.

THE LION-HEARTED LEADER

An Intimate Impression of Syama Prasad Mookerjee

Article Two

CHANGING THE VEHICLE OF PATRIOTIC SERVICE

[Specially written for *The Modern Review*]

By ST. NIHAL SINGH

IV*

THE staircase seemed to be moving. The whole of it. How? By some invisible mechanism. All one had to do was to plant the feet on the nearest step, stay there till the landing above was reached and then get off. There was no climbing, step by step. No effort was involved.

Way back in the early years of this century, when my eyes first lighted upon this contrivance on the Pacific coast of the United States of America, it impressed me as being a marvel of applied science. A little later, when moving staircases were installed in some of the Underground Railway ("Tube") stations in London, I noticed that boys and men—and a few women—were not content with being carried up without physical effort on their part, but that, to save time, or to use up a little of the abounding energy within them, or perhaps unable to resist the temptation to show off, they jumped from step to step and arrived at the top earlier than diffident slow-coaches like myself.

To Syama Prasad Mookerjee came, almost as an item of his inheritance, the moving staircase of educational administration. Hardly had he passed out of the University portals when he, without ado, planted his feet on the step that came near him without any exertion upon his part. This, as stated in the preceding article, was his election in May, 1924, to the Syndicate.

Had he been of a phlegmatic temperament he would have stood quietly upon it, sure in the knowledge that he would be carried right up to the top. Being dynamic—I use the word designedly and in preference to "ambitious"—he would not let the mechanism that he was confident, worked noiselessly, faultlessly, carry him, in its own time, to be the Vice-Chancellor. By dint of his own motive-power he jumped up and up and, in 1934, to the surprise of those

who had not rightly assessed his character and capacity, he, at 33, was installed as the chief administrator of his Alma Mater.

But—and that but is important—this was not the only hoist that he fancied or that to him was accessible—easily accessible. There was a lift (or elevator, in American phraseology) in addition to the educational moving staircase. It led into the legislature.

Some urge, some impulse within him, made him enter this lift in 1929, while he was only a syndic of the University. By a trick of Fate (shall I say?) it carried him into the "upper house," while the "lower house" more or less monopolised such power as Britons, noted for their possessive propensities, passed on to it. In the circumstance of the day the Council, as it was designated, was not a very important or influential organ. It nevertheless provided opportunities—opportunities for self-expression and possibly for patriotic service.

The Congress, in behalf of which he had stood and had been elected by the University, decided, the very next year, to non-co-operate with the "Satanic Government." It called out the legislators. Syama had his doubts about the move: but he, without question or delay, resigned. Having satisfied his sense of honour, he stood as an independent and was re-elected to the Council.

In 1937, while well into his second term of office as Vice-Chancellor, a new chapter opened in his life. Elections were held under the Government of India Act of 1935. He stood from the University constituency for the Bengal Legislative Assembly.

Even in the spring of that year, when he began throwing tendrils round my heart, he was using this legislative lift without giving up the moving staircase of educational administration. As I indicated in the preceding article, a tumult seemed to me, however, to be raging in his breast. With this I purpose to deal now in some detail.

It was caused by the mental conflict over

* The section numbers run on with those in Article One, printed in the September, 1953 number of *The Modern Review*.—Editor.

the mode and means of his service to the country. Was he to continue to devote himself more or less exclusively to managing the affairs of the University, or was he largely to concentrate his attention upon the political sphere? Or was he, in the figure I used in the beginning of this article, to have one foot on the moving staircase and the other in the lift?

What would be best for the people? That was the question he seemed to be pondering at the moment.

As I discerned from the outset, his thoughts were not at all for himself—but all for them. How could he conserve freedom in jeopardy—how could he make his maximum contribution to the country's welfare? By going on much as he had been going, or . . . ?

It was evident that he could not occupy the Vice-Chancellor's chair for ever and a day. At the moment of which I am writing he was coming towards the end of his second term of office. When he vacated it he would no doubt continue to supervise and to develop the Post-Graduate studies. That was the lever of the greatest potency. So long as he could operate it he could render invaluable service to the University and through it to the people of Bengal.

But he was greatly dissatisfied with the way things were going in the country. Only recently a new craftsman had voyaged to India and had taken his place at the imperialist loom in Delhi. The Marquis of Linlithgow had come to it with a pattern in his hand. That pattern was largely of his own design. It had taken shape when he was the Chairman of the Joint Committee of the two Houses of Parliament on the Government of India Bill, 1935.

One portion of the federal structure had come into being. Under it Syama had been elected to (what may, in the circumstance of that day, be termed) the people's house. The other had, however, been marred by the Earl Willingdon, who, not long before, had quit functioning at that loom of destiny. So at least his successor must have thought.

The Rajas were supposed to have accepted Federation. There were murmurs—rumours. Nobody in his senses expected, however, that when the hour struck any member of that exalted order would have the temerity to shun the parliamentary parlour specially provided for them.

Much to everybody's surprise the Jam Saheb of Jamnagar—the famous cricketer "Ranji"—had openly refused to knuckle under.

The revolt had taken place at an open session of the Prince's Chamber—the "Narendra Mandal," in the phrase of that Maharaja of Alwar who had been broken by that very noble Lord.

As a consequence, the accession of the "Princes of India" to the Union as settled by the Linlithgow Fourteen, could not be quietly secured through the vote of the Chamber. The new Viceroy hoped that, despite his immediate predecessor's bungling, he may be able to persuade the Rajas to change their minds. "Ranji" had died within a few days of the tussle in that Chamber and, as everyone thought then, as a direct consequence of the insult his proud spirit could not bear. That was true enough. The revolt had not seemingly died with him.

Linlithgow had, however, the supremest faith in his skill as a political angler, particularly because he had it in his power to manufacture bait that, in his view, none of their Highnesses would be able to resist. Disillusionment lurked round the corner.

According to the imperialists' calculations, the coming of the Rajas into the Federation was the surest way by which the British could avowedly give away power and yet, in reality, retain it. Weightage had been claimed by the representatives of the Princely Order as their price for entering the proposed union. It had been conceded to them by the spokesman for what then was called British India in contradistinction to Indian India or India of the Rajas.* This weightage, coupled with the mutable legislators that are to be found in any assembly in the world, would enable the Britons who pulled the strings, to defeat any move that they may deem dangerous to their monopoly. It is contended on authority that seems to be indisputable that "Ranji" defied Willingdon because he would be no party to the eternal enslaving, through this device, of his brethren of British India.

Important as the gilt strand was for the completion of the pattern Lord Linlithgow was weaving at the imperial loom set up in the Viceroy's House (as the magnificent pile was then, with British modesty, called) at New Delhi, there were other threads that would serve his purpose equally or nearly as well. There was, for instance, Mohamed Ali Jinnah's Muslim League, with its ramifications all over India.

* See my book *The King's Indian Allies: The Rajas and Their India*. (Sampson Low, London, 1915).

Bengal that then absorbed Syama Prasad Mookerjee's energies, though, in his thoughts, there was plenty of room for the broader issues affecting the Motherland, had become the hotbed of separatist activities. These had been whipped up, sometimes with scandalous flagrance but generally under the rose, by Britons placed astride the Province and their bureaucrats.

This had been going on for decades. Sorely tried by the Bengalis, the Earl (later the Marquis) Curzon had hacked it into two in 1905. Rallied for his bias against the Hindus, Bamfylde Fuller, while ruling the newly constituted East Bengal with the Muslims predominant in its population, likened himself to a man with two wives, who favoured now one, now the other. To still agitation the two Bengals were reunited in 1911, but India's capital was removed from Calcutta to Delhi and the western districts, rich in coal, iron, manganese and other minerals, were lopped off.

Disparate increase in the population had, in time, placed the Muslims in a small numerical majority even in united Bengal. Though inferior in education and wealth, this majority, petted by officials and secretly working in concert with them and unashamedly backed up by the vested British interests, acquired dominance. To any one who had the eyes to see, this combination of alien imperialists and Indian separatists constituted a terrible menace to Indian nationalism and even honest, decent administration. Such was the case in the 'thirties when I returned to the Motherland from my protracted world wanderings and soon after Syama Prasad Mookerjee formed a deep attachment for me.

As he surveyed Bengal, in which, save for 20 months or so, he had lived since birth, he was sick at heart. His eye lighted on none who had the character, courage and wit effectively to counter these anti-national tendencies. In this event, he felt that it would be wrong for him to go on hugging the life that had given him, in his early manhood, position, power and no small opportunity to hasten the pace of progress, and to refrain from doing what lay in him to fight down these evils.

It would be wrong to say that he was sucked into politics. No. His choice was deliberate. It was made with much searching of heart. This not because he would have to give up something certain for something uncertain. He did not have any doubt that he would succeed in the political sphere as he had done

in the educational one. Success or failure, in fact, did not matter to him. Not personally. His concern was only that he must not hang back when the call of duty rang in his ears—call from the mother in anguish at the misdeeds plotted and perpetrated by an unholy alliance of indigenous and alien forces. And he did not.

V
During the brief few years when the educational administrator was turning into the political crusader, I saw or heard from him at fairly frequent intervals. Three things about him impressed me most during this period, his

- (1) love of the University and concern for its steady, accelerated advancement;
- (2) anxiety about our civil liberties and determination that he should leave nothing undone to defeat the destroyers of freedom; and
- (3) longing for keeping green his father's memory, particularly through an imaginatively written memoir of that illustrious parent.

In a letter that he indited in his bold, legible writing from the Senate House, Calcutta, on March 18, 1937, he had this to say about "our students":

"We shall be delighted to welcome you here during your visit to Calcutta. We are however closing for Easter holidays and it would be convenient if you came here early in April . . .
"You must keep one afternoon free for us. I would like you to give a short address to our students. I would also like you to go round the different University buildings, which we may do one morning."

How clean-cut were his ideas and how openly, tersely he expressed his wishes! As I drew these conclusions my glance fell upon the seal in the left-hand, top corner of the stiffish sheet upon which he had written. Between the words "Calcutta University" and "Advancement of Learning" there was the "Dieu Et Mon Droit" device with its ever so familiar British Crown interposed between a rearing lion and a steed—ever so familiar and yet ever reminiscent of our psychological as well as our political subordination. A sight of it trooped into my mind episodes connected with our long-drawn-out struggle to shake off the shackles put upon our intellect, just about a century earlier, by Macaulayan casuistry spun to serve the slaying intent of an imperialising Governor-General—the Lord William Bentinck. A shadow was cast athwart these recollections of the expunging, at the behest of petty-minded separatists, of certain emblems and words from the University seal, though they had come out of the crucible of our culture, old—old, yet ever new. I could

visualise the difficulties bred by prejudice masquerading as religion that Syama, in administering the University, must have been encountering.

What joy would it be for me to be taken round the various faculties by a man who was almost born in the University and who, in addition to being its Vice-Chancellor, was President of the Post-Graduate Councils in Arts and Sciences! I could not help feeling, too, that, to borrow the phrase from the railway-man's cant, the point had been set that would take Syama's coach from the educational to the political track. Of this I wished to learn from his own lips.

While Syama was taking me round the University I casually mentioned to him the desire to revisit Chandernagore. Since I had been taken there previously, during one of my 1921-23 visits to Calcutta, by a young Chandernagorean who was an artist to his finger-tips, I had spent a whole year on the Continent, mostly among French-speaking peoples. This had made me all the keener to peer, if possible, into the minds of our countrymen in French tutelage.

I had barely gone back to my "palace on wheels" at Howrah Station when the Professor who taught French at the University called and handed me this missive from Syama, again in his own hand:

"This letter will be taken to you by Mr. Chandra who has very kindly arranged for your visit to Chandernagore. I hope you will enjoy your trip."†

I never have had, anywhere in the world, half so capable and considerate a guide as Mr. Chandra proved to be. He took me home after a long interview with the Administrator and showing me the sights and there his kindly wife, who had come from Calcutta specially for the purpose, had spread a luncheon fit for a king.

Syama fell seriously ill soon after my pilgrimage to the University. I use the word "pilgrimage" advisedly: for most of the men who helped me to mould my mind way back in the concluding quarter of the XIX century

came out of that temple of learning. Northern and North-western India owes to it an irredeemable and ineffaceable intellectual debt.

When Mrs. St. Nihal Singh and I returned to our "Suryasthanam" in Dehra Dun after our next visit to Calcutta, I wrote to Syama:

"It was a great disappointment to Mrs. St. Nihal Singh and me that we could not see you during our last visit to Calcutta. Brief as it was, I enquired over the telephone more than once about your health and was told that no visitors were permitted. Gurusadai Dutt,* who called on me and with whom we subsequently dined, told me that he, too, had not been permitted to enter your room.

"Pray relieve our anxiety by letting us have a line to assure us that you have been restored to normalcy. We are very fond of you, not only because you are your father's son and he was very good to us, but also because you are you—because of your affectionate nature and your intentness upon forwarding Bengal's—and India's—cause. We expect great things from you, educationally and politically, and we hope that you will not be prodigal with your physical vitality, as, I am afraid, you are inclined to be . . ."

By return of post came his reply:

"Thanks very much for your kind letter. I am much better now. I am sorry to have missed you when you were in Calcutta last time. With best wishes to you both. . . ."

This assurance was reinforced by his hand-writing, as firm and clear as ever. Though he gave no indication in this letter, he must have noticed that in my view he had entered the political field—for good. At that time I hoped that he would be able also to go on with his educational work: but as we shall see, politics proved to be a jealous mistress, admitting no rival.

[Article Three will appear in the November issue of *The Modern Review*].

* At that time the most senior Indian Civilian in the Presidency, holding one of the highest appointments in the Bengal Administration. I knew him from his early manhood. Born in an humble home, he, mainly through his exertions and through the loving, efficient co-operation of his highly educated wife, Srimati Saroj Nalini Dutt, herself the daughter of a pioneer Indian Civilian, had made his way in the world. Yet he never forget the woes and welfare of the lowly. He helped his wife to build up a magnificent institution for serving women and children and himself tried to regenerate the youth of India through his Brattachari drills and camps. Possessing a keen sense of artistic perception, he further sought to revive folk-songs, folk-dances and the crafts and arts of rural Bengal.

† Letter dated Dehra Dun, U.P., September 26, 1937.

§ Letter is dated 28.9.37, but bears no address—no doubt 77 Asutosh Mookerjee Road.

† This letter was dated 23.4.37 and bore the address, 77, Asutosh Mookerjee Road, Calcutta.

TAXATION STRUCTURE OF INDIA

Problems Before the Taxation Enquiry Commission

By SURESH PRASAD NIYOGI, F.R.E.S. (Lond.)

IN the economy of every modern capitalist country taxes play a very important role. In fact, taxation structure is the corner-stone upon which the fiscal edifice stands. This is because every modern State has to undertake welfare activities which require adequate finance. Moreover, in modern times taxes play a very important role in eliminating disparities in the distribution of wealth. Even in the economy of Socialist Russia, which is based on the principle of equitable distribution of wealth the importance of taxes could not be washed out altogether. The problem also assumes special importance in our country particularly at this dawn of planning era. For, finance, the ever-dreaded nightmare to all developmental activities in any under-developed country, is now a puzzling problem before us. On the satisfactory solution of this financial handicap depends much of the success to be achieved in treading the unfamiliar path of the mixed economy.

When to meet the increased war expenditure and other expenditures of immediate nature due to the partition of the country, the Government was introducing new taxation measures, the need for appointing a Taxation Enquiry Committee was felt. It may be pointed out that in 1924 a Taxation Enquiry Committee was appointed in this country for the first time. After that in 1935 an Income-tax Enquiry Committee was appointed. Due to the excessive profits made during the war when tax-evasions were on the increase, an Income Tax evasion committee was appointed. Dr. John Mathai as Finance Minister first spoke of appointing a new taxation enquiry committee. His proposal had the enthusiastic support of informed opinion throughout the country. Our present Finance Minister in his last budget speech announced the appointment of a Taxation Enquiry Commission with Dr. John Mathai as chairman. The present Commission have to make recommendations with regard to the modifications required in the system. In particular, the Commission have to examine the incidence of taxation on different classes of people and in different states and to consider the tax system in relation to the objective of reducing economic inequalities. They have also to consider the bearing of the structure and level of income taxation on capital formation in dealing with inflationary and deflationary situations. Finally, the Commission have to examine the suitability of the tax system as a whole with reference to the resources required for the country's development programme and to suggest, if necessary, fresh avenues of taxation.

In analysing the taxation structure of a country we should know first of all: (i) How far the taxation

structure is effective, (ii) How far it can effect production and enterprise, and (iii) How far it is effective in redistributing wealth in the country. It appears from an examination of all these criteria that unlike the tax system of some other countries the only object of the Indian tax system is the production of revenue. No attempt is made here to remove or modify, through its system of public finance, the inequalities that exist in the distribution of wealth among the different classes of society.

Our Central and State Governments in framing their budgets do not professedly adhere to any of the current theories of the apportionment of taxation. As a matter of fact, however, so far as the income-tax is concerned, they have definitely accepted the principle of progressive taxation.

It can categorically be asserted that the Indian tax system is not unitary, i.e., it does not make any reliance on single tax. It rather inclines to the opposite extreme, viz., the multiple tax system. For, the taxes are collected from a fairly large variety of sources.

Just like all other modern countries India also has a mixed tax structure composed of both direct and indirect taxes. The land revenue and the assessed taxes are direct whereas the customs and excise duties are indirect. Opium revenue partakes more of the character of profit from commercial transactions than of a tax. It must be remembered in this connection that it is hardly possible to draw a sharp line of demarcation between direct and indirect taxes.

Empirically it has been found that the tax structure of a country is more or less fixed. Mrs. Hicks opines that except in the wake of a revolution it takes years to switch over from a commodity tax structure to an income-tax economy. A study of the history of taxation in capitalist countries, shows three distinct trends: first, swing-away from indirect taxes to direct taxes, secondly, return from direct taxes to indirect taxes and finally, swing-away towards direct and indirect taxes. A careful examination, however, reveals that the Indian tax structure has a strong bias for commodity taxes. Recent history of the Indian tax structure is marked by two broad movements—the one is a swing-away from the commodity taxes and the other a return to the commodity taxes.

During World War I, direct taxes amounted for a very small proportion of the total tax revenue. The Taxation Enquiry Committee of 1924 came to the conclusion that the total burden of taxation was not oppressive on any particular class but its distribution was unequal. So it affected the poorer section of the

people proportionately more than the richer classes. This will be evident from the table given below:

Heads of revenue	Burden on the rich	Burden on the poor
Customs	20	21
Land Revenue	20½	21½
Railways	33	60
Municipal	3	10
District Board	—	10
Income-tax	20	Nil

(K. T. Shah's figures)

The actual incidence was Rs. 6-1-8 pias per head in 1922 according to the calculation of Sir Purusottam-das Thakurdas and it came down to Rs. 4-12-11 in 1937-33 according to the Government of India.

But since World War II, drastic changes have taken place in our tax structure and direct taxes have become an important item in it. The following table gives the position:

	In crores					
	1941-42	1942-43	1943-44	1944-45	1945-46	1946-47
Total direct taxes	44.48	86.32	129.91	192.21	180.25	162.06
Indirect taxes	122.52	118.28	150.91	204.83	260.72	278.06
Total revenue	167.00	204.63	280.83	397.05	440.98	431.65
Per cent of direct tax to total tax	26.3%	42%	46.3%	48.3%	40.8%	37.5%

From the figures given above it appears that in 1938-39 the contribution made by direct taxes constituted nearly 22.6 per cent of the revenue of the Government of India. Due to the exigencies of war the increasing need for tax revenue led to a rise in the rates of direct taxes that accounted for a considerably large proportion of the total revenue in 1944-45 (i.e., 68 per cent). It was about 48 per cent of the total tax revenue. This increasing importance of direct taxes may be ascribed to political reasons as well as economic reasons such as the difficulty of balancing the budget. During the War years the balance decidedly tilted in favour of direct taxes and this led to some economists' approbation. Some were of opinion that the importance of income-tax was commendable on the ground of distribution and maximisation of welfare as well as from the standpoint of productivity. The late Mr. N. R. Sarkar in presenting the West Bengal Budget for 1950 made a plea for moving the income-tax much higher. The combined effective rate of income tax and super-tax on incomes over Rs. 30 lakhs was nearly 85.7 per cent while in the U.S.A. the maximum combined rate was 77 per cent. In India, a man with an income of Rs. 1 lakh had to pay 48.2 per cent in tax, whereas in the U.S.A. a man with an income of \$1 lakh had to pay 45.64, provided the assessee was married and had only 2 children. Mr. Sarkar made a plea for the reduction of income tax rates mainly with an eye to stimulating investment and attracting foreign capital. As a matter

of fact, countries with economies comparable to ours (Canada, Australia, etc.) have reduced their rates of income tax in the post-war period. In Australia there has been a 23 per cent reduction in this respect with 67 per cent tax on the highest slab of income. Canada has also reduced her income tax rates by 16 per cent in 1945.

A comparative statement of revenues of some countries in the world during the post-war period is given below:

Country	1938-39=100			Highest per cent reached in 10 years
	Growth of Revenue 1938-39	Income-tax Revenue in 1938-39	In 1948-49	
U. S. A.	851	43	76	79 (in 1944-45)
Canada	530	28	49	57 (in 1944-45)
South Africa	468	36	42	52
U. K.	405	45	46	59
Australia	373	13	44	54
India	393	22.6	49.7	60.9
New Zealand	...	...	24	48 (44.45)
Ceylon	...	18	21	21

Furthermore, Mr. Sarkar emphasised the need of relating the fiscal policy to the existing state of affairs.

It has been argued by some that a high rate of income tax reduces saving and capital formation and produces a very unfavourable effect on the incentive to invest. The *Eastern Economist* have even argued that a high rate of income tax has actually led to dissaving in India. But on theoretic grounds it may be contended that dissaving should be accompanied by concomitant disinvestment. Mr. Ranganekar has pointed out successfully that no disinvestment has occurred in India at the present time. Therefore, the dissaving thesis so ingeniously brought forward by the *Eastern Economist* cannot but fall to the ground.

That high income tax kills the incentive to invest and leads to dissaving is but one side of the picture. On the other side, however, there are serious considerations which should not be ignored at any rate. A steep graduation of income tax leads to a shift of income from the saving class (high income brackets) to the spending class. Thus with a high propensity to consume nobody can expect that investment will be unfavourably affected. A policy of graduated income tax *cum* social expenditure will more decidedly give an impetus to the progress of investment.

Furthermore, under the existing situation of inflation one very significant question may be posed in this context: Does not inflation by itself distribute the income in favour of the rentier class? Most certainly it does. Hence, what the Government takes away in the shape of taxes from the high income brackets can be justified.

On the other hand, the slackening of investment in India at present might be ascribed to other reasons as follows:

(1) Investors in post-war years nourish an expectation of profit which stands at unduly high pitch. The earning of war profits has made them too greedy to readily accept the peace-time economic conditions.

(2) In view of the inflationary situation there has been a psychological tendency on the part of the investors to expect future rise of prices. Hence, there has been a tendency towards long-term investments.

(3) The lack of any incentive to invest may also be ascribed to the tug-of-war between the investors and the Government.

(4) The lack of saving may also be due to the prevalence of high prices. Rise of prices increases the propensity to consume with an increasing flight of money towards goods because of the progressive decline in the value of money.

Of course, it cannot be denied that the real burden of income tax in India is much higher due to the presence of widespread evasion. Large-scale evasion is a pointer that tax rates are too high.

Now let us turn to the detailed analysis of the budgets. In the beginning of the post-war age we find the priority of indirect taxes. In the Rowland Budget of 1945-46, the rates of direct taxes were reduced. After that Janab Liakat Ali Khan introduced some new direct taxes and of these the capital gains tax may be mentioned. But in later years Mr. Chetty and Mr. Deshmukh, in order to give an incentive to savings and capital formation reduced the rates of direct taxes. The abolition of capital gains tax and business profits tax in the budget of 1949 and 1950 are remarkable facts. The imposition of duty on cotton by Dr. Mathai in 1950 clearly indicated that the trends were towards indirect taxes. Mrs. Hicks opined that in the post-war years, the burden of direct taxes has been considerably reduced as compared to indirect taxes and the high income groups receive much relief. But in the budget of 1951-52, the Finance Minister introduced both direct and indirect taxes. In the colourless budget of 1952-53 we find the shadows of the past budgets. In the budget of 1953-54, income taxes have been reduced but postal rates have been increased. So from these budgets it clearly appears that in the Indian tax structure the importance of both direct and indirect taxes and the scope for new taxes are on the increase.

In the Five-Year Plan we find that out of the total planned investment of Rs. 2,069 crores in the public sector Rs. 738 crores are expected to be available from revenue surplus of the Central and State Governments. The revenue surplus is to be secured by additional taxation and the sources to be tapped for the purpose are higher incomes from land, estate duty, wider coverage and better administration of Sales tax, Betterment tax, Motor Vehicles tax, etc. The financial position of the Central Government is becoming worse day by day. A review of the Central Budget will show that the Centre has been producing deficit budgets for

the last 16 years or so. One way of achieving surplus is to reduce expenditure on civil administration but experience shows that expenditure on this account has been mounting higher and higher since independence. In 1951-52, there was a revenue surplus of 93 crores. In 1953-54, it is a deficit of 140 crores.

But the chronic budget deficit during the last few years, especially in the Budgets of West Bengal and Bihar, have led the authorities to increase taxes; and the taxing capacity has reached the maximum in most of the States leaving no room for new or higher taxation. Now let us take the case of taxes proposed by the Commission. Sales tax in Part A and B States taken together contributed about 14.6 per cent of the total revenue of the States. The yield from this source in course of a few years has increased to about 60 crores which was about 17.24 crores in 1947-48. This is due to the fact that the schedules of exemptions to sales tax have been curtailed and a few more additions have been made in the schedule of taxable items in most of the States, particularly, Bombay, Bihar, West Bengal and Madras. Other taxes contributing to the revenue of the States are, Excise 11.4, Stamp 5.5 and Land Revenue 14.6. The yield from entertainment tax has also increased due to the increase in the rates of the tax in most of the States. The yield from the betting tax has increased in West Bengal and Bombay but declined in U.P. and Madras due to the policy of the Government to discourage betting and gambling. How can this tax be increased?

The average taxation per head in India is very low. By comparing these figures with the relevant figures of countries like Australia, Canada, etc., it is sometimes sought to prove that the burden of taxation is not heavy as is sometimes imagined, that is, there is scope for increasing the taxation on consumption. While it may be accepted that there is some scope for minor readjustments as a whole it may be said to have reached its fullest limit under the existing state of our economy. Comparison between India and other advanced countries is rather misleading, for the general standard of living in these countries is higher and hence the lower income groups in these countries are in a better position to bear higher taxes on consumption.

Again some say that as the proportion of tax revenue to national income tax here is lowest in the world there is ample scope for further taxation. As for example, the Planning Commission has pointed out that in India it is only 7 per cent. The proportion of tax revenue to national income is as high as 35 per cent in U.K., 22 per cent in Australia, 23 per cent in U.S.A. and Japan, 27 per cent in New Zealand, 19 per cent in Canada, 20 per cent in Ceylon, 16 per cent in Egypt, 15.5 per cent in Cuba, 14.4 in Chile, etc., and 14.4 in

Brazil. But in a backward country like India, where a vast majority of people do not have enough money even to get two meals a day, where only less than 8 lakh persons out of a population of 38 crores pay the income tax and where national savings are not more than 5 per cent of the national income, the taxable capacity is much lower. If we take the percentage of taxation to national savings we find that the taxable capacity of the people has almost reached the maximum, that there is no scope for further taxation.

The people are already paying more direct (28 per cent) and indirect taxes than they can possibly afford. If direct taxation is increased and the prices of goods rise the already harassed consumer, who has suffered all the consequences of super-inflation, would not be able to stand the strain. If direct taxation is increased people who pay the income tax would be forced to reduce their savings still further and to contract the output and their effort in industry.

SUGGESTIONS

(1) Since the whole process of direct taxation is unscientific and also gives rise to some anomalies and gaps, the reform of direct taxation is long overdue. Within the same scale the principle of ability to pay is not fully taken account of. Therefore, some sort of allowance on the British model should be provided (e.g., allowance for children, etc.).

(2) Again, the method of income taxation should be extended more and more to the agricultural sector. In fact, agriculture contributes 54 per cent of the national income, but pays only 12 per cent to the Government revenue. If the burden of taxation is properly distributed and if more revenue is derived from agricultural income tax then the burden will not fall so heavily on wage-earners.

(3) The desirability of reimposition of the salt tax may be considered. As it is an old tax the effect of the tax on the payee is not likely to be very much.

(4) Land revenue at present contributes only 8 per cent of the total tax revenue as compared with about 25 per cent in 1939. There is scope for further upward revision of land revenue.

This revision, it is hoped, will yield more revenue to the Government but the reorganisation of the tax system may mean some loss. To quote Prof. P. C. Jain:

"These sources would yield some additional revenue but the much needed rationalisation of the tax structure as between different classes of people and a proper balancing of the direct and indirect taxation would mean some loss of revenue to the Government. It may be possible that if all these changes are made the Government's revenue surplus may increase by a small amount but it can not possibly be expected to fill a substantial portion of the gap."

II

QUESTION OF REDUCING ECONOMIC INEQUALITY

The most important point in regard to the terms of reference to the Commission is to consider the tax system in relation to the objective of reducing economic inequalities. It is well-known that the Indian income structure is today far from satisfactory. It is now generally agreed that a more equal sharing of the national product by the different income brackets are necessary not only from the point of view of social justice, but even for full mobilisation of the productive resources of the community. It is, therefore, essential that this inequality of income should be removed in any planning.

There are three basic causes of unequal income distribution. These are: (1) Unequal distribution of capital ownership, (2) Too large portion of national income paid to capital owners, and (3) Unequal opportunity for acquiring skill and getting adequate nutrition and medical care.

One way of changing the distribution of income within a capitalist society is to redistribute incomes through taxation. The percentage of income available to the low income brackets can be increased by decreasing the taxes. Also the relative income of those in the high income brackets can be increased by decreasing their taxes.

There are various methods of redistribution of income but we are specially interested in the redistribution of incomes between groups of families. The grouping of families can be effected according to a number of criteria such as types of income, industry, occupation, size, etc., but since the mobility between industries, occupations, districts and regions are comparatively free we are more interested in redistribution of incomes between groups classified according to the standard of living. The latter type of redistribution is called vertical.

Now-a-days in England a very significant part is played by horizontal redistribution, i.e., redistribution from families with smaller number of dependants to those with greater number of dependants. Under Britain's system of food subsidies, families with a large number of dependants reap the greatest benefits.

A close scrutiny of the British and American taxation reveals that the percentage of income paid as taxes shows a steady increase from the lowest brackets to the highest in U.K., whereas in the American tax system the percentage of income paid as taxes is less for the middle and the lowest income brackets. The British tax system is progressive throughout all income brackets, whereas the U.S. tax system is regressive in the lowest income brackets, approximately proportional in the middle income brackets and progressive in the highest income brackets. However, the tax systems of both the coun-

tries decrease the portion of the total national income available to those in the high income brackets and increase the portion available to those in the low income brackets.

Now let us consider the economic consequences of redistribution of taxes. These are:

1. *Corporate Tax*: The corporate income tax is largely paid by persons in the upper income brackets. It is a revenue measure well-suited to reducing the disparity in income distribution.

Recent study shows that corporate savings form an important portion of the total national savings in a community and that it plays a very important part in financing national development programmes in highly advanced countries like U.K., and U.S.A. This has also various advantages in financing economic development programmes over the other forms of domestic savings. Hence, in India, some have opposed the tax. But the needs of public exchequer at the present moment are paramount and it will, therefore, not be desirable to reduce the rates of this tax. It is, therefore, suggested that corporations who will use the undistributed profits for the purpose of the Plan should be exempted up to a certain percentage from taxation.

2. *Sales Tax* collects a larger portion of the income of the lower income groups than it does of the upper income groups. This can be made progressive by laying the tax only upon certain articles consumed to a great extent by those receiving the larger incomes, e.g., expensive liquor, cigar, cigarettes, etc. Savings of upper income brackets should be taxed. This is particularly necessary to reduce the gulf between the poor and the rich. We should also see that savings are not taxed twice—once at the source and again when savings yield income. Four remedies have been suggested to remove the difficulty. We shall consider only the last one, i.e., the exemption of future investment income from taxation. This seems to me the best remedy in this country. But there is one administrative difficulty inasmuch as no Parliament can bind its successors. If a definite period is specified after which future investment income would be taxed, then this method will avoid many undesirable repercussions.

3. *Property Tax* can reduce the wealth of individuals obtaining larger incomes. But the tax will not have so great an income-equalising effect as the individual income tax because it is not levied at progressive rates. However, its effects even with proportional rates would be similar because of the concentration of property ownership in the upper income brackets.

In our country property tax should also be introduced. But there is some inherent weakness in the tax as regards assessment, collection, etc. The Commission should give their careful consideration to the

problems. The Commission should also examine the desirability of exempting (1) Government-owned property, (2) Property owned by religious, educational and charitable organisations, (3) Homestead up to a certain limit should be exempted from the tax. In this connection the imposition of tax on bricks by certain local authorities may also be examined.

4. *Social Security Taxes*: It is assumed that the contributions made by employers are passed on in higher prices, as they are during a period of a pre-vailing sellers' market; these contributions are paid largely by the workers in the middle and upper income groups whose share in the nation's total consumption is the highest. Also it is likely that social insurance tax payments made by employers for upper income wage-earners are most readily shifted backward in lower wages. For, the wages received by those workers include a surplus above the requirements of subsistence which can be reduced more easily than money income required for subsistence.

5. The collection of *Death Taxes* reduces the wealth and income of the beneficiary and not of the descendant. Death taxes reduce the concentration of wealth in the future, but they do not affect the current distribution of wealth and income. These taxes are particularly desirable because they do not cause the reduction of total satisfactions and individual initiative through a reduction of income earned. This makes these taxes particularly desirable in maximising satisfactions and reducing the concentration of wealth and income. The Government of India have already introduced the Estate Duty Bill. Those who oppose the bill say that the enactment of the bill will reduce capital and savings in the country. But it may be pointed out that death duties are seldom paid out of capital. Taxes as a rule, even though based upon the capital value, are met out of current income or at least income not yet converted into capital plant. In any case, in this effect it is comparable to high and progressive income tax. While it undoubtedly reduces large estates, it does not mean any destruction of the existing capital as such. The remarks of the Colvin Committee are very relevant in this connection:

"Though death duties are assessed on capital, they destroy no existing capital, at most they absorb potential capital by diverting to the payment of the duties, income which would otherwise have gone into new savings. In this they do not differ from income tax or any other tax of comparable magnitude. The property sold must eventually be bought by someone who has free income seeking an investment and the only effect is to divert this income from the creation of a new to the purchase of an existing investment. There is no reduction of actual capital."

As regards the effects of death duties on savings, there are divergent views. It is held that it reduces the incentive to save, in a very deterrent manner.

Here again, there is comparison between income tax and death duties. Highly steep income tax reduces the incentive to savings to a certain extent. The same is true in regard to death duty. The Colwin Committee, however, considered that "Taking physical and psychological effects together, we think that the estate duty is distinctly more damaging to saving than the income tax (although we do not suggest that the difference is great)." This result is due in part to the fact that under the existing scale the bulk of the duty is drawn from the largest estates. We doubt whether the estate duty is more damaging than income tax to enterprise. On the whole, we are inclined to think it is less so. Prof. Pigou, however, holds the contrary view. He is of opinion that

"Death duties have no deterrent effect and are rather a good form of taxation in that people are probably not discouraged from saving by thinking of the death duties as they are by thinking of an income tax on unearned incomes."

In his evidence Dr. Dalton was also of opinion that

"The prospect of heavy death duties will stimulate those who are waiting for a windfall of inherited wealth to work harder and to save more than they would do otherwise."

6. The individual income tax with progressive rates has a levelling effect on the distribution of

incomes of a nation. The incomes of the high income receivers are reduced by a greater amount than the incomes of the middle and low income receivers. This effect is desirable in a democracy, for political equality is much more difficult to maintain under conditions of neat economic inequality. Also a tax resting with greater weight on an individual obtaining a large income enables the Government to obtain required revenues without pressing on the necessities required for a healthy and efficient population.

A very important point in the redistribution of wealth which deserves special attention of the Commission is the too much concentration of economic power in Banking and Insurance companies. In India, now-a-days the entire economy is controlled by a few families. This is against the social ideal envisaged in the Constitution which wants to establish a social democracy for India. The Constitution also disfavours concentration of wealth in a few hands. The only effective remedy of eliminating this concentration of economic power is to nationalise these concerns. But, as nationalisation will face some difficulties at the present moment, my suggestion is to impose a high rate of taxation on the incomes of these monopolistic anti-social business concerns.

It is hoped that the Commission will give their careful consideration to the problems raised above and suggestions made.

—O—

THE ART OF SUDHIR KHASTGIR

BY SUMANTRA SEN GUPTA

An exhibition of paintings, and drawings by the eminent artist S. Sudhir Khastgir was recently held in the Salon of the Academy of Fine Arts, Calcutta.

Opening the Exhibition on the 1st of August, 1953, His Excellency Dr. H. C. Mookerjee, Governor of West Bengal, paid handsome tributes to the artist. Although Dr.

Mookerjee, in the outset, remarked that he was not one of those who had any claims to criticising art, his speech, when completed, proved that he was a real connoisseur of art. Dr. Mookerjee's assessment of the works of S. Khastgir revealed his close intimacy with the artist's works.

Dr. Mookerjee was much impressed by the realistic subjects chosen by the artist for his compositions. S. Khastgir was essentially an artist of the people—the ordinary people. The artist derived inspiration from such simple sources as the life of the country-folk. Rather than neglect these people near the earth he keenly observed them and created his work around them. Indeed they were his own people. It would, therefore, not be wrong to say that there was no place in his art for sophistication. The pompous, the fashionable, the ostentatious, held no inducement for him. His work reflected warm humanity as the story he had to tell was

Spring-dance
By S. Khastgir

that of life in its simplest and most genuine form. Khastgir was not only a great painter but a great sculptor as well. One of his masterpieces was *Winter*, Continuing, Dr. Mookerjee further said that the artist's

To the field
By S. Khastgir

work was varied and refreshing as he had attained a great freedom of expression, never being bound to one particular mood or subject at a time. The artist possessed compositional adroitness, psychological insight and discreet symmetry. His general treatment was charmingly bold and vigorous. His work was infused with freshness and vitality.

However, in the opinion of Dr. Mookerjee the most outstanding feature of the artist's work was the versatility of his genius. S. Khastgir's efforts ranged from drawing with pencil, ink, charcoal to oils and water-colour. He worked with equal facility through all these mediums; this was indeed, the true expression of the artist's greatness. He was not bound to one style or one medium of manifestation, but there was constant variation. The colours used in his paintings and drawings were in keeping with his vigorous treatment. These colours were often bold, yet these radiated a feeling of softness. But the artist triumphed in the beauty of his lines whether he worked in colour or in monochrome. These "pure" lines lifted his pictures to a state of absoluteness.

Dr. Mookerjee noted with pleasure the fact that S.

A sketch in crayon

Gossip
By S. Khastgir

depicting an old woman sitting in front of a fire, warming her hands. The expression on the old woman's face conveyed a sense of helplessness; old age was captured so very vividly that it made the model almost living. Concluding, Dr. Mookerjee said that it was the joy of creation and nothing else that supplied the motif of all the artist's work. His creations were not something deliberate—but spontaneous—coming out, as it were, from a great urge of the inner self. The artist had chosen this line, which was not very remunerative, because of the great pleasure and joy that he derived from it.

Baul
By S. Khastgir

Dr. Suniti Chatterjee also spoke a few words in appreciation of the artist, whom he knew for a long time. Speaking of him, Dr. Chatterjee gave the details of the artist's life. S. J. Sudhir Ranjan Khastgir was born on 24th September, 1907. He was a disciple of S. J. Nandalal Bose of Kala Bhavan, Santiniketan. He toured extensively over India and Ceylon to study ancient Indian art and architecture. His works were exhibited in the big cities of India, mostly in one-man shows. In 1937, an exhibition of his paintings was held in London. He toured over England and the continental countries, visiting their art-centres.

Dr. Chatterjee remarked that in 1927, S. J. Khastgir along with Sri Ram Kinkar Baij, started working on an

entirely new form of sculpture at Santiniketan. From the very beginning S. J. Khastgir surprised everyone by producing some masterpieces. *Daughters of the Soil*, produced in the same year, was an example of the greatness of the artist's creation even in the initial period of experiment. Dr. Chatterjee considered S. J. Khastgir as one of the greatest artists of our times. Dr. Chatterjee was, however, of the opinion that his sculptures rose above his paintings and drawings. It was Khastgir the Sculptor that he admired more than Khastgir the Painter.

I have been fortunate enough in knowing S. J. Khastgir

Tejesda's hut
By S. Khastgir

intimately. It was my pleasure to accompany him to no less a place than the famous Sun Temple at Konarak in Orissa. During the trip, I discovered to my joy that he had a very affectionate disposition, always ready to share one's thoughts with a charming smile. In the ruins of the Sun Temple the artist's face was transformed into a mirror of agony; he suffered within himself for the decay that was creeping into the temple. His extremely sensitive mind seemed to rebuke Nature for the grave injustice she was doing to the exquisite man-made Temple.

I have been acquainted with the artist's works for quite some time. The portrayal of ecstatic figures—specially of dancers—is one of the artist's favourite

subjects. This has resulted in some of his finest compositions. The ecstatic figures, in many of his paintings, attain a height which makes one feel that these figures are, in a way, in tune with the infinite. The restless self in the artist finds true expression through these figures—bold and vigorous, yet so sublime and absolute. Real beauty has been captured by the artist in the human form in movement—beauty that is fascinating.

Coming to his sculptures, I would venture to add that his work with the chisel is as great as his work with the brush. Both bear the hallmark of his unmistakable power. To choose between two really great things is a very difficult proposition. The versatility of the artist

has made his position unique in the field of Indian art. Such a prodigious worker both with the brush and the chisel is rarely to be found.

Ever experimenting with new styles and expressions, S. J. Khastgir has made his work very dynamic. Of late, there has been a marked tendency on his part to attempt "abstract" pictures. This is a bold and laudable attempt and may well be the evolution of a new style. Even in his new efforts the artist is completely at ease. The gradual inclusion of the abstract motif in his paintings is probably a pointer that the artist has at last found his goal—the culmination of his true genius. All we can do is to wait and see.

—O:—

PROF. V. LESNY AND INDIA

By MILADA GANGULI

WHEN I, during my first visit to Santiniketan, was introduced to Gurudeva and he had learned that my home was Czechoslovakia, he said: "Oh, we have a good friend there, Prof. Vincenc Lesny. He spent several months with us here and we were very fond of him. He knows Bengali quite well."

And, indeed, India had a good friend in Prof. Lesny,* perhaps one of her greatest, most devoted friends. Those who knew Prof. Lesny could feel it from his attitude, from his enthusiastic talks, others from the many books on India he had written and from his innumerable translations and contributions to both learned and popular journals at home as well as abroad.

Prof. Lesny became interested in Indian philosophy, religions and Indian languages already as a student. As early as 1917 he published his first scientific treatise, *The Developmental Degree of Prakrit Dialects in Bhasa's Dramas*.

Perhaps the most comprehensive work is his *Spirit of India*, published in 1927 and its enlarged edition *India and the Indians—A Pilgrimage through the Centuries*,

* Prof. Dr. Vincenc Lesny, (born April, 1882, died April, 1953) was Professor of Indology at the University of Prague. Through his scientific work he belongs to the most outstanding orientologists of the world.

published in 1931. The first page of the book bears a picture of Gurudeva with Prof. Lesny and the second page a translation of a poem by Gurudeva: "Oh, India, my dear Motherland."

Prof. V. Lesny with Gurudeva in Santiniketan

In this work the author takes us through the ages from the oldest Harappa culture to the fight for national freedom, and makes us acquainted with the main currents of Indian thoughts, religions and literary achievements.

It contains a big chapter on Rabindranath and his work and extracts from his poems.

Prof. V. Lesny and Rabindranath in Santiniketan
Rabindranath's poetical works captured Prof. Lesny's mind as early as 1914 when he published a

Prof. V. Lesny with Indian visitors at the Oriental Institute in Prague

selection of his poems. His love and admiration for Gurudeva was strengthened by his two visits to Santiniketan in 1923 and again at the invitation of Gurudeva in 1927. Because of his intimate knowledge of Sanskrit and Bengali it was possible for him to

publish a great number of excellent translations of Gurudeva's works.

From his direct contact with Rabindranath, Prof. Lesny created a detailed biography, *Rabindranath Thakur, His Personality and Work*. Unfortunately, the bulk of the English translation of this book, with the exception of a few hundred copies, was destroyed in

Rabindranath's letter to Prof. V. Lesny

London by a bomb during the last war. Prof. Lesny was one of the first scholars to show the greatness of the Poet's personality, the developmental trend of Rabindranath's creative activities, his educational ideas and his life's struggle for India's freedom.

After many years of thorough study of Buddhism, Lesny published in 1948, in an enlarged form, his book *Buddhism*, where he answers questions on Buddha's teachings and its influence on Christianity.

Prof. Lesny wrote also many scientific treatises on Bhasa's and Kalidas's dramas, Zoroaster's doctrine, on Avestan language and several studies on the language and the life of the Gypsies and valuable papers on the centuries-long contacts between the East and the West. Here belongs one of his latest works, about the travels of a Russian merchant Afanisiy Nikitin across the three seas to India in the 15th century.

Prof. Lesny was one of the founders of the Oriental Institute in Prague, that centre of Oriental scholars of Czechoslovakia, and the School of Oriental languages;

he organised lectures, exhibitions and conferences of Oriental scholars. He founded the cultural magazine *Novy Orient*.

To promote friendly relationships between India and Czechoslovakia he founded, after the last war, the

Indian Section of the Oriental Institute.

In these few lines I could only briefly touch upon Prof. Lesny's whole-life's efforts to create a deeper understanding of India and happy relationship between India and his own country.

MILE-STONES TO OUR FREEDOM STRUGGLE Patriotic Movements and Associations of Early Nineteenth Century

By JOGESH C. BAGAL

II

THE PRESS AND THE PLATFORM

WITHDRAWAL of the Press Regulation in 1835 by Sir Charles Theophilus Metcalfe not only paved the way for free discussion of public questions, but gave fillip to the Press industry also. Some newspapers were newly started, some were revived and those in a moribund state amalgamated with others. *The Hindu Pioneer* appeared as a fortnightly on 27th August, 1835, the editor being Kailas Chandra Dutt, an ex-alumnus of the Hindu College and second son of Rasamay Dutt. *The Reformer* of Prasanna Kumar Tagore and *The Calcutta Literary Gazette* of Captain David Lester Richardson came under the management of the proprietors of *The Bengal Herald*. Dwarkanath Tagore, the philanthropist business-magnate, purchased the proprietary rights of *The Englishman*. A considerable share of *The Bengal Hurkaru* also devolved on Dwarkanath, as *The India Gazette* of his was amalgamated with the former.

The Vernacular Press received no less an impetus. *Samachar Darpan* of the Serampore Mission and *Gyananveshan* of Rasik Krishna Mallik of 'Young Bengal,' both bi-lingual weeklies, continued as before. *Sambad Prabhabkar*, the famous Bengali journal, discontinued for a time, was revived by its editor, Poet Iswar Chandra Gupta, as a tri-weekly on 10th August, 1836. It turned into the first Bengali daily on 14th June, 1839. In March of this year another Bengali weekly, *Sambad Bhaskar*, appeared under the editorship of Pandit Gaurisankar Tarkabagish, who had already gained eminence as a journalist. *Sambad Purnachandrodaya*, another Bengali newspaper of considerable repute and of long standing, was started even before the withdrawal of the Press Regulation, on 10th June, 1835. These journals continued, unhampered, the discussion and criticism of the various measures of the Government and lent unstinted support to the patriotic movements and associations of the time.

The societies of the earlier 'thirties gave place to others of more particular and pointed views. The Academic Association continued but short of its former vigour. The prominent members of this Association participated more and more in the discussion of political and social questions. The Charter Act Meeting of 1835

had a great spokesman in Rasik Krishna Mallik. The Calcutta Public Library, the only meeting-place of the intellectuals, both European and Indian, owed its inception no less to the initiative and resources of the Indian leaders. Ramgopal Ghose, a stalwart of 'Young Bengal,' started the Epistolary Association with his friends, with a view to discuss public questions in

Radhakanta Deb

form of epistles. In the late 'thirties, the Indian labour was much in demand by the Britishers for exploitation in Mauritius, Bourbon and other British territories overseas. The poor labourers, contemptuously called *coolies*, were amassed in the most unhealthy parts of Calcutta and left to suffer and even to die. David Hare took up the matter in hand and with the help of his Indian friends organised a public meeting on 12th March, 1838, to ventilate the grievances of the labourers. As a result

of these efforts the Government concerned modified the rules of emigration for the mitigation of their miseries.

But an association of the mid-thirties deserves special mention. Bangabhasaprasika Sabha was originally a cultural body, and its deliberations were conducted in Bengali under the presidency of Pandit Gaurisankar Tarkabagish. At one such meeting held on 8th December, 1836, the scope of its discussion was extended by a resolution moved by Kalinath Roy Chaudhury of Taki to matters political. The actual resolution was to the effect that "the Society should petition Government or take other matters with a view to prevent a national grievance."¹ The Society included the gentry as well as the litterati.

Debendra Nath Tagore

At this time the question of the "Resumption of the Rent-free lands"² was uppermost in the minds of our leaders. The Society took up the matter in hand. It held some sittings in which its members took an active part and thrashed out the *pros and cons* of the governmental action. Ramlochan Ghose, an influential member of the Society (father of Monomohun and Lal Mohun Ghose), supported the Government and placed cogent reasons in favour of his contention. But the majority of the Society, including the editors of *Sambad Prabhakari* and *Sambad Purnachandrodya*, Kalinath Roy Chaudhury, Gaurisankar Tarkabagish

and Munshi Amir, protested vehemently against the measure. They also proposed to arrange a public meeting in protest and send a petition to the Government stating therein their views. But this proposal did not materialise. Because a more representative body was needed for concerted action.

THE LANDHOLDERS' SOCIETY

This need was supplied by the Landholders' Society, in which the leaders of both the progressive and the conservative section of the community joined. It was purely a political body. The leading landholders of Bengal met in a conference at the Hindu College Hall on 11th November, 1837. It was proposed here to form a society on the lines of the Bengal Chamber of Commerce to discuss the governmental and other matters from a political view-point. The Society would also see that people's interests in land were particularly safeguarded. A provisional committee was formed with Radhakant Deb, Ramcomul Sen, Tarinicharan Mitter and Prasanna Kumar Tagore. According to *The Reformer*:

"The only instructions with which the members of this provisional committee were charged was, that in preparing the rules they should bear in mind that the association was intended to embrace people of all descriptions, without reference to caste, country, or complexion, and rejecting all exclusiveness, was to be based on the most universal and liberal principles: the only qualification necessary to become its members, being the possession of interest in the soil of the country."³

The provisional committee prepared rules for the proposed society. They must have taken the views of the European leaders beforehand. The latter also wanted to act jointly, because they had acquired considerable interests in the land since the Charter Act of 1833. So we find in the inaugural meeting of the Society on 19th March, 1838, leaders of the European community take prominent part in the discussion. Radhakant Deb presided over the meeting. In his address he laid bare the objects of the society in the following suitable words:

"... circumstances pointed out the expediency of forming a society the benefit of which would be felt not only in Calcutta but all over the country... Representations were always necessary to be made to government; in these proceedings if anyone adopted an erroneous course, the society afforded a ready means of correction, and through it grievances could be easily brought to the notice of the proper authorities. It was a common saying among the people that straw could be easily broken by the finger when in separate blades, but if several blades be united together and formed into a rope, it was capable of confining even a wild elephant and reducing it into subjection. Union among the people was therefore highly necessary, and the establishment of such a society was much called for in order to keep a

watch over the measures of Government and its functionaries and for the purpose of making representations to it."⁴

Resolutions were passed, formally inaugurating the Landholders' Society and adopting the rules framed by the Provisional Committee. An influential executive committee was constituted with Raja Radhakant Deb as president, and Prasanna Kumar Tagore and John Cobb Hurry, Editor of *The Englishman*, as secretaries. The members of the committee included such notables as Dwarkanath Tagore, Kalinath Roy Chaudhury of Taki, Raja Rajnarain Ray of Andul, Raja Kalikrishna, Asutosh Deb, Ramratna Ray of Narail, Ramcomul Sen, Satya Charan Ghosal of Bhukailash, Munshi Amir, a prominent Mahomedan of Calcutta, Theodore Dickens, Bar-at-Law and George Prinsep. David Hare took a lively interest in the formation of the Society. But the main impetus came from Dwarkanath Tagore. It was not a little due to him that the Europeans were induced to join the Society so actively.

The immediate object of the Society was to fight the 'Resumption' measure of the Government. But it was subsequently so broad-based as to include matters pertaining to the welfare of the country. The Society wanted improvement and reform in the civil administration. The Government could not but recognise the Landholders' Society as a representative body and treat it in the same way as they did the Bengal Chamber of Commerce, dominated by the Europeans. They used to send draft bills for opinion to the Society. The Society, in its turn, criticised them and often offered suggestions for their improvement.

In the annual report for 1838-39, the secretaries gave a brief account of the national activities of the Landholders' Society in the country. The committee of the Society submitted memorials and appeals to the Local and the Supreme Government. The memorial on the resumption of *Lakheraj* tenures did not elicit any favourable reply from either of them. They now proposed to appeal to the Government of England, the 'land of liberty, humanity and justice.' The committee expressed satisfaction at the extension of the vernacular language in the proceedings of the Courts of Justice since the beginning of 1839. They also considered some other matters, such as, revision of the Stamp Act, the comparatively high duty charged in England upon Indian and Canadian tobacco, etc. They suggested an equalization of the duty.

We have a full report of the second anniversary of the Landholders' Society which came off on 30th November, 1839. The Society had appointed an agent in England, named John Crawford. The annual report, above mentioned, referred to his zealous exertions. The committee kept up a regular correspondence with

him. Mr. Crawford, so says the report, was the "channel of communication between this Institution and the British India Association of England." This Association was newly started, and the committee of the Landholders' Society, says the report, "strongly recommend you to co-operate with the British India Association, the object of that Institution being so identical with that of your Society." At the end of the report, the secretaries, on behalf of the committee, called particular attention of the members "to the

George Thompson

nature of the institution (the Landholders' Society), to its national character, and the great objects of national improvement which form its basis, to the number of those who are likely to be benefited by it, and to the amount of the revenue they contribute in support of the Government of the country."⁵

Several resolutions were passed in the meeting. The main resolution was regarding the resumption of rent-free lands. In another resolution, the Society welcomed the formation of the British India Society of London and appointed a sub-committee to correspond with them. It was directed to correspond with the London Society, particularly, on the following subjects: (1) the prevention of the resumption of rent-free tenures, (2) extension of the permanent

1. *Samachar Darpan*, 17th December, 1836.
2. By the Regulation II of 1819 as modified by the Regulation III of 1823 the Government started resumption of rent-free lands which were computed to be one-third of the total area of the Bengal Presidency.

3. Quoted in *Samachar Darpan*, 18th November, 1837.

4. *Samachar Darpan*, 21st March, 1838.

settlement,⁶ (3) reform of the judicial, police and revenue systems, and (4) the granting of waste-lands to occupants on equitable terms, so as to encourage the application of capital to the soil of India.

The Landholders' Society continued its work vigorously for some time. It succeeded partially in the modification of the "Resumption" question. Up to ten bighas of land were allowed rent-free to an individual. The British India Society, of which I shall speak presently, took up its cause and worked for the good of India at the very seat of the British Government. The pioneer efforts of the Landholders' Society could never be over-estimated. Raja Rajendra Lala Mitra later referred to its achievements as follows:

"He looked upon it (the Landholders' Society) as the pioneer of freedom in this country. It gave to the people the first lesson in the art of fighting constitutionally for their rights, and taught them manfully to assert their claims and give expression to their opinion. Ostensibly, it advocated the rights of the Zemindars but as their rights are ultimately bound up with those of the ryots, the one cannot be separated from the other."⁷

Tarachand Chuckerverty

THE BRITISH INDIA SOCIETY, LONDON
The London Society of the above name played an important role in our nascent constitutional struggle, and deserves separate treatment. The Society was established in the middle of 1839. W. W. Adam, a friend and disciple of Raja Rammohun Roy and a close associate of Dwarkanath Tagore, took initiative in forming this Society. Previous to his departure for England, he had even consulted Ramgopal Ghose, one of the 'Young Bengal' and induced him to supply materials regularly regarding Indian affairs. Since its formation, the Society was largely assisted by the Landholders' Society of Calcutta.

6. This item formed the Omnibus Resolution of the Indian National Congress for a good many years.—J. C. B.

7. Raja Rajendra Lala Mitra's Speeches (S. K. Lahiri, 1892), p. 25.

Even during the first year of its existence, the London Society was able to enlist the active sympathy of such a humanitarian as George Thompson, the famous worker for the liberation of slaves. He was also a finished orator. Along with a few others Thompson toured important centres in England and delivered speeches on various Indian topics in especially organised meetings. The Society got them printed in book-form for distribution. Sir Charles Forbes, a true well-wisher of India, subscribed five hundred pounds to the Society.

In its first annual meeting (July 5, 1840) the Society passed several resolutions, drawing attention of the Government to the different aspects of the maladministration of India. The main resolution, which might be regarded as embodying the real object of the meeting, was comprehensive, and ran as follows:

"That this meeting is of opinion, that the oppressive and fluctuating amount of the land revenue, the general resumption by the Indian Government demand on lands hitherto held rent-free, the imperfection and corruption in the administration of police and justice, the maintenance of vexatious monopolies, are evils which ought to receive the immediate attention of the Government of this country, as tending to produce distrust and discontent among the native population, to unsettle the tenures of property, and endanger the public peace, to cramp the exertions of industry and the progress of improvement, to lessen the production of exportable commodities, and by necessary consequence, the capacity of extending commercial relations with Great Britain and other nations, and to diminish the force of the example which England has set by the abolition of slavery in the West Indies, and thus perpetuate the existence of slavery in the other parts of the world."⁸

The Society published the *British Indian Advocate* from January, 1841. William Adam edited the journal:

"One of the ends contemplated is," wrote the Editor in its very first issue, "to make the journal a medium of communication between the people of England and the people of India, faithfully representing the sentiments of each to the other on all the great questions that affect their rights and interests."⁹

The relation between the Landholders' Society and the British India Society were all along cordial. And even when the former showed signs of languor, the other was active. In the meantime there had been some forces at work in Bengal itself which require a little elucidation.

TWO SOCIETIES OF THE YOUNGER SCHOOL

The Landholders' Society was, really speaking, a society of elders. The younger section, or the 'Young Bengal' as they were popularly known, did not join this Society either individually or *en masse*. The objects of the Landholders' Society were mainly political. But politics formed only a part of our

8. *The Friend of India*, 1st October, 1840.

9. Quoted in *Reminiscences and Anecdotes of Great Men of India*, etc., by Ram Gopal Sanyal, Vol. II, p. 25.

national life. Other aspects, especially the educational and cultural aspects, required to be properly attended to for strengthening the morale of the people. These, in other words, might be called the constructive aspects of our national activities. And the 'Young Bengal' began to attend to these aspects more zealously than before.

The Society for the Acquisition of General knowledge, rather a longish name, and the Tattwabodhini Sabha were almost contemporaneous of the Landholders' Society. The former was started even a few days earlier, on 12th March, 1838. The Tattwabodhini Sabha came into being on 6th October, 1839. Both of them were mainly cultural institutions, one having for its object the spread of higher knowledge and newer experience amongst the ex-students of the educational institutions and through them, to the generality of the people. The object of the Tattwabodhini Sabha was the cultural regeneration of the people on the lines of the Brahmo Somaj of Raja Rammohun Roy.

But both these institutions contributed largely to the growth of nationality, based on national culture. The Society for the Acquisition of General Knowledge, had, for its President, Tarachand Chuckerverty, considered at that time the foremost leader of the younger section. Ramtanu Lahiri and Peary Chand Mitra were its joint secretaries. Such eminent public men of later times as Ramgopal Ghose, Dukshinaranjan Mukherjee and the Rev. K. M. Banerjee sat on its committee. David Hare was unanimously elected 'Visitor' of the Society. Discussion ranged between history, literature and science and could be conducted both in English and Bengali. The newly educated had already spread throughout the Bengal districts and even beyond the Bengal Presidency. Some were posted as Deputy Collectors in those places. They read papers on the condition of the respective places, based on knowledge and experience. Local history, topography, social condition of the masses—everything came to be discussed and debated upon. Thus a bond of fellowship was growing between the classes and the masses, at least on the intellectual plane. Papers were read and addresses delivered both in English and Bengali, giving the mother-tongue the same status as English.

Debendra Nath Tagore (later, Maharshi), the eldest son of Dwarkanath Tagore, was the founder of the Tattwabodhini Sabha. The Sabha did not confine itself to discussion only. Just after its start, it took up the work of the proper dissemination of Indian culture through educational institutions, started on 'national' lines. The Sabha ran a Pathshala where instruction was given on useful subjects through the medium of Bengali. The study of Sanskrit was a special feature of the institution. To keep pace with the time, English was also later added to its curriculum.

The school was transferred to Bansberia early in 1843—a village in the Hooghly district. Schools were opened in the mofussil after the model of the Pathshala. People were imbued with nationalism through these 'national' schools even in those early days of transition.

Tattwabodhini Patrika, organ of the Tattwabodhini Sabha, started in August, 1843, became the forum of discussion on different aspects of our national life. Besides the religious subjects, those on literature, science, education, culture, health, economic condition of the people, intrusion of the Christian missionaries in our body-politic—all came to be discussed and thrashed out in different articles. Akshoy Kumar Dutt

Ramgopal Ghose

was its editor; and Debendra Nath Tagore, Rajnarain Bose, Rajendra Lala Mitra, Pandit Iswarchandra Vidyasagar, Pandit Ananda Chandra Vedantabagis, were amongst the valued contributors of the *Patrika*. Nationalism was to be based on our national culture. This fact was brought home to the minds of the people in those days through the writings of this journal. The *Patrika* rendered immense service to the country in the 'forties in combating the anti-national activities of the Christian missionaries.¹⁰

THE BENGAL BRITISH INDIA SOCIETY

In the early 'forties the Landholders' Society began to show signs of decay. Two reasons may be

10. Facts about the Tattwabodhini Sabha, etc., have been elaborately dealt with in my *Debendra Nath Tagore* (Sañitiya-Sadhak-Charitmala), pp. 19-40.

assigned to this. The Europeans gradually withdrew, because their interests came to clash with those of the Indians. The younger section also kept themselves aloof from this society. But Dwarkanath Tagore, the principal founder of the Landholders' Society, reposed enough confidence in the 'Young Bengal' and expected much from them. While returning home from England, late in 1842, Dwarkanath brought with him the famous philanthropist and friend of mankind, George Thompson, and introduced him to the leaders of the 'Young Bengal.' At a meeting of the Society for the Acquisition of General Knowledge, held on 11th January, 1843, the latter extended a cordial welcome

Pearychand Mitra

to George Thompson and requested him, while in their midst, to benefit them with his mature advice for the improvement of their motherland. Thompson's subsequent speeches inspired the young and old alike. The Landholders' Society grew active. They even appointed Thompson agent in England to speak and act on their behalf. But the most useful work during his sojourn here, was the foundation of the Bengal British India Society on the lines of the British India Society of London, by the leaders of the 'Young Bengal.'

The Bengal British India Society was formed at a meeting held in the Foujdari Balakhana Hall,¹¹ Calcutta, on 20th April, 1843. George Thompson presided. The elite of the city attended the function. But most of the elders refrained from joining the

Society, perhaps for its more progressive character. George Thompson spoke very highly of the younger leaders, especially of Tarachand Chuckervetty. There were six resolutions in all, passed at the meeting. These related to the aims and objects of the Society, the programme of work it would follow as also the committee of management. The third resolution speaks of the aims and objects of the Society, and is given below:

"3. That a Society be now formed and denominated The Bengal British India Society; the object of which shall be the collection and dissemination of information, relating to the actual condition of the people of British India; and the Laws and Institutions, and Resources of the country; and to employ such other means of a peaceable and lawful character, as may appear calculated to secure the welfare, extend the just rights, and advance the interests of all classes of our fellow subjects."¹²

A provisional committee was formed with Chandrasekhar Deb, Tarachand Chuckervetty, Ramgopal Ghose and Pearychand Mitra (Secretary) to frame rules of the Society and prepare an address to the public, based on the resolutions. A strong executive committee with these and other persons was constituted. There were only three Europeans on the committee. Like the Landholders' Society, this Society, too, was a political body. But it differed from the former on two principal points: (1) The new Society laid more emphasis on work in this country rather than in England and (2) this was mainly Indian in character. Besides political questions, the Society included matters, social, cultural and municipal in its programme of work. From this point of view, the Bengal British India Society may also be rightly called the first national political organisation of the country. In *The Bengal Spectator*, started during the previous year, the Society had its own organ. The paper was turned into a full-fledged weekly.

Even from its start the Society incurred odium of the European community for its unstinted efforts of a progressive type. Its conservative section did not at all like the speeches and movements of George Thompson which, they thought, were too radical and advanced for the country. They spouted venom over the proceedings of the 'Young Bengal.' They went so far as to nick-name the party as "Chuckervetty Faction," after the surname of their leader Tarachand. In spite of these hostilities from the European quarters, the Society was able to do considerable work according to programme during the first year of its existence. In his first annual report, Secretary Pearychand Mitra narrated the various activities of the Society. The Society gave opinions on several acts of the Government, sent memorials to the House of

Commons and Court of Directors, and petitioned the Government of India on the subject of proposed Small Causes Court in Calcutta. The Society attended to another important subject, namely, "Compilation and publication of evidences relative to the efficiency of Native Agency in the administration of the affairs of the country, with a prefatory notice of the offices held by the Hindoos during the Mahomedan administration and of those to which they are now eligible." The object of this compilation was to support the petition sent to England on behalf of the citizens of Calcutta 'praying for effect being given to 87 Clause of the last Charter Act.' The Committee also sent a questionnaire on the condition of the Ryots to the moffusil leaders.

The first anniversary of the Society was held at the Foujdari Balakhana Hall on May 2, 1844, before which the above report was presented. The office-bearers for 1844-45 were elected as follows: W. Theobald, Vakil of the Supreme Court,—President; G. F. Remfrey and Harimohan Sen—Vice-Presidents; Pearychand Mitra—Secretary; Ramgopal Ghose—Treasurer; Brajanath Dhar, Gobinda Chandra Sen, Dukshinaranjan Mukherjee, Tarachand Chuckervetty, Chandrasekhar Dev, the Rev. K. M. Banerjee, Shyama Charan Sen, Ramchandra Mitter, Satcouri Dutt, G. F. Speed, and E. Colebrooke—Members.¹³

During the second year, the Society applied its attention to the municipal improvement of the Metropolis. It collected information respecting the rural population. The Society's attention was directed to social matters. According to the president, "Native polygamy was one of them . . . He valued much the expression on the part of Hindoo members, a strong disapprobation of the custom. . . . With equal propriety, the re-marriage of Hindoo widows had engaged the attention of the Society. . . . The Society had applied for the opinions of the highest Hindoo living authorities. . . . With still greater satisfaction he referred to what the Society had done on the subject of Hindoo female education."¹⁴

Since 1845, the Tattwabodhini Sabha took up the social matters in right earnest. The Bengal British India Society began to bestow more attention on things political, as it had done during the first year. Both these associations supplemented each other's work and became a force in the land. Ramgopal Ghose became the President of the Bengal British India Society in 1845-46 and continued in the post till the end of the decade. Meanwhile another movement started which induced various sections of the community to act unitedly.

THE ANTI-MISSIONARY MOVEMENT

The onslaught of the Christian Missionaries against the Hindu society and religion grew intense in the mid-forties under the leadership of the Rev. Dr. Alexander Duff. Conversion was resorted to in the towns and the moffusil. The free schools of the missionaries turned into places of conversion. Leaders of the Hindu community headed by Debendra Nath Tagore could no longer tolerate this state of affairs. They wanted to start free schools for indigent Hindoo boys. With this object a huge public meeting was held on 25th March, 1845. The meeting resolved to establish a model free English school as the first practical step to counteract the missionary plan. A strong committee was formed with Raja Radhakant Deb as president, and Debendra Nath Tagore and Harimohan Sen, the eldest son of Ramcomul Sen, as secretaries. This was almost the first event when the elder and the younger section met for the first time for the realisation of a national purpose. As a result of these efforts the Hindu Charitable Institution was established on March 1, 1846. Motilal Seal, the Rothschild of Calcutta, had also started a free school of his own initiative in the meantime for the same purpose. The services of *Tattwabodhini Patrika* should be gratefully mentioned in this connection. The paper in its editorials unravelled the evil intentions and doings of the missionaries and their baneful effect upon our national life, education and culture.

The anti-missionary movement, sponsored by Debendra Nath Tagore under the auspices of the Tattwabodhini Sabha and carried on with unabated zeal up to the middle of the 'fifties, contributed largely to the growth of our national unity. It was considerably successful in stemming the tide of the proselytising activities of the Christian missions.

During the 'forties the Tattwabodhini Sabha and the Bengal British India Society rendered immense services to the community by their political and cultural endeavours. Bhudeb Mukherjee, the great thinker and litterateur, offered these felicitating remarks on their far-reaching effect:

"The Tattwabodhini Sabha determined the sort of religion the young educated should follow. The Bengal British India Society, under the chairmanship of a patriotic Bengali (Ramgopal Ghose) began to pay exclusive attention to its political work. It is usually said that the Bengalis cannot do anything of their own initiative, and what they do, is the copy of some other's work. But the Brahma Sabha (here, the Tattwabodhini Sabha) and the Bengal British India Society are not another's copy, nor have they received any foreign help. The seeds of future changes in the Hindu community were sown by these two societies."¹⁵

A GLANCE INTO THE POSITION OF THE TEA INDUSTRY IN INDIA

By JYOTIRMOY ROY, M.A.,
Economic Research Section, Indian Central Jute Committee

Tea is no longer a luxury. Apart from being the source of bread for a good number of our brethren it also fetches substantial foreign exchanges to the country.

Recently there has been a hue and cry that the tea industry is in peril and as such demands sympathetic attention from every quarter. This article is not concerned at all as to why the industry that earned a bumper profit during the war years is now in need of spoon-feeding. It aims at giving an overall picture of the tea industry in India with the help of readily available statistics.

The plantation of tea varies greatly in size from State to State. Before the partition, the total number of plantation was 6,551. In Assam, 1,128 plantations are reported to have had a total area of 440,278 acres which gives an average of 390 acres per plantation while in Bengal the average size of 413 plantations was 515 acres, in Travancore the average area of 220 plantations was 351 acres, and in Mysore the average area of 15 gardens was 297 acres. In Cochin, Bihar, Uttar Pradesh and Madras the average was much smaller being about 186, 155, 134 and 37 acres respectively. In the Punjab, where the plantation of tea is carried on a small scale, the average area per plantation was only 4 acres in the pre-partition days. The above figures relate only to the tea-bearing areas and excludes the area not under tea though in occupation of the planters.

No statistics are available after the period 1949-50 which were published only by the latter part of 1952. The following table shows the production of tea in different States up to the year 1949:

States	1942	1948	1949
Assam	308,879*	311,089	314,357
West Bengal	152,999**	150,238	166,136
South India	95,153	107,406	95,616
North India	4,927	3,333	3,123
Bihar	2,101	1,989	2,123
Tripura	Not available	3,752	3,675

* Including Sylhet dist. ** Pre-partitioned Bengal.

The average production of tea per acre varies widely in different districts. In 1942, the highest being 960 lbs. in Jalpaiguri and 955 lbs. in Goalpara, while the lowest figures were 184 lbs. in Ranchi and 51 lbs. in Garhwal (U.P.). The average for the whole of India was 724 lbs. per acre.

Tea occupies a prominent place in our export trade and the United Kingdom is the best of the buyers. The table given below shows the distribution of our foreign trade in tea between the different countries:

Countries	1942-43	1948-49	1949-50
United Kingdom	78.2	69.3	62.6
Rest of Europe	0.3	10.6	8.5
Asia	6.8	7.9	5.6
Africa	1.2	0.7	4.0
America	9.4	9.4	15.2
Australia	4.1	2.1	4.1

During 1949-50, 7,983,287 lbs. of waste tea alone was exported from India. Of the total quantity of Indian tea exported to the U.K. a considerable amount is normally re-exported to other foreign lands. A certain amount is also imported in India; and before the year 1942-43 Burma was the chief importing country; that position is now usurped by Ceylon.

It is very difficult, if not impossible, to estimate the per capita consumption of tea in India because the figures quoted above are not quite accurate as they were supplied by the planters themselves voluntarily. Moreover, no accurate data of land frontier trade are available. So, in a very vague way, deducting the amount of export and the stock left at the end of the year, and summing up the previous year's stock and the current import, the following figures are obtained which give a rough indication as to the internal consumption of tea in India:

Years	Consumption in million lbs.
1936-37	81
1938-39	93
1941-42	112
1947-48	217
1948-49	159

[Figures up to 1947-48 refer to undivided India]

For facilitating the export of tea, India imports a huge amount of tea chests and other accessories from foreign countries besides the purchase of machineries. Table No. IV records the distribution of the above amongst the three important exporting countries:

Countries	Tea Chests		
U. K.	1947-48	1948-49	1949-50
U. S. A.	1,510	11,703	5,34,206
Canada	1,01,72,836	1,10,63,515	10,35,349
	1,35,216	27,95,018	1,66,687
Total	1,08,77,403	1,88,76,937	1,26,59,847
	Machineries		
U. K.	54,56,027	55,25,153	69,26,098
U. S. A.		12,987	
Canada			
Total	56,28,828	56,93,841	70,47,316

Weighing : Baskets loaded with picked leaves are carried by workers to the weighing centre before being taken to the factory

Sorting and Grading : The leaves are sorted according to their size and quality before being packed into paper-lined chests

Plucking : Two leaves and a bud at a time is the secret of fine plucking. This work is done chiefly by women who carry light bamboo baskets strapped to their backs

Rolling : The rolling machines process the withered green leaves which are twisted, breaking open the cells containing the stimulating juice of tea

Tea plantation in India is a potential source of employment and the condition of the labourers are far from being satisfactory. It is, however, a good sign that the National Government's attention has been diverted to this direction also. Labourers are mainly recruited through Sardars (middlemen) who approach the villagers in far distant lands and promise them all possible earthly pleasures in return of their leaving the homestead and joining the tea gardens where even the children are paid! The poor villagers fascinated by these alluring promises come to the garden *en bloc* only to realise that their future is sealed.

Transport: Tea chests are being loaded on to river boats. Considerable difficulty is experienced over getting the tea from the producing districts to the market at Calcutta. Tea chests are required to be carried by men, lorries, bullock carts or water transport

The number of persons employed in the industry in 1942 was returned at 923,742 which rose to 985,616 in 1949 in spite of the fact that certain tea-producing areas acceded to Pakistan. The following table gives the number of persons in different categories employed by the industry in recent years:

Years	Garden labour	Outside labour (permanent)	Outside labour (temporary)
1948	863,915	52,416	53,399
1949	880,774	53,180	51,662

Below is another table to show the average monthly income of plantation labour in different years:

Settled labour—	Men Rs. as p.	Women Rs. as p.	Children Rs. as p.
1941-42	10 7 4	9 12 9	6 4 4
1945-46	11 14 6	10 7 1	7 5 11

	Men	Women	Children
1946-47	18 4 1	15 9 7	9 9 6
1947-48	21 14 3	19 6 11	14 8 1
Faltu or Basti labour—			
1941-42	9 7 11	8 11 5	5 13 8
1945-46	11 13 8	10 11 0	6 10 3
1946-47	16 1 10	15 4 6	9 0 0
1947-48	22 11 9	18 15 1	11 0 10

The above wage rate has been modified with effect from December, 1951. An adult male labourer now earns a cash wage of Re. 1-3-0 per day which is farther supplemented by an income of two and a half annas per day in gardens with more than 500 acres under plantation and two annas in gardens having less than 500 acres under plantation. The daily wage of a female and a child labourer now comes to Re. 1-1-0 and 13 annas respectively.

In 1903, an Act known as the Indian Tea Cess Act IX of 1903 was passed at the request of the trade for the promotion and manufacture of tea. Under this Act a duty of $\frac{1}{2}$ pie per pound was levied on all Indian tea exported up to the 30th April, 1921, after which the duty was raised to $\frac{1}{2}$ pie per pound. By increasing the duty gradually in March, 1939, it was fixed at one rupee and annas six only per 100 lbs. and in May, 1946, it was subsequently reduced to rupee one. It was again raised to one rupee and six annas per 100 lbs. on 10.1.48 and the final enhancement took place on 5.11.49 when it was made one rupee

and annas ten only. The whole of the amount collected was credited to the India Tea Cess Fund which was governed by a committee appointed for the purpose. The Indian Tea Cess Act expired on August 1, 1949, when the Central Tea Board Act came into force. The total amount collected in different parts of India in 1948-49 was Rs. 58,09,000 against Rs. 41,97,000 in 1947-48 and Rs. 35,73,000 in 1946-47. This shows that the industry is in a prosperous condition in spite of losing some tea-growing areas which acceded to Pakistan.

Excise duty in respect of tea brings approximately an annual revenue of Rs. 14 crores to our national exchequer. Every pound of tea must be duty paid before it is allowed to come out of the factory and the present rate of excise duty is as follows: If exported—annas four per pound, if not exported—annas three per pound.

The tea industry in India is mainly conducted with foreign capitals. Table No. VII given below

illustrates the capital structure of the tea industry in India:

Years	Companies incorporated in India Rs.	Companies incorporated outside India Rs.	Total Rs.
1942-43	1,50,572	26,877	4,92,413
1944-45	1,50,691	26,687	5,08,932
1945-46	1,61,218	26,703	5,06,518
1946-47	1,77,272	26,072	5,17,258
1947-48			5,24,899

The living condition of labourers in tea gardens is bad, which in Indian-owned industries is worse still. The war brought an unexpected boom to the industry; the profit was practically consumed by the management and the shareholders who did not even see the necessity of creating an adequate reserve fund to tide over unforeseen contingencies. The peril that the industry is now facing is mainly due to the above-mentioned factor. The labour got practically nothing out of these bumper profits and there are hardly any cheap canteen in the tea gardens to supply hygienic food to the labourers. The only amusement provided by the management is the installation of a radio set in the office building from where occasionally programmes are broadcasted. Arrangement of sports and games is more on paper than in reality and almost all the gardens are operated on "no work no pay" basis. Hospitals are meant for governmental

inspections while the outdoor dispensaries are in chronic dearth of medicines.

There are several well-known organisations of the planters whose aim is to bargain as much benefit as possible for themselves while there is practically none to look after the cause of the poor labourers. Trade Unions are run on the whims of the party bosses and they are more political than economic; this type of trade union activities do not cover even all the gardens. As such whenever necessary the management purchases a section of labourers to suit its own objects and the last general election furnishes immense proof as to how the labourers can be bribed to suit the cause of the capitalist owners.

There have been some legislations aiming at the welfare of the plantation labour but the situation as it is will convince even a casual observer that those legislations are honoured more in the breach than in their observance. Strictest possible measures must be adopted to enforce the spirit of those legislations if the welfare of the toiling masses is really aimed at.

These are not to be mistaken as generalisations. The writer who lives in a place surrounded by tea gardens claims to have an intimate knowledge of the state of affairs in the tea industry and whatever he has said in this article is the outcome of his first-hand knowledge.

—:O:—

THE CHALLENGE OF ANGLICISM AND CULTURAL REVOLUTION IN BENGAL

By NANIMADHAB CHAUDHURI, M.A.

It is reported that a history of the Indian Struggle for Freedom is going to be written. We do not know on what lines this history is proposed to be written; whether the facts of this history will be restrictively selected and interpreted in the light of a particular school of thought or facts will be impartially selected and objectively treated to tell the full story how the nation's endeavour for attainment of freedom has been again and again halted or delayed by obstacles created by alien and native opponents of Indian nationalism, by the people's own weakness or by the shortcomings of leadership. We shall have, perhaps, no opportunity to know all this before the history, if the proposal to write it materialises, is published.

When the report that a history of the nation's struggle for freedom is proposed to be written reached us our eyes rested for a minute on the face of Bengal

today, pale, anxious and deeply furrowed by agonies and sufferings of the last half a century and then slowly wandered through the realm of forgotten memories and settled down on the face of Bengal as it was more than a century back.

Those were the days of the new awakening of India and it was on the soil of Bengal that the awakening took place. Raja Rammohun Roy (1772-1833) inaugurated the new era of awakening.

Through the united efforts of Rammohun, David Hare and others, the Hindu College was established in 1817 and English became the medium of instruction in India in 1835. The first effect of English education had an unbalancing effect on the majority of those who received it. For nearly thirty years from 1817 a great mental ferment marked by loss of self-possession seized a large section of the middle class

English-educated Hindu Society in Bengal. It was the age of the challenge of Anglicism and rise of the Young Bengal School.

A perusal of the contemporary records of the exploits of the first generations of the Young Bengal School will now provoke a laugh. But they were serious-minded people, though somewhat ostentatious. They were possessed by a mania for destruction and hurled indiscriminately their blows of criticism against Hindu religion, Hindu society, Indian languages, customs, manners, dress, etc. Their words and deeds breathed an exaggerated rage against and contempt for the society in which they were born and betrayed infatuation for things foreign. They cultivated Anglicism in everything with a vengeance. The following extract throws interesting light on the time:

"Indeed the rage for Anglicism went so far among the first generations of English-knowing men that a giant of English learning of that time used to sprinkle brandy over his children's rice saying, take your rice with the milk from the English cow, it will make you strong. . . . Some English-knowing men of that time thought the manners and customs of the people of India were Satan's devices while others regarded them as Brahminical devices. With them it was manliness par excellence to hate those manners and customs. Yes, that proved moral courage and independence. And the English-knowing youth who behaved in that way were applauded as wise by the Englishmen of that time."

While the British well-wishers of India were still gloating over their easy success in the task of anglicising the Bengalis, furnishing incidentally in their eyes one more evidence of the superiority of Western civilisation over the Eastern, and the challenge of anglicism threatened the contemporary Bengali society, something unsuspected was shaping itself beneath the surface of that society.

While adopting English dress, English food and drink and English manners the Young Bengal also memorised Bentham, Bacon, Thomas Paine, Byron, and Shelley and studied the political history of the English people, the history of the French Revolution and American struggle for independence. They became anglicised in mind as they had become anglicised in manners and dress. The direct result of this intellectual anglicisation was that they completely shed off the inferiority complex of a conquered people. They regarded themselves as belonging to the same level with Englishmen in education and culture. And they started demanding to be treated as such.

The challenge of Anglicism evoked a retort not realised by India's rulers.

And by this time a fresh wave from Europe had reached the shores of India, helping to put the Young Bengal again on their feet.

In Germany, France and elsewhere scholars were carrying on researches in Comparative Philology and Vedic and Avestan studies. They proclaimed to the world that the Hindus of India, though dark-skinned, were distant kin of the European Aryans. The Young Bengal were astonished when they heard it; their exultation knew no bounds and their thoughts began to follow a new track. It was the track which the great Rammohun had shown.

Little by little the attention of many of the members of the school turned to the ancient religion, literature and philosophy of their country, to the ancient glories of their ancient land. Things of their own country which they had learned to despise revealed themselves as possessing a new significance. Those that had turned their face towards Europe from a sense of frustration and despair, thinking that a people held in subjection for long centuries they had nothing to be proud of, now looked back to their own country. They realised that they had indeed a proud heritage of ancient wisdom and learning, they were descendants of far-famed ancestors. The first unhealthy mental ferment began to subside; the spell of anglicism was broken.

On the soil thus prepared a cultural revolution of the greatest significance took place in Bengal. It opened the epoch of a new awakening in India. It marked the beginning of national renaissance in India after seven centuries of political subjection, moral stagnation and intellectual somnambulism.

The claim for equality with the English and demand for equal treatment with them presaged a clash between the English-educated young Bengalis on the one hand, and, on the other, the new feeling of pride for the ancient glories of their country and deep regret for her present fallen condition roused them to devise means for her uplift.

The clash was the first phase of revolt declared by the English-educated middle class Bengalis against British administration in India. The voice of revolt became distinctly audible after the Sepoy Mutiny.

It was at this time that a section of the Young Bengal school led by Ram Gopal Ghose and assisted by some landholders and wealthy men founded the British Indian Association (1851) for securing the right of greater participation in administration for the children of the soil. It was the first political organisation in India.

Shortly after this the great Mutiny broke out.

TEACHING OF ENGLISH IN THE SECONDARY SCHOOLS

By S. N. RAY, M.A., Ph.D.,
Delhi University

If an English teacher today thinks of planning for the future education in this country, he has to satisfy himself whether he has any future for himself. In other words, he has to assure himself if there would be a legitimate place for the study of English in the curricula of the Boards and Universities of this country. That assurance I think is not difficult to give. It will be clear to anybody who happens to wander through the collections of books in the libraries of any school or college devoted to the teaching of Medicine, Engineering, Military Science, Forest Research or Geological Survey. Are these books, he will ask himself, mere junk to be scrapped or useful? If higher education is impossible without them, how are we to get them in our own language? Will the books on military strategy, histories of wars, biographies of great soldiers, accounts of how wars were won or lost, now to be found in the Defence Academy, Dehradun, be ever translated into Hindi, or if so, how long will it take, and how about the cost? Coming nearer home, is research in Indian history possible without acquaintance with the original findings of the great European scholars of Indian archæology? An attempt of course is being made to bring out textbooks in Hindi as quickly as possible. But is the newly coined terminology with its flexible connotation good enough for exact science, or even for law where each term must have a fixed meaning well-known to all? A dispassionate consideration of these problems is sure to impose a restraint on the enthusiasm of the people who would discard English, say, at the end of ten or fifteen years. If to dislodge Persian, at one time the language of culture in this country, took about a century, how long will English which has struck a deeper root in our soil, a root more widely spread and intimately interwoven with our mental life than Persian? A time-limit for the exit of English from the cultural life of this country can therefore be set only by a facile optimist.

Here is the justification of our existence and ground for continued usefulness in society. We must realize that our days are far from nearing an early end. Even when English will be squeezed out of its strong position, it will continue to serve a very great purpose in this country. English is the language of every port, and is spoken or understood over at least half of the world. The demands of commerce and diplomacy, if not the need for international contact on personal level, will make it incumbent on us to acquire a good knowledge of it.

If I am taking the liberty to rehearse these well-known facts, it is to remove the misgivings of some of our worried friends, and to look ahead with a clear conscience and knowledge of our place in the new dispensation of our country.

It is true English one day will go out of the syllabus as a compulsory subject of study, and its place will be gradually taken by Hindi. We must not forget that at one time our grandfathers took their young people out of the *maktabs* and *pathshalas* (tols) and sent them to High English Schools, for the knowledge of English was the *sine qua non* for Government employment. The same paramount necessity will drive the future generations to the cultivation of Hindi, even in regions where it is not known or taught.

But the reasons mentioned above will remain, and English will have to be studied by all who would look forward to higher education. It is possible that this will be done with a split mind and ever-waning purpose. The time which was given to its acquisition hitherto will perhaps not be available. Yet as much of it must be learnt as would help the future generations to use it, *if not for writing or speaking, at least for reading and understanding*, with as much facility as their predecessors.

The task of the future English teacher will grow more difficult and involve greater responsibility than now, but it would not be impossible if approached with a well-prepared plan. This must save much frittering away of energy of the present system and ensure progress in a much shorter time than before.

The question therefore is at what stage should a student be introduced to a course of English, where he will end it, and how shall we conduct it so as to produce the most effective results.

At present the study of English commences even from the lowest class. Each student has to give up the greater part of his time for about ten years in acquiring a good knowledge of the language. But it does not end there. It continues for another two years at least, if not four. Still a confident grasp of the language is nowhere in sight. Perfection no one can claim. And all this at what cost? This early imposition of an alien tongue on a young learner, deprives him of much valuable time when he could have gained a good deal of useful knowledge. For example, at present he finds very little time for geography, drawing and common knowledge. He has very little opportunity of knowing the history of any country but his own. Scientific and vocational subjects cannot have place on the time-table for the same reason. He has to sacrifice all interests in life because he has no time for them.

A young student whose mental horizon has not widened beyond his home and his immediate neighbourhood, wonders why he should be subjected to the torment day and night for the acquisition of something whose value is of doubtful significance to him. If it is so now, would it not appear more futile to him in the future? Formerly he was at least aware

of the physical presence of the Englishman in his own country and saw his life at least from a distance. In course of time, the Englishman will become as legendary a figure as Alexander, Chengiz Khan or Nadir Shah. If this is so, the young learner will have no chance of discovering his contact with, and realize his interest in, the West before he starts upon the scientific subjects, and this will not happen before he comes to the last lap of the Middle School stage. If I were to plan for him, I would introduce him at this stage for the first time to the rudiments of the English language. This may be in Class VI or Class VII, probably the latter. I have reasonable grounds for hoping that he will now take to it with an awakened interest and delight. Just for the sake of novelty, and perhaps with some puzzled amusement, he will romp through the alphabet and the mystery of the English vowels.

What shall we do now not only to sustain this interest but also to stimulate a sense of wonder in his mind? I would put before him those very English words he has been using all his life under the guise of his mother tongue. Thus he would be amused to know that bat, hat, pan, fan, pin, tin, line, fine, boot, shoot, ball, goal, kick, back, bowl, catch, shirt, photo, rail, train, light, and numerous other words in daily use even by the illiterate, are really English. These and their uses will keep him occupied in the first year of his new venture.

It is claimed by the supporters of basic English that one can express oneself with eight hundred and fifty selected words. I would therefore ply the novice with a little more than two hundred new words every year for four years from Class VII to Class X. Indeed, I would set my target a little higher. It would be twelve hundred or three hundred per year. In addition to the words with whose sound he is familiar already, I would introduce him to the names of objects he is surrounded by at home, school and in the neighbourhood. I would perhaps begin with the kitchen and the dining room and move out to the neighbourhood and the school and onwards. Like the star, his mind must be kept moving, though not perceptibly perhaps but in effect. By daily repetition, he will thus remember the names of animals, their sound and simple behaviour, and also the names of inanimate objects and the verbs to describe them with. Stage by stage he must go forward according to a plan acquiring more vocabulary and its uses. Wave after wave with a calculated rate of attainment, the student must reach the predetermined goal. If he fails, he must not study English. *Let him try something else, and not aspire after University education which, as far as I can see, will not be within the reach of those who would not possess the knowledge of some European language.* All over Europe, a student has to learn a modern language which is not

his own. In some States, he has to acquire three or four languages.

At this stage, I would not harass the young learner with any poetry or drama, nor with the grammatical definitions. Indeed I would not scare him with such forbidding terms as Orthography, Etymology and the names of the Moods of verbs. Rather than making an attempt with the abstract rules of grammar, I would initiate him to the mysteries of grammar by means of simple sentences with known words showing their relationship with one another. Only in the final year, of the Matriculation, a simple grammar showing the various uses of words should be put before him so that he learns systematically what he has known before.

Should he not study any literature all this time? Of course he will, but only the one written for him with the words he has already been acquainted with. As his vocabulary increases, the volume of his literature will increase in the corresponding manner. If he proposes to go in for science, I would put into his hands such writings of scientific nature as would familiarize him with scientific language. Should he think of literature, he must do some poetry and stories, in addition. Indeed I would prescribe for him an additional paper consisting of poetry, drama, essays and stories.

But specialization cannot be thought of at the Matriculation stage. It really begins at the Intermediate. A student then makes up his mind what he is going to study in the future. Here therefore the course of English syllabus should be so framed and enforced that he is not thwarted in his later studies by his inability to understand the books in English that he wants to consult for a more comprehensive knowledge of the subject he might perhaps be studying in an Indian language. Such books should be put into his hands as deal with science if he is a science student, or if he pursues an Arts Course he must familiarize himself with a diction sensuous and speculative.

It must sound as a tall order, because books have never been written or selected with a purpose. But a beginning must be made, and there is no dearth of people who are capable of this task. The Bihar Text Book Committee has already begun this laudable work according to its needs and plan. This should be emulated everywhere and we shall have all the books we want.

This is my scheme for Secondary Education. I am profoundly interested in it because I have to shoulder a heavy burden at a later stage. Possibly there is nothing in it that has not been thought of or said before. I have made bold however to set them before my readers for a discussion. I shall be amply rewarded if it results in a clarification of thought.*

* Read before the All-India English Teachers' Conference (1952) held at Ajmer.

DR. RADHAKRISHNAN

By PROF. N. VENKATA RAO, M.A.

"UNLESS philosophers become rulers or rulers study philosophy, there will be no end to the troubles of man." Such was Plato's conception of a ruler. With the help of the Light of Reason the philosopher is able to guide the destinies and affairs of men. Asoka, Akbar and Marcus Aurelius were the philosopher-kings of yore who administered their countries wisely and justly. They were no mere dreamers that lived in the abstract world of ideas. They were practical enough to bring their philosophy down to the Assemblies and Council Halls. It is just that a philosopher like Radhakrishnan should have been chosen as the first Vice-President of the Indian Republic. With his long and varied career as Professor and Administrator, Preacher and Diplomat, he richly deserves the place.

Born on 5th September, 1888 to orthodox parents at Tiruttani, Radhakrishnan enjoyed neither the advantages of wealth nor birth. From the early years he dreamed of the things of Eternity and had a firm faith in the reality of an unseen world behind the flux of phenomena. By nature, shy and sensitive, he loved silence and solitude. He always lived in the world of books and made companions of poets and philosophers. His pursuit of the world of ideas earned him a reputation for coldness and indifference. But, to quote his words:

"I am capable of strong and profound emotions, which I generally tend to conceal. I am nervously organised, sensitive and high-strung."

Radhakrishnan had his education in the Christian Missionary Schools where he early imbibed the teachings of Jesus. But his pride was wounded when he heard Christian Missionaries attacking the Hindu beliefs and practices. As a zealous young man, inspired by the work and eloquence of Vivekananda, Radhakrishnan determined to clear the cobwebs of prejudice of these missionaries and vindicate the spirit of the Vedanta. Steadily and ceaselessly, he worked up to his dreams, became the interpreter of the East, and carried the greatness of the Vedanta to the Western world.

Radhakrishnan drank deep of the wisdom of the Upanishads and the Gita, the epics and the Puranas, the great teachings of the religions and philosophies of the East and West. His acquaintance with the literatures of the world is deep and profound. He tempered his mind with scientific knowledge and earned a reputation for precise thinking. Thus he acquired a wide knowledge of human affairs, a broad outlook, religious tolerance and successfully and harmoniously blended the Eastern and Western cultures in his teachings. His mind is a fine flower of culture, a synthesis of all that is true, good and beautiful.

Radhakrishnan's early thesis on the *Ethics of Vedanta* shows his bent of mind. It was a reply to the charge that

the Vedanta had no room for ethics. It won high praise from his teacher. His main argument is that

"Religion must express itself in a reasonable thought, fruitful action and right social institutions."

To him religion is not a dogma or a ritual. It is essentially a personal experience, a concern of the inner religion, for which faith and hope, spiritual labour and life which lifts man above the meaningless existence and dull despair. The sense of the infinite is the basis of moral activity are essential. The ethical aspect is vital for the purification of the mind and communion with God. With this end in view, Radhakrishnan maintains that Hindu Religion is not other-worldly, that conduct is supreme, and the doctrine of Maya belongs only to the phenomenal existence and does in no way conflict with the ethical seriousness. Thus his view is spiritual and non-dogmatic. In this light he has interpreted the East to the West. His writings bear the stamp of a creative artist with lucid style, clear insight, fertile imagination and sympathetic understanding.

Radhakrishnan is not blind to the weaknesses of Hindu Religion. It has fallen on evil days, lost much of its old vigour and vitality, become dull and listless. Many of our practices have disgraced our religion, blocked the way to progress and social reconstruction. We have mistaken tradition for Truth and the household gods are dethroned by the tin-gods of fashion and vanity. These gross abuses must be eliminated ruthlessly. We have to learn much from the West—its vitality and courage, its science and technology.

"After a long winter of some centuries, we are today in one of the creative periods of Hinduism."

It is not without misgivings that Radhakrishnan looks upon scientific progress and industrial civilization. Science helps us to build up our body and mind. But the cultivation of the spirit is equally necessary. In spite of our tremendous progress in knowledge and scientific invention, we are not above the level of past generations, in ethical and spiritual life. Mechanization is the death of the spirit. Void within, we are reduced to mere atoms in a community, members of a mob.

Radhakrishnan sees abnormal inequalities in modern society and pleads for social justice and rational distribution of wealth. Today luxury and starvation dwell side by side. He thinks that

"The Russian experiment, whatever we may think of it, is at least an honest attempt to secure for all an equal share in things which constitute the physical basis of life. The glaring contrasts of poverty and wealth are not accepted by them as inevitable."

Society has become intensely selfish and greedy; love of humanity is replaced by love of power and the

ture of position. Physical efficiency and intellectual alertness are dangerous if spiritual illiteracy prevails. Loss of faith and indifference to ethical discipline have resulted in the crisis of modern civilization.

Radhakrishnan deplures the lack of spirit in the modern civilization and its pursuit of the glittering bubbles of life. The trouble with our civilization is its neglect of the enduring things of life and the preoccupation with the fleeting. It is sacrificing Life for the sake of life. Our civilization is emptied of its spirit-content. Politics and economics do not take their direction from ethics and religion. Our society can be remoulded only by sincerity and understanding, by ethical discipline. Only integrated personalities can save us by their inner strength and sincerity.

"They by their self-sacrificing will contribute to the reign of God, of love, of virtue on earth. The stronger individuals help the weaker ones until all are saved."

Radhakrishnan is a Hindu to the core. We find the spirit ruling him at every step. A spare, light figure, keen alert face, bright brown eyes, his personality is arresting. As a Hindu preacher delivering sermons from Christian pulpits at Oxford and Birmingham, Manchester and Liverpool, he made a profound impression on the audience. With a melodious and beautifully modulated voice, he conveyed his thoughts in a series of exquisitely turned phrases thus revealing his mastery of English language as well as Hindu metaphysics. His lectures were spontaneous outpourings of a soul that gazed at Eternity. "The audience swayed at times to his chant; and one felt as if the barrier between the East and West was gone." Referring to his sermon on "Revolution through Suffering," an Oxford Daily observed:

"Though the Indian preacher had the marvellous power to weave a magic web of thought, imagination and language, the real greatness of his sermon resides in some indefinable spiritual quality which arrests attention, moves the heart, and lifts us into an ampler air."

I had the opportunity to hear his Gita Lectures delivered at the University of Benares during his Vice-Chancellorship. Every time I heard him he was lifted into a rarer and diviner atmosphere.

Radhakrishnan is a Hindu not only in his thoughts and outlook, but also in his dress and habits. His food is simple and frugal without the touch of an ascetic; his dress too is simple and immaculate; his hair is never combed (now he has grown bald). He entertains his guests on a strict vegetarian fare seasoned with brilliant talk. He is accessible to all and sundry. He undergoes a severe self-imposed discipline.

The detachment of Radhakrishnan is really remarkable. A beloved husband to a devoted wife, an affectionate father to brilliant children, servant to all, he leads the life of Janaka with detachment, simplicity and humility. He is not an ascetic but he attaches little

importance to the joys and values of the earth. Authority sits lightly on him. The choicest delicacies of the dinner room at All Souls were not an attraction to him. "Some say that he used his private key to go out of the college by the back door when he found the front door jammed by celebrities."

Radhakrishnan has made this wide world his own home; mankind his kith and kin. Like a bird of passage he constantly moves from one part of the globe to the other, meeting and addressing people of different types and creeds. Whether lecturing to a class or addressing statesmen his burden is invariably the same—the re-establishment of the Indian outlook of life in the heart of the human family. Society must live in peace and toleration. Hatred and ill-will must cease; intolerance and violence must go. Love and compassion must rule the world. Catch-words like socialism and capitalism do not appeal to him.

As a teacher Radhakrishnan came into contact with many young men pulsating with life. He educated them to a belief in a spiritual and ethical universe, stressed the importance of prayer and a frequent withdrawal to oneself from the machinery of existence. A genuine teacher is a living lamp that kindles light in his pupils, quickens them to the ideas of Truth and Beauty. Through suffering we grow and obtain grace. With the shedding of ego, love reigns supreme, and love is greater than law or justice, learning or fame.

"The touch of a compassionate hand," writes Radhakrishnan, "often illuminates one like lightning-flash in the darkness. Profound influences are wrought by creative minds by a light gesture or a brief conversation."

Radhakrishnan is not a pedantic scholar or cold dispenser of thought. He is intensely human and is alive to the value of emotions. He has a capacious heart and sympathetic understanding. He suffers fools and criminals. The infinite pathos of life, he says, call for infinite understanding. He sees in the sinful, the mystery, the beauty and the sadness of life. He has the magic gift of confidence and his correspondents include all and sundry craving for help and advice.

"It pleased me to know," he writes, "that to some lonely or enslaved souls I was perhaps the only or the first person to show any sympathy or understanding."

Radhakrishnan is an apostle of culture, an ambassador of love. He works for sweetness and light to make the will of God prevail. Blessed are they that spend their lives in dispelling ignorance and mitigating misery. Great souls like Buddha, Christ and Gandhi strove to lighten the burden of humanity by suffering and love. "If we are to imitate in some small measure their example, we must help the weak and comfort the unhappy." A little help, a kind word, or even a smile may go a long way in alleviating human misery.

THE LATE MR. T. R. VENKATRAMA SASTRY A Personal Tribute

By P. RAJESWARA RAO, ADVOCATE

THE passing away of Sri T. R. Venkatrama Sastry, the doyen of Indian liberalism and a Constitutional lawyer of considerable erudition and noted for his moderation and caution marks the end of an epoch in the public life of our country. As a faithful disciple of the late Rt. Hon'ble Mr. V. S. Srinivasa Sastry, he lived up to his faith to the last breath of his life. Like most of the public men of his generation, he took to the legal profession and soon made his mark as a great jurist and an eminent advocate. The Advocate-Generalship in Madras came to him in the normal course. Though he succeeded Sir C. P. Ramaswamy Iyer as the Law Member in the Governor's Executive Council, he could not remain in that position for more than 48 hours consistent with his notions of dignity and self-respect as the Police Portfolio was suddenly removed from the control of the Law Member. His exit opened the door to yesmen who were awaiting an opportunity.

Whatever his politics were he espoused the just causes whenever and wherever they cropped up. When Rev. Paton, the Christian Missionary, was unjustly beaten by the Police during the Satyagraha Movement, he lodged his protest. Again when the Madras High Court sought to take action against Mr. Vaidyanatha Iyer of Madura for defying the ban imposed on him by the executive during the Quit India Movement of 1942, Mr. Sastriar stood by him and described the conduct of Sri Vaidyanatha Ayyer as a symbolic protest against an order which he considered to be unwarranted. The then Chief Justice Mr. Lionel Lach who was both imperious and hot-tempered cooled down and closed the matter with a censure. The tragic end of Mahatma Gandhi sent the Rashtriya Swayam Sevak Sangh into disgrace. Many were grieved to find this brotherhood of Hindus built upon sustained service and sacrifice disintegrating. In the fitness of things Mr. Sastriar came to its rescue and rehabilitated it in the eyes of the public and the Government alike. The instances are merely illustrative and not in any sense exhaustive.

He touched life at many points. He was an ardent social reformer. He was the earliest champion of equal rights for women. As a member of the Sir B. N. Rao's Committee on the codification of Hindu Law he rendered yeoman's service. He was interested in the cause of higher education and was intimately

connected with the various academic bodies of the Madras University for a long time. He also officiated as the Vice-Chancellor of the Annamalai University. Above all, he was a Sanskrit scholar and was responsible for the upkeep of the Kuppaswami Sastri Sanskrit College and Research Institute. He also enjoyed his share of club life till the end.

Above all, he was unassuming and fast in his friendships. As one known to his master the late Rt. Hon'ble Sastri, I required no introduction to him and enjoyed the privilege of his friendship. He always received me with great warmth. We exchanged notes on public problems. I differed from him often and even gave publicity to such differences. But it never affected our personal relations. I always admired his enthusiasm for the study of public problems. He expressed himself on every crucial issue. When I met him last in April, though signs of senility were apparent, his mind was mobile. Though the atmosphere was surcharged with ill-will, animosity and prejudice on account of the impending formation of the Andhra State, we talked to, instead of talking at, as Indians. We discussed all the topical issues at length and in detail, with impartiality and detachment. I wish that all my contacts were at such a high cultural level. He was definitely distressed over the formation of States on linguistic basis before we consolidated our freedom and developed the spirit of Indian citizenship. He was also apprehensive that the separation of Andhra would let loose the forces of communalism in Tamilnad. When I asked him why did he not at least agree to the conversion of Madras into a C class State, he replied with a spirit of resignation that the lot of Madras was after all cast with Tamilnad. But the Indian in him desired that the residuary State should be known as the Madras State, where the non-Tamils also would feel at home. He told me that some of his well-meaning friends (since they are distinguished Tamilians, I do not want to disclose their names) criticised him for saying that Madras should be part of Tamilnad. They wanted him to say that Madras would not be part of Andhra and leave it at that. He had settled views on many problems. He felt that there was more politics than music in the Tamil Isai Movement. He was all admiration to the inherent musical potentialities of Telugu. In the event of a clash between the two power-blocs on the international scene, he was confident that India would be

neutral. He was an invaluable link between the older and the younger generation.

He passed away full of years and honours. But his death has created a void which cannot be easily

filled up. I salute Sri T. R. Venkatrama Sastry, the liberal, patriot, scholar, educationist and philanthropist who passed away from mortality to immortality.

—:O:—

AN OUTLINE OF A SCHEME TO ATTRACT YOUNG MEN OF MIDDLE CLASS FAMILIES To Adopt Agriculture as a Profession

By DEBENDRA NATH MITRA

It is high time that earnest endeavours should be made to encourage young men of middle-class families to adopt farming as their main occupation. But prior to it, it is important to demonstrate adequately that farming, on an area of land, 10 to 15 acres, which may be readily available in the countryside to some young men, is a paying proposition. With this object in view an area not more than 15 acres in suitable localities may be acquired or taken on lease by Government and a cropping scheme adopted in order to demonstrate abundantly that farming on such a small area pays sufficiently to enable a young man to maintain his small family. The farm will be run on absolutely economic lines and the buildings, sheds, etc., constructed on it should be as simple as possible, fitting in with the conditions prevailing in villages, with such improvements which may be effected within the means of a villager. The methods adopted to run the farm should also be within the reach and means of an average cultivator.

A young man of the locality, preferably a Matriculate, with a bias towards agriculture and possessing some capital, should be entertained at the farm as a learner, but he should be required to work on the farm with the labourers doing with his own hands all the operations of the farm. The training should be so arranged as will give him an insight into the working of the farm in all its sections in-

cluding cropping, accounts, balance sheets, etc. He should be given a wage of Rs. 65 a month.

A farm of this type should be run in a locality for 3 or 4 years entirely at the cost of Government and under the spot supervision of a competent agricultural officer. In course of this period the Agricultural Department should be able to demonstrate that the cropping scheme worked out at the farm is suited to the local conditions and is a distinct improvement over the local methods. If they cannot demonstrate it within a reasonable period, the farm should be abolished.

But if they can demonstrate that the farm is sufficiently paying to enable a young man and his family to maintain themselves it should be offered to the young man to run it on his own account. If he has funds, he may purchase the farm at a reasonable price or the farm may be leased out to him on a reasonable rate of rent. If the farm is paying the young man is likely to be attracted to enter into an agreement with the Government under suitable conditions to run it on his own account.

The above is only an outline of a scheme to attract and inspire suitable young men to adopt agriculture as a profession. Details may be worked out.

A number of farms of this type will also serve as an object-lesson to the cultivators of the locality.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquires relating thereto answered. No criticism of book-reviews and notices is published.

Editor, *The Modern Review*.

ENGLISH

THE TEACHINGS OF THE UPANISHADS: By Basanta Kumar Chattopadhyaya. University of Calcutta. Pp. vi + 326. Price Rs. 10.

Sri Basanta Kumar Chattopadhyaya, who has utilised his retirement from an exalted post under the Government of India, gives in the volume under review a summary of his convictions, based on wide reading, concerning some of the fundamental conclusions of orthodox Hindu philosophy and religion. The key to his position is to be found in the last chapter, namely, "Complete Truth in Vedic Religion," in which he tries to establish the superiority of Hinduism over other religions, indigenous and foreign. In the chapter preceding he gives a summary of "Other Schools of Hindu Philosophy" and attempts to prove the superiority of Vedanta over other systems of thought, orthodox and heterodox alike. In the chapter of "God and the Soul" he tries to show that Ramanuja has given a better interpretation of Vedanta than Sankara.

The reader can now expect what the general aim of the author would be like: it is to establish the superiority of the theistic position with the help of the Upanisads. This objective has narrowed the scope of the enquiry by practically limiting the treatment of the Upanisadic materials to their bearing upon the nature of the soul, its spiritual training, and its ultimate destiny. The book is therefore not a comprehensive study of the Upanisads like that of Deussen or Ranade nor a critical account like that of Keith or Belvalkar and Ranade. In fact, the introduction of Vedanta and Bhagavadgita materials has tended to obscure to some extent the exact Upanisadic speculation. Conversely, the inclusion of the big penultimate chapter on other schools has somewhat widened the scope of enquiry though it has tended at the same time to deflect the attention from the Upanisads proper. The book is, therefore, to be regarded more or less as a critical examination of the Vedanta as interpreted by Sankara and Ramanuja with the help of Upanisadic texts and as an attempt to establish the validity of the traditional Hindu view as against the criticisms of modern scholars, both Eastern and Western.

But within the limits set by himself the author shows intensive study and deep meditation. His spirited defence of the Hindu view of life with its doctrine of karma, its eschatological speculation, and its scheme of spiritual discipline and his vindication of the Varnashram Dharma make him a redoubtable champion of Hindu orthodoxy. It is obvious that on some of the positions taken up by him it is possible to join issue with him, seeing that divergence of opinion is present

within the orthodox texts and interpretations themselves and an historical evolution of thought cannot be lightly set aside in favour of an eternally fixed canon. A wholesale support of ancient texts runs the obvious risk of ignoring evolution of human thinking in all parts of the world with the growth of critical faculty. Naturally, arguments have sometimes to be twisted to support a personal view-point.

The salient points that the author wishes to make out are that the Upanisads did not condemn or abandon unequivocally the performance of ordained duties and the invocation of the gods in the Vedic fashion and that they did not make the practice of morality difficult, illogical or superfluous. He naturally justifies the use of images for worshipping God, but wisely permits sectarian difference on temperamental grounds, and even supports syncretism and synthesis. He holds that the Smritis and the Puranas can be relied upon to supplement the Upanisads in spiritual matters as being ultimately based upon the Vedic tradition. He has no difficulty in showing that Sankara's philosophy is neither Vijnanavada nor Berkeleyan idealism, though it is not a better guide than Ramanuja's, and that it is not impossible to reconcile the two statements that Brahman has no parts and that the *jiva* is a part of Brahman. He has used his mathematical knowledge to establish that space and time can be proved to be limited and false in an ultimate reference. Naturally, philosophies that take matter as equally important with soul find no support from him though he does not favour Sankara's *vivartavada* as an explanation of matter and finite souls.

This short review does not do full justice to the wealth of materials to be found in the book nor to the simple and forceful style in which the author defends his view-point. It is a matter of great regret, however, that due to very bad proof-reading a large number of mistakes should manage to linger on in the text and need correction in the next edition. His spelling of Sanskrit words is not free from mistakes and the diacritical marks have not been properly used in many places. Seeing that it is a Calcutta University publication, expert aid should have been placed at his disposal for removing slips and checking references. The author's own mistakes are very few as compared with the errors in printing. If these are ignored, we have in this volume a unique spectacle of a highly cultured Hindu not afraid or ashamed to own publicly his allegiance to the much criticised and much maligned culture of this ancient land that has weathered so many storms in course of its long career and shown renewed vitality when all seemed to be lost through the hostile attack of outsiders and the wavering faith of its adherents.

HARIDAS BHATTACHARYA

MYSTIC APPROACH TO THE VEDA AND THE UPANISHAD: By M. P. Pandit. Published by Sri Aurobindo Library, 369 Esplanade, Madras. Pp. 142. Price Rs. 3.

This book is a collection of six papers contributed by the author on special occasions to the Annual Numbers of Sri Aurobindo Circle, Bombay and Sri Aurobindo Pathamandir, Calcutta. These papers are, according to the learned author, governed by a unity of purpose which is to test and see for ourselves how far the claim made for the Vedas as revealed scriptures is justified and also to appraise the soundness of the mode of symbolic interpretation. The main principles of mystic interpretation of Sri Aurobindo are enunciated in the first paper and application of this method and the results it yields are illustrated in the subsequent chapters and on the legend of Shunahsepa. The last chapter emphasizes the need for a new approach to the Upanishads. The author observes that Upanishads do not constitute a departure from the Vedas but they draw upon and continue the spiritual tradition of them. He asserts that they are not philosophical texts but essentially living guide-books to the seekers of Truth. There is in the Rig-Veda a Sukta named after Rishi Shunahsepa. Shunah denotes bliss, and sepa, a ray. Its literal meaning is, therefore, a ray of bliss. The Rishi finds himself bound by a bond and aspires after release and to be restored to Aditi. The legend recurs in the Aitareya Brahmana. Some Western Indologists conclude from this legend that *narabali* or human sacrifice is mentioned in it. Like Dr. Rajendralal Mitra, Colebrooke, Wilson and Rosen, the present author challenges their false conclusion and refutes it with strong arguments.

SWAMI JAGADISWARANANDA

BENOY KUMAR SARKAR (A Study): By Haridas Mukherjee. Dasgupta and Co., Calcutta, 1953. Pp. 76. Price Rs. 2.

The late Professor Benoy Kumar Sarkar deeply impressed himself upon his contemporaries at home and abroad by the amazing richness and versatility of his talents, the originality and boldness of his ideas, and the extraordinary fruitfulness of his literary output. It is therefore in the fitness of things that an attempt should be made in the present monograph to do justice to his remarkable career with special reference to his manifold activities spreading for nearly half a century over different branches of thought and action in connection with the Indian liberation movement. To the present reviewer, the work is specially welcome as it gives him an opportunity of paying his homage of affectionate regard for the memory of one whom he had learnt to esteem as one of his most valued friends since he was a fellow-student at the Presidency College at the beginning of this century.

The book consists of three chapters of which the first gives Professor Sarkar's life-sketch, while the second and the third deal in detail with his services to Bengali literature and with his contributions in the field of comparative study of Eastern and Western cultures. It is adorned with a portrait of Mr. Sarkar and it concludes with a number of appendices consisting of appreciative extracts from his friends and admirers in and outside India. Dr. Radhakumud Mookerjee, as a senior fellow-worker of Mr. Sarkar for many years, contributes an appreciative Foreword.

On a few minor points we may offer our criticism of the present work. The author's treatment suffers from a certain amount of duplication, the material of the second and the third chapters being anticipated

to a slight extent in the first chapter. The author, again, has fought shy of the question, why such a highly gifted person, to quote an extract from the Foreword, "did not get his dues in life which was somewhat marked by a subdued sense of frustration?"

U. N. GHOSHAL

BENGAL VILLAGE IN WOOD-ENGRAVING: Engraved by Haren Das with a foreword by R. N. Chakravorty and Introduction by L. M. Sen. Ten examples, two in colour. Published by G. C. Laha and Co., 1 Dharmatala Street, Calcutta. Price Rs. 12.

This is a fine collection of wood-engravings representing typical scenes from Bengal village-life, of considerable charm and beauties. Wood-engraving is not yet a popular art though it has immense possibilities in the realm of illustrated journalism, particularly, in the Sunday editions of our dailies, still addicted to the pernicious habit of using clumsy, smudgy half-tone blocks which could be easily replaced by wood-engravings which will help to keep alive a group of artists, specializing in this art. The price is prohibitive and will prevent a large circulation.

O. C. GANGOLY

RECONCILIATION IN SOUTH AFRICA AND THE STATUS OF THE INDIANS IN INTERNATIONAL RELATIONS: By H. K. Junckerstorff. Published by Book Land Limited, 1, Sankar Ghosh Lane, Calcutta 6. Price not stated.

"Africa is on the march . . . The crucial question governing the future of the Dark Continent is the problem of the racial, religious and linguistic minorities incorporated in the old States and the new ones to be created."

Dr. H. K. Junckerstorff of St. Louis University gives in the volume under review a terse, yet on the whole clear, account of the plight of the more than three lakhs of South Africans of Indian origin. He knocks the bottom out of the Union Government's contention that the Indian problem is the domestic concern of South Africa by clearly demonstrating that Indians in the Union of South Africa are a national minority in international law, one which "includes only those non-dominant groups in a population which possess and wish to preserve stable ethnic, religious or linguistic traditions or characteristics materially different from those of the rest of the population." (Definition by the Sub-Commission on Prevention of Discrimination and Protection of Minorities established by the United Nations). Specially brilliant is Chapter VI which shows how the South Africa Government has denied to the Indian minority the rights guaranteed by the Universal Declaration of Human Rights.

The rulers of South Africa should remember—more in their own interest than anybody else's—that the suppression of the minorities "will bring internal trouble and revolution." A policy of tolerance, mutual understanding and mutual help will usher in an era of peaceful progress in that benighted land.

The learned Doctor should have been more careful, however, about some of his statistics. Thus, according to him, Indians in South Africa number 282,500. In reality they are now more than 300,000. Again, in one place (p. 25) he puts the number of Indians in Durban at 113,400, and in another (p. 56) at 128,241. Both cannot be correct at one and the same time. These and similar inaccuracies and contradictions should be removed from the next edition.

SUDHANSU BIMAL MUKHERJI

WHEELS ROUND THE WORLD: By Alan Hess. Published by Newman Neame, London, 1951. Pp. 94. Price 15 shillings.

This exciting little book narrates the daring exploits and the quixotic adventures of the pioneers of motor traction from the end of the last century down to our times—of men battered, twisted, thrown about, but never vanquished or thwarted by the unspeakable hazards of the road. Here we read about the three-ton contraption—painted bright yellow—of Dr. E. E. Lehwess christened "Passe-Partout," which, after a flamboyant announcement of a round-the-world circumnavigation, lumbered its way from London through an interminable succession of dinners, receptions and festivities, and finally ended up ignominiously by getting bogged in a snowdrift near Nijni Novgorod. Then there was the three-car race from Peking to Paris organised by *Le Matin* in 1907. The winner was Prince Borghese who reached Paris in 60 days. 1908 saw an even more ambitious race from New York to Paris. The journey was initially planned via Alaska over the frozen Bering Strait. But this part of the programme was abandoned at the last moment. Andre Citroen's Sahara expedition in 1922-23 in an aluminium car, which took 22 days to make the crossing, was another mile-stone in the life of the "horseless carriage." Also remarkable were Michael Terry's dash across Northern Australia's "Never Never Land," in 1923, through 200,000 square miles of bush and desert country and the desperate ingenuity displayed by the men of the Court-Treatt Cape-to-Cairo expedition during 1924-26. Equally spectacular were Captain T. Yates-Benyon's race from London to Calcutta in 1932, the Sleigh expedition from Algiers to the Cape in 1938 and, finally, the author's own air-cum-overland circumnavigation of the world in the record time of three weeks in June, 1951. Numerous beautiful sketches from the pen of George Bass and eight pages of illustrations covering Hess' round-the-world trip enhance the value of this exceedingly well-produced book.

RAMESH K. GHOSHAL

QUESTIONS AND ANSWERS ON THE WEST BENGAL SECRETARIAT CLERKSHIP EXAMINATIONS: By B. Sanyal, M.A., B.L. Published by the author from 106, South Sinthee Road, Calcutta 30. Pp. 138. Price Rs. 5.

Questions 1947-52 are included with answers besides a very useful Appendix at the end of the book. Rules of the Examination together with the syllabus are also given for the benefit of the examinees. This is the fifth and up-to-date edition of the book and shall prove a useful guide to those for whom it is intended.

DIRECTORY OF THE BOOKSELLERS AND PUBLISHERS, 1953 (Parts I and II): Compiled by Dewan Ram Prakash. Published by Bookwala Brothers, Calcutta 17. Pp. 214. Price Rs. 10.

Part I contains names and addresses of Booksellers and Publishers in India and Pakistan, alphabetically arranged according to places of business. Part II contains names of Newspapers and Periodicals similarly arranged. Although a useful publication, the price fixed seems to be a bit too high.

A. B. DUTTA

BENGALI

BANGLAR BARSALIPI, 1360 (B.S.): Edited by Sisirkumar Acharyya Chowdhury. Published by

Sanskriti Baithak 17, Pandit Place, Calcutta 29. Pp. 352. Price Rs. 2-8.

This is a Bengali Year-Book dependable and up-to-date. Its popularity is proved by the fact that this is the tenth year of its publication. We have no hesitation to remark that from a schoolboy to a businessman, particularly, those who cannot make use of Year-Books in English, this handy volume will prove extremely useful.

A. B. DUTTA

KRISHI-BIGNAN, Vol. II (Fasal Sabji-O-Fal): By Rai Rajeswar Das Gupta Bahadur, I.A.S., M.R.A.S. (Eng) and edited by Ramesh Das Gupta. Published by the University of Calcutta. Pp. 607. Price Rs. 10.

The book deals with a subject, applied agriculture, which is throbbing with life to-day and is in the forefront, now when India is making a bold bid to be self-sufficient in food. The book is of interest because it is written by one who in the earlier part of the twentieth century instilled the life or the spirit of research in agricultural enterprise in Bengal.

Agriculture in India, then, was just a by-word. The Government sent men abroad for agricultural training and on their return gave them magistrateship or something like that, while the state of agriculture in the country was getting worse and worse. The author felt the distress of the cultivators and was determined to improve the condition of agriculture. He invented improved agricultural implements and found out more scientific and economical methods of agriculture. It is a pity we lost him early, but we are fortunate enough to be left with his masterly views and ideals in his books.

The book under review is a part of the author's encyclopaedia on agriculture. In every page of the book we feel his keen passion for improvement of agriculture in India. This particular book deals with crops, vegetables and fruits, from economic, practical and theoretical aspects. Whatever the author has dealt with he has done exhaustively and in lucid style to be understood by anyone with an elementary knowledge of the Bengali language. The book is indeed an asset—the first of its kind in Bengali language. The book has kept up with the modern views and facts in the fast developing science of agriculture. This reflects much credit on the author's knowledge and farsightedness. The book has been admirably edited and revised by Ramesh Das Gupta with his thorough knowledge of the subject. There is a chapter on popular sayings to interest the general reader and an appendix containing cost of cultivation of important crops, vegetables and fruits to help the wise and thrifty farmer. The author has dealt with the subject in several well-classified chapters and has given all the information that the reader may wish to know. He has dealt separately with the insect pests, and plant diseases, and their prevention, manures, cultivation, seed required and nett yield per bigha, for each item. In the chapter on fruits he has dealt at length with the procedure and use of different types of grafting.

This sumptuous Volume of about six hundred pages embodies the experience and observation of an enthusiast and specialist in agriculture.

Now that the national government have come to realise the importance of improved agriculture in India the book ought to be the text-book for students in agricultural colleges and schools and in the hands of all officers entrusted with agricultural improvement.

HEMENDRA PRASAD GHOSE

HINDI

HINDI SAHITYA KI PARAMPARA: By Hansraj Agarwal. Published by Sahitya Prakashan Mandir, Lashkar, M. B. Pp. 436. Price Rs. 5.

A handbook of Hindi literature tracing its growth from the beginning to the present day, briefly but informatively, against the triple concurrent background of political, social and cultural influence and environment of each period. As such, it will be found very useful by students but it could be used with advantage also by all those who desire to have ready at hand a helpful reference book on the subject. But the handbook is more than a history of Hindi literature; it is a delightful interpretation and assessment thereof as well.

KALA KI KALAM: By Raghuvir Sharan "Mitra." Published by Akhil Bharat Rashtriya Sahitya Prakashan Parishad, Meerut, U.P. Pp. 163. Price Rs. 3.

A collection of sixteen stimulating critical essays on Art, Literature, Beauty in Poetry, Literature and Society, Mysticism and other allied themes. The author is a well-known litterateur and critic, so he has written with intellectual acumen and literary flair and felicity. G. M.

GUJARATI

SHI K. M. MUNSHI-NI PATRA-SRISTHI: An Album of pictures drawn by Ravi Shankar Rawal and published by Guzerat Sahitya Sabha, with a dedicatory page signed by C. M. Diwan, K. K. Sastri, D. D. Shah, Ballantyne Haveli, T. N. Darvaja, Ahmedabad. 1953. 32 colour plates. Price Rs. 25

This is a respectful tribute offered by his countrymen to the Hon'ble K. M. Munshi, the distinguished son of Gujarat, on his 60th birth-day. Such *Fechtiche* volumes of tribute have become quite fashionable in India. But generally such tributes are in the form of a bunch of learned essays and articles from the pen of scholars and savants. But this is a new departure as it avoids the trodden path of literary contributions and takes the form of a bunch of Water Colour Paintings, specially painted by Ravi Shankar Rawal, the famous artist and journalist of Ahmedabad. The 32 pictures, each mounted on cartons, with a descriptive note in Gujarati and Hindi, are in three sections: Vedic-Pauranik (14), Historical (14) and Social (4). The pictures are imaginative presentations, not always happy in their designs, draughtsmanship and colour scheme, the best pieces being Kartavirja-Arjun, Daddanath Aghori, Dhodha Bapa, Chaula, Muhammad of Ghazni, Prasanna, Ranak Devi and Kirtideva. The unspecified portrait pasted on the Album is a powerful study of an unidentified historical figure. The famous Gujarati artist has set a new precedent for the forms of Prasasti volumes which it is hoped will be followed by later pilgrims on the same path.

O. C. GANGOLY

1. **SHRI KRISHNI AN OR AT THE MONTH OF THE GUN**: By H. D. Dave.

2. **GITA SAPTARATNA SAPTATI**: By Babubhai Ichcharam Desai, B.A.

Both published by the Gujarati Printing Press, Bombay 1. 1950. Cloth-bound. Paper-cover. Pp. 176: 171. Price Rs. 4-12, Re. 1.

The weekly paper *Gujarati* presents to its subscribers at the end of every year, a novel or other book for the last sixty-six years. Book No. 1 is its present for the sixty-seventh year. A man called Bhandas was, through jealousy, unfairly shot, by Maharaja Khanderao, at the month of the Gun. Later he

repented and honoured in open Darbar his widow and daughter-in-law. The book sets out that story and is based on the archives of chroniclers (Bahroti). The second book contains the Sanskrit text and Gujarati translation of the first Part (Shlokas 1-40) of the 18th Adhayaya of the Gita, with useful explanations and comments based on the sermons of Godse Shastri-Babubhai is a close student of the Gita and has propounded its principles very well.

MAHASABHANUN BANDHARAN: Published by the Gujarat Vidyapitha, Ahmedabad. 1948. Paper cover. Pp. 17. Price As. 8.

This is a Gujarati version of the contribution of the Hindi Rashtriya Mahasabha as adopted at Bombay on 24th April, 1948.

SATYAGRAHA MIMAMSA: By Maganbhai P. Desai. Published by the Gujarat Vidyapitha, Ahmedabad. 1948. Thick card-board. Pp. 294. Price Rs. 3.

This is the second edition of a book first published in 1934, when Satyagraha was being practised at its highest. Its significance, its object, its limitations, its *ahimsa* character, and every phase relating to it was given there. During the course of fifteen years after 1934 many occurrences have taken place, to which Shri Desai has referred in his extensive Introduction. He has noticed that Sangathan-Union can be based on jealousy, envy, hatred and falsehood, instead of on love and truth, and gives us an instance, the union of Muslims brought about by the late Mr. Jinnah. Kaka Kalelkar's second Introduction, i.e., Introduction to this edition, entitled "The Direction in which Hope Lies," is a valuable guide to workers in this line.

ARTHASHASTRANI PARIBHASHA: By Vithaldas Maganlal Kothari. Published by the Gujarat Vidyapitha, Ahmedabad. 1948. Paper cover. Pp. 66. Price As. 14.

In these days of economic upheavals a sort of Dictionary, giving synonyms and explanations of economic terms and phrases was necessary. Mr. Kothari has met the need, by this small volume, where he gives the meaning, significance, and trend of nearly 500 English words and phrases, and explains them, e.g., cornering, currency, dumping, socialism and many more. K. M. J.

GOPALAN: By Natubhai Solanki. Navajivan Prakashan Mandir. May, 1953. Price Rs. 3.

Natubhai Solanki has been trained in Sabarmati Gandhi Ashram working on cow-keeping, and has produced a book on Gopalan in Gujarati covering different aspects of the problem. He has carefully studied Shri Satish Das Gupta's well-known book as well as the special issue of the *Kalyan*: *The Romance of the Cow*, Sri Valjibhai's *Go-Raksha Kalpataru*, and he has in course of seven chapters produced a handy book showing how the cow was held in great request in our ancient books. He has described the different breeds, milk and milk products. He has also treated ordinary cattle diseases and easily available remedies and *pinjrapoles* for the old and infirm. He has assessed the value of cows against buffaloes, bullocks against tractors, and in a few appendices he has shown how records are to be kept regarding cows and how the various forms of Vanaspati and similar products are to be balanced against ghee, concluding his books with miscellaneous interesting side topics. The book is sure to be very useful to all interested in our cattle wealth, and surely their number should be large enough to embrace all rural welfare workers.

INDIAN PERIODICALS

Professor Girindra Sekhar Bose

Dr. S. C. Mitra writes in *Science and Culture* :

Dr. Girindra Sekhar Bose, D.Sc., M.B., F.N.I., the first Professor of Psychology of the Calcutta University and one of the founders of the Indian Psychological Association, passed away on 3rd June last at the age of 67 years. He had a stroke in 1949 and since then he had been practically confined to bed till the time of his death.

We had the privilege of living in close association with Dr. Bose for more than 30 years and thus had the opportunity of witnessing the gradual development and unfolding of the rich and varied powers of his mind. We first came in contact with him in 1917 when he was our teacher. What struck us most at that time was the keenness of his intellect, his novel methods of teaching, and his original ways of interpreting the phenomena of mind. Above all, the rigorously scientific bent of his mind fascinated us. Everything that he said and did, even the routine of the daily activities of his life was based on strict scientific principles. Through close contact we gradually realised the versatility of his interest and his capacities in different fields of intellectual and social activities.

Girindrasekhar was a son of Dewan Chandrasekhar Bose and was born in Darbhanga on January 30, 1886. He is survived by three elder brothers, one of whom is Rajsekhar Bose, a former manager and a present director of the Bengal Chemical and Pharmaceutical Works; a master of Bengali humorous prose who writes under the pen name *Parashuram*.

Graduating in science in the year 1905 with Honours in Physiology and Chemistry in both of which he obtained First Class and stood first, Girindrasekhar entered the Medical College. Passing out all medical examinations with great credit in 1910 he began his career as a medical man. By this time he had already mastered the techniques of hypnotism. From a very early period of his life he was deeply interested in the workings of the mind and had a burning desire to study these in a thoroughly scientific way. The creation of the Psychology Department in 1916 gave him the desired opportunity, and he at once took advantage of it. He joined the Department as a student and acquainted himself thoroughly with all that the leading psychologists of the day had to say about mind. He passed the M.Sc. examination in Experimental Psychology in 1917 in the First class. He however was not satisfied with what he learnt about psychology from the authorities and found serious gaps in the theories about many of the mental phenomena. At that time Sigmund Freud's revolutionary theories had begun to agitate violently the scientists, the religious men and leaders of society of the Western countries. Storms of protests and personal vilifications were the order of the day. Dr. Bose however, was convinced of the truth of Freud's discoveries and found them extremely helpful in explaining much of the hitherto unexplained mental phenomena. He was bold enough to adopt and preach Freud's theories and began practising psychoanalysis himself. It was a great step taken in the history of the progress of psychological

studies in our country. To-day psychologists, anthropologists, historians and even fashionable leaders of our society refer to Freud and speak of his psychoanalytical theories but let us remember that it was Dr. Bose who introduced Freud to India and it was he who was the pioneer of psychoanalysis here.

Dr. Bose was not content merely to discuss and disseminate Freud's theories. He began his own investigations on the unconscious regions of the mind and soon made contributions which attracted the attention of Freud, Ferenczi, Jones and other foremost psychoanalysts of the day.

It was these researches which won for him an international reputation and Dr. Girindrasekhar Bose was asked to be a collaborating editor of the *International Journal of Psychoanalysis*. In the meantime he obtained the D.Sc. degree of the Calcutta University in 1921 by submitting his thesis on "The Concept of Repression." In the general psychology too he made a number of original contributions and Spearman in his famous book *Psychology down the Ages* quoted long extracts from Dr. Bose's article on Illusion and elaborately discussed the views expressed therein.

During the course of his psychoanalytical researches, however, Dr. Bose's versatile mind soon realised that there were parallelisms and similarities between the psychoanalytical view and the ancient Indian conceptions about the mind. Accordingly with his characteristic zeal he began with the help of Pandits to study the ancient Sanskrit texts, philosophical, mythological and historical. The products of his devotion to these studies are his well-known treatises *Puram Prabesh*, *Gita* and other articles. The manuscripts of another book had been completed before his death but unfortunately had not been published as yet. With the help of a German tutor, Dr. Bose learned the German language and acquired considerable proficiency in it. His studies on the psychology of language, Bengali technical terms, are authoritative ones. The pages of many journals, English as well as Bengali, have been enriched by his valuable contributions. It was his book *Swapna* written in plain, easily intelligible Bengali language, which first introduced the theories of Freud to the intelligent lay public of our country. As such it was a definite contribution to our own literature. Juvenile literature also did not escape the touch of his hand and his *Lal-Kalo* will always occupy a distinctive position in this field.

Apart from these versatile intellectual activities he had many other solid achievements to his credit. For wider propagation of psychoanalytical knowledge he founded the Indian Psychoanalytical Society, the first of its kind in India, if not of Asia, in the year 1922, long before many other countries of Europe and States of America thought of doing so. He remained the President of the Society, which was affiliated to the International Society, till the last day of his life. Another notable achievement of his was the opening of the Applied Psychology Section in the Department of Psychology of

our University. He considered it humiliating that whenever we had to discuss anything about the child mind or any other topic of Psychology, we had to rely on observational data of other foreign countries. While our students know many things about the I.Q.'s of the British and American boys and girls and the temperamental qualities of the children of Germany and Switzerland they did not have any reliable scientific data about the children and youths of our own country. In order that this serious defect could be overcome the Applied Psychology Section was started with the main object of collecting data and carrying on researches. A scheme was formulated with the help of Dr. Myers, the Founder of the National Institute of Industrial Psychology, and Dr. Spearman, the then Professor of Psychology of the University of London, both of whom happened to be present here at that time at the invitation of the Indian Science Congress. The late lamented Dr. S. P. Mookerjee, the then Vice-Chancellor of the Calcutta University gave full support to the scheme and the section was inaugurated in 1938. It was the earnest desire of Dr. Bose that this section would gradually be converted into a full-fledged Postgraduate Department of Applied Psychology and Dr. Mookerjee assured him that there would be no difficulty in doing so.

It is a matter of deep regret that even after fourteen years, this undertaking given to Dr. Bose has not been implemented by the responsible authorities. Even now efforts have to be made every year to induce authorities to extend the life of the Applied Psychology section. It will be a fitting recognition of Dr. Bose's efforts in this direction if finally a separate Applied Psychology Department of the University be established. To Dr. Bose goes the credit of starting this completely new venture in our country.

The most important activity of Dr. Bose in the social sphere was the starting of the Lumbini Park Mental Hospital.

Bengal did not have any hospital, Government or private, run on strictly scientific lines for the treatment of the mentally diseased persons. The Lumbini Park is the only hospital in Bengal where all the latest methods of scientific treatment, physical as well as psychological are meted out to patients suffering from diseases of the mind. Starting with 3 beds in 1940 Dr. Bose had raised the hospital to its present position where 80 patients can now be accommodated. It is still a completely private institution and receives no help from the Government.

Dr. Bose's radiant appearance, his magnetic personality, his winning smile attracted everybody towards him. His deep insight and his wide sympathies had considerable influence on his friends, acquaintances and patients. As he was versed in so many subjects it was always a treat to listen to his discourses whether in the academic circles or in drawing room parleys.

Lastly, I cannot refrain from mentioning one thing which has made a deep impression on me. The way he bore his illness during the last 4 years of his life was wonderful indeed. Not a single day did I hear him making any complaint or fretting about his illness. Unless asked he would never voluntarily speak of his ailments and of the pains and troubles he had been suffering from. This spirit of calm resignation is seldom met with now-a-days. If I be permitted to use such an expression, I would say that while other persons read the Gita, our Dr. Bose used to live the Gita.

OUTSTANDING PRODUCTS OF HERING & KENT

ROYAL OONIM : Super vitalising Tonic for MEN and WOMEN. Restores youthful vigour and vitality at any age. Rs. 50 for 3 weeks course ; Rs. 200 for complete course of 12 weeks.
OONIM : General all-round tonic for men & women. Rs. 7-8 for one week ; Rs. 22-8 for 3 weeks ; Rs. 90 for 12 weeks complete course.

H. J. Massingham

THE CRAFTSMAN AND SOCIETY

John M. Todd, a Britisher of Pacifist convictions and Gandhian sympathies, writes in the *Aryan Path* appreciatively of the late H. J. Massingham's contribution to agricultural and industrial reform :

There has died recently in England a man whose great concern was to see the restoration of the intensively cultivated small farm, and the revival of the myriad rural crafts which are needed by it. H. J. Massingham was no 'sentimentalist'. He knew that agriculture and rural society generally must adapt itself to and take advantage of industrial power. So sure indeed was he that the day of the old craftsmen had gone that he made a collection of representative agricultural instruments and craftsmen's tools, to make possible the study of techniques which had ceased to be practised. This collection has now become a permanent museum situated at Reading, in Berkshire, England, useful to the student of history, the economist and the sociologist.

But Massingham knew that any healthy society must be based on a thriving agriculture and must have a responsible attitude towards every bit of work that any man or woman does. He held up the achievements of the past in England, and put a spotlight on the modern abuses of the natural world. He was a prophet, though a minor one. Like most prophets he was detested or laughed at by entrenched opinion for his central message, whilst he was equally adulated by a following of men unknown to fame.

His literary fame in England rests on a collection of books describing the English countryside, *English Downland*, *Cotswold Country*, *Chiltern Country* and his last book, *The Southern Marches*. These fine books are the fruit of his early work at London University as an anthropologist who also studied geology, combined with an increasing interest in the relationship between society and religion. The result is a quite remarkable ability to convey the "feel" of a countryside. Massingham knew the underlying physical nature of it, and the historical processes, social and spiritual, which it had seen.

But all this was ultimately only the happy overflow from his most substantial work and his deepest convictions. It was these convictions which enabled him to convey the sense of wholeness, of harmony, of unity in diversity, in his descriptions of the limestone hills, the stone villages which they nurtured and the craftsmen who lived there, of the chalk downs with their treeless pastures, and religious monuments.

Like most prophets, Massingham was a fighter. He was not content merely with making careful historical surveys of country craftsmen. He did make many of these; though through them could always be seen Massingham's own passion for good work, for beauty wedded to usefulness. But, further, Massingham felt the need to take up controversial positions on contemporary questions. Thus he became known as a bitter critic of the policy of the Forestry Commission in England in planting great areas of hill-sides exclusively with conifers. He became known also as almost fanatically opposed to the use of artificial fertilizers, at least as a virtually complete alternative to organic manure. And Massingham became known too as one of those who maintained that the wholemeal loaf should be the loaf to be subsidized, not that made from flour from which the germ and the outer skin of the grain had been removed.

There has been a spate of books in the last few years about world food shortage and soil erosion, and most of them go to one extreme or another on an exclusively material level in propounding solutions.

One will advocate compulsory birth prevention. Another will advocate the exploitation of natural resources on a vast scale. For Massingham either of these answers is an attempt to make a short cut past the most fundamental considerations. He maintained that any approach will be doomed to failure if it looks on nature as something "to be conquered." The materialist approach forgets that man is a creature, set amongst creatures. It ignores the fact that God made the world, and ordered it in a system of love. Man thus has no right to treat the natural world just as he thinks fit. His proper attitude is indicated in a phrase which Massingham used to describe the peasant: he is wedded to the natural world in husbandry.

Massingham presented his own thought most methodically in a book published in 1943, *The Tree of Life*. It is a historical survey of religion, society and literature in England. In it he quotes a key passage from T. S. Eliot's *The Idea of a Christian Society* :

"A wrong attitude towards nature implies, somewhere, a wrong attitude towards God, and the consequence is an inevitable doom. For long enough we have believed in nothing but the values arising in a mechanized, commercialized, urbanized way of life; it would be as well for us to face the permanent conditions upon which God allows us to live upon this planet."

The publications of the SHIROMANI GURDWARA PARBANDHAK COMMITTEE, Amritsar in Punjabi, Hindi and English are sold almost at their cost prices. The first editions of the Holy Guru Granth Sahib in Punjabi and Hindi are out and Bheta fixed is Rs. 40, and Rs. 16, respectively. Printing of Gurbani in Punjabi is done through Photo Blocks. "Muslim League Attack on Sikhs and Hindus in 1947" 20" x 26 1/8" size, antique paper with pages 453 is sold for Rs. 8 only. For further information and free copy of the catalogue, please write to the Secretary.

In a short article of this sort it is impossible to indicate the full scope of the theoretical background to Massingham's thought which *The Tree of Life* provided. But one can indicate its purport by practical examples from his other works. Massingham observed that few men have lived so well and so happily and with such benefit, in the ultimate sense, to others, as the peasant and the craftsman. So he travelled far and wide observing the last inheritors of their traditions. Here were men who had clearly fulfilled the conditions upon which God permits us to live on this earth. Here were what the modern philosopher calls the "synthetic criteria" by which we could judge modern society.

In 1942 Massingham wrote *The English Countryman*. This was again a historical survey and perhaps the greatest of Massingham's works, illuminated with his own personal acquaintance with contemporary craftsmen.

At the end of Chapter III, entitled "The Craftsman," he wrote :

"I have known many craftsmen of various types and trades and I possess many of their works and implements. Is there a family likeness between them as there certainly is between their tools? Since their personalities are probably more diverse than those of an equal number of mechanics or factory-workers for the simple reason that their work gives them latitude for self-expression, it would seem that a family likeness, say between an Oxford saddler, a Dorset thatcher, a Cotswold slatter, a Yorkshire hurdler and Sussex wheelwright could not possibly exist. From my experience which is not small, it does exist, this shared quality of being, and, for want of a better word, I shall call it serenity. . . . This equanimity of temper, exceeding rare in an age of schizophrenia, is conferred upon them by the nature of their work and their intimate contact with Nature herself. It is not insensibility but poise, and, if it owes something to inheritance, still more to lack of frustration, more yet to consciousness of service and even more to the small green world in which they live, it owes most of all to an attunement with the will of Creation itself."

The "will of Creation" is an ambiguous phrase and typifies Massingham's principle fault, that of verbal inexactitude. Yet the principal meaning is clear. He had been elaborating the virtues of the craftsmen in the preceding pages. He described the training of son by father, and referred to Arthur Bryant's description of this sort of education as "a mental and spiritual discipline," Massingham went on :

"Tradition became variable within certain limits because the human element, nourished by skill and personal responsibility, was always replenishing it It fostered rather than fettered individual treatment and so was inevitably antipathetic to mass-production But it is impossible to understand this interplay between tradition and individuality except by watching a craftsman at work," and Massingham here goes on to describe the Cotswold dry-wallers.

The complex traditions of the old crafts, bound to no time-sheet united with a regional self-sufficiency, and acting by an interchange of goods and services rather than money, were the pillars and arches of a social structure whose core of soundness was no less ethical than economic.

Many times during his life Massingham made his basic attitude to the machine clear, although, as we shall see later, he failed to apply his attitude to the industrial world. In *The Tree of Life* (p. 157) he wrote :

"It is not the machine itself which has been responsible for this degradation, since electricity and the internal combustion engine could and should be of the utmost service in the diffusion of property. It is the machine in combination with a predatory philosophy which has degraded work and finally gone on without it, and this is the work of the economic system which has degraded property and has gone on into a functionless finance."

From there he goes on to quote from R. H. Tawney's *The Acquisitive Society*, about the morally satisfactory nature of mediæval economics. Massingham sums this up :

"The peasant's relation to the land is symbiotic by nature, and so the reverse of predatory. . . . The hallmark of every peasant society is that of integration between nature and religion, freedom and tradition, responsibility and ownership, social service and individual rights. That such wholeness was commonly realized in practice would be too much to claim; what is incontrovertible is that it was the normal and familiar pattern of peasant society."

Massingham emphasized "wholeness" as an essential characteristic of the craftsman. His is a synthesizing work. A master of his own craft, the craftsman is also skilled in understanding his material from its first natural setting to its final use, whether it be from tree to chair, osier bed to basket, stone to house, or sheep to serge. He is in a sufficiently close relationship to the natural setting and to the ultimate consumer to produce an article which is perfectly fitting; he moulds its natural beauty into efficient utility, the result of an under-

standing, in love, of the created world and of the men and women for whom he works. Part of the craftsman's particular virtue, then, is to be situated in this organic position. He cannot function in the abstract.

In the craftsman Massingham sees the perfect example of man coming to God through nature, man finding beauty through the ordinary processes of his craft, man expressing truth, by fitting harmoniously in with the laws of the natural world.

There is material here for the theologian to consider. But there is material also for the sociologist and the economist. How can the virtues of the craftsman, these supremely fine developments of the best in human nature, be educed in the modern industrial world? To what extent should it be a long-term aim in industry to make it possible for the majority of workers to have an opportunity to be craftsmen in some sense of the word?

Massingham did notably fail to attack this central problem of work in the industrial world. His thought never attained a full engagement in England. Yet the work he did achieve may in the end prove to be of wider import; and, in any case, encouragement of the old traditions, and efforts to enable craftsmen to adapt themselves to modern conditions, are valuable and important. Massingham did much in this sphere; in England the Rural Industries Bureau also has done very much.

In *The Wisdom of the Fields* (p. 136), Massingham cites as a typical instance of adaptation the case of a Somerset wheelwright:

"Sid Poole uses a bandsaw and so presented me with one more example of the utility of the small machine to the master-craftsman. He maintained that it not only freed him to devote more time to the artistry of his handwork but cut out the shapes of the fellows more accurately than by hand."

In 1947 Massingham edited a book called *The Small Farmer*, a principal theme of which was the need for small agricultural machines. One of its chapters, "Small Machines for Small Farmers," by L. T. C. Rolt, dealt with the subject exclusively.

Can we say anything about industrial mass production in the light of Massingham's work? There is no question of doubting the goodness of using the power of steam or electricity or atomic energy. What might, however, be questioned is the wisdom of concentrating the work of design itself solely in the designer of the machine. Can the love of a Christian, can the personality of a human being, be properly exercised in producing the stock responses required in minding a machine which not only has its own power, but also the ability to complete an article within itself?

Mass production has sometimes to produce articles of doubtful quality, to last only a short while, in order that there shall be a continuing demand for the products of the mass-producing machine. On the other hand, we live in an age which is developing its understanding of

the natural world so rapidly that it could be unwise to commit oneself to objects that were going to last a very long time. But these considerations do not humanize work that is essentially inhuman.

As industrial organization is increasingly considered from the point of view of the human being, Massingham's witness will be increasingly of value as a yardstick.

Eventually it should be possible to talk quite realistically about the machine being used by human beings.

The revival of rural society and the increasing use by it of the machine may serve as an example here of what will enable industry to develop in the most human way. In England at the moment a great increase in agricultural production is being planned. In the last ten years a great revival has already taken place. And the work of Massingham and many others like him has been a part of it. At last it is again being widely understood that no society can be healthy, economically and spiritually, if it has not got its feet firmly on the agricultural ground.

The earth is provided by God for the provision of basic necessities. It is ignored only on pain of many troubles. On the most realistic level it has been obvious since the middle forties that it would become necessary for England to alter very considerably her "workshop of the world" economy. It is now becoming clear all over the world that man and the earth are in a relation to each other which has certain rules—there are quite definite conditions under which we are permitted to live on this planet.

Massingham is one of the minor prophets who have been recalling men to an understanding of these conditions. His thought and writings will enable man not to go slavishly backwards in time, attempting to copy the exact patterns of a past age which can never be revived, but to use these past achievements in developing the natural world today in the most human way possible.

Fifth Edition Now Ready:

EPICS, MYTHS & LEGENDS OF INDIA

Sacred Lore of the Hindus, Buddhists and Jains by P. Thomas, author of "*Hindu Religion, Customs & Manners*". With a coloured Frontispiece & 263 Half-tone & Line Illustrations. Rs. 19. Here is a fascinating book, which explains the spiritual and philosophical conceptions of Hinduism, Buddhism and Jainism all told in Epics, Myths & Legends. The book is beautifully illustrated by photographs of masterpieces of Indian sculptures & paintings.

Goa and the Problem of Merger

M. N. Wagh writes in *The Indian Review*:

We in India have the strong feeling that if a referendum is taken in Goa, the Goans, one and all would plump for a merger with India. This view is held not only by the proverbial man-in-the-street, who is a weather-van without an opinion of his own, but also by those who profess to be experts on the Goanese situation.

From the newspaper accounts of terrorism in the form of arbitrary imprisonment and whipping of those who talk, or are alleged to be talking against the Portuguese Government, we have come to take it for granted that the Goans if called upon to vote, would unanimously vote for a merger with India; that India, or Bombay in particular, is a heaven for them. This is a delusion, and the sooner we get over it the better.

There is no doubt that Goa is out and out a police state. It is beyond doubt that the Portuguese are interested only in making the maximum out of the manganese and wine industries that flourish there, that they do not want to utilise these resources for the general good of the colony. It is also true that Minister Rodrigue's promise to redress the grievances of the people was a sham to postpone, or if possible to evade altogether, what is a desideratum. It is also true that the ugly incident that occurred when the Minister toured the pocket reverberated through every nook and corner, and lingered many a day after its occurrence.

But—and that is a big 'But'—in spite of all these bad features of Portuguese colonial rule, which would normally have strengthened the embryonic desire of the subject people to cast off the shackles of slavery and be free, the problem of merger does not hold much attraction to a Goan. It is a paradox no doubt, but a paradox which can be easily explained only if we examine closely the background of life that the people in Goa lead.

Poverty does not necessarily mean discontent and unhappiness. Poverty foments discontent only when it verges on starvation and destitution. It is then that he people manifest their discontent with revolts and revolutions. A Goan is poor, economically or clearly, monetarily poor. He has no bank account, nor does he invest his money, for he has no money to invest. But he gets without difficulty what every human being in a civilised society should get, food, shelter and clothing. In the absence of stream-lined publicity and mass advertisement the temptation to struggle for luxuries is more or less nil. Hence the contentment and sense of security. An average Goan family with five to six children cultivates rice and if possible supplements its income from land by a wine shop called a taverna, or grocer's. From father to the youngest member of the family everybody is engaged in his or her piece of work and six to eight hours to toil and toil leave little or no time for thoughts of freedom and politics. The family lives in a shell of its own. The Minister's tour was merely a ripple in the otherwise smooth, monotonous stream of its life. Nobody understood the significance of the visit; nobody cared to know. Nor does anybody really feel that reform is necessary. The people are not only poor, but illiterate—insouciantly illiterate.

This is a vital fact. It is essential to look at the problem of merger in the light of this vital fact. The delusion under which we labour stems from ignoring it.

If after a study of the life of the people in Goa, we turn our eyes to our shores, we will find that Goa and Bombay are Poles apart. If Goa has no major food

problem, and rice though insufficient for home consumption can be imported conveniently, we have got a tremendous food problem to tackle. If Goa has adequate housing supply many of us here have to sleep in garages and even foot-paths. If crime is conspicuous by its absence in Goa, we are getting more and more worried over our mounting crime graph. And above all, if wine is the tea of Goa, we here have to rest satisfied with pure water, or what for our consolation we call, Adam's ale. What have we got to offer the Goans in exchange for the peaceful, happy life that they lead there? Ave, there is the rub. "Goa might be a frying pan, but do you think we are eager to jump from the frying pan into fire?"

That was the answer, more like a rhetorical question that I had to take when I asked a man in Assolna, a village three miles from Murgao: "What do you think about a merger with Bombay?" In Kanakona also I pointed out to a policeman named Caroz with whom I had made friends the absence of educational facilities in Goa, and the charm of education in Bombay: "Is your damn education going to get me food, shelter and wine?" The answer was as convincing as the answer that a lady is reported to have given, when a journalist asked her if television would replace newspapers: "We can't wrap herrings in a television!"

Such answers as these are not rare. They are a common feature. They clinch the issue; they leave one speechless, stunned. In short, they reflect the attitude of the Goans towards merger. We have to realise that the problem of merger is not as easy as all the experts argue it is. The necessity of awakening the people is of utmost importance; it comes first and foremost. In carrying on propaganda there is one grave danger of hurting the conservativeness or susceptibilities of the people. The problem is as delicate as the problem of birth-control, or the problem of enlightening an adolescent mind. Here we can very well imitate the method of door-to-door indoctrination carried on by the communists in our country. This method has yielded good results to the communists. By constant repetition of the fact of slavery, by making the people aware of the injustice of their life, public opinion can be mobilised. Such intrepid leaders like Brute De Costa are striving to do that.

How Jews Built the Movie Industry

In the *Jewish Frontier*, July 1953, Ben B. Seligman tells the interesting story of one of the most romantic and gigantic industries of the modern world, viz, the motion picture industry and startles us by revealing that it is the Jews who came to Hollywood and built the movie industry in America:

The history of Jewish enterprise in the Diaspora is largely a history of peripheral industries. Developed by entrepreneurs who were compelled to seek their fortunes in untried pastures, these industries acquired non-Jewish respectability only when their high profits were well established. During the Middle Ages money-lending and banking were the only occupations open to Jews, and later it was foreign trade that permitted them to display their commercial talents. But these pursuits were viewed with disdain by the populace, and the authorities did not mind letting Jews extract the initial profits. This pattern of industrial development holds true even in America: and the motion picture industry is the classic example.

The motion picture industry is young—its commercial beginnings go back to but 1896—but it has already passed through all the major phases of capitalistic growth. Innovators forcibly took the industry away from unimaginative inventors and promoted it into a fantastic money-maker. Expansions and mergers marked its history during its first three decades, and once financial success was firmly established, Wall Street moved in quietly to capture another bastion for finance.

The potentialities of the motion picture were not recognized by the first promoters and inventors. They were anxious to protect patent rights, and did not seek a mass market. The task of development was undertaken by hard-driving, aggressive nickelodeon operators willing to shoulder the risks of an infant industry. They did their own financing; they wrote their own scripts; they built their own scenery; they developed the films and exhibited

the pictures in their own primitive theatres. They had a capacity for work that only those on the periphery of the business world possess. These entrepreneurs were glove salesmen, pharmacists, furriers, clothiers and jewelers. They were innovators, arrogant and often vulgar, but they knew what the people wanted and they created a form of entertainment within the reach of all. Responsive to the demands of a hungry movie-going public, they created the feature picture and the star system. Their names were Zukor, Fox, Lasky, Loew, Mayer, Selznick and Goldfish.

In the beginning the movie industry was shunned by respectable business men. They thought it a low form of amusement that would only ruin reputations. The public, however, felt no such qualms and demanded more films. Studios mushroomed all over the country and anyone who could rent or steal a camera became a producer. By 1909 competition had become so intense that the larger manufacturers formed the Motion Pictures Patents Company as a measure of self-protection. Independent producers, however, refused to be intimidated by the patent combine's legal tactics, and economic warfare raged unabated.

The bitter struggle between the patent combine and the independents continued until in 1914 the MPPC

ceased to be a dominant factor. Carl Laemmle had formed a powerful protective association; William Fox, faced with a shortage of films for his theatres, began to produce his own pictures; the Lasky organization became too important to be suppressed. Men of that calibre did not accept easily the restrictive dictates of the early movie monopolists. Leading a shoestring existence, they did not mind an occasional hasty trip to Mexico to avoid an injunction suit.

The need for quick escapes from the patent combine's process-servers compelled the independents to seek movie locations close to the Mexican border. Southern California became the ideal place, for here one found superb replicas of the deserts of Africa and of the wilds of India. Continuous sunshine permitted all-day shooting and cheap labor made mob scenes an inexpensive undertaking.

The experience of the patent combine proved to alert movie entrepreneurs that distribution and exhibition were the keys to absolute control. Adolph Zukor, William Fox and Marcus Loew began to dispose of their nickelodeons and acquire more dignified theatres. The extremes to which the early magnates went in their search for dignity is illustrated by one of Loew's theatre purchases. He bought a closed burlesque house in Brooklyn that had been often raided by the police. When acquired, the building was being used as a storage place by the Salvation Army. The decrepit theatre was fumigated physically and morally; for several months it was used by a troupe of Italian Shakespearean actors. Loew then opened it as a respectable family movie house.

Marcus Loew was a conservative business man in an industry marked by flamboyant extravagance. He started life as a newspaper boy on New York's East Side and by the turn of the century had become a fairly successful furrier. Peep-shows, the latest rage in low-cost, high-profit entertainment, offered a more attractive field, however; and together with Adolph Zukor, Loew began to build a chain of penny arcades. Zukor and Loew were very unfriendly partners; each wanted to run the business his own way. When the firm rented new office space, Loew conveniently forgot to provide his colleague with a desk and chair. Zukor could not overlook the insult to his dignity; he left to become an independent producer of films.

Throughout this early period of Loew sought to exhibit a better kind of picture. But he soon found it difficult to obtain good films, for Zukor, his erstwhile partner and now an important producer, stubbornly refused to exhibit in the Loew chain. In 1920 Loew decided to make his own pictures. He bought out a moribund producing company called Metro Pictures, and in 1924 added the Goldwyn Picture Corporation and

L. B. Mayer Company. Thus was formed the alliterative MGM; Loew's producing subsidiary.

L. B. Mayer, born in Poland, came to the United States in the late 1890's. A member of the original group of Jewish furriers, jewelers and nickelodeon operators who built the movie industry, he became MGM's chief. Mr. Mayer's fantastically high salary testifies to his shrewd bargaining powers. When Loew wanted to buy his firm, Mayer inserted a profit-sharing clause in the contract—a clause that has often brought his yearly earnings close to the half-million mark.

After Marcus Loew's death in 1927, the enterprise was directed by Nicholas Schenck, a hard-headed business man who followed the conservative practices of his predecessor. Schenck had come to America in 1892 with his brother Joseph, and together they had operated an amusement park at Fort George, N. Y. One day Marcus Loew came there to show movies and the Schenck boys were imaginative enough to forget the amusement

park game. Nicholas joined the Loew organization and Joseph became a movie producer. Nicholas Schenck soon won the reputation of knowing best where to build theatres. Thus, although the Loew chain is much smaller than the Paramount or Fox group, its income is markedly increased by the fact that about half of its houses are first-run theatres.

It was Adolph Zukor, however, who established the pattern for expansion in the new industry. Emigrating to America with \$40 sewed into the lining of his coat, he sought his fortunes in the novelty-fur business. Penny arcades were more exciting, though, and in 1905 Zukor transferred his energies and his \$200,000 profit in furs to that outcast branch of the entertainment world. When motion pictures became an important addition to the line of arcade gadgets, Zukor immediately realized the potentialities of the new entertainment form, and they soon became the sole attraction.

Exhibitors in those days had very poor fare to show. Skirt dances, a dare-devil ride in a barrel over the falls, or the pounding of surf on the coast of Maine made up the twenty- or thirty-minute program. Zukor wanted pictures that told a coherent story; the unprecedented success of Sarah Bernhardt's *Queen Elizabeth* strengthened this desire. After his split with Loew in 1912, Zukor went into picture production and formed the Famous Players Company.

Within four years he was at the top of a brawling infant industry. Motion pictures in those days were distributed by so-called exchanges. Zukor did business with the Paramount Picture exchange, headed by a

W. W. Hodkinson. Dissatisfied with the financial arrangement imposed by Hodkinson, Zukor suggested a merger. The former indignantly refused, but he failed to reckon with Zukor's pertinacity. Zukor quietly bought up most of Paramount's stock and within a year was able to oust Hodkinson.

Zukor reasoned that control of the market rested upon control at the source; if the best actors belonged to Paramount, he thought, the exhibitors would be at his mercy. Within a few years Zukor assembled a great collection of talent. Film rental fees increased sharply and block-booking was forced upon the reluctant independent exhibitor.

The latter, however, did not willingly accept this situation. In 1917 several theatre circuits formed First National Pictures, a producing company. With their own supply of film, they could exclude competitors' pictures from their theatres. Soon First National had 5,000 members and Zukor began to worry about theaters rather than talent. For two years he watched First National's tactics and then decided that it was time to set up his own distribution and exhibition outlets. Convinced that theatres were a good investment, he sold ten million dollars' worth of securities through Kuhn, Loeb and Company and began to build the Paramount movie chain.

The technique by which a theatre circuit was welded was not a soft one. An independent exhibitor was approached and bluntly told either to sell his property or suffer the competition of a newly constructed theatre. Independents screamed that the industry was

Widely appreciated at home & abroad..

April 13, 1953

Gentlemen,
Enclosed please find Bank Draft for dollars (\$5.00) for which please send me another supply of Neem Tooth Paste.

I believe I have a small credit from my last order on May 6th 1951.

My dentist shakes his head and can not understand why I no longer need to come in every six months to have my teeth cleaned.

He has been my dentist for the past fifteen years and my last trip in was the first time my teeth had needed cleaning since just before I started on my round the world trip five years ago.

It seems ridiculous to send all the way to India for tooth paste when there are so many brands on the market here, but he admits now that it is worth the trouble.

That with diet and other factors the same I have found something that is preserving my teeth that I otherwise would have lost in a few more years.

Again I thank you.

Yours very truly,

Mrs. A. W. Hunter

being "raped," but Zukor went his way, disposing of First National's individual members one by one. By 1921 he controlled over 300 movie houses and in 1926 his acquisition of the Chicago Katz-Balaban circuit completely destroyed First National's importance in the motion picture industry.

With more than 1,600 theatres exhibiting the Paramount product, Zukor felt safe in the face of the depression. But the quiet ex-furrier discovered that even so depression-proof an industry as motion pictures could not carry the heavy fixed charges imposed by Wall Street financing. Paramount began to hit the financial reefs and for two years 53 assorted law firms, banks, investors' committees and experts scowled and quarreled over the ailing corporation. Involved in all this high legal bickering were the Chase National Bank, the Royal Insurance Company, American Telephone and Telegraph, and the Atlas Corporation. Paramount was finally reorganized in 1935. Of the old officers only Zukor and George Schaefer remained; the new board of directors was composed of bankers and real estate men. John Otterson, head of A.T. and T.'s Electrical Research Products, Inc. (ERPI) became president.

The early movie pioneers were quite aware of their humble origins and their thirst for industrial power was perhaps motivated by an unconscious urge to be treated as equals. But not all of them felt that it was necessary to create financial monstrosities; some preferred to be known as artistic picture makers. Such a man was Samuel Goldfish.

Goldfish left his native Warsaw at the age of 10 and arrived in Gloversville, N. Y., one year later. At 15 he began a successful road-salesman career in the toughest itinerary in the glove business. One day he walked into a Herald Square nickelodeon and became fascinated by the notion of owning a theatre. He soon discovered that it was cheaper to produce and sell films. Together with his brother-in-law Lesse Lasky, a vaudeville producer, and on a capital of \$26,500, he organized the Jesse Lasky Feature Play Company. Goldfish soon acquired the reputation of a man who did things his own way or not at all. When Lasky merged with Zukor in 1916, Goldfish stepped out to create a new production unit. His partners in this venture were the Selwyn Brothers.

The new business was called after the founders, Goldwyn Pictures. Goldfish thought so well of the title that for the first time in the history of corporate enterprise a man named himself for a corporation: Goldfish became Goldwyn. And despite Zukor's hope that it would fail, the new company became a factor to be reckoned with.

Goldwyn's great contribution to movie making was his emphasis upon quality. In 1919 he conceived the notion that the key person in production was the writer. Before this a scenario had been nothing more than a rough outline to guide the director. Of course, this elevation of the writer to an important position may have been but a shrewd competitive device turned against Zukor, who had cornered the market in acting talent. Goldwyn hired such writers as Rex Beach, Gertrude Atherton and Maurice Maeterlinck. While he failed to obtain many usable scripts, he did get a good deal of valuable publicity thereby.

When MGM was formed in 1924, Goldwyn tried to establish himself as production chief. Here, however, he suffered one of his rare defeats and was forced to withdraw. Not at all disturbed by this unfavorable turn of events, he organized another movie company, Samuel Goldwyn, Inc., Ltd. Here he was absolute boss and the responsibility was all his own. He continued to emphasize the quality of his pictures; in no other way could they have been exhibited. Then when the sound film made dialogue an important feature of the movie, Goldwyn's faith in writers was vindicated.

Most producers also tried to duplicate Zukor's tactics. They realized that their pictures possessed value solely in proportion to the number of theatres they controlled. Movie-making could be enlarged only by tapping an extensive market, and the need for a continuous outlet soon overshadowed the processes of production. Distribution and exhibition became the major means of eliminating rivals and of acquiring control of as large a segment of a highly competitive market as one could grasp.

The struggle for the movie market produced gigantic interlocking corporations whose complexity paralleled the complicated corporate structures in utilities, finance and automobiles. Independents were ruthlessly eliminated; production, distribution and exhibition became the functions of a few large corporations.

With the battle for theatres increasing in intensity, Eastern bankers began to recognize motion pictures as a legitimate enterprise. As Leo Rosten says, Hollywood shifted from the Arabian Nights to Dun and Bradstreet. The bankers, however, could think only of box-office receipts and this markedly influenced movie-making policy. In the early days producers exercised their ingenuity without any financial inhibitions; but with the advent of big business, Wall Street supervisors replaced the Hollywood genius. The supervisor's job was to protect his employer's investment; players and directors were selected with both eyes on the box office. A motion picture had to have "production value," "picture sense" and "box office appeal." And, of course, the best way of assuring these was to imitate the smash-hit formula of another company. Forced into this orientation, the motion picture as an art form began a steady decline.

Wall Street men as well as Wall Street money entered the movie industry. W. C. Durant, of the General Motors Corporation, and Harvey Gibson, of the Liberty National Bank, became members of the board of directors of Loew's. The Duponts and the Chase National Bank sponsored the formation of Goldwyn Pictures. The financiers reorganized the larger movie companies and mergers were effected. Soon the public began to recognize the signatures of these new movie-makers.

Into the midst of all this, the sound film broke with an impact that further shook the hold of the old-timers and strengthened that of the financiers. While most industries were prostrated by the depression, the motion picture industry remained financially healthy. Wall Street gazed at this astounding example of economic health and resolved more than ever to secure absolute control.

NOTES

The Gorwala Study of Calcutta

Calcutta has been going through a series of demonstrations and disturbances, which reached a peak in July last. Much in the July disturbances was puzzling, not only to officialdom, but also to the observant by-stander. Mr. A. D. Gorwala made a study of the situation and presented it to the public in a summary form through the columns of the *Statesman* on October 19 last. This survey is important, not only because of the writer's repute as a trained observer but also because of the gravity of the issues. For a superficial survey it is surprisingly deep in places, but all the same, it has the defects of omissions and wrong conclusions as is common in all bird's-eye views of an unfamiliar terrain. But its importance cannot be denied nevertheless, and we propose to deal with it in some detail. The *Statesman* has rendered good service to the citizens of its parent city by presenting such excellent fare for thought though its full implications do not seem to have been realized by many.

Let us take the omissions first. Mr. Gorwala has completely failed to see the part played by most of the popular newspapers of the city, most probably because he and his informants are not acquainted with the vernacular papers. The English language dailies were not all in a helpful attitude either, but even the most rabid amongst them were restrained in comparison with most of the Vernacular papers. These latter were the backbone of all the demonstrations and disturbances, as the leader of the July movements himself thankfully acknowledged to the editors he had called for a Press interview on the day the movement was called off. Indeed, taken as a whole, the attitude of the Vernacular Press was deplorable.

Even more deplorable has been the loss of contact between the common citizen and the Government.

This has been brought about because of the breach between the intelligentsia and the Congress Party. This has resulted in the Government becoming totally out-of-touch with public opinion and ignorant of the factors that were breeding mass unrest. The July movement took the Government completely unawares, which fact has been missed by Mr. Gorwala. This increasing loss of faith in the Congress and the Congress Governments, on the part of the informed and intelligent section of the public, is on the increase everywhere, and as a result the Government cannot find any means of rallying public opinion on its side in a crisis. This is the case in West Bengal today. Tomorrow it will spread out to other States unless the Centre wakes up. The Congress no longer possesses the sanctions that it had in 1947, or even in 1951.

We have dealt in detail with the July disturbances in our editorials of August, and therefore we need not recapitulate. We shall now proceed with the text of the Gorwala study.

Mr. Gorwala's study is as follows:

"The city of Calcutta has never been particularly noted for the tranquil behaviour of its inhabitants. To-day, however, the observant visitor finds an intensity of feeling far beyond the normal. Calcutta is even less at peace with itself than at any time in the past. A deep malaise seems to be eating into its system. Uncertainty, lack of confidence, fear—these appear to be the keynotes of its thought. Even the normally care-free are affected.

Calcutta has, of course, suffered more in the years since Independence than any other great city in India. Partition reduced its hinterland considerably. Its principal industry was cut off to a great extent from the areas where grew the raw material for its products. Refugees poured into it off and on for years, refugees of a kind unknown elsewhere, often totally unwilling to adjust themselves to a new life, resentfully anchoring themselves to their misery. More recently, low prices and lower exports for

AFTER TOILET

By Gopal Chandra Ghosh

Prabasi Press, Calcutta

the products dealt in principally, jute, tea and coal, have led to considerable deterioration in the economic position, involving substantial reduction of profits, and losses, for many firms, with consequent shrinkage of opportunities of employment. All this time the cost of living has continued high, making life year after year more difficult for the middleclass and the working man."

We would add that Calcutta suffered far more from war conditions than any other city or town in present-day India. The children of the soil suffered from the evils of war for three years, without receiving any of the benefits that other cities enjoyed. So the period of suffering started from 1942. In 1943 was the Great Famine.

"Psychologically, too, Calcutta suffers from deep-seated frustration. Very little of the trade or industry of this great port is in the hands of its native children. Almost all positions of importance in these spheres are held by people from outside the State or the country. In business, the Bengali does not come even a bad second. On the political scene too, his metier of the past, he feels he plays no great part now. None of the major Ministries at the Centre is held by a Bengali. The latest of Bengal's great men, Dr. Shyama Prasad Mookerjee, resigned his Ministership because of the policies of the Central Government and even the striking role he played in opposition came to an end with his unfortunate death, the circumstances of which further embittered the people of Bengal against the Centre and authority generally. Within the State, the Bengali sees what is in effect a one-man Ministry, an energetic personality holding power almost alone, partly because there is none other of equal calibre to support him and partly because he chooses not to work with really able and good men outside his party."

This frustration is far more deep-rooted than Mr. Gorwala could possibly imagine. The native children were forcibly dispossessed of their share of the trade and industry from 1903 as a result of victimisation of the Bengali by the British in retaliation for the Swadeshi movement and the Nationalist agitations of 1903 against Lord Curzon's imperialism. The Bengali had hoped that he would get back all that he had been forcibly deprived of, when freedom came. He has reasons, therefore, to feel that he has been swindled.

"Despite these and other difficulties, for a time the Government of Bengal seemed to have a sufficient grip on the situation. Though its efforts at amelioration were by no means always rightly-oriented or effective, it gave the impression that it was striving hard, and thus gained a certain amount of goodwill, in spite of the general feeling that it was not altogether averse to acting in the interests of some of the rich men who were its supporters, even when such action did not necessarily accord with the public good."

"Now, however, all this goodwill would seem to have

been dissipated. The conduct of the Government in recent months has been largely responsible for this. Its extremely undistinguished handling of the situation caused by opposition to the increase in tram fares, during the whole of which period the Chief Minister remained away, started the decline in reputation. Since then there has been further evidence of the same lack of ability to manage. Despite the Chief Minister's return, the Bengal Government has allowed itself to be so bullied and intimidated from time to time that it seems that all that is necessary now to bring about a change in policy is the gathering together of a crowd of several thousands on the Maidan, the making of emphatic speeches and the sending of deputations to see the Ministers."

"The Communists have naturally taken the greatest advantage of this state of affairs. Their usual exploitation of the difficulties of the people and the Government, economic and other, has received an added impetus from the lack of will displayed by the Ministry and the consequent victories they have won over it have added greatly to their reputation, strength and influence. They seem to have been considerably assisted by the feeling in some Governmental circles that there was really no point in resisting them vigorously since even at the Centre there was now beginning to be a view among some quite influential Ministers that they were the party of the future and were bound to win in time."

"The Communist doctrine of the inevitability of the success of the Communists was, it is said, being stated privately by at least one senior Minister. What then was the good of the State Ministry in its enfeebled condition attempting to hold out against the Communists? How could it even be sure that, if it did, it would receive the full and unflinching support that it had a right to expect from the Centre?"

"A variation of this feeling has already led to the intimidation of business executives by employee unions led by Communists, without evoking any counter-measures. The Calcutta Communist labour leader has added a new variation to the old Indian custom of sitting 'dhurna.' A large number of the employees march into an executive's room, sit down in front of him and say they propose to prevent him from leaving until he agrees to whatever demands they wish to put forward. From time to time, they urge him to sign a paper and, on his refusal, the union official, usually a Communist, each time delivers a short address on the sufferings of the proletariat and the blood-sucking habits of employers and their tools."

"Such a session has in some cases lasted until the early hours of the morning; sometimes the telephone wires connecting the office are cut to prevent any contact with the outside; sometimes, aid from outside is refused by the executive, who having little confidence in Government's ability to look after him later, prefers to bear his cross now. On occasion, the intimidation brings successful results from the point of view of the union. In any case, it increases the influence and prestige of the

Communists and reduces that of the Government. What faith can one have in a Government which cannot protect one from such gross intimidation, of which one dare not even complain, lest worse befall? And how strong and well-organized must not the Communists be when they can with impunity behave in this manner?"

This is a fairly accurate picture excepting for the fact that undue emphasis has been put on the Communist Party. That party, of course, is a foreign inspired and guided disruptionist body. But the leading roles in all the disturbances were taken by their fellow-travellers of the day, the P.S.P., the R.S.P., and the Forward Bloc groups. Without them the C.P.I. could not have done much, if anything at all. The Communist menace is confined mostly to the student community and some fractions of organised labour.

"The situation is indeed full of danger. In the circumstances of Calcutta, the future may well see a tremendous increase in Communist power in Bengal, unless immediate and vigorous steps are taken to put an end to the present Communist dominance. In this matter there must be the fullest co-operation between the State and the Centre. The State by itself can do little unless it receives the wholehearted support of the Centre. There must be an unequivocal repudiation of any pro-Communist tendencies by the Centre. It must be made quite clear that the Centre regards as the veriest moonshine talk about the ultimate victory of the Communists and that for its own part it will deal severely with anyone, however high in authority, who attempts to shatter morale by such talk. The Centre must be exceedingly vigilant and must take all action allowed by the law against the Communists. It must also endeavour to meet Bengal's legitimate desire to have a person in whom the Bengalis can rightfully take pride in a senior Ministership at the Centre."

"The State Government too must make up its mind to govern. Having decided, after careful consideration, on policy, it must carry it out determinedly, not allowing every stress that appears to influence it into changing direction. Dealing firmly with the Communists, it must create confidence in its ability to protect and to punish. In consultation with the Centre, it must take such measures as will reduce the strain upon the middle and poorer classes and give them a feeling of hope. It must attempt to remedy their grievances of its own accord, not wait until they have become so deep-seated as to cause an explosion. By its behaviour, it must make clear to the people that integrity inspires its every decision and action. Then only will it be enabled to meet the dangers that threaten not only it but the values it should cherish and the organized society that it is its duty to guard."

This is correct so far as it goes. But the most important factor is the rehabilitation of the children of the soil. They are being deprived of all means of

livelihood even today. Land and jobs are going to the refugees and contracts and trade passing to the non-Bengali in unfair competition. This must stop.

Student Unrest in Lucknow

Disturbance of peace and upsetting of civic life by student demonstrators has become a common occurrence in Calcutta. But this lawlessness and lack of discipline is evidently contagious; particularly when unprincipled politicians and inane journalists can fan the flames with impunity. In Lucknow, we see the outlines of the all too familiar pattern. Let us hope the U. P. Government will handle the situation with firmness and tact.

Lucknow, Oct. 24.—Over 2,000 students of Lucknow University this afternoon raided the union building closed by the authorities and after a slogan-shouting ritual burst open the doors and took possession of it.

The students' action committee sent out squads to the University asking the students to participate in what was described as the "grand festival of lock-breaking."

Earlier in the day, representatives of the agitating students met the Vice-Chancellor and asked him for the union building or some other suitable place for two fasting students.

Soon after occupation, the students set about cleaning the building and then shifted the hunger-strikers into it.

Tonight the union building was again functioning as the HQ of the students.

In an interview the Vice-Chancellor, Acharya Jugal Kishore, described the students' action as a serious example of indiscipline but he would consult his colleagues before taking any steps.

The Vice-Chancellor expressed regret at the impatience shown by the students whose demands were under examination by the relevant authorities. He said the expulsion of 14 students could be reviewed if the students concerned individually expressed regret for their past behaviour.

He indicated that the correspondence which had passed between him and Mr. K. M. Munshi, the Governor and the Chancellor, would soon be published.

Linguistic States

In the October 17 issue of the *People*, Sri S. N. Agarwal has written an article on the matter of agitation for Linguistic States. As the subject is of interest to a great many of our readers, indeed, to all thoughtful men, we adjoin *infra* extracts from it, with our comments. Sri Agarwal writes:

"There appears to prevail a wrong notion that the new State of Andhra has been constituted because of enormous pressure on the Central Government through fasts and civil disorders that followed a sad demise. This is, however, an erroneous impression which must be removed from the public mind in the interests of

Andhra and the creation of other States in course of time.

The announcement by the Prime Minister about Andhra a few days after the violent and unruly demonstrations might have been, at best, unfortunate coincidence. But anybody who thinks that the Government of India was coerced into this announcement owing to threats of any kind does not know our Prime Minister. We have no doubt in our minds that if the unseemly disorders had not taken place in Andhra, the new State would have been brought into existence at least a few weeks earlier."

We have no doubt that Sri Agarwal sincerely believes in what he has written. We only wish we could believe it to be true.

"The latest resolution of the Congress Working Committee makes it abundantly clear that the Government of India is determined to redraw the map of India on more rational foundations after receiving the report of the proposed High-powered Commission. But all those who still seem to think that threats of fasts or violent upheavals would succeed in hustling the Government into hasty action will be doing a great disservice to the cause of the Reorganisation of States in India."

We do not believe in violent upheavals either. But we confess we have lost faith in these twopenny High-powered Commissions.

In this context he writes about the Andhra State as follows:

"Will this new State be just an imitation, and perhaps a poor imitation of the other existing States? Or will it be modelled on a different pattern so that it might serve as a good example to other States? It is on the satisfactory answer to this crucial question that the success of the Andhra State would ultimately depend. If Andhra tries to copy the ways of the existing bigger States in the country and take pride in the magnificence of its buildings and the 'dignity' of its Ministers and other high officials, we do not feel very enthusiastic about the future of this new State.

On the basis of the fashionable model, the Andhra State would be a deficit unit of administration to the tune of about five crores of rupees every year. It is, therefore, being suggested by the 'experts' of Public Finance and Administration that the policy of Prohibition should be abandoned in the Andhra State in order to balance its Budget. This is very short-sighted and even mischievous proposal.

By scrapping Prohibition, the new State may be able to balance its Budget in terms of rupees, annas and pies; it will, however, lose the balance of its social and moral structure which is as important, if not more, as the economic and financial stability of an administration."

We are in complete agreement with Sri Agarwal on these points.

The main editorial of the *Harijan* for October 17, is devoted to the same subject. It says:

"The question of redistribution of States in the Indian Union is fast getting prominence all over India. It has therefore compelled both the Government as well as the political parties to pay heed to it, whether they like it or not. Shri Jawaharlal Nehru spoke on it during his last tour in South India at Madras. Mr. Rajagopalachari inviting Mr. Nehru to speak, said that they were glad the Congress President and Prime Minister was going to tell them a few things which they would keep as 'wise and permanent advice.' The speech is summarized below from *The Hindu*, October 3, 1953:

"I shall confess to you," Mr. Nehru said, "that I did not wish to hurry it. I wanted to delay—I am not talking about Andhra, I am talking about general problems—till the other processes of consolidation in India had taken place. We are consolidating our country in many ways and we are, I think, a strong national unit in the world. Nevertheless, there is much to be done if we are to bring about what I would call the full emotional integration of India and her people."

"I would have preferred," Mr. Nehru went on, "that this process of re-fashioning the provinces and States of India was postponed or delayed till we had built the country with a solid foundation. I had no doubt that it was necessary to some extent to re-fashion the map of India, but I cannot say to what extent. There is no reason why we should accept everything that came down from the British as a permanent institution in India. The process has begun and let us do it well and thoroughly. Let us not be afraid of it or sorry about it. It is certain it is a historic development which is taking place or is going to take place all over India, in various shapes and forms."

In a way Pandit Nehru has thus contradicted Sri Agarwal's primary assumption that pressure tactics were not needed.

"The Prime Minister, in this connection, referred to the talk about linguistic provinces and observed that while there might be something in it he did not like this particular phraseology, 'linguistic provinces.' Language was no doubt important and represented a major element in the culture of a people. They wanted to preserve the variety of culture in India which was represented among others by language and to give the languages, whether Tamil, Telugu or any other tongue, full opportunity of growth and cultural expression. 'But when we talk about linguistic provinces, while we lay stress on an important aspect of the question, the trouble is that we somehow ignore many other important questions. The question has to be considered in its entirety in all its aspects, linguistic, cultural, administrative, financial, security, defence and so many other things. Then, you are in a position to look at the picture as a whole. Also, you cannot isolate the

problem of any one State, because one State adjoins two, three or four States. As soon as you touch one State, it affects other States. People do not seem to realize it. The formation of the Andhra State is relatively the simplest problem and yet it was by no means simple. All kinds of difficulties arose and will arise, no doubt."

But what should be done when one State tries to suppress by foul means the very mother tongue of a minority group within its boundaries, as is being done in parts of Bihar and Assam?

"Mr. Nehru said that there were demands for linguistic States in South India and in Western India. They could not be treated in isolation. Let them, for instance, take the demand for a Maharashtra State. The Maharashtrians were a fine and virile community among the people of India. There was nothing wrong in their desire for a Maharashtra Province. But, as soon as they began to consider this problem, they could see how many questions arose. The first naturally was that the Bombay State would have to be broken up with other consequences.

That applied to Karnataka also. The Kannadigas wanted a State. He sympathized with them and there was no reason why they should not have it. There was more reason on their side than on the side of many others. But Karnataka by itself was not a simple issue. If they took up the problem, Mysore came into the picture. Bombay, Madhya Pradesh and Berar also came into it. They could not just say: 'You can have Karnataka province and there it is.' The whole of Central and South India would be shaken up. Therefore, they had to consider the picture in its entirety.

The biggest problem, Mr. Nehru pointed out, was economic. They talked a great deal and rightly about the economic problem. The principal question was the economic issue of raising the standard of people and getting rid of unemployment and poverty. 'If this is the biggest problem,' he asked, 'should we do something which comes in the way of a solution of it or delay it? It is an important consideration. That is why I say, language, though an important factor, is not the overriding factor. The other factors have to be considered.'

'It is for this reason,' Mr. Nehru said, 'that we are going to appoint a High Power Commission to go into these matters.' He had always thought of the appointment of such a Commission because he did not think that they should accept everything as it was in India today. But certainly he had hoped that the appointment of such a Commission would be delayed for at least ten years till independent India settled down and that they could take up the cutting up of States in a slightly different way.

Mr. Nehru said that they came to the conclusion that it was better they did not delay the matter. 'If by delay one merely keeps the people's mind in

ferment, it is not worthwhile. So, we have decided to go ahead with this Commission.'

We are glad that Pandit Nehru has at last realised that it does not pay to ignore the factors that agitate the people's mind. But does it always pay to ignore some people's demands? He has very carefully omitted the case for the inclusion of contiguous Bengali-speaking areas in West Bengal.

"The Congress President hoped that the Commission would be appointed in the course of this year and that it would go ahead with its work quietly and dispassionately. How far the Commission would be able to do its work in such a manner depended upon other people. Anyhow, it was his intention that the Commission should work in that way and take into consideration the picture of India as a whole.

'I am not prepared,' Mr. Nehru said, 'to consider linguistic provinces singly. But I am prepared to consider here and now the whole of India, how the reorganization of States could be carried out keeping in mind all factors and keeping in view linguistic, cultural and other matters, so that the Commission can put before India a full picture.'

'This business of linguistic provinces,' Mr. Nehru declared, 'narrows our outlook and makes us less conscious of India and more conscious of our State or province. If this is the result, it is a bad result. The overriding consciousness of the people must be of the country as a whole. It is what is called national consciousness. Otherwise, you become narrow and provincial.' If in each State, people become narrow or had an awareness only of their own State, it was bad. They had to guard against it."

If Pandit Nehru could enforce full rights for all people in all parts of India then he would be justified in making such a statement. As he is unable to do so, we cannot attach the slightest importance to it.

Subject to what we have written above, we are in agreement with what Sri Maganbhai P. Desai has written on the same subject in the October 31 issue of the *Harijan*, from which we append an extract below. But we wish he had also given his opinion on the complicated issue of Hindi "imperialism," in all its aspects, with particular emphasis on Manbhum.

"The demand for the formation of linguistic provinces has recently grown increasingly insistent and may soon become an irrational clamour. It is high time that we got it clear in our minds what it is exactly that we want in this matter. Else there is reason for the fear that in our zeal for an otherwise admirable objective, we may lose our bearings and drift away into directions that we least expected. For the forces of pride and prejudice which the controversy round this issue is fast unleashing, are a growing danger to the unity of India.

There are in India several major languages, each of which is spoken by lakhs and crores of people. It is therefore natural as also desirable that the administration,

including the administration of justice and education in a particular area, should be carried on in the language of the area concerned. This alone will enable the mass of our people to have the real taste of Swaraj and create the necessary atmosphere for their intellectual and civic development. In fact, Swaraj loses much of its meaning if this is not done.

This was the simple truth which came to be formulated in the shape of the demand for the refashioning of India's map on the basis of linguistic areas. However, the need behind the demand was as stated above. And that need remains as true today when we have attained Swaraj as it was in the past. That is why the people continue to cry for it.

The Congress appreciated this need and organized its work on that basis from as early as 1920-21. This arrangement suited the convenience of the people and was greatly instrumental in creating and educating public opinion in favour of this idea. Indeed its hold on the mind of the people soon became firmly established. Not only that, to some who were too intensely attached to it, it almost acquired the virtue of a fetish.

But the formation of provinces on a linguistic basis in the Constitution of the Congress did not mean constituting the entire area in which a particular language is spoken into one single separate State. It was not based on the slogan—'One language—one State'. It is very necessary today to get this fact clear in our minds. For example, the Congress recognized several provinces, such as Bihar, U.P., Delhi, Punjab, etc., in the large Hindi-speaking area in the North. In the same way, the Marathi-speaking area comprised Maharashtra, Vidarbha, and Central Provinces (Marathi). On the other hand, the C.P. which were one administrative unit, comprised of these Congress provinces—Mahakoshal, Vidarbha, C.P. (Marathi). The Bombay City constituted one separate province by itself; and there were three other Congress provinces in the Bombay Province. Congress Gujarat included Kutch and Saurashtra. This shows, though the Congress provinces were said to be based on language, it did not mean that the entire area of a language was to be brought under one administrative unit and constituted into a separate province. The essence of the principle in this regard was, as indicated above, the adoption and use of the language of the common people for all work, administrative, educational, judicial and otherwise.

To this end, in some cases, as in the then Central Provinces, where it was felt necessary to demarcate an existing province linguistically, it did so. But in others where the said purpose could be achieved without any formal division, it did not do so, though it followed the principle in practice. The Congress did not countenance the view, which some are wrongly advocating today, that the entire area of a language should be brought within a separate administrative unit."

Sri Prakasam and the P. S. P.

Sri Prakasam's resignation from the P.S.P. has caused a very considerable stir in that political body. The whole question is very ably discussed by Shri Dinkar Sakrikar in the October 17 issue of the *Vigil*. Sri Sakrikar writes:

"The successful execution of a manœuvre by which Sri Prakasam's exit from the P.S.P. was secured is a matter of grave concern for everyone who is pledged to building a democratic society in this country. That instead of an honest, principled and conscientious attempt to follow well-defined traditions of democracy, a deliberate, calculated and, it must be confessed, a successful attempt was made to by-pass the demands of a democratic system in order to ensure 'power' for the ruling party, raises a problem in the practice of democracy which should exercise the minds of all irrespective of party affiliations. The discomfiture which the PSP has suffered in Andhra is nothing compared to the serious repercussions that this may have on the political life of the country. The question is not of the PSP's ability to enforce discipline among its ranks but of the democratic system preserving its basic code of political morality without which it will inevitably collapse.

'Power' is the motivation behind all politics. At least that was the accepted belief until Mahatma Gandhi outlined a new orientation of politics. The 'real politik' was not confined to Germany. In every country politicians resorted to it to further their personal or group ambitions or the parochial interests of their nation as against the wider interest of an international community. 'Real Politik' was not even the product of the capitalist society, for long before laissez faire economy was born the Prince of Machiavelli had become the Bible for all statesmen. Even in India the accepted mode of conducting politics was outlined in *Chanakya-niti*, which is the Indian version of Machiavelli. In modern times, Lokamanya Tilak advocated the policy of *Sadam Prathi Sadyam*. Gandhiji differed from this approach radically. His whole being revolted against it for he believed in 'conversion' of an enemy not his defeat, much less his destruction. He stood for conquest by love and evolved a new terminology for his programme of mass action. He called it Satyagraha in which the victory would be not of this or that party but of Truth, leaving behind no trail of bitterness. All suffering and sacrifice in his movement were to be undergone by Satyagrahis, and not by those whom the Satyagrahis sought to win by their soul force. As against the slogan of *Sadam Prathi Sadyam*, Gandhiji raised the slogan of *Sadam Prathi Sakyam*. He had accepted the Sermon on the Mount which ordained: "Love your enemies, bless them that curse you; do good to them that hate you, and pray for them which despitefully use you and persecute you." He never countenanced any

thought and action which violated this indictment. In every situation Gandhiji always considered what was right, what was consistent with what he regarded as his religion. He never tolerated the water-tight division of religion and politics and could not bear the idea of judging any issue on purely 'political' considerations. He was accused of introducing religion in politics. He explained to a correspondent: "I do not conceive religion as one of the many activities of mankind. The same activity may be either governed by the spirit of religion or irreligion. For me, every, the tiniest, activity is governed by what I consider to be my religion." By his refusal to let politics be divorced from 'religion,' he changed the fundamental conception of politics. He rejected categorically the power-motivation of politics and substituted instead the service-motive.

The most saddening feature of the public life in post-freedom India is the return to real-politik and the rejection of Gandhiji's conception of ethical politics. No doubt India still talks in international assemblies with a high moral tone and proclaims moral purpose as the basis of all her politics. India believes that she has a right to preach to the world, and when the world remains unimpressed, Indian spokesmen lose their temper and revert to the political theme of Asian resurgence. Beneath the polite pleasantries that are addressed as a matter of course is a lurking suspicion that we are either moral cowards or the less harmful type, the insufferable sanctimonious humbug."

We agree with Sri Sakrikar in his analysis of the present-day trends in the Indian political fields. But in levelling all his accusations against the Congress, does he not assume that the P.S.P. is above all these? If so, we beg to differ. Here, in West Bengal, we have just had a visual and forceful demonstration of real-politik, led and organised by the P.S.P. leaders. We say this with sorrow.

Democracy and Real-Politik

The editor of the weekly *Star* of Lahore has written an open letter to the Prime Minister of Pakistan, in the October 23 issue. Much of what he has written could be said with a good deal of force, about our own Prime Minister. We do not for a moment hope that this excellent attempt on the part of the editor of the *Star* will meet with any response, unless his Prime Minister is less of a *khushamad* addict than ours. We append an extract below:

"Incidentally, it is highly insulting and humiliating to believe that save the Prime Minister, our nation cannot produce a single man—or woman—who is fit to mount the League horse as President. The fact is that if any leading public man, outside the Government, becomes the League Chief, he is sure to provide a powerful and popular check on the misdeeds of the Government, his own Muslim League Government. Since our present rulers seem determined to continue in power as long as they can, the

situation I have tried to imagine would mean that either they shall have to commit political *hara kiri* or they would be democratically murdered in course of time. If it is said that no set of rulers can ever be expected to work for their own liquidation, my only answer is that ultimately, all attempts to dodge democracy result in the liquidation of democracy. Are we prepared for it?

"Dear Prime Minister, I really wonder whether you were cajoled or coerced into accepting the Presidentship of the Muslim League. I cannot imagine, sir, a more undemocratic act on the part of those who gave you such an advice. I assure you that they are not your friends, but flatterers. Probably you know that Quaid-i-Azam was given a similar offer but he declined it. And, then, sir, can you really work as Prime Minister, Defence Minister and League Chief? I believe that you should not even hold any portfolio, for you can best act as a co-ordinating factor, a supreme supervisory agent, a vital link between the various ministries, a sort of hyphen that joins the different departments of the Government. Think it over: it is not only a matter of your personal prestige and popularity; it is a question of your success as Pakistan's third Prime Minister.

"In the circumstances I have depicted above, am I not entitled to ask: Is Pakistan a Democracy?"

North-East India Tribals

There is considerable disaffection amongst the tribal peoples in North-East India, as was prominently shown during Pandit Nehru's visit. The forces behind this disaffection are complex, and there is no want of instigation. News like the following make sad reading particularly the shocking news of the attack on the goodwill mission, made by the Tagin tribe in the unadministered zone.

Jorhat, Oct. 26.—Four leaders of the Revolutionary Nationalist Party of Manipur have been sentenced to six months' imprisonment by the Sub-divisional Magistrate of Imphal, Mr. O. Chaoba Singh, according to news reaching here today. They will be placed in "A" Class.

They were arrested on April 24 under Sections 120B, 124A, and 153A IPC for holding a meeting on April 19 in the Polo Ground, at which they were alleged to have delivered provocative speeches demanding an "independent buffer State of Manipur," and threatening to launch the Satyagraha movement on the 15th day from the date of the meeting.

The Revolutionary Nationalist Party of Manipur was formed by amalgamation of the All-Manipuri National Union and the Gandhi Sevak Sabha.

Jorhat, Oct. 29.—Twenty-five Government officials including some military personnel were killed by hillmen in the interior area of Abor Hills in Nefa recently, it is reported.

A party of Government of officials touring Abor Hills

in a goodwill mission was attacked and killed wholesale by about 500 hillmen when the officials were distributing sweets among children. An operational force was rushed to the spot. Further details are lacking at present.

The Etawah Project

The Weekly Magazine Supplement of the *Hindu* of October 18 contains a very succinct and informative account of the Etawah Pilot Project, by Taya Zinkin. What is written therein is worthy of note by all the ministries of agriculture and food. For the Etawah experiment is a series of practical demonstrations of what is likely to benefit the country and what is pure waste—such as, the Krishikar Pandit competitions. We append extracts below:

The main object of the Etawah Pilot Project is the improvement of agriculture.

Improvements meet with response strictly according to the benefits they bestow. Improved seed increases yields by 30 per cent. Improved seed plus green manure increase yields by 68-70 per cent. Improved seed plus green manure, plus complete manuring (ammonium sulphate and superphosphates) increase yields by 100 per cent and sometimes even bring yields up to 22 maunds per acre. Now to the economics of it. Improved seeds cost nothing. One maund of green manure seed—needed for one acre—costs Rs. 12 and the cost of ploughing it under is another Rs. 10, extra water may be Rs. 8 per acre. Total cost to improve yields by 68-70 per cent equals Rs. 30 in order to get Rs. 150 worth of extra wheat. Well worth it. Fertilisers will cost Rs. 20 more and require another Rs. 8-10 worth of water, the extra wheat thus obtained will fetch another Rs. 42 for a capital outlay of Rs. 23. When one takes the work involved into account, it is not worth it. Therefore the offtake of "almonia" as the villagers call it, has dropped so sharply that it has drained the scanty resources of the co-operatives which are still carrying last year's damaged stocks—bought at Rs. 350 against the present price of Rs. 275.

Indeed this costing brings one to a critical and dispassionate analysis of the results achieved by the Krishikar Pandits. One such Pandit who had topped all jawar records, give the recipe of his success in the *Indian Farmer*. Curiosity drove someone to calculate his costs and found that, having paid for all his activators and the labour, he was Rs. 3 out of pocket per acre. But back to Etawah.

The same demand which exists for improved wheat exists for improved peas. The new 163 strain produces 26 maunds instead of 15. The only cost is Rs. 20 for the additional water per acre and the return is Rs. 140. The villager needs no persuasion, the Project needs more seeds. There has also been a great response to the Patna Potato—a small brand—which grows quickly in between seasons and for which the seed, being small, costs only Rs. 23 per acre against Rs. 40 for the usual large size. The Patna variety brings the

usual 100 maund per acre yield up to 236, a net gain of Rs. 540 per acre for an outlay of Rs. 180 (manure, fertiliser, water, etc.). Three years ago there were 50 acres under potatoes in the Project areas, there are now over 500; the villagers eat them and sell them in the Etawah market; the co-operatives have so far failed to plan for marketing.

The Kosi Project

The Kosi has been rightly termed the River of Sorrows in North Bihar. Vast tracts of arable land are laid waste every year and hundreds of thousands rendered homeless by this erratic and turbulent river. We are glad that decisions have been taken to attempt to curb the destructive power of the Kosi at last as the following report shows:

Patna, Oct. 27: The Government of India have decided to start the work of Kosi Project in the coming winter, it is learnt here.

The first stage envisages the construction of a barrage at Terhi Bazar with embankments on both sides of the Kosi river and a canal system on its right as well as its left bank.

With the completion of the project the river is expected to be confined between its two embankments which may be as wide as six miles and people on both sides of the sixty mile long embankment will have security they have not enjoyed for ages.

Later news, emanating from New Delhi, where a discussion was held at a meeting of the Central Board of Irrigation, give a more detailed account of the problem:

"Mr. Kunwar Sain, who summed up the discussion, stated that no single measure was likely to be adequate in meeting the challenge of the Kosi. The problem required a combination of all the known solutions—a dam, a barrage, and embankments. He stressed the uniqueness of the Kosi problem. It was so difficult that it could only be solved by people who gave it full thought and were so steeped in it that they remembered it even when asleep. He appealed to the engineers to think about the Kosi, India's biggest engineering problem, and send him suggestions which he promised would be fully examined.

"In a sense, the Kosi presented three problems. The first was the problem of floods. The peak discharge of the river varied from 200,000 to 700,000 cusecs. As in all flood problems, the solution lay in reducing the discharge to manageable proportions. This could only be done by building a storage dam so that the water could be released more gradually. The dam had to be of adequate capacity. Any such dam would necessarily be expensive. That is why one had to think in terms of a temporary but cheaper solution.

"Secondly, the Kosi brought down coarse sand which it spread over a wide area, rendering it barren.

Evidence of it was unmistakable. People were trying to reclaim the land which the Kosi had spoiled. Intrinsically, the land was extremely fertile.

"Thirdly, the Kosi was shifting its course westwards. Some thought it would eventually swing back. But the land on its right bank was precious. It was necessary to check the damage the Kosi was causing.

"Referring to remedies he said he was not thinking in terms of a storage dam in the immediate future. The other two problems of sand and meandering were inter-connected. The PWD was studying the relevant factors of silt discharge, gradient, etc. A great deal of data had now been collected. He hoped to announce certain conclusions by the middle of November."

D.V.C. Power Supply

We append below a curious bit of news which appeared recently in the daily press. We call it curious because the "decision" taken seems to be out-of-date by about three and a half years. Have the decisions on flood-control and irrigation been taken or do they await the completion of the dams?

New Delhi, Oct. 27: A decision to extend the power transmission system of the Damodar Valley Corporation to Calcutta, Patna and Gaya was taken at the Inter-State Conference which reassembled in New Delhi today under the presidentship of Mr. Gulzarilal Nanda, Minister of Irrigation and Power and Planning, Government of India.

The extension of the power supply to Calcutta will necessitate additional generating equipment for housing which provision has already been made in the Bokaro Power House structure. The programme in this connection will be reviewed after a year, depending on the growth in demand for power in the DVC and Calcutta areas.

The C.P.I. and the Forward Bloc

In the July disturbances in Calcutta, which were the planned preparation for the South-East Calcutta Parliamentary bye-election, the "Leftist" groups co-operated with each other in making the life of the common citizen miserable and in increasing the circulation of certain Calcutta dailies, which boosted the movement. Now they have fallen out as evinced by the following report:

"Pandit Sheelbhadra Yajee, Secretary-General of the All-India Forward Bloc, has issued a statement describing the decision of the West Bengal Communist Party to set up Mr. Sadhan Gupta as its nominee in the bye-election to Parliament from South-East Calcutta Constituency as a 'betrayal' of its agreement with the Forward Bloc.

"Pandit Yajee said that after prolonged negotiations among the leaders of the Forward Bloc, the Praja Socialist Party, the Revolutionary Socialist

Party, the Communist Party, the Bolshevik Party and others it had been decided by all Left parties that Dr. Bhupal Bose, the Forward Bloc nominee, should contest the seat, which had fallen vacant following the death of Dr. Shyama Prasad Mookerji, against Dr. Radha Binode Pal, the Congress candidate.

"The West Bengal Communist leaders, including Mr. Jyoti Basu, had assured him, Pandit Yajee said, that if the CPI was not driven out from the United Famine Resistance Committee they would not set up any CPI candidate but support the Forward Bloc nominee. The Forward Bloc and other Left parties had fulfilled the conditions. The CPI had set up Mr. Sadhan Gupta as its candidate."

Bhoo dan and the Churches

The fragrance of Bhoo dan Yagna has been wafted abroad by the action of the Bishops of the Southern Christian churches. We find the following report in the September 18 issue of the *Worldover Press*. We add our felicitations to these dignitaries of the Churches mentioned for their very appropriate action.

Kottayam, India.—Acharya Vinoba Bhave's "Bhoo dan Yagna" (Land Gift Sacrifice) Movement has received support from the heads of the indigenous churches located in the southeast coastal strip of India, commonly known as the Kerala region. In a joint statement to the Protestant and Syrian Christians in this part of the country the bishops urge them to counter the violence of the Communists with the love and non-violence basic to the Land Gift Movement.

Nearly a million and a half acres of land have now been distributed through the appeals of Vinoba Bhave for voluntary gifts. This is in contrast to some 30,000 acres distributed by Indian Communists in places where they have sufficient political power.

The signatories to the statement endorsing Vinoba Bhave were the bishops of the Mar Thoma Syrian Church, the Malankara Jacobite Syrian Church, the Knana Syrian Church and the Kottayam diocese of the Church of South India. Among them they reckon nearly a fourth of the entire non-Catholic Christian population of the country.

Considerable importance attaches to this open move on the part of the bishops because no other church prelates have so far come out thus in support of the Land Gift Movement on their own initiative. Besides, the Christian elements in this part of India, which comprises Malabar and Travancore-Cochin states, are among the wealthiest in the nation. The ancient churches count among their members many influential proprietors of large land areas.

Railway Ills

Our railways, which are all nationalized, are suffering from many evils, which emanate from many

different sources. Some of them are due to faulty or ill-planned administration, some originate from the travelling or using public, and others are due to purely nefarious activities of criminals. Recently public attention has been drawn to some of them as the following news shows:

"New Delhi, Oct. 23.—The National Railway Users' Consultative Council, which concluded a two-day meeting here today, urged the Railway Ministry to take suitable steps to eradicate ticketless travel and beggar nuisance from the Railways.

The Council "viewed with concern the national loss that was taking place owing to ticketless travel" and recommended that the Ministry should take steps not only to improve the efficiency, calibre and integrity of the ticket-checking officials but also to secure public co-operation in the eradication of this evil and enthuse public opinion generally against it.

The Council suggested that its members and members of the Zonal Committees should be enabled to call upon the ticket-checking staff to make checks in their presence.

With regard to elimination of the beggar nuisance, while the Council recognized the difficulties of the problem, which were often aggravated by misplaced sympathies, it considered that "tangible results can only be achieved by adequate and effective action by police in dealing with beggars at stations or on trains."

The Council urged the State Governments to pay particular and immediate attention to the removal of this nuisance and take effective legislative and other action."

Theft on trains and pilfering from goods wagons have become rife. Certain stations, like Khargpur, have become notorious. The *modus operandi* of the thieves is well-illustrated in the following news that appeared on October 30. It is difficult to believe that such bold attempts could be made without the connivance of some of the railway staff:

"Shortly after midnight of Wednesday-Thursday, the police surprised a gang of about 25 men and arrested 10 of them while, it is alleged, they were removing buckets from a railway wagon which they had broken open near the outer signal on the Sealdah South Section. The wagon was immediately behind the engine of a train that was coming from Canning and was due at Sealdah at 12-30 a.m.

Over 100 buckets, which had been thrown out of the wagon, were seized. A knife, about 15 inches long, was found on one of the men arrested. A near-by bustee was searched later in the night and nine more arrests made.

It is stated that the signaller at Sealdah noticed that although he had given the green signal to the train, the red signal continued to show. This made him suspect that the mechanism had been put out of order by pilferers to stop the train.

He immediately communicated his suspicions to the

Railway Police, a party of whom and of the Railway Protection Police went to the place. Seeing them, the thieves began to run, but 10 of them were caught. Later, the Railway Police searched a bustee in the direction of which the men had fled."

Industrial Finance Corporation

The annual report of the Industrial Finance Corporation for the year ended 30th June 1953, indicates that industrial concerns in India appear not to have taken full advantage of the long-term credit facilities provided by the Corporation. Although the number of applications increased from 54 to 74 and the amount of loan sought from Rs. 7.3 crores to Rs. 8.25 crores, the actual number of applications sanctioned and the loans granted thereon declined from 33 and Rs. 4.45 crores to 14 and Rs. 1.43 crores respectively. The number of rejections, too, was high at 30, as against 19 in the preceding year. Moreover, the number of applications under consideration at the end of the year, too, remained very high at 41 for loans amounting to Rs. 5.22 crores, as compared with 17 applications for Rs. 2.02 crores during the last year. The report explains this state of affairs as follows:

"Though the number of applications was larger than in the previous years, the proposals were often not well-thought-out, and some of the applicants did not show keenness in pursuing their applications. For this reason, more time had to be devoted on the consideration of the applications."

The types of industries and the amount of accommodation sanctioned to each of them during the year, as compared with those of the previous year, are stated below:

	(In lakhs of rupees)		
	Amount sanctioned during year ended	Amount sanctioned up to year ended	Total
	30. 6. 53	30. 6. 52	
Textile machinery	...	64.00	64.00
Mechanical engineering	5.00	68.00	73.00
Electrical engineering	12.00	114.50	126.50
Cotton textiles	65.00	204.75	269.75
Woollen textiles	...	35.00	35.00
Rayon industry	...	50.00	50.00
Chemicals	11.75	186.00	197.75
Cement	...	90.00	90.00
Ceramics and glass	...	119.00	119.00
Oil mills	3.50	2.50	6.00
Electric power	25.00	17.50	42.50
Metallurgical industry (non-ferrous metals)	...	35.00	35.00
Iron and steel (light engineering)	17.50	50.50	68.00
Aluminium	...	50.00	50.00
Sugar industry	...	115.00	115.00
Mining	...	30.00	30.00
Paper industry	...	74.00	74.00
Automobile and tractor industry	...	50.00	50.00
Unclassified	3.50	47.70	51.20
Total	143.25	1,403.45	1,546.70

The above table indicates that the textile industry stands foremost amongst the borrowers of the Corporation, accounting for nearly a fifth of the total amounts sanctioned. The chemical industry continues to hold the second place, while electric and ceramic and glass industries have stolen a march over that of sugar, which has come down from the third to the fifth place.

The total amount of bonds outstanding at the end of the year under review remained at Rs. 5.80 crores. The Corporation will soon sell further bonds of the face value of Rs. 2 crores. The Directors observe that, with the rising cost of borrowing, the Corporation was compelled to raise its rate of interest on its loans to 6½ per cent with a rebate of ½ per cent for prompt payment of interest and instalments of principal on the due dates.

The following table will show the State-wise distribution of the loans and the total amount sanctioned as at the end of June, 1953:

	(Rupees in lakhs)			
	Up to 30th June 1953		Up to 30th June 1952	
	No. of Units	Amount	No. of Units	Amount
Assam	27	427.5	29	415.00
Bombay	5	83.0	7	83.00
Bihar	3	39.75	4	29.75
Madhya Pradesh	4	27.50	4	20.00
Punjab	6	126.50	6	121.50
Madras	2	59.00	2	59.00
Orissa	7	54.70	9	54.70
U. P.	17	301.75	16	250.00
West Bengal	2	60.00	3	50.00
Rajasthan	3	140.00	4	140.00
Saurashtra	1	3.50	1	3.50
Madhya Bharat	3	65.50	3	65.50
Travancore-Cochin	7	98.00	5	71.00
Mysore	2	60.00	1	40.00
Hyderabad				
	98	1,546.70	94	1,403.45

For the first time since its inception, the accounts of the Corporation show a profit which is large enough to pay the whole of the guaranteed dividend of 2½ per cent on its paid-up capital of Rs. 5 crores without assistance from the Government by way of subvention. The profit before taxation for the year ended 30th June, 1953, aggregated Rs. 23.17 lakhs as against Rs. 9.26 lakhs in the preceding year. It may be mentioned here that in the preceding four years, the Corporation had received an aggregate amount of Rs. 26.9 lakhs, as subvention from the Government of India.

Estate Duty Act

The Estate Duty Bill which was passed by the House of the People on 15th September 1953, has come into force with effect from October 15, 1953. The objects of the Government in introducing the measure are two-fold—to rectify, to some extent, the existing inequality in the distribution of wealth and to assist the States towards financing their development schemes.

It may be noted that one of the directive principles of State policy calls for prevention of the excessive concentration of wealth in the hands of the few, and this measure will go a long way in fulfilling an objective of that directive.

Although the Indian Estate Duty Act is modelled on the British Act, it differs in two important respects from the latter. In the United Kingdom, the step system is in force, whereas in India the slab system has been adopted. Under the slab system, the incidence will be much smaller, particularly on upper income levels. Secondly, the rates in India are much lower than Britain's. For example, in Britain exemption is given to estates not exceeding £2,000; in this country, exemption is given to estates not exceeding Rs. 50,000 in the Mitakshara families and Rs. 1 lakh in case of others.

The Indian maximum rate is 40% on property exceeding Rs. 20 lakhs; whereas the British maximum rate of estate duty is 80 per cent. In that country, estate duty at the rate of 40 per cent is payable on the whole of a property the value of which exceeds £60,000 (Rs. 8 lakhs) and does not exceed £75,000. Further, in Britain there are succession and legacy duties in addition to the estate duty. Estate duty is a mutation duty, succession and legacy duties are acquisition duties. The Indian rates are so low, that they will in no way act as a deterrent to capital formation. The incidence on the first four slabs has been kept at a rather high figure. It is also clear that the rates of levy on the higher slabs are well below the worst expectations entertained in the market. Because of the slab system, even the big estates will get the advantage of lower rates on the initial slabs and the rate applicable on the total value of the estate will be less than 40 per cent.

The following figures will support the contention that the incidence of the Estate Duty will be much lighter in this country than in many other countries having a similar legislation:

Value of Estate	India	U.K.	Australia	Ceylon	Pakistan
	%	%	%	%	%
Rs. 1.5 lakhs	2.5	6.0	3.9	5.0	6.0
Rs. 2.0 lakhs	4.38	8.0	5.2	7.0	6.0
Rs. 3.0 lakhs	7.08	15.0	7.1	8.0	8.0
Rs. 5.0 lakhs	10.25	24.0	10.3	10.0	12.0
Rs. 20.0 lakhs	20.0	50.0	26.1	16.0	30.0

An issue which figured prominently during the passage of the Bill in the House of the People, was the question of setting up an independent appellate authority to which an appeal could be preferred, if a party was dissatisfied with the decision of the taxing authority. The position now is that an appeal can be made to the Court when a question of law is involved. But, if there is a difference of opinion on matters relating to the facts of the case, the decision of the Central Board of Revenue is final. The objection to this arrangement springs from the fear that the Central Board of Revenue will not interfere with and that the Board might even actively support

and confirm the decision taken by its subordinate officers. In this respect, the Government's defence of the existing position was not very convincing. It is true that from the purely administrative point of view, there is a great deal to be said for avoiding the delays inevitable in references to law-courts. But that is not so important as the necessity for ensuring that justice will be done. So long as the prosecutor and the judge belong to the same interest, apprehension there will always be in the minds of the people about the justice of their case.

Mr. Deshmukh was afraid that if appeals were allowed to an outside authority, it might lead to confusion and lack of uniformity. It is admitted by all that the language of the Bill is very complicated and verbose.

As regards the justification of death duties, Gladstone observed, "The carrying of properties in perfect security over the great barrier which death places between man and man is perhaps the very highest achievement, the most signal proof of the power of the civilised institutions and an instance so capital of the great benefit conferred by law and civil institutions upon mankind, and of the immense enlargement that comes to natural liberty through the medium of the law, that I conceive nothing more rational than that, if taxes are to be raised at all, the States shall be at liberty to step in and take from him who is thenceforward to enjoy the whole in security that portion which may be *bona fide* necessary for the public purpose."

All rights are created, recognised and protected by the law. The right to property is fundamentally a creature of law and nature has not given any right of ownership over property after death. The right to transmit property by will is created by law and there is nothing objectionable if the State steps in after death of a person to take a share of his estate. Death duties are a sort of final settlement of taxation liability on the unearned accretion in wealth arising from the non-taxability of capital gains and appreciation in value of property. Though death duties are assessed on capital, they destroy no existing capital; at most they absorb potential capital by diverting to the payment of the duties income which would otherwise have gone into new savings. In this way they do not differ from income tax or any other tax of comparable magnitude. Even where estates are sold to meet the duties, capital is only transferred, not destroyed. The property sold must eventually be bought by someone who has free income seeking an investment, and the only effect is to divert this income from the creation of a new, to the purchase of an existing, investment. There is no reduction of actual capital. From the collective point of view, there will be no loss of existing capital, for ultimately the source of payment will be somebody's income.

Unemployment

The Planning Commission has recently addressed the State Governments on the question of urban unemployment. The Commission, which has been

engaged during the past few weeks on a study of the unemployment position, observes that on account of the inadequacy of the available data it is difficult to say whether there has been any absolute decline in the total volume of urban employment. But it appears that the growth of fresh employment opportunities, especially in the private sector, has not kept pace with the numbers seeking work. This declining trend in employment position, while the Five-Year Plan is in operation, has naturally agitated the public mind and the view has been expressed that if through the implementation of the Plan employment position does not improve, the Plan be revised in directions needed for providing additional employment. The existence of this public apprehension finds due recognition in the Planning Commission's communication to the States.

It is pointed out that the Plan, in recommending the fullest use of the available man-power resources by operating labour-intensive methods of production, had kept the employment problem in the forefront. It had also suggested certain special steps to be taken with a view to laying the foundations of proper employment policy. These recommendations included maximum utilisation of the unemployed manpower in the implementation of development projects, minimum expansion of money incomes, speeding up of capital formation, safeguards against excessive unemployment arising out of technological change and proper distribution of capital in new investments with a view to keeping employment opportunities to the maximum.

While the employment aspect was thus kept fully in view in the Plan, in the actual implementation of the programme, the Commission observes, a gap has arisen between the rate of development contemplated in the Plan and the rate actually achieved. This is mainly because many of the development schemes included in the Five-Year Plan were started before the Plan was formulated and some of the important social and economic policies recommended in it have not yet been implemented sufficiently to cause an impact on the employment situation.

The gap should be reduced, the Commission observes, and necessary adjustments made both by the Central and the State Governments. So far as the Central projects are concerned, these adjustments are being examined by the Planning Commission in consultation with the concerned Ministries of the Government of India.

In view of the above, the Commission does not feel it necessary to change the fundamental approach of the Five-Year Plan or its broad pattern of priorities or allocation of resources. On the other hand, fuller implementation of the programme laid down in the Plan and strengthening it at points where it is weak, will achieve useful results.

The Commission's recommendations in their communication to the State Governments are confined to urban unemployment. In regard to the rural sector, the Commission points out that there are large schemes in the Plan which have added considerably to employment opportunities.

The following programme, which is expected to relieve educated unemployment to some extent, has been suggested. The communication points out that in regard to most of the suggestions, necessary action has already been initiated by the Central Government or will be taken shortly. The suggestions are:

- (1) Special assistance to individuals of small groups of people for establishment of small industries and business under the State aid to industries or other similar legislation and in other ways;
- (2) Expansion of training facilities in those lines in which manpower shortage at present exists. There are several directions in which shortages of personnel exist which impede the progress of schemes under the Five-Year Plan. Expanded training facilities will do away with these shortages, at the same time opening up new employment opportunities for semi-skilled workers;
- (3) Active encouragement to be given to the products of cottage and small-scale industries through the purchase of stores required by State Governments and public authorities;
- (4) Municipal authorities, private educational institutions and voluntary organisations should be assisted in establishing adult education centres in urban areas. In rural areas, one-teacher schools should be encouraged to be opened;
- (5) The proposed National Extension Service should be handled with courage, for its own sake inasmuch as it is fundamental to the growth of rural economy in India as well as for the immediate contribution it can make towards the solution of the problem of educated unemployment;
- (6) Development of road transport. The existing licensing policies should be re-examined with a view to stepping up road transport development, particularly through private agencies.
- (7) Implementation of slum clearance schemes and programmes for the construction of houses for low income groups in urban areas;
- (8) Encouragement of private building activities;
- (9) Planned assistance to refugee townships, which suffer from a somewhat chronic unemployment, with a view to developing a sound economic base for their continued existence;
- (10) Encouragement of schemes for development of power sponsored by private capital. At present in several growing towns there is shortage of power which impedes the maintenance of employment and development of industry. The State Governments may review the power position in different areas and to the extent that schemes for meeting power shortage have not been included in the Five-Year Plan send up further proposals indicating the extent to which private capital might be available;
- (11) The last suggestion of the Commission, which is somewhat novel, is for the establishment of work and training camps at places where mainly, through action taken by the Government, work opportunities exist, for example, in projects for

slum clearance, housing for low income groups, irrigation and power projects, road construction programmes, afforestation and soil conservation and co-operative land resettlement projects, etc.

The Commission has urged on all the State Governments to consider this idea, which has been tried in other countries. It may be possible for the Central Government to give some assistance to suitable schemes for work and training camps which State Governments may propose as a specific measure for relief from the present deterioration in the employment situation.

The Commission's communication to the State Governments is based on a comprehensive analysis of the existing unemployment situation. It examines the various factors at work which might have accentuated unemployment. Some of these factors are seasonal and temporary in character, some specific to particular areas or regions or to particular trades or industries, and some arise out of frictional adjustments in the labour market. The Commission has asked the State Governments to examine the employment situation in their States and to indicate the factors at work and the extent to which they can take action to influence them.

World Monetary Trends

The latest Annual Report of the International Monetary Fund notes an improvement in the world payments position. Substantial progress is stated to have been made in the direction of general payments balance; indeed, the improvements in the world's balance of payments with the dollar area during the year 1952-53 appears to have certain elements of permanence which were lacking in 1950. The Fund's analysis of the world payments situation during the year under review may be summarised as follows:

- (1) Despite the downward trend in the world trade that became evident early in 1952, the world payments position for the year as a whole showed a much better balance than in 1951.
- (2) The widespread payments crisis at the beginning of 1952 affected particularly the raw material exporting countries.
- (3) The most significant statistical evidence of the improvement in the world payments position in 1952 is the balance of payments of the rest of the world with the United States.
- (4) The supply position outside the dollar areas has also improved on the whole, a result, in part, of the abatement of inflationary pressures.
- (5) It would be rash to take it for granted that the battle against inflation has now been won. It is significant that, in many parts of Europe, the inflationary impact of rising defence expenditures was kept in check throughout 1952.
- (6) In 1952, as in 1951, the overall inflationary tendencies were, as a rule, stronger in the raw material-producing countries than in the industrial nations.

World Trade with the USA: The Fund refers in particular to what is called the "residual dollar problem" and points out that the US balance of payments surplus disappeared in the second half of 1952 when the country had a small deficit with the rest of the world. Such a welcome change was brought about by an effective control of inflation, although it must be admitted that even today inflation has by no means ceased to be a problem. The Fund observes that in order to prevent any deterioration in the present position, it is of the utmost importance that a high level of employment is maintained in the US and that proper monetary and fiscal policies are enforced in Europe.

The Fund is cautiously optimistic about the attainment and maintenance of a rough balance of payments between the US and the rest of the world. But it warns against its precarious character. The Fund observes: "For many countries, the balance would be disturbed by any considerable weakening of the prices of their staple exports. The possibility of a decline in the United States' activity has also caused concern. It should not be assumed that an easing of political tensions, which permitted a substantial reduction of defence expenditure, would necessarily be followed by any serious contraction of economic activity as a whole in the United States. The US economy has shown a degree of adaptability sufficient to take full advantage of the opportunities for the higher real levels of production and consumption that relaxation of rearmament pressures would permit. The maintenance of high levels of production and employment is a major objective of public policy in the United States. The greater the success of US policy in maintaining domestic stability, the better the prospects for continued progress towards the establishment of a stable multilateral international trading system."

Convertibility Aims: In the considered opinion of the Fund, the improvement in the general payments position in recent months has been in a large measure, the result of the return to "active monetary policies." It commends the renewed efforts of several countries to achieve convertibility of currencies, but stresses the fact that convertibility is not an end in itself. The view that convertibility is an attractive ideal which cannot, however, be realised in a remote and indefinite future, has increasingly given way to the conclusion that progress towards the establishment of convertibility and progress towards the elimination of the dollar shortage should proceed side by side. However, convertibility is not an end in itself. It is only desirable, because it makes possible greater flexibility in international payments, and the benefits of the international division of labour, based on unhindered multilateral trading. It would be valueless if progress towards convertibility by any country was achieved at the cost of imposing new restrictions on trade. The renewed determination with which many countries are endeavouring to move towards convertibility is a most encouraging development. The IMF itself must do everything to support the efforts that are being made,

and to take advantage of the recent progress which has occurred towards a better balance of payments of the rest of the world with the dollar area.

The Fund lays special emphasis in this connection on two important factors. First, the determined efforts of some countries to achieve convertibility of currencies deserve the utmost encouragement. Secondly, the uncertainty of the timing of decisive steps does not mean that countries cannot, in the meantime, take less far-reaching measures which have immediate value. These include, among others, (a) domestic financial and economic stability, (b) larger dollar earnings, (c) education and ultimate elimination of exchange restrictions and discriminatory trade restrictions, and (d) restoration of international capital markets. The Fund wants serious attention to be paid to the last-mentioned measure. For, according to it, capital imports may be a necessary condition for the elimination of inflationary pressures in the underdeveloped countries. At the same time, many underdeveloped countries are recognising that they have a responsibility for ensuring their maintenance of conditions which will make foreign investors feel assured of reasonable security for their investments and the earnings expected to flow from them.

To the extent that an increased flow of capital—particularly long-term capital—from the USA to the rest of the world can be developed, the USA should have a corresponding current account surplus. If the US current account were balanced, the existing disparity between the rate of capital accumulation in the US and in other countries would be accentuated. Any further widening of the gap between the productive capacity in the USA and in the rest of the world would place severe strains on many other countries in their efforts to maintain international equilibrium. Rapid development through diversified industrialisation has come to be accepted as an important objective of economic policy in many of the less developed raw material-producing countries, chiefly because it seems to be the most satisfactory way of increasing real incomes.

British and American Asian Policy

The difference between British and American approaches to the problems of the Far East is not the creation of fanatics, but of geography and history. In the eighteenth century, trade with China was carried on by the East India Companies of European nations. The British, who became predominant in the trade at Canton, regarded it as an extension of their commerce with India, and in so far as the East India Company did not itself directly do business in China, the market was left to the so-called "country" ships sailing under licenses from India. Politically, India with her sea approaches became the pivot of Britain's policy as an oceanic and imperial Power. In so far as Britain looked beyond Europe in diplomacy and strategy, India and the Indian ocean occupied the foreground of the picture; China, Japan and the Pacific belonged to the remote background,

By the beginning of the twentieth century Britain had acquired a very substantial economic stake in the Far East and for a few years Far Eastern affairs became of cardinal importance for British foreign policy. The Russian penetration of Manchuria after 1895 aroused fears in London that China was about to fall under Russian domination, and Britain made her first definite departure from "splendid isolation" in world politics by concluding an alliance with Japan to check Russia's Far Eastern expansion. But it has to be remembered that Anglo-Russian rivalry in the Far East at this time was only an extension of a conflict of policies which already involved Turkey, Persia and Afghanistan, and the alarm about China was primarily due to the British sense of weakness in that region of the world. The Anglo-Japanese alliance was intended to redress the regional balance of power, otherwise strongly in favour of Russia, by giving support to a nation able and willing to act locally against Russia.

The pattern of British Far Eastern policy between 1905 and 1918 has since been twice repeated, first in relation to Japan between 1931 and 1941, and again in relation to Communist China since 1949. Its basic principle is to avoid, even at the cost of great sacrifices of interest and prestige, any involvement in a Far Eastern conflict which would require diversion of British power from regions of more vital importance.

British foreign policy and strategy are ultimately based on a scale of priorities which sets Europe and the Mediterranean first, the Middle East and the Indian Ocean second, and the Far East by a long way third. If in a time of crisis certain interests have to be thrown overboard to lighten the load, those which are located beyond Singapore must be the first for sacrifice, and those from Suez eastward must be next; but the needs of security in Europe can never be sacrificed because the very existence of Britain as a nation depends on it. The fall of Singapore in the last war did not finish Britain; even Rommel's entry into Cairo would not have been a mortal blow; but had Hitler's army been able to cross the Channel in 1940, that might have been the end of everything for the British people.

The American scale of priorities is necessarily different. Situated between two broad oceans, the United States has never had to face the same kind of problem of strategic security as that which has been a condition of British foreign policy, and until very recently most Americans thought that isolation was a safe and profitable course for America to follow in world affairs. But in so far as America has emerged from isolation and become involved in the course of history beyond the oceans, the involvement has been as much trans-Pacific as trans-Atlantic. Indeed, it has been even more, for, although the Pacific is wider than the Atlantic, the American acquisition of Hawaii and Alaska and four decades of sovereignty in the Philippines have brought America closer to Asia than to Europe. If there is one part of the world in which Americans, generally speaking, took

little or no interest, it was that region comprising the Middle East, India and the Indian Ocean, which to the British was, and is, so much more important than the countries bordering the Pacific.

The experience of the last war simply confirmed and accentuated the divergence between the two angles of vision. For the British, the war against Japan was a sideshow as compared with the struggle in Europe. For the Americans, the two wars were approximately equal in scale and significance if the Chiefs of Staff always maintained the strategic priority of the European fronts, American popular emotions were more deeply committed in Guadalcanal and Okinawa than in Sicily. Indeed, the circumstances of the conclusion of the second world war, which left the United States participating with Britain, France and Russia in the control of Germany and Austria, but with virtually sole responsibility in Japan, meant that America was more profoundly involved as a nation in East Asia than in Europe.

Another difference separating British and American policies in Asia and closely connected with the basic difference of geographical approach was the focus of view on India and on China respectively. Even though American action at the end of 1945 had the effect of depriving the National Government of its only chance of victory, the final outcome of the civil war appeared to both Chinese and Americans as a Communist triumph not only over the Kuomintang but also over the United States, and the cup of defeat has been all the more bitter for Americans to swallow because of the traditional special friendship between the two countries. The fact that for the last two and a half years a Chinese army has been killing American soldiers has hurt the American nation as a whole less than the outrageous misrepresentation of the American record in the Far East and the denunciation of past generosity in medicine and education to a backward China as "cultural aggression." The Chinese Communists are not merely a Marxist-Leninist party which has gained power in yet another country; they are, above all, an anti-American faction which has alienated the affections of the Chinese people from China's best friend. For this reason, America is basically unwilling to accept what happened in China as an irreversible decision or to admit that the "People's Republic" represents China as a nation. The British, on the other hand, do not share this attitude, and an account of their different relation to China in recent years have great difficulty even in understanding it. The British have viewed China since 1945 with the matter of fact detachment of a spectator who feels himself quite outside the game. They have no sense of failure because they have not tried to achieve anything; they are not greatly disappointed because they never expected postwar China to be stable; they do not like the new regime, but they think it has come to stay and hold that it must be accepted as an accomplished fact.

This difference of attitudes is primarily a matter

of feeling, but it corresponds to a contrast of strategic preoccupations more definable in terms of national interest. As a result of the "Pacific," America has acquired a strategic "frontier" in the Western Pacific, running down from Alaska through the Aleutians, Japan and Okinawa to the Philippines, over against the Russo-Chinese power bloc on the mainland of Asia. This defensive system is the Pacific counterpart of the Atlantic-European system, with its frontier from Norway to Turkey, in which America participates as a member of NATO. In the event of a war between the Soviet Union and the NATO Powers there would inevitably be from the outset a fighting front in the northern Pacific as well as in Europe and the Atlantic. The situation now is quite different from what it was in World War II. There was then ultimately a Pacific as well as a European war, but they were geographically separate spheres of conflict; Germany had no territorial base in the Far East; and Japan, though engaged in hostilities in China, remained neutral in relation to the European war for more than two years after its outbreak. The Soviet Union, on the other hand, straddles Europe and Asia, so that any crisis which involved the USA in an armed conflict in Europe would mean also a Russo-American war on the other side of the world.

More specifically, there are three dangers against which American strategic planning has to provide. In the first place, Siberia is less than a hundred miles from Alaska at the nearest point, and this is the only area in which it would be practicable for Russia to attempt an incursion into the North American continent; such a move might have but little real military importance, but the psychological effect of "carrying the war into America" would be so great that it would be essential to meet the attack successfully. Secondly, even though Russia lacks sea power comparable to that of Japan in 1941, the Pacific would probably be infested with Russian submarines from Siberian bases, and long-range missile-bearing aircraft might strike from Kamchatka at Hawaii and Seattle. Thirdly, Russia would probably attempt an invasion of Japan in order to gain control of her industrial capacity and skilled labour for war purposes. The entire burden of defence against all these possible strategic threats (which are implied in a hypothetical war with Russia, whether China is a belligerent or not) must be borne out by the USA. On the Atlantic side, in contrast, Britain and France are in the first line for any conflict with Russia, and there is no Russian territorial base close to North America.

Ever since India became independent there has been an effort on the side of Britain to adjust British policies in Asia to Indian views whenever possible and to avoid giving Delhi any ground for suspicion

that India was not being regarded as fully sovereign entity, in the field of foreign affairs. But India's ostentatious neutralism in the cold war, the sympathetic attitude of India towards Communist China, and the Indian leadership of the so-called bloc of Asian and Arab States in the United States, all tend to produce tensions between India and the USA and these react on British-American relations because of the constant British desire to conciliate India and give full consideration to the Indian point of view. The history of the last five years shows that increases of Communist pressure in Europe tend to bring Britain and America closer together, while increases in the Far East tend to drive them apart.

Indian Troops in Korea

India has been placed in a most unhappy and anomalous position by Pandit Nehru's decision to send troops to guard prisoners who are unwilling to be repatriated. In trying to maintain a strict neutrality, India is being accused of partisanship by interested parties, the most bitter accusation emanating from South Korea.

Placed as he is we would sympathise with Mr. Rhee, if his remarks were not so rabid and outrageous. And we regret to see that a good bit of American opinion, which is strongly biased and unfair, seems to be on his side.

We have no doubt that our soldiers will carry out their duties in a true and forthright fashion, but we do think that Pandit Nehru should have considered all possibilities before placing them in this unenviable position. The British Press has, on the whole, taken a fair view of the case.

The *Spectator* (October 9), discussing the position in Korea under the heading "Indian Village," writes: "How does the President of South Korea come to be a major threat to peace? Partly because of the decision, taken 18 months ago by the United Nations Command, to replace the American troops fighting in Korea by South Korean troops, and to train and equip 15 South Korean divisions to that end.

"In 1952, when there was no end in sight to the Korean war, this may have been inevitable. But in October 1953, when there is an armistice in Korea but no peace conference in sight, and when Mr. Rhee does not want to observe the armistice, it is a source of danger.

"For the latest from South Korea has been a statement to the effect that he will either throw the Indians, who are supervising the armistice, out of force, or organize another mass escape by prisoners under Indian supervision.

"To permit him to do either or both would be to tear up the armistice. Now it is possible that Mr. Rhee will not—or will not find the means to—carry out these threats. It is also possible that China, which

signed the armistice presumably because it wanted peace, may not choose to exploit a breach of the truce by South Korea as a pretext for starting the war again.

"But neither of these possibilities is certain enough to justify the United Nations taking the smallest risk with Mr. Rhee; if war were to start again, there is no knowing where or how it would end. This is the background to the week's events in Indian village.

"The Indians complain that the 23,000 prisoners in their charge, waiting to have their brains 'washed' by propagandists who hope to persuade them to return to their Communist homes, are infiltrated by Kuomintang and South Korean agents and are resisting the whole operation in a highly organized way; they have also warned the United Nations that they are not prepared to use the necessary force to repel a mass escape.

"The United Nations, through General Clark and a number of other less official American spokesmen, has merely replied with the complaint that the Indians are organizing the operation to the Communists' advantage. Yet there is only one thing in all this that really matters; the armistice must not be broken by South Korea.

"This means that the United Nations, which is in the context the United States, must leave President Rhee in no doubt whatever that his troops will get no supplies and his Government will be disowned if he reaches out a hand against the Indians or to release the prisoners."

India and Pakistan

The relations between these two neighbours can never improve until the spirit of give and take is correctly established both ways. So far it has been "give" on India's side and "take" on the other's.

"In recent weeks there has been several minor setbacks in the relations of India and Pakistan. India has decided not to extend the life of the Indo-Pakistan trade agreement, which expired on September 30, for the sound reason that the present import policy of Pakistan does not provide for the issue of licences for the import of certain important items scheduled for import into Pakistan from India.

"The Prime Minister of India has written to Karachi refuting the accusations made against India for the virtual failure of the Indo-Pakistan conference on exchange of enclaves, held recently in Calcutta, and the continued deadlock over the evacuee property issue. Karachi is being urged to rescue at an early date negotiations on the evacuee property question, as this is holding up payment of compensation to displaced persons, Pakistan is yet to ratify the limited agreement of last August on evacuee property."

British Coup in Guiana

On August 9, Sir Alfred Savage, Governor of British Guiana, declared a state of emergency, suspended the six-month-old constitution and dismissed the first popularly elected Government headed by Dr. Chedi Jagan, with a view "to prevent Communist subversion of the Government and a dangerous crisis both in public order and in economic affairs." The Governor declared that he would himself run the administration with the help of advisers. A commission of enquiry would be appointed to recommend on a new constitution, he said.

A Colonial Office statement issued simultaneously in London and Georgetown, said that Her Majesty's Government was quite satisfied that the elected Ministers and the Party (People's Progressive Party) were completely under the control of a Communist clique. It was clear from the actions and public statements of the leaders of the People's Progressive Party, the statement continued, "that their objective was to turn Guiana into a totalitarian State-subordinate to Moscow and a dangerous platform for extending Communist influences in the Western Hemisphere." The statement charged the leaders with having tried to undermine the loyalty and discipline of the Police force and of persistently intruding into the sphere of the Public Service.

We have yet to see an unbiased report on the British Guiana affair. Dr. Jagan and his associates have denied that there was any move by them in concert with world Communism. Mr. Attlee, on the other hand, has stated, after a long interview with Dr. Jagan that there were undoubted signs of Communism in the methods and moves of the Jagan Ministry, and Mr. Attlee's statement cannot be brushed aside lightly. Of British Press reactions seen by us, that of the *Spectator* seems to be the most clearly formulated.

Writing under the heading "Destination Georgetown," the *Spectator* (October 9) says: "What precise contingency has led the Governor of British Guiana to call for British warships is not known. But Sir Alfred Savage is not the man to use big battalions unless he is forced to, and trouble, including bloodshed, is threatening the colony.

"It is a tragedy that good rule cannot always be its own reward. In theory, there is everything to be said for the gradual transfer of responsibility to native peoples; in practice, whether that transfer succeeds, as it appears to be succeeding in the Gold Coast and Jamaica, or whether it is abused, as it has been in British Guiana, depends on a number of factors which are beyond the control of the British Government or its administrators.

"It is a risk which has to be taken; and when it does not come off, it is no triumph for the reaction-

aries, but one of the inevitable facts of political life that reformers have to face."

The *Spectator* goes on: "The new British Guiana constitution gave, for the first time, a responsible voice in their government to the people of the colony. It was based on full adult suffrage, and on the principle of Cabinet responsibility for the majority party."

"It so happened that the majority (and virtually only) party was led by an Indian, who is now Prime Minister, and his wife, a lady from Chicago with a chip on her shoulder and a powerful character."

"From the first, this pair were opposed to the new constitution because it contained certain safeguards, such as reserve powers for the Governor, a second House appointed on a non-elective basis, and three (out of a total of nine) official members on the executive, all of them minimum safeguards against an abuse of democracy by people who were not accustomed to it."

"The Jagans were also under the influence of Moscow, and had for some years been at work on the primitive but susceptible minds of the workers on the sugar plantations and bauxite mines who live and work in the crowded, arid, narrow plain between the sea and the swamps. The Jagans and their People's Progressive Party were then, under the new constitution, elected to power; and they proceeded—it can only be assumed—with the intention of boycotting the constitution itself, to disregard those conventions without which democracy cannot work."

"The Prime Minister takes his cues from Moscow; the Minister of Labour retains his trade-union post and organizes a Government strike in sympathy with the sugar workers; and now a petition is being organized by the Prime Minister's wife to demand the removal of the remaining checks built into the constitution."

"There is no reason," says the *Spectator*, "why the first attempt to breathe new life into the colonial body should be allowed to be stifled by people with foreign interests at heart. If the ships, whose destinations have been so extraordinarily mobile, are to assist a liberal-minded Governor to restore order and, if possible, to save a democratic experiment, then one must reluctantly wish them a good voyage."

Trieste

The chances of a flare-up on the Italo-Yugoslavian frontier seem to be less likely now than it was about a fortnight ago. The position then was highly critical, thanks to the hasty and ill-advised decisions of the British and U. S. Governments. The following British Press reports give a clear picture of the affair:

The *Spectator* (October 16) says: "The question of Trieste is one of the most knotted and tangled questions in Europe, but there still might be a hope of settling it if one of the many parties to the present

dispute were following a wise and coherent policy. But not one is."

"The British and U.S. Governments, in their announcement of October 8 that their troops would be withdrawn as soon as possible from Zone A of the Free Territory and the administration of the zone handed over to Italy, displayed a crudity, an impatience and a complacency which seemed quite misplaced from the start and have, in fact, led to nothing but trouble."

"President Tito, by making speeches which were unpleasantly reminiscent of some of the outbursts of the pre-war dictators and by threatening to move Yugoslav troops into Zone A if the Italians tried to take it over, went far beyond any right he possesses."

"The Italian Government, by accepting the Anglo-American invitation to take over in Zone A while refusing to modify their claim to Zone B as well, and even refusing to have anything to do with the one reasonable suggestion that President Tito made—the suggestion that there should be an immediate four-Power meeting to discuss the Trieste question—also helped to push the question into the realm of bombast and intransigence. The Soviet Government, while rushing in to underline all the difficulties and dangers of the situation, made no attempt whatever to remove any of them."

"For Trieste is, of course, the port for Austria and Czechoslovakia, as well as being a largely Italian city surrounded by a mainly Slovene countryside. And so long as the natural traffic between Central Europe and the Adriatic is subject to incalculable political interference, no stable solution to the problem is available."

"It is not merely a matter of relations between Italy and Yugoslavia. It is also a matter of time. And even to pretend that during the long period before the affairs of Trieste eventually settle down the Western Powers can wash their hands of the matter is nonsensical."

Time and Tide (October 17) writes: "It is most unlikely that the Trieste affair will push Marshal Tito back into the arms of the Russians, but that does not mean that in planning such a move the British and American Governments should not have taken into consideration the nature of the country and people whom Marshal Tito has led into friendly relations with the West."

"It may well be that the authorities who give the orders for the anti-British and anti-American demonstrations in Belgrade and other cities are the same as those who later hasten to apologize for the excesses committed. That should not obscure the fact, however, that the present rulers of Yugoslavia are forced to make such protests in deference to those, both on the Right and on the Moscow-inclined Left, who wish to discredit and weaken the regime."

Palestine Affairs

Tension has risen considerably in the Arab-Israeli relations due to the armed raid on a helpless Arab-

village in the Jordan area inflicting death and destruction on innocent Arab villagers. The State of Israel has denied responsibility and accusations and counter-accusations are going on. But there can be no denying of the incident."

Referring to the Security Council's discussing the Qibya incident on the Israeli-Jordan frontier, *The Times* says: "This brutal action was promptly, and rightly, condemned by the British Government in the strongest terms, as it was the United Nations Mixed Armistice Commission on the spot. Now fears of the likely consequences seem already justified by the mounting excitement and indignation in all the Arab capitals."

"So long as the armistice lines separate the Arab villagers from the land they were accustomed to cultivate; so long as semi-starving refugees look across the arbitrary political boundary at the houses, wells and groves which they once owned, so long will the lives and property of the Israelis as well as the Arabs, of women and children as well as men, remain insecure and hazardous in the border districts. Life is hard for the people on both sides; raids provoke reprisals; murders lead the bereaved either to take the law into their own hands or to clamour urgently for punitive action by their own security forces."

The Times ends by suggesting that the frontier could be patrolled in much the same way as the Kashmir cease-fire line has been kept intact. "United Nations observers there are on the spot when things begin to happen," says *The Times*.

Anti-Communism in Chile

We, in India, are as a rule oblivious of the existence of that part of the Americas that is known as "Latin," in so far as world-politics are concerned. Occasionally we get glimpses of the situation as in the following report from the *Worldover Press*, which shows that that part of the world is sharing stresses in World-Politics equally with the rest. The report given below shows a change, however slight, in the situation:

"Santiago, Chile.—As a reaction against the recent Congress of Culture held in Chile by Communists and fellow-travelers of Latin American countries, a new, non-Communist Congress for the Freedom of Culture has been organized under the chairmanship of Dr. George Nicolai, world-famous scientist, and Roberto Aldunate, outstanding writer and social worker."

In its manifesto, the new movement asserts: "We proclaim the evident truth, that freedom of opinion is an inalienable right of the human being. And this means that one is free to express this opinion especially when one disagrees with those who exercise authority. The man who has no right to say 'No' is a slave."

"In the totalitarian states, the fetters on freedom are not presented to the people as sacrifices. On the contrary,

they are exalted as the triumph of 'progress' and as 'the climax of a new civilization.' We consider that the theory and practice of the totalitarian states constitute the greatest threat that humanity has had to face in the course of history."

The Communist Party, founded in 1918 by Luis Emilio Recabarren, was able, for some 20 years, to exert a strong influence over the workers. However, the lack of insight and good judgment shown by the leaders who followed Recabarren was so tragic that most strikes organized by the workers to secure better wages and living conditions ended in disastrous defeats. As a reaction to this brutal type of leadership, a number of intellectuals and moderate labor leaders organized the Socialist Party in 1933. Its democratic ideals attracted the sympathy of laborers, students and intellectuals in such strong numbers that the Communist control over the workers was completely overthrown by the new party.

Internal battles, however, caused by Communist "fifth columns" and widespread infiltration, produced a series of splits, which all but destroyed the great influence this party had in Chilean administrations from 1938 to 1948. The weakening of the Socialists offered another opportunity to the Communists to regain lost ground, but nevertheless the tactics of the Communists have served to lower their influence to a very small potential.

To make things worse for the Communists, two prominent former members of the party, Senator Guillermo Guevara, loyal spokesman for the poor and a former representative, and Marcos Chamudes, cultured orator and newspaperman, have made known publicly their repudiation of Communism. Senator Guevara in a written statement declared: "After 30 years' membership in the Communist Party, I have arrived at the conclusion that this Party is not managed by Chileans. Rather, it is governed by foreign elements who have nothing to do with Chile. Every move of the Party is made on orders received from foreign bosses who labor in the shadows. Many times, public opinion has been surprised to observe the contradictory steps of the Communist Party. For this there is only one explanation: the bosses give those orders, and the local servants have to obey."

Elections in West Germany

The Adenauer victory in the West German Elections have been boosted up in the Press of the Western democracies as being a vindication of their claims and principles. The Press in India has also supported that view, though in a luke-warm fashion. But here we have a slightly different picture from the *Worldover Press*. It shows that democracy has yet to go a good bit further before it can claim West Germany as being a convert.

"If you are one of those who are kicking up their heels in sheer elation because of Chancellor Adenauer's smashing victory in the West German elections, it may be worth suggesting that you might, if you care anything

about realistic facts, take it just a bit less enthusiastically. There are a number of good things about that election, but there are bad things also. The latter will be obscured for a time, but will gradually come to the fore.

The best thing, obviously, is the stunning witness given by the balloting to the bankruptcy of the Kremlin's program towards the German people. Perhaps the biggest single thing contributing to the Adenauer vote was the series of revolts last June in the Soviet Zone. Russian prestige took a nose-dive, just as, in the votes, did West German Communism. The Soviet Union, whatever else, will now have to reconsider its German policy drastically.

Another good thing was the heavy vote, which shows a desire of Germans to participate in national decisions. In a country that has had scant experience of democracy, and before the end of the war only one brief period under the ill-fated Weimar Republic, this is certainly encouraging.

Perhaps most important of all, however, is a pronouncement made by Adenauer in a post-election speech. Do you remember back to the beginning of World War II, and the role of Danzig and the Polish corridor? Many observers, this one among them, have felt that the greatest threat of war in Europe might well come from the determination of a remilitarized Germany to get back its eastern territories, now largely in the hands of Poland, by force. It is something, at any rate, to have the Chancellor on record as saying a solution could be worked out with a free Poland, and "in any case, this problem must on no account become the cause of a war."

It is natural for Westerners to want their policies vindicated, but have we come to the point where anything goes to get our desires? Adenauer's influence over the electorate cannot be separated from his methods in setting up the machinery in a way to favor his coalition. It is tied up, too, in his huge campaign slush fund, his wild accusations (almost unforgivable in view of his past tenderness to former Nazis and to the less spectacular totalitarians) that the Social Democrats had accepted financing from East German Communists. If anything, the Social Democrats are stronger anti-Communists, and they do not qualify their detestation of all totalitarians, Fascists and semi-Nazis included.

The Adenauer vote, of course, is being interpreted as primarily one for German rearmament and participation in the European Defense Community. That it must be so regarded to some degree is apparent; but the extraordinary economic revival under Adenauer will take first place in the minds of balanced commentators, as it surely did in the thinking of the Germans. The curious fact to be noted at this point is that one reason for the amazing prosperity of West Germany is its lack of expenditures on huge armies—the very armament the new Adenauer vote is supposed to have endorsed.

The relatively low vote achieved by the organized neo-Nazis is widely hailed as evidence that Nazi ideas

are dead. One could wish that this were true; but the most dangerous pro-Nazis are not in the openly neo-Nazi party. They are, instead, among those who backed Adenauer. If neo-Nazism is to wield influence, these people realize, it can happen best, and perhaps only, through the setting up of new German armies. Many of the old Nazi leaders "want in," and former General Herbert Gille has gone so far to curry favour that he contends the whole idea of a united Europe originated in the ranks of Hitler's SS forces! There are at least 150,000, and possibly 200,000, former members of the Elite Guard available for military service, and they know that to get in a new army, their best bet is Adenauer.

It may work out, as Adenauer believes, that his wide support assures the creation of the European Defense Community, but on that subject the French still have a lot to say. They are probably correct in foreseeing a stronger German intransigence over the Saar, their sorest point. They are not going to relish being faced with the alternative of signing up or losing help with their own arms contribution, while Washington goes on building up the Germans with thousands of tanks and the similar types of armament. American leaders were saying only a short time ago would not be given to the Germans for many years to come."

Newspaper Circulations

The following bit of news from the *Worldover Press* is of interest. It shows that newsmindedness does not merely depend on the literacy index or on the standard of living, both of which are the highest in the world in Sweden. It cannot be denied, however, that they are prime factors, as the figures for Asian countries outside of Japan would show:

Dublin.—Studies made of the press in Eire on Southern Ireland during 1950, and recently released, indicate that the total circulation of daily newspapers is 600,000. This is about 200 for each 1,000 inhabitants. The figure is regarded as low compared to many other countries, but is higher than that for Spain or Italy. Figures for the United Kingdom, per 1,000 inhabitants, are 598, for Australia 440, for Denmark 414, for Norway 410, and for Sweden 416.

Dr. Gopal Chandra Chatterjee

We regret to learn of the death of Rai Bahadur Dr. Gopal Chandra Chatterjee, the eminent bacteriologist, on the 16th October last at his Calcutta residence at the age of 84. He was a frequent contributor to the Scientific Medical Journals, and a great public worker. As founder of the Central Anti-Malarial Co-operative Society he was responsible for the establishment of several thousand village anti-malarial societies throughout Bengal. He also established the Home Crafter's Association at his native village at Sukchar. He also published several booklets for the improvement of fisheries, and on fish-culture; and on the decay of the Bengal rivers. We hope to publish some day a short sketch of his life with a list of his important scientific articles.

DECENTRALISED ECONOMY

An English View

By BIMALCHANDRA SINHA, M.A.

THE talk about decentralised economy is not a new one so far as India is concerned. Of late, this question was very forcefully raised by Gandhiji, for he felt—and rightly so—that there cannot be any real democracy without a decentralised economic structure. The classical pattern of industrial development and capitalist growth always leads to concentration, even on the world scale. In fact, Lenin successfully argued that Imperialism was the highest state of finance-capital where concentration attains its highest degree. In fact, in the heyday of capitalism, London was not only the capital of the biggest empire in the world, but it was also the hub round which world trade, commerce and finance revolved. A completely decentralised economy is obviously one answer to this evil of capitalism, the other answer being a still more concentrated economy after abolishing all individual ownership. India, however, never had a tradition of over-centralised economy. For one thing, there was never a strong Central Government controlling the whole of India before the British rule. The little village republics—so much idealised by Rabindranath in his *Swadeshi Samaj* and so much condemned by Marx in his *Letters on India* as so many seats of autocracy and conservatism—had been our usual pattern. For another, it is doubtful if our administrative machinery is still strong enough to bear the strain that an over-centralised and rigidly controlled economic system on the Soviet model will put on it. Finally, there is the question of individual liberty and the efflorescence of individual genius. Whether we accept all these arguments or not it cannot be denied that there are very strong practical reasons in favour of a decentralised economy for India.

It is interesting to examine in this background the developments that are taking place in some other countries, specially in Great Britain, the biggest centre of concentration. It should be, however, remembered that the changes that are taking place there are due to reasons mainly different from ours. Naturally their policies must be related to their past, to the world situation as it affects them and to the factors that are changing their economic structure. These would be naturally different from our own. Still there are some fundamental questions of universal interest. Moreover, we sometimes supplement the economy of Great Britain and other advanced countries of the world; the existence of an advanced type of economy as Britain had depends on the existence of underdeveloped countries like India. Industrialisation and development of backward countries correspondingly modify the economic pattern of the advanced countries and set up a new world pattern

as well. In a way, the two groups of countries present two sides of one picture.

PLANNING FOR DECENTRALISATION

England started planning her future policies even before the second World War. Changes during and after the war led to some changes, but the basic direction remains the same. Two major reports which discussed and shaped these policies are the Report of the Royal Commission on the Distribution of Industrial Population, 1940 (Barlow Commission)* and the Report of the Committee on Land Utilisation in Rural Areas, 1942 (Scott Committee-†). These two reports cover almost the entire area and indicate the policies regarding urban and rural areas. Various Acts have also been passed in accordance with the suggestions made in these reports and various organisations and authorities have started functioning under those Acts. On the present occasion we would confine ourselves to the first report, though the way in which Great Britain has been handling her land utilisation has also important lessons.

The terms of reference for the Barlow Commission fall into three parts. They were asked to find out, first, the causes of the present distribution of the industrial population and the probable direction of any change in that distribution in the future. Secondly, they were asked to examine the social, economic or strategical disadvantages of concentration. Thirdly, they were asked to suggest remedial measures, if any to be taken in the national interest. We shall describe the important findings of the Commission under each of the above sections separately.

BACKGROUND OF THE PROBLEM

At the beginning the Commission very aptly points out that two outstanding features of population growth have marked the last couple of centuries. The first has been the "astonishing expansion of the nations of the Western civilisation." The second, remarkable feature of population growth has been "the even more rapid proportional rate at which the great urban centres of Western civilisation have spread, overflowing their boundaries and forming sprawling agglomerations of humanity, many of dimensions without precedent in world's history." This change is mainly due to the effects of the Industrial Revolution. In Great Britain this development had certain distinctive features. First, the acreage of Great Britain in comparison with other Western countries is exceedingly limited in proportion to the size of its population. For England alone the

* Cmd. 6153 H.M.S.O., London.

† Cmd. 6378 H.M.S.O., London.

density per square mile was 766 in 1939 (West Bengal has however a higher density now). The second distinctive feature, comments the Report, is "the vast—and many would add alarming—growth of population in London and South-Eastern England, largely at the expense of the rest of the country." We shall have occasion to compare this overgrowth of London with the overgrowth of Calcutta.

CAUSES OF PRESENT POPULATION DISTRIBUTION

It is well-known that by the middle of the nineteenth century Great Britain had become the workshop of the world, and for the rest of the century the exports of the products of British mines, factories, shipyards increased while the imports of agricultural products and raw materials also increased. Great Britain also became a great exporter of capital. But all this has undergone very profound changes in the present century. The Commission notes several important changes and comments as follows:

"In all these respects the industrial structure of Great Britain has profoundly changed. In the first place the railways have lost their monopoly of inland transport and are faced with the keen and ever growing competition of road transport. Secondly, steam has lost its place as practically the sole source of power. It was the discovery of the internal combustion engine that destroyed the monopoly of railways. . . . Electricity and oil are being increasingly used as sources of power in factories and other large establishments. . . . In the third place the growth of international special-

isation in the sphere of industry has been checked, largely on account of a widespread protectionism generally termed economic nationalism. But as far as Great Britain is concerned that is not the only factor in the situation. The growing use of electricity and oil as sources of power and the growth of invention have reduced the advantages enjoyed by this country during the steam age and tended to foster the process of industrialisation in other countries. Moreover, the element of monopoly enjoyed by British trade though being the first in the field has disappeared through the industrial growth of other countries possessing similar natural resources and therefore reproducing the industrial structure of this country. Finally, the growth of new industries has been accelerated, to a marked extent, by specific inventions, such as the radio."

All these factors have fundamentally changed the industrial structure of Great Britain. The most important change is the growing importance of light industries in the place of heavy 'basic' industries. The Report points out that hitherto the principal 'basic' industries constituted the foundation of the industrial economy of the chief industrial areas in the North and the West. Now this is all changed. In fact, this is one of the reasons for the growth of London where certain new factors, such as the proximity to the market, availability of electricity and so on, are influencing the location of the new light industries in that area.

What was the distribution of the industrial population? The following tables would make the position clear:

TABLE I
Distribution of the Total Population

Area	Population in thousands				Proportionate population			
	1801	1901	1931	1937	1801	1901	1931	1937
1. London and the Home countries	1892	8655	11123	11843	18.0	23.4	24.8	24.8
2. Lancashire	673	4387	5039	5013	6.4	11.9	11.2	10.9
3. West Riding, Noths. and Derby	891	3953	4915	4964	8.5	10.7	11.0	10.8
4. Staffs, Warwick, Worcs, Leics and Northants	851	3404	4298	4482	8.1	9.2	9.6	9.7
5. Northumberland and Durham	318	1791	2248	2207	3.0	4.8	5.0	4.8
6. Mid Scotland	387	2277	2645	2738	3.7	6.2	5.9	6.0
7. Glamorgan and Monmouth	116	1158	1663	1568	1.1	3.1	3.7	4.4
8. Rest of Great Britain	5373	11375	12900	13193	51.2	30.7	28.8	28.7
Total	10501	37000	44831	46008	100	100	100	100

TABLE II
Distribution of the 'Occupied' Population

Area	Gainfully occupied population (thousands)				Proportionate number of gainfully occupied persons			
	1801	1901	1921	1931	1801	1901	1921	1931
1. London and the Home countries	519	3838	4614	5417	12.3	23.5	23.8	25.7
2. Lancashire	321	2090	2448	2591	7.6	12.8	12.6	12.3
3. West Riding, Noths. and Derby	356	1794	2153	2351	8.4	11.0	11.1	11.2
4. Staffs, Warwick, Worcs, Leics and Northants	439	1522	1864	2104	10.4	9.3	9.6	10.0
5. Northumberland and Durham	92	705	897	928	2.2	4.3	4.6	4.4
6. Mid Scotland	130	1021	1197	1212	3.1	6.3	6.2	5.8
7. Glamorgan and Monmouth	43	473	692	682	1.0	2.9	3.6	3.2
8. Rest of Great Britain	2316	4839	5557	5770	55.0	29.9	28.5	27.4
Total	4216	16312	19442	21055	100	100	100	100

Several features are noticeable. (1) There is heavy concentration of population—general as well as industrial—in certain regions. The seven specified areas constitute only 27 per cent of the total area of Great Britain, but their population in 1931 was 73 per cent of the occupied population and 71.3 per cent of total population. (2) London has been growing immensely. As the Report says:

"Over the period 1923-27 all the specified areas, except London and the Home countries and the Midland countries, lost position relatively to the country as a whole. . . . On the other hand, between 1932 and 1937 the insured population of London and the Home countries increased by more than 4,20,000 persons. . . . The rate of increase in the number of insured persons was nearly twice as high in London and the Home countries as in the whole country."

The main reasons are not far to seek. They are to be found in the changed economic conditions and altered industrial structure. In the words of the Commission:

"While the relative increase in the insured population in London and the Home countries is mainly due to the importance of the expanding industries in the economy of that area, it is partly due to the fact that the area has offered greater attraction than others to such industries as the distributive trades, general engineering, dress-making and millinery, miscellaneous metal goods industries, motor vehicles, cycles and aircraft, and chemicals. . . . After the war the decline of the 'basic' industries removed a population restriction upon the expanding industries, and this took place at a time when a spate of new inventions brought new light, or relatively light, industries into being."

The Commission therefore concludes that

"It would not seem unreasonable to anticipate that the importance of pre-war 'basic' industries may decline, and that that of other industries may increase, and in that event the industrial areas containing the former will only be able to keep up with the national rate of general industrial progress, if they are able to stimulate within themselves a growth of the miscellaneous light industries in excess of the rate of growth of such industries in the country as a whole." (Italics mine).

SOCIAL, ECONOMIC AND STRATEGICAL DISADVANTAGES

This is the picture of population distribution. Now what social, economic and strategical disadvantages? The Commission enumerates many, while not forgetting to mention the advantages as well. Its main conclusions are as follows:

Social: The main social problem is obviously the problem of health. On this point, however, expert opinion does not support the view that large towns must suffer higher mortality rates than the country. In fact, the gap between urban and rural mortality has already been narrowing. The adverse effects upon health of the defects of present urban life can be minimised by planning. The next problem relates to housing. At the time of the survey of overcrowding

made in England and Wales in 1936 in pursuance of Section I of the Housing Act, 1935, 342,000 dwellings were overcrowded. The number of houses still required to remedy slum and overcrowding is estimated by the Commission to be 430,000. Central re-development is enormously costly; land-values too are extremely high. Then there are other problems, such as lack of open spaces, smoke and noise and so on. The immense size of Greater London and its continued growth over a wide radius constitute a special problem from the social point of view. Considering all the social advantages and disadvantages the Commission advocates the following lines of policy, viz., (1) Continued and further re-development of congested urban areas, where necessary, due regard being paid to the retention of such advantages as a well-planned town can provide, and the addition, as far as possible, of the cultural and physical attributes of the country; (2) *Decentralisation and dispersal of both industries and industrial population from such congested areas* (italics mine); (3) Provision of checks, as far as possible, to the further growth of London.

Economic: We have already mentioned some of the economic factors involved. Besides these, the Commission further considers the advantages and disadvantages of localisation and specialisation, proximity to large markets, variety of occupations in large towns, street traffic congestion in large towns, separation of homes of work-people from places of work and effects of long daily journeys, increased land values, public burdens arising from the establishment of industries in undeveloped areas and, above all, the effects on agriculture. Having discussed all these points, the Commission concludes that

"Concentration of industry and the industrial population undoubtedly possesses definite economic advantages. . . . They may be briefly summed up as consisting of (a) proximity to market, (b) reduction of transport costs; (c) availability of a supply of suitable labour. . . . Great, however, as the advantages may be, they are accompanied by disadvantages, chief amongst which are (a) heavy charges on account mainly of high site values, (b) loss of time through street traffic congestion. . . . (c) the risk of adverse effects on efficiency and output on account of the fatigue incurred by work-people through having to make long daily journeys."

Strategical: We need not discuss this point. The conclusion is obvious. The Commission remarks that

"A policy of decentralisation or dispersal of industry from over-crowded areas is definitely to be recommended on strategical grounds."

THE FUTURE

Having discussed all these points, the Commission goes on to make its recommendations. These recommendations cover a very wide range which includes the creation of a central planning authority, setting up of garden cities, control of population and population distribution, development of the special

and depressed areas in relation to the balance of industry throughout the country, the special problems of London, transport and traffic, regionalism and the distribution of industry and so on. The main recommendations of the Commission have been summarised as follows in the Report itself:

1. A Central Authority, national in scope and character, is required.
2. The activities of this Authority should be distinct from and should extend beyond those within the powers of any existing Government Department.
3. The objectives of national action should be:
 - (a) Continued and further re-development of congested urban areas, where necessary.
 - (b) Decentralisation or dispersal, both of industries and industrial population from such areas.
 - (c) Encouragement of a reasonable balance of industrial development, so far as possible, throughout the various divisions or regions of Great Britain, coupled with appropriate diversification of industry in each division or region throughout the country.
4. The continued drift of the industrial population to London and the Home countries constitutes a social, economic and strategical problem that demands immediate attention.

The recommendations of the Commission are now given effect to through suitable legislation. The most important piece of legislation is the Distribution of Industry Act, 1945.

CONCLUSION

Several interesting facts emerge out of the above analysis. For long England has been the centre of world capitalism and she had reached a very advanced state of capitalistic development. Now that situation has completely changed. As Stalin recently pointed out, there has emerged a very big bloc of socialist countries and the capitalist system consequently no longer covers the whole world. Moreover, there has been an acute crisis within capitalism itself. As a result, capitalism has been trying to keep itself also through all possible adjustments. Emergence of light industries and the demand for decentralisation are only symptoms of that change. It is being increasingly realised that the concentration on 'basic' heavy industries, also concentration all along the line would be totally unworkable in the changed situation. Hence these changes.

Obviously, these factors do not operate in India. There has never been any proper development of the classical pattern of capitalism in India and there can never be. This does not however mean that there has been no development of capitalism in India. But from the very beginning there has been distorted growth. The only solution in this situation is a straighter and quicker transition to socialism without going through the whole gamut of capitalism.

It is from this angle that the British experiment has some important lessons for West Bengal. The

situation in Great Britain and the situation in West Bengal do not, of course, have the slightest similarity. Nevertheless, West Bengal has, in comparison with the other States in India, progressed more along the lines of distorted capitalism and has consequently reached a much deeper crisis than most of the other Indian States. The index of industrialisation is higher; so also the index of commerce and trade. There is a giant city and a big industrial region and this area is growing fast. But as we have tried to point out elsewhere, all these signs are not really signs of growth. In fact, all statistical data point towards rapid decay and disintegration and the deepening of the crisis. There is a regression towards agriculture; degree of dependence is increasing in every sector; there is growing concentration of wealth in every direction; there is consequential disintegration and that at a very fast rate—at the lower level—in all sectors, particularly in the agricultural sector. Owner-tenants are losing their land and becoming share-croppers; even fairly substantial peasants have been involved in loans for meeting the expenditure on food. The giant city of Calcutta and a few other cities are growing at the cost of the countryside and the other towns. There is, of course, a continuous drift from the country to the town,—but that is not always because there is any scope of more and better employment in the town, but because there is absolutely no possibility of even scratching a living from land for the surplus population. This situation calls for bold and fundamental changes. West Bengal falls into four natural regions, viz., (1) Roughly, the Burdwan Division excluding the sea-coast, this area being served by the DVC and Mor Projects; (2) The North Bengal region with their seasonal streams which can be dammed on the Swiss model; (3) Decadent Central Bengal consisting mainly of Malda, Murshidabad, Nadia and parts of 24 Parganas; and (4) The areas bordering on the sea, particularly the Sundarbans. These regions have different problems and each demands solution on lines peculiar to them. For these reasons it is not unreasonable to suggest that four semi-autonomous Development Boards should be formed for developing these four regions. Moreover, it is necessary to remember that there must be integrated development everywhere leading to a fundamental change in the structural economy. The Community Project scheme talks of integrated development, but for various reasons discussed elsewhere, the Community Projects are not expected to effect that widespread fundamental change which must be the first pre-requisite in any scheme of real development. Decentralised economy and regionalism, combined with integrated development of the entire area within the framework of an expansionist economy—this seems to be our only solution. In that matter the British experiment has interesting lessons for us.

THE POPULATION PROBLEM IN INDIA

By Prof. J. C. SINHA, M.A., Ph.D.

THE population problem lies at the root of mass movements of population from one country to another, not merely for political or religious reasons but "for fresh fields and pastures new." So far as our country is concerned, the population of the Indian Union in 1951 reached 357 millions, excluding the population of Jammu, Kashmir and some tribal areas, as compared with 315 millions, the population for the same territory in 1941. In other words, there was an increase of 42 million in ten years, i.e., a percentage increase of 1.25 per annum.

2. THE POPULATION PROBLEM, A WORLD-WIDE PROBLEM

From the economic point of view, the population problem is a world-wide problem, according to what Keynes said more than a generation ago.

"The time has already come," he said, "when each country needs a considered national policy about what size of population, whether larger or smaller, is most expedient and having settled the problem, we must take steps to carry it into operation."

3. CONCEPT OF OPTIMUM POPULATION

The first question which we have to decide is whether the existing population of 357 millions is the most desirable size for us at the present time. Optimum population means the most desirable size of the population of a country at any point of time, other things (e.g., capital, scientific and technical knowledge and natural resources) remaining constant. This optimum is, therefore, not constant in different periods of time. In the economic sense, the optimum is usually defined as the size of the population which is such as to produce maximum economic welfare. But the expression 'maximum economic welfare' cannot be precisely defined. It is not therefore possible to calculate accurately what constitutes the optimum population of the Indian Union at the present time. All that we can try to ascertain is whether there are symptoms of over-population or under-population in our country.

4. OFFICIAL VIEW, PAST AND PRESENT

More than a generation ago, the official view of our British rulers was that the undoubted poverty of the Indian masses at the time was due to over-population in the country. Our nationalist political leaders opposed this contention. In their opinion, India was then under-populated and the poverty of our country was due to the exploitation and mal-

administration of the British people. Mahatma Gandhi supported this latter view in the *Young India* of April 2, 1925, where he observed that with a proper land system, better agriculture and supplementary industries, India could then support twice her existing population.

It is interesting to note here that the present official view of our national government is that India is at present very much over-populated. As the *Draft Outline of the First Five-Year Plan* points out, during the 50 years from 1901 to 1951, the population of the present Indian Union has increased by about 52 per cent. According to this Report, while the sown area per person has steadily declined, the productivity of agriculture has remained almost stationary and industrial development giving employment to only 2.4 million workers, has so far failed to offset the pressure of population on land. As a broad outline, this is substantially true.

5. POPULATION AND FOOD SUPPLY

But how far is this official view supported by indisputable economic facts and theory? Let us first consider whether our existing food supply, not merely what we actually grow but also the excess of import over export of food-stuffs, indicates over-population. Mr. Kidwai, the present Food Minister at the Centre, expects that India will be able to do without any import of food-grains in the near future. But this appears to be too optimistic. With regard to the question of our food supply, the following points may be noted. First, our food production figures are usually, though not always, under-estimates. Secondly, we have to take an average of good and bad years in making our estimate of food position. Thirdly, we have to make an allowance for wastage after the crops have been harvested and stored. Such allowance for wastage has also to be made for imported stuffs after they have been stored.

But the most difficult of all problems is to ascertain with a fair degree of accuracy the per capita food requirements in our country. Thus Prof. K. T. Shah and Khambata in their *Wealth and Taxable Capacity of India*, came to the conclusion that for the average production of 1900-1922, there was a deficit of 40 per cent in our food-supply. Prof. Brij Narain, on the other hand, came to the opposite conclusion that there was no lack of food in the country during the twenties of the present century.

6. QUANTITATIVE FOOD REQUIREMENTS BY THE F.A.O.

Quantitative food requirements are now usually estimated in terms of heat units called calories, obtained from food products. According to the F.A.O. experts, a normal male of 25 years of age, living in the temperate zone of 50° F.H., and working 8 hours a day in light industries or agriculture, would require 3200 calories a day, while women, children and older people would require less. Climate is also an important factor. People of warmer regions would require a smaller number of calorific units. But the physiological minimum, as reported by the U. N. R. R.A. is 1400 calories per day for an average human being all over the world. The F.A.O. further estimated that the food supply of India provided on an average for 1601 calories per capita per day in 1951-52, a figure which is only 200 units more than the physiological minimum. Further, the protein content of average diet in India is lower than that in similar countries like Pakistan, Ceylon, the Philippines, China and Japan, etc. This will be clear from the Table¹ given below:

Countries	Estimated Energy and Protein Content 'Per Capita' of Daily Average Food Supply			
	Pre-war	1949-50	1950-51	1951-52 as % of 1950-51
Ceylon	2140	2010	2060	100
China (a)	2230	2030	2120	102
India (b)	1970	1620	1570	102
Indonesia	2040	1880	1950	101
Japan	2180	2000	2100	102
Pakistan		2240	2160	100
Philippines	1920	1860	2050	99
	Total Protein (Grams)			
Ceylon	48	46	48	101
China (a)	71	62	65	101
India (b)	56	42	42	102
Indonesia	46	42	44	100
Japan	64	52	53	100
Pakistan	..	60	58	100
Philippines	45	44	47	99

Further, the average Indian diet is very ill-balanced and is responsible for the prevalence of deficiency diseases. It seems therefore that India has more mouths than it can properly feed, thus showing signs of over-population.

7. TWO TESTS OF OVER-POPULATION

Is there no precise test for over-population? Two tests have been suggested by economic theory:

- Changes in the average expectation of life at different ages; and
- Variation in per capita real income, assuming that the distribution of income has remained substantially the same.

The first test was suggested by Dr. Drysdale in the World Population Conference, held at Geneva in 1927. This is also called the longevity optimum. It

means that if the average expectation of life increases, there is a definite increase in economic welfare and consequently little sign of over-population. The latest figures of an authoritative character for changes in the average expectation of life in this country are found in the *Actuarial Report*, attached to the *Indian Census Report for 1931*. It appears from this *Actuarial Report* that the average expectation of life for males of all ages up to 80 years, was higher in 1931 than in 1881, 1891, 1901 and 1911. (There is no Table giving average expectation of life in 1921 Census Report). But the *Actuarial Report for 1931* reveals the contradictory fact that females of ages 10, 20, 30 and 40 showed a decline in the average expectation of life in 1931 as compared with 1911 and females constitute about half of the total population.

In the subsequent Census Reports of 1941 and 1951, there is no table giving comparative figures for changes in the average expectation of life. We cannot therefore apply the first test in determining how far India is over-populated or under-populated at the present time.

Does the other test, viz., variation in per capita real income offer a more satisfactory answer to the question of over-population? Carr-Saunders, an authority on population problems, holds the view that when the per capita income is increasing, there is little sign of over-population, but on the other hand, when the average real income per head is declining, we have good reason to suspect over-population. Has our per capita real income been increasing or declining? Prof. Findlay Shirras in his article on the "Population Problem in India" in the *Economic Journal* (Lond.), March, 1933, estimated that the per capita real income in India, was gradually increasing from 1901 to 1929-30, though there was a fall in real income in 1921 as compared with the figures for 1911. He therefore concludes that India was under-populated up to 1931.

The *Eastern Economist*, on the other hand, in its Annual Number, 1948, came to the conclusion that during the period of the second World War and immediately after its close, the per capita money income of British India, as adjusted by the Bombay Cost of Living Index Number, declined from Rs. 67 in 1939-40 to Rs. 59 in 1946-47. In other words, by 1946-47, British India was over-populated.

For the next few years, no comparable statistics of per capita national income is available. The Ministry of Commerce, Government of India, gives the following estimates of average money income per head for the Indian Union before the integration of States, in 1945-46 and 1946-47, viz., Rs. 204 and Rs. 228 per annum. The Mahalanobis Committee's estimate for the Indian Provinces and the States in 1948-49 is Rs. 255. These figures refer to different areas and have not been converted into real income by an appropriate index number.

But it may² be said that for years after 1940-47, there has been no material change in our economic condition; on the other hand, population was increasing, as revealed by the last Census. Thus our available statistics does not enable us to give a precise answer as to the degree of over-population in India at the present time. All that we can say is that our country is somewhat over-populated.

8. LONG PERIOD TREND OF OUR POPULATION

Is our present population going to double itself during the next 50 or 60 years, as recently prophesied by a member of the Central Ministry?³ The Planning Commission also observe:

"It has been assumed, as a first approximation, that population will continue to grow over the next generation at the rate of 1½ per cent per annum."⁴

In other words, the population of the Indian Union would reach 500 millions at the end of 25 years. But in finding out the long-period trend of our population, neither the existing excess of births over deaths nor the annual percentage increase of population during the last decade, alone is adequate. We should try to ascertain the net production rate, as suggested by Prof. Kuczynski in his *Measurement of Population Growth*. The pertinent question here is this: Are fertility (i.e., actual number of children born) and mortality such that 1,000 newly-born girls during the span of their lives, give birth to 1,000 girls or more or less?

Prof. D. Ghosh in his *Pressure of Population and Economic Efficiency in India* assumed the fertility rate of Cochin to be the fertility rate of India and applied it to the all-India Life Table for female population in 1931. He came to the conclusion that the net reproduction rate for India at the time was 1.10, i.e., under the influence of current fertility and mortality conditions, (these rates remain substantially the same for long periods of time unless major political, economic and social changes intervene) the population of India had a tendency to increase at the rate of 10 per cent per generation of 25 years. Subsequent Census Reports do not give accurate data for the calculation of the net reproduction rate in India. It should be remembered in this connection that in a more recent study by Prof. Kingsley Davis the net reproduction rate for undivided India in 1930-31 is calculated to be higher, viz., 1.26.⁵ This is all the more surprising, for the basic fertility rate is the same in either case, viz., that of Cochin.

Prof. Davis has, however, used the Chilean rate in his detailed calculation, because of its similarity with the Cochin rate. But such coincidence should not blind us to the many discrepancies in political, economic, social, religious, psychological and racial conditions of the two countries, on which the fertility rate ultimately depends. To sum up, it is difficult to estimate the net reproduction rate of the Indian

Union at present, unless necessary data become available. All that we can say at present with confidence is that we have an increasing population, but until we arrive at 1.40 as the net reproduction rate, we cannot conclude that the population would increase by 40 per cent, i.e., would reach 500 millions in a generation. A priori arguments, such as declining mortality urged by the Planning Commission, point to an increasing population but do not estimate future population accurately. It is out of the question to make any forecast worth the name as to what our future population would be after two generations in the present state of our statistical information on the subject.

THE REMEDY FOR OUR GROWING POPULATION

Even if we avoid all exaggerated statements, we have to face the problem of growing population fairly and squarely. There is no specific remedy but there are several remedial measures which may be broadly classified under three heads: (a) moral restraint, late marriage and birth control in the first place; (b) increased productivity, both of industry and agriculture for raising the standard of living of the masses in the second place; (c) and in the third place, fiscal and other measures, i.e., attempt through taxation and other means, e.g., social security schemes, a better distribution of wealth within the framework of the present capitalistic order. Further, elementary education must be more broad-based than at present. If adequate funds are not available for this purpose, there may be, if necessary, conscription of college students as temporary teachers during their long vacations, supplemented by a smaller number of regular teachers. And above all, there must be real emancipation of women.

Moral restraint is undoubtedly the best remedy, but it is confined to a limited number of people in whom the sense of responsibility is sufficiently developed. The age of marriage of both sexes, has already been raised among the middle classes but it is yet to come among the masses. Birth control also is still a far cry, specially among our uneducated classes and illiterate agriculturists. It may, however, be hoped that with the spread of education specially among women, such measures would be more widely used in our country, to make the planning of family possible. The limited number of birth control clinics which have been started, have already done something to relieve the misery of middle-class mothers, suffering from repeated child-bearing. More clinics of this type should be established with State aid by responsible persons who should take sufficient care to impart this knowledge only to married people as far as practicable. Moralists who object, should note that the lack of birth control measures has not infrequently brought about utter demoralisation, famished children and dying mothers in the poorer ranks of our society.

Mainly on eugenic grounds, there should be compulsory sterilisation by the State of the leper and the lunatic as far as feasible.

It should, however, be recognised that birth control measures alone cannot solve our population problem. We have therefore to concentrate on the second kind of remedies, viz., increased productivity, both of our industries and agriculture. The word 'productivity' is deliberately used, for greater production at a higher cost, might lead to further inflation, if the consumer can be coerced to buy at higher prices. In other words, we should aim at a larger output, both in industry and agriculture, with greater efficiency than at present. Let us hope this will be achieved, even partially, under the Five-Year Plan. Moreover, if the system of taxation becomes more equitable and there is a better distribution of wealth in the country, if there are wider social security measures and greater spread of knowledge among the masses, their standard of living is bound to rise and with such a rise in the standard of living, birth rate is likely to decline, as has been the experience of many advanced countries in the West. As Prof. Brentano rightly observed long ago:

"With increasing prosperity, mankind generally rises above the state of blindly giving way to its animal instincts, and so parents become more and more conscious of their responsibility both for the character and number of human beings whom they bring into the world."

So far as character is concerned, we have some leeway to make up, for unfortunately, we are still in

the days of Walpole when almost every man had his own democracy in our country becomes genuine, if "from log cabin to the White House" becomes a reality in this land, the hope and ambition of rising in life might induce many an able man of limited means with no great social connection, to reduce the size of his family, as has happened in England where within a few generations the average size of a family has declined from 5.5 to 2.2.

There is thus no panacea for our population problem. All that may be urged is that we should not take any alarmist view of the problem and indulge in wild statements. We should apply all the remedies suggested above, with patience, courage and faith in ourselves.

—:O:—

PROBLEMS OF INDIAN AGRICULTURE

By PROF. B. K. SINGH, M.A., B.COM.,
Benares Hindu University

GENERALLY speaking, agriculture is the mainstay of Indian prosperity. The people depend upon the primary industries for a living, with little development in the secondary industries of manufacturing. Whereas in 1931, among the gainfully employed population, agriculture claimed 67.1 per cent, only 10 per cent were employed in the field of manufacture.¹ While the advanced countries have passed from the stage of primary occupations to that of secondary or tertiary occupations, primary occupations predominate in India, and even secondary and tertiary occupations are embedded in the former. The following figures elucidate the position. The Table² shows the distribution of occupations in four countries:

Countries	Primary (Agr., Forestry and Fishing)	Secondary (Mining, Building and Industries)	Tertiary (Commerce, Transport & Services)
1. U. S. A.	19.3%	31.1%	49.6%
2. Canada	34.5%	23.2%	42.3%
3. U. K.	6.4%	43.9%	49.7%
4. India	62.4%	14.4%	23.2%

"It is evident that the key to the Indian economic problem lies even more in improving agricultural standards and productive power than in the creation of large-scale industries apart from such improvements. Only a rise in the standards of peasant consumption can provide a secure basis for intensive industrial development."³

The significance of agriculture in India's economy and its inter-relation with the expansion of industrialisation needs to be appreciated. Improved agriculture

3. C. D. H. Cole: *An Intelligent Man's Guide to the Post-War World*, p. 815.

ensures the supply of raw materials to the industries which, in their turn, create a demand for agricultural products and increase the income of the farmers.

"One might consider industrialisation as one chapter of agricultural reconstruction, or might treat the improvement of agrarian production as one chapter of industrialisation. What matters (in regard to underdeveloped agrarian economies) is to remember that the two are interconnected parts of one problem."

The Famine Commission (1877-78) emphasized the development of industries, other than agriculture, to solve the unemployment problem in India. But the success of a well-co-ordinated and balanced programme of industrialisation must necessarily depend upon the proper development of the agricultural resources of the country, for the foundation of our prosperity is essentially agricultural. The fate of cotton and jute industries depends directly upon the production of these two commodities. To have a balance between rural and urban economies, agriculture must be the base and industry the apex and not vice versa.

Agriculture is the fundamental basis of the national economic structure of India. It provides the source of livelihood to about four-fifths of the population and furnishes 75 per cent of the annual income of the country; it supplies 90 per cent of the products for the internal trade. The important role of agriculture in our economy cannot be over-emphasized. Our economic progress is inextricably linked up with the development of agriculture.

Why is it, then, that Indian agriculture, judged by the test of productivity, has remained unprofitable, backward, and unprogressive and fails to obtain increased yields?

Why is agriculture in India "only 86 per cent as efficient as the average production in the important countries of the world, but compared with most of the European countries, scarcely more than 50 per cent as efficient?"⁴

It is of paramount importance to analyse the causes of agricultural inefficiency and adopt measures to eradicate them. We cannot raise the standard of living of the masses unless we restore agriculture—the soul and barometer of our economic order—to a position consistent with the accepted modern standards of market economy.

India is not deficient in the natural resources or physical factors which influence the development plans of a country—it needs only to fully utilise them in a sound pattern of economic reconstruction by sustained and concerted efforts.

An increase in population and decline in output resulted in a lower standard of living. Thirty-five per cent of the population is unable to secure adequate food even under normal conditions. The intensive pressure upon land due to the problem of "too many people and too little capital," to quote Sir E. John Russell, gives rise to severe agrarian poverty and increasing deterioration of agricultural lands. High pressure agriculture would naturally be unprofitable. It is imperative to reduce "the incidence of the density of population through adjustment of regional resources to the regional dynamics of population," through a "programme of economic administration so as to increase the propensity to consume of the rural population and to maintain a reconstituted structure of occupational distribution."

Productive efficiency can only be enhanced if technical improvements are effected. There is no gainsaying the fact that the crux of the agricultural problem is the inability of the rural machinery of adjustment to effect technical improvements due to a rigid cost-price structure and extreme poverty.

To hold that "the central problem is psychological, not technical" forces us to a blind alley and compels us to leave the 'intractable' problem by proclaiming that our economic difficulties are possibly insoluble.⁵ However strong-willed the cultivator might be he cannot improve his methods of cultivation while the present technical and institutional defects in Indian agriculture persist. It was idle on the part of the Royal Commission on Agriculture in India, 1928, to blame the outlook of the peasant and to state that he lacks the will to achieve a better standard of life when they admitted that

"In a country with such a long history little surprise need be felt that a system of tillage based on experience should have reached a stage beyond which further progress was bound to await scientific discovery,"

and when they confessed that

"The cultivation of rice in the deltas has reached a marked degree of perfection and the wisdom of many agricultural proverbs remains unchallenged by research."⁶

It is from no lack of knowledge or skill, but from the inexorable conditions under which he lives, that the Indian peasant suffers.⁷ It has been aptly remarked that

"The troubles of Indian agriculturists are due to the presence of objective disabilities than to the existence of subjective deficiencies."¹²

On the technical side, Indian agriculture suffers on account of its inability to adapt itself to the dynamics of a competitive world economy. The farmer produces commodities irrespective of market conditions, profits or prospects of future demand; he sells at the harvest-time when prices are lowest and accepts prices which the intermediaries are willing to pay. This reduces his occupation to a level of mere subsistence. In fact, as was revealed by the inquiry into the costs of production of crops conducted by the Imperial Council of Agricultural Research, the margin of profit calculated on an accounting basis, is often negative and the producer is only able to eke out a meagre existence.¹³

The microscopic scale of farming caused by subdivision and fragmentation of holdings should yield place to economic holdings, "which will provide an average family the minimum standard of life considered satisfactory."¹⁴ The process of sub-infeudation and morselment of land, scattered holdings, and seasonal unemployment* should be stopped by the laws of inheritance.

"Unless and until, therefore, land owning or holding is wholly nationalised and reconditioned as a public enterprise, eliminating the profit motive—under a system of co-operative farming—there is little hope of this great problem being solved."¹⁵

An integral scheme of land reclamation, rehabilitation of credit, reduction of rural indebtedness, provision of manures and implements, a regenerated cattle economy, adequate transport and marketing facilities, establishment of a parity between agricultural and industrial prices, would alone be able to redeem Indian agriculture from the vicious circles of subsistence economy.

The system of farming must be flexible enough to adjust itself to the changes in the quantity and quality of food that the consuming public requires. It requires the transition of agriculture from a way of life to a form of business by breaking down the shackles of subsistence economy and the establishment of medium-scale agriculture.

"The farmers," says A. G. Street, "are watching their capital shrink steadily year after year, in a hurt and bewildered frame of mind."¹⁶

This sort of muddled fatalism must surrender to constructive optimism. The marriage of agriculture with the latest improvements in the technique of farming provides the initial premise of a sound agricultural policy and gives us a clue to solve our complex problems.

"The nation has a right to ensure that all land is put to the best use and that it is adequately equipped for its purpose."¹⁷

"This objective can be achieved only if our schemes of agricultural improvements are projected into a proper system of land tenure. Land tenure is of basic importance and is an essential prerequisite for other agrarian reforms."¹⁸

The remarks of R. H. Tawney are illuminating in this context:

"Improvement of agricultural methods is, no doubt, indispensable; but it is idle to preach that doctrine to cultivators so impoverished by the exactions of parasitic interests that they do not possess the resources needed to apply it. In the Europe of the 19th century, the reconstruction of the legal fabric of the land system preceded the modernisation both of productive technique and of the business side of farming; nor, in the absence of the first, would the last two have been possible."¹⁹

All the schemes to renovate agriculture, however, founder on the rock of irrigation. Indian agriculture depends upon the vagaries of the weather. Insufficiency, irregularity or uncertainty of water supply is the crux of the problem.

"Agriculture in India has been a gamble in the monsoon, to the vagaries of which irrigation is the only effective solution."²⁰

Irrigation is the most essential requirement of cultivation and a regular and adequate water supply is the main problem on the solution of which depends, *inter alia*, the success of any blueprint on agriculture. It is an inevitable factor for the increase of agricultural production.

"Among the measures that may be adopted for increasing the area under cultivation, the first plan must be assigned to works for the supply and conservation of water."²¹

The scarcity and uncertainty of the main source of water supply, the annual rainfall, is the principal source of worry and a constant headache to the Indian peasants.

21. Dr. Vera Anstey : *Economic Development of India*, p. 1.

No substantial improvement in agriculture can be effected, security in future against calamitous failures in the food supply cannot be obtained unless we follow the classical example of river culture that has been tried in Germany and America.

"Irrigation is everything in India," observes Sir Charles Trevelyan and adds, "water is more valuable than land because when water is applied to land it increases its productivity at least six-fold, and generally makes a great extent of land productive which otherwise would produce nothing or next to nothing."²²

This aspect becomes more striking when we realize that the whole country is dependent upon the timely arrival of the monsoon, because all major agricultural operations are regulated by this phenomenon. The great advantage of irrigation was that it lessened the threat of famines, danger from the vagaries of the seasons was mitigated and agricultural improvement was encouraged.

Irrigation helps commercialization of agriculture by stimulating cultivators to produce for the market, and not only for home-consumption. Agriculture, which is today vitiated by the features of subsistence economy, would cease to remain impoverished and sapped. It would become a flourishing occupation and a national industry. It would also ensure the full employment of the natural and human resources associated with the land.

Real and enduring agricultural progress cannot be visualized without consolidation. Any programme that aims at the economic amelioration of the rural areas must give the problem of consolidation of agricultural holdings the first priority. This can be achieved only when the planning authority is prepared to strike at the root of the evil and effect a fundamental change in the customs and laws of inheritance which allows 'each heir to take a share of each field wherever situated' thus subjecting land to a continuous series of 'economic earthquakes' due to subdivisions.²³

Apart from the social consequences, the evil of subdivision gives rise to a number of economic problems. Defective agricultural operations, inadequate supervision and little interest in far-away fields, waste of time in moving bullocks, ploughs and implements from one field to another, loss of valuable space on account of hedges, mud-walls and demarcation boun-

daries which gives rise to boundary-disputes, affrays and quarrels on account of cattle trespasses and litigation (which means enormous waste of money and increased indebtedness), congested living and unhealthy surroundings—all these defects arise due to subdivision and fragmentations of holdings. No improvement measures can be carried out on a piece of land measuring two to four acres. It means uneconomic and wasteful agriculture.

"It is calculated that expenditure for cultivation of land increases by 5.3 per cent for every 500 metres of distance for manual labour and ploughing, 20 to 35 per cent for transport of manure and 15 to 32 per cent for transport of crops. It has been further observed that on compact holdings the income from farming would be increased by at least 20 per cent without any modification in the methods of cultivation."²⁴

The restoration of agriculture on a sounder footing requires the increase of a reduced output to a more normal volume and the 'regeneration of a historical trend towards technological advancement'. Reconstruction of the rural framework has to embrace both functional and institutional reform if we are to be successful in giving to the plough its original glory as the symbol of our prosperity.

India is pre-eminently suited to intensive farming if only the inherent natural and economic advantages are properly exploited in a well-co-ordinated scheme of economic conservation along indigenous lines that do not prove alien to the genius of the peasants dwelling in the area. It is futile to import foreign methods and put up pockets of apparent economic plenty with the rest of the state submerged in the old pattern of subsistence farming. It is high time that we implemented a well-knit plan of rural conservation throughout the State. 'Glass-house' planning and laboratory research should yield place to constructive field work.

We must realize that our agriculture has been caught in the vortex of inefficient production and competitive exchange. We are no longer in the area of economic isolation. The economic backwardness of the rural population can be removed by a decentralized industrial structure and by providing opportunities for industrial employment close to the home of the rural population. This would stop what Prof Lionel Robins calls 'the drift of the land' and the virility of the village as a social unit would be restored.

WHAT IS THE TRUE PROPORTION OF THE HINDUS IN BENGAL?

By J. M. DATTA, M.Sc., B.L., F.R.S.S. (Lond.)

Mr. PORTER, the Census Superintendent of Bengal for 1931, speaking of the accuracy of the Census, says:

"In 1921, the Census Superintendent estimated that the figures returned were not likely to be wrong by more than one per mille of the whole population and that the accuracy was considerably greater for rural areas. A similar claim can confidently be made also on the present occasion." (See page 2 of the *Bengal Census Report*, 1931, paragraph 4).

Mr. W. H. Thompson, the Census Superintendent of Bengal for 1921, writes thus:

"The census of a stay-at-home rural population through the agency of local people under the careful supervision which was exercised over them, is an operation which, even in a country where education is not far advanced, may be one of great accuracy. Almost every rural enumerator had lived all his life among the people he was to enumerate and was personally known to nearly all of them. The urban population is no more than 6½ per cent of the whole. . . . It may be considered very unlikely that the census total is out by as much as one per mille and it is probable that it is very much more accurate." (Vide *Bengal Census Report*, 1921).

The same Mr. Porter speaking of the accuracy of the census figures for Calcutta, says:

"It is difficult to give a confident estimate of the accuracy of the figures recorded. It is customary for a great outcry to be raised as soon as the Census of Calcutta had been taken and allegations are freely made that there has been a wholesale omission of persons who should have been recorded. . . . On the whole, it is unlikely that the enumeration on the present occasion was less accurate than in 1921 and as then it is possible now also to claim that the inaccuracy does not amount to as much as 2 per mille and is probably nearer 1 per mille." (See page 2, paragraph 4 of the *Calcutta Census Report*, 1931).

Although the claim for accuracy within 1 per mille has been made the basis of this assertion has nowhere been discussed in the Reports. We have had our doubts, and we tried to show in the *Science and Culture* for February, 1941, that this claim is untenable.

The *Encyclopaedia of Social Sciences* says:

"The accuracy of a Census is ordinarily judged by the accuracy with which the population has been counted, and that under American conditions is, according to the expert opinion of Francis Walker and Carrol Wright, probably within one per cent of the truth. (Italics ours). . . . Negroes are enumerated less accurately than Whites and the probable error of that count may be as high as two per cent." (See Vol. II, p. 300).

If in civilised America with a very high percentage of literacy and paid enumerators, the inaccuracy of

the census count is of the order of 1 or 2 per cent, in India it is expected to be higher.

The 1951 Census was acclaimed throughout the country as the "First Census of Free India"; and therefore succeeded in securing public co-operation in much more abundant measure than on any previous occasion. This has been admitted by the Registrar-General of India. In particular the press was exceedingly helpful. In the 1941 Census, as is generally known, there was competition between the communities in parts of Bengal and the Punjab with the result that numbers were inflated. The Muhammadans of East Bengal, mostly rural areas, inflated their numbers by some 26 lakhs; i.e., by some 10 per cent. The Pakistan Government in their *Census Pamphlet No. 2* admits that there has been inflation of the number of Muslims. Over-enumeration of this wilful and anti-social character, motivated by communal politics, was fortunately absent this time. Further both in 1921 and in 1931, the Hindus boycotted or neglected the census operations on account of the Non-co-operation and Civil Disobedience movements of the Indian National Congress.

It would be reasonable in these circumstances to conclude that the 1951 Census is a better and more accurate enumeration than the previous ones. But how good is this enumeration? It cannot be claimed that it presents the exact truth, and there are no errors or omissions. Let us remember that even in truncated India, i.e., Bharat, there are six crores and forty-four lakhs of houses to be visited; and there were 59 lakh enumerators, mostly unpaid workers. It cannot be claimed that they made no mistakes; that every occupied house, without any exception, was numbered; that every numbered house, without any exception, was visited; and that every person in every house was enumerated without any exception.

The Registrar-General admits that

"Omissions were not merely probable, they must have occurred. This is true as much of the Census in India as in all other countries. Again, as the count has necessarily to be taken over an extended period, and the people move about during the period, one cannot be absolutely sure that the same person was not counted in two different places by two different enumerators, even though every precaution had been taken in advance in order to guard against this contingency. Over-enumeration is, therefore, possible though far less likely than under-enumeration."

The United Nations in one of its publications speak about the accuracy of census enumeration thus:

"The completeness of enumeration can be estimated by a well-planned verification carried

out immediately after the original enumeration in a scientifically selected sample of the areas. Where this has not been done, the extent of under-enumeration or over-enumeration can sometimes be estimated afterwards by comparing the census figures with data from other sources, such as nominally-complete population registers. Tests of completeness can also be made by examining the consistency of the return for certain population groups, such as males and females in various age classes, or by comparing the results of successive Censuses for individual localities or population categories. However, a scientific appraisal of the accuracy of census results has been avoided by the official statistical agencies of some countries. The result is an unfounded impression in the minds of uncritical users of the figures that they are perfectly reliable. In some countries there is a progressive tendency to discuss frankly the defects in census statistics, but until this practice becomes general it will be difficult to determine with any precision the degree of reliability of the figures for most areas of the world."

A precise estimate of the extent of error present in the Census count in India has never been made before. That it is possible to make such an estimate through verification organised on a random sample basis is a recent idea. Sri Prasanta Chandra Mahalanobis' investigations have made it possible and made it a practical proposition. When this possibility was brought to the notice of the Government of India, they approved the proposal that a sample verification of the 1951 Census count should be carried out.

This verification has established that the 1951 Census count contains a net under-enumeration of error. For the country as a whole, the nature of this under-enumeration may be thus described in the words of the Registrar-General, India:

"For every thousand persons included in the Census count, eleven other persons were probably omitted. It is a reasonably safe conclusion that the number of persons omitted (per thousand counted) could not have exceeded 12 or fallen short of 10."

The estimate of error present in the 1951 Census count varies from State to State, zone to zone; and from rural to urban areas. We give below the relevant figures for India and East India only:

Verbal figures for 1951 Census	Verified household population per 1,000 persons enumerated in 1951 Census	Reasonably safe limits for actual household population per 1,000 persons enumerated in household	
		Lower limit	Upper limit
<i>India—</i>			
General	1,011	1,010	1,012
Rural	1,010	1,009	1,011
Urban	1,014	1,012	1,016
<i>East India—</i>			
General	1,018	1,016	1,020
Rural	1,015	1,013	1,017
Urban	1,049	1,038	1,060

As is to be expected the under-enumeration is greater in urban areas than in rural areas. The above difference represents the net inaccuracy of enumeration, the resultant of both under-enumeration and

over-enumeration. Compared to the rural the urban under-enumeration is 3.4 per cent more.

Although there are good reasons to suppose that the census enumerations in 1921 and in 1931 are more inaccurate than in 1951, let us assume that the order of inaccuracy is the same.

We shall now discuss the effect of inaccurate count in the earlier censuses in calculating the proportion of the Hindus and the Muhammadans in Bengal. In all subsequent discussions we take the Hindus to be synonymous with the non-Muhammadans.

The percentage of the Muhammadans in Bengal has shown to be 53.55 in 1921, and 54.44 in 1931 in the Census Reports. Even if the census count be correct to 1 per mille, the calculation of percentages to second place of decimal is unjustified.

The religious distribution between rural and urban areas has been shown to be as follows:

	Number living in towns per mille of the total population of each religion		
	Hindus (pure)	Non-Muhammadans including Hindus	Muhammadans
1921	107	107	35
1931	115	115	37

As more Hindus both absolutely and relatively in urban areas than Muhammadans the chances of Hindus being under-enumerated is greater. The amount of under-enumeration in the case of Hindus is $3.4 \times 115 / 100$ or 4.91 per cent and that for the Muhammadans is $3.4 \times 37 / 100$ or 1.26 per cent. The resultant disadvantage in the case of the Hindus is 4.91—1.26 or 3.65 per cent. In 1931, 73 per mille of the total population lived in towns or urban areas, the disadvantage of the Hindus in the total population is .27 per cent.

Thus their real percentage in the population is 45.83 and not 45.56 as recorded in the Census.

This we have calculated on the assumption that under-enumeration in both cities and towns are of the same order. It is common knowledge that greater the urbanization greater are the chances of escaping census enumeration. Mr. Porter is inclined to admit that the census of Calcutta is twice more inaccurate than that of Bengal. Our experience as the Secretary of the All-Bengal Census Board in 1941 tends to confirm us in the belief. There may have been an inflation of the Hindus; but my own brother-in-law residing in the 4th flat of B block of Jatindra Mansions escaped enumeration. And this in spite of the fact that the local Charge Superintendent of Census being a member of our Board, and a councillor of the Calcutta Corporation.

If one person escapes enumeration in an ordinary town, three or four persons escape enumeration in cities like Calcutta.

The population of all cities in Bengal in 1931, was 16,24,100. Of the number of Muhammadans was 4,29,683. The disadvantage of under-enumeration in the case of Hindus, numbering 11,94,417, is $(11.94-4.30) \times 34 \times 3 = 78,000$. The effect of such under-enumeration on their communal percentage is $78/232.77 \times 100$ —the population of Hindus 0.34 per cent. Their percentage is more likely to be $45.83 + 0.34 = 46.17$ than what is recorded in the Census. But our estimate is bordering almost on speculation.

Throughout the above discussions we have proceeded on two assumptions, viz., (1) the order of inaccuracy in 1931 is the same as in 1951; and (2) in the rural areas the inaccuracy of count is the same for both the Hindus and the Muhammadans, irrespective of their mobility.

In the 1921 Census Report and Tables, occupations by religion were given. Of the Muhammadans 77.3 per cent were "ordinary cultivators"; the corresponding percentage amongst the Hindus being 48.9. Of the persons engaged in trade more than three-fourths were Hindus; of the persons engaged in transport, a little over one-third were Muhammadans. The ordinary cultivators are from the very

nature of their calling immobile, and are likely to be correctly enumerated at the census. Not so those who are engaged in trade and transport even in rural areas.

The total under-enumeration in East India is found to be 1.5 per cent. If we assume the enumeration in the case of ordinary cultivators to be correct, then the under enumeration in the case of the rest of the rural population would be 3×1.5 per cent as nearly two-thirds are engaged in such cultivation. If we take the under-enumeration of non-cultivators to be midway between the averages of rural and urban under-enumeration, it would be $(1.5+4.9)/2 = 3.2$ per cent.

Let us take 4 per cent to be the order of under-enumeration in the latter case. The communal disadvantage of the Hindus would be

$[(51.1-22.7) \times 4]/4$ or 1.1 per cent of the rural population. As 93 per cent of the total population is rural the communal disadvantage of the Hindus would be more than 1 per cent.

Thus their total disadvantage is 0.27 per cent for urban population, plus 1.02 per cent for the rural population = 1.29 per cent. Thus their communal ratio may be as high as 46.9 per cent.

—:O:—

HISTORICAL BACKGROUND OF THE INDIAN NATIONAL MOVEMENT

By NANIMADHAB CHAUDHURI

THE cultural revolution which took place in Bengal shortly after the introduction of English education marked the opening chapter of the history of the Indian struggle for freedom under British rule. The renaissance movement with its keen consciousness of rich cultural heritage, its profound emotional emphasis on nationalism and lofty challenge to the Britisher's moral right to rule India, which started in Bengal in the second half of the nineteenth century, as a result of this cultural revolution, gradually crossed provincial boundaries and embraced the whole of India. "Young Bengal" of the 'thirties and 'forties was the father of Young India, still lying in the womb of time. Mahatma Gandhi writes in his *Indian Home Rule*:

"What you call the real awakening took place after the Partition of Bengal. . . The spirit generated in Bengal has spread in the north to the Punjab, in the south, to the Cape Comorin."

It is proposed to show by means of contemporary documents that though it took the rest of India as late as 1905 to feel the full effect of the awakening in Bengal, the awakening really began half a century earlier.

Before we proceed to trace the progress of the renaissance movement in Bengal a brief outline of the

historical and political background of this movement without which the picture that we wish to draw will be incomplete, may be given here.

The first of the several movements which formed the background of the renaissance movement, was anti-British in its origin and started among Indian Moslems. It is known as the Wahabi movement. It began as early as 1823-24. Its basis was religious assertiveness and the principal object was re-establishment of Moslem supremacy in India which had been lost to infidels. Its secondary object was religious and social reform, that is to say, restoration of Islam in India to its original purity by doing away with un-Islamic excrescence which had crept into it due to long contact with infidels.

Though anti-British in its origin the first target of the Wahabis was the Khalsa State. In Bengal, there was a Wahabi insurrection in 24 Parganas under Titoo Mir in 1826 and the target was the Hindus. The story of the Wahabi plots leading to the Mulka and Sittana campaigns in 1863, arrests in Bengal and Bihar in 1868, assassination of Lt. Omaney and subsequent assassinations of Mr. Justice Norman and Lord Mayo is well known. Wahabism spread to East Bengal and the activities of the sect, known as Farazi, are reported from time to time from 1872 to 1910.

HISTORICAL BACKGROUND OF INDIAN . . . MOVEMENT

Referring to the spread of Wahabism in India, Hunter wrote in the third quarter of the nineteenth century:

"Fifty years ago the Moslems were simply a recognised caste. Through the preachings of the Maulvis a change was brought about. They have ceased to be merely a separate caste in the rural organisation and have become a *distinct community*."

This means that within seventy years of the establishment of British rule in India the bonds of Hindu-Moslem unity cemented through several centuries of efforts in the religious, social, literary and political spheres were undone. English historians have euphemistically described the fact as Moslem revival.

Though anti-British in its origin the Wahabi movement has nothing to do with the Indian nationalist struggle in its aims, character and methods. Though the primary object of the movement failed, the seed of separatism which it sowed was of great significance in the Indian political agitation.

Reference may be made next to the greatest event of the nineteenth century in India, namely, the mutiny of a large section of the Indian army. The great rebellion of 1857 was the third mutiny of the Sepoy army; the first broke out at Vellore during the regime of Sir John Shore and the second at Barrackpore under Lord Amherst.

Vir Savarkar has described the great mutiny of 1857 as the first war of Indian independence; but in this war, the religious and emotional aspects were more prominent than the political aspect. It was a remarkable phenomenon in the sense that it was a combined blow of the Hindus and Moslems against the alien rulers of the country, but they combined not for the same purpose. The Moslem sepoys joined the mutiny with the hope of re-establishing Moslem supremacy in the country while the Hindu sepoys rose in revolt deeply stirred by the fear of clandestine attack on their religion and suspicions about the motives of the educational and social reforms of the alien Government. They joined hands with the Moslems without any clear conception of the political effect of their action; probably they did not see anything objectionable in the prospect of re-establishment of Moslem supremacy. All those who joined the mutiny undoubtedly had in common the desire to drive away the hated alien usurpers but their political programme did not go beyond restoration of the *status quo*. The British had created large vested interests in the country and there were innumerable active and passive supporters of the English in every stratum of

society. They had under them plenty of loyal Hindusthani sepoys to fight and kill the mutinous Hindusthani sepoys.

There is little doubt, however, that if the sepoys had succeeded the united India which the British had built up through a century of efforts would have broken into pieces and the awakening of Indian nationalism would have been delayed, no one knows how long.

We come next to the Indigo rising (1860-61) in Bengal. The Indigo rising was the first example of organised non-co-operation or passive resistance in this country and the authors of the movement were the ryots of Bengal. The basis of this non-co-operation movement was purely economic, no lofty spiritual or emotional inspiration was needed to prop it up.

The Indigo Commission wrote in their report:

The ryots unitedly refused to sow indigo. "The circumstances were favourable to this revolt, and the ryots showed firmness and zeal for resistance and for combined action."

Referring to a few acts of violence committed by them the Commission wrote: "There was great excitement among the ryots. When an excitable but intelligent mass is roused up and prepares to think and act independently it is not unexpected that there would be some excesses." The Government of Sir Peter Grant, L. G. of Bengal, was all along sympathetic to the disaffected ryots.

When a few years later (1868-69) the indigo ryots of Champaran in North Bihar unitedly refused to sow indigo and sowed winter crops in indigo lands the planters grew furious. The Government rebuked them so severely that they lost heart.

The large-hearted sympathy and generosity which the Government showed in their dealings with the Santal rebels (1854-55) characterised also their dealings with the intransigent indigo ryots.

In the background of the new movement which the English-educated middle-class Bengalis started in the second half of the nineteenth century there were three different trends of the movements noted above, the trend of Moslem separatism arising out of the Wahabi movement, the trend of armed rebellion deeply tinged by religious zeal and racial hatred, but without a clear and politically conscious objective of the Sepoy Mutiny and lastly, the trend of organised non-co-operation or passive resistance of the Indigo rising.

The progress of the new movement will have to be studied against this historical and political background.

INDIA AND CHINA

By PROF. S. N. AGARWAL

EVERYBODY talks of China these days. There is no harm in talking about a neighbouring and friendly country which is bound to India by cultural ties through the ages. But it is certainly wrong to under-rate our own achievements and lull ourselves into the delusion that China has found a panacea for all the ills from which India suffers. We have full admiration for what China has been able to achieve during the last three years in various phases of national life. She has been able to fight successfully the twelve-year-old inflation; nation-wide agrarian reforms have liberated the peasants from feudal tyranny; vast river projects have been instituted to change the face of nature and supply power and irrigation; new factories have been built and new mines opened. The new Chinese Government has also succeeded considerably in checking corruption and inefficiency in administration and in increasing agricultural and industrial production to an appreciable degree. But we cannot afford to forget that China has adopted the path of dictatorship and totalitarianism. Chairman Mao Tse-tung has coined a new term for such a political organisation and calls it the "People's democratic dictatorship." It is, however, quite clear that this new administrative pattern will be almost the same as the well-known "dictatorship of the proletariat" which, while solving certain problems, has given rise to a host of other problems through the regimentation of mind, men and machines. While India won her political freedom against an alien rule through peaceful and non-violent methods and established a broad-based democratic state, China suffered a prolonged agony of Civil War and founded a 'one-party' dictatorship through blood and violence.

It is true that India's Independence was less spectacular; it was a smooth and peaceful transfer of political power with hardly any changes in the administrative machinery. We were surely spared from a number of hardships and agonies which come in the wake of a violent revolution. But India had also to inherit many ills and shortcomings of the British administrative set-up which still continue to be a source of hindrance in our path of quick progress. Nevertheless, it will be improper to undervalue our own achievements during the last six years of freedom. India had to face the stupendous task of rehabilitating about 75 lakhs of people uprooted from Pakistan. Thanks to our able leadership and administrative planning, our country has been able to solve the problem of displaced persons better than many other nations of the world. We have so far spent about 180 crores of rupees on relief and rehabilitation; about 200,000 refugees have been placed in jobs through the Employment Exchanges; over 80,000 have been absorbed in the Union and State Government offices. The Government has succeeded in settling about 16 lakh and 25 thousand people on land in

different parts of the country. Provision has been made for about 25 lakh displaced persons in evacuee houses or new tenements and there is a proposal to construct 30,000 new tenements during the current financial year. Besides solving the onerous and arduous task of rehabilitation, the Government of India integrated 600 and odd feudal States into the Union within a few months after Independence. Thanks to the wisdom and foresight of the late Sardar Patel, this process of consolidation without a fireshot was unprecedented in the history of the world. India was also able to frame and inaugurate a new Constitution within two and a half years of political freedom. This Constitution, based on democracy and adult franchise, is, surely, one of the best among the constitutions of the world. Within two years of the framing of the Constitution, the Government of India could prepare the electoral rolls of about 18 crore adult voters in the country and successfully hold the General Elections on an unprecedented scale in the annals of public administration. During the last six years, India has enjoyed political stability and civic peace which are rare commodities in Asia and even other parts of the globe. Besides political freedom, India has also prepared and launched her First Five-Year Plan for the attainment of social and economic freedom. Although our Plan is not very ambitious, it is the first Plan of its kind under a democratic set-up and occupies a unique place in the history of economic planning in the West as well as in the East. Community Projects covering about 20,000 villages in the country have already been started and the National Extension Service is expected to serve all the 5½ lakh villages within a period of 7 or 8 years. About 800 crores of rupees are being spent on giant Multi-purpose River Valley Projects which will irrigate about 17 million acres and generate 1.5 million KW of electric power. A chain of National Laboratories have been set up in India for conducting Research in different fields of modern science. Besides the expansion of Industries in the private sector, the Government has been able to start Key Industries like the Sindri Fertiliser Factory, the Chittaranjan Locomotive Works, Indian Telephone Factory, the Hindustan Shipyard, the Hindustan Aircraft Ltd., the Machine Tool Factory, the National Instruments Factory and the Oil Refineries. A Scheme for the erection of a 100-crore Iron and Steel Plant has also been finalised recently. Far-reaching Land Reforms, abolishing Zamindari and other feudal rights, have been enacted in almost all the States in India. More radical measures in the form of the fixation of ceilings on land holdings are being adopted by different State Governments. Acharya Vinoba Bhave's *Bhoodan* movement has shown a novel way of solving the problem of land redistribution through peaceful and non-violent means. The collection of about 21 lakh acres of land so far through voluntary donations is unique in the annals of

human relationship in the world. All these are remarkable achievements of Free India for which we should all be legitimately proud. There is, however, no cause for complacency; we must not rest on our laurels and try to subsist on past achievements. We should constantly review our faults and shortcomings and quicken the pace of progress in the social and economic spheres.

We should look at China in a spirit of healthy emulation. We should admire her achievements but should not be blind to the other side of the picture. We hear very much about the land reforms in China. But do we know that there is still the system of individual proprietorship in land and that the new Chinese Government has not yet taken away land owned by "rich peasants" and cultivated by themselves or by "hired labour"? Portions of land rented out by rich peasants have also remained untouched. The *Agrarian Reform Law* provides that "land and other properties of the middle peasants (including well-to-do middle peasants) shall be protected from infringement." In certain respects, therefore, the land reforms in China are even less revolutionary than those of India. In the Industrial sphere, China is still following the system of "mixed economy" in which there is great scope for private enterprises; in fact about 80 per cent of the trade capital in China consists of "private capitalist enterprise." These capitalists in China are, of course, called by a high-sounding name, "national bourgeoisie." As Dr. Gyan Chand recently observed, private enterprise in China was "not merely tolerated, but was assigned an integral part in national development projects." Even enthusiastic Communist workers do not hope that China will be in a position to achieve full Socialism in less than 20 years. A study of Labour laws and regulations in China will indicate that they are not very much more progressive than those in India. So far as Law reforms are concerned, China has scrapped the old legal system and has evolved a new type of People's Courts in which there is not much room for professional lawyers. It cannot, however, be claimed that the Chinese Courts follow any codified laws yet; the personal factor counts for much in the administration of Justice. The Government of India has now announced the introduction of a legislation incorporating far-reaching Law reforms in the country. China and India can both learn from each other in this sphere. The Chinese schools, colleges and universities have, undoubtedly, changed a great deal. But well-known Indian educationists like Dr. Amarnatha Jha and Prof. Mujeeb have not been impressed by the new educational and cultural standards. The Chinese Universities have huge libraries but teach hardly anything except the writings of Lenin, Marx and Mao. There is not much "academic freedom" in these educational institutions; indoctrination and "brain-washing" of the young boys and girls is not very conducive to the growth of balanced and broad-based thinking. The freedom of Press and expression, whatever

may be said to the contrary, is also considerably curtailed. There is, perhaps, some freedom of self-criticism within the Party; but there is not much scope for the freedom of expression in general. Tall claims are made for a great increase of production in the agricultural and industrial sectors. We are told that the production has "doubled" or "trebled." But there are no reliable and scientific statistics yet to indicate the exact position. It is surprising to know that China is now preparing for its *First Census* on a nation-wide scale. The Communist countries have developed a special technique of world-wide publicity through which only the bright side of the picture is made known to the public. We must admit that India has yet to learn the art and science of proper publicity. We should not, of course, indulge in one-sided propaganda; but our achievements should be properly presented to the people to arouse their enthusiasm and to clear certain misconceptions. In India we are averse to the importing of foreign experts. But do we know that, according to figures given by Karanjia himself, there are 60,000 Russian experts in China at present? India has been able to evolve a positive policy of neutrality in International affairs. But has China been able to develop her own personality apart from that of the U.S.S.R.?

Let us, therefore, not lose our sense of proportion. China has, undoubtedly, been able to achieve much during the last three years. India also has many creditable achievements to her credit. In both countries, there is still much that remains to be done. We should, therefore, approach the task of improving the social and economic condition of the masses in a spirit of humility and service. It is no use extolling one country to the skies at the cost of the other. China has chosen the path of totalitarianism although it may be pleasantly termed as the "dictatorship of the masses." India is wedded to the method of democracy and peaceful revolution for the attainment of social and economic ends. It is wrong to think that the totalitarian method is always fast and that the democratic way is necessarily slow. Given the will and the clarity of vision, democracy can be as fast, if not faster, as dictatorship. Democratic functioning of a State is also more sure, steady and lasting. We should, therefore, try to learn the good points of China as also those of other countries of the world. But we should always bear in mind that each country has to pursue her path of salvation according to her own genius and culture and traditions. It is good to be critical of our own achievements. But to decry our own work and unduly praise the work of another country will be, to say the least, unpatriotic! We earnestly believe that India is a land of destiny and has a definite message to give to the world. That message is the message of Gandhi, Nehru and Vinoba. It is our sacred duty to keep this message always in our thoughts and to try our utmost to implement that message with humility, faith and determination.

THE EXTENT OF UNEMPLOYMENT IN INDIA

By BELA BOSE, M.A.,

Professor, Hoogly Women's College

THREE years after the introduction of the Five-Year Plan, the Planning Commission has become very much worried at the growing unemployment. Increase in unemployment with the progress of the plan indicates that there has been something radically wrong in the plan itself. The main purpose of the National Economic Plan should be an all-round economic development of the country. No plan will be worth its name unless it can assure full employment or something very near it and a fair standard of life. Our Five-Year Plan seems to have failed here. The primary reason for this failure is our lack of data on the degree and nature of unemployment, both actual and potential. The Chapter on Unemployment in the Five-Year Plan discusses the problem only from the standpoint of public works. This may be a temporary solution. A lasting solution may be found only through perennial sources of employment.

Any data about unemployment that we have in our country relates only to frictional unemployment. No attempt seems to have been made to ascertain the degree of the other two sectors of unemployment, namely, involuntary and disguised. Only people on the frictional sector of unemployment register their names at the Employment Exchange. We have yet no arrangement to record or ascertain the number on the other two sectors of unemployment. An attempt will be made here to determine the degree of unemployment in the second and third sectors.

A study of India's sources of livelihood since 1901 reveals that pressure on land has been steadily on the increase and livelihood from industrial occupation on the decline. For example :

Changes of Population in Livelihood Groups

	(In millions)		
	1901	1911	1921
Primary production	192	227	231
Industry	40	35	33
Commerce	4.2	18	18
Profession, etc.	10	11	10

In 1931, Census dependents are not shown. But the trend is the same. Later censuses are incomplete.

With the growth of population employment on agriculture is increasing. In the industrial field there has been a definite decline in the number of persons since 1901. Industrial advancement has not increased employment. The number of persons employed on industry before and after the first

World War was the same in spite of the fact that a rapid and substantial industrial development had in the meantime taken place. Employment on the secondary sector in 1921 is very much lower than it was in 1901. The only explanation that may be offered is that the lower employment was due to higher mechanisation and gradual elimination of smaller industries. This alone explains why employment fell when industrial production increased. The four-fold increase in the tertiary sector, that is, in commerce, confirms this view.

The following table showing a breakup in the industrial employment further confirms this view :

Total Workers and Dependents in Different Industries (Figures in 000)

	1901	1911	1921
Cotton textile	574	459	479
Silk	93	49	14
Earthen & stone wares	357	189	196
Brick and tile	14	35	81
Butter and ghee	1.2	15	57
Cane-work	162	139	137

Here it is found that with increasing mechanisation in textile production, namely, the introduction of spinning jenny and power loom, employment in this field fell from 574,000 in 1901 to 499,000 in 1921. With the appearance of artificial silk, employment on natural silk industry had a drastic fall from 93,000 to 14,000 during the same period. Taking Murshidabad, the home of silk industry we find that employment in it fell from 40,217 in 1901 to 21,338 in 1911 and to 2,912 in 1921. Similarly with the appearance of aluminium and enamel wares, earthen and stone wares declined. A large number of people in this essential industry were driven out of the field. The rise in the standard of living and the increase in the number of the middle class, specially during the war, registered a high increase in brick and tile, and butter and ghee industries. The demand for modern houses encouraged the brick and tile industry while the increase in the purchasing power of a particular section was the cause of expansion in the latter.

The serious condition of involuntary and disguised unemployment has been revealed in the General Report No. 1 on the First Round of the National Sample Survey issued by the Department of Economic Affairs, Ministry of Finance, Government of India. According to the 1941 Census Reports for the areas which are now included in the Republic of India, the

THE EXTENT OF UNEMPLOYMENT IN INDIA

375

average size of household in the rural area was 4.99 persons. Since then population has increased. The Sample Survey Report gives the average size of household in 1951 as consisting of 5.21 persons out of which 1.46 persons or 28.1 per cent are earners, 0.87 persons or 16.6 per cent are earning dependents and 2.88 persons or 55.3 per cent are non-earning dependents.

TABLE A

Average number of persons per Household in Rural areas and their economic status in 1950

Economic status	Persons	Per cent
Earners	1.46	28.1
Earning dependents	0.87	16.6
Non-earning dependents	2.88	55.3
Total	5.21	100

Any employment plan will be unsuccessful unless we start from this base. The problem may be colossal but it is real.

The disguised nature of unemployment is seen even amongst the earners, whose average income is almost half of average expenditure. The following two tables from the N. S. S. Report are relevant :

TABLE B

Annual expenditure on consumption in the Rural Areas

Item	Rs. per household
Food	758
Fuel and light	37
House rent	7
Clothing, bedding, tailoring charges	121
Miscellaneous including pan, tobacco and intoxicants	221
Total	1144

The annual expenditure incurred per household is Rs. 1,144.

TABLE C

Value of production in Agriculture and Animal Husbandry

Item	Rs. per household
Value of agricultural crops	403.32
Value of livestock products produced and consumed at home	47.89
Value of livestock products produced	14.56
Total	465.77

Cost of agriculture and animal husbandry has been assessed at Rs. 107.32. Therefore the real income from agricultural products comes to

Rs. 465.77—Rs. 107.32=Rs. 358.45.

The income from agriculture and animal husbandry comes to Rs. 358.45 per household.

The All-India averages of the value of production and costs per household in industrial production are given in the Table below :

TABLE D

Production and costs in household industrial establishments in Rural Areas

Item	Rs. per household
1. Value of production	80.07
2. Costs—	
1. Fuel and power	2.66)
2. Raw materials	52.09)
3. Maintenance and repair	1.25)
4. Other expenses	9.36)
	65.36
3. Value added gross of depreciation (1 & 2)	14.71
4. Income from industrial servicing	4.70
5. Total of items 3 & 4	19.41

Income from industry is therefore Rs. 19.41.

Of the household selected for completing the enterprise schedules in the Sample Survey, only about 7 per cent were found to have any handicrafts or trading activities.* Particulars on industry, crafts and trade, including fixed capital, machinery and tools, fuel, power, raw materials, quantity and value of production, types of labour used, source of finance and income from industrial servicings were included in the Household Schedules for detailed information on household enterprise.† The production from enterprises not owned by rural households (i.e., those owned by jointstock companies, local and provincial Governments, Co-operatives, households living in Urban areas, etc.) were excluded from the survey.

All-India averages of values of stocks and turnover per household in trading are given below :

TABLE E

Gross Trading income in Rural Areas (July 1949 to June 1950)

Items	Rs. per household
1. Value in cost price of opening stock and replenishment	158.99
2. Value in cost price of the closing stock	20.46
3. Cost price of merchandise sold=(1-2)	138.53
4. Value in selling price of merchandise sold	179.10
5. Gross trading income=(4-3)	40.57

The gross trading income per household is thus Rs. 40.57. Here again the trading operations done by non-household enterprises or by households living in Urban areas but operating in Rural areas have been excluded from the scope of this survey.‡

All-India averages of incomes from services of various types are given in the Table below. The particulars in this case were not restricted to employment in household enterprises only but covered employment in non-household enterprises also.

* National Sample Survey Report, p. 59.

† Ibid., p. 44.

‡ Ibid., p. 60.

TABLE F

Gross income from services in Rural Areas
(July 1949 to June 1950)

Items	Rs. per household
1. Agriculture and animal husbandry, forestry, fishing	94.18
2. Exploitation of minerals	2.58
3. Manufacture	14.30
4. Construction of building	13.00
5. Electricity, gas, water supply, and sanitary services	3.25
6. Trade, commerce, real estates, trading, etc.	11.01
7. Transport, storage and communication	30.43
8. Professional services	56.89
9. Others (including services not specified)	4.02
Total	229.66
The total income comes to	
Agriculture	Rs. 358.45
Industry	19.41
Trade	40.57
Services	229.66

Rs. 648.09

In the present study for the calculation of the income per household in rural areas, the income from all the sources of livelihood existing in the village have been taken to constitute the total income. But this is not the actual case. One household does not have all the sources of income. Generally most of the people pursue mainly one type of profession, i.e., they follow either agriculture or industry or trade and so on or at the most, they may have two together. In that case the matter would be all the more worse. The best case, i.e., where one household has all the four sources of income, has been taken as the basis of our calculation and even that reveals the staggering deficit mentioned above.

The extent of the gap is therefore—

Rs. 1144—Rs. 648.09=Rs. 495.91.

Here the income has been calculated on the basis of the income-data of the National Sample Survey Committee. The per capita average income has been assessed by the National Income Committee at Rs. 255. This should give an income of

Rs. 255 × 5.21 = Rs. 1328 per family.

But this figure is a composite average of the incomes of the rich and the poor, Urban and Rural population taken together. The disparity of income and opportunity of employment in Urban and Rural areas in this country are so widely different that any application of the National Income Committee's figure to

the Rural sector will be far from the real state of affairs. Therefore, the calculation of rural income and expenditure made in the National Sample Survey Report has been relied upon while assessing unemployment in Rural areas.

Thus, where income is Rs. 648.09 and expenditure Rs. 1144, the only way to fill up the gap is either reduction in standard of life or increase in rural debt. In India, we find both. If we believe that nobody wants to starve or to be in perpetual debt, we must assume that if employment is provided for these people, they will readily accept it, that is, although disguised it is one of involuntary type.

For the present let us make a rough calculation about the numerical extent of actual unemployment. In Table A above, it is found that 23.1 per cent are earners, 16.6 per cent earning dependents, and 55.3 per cent non-earning dependents. In terms of numbers this will be—

Earners—23.1 per cent of 36 crores=10.1 crores.

Earning dependents—16.6 per cent of 36 crores =6 crores.

Non-earning dependents—55.3 per cent of 36 crores =19.9 crores.

Therefore, 19.9 crores are totally unemployed while the earners, that is, 10.1 crores are under-employed because they cannot meet their family budgets. The exact number of involuntary unemployed persons would come to 10 crores if we deduct from it 9.9 crores as children, women unwilling to work, the old and invalid. These people wholly depend on others for their existence. But they are able-bodied men and women who are ready to work at any rate of remuneration if they are given the opportunity. Our society fails to employ them and therefore they are involuntarily unemployed.

The deficit budget of the family thus proves that though employed in some sort of work these people cannot maintain their family properly. Their true nature is however obscure. Apparently they appear to be engaged but in reality they are underemployed. They have, therefore, been rightly described by Mrs. Robinson as disguised unemployed. Ten crores of earners plus 6 crores of earning dependents constitute the total number of disguised unemployed who are definitely not frictional. Approximately the number of disguised and involuntary unemployed persons is, therefore, 10+10+6=26 crores.

The problem now is one of numerical extent and however colossal it may appear, it must be solved.

SUFFERING HUMANITY AND DECENTRALIZATION

By MANKUMAR SEN

If anything characterises the Gandhian way of life and distinguishes it from the various 'isms' of the world which are nothing but degenerated sectarianisms mostly, it is the ardent advocacy for utmost decentralization of our political and economic administration. In fact the very basis of 'Gandhism' is the conception of a decentralized democracy. Gandhiji adopted Truth as the End and Non-violence as the Means to that End. Naturally, therefore, centralization of power and production which for all practical purposes shields the use and spread of violence and thrive on irreligious behaviour, completely materialistic outlook and utmost machinization, is repulsive to Gandhism. To Gandhiji, villages were the real portrait of India, her culture and heritage, village republics the basic units of Democracy and village industries the life-blood of economic organisation. 'Industrialism is, I am afraid, going to be a curse for mankind'—this was the warning of that great seer to the machine-mad world.

INDUSTRIALISM AND INDIVIDUALITY

Those that can look ahead and look introspectively have no manner of doubt to-day, that the road to a 'quantitative civilization' that the Industrial Revolution of the nineteenth century opened up is the road to dehumanization and disaster of the civilized society. Through machine and mechanization a vicious force of de-personalization has been let loose. Man's unique personality has been trampled under giant machines. The 'Democracies' thriving on industrial economy, extremely centralized, have actually lost their balance and fighting one another in the competitive market which can hardly ever contribute to the cause of world peace. Scramble for profits in industries induces, for obvious reasons, the curtailment of the wage-structure to lessen the cost of production and make the marketable goods cheaper. Thus the wage-earners who constitute a large percentage of the consuming public are hit hard and slump shadows the market in absence of adequate purchasing power. In this way, the human beings in factories receive no better deal than other commodities with use-value. Money being the only criterion of valuation, specific human features, vocational trends of individuals are being blotted out conscientiously and there is 'robotism'—or movement of human machines all around. Vocations or pursuits of man are being made to conform to set patterns or standardized institutions and not the vice-versa. Raw materials are dumped on cities or industrial towns thus depriving the village industries their rightful share in the same and the villagers their natural occupations.

The emphasis has thus shifted on to the city-centres, and the villages, despite their natural resources and man-power, are starving and decaying rapidly.

ROLE OF MACHINE

Originally machine was conceived of as a willing slave of man, and now by virtue of its dominant role in factory civilization man is being made to serve the machine—his master. Sacredness of individuality is sacrificed for abundant material possessions, for more and varied production for bringing more money. This tragic devaluation of fundamental human values is noticeable on a vast scale today—in standardized production, in mendacious sale propaganda, and in so-called amenities of life. In every sector, it is the vague and viciously dangerous idea of 'average man,' not the very natural dissimilarities, peculiarities, mental make-up, hereditary habits or the nature of life's yearning, that holds the field. The result is that man himself has been made a mere abstraction. "Truth and beauty of human life bring only disdain for their un-realism or incompatibility with the modern age!" But is not the history of civilization the collective chronology of individual achievements? Teachers, poets, prophets, philosophers, architects, musicians, social workers and a host of others—have not they in their own way developed and enriched what we call civilization today? Is it acceptable even to the meanest intelligence that all such thought-currents can be standardized and made to obey a set pattern, a centralized behaviour, without wanton detriment to humanity or individual personality itself? Unfortunately, the world around provides only a contrary answer. We have so far probed into the deepening ills of centralized capitalist economy and its attendant administration—now, we turn to the land of communism.

COLLECTIVE EGO

Manifestations of a collective ego at the cost of individual enterprise and liberty of expression of one's self in the land of communism depict a still more disappointing picture of standardization and centralization. Here, of course, unlike the Democracies, the concentration of power both political and economic is by the State itself. As Rene Fullop-Miller, a noted pacifist, observes:

"In order to turn individual man into collective man it was imperative to exterminate his individual soul, that is the main spring of his unique personality. There was neither place nor need for individual thought, feeling or judgment. Man was called upon to give up his individuality so that he could more easily be turned into a spare part, an interchangeable

screw in the 'social machine.' The supreme goal was a mechanized and purely quantitative combination of human mass-particles that would obey the laws of collectivity and thus attain collective bliss. Gandhism discards outright this regimentation. Gandhiji believed in the essential oneness of man, yet according to him, 'The individual is the one supreme consideration.' To him goodness or badness of an individual was really a concern of the whole community, nay of the whole world."

A small body of determined spirits fired by an unquenchable faith in their mission can alter the course of history—that was Gandhiji's firm conviction. He was not prepared to submit the individual to the tyrannical bogey of collectivism and 'historical inevitability.'

LIFE AND LIVING

Confusion between 'life' and 'living' seems to explain these pitfalls of Industrialism otherwise strewn with many blessings too. Caught up in the whirlpool of material possessions resulting from revolutionary changes in the technique and scale of production we have confused 'living' with life,—have made a tragic equation of bountiful life and bountiful living. Thanks to machine, the standard of living has reached dazzling heights, at least in some countries,—but by no stretch of imagination they can be said to have evolved a proportionately high standard of life. Rather, the craving for material satisfactions has naturally belaboured the soul of man so much so that thoughts of sublimation and expression of the inner self, however respected in academic lessons, no longer determine the way of man's life. We have changed quite naturally, with the change of times; but rejection of the eternal human values and wholeness of man in the frantic search for a materialistic civilization has axed at the very root of human progress. Life's art and beauty are quickly drying up, nobility and nicety of the soul are decaying due to increasing aggressiveness of the outer world. Bereft of the charm of nature, the holy threads of community life, the standardized man of modern democracies makes no different reading from abstractions, statistical metaphors. The flight of the soul is being wrecked at every step and a vain attempt to substitute the emotional urge, the desire for real life with rotten, repulsive and exciting things and theories only precipitates the last days of this machine age.

CITIES AND SMALL COMMUNITIES

Man's love for cities, for superficial living in the centres of attractions away from the abundant blessings of Nature—the villages—has developed either from economic necessity or from a surrender to the necessity of the handful of persons that hold the reins. We now see that the civilization as transformed since the advent of the 'Machine Age' has no more than the remotest connection with good life. Concentration of wealth and power that constitute the attributes of this age have no regard for simple and noble life, no respect for the 'whole man.' In fact, this industrial and centralized

civilization cannot but discard 'man' as the highest creature on earth for its own sinister designs. But in this wild manifestation are revealed the values of small community where human relations, sense of social service and responsibility, and Nature's unbounded influence determine the way of individual and collective life. Nature being the finest teacher of man, individuality and greatness of mind is most pronounced in decentralized small communities. Neighbourliness and simple living instead of complex and utterly mechanistic life of the cities cannot develop in the soul-less, un-social ways that obtain in the din and bustle of the industrial towns. Once we can limit ourselves to the genuine wants, build up self-contained co-operative village units free from drudgery and complexity, exploitation and regimentation, scramble for power and profits, life will become purposive, vital and dynamic. Gandhiji has shown by his words and deeds, the number of institutions and organizations, the pattern of such a society based on village industries and village republics. Spiritual isolation and starvation of the mind that obtain in large populations have no scope whatsoever in decentralized societies where the influence of nature and willing co-operation alone count. Of all the ancient civilizations, India is most noted for her agro-industrial communities with real communism as the propelling force. To those that shout to the housetops in favour of the scientific civilization as an unmixed blessing the following quotation from Prof. A.V. Hill's (President, British Association for the Advancement of Science) speech delivered on 3-9-52 under the title "The Ethical Dilemma of Science" should be an eye-opener:

"Completeness and dignity are brought to man by three main channels, first, by the religious sentiment, and its embodiment in ethical principles, secondly, by the influence of what is beautiful in Nature, human personality or art and thirdly, by the pursuit of scientific truth and its resolute use in improving human life."

Gandhiji conceived of Absolute Truth as the End and Non-violence as the Means; means for individual as well as group practice. Village industries and village republics are the basic steps on this way. They opened up the way to what is called practical non-violence. Non-violent living is attainable only by self-imposed discipline, which alone can produce hardy, diligent, responsible and talented individuals, rich and powerful societies based on moral values. This disciplined behaviour coupled with an intimate knowledge of one's neighbour makes an impregnable defence against the infiltration of narrow ideas, sectarianism, and ignoble imitations. Too many pitfalls have tarnished the long road beginning from the Industrial Revolution. It is high time we take up the ways and means to a better life with much lesser possessions,—which is the Gandhian way. Modern civilization with a faulty edifice is bound to tumble down unless the decentralization of economic and political organization is taken up in all earnestness.

GIUSEPPE MAZZINI AND MAHATMA GANDHI

By ANTHONY ELENJIMITAM

In the history of nations, from time to time, there appear a few individuals who become the incarnate spirit of a nation and, at the same time, become the representative mouthpiece of the entire human family. In such men nationalism and internationalism, patriotism and humanity are not antithetical truths, but one integrative of the other. It is so remarkable that such prophetic minds, idealists to the core, appear in some most critical periods of history of a nation. Providence and fortune conjure up to rain down torrents of new light and life through them.

They finish the job which Heaven has assigned for them and, then, depart from the stage of historical man. But their ideals and influence continue to work far more powerfully after their death than during their life; for, being prophets beyond the common reach of the masses, it takes decades and even centuries to unfold the significance and mission of such men. It is long after they are dead and gone that generations, historians and thinkers begin to appraise them in their real perspective. As Kahlil Gibran says: "It is long since the cedar tree has fallen, but its fragrance endures, and will for ever seek the four corners of the earth."

II

If the history of the Italian *Risorgimento* has so many striking parallels with the Indian Independence movement, Giuseppe Mazzini is the Mahatma Gandhi of India and Gandhiji is the Mazzini of Italy. If, of the triumvirate of the Italian *Resorgimento*, Mazzini were the prophet, Cavour the diplomat and Garibaldi the soldier, then Mahatma Gandhi is the prophet, Jawaharlal Nehru is the statesman and Subhas Chandra Bose is the soldier of Indian Independence movement. These two men, viz., Gandhiji and Mazzini are seers, prophets, ethical revolutionaries, pioneers of freedom of body and soul, heralding the future still unborn.

Mazzini was not merely the representative prophet of Italy, but the image of the classical Latin civilization symbolised in Rome; Rome that ruled over the world for centuries under Caesars; Rome that rules over nations under Popes; Rome that still has the potential power to integrate both Caesar and Pope and spiritually and ethically be the mistress of the western world, not any more through domination, exploitation, imperialism and military prowess, but through the motherly warmth of Latin civilization, the invisible empire of imponderable values and ethical culture. Mazzini himself lived in a state of exultation, being for ever conscious of his vocation to uphold the banner of that Roman civilisation which makes the Eternal City, *caput mundi*, which made him bless with the same idealistic enthusiasm both *urbem et orbem*; Rome and the world. Says Mazzini:

"In me survives the faith in Rome. Within the walls of Rome life has twice unfolded as unity of the world. While other peoples vanished for ever after the completion of a fleeting destiny, and none came twice to the front, life there went on eternal and death was never known . . . Why should there not arise out of a third Rome an Italian people, whose emblem floats before me; why not arise a third and greater unity, which shall set in harmony earth and heaven, right and duty, which not to the individual but to the peoples, to the free and equal, shall speak a luminous, unifying word about their mission in this earthly vale?"

The mainspring of all activities of Gandhiji also was the ever-present consciousness in him that he was the inheritor, propounder and apostle of the faith that is India. India also has risen twice in history and there is no reason why she cannot be the Mother of many nations a third time. During the reign of the *Maurya* Emperors, notably under Asoka, India's borders extended beyond her geographical frontiers. Then came the Buddhist period when Greater India extended to almost all Asian countries. The second rule of India over other nations was not through swords and arms, but through moral force, religious truths and imponderable values, much in the same way Popes rule the world, through Roman Catholicism. Like Mazzini, Gandhiji also believed that political freedom, unity and cultural resurrection of India will prove to be an undeniable blessing to both East and West, because India still remains the classical land of philosophy and religion.

Like Mazzini, Gandhiji's religious psychology was all-inclusive and was opposed to all forms of sectarianism, going to the very rock-bottom of ethics, values and spirituality in religion. For this reason Mazzini had to encounter attacks from Christian orthodoxy and exclusivism and Gandhiji from Hindu orthodoxy and exclusivism. Says Gandhiji: "Just as God is one though His names are different, Religion also is one in spite of its different names; because all the religions have been derived from God."

Both Mazzini and Gandhiji lived by a living faith in the living God. To the Mazzinian maxim: *Dio e popolo*, "God and the people," Gandhiji's axiomatic truth was: "God and Humanity." Belief in God was the dominant feature of the two prophets, a faith so real, so powerful to mould their life and inspire action for the freedom and welfare of their countries and of mankind at large. Says Gandhiji: "I believe in God much more than I believe in the fact that you and I are alive and I am speaking to you."

Ethics of politics and sociology which both Mazzini and Gandhi deduced and expounded so masterly and vividly in their various writings were derived from their hold on God. Both these prophets were essentially and pre-eminently religious souls; all their politics and

fight were but the outward expression of their deep-seated religious quest and inner urge to reach God who is Truth, Truth that is God. Says Gandhiji:

"If I seem to take part in politics, it is only because politics today encircles us like the coils of a snake from which one cannot get out no matter how one tries. I wish to wrestle with the snake. I am trying to introduce religion in politics."

Mazzinian sociology, ethics and political philosophy, as mirrored in his life and writings, notably in his classical *Diritti e doveri dell Uomo* of 1840, are all derived from his intense religious psychology which hungered and thirsted after righteousness, which could not brook injustice, inhumanity and slavery anywhere.

Mazzini (1805-1872) was an elder brother to Gandhiji (1869-1948), and the latter has recognised his debts to the former. Mazzini's *Young Europe* of 1834 and his *Young Italy* inspired Gandhiji to start his *Young India* movement. Mazzini wrote in 1834 that his *La Giovane Europa* was an association of men believing in the future of liberty, equality and fraternity for all mankind. Similarly, Gandhiji proclaimed that his *Young India* movement went beyond the geographical frontiers of India and embraced the entire human family.

Mazzini and Gandhiji were eminently men of action, not arm-chair philosophers and touch-me-not saints. To those who compared Gandhiji to Francis of Assisi and advised him to retire to meditation and prayer in the solitude of the Himalayas, Gandhiji replied: "My Himalayas is right here; in the struggles of the poor, downtrodden and the lost." Mazzini also replied his critics in a similar vein when he wrote in his *Pensiero ed Azione* (Thought and Action) in the year 1859:

"I am but a voice crying action. But the State of Italy cries for it also. So do the best men and people of her cities. Do you wish to destroy my influence? Act."

The political dynamism of both Mazzini and Gandhiji were the overflow of a philosophy of life which they were deeply convinced of, and which they intensely lived. There was little or no gulf between their ideals and their practice, their faith and their life, their public and private life. This gave irresistible power and strength to both of them; and cowards, hypocrites and tyrants had to bow before their saintly, prophetic, dynamic and powerful personality. Both of them were one with the people, away from the plutocratic, bureaucratic and aristocratic snobbery and right in the midst of the poor, downtrodden and the lost. Mazzini, after seeing the miserable plight of the refugees from Genoa, was struck at heart, and ever since he wore the simple, austere, poor black mantle. Mahatma Gandhi saw the grinding poverty, social slavery and economic exploitation of the broad peasants and workers of the Indian subcontinent, and he dressed himself in a simple loin cloth and shawl, symbolizing thereby his identification with the broad masses of his country. This mass appeal of the two prophets, their unalloyed idealism and unflinching faith gave them a sway and

control over the masses which helped to fructify their dreams and ideals in no small measure.

Although both Mazzini and Gandhiji stood for the unity of their country, Mazzini, being more a practical political than Gandhiji, envisaged a strong centralised Italy, opposing decentralisation and federalism. Gandhiji, on the other hand, stood for more and more decentralised form of government, often to the point of anarchic liberalism. Mazzini, on the other hand, saw that times are changed and that strong rod was essential for the upkeep of Italian unity and power. Mazzini wrote:

"This young Italy is unitary; for without unity there is no real nation, because without unity there is no power, and Italy, surrounded by unitary nations, which are strong and jealous, must, above all, be powerful. Federalism would reduce it to the powerless condition of Switzerland, and under stress of necessity it would fall under the influence of one or another of the neighbouring nations. Federalism would give new life to the rivalries of different localities which today are quenched, and so lead Italy back to the Middle Ages. . . . Seeking the destruction of the unity of the great Italian family, federalism would render utterly vain the mission that Italy is called to fulfill for humanity."

As Proudhon opposed Mazzini's ideas of a centralised and strongly united Italy, so Subhas Bose opposed Gandhiji's religious mysticism and philosophical anarchism applied to the problem of Indian independence and Indian unity. As Mazzini's dream of a strong Italian Republic was thwarted with the advent of Italian monarchy under Victor Emmanuel II in 1870, so Gandhiji's dream of Indian Unity was defeated when the country was partitioned in 1947, thus giving birth to India and Pakistan. The broad parliamentary and liberal traditions of the Congress are today leading the country to further weakening through the creation of linguistic provinces, freedom of the capitalist class to exploit and for the broad masses to starve and die, which the saintly heart of Mahatma Gandhi, the Father of the Indian Nation, could not have allowed.

Mazzini, after the restoration of Italian Monarchy of Casa di Savoia, wrote:

"The Italian people are led astray by a delusion . . . but monarchy will never number me amongst its stalwarts or followers."

It is known that Gandhiji also had many disillusionments after Indian independence. Gandhiji deplored the lack of revolutionary spirit for sweeping changes, to bring about the much-needed socio-economic regeneration of India, which alone makes political *swaraj* meaningful. Gandhiji, the idealist, was sore wounded seeing the rising tides of self-interest among Congressmen and capitalist class. As Dr. Sarvapalli Radhakrishnan said, after the Mahatma was martyred in Delhi on 30th January, 1948 that the misdeeds of many of his erstwhile followers and countrymen had pierced his heart "long before bullet pierced his body." Mazzini died in Pisa on 10th March 1872 greatly disillusioned,

as Gandhiji died in Delhi frustrated, hit by the bullets of one of his own countrymen, crowning his long prophetic life with the blood of martyrdom, like the great Abraham Lincoln in the United States.

III

During the long exile of Mazzini in England, among the various glowing tributes by non-Italians to the prophet, there is one of Thomas Carlyle, who writing to *The Times*, said:

"I have had the honour to know Mr. Mazzini for a series of years, and, whatever I may think of his practical insight and skill in worldly affairs, I can with great freedom testify that he, if I have ever seen such, is a man of genius and virtue, one of those rare men, numerable unfortunately but as units in this world, who are worthy to be called

martyr souls; who in silence, piously in their daily life, practise what is meant by that."

The above is an appreciation of an Englishman of high literary and cultural standing. But the appreciation coming from representative Indians on the life and ideals of Mazzini is of far greater significance. Gandhiji has borne momentous testimony to Mazzini. Giuseppe Tucci writes in the *East and West* Quarterly magazine that he found translations of the work of Mazzini into Indian vernaculars. The present writer has come across individuals and groups who consider Mazzini akin to Indian spirit. After all, India and Italy are the two great mothers of very similar civilizations, one in the East and the other in the West, easily recognizable through their representative prophets, notably through types like Mazzini and Gandhiji.

SECOND INTERNATIONAL CONTEMPORARY ART EXHIBITION, CALCUTTA

By KAUNDINYA

THIS Exhibition, organized by the All-India Art and Craft Society of New Delhi, was first inaugurated by Dr. Rajendra Prasad, President, at New Delhi on 5th May, 1953. It has now been brought to Calcutta for a month and will travel to other cities, one after another.

To the ordinary man in the street, with no particular responses to the demands and blandishments of works of beauty, an International Exhibition may spell nothing more than a cheap journalistic stunt, to boost the work of the Delhi Society, which claims the monopoly of presenting and patronizing Indian Art and Indian artists in a continuous career of selfless labour. In Calcutta, we have a live and very much active Art Society, called the Academy of Fine Art supported by the citizens of Calcutta and of other cities and it is an "All-India" body with a rich programme of exhibitions and patronage of Indian Art. Last year the Calcutta Society was authorized by the Government of India to select and send a representative collection of Indian Art for exhibition in the cities of the United States. The collection has been exhibited already in Washington and a few other cities and will be shown in New York very soon, to be

followed by exhibitions in other cities. The show has claim to be the earliest pioneer of an International already earned appreciation in the local press and Exhibition arranged in 1917, exhibiting a group of aroused interest of American citizens in the production of modernistic paintings representing the works of the tions of Indian contemporary artists. A year before, a world famous Russian artist, Wassily Kandinsky and

Rippling (lino-cut)
By M. C. Escher, Netherlands

collection of modern Indian paintings was shown at the Haward University in the States at which many pieces were sold. In previous years, other exhibitions had been sent out from Calcutta to travel through all the 52 cities of the States.

As regards Europe, Calcutta in 1914 sent out a remarkable collection of the masterpieces of Abanindranath Tagore and of his pupils, which, praised by all the best art-critics of Europe at Paris, the vortex of Art, created an international sensation placing India on the map of the world's culture. Other Indian exhibitions were sent out from Calcutta and won rich appreciations in Berlin, Leipzig, Munich and other European cities. The paintings that the art-connoisseurs of Calcutta sent out for appreciation in Europe and America were always carefully selected by the best connoisseurs and maintained a high level of standard, unattained by any other exhibitors. So that, as an art-centre, Calcutta can claim unique distinctions in presenting works of Art for international appreciation. Calcutta can also

Landscape (oil)
By Fernand Leger, France

As the specific gravity of art studies and art appreciation is gradually shifting to New York and Washington in the United States, following the model of the Venice "International," an analogous annual Forum to adjudge progress in Art has been built up

of his followers, who attempted to demonstrate the new doctrine of "Spiritual in Art" enunciated in the famous treatise, *Art of Spiritual Harmony* (Munich, 1912).

Speaking of "International" Exhibitions and their purpose and aims we are reminded of the world-famous International Exhibition held at Venice every alternative year, where the best productions of Art from all the countries are received and selected by a competent jury and then exhibited for open display to invite the criticism of the educated art-public. Venice at this time attracts art-connoisseurs and visitors from all parts of the world, the show being regarded as a great event and opportunity to examine and adjudge the progress of Contemporary Art. Learned reviews of this great event, written by the best art-experts, are published in all the art-journals of Europe and America.

in New York. They call it the "Multi-national Exhibition," a happier title than "International." The "Multi-national" is regarded as a valuable eye-opener to artists. For it is an exhibition in which one can make discoveries, in which one breathes the fresh atmosphere of freedom, youth and adventure. It helps to introduce new and original artists to the American public and develops the idea, that all art in the world cannot be seen and studied by traversing the beaten track which leads from Paris to New York. Above all, a Multi-national Exhibition is an active agent in promoting international friendship.

The Carnegie International Exhibition has somewhat similar aims and analogous ideals.

Now let us turn to the International Art Exhibition brought to Calcutta by the Delhi Society, accompanied by much fanfare and newspaper publicity. The huge expenses of this travelling show are being met by the Government in parading the show from city to city. The exhibits were not selected or gathered by the Delhi Society or by any expert Committee. They were received by the Society as Government agents through the different Foreign Embassies and it is obvious that the exhibits were not selected by any committee of experts. For many of the sections are filled with mediocre items collected haphazard to represent each country.

In the first place it is an exhibition of *paintings only*, with some specimens of copper-plates, aqua-tints and black and whites, with no specimens of sculpture. So that the proper designation should be that it is an International Exhibition of paintings and drawings.

But whatever may be the limitation or imperfection of the show, it is a creditable assembly of a large body of contemporary paintings from 29 different countries, which offer an opportunity to art-lovers in India, anxious to make intimate and direct contact with the present-day art-products of various countries of the world. When we realize how difficult it is for poor Indian artists and art-connoisseurs, with thirst for Art, to undertake expensive and arduous pilgrimages to all parts of the world to see, to know, and to study the latest expressions of other races and countries in the field of visual arts and to benefit by the new experiments which artists are undertaking for solving artistic and spiritual problems very similar to the problems confronting Indian artists in the new and depressing economic conditions of modern times, we realize, with gratitude, the valuable educational service rendered by the Government in sponsoring this exhibition of paintings brought from 29 different countries. The æsthetic map is extensive enough and those who cannot travel all over the world will gratefully appreciate these rich and varied gifts brought to their very door-steps for direct study and instructive intercourse.

But there is another side to this picture. Many

people think that it is placing the cart before the horse.

The Government has not yet done anything substantial to render the position of contemporary Indian artists on a sure, safe, and economical footing, not only by providing a large number of scholarships, prizes, and travelling bourses to deserving art-practioners, but also by active patronage by employing a large number of Indian artists, through important Commissions, to execute frescoes and decorations of public buildings and to raise monuments to

The Engine Room (dry point)
By Ture Jorgenson, Sweden

honour our great men and women. It is a mockery to bring International Exhibitions, before the status of practising Indian artists is placed on a sure, economic foundation to relieve the widespread unemployment prevalent amongst the qualified artists, who pour out from our many art-schools in India in large numbers, every year, seeking work and employment and finding none to their utter despair and frustration. If our artists cannot be employed in works of public and civic utilities to decorate our Town Halls, Assembly Buildings and Universities, it is better to close the doors of our Art Schools which are adding to the crowd of the educated unemployed.

Several lakhs have been spent and are being spent

to assemble, to transport and to parade this huge show through the principal cities of India. The money could have been better utilized by purchasing a few of the outstanding pieces for permanent exhibition in a wing of our National Galleries.

Love-making butterflies (etching)
By Stig Asberg, Sweden

Turning now to the contents of some of the sections, not all of equal merit, we find that the Chinese section is the most impressive and the most popular one, escaping the modernistic "frightfulness" which dominates most of the other sections. The outstanding piece in this section is a large landscape on paper, depicting weird rocks, clouds, mists and foaming rivers. It has the characteristically Chinese manner of depicting a Chinese landscape. But the more outstanding and vital works are the black and white study of birds, horses and lotuses, which reveal wonderful mastery of brush-work, and impressionistic vision. A very popular piece in this section is a *genre* study of a grandfather with his grandchild reading

newspaper. It is from the brush of Chiang Chao-lo. It has power and simple beauty even if it is cheaply realistic without any great vision.

In the French section, not very representative or strong, with poor examples of Matisse and Picasso, the high-lights are provided by two Abstractionist landscapes, one here reproduced, representing Fernand Leger, one of the great masters of modern painting. The American section is full of many powerful Cubistic essays, disconcerting in their bravura and in the daring distortion of form. In a sober academic

vein of sentimental interest is a study of "Mother and Daughter" by Y. Kuniyoshi, a Japanese, naturalized in America, which gives some relief to the ordinary visitor, unable to sympathize with post-Impressionistic and Cubistic frightfulness. In black and white works the most rich and inspiring sections are those contributed by Sweden and Norway. There are here many original and impressive pieces of an extensive range of vision and treatment. An etching by S. Asberg, representing "Love-making Butterflies," is a conscientious study executed with a wonderful minutiae of details. A very weird design by T. Jorgenson, cryptically labelled as "Engine Room," is a powerful piece of creative invention depicting a shape of pre-historic animal form, suggested perhaps, by the gigantic shapes of fantastic motor appliances. It looks more like a gigantic black bear fondling its young one. Less enigmatic and more pleasing is a clever piece of "Patterning" (made by Escher, an artist from Netherlands) out of the reflexions of trees on a sheet of water, happily labelled as "Rippling."

The different phases of modernistic painting in Europe and America have evoked loud protests and trenchant criticisms not only from laymen, but also from academic painters, committed to the doctrine of accepting the function of Art as a picturesque and accurate presentation of forms of Nature, and that these distortions, deformities and abstractions are not the products of sober, normal or healthy vision. Most of the interpreters of the modern movements claim a charter of freedom from the tiresome necessity of learning to draw and other such-like quixotic accessories to the art of painting.

In most of these quixotic creations with fantastic and frightful distortions of form, the spectator is "invited to a display of artistic fire-works which does not always come off, but unmistakably smokes and splitters."

COORG, THE LAND OF THE KODAGAS

By G. SRINIVAS RAO, M.A.

SITUATED on the eastern slopes of the Western Ghats, betraying monsoon, produces, besides coffee and pepper, surrounded by green-wooded mountains, is Coorg—the cardamom, oranges, and sugarcane. The Coorg forests Land of the Kodagas. This tiny state is noted for its supply all kinds of good wood and are the abodes of

big game-hunting. The climate, as prevalent in all other hill-stations, is delightfully convincing, though a little too cold in winters.

The inhabitants of Coorg, Kodagas as they are called, are noted for their personality, individuality and hospitality. Having been born and lived for centuries in mountain-homes amidst awful surroundings, the Coorgs, by their very nature, have become fearless, strong and aggressive. Rightly proud of their martial blood, thousands of Coorg youths today are serving in the Army with great skill and capacity. It is the Coorgs who have given us our first Indian Commander-in-Chief and Lieut. Gen. Thimmaya. They are seen holding today high posts in practically all walks of life. Their picturesque national dress certifies the fact that they are warriors by race though they are essentially "sons of the soil" and lovers of pastoral charms. Though Hindus by religion, the Coorgs have preserved their

Coorg lads preparing for an Army career
Courtesy : Films Division

irresistible charms of Nature and has been hailed as the "Scotland of India." Its delightful climate and the hospitality of the people welcome the visitors from all corners of the globe.

The journey to Coorg is highly exhilarating. There are no railways so that one has to depend on buses and cars which, however, are easily available from Mysore, about 80 miles away. Throughout the journey it is a feast for eyes to behold the marvellous creation of Nature, thick forests and bamboo bushes, rich coffee estates, the swift-flowing Caverry river, tiny waterfalls overflowing right through the winding road, and the avenue of trees of all sorts.

Besides being a tourist paradise, Coorg has a right to feel proud of its unique prosperity from the economic point of view. With an average rainfall of over 60 inches a year, it is one of the largest producers of coffee and pepper, in the whole of India. Paddy is "scientifically" grown with the result that the output is almost double that of other states. The fertile soil, with un-

Kodaga boys in their national costume
Courtesy : Films Division

society from some grave evils of Hinduism and have scant respect for the ever-dominating Brahmins.

Child-marriages, widowhood, and dowry system are unknown; and the fair sex holds the dominating position in all their walks of life. It is all due to the triumph

Hunting in the forest of Coorg
Courtesy : Films Division

of education which is widespread in the entire state of Coorg. The latest census has revealed that Coorg stands third in the whole of India in literacy. Kodugu is their mother-tongue which is a mixture of almost all South Indian languages.

The women of Coorg are noted for their personal charm, complexion and beauty. They are fastidious in their love of finery and show a pleasing taste for jewels and dressing. They have their own Coorgi style of sarces which is at once unique and arresting. The women of Coorg have shown a great advancement in the fields of Art, Music and Literature and have shown a superiority over their sisters elsewhere in India. Society has granted equal rights and dignity to their sex, and they have always been honoured in and outside their domestic life.

Mercara, the capital of Coorg, being 3800 ft. above sea-level, enjoys a peculiar distinction and is the centre of all gaieties. This lovely hill-station provides endless

charms which the visitors can never resist. Most of the houses are single-storeyed and are built on the slopes of hills while the roads are zigzag and up and down. Mercara has today a college, schools, a convent for girls, a cosmopolitan club, parks and a grand old fort where the Government offices and the Legislative Council are located.

No one will be more welcome to Coorg than a Nature-lover who will be sweetly thrilled and exhilarated by the majesty of green-wooded mountains which enclose this wonderful Kodaga land blessed by the bounty of Nature. The "Raja Seat" and the "Stewart Hills" present the visitors magnificent and serene sights of Nature's majesty which bring solace and unknown joy to human hearts. The far-off light-green mountain rows, nearby paddy fields, swift-flowing Cavery and thick bunches of trees have made the "Raja Seat" the most charming spot in the whole of Coorg. Every one has paid one's humble homage to this charming piece of land. "Coorg has been compared to Meru among mountains, jasmine among flowers, and to a string of pearls around the neck of an enchanting girl." The birth of the Cavery, India's sacred river, in the hills of Coorg has added more prestige and prosperity to the land.

A brief description of the Coorg wedding seems highly desirable to appreciate the customs and novelty of the Coorgs. The celebrations start actually a couple of days before the wedding day and there is great feasting in the nights. On the day of marriage the bride, winsome in magnificent dress and ornaments, is seated at the "mandapam," surrounded by men in

Stalks of rice being distributed by the chieftain during the Huttari festival
Courtesy : Films Division

their national costume and by women in dazzling and colourful attire. In the absence of the priest, some elderly persons, Aruvus as they are called, sing and

bless the bride. And then follows the long row of visitors who offer milk and give away the presents to the bride. All through this time similar proceedings will be carried on in the groom's place. A grand dinner is ready by now after which the Kodagas enjoy dancing in the open courtyard. Later, in the dusky hours, with the approach of nightfall, comes the groom with all his people handsomely dressed, cuts the six plantain trunks with a naked sword at each stroke, and meets the expectant bride. Again there are ceremonies, dinner, drinks and dancing to the tune of music and band. Finally the bride leaves the place with her husband in a mingled atmosphere of deep sorrow and unknown pleasure.

Public Offices Building, Fort, Mercara

The Kodagas celebrate different festivals in their own delightful and convincing fashion. Among their more important festivals are the Thale-Cavery and the Huttari or the Harvest Feast, which comes off mostly in December. The Huttari dances are probably the most pleasing to behold. Kodagas, dressed in their picturesque national costume, with glittering "Odi Katti" and golden threads bordering their dress, amuse themselves and the encircled audience with their songs and dancing. And then one moonlit night, the chieftain of the town, followed by hundreds of men and women with lamps and plates of rice, slowly moves on to the nearby paddy-field and utters in a gentle voice—"Poli Poli Deva," while the others join him in their singsong tunes. In a solemn style he then cuts the first stalks and distributes among them. This new rice is proudly eaten with the first harvest meal.

Coorg thus presents the greatest holiday fun to its

visitors. It is always a great pleasure to meet these Coorgs who own this rich land, these peculiar customs

The Raja Seat, Coorg

BURMAH SHELL REFINERY TO SAVE 6 CRORES IN FOREIGN EXCHANGE

INDIA'S largest oil refinery, now being built by Burmah-Shell and which is expected to come on stream in early 1955, will produce the principal petroleum products.

Foundation work for some of the larger units of the Refinery has already begun

ducts, Motor Spirit, Kerosene, High Speed Diesel Oil, Light Diesel Oil, and Bitumen required in Indian market.

As a result of this the Government of India are expecting a saving in foreign exchange of between Rs. 4.3 to 6 crores per annum, due to the cheaper crude oil being imported, instead of the more expensive refined products.

The Rs. 25-crore Refinery, which will have a two-million ton refining capacity, is being designed by technical experts in the Royal Dutch Shell Group Offices in Holland and will incorporate the most modern features of refinery design, including a catalytic cracking unit which, apart from increasing the yield of Gasoline, also improves its quality.

Twelve miles of road will be constructed, 400,000 cubic yards of earth will be moved and tankage to hold about 450,000 tons of oil will be erected. The largest diameter plant steel column will be 27 feet and the highest plant column will be 130 feet.

The crude oil for the Burmah-Shell Refinery is expected to come from the Persian Gulf area and will be carried in tankers of up to 30,000 ton capacity. The tankers will use the new marine terminal at Butcher Island in Bombay Harbour.

A considerable portion of the 450-acre site at Trombay has now been cleared and levelled, roads built, storage sheds for sheltering materials and equipment from the monsoon erected and foundation work for some of the larger units of the refinery already begun.—BSIS.

RACE-CONSCIOUSNESS AND RACE-ANTAGONISM
POLITICAL, social and cultural movements of the mid-forties were forging a change in the relations between the Indians and the Europeans, or at least their vocal sections. The Bengal British India Society and the Tattwabodhini Sabha instilled the spirit of self-help and self-assertion into our people, who would no longer tolerate European arrogance, or bow down to European leadership. A few instances may be cited. The elite of Calcutta, both Indian and European, assembled at a meeting on 24th December, 1847 to arrange for presenting an address to Lord Hardinge, the Governor-General, on the eve of his departure from the country. It was due to the strenuous efforts of the Rev. K. M. Banerjea and Ramgopal Ghose that the resolution was so amended as to include a suitable reference to Lord Hardinge's services with regard to Indian education. In another amendment, Ramgopal moved for a statue of Lord Hardinge instead of a mere portrait to be hung in the Town Hall. The European leaders opposed both the amendments as a body, but it was due to the spirited and reasoned advocacy of Ramgopal Ghose that these were carried in full. The next morning *The Englishman* eulogised the speech of Ramgopal for flooring three eminent barristers of the Calcutta Bar and gave him the epithet of Indian Demosthenes after the famous Greek orator, Demosthenes. This incident may appear trivial today. But it was a great pointer to the fact that the Europeans and Indians were very rapidly being estranged from one another even in non-political spheres.

The cause of education also suffered for this European arrogance. The Indian members of the managing committee of the Hindu College came to clash with its European members on the question of the retention of the services of a teacher, Kailas Chandra Bose, who had embraced Christianity. The frivolous manner in which the subject was treated in the managing committee as well as in the Council of Education by the European members that such a sober person as Prasanna Kumar Tagore got exasperated and resigned his hereditary governorship of the College.* The European members of the Committee and the Council did not scruple to act against the fundamental rules of the College by allowing the fresh Christian converts to remain there. This action of theirs resulted in the withdrawal of Raja Radhakant Deb from the College Committee

after his unstinted and continuous services for the period of thirty-four years. The European section had at last to bow down to the popular demand in both the cases, but the bitterness engendered by the controversy between the parties remained for long and determined the course of their future actions.

John Elliot Drinkwater Bethune

DEFENSIVE MEASURES AGAINST THE MISSIONARIES

The Indian leaders grew more conscious of the anti-national activities of the Christian missionaries. But the latter were by then the *confidant* of the powers-that-be. Raja Radhakant drew the attention of Dr. Horace Hayman Wilson, the great orientalist and a sincere friend and well-wisher of India, to this menacing factor in the following words:

"Missionary influence is now on the ascendant; every department from the fountainhead of Government to the lowest course of office is infected with it."

This influence culminated in the Government's passing the Lex Loci Act of 1850, which gave the

2. *Ibid*, *ibid*.

3. This and other letters of Radhakant were found copied in several MSS. volumes in his family library.

Christian converts the right of inheritance to the property of their Hindu parents. The Indian leaders protested against the measure to the Government here, and sent memorials to the Houses of Parliament in England. But every attempt of theirs proved abortive. This also goaded them to have recourse to self-help and self-assertion.

Pandit Iswarchandra Vidyasagar

In a mammoth meeting held at the Oriental Seminary on 25th May, 1851, under the presidency of Raja Radhakant Deb, the Hindus resolved to accept the Christian or Mahomedan converts to their own fold even without any substantial penance on the latter's part. In its following issue on 5th June, 1851, *The Friend of India* editorially discussed the proceedings of the meeting and referred to the above resolution as "one of the most important events of the present (i.e., the nineteenth) century." In consequence mainly of this resolution, the "Patitoddhar Sabha," or the Society for the reclamation of the fallen, was formed with Raja Radhakant as president. A booklet was published in 1853-54 under the auspices of this Sabha. This pamphlet gave an account of the easy reclamation of the opulent Hindus who had gone astray and asked the people to help the poor converts whenever needed. It also referred to some services already rendered to the latter by some sections of the Hindus. The booklet contained an exhortation in Sanskrit for this purpose, styled as *Byabastha Patrika*, by one hundred Hindu Pundits of eminence belonging to different centres of Sanskrit studies all over Bengal. A periodical was published by Iswar Chandra Nandi, Principal of the Hindu Charitable Institution, in

August, 1852, for combating Christianity and the actions of the missionaries.

THE "BLACK ACTS"

Even towards the end of the 'forties the clash between the Indians and the Europeans grew more intense and vocal than could have been expected. And this was especially on the political plane. John Elliot Drinkwater Bethune came to India in April 1848 as 'Legal Member' to the Government of India. Within the first few months of his arrival he was able to make friends with Ramgopal Ghose, the most popular and active leader of the day. Both of them sat on the Council of Education, Bethune as President and Ramgopal as one of its members. It was, perhaps, here that they came to know each other's noble intentions closely. In his endeavours to found a female school, Bethune was largely assisted by Ramgopal and, through him, by his friends, Dakshinaraman Mukherjee and Pandit Madanmohan Tarkalankar. Bethune appreciated their services. He was bent to do his utmost for the good of the people.

Convinced of the legal anomaly of the treatment between the Indians and the Europeans, Drinkwater Bethune formulated four draft bills in late 1849 and early 1850, as Legal Member, and got them published in the *Calcutta Gazette*. These were meant for empowering the criminal courts in the mofussil to try cases in which Europeans were involved, and giving more power to the mofussil executive and judiciary for other purposes also. Since the Charter Act of 1833, and even after Macaulay's law of empowering the Civil Courts to try the civil suits of the Europeans, the latter had been moving in the mofussil districts as "free" Britons for the last fifteen years. They had developed a sense of racial arrogance and superiority over the weak and 'dependent' Indians. The Supreme Court of Calcutta only was eligible for trying the 'criminal' Europeans. Being far away in the mofussil, they could be hardly brought to book by that august tribunal. The menace of the "free" Britons was no less intense than that of the missionaries; it was eating into the vitals of both of our social and economic fabrics.

During the fifteen years after the passage of the Charter Act, the Europeans had been more numerous in the city and the mofussil, strong and organised. They had their spokesmen in the eminent Barristers of the Calcutta Bar, such as, Thomas Turton, Theodore Dickens and James Hume. Some of the influential newspapers of Calcutta also supported their cause. So, when the draft bills of Drinkwater Bethune appeared in the *Gazette*, the "free" Britons started a fierce agitation against them. They held meetings in the metropolis and spouted venom over their author. Like the previous Act of Macaulay, they nicknamed the bills as the "Black Acts."

THE INDIAN SUPPORT

The Indians also had by this time become conscious of the defective law and their untenable position. They gave their cordial support to the proposed laws, especially those which sought to remove the legal discrimination. Ramgopal Ghose gave vent to these feelings of his countrymen in a pamphlet, called *Remarks on the "Black Acts."* In this pamphlet Ramgopal narrated the history of the attempts at removing this anomaly during and after the passage of the Charter Act of 1833, refuted the arguments of the "free" Britons for retention of the defective law and referred to the glaring instances of tyranny and oppression by the Europeans in the districts, which was only possible for their exemption from the jurisdiction of the mofussil criminal courts. This pamphlet exposed the hollowness and unjustness of the European agitation against the proposed Acts.

The Europeans were so much incensed with the pamphlet that they voted the removal of its author Ramgopal from the Vice-Presidency of the Agri-Horticultural Society in January, 1850! It should be noted that Ramgopal was elected to the post in January, 1845, by the Europeans, who all along formed the majority in the Society.† It was also due to the liberal donation of Ramgopal that the Agri-Horticultural Society could be removed to the newly built Metcalfe Hall, where the Calcutta Public Library was housed. On this shabby treatment meted out to Ramgopal *The Friend of India* wrote a long editorial in its issue of 17th January, 1850, strongly condemning this action. Appreciative references were made in the editorial to the valuable services rendered to the Society for several years by Ramgopal. Amongst other things, the paper wrote that "A scientific institution like the Agri-Horticultural Society might, one would have thought, have been kept uncontaminated with political animosities." This insult of Ramgopal was too much for the people to go unchallenged.

The Government of the day could not, however, boldly face the European agitation. They were forced to withdraw the Bills. But 'good cometh out of evil.' This served as an eye-opener to the educated Indians. The virtue of united efforts, may-be for an unjust cause, manifested itself to them. The *Lex Loci* Act of 1850, to which I have referred already, showed the people which way the wind was blowing. Many attempts had hitherto been made for united action. The Landholders' Society and the Bengal British India Society which once did yeomen's service to the cause of our nationalism, did not last long due to popular indifference and party dissensions. Now these onslaughts on the educational, social and political spheres

once again roused the educated and opulent sections of the country to unite together and counter-act the activities of the interested parties and strengthen the hands of those who represented the good causes. The consequence was that the leaders this time resolved to found an association at least for three years for safeguarding our national interests. Moreover, the renewal of the Company's Charter was imminent, being due in 1853. They should present a united voice for the reform and reconstruction of the Government of India in such a way that the amelioration of the condition of the people might be assured.

Rajendra Lala Mitra

THE NATIONAL ASSOCIATION

Discussion continued for some time amongst the leaders. A political association was formed, and christened the National Association on 14th September, 1851, under influential auspices. The object of the Association was generally to adopt 'measures which may contribute to the welfare of the country.' The Association was "to be composed of members of all classes of the subjects of this empire, without any distinction of caste, creed or colour." The object of the Association was further explained as follows:

"That by the help of this Association we may be able to assert our legal rights by legitimate means, it is resolved to apply for any amendment or reform, as the case may be, either to the Local Government or to the authorities in England."

The Association was to continue for three years. The Charter would be renewed during this time, so it was deemed necessary to 'have an agent in that

† *The Friend of India* for January 16, 1845 : Weekly Ept. of News, Thursday, January 2.

4. *The Bengal Hurkaru and India Gazette*, 26th September, 1851.

time in England to lay before the Imperial Parliament our wants and grievances when that question comes on for discussion before that body.' The promoters of the Association were conscious of their past failures, so this time they solemnly declared that 'we will do all that lies within the sphere of our respective means and abilities, for the furtherance of these objects.' Debendra Nath Tagore was appointed secretary to the National Association with an establishment to assist him. It should be noted here that the term 'National' has been applied to an association of this nature for the first time. Because the Association aimed

Rajendra Dutt

at fulfilling objects, which were 'national,' and not local or regional or of any particular class or community. On the formation of the National Association, *The Bengal Hurkaru and India Gazette* (18th September, 1851) wrote :

"We have assurance, that such men as Baboos Prosunno Coomar Tagore and Debendernath Tagore will never associate their names with an undertaking which they do not hope to carry out . . . This time we have independent and honourable men for leaders and prime movers."

THE BRITISH INDIAN ASSOCIATION

To make the Association truly national, the leaders and prime movers of the Association widened its scope and included both the landed as well as the intellectual aristocracy in its fold. Rules were prepared for the reconstituted body. The National Association was transformed into the British Indian Association, just after a month and a half after its

foundation. For at least a quarter of a century, this Association served the whole country as its accredited spokesman. Really speaking, the British Indian Association was the first national political body in the whole of the British territories in India.

The establishment of the British Indian Association on 29th October, 1851, signalled a new era in the history of our political progress during the modern times. Leaders of the conservative and the progressive section veered round the Association for the first time, for the fulfilment of common political ends. It was placed on a sound footing, and its permanence was assured, though started at first for three years only. The objects were concisely and more clearly put in the following lines :

"That a society be formed for a period of not less than three years under the denomination of the British Indian Association, and that the object of this Association shall be to promote the improvement and efficiency of the British Indian Government by every legitimate means in its power, and thereby to advance the common interests of Great Britain and India and ameliorate the condition of the native inhabitants of the subject territory."⁵

It is not known to many that Raja Pratap Chandra Singh of Paikpara was the convener of the National Association. He was also instrumental in transforming this body into the British Indian Association. Pratap Chandra Singh should be honoured as the principal promoter of the British Indian Association. The Association had on its executive committee the flowers of the Indian community of the time, such as, Raja Radhakant Deb (President), Raja Kalikrishna and Raja Pratap Chandra Singh (Vice-Presidents), Raja Satya Charan Ghosal, Harakumar Tagore, Ramanath Tagore, Durga Charan Datta, Jay Krishna Mukherjee, Prasanna Kumar Tagore, Asutosh Deb, Harimohan Sen, Ramgopal Ghose, Pearychand Mitra (Members), Debendra Nath Tagore (Secretary) and Digambar Mitra (Assistant Secretary). The committee was strengthened and reshuffled by the addition of such intellectuals as Harish Chandra Mukherjee of *The Hindoo Patriot*, Rajendra Lala Mitra, Kishory Chand Mitra, Dakshinaraman Mukherjee, Raja Iswar Chandra Singh (also of Paikpara), Chandra Sekhar Deb and several others.

"Eternal vigilance is the price of liberty." The leaders of the Association appear to have followed the motto both in letter and in spirit since its foundation. The Association thrashed out each and every draft proposal of the Government and gave its views fearlessly and in a straightforward manner. But during the first two years of its start its leaders were preoccupied with the preparation and presentation of a petition to the Houses of Parliament on the

5. *The Citizen*, 13th November, 1851, as also *The Friend of India* for 27th November, 1851.

eve of the renewal of the Charter. In order to act unitedly, the Association's Secretary, Debendra Nath Tagore, issued a letter to the leaders of Bombay, Poona, Madras and of the Upper Provinces to present a single petition to the Parliament; because the object being the same, that is, reform and reconstruction of the Indian Government for the well-being of the people, a common petition would prove to the foreigners that we were one and indivisible, and could act unitedly for a common purpose. This memorable letter* of Debendra Nath roused the leaders of the other provinces to political action. A branch association of the Calcutta body was founded in Madras. The Deccan Association of Poona and the Bombay Association were started during 1852 on the model of the British Indian Association of Calcutta.⁶ For their provincial bias, they could not act unitedly with the Calcutta Association. But the petitions they separately sent to the Parliament were largely in conformity with the one of the British Indian Association.

The Association's petition, regarded as the charter of our constitutional agitation for political freedom, covered all the aspects of the Indian administration. It emphasised immediate introduction of two things at least, namely, (1) representative Government for India on the colonial lines, whereby majority of the members in the legislature would be Indians, and (2) the Civil Service examination simultaneously in India and England, so that the Rule 87 of the Charter Act of 1833 might be translated into action. It also stressed the reform of the judiciary and the police, spread of education, importance of agricultural and industrial improvement, and so on. The Association appointed a permanent agent in London to work on their behalf.

THE INDIAN REFORM SOCIETY

Even then India had several ardent friends and well-wishers abroad. John Bright and Richard Cobden, the two prominent liberal leaders, and members of Parliament, were on our side and did not hesitate to espouse our cause, whenever needed. On the occasion of the renewal of the Charter in 1853, these and other friends established the Indian Reform Society. The object of the Society was generally to look after the interests of the Indian people, and particularly to have important alterations made in the Charter Bill. The British Indian Association welcomed the formation of the Society. In its monthly general meeting, held on 6th May, 1853, the following resolution was passed :

"That this meeting has learnt with lively feelings of satisfaction of the formation of the Indian Reform Society, that the committee be

* Substantial portions of this letter have been quoted in *The Rise and Growth of the Congress* by C. F. Andrews and Girija Mukerji (1938), pp. 105-7.

6. *The Bengal Hurkaru and India Gazette*, December 9, 1852.

requested to correspond with that Society, and keep it informed of the wants of the country; and as a proof of the great interest, the Association takes in the success of the Society, and in furtherance of its objects a contribution be forwarded by the committee by the first mail."⁷

The Indian Reform Society rendered valuable services during the discussion of the Charter Bill in the Houses of Parliament. At some stage of the discussion it sought to postpone legislation till sufficient information had been obtained. With the view to enlighten the public mind on the questions to be brought before Parliament, the Society published

Motilal Seal

from time to time several important pamphlets, written by authors of extensive local knowledge and experience. The Society even went one step further. It deputed its President, Delby Sigmour, M.P., to India to collect first-hand information on the spot during 1853. He arrived at Madras and toured some places in Southern India for searching enquiries. He had to return to England from Bombay and could not come down to Calcutta. But the British Indian Association found in the Society its worthy prototype. Its committee kept on regular correspondence with the London Society, supplied important materials and sent occasional remittances, raised from amongst its members. The service of the Indian Reform Society did not go unnoticed even by the Indian public. A general meeting of the people was held on 26th June, 1853, at the Hindu Metropolitan College, at which

7. *The Hindu Intelligencer*, 30th May, 1853.

resolutions were passed acknowledging the services of the Society and for raising a subscription for contribution to its funds. On behalf of the meeting, the committee of the British Indian Association remitted a contribution of £500 to the Society out of the subscriptions raised for the purpose. After the renewal of the Charter, the Society continued for some years more. At the time of the transfer of the Indian Government to the Crown in 1858, John Bright kept watch on the Bill for Transference on behalf of non-official India, as president of the Indian Reform Society.

The Rev. James Long

THE NATIONAL PROTESTS : THE HINDOO METROPOLITAN INSTITUTION

The British Indian Association watched the proceedings in the Parliament from here, and took every opportunity to voice the popular feeling for or against any actions or utterances there. One such instance should be especially mentioned. Frederick Halliday (afterwards 'Sir' and first Lieutenant-Governor of Bengal) cast aspersions on Indian character in the course of his evidence before the Select Committee of the Parliament. As mouthpiece of the nation, the British Indian Association organised a huge public meeting at the Calcutta Town Hall on 29th July, 1853.

This meeting was said to be 'more numerous than any that ever assembled within those walls,' and 'it was composed of persons of all classes of the native community.' Ramgopal Ghose, the popular leader and one of the prominent members of the Association, made a vigorous speech, refuting the charges of Frederick. The proceedings of the meeting demonstrated to the British public what were really the sentiments of their Indian fellow subjects. The Association convened similar public meetings at different times for popular education as also for sanction to their proposals.

The spirit of protest and self-assertion was not confined to political matters only. The autocracy of the British officials had died hard, and followed a course quite unsuited to the growing self-consciousness of the community. The Hindu College was a hard nut for the official hierarchy to crack. The latter had, however, by this time, almost become its controlling authority. They admitted an undesirable into the College, which the Hindu community took strong exception to. Their sentiments were not respected. Their leaders rose equal to the occasion. Just like Debendranath Tagore in the former decade, Rajendra Dutt of the famous Dutt family of Wellington, took the initiative in giving practical shape to these sentiments, collected together the great leaders and formed an influential committee for the establishment of a national college under the sole management of the national leaders. The result was the Hindoo Metropolitan College, the inaugural meeting of which was held on 2nd May, 1853. The College opened on the day with David Lester Richardson, the famous educationist and ex-Principal of the Hindu College, Hugli College and Krishnagar College, and a galaxy of teachers on the instructing staff. The latter included Pandit Ramnarain Tarkaratna, the famous playwright and author of *Kulinkula-Sarbaswa*. The college was founded on the nucleus of the David Hare Academy and the Seal's Free College, thanks to the self-sacrificing spirit of Gurucharan Dutt and Motilal Seal, their respective founder-proprietors. Motilal Seal also made an endowment for the college by the gift of properties, the monthly income of which was Rs. 500. It should be stated here that many private institutions, of junior and senior standard, were established in the mofussil by private initiative and enterprise, along with the Government institutions, which were necessarily fewer in number. These institutions, whether political or educational, were purely national, because the initiative and resources of these institutions as also their founders, and personnel of their committees were all Indian.

THE CULTURAL SOCIETIES AND SABHAS

But this was not strictly the case with the cultural societies and Sabhas of the period. The prominent among

8. *Ibid*, 16th May, 1853.

them should be referred to here, however briefly, as their contribution to the building-up of our life and culture as well as to the growth of our sense of nationality was not negligible. The first of these was the 'Vernacular Literature Society.' This was a mixed body of Europeans and Indians where, at first, the Europeans predominated. The Society was founded in December, 1850, with Drinkwater Bethune as President. The members of the Society included such prominent figures as Raja Radhakant Deb, Rajendra Lala Mitra, Pandit Iswarchandra Vidyasagar and Joykrishna Mukherjee of Uttarpara, who first mooted the proposal. The Rev. James Long was a valuable addition to the Society later on. The object of the Society was to bring out Bengali publications through translation of the English books of general knowledge. The Society sometimes published original treatises also. *Bibidhartha Sangraha* was brought out by the Society in the middle of 1851 under the editorial management of Rajendra Lala Mitra, the great archaeologist and political thinker of the latter days. James Long devoted his life for the collection of Bengali books and propagation of Bengali through his writings. He later on became famous as publisher of the English translation of *Nil-Darpan*, for which he courted imprisonment during the early 'sixties. It was while he was searching for the Urdu manuscripts in Delhi in the mid-fifties that the Rev. Long witnessed the serious discontent and disaffection amongst the common people there against the British Government. This resulted in the outbreak of the Sepoy Revolt, misnamed the Sepoy Mutiny.

The Bethune Society was formed on 11th December 1851 in memory of Bethune who breathed his last in the previous August. Though Dr. F. J. Mouat was the principal promoter of the Society, yet it was mainly Indian in character, the majority of its members and sympathisers being sons of the soil. The first secretary was Pearychand Mitra, and, on the committee sat most of the influential and intellectual Indians of the day. Science, literature, arts, education, social and sanitary matters—everything pertaining to the improvement of our culture could be discussed in its monthly and special meetings. But politics were eschewed for all time. Many European and Indian worthies read discourses and delivered lectures before the Society. The first of the kind was delivered by Dr. Suryakumar Goodeve Chuckervertty on the sanitary improvement of Calcutta. The paper of Col. Goodwyn on the importance of Industrial Arts led to the formation of the Society for the Promotion of Industrial Arts. The Art School of Calcutta was founded by this Society in 1854 on a very sound footing, and it is now hundred years old. During the 'fifties, discussions in the Bethune Society were responsible for many movements of national importance.

The Society for Social Improvement (or, *Samajonnatibidhayini Suhrid Samity*) of Kishory

Chand Mitra, founded on 15th December, 1854, conducted regular discussion on social improvement. Maharshi Debendra Nath Tagore was its president and Kishory Chand Mitra and Akshoy Kumar Datta, Editor of *Tattwabodhini Patrika*, secretaries. Among its members were such notable figures as Harischandra Mukherjee, Pearychand Mitra, Gourdas Bysak, and others. The Society directed their attention to the improvement of the condition of the females. A girl school was started. It also mooted for the re-marriage of the Hindu widows. And when Pandit

Kaliprasanna Singh

Iswarchandra Vidyasagar was agitating for this purpose, the Society assisted him materially. A largely signed memorial was forwarded to the Government at a time when there was strong opposition against the Widow Re-marriage Bill of the Government.

The Bidyotsahini Sabha of Kaliprasanna Sinha, though mainly a literary body, supported the cause of the widow-remarriage by more ways than one. The Sabha not only sent petition to the Government in support of the Widow-Remarriage Bill, but its founder-secretary, Kaliprasanna Sinha offered a reward of thousand rupees to each and every person marrying a widow. Other questions of social improvement also received its attention. On its literary side, special lectures and dissertations were arranged and discussed. It also encouraged the composition of dramas for play on its own stage. The Sabha gave an

address to Michael Madhusudan Dutt on the completion of his *Meghnadbadh Kavya*. It should be said here to the credit of Kaliprasanna Singha that he at once deposited to the Court one thousand rupees of fine, the part of the punishment of the Rev. Long given him for his publication of the translation of *Nil-Darpan*.

The Family Literary Club of Burrabazar, Calcutta, was another cultural institution of long standing, where the intellectual Indians and Europeans met, and the best that was in the Eastern and Western culture was discussed. It was founded on 27th April, 1857, just a few days before the outbreak of the 'Mutiny,' but the ascerbicities of the 'Mutiny' and the ill-born legacy that it left for many decades to come, never touched the members of the Family Literary Club. It was from the third year that the Rev. Long presided over its deliberations for long seven years. It was here through a speech of Long, on 27th April, 1866, that the Social Science Association of much unity was first germinated.

RACIAL ANIMOSITY: THE "BLACK ACT" AGAIN

By 1857, English education had spread through Government and private institutions. The Indians, at least their educated section, had imbibed the Western thought and culture. The current of national upheavals in the States of Europe was also reaching the shores of India with all their social and political implications. The British Indian Association agitated for our political rights and privileges, sometimes in the shape of petitions and memorials to the higher authorities here or in England and sometimes by holding public meetings in order to focus public opinion on different political matters. The Universities were established in Calcutta, Bombay and Madras almost simultaneously in the first half of 1857. Higher education, both in its cultural and literary aspects, came to be regulated and controlled by them. Different cultural and literary societies systematically disseminated knowledge and education of a higher as well as a popular sort to the people. A sense of self-consciousness amongst our educated sections had grown to a degree, and there was no way going back. In the face of such an attitude, the arrogance and self-styled superiority of the Britishers were simply intolerable. Racial antagonism between the Indians and the Europeans was the inevitable result. An event soon happened when this antagonism manifested itself in naked colours.

The so-called "Black Act" was again placed on the Legislative anvil in early January by Sir J. P. Grant, the Legal Member and the future Lt.-Governor of Bengal. It was just like throwing a stone at a hornet's nest. The Europeans assembled at a meeting in the Town Hall in early February. They had now

been thoroughly organised. They had their spokesmen in the Calcutta newspapers. They were moving heaven and earth and would on no account give respite to the Government for calm consideration of the matter. The Indians too had been vocal. They would not take things lying down. The British Indian Association gave the lead. A public meeting was organised under its auspices on 6th April, 1857, in support of the proposed Act. In the absence of Raja Radhakant Deb, permanent President of the Association, Raja Kalikrishna, presided over the meeting. The speakers included Raja Pratap Chandra Singha, Rajendra Lala Mitra, Joykrishna Mukherjee, Digumbar Mitra and Ramanath Tagore. George Thompson, who had come to India again, was present in the meeting and lent his wholehearted support to the proposed Act. In a letter to the President, Dr. Alexander Duff gave his full support to the objects of the meeting and wanted the legal discrimination to be removed as early as possible. Several resolutions were passed. The main resolution speaks for itself and runs thus:

"That in the deliberate judgment of the meeting, justice and sound policy as well as the altered circumstances of the country require that all classes of Her Majesty's subjects within Her Majesty's Indian Dominions should, in all cases of criminal prosecution for whatsoever description of offence, be amenable to the same laws and be tried by the same tribunals, and no sections of the community should, by reason of place of birth, or religion, or official position, possess any exclusive privilege or supposed advantage, distinguishing them in the eye of the law from the rest of their fellow subjects. This meeting, therefore, earnestly hopes that the principle that no class of Her Majesty's subjects should be exempted from the criminal jurisdiction of any of the mofussil courts will be fully tried out in the scheme of criminal procedure now under the consideration of the Legislative Council."

Race-antagonism prevailed for some time on this account. One interesting incident happened. In his speech, Rajendra Lala Mitra, spoke of some of the Englishmen here as 'sweepings of the British Society,'⁹ This enraged the Europeans so much that, like Ramgopal Ghose in the early 'fifties, he was removed from the committee of the Photographic Society of India, of which he was the first Secretary and Treasurer! For the outbreak of the Mutiny in early May, the Government of India could not proceed with the Bill further. The race-antagonism of the Britishers found a suitable outlet in the 'Mutiny' to wreak vengeance upon the Bengalis with redoubled force. But that is another story.

9. Detailed proceedings of the "Native Meeting" were published in *The Hindu Intelligencer* for 13th and 27th April and 4th May, 1857.
10. *The Hindoo Patriot* for 27th August, 1857.

THE LION-HEARTED LEADER

An Intimate Impression of Syama Prasad Mookerjee

Article Three

MAKING THE MOST OF MAKE-BELIEVE

By St. NIHAL SINGH

VI*

THE room in which I found myself on a winter's afternoon in 1942 bore witness to the refined taste of its owner-occupant. This in a quiet, unostentatious but nevertheless unmistakable way. It bespoke of his affluence, too. Self-acquired affluence, it suggested, for wealth that descends through the paternal pipe-line flows fast and floods. Superfluity had been barred from this room with a high hand. The furnishings reflected likewise taste—restrained taste. There were no gaudy effects that jar my sensitive and (I fear) somewhat finicking soul in many a home that I, in my never-ending perigrinations, visit in all parts of the Motherland. What ornaments there were bore the stamp of a collector who had travelled widely and had bought with care a piece at a time, carrying in his mind the earlier acquisitions with which the new one or ones would have to be associated.

While I was wondering if the owner-occupant, who was one of the busiest men in any profession or in politics in Calcutta, could make the time even to dip into the volumes ranged tier upon tier on yellowy-grey metal shelves, he noiselessly sauntered into the withdrawing room (as Thackeray, in his day in that very metropolis would have said). Genial by nature, at sight of one he had known since his student days abroad, he beamed at me and shook my hand in his hearty, vigorous way. We had not met for many a moon. His first words were in the nature of an anxious inquiry about the accident that had befallen me a little earlier while coming down holy Kamakhya hill on a dark night without lantern or torch. I took a step or two to show him that Dame Nature, coaxed and courted by the medical attendants, had been gracious and I could walk on my own power without limping. Having thus relieved him of any anxiety he felt about me, I remarked:

"Now I am here so that you may enlighten me as to what has been happening in this Presidency while I perforce have been unable to pay my periodical visits to it. I spoke of this to you over the telephone."

"That I shall," he promised.

Just that split second there was a noise as of a door opening at some distance—of shuffling of

feet and of steps becoming more and more audible. At the approach of a well-fed figure, we all (for Mrs. St. Nihal Singh had, as usual, accompanied me) got up. My host advanced, shook by the hand the caller, who, as I thought, had dropped in at an hour when the busiest of persons can make time for a chat over a cup of tea. Presuming that I was meeting him for the first time my host said: "Our Chief Minister, Hon'ble Moulvi Fazlul Haq."

I expressed pleasure at meeting Fazlul, as half the world called him, and asked:

"Where is your kinsman, my young friend Syud Hussain? I have not set eyes on him since he, years ago, left us in London and scampered off to my old stamping ground (the United States of America)."

I forget what reply he made. Perhaps that he did not know precisely where that gypsy was at the moment. Evidently my mind was too much occupied comparing the newly made acquaintance with an old, old friend to take in the reply, even if it had not been a polite nothing.

For the sake of the generation that is now growing up unacquainted with the old-stagers, let me add, *en passant* that Syud's whole frame thrilled at merely the mention of the Motherland. I remember he, early in the nineteen-tens, rolled up his shirt sleeves and doubled up his fist to settle an account with a Briton (or was he a colour-conscious Colonial?) who had, in a stage-whisper, spoken disparagingly to his companion of these "niggers" crowding the sidewalks of the Empire's capital. He was incapable of herding Muslims in a separate political corridor and spoke to me, with no little heat, of the imperialistic machinations that were keeping them at loggerheads with the Hindus.

And here was Fazlul. By the separatist ladder he had climbed into the highest seat in the Presidency save that occupied by his mightiness stationed as the supreme imperialist agent there. What of his allegiance to the Mother?

While I was complimenting myself on the opportunity furnished by the God of Chance for me to try to probe the depths of the first minister's heart there was again noise of a door opening at some distance, of shuffling of feet and of steps becoming more and more audible as they proceeded us-wards. At approach of a heavier-set figure than Fazlul's we all stood up once again and

* The section numbers are continuous with those in articles 1 and 2 in the September and October, 1953, issues of *The Modern Review*.—Editor.

shook hands with the fresh arrival and expressed joy at his coming.

VII

At least upon my part the joy was genuine. I had not come upon Syama even on our side of India since some weeks earlier he (on December 11, 1941, to be exact) had chosen to associate himself with the man alongside whom he now sat facing us three. What had induced him to do so? That thought had crossed my mind time and again. It was scarcely of a kind that could be asked on paper, so I had waited till our next meeting, which I expected to occur any day.

Ambition? That potent impulsion could not be ruled out, despite all the credit I gave him for his devotion to the Mother's cause (of this I wrote in the previous article).

That the Finance Portfolio had been placed in his capable hands seemed to argue that he might be feeding the flame of self-aggrandizement. But I was sure, without entering into any pact that might adversely affect any patriotic interest. I had the completest confidence in his integrity.

There was, however, something more to be said and considered. What mortal man would resist the opportunity to jump into the penultimate step on the presidential government ladder and that at a single bound?

Could Fazlul offer less to the head of the Hindu Sabha of that province, or could that head accept less with any sense of values—with self-dignity?

I thought of his father. Some one had suggested Asutosh in connection with the post on the Governor-General's Council—verily a steel ring thrown round the Mother's neck—that John (later the Viscount) Morley who, after the coming of the Liberals into power in 1905, had been sent to the India Office, was so keen on giving an Indian that he threatened to resign to overcome King-Emperor Edward's unwillingness. Lord Minto, who had fought and bled for the Empire and governed the original Dominion, (as Canada, not yet fully out of Britain's leading strings, was called by the romancers), and was playing the *divide et impera* game more furiously than it had ever been done before, would not hear of it. The High Court Judge was of too independent a nature tamely to toe any line that might have been laid for him. The job had gone to "S.P." Sinha (afterwards created at Edwin Samuel Montagu's instance, a Baron of the British realm), who had a remarkable gift for adjusting himself to any position so long as it was far removed from radicalism.

What on earth had induced Asutosh's second son to cohort with Fazlul?

At that moment Syama was, in fact, the head

of the All-India Hindu Sabha. "Working President" was, I seem to recall, the title he bore.

The moment was dismal. Following the outbreak of hostilities the British had rushed India headlong into the conflagration that in time was to spread to eastern India and beyond. They did not have the decency to seek the consent of the Legislative Assembly that they themselves had haltingly created. They doubtless funked such a reference.

They had packed the Assembly with all the yes-men they could contrive to run into it. There were, in addition, the Muslim Leaguers, acting in a solid block as Mohamed Ali Jinnah (whom I first met in 1910 with an introduction given me at Lord Morley's behest) willed. At so crucial a juncture as this he was sure to calculate as to how he could place the Indian National Congress at a disadvantage and thereby further the separatist designs from which the Mahatma Gandhi had tried again and again to wean him but had only succeeded in making him the more intransigent.

Even then the Tory British agent in India (Lord Linlithgow) would not take the risk of the legislature refusing him support. That support, he knew, was undeniably vital to the successful prosecution of the war that, at least in its initial stage, was almost to overwhelm his people and those who had cared or dared to join them. So he bulldozed the people in his iron grip.

No individual or organization in India had the power to prevent the aliens in the Indian saddle from using our armed might and our raw materials in any way or to any extent they chose to employ them. The Congress, however, decided to make them suffer the consequences of the affront they had offered us. Under orders from the High Command Ministers answerable to it were withdrawn and the onus of running those particular provinces was thrown upon the imperialists.

The high-mindedness of this action was not doubted by any devotee of Mother India. Its expediency was, however, questioned by many a politician. By none more than by Syama and his associates of the Hindu Mahasabha. He was of the view, as he put it to me, that the withdrawal of Congress Governments from the United Provinces of Agra and Oudh (now Uttar Pradesh), Bombay and Madras would place the people inhabiting those vast areas wholly at the mercy of the bureaucracy, always unscrupulous when imperialist interests were in jeopardy and now frenzied and desperate. Jinnah's legionaries would, in the meantime, function as merrily as ever. With the junta in office in the Punjab—the principal recruiting ground—the British would be enabled to replenish the wastage in the Indian armed forces as it occurred and also to raise fresh battalions.

He was apprehensive, moreover, that the disorders that were sure to result from the Congress-Government clash would intensify repression to an extent so far unheard of. Nothing, in his opinion, could throw the British into Jinnah's arms—arms always eagerly extended towards them—as this move would do.

The event threw upon the Sabha, he felt, a responsibility almost too onerous to shoulder. To evade it, however, was fraught with the direst consequences. The unholy concert of the imperialists and the Leaguers would, he feared, work havoc to the Hindus. The weal of the majority community was in jeopardy.

I nevertheless felt that all the nationalist forces in the country must cohere. At core all were one. Whatever differences existed between them were in respect of the *modus operandi* and not about the goal. If conjoint action was ever needed, this was the moment for it.

The separatists would, I was convinced, go their way. They might feign to go independently. In so doing they would not deceive any one save, perhaps, themselves. This for a simple reason. The way of the separatists might run parallel to that of the bureaucrats: but only for a while. The two would, in course of time, meet and become one. The sham would be exposed and exposed soon enough.

Given goodwill and plenty of patience, the anti-imperialist front could have been organized, since the objective of the Hindu Sabha did not vary, even by a hair's breadth, from that of the Congress. Both were desirous of shattering the shackles.

The Liberals—or the "Moderates," as they by their political opponents were called,—felt the fetters as keenly as did the others. Temperamentally they might be opposed to shattering them. Filing them was more in their line.

In the atmosphere heated by the war and the contentions roused by the high-handed manner in which Britain had joined India in the conflict differences existing between one school of Indian nationalist thought and another were not ironed out (as Americans say). While I could see just exactly how each of them, for lack of what the scientists call a catalytic agent, they failed to combine, I could not but deplore our inability to take concerted action. A heave at that fateful hour—a heave conjointly upon the part of all nationalists—and the imperialists would have had to come to terms with us or be thrown out.

VIII

Syama had not only disapproved of the resignation tendered by the Congress Ministers, but had, as I remarked before, got into Bengal's government. And now on that winter afternoon he sat

side by side with his chief in the parlour of one who was on terms of friendship with them and us and who, out of the kindness of his heart, contrived that meeting had, I perceived more and more clearly as we got to talking while munching the delicious looches* and Singharas† that were being served piping hot. He had brought us together so that we could, in complete privacy, informally discuss matters. Syama and Fazlul had not casually dropped in.

If the drawing room offers advantages for the exchange of views, conventions cramp conversation. It must be confined in channels approved by the social code, which sets bounds to the pursuit of enquiries. Proprieties have to be observed, particularly when a pair of sharp feminine ears are listening to every word that is being uttered and a pair of sharp eyes are measuring the heightening or blanching of colour in the countenances of the persons with whom her spouse is having a word that might easily degenerate into squabble.

During my lengthy experience I have angled in many mental waters. Never, however, have I paid out line so liberally or at such speed or with such patience, or certainly been so extravagant in putting into it every milligramme of skill I had acquired, as I did that afternoon. And the catch?

I blessed my stars that I had not been on an assignment. Had I to empty the net on an editorial table the sight of the minnows unloaded would have shocked my compeers of the diurnal journalistic conference and I would have been abased in my own eyes.

Strange to relate, therein lay the reward for my lengthy angling. I had pursued salmon. I had landed a gauge.

It was a gauge for measuring the difficulties that Syama was encountering every split second of his administrative life—difficulties that must have chased him in the house and even the bed-chamber. That was a gain that would be cheap at any price.

The gauge not only was for Syama, but also for the man who, subject only to Providence's junior partner (the supreme British agent in Calcutta), dominated that huge, multi-millioned Presidency. I hardly needed to be reminded that Fazlul had climbed one ladder—the ladder of Number Two Service in the State (as we now call it)—had gone up several rungs when it ceased to interest him. Like a master-gymnast he had let go of it and jumped on to the trapeze that, for the moment, he fancied. For a time he could be seen pleading, mostly in courts of no exalted status, the cause of some confounded

* Thin, pancake-like bread fried in deep fat.

† A kind of rissole also fried in deep fat.

person for the fee in which the client held him for an hour or a day. Suddenly he felt that he had had "bliful" (to borrow a phrase from Fielding). Another somersault and he was on the political hobby horse. He sickened of the goal towards which his hobby horse's face was set—nationhood, one and indivisible. Off he vaulted. A sprint—a jump—and he was astride the parallel bars of separatism.

The crack of the whip irritated him not long afterwards. Or was it that he shied at the lank, tall figure that wielded it? It may have been that he could no longer brook being No. 2 to any one who sprang from the same soil as he did, though the whipster first saw the light of day in India's far west (Karachi) and the aspirant for Chief Ministership first opened his eyes upon East Bengal. I wonder if my old acquaintance Jinnah was not happy in his heart at Fazlul's quitting the circus (to continue the figure of speech I have borrowed from showdom), and setting up his *Krishak* (Cultivators') Party. A little later the rebel called it "Progressive".

This, then, was the man who Syama must perforce carry with him, if he were to succeed in keeping open the course through which finance flowed into fields that supported nutriment to the "minority community" as well as the "majority community" (to employ the jargon of the day, instead of plain English speech as it is written in the Queen's realm). In addition to finance—minding the rupees, annas and pices—which constituted, his special concern as the Finance Minister, he had, in virtue of his joint responsibility as a member of the Cabinet, to use his wit to prevent the erection of dams in certain channels. The design for these was hatched in the incubator of Bias. In changing the pattern of patronage, they were consequently causing much anguish to a considerable number of persons who, in one way another, were adversely affected. At the time Syama entered office there was a loud outcry, not only from these victims of malevolence but also from men and women of vision who saw that, as the inevitable effect of favouritism, inefficiency and corruption were becoming rampant.

Policies, too, were being hatched in the incubator of prejudice. These, when applied particularly to the premier University in Calcutta, would alter the current of life—dry up some of the springs of life. This caused no little concern to public workers sincerely interested in the well-ordered, all-round progress of society in general.

Much was expected of Syama. With his intimate experience of University administration he, it was hoped, would exercise financial control in a way that would prevent glaring injustice to

persons, who, through desperate increase in population, had recently been placed in the "minority community" category, and to the institutions that they had established or were establishing.

Faith was reposed in his nationalist outlook, broad intellectual horizon and his all-embracing sympathy. These would help his colleagues of the Cabinet to put an end to the narrow policies conceived to promote the interests of a particular section of the people that had become the order of the day. The Ministry would, instead, calmly though quickly survey the needs and aspirations of all sections and particularly those who, through lack of economic stability or intellectual quickening or through the operation of age-old racial injustice, were least able to take care of them. They would formulate measures that would be as large-hearted as they would be practical.

When I saw him privately (more than once, I recall), subsequent to the little quiet tea party of which I have written, we discussed these matters. He was neither elated at his preferment nor did he cherish my illusion about his ability to reshape affairs. He, it seemed to me, had taken a shrewd measure of the forces to whom he would have to give battle day in and day out if he were to be able to do anything at all.

Fight was in his blood. He never courted it. Never did he run away from it either.

Just because he had unhurriedly taken on the job that a man lacking his leonine courage might well have evaded, he now refused to be daunted by the difficulties he was encountering, tremendous though these difficulties were. With calmness that, in the circumstance, impressed me as remarkable, he seemed determined to deal with each issue as it arose—resolve whatever complexity presented itself to him. His was a sanguine, positive nature and a singularly agile, resourceful mind.

Was he, however, even dimly conscious that at that stage it was not Fazlul or any other colleague whom he would have to tackle, quite so much as Providence's junior partner stationed by Mother Britannia at Calcutta to mind her imperialist interests? The multifarious functions assigned to him and the powers and privileges given him for the discharge of those functions reduced representative government to a farce. In making the most of a constitutional make-believe, solemnly set up in Bengal as in other provinces of India under the Parliamentary Statute of 1935, he, in less than twelve months of assuming office, came to the dead end and regained freedom. This I shall discuss in the article that follows.

[Article 4 of this series will appear in *The Modern Review* for December, 1953.—Editor].

TOYNBEE

His Philosophy of History and Treatment of Modern Civilization

By BUDDHA PRAKASH

Of all attempts at formulating a philosophy of history and explaining the trends of modern civilization in its light, Toynbee's has been the most successful in firing the imagination of the West with a brilliant and roseate possibility of incessant progress towards perfection and betterment. In the feverish and hectic quest for an adequate response, on which the overwhelming and flabbergasting challenge of the Eastern world under the impact of Communism has launched the minds of the present frustrated generation of the West, Toynbee has kindled the beaconlight of the coming Christian *denouement* of the theodician drama of damned civilizations, towards which it is hurrying with a hopeful air. This *denouement* is the second coming of Christ which a spiritual renaissance caused by the strengthening of faith in the Christian teachings embodies and symbolises. In order to prepare our minds to accept the certainty of this epiphany he has made us watch the twenty-one-act-drama of the rise and fall of civilizations and imbibe the philosophy of history that runs through it as the central theme.

Toynbee's philosophy of history centres round the concept of civilization which is defined as "the smallest unit of historical study at which one arrives when one tries to understand the history of one's own country." (*Civilization on Trial*, p. 222). The genesis of a civilization lies in the process of evolving "responses" to the "challenges" of circumstances. The adequacy of the "challenge" determines the effectiveness of the "response." The stimulus of hard countries, new grounds, blows, pressures and penalizations provokes the faculty of breaking forth from a state of inertia (*yin*) into a phase of creative action (*yang*). The response not only meets the challenge for which it is devised but also presents another challenge that calls for another response. This process of continuing to respond successfully to recurring challenges is called "growth." Its characteristic is an inner adjustment called "self-determination" and a spiritual development called "etherialization". The "growth" of a civilization is the work of "creative personalities and minorities" which rally the rank and file of the people around them by the magic of their genius. The *modus operandi* of the "creative personalities and minorities" is the "creative movement of withdrawal and return," that is to say, a retirement from the field of action and the accumulation of creative force and after that a reappearance on the stage and the performance of constructive work. No sooner do the people refuse to fall in with the "creative leaders in response to the magic of their appeal, than the civilization enters on a phase of decline. The process of "self-determination" stops, the tendency of "differentiation" or the development of the individuals in a variety of ways in accordance

with the diversity of their geniuses is replaced by a pattern of "standardization" in which the individuals lose their originality and submit to a procrustean social integration. In other words, the behaviour of the people becomes "mechanical," social system splits up into "dominant minority" and "internal proletariat." Their conflicts allure the "external proletariat" to invade and enslave their society. The "schism in the body social" is paralleled by a "schism in the soul." The spirit of the "dominant minority" expresses itself in "higher philosophy," the genius of the "internal proletariat" produces a "higher religion" and the ethos of the "external proletariat" gives birth to "heroic epics." These elements form the matrix of a new civilization. The "breakdown and disintegration" of a civilization exhibits the alternation of respites and relapses which is explained by the formula of "rally-and-rout." In broad tendencies, the "rally" characterising the "age of growth" is followed by a "rout" expressed in "a time of troubles," which, in turn, is succeeded by a "rally," namely, the "universal state," that is finally overtaken by another "rout" marking an "interregnum". Within each of these periods the rhythm of rally-and-rout continues to beat. Usually there is found to be one rally followed by one rout in the course of a "time of troubles" and one rout followed by one rally in the course of a "universal state." Thus the normal rhythm seems to be "rout-rally-rout-rally-rout-rally-rout": three-and-a-half beats. In the process of breakdown, a "civilization" gives birth to a "higher religion" and it is through these religions that the progress of humanity is kept up. "Encounters" between civilizations in time and space result in the amalgamation of these religions and the consequent and gradual unification of the world. The "periodic downfalls of civilizations are the wheels on which the chariot of religion mounts towards heaven." The cyclic movement of the wheels, symbolic of the periodic growth and decline of civilizations means also the linear advance of the vehicle, they carry, that stands for religion, in which the spirit of progress is enshrined.

Basing himself on the philosophy of history outlined above, Toynbee has "almost ventured to cast the horoscope of the one civilization that is still alive and on the move." (*A Study of History*, Vol. VI, p. 321). He fixed the time of troubles for the Western Christian Civilization between 1378 A.D. and 1797 A.D. for the Western half and between 1126 A.D. and 1528 A.D. for the Eastern half. The two universal states following these times of troubles are the Napoleonic empire (1797-1814) and the Danubian monarchy (1528-1918). (*A Study of History*, Vol. VI, pp. 327ff., table I). According to him, the wars of religion of the sixteenth century are clear indications of the breakdown of the Western civilization. While

dealing with these wars he is struck not only by the rifts that tore Christendom apart but also by the terrible paradox that from the highest good and the belief in one God the suicidal poison of intolerance was distilled; and he is confirmed in his opinion by the fact that the appeasement of the third quarter of the seventeenth century that followed these wars of religion was based not on the abiding foundations of faith but on the sandy terrain of a cynical temper born of indifference and weariness. Hence this period of peace was followed by a worse relapse—the wars of nationalism reinforced by the combined drive of energies generated by the forces of democracy and industrialism that started from the French Revolution. Here Toynbee suggests that the universal state of the Western civilization is yet to come. If it comes through a knock-out blow, as in the case of the earlier civilizations, this civilization is doomed to perish but if it comes through the willing co-operation of its component parts, it will live on. ("The Next Step in History" in *Look*, November 18, 1952). In his opinion the cold war between Russia and the West provides the necessary challenge to keep the Western civilization on its toes and devise a pattern of co-operative unity. Here it would be observed that Toynbee relinquishes his former position according to which the universal states of the Western civilization were the Napoleonic empire and the Danubian monarchy.

Besides these features, he sees in the Western civilization the social schism manifesting itself in a dominant minority and an internal proletariat which is the culminating point in the disintegration of a civilization. The loss of style and the tendency to ape alien fashions and barbaric forms of art have also attracted his notice. The most tragic features of Western civilization, scepticism, neo-paganism and spiritual slackness have made a morose impression on his mind. (*A Study of History*, Vol. V, annexe). He has called this period of European history starting from the seventeenth century, "post-Christian" ["The World and the West" (Reith Lectures, 1952) in *Listener*, Nov. 20, 1952] and has likened it to the Hellenistic age in which the vast region from the Ganges to the Tyne felt the impact of a soulless Graeco-Roman culture. [*The World and the West* (Reith Lectures, 1952) in *Listener*, December 25, 1952]. We know that as a result of the Hellenistic impact on the East and as a consequence of the travail of the breakdown of this civilization a large number of new religions arose and spread over the whole realm of this disintegrating civilization and gave birth in its place to a new civilization. "Christianity and Islam arose as alternative responses of the Syrian world to Graeco-Roman penetration: Christianity a non-violent response, Islam a violent one; Mahayanian Buddhism and Hinduism are the gentle and the violent responses of the Hindu world to the same Graeco-Roman challenge. ("Encounters between Civilizations" in *Civilization on Trial*, p. 219). On this showing the dissemination of modern Western civilization over the face of the globe is also fraught with the possibility of

the rise of new systems of thought and belief which are likely to overshadow and eclipse this very civilization. We know that Western civilization meaning thereby science, democracy, industrialism, secular attitude, common law and rational outlook, has caused a great upsurge in the East. These forces have coalesced with the deep-rooted patterns of integrated and co-ordinated conduct that constitute the architectonics of Asian culture. The concept of *Rita* in India, the idea of *Asha* in Iran, the system of *Tao* in China, the discipline of *Yassag* among the nomadic peoples of Central Asia and the tradition of *Millat* and *Tamait* in Islam are symbolic of the universal co-ordination and social adjustment to which the life of the individuals must of necessity conform. In such an environment the Western technique of democracy has naturally become qualified by the epithets "new" and "planned." Qualitatively viewed it has become quite different from what it connotes to the European mind. If in Asia it is the religion of uplift and progress whether in the form of Mao-Tse-Tung's "new democracy" or in that of Jawaharlal Nehru's "planned democracy," it is surely antithetical to the civilization of the West just as the religions mentioned above once were.

There is another aspect of this possibility. We have seen that according to Toynbee in the breakdown of a civilization and the splitting up of the body social in the "dominant minority" and "internal proletariat," the latter produces a higher religion which becomes the chrysalis of a new civilization. We have also noted that the Western civilization has reached the stage in which the Hellenic civilization was after the fourth century B.C., in other words, it has broken up into a "dominant minority" and an "internal proletariat." This "internal proletariat" of the Western civilization has produced communism, which, according to such a keen observer as J. M. Keynes, "represents the first confused stirrings of a great religion," (J. M. Keynes: *Laissez Faire and Communism*, pp. 134-135), precisely as the internal proletariat of the Hellenic civilization became the spearheads of the Oriental religions including Christianity. We know that Christianity led to the growth of modern Western civilization which was different from the Hellenic civilization, though it was affiliated to it and borrowed much from it, similarly Communism is going to produce a civilization which has no place for the Christian Church and its ethics and the laissez faire economy and democratic institutions as understood in the West. On this showing the days of the Western civilization are numbered and the communist civilization, the twenty-second in the list of Toynbee, is proceeding to swallow it up. If the historic role of a civilization is to rear up a religion in its womb and to break up and give it birth, can we not see that the Western civilization is passing through the throes of the birth of Communism and by breaking down in this process is fulfilling the historic mission which is its *raison d'être*.

Toynbee fights shy of these logical results of his philosophy of history in its application to the modern

Western civilization. He still hopes that there is much scope for the Christian Church and the English Constitution, characterized by the faculty of steering a middle course between the extreme forms of conduct. ("A Study of History in the Light of Current Developments" in *International Affairs*, October, 1948, p. 504). He sees a great field for Christianity even in Communist China and India and finds in the conversion of the Negroes to Christianity the shimmering of a Christian spiritual renaissance. In the organization of the Roman Catholic Church with its hierarchy and its institution of Mass he envisages the system of world unity in which political authority and spiritual leadership would be consolidated and co-ordinated. This civilization of "Church Militant" would mark the spiritual awakening of mankind in a kingdom of God and would thus inherit all philosophies from Akhnaton's to Hegel's and all religions from primitive cults to those practised in our day. ("Christianity and Civilization" in *Civilization on Trial*, pp. 240ff.)

Is this view of the future of the Christian Church warranted by what we know of history? The answer to this question has perforce to be returned in the negative on the following grounds. Toynbee himself holds that in the expansion of Western civilization the religious factor acted as a retarding force while the technological factor proved as the expansive element. [*The World and the West* (Reith Lectures 1952), *Listener*, December 18, 1952]. In the sixteenth century the Portuguese harbinger of Western civilization in the Far East were repelled by Japanese statesmen simply because they presented this civilization as a rival religion whereas in the nineteenth century the representatives of the self-same Western civilization were welcomed because they offered it as a new technology. Likewise, in India and the Middle East the success of Western civilization is primarily due to its dissociation from religious motives. In Russia, the adoption of some of its features would

have been unthinkable had it been necessary to import with them the Christian doctrine of the western type. As a matter of fact, history has made the Mohammadan and Orthodox Christian averse to Western Christianity. How can we therefore think that this religion and Church would be acceptable to these Easterners in the very form in which they have been hating it from a fairly early time.

Besides this, Christianity, particularly in its Protestant form has given birth to modern capitalism as Max-Weber has very ably shown. The vocational ethics, the rational and utilitarian scale of values, the sanctity of private property, the consideration of material prosperity as a sign of divine grace constituted the *Wirtschaftsethik* of Protestantism which has produced the modern capitalist system. (Max Weber: *Religionssoziologie*, Vol. I, pp. 238 ff, recapitulated in R. H. Tauney: *Religion and the Rise of Capitalism*). Max Weber's aforesaid thesis has been accepted with some modifications by the famous German Sociologist Ernst Troeltsch. While he accepted the formative influence of Protestantism on the growth of Capitalism he also emphasized the contribution of the latter to its fruition and expansion. (*Protestantism and Progress*, Eng. tr., p. 138). Thus the Christian religion, which has such intimate association with Capitalism, that, according to Marx and Somhart, has widened the gulf between the bourgeoisie and the proletariat and thus provoked a social schism in Western civilization, can never be adaptable to the new needs of an economic reconstruction through which this civilization is going to be transformed into a new entity.

Thus we observe that Toynbee's treatment of modern Western Civilization negatives his philosophy of history. It illustrates the serious flaws in his reasoning and elucidates the tragic fate of the Western civilization which he tries to veil in a religious cover by turning his back on the realities of historical development.

—:O:—

TRENDS IN CONTEMPORARY ENGLISH VERSE

By MICHAEL HAMBURGER

CRITICS and reviewers of poetry whose taste was formed during the 'thirties, when "political consciousness" and social comment were the programme of the leading school, have recently been complaining about the poverty of contemporary verse. There can be no doubt that the poetic climate in England has changed considerably in the last 20 years; it is also true that much of the work produced in the present decade is less experimental, less topical and, superficially at least, less "modern" than the verse produced in the 'thirties by Auden, Spender, Day, Lewis and MacNeice.

The average competent poem written in the last few years may well be less exciting to readers whose chief concern is with novelty; but the average competent poem is of little importance, except in so far as it testifies to the spirit of the time. What matters now, and has always mattered, is whether the spirit of the time is such that it permits the creation of major work which is likely to outlast the fashions and passions of an age.

Before going on to comment on some books of poetry which I believe to be in that class, I should

like to draw the reader's attention to a number of recent anthologies, for these are a better introduction to general trends than the necessarily brief remarks of a reviewer. *New Poems* (Michael Joseph), an annual anthology sponsored by the P.E.N. Club, is the most representative, since its editors attempt to select the best work produced in the course of a year by poets of every school and of every generation. The oldest contributor to the current volume, Walter de la Mare, has just celebrated his 80th birthday; the youngest, Terence Hards, was born in 1929.

Springtime (Peter Owen), edited by G.S. Fraser and Iain Fletcher, is less representative, being confined to the work of poets either very young or not yet well established; it is more consistent and more idiosyncratic than *New Poems*, for the editors were able to indulge their marked preference for certain types of verse. Lastly, there is *Images of Tomorrow* (S.C.M. Press), a selection by John Heath-Stubbs of work by poets who were not widely known before 1939; the poems in this volume were chosen with a view to their relevance to the Christian theme, and are therefore mainly philosophical, though without conforming to any sectarian orthodoxy.

NO LACK OF VARIETY

I have mentioned these anthologies because I believe that, in spite of complaints to the contrary, even the minor verse produced in recent years is well worth the attention of readers interested in English life and literature. If, on the whole, such verse is close to the formal conventions and traditional themes of past centuries, the fact in itself is significant; nor is there any lack of variety or of innovation, though the differences may be more subtle and the innovation more tentative than in ages of great revolutionary zest.

Compared with Dylan Thomas, who has recently published his *Collected Poems* (Dent), the youngest generation certainly seems somewhat lacking in zest. Born in 1914, he became famous before he was 20; the impact of his early verse was such that it may be said to have broken the domination of the sociological school. Himself the initiator of a school known as the New Apocalypse, he is, above all, a highly subjective lyrical poet with an inimitable command of music and metaphor.

On the rational plane, much of his verse is difficult, not to say incoherent and obscure; but, as its popularity shows, this difficulty is resolved on the plane of feeling, by the appeal of its potent imagery and an eloquence

unequalled in contemporary verse. Unlike that of the Auden school, his imagery is more often derived from nature than from the urban scene; his symbolism, partly sexual and partly religious in his early work, has now become more accessible to traditional ways of thought.

A considerably older poet whose *Collected Poems* (Faber and Faber) have recently appeared is Edwin Muir (born 1887), who has long been known as a poet, novelist, critic and English translator of Kafka's works; but for many years his poetry was eclipsed by the fame of younger men, the founders of movements and creators of fashions.

A SINGLE THEME

Also, like most of the best poets of our time—Dylan Thomas' precocity is an exception, for, by the very nature of his talent, he is less dependent on experience—Edwin Muir has developed slowly; unlike Dylan Thomas, he is a philosophical poet whose forms, metres and diction are not violently original. Indeed, his work has a certain austerity which was too often mistaken for monotony; but its lack of surface brilliance conceals a gentle and unassuming strength, a nobility no longer disputed now that he has reached his maturity. Slowly, with admirable persistence, he has pursued a single theme, exploring the labyrinth of our time until, in his latest work, the exit was revealed to him. His world has always been that of the eternal values, moral and spiritual, and these he has embodied in the true language of poetry, in symbol and myth.

I have left myself little space to discuss the poetry of Kathleen Raine (born 1908), who has something in common with Edwin Muir; like him, she is concerned not with appearances, but with archetypes. Her development, too, has been gradual, but her latest collection, *The Year One* (Hamish Hamilton) establishes her as one of the purest poets of our time. Edwin Muir was born in the Orkney Islands; Kathleen Raine, though born in London, owes her formative experiences to the landscape of Northumberland. She is not a nature poet in any romantic sense of the word; she neither describes nor sentimentalises nature, but uses its images to evoke an intense vision of her own, sometimes mystical—as in the longest and greatest poem in her new collection, *Northumbrian Sequence*.

I should like to mention several other poets who have reached their full stature in recent years; but the work of these three poets alone may bear out my belief that English poetry is as rich and as vital as ever.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto be answered. No criticism of book-reviews and notices is published.

Editor, *The Modern Review*.

ENGLISH

THE LIFE OF MAHATMA GANDHI (Parts I and II): By Louis Fischer. Published by the Bharatiya Vidya Bhavan, Chaupatty, Bombay. Pp. vii+321 and vii+327. Price Rs. 1-12 each.

The best single volume biography of Mahatma Gandhi was produced by Louis Fischer in 1951. There was an English and an American edition, and we are now presented here with a very cheap, and well-produced Indian edition under the auspices of the Bharatiya Vidya Bhavan.

It is perhaps unnecessary to enter into the merits of Fischer's well-known biography. One may, however, be permitted to point out that the book sometimes fails to carry one to the great depths of Gandhi's innermost philosophies as it helped in moulding the course of his life. That does not, of course, matter where the purpose is to present a factual picture of a great life, and where the author had constantly to keep in view the Western reader for whom the book was primarily being written. Indeed, such an objective study may help even an Indian reader in correcting his preoccupation with the thoughts and aspirations of a great man rather than with the actualities of his life. We hope the book will be widely appreciated by Indian readers as it has been by readers outside.

N. K. BOSE

A PHASE OF THE SWADESHI MOVEMENT (National Education), 1905-1910: By Haridas Mookerjee and Uma Mookerjee. Published by Chatterjee and Co., Ltd., Calcutta. 1953. Pp. 84. Price Rs. 2.

This is an excellent monograph dealing with the most important aspect of the liberation movement which swept over Bengal in the second half of the first decade of this century and which marked if not "the beginning" (p. 10), at least an intensification of our struggle against the then alien ruling power in our land. The history of the national education movement in Bengal during the years 1905-1910, though immediately inspired by Lord Curzon's Indian Universities Act of 1904 and its aftermath in the shape of the Carlyle Circular, is the history of release of the pent-up forces of discontent among our intellectuals against the tendencies of the educational system imposed upon us by our British rulers in the past. Combining in rare perfection the highest qualities of idealism and practical constructive effort, it drew into itself almost all the mature talents and the youthful energies of the Bengali people at the time. It found its tangible expression in the remarkable experiment of new educational institutions (Bengal National College and School in Calcutta and the affiliated National Schools in the mofussil) with their

original and highly successful scheme of studies. In the work before us, the joint authors have done full justice to the story of the genesis and the maturity, as well as the subsequent collapse (in spite of its brilliant promise) of this movement. Their treatment of the subject shows on every page the handwork of trained students of history. With great industry they have gathered their material from the study of old files of newspapers and the evidence of eye witnesses and have corrected at some points the errors of previous writers in the field. Likewise they have carefully analysed throughout the forces at work behind the movement. We have no hesitation in wishing this work the widest publicity for it deals very successfully with a phase of our independence movement which fills a glorious chapter in the recent history of our State and our country.

U. N. GHOSHAL

(1) **ANCIENT AND MEDIEVAL NEPAL**: By D. R. Regmi. 1952. Pp. vii+178. Price Rs. 4.

(2) **WHITHER NEPAL**: By D. R. Regmi. Printed at the Prem Printing Press, Lucknow. 1952. Pp. ii+181. Price Rs. 3-8.

These two important publications, (1) on the history mainly of ancient Nepal, (2) on present-day Nepal, would be offered ready welcome by the educated public, as being the version of Nepalese ancient and contemporary history by its own historian. Nepal, Mithila and Kashmir have the unique distinction among the many States of this sub-continent of possessing dynastic chronicles (*vamsavalis*) which form one of the principal sources for the reconstruction of history. All that we know about the history of this land is primarily the work of European scholars like Wright, Kirkpatrick and Sylvain Levi. But in the books under review, a Nepalese college teacher, D. R. Regmi, now the President of the Nepalese National Congress, offers an account of the ancient and contemporary Nepal.

In the first book under review the author makes a laudable effort to present a sketch of the history of his country by a critical study of the sources literary, epigraphic and numismatic and revision of the chronology of the early period. He rejects Bhagwanlal Indraji and R. G. Basak's views on the date of Manadeva and differs from Levi as to the starting-point of the Newari Era. He similarly refutes K. P. Jayaswal's opinion as to the dyarchical executive in Nepal, being derived from the Lichhavi constitution and traces out this peculiar feature to the times of Amsuvarman and Jisnu Gupta. Of special interest is the account offered here of (i) King Amsuvarman—his rise to kingship, extent of his kingdom, his administration and patronage of Sanskrit studies, and (ii) of the Lichhavi restoration, (8th Century A.D.) which was marked by the

military triumph of the king named Aramudi (unidentified) over the Kashmiri King, Jayapida and increase in the social status of the rulers, so that Sivadeva and Jayadeva married respectively a Maukhari and a Gauda princess.

Nepal is a land abounding in temples where cow-killing, according to law, is a capital offence. Kirkpatrick hardly errs in exaggeration when he says that there are as many temples in the valley as there are houses, and as many idols as there are men. The author enters into a discussion of the Nepali style of architecture and is perhaps the first scholar to offer us in the English language an account of the contribution of the Nepalese master-architect, Ar-ni-Ko who entered Kubilai Khan's service in 1263 and left an indelible impress of his work in the Celestial Kingdom. But some of the author's contentions, e.g., the identity of the Kiratas with the Newars, the invention of the so-called pagoda style and the modelling by the Newars of the Tibetan script of the Gupta style, lack sufficient proof.

In the second book under review, the author attempts to give us a sketch of the contemporary history of Nepal, with an analysis of the political forces that are at work and their possible repercussions on the destiny of a comparatively backward people. Here unwillingly perhaps the author takes up what is reckoned as the most baffling of all the historian's arts, viz., writing the history of one's own times, and fails lamentably, for one misses here a clear and consistent narrative of the dramatic circumstances that ended the Ranadom in Nepal and also an account of the various political parties that play upon the kaleidoscopic political stage of the country.

D. R. Regmi is an ardent patriot and the pages in this book are vibrant with this sentiment. But the reviewer regrets that some of the chapters here, e.g., "Nepal in retrospect," read like the harangue of a professional politician rather than the sage discourse of a reflective college teacher. Much that has been incorporated in this treatise, e.g., the Chapters IV, V, VI and VII are of a polemical nature and hence of ephemeral interest. The chapter, "India and Nepal" is well worth a perusal, for here the author, by describing the strategic position of Nepal, points out its importance to India's security in view of the imposition of the Communist hegemony over Tibet, and the great hazards to which the anti-Communist front of the present administration exposes Nepal.

We would recommend a thorough recasting of the pair of useful books, when they go into print for the second time. The obscurities in the pages should be cleared up, prolixity in narration avoided and errors of syntax and print which are plentiful be corrected.

N. B. Roy

1. POPULAR ESSAYS IN INDIAN PHILOSOPHY: Pp. 122. Price Rs. 5 or 7s. 6d.

2. THE QUEST AFTER PERFECTION: Pp. 120. Price Rs. 5 or 7s. 6d.

Both the books are from the pen of Prof. M. Hiriyanna and published by Kavyalaya, Mysore.

Sri M. Hiriyanna was the distinguished professor of Sanskrit in the Mysore University. As the author of the *Outline of Indian Philosophy* he has been widely known in India and abroad. Full of years and honours he passed away in 1950 as an octogenarian. He was a very profound scholar and renowned professor of modern India. Though he was not a prolific writer yet his writings bear the distinct stamp of deep erudition and uncommon insight.

The first book under review contains seventeen learned essays on Indian philosophy and Sanskrit

culture contributed to various journals and publications. The fourteen papers among them were already published in different places and the remaining three on Maya and Indian Philosophy are brought out here for the first time. The paper on Indian Philosophy was contributed to Tamil *Encyclopaedia* where it will soon appear rendered into Tamil. Other essays are written on Karma, Reincarnation, Purusartha, Sankhya system, Upanisads, Sanskrit learning and similar cultural subjects.

The second book contains eight thoughtful articles on the ethics of the Upanisads, Philosophy of Value, Quest after Perfection and other philosophical subjects. The paper on the message of Indian philosophy was the address as the General President of the Indian Philosophical Congress held at Hyderabad (Deccan) in December 1939. The two papers on Quest after Perfection are two Miller lectures delivered in December, 1940, under the auspices of the Madras University.

Prof. Hiriyanna aptly observes that practical interest has ever been the distinguishing feature of Indian philosophy, and the main aim of Indian philosophy as a whole is to determine the ideal of practical life rather than merely to formulate a set of theoretical views of the universe. Philosophy has always been inseparable from life in India. The goal of Indian ideal of life, according to the author, is *sannyas* of self, or self-renunciation and not world-renunciation. The learned author who was himself an ideal philosopher in the Indian sense pertinently remarks that self-renunciation must be practised through loving service. He asserts that not a particular section of people but all men and women irrespective of caste, colour, or creed can be *sannyasins* in the real sense; because all have their places in society and respective duties pertaining to them which they can practise selflessly. In the opinion of the wise author this is the central message of Indian philosophy.

The writings of the learned author are not only thoughtful but also original, and readable. Clarity of conception and simplicity of style characterise his masterly essays. All students of Indian philosophy have got much to learn from these two books under review. A perusal of these handy volumes is sure to reorient our outlook and reform our views about Indian philosophy. A biographical sketch of the late lamented author should have been added in these two books.

SWAMI JAGADISWARANANDA

THE TEACHING OF ENGLISH IN INDIA: By R. L. Mehta, M.A. (Oxon). Orient Longmans Ltd., 17, Chittaranjan Avenue, Calcutta. First published in 1950. Pages 326. Price Rs. 6.

English occupies an important and useful place in our educational system. Apart from its wealth and beauty it has a utilitarian value in the international world and in this respect it cannot be suitably replaced by any other single language. In our pre-independence days English held the place of honour and took up much of the time and energy of the educators. Emphasis on the subject has been lessened in the post-independence period and a general tendency is noticeable among the school and college population to take the subject with some amount of indifference, the inner working of their mind being that with the quitting of the English this language also has fallen from grace. The zeal and propaganda for the new *lingua franca* for India has also contributed to this mentality to a great extent. But if we consider the matter with a serene and dispassionate

mind we are forced to the conclusion that English cannot be minimised without detriment to our national culture and international importance.

The present volume deals with the problem connected with the teaching of English in India and the suggestions and observations of the author based on his deep knowledge and practical experience in the class-room are sure to be of immense help to the teachers of the subject. Unlike ordinary books of dry pedagogy Shri Mehta's book is enlivened with illuminating personal touches. Representing the correct attitude from the Indian point of view towards English and the teaching thereof, the volume under review is written in a racy style and is eminently readable.

NARAYAN C. CHANDA

YUGOSLAVIA: THE LAND OF NEW HORIZONS: By Prabhakar Padhye. Published by the author from 774, Tilak Road, Bombay 14. Price Rs. 3-8.

The author, the Editor of the *Nava-Shakhi* of Bombay, visited Yugoslavia as a delegate to the Zagreb Peace Congress in 1951. He describes his experience in Yugoslavia in the slender volume under review. He contends that Tito's Yugoslavia with its 'democratic communism' as distinct from the 'Statism' and 'totalitarian communism' of Stalin's Russia, is the true standard-bearer of Marxism. Moscow and her partisans do not however agree.

Mr. Padhye however has succeeded in giving to his readers a more or less clear idea of the experiment in the Balkans.

The volume seems to have been rather highly priced for its size—112 pages of reading matter including a Preface and two Appendices.

SUDHANSU BIMAL MUKHERJI

SANSKRIT

THE VAJRASUCHI OF ASVAGHOSA: By Sujit-kumar Mukhopadhyaya, Lecturer in Sanskrit and Tibetan, Visva-Bharati Cheena-Bhavana. The Sino-Indian Cultural Society, Santiniketan, India. Price Rs. 3.

We have here a nice critical edition of the *Vajrasuchi*, an interesting Sanskrit work attributed to the great Buddhist polymath, Asvaghosa, which seeks to demonstrate the hollowness of the Brahmanical system of caste. The edition is accompanied by an English translation and an appendix containing the text of the *Vajrasuchyupanisad*. Besides, there are the word-index and the valuable notes of the learned editor, which trace, as far as possible, the sources of the quotations in the text and occasionally cite parallel passages from different Brahmanical works echoing views similar to those expressed in the text of the *Vajrasuchi*. The edition is based on six manuscripts and the edition of Weber published in 1859. The extent and nature of help received from the latter, however, are not quite clear. An earlier edition made by Wilkinson and the translation of Hodgson published respectively in 1839 and 1829 have not been utilised or mentioned. As regards the antiquity and authorship of the work there seems to be legitimate room for doubt though the learned editor is of a different opinion. The style of the work, in particular, scarcely appears to be as old as the time of Asvaghosa, the celebrated Buddhist writer of the beginning of the Christian era.

CHINTAHARAN CHAKRAVARTI

BENGALI

RABINDRA-MANASA: By Jyotirindra Chaudhuri. General Printers and Publishers Ltd., 119, Dharmatala Street, Calcutta. Price Rs. 8.

In nine chapters the book deals with Rabindranath's Philosophy of Life, the influence exerted on his mind by the Upanishads, Vaishnava poetry and Western literature and science, his treatment of Nature and Woman, nationalism, attitude towards children and materials for literature. The author deserves praise for his power of appreciation and independent personal approach. We expect from him more comprehensive studies in the works of Tagore.

D. N. MOOKERJEE

HINDI

RUP AUR SWARUP: By Ghanshyamdas Birla. Published by Sasta Sahitya Mandal, New Delhi. Pp. 46. Price ten annas.

The author, an adept in the canons of the counter and the cash-box, appears to be also an adept in the art of autocracy. For, in the four essays, contained in the present booklet,—Their Themes being Form and Spirit; This World and the World Beyond; The Subtle and the Gross; Movement and Progress,—he reveals himself as a philosopher of the common road, who knows how to shake off the claims of the counter and flying into the empyrean of the invisible, descend on the earth with a smile on his lips saying, "Now I shall tell you interestingly something of the wisdom which lies behind and beneath the visible." He wields his pen with the effortlessness of an experienced essayist.

GANDHI-GATHA: By Bhupnarayan Dikshit. Pp. 202. Price 2-8.

KRISHNA-DUTA: By Bhupnarayan Dikshit. Pp. 56. Price Re. 1.

Both available from Sharada Mandir, Katra Shamsheri, Etawah, U.P.

The first is a long narrative poem on the life of Gandhiji, while the latter is a poem in four cantos, composed in Sanskrit *chhanda*, centring round the story of Sri Krishna. Both are in Sanskritized Hindi which makes it, therefore, rather difficult for an average Hindi or Hindustani reader or student to enjoy the author's verse without somewhat of a strain, thus distracting not a little from his delight in them. But both lend themselves commendably to congregational *katha*-recitation among lovers of Hindi poetry.

GALPA-MALA: By Prabhat Kumar Banerji. Shivanand-Dham Prakashan, Nagpur, Ajani, M.P. Pp. 63. Price Re. 1.

A sheaf of nine short stories by an amateur who, however, knows that a story must be, above everything else, "a pass-timer," and, therefore, stands on the threshold of promise. There is still, however, not a little of "laboured" imagination, incident and art in his style and plot.

G. M.

TAMIL-ENGLISH

KAMBA RAMAYANAM—A STUDY: By V. S. Aiyar. Published by the Delhi Tamil Sangam, MC. 1/3028, Parliament Street, New Delhi. 1950. Price Rs. 7.

To non-Tamilians who have merely heard that Tamil literature is very old and that in point of culture it is second to none this will come as a refreshing storehouse of information and it is quite possible that they will get so much information from the brief survey of Tamil language and literature appended to the work by way of preface that they may not be able to proceed further into the book itself. But those who will proceed into the book are sure to find an exhilarating course of reading about Kamban, V. V. S. Aiyar and the story of the Ramayana as told by Kamban. Even the Tamil readers, one feels sure, will be grateful to the Delhi Tamil Sangam not older than six or seven years by now for having undertaken this venture and executed it so well. Here one meets the author Kamban who composed the Ramayana in Tamil and who belonged to the 9th Century A.D. and the Ramayana which was actually recited by the poet before a selected audience of scholars, and the poet received for his recompense rightly enough the title Kavichakravarty.

V. V. S. Aiyar belonged to our times and had been a non-compromising fighter for freedom and after a stormy life spent from London to Amsterdam—from Paris to Pondichery, was at last reckoned as one of the conquests of Gandhiji, who transformed him from a violent revolutionary to a champion of *ahimsa*. This stormy life—a firebrand revolutionary, a scholar, a journalist, a teacher of the new type, an organiser of Ashrams—this heroic life full of vicissitudes was cut off in 1925 by the cruel waters of the Tambrabaraparani into which he jumped to rescue his drowning daughter to be both whirled into eternity.

It was during his nine months of prison life between 1921-22 that he wrote his critical study of Kamba Ramayana. He had written in those nine months a little over 140,000 words, surely a performance which does credit to his industry and intellect. The great hold which the story of Ramayana has on the bulk of the people of India and specially those living in the South is but too well-known and this should make us aware of its scope for wide use among Indians of all classes for character training.

V. V. S. Aiyar, after emphasising the place of Kamba as a popular teacher who will hold his own with the greatest, gives the story of the Ramayana after Kamba and compares it with the epics of Europe (though he just touches the fringe of the subject) and passes on to examine the build and structure of Kamba's work and its development. The development is, however, indicative of the great individuality of the writer Kamba. The conventional supernatural of the Ramayana may require a special note to the modern reader and Aiyar has supplied it. He has then taken up the great characters of the Ramayana—Rama, Lakshmana, Indrajit, Vibhishana and Kumbhakarna, Vali and Sugriva, Hanuman, Ravana, Bharata and there he stopped short, snatched away from our world by death. A member of the Delhi Tamil Sangam, however, has appended on his own responsibility and that of the publishers, a note on Sita, which would otherwise have been missed very much. Aiyar's verse translation, spread throughout the book will show his knowledge and mastery of the languages—English and Tamil.

Aiyar was one of the interpreters of Tamil literature to the non-Tamil world and the reviewer would be glad to admit with approval the sentiments expressed by Shri K. Santanam, who had written a foreword to the book: "The Delhi Tamil Sangam had done a great service to all lovers of literature by undertaking the publication of this study."

The reader who has been introduced to Kamba Ramayana by Aiyar will surely look forward to the Delhi Tamil Sangam for such publication of other works by V. V. S. Aiyar.

P. R. SEN

GUJARATI

(1) AROGYANI CHAVI. (2) SATYAGRAHA ASHRAMNO ITIHAS: By Kaka Kalelkar. Published by the Navjivan Prakashan Mandir, Ahmedabad. 1948. Paper cover. Pp. 68 : 96. Price As. 10 : Re. 1.

Both these books from the pen of Mahatma Gandhi were written while in jail (1942). The first is an exposition of principles, according to his belief, on which the human body can preserve its health, and so he calls it "A Key to Health." These are not theories. These beliefs he has put into practice. The history of the foundation of the Ashram at Ahmedabad in 1915, and its progressive development, its activities, its functions, its prayer meetings, all these have been recounted by its founder, Gandhiji. There could not be a more valuable contribution to the history and genesis of this Satyagraha Ashram than this record in his own hand. Kaka Kalelkar has arranged in book-form what was at time loose material and fragments.

(1) SANSAR ANE DHARMA. (2) SAMULI KRANTI: By Kishorlal G. Mashruwala. Published by the Navjivan Prakashan Mandir, Ahmedabad. 1948. Paper cover. Pp. 257 : 164. Price Rs. 2. Re. 1-8.

Shreejutt Mashruwala, on whom had fallen the mantle of Gandhiji in editing the *Harivan* was a quiet, earnest, unobtrusive, religiously minded thinker, student and writer who had adopted "plain speaking as his motto in life." Pandit Sukhlalji has written a Preface, and Shrijutt Kedar Nathji has contributed an epilogue to the first book which sets out in a scholarly, rather saintly way, the duties and responsibilities of one in the world and non-world (Dharma). It is philosophical, but free from the technicalities thereof, which scare off ordinary readers. The title of the second book means Complete Revolution and Shreejutt Mashruwala explains what he means by treating the topic in four sections, (1) Religion and Society, (2) Economics, (3) Political and (4) Educational. He advocates change everywhere, till what he calls, Bhadra Sanskriti and Sant Sanskriti are established in the world. This book is the result of much thought and serious study.

KHADIVIDYA PRAVESHKA: By M. P. Desai. Published by the Gujarat Vidyapitha, Ahmedabad. 1948. Paper cover. Pp. 186. Price Re. 1-4.

This is the third edition of that excellent handbook which introduces and guides the reader to the methods by which he can become a student of Khadi Vidya. The technique of the subject is well set out, and suitable additions made to the text, in the light of experience gained after the publication of the second edition in 1945.

K. M. J.

PRABUDDHA BHARATA THE HOLY MOTHER CENTENARY NUMBER

The PRABUDDHA BHARATA, started by Swami Vivekananda in 1896, enters the fifty-ninth year of its publication from January 1954. We are glad to inform our readers that the January, 1954 issue will be a Special Number to commemorate the Birth Centenary of Sri Saradamani Devi (which comes off on 27th December, 1953), the worthy consort of Sri Ramakrishna, well-known as the Holy Mother on account of her immaculate purity and great spiritual attainments.

This bumper Number, which will be printed fully on art paper and will be profusely illustrated, will contain a good number of interesting articles on the several aspects of the Holy Mother and on the role and achievements of women in Indian national life down from the Vedic times.

CONTENTS

1. Sri Sarada Devi—By Hon'ble Sri Justice P. B. Mukharji
2. Devi Saradamani—By Dr. Mahendranath Sircar, M.A., Ph.D.
3. The Characteristics of Indian Womanhood—By Hon'ble Sri Justice N. Chandrasekhara Aiyer
4. Women in the Vedas—By Dr. Abinash Chandra Bose, M.A., Ph.D.
5. The Holy Mother—By Dr. (Mrs.) S. Muthulakshmi, Reddi, M.L.C.
6. Womanhood as a Spiritualizing and Unifying Force in Indian Tradition—By Dr. C. Kunhan Raja, M.A. Ph.D.
7. Indian Women through the Ages—By Dr. Kalidas Nag, M.A., Ph.D.
8. Woman in the Upanishads—By Sri R. R. Diwakar, Governor of Bihar
9. The Role of the Mother—By Srimati Lila Majumdar

April 13, 1953

Gentlemen,
Enclosed please find Bank Draft for dollars (\$5.00) for which please send me another supply of Neem Tooth Paste.

I believe I have a small credit from my last order on May 6th 1951.

My dentist shakes his head and can not understand why I no longer need to come in every six months to have my teeth cleaned.

He has been my dentist for the past fifteen years and my last trip in was the first time my teeth had needed cleaning since just before I started on my round the world trip five years ago.

It seems ridiculous to send all the way to India for tooth paste when there are so many brands on the market here, but he admits now that it is worth the trouble.

That with diet and other factors the same I have found something that is preserving my teeth that I otherwise would have lost in a few more years.

Again I thank you.

Yours very truly,
Mrs. A. W. Hunter
3801 Wallingford Ave.
Seattle 3, Washington.
U. S. A.

The letter from an American lady is convincing about the supreme quality of NEEM TOOTH PASTE.

It contains intrinsic principles of NEEM and natural CHLOROPHYLL, well-known for antiseptic, germicidal and deodorant properties.

THE CALCUTTA CHEMICAL CO. LD.
CALCUTTA-29

Mau Mau and S.S.

In an article in *The Aryan Path* Roy Bridger considers the aspects of the problem caused by man's alienation from the land. He starts with two symptomatic disturbances—the Mau Mau in Kenya and the S.S. in Germany—and carries his enquiry to root causes:

The Kikuyu have been described as politically the most developed tribe in East Africa. They are also the most overcrowded. Their two main reserves have population densities between 1,000 and 1,500 per square mile. At the present rate of increase the population would be doubled in 40 years.

Germany, a country in which political consciousness has for long been deeply rooted, is also one with a marked interest in *lebensraum* problems. Saxony, where the proportion of urban population is higher than in most of the country, has a population density only slightly less than 1,000 per square mile. Deep in this congested interior the Nazi denunciations of Versailles fanned the smouldering feelings of oppression into volcanic activity. Again a world war raged. Millions died. There followed an irresolute period of Allied Occupation, during which several old grievances were recalled and some new ones formed. Eventually a day arrived which bore a curious resemblance to a great many days of 20 years previous: 5,000 men of the former Waffen S. S. (Hitler's elite troops), many wearing jack-boots, gathered to hear a one-time German general launch a bitter tirade against the Western Allies. "Who are the real war criminals?" he asked. "Those who made the Versailles Treaty." (Cheers) They had dropped bombs on non-military objectives. They were now busy making new weapons. He concluded with a condemnation of Allied treatment of S.S. war prisoners which drew shouts of "Filthy swine!" from his audience.

A high density of population is not in itself a danger sign. The two largest Channel Islands have very high figures. Jersey is about equal to Saxony in population density, while Guernsey, with 1,600 per square mile exceeds even the Kikuyu reserve.

Only one and a quarter per cent of Rhodesia's "black north" are Europeans. They tend to turn towards the Union of South Africa and towards Pass Laws and *apartheid*, rather than towards the humane toleration of pre-Mau-Mau Kenya. "The truth is that in his inmost soul the white South African despises the African," a press correspondent concluded in a recent dispatch from Capetown. "I have one great fear in my heart," said Msimangu in *Cry, the Beloved Country*, "that one day when they turn to loving they will find we are turned to hating." South Africa, with its seemingly irreconcilable human divisions, its mounting soil erosion problems and its inhuman industrialization, is one of the unhappiest countries in the world.

That all the Africans in Kenya should turn to hating would be most disastrous. "If we fail in Kenya we are finished in Africa," wrote Negley Farson in *Last Chance in Africa*. The Kikuyu Central Association, a

representative society formed about 20 years ago, was suppressed during the war.

The nationalist aspirations found expression in the Kenya African Union led by Jomo Kenyatta, while the extremists went underground as Mau Mau.

To a certain extent the campaign to drive out the British is an unfortunate irony of timing. It is clear that the fundamental cause of unrest is land hunger, and it is also clear that until this is removed there is little hope of peaceful development. Yet within the last ten years a revolution has been taking place in the attitude of the Africans to their land which makes the political approach seem old-fashioned. The tribal system of land ownership is breaking up. Agricultural productivity, hampered in the past by a communal system of land-holding which forbade individual initiative, has been suddenly and dramatically stepped up by enclosure.

It would be as wrong to assume that all modern farming methods are inferior to those practised in some previous period of faultless husbandry as to accept the view that the changes which have taken place have been all improvements. Many previous peoples have failed to maintain themselves on the land at their disposal. The alarming present-day state of affairs—according to Jacks and Whyte (in *The Rape of the Earth*) more soil was lost to the world between 1914 and 1938 than in the whole previous history of mankind—has been occasioned largely by the use of power-driven machinery. The old systems of communal ownership of land had grave defects, and there can be little doubt that the gradually emerging idea of enclosure has been a stabilizing factor.

But enclosure not only makes better farming possible: it gives rise to a landless class who, in the absence of any alternative, look for employment in the towns, which become increasingly industrialized. The acreage enclosed is often considerably more than sufficient to support a man and his family. In North Nyanza, for instance, large-scale farms of several hundred acres are developing.

Running through the Mau Mau disturbances and the S.S. outbursts, and linking them with similar manifestations in other parts of the world, are certain fundamental issues.

One is the question whether food should be grown locally and under either the control or the surveillance of the consumer, or whether it should be grown by a special class called *farmers*, the consumer neither possessing nor desiring information about the way in which his food is produced. Another is whether the guiding principle is to be individual enterprise or whether a system of paid employment is to be preferred.

The modern choice has of course been to relegate food production to paid labourers under the direction of a class of men who had originally been self-supporting peasants but were now in the process of becoming out-

door factory overseers. Remnants of the old peasant system survived in spite of every discouragement, however, and in the teeth of an almost world-wide swing towards cash-cropping and paid employment.

Year after year, century after century, the peasant ploughs his patient furrow across the world. But the men without land are swept to and fro like seaweed wrenched from its moorings by a storm. Their heads spin giddily under the pressure of a thousand fears and fancies. "Greece and Turkey would march against Bulgaria, Yugoslavia against Hungary," proclaims a current analysis of the international scene. It reads like a Phillips Oppenheim novel. Geographical grouping was serviceable enough in the days when Wessex marched against Mercia, but its usefulness as a rallying agent is now outworn. Other links between people fill the place once occupied by patriotism. Finance has for long snapped its fingers at frontiers. Intellectuals and scientific workers have formed their own international groups. Sport is making great efforts to get clear of tiresome political encumbrances. Even the United Nations, painfully steering between complexity and chaos, seems to be able to secure results only when groupings other than nations are at work. But the supremely international figure, the quiet man behind the plough, is overlooked—as yet.

The resistance movements, it is true, are growing increasingly formidable. In the anti-Communist bloc, for instance, a chronic witch-hunt is in progress, intended to root out those of its citizens who are obviously disinclined to march against a partly geographical, partly ideological, enemy.

But the ideological struggle itself is becoming out-of-date. The massing of workers against bosses presupposed an attractive share-out when at last the bosses had been overthrown. Today, thanks to the exploitative economy of the Industrial Revolution, the earth is no longer a perpetual cornucopia. The big prizes have already been won.

In the meantime the technique of destruction has made unprecedented advances.

Man removed from his land is cut off from his full nourishment. Without the responsibilities of guardianship he cannot appreciate the continuity of life. He strives desperately to find a compensatory purpose. The hunger of the body for adequate nourishment, of the soul for self-assertion—these are the unseen forces behind the malignance of the ambush, the frenzied surge of demonstrators and the fateful tramp of marching men.

The Land Problem

In the course of an article in *The National Christian Council Review* dealing with national issues C. Arangaden discusses the land problem:

The most insistent demand for justice in a predominantly agricultural country like ours is in respect of land. Land has been one of the most abused things in India. It was made to function and still has not ceased from functioning as a component of a feudal-capitalist system of power. Such systems have claimed sanctity based upon the fact of historical possession. Possession bases itself upon factors like conquest, robbery, grants from rulers, acquisition by purchase, inheritance and so on. The alienation of vast tracts of rich tribal land to cunning and unscrupulous intruders in these areas was nothing but day-light robbery. British conquest and the economic policy it imposed upon India was largely responsible for the destruction of indigenous industry and the abnormal and disastrous increase of the agricultural population. Speculation in agricultural land by Indian industrialists and leaders of commerce, the concentration of land in the hands of certain castes in many areas have led to the destruction of the free agricultural class and the swelling of the number of the landless labourer sold into 'wage slavery.'

The land question, then, is to be understood in terms of the conflict between the historical and the real aspect of possession. The Christian is guided in this area of concern by two principles. The first is, 'the earth is the Lord's,' that is, absolute ownership belongs to God alone. The second is, our own ownership is in His behalf. Such ownership is not a private affair; it is a concern of the community and nation. It does not carry with it an absolute right to use, or abuse it. In other words, every man has the right to the land from which he is to draw a subsistence. This is rooted in the order of creation. Land to the tiller is a clear enough Biblical principle, that is, in so far as he is willing and capable of tilling it. It follows from this that the individualistic conception of property with its claim to absolute right of use or disposal, speculation in agricultural land, unqualified rights of inheritance and the like have no sanction in Christianity. The Biblical ideal is of a free peasantry and it remains a postulate of justice in Christianity.

This leads us to a rejection of the communist solution, namely, nationalization and collectivization of land. The official approach has been the abolition of land-lordism with compensation wherever necessary. There are others who oppose compensation altogether. Official land reforms are limited to improving conditions of existing tenure and are heedless of the claims of the vast army of landless labourers. Vinoba Bhave's *Bhoodan Yagna*, on the other hand, focuses attention upon these forgotten men and their needs. This movement, so long as it proclaims the supremacy of the spiritual over the material and does not lead to problems like further fragmentation of holdings, merits our support. However, it cannot be considered as a substitute for the agrarian reforms promised and deferred so far. Such reforms wait upon comprehensive legislation by the Centre. Such legislation could provoke serious internal strife, and the attitude of high-ranking civil servants, army officers, police and intelligence service men is of crucial importance in any such venture.

Crime and its Cure in India

Crime is on the increase in India as are its population and problems arising out of it. J. K. Soumitri Sharma observes in *The Vedanta Kesari* :

As every one knows every anti-social act is a crime. But it is the result of a series of causes and not of a single one. The four basic needs of man as enunciated by Manu—Dharma, Artha, Kama and Moksha—can be fulfilled only when man lives as a social being, as a member of a civilised society. Otherwise a jungle man would be an articulate animal at the most. Whenever any of these human urges are interfered with, there is friction and man indulges in the committal of crime. But before anyone is adjudged as a criminal it is the duty of society to understand the situation thoroughly, analyse the effects of climate, food, heredity, education and neighbourhood, economic and political influences and so on, and then devise appropriate means of reclaiming him instead of condemning him and losing him for ever. Quite often, a criminal is forced to become an adjudged professional, as though all the malevolent planets conspire together to make him so.

CRIME AND CLIME

Crime varies with the seasonal and topographical conditions of the place and the environments of the person. Even the types of crime vary with the climatic conditions. Crime in hot countries is usually against an individual, whereas in cold countries, it is against property. In hot countries, the act is mostly impulsive, whereas in cold countries, it is a cold-blooded design, well laid out and executed, and even on organisational magnitude. In warm countries, we find a slight provocation causing exchange of fists and burning of tram cars and juktas. In cold countries even a pistol is aimed with a calm hand, a steady nerve and a pre-plan. In tropical countries such as ours, the climate exhausts the man, lessens his food consumption and makes him docile and thus minimises the incidence of crime. Whereas in cold countries, heavy alcoholic drinking, meat eating and sex indulgence contribute much and prompt the man for thrills and adventures and thus cause an enormity of crime.

CRIME AND HUMAN ELEMENT

Is criminality a hereditary trait? Biologists hold strongly that tendencies are transmitted from parents to children. A child born of a drunkard certainly craves for alcohol, and can be offset only by cautious up-bring-

ing. Weak children born of weak parents are known to possess more criminal tendencies than normal ones. It is said that deficiency of pineal gland produces sub-human mentality; and excess of adrenals causes aggressiveness; and a disproportionate prostate gland results in sexual abnormalities. That is how some persons are said to be a prey to theftomania even in their later years of responsible status in society.

CRIME AND ENVIRONMENTS

More than the man or the climate, it is the social environments that contribute to crime most. It is the family, the school, the associates and the playground that affect a boy's set-up and his future career. Grinding poverty and distress in family, many a time give room for prostitution, theft, and fraud which are necessarily the worst crimes. Many a time boys and girls are trained for it. Once a boy succeeds in picking pockets and goes unsuspected, he gets emboldened and dares for bigger crimes. For grown-ups there are any number of incentives for crime, especially in big cities. Large cities throughout the world are the ant-hills of crime. It is the cities that give shelter to the perpetrators, whose identity can be easily camouflaged in the surging crowd.

PROMOTERS OF CRIME

Many a modern Indian film glorifies six immoralities, provokes carnal appetites, encourages vagabondism and lawlessness and somehow grudgingly shows virtue all along fighting hard and quite often ending in a losing battle. Young minds are allured by the daredevil stunts staged on the screen. Many such movie-makers in our land, who manufacture box office hits and bloat their purses are not only passed off as great artists and directors but are claimed as the choicest citizens of our land of culture. In reality they are the parents for the propagation and multiplication of crime. Another agency is the cheap literature that is being voraciously swallowed by our present educated young men and women in the shape of night-reading booklets and journals. There are hundreds of magazines distributing immorality in the garb of catering sex education; and our young generation must specially beware of them, because they are responsible for vitiating the mind beyond repair, if not beyond repentance, and thus destroying the very roots of our great culture.

CRIME VERSUS DETECTION

Crime varies with time, purpose and circumstances. For, after all, it is the society that determines the crime. Ordinarily robbery is a crime. But if a Shivaji does it to build up his armies and to liberate his motherland, or a Stalin does it for the sake of building up his Party, they are deemed as meritorious acts. Normally murder

is the worst crime. But if the same person commits good many murders in an enemy camp, it is a heroic feat. One would even bless one's own country's bombers to shower hell and fire over the enemy territories. In some countries prostitution is a crime and in some it is not. In olden days hand would be cut off for a simple theft. But under the present judicial set up-up, even a murderer is set at large for want of evidence.

As are the variations in crime, so are its detection too. In days past, large footprints were necessary clues. Sherlock Holmes was a hypnotic word for detectives. But in this scientific age, precision and surety of detection have reached astounding proportions. The methods are such that even if a top rank gangster like Bhupat has crossed the continents, spanned the seas and is hiding in a cave in a remote corner of the globe, still he can be surely caught beyond scope of escape. But the criminals also being contemporary products of the same stock of society, resort to more ingenious ways of perpetrating the crime. Iron safes and safety rooms are left out safe. And open day light hold-ups at Bank doors and streets have come into play. Science and intelligence are no monopoly of the police alone. Criminals also have easy access to them.

REPRISAL THE BASIS OF PUNISHMENT

Since the day man has started living as a social being, crime has existed and punishment also is being given in a variety of ways. No small amount of human genius has been spent to find novel and unique ways of torture. Slow death on the oil-mill, boiling alive in water or oil, tearing the body by elephants, peeling off the skin, sewing up in animal skin, nailing on the cross, these and many other forms have been tried to get rid of not only the criminal but the crime itself for ever. But crime has persisted. Retaliation for wrong still prevails. Vengeance still forms the foundation of Penal Law. Reprisal is still its guiding principle.

MODERN REFORMS

But now rapid changes have been taking place to reclaim an offender into society and to prevent crime. The aim of punishment now is to recondition the prisoner's personality. Especially in the West and even in Japan, the prisoner is being trained in regular habits with a view to establishing harmony in his life. He is given good comforts of life and put under proper systematic daily routine. Bathing, exercise, regular times for food, hard but interesting vocational work and adequate rest and plenty of literature to improve himself will certainly put him on right lines. There are a lot of incentives for self-improvement and character-building. In fact, he is so well reconditioned that he returns to the world fully equipped for a new and reformed mode of living. Even the word 'prison' is discarded and is called penitentiary and reformatory. Prisoners are called inmates. Cells and barracks no more give the impression of cages and dungeons. Juvenile delinquents are even better treated with care and compassion. For, a juvenile delinquent of today, if left uncared, will be the confirmed criminal of to-morrow. In case an offender sins against a society or vice versa, both are losers. In most of the cases of young delinquents, the causes that lead to crime are beyond their control. As such, a little attention on the part of society is enough to put them on the right track. So in the West, most of these potential criminals are being reclaimed into society with success.

IT IS NEVER TOO LATE TO MEND

The subject of juvenile delinquency is so vast and developed that for want of space, I shall confine only to this much that it still requires greater attention of our society and the Government to locate them and recondition them so that they will be useful citizens. Hundreds of vagabonds are being still manufactured in theatres and by-lanes of our big cities. Jails have got but only a flavour touch of reformatories. High stone walls, enclosed corridors, dingy cells, steel-bars and locks, bug vermin and company unlimited, hard and moist floor, coarse mat, smelling bed covering, most nauseating uniform, wooden badge and the buffoon's cap, insufficient and non-nutritious food, long queue even for latrines, rod beating, hanging by arms, and a hundred and one variety of tortures at the hands of the hard-boiled warders, absence of magazines, books or any literature or intelligent pastime are still the horrid marks of ordinary prisons in India to-day. They are still a hell on earth, where those who enter should leave hope behind.

Knowing full well that any amount of penal laws and jails cannot mitigate the incidence of crime, let our people try to train themselves and their children on the basis of our great culture and most of the causes of crime will be certainly eradicated from our glorious land.

How Jews Built the Movie Industry

II

During the twenties Warner Brothers found itself on the down-grade, for with no controlled exhibition outlets of its own, even a superior producing company could not live. At that time the Western Electric Company had just developed its first motion picture sound equipment, and of all the leading companies only Warners was willing to try it. Sound had an amazing restorative effect. Warner Brothers became the only movie company, with the exception of Loew's, that was able to survive the depression without financial reorganization.

Mr. Warner, Sr., was a Polish-Jewish farmer who had come to America in 1883 and settled in Ohio. Harry, the oldest son, had started his business career as a shoemaker. Several years later he went to work for the Armour Meat Packing Company. His brothers Abe and Sam had other ideas, however; they toured the country exhibiting their single print of "The Great Train Robbery." Barnstorming was profitable enough to enable them to buy a nickelodeon in Newcastle, Pennsylvania, where Harry joined them. By 1917 the Warners had developed a successful movie exchange.

That year James Gerard published his *My Four Years in Germany*. With characteristic enterprise Harry Warner secured the screen rights and the sensational film of Gerard's experiences, grossing nearly one million dollars, made the Warners tonight producers. This picture also established the Warner Brothers pattern. Their products, generally based upon the events of the day, became what were called topic-snatchers.

Hollywood's financial terrain was exceedingly rough, and it needed Waddill Catchings, the ever-optimistic partner of Goldman Sachs, to take the Warners in hand and teach them how to become important movie magnates. But for the advent of sound, Warner Brothers would never have reached the top of a brawling competitive industry.

It was Sam Warner who insisted that the company gamble on the Western Electric's sound device. Most of the motion picture firms had refused to have anything to do with the new gadget. Warners obtained an exclusive license to the device, in return for which they agreed to sell 2,400 complete theatre sound-equipment systems for Electrical Research Products, Inc., the Telephone company's subsidiary. Then came the remarkable "Jazz Singer" and all the film companies and theatres clamored for equipment. ERPI promptly cancelled its exclusive contract with Warner and sold equipment to all comers. Today, one of Harry Warner's pet antipathies is the telephone.

The Warner boys quickly realized that they would have to control their own outlets if they were to stay in business. From 1928 to 1930 they bought as many theatres as they could and with the acquisition of the powerful Stanley circuit reached their goal. Selling debentures and common stock, they built up a chain of over 500 theatres. Music publishing firms, a radio factory and a lithographing plant were among some of their more curious purchases.

Becoming adept in high finance, Warners' stock manipulations were brilliant enough to dazzle the most jaded of Wall Street operators. During the twenties, stock was sold to an investment-mad public through Renraw, the Warner Brothers' personal holding company. Renraw (the family name written backwards) then lent the proceeds, interest free, to Warner Brothers, thus circumventing the bankers. But the Warners always held on to the voting stock—no one was going to tell them how to run their own business.

Radio Corporation of America also tried to market sound equipment for movies, but the field had already been quickly gobbled up by Western Electric. Within a year after Warners proved the practicability of sound pictures, Western Electric had exclusive contracts with 90 per cent of the movie firms. The only alternative for RCA was to create its own movie empire. A holding company, the RKO Corporation, was formed, with control

divided between RCA, the Atlas Corporation and Rockefeller Center, Inc. RKO Pictures was organized as the producing subsidiary and the Keith-Orpheum theatre chain became the exhibiting outlet. Here was a motion picture giant built exclusively by financiers whose sole motive was to exploit a new technological device.

Between 1927 and 1935 the industry was rocked by a struggle to control the patents for sound equipment. ERPI signed long term contracts with Loew's, Paramount, United Artists and Universal. Only 95 theatres in the country had other than Western Electric reproducing apparatus, while 1,946 theatres had Western Electric equipment. RCA seemed to have been virtually eliminated from the field; only the large RKO chain used its sound devices.

RCA finally filed an anti-trust suit against the Telephone company interests and in 1935 a peaceful agreement was signed to give RCA new rights in the sound-equipment business. This legal battle was in the last analysis fought by the two financial giants of American industry—the Morgan and the Rockefeller empires—who now control motion pictures, sound equipment and monetary sponsorship having assured them a monopoly beyond the wildest dreams of the old Motion Pictures Patents Company of 1909.

The famous case of William Fox well illustrates the power of finance in the motion picture industry. Fox held the American rights to Tri-Ergon, a European sound system; this was dangerous competition for Western Electric. Patent-infringement suits and anti-trust charges, however, did not trouble the Fox Corporation. Fox continued to expand and at one time he virtually dominated the motion picture industry in America. But even he could not withstand the determined onslaught of the Telephone interests.

Fox was born of Jewish immigrants from Hungary. His father earned a meager livelihood selling home-made shoe polish on New York's East Side. Young Fox started out in a cleaning and dyeing establishment at \$17 a week. One day in 1904 he took the \$1,600 he had saved and bought a movie house in Brooklyn. From then on he went ahead steadily in the budding industry, became one of the first to defy the old patent pool, launched into production, and gradually expanded his theatre holdings.

In 1927 Fox began to gobble up theatre chains; in 1929 he secured control of Lowe's and Baumont British. But these operations required financing, whereupon Halsey, Stuart and Co., an investment banking firm with Western Electric connections, extended the necessary assistance in the form of short-term loans. Then came the 1929 crash. When Fox tried to renew his loans the bankers insisted that he relinquish control of his company. Fox sought aid from other sources, but no other banker seemed willing to oppose the house of Morgan.

In the end Fox was forced to sell his holdings to H. L. Clarke, an L. S. J. associate, for \$18 million. Until a few years ago the Chase National Bank was the largest stockholder in the Fox films.

The motion picture industry, dominated by the "Big Five"—Paramount, Loew's, Twentieth Century Fox, Warner Brothers and RKO—is now very much concerned with the competition of television and the resultant impact on the box office. The lush days of 1946, when any strip of film made money, are over. The movie makers, more than ever, insist that only "high value" entertainment will draw people away from their comfortable parlors into the motion picture houses: high value here means box office appeal.

The most profitable pictures are those that successfully transfer the soap opera to the screen: Universal's *Pa and Ma Kettle* series, which go on as interminably as the Hardy pictures, bring a fantastically high return to its maker. On the other hand, the prestige film becomes the tail end of a double feature. While cutting overhead costs as drastically as possible, Hollywood makes more pictures in an effort to recapture an audience that is now seeking entertainment elsewhere. This in turn reinforces the sure fire cycle formula and strengthens the hold of "business men" on the industry.

Of the old timers, there are few still in control. Only in Loew's, where Nicholas Schneek still rules, and in Warner Brothers, do the original Jewish interests still predominate. Of ten Paramount directors, only two are Jewish as compared with 12 out of 19 in 1927. Twentieth Century Fox is now controlled by non-Jewish personnel and even in Loew's the number of non-Jewish officers and directors is greater today than in 1927.

As in most modern corporations, stock ownership is widely dispersed in the movie concerns. There are about 15,000 stockholders in Loew's and of the twenty largest holders, four are officers. Their ownership, however, is but four per cent of the stock. Stock ownership in Warner Brothers is also dispersed, as it is in Paramount. The significant element in the financial structure of the movie companies is the large proportion of borrowed capital.

The history of the movies exemplifies what happens in a now successful one time disreputable industry. Jewish entrepreneurs, after demonstrating the hard headed practicality of their dreams, are compelled to surrender their leadership to financiers. Patent control, debt financing and a huge investment in fixed capital demand steady returns. Business conservatism dictates stereotyped products that will assure that income; experimentation is too risky. In motion pictures, the one industry that affects educational and cultural values more than any other, this compels the immaturity to which we have become accustomed. *Jewish Frontier*, July, 1953.

New Zealand's Place in World Trade

D. P. Taylor, M.Com., delivers the Henry Morley Lecture, as published in the *Journal of the Royal Society of Arts*, 7th August, 1953:

Nearly 120 years ago, from this very street where we are now meeting, a man of some stature in New Zealand's history published a book entitled *The British Colonization of New Zealand*. The man, Edward Gibbon Wakefield, was the founder of the New Zealand Company and was largely responsible for the decision of the British Government, in 1840, to annex New Zealand as a British Colony. The New Zealand Company and the somewhat similar associations which settled Canterbury and Otago were not commercial enterprises designed to show a profit for their organizers, but nevertheless behind the formulation of these schemes lay the prospect that the new country would export products of use to the old and would grow to play an important part in the pattern of British world trade.

Wakefield's book was designed to persuade government and public opinion in favour of the early annexation of New Zealand, and it is significant that he laid great stress on the possibility of developing trade with the proposed colony. In the course of our survey of New Zealand's trading position, we shall have occasion to look at Wakefield's ideas and see how they have worked out in the passage of time; but it is sufficient at this point to take note of the fact that New Zealand's present very close association with the United Kingdom began, to some extent, through the possibilities of trade and, as will be seen as we go on, the trading link has brought our two countries closer and closer together as the years have gone by.

SPECIAL FEATURES OF NEW ZEALAND'S TRADE

The title of this lecture—"New Zealand's Place in World Trade"—may raise doubts in some minds and some might say that so small a country has such a minor share of world trade that it is rather grandiloquent to speak of her as having a place in world trade at all. Indeed, when comparison is made with the massive trade figures of the United Kingdom, it must be admitted that New Zealand's total overseas trade is small. Nevertheless, there are some unique features about New Zealand trade which are of interest not only to professional economists but also to the merchants, manufacturers and the general public of this country. The British people, indeed, are vitally concerned with New Zealand, for we supply such a large proportion of their rations of butter, meat and cheese.

The outstanding feature is that New Zealand has the greatest value of trade per head of population, of any

country in the world. In 1951 our total visible trade, imports and exports, amounted to \$454 million, or £233 10s. od. per head. The comparative United Kingdom figures were \$6,620 million, or £131 10s. od. per head; so it will be seen that even if our total trade volume is relatively small we do have a more vital interest in international trade than most countries. The second feature is that, for its overseas income, New Zealand depends upon the export of a few agricultural commodities directed largely to a single market. The United Kingdom market is so important that scarcely any aspect of our trade can be discussed without reference to the trade relationship between the two countries. We have been linked contractually by preferential tariffs and by bulk purchase agreements for three of our chief exports—butter, cheese and meat—for a number of years. These agreements have aimed at producing stability, but in a period of severe fluctuations, such as we have experienced since the last war, bulk purchase agreements bring problem for both

buyer and seller. These problems will be touched on later.

A remarkable illustration of the closeness of the economic ties between New Zealand and this country was provided a few months ago when the New Zealand Arbitration Court decided against a general increase in wages, stating in its judgment that while the economic and financial position of the United Kingdom was so perilous a substantial increase in wages was undesirable. Surely few countries have ever consciously conducted their own internal financial policies so positively to avoid placing strain on a trading partner's economy.

A third unique feature arises from the fact that there has been practically no change in our main source of income from the same products for the past fifty years. This does not mean, however, that the economy is static. Agricultural output and secondary industries show continuous development. Finally, New Zealand provides a very interesting economic illustration of a country entirely dependent on the export of primary products for its earnings of overseas exchanges, whose internal financial position is consequently vulnerable to fluctuations in the prices of these products, but one which is making a real effort to ensure some stability in the face of these difficulties. Nevertheless, it has been well said that the export market is the determining factor of New Zealand's economic life. Before studying this economic life in greater detail, it might be helpful to consider briefly New Zealand's geographical position.

IMPORTANCE OF AGRICULTURE

New Zealand consists of two main islands with a total area a little greater than the United Kingdom. Situated in the South West Pacific, in temperate latitudes, it has a climate well suited to agriculture on the European pattern. Its distance from other land masses, its narrow size, high mountain ranges and long coastlines lend themselves to plentiful rainfall but, nevertheless, there is generous sunshine giving suitable soil temperatures as well and the combination of the two leads to the provision of New Zealand's chief asset which is just plain, but believe me, very important, grass. Of the country's 66 million acres, 43 million are farmland, of which three quarters are in grass. New Zealand's dependence on good growth of grass is shown in the fact that we export well over £200 million of grass each year in the form of butter, meat and cheese. New Zealand farmers have been described as the best grass farmers in the world and certainly the Department of Scientific and Industrial Research and the Agricultural University Colleges have done much to ensure that this description remains true. New Zealanders have pioneered in the practice of extensive application of phosphatic fertilizers and the development of grasses and clovers for the efficient use of these fertilizers. We were one of the first countries to use the aeroplane to distribute fertilizers, particularly in the back hill country, and it may be that we are as far ahead as any other country in the application of this new development. Our Chairman, as a distinguished leader of New Zealand scientific thought, knows well that research is still going on with the principal motive of ensuring that New Zealand's main asset—its agricultural and pastoral industry—continues to progress.

Wakefield and his contemporaries, as his book shows, considered that New Zealand would be an excellent farming country and would also provide abundant timber and flax. They anticipated that it would have a rich fishing industry and be the centre of an important whaling and sealing industry. They were quite confident that New Zealand would provide a plentiful supply of minerals and they even went so far as to imagine that it might in future become not only a Britain of the south in social patterns but, a highly developed manufacturing and

OUTSTANDING PRODUCTS OF HERING & KENT

ROYAL OONIM: Super vitalising Tonic for MEN and WOMEN. Restores youthful vigour and vitality at any age. Rs. 50 for 3 weeks course; Rs. 200 for complete course of 12 weeks.

OONIM: General all-round tonic for men & women. Rs. 7-8 for one week; Rs. 22-8 for 3 weeks; Rs. 90 for 12 weeks complete course.

BIOSIL HORMONE CREAM: Genuine hormone treatment for restoring the freshness and firmness of youth to the aged, wrinkled skin. Women of 60 regain complexion like women of 20. Indicated for wrinkles, lines, blemishes, bad colour, disfigurement, blemishes and skin disorders (acne, pimples, etc.) Rs. 5-8 per tube.

SIMBOOGI HAIR LOTION: An unfailing hair-grower. Positively grows new hair and stops falling hair, dandruff, itching scalp, etc. Rs. 3-8 per bottle. **SIMBOOGI HAIR OIL:** A delightful ideal hair-dressing and tonic for correction of various hair, scalp and brain troubles. Rs. 3-8 per bottle.

LUNEGON: The most effective nerve and brain sedative tonic, indicated for mental and nervous disorders. Immediately calms and soothes high mental and nervous tension. Contains no injurious, depressing or habit-forming drugs. Rs. 4 per packet of 50; Rs. 70 per packet of 1000 tablets. (Hospital packing).

DISNIL: The most effective oral remedy indicated in the treatment of Diabetes Mellitus. Rs. 15 per packet.

SILVITA: For acidity, heart-burn, sour stomach, dyspepsia, wind and fullness after meals, etc. Rs. 4

trading country occupying the place of Britain with Europe in the South Pacific and directing its trade to Australia and the Far East. New Zealand history is yet too short to write off this destiny completely but it seems unlikely, for Wakefield and many of his contemporaries miscalculated the country's resources. They were confident that the country had great mineral wealth which would provide the foundations for thriving manufacturing industries, whereas, in fact, New Zealand lacks supplies of most useful metals. The early forecasts were, of course, correct about New Zealand's future as a farming country, although flax and timber have proved secondary products compared with the huge exports of wool, meat, butter and cheese. But then Wakefield could not foresee the immense contribution which refrigeration was to make to New Zealand's economy in making possible the transport of perishable foodstuffs. Time does not permit a description of the development of refrigeration, which is a story all on its own—nor of the gold rushes which brought wealth and a vigorous population to the country.

GROWING MANUFACTURING INDUSTRIES

From what has been said so far you may have gained the impression, one that is found to be widely held, that New Zealand is simply one great farm. That is, however, far from true, for the internal economy is much more complex. Secondary industries designed to provide many of our demands for consumer goods and light capital equipment have of recent years made rapid progress.

In 1881 the only industries with a total capital above £200,000 were those connected with saw-milling, gas-works, grain milling, brewing, printing and coal mining, but others worth noting and which have subsequently grown in importance are the woollen footwear and colthing industries, and the manufacture of agricultural implements. By 1890 frozen meat production had become the largest of our secondary industries, but apart from this change there had not been much alteration in the pattern of secondary development, although there had been substantial increases in the capital of established concerns. During the Second World War, when United Kingdom factories were turned over almost entirely to war production and New Zealand herself was facing possible invasion from the North Pacific, it was necessary to transform and expand our factories to produce large quantities of Service equipment, including cloth, small arms, Bren gun carriers, mortars and bombs. The small ship-building industry was also enlarged to turn out numbers of small naval craft; and thus, at the war's end New Zealand had a greatly extended manufacturing capacity available for peace-time production, and, moreover, precision engineering had been established.

A stimulus of a different kind was given in the depression years of the early 1930s. New Zealand suffered almost as badly as any other country, for we are, as has been pointed out, heavily dependent on exports of farm products for our overseas income and internal prosperity. In the depression, prices paid for New Zealand primary products were so low that the whole financial structure of the country was in danger of collapse. Unemployment was heavy and many believed that the only way to ensure that New Zealand was never again subjected to such dire social distress was to provide work in secondary industries so that we should never again be so entirely at the mercy of fluctuations in world prices for our primary products. Consequently Parliament sought means of stimulating new industries, but before much had been done New Zealand began to face a severe shortage of overseas exchange, and at end of 1938 it was considered necessary to introduce import

control to ensure that what overseas funds we had were spent on buying essential goods and equipment. The protective effects of import controls are well known and there is no doubt that they did shelter New Zealand manufacturers and assisted the expansion which took place in the war and post-war years.

To-day New Zealand industries not only consist of woollen mills, saw-mills, clothing factories and footwear factories but include the manufacture of tyres, plastics, paints, radios, refrigerators, electrical equipment, car assembly and kraft paper manufacture; indeed, most types of light engineering are now undertaken in New Zealand. The shortage of base metals and the limited domestic market provided by a population of two million people have so far precluded the establishment of heavier industries.

The trend toward greater self-sufficiency for many consumer goods will undoubtedly continue but it is not anticipated that this trend will affect the volume of imports, although these will consist more and more of the heavier types of goods and equipment we cannot yet make ourselves. We do not export many manufactured goods, other than processed foodstuffs and for decades to come the bulk of our exports will remain primary products, although an important contribution may come from industries, such as electro-chemical industries, based upon supplies of cheap electric power.

The U. S. National Labor Relations Board in 1952

In the United States, the National Labor Relations Board, a 5-member commission operating under the Management-Labor Relations Act, has two major responsibilities: to hear and render decisions on charges of unfair labor practices brought to its attention by management or labor; to conduct elections to determine who (if any) union workers wish to designate as their representative for collective bargaining purposes.

Operating under new streamlined procedures, the Board conducted the largest number of representation elections in its 17-year history, according to the NLRB's Annual Report covering fiscal year 1952. The 6,866 elections which the board held represented a 5 percent increase over fiscal year 1951. Nearly 800,000 employees were eligible to vote in these secret ballot elections which determined whether or not and by which union they wished to be represented in bargaining with their employers.

This stepped-up activity stemmed, in part, from a board decision to give representation cases precedence over cases involving unfair labor practices. At the same time, the board expedited processing of representation cases by simplifying some procedures.

American Federation of Labor and Congress of Industrial Organizations unions competed for recognition in 722 elections; AFL unions won 337 of these elections, CIO unions 298, and unaffiliated unions 12. The workers voted against union representation in 75 elections. Statistics such as these recently prompted the AFL and the CIO to propose a 2-year pact, effective January 1, 1954, which forbids the raiding of employees in an established local which has a contract with an employer or certification by the NLRB. The no-raid pact, however, does not cover the subject of rival claims to units of unorganized workers.

AFL unions won 3,089 of the 4,711 representation elections in which they participated. Unions affiliated with the CIO won 1,404 of the 2,502 elections in which they were involved. Unaffiliated unions won 60 per cent of the 776 elections in which they sought representation.

The board, acting on petitions filed by employees seeking to have their bargaining agent decertified, conducted 101 such polls. In 74 of these elections, the representatives involved were decertified; unions won the remaining 27 elections. The provision for decertification elections did not appear in the earlier Wagner Act which was amended in 1947 by the Labor-Management Relations Act (Taft-Hartley law.).

The number of charges of unfair labor practices filed with the board in fiscal year 1952, increased slightly (4 percent) over last year. Seventy-nine percent of the 5,454 unfair labor charges were made against employers; the remaining 21 percent against unions. Only 13 percent of the cases required a trial before the board members.

Employers were most often charged with having discriminated against employees for participating in union activities; next in importance were charges against employers for refusal to bargain in good faith. Unions were most commonly charged with having caused or attempted to cause employers to discriminate against employees for failing to become union members; illegal restraint or coercion of employees in the exercise of their right to engage in union activity or to refrain from it was the next most common charge against unions.

Employers charged with unfair labor practices took remedial action in 1,263 cases during fiscal year 1952; in the vast majority of these cases the employer took this action by agreement rather than by NLRB or court order. In most cases the employer posted a notice within 60 days on the employee bulletin board stating that he would no longer continue the unfair labor practice with which he had been charged. Other employer remedial action included withdrawing recognition or assistance from a company-dominated union; disestablishing such unions; placing workers on a preferential hiring list; and bargaining collectively with employees. In addition, employers offered 1,801 workers reinstatement to their jobs and paid back-pay awards of over \$1.3 million to 2,734 employees.

Unions undertook remedial action in 297 unfair labor practices cases; in more than half these cases the action was taken by agreement of all parties and not NLRB or court order. As was the case with employers, unions most often posted notices on employee bulletin boards indicating they would cease the unfair labor practice. Unions also agreed to cease requiring employers to give them assistance and, in 14 instances, agreed to bargain collectively with employers. Back-pay awards of \$23,910 were made by unions to 87 workers.

The *New York Times*, commenting editorially on the NLRB's 17th Annual Report, noted: "Apparently the election process is becoming more and more acceptable to employers and employees as an integral part of peaceful industrial relations. Its acceptability is no doubt enhanced by the increasing tempo with which such elections are being processed. . . . The NLRB is to be commended for speeding up its procedure and, to a measurable extent, reducing the incidence of industrial conflict."—*American Labor Review*.

WHOLE No. 564

NOTES

The Congress in West Bengal

The next All-India session of the Congress is going to be held in West Bengal. To be exact, it is going to be "celebrated" at the site of the satellite township of Kalyani, at a distance of approximately 40 miles from Calcutta.

We have no doubt that the session will be held with the glitter and pomp of a durbar, in line with what was done at Jaipur and Hyderabad. And further the plans for Kalyani will receive some minor fillip in the way of advertisement and very partial completion, free of charge, of certain conveniences, such as drainage, water supply and electricity connections. But what would it achieve in the way of rehabilitating the Congress in the hearts of the people? That is the vital question, though it seems to have been lost sight of by our Gods That are Failing.

The W.B.P.C.C. issued a few posters during the bye-elections, stating that the Congress was born in Bengal. This is undoubtedly a fact, undeniable by even those of the ilk of Pattabhi Sitaramayya. But today the Congress stands a good chance of being regarded as a stranger and an impostor in the province and city of its nativity. Why should it be thus, is the question we ask with all the emphasis at our command.

It cannot be denied that the Congress is being looked upon with open hostility by quite a considerable section of our younger generation. And that its acts of omission and commission are viewed with deep disappointment tinged with strong resentment by the vast majority of the older and more thoughtful portion of the public. This is particularly true of Calcutta, and, if timely consideration be not given, this will be true of all West Bengal.

That the Congress Government is out-of-contact with the people, was amply demonstrated during the July disturbances. Matters have improved somewhat since then, but no substantial progress has been registered, as was fully evident during the South-East Calcutta Parliamentary bye-election, of which the result came out on November 27. In that the Communist candidate Mr. Sadhan Gupta was elected, having secured 58,211 votes, the Congress candidate Dr. Radhabinod Pal securing 36,319 votes. The other candidates, Dr. Bhupal Bose of the Forward Bloc and Mr. J. P. Mitter of the Jan Sangh, forfeited their deposits having got only 5,415 and 5,431 votes respectively. The Congress thus was defeated by a majority of nearly 22,000 votes, in the city of its birth.

That Communism *per se* is not a fighting force all over West Bengal yet, was demonstrated, however, in the other bye-election held simultaneously in Nawadwip-Krishnagore Parliamentary Constituency. In this the Congress candidate Srimati Ila Pal Chowdhury defeated her Communist rival Mr. Sushil Chatterji by over 42,000 votes having secured 69,636 votes to the 27,455 votes of her Communist rival. The P.S.P. candidate, Sri Mihir Lal Chatterjee, came a bad third with 19,802 votes, as was expected.

Srimati Ila Pal Chowdhury is an absolute newcomer in the public life of West Bengal, despite all that has been published in the daily press. She has not had any contact with any phase of public activities until very recently. All the more praise is due to her for her successful election campaign. Most probably she fought the campaign with the enthusiasm of a new-comer, unfettered by the shortcomings and blemishes that have accrued to most Congressmen. Praise is also due to the Congressmen who carried on

the campaign over the scattered and difficult terrain of a countryside constituency.

Dr. Radhabinod Pal is a man of high standing in public esteem, being a jurist of international standing and unsullied reputation. The constituency is compact and easy of approach and within easy reach of the headquarters of the W.B.P.C.C. And yet he suffered a miserable defeat!

It is unanimously agreed amongst all trained observers that the Congress lost by sheer default. There was no campaign in evidence anywhere. Indeed a veteran journalist with a great deal of experience of electioneering in Calcutta said he had never seen a Congress candidate being let down like this.

Now that the expectations and excitement in the South-East Calcutta election have died down, a dispassionate view should be taken as to where the parties stand. Those who voted against the Congress are not all anti-Congress. They say thus:

"We are not anti-Congress, but we do not see eye to eye with some of the policies of the premier party. We know that the Congress enjoys the majority in the Union Parliament, and one more member will not in any way alter its position. But we want to register our protest on this occasion against its present policies. The Communists are a minority in the Legislature and one more member will not make it a majority party. Still we must vote for its candidate and this is just a protest and warning too that if the Congress does not make amends, it will have to lose many more seats in the next election."

But what about the leftist parties (other than the Communists)? This election may be taken as a pointer that in no distant future they are destined to die a natural death unless they awaken to realities. In the last general election some of these leftist parties formed an entente with the Communists under the name of the USO. At that time the Communists were still to a certain extent handicapped with their war-memories. Naturally they welcomed the entente. But they knew full well that it was just a patchwork pact to be broken as soon as their purpose was served. And they broke the entente soon after the general election.

The position is now altered. The so-called leftist parties are today practically without organisation, without strong, clear-cut policies and ideologies, and lastly, without resources. These splinter groups and organisations are now compelled to play a second fiddle to the Communist party, seemingly only to delay their elimination from the political arena of India. During the last tram strike they tried to make capital out of the agitation and to lay the foundation for this election thereby. They are now disillusioned, but they should have foreseen this at that time. At their cost the Communists have won, because they are a strongly organised party. Sri Silbhadrā Yajee is now alarmed at the future prospect of his party. He says that the Forward Bloc did not hold many meetings in support

of their candidate. But that is poor consolation and a paltry defence too. The Forward Bloc did its best and their defeat was just inevitable under the circumstances.

The next general election will be fought between the two major parties—Congress and the Communists. The other leftist parties will have to join either of these parties or will go the way of political extinction, unless they see reason. The P.S.P. which is by no means a splinter group has lost not only both the elections, but a very considerable amount of prestige. And for that they have to thank their Calcutta executives, who thought they could win the elections as fellow-travellers. If the P.S.P. wants to survive in West Bengal, it should start with a searching enquiry into the workings of its party-organisation here.

Congress Reverses in U.P. Civic Elections

The Congress has suffered a surprising defeat in the recently held civic elections in Uttar Pradesh. As the *People* writes, the civic elections had been described as 'miniature' general elections. Though the Congress still topped the list in numbers of seats secured "the fact remains that the Congress has suffered heavy and unexpected reverses," writes the special correspondent of the *People* in Lucknow. The correspondent adds: "The *People* prognosticated a resounding victory for the Congress—anything between 75 per cent and 90 per cent. It seems we must eat our words now. We have proved to be bad prophets."

The Correspondent lists the inability of the Congress Parliamentary Board to mobilise its forces to the full as one of the causes of the defeat of the Congress. Growing popular resentment towards the Congress Government was also a contributing factor. The cost of living was rising higher and higher and unemployment was on the upgrade. Added to this was much factionalism inside the Congress itself. Casteism and Communism also had a hand in the Congress defeats, the correspondent writes.

Next to Congress the most successful has been the Citizens' Democratic Front, consisting of Communists and fellow-travellers. Out of 31 seats contested the Front has secured 26 while the Congress could secure only 39 seats by contesting for 106 seats.

According to the statement of Sri Govind Sahai, General Secretary of the Citizens' Democratic Front, on November 9 the party position on that date was as follows:

Party	Seats contested	Seats won	Percentages of seats won to seats contested
Congress	106	39	36.7
C.D.F.	31	26	84
P.S.P.	34	12	35
Hindu Maha Sabha	30	12	40
Independents	112	23	20.5

In the Four bye-elections to the State Assembly, however, the Congress has fared much better by secur-

ing three seats. The Communists failed to gain any seat and the fourth one was annexed by the P.S.P. Two bye-elections were still pending.

Devanagari Script Reform

Two distinct points of view seemed to dominate the deliberations of the Devanagari Script Reform Conferences which sat at Lucknow on November 28, under the chairmanship of Sri S. Radhakrishnan, Vice-President of India.

Dr. Radhakrishnan stressed the need to have a uniform script for Devanagari for the whole country. "Our aim should be simplicity and speed. We should not, of course, make changes simply to suit typing and printing," he said.

The need for simplifying the Nagri Script was recognised by the spokesmen of both sides, Dr. Sampuranand and Kaka Kalelkar, but the former, while initiating the general discussion on the subject, emphasised that the richness and beauty of the language should not be sacrificed for the demands of "mechanisation" of the script. Kaka Kalelkar, however, pointed out that the question was not of retaining or sacrificing the beauty of the language but was that the script should be so simplified as to take the language to the widest section of illiterate masses and further so that the unifying heritage of different languages of India, all of whom were derived from Sanskrit, should emerge.

Dr. Radhakrishnan, in his presidential address, expressed yet another point of view. He said that there should be a uniform script for the whole country but suggested the use of both Roman and Nagri scripts and added that "such co-operative usage (of two scripts) will bring us into intimate relations with our Sanskrit heritage and also European culture." He also warned that displacement of regional scripts by Nagri was not a practical proposition at present.

"We have the same alphabet in many Indian languages but different scripts. We may also arrange the Roman letters in the Sanskrit order. This will help to popularise Hindi in non-Hindi-speaking areas and spread the knowledge of Indian literature, philosophy and religion outside India more easily and effectively.

"It is sometimes suggested that both the Nagari and the Roman scripts may be used for the expression of Sanskrit. Such a co-operative usage will bring us into intimate relations with our Sanskrit heritage from which almost all the languages of India are derived, and European culture. The Roman script adapts itself to expansion by the use of diacritical marks. The Roman script, it is contended, is not European in its origin but is really derived from Asia and is well suited for the expression of Sanskrit. I realise that this suggestion is beyond the scope of the conference

which is convened for the specific purpose of effecting the necessary improvements in the Nagari script to suit the needs of the modern printing press, typewriting and those of the growing politically conscious population.

"The suggestion that one uniform Nagari script should be employed for all the languages of India will have to be considered with great care and caution. The use of the Nagari script for Sanskrit in many parts of the country is not very old. We owe it to the work of the European Sanskritists and the unifying tendencies of the different Universities from 1957 onwards. The first volume of Max Muller's edition of Rig Veda Samhita was published from Oxford in 1854 and the Universities of Calcutta, Bombay and Madras which were founded in 1857 started prescribing Sanskrit texts in Nagari script. Till then Sanskrit works were written in Bengali, Assamese, Oriya, Maithili, Newari in Nepal, Sarada in Kashmir, Telugu, Kannada, Grantha in the Tamil country and Malayalam. The Nagari script was used for Sanskrit works in the Hindi area, Rajasthan, Punjab, Gujarat and Maharashtra. To suggest the displacement of native scripts by Nagari is not at the present time a practicable proposition. All these local scripts as well as Nagari are derived from the old Bramhi script. When Hindi in Nagari script is more generally accepted in non-Hindi areas, the people who speak other languages will also become familiar with the Nagari script and perhaps may adopt it as an alternative to their own. In these matters, natural growth should be the method and not official imposition.

"The punctuation marks which are in use in English may be adopted.

"As for the international numerals or the Devanagari numerals, there are arguments for each. The Nagari script and the Nagari numerals, it is said, should go together. They form an organic whole. When it is decided to use the Nagari script, consistency demands that the Nagari numerals should also be used. On the other side, it is said that international numerals are used the world over. Even countries like the Soviet Union which insists on the general use of the Russian language by all its people, use the international numerals and not their national ones. These numerals, it is argued, were originally Indian and spread to Europe through the Arabs. If the international numerals are used, accounting, book-keeping, etc., are greatly facilitated when trade and commerce are becoming international. It is suggested that in Hindi correspondence the Hindi numerals may be used and in all other cases international numerals."

Pandit Nehru sent the following message:

"It is not quite clear to me what exactly is going to be discussed at the Devanagari Script Conference, which is going to be held soon in Lucknow. Problems of language and script are normally dealt with by a

small body of scholars or experts and then considered by large gatherings or organisations. I do not know if this preliminary stage has been passed already and there are specific proposals to be considered.

"Not knowing this, I am at a disadvantage.

"If the conference is going to consider the problem of script only, I imagine that this falls into two parts:

(1) The adoption of the Nagari script by the other Indian languages, or by as many of them as possible.

(2) The improvement of the Nagari script so as to make it more suitable for printing, typing and other forms of modern usage.

"It is obviously desirable that we should bring about some uniformity in India in the matter of script.

"This applies more especially to the scripts of the languages derived from Sanskrit and secondarily to the other languages of India. If we have a uniform script, this in itself would remove a major barrier in the learning and understanding of other languages in India. It would be a unifying force and far more people than today will know more than one Indian language.

"This is so obvious that it needs no argument.

"The result of having one script would actually lead to a much wider acquaintance of those languages which at present have another script. Our decision to make Hindi in the Nagari script, the national language of India gives undoubtedly a big pull to people living in the Hindi-speaking areas. Others will no doubt learn Hindi, as they are doing now. But, normally speaking, they will not know it as well as a person whose mother-tongue it is.

"I think it is important that every Indian should know at least one Indian language other than his mother-tongue. In the case of people living in the non-Hindi-speaking areas, that other language will necessarily be Hindi. For the Hindi-speaking areas, the other language will have to be a different one, Bengali, Gujrati, Marathi, Telugu, Kannada, Oriya, Assamese, etc.

"In Europe there are many great languages, but all of them except in the Slav regions, are written in the Roman script. That is a great advantage and many literate persons can at least read every other language even though he might not understand much of it. That advantage will come to India if we have one script.

"I remember the complaint of a young Khasi boy in Assam. He told me that he had to learn his own language, that is, Khasi, which was written in the Roman script. (This was introduced by the Christian missionaries many years ago and still continues, Khasi books and Grammar being in that script). Then he had to learn Hindi in the Nagari script and Assamese in its own script. Also he was keen on learning English. Thus the poor boy had to learn four languages and three scripts.

"This did appear to me a bit too much. This would

apply to all the Tribal areas. That boy suggested, of his own accord, that Assamese might be written in the Nagari script. That would simplify, to some extent, his work, as obviously it would.

"Thus no argument is needed for having one script for the whole of India if possible. This will create difficulties to begin with, but, once done, it would make things easy for all of us. We, in Northern India, would learn the Southern languages with far greater ease. People in the South of India would learn Hindi easily as well as any other language. The real difficulty, of course, is a practical one and how far people would willingly accept such a change in the script. Language in all its forms, including script, is something which is a very intimate part of an individual, a group or a nation. It is not easy to change it and passions are frequently aroused in such controversies. Therefore, one has to proceed with the greatest caution and goodwill. Attempts to impose a language or a script create difficulties, and usually can only be done successfully by some authoritarian regime. The change-over should have a considerable measure of support from the people most concerned.

"Two scripts are to remain, or rather should remain, in India, namely, Urdu or the Persian script and the Roman script, in which English or the European languages are written. There is no sense of conflict between them and Hindi. These are completely different and cannot be absorbed in Hindi. The Roman script keeps us in touch with the world generally and we must know it. The Persian script is still used by a large number of persons and is a link between us and Western Asia. It has been used in India for many hundreds of years and is part and parcel of our life. Naturally it will be dominated by Hindi and Nagari more and more. But it should be preserved and encouraged in its own sphere as something which adds to the richness of our life and thought, just as the Roman script does over a wider field.

"The second question is the reference to the possibility of the present Nagari script being simplified or improved for purposes of printing, typing, etc. While the script is scientific, it is slightly cumbersome for these purposes and therefore efficiency suffers considerably by its use in its present form. This is a matter for experts to consider, some proposals have already been made for such an improvement."

Forced Labour

An international committee has laboured for two years to establish the fact that many countries use political prisoners as slaves. The man in the street has little doubt that slave labour is a fact. Yet he has equally little idea of its scale, and its very existence is hotly denied by the governments concerned. Such denials inevitably carry some weight when the accusations are levelled by refugees or by governments politically opposed to the accused regime.

Real value, therefore, must be attached to the carefully objective and restrained report compiled by a United Nations committee composed of three eminent individuals representing three continents. Sir Ramaswami Mudaliar of India, Mr. Paal Berg, former president of the Norwegian Supreme Court, and Sr. Sayan, former Foreign Minister of Peru, issued their 620-page report on June 24th, almost two years after their appointment. They were instructed by the UN Economic and Social Council to study the extent to which forced labour is used not only for political repression but also as an economic weapon of governments.

These three men were faced at the start by the fact that during public sessions of the Council no less than 23 nations had been accused of practising forced labour. The 23 included Britain, Australia, France, South Africa, the United States, Eastern Germany, the Soviet Union, Czechoslovakia and Communist China. But the committee was required to consider other countries too. In fact, it sent a brief questionnaire to all governments, whether members of UNO or not, asking for information about their relevant laws. Forty-eight governments replied; those that did not include the Soviet group, thirteen of the Latin Americans, Persia, Egypt, Portugal and Pakistan. As to the 23 accused, each was supplied with copies of the allegations and of supporting documentary evidence where it existed, and asked to comment. The Soviet group and some of the Latin Americans declined to comment.

While the committee was being denounced by Moscow and Prague as a tool employed solely to calumniate the Communist nations, it was painstakingly probing the truth of a long series of sweeping accusations which those nations themselves had made, in almost every case without any supporting evidence. For example, a Soviet spokesman declared that the British Control of Engagement Order of 1917 had "deprived the British workers of all their rights." The committee, however, found that only 15 directions to work were issued under this order in 1947, 14 in 1948, and none in 1949, while the order itself was revoked in 1950. The Polish allegation that 20,000 Africans had been subjected to forced labour in one year in the colony of Gambia and the Byelorussian accusation that Tanganyika groundnut scheme was based entirely on forced labour, were proved false.

But the committee in no way set itself to whitewash the non-Communist world. A scrutiny of Portuguese law revealed that Africans who went to work on the island of San Tome, although voluntarily, were liable to find themselves in a position akin to one of forced labour. In Spain, the committee found that very broadly defined political offences were liable to severe punishment involving forced labour. A system of forced labour of significance to the national economy

was judged to exist in South Africa, in the indirect sense that most of the population was channelled, by discriminatory laws, into agricultural and manual occupations in which many of the Africans were strictly supervised by the authorities.

The committee went further and examined the position in Malaya, Kenya, the Belgian Congo, Bolivia and Nauru. Its conclusion is that in each case existing regulations might, if extensively applied and broadly interpreted, lead to the creation of a system of forced labour. The evidence did not suggest that such a system existed in these territories, but the possibility could not be ruled out. The same warning was given as regards vagrancy laws in some States in the United States.

All this, however, was overshadowed by the committee's findings with regard to the Soviet bloc. When studying these countries, the committee carefully refrained from accepting any estimates of the size of the slave labour population, reports on the location of the Soviet prison camps, or evidence of mass deportations. It applied itself essentially to a study of existing Soviet and satellite laws and administrative practices. As to the Soviet Union itself, official publications clearly established the fact that persons suspected of political errors are sentenced to forced labour often without any right of appeal or of representation by a defending counsel, and sometimes by an administrative organ instead of a court. They further established that most of those sentenced are sent to labour camps or colonies in remote and undeveloped areas or at the sites of big mining and construction projects. As one Soviet publication puts it, "The stupendous work done by corrective labour camps is of enormous importance to the national economy."

The committee's findings that in the Soviet Union forced labour is used not only for political coercion, but also as an important element in the national economy, is applicable also to Bulgaria and Czechoslovakia. As to Poland and Hungary, the committee did not find the evidence conclusive, but it held that the laws of these countries gave their governments power to employ forced labour as both a political and an economic weapon. In Rumania, it was found that forced labour was, in fact, used for political repression, and could also be made to serve economic purposes. The committee was unable to study the situation in Albania and Communist China since it could not obtain copies of the relevant laws and regulations. Further information was also needed about Eastern Germany, but the committee noted official Communist admissions of the existence of labour camps, documents establishing the fact that Germans were directed to work in the uranium mines, and extracts from the East German Criminal Code, which empowers courts to inflict forced labour "without conducting a full hearing."

It is strange that the Indian delegation to the United Nations dissociated itself from the views of the committee on forced labour. The preface to the Report on forced labour states that the members of the committee "had acted in a purely individual capacity and that they did not represent any government or party and that the opinion they had expressed in their report did not and could not commit their respective countries." The Soviet delegate, M. G. F. Saskin, denounced the report as it disclosed the inside story of the labour situation in the Soviet bloc. He vehemently attacked both the Chairmen, Sir Ramaswami Mudaliar and Mr. Paal Berg, the former as a "servant of the colonial imperialists" and the latter as a "Quisling renowned for toadying to the Fascists." The Norwegian delegate resented this remark against an eminent personality of his country. But the Indian delegate said no word which is exceedingly strange.

Peace Prize

The conferment of the Nobel Peace Prize on General George Marshall, the former Chief of Staff of the American Army, makes one wonder whether the terms *peace* and *war* have become synonymous with the Nobel Prize Committee. The man who played a leading role in the second world war, the man who is in no mean way responsible for deciding the Allied Policy that ultimately led to the subjugation of the defeated nations of Europe is now recognised to be an upholder of peace. It may be that peace having been annihilated in the second world war, peace is now non-existent and has yielded place to war, hot or cold. War now being the sole survivor of the two, the Nobel Peace Prize Committee probably thought that henceforth the best upholder of war should be awarded the Nobel Peace Prize.

If one sees the matter from this point of view, the puzzle may be cleared why Mahatma Gandhi was not awarded the peace Nobel Prize. It is simply because to the Committee peace is now non-existent.

Trade Unions in India

Prof. Van Dusen Kennedy, Berkley University, California, in the course of his address to the Mysore State branch of the Textile Association of India in Bangalore in the first week of November, stated that the striking difference between the Indian Trade Union Movement and the American was that the unions in the United States were led by men who had come up from the ranks of the working classes, while in India, they were led by persons who had nothing to do with the concerned industry but belonged to some political party. Secondly, he said that labour-management differences in the US were thrashed out between the parties concerned, whereas in India the Government and the tribunals often come in, and very largely, into the picture. In America, there are provisions for written agreements and their

proper execution. Thirdly, in the United States, there is a national union for each industry exercising full powers over its branches; but there is no such centralisation in India, the units being knit together only very loosely in the form of a federation.

These observations by Prof. Kennedy bring out the essential difference between the American and the Indian labour movements and the weakness of the latter. The Trade Union Movement in this country is neither centralised nor is controlled by the workers themselves. The movement is disrupted by a number of rival central associations dominated by one political party or the other. The All-India Trade Union Congress was founded in 1920 and affiliated to the World Federation of Trade Unions. It is now fully controlled by the Communists. The Indian National Trade Union Congress, founded in May 1947, and affiliated to the International Confederation of Free Trade Unions, is run by the Congress Party. The Socialist Party founded in 1948 the Hind Mazdur Sabha. There is again the United Trade Union Congress, which broke away in December 1949 from the AITUC. The Trade Union Movement in this country is thus controlled by India's political parties. The result is that the economic and social interests of labour are sacrificed at the altar of political rivalry and personal jealousy. Small wonder that where political consideration predominates, economic welfare of the labour goes at a discount. This factor explains the absence of machinery for mutual settlement of disputes and the consequent interference of the Government in labour disputes. Unless such outside political control goes, there is little prospect of ensuring harmonious labour management relations.

The number of affiliated unions and their membership during 1951 was as follows:

Organizations	Number of affiliated unions	Membership
Indian National Trade Union Congress	1,220	15,68,668
All-India Trade Union Congress	736	7,58,314
Hind Mazdoor Sabha	517	7,74,263
United Trade Union Congress	332	3,84,962

India's Mineral Production in 1951

The total volume of minerals and ores excluding petroleum produced in India during the year 1951 has been estimated at over Rs. 105 crores as compared with Rs. 83 crores in 1950.

The reserves of Gondwana coals in seams of workable thickness, that is, four feet and above, of a quality which can be used for most purposes, not exceeding 25 per cent ash content and occurring within one thousand feet of the surface, have been estimated at 20,000,000,000 tons. Of this, the good quality coal would amount to about 5,000 million tons, or 25 per cent of the total reserves. India's known reserves of chromite are of the order of 200,000 tons of high grade ore, while the reserves of lower

grade ore are estimated at several times as much. The total estimated reserves of copper ore at the close of the year 1950 stood at 3,087,195 short tons and the total reserves of gypsum are roughly of the order of 67 million tons. Major iron ore reserves total up to 10,200 million tons. The Lapsa Buru deposit of Kharsawan is the largest kyanite deposit of its kind in the world and the reserves have been estimated at 200,000 tons within a depth of a few feet. India has large reserves of high grade manganese ore. There are many other strategic minerals of which India possesses fair reserves.

Iron Ores of India

India is one of the few countries of the world containing large and abundant reserves of iron ores, according to an article contributed by Dr. M. S. Krishnan, Director, Geological Survey of India to the latest issue of the *Indian Minerals* (Vol. VI, No. 3).

The ores are distributed widely in various parts of India and are of four general types. Of these the more important are hematite and quartz-magnetite rock. The former type of ores occurs in large deposits in Bihar, Orissa and Central Provinces and the latter is seen in the Salem and Trichinopoly districts of Madras.

Iron ore has been smelted in India for perhaps 3,000 years, for it is known that articles made of iron and steel of Indian origin used to be marketed in the Levant some centuries before Christ. The famous Damascus blades for swords, were made from Indian steel. The smelting was done in very numerous but small furnaces scattered over the country wherever some kind of iron ore and charcoal were available. The famous iron pillar near the Kutab Minar at New Delhi has won the admiration of many. Analyses of the iron were made by Dr. Percy, late of the School of Mines, and Dr. Murray Thompson of Roorkee College, who found that it consisted of pure malleable iron without any alloy. The pillar which shows no sign of rust is a testimony to the skill and art of Indian iron-makers 1,500 years ago.

It was known that in the 18th century steel taken to Britain from India was of two kinds. One was in the form of conical ingots and the other in the form of flat round cakes. The former was *wootz* steel made in crucibles in the Trichinopoly district of Madras and in certain places in Hyderabad. The word *wootz* belongs to the Telangana language of the south-eastern parts of Hyderabad State. It was produced by the carburisation of wrought iron in crucibles, using a principle which was unknown in England until the year 1800. The latter, i.e., steel in the form of flat iron cakes, was made by the partial removal of carbon by oxidation from cast iron.

Five-Year Plan and Agriculture

Agricultural development has been given a high place in the Five-Year Plan, and the success or failure of

the Plan is therefore naturally going to depend very largely on what the agriculture is able to achieve. Dr. Punjabrao Deshmukh, Union Minister for Agriculture, addressing the Conference of State Ministers of Agriculture and Co-operation, held recently in New Delhi, said, "Thanks to the good rains and seasonable weather last year, the overall acreage under cereals are the highest even in 1952-53, being 200 million, and the total production of cereals during that period was 5 million better than the previous year. In rice, maize and barley, we have had an all-time record production in 1952-53."

He further said that the usual grow-more-food efforts have been supplemented this year with a drive for the new method of rice cultivation. The seventeen States that have reported so far estimate that over 3.4 million acres of land has been put under this method. It may be that all the items of the new method may not have been followed uniformly everywhere. But the addition to rice production will not be inconsiderable. The south-west monsoon has on the whole been satisfactory in most parts of the country, although extensive damage by floods has been reported. In spite of this widespread calamity, it is being hoped that India's overall production will not suffer.

Referring to land reform policies, including imposition of ceilings on holdings, Dr. Deshmukh said, "The general lines of land policy have already been laid down by the Planning Commission. One important question on which there seems to be difference of opinion is the question of ceilings on holdings. The idea of ceilings has already been given effect to in a number of States as the limit for future acquisition and as the limit of resumption of lands. The question of imposing a ceiling on the existing holdings has recently been taken up by certain States and this has undoubtedly a direct bearing on agricultural efficiency and output."

Apart from better production, the question of marketing of the agricultural produce is very important. It is axiomatic to say that unless there is an adequate return to the farmer, it is idle to speak of enticing him or entertaining the ambition of greater production. Moreover, the agricultural industries, big or small, are all almost everywhere in the hands of non-agriculturists, with the result that there is a perpetual conflict of interests between the two. In this conflict, the cultivator, being the weaker, always and consistently loses. Steps should therefore be taken to enable the agriculturist to establish his own industries.

Census of India

The All-India Census Report, 1951, (just published), has been prepared at a cost of Rs. 1.49 crores (or Rs. 41½ per 1,000 persons enumerated as against Rs. 15½ per 1,000 enumerated in the 1931 census). The Report of the 1951 census is presented in 17 volumes which are divided into 63 parts. The Report reveals that India is more densely populated than Europe which is itself

the most densely populated region in the world. In relation to the natural resources available for the production of food, India is even more heavily populated than Europe. But while Europe has brought only 30 per cent of his land under the plough on the average, India has brought 43 per cent of her land under cultivation. The pressure of population on land in India will be evident from the fact that, although the land area of the USA and Soviet Union put together is nine-times as large as India's, these two countries have together a smaller population than India.

The total area of land is 812 million acres and the population of the Indian Union between 26th January and 1st March, 1951, was 356, 879, 394. The land area *per capita* comes to 2.25 acres (including Jammu and Kashmir). Out of India's 812.6 million acres, 86.9 million (or 10 per cent) acres lie in mountains. The word "mountain" in this connection means steep land at a very high elevation and excludes all land below a limit of 7,000 feet above sea-level. Nearly two-thirds of such mountain tracts (54.8 million acres) are found in Jammu and Kashmir. The remaining one-third is distributed among three zones: 14.1 million acres in East India, 9.7 million acres in North-West India, and 7.9 million acres in North India. Less than 500,000 acres are in South India. In West India and Central India there are no mountains in the strict sense of the term.

Next to "mountain" tracts come hilly tracts. The term "hill" is used to cover all kinds of weathered highlands (except mountains) without reference to the level at which the hills are situated. It also covers the entire area of all ranges other than the Himalayas, as also the foothills of the Himalayan range up to 7,000 feet above sea-level. Hilly tracts thus defined covers 150.9 million acres of all land in India (18.6 per cent). This area is divided among four zones: East India 52.5 millions, Central India 33.3 millions, South India 27.8 millions, and West India 19.8 millions.

There are 8.8 million acres of hill tracts in North-West India outside Jammu and Kashmir and 2.7 million acres in Jammu and Kashmir. There are 4.1 million acres of hilly area in Northern India and 2.1 million acres in the Andaman and Nicobar Islands.

Plateaus are the third kind of tracts. They comprise all types of flat tracts of land which lie between 1,000 feet and 3,000 feet above sea-level. Such tracts measure 224.8 million or 27.7 per cent of all the land in India. Almost exactly one-half of all plateaus (112.5 million acres) is found in Central India including Madhya Pradesh, Madhya Bharat, Hyderabad, Bhopal and Vindhya Pradesh. The remaining half is distributed as follows: North-West India—30 million acres; South India 28.6 million acres, West India 28.4 million acres and East India 2.4 million acres. A fringe of North India measuring 3.4 million acres is also plateau land.

Lastly, come the plains. India has 349.9 million acres of plains or 43 per cent of all land in India. They

are distributed thus: East India 80.5 million, North-West India 74.2 million, North India 57.2 million, South India 50.6 million, West India 47.6 million and Central India 39.5 million. Plains are generally the best for purposes of cultivation and settlement of people.

But all the 350 million acres of plain land are not fertile or even cultivable. Some parts of the country have vast stretches of land which can be called land only in a technical sense. The "Rann of Kutch" is an instance in point. It measures 5.9 million acres and is not cultivable. So also is 25.4 million acres of Rajasthan dry area. The capacity of this area to support life is negligible. Then come the sandy wastes and marshy lands which occur in many tracts. Such lands account for 33 million acres in North-West India and 7.5 million acres in West India.

Thus, out of a total land area of 812.6 million acres, unusable area accounts for 308.2 million acres. Topographically usable area therefore is of the order of 504.4 million acres. All the usable area, however, is not cultivable. Even within this area, there lie large patches of land which are little better than barren rock, and have no soil or cover. Information regarding the nature and extent of soil cover available for land in different parts of the country is mostly descriptive. There are four main groups of soils in this country, namely, alluvial, black, red and lateritic. A brief description of these soils is given below:

(1) Four main groups of soils are found extensively all over India. Among them, the alluvial groups is by far the most productive. They are distributed over practically the whole of the Gangetic plains in Uttar Pradesh, West Bengal and extend to the Punjab and parts of Assam and Orissa. The coastal tracts of Southern India are also alluvial, especially at the mouths of the rivers, where they are known as deltaic alluvium. The soils are deficient in phosphoric acid, nitrogen and humus, but not generally in potash and lime.

(2) The black soils of India are loamy to clayey in texture, vary in depth, and contain lime *kankar* in varying percentages, and free calcium carbonate. These soils are generally suitable for cultivation of cotton and are known in many places as "black cotton soils" or *regur*. Resembling tropical black earth, they are very well defined soils which occupy the greater part of Bombay and Saurashtra, western parts of Madhya Pradesh, Madhya Bharat and Hyderabad and some parts of Madras including the districts of Tirunelveli and Ramanathapuram. The soils are fairly fertile and very useful for commercial crops.

(3) Another fairly well-defined and extensive group consists of red soils. They differ widely in depth and fertility in different parts of India and are generally of medium to low fertility. They cover very large tracts of Madras, Mysore, south-east Bombay, east Hyderabad and a strip of tract running along the eastern part of Madhya Pradesh to Chhota Nagpur and Orissa. In the

north, the red soil area extends into and includes the greater part of the Santhal Parganas in Bihar, the Birbhum district of West Bengal, the Mirzapur, Jhansi and Hamirpur districts of Uttar Pradesh, northern portion of Madhya Bharat, the Aravallics and the eastern half of Rajasthan.

(4) The last of the four main groups consists of laterite and lateritic soils. Soils of this group are derived by the atmospheric weathering of several types of rocks under monsoon conditions of alternating dry and wet periods. Well-developed laterite and lateritic soils are found on the summits of hills of the Deccan, Madhya Bharat, Madhya Pradesh, and of the Rajmahal and Eastern Ghats, and certain parts of Orissa, Bombay, Malabar and Assam. The soils are deficient in potash, phosphoric acid and lime.

(5) Other miscellaneous types of soils include desert or arid soils occurring in the regions having low rainfall, e.g., Ajmer, Eastern Rajasthan, etc. Marshy or peaty soils occur over small areas in Travancore, and in parts of West Bengal, Orissa and Madras. Hill soils, which are generally sandy or red loam, occur in the hilly regions of West Bengal, Punjab and Assam.

As regards the sex ratio, the census figures have revealed that not only males and females are unequal in numbers, but also that the magnitude of this inequality is also different in different parts of the country. In the country as a whole, the sex ratio is 947, that is, there are 947 females per 1,000 males. It varies widely among the zones. The lowest value is 883 in North-West India and the highest is 999 in South India where practically equality of the sexes is attained. The other four zones vary thus: 910 in North India, 938 in West India, 945 in East India and 973 in Central India. Regarding the marital status pattern, the Census Report states that in the country as a whole roughly every other male person is unmarried; while rather less than two out of five females are unmarried.

Births have occurred during the ten years 1941-50 at an average rate of 40 per thousand per year; and deaths have occurred during the same period at an average rate of 27 per thousand per annum. The natural increase of the population is therefore taking place at an average rate of 13 per thousand per year.

As regards livelihood pattern, the Report states that the pattern varies from one zone to another. There are 402 landless agriculturists for every one thousand agricultural landholders. There are enormous differences in this respect from State to State. This number of landless agriculturists per thousand agricultural landholders is the smallest in UP (161) and the highest in Travancore-Cochin (782). The numbers for other major States are: Mysore 190, Assam 235, Orissa 271, Bombay 383, Madhya Bharat 397, Madhya Pradesh 413, Hyderabad 507, Bihar 510, Rajasthan 544, West Bengal 609 and Madras 714.

Economic Condition of the Indian People

The economic data analysis of the 1951 Census reveals that agricultural classes account for 249,074,901 persons and non-agricultural classes 107,553,411. Of the agricultural classes 71,049,356 persons are self-supporting; 146,956,640 are non-earning dependents; and 31,068,905 are earning dependents. Among the non-agricultural classes 33,350,447 are self-supporting; 67,334,634 are non-earning dependents; and 6,868,330 are earning dependents.

Among the agricultural classes, 58,514,694 males and 12,534,662 females are self-supporting; 45,193,466 males and 89,763,174 females are non-earning dependents; and 10,479,295 males and 20,589,610 females are earning dependents. Among the non-agricultural classes, 28,662,536 males and 4,687,911 females are self-supporting; 25,407,927 males and 41,926,707 females are non-earning dependents; and 2,937,036 males and 3,931,294 females are earning dependents.

Among the agricultural classes, 167,326,578 persons and their dependents are cultivators of land wholly or mainly owned; 31,618,073 persons are cultivators of land wholly or mainly unowned; 44,309,019 persons and their dependents are cultivating labourers; and 5,321,231 persons and their dependents are cultivating owners of land and agricultural rent receivers. There are 402 landless agriculturists for every one thousand landholders.

Among the non-agricultural classes, 37,671,902 persons (including dependents) are engaged for their livelihood in production other than cultivation; 21,311,898 persons are engaged in commerce; 5,620,717 persons are engaged in transport; and 42,948,894 persons in other services and miscellaneous sources.

On an average every house in India is occupied by 5.5 persons. Of the total of 64,361,676 occupied houses in the country; 54,056,388 are rural houses occupied by 295,004,271 persons, and 10,305,288 are urban houses occupied by 61,875,123 persons. This gives an average of 5.4 persons per house in the rural area, and six persons per house in the urban area.

India has an area of 1,176,864 square miles, 558,089 villages, and 3,018 towns with a total population of 356,879,304 persons. This excludes the population of Kashmir State and the population of the Part B tribal areas of Assam, but includes the population of Chandernagore.

Regarding the marital status pattern, the report states that in the country as a whole roughly every other male persons is unmarried (total 88,147,296); while rather less than two out of five females are unmarried (total 65,950,673).

Despite the Sarda (Child Marriage Restraint) Act, 1929, nearly 14.5 per cent of females and 6.3 per cent of males aged between 5 and 14 years are married.

Prevalence of polygamy is revealed for the fact

that married females exceed married males by 124,911 persons.

During the period 1941-51, births have occurred at an average rate of 40 per thousand per annum; and deaths have occurred during the same period at an average rate of 27 per thousand per annum. The natural increase of population has been at the rate of 13 per thousand per annum.

Abor Hills

Commenting on the sad and unfortunate events in the Abor Hills where a number of officials of the Assam Frontier Agency had been killed by tribesmen the *Chronicle* points out that it served as an eye-opener as to the situation prevailing in the region. Characterising the incident as "nothing short of an insurrection," the paper commends the steps the Government proposed to take.

But the paper urges "utmost care and caution," keeping in view the geographical position of the area, activities and developments in the neighbouring areas beyond Indian borders and the nature and temperament of the tribal people. The Government of India should give closer attention and assume direct responsibility of the affairs of the region. All endeavours should be made to win the hearts of the people and the evil forces, who, the paper suspects, were being worked up by the foreign agencies, alienated from the rest of the people. And to achieve this objective specially trained officers would have to be deputed to this region. Otherwise, writes the paper, "situation may take, we reasonably apprehend particularly from the happenings in the Naga Hills as well, a very serious turn when Government of India will have only to repent and regret."

The latest information, as revealed by Shri Bishnuram Medhi, Minister in the Assam Government, goes to show that the Abor would listen to nothing but force. That force will have to be applied was evident from the very first, because these tribals are primitive people totally ignorant of outside affairs. There is no alternative therefore before the Government of India.

The Abors of Assam

Sri Satyen Sen writes in the *Hindu*: "Under the North-eastern Frontier Agency, the tribes who live in the mountains, east of Bhutan are the Akas, the Daflas, the Miris, the Abors and the Mismis. The hills inhabited by the Akas lie to the north of the Darrang district in Assam between the Dhansiri and Dikrai rivers. The Daflas live in the ridges that lie north of Darrang and Sibsagar districts between the Bharabi river and the Ranganadi. Miris live in the area lying to the north of Dibrugarh intersected by the river Subarnasiri. The hills wherein live the Abors are to the north of Lakhimpur district between the Siom river on the west and the Dihong river on the east. The Mismi

area is spread over the hills to the north-east of the Lakhimpur district. These hills sweep round the head of the Brahmaputra valley. The administrative districts of the Se La or Dafla inhabited area, the Subarnasiri or Miri area and the Abor Hills of N.E.F.A. have a co-terminal border with Tibet. The Mismi Hills district which lies to the east of Abor Hills adjoins both Tibet and Burma."

The Abor region is perhaps the wettest part of the earth. The Abors are a fast dwindling race. The population was 10,761 in 1951 compared with 17,646 in 1941. There were only 695 females for every thousand males. The word 'Abor' was derived from *a-bari*, meaning "untamed." British official contact with these tribesmen began in 1847. Since then periodical expeditions had been sent by the British Government in India designed to subdue the Abors, but with partial success only. In peace time, the Abors were truthful and honest, but in times of war they would not hesitate to bluff and trick the enemy into their clutch. The Abors were very conservative by habit and did not favour the idea of going away from their villages and suspected strangers. The chief weapon of the Abors was bamboo-made long-bow shod with iron, and fitted with a cane string. Almost everyone of them carried a sword. They were expert craftsmen and the womenfolk were expert weavers.

There were easily accessible roads to Tibet in the Abor Hills but those had hardly been used for direct communication between India and Tibet because the Simong Abors and the Bono-Janbo tribesmen inhabiting the area did not let anybody through and share in their profits of monopolistic middlemen's trading on Tibetan goods in their own hands.

Referring to the recent unfortunate happenings Sri Sen urges upon the Government to initiate a scientific study as a long-term measure to transform the turbulent nature of some of the Abor clans and to encourage and support philanthropic organisations to open centres there with a view to establishing closer links between the tribesmen and the people of the rest of India.

A Great Omission

The All-Bengal Medical Conference, recently held at Midnapur, adopted several good resolutions. But one thing is missed and that is a great omission as it relates to the medical practitioners themselves—it is their fees. In recent years fees of the medical practitioners are being increased, particularly in Calcutta, to almost prohibitory levels—prohibitory in the sense that such exorbitant fees have made many medical men out of bounds to the majority of the people. Plainly speaking, fees are now so high that they are nothing but prohibitive. Perhaps in no other States of India fees of the medical practitioners are so high as in West Bengal. Even in a great city like Bombay, fees are much lower. Then why the medical fees are so exorbitant in Bengal?

In Britain the Labour Government had to nationalise the medical service to check the profiteering fees of the medical men. In that country also doctors' fees became exorbitant and just to break up the rising pace of their charges, medical practitioners' services were statutorily nationalised and private practice was regulated. Most medical men are now under services of the State and they are paid for by the State. But their services are in a way, free to the public—they cannot charge fees directly.

It is time that the Government of West Bengal and the medical profession as a body, considered the desirability of devising some measure whereby to check the ever-rising fees.

Demand For A Punjabi State

The *Bombay Chronicle* of November 10 reports that presiding over the Punjabi-speaking State Conference held in Bombay at Shivaji Park on the 8th November, Sardar Gian Singh Rarewalla, former Chief Minister of Pepsu and President of the Pepsu National Front had reiterated the demand for a Punjabi State.

The demand for the creation of a Punjabi State had been going on for a long time, Mr. Rarewalla said. But because the Sikhs had vigorously voiced the demand, some narrow-minded opportunists had tried to discredit it as a communal move and thereby create suspicion and mistrust in the minds of the people. Mr. Rarewalla had no doubt that the creation of the Punjabi State "would end the party frictions and bickerings in north India and would usher in a new era of peace and prosperity," the paper reports.

"The greatest justification," for the formation of a Punjabi State, "was the development of the Punjabi language and the Punjabi culture," he had said. Though Punjabi had been recognised as one of the fourteen regional languages, in the Punjab, Punjabi had not been accorded the encouragement it deserved. Mr. Rarewalla had pointed out the unsatisfactory demarcation of boundaries and had pleaded for a readjustment. He had expressed the view that only in a linguistic State could the people contribute their best for the progress of the country. In this connection he had referred to the high praise bestowed by Sri Nehru on the system of linguistic States in Russia.

According to the *Bombay Chronicle*, he had complained "that a section of the Punjab press had been dubbing this demand as a demand for a separate Sikh State or even Khalistan. He felt that they were trying to create this misunderstanding by raising false and misleading slogans and appealing to the communal sentiments of the people."

Mr. Rarewalla had also urged the Government to announce the personnel of the Boundary Commission without delay and had put forward the demand that not only should the Commission have wide powers but that the Government should be bound by its decisions.

A Vicious Convention

Recently a Conference of the Muslims was held in Aligarh, where much anti-Indian, Muslim communal propaganda had been indulged into. Fantastic charges were made of massacre "of Muslims in Free India uprooting of lakhs of them, colossal devastation of their properties, desecration of their mosques, mausoleums and graveyards, which had created a sense of horror, insecurity and frustration in the minds of Muslims." The conference brought into existence an All-India Muslim Jamiat with headquarters at Aligarh.

The proceedings of the Conference did not find much publicity in the Indian press but was much publicised in the Pakistan press. Referring to this conference the *People's* special correspondent in Lucknow writes: "Between the genuine ignorance of the public and the amused indifference of the Government, certain lessons may be drawn from the recent Muslim gathering at Aligarh."

"Following the typical Muslim League tactics," the correspondent continues, "the cry was raised for reservation of seats in the legislatures and for proportions in the services. There was also talk of a minorities convention to meet the growing menace."

He concludes with the remark that history has showed that "Aligarh has played a vicious part in Indian politics. At any rate a good many of its alumni are still finding that their best prospect is the high road to Pakistan. The passports office in Aligarh is the most overworked in India."

Asked to give his comments on the proceeding of the Conference, Mr. Nehru said at his Press Conference in Delhi on November 15 that he had seen the reports of the proceedings of the conference in the Pakistan press and in a section of the Urdu Press in India. He added: "I have other reports too. The Convention itself was a small affair and not important from the view of the numbers or influence. But I do think that the line adopted by that small convention was, if I may use a strong word, vicious."

An "Islamic Republic" for Pakistan

Mr. Aziz Beg, editor of the Lahore weekly *Star*, writes under the heading "Must We Have An Islamic State?":

"The situation created by the demand for an 'Islamic State' and an 'Islamic Constitution' is so confusing and amusing that any attempt to clarify the issue should be welcome to the votaries of modern, progressive Pakistan."

Referring to the proposition for the institution of a Board of Ulemas to whom the legislators would look for guidance Mr. Beg writes:

"To bestow on this class the status they demand would be to kill democracy before it is born and destroy the foundations of Parliamentary form of Government."

Regarding the provision that the head of the State

must be a Muslim he opposingly quotes the remarks of Mr. P. D. Bhandara, a Minority Member. Mr. Bhandara had said in his speech before the Constituent Assembly that the provision in the Constitution was unnecessary because even without the legislation this exalted position was more likely to be filled by a Muslim, due to their overwhelming majority, than by any other.

"Mr. Bhandara has aptly summed up the position," writes Mr. Beg, "and it will be a pity if his plea for sanity is misconstrued as a plea for minority rights."

Some Turkish papers have criticised the "Islamic State" resolution. They point out that this chosen path is the one Turkey had to discard after half-a-century of bitter experiences.

Indo-Ceylon Talks

Commenting on the Ceylon Premier, Sir John Kotelawala's rejection of Premier Nehru's invitation to come to New Delhi to straighten out the issues which had tended to strain the friendly relations between India and Ceylon, the *Hitavada* writes that even if a broadminded view were taken of the affair and the Ceylon Premier excused for having commented on the invitation before dispatching an official reply to New Delhi, none could fail to note the heavy underlining of the problem of illicit immigration. "By stating that he would accept the invitation only after he had investigated this problem, the Ceylon Premier has left the unfortunate impression that the future of some 8 lakhs of Indians in Ceylon is a matter of small importance when compared with that of illicit immigration," India's anxiety to stop which had never been doubted, the paper writes.

The paper continues: "The indefinite postponement of the Indo-Ceylon talks and his (Sir John's) reply to Peter Kenneman's questions in the House of Representatives combine to show that the Ceylon Indians have a long time ahead of them for a final settlement of the citizenship question. Asked to give an indication of the progress made in registration of applicants under the Indian and Pakistani Citizenship Act, the Ceylon Premier stated that out of a total of 2,37,034 citizenship applications received—and these cover nearly 8 lakhs of residents—only 56,669 have so far been investigated. This means that barely a fifth of the Ceylon Indian population know their future. The rest are still at the tender mercy of the officials in charge of the work of registration."

Lack of staff was the lame excuse, offered for this deplorable delay. Of the 56,669 applications considered, 6,903 had been approved—granting citizenship to 23,751 persons—8,298 applications had been rejected—involving perhaps the claims of over 20,000 persons—while 5,468 applicants had been asked to show cause why their applications should not be rejected.

Referring to these facts the *Hitavada* writes: "Can any fair-minded observer of this Indo-Ceylon problem any longer believe that the Ceylon Government is keen on a final and a satisfactory settlement of the claims of some 8 lakhs of Indians to citizenship? Would not such an observer be justified in concluding that all this emphasis on illicit immigration is but a device for further procrastination in dealing with the main issue."

It is superfluous to attempt an answer.

U.S. Bases in Pakistan

Recently the Press in the USA paid much attention to the proposition of a military pact between the USA and Pakistan. A few days before Mr. Ghulam Mohammed, Governor-General of Pakistan, reached the U.S.A. the *New York Times* wrote editorially on November 5, that major part of the talks between the Pakistan's Governor-General and the President of the United States would "centre about exploring possibilities of a military alliance between Pakistan and the United States." A regional arrangement for Middle East Defence having failed, a bilateral arrangement with a single potentially strong country, such as Pakistan was very much in Pentagon's favour, the paper believed. "Eventually," wrote the paper, "a regional defence pattern may be evoked but a start can be made in the case of Pakistan, such as has already been made in the case of Turkey."

The Pakistan Government formally released this editorial to the Press on November 6. Diplomatic quarters attached much importance to this release by the Pakistan Government since the Government normally released only those Foreign Press editorials which were in keeping with the Pakistan Government's point of view.

Stating that the USA had first become "interested in the strategic possibilities of Pakistan more than a year ago when Admiral Radford, now Chairman of the United States Chiefs of Staff, visited Pakistan as Commander-in-Chief of the Pacific Fleet," Mr. Homer Bigart, *New York Herald Tribune* Washington correspondent wrote that formal discussions between the USA and Pakistan might start at the White House luncheon to Ghulam Mohammed; which "could lead to a military alliance and establishment in South East Asia of American air bases within easy striking distance of Russia's great new industrial centres behind the Urals." He also wrote that informal discussions had been under way for weeks both at Washington and Karachi and that Pakistan had announced her willingness to negotiate an air base deal provided the United States would supply arms for Pakistan's quarter million man army.

The State Department continued to deny reports of any such talk, but informed sources stressed that such talks had indeed been taking place informally.

The *Times* reported that while the State Department had denied any negotiations going on, a departmental spokesman had said that there had been "continuous conversations and considerations" on Middle East Defence and those talks could be linked with the visit recently of Gen. Ayub Khan, the Pakistan C-in-C to the U.S.A. (*Statesman*, 15th Nov.)

On November 17, Mr. Dulles, the U.S. Secretary of State, declared that no negotiations had been under way with Pakistan for establishing American bases in that country; but he added that he did not rule out the possibility of such a Pact with Pakistan in future. However on November 18, President Eisenhower, addressing a Press Conference at Washington, stated that the question of military aid and bases had not been discussed in detail when he had met the Pakistani Governor-General. This means that some such discussion had definitely taken place, Mr. Dulles' denial notwithstanding.

Meanwhile *Reuter* reported from Washington that high Pakistani sources in New York had informed U.N. delegates and others that Pakistan had indicated her willingness to grant America bases, if the U.S.A. armed her. The report said: "According to Pakistan and U.S. estimates, it would cost \$250 million to re-equip the Pakistan army on modern lines, especially since it was the aim to block potential land invasions at passes such as Khyber Pass."

On enquiry from the Government of India the U.S. State Department had made it clear that while India would be kept informed about the developments and her views would be taken into account, any decision might not necessarily require her compliance.

At a Press Conference in New Delhi on November 15, Pandit Nehru referred to the reports of negotiations of a military pact between Pakistan and the U.S.A. and said that it was a "matter of the most intense concern to us and something which will have far-reaching consequences on the whole structure of things in South Asia and especially on India and Pakistan." He said that from all accounts it appeared that matters had advanced quite far. The way "this major development" was taking place surprised him, said Mr. Nehru.

Asked if Pakistan could give bases to the U.S.A. in Gilgit, the Prime Minister said: "So far as we are concerned, it is not open to them to do anything in Kashmir."

Commenting on Mr. Nehru's statement, Mr. Ghulam Mohammed, Governor-General of Pakistan, said: "I was extremely surprised to see that Mr. Nehru has commented on these reports without first thinking to verify their veracity."

"I wish to make it absolutely clear that Pakistan will never be a camp follower of anyone." He characterised as "absolutely baseless and unfounded," reports of military talks between the U.S.A. and Pakistan.

Meanwhile, the East Pakistan Awami League had

strongly opposed Pakistan's making any "military alliance" with any country and had wanted the country to remain in the peace camp. The Pakistan Student Federation had also made known its disapproval of granting bases to foreign powers.

Characterising the U.S. move for military bases in Pakistan as a "challenge to India," the *Vigil* writes: "The U.S.A. had made this move with the full knowledge that it would be intensely resented by India for its disturbing effects both on the entire regional strategic situation and on the relative military strength of India and Pakistan." The consolation that India would be kept informed of the developments was hardly worth anything. India's verbal protest also was not likely to be an appreciable deterrent to U.S.A.'s moves, which indicated that "Apparently, the Pentagon and the State Department calculated that the advantages of a military pact with Pakistan would be greater than the disadvantages of any possible consequences of India's resentment at it." In this context the paper urges the Government of India to take the initiative for organising a South Asian resistance to it. And for that India should not mind giving up American aid, if necessary.

Commenting on these developments the *Hitavada* writes: "It does not require much acumen to foresee the effect that a U.S.-Pak Defence Pact will have on the Indian sub-continent in relation to the 'cold' war between the Communists and the West. Thus far the process of containment of Communism was confined to NATO, its eastern extension up to Turkey and to an arc running from South Korea and Japan, through Formosa and the Philippines to Indo-China. There was thus a big gap in this chain of defences, which the U.S. in particular were keen on closing. With the displacement of Dr. Mossadeq, Iran has now formed yet another link—weak though it be in comparison with those of Turkey and Greece. If the White House talks bear fruit, Pakistan will form the southern end of a defence arc, which starts in the North Sea and ends in the Arabian Sea. Allied air forces based in Greece, Turkey, Iran and Pakistan would thus be able to strike effectively at Russia's atomic and industrial plants sheltered by the Urals. From the Russian point of view these bases would naturally constitute the first targets to be destroyed in the event of hostilities breaking out. Should U.S. bases be sited in both West and East Pakistan, it would place India in considerable danger of being dragged in willy-nilly into the struggle. Apart from this consideration, a Pakistan Army armed to the teeth with American help would make for increased truculence on the part of Pakistan in her dealings with her neighbours—India and Afghanistan. Looked at from every angle the ceding of bases to the U.S. in return for equipment for Pakistan's army will be a step fraught with danger to India and the other Asian nations that have so far managed to keep out of the 'cold' war."

United States and Colonialism

Outlining the principles guiding the United States in dealing with colonialism, Mr. Henry Alfred Byroad, U.S. Assistant Secretary of State for Near Eastern, South Asian and African Affairs, said in a speech delivered on October 31 before the World Affairs Council of Northern California that turning to international relations the "principal concern" of the U.S.A. was "the threat of Soviet aggression," to which only "secondary emphasis" was given by the dependent peoples of Africa, the Near East, South Asia and the Far East. In many of those areas the principal motivating force was the desire of dependent peoples to end foreign domination and achieve political and economic self-determination.

Mr. Byroad said: "This movement toward self-determination is one of the most powerful forces in twentieth century affairs," but there was "a paradox" in that fact. The Western nations, after a prolonged experience of sovereign independence were coming to recognise that self-sufficiency was a myth and several of the older nations were "now engaged in creating new forms of association in which portions of national sovereignty are voluntarily surrendered."

The movement towards self-determination had recently encountered an "even more strange and potentially more tragic paradox." While old-type colonialism was disappearing, a new type of imperialism—Soviet imperialism—was raising its head. But the dependent nations did not appear to be quite aware of this danger.

He agreed that the colonial policy of the U.S.A. had not been clear to many. He defined the basic policy of the U.S.A. to be the belief "in eventual self-determination for all peoples" and an "evolutionary development to this end."

"We recognise that self-determination will not always be exercised in the form of national independence. Some people may choose voluntarily to unite or associate themselves, on a free and equal basis, with the nations which have governed them in the past. The British Commonwealth of Nations and more recently the French Union, are outstanding examples of the kind of association which now nations may undertake without impairment of their powers to determine their own destinies."

Explaining why the U.S.A. insisted on a policy of "evolution" and not of granting dependent peoples "immediate sovereignty," Mr. Byroad said that it was a "hard, inescapable fact that premature independence can be dangerous, retrogressive and destructive." In his view, unless it was recognised "that there is such a thing as premature independence, we cannot think intelligently or constructively about the status of the dependent peoples."

If independence were granted to a country, unable to maintain it, it would only invite internal chaos and

external aggression. Moreover, "national independence is by no means a cure-all for the perplexing problems of Asia and Africa."

The U.S.A. frankly recognised her "stake in the strength and stability of certain European nations which exercise influence in the dependent areas." These European nations were the allies of the U.S.A. and shared many common interests with her. The U.S.A. was much interested in the role of these powers in the context of the international balance of powers and could not "disregard their side of the colonial question" without injury to her own security. To quote Mr. Byroad: "In particular we cannot ignore the legitimate economic interests which European nations possess in certain dependent territories. Nor can we forget the importance of these interests to the European economy which we have contributed so much to support."

These considerations led the U.S.A. to advocate a policy of "evolutionary development" for the independence of the colonial peoples.

Mr. Byroad wanted to make one point very clear that, "Despite our interest in European economic health, we most certainly do not propose that the rights of dependent peoples should be subordinated to this interest. What we propose is that all parties concerned carefully consider their own interests. This is not a question of preserving Europe's strength at the expense of dependent peoples. It is rather a question of finding ways to increase strength of both. An evolutionary approach to self-determination can help to preserve legitimate European interests in foreign territories—while at the same time giving these territories economic opportunities and benefits which would be lost by a complete severance of relations."

U.S. Investments in Asia and Africa

Direct American investments in the Near East, Africa, Asia and Oceania totalled \$1,300 million in 1950, compared with \$500 million in 1943, according to a survey released at the end of October by the U.S. Department of Commerce.

The survey, the fifth of its kind since 1929, covers only substantial private investments. These include investments amounting to 25 percent or more of the equity.

The "survey does not include the China area. The investment figure has swelled through investments in Near Eastern Oil, the survey notes.

Investments in the area, exclusive of China, jumped from 6.5 percent of the world total in 1929 to over 11 percent of the total in 1950.

Total American investments in all areas of the world was \$11,788 million in 1950, the census reveals.

Investments in the Arab countries, most of it in oil, rose from about \$60 million to some \$680 million in the seven year period up to 1950. Oil investments absorbed \$844.1 million of the total \$1300 million invested in the Near Eastern, Asian, African and Oceania area

in 1950; manufacturing received \$213.6 million; trade, \$81.4 million; transportation, communication and public utilities, \$53.6 million; mining and selling, \$56.5 million; and agriculture, \$38.7 million.

Countries specified in the 1950 census include India, \$37.7 million; Egypt, \$39.3 million; Siberia, \$82 million; Israel, \$14.8 million, and Pakistan \$7.8 million.

Quadruple Emissaries for U.N.

We have always held that children are the best emissaries of International amity. Here is an instance:

Gainesville, Florida, Nov. 24—The quadruplets born prematurely to a Palestine Arab student couple here neared the close of their first week of life today with a good chance for survival and a definite hold on the heart-strings of Gainesville citizens.

The outpouring of concern and affection for the tiny new neighbours has somewhat overwhelmed 34-year-old Wasfe Ahmad Hijab and his 33-year-old wife Abila, already the mother of a three-year-old daughter Nadia.

Classmates of the Hijabs at the University of Florida have set a \$5,000 goal for the cash fund they are raising under "Hijab Point Four Programme."

A group of local civic organisations have started another cash fund.

Local merchants are furnishing layettes, shoes and clothing. A laundry will give free diaper service for a year. Two milk companies are planning to contribute free milk. The hospital which is caring for the mother and quadruplets is giving free use of all medical equipment needed to help the babies live. Nor need the Hijabs worry about doctor bills.

British Guiana and the U.S.A.

The October 23 issue of the *Worldover Press* carries the following comments by Devere Allen on the part played by the U.S. authorities in the British Guiana affairs:

Fast-moving events in various parts of the globe are sufficiently alike in some respects to raise a fundamental question: how much, when, and for what reasons are great powers justified in any intervention in the affairs of smaller countries?

Did the United States, for example, have to be quite as speedy and unquestioning in backing the dispatch of troops and warships by the British to their Crown Colony, British Guiana? It may have aided U.S.-British relations, but it will damage Washington in many a Latin American land, no matter how ardently anti-Communist. It tended, too, to make it look as though the sole issue in British Guiana were Communism.

There seems little doubt that the people's Progressive Party led in British Guiana by Cheddi Jagan and his American wife has come under strong Communist influence. But could the Jagans, and their friends, have gained such power if the British, long ago, had intervened to see that sugar and mine workers were decently paid, and given the right to organize into truly

independent trade unions for collective bargaining? After nearly a century and a half of British rule, the Franchise Commission set up in 1944 reported that the colony was not ready for universal adult suffrage. The new constitution still maintained property qualifications for the vote, and required a minimum income of \$1,200 a year. Why has education so lagged?

In the case of British Guiana, there is at least one significant factor. There was no big local army, no appreciable armament, to create a problem for the British landing forces. Whether or not the elements struggling for independence from Britain wanted to be peaceful, they jolly well had to be.

There are many ticklish situations elsewhere, however, some involving the United States directly, where this is not so. Suppose the quarrel between Yugoslavia and Italy over Trieste, for example, should actually burst into combat. American inability to intervene on behalf of peace would be due very largely to the armament it has given away to both sides, and given, ironically enough, to safeguard the free world. If Tito let loose his troops, and U.S.-British forces took the side of Italy to back up the granting of Trieste to the Italians, it would be another instance of American soldiers killed with American guns and military equipment. And if Italians began the use of force, they also would be using U.S. arms.

In an unprecedented criticism of Guatemala, the State Department has castigated the Guatemalan government for allowing Communists to win too great an influence. But if the Communists should take complete power in that country, they would be capable of holding it for a strange reason—the armament given by the U.S. to the reactionary, cruel dictator, Jorge Ubico, during World War II. It is worth remembering that Ubico got more arms by far than comparatively democratic Mexico, though the latter had a population more than seven times as great.

For the Western world, this is no easy question. It believes it must arm the free nations, so-called, against the Communist menace. But the free world has a way of turning against freedom, place by place. No better illustration could be found than South Korea under Syngman Rhee. Rhee's virtual dictatorship threatens the peace. His agents have tried to disrupt the armistice, with Rhee's blessing. Rhee puts the U.S. in the unhappy position of supporting the very things we abhor in the tactics of Communism. But the stronger Rhee gets with U.S. arms, the more vital to us is his co-operation, the less we can control him.

British Action in Guiana

Though the British Conservative and Labour statesmen have been unanimous in denouncing the People's Progressive Party and its leaders, that by no means indicates that the British actions there were justified or that there was any Communist plot. As the *London Economist* writes: "The White Paper (pub-

lished by the British Government on British Guiana) contains nothing approaching 'proof' that a definite plan was being hatched, in order to overthrow the constitution and set up a Communist Government. This may simply reflect the nature of Communist plots, they are not easy things to track down. But since the Government's early pronouncements rested the case on the existence of a plot, the White Paper has not cleared up many people's doubts." (Quoted by *Vigil*, Oct. 31).

Indeed, "British Guiana has been a gigantic advertisement of the New Colonialism of Britain, supported by the United States of America. Dr. Jagan may go home—and perhaps to jail—a sadder man, but the world is deeply indebted to him for the wisdom that has been forced on it by the British action in Guiana, in response to the nationalist activities of the P.P.P.," writes the *People* editorially.

Continuing the paper writes, "Nationalist, we would emphasise, because not all the blatant lying and contemptible propaganda of the British masters can convince the world that either there has been a Red plot in Guiana or that there was the least little of evidence of potential and contemplated violence. The methods adopted by the P.P.P. have been quite peaceful. The world has admitted it."

"... Anti-Communism is providing a convenient mask for a super-colonialism, which would doom the Asian and the African races to perpetual slavery. Britain would not have dared to take the action she did in British Guiana if she had not been supported, in fact, instigated, by Wall Street and the State Department."

Concluding the *People* writes: "Dr. Jagan has done a great service to the world by proving the greatest danger which confronts it today—the unyielding European domination of Asia and Africa for the good of the holding powers, and for the material benefit of the Almighty Dollar, the over-all patron of the 'Free World'."

In reply to a question in the Council of States by Sri Satyendranarayan Mazumdar, a Communist member from West Bengal, Pandit Nehru told that India did not propose to take the Guiana issue to the U.N. In reply to another question by P.S.P. member, Pandit Nehru described the labour conditions in British Guiana as appalling. The Government of India is reported to be considering an early representation to the British Government about labour conditions in British Guiana, which affect a large number of workers of Indian origin.

Apartheid

The *Worldover Press* for October 23, gives a very clear survey of the position regarding race-antagonism in South Africa, by Clive Gray:

Johannesburg, South Africa: It is worth remembering that *apartheid*, or extreme race segregation, is not new. Even the word has been a part of Nationalist

vocabulary for a long time, and the policy is almost ages old. Before the Nationalists came to power in 1948, what is now called *apartheid* was so taken for granted that it needed no name at all. But it steadily built up resentment.

Thus it is untenable to say, as the United Party does, that it is only Nationalist extremism in carrying out *apartheid* which has antagonized the non-Europeans and caused the present racial conflict in South Africa. The awakening of Africans and other non-Europeans would have taken place just as inevitably under a United Party regime, though perhaps a few years later. The Nationalists have brought the question to a head, however, and not until recently were people on both sides of the color line inclined to regard segregation as a burning and dynamic issue.

As far as Johannesburg is concerned, the chief new factor is segregation in the main railway station. Previously, non-Europeans were allowed to go down the front steps into the main station area, and could watch the gold-fish in the tile-lined pools on both sides of the hall. Now, they can't go down the front steps at all, but after entering through the front doors, must veer sharply to the right and go around the balcony down to the trains on the other side.

In the public conveyances and conveniences, however, and in the residential areas, the schools, etc., segregation has existed ever since the city was founded in 1885. In this respect, Johannesburg was conforming to the laws and customs of the old Transvaal Republic.

In one vital particular, nevertheless, *apartheid* in Johannesburg is proceeding toward a definite goal, a step which is arousing great concern. The policy, which goes by the name of "Western Areas Removal Scheme," involves the transfer of 58,000 African residents of Sophiatown, Martindale, and Newclare townships in Western Johannesburg to a now barren veld area six to seven miles away, known as Meadowlands. The United Party drew up this scheme around 1937, at the instigation of European residents in newly developed European sections around the three African townships. Little action was taken on it until 1949, shortly after the Nationalist government came to power, when impatient European residents prodded the Minister of Native Affairs.

The Minister, sensing an opportunity to throw the United Party city council into turmoil, and to implement his *apartheid* ideology, asked the council what it intended to do. The council then swung into action, and by 1950 a Western Areas Ad Hoc Commission had prepared a report outlining the scheme. The Minister now has a commission of his own surveying details of the plan.

While the affair is complex, it is possible to summarize the motives and rationalizations behind the government's scheme. The Europeans think along these lines:

1. The presence of a native area near a thriving European community breeds racial friction and constitutes a danger to the community's welfare.
2. This nearness produces a rise in crime and lowers property values.
3. Slum conditions in African quarters have reached such an appalling state that the native community can be rehabilitated only by moving all 58,000 inhabitants to a newly built, scientifically planned township near the other native "locations" around Orlando.
4. And finally, according to the Europeans, freehold tenure, now existent in the three townships (natives in Sophiatown, etc., may own land as well as housing improvements) inevitably leads to slum conditions and rent exploitation.

It is pointed out by Europeans that of more than 13,000 families living in the area, only 350 own the land they live on, while two-thirds of the area is classified as a slum. Thus freehold rights must be taken away from natives who have them, and all must henceforth reside in municipal locations, where tenure is on a lease-hold basis, or where at best the native may build and own his own house, but can be forced to sell out and leave if he loses his employment in the city.

That African property ownership is the real issue is indicated by the fact that a "location," the "Western Native Township," was founded in 1918 before any Europeans were within several miles of it, and no one suggests moving its inhabitants out. Here, however, they are not permitted to own property. Yet the Western Areas townships whose residents are to be moved were established even earlier, in 1905 and 1912.

The Nationalists, ironically, argue that there is only minor opposition among the natives, yet in the next breath they say they will not listen to opposition spokesmen, on the ground that white left-wing agitators have put all these ridiculous ideas into the natives' heads.

If they go ahead with the plan to move the natives, the whites will be guilty of a breach of contract. They will heap up fuel for racial conflicts, for it is doubtful whether they can expel the Africans without provoking violence both from those who own their homes and the others who, not owning anything, still like to be near their jobs.

Housing is already a problem in the city, yet the removal scheme will require the construction of 13,000 houses for the Western Areas residents alone, even if some of the Africans do their own building. And of the 80,000 Africans now living in the municipally controlled slums of Orlando ("temporary shelters") and other shanty towns, not one will be re-housed, as it is, for several months, although the city promised in 1946 to have them all rehoused by 1951.

If the white authorities had not contented themselves for 15 years with dreaming of the removal project, the slum conditions might have been greatly alleviated. Health regulations could have been more

strictly applied. Many poor houses could be repaired, and the sound houses from which natives are to be moved are estimated to be now worth a million dollars.

In any case, the government has already bought the Meadowlands region, while with characteristic bull-headedness it has rejected all other programs for the Western Areas. The Transvaal Nationalist newspaper has even contended editorially that no counter-proposals exist! Meanwhile, before long, the Western Areas of Johannesburg seem destined to become a crucial sore spot before the public opinion of the world.

White "Democracy" in Kenya

Even after a year of brutal repression the British imperialists have been unsuccessful in their efforts to curb the urge for independence of the Kenya people. They have burnt large numbers of villages, bombed Kikuyu reserves, arrested thousands of Kenya patriots and have gaoled the leaders of the Kenyan African Union. Now the European community in Kenya has demanded the reservation of 'White highlands' for Whites only. In a political testament Kenya's European political leaders have demanded the continuance of British rule and the strictest control of immigration from the East for preserving "the Western character of the new civilisation of Kenya and the English language and culture, and protect its people from successive economic competition from abroad."

All-Korean Elections

Washington, Nov. 24—In an editorial entitled "An All-Korean Election" the *New York Times* said yesterday:

"President Syngman Rhee has sharply reversed his position on the question of an election under which Korea might be unified, and in so doing has greatly strengthened the negotiating position of the United Nations. He had previously held that, since his government was the legally constituted and recognised one for Korea, all that was necessary was for the North Koreans to fill the vacant assembly seats that had been reserved for them. He says now that he will not oppose a plan for a new nationwide election, north and south, that might choose himself or any other person for the presidency, provided only the choice is free.

"The statement does not alter some of the hard facts in the case. It is still to be determined if the Communists—Russian, Chinese and Korean—have any intention of permitting the unification of Korea on any terms whatever. The cynical, therefore, may say that President Rhee is on safe ground. Most persons familiar with the Korean scene would say also that he is personally on safe ground in any case, since there is little doubt that in a free election he would be returned overwhelmingly. To his countrymen he remains the first Korean.

"But when these discounts are fully recognised, the fact remains that President Rhee has made, not a

personal concession, but a great contribution to the cause we have espoused. The United Nations has repeatedly affirmed that its objective is a free, united and democratic Korea. The opponents of the United Nations—and of Dr. Rhee—have repeatedly asserted that what was ahead was a sinister movement to perpetuate a 'dictatorship' with the military support of the United States and to extend it to an unwilling North Korea. That this allegation was demonstrably false has not made it less effective in some quarters in vilifying the United States, Dr. Rhee and the United Nations' aims for Korea.

"Dr. Rhee's statement should clear out some of this underbrush and broaden the path to settlement, at least, as far as the United Nations is concerned. If unification proposals, including that of an all-Korean election, are made, the United Nations will not be obliged to face the retort that Dr. Rhee and his government would not permit such a course. There does not, therefore, need to be the insidious suggestion that the United Nations would be obliged to negotiate with the Communists on the one hand and with Dr. Rhee on the other.

"This should not imply that the United Nations has a moral right to make decisions for the Koreans without even the courtesy of consulting them. It does imply that it will be far easier to reach a ground of full agreement with the Korean Republic than has sometimes been supposed, and even declared.

"More than that, Dr. Rhee has put the emphasis precisely where it should be placed. A unified Korea is important and it is Dr. Rhee's constant goal. But it is no less imperative that this united Korea be free and democratic also. In stressing the criterion of free choice and his complete willingness to abide by it, the Korean president has strongly reaffirmed the philosophy and ideals of the free world."

Let us hope that the South Korean President continues in the same lucid frame of mind in all other matters germane.

A Lurking Danger

Sri Nehru is reported to have said at his Press Conference in New Delhi on November 15 that, in case, the Korean Political Conference was not held, the Neutral Nations Repatriation Commission, of which India is the Chairman, would probably have to place the differences before the two Commands and let the U.N. and Communist Commands in Korea decide for themselves what to do with unrepatriated prisoners.

Under the provision of the agreement on armistice the prisoners are to be released after January 22, 1954, even if no political conference is held.

Senator Knowland, leader of the Republican Party in the U.S. Senate, has criticized this statement as presenting the "free world" with "a grave and critical crisis." He has accused India of following the basic line of the Communists in Korea and has advised keeping India out of the Korean Peace Conference.

"In effect," said the Senator, "Mr. Nehru is proposing that these people be held in bondage indefinitely. There is no moral or legal justification for any such action."

He has urged President Eisenhower and the State Department to reject Mr. Nehru's statement.

The *Bombay Chronicle* in an editorial on November 20 writes that Mr. Knowland was almost aggressively outdoing Mr. Dulles himself in his policy and activities. His war-mongering remarks might have been ignored but for his influence in the U.S. ruling circles. Refuting Mr. Knowland's criticism of Mr. Nehru's remarks, the paper writes:

"It, because of mutually conflicting attitudes stubbornly insisted upon by both sides, the terms of the armistice agreement fail of fulfilment, what else can the Indian command do than to refer back the whole thing to those who imposed its difficult responsibilities on India. How does it follow that Mr. Nehru, as Senator Knowland charges, proposes in effect, that the prisoners should be kept in bondage indefinitely, or that it is Mr. Nehru, who is presenting the 'free world' with a 'grave and critical crisis'?"

The Senator's statement signalled a greater international danger inasmuch as he had also laid down an Asian strategy for the United States, based on the exclusion of India, Burma and Indonesia, which were "neutralist" States. This plan was bound to fail; and the American Government could be wise to "induce Senator Knowland to learn the facts of geography and to open his eyes to the realities of the situation in Asia," the paper says.

These are trying times, we know, and passions are likely to run high amongst those who were directly concerned with the struggle in Korea. But people like Senator Knowland should know better than to further aggravate the situation. Here in India there were many well-wishers of Pandit Nehru who wanted him to keep well out of the Korean Affair. These were the people who knew the mentality of people like Knowland.

Bermuda Conference

It has been announced that the leaders of the three Western Powers, the U.S.A., U.K. and France will meet in Bermuda from December 4 to 8 for a discussion of "various matters of common concern to the three Powers." This meeting is being convened at the initiative of Prime Minister Churchill whereas the previous one, scheduled to have been held early in July but which had to be postponed on account of the ill health of the British Prime Minister, had been announced at the request of President Eisenhower. During the interval of six months between these two announcements, the international situation has assumed a somewhat different appearance. At the time of Sir Winston Churchill's announcement in May, the situation was pregnant with the expectation of a East-West meet and some hopes of success were also expressed in

view of the liberal gestures of the Malenkov Government in U.S.S.R. But now after several exchanges of notes between the Western Powers and the U.S.S.R. and the Soviet Union's finally turning down an invitation for a Four-Power meeting at Lugarno, hopes of an early East-West accord have dampened.

There will be no formal agenda of the Bermuda Conference. But it is understood the problem of Germany will be the chief item. The representatives of the Big Three will try to co-ordinate their attitude to the German question as well as for a reconciliation of their diverging attitude to the Far Eastern situation. Continued stationing of American troops in Europe and the growth of Communism in Indonesia will also presumably be discussed in the Conference.

There has been little enthusiasm in Britain and France over the announcement of the Conference. The British diplomatic sources are sceptical of the outcome of such a meeting in any genuine bridging of Anglo-American differences of views and policies. The diplomatic correspondent of the *Manchester Guardian* went so far as to suggest that the only reason why the British Prime Minister was journeying to Bermuda was because it was the only way he could try to see Mr. Eisenhower now that he had become President of the United States, reports the *Statesman*.

Reuter's correspondent in Paris reports that the French Premier, M. Laniel, had accepted the invitation with great misgiving. French diplomatic quarters were unanimous in their belief that the meeting of the Big Three would be used by the American and British statesmen to force from the French a promise to ratify the European Army Treaty in the near future or, failing that, to get them to agree to grant German sovereignty under the Bonn Convention, independently of what happened to the Treaty. The French Premier could hardly agree to the proposal of granting sovereignty to Western Germany before the terms of her rearmament had been agreed upon without risking the fall of his government. Moreover, both M. Laniel and M. Bidault are potential candidates for the French Presidential elections scheduled on December 17. Any commitment on the Treaty would amount to losing the anti-Treaty votes in the Assembly.

But, as the *Times'* Washington correspondent reports, the U.S. Congress "will be in an impatient mood by February, and is unlikely to accept any programme of military aid until it knows what is going to happen in France. As things look at present, the date of possible ratification seems to be approaching uncomfortably close to the date when Congress will want to go home to start campaigning. This will presumably be explained in detail to M. Laniel and M. Bidault in Bermuda." (*Statesman*, 12.11.53)

The French Prime Minister is likely to point out the fact how the Indo-China campaign was sapping French military and economic strength. He will pro-

bably advocate talks with Russia on all-Asian problems as the proper way to settle the Indo-China problem and end the costly campaign there.

French diplomatic quarters expressed the view that an outstanding feature of the Bermuda Conference would be an attempt by Sir Winston Churchill to secure to the approval of President Eisenhower and Premier Laniel for a lone visit to Moscow and an informal talk with Premier Malenkov.

Opening a debate in the Political Committee of the General Assembly on the Soviet proposal for measures to avert the threat of a new world war and to reduce tension in international relations, M. Vyshinsky, the Soviet delegate, said that the Bermuda Conference could only serve to intensify international tension instead of reducing it.

Replying to M. Vyshinsky Mr. Selwyn Lloyd, British Minister of State, told the U.N. Political Committee that the Bermuda Conference was a "normal and friendly meeting" between the leaders of friendly States and was not directed against anybody. The British did not object to Malenkov meeting Mao Tse-tung. Therefore he did not see how could the Soviet Union object to the Western Powers meeting to discuss their common problems.

Kuomintang Troops in Burma

M. O. Orestov writes that though the seventh session of the General Assembly had denounced the hostile acts of the Kuomintang troops against Burma and had called for the disarmament and subsequent internment, or withdrawal, of the Kuomintang gangs from Burma, it was learnt from the report of the Burmese delegation to the current session of the General Assembly that the Assembly's resolution had not been carried out, that not a Kuomintang soldier had been withdrawn from Burma, and that the tension in that area was even greater than before.

M. Orestov writes: "The Kuomintangists behave so impudently only because they feel that they have the support of the aggressive forces of the United States of America which are deliberately creating complications in South-East Asia and the Far East."

As a result of Burma's complaint to the UNO in March this year and following the recommendations of the General Assembly of the UN, negotiations had opened in Bangkok between the representatives of Burma, Taiwan (Formosa), Thailand and the U.S.A. But no solution could be possible as to quote M. Orestov, "Encouraged by the American diplomats, Chiang Kai-shek's delegates demanded at first that the Government of Burma should terminate hostilities against the interventionists on Burmese territory. Then they requested Burma to withdraw her troops in order to allow the Kuomintangists a 'safe passage' to Thailand. Not content with these impudent demands, they declared that the question of withdrawing the Kuomintangist troops could be settled only if Burma

would release about 1,000 Kuomintangists taken prisoner. Chiang Kai-shek's 'delegates' cynically alleged that the 'government' of Taiwan was not responsible for the conduct of the Kuomintang troops in Burma, in general, and could not issue orders to them."

The "representatives of the Command of the KMT troops in Burma had declared from Bangkok that the UN resolution was 'unlawful' and senseless," and that their troops had no intention of leaving Burma.

Convinced that the negotiations could no longer be fruitfully conducted, the Burmese delegate had left Bangkok on September 17. And from September 20 Burmese Air Force began bombing KMT strong points in Burma.

Commenting on the threats of relation by the Taiwan authorities U Pe Kin, Burmese Ambassador to Thailand, had declared on October 3: "Let it be known to those who still doubt that these men (KMT bandits) have been and are receiving supplies by air from the authorities on Formosa, and it should be clear to everybody that Formosa is not only an accomplice in the encroachment upon Burma's sovereignty, but that it exercises full control over the so called foreign troops."

As late as on November 27, the chief Burmese delegate to the UN expressed his disappointment at the manner in which the question of the withdrawal of the KMT troops was being considered.

Philippine Elections

The recently held Presidential elections in the Philippines have come in for some comment in the Press of the world. Even as early as July the foreign press had been showing keen interest about the outcome of the electoral contest.

The victory of Senor Ramon Magsaysay of the Nationalist Party over his rival President Quirino of the Liberal Party does not signify any substantial change in the realities of the Philippines, as they exist today. The country is seething with discontent and President Quirino's defeat only brings that in bold relief. Even after about half a century of American rule and seven years of independence the Philippines still remains a peasant economy of low productivity. The peasants are in dire poverty and virtual slaves of the landlords. Modern industry is very small accounting for only 5 per cent of the national income. Before the war a quarter of the national wealth of the country was in the hands of the foreigners. Americans controlled about half the public utilities and most of the mines of gold, iron and manganese. And foreigners handled 80 per cent of the exports and imports. To quote Maurice Zinkin the income of a Filipino "even in real terms was no higher than that of the poorest American class, the Negro share-croppers of the South." As a result there has been widespread peasant revolt in Central Luzon under the Hukbalahap (People's Anti-

Japanese Army), recently renamed Hukbong (People's Liberation Army). All the efforts of the Quirino Government to suppress the Huks have so far been unsuccessful.

Both the Nationalist Party and the Liberal Party represent landlord and comprador groups, contending with one another for power. As the *Statesman* writes, commenting on the Nationalist victory, the Nationalist Party "almost certainly still includes elements whose main desire is a change in the beneficiaries of, rather than an end to, the spoils of political office." These parties have strong American links. Until March, Senor Magsaysay had been President Quirino's Minister of War, "to which post," writes G. Levinson, "we have it on the authority of *Current Biography* (U.S.A.) he was appointed on direct orders from Washington."

The American influence in the political life of the Philippines has been sharply demonstrated by President Quirino's charge of their direct interference in the elections. *France Presse* reported that American dollars had been pouring into Magsaysay's election fund. President Quirino and Senor Eugenio Pereg, Speaker of the Lower House, accused American Government representatives of interference and President Quirino cited several instances, reports the *UPI*. He named Major-Gen. Robert Cannon of the U.S. military advisory group. The *Times*' Washington correspondent reports that President Quirino had "also found in his possession a 'secret circular' issued supposedly by Maj.-Gen. Cannon to his officers in which, it is alleged, plans were set forth to ensure the election of Senor Magsaysay." (*Statesman* 22.11.53).

The correspondent of the *Times* adds that "Admiral Spruance, American Ambassador, said what Maj.-Gen. Cannon did was 'to ensure, so far as he could, that the elections would be held in a free and honest manner and without intimidation,' and what was done was 'with my knowledge and approval.'" (*Ibid*).

NEW YEAR'S SUBSCRIPTION TO THE MODERN REVIEW

Subscribers, whose subscriptions expire with the current December number are requested to send the next year's subscription quoting their respective serial subscribing numbers before the 28th instant by money-order. Otherwise, unless countermanded, the January number will be sent to them by V.P.P.

Those who may happen to have sent their subscriptions immediately before the arrival of the V.P.P., should refuse the V.P. packet as fresh packets will be sent to them by ordinary book post as soon as the money-order reaches this office.

MANAGER, "THE MODERN REVIEW."

HISTORY'S WARNING TO INDIA

By DR. JADUNATH SARKAR, D.Litt., Hony. M.R.A.S.

MANY years ago, at the annual Congress session in Calcutta, when feelings were running high between the old Moderate leaders and the younger school of Extremists,—Pandit Motilal Nehru as an "Elder Statesman" was trying to apply persuasion by reading from a history book how a European nation had acted in similar circumstances. Bipin Pal bellowed forth, "Motilal, don't read history. Make history!" It was an idiotic interruption. But what of that? The audience cheered it to the echo. Pandit Motilal shut his book and sat down, feeling that it was useless to cast the pearls of human wisdom before the callow youths of Calcutta.

INDIA AND ITALY AFTER LIBERATION

I have been refused admission to Bipin Pal's school for being over age (70 years too old). There is no help for me but to join the followers of Pandit Motilal and recite a page from history here, because history has preserved the story of the past experiences of our race to serve as a guide or a warning to us. India in 1947 was just like Italy in 1862,—or rather worse off, because unlike Free India, the newly united Italy had no alien State within its natural borders, the sea and the mountain. But the ministers of New Italy brought ruin upon their country within twenty years of the death of Cavour.

Here is an inside view of Italy's government after liberation:

"A great cause had evoked great leaders, but the goal once reached, the tension slackened. No statesman of first-rate ability was brought to the front, and men of second rank were confronted with . . . problems which would have taxed the genius of a Cavour. . . . Some of the ministers (in 1876) were moved by personal ambition. They had little cohesion and less willingness to sacrifice personal aims to the common weal. . . . Face to face with the party of order [the Ministry] stood a body which was not so much an Opposition in the true sense, as a confused chaotic crowd, . . . ambitious youngmen struggling to rise, . . . without any political principle. Around these were grouped the derelicts of the shipwreck of old dogmas and lost causes,—[Ramrajya Parisad and Hindu Mahasabha even in Italy!]

"The finances of the State had been reduced to something very near ruin . . . by the great political changes between 1859 and 1863 and the wastefulness of the various provincial governments. . . . The story of Italian finance since 1870 is that of a grievous and increasing burden of expenditure patiently borne by a country poor in natural resources and young in the practice of industry.

"The people were losing faith in their rulers and, amidst the widespread disorder, the teachings of the extreme democrats [what are now called

Communists] fell on willing ears."—*Cambridge Modern History*, Vols. XI, Ch. 19 and XII, Ch. 8.

The maladies of that newly enfranchised nation have an ominous likeness to those of Free India today. First, Parliamentary Government could not work among a people accustomed to autocratic rule for six centuries; ministries broke up every now and then because there was no union on political principles but only groups or factions formed by selfish politicians greedy of power and gain. Look at our Pepsu and East Punjab—and at many other provinces, where the sin of selfishness has been merely covered up with a cane basket for a time. Secondly, in the frantic attempt to secure votes, large numbers of posts were unnecessarily created. The administration's pay bill was doubled or trebled, by giving posts to an army of political underlings. West Bengal though now reduced by Partition to one-third of its old area under British rule, has added 30 deputy ministers to its bloated ministry, and every now and then some of these are being pushed up to higher pay as "ministers without Cabinet rank." Dr. B. C. Roy is the greatest political physician of India, and his discovery—this infallible Vigour Pill for anæmic ministries has been taken with success also by New Delhi, the Delhi State, and Madras, not to speak of the lesser territorial fry.

From this followed the third evil,—administrative slackness and inefficiency, even corruption. Like the New Italy we seem to have gone back to the middle ages and the reign of our Nawabs have come back, so far as the quick transaction of public business goes.

The fourth striking parallel with Italy is afforded by the rupture between the domineering North and the neglected South of the peninsula. There was widespread rebellion (concealed under the name of Mafia or brigandage) in the Naples province, against the insolent, selfish, and negligent rule of the Federal Government in power at Florence (afterwards Rome). The evil has been intensified in India, because the Italians had the same religion, language, and social system (i.e., freedom from caste) all over that great peninsula. But what can the Dravida Kazagam find to its taste in what Nehru has aptly called "the imperialism of the Hindi language?"

The fifth point of the parallel is the megalomania that has seized our supreme rulers. New power like new wine is heady. On being suddenly raised to the supreme government of 350 millions of men and a revenue of 400 crores of rupees every year, they are trying to do everything in the grand style and to rub shoulders with the first-rate Powers of the world. The

ambition of the new Italian Cabinet to found a colonial empire like those of England and France led to the waste of money and lives in Abyssinia and the Adowa disaster. We have as yet escaped such a disgrace, but we are opening diplomatic agencies in every country of the world, and frequently raising our representatives in small countries of no close concern to us, to the ambassadorial rank, which means the highest grade of expenditure. We are being told by the Government Publicity Department that this Project of our Government is the biggest in Asia, that Dam is the highest in the world. A great American engineering authority who visited India a year ago, declared that it would be better if we undertook moderate-sized projects involving expenditure within our means, and that after these schemes had succeeded and we had gained experience in work and trained personnel, we should later embark on grander projects.

But this advice has been ignored as worthy of *banias*! And the natural consequence is being seen now. Finance is exerting its relentless pressure on our rulers' swollen heads. The grand Kosi Project has had to be dropped, but nothing has been done to save 6,000 square miles in Bihar from annual destruction. The Nemesis of all this in Italy has been State insolvency, and the currency (the *lira*) has sunk to the level of the German *mark*. For the collapse of the *franc*, the French Government can legitimately plead two World Wars which made the soil of France the theatre of their devastations. India's rulers have no such excuse to offer for their monstrous currency inflation.

ITALY AND INDIA TO-DAY

Away with the dead Past; even the Present has its lesson for us. The post-war condition of Italy supplies an exact parallel to that of Republican India, except in two respects. In consequence of the enormous resources of our vast continent-like country, state bankruptcy is not so near us, as it is to the sterile war-ravaged Italy; and secondly, only one party has been able to manage our Government during the last six years in contrast with the kaleidoscopic changes of Ministry in Italy. A profound and dispassionate analysis of the present Italian Government and the condition of the people under her new democracy is given in a book by an Italian Professor, of which the *London Times* has published a summary. No thoughtful Indian can read it without alarm verging on despair, because the parallel with our Government is so close that it looks like a faithful photograph of the Republic of India.

First, the Government of India like that of new Italy has created an immense number of new public posts to feed the mouths of its political supporters and election agents, because a democracy must be run by votes, and votes must be bought from a people

who do not possess the public spirit and political honesty which marked ancient Rome and modern England.

This doubling or trebling the number of State employees has not increased the speed or efficiency of the day-to-day administration, but has had exactly the reverse effect. The new officers have been selected for the purpose of extending party patronage or what is more properly known as nepotism, and not by any efficiency test, and hence, all work has gone slack, and files lie buried for months without being attended to amidst the confusion caused by countless departments and divided responsibility. The officials do little work, and yet they are discontented, because it is beyond the power of any State to pay adequate salary to such an inflated army of officers. The natural consequence is the offering of bribes by people who cannot wait indefinitely in getting their work done and the taking of bribes by State employees who must make hay while the sun shines.

Parties are forming and breaking up daily in the legislature among the Opposition and also among "rebel Congressmen," because there is no real fundamental difference of political principle among our Deputies, but only personal vanity and sectional interest. The Ministry itself issues a pompous communique or project of a plan one year and eats its own words next year—even next month, as in the cases of the sugar purchase, export duty on jute fabrics, food self-sufficiency and procurement policy, and so on. It is a revolving inconstant world, judging by New Delhi's antics.

Secondly, administrative inefficiency with its natural consequences of slackness and bribes offered and accepted, increases the cost of administration and most Government-sponsored undertakings are therefore running at a loss. In both these countries, Italy and India, the currency has not recovered stability after six years of peace, and their paper money has only a fictitious value in the international money market which has to be buttressed up by the control of imports and exports.

Thirdly, labour unrest has become chronic. Empty stomachs cannot be filled with leaders' speeches and promises of "wonderful good things" next season under the latest plan. Most consumer goods are beyond the reach of even middle class men. Every strike, every go slow movement, every forced lock-out, is economic waste; the country's resources in manpower and materials thus remain unproductive and this will inevitably increase the national poverty.

In Italy, owing to ever-changing ministries, all matters are left to drift and to take care of themselves, and no leader takes a strong, far-sighted action to prevent the drift. In the Indian Republic we have had one stable ministry for six years. But is there any difference in the result?

STATE BANKRUPTCY LOOMING AHEAD

Megalomania in the heads, inefficiency in the administration, and the triumph of the separatist spirit in every limb of the country, will have the inevitable consequence of reducing the income of the State, swelling its expenditure and thus bringing on public bankruptcy, and the insolvent State will break up or be sold up—to whom?

This is no imaginary danger. It is the interest of every sober Indian to read the signs of the time. The solvency of a person is measured by the credit he enjoys in the money market, or in other words, the rate of interest he has to pay in borrowing money. In July last, the Government of India raised a loan at 3½ per cent interest, a part of which was needed for paying off an older debt of 3 per cent only. The old 3 per cent public loan has been selling at 20 per cent depreciation, that is to say those who trusted Government with Rs. 100 ten years ago, can now get only Rs. 80 by cashing their paper. This is an exact measuring rod of our present rulers' standing in the money market.

Most significant and sinister is the conduct of the Madras Government. It advertised for a loan of 5½ crores at 4 per cent, about 1½ crores of which was required for repaying an older debt bearing 3 per cent interest; that is to say, the Madras Government will henceforth have to pay every year six lakhs as interest where it was paying only 4½ lakhs before. Thus, the debtor's credit has suddenly slumped by 33½ per cent.

The cost of living today is four times of what it was in 1939, but has every one's income increased four times during these 13 years? Government is trying to make its own both ends meet by raising the court fees, railway fares, postal charges, and taxes. A journey from Howrah to Bombay now costs double of what it did in 1939; the registration of a letter costs threefold, and the book-post rate is double of the old. But has our Government on its part raised the limit of exemption from Income Tax to four times the old amount of Rs. 2,000? No. Then how can we balance our domestic budgets?

An over-inflated bogus currency (of paper and nickel) and deficit budgeting are the danger signals on the economic line. Is it safe to disregard them? As Burke truly said, "The revenue of the State is the State."

UPLIFT OF THE MASSES, OUR SUPREME QUESTION

But apart from the all-overriding question of finance, the supreme problem before Free India is not political but social, in the widest sense of that term. I mean, the problem of problems for us is,—how to raise the poor ignorant backward people of the former Native States to the economic and educational level of the citizens of the advanced provinces of British India? How to give the Kashmiri or Rajput peasant, goatherd or craftsman, the school, hospital and economic oppor-

tunities which we enjoy in our older provinces? So long as this equalisation is not effected (not merely preached from the platform), democracy or representative Government for India as one unit will remain a cruel mockery.

Let me illustrate the point by means of a scene which has remained printed on my memory for nearly fifty years. I was then travelling through Malwa, and looking out of the railway carriage window saw a Rajput tilling his field. He was poor and had only one cattle; so he had tied his bullock to one end of the yoke and his wife to the other, and himself drove the plough. Is not this an exact picture of the political equality between the voter of Comrade Gopalan in Madras and the ever-starving God-forsaken, Kashmiri workman or the semi-servile Rajput tiller of the soil?

THE BRIGHT SIDE

Such a survey must not, however, fill us with despair, if only we could be assured of wisdom and strength in our leaders in the years ahead. Their past achievements can inspire us with hope. Our nation's gains during the last six years are obvious, in some respects actual achievement, in others only a beginning, the fruits of which time alone can show: (1) The political unification of India has been secured by the integration of seven hundred and odd Native States and small independent authorities. (2) Peace, within and outside, has been maintained, leaving our leaders free to work for the people's good and the people free to pursue their own interests. (3) Social reform has been actively undertaken, feudalism is being everywhere abolished by law, the land is being assured to the tiller, the equality of all the people under the law has been proclaimed in the constitution, and it has been openly declared that the avowed policy of our leaders is to make India a Welfare State in every respect. All this is in theory, however, and the full carrying out of such a vast and ambitious programme will take many years—probably many generations. But an earnest, almost breathless attempt is being made for the uplift of the depressed castes and the labouring classes oppressed for centuries.

All these are to the good. Also credit must be given to our rulers when we remember the suddenness and severity of two tasks thrown upon them at the very outset. The first is the Refugee problem. More than forty lakhs of uprooted humanity have been pouring into India from the east and the west, and our Government has generously accepted the task of settling them regardless of expense. It is an event far more harmful and sad than the mass migrations of tribes (*Volk-wanderung*) in the early ages of the world's history, which ended in the formation of new States and new cultures in virgin or thinly peopled lands. West Bengal's density of population is 880 per square mile and 25 lakhs of Hindus have fled to it from Eastern Pakistan since Independence Day.

Secondly, the stress generated in dissolving the feudal social and administrative system, a thousand years old, over fully one-third of India's land area,—is so immense that even the best governments may be convulsed by it. But this reform cannot be brought about by a mere vote of the legislature or a proclamation in the Government *Gazette*. Feudalism could be abolished in France only after the streets of Paris had been deluged with blood, and a long and murderous Civil War had raged in La Vendée. Free Italy had to wage a long war with the superstitious poor, ignorant, and neglected southern provinces, while its governing party was the enlightened progressive men of Milan and Rome.

THREATS TO OUR NATIONAL LIFE

Let me now turn to the dark side of the picture. Here the dangers threatening us are: (1) The separatist spirit of every province, linguistic group and even caste. Can federal India successfully fight this tendency to Balkanisation? (2) Financial collapse. Free India has made no attempt to check the inflation (prices raised four-fold in 12 years—1939-1951); hence follow popular suffering through hunger, unemployment and the inevitable decrease of private charity. This is at the root of the labour unrest raging throughout the country year after year. Half-fed labourers cannot fill their stomachs with political speeches. The mischief works in a vicious circle. Labour trouble diminishes production and in the same proportion increases the average cost. Thus Indian goods are less and less able to stand in the competitive markets of the world, and finally losses force factories and plantations to close and capital to be scared away from founding any new business in such a country. This aggravates unemployment and poverty of the masses. (3) Democratic government through the elected representatives of all the adult population of the country, is impossible in India today. Its pre-requisite is the existence of two parties each ready and strong enough to undertake the administration if called upon, by turns. But here we have only one vast party held together by a junta at the top, and ninety-nine splinter groups with only a fractional support in the country, who unite and dissolve their coalition every day. In fact, our electorate—that is the whole nation (male and female) has not yet passed through the centuries of political education and experience necessary for working democracy of the modern type. (4) The life of our political leaders depends on their securing votes. This has led to the creation of needless new posts, nepotism, administrative inefficiency—the combined result of which is corruption and delay in office work.

No sober thinker can fail to notice that the Congress Government has alienated the intelligentsia,

who held sullenly, almost contemptuously, aloof from it, though they do not oppose it. A few examples are significant: life-long patriots like Sarat Bose, Acharya Narendra Dev, Pandit Hriday Nath Kunzru and Dr. M. N. Shah (Fellow of the Royal Society of England) were opposed by the Congress Caucus when they stood for election to the House of the People.

THE REMEDY?

The remedy lies in a bold stroke of statesmanly imagination, relentlessly pursued. Let our Federal Government follow a policy of strict retrenchment and austerity, and immediately start creating small self-contained ever-ready and expert units of welfare workers on the plan of the Commando Corps during the last War. At short notice, one such unit (with its leaders, workers, escort and stores for two months) will be quickly transported and dumped down among a people still living in mediæval darkness and feudal misgovernment. The new-comers, fully financed by the Central Government will immediately open schools, hospitals, cheap roads and training work shops among the local people and put them on the way to increasing their earning capacity and their sons on the path of leading a richer and higher life in the next generation. Voluntary social uplift workers (like the Ramakrishna Mission and similar devoted monks, or the laity of the Arya Samaj) will supplement the necessarily limited State-agency if they are subsidised and helped. Thus only can the plan be implemented within one generation at the earliest.

Historians have not failed to notice that "the political emancipation of the South (of Italy) was achieved in a few months; forty years have passed, and its economic emancipation is still to seek." (C.M.H.). Therefore, the true integration of India is not the changing of the colour-patches on the map of our country; it must be a cultural and economic integration. This task is a challenge to our statesmanship. The coming years will show how far the challenge has been met and the various parts of India have been assimilated into one organic whole. Only after this great feat has been actually performed, it will be legitimate for us to shout *Jai Hind*!

Pandit Jawaharlal proclaimed at Patna that the Congress Government would abolish poverty and unemployment, and nearly a quarter million of people cheered him. What a charming promise this! It looks like the twin-brother of a promise to extinguish poverty in France made by another ex-political detainee (from the fortress of Ham, a century before our political detainee from Ahmadnagar fort). His pamphlet *L'Extinction du Paupérisme* proved a best-seller and brought all France to his feet.

The promise was realised twenty-three years later—at SEDAN.

THE INDIAN CONSTITUTION: ON THE ANVIL

By IQBAL NARAIN, M.A.,

Department of History and Political Science, Agra College

"The government of a people by itself as a government of one people by another does another for its own use, a place to make its own inhabitants."—JOHN STUART MILL.

has a meaning and a reality, but such a thing not, and cannot exist. One people may keep money in a human cattle farm, for the profits of

PEOPLE all the world over have loved self-government and struggled to achieve it. Philosophers have eulogised 'Home Rule', and poets glorified it in song and verse. Naturally, therefore, citizens in every country feel devoted towards their self-made constitution for it affirms and shields their right to be gods of democracy. And so, if on the one hand the English constitution has got its philosophers and poets, the American constitution too has its votaries and champions. Yet the Republican constitution of India—the hall-mark of our triumph in the struggle for freedom—has courted more criticism than praise. Many of our own countrymen honestly feel that the new constitution is 'no good' and that the earlier it is done away with, the better for India. For example, Sri Jaya Prakash Narain, the Socialist leader, wrote on January 26, 1950:

"Let us not forget that the constitution that comes into force to-day and brings republic into being, is in itself a source of the greatest danger to both individual freedom and social justice. Therefore, at the earliest opportunity, a really representative constituent assembly must be convened to frame a new constitution that may become a fit instrument for social democracy."

Appraisal of the Indian Constitution thus is an issue of crucial importance. For it would mean a judgment on the toil of three hundred of our fellow Indians who sat for two years, eleven months and seventeen days to hammer out a Constitution for mother India. Has it all been a huge waste and does it deserve to be discarded? To find an answer to this question, an attempt has been made at an impartial analysis of the main attacks levelled against the Republican Constitution of India.

1. AN UNDULY LONG CONSTITUTION

At the outset we find that the bulk of our Constitution has been put to searching criticism. Critics hold that our Constitution is unduly long and it, therefore, deprives the body politic of that flexibility of limbs which is a pre-requisite of its healthy working.

Indeed what strikes one in the Indian Constitution as a document is its comprehensiveness. It is embodied in 395 articles, nine schedules and the First Amendment Act. Dr. Ambedkar did not draw a long bow when he

described it as the bulkiest in the world. If the French Constitution under the Third Republic was remarkable for "its brevity, its incompleteness, its lack of sonorous phrases and challenging principles," the Republican Constitution of India is a type by itself for its vividness, its exhaustive details and rich ideology which is imbued with a liberal, democratic and pacific spirit. If the god-fathers of the American polity left the Constitution, as Russell Lowell puts it, to be "woven on the roaring loom of time" through a process of trial, error and correction, consensually-gods in India have attempted to weave the entire fabric themselves and are now proud of its completeness and rich pattern.

On the score of length and comprehensiveness our Constitution does differ from the other constitutions of the world. Most of the other constitutions of the world only embody the general principles and broad rules for the working of governmental machinery. They leave the details about the procedure of administration to be filled in by the legislature as and when circumstances require. But in the Indian Constitution many such details have also been incorporated. The Indian Constitution does not merely define the organisation and functions of the three main organs of government both at the centre and in the units and lays down provisions about citizenship and fundamental rights; it also deals with such minor details of administration as provisions about finance, property, contracts and suits, trade and intercourse within the territory of India, the services, the elections, minorities, official language, etc., etc. And hence the bulk of the constitution.

The bulk and comprehensiveness of our constitution has been explained and defended on the following grounds:

(a) The vastness of the country, the diversities of its population and the varieties of its interests account for and justify this elaboration. India's 340 millions of people, their different religions, their varied languages, the presence of many minorities in the country necessitated detailed specifications.

(b) The bulk of our constitution is inherent in its very nature. Explaining this Sri Joshi has ably stated:

"Another reason is the nature of the Indian Union, which conforms to no accepted theory of federalism and which adopts the ingredients of

1. The Republic Number of Janta, dated January 26, 1950.

different systems of government (Parliamentary and Presidential) to meet India's peculiar needs and conditions and whose avowed objective is to achieve the Welfare State."²

Our constitution has been assigned a double role. It has to be federal in normal times and unitary in the days of emergency. To enable the Constitution to play this double role, a set of emergency provisions had also to be incorporated and these in turn naturally added to the bulk of the constitution. Not only this. The framers of our constitution have embodied in one political structure States with varied political development both in point of consciousness and governmental structure. British Indian Provinces, the Native States and the Chief Commissions' Provinces differed so much from each other that different sets of conditions had to be incorporated in the constitution. Thus the bulk of the constitution increased still further because it "contains not only the constitution of the union, but also the constitutions of the States which are of different categories."³

(c) The plant of democracy has become foreign to the Indian soil due to the age-long political serfdom of the country. India was thus not fit to develop healthy democratic conventions particularly because of its illiteracy, poverty, political backwardness and lack of national character. Detailed provisions had, therefore, to be made to pursue the hard-won democratic ideal. The fathers of the constitution did not want to take any risk in the game of self-government. They did not want that the new constitution too, like the Morely-Minto and the Montagu-Chelmsford Reforms, should be deprived of its spirit and made soulless by the rules which may be framed by the civil service of the country. Dr. Ambedkar has well expressed this viewpoint in the words:

"It was only where people were saturated with constitutional morality that one could take the risk of omitting from the constitution details of administration and leaving to the legislature to prescribe them. Democracy in India is only a top dressing on the Indian soil which is essentially undemocratic. In these circumstances it is wiser not to trust the legislatures to prescribe forms of administration."

(d) It is also true that the detailed provisions have enriched our constitution as these embody the experience of the great democracies of the world where similar provisions have been tested and found to have survived the wear and tear of politics. As Sri B. N. Rau has stated:

"It is undoubtedly true that the Draft has borrowed from other constitutions and notably from the Act of 1935 To profit from the experience of other countries or from the past experience of one's own is the part of wisdom. There is another advantage in borrowing not only the substance but even the language of established Constitutions; for, we obtain in this way the benefit of interpretation put

upon the borrowed provisions by the Courts of the countries of their origin and we thus avoid ambiguity or doubt."⁴

Yet the comprehensiveness of the Indian Constitution remains only a qualified blessing. At some places our Constitution, as seen above, goes into very minute details. This is uncalled-for by considerations of practical political wisdom. It is likely to hamper the hands and puzzle the heads of those who shall have to work the constitution in keeping with the needs of time and place. Life is not all theory; it has to be supplemented with practical wisdom. And so it is justly feared that the Constitution may become less responsive to the growing aspirations of the people and practical exigencies of time and place. It might render our constitution too rigid and consequently too remote from the run of life. True there is provision for amendment in the Constitution to adjust it to the march of progress. But alas man by his very nature takes things as they are and seldom bothers to change or improve upon them unless categorically warranted. Thus it has to be admitted that our constitution, though it embodies the concentrated political wisdom of the ages, ignores the basic truth that a real constitution is a living body of general and growing prescriptions carried into effect by living persons. Our Constitution in a word is not likely to be a living organism in its working and growth.

2. A BAG OF BORROWINGS

Another severe charge against our constitution is that it is nothing more and nothing less than a bag of borrowings—a fantastic and incoherent amalgam of the varied provisions of the different constitutions of the world.

It cannot be denied that the god-fathers of our constitution freely borrowed from other constitutions of the world. A few examples would illustrate this. The very democratic basis of the Indian Constitution with adult franchise as its cornerstone is a western conception.⁵ The parliamentary pattern of our Constitution is again all British. The chapter on Fundamental Rights corresponds to the American Bill of Rights. In the Directive Principles of State Policy one can trace a parallel to the Irish model. The President of the Indian Union is an enlarged copy of the French President. Our federal fabric has been designed after the American model. It is also true that our Constitution resembles the Act of 1935 to a great extent, and so it is claimed that our Constitution-makers have only aped the Act.

But it has to be noted that though India's constitution-makers copiously borrowed, they have well adjusted the borrowings to Indian conditions. Our Constitution is

4. Quoted by D. R. Gadgil in *Some Observations on the Draft Constitution*, Preface, p. ii.

5. This is a disputed point. Dr. K. P. Jayaswal in his *Hindu Polity* (pages 23 to 186) has shown that election was a general feature of the Republics in ancient India.

not a wild jumble of the borrowed provisions of the Constitutions of the world. They have been knit together to evolve a coherence of their own. The framers of our Constitution did not borrow blindly but with their eyes open to the utility of the provisions for our country. "In other words, the wisdom of the members of the Constituent Assembly, lay in their realization that more was to be gained from selective borrowings than from blind originality."⁶ They did not feel shy in making departures in the interest of India and the Indian people. Dr. Rajendra Prasad, the President of the Constituent Assembly, declared in a trumpet tone:

"We are not bound to have a constitution which completely and fully falls in line with known categories of Constitutions in the world."

A few examples will illustrate the truth of the aforesaid statement. Single citizenship and a single integrated judiciary are prominent deviations from the American Constitution. Again the principle of judicial review has grown as a convention in the U.S.A.,⁷ but it has been expressly made a part and parcel of our Constitution by defining the structure and powers of the Courts in the Constitution itself. Not only this. If the framers of the American Constitution "were animated by a sleepless jealousy of Government power"⁸ in their desire to secure the rights and liberties of the citizens against State interference, our constitution-makers have aimed to harmonise the concept of individual liberty with the ideal of State security by insisting upon the individual that no rights are absolute and the best guarantee to the exercise of a right is its proper use in the larger interests of the community. Our Constitution thus safeguards the rights of the individual on the one hand and guards the State against the arbitrary play of these rights on the other. Moreover, our Fundamental Rights are not mere ideals. But these are ideals cast in a realistic mould suited to India. For example, the abstract ideal of liberty has been employed in our Constitution to give a sense of security to our brethren, particularly Muslims, who form a minority in our country. Similarly, the abstract dogma of equality has been used to better the lot of untouchables, the miserable outcasts of our society. Such examples may be multiplied to show that our Constitution is not a second copy of the American Constitution. Likewise, the chapter on the Directive Principles in our Constitution differs from its Irish model in so far as it incorporates the needs of India and does not repeat parrot-like the substance of the Irish Directives. In the same way our Constitution differs from the Act of 1935 in many ways. One significant deviation may be noted here. The Simon Commission Report, the Bible of the Act of 1935, held:

"Many of those who came before us have urged that the Indian Constitution should contain definite guarantees for the rights of individuals in respect of the exercise of their religion and a declaration of the equal rights of all citizens. We are aware that such provisions have been inserted in many Constitutions, not only in those of the European States formed after the War. Experience, however, has not shown them to be of any great practical value. Abstract declarations are useless unless there exists the will and the means to make them effective."⁹

And accordingly the Act of 1935 did not provide for any Bill of Rights. But the authors of our Constitution felt the incorporation of the Fundamental Rights necessary to awaken and enthuse people about the glorious vision of their liberty. And they did incorporate them. It is also interesting in this context to note that our Constitution is unique in so far as it provides for a flexible federal structure which can be stretched or bent so as to meet emergencies without breaking its framework and when the emergency has passed, it can slip back into its fold like a tree whose outer branches have been pulled aside to let a vehicle pass.

It has also to be mentioned in this connection that the critics who hold this view have perhaps a wrong notion about the goal that our constitution-makers had set before them. They perhaps think that they were attempting an original Constitution. But the fact is that their objective was only to frame a good and workable system, whether original or otherwise. Besides, today, when constitutions of all kinds have so much developed, to attempt an original constitution would have, at worst, been an attempt to churn the sea and at best, an utopian flight reminiscent of Plato's Republic which is too good for this world.

3. NOT A PEOPLE'S CONSTITUTION

It is also contended that our Constitution is the product of the labours of a Consensus which was in no sense representative of the people. The members of this body were indirectly elected on a communal basis by members of provincial legislatures to which election had been held in 1946. The voters who elected these representatives comprised only eleven to fourteen per cent of the total adult voters. The Constituent Assembly became a statutory body after the Independence Act of 1947. After partition this body became a rump consisting of 307 members, of whom 235 came from the provinces and 72 from the States. The Socialist party declared that the Constituent Assembly was not the real political representative of the people as it was not elected on the basis of universal adult franchise and so the constitution that it framed could not be regarded as an embodiment of the will of the people.

This argument loses its force when one realises that the political circumstances at that moment in India were such that even if a new constitution-making body were

2. Joshi: *The Constitution of India*, page viii.

3. *Ibid.*

to be elected on the basis of adult franchise, the Congress party would have come to power and the Constituent Assembly would have had similar character, shade of opinion and ideals. Consequently our constitution would have also been similar to what it is at present. Even Sri N. M. Joshi, the veteran Labour leader, subscribed to this viewpoint when he stated:

"It has to be admitted that organizing elections on adult franchise basis would have taken some substantial time and perhaps even if elections on adult suffrage basis had been held, the Congress party would have secured a definite majority in the Constitution-making body."¹⁰

Besides, what makes a Constitution that "of the people" is the location of sovereignty in the people. Recognising the principle of popular sovereignty, the Preamble states:

"We the people having solemnly resolved to constitute India into a Sovereign Democratic Republic . . . hereby adopt, enact and give to ourselves this Constitution."

The New Constitution of India does not only provide for people's Sovereignty but also for people's rule. The Constitution envisages a democratic government in which the average citizen has direct access to the seat of authority. He now enjoys the right to political power—the right to elect and to be elected. All discriminations based on birth, wealth, colour, race or sex have been set aside. The introduction of universal adult franchise, the abolition of separate communal electorates and untouchability, the grant of justiciable Fundamental Rights and the institution of an independent judiciary—all these go to make our constitution essentially "of the people." In fact our constitution re-affirms with a refreshing boldness the democratic ideal laid down by Lincoln:

"Government of the people, by the people, for the people shall not perish from the earth."

It has also to be noted in the context of the aforesaid criticism that the constitution of the U.S.A. too was not representative of the people in the sense in which the critics use the term. And yet it is a people's constitution. As Munro writes:

"Of course it can be argued and quite rightly, that the men who framed it (the American Constitution) were not chosen by the people, nor was their work ratified by a popular vote. But the fact remains that the document asserts itself to be an ordinance of the people and has been accepted as such for nearly five generations. Without the acquiescence of the people it could never have been continued in force during all these years."¹¹

4. EXPERIMENT OF DEMOCRACY—A HASTY STEP

Under the Indian Constitution to-day every one above 21 years of age votes and votes alike. Critics hold that India is not yet fit for an experiment of democracy

on such a vast scale. In the vein of an undiluted pessimist they are honestly afraid of enfranchising all adult citizens of India who are as yet not literate and who have no experience of democratic government. Here again the critics err. They forget that democracy is its own school and it teaches through a process of trial, error and correction. To quote Carlyle:

"Democracy will itself accomplish the salutary universal change from the delusive to the real and make a new blessed world of us bye and bye."

5. THE DANGERS OF A SECULAR POLITY

Critics hold that on account of the secularism of our Constitution people might develop a gross materialistic outlook and great treasure-houses of spiritual knowledge, such as the Ramayana, the Bhagwat Gita, etc., might be ignored or treated with contempt by the Government and the people alike. As Sri J. P. Suda observes:

"There is, however, one danger lurking in the idea of a secular Indian State. The genius of our race has been spiritual. Whereas ancient Greece struck the note of intellectual greatness and contributed to humanity priceless intellectual treasures; whereas ancient Rome struck the note of civic greatness and gave to mankind a wonderful system of law and administration; ancient India struck the note of spiritual greatness and placed before mankind deep and eternal spiritual truths. These truths are preserved in the great epics, the Ramayana and the Mahabharata and the Bhagwat Gita. If the secular Indian Republic ignores these great treasure-houses of spiritual knowledge, it would do itself great and irreparable injury."¹²

But one need not harbour this fear. A secular polity, as Venkataraman writes in his famous book *A Treatise on Secular State*, is "neither religious nor irreligious nor anti-religious but is wholly detached from religious dogmas and activities and is thus neutral in religious matters." The secular State in India does not in any way imply the idea of irreligiousness. Moreover, religion and faith are matters of individual conscience over which the State has little control. The Gita and the Mahabharata which have survived the days of religious persecution can hardly suffer eclipse in the era of universal religious toleration which is the mainspring of secularism. They have an enduring grace of their own which neither the scissors of time nor the tide of human passion can effect.

6. A POLITICAL DEMOCRACY WITH CAPITALISTIC FOUNDATIONS

Lastly, it is urged that like England, India too enjoys a political democracy with capitalistic foundations. An Indian Laski may well say that the Indian Constitution "is the expression of a politically democratic government, it is not the expression of a democratic Society."¹³ We have no economic democracy which is

the backbone of a democratic society. Our society is still divided between 'the haves' and 'the have-nots'. We do not have in actual life equal opportunities for self-development. Poverty is our greatest curse. Wealth and not merit is often a passport for individual progress and social esteem. India in these respects is hardly better than England and here also one has to say like Laski:

"It is, no doubt, true that wealth in Great Britain can purchase for itself access to the highest social place. But it is also true, that save for a favoured few, any serious approach to equality of opportunity does not exist."¹⁴

Critics go further and say that our Constitution is likely to perpetuate this state of affairs. It recognises people's right to property. It lays down that "no person shall be deprived of his property save by law." It also stipulates that "such laws must provide for compensation for the property taken possession of or acquired."

There is much substance in this argument. Yet it has to be noted that in India we have gone one step ahead of England in the evolution of social democracy. The Zamindari and the Jagirdari systems, the outworn ramparts of the feudal age in India, are being demolished,

14. *Ibid.*

while the Lords still hold sway in England. Moreover in our Constitution itself the gradual evolution of socialism has not been completely ruled out. Instead in the "Directive Principles of State Policy" directives have been issued to the newly born infant polity of free India to approach this ideal. Our fundamental rights to equality are also steps on the road to socialism. The very fact that our Constitution-makers have provided for compensation in case private property is acquired shows that they are eager to abolish it. As Mr. Ananthasayanam Ayyangar said:

"The Constitution is intended to usher in a Social Democratic Republic. This is the essence of the two conflicting ideologies prevailing in the world—the capitalistic democracy of the west and the Socialist dictatorship of Russia."

It cannot be denied, however, that the march to the El Dorado of social democracy in India will be long and weary due to the 'compensation clause.' Yet the compensation clause itself is not immutable and our political democracy, like every other, must some day grow into a social democracy. This change is in the very logic of 'evolutionism.' But the time spirit alone can determine whether social democracy will emerge as a 'child of evolution' or as a 'piece of revolution.'

—O—

PLANNING FROM THE BOTTOM

By Prof. S. N. AGARWAL

ONE of the Directives of the Indian Constitution is that "the State shall take steps to organise Village Panchayats as units of self-government." Gandhiji also laid great stress on the desirability of decentralising economic and political power in India through the revival of gram panchayats. His dream of true Swaraj consisted in the creation of "self-sufficient and self-governing village republics" throughout the country. Fortunately, almost all the State Governments have already enacted the necessary legislation for instituting Village Panchayats in their respective areas. Their constitutions and powers differ considerably from State to State. But they do contain potential seeds of rebuilding our new democracy from the bottom upwards on the basis of well-organised rural communities.

Village communities in India have formed an integral part of our national life from time immemorial. Gramini or the leader of the village is mentioned in the Vedas: reference to Gram Sabhas is found in the Jatakas as well. The Dharma Sutras contain frequent references to Gana and Puga which denoted village and town corporations in Ancient India. The Indian rural republics continued to

flourish during the Hindu, Muslim and Peshwa Governments till the advent of the East India Company. They survived the wreck of dynasties and downfall of Empires. As Sir Charles Metcalfe observed, the village communities "seemed to last where nothing else lasts." In the words of Sir Charles Trevellyn, the Village Municipalities "have stuck to the soil like their own Kusha grass." It was mainly during the British regime that these Village Panchayats gradually died down owing to excessive centralisation of administration and economic organisation.

It is being recognised by all the leading political and social thinkers of the West that modern democracy in order to succeed as a practical measure of socio-economic organisation, must be decentralised. "If men's faith in social action is to be revived," states Prof. Joad, "the State must be cut up and its functions distributed." Dr. Boodin also regards "small, closely-knit republics to be the true moral units of civilisation." Modern Sociology upholds the principle that "man is happiest when living in small communities." Analysing the drawbacks of modern States, Prof. Adams wants us "to go to the root

10. *Ibid.*, dated January 25, 1950.

11. W. B. Munro: *The Government of the United States*, (Fourth Edition), Chapter V, p. 62.

13. Laski: *Parliamentary Government in England*, p. 38.

of the trouble and pursue a bold policy of devolution, of decentralization." Lewis Mumford, the well-known American Sociologist, recommends the building up of "small balanced communities in the open country." In modern America the small communities are yet playing a very important role in the revival of rural life and co-operative effort. *Kentucky on the March* is a romantic story of men and women working together for the common good of all in a small locality. Prof. Richard Peston, in his book entitled *Small Town Renaissance* emphatically asserts that "vigorous small communities provide the only atmosphere in which democracy can thrive and remain a powerful force." Dr. Borsodi has been trying the experiment of decentralised small-scale community in his School of Living near New York. Dr. Morgan's work at Yellow Springs, Ohio for the organisation of community life is also a heroic attempt to preserve and stabilise the democratic way of life.

The idea of Village Panchayats is, thus, not a medieval conception: nor is it a relic of tribalism. As Dr. Radhakrishnan remarks: "Going back to villages is not to become primitive: it is the only way to keep up a mode of existence that is instinctive to India." Dr. Radhakamal Mukerjee in his *Democracies of the East* points out how the village communities "will furnish the basis of a new type of polity which in its co-ordination of diverse local and functional groups will be more satisfying in the State constructions of the future than the centralise structure of the parliamentary pattern." Instead of being old-fashioned and out-of-date, this pattern of rural panchayats as the basic units of administration, and economic organisation is in accordance with the spirit of this age of scientific progress. Science, with all its modern technological achievements, should make for decentralisation rather than for centralisation. It is also not right to think that village panchayats will lead to isolationism. Even in ancient times there was well-organised co-ordination at all levels. In fact, the progress of science and democracy must inevitably promote devolution of economic and political power in modern times.

National Planning under democracy can succeed only if we try to build and plan from the bottom and not attempt to force plans down the throats of people from the top. The essence of sound economic planning is, therefore, decentralisation in the form of well-knit rural and even town communities. We are glad to find that the First Five-Year Plan in our own country is aware of this need for decentralisation in the economic sphere. The scheme of Community Projects and the National Extension Service

is a step in the right direction, although there may be honest differences of opinion regarding the details. The plans for Local Projects are, in our opinion, the very heart of our National Plan. But these Local Projects can succeed on a lasting basis only if there are well-organised small communities in the form of Panchayats throughout the length and breadth of India. Our civil and judicial administration also can visibly improve if we seriously attempt to build the edifice of our *Swaraj* from the very bottom, i.e., the village community.

The ancient traditions of Village Panchayats in India have been in the direction of "composite" democracy as against the present type of "party" democracy. The voice of the *Panchas* was always considered to be the voice of God. "Panch Parmeshwar" was the ideal of these rural republics. Elections to the Panchayats were mostly unanimous: whenever it was not possible to achieve unanimity election was completed by means of lots drawn by the youngest child in the village. If we desire to rebuild the country from the bottom on sound foundations of democracy, we must resuscitate our Panchayats on the traditions of composite democracy. It is but proper that the Congress Working Committee has instructed the Pradesh Congress Committees, that, as far as possible Congress should not try to contest the Panchayat elections on a party basis. The Praja Socialist Party is also of the same view. It is hoped that other political parties in the country will consider this matter seriously and solemnly decide not to make the Village Panchayats an arena for party politics. We must all co-operate whole-heartedly in revivifying our ancient Panchayat traditions on the model of a broad-based, non-party, non-communal and enlightened democracy. Only then can we hope to reconstruct India according to the real genius of the nation.

Before we plan for a more systematic and well-organised establishment of Village Panchayats in the country it is very essential to collect all relevant data regarding the existing condition of the rural communities in different States. We must make a comparative study of the Panchayat Acts in various parts of India. The A.-I.C.C. is planning to collect the necessary information and statistics in this connection and publish it as early as possible for the guidance and benefit of all those who are vitally interested in this problem. This publication will serve as the basis for future reforms in the working of Village Panchayats in India. We earnestly appeal to all concerned to help us in this important national task of planning the welfare of our toiling millions from the bottom upwards.

THE HISTORICAL RECORDS IN KOTAH

By DR. GOVIND S. SARDESAI, Hon. D.Litt.

A Saraswat Brahman from Maharashtra, bearing the surname of Pandit Gulgule, settled in Kotah and rose to be a jagirdar of that Rajput Kingdom. In the mansion of this family in Kotah city, known as Sarola House, a very large collection of old historical papers in the Marathi language (with a hundred or so in Persian) has been preserved, carefully arranged in bundles according to their writers. These are materials of first-rate importance to students of Maratha history and of North Indian history in general during the eighteenth century. Two members of this family,—Balaji Yashwant (in office 1724-1759) and his son Lalaji Ballal (1760-1821), successively held the important position of revenue collectors in Hindusthan under the Sindhias of Gwalior. As Kotah occupies a central place in the line of communication between Delhi and Poona, the Gulgules were naturally led into various activities, as bankers and agents for many other Maratha chiefs as well; they had to secure permits and supply escorts to travelling Maratha officers and pilgrims, purchase military stores and supplies, recover loans, trace offenders, and transact all kinds of financial operations in general. The correspondence naturally rising out of the discharge of these duties during so many decades, grew in the end into a huge mass of documents which have survived till now, with remarkably little loss.

The late Rao Bahadur D. B. Parasnis of Satara was the first to draw public attention to this *daftar*, through his monthly magazine, named *Itihas Sangraha* (c. 1915), but none else cared to study them till 1927 when I paid my first visit to Kotah with my friend V. S. Wakaskar, and together we spent some ten days in studying these old papers. My preliminary note on them was published soon afterwards. In 1929, I paid a second visit to Kotah, this time with Sir Jadunath Sarkar (who explored the Persian papers and transcribed them). We jointly wrote to the Gwalior Government and drew its attention to the primary importance of these records for the history of the Sindhia dynasty. Next Sardar Anand Rao Phalke of the Gwalior Service took an interest in them and published three volumes of Selections, namely,

- Vol. I containing 296 letters (published in 1929)
- Vol. II containing 198 letters (published in 1930)
- Vol. III containing 466 letters (printed in 1937 but published in 1946).

These made a total of 960 letters available in print, roughly one-six of the mass. Sardar Phalke touched only the fringe of the collection, and covered its beginning, while the main body of the papers remained unexamined. During the Second World War, Maharaj-kumar Dr. Raghuvir Singh (of Sitamau) at his own expense got all the Marathi papers, written in the old

Modi script, transcribed in Devanagari characters and typed in triplicate. He supplied me with a complete set of these typescripts during 1946-48, and I have now finished my intensive study of the whole mass. As research-workers in this field know, most of these old letters are without dates and sometimes the name of the writer as well is wanting. Patiently working through these large bundles, I supplied the dates through the circumstantial clues furnished by the subject-matter, except in the case of a hundred or so letters (mostly too short or fragmentary) which have baffled me. I have added a short English summary and description at the end of every letter, and in many places inserted explanatory notes and critical estimates in the margin in pencil. Thus the copy edited by me can at once serve as a press-copy if it is decided to print it; but before that event, my annotations will serve as a chart guiding earnest students most quickly to the topics that are of concern to them.

THE UNIQUE VALUE OF THESE RECORDS

My exhaustive study revealed many important features of this collection; facts and episodes previously unknown were here discovered for the first time, and numerous shrewd reflections on men and events by very keen-witted contemporary observers were found, which will prove of inestimable value to our future historians; linguistic, social, and economic peculiarities, the shape of trade and banking, of prices and rates of exchange, are correctly noted, so that this collection will stand as a mine of indispensable information to every one who wants to draw a correct and full-picture of how our predecessors lived and thought and worked in the 18th century. Not merely the historian of dynasties and battles will be benefited. I enumerate below some of the important things which are brought to light in this collection only and some others which cannot be fully or correctly known except with the help of the information given here. This will serve as a helpful chart guiding future research-workers through this hitherto unknown continent.

1. Mahadji Sindhia's early career, up to 1767, is known from a few dim traditions only, but it can be reconstructed on the authentic basis of facts from the Kotah papers.

2. Many details of his later career are given here by eyewitnesses, which supplement and correct the current accounts.

3. On the last two years of Mahadji's life spent in Poona (1792-1794), and his patriotic but futile efforts to set the Peshwa's government in order, these records supply many additional and luminous details, which will correct the partisan writings of Nana Fadnis's followers.

4. The entire career of Yashwant Rao Holkar and his relations with other States can be traced step by step here.

5. There are almost day-to-day records of the doings of Peshwa Baji Rao II and Daulat Rao Sindhia and their evil satellites. We also see, how many wise soldiers and ministers and patriots without office made a last effort to avert the ruin of the Maratha State, but were frustrated by such masters.

6. Many worthy persons,—Brahmans (particularly Saraswats), Marates and even humbler castes,—can be rescued from the semi-darkness or even oblivion with which history has shrouded them up to now. I draw particular attention to Ambaji Ingle, Lakhwa Dada Lad, Jagannath Ram Kerkar, Jivba Dada Bakhshi, Zalim Singh, etc.

7. Among the writers of these despatches nearly a dozen clerks stand out for thier extraordinary ability in observing and reporting, and their mastery of style. The historian of the evolution of Marathi prose will find here indispensable material of precise date. A biographical dictionary can be compiled of our agents, diplomats, soldiers and business managers who appear on the crowded stage of these sixty eventful years, and most of whom were not hitherto known even by name. The two notable members of the Gulgule family from whom this historical store-house originated, lived in stirring times and were often at the pivot of affairs, they also rendered services to the Maratha State which

deserve to be permanently recorded in a full-length biography. This would be no unworthy subject for a thesis of original research.

HOW I HAVE ARRANGED THESE RECORDS

The Kotah Daftar does not deserve printing in its entirety. After rigorously excluding all commonplace business papers and formal letters and despatches of third-rate importance, I have selected for publication nearly 1800 documents or a little over one-third of the papers placed before me. On the transcripts themselves I have put the letter V in red and blue pencil at the head of every letter selected for printing and two zeroes at the head of those to be rejected. On the outer cover of each bundle I have noted the important features of its contents.

The documents that came to me numbered 4415, but Dr. Raghuvir Sinh's list gives the number as 4750, evidently because he counted the sheets, while I counted the documents, some of the despatches running to more than one sheet.

In conclusion, I must state my great fear that if this valuable Daftar cannot be made available for study, it may eventually be lost to history. No private owner or literary society can bear the cost of printing the selection I have made. The State alone can do it, and the State unquestionably owes some gratitude to the memory of those who had kept it alive in the past.

KOTAH RECORDS, CHRONOLOGICAL ANALYSIS

Serial No. of bundles	Year	No. of letters read.	No. of letters selected for printing	No. of letters rejected by me
1	1733-60	121	117	4
2	1761-70	233	184	39
3	1771-75	396	236	160
4	1776-80	592	374	218
5	1781-85	310	114	196
6	1786-90	250	138	112
7	1791	108	73	35
8	1792	142	89	53
9	1793	146	82	64
10	1794	179	65	114
11	1795	117	37	80
12	1796	147	25	122
13	1797	61	19	42
14	1798	80	10	70
15	1799	129	24	105
16	1800	124	8	116
17	1801	96	8	88
18	1802	278	34	244
19	1803	110	34	76
20	1804	155	71	84
21	1805	100	21	79
22	1806-57	234	10	224
23	Undated	317	0	317
Total		4415	1773	2642

Noticeable points.

Phalke has printed 54 of these.
Useful for Mahadji's early career.
British intervention in Poona politics.
First Anglo-Maratha War.
Mahadji and the British.
Wars in Rajputana.
Mahadji restores Udaipur Rana.
Sindhia-Holkar rivalry.
Mahadji attempts to reform Poona administration.
Mahadji's death and its sequel.
Madhav Narayan Peshwa's death and its consequences.
Search for a new Peshwa.
Baji Rao II comes to power.
Daulat Rao Sindhia losing ground in South.
Sindhia widows' war (3 years).
Rise of Yashwant Rao Holkar.
Daulat Rao losing ground in North.
Peshwa defeated, flees from Poona.
Details of war with the English.
Yashwant Rao Holkar blazes up.
Vanish Maratha glory.
Daulat Rao humiliated by his subordinates.
Requires further examination.

INCENTIVE IN AN AGRICULTURAL COMMUNITY

By BIPIN BEHARI, M.A., B.Sc. (Lond.) X

EVIDENCE is not wanting to show that the nations which did not work sufficiently hard to raise their production perished in the struggle for survival. A similar situation has arisen in India. India has the most fertile lands in the world, but the average yield is tragically low: U.S.A. yields—1,480 lbs., Japan 2,307 lbs., Egypt and Italy 3,000 lbs. while India produces only 731 lbs. per acre. India is the main source of the world's supply of ilmenite, manganese, monazite, zircon, and mica. Her iron ores have the highest metal content. India has enormous amount of untapped resources which are very useful for any civilised nation of the world; but the National Income of the country is as low as Rs. 255 per year. In order to exploit the natural resources of any country efficient organization and enthusiastic co-operation of the people are necessary. The first Five-Year Plan of India is an effort in that direction, but the problem of proper and adequate incentive to the worker still remains to be resolved.

Twentieth Century has weakened the capitalistic philosophy and there is socialist upsurge all over the world. Social consciousness has increased. People who continuously toil on fields and sweat with machines are acquiring control over the government. Right to work is accepted and everybody expects free health services. At present monetary incentives are of doubtful efficacy, and the failure of bonuses and Payments by Results (PBR) is evident. Influence of both the whip and the carrot has declined; the problem of human motivation requires a fresh analysis.

Mr. Balchin writing in the *Occupational Psychology* of July, 1947 started a very lively series of discussions regarding incentive to work under the caption "Satisfaction at Work." This discussion attracted the attention of psychologists, sociologists, industrialists, anthropologists, and economists.¹ In this article Mr. Balchin analyses three phases in the history of incentives and finds three main drives of human activities. In the society prior to Industrial Revolution the individual often for long hours did

exhaustive work. During this period beneath all complaints of the hardness of a ploughman's lot there was odd pride and satisfaction in the direct struggle between man and nature, and in using certain skill and knowledge to produce something of obvious tangible value. In the second phase of mechanization industrial workers had to work in complicated large-scale organisations and there was a very great gap between the effort and its tangible result. During this period though the satisfaction derived in the earlier period is lost yet the masochistic pleasure especially enforced by the religious dogma was a source of satisfaction. With the advent of industrial civilisation with decay in the religious faith the source of satisfaction altered. Labour and management together set out coolly and rationally to destroy the old sadistic-masochistic pleasure in effort and discomfort for their own sake and to make the point that there was no virtue in hard work for its own sake. Incentive was not satisfaction but the radio set was. Under the present conditions some of the old resistances are removed but no positive incentive is provided.

Mr. Balchin further goes on to analyse the factors of motivation for the individual. He states three conditions under which the individual works: either he must or he should or that he wants to. The first is very powerful in a community where the struggle for survival is very hard. 'He who does not work shall not eat' is much more emphatic under subsistence economy than 'He who does not work shall not have a radio.' In the second case, work is just a duty. When the National Income is concentrated among a very limited section of the population, then the teeming millions of the industrial world will not have the ethical inspiration of unattached effort, especially under industrial discipline. Men might work for themselves, for their family members or for their friends or for the person whom they love. There is truth in the statement that nobody works for abstract society. In the third instance, it is assumed that the individual is an artist. But the assumption is of doubtful value.

Mr. Balchin concludes that if work and pleasure are much more integrated there will be greater enthusiasm for work. According to him, there is no harm in introducing the technique of the professional entertainer. "Why should the Devil have all the tunes?"—asked Martin Luther, when they accused him of setting hymns to the music of drinking songs; but the same can be the answer of the industrialists to the musicians. We should arrange for work to merge into human activities, so that it ceases to be a separate concept and yields at least as much satisfaction as any other part of life. A time may come

when nobody could be demanding any labour from anybody if the work is not pleasant and enjoyable.

A statistical investigation was carried on in England just after the war to find out the popularity of different incentives.² A sample of 300 men aged 18-19 years, of various levels of intelligence ranked eight 'incentives' and also expressed their attitudes towards the same items by means of paired comparisons. The items ranked were Pay, Hours, Variety, Leave, Prospects, Security, Efficient Organization, and Good Workmates. These items were classified under two sections: Group A consisted of Prospects, Security, Variety and Efficient Organization; Group B consisted of Workmates, Hours, Pay, and Leave. The persons under observation were classified according to their level of intelligence. The survey indicated that (i) the incentive for one person might be disincentive for the next group. Generalisations about incentives without prior measurement of intelligence might lead to dangerous conclusions. (ii) Intelligence, occupation and occupational preferences are conditions which influence the incentives most. Social conditions, age, marriage have important influence, but they were not considered in this investigation. (iii) Intelligent workers are more interested in long-term incentives associated with the job itself, and the lower intelligent groups seek short-term incentives and compensations for doing a job. They prefer social incentives rather than satisfaction in work. Group A (Prospects, Security, Variety, and Efficient Organization) is preferred by the intelligent group whereas the other group preferred Group B, (viz., Workmates, Hours, Pay, and Leave). (iv) Making the work more interesting for lower grade intelligence may spoil the whole work situation from his standpoint.

Mr. Balchin and Professor Mace both emphasise the importance of social factors for human motivation whilst the statistical investigations bring into relief the significance of individual characteristics. As a matter of fact, the problem of motivation can be properly analysed only in relation to the society. Under the present industrial system the relationship between the individual and the society is disrupted. Even the social consequences of Industrial Revolution is noted with disappointment.³ As early as 1829 Frederic Le Play, a French engineer (who toured from the steppes of the Eastern Europe to the Atlantic shores of France, and whose observations are recorded in six volumes published between 1855 and 1879) doubted whether technical and industrial develop-

ments were at all beneficial to the various European communities.⁴ Le Play stated that in simpler communities there is social stability and there is willing participation of every member of the community in social activities. With respect to the modern and characteristically industrial community the situation is entirely contrary: there is extensive social disorganisation, social code is ignored, peace and stability has definitely waned. Remarkably similar observations were made towards the end of the nineteenth century in France by Durkheim in his *Study of Suicide* published in 1857. He showed that the difference between a modern and technically developed and the simple ordered community is that in the simple community the interests of the individual are subordinated to the interests of the group. The individual number of this primitive society can clearly anticipate during infancy and adolescence the functions that he will fulfil for the group when adult. The anticipation regulated his activity and thinking in the adolescence and culminates in a communal function and a sense of satisfaction when he is fully grown. In a technically improved community there is a tendency of disruption between the individual and the group collaboration. In extreme instances, Durkheim goes on saying that "we may find individuals who have lost all sense of social relationship or obligation—the melancholic, the suicidal, the 'lone wolf' or the criminal." In modern industrial society we find two symptoms of social disruption, viz., the number of unhappy individuals increases and, secondly, there is disruption of the relationship between the individual and the society. In a civilised world with industrial, mechanical, and physiochemical advance there has been destruction of all the historic and personal relationship.

The effect of industrial development was primarily to take the individual out of his social and family setting and to place him all alone confronting the gigantic mechanized organization where the individual pales into insignificance. What was important in the industrial revolution was the beginning of an industrial discipline which was impersonal and inhuman. The workman was summoned by factory bells; his daily life was arranged by factory hours; he worked under an overseer imposing a method and precision for which the overseer had in turn to answer to some higher authority; if he broke one of a long series of minute regulations he was fined, and behind all this scheme of supervision and control there loomed a great impersonal system. The individual had no initiative. He had no satisfaction of seeing his own tangible product going to the consumer, and there was no security of his employment. He had to work hard because he had to. Unless he worked harder than his fellows he would be the first to be eliminated in the

economy drive. The whip was the most powerful incentive.

Agricultural workers have a different life to live. The rhythmical seasonal fluctuations have enabled agricultural workers to live very near to nature. The influence of nature in the diurnal life is considerable in reducing the fatigue of hard work. Life moves in rhythm, and the monotony of repetitive jobs is not soul-destroying. Peasants work hard when there is need for it. He has complete leisure when his labour is not required. Life is philosophic and influence of religion is great. Agriculturists start their sowing and their harvesting on auspicious days, and they believe in the sanctity of tradition and of religion. Promise of future heaven had been a greater inspiration than the rivalry or the competition of his fellow workers. In spite of hardness of a ploughman's fate, there was pride and satisfaction in the direct struggle between Man and Nature and in using a certain skill and knowledge to produce something of obvious tangible value. He worked according to tradition and any deviation from that would bring stigma to the individual. Harder work could be possible because the harder the work the greater the respect among his compatriots and the greater the reward in life after death.

In a simple society where mechanisation has not proceeded very far and where money does not play a very significant role, the relationship between the members of the group is regulated according to basic human impulses. In such a society advantages of the idyllic life are present but there are certain incentives for the individuals. These incentives are based on the understanding of human emotions and their feelings. The inherent desire in mankind to excel his compatriots has played an important role in such a community to encourage and to induce people to hard work. A typical situation exists for example in Tikopia, a remote island community on the fringe of the British Solomon Islands Protectorate.⁴ The people some 1,300 tall, fair-skinned Polynesians live on a diet of fish, fruit and vegetables. They wear a rough cloth made from bark of the paper mulberry, and they use steel tools obtained from occasional exchange with the few European vessels that call. Of internal exchange of the ordinary kind there is very little. Goods do exchange hands frequently but nearly always by process of ceremonial gifts and counter gifts. In such a community fishing of bonito is a very trying task, it can be taken only with very strong rods and line and by a very expert hand. When the day's fishing is over any fisherman who has obtained a good catch—of ten or more—is entitled to stand his rod up in the stern of the canoe as he comes inshore. Such a man is known as "man of bonito"—a label

with some prestige to it. He can get poems composed in his praise and get that sung in the community. The symbol of putting rod up against one's canoe or making a song about one's own self so highly prized, is simple, yet it is precisely in these non-material ways that the human beings in a society finds some of his most cherished goals. It is the opinion of his fellows that gives value to these simple tokens, which helps to spur him on.

The pattern and the values of the present Indian Society are changing. In less than a century the economic structure of our country has changed so fundamentally that the leaders of the Sepoy Mutiny would not recognise the final texture of our present society. India is undergoing transformation. Mechanical developments and agriculture, both have sway over the Indian economy at present. India has one of the most fertile lands in the world; food crops occupy 80 per cent of the cultivated area and one-third of the rice production of the world is grown in India. She is one of the largest producers of sugar, in tea-production and export she ranks first. India's rich forests grow nearly 4,000 varieties of fine timber useful for almost every use. India has the largest monopoly of lac production. It is the second largest producer and exporter of raw cotton. Agriculture supports about 70 per cent of the entire population. Though India had been primarily an agricultural country and though agriculture still remains the premier source of national wealth, yet the speed of industrialisation and the scale of industrial expansion have been colossal. Cotton Textile is by far the largest industry of the country. As a cotton-producing country India occupies the second place in the world. Tata Iron and Steel Works at Jamshedpur are now the largest steel works in the East. The leather industry of the country is eating into the European markets. Rubber, cement, match, glass, soap, automobile, electrical equipments, drugs, and pharmaceutical industries and chemical industries are gaining favourable grounds in the national economy. India's tea, sugar, match and vegetable oil industry are among the biggest in the world. India ranks fifth in the world in volume of trade and is one of the largest industrial countries of the world.

Because India has a highly capitalised industrial growth and because agriculture still holds a greater sway over the Indian population, the pattern of Indian life can neither be a true replica of the Western life, nor of the old agricultural community. We are in a changing society: the advantages of old social groupings are vanishing. Now a child born in a Vaisya family is not necessarily expected to perform the duties of a businessman. Under the old caste-system (or social groupings) the society expected a certain type of performance and efficiency from the individual and the individual equipped himself to come up to

4. Professor R. Firth: "Anthropological Background to Work," *Occupational Psychology*, April, 1948

social expectations. When the new society is taking its shape, the old social groups are breaking away and the individual is left all alone to take his own care. He gropes in darkness for his settlement in life. His vocational selection is mainly guided by glamour of the profession and parental wealth at his disposal for the requisite training. Furthermore, there is not much co-ordination between education and vocation. Unless the man and his training are suited for the job, it would be impossible to think of happiness at work.

Agriculture, even today, is mainly an inherited profession. Peasants have neither adequate training nor sufficient money for mobility to the industrial centres. Their lives are guided by social regulations. Any deviation from the beaten track might lead to social ostracism. The same rotation of crops and the method of cultivation persists in the same region. Sowing and harvesting are guided by heavenly phenomena—either the nautical almanac of the village priest is consulted for the beginning of sowing and harvesting or the advent of the monsoon rains regulates the course of events. Gods, priests, stigma, social ostracism and communal relations still regulate the agricultural community of India.

Industrial labourers are drawn from villages and their course of action is mainly guided by agricultural requirements. Demand for agricultural labour is seasonal which influence the mobility of labour from agriculture to the industrial centres. There is horizontal mobility among the agricultural and the industrial labourers. There are two principal cropping seasons: *kharif*, the summer rain cultivation and *rabi*, the winter rain cultivation crops. *Kharif* crops are sown at the outbreak of monsoon and is harvested in September or October. *Rabi* crops are sown in October or November and is harvested in April or May. At the approach of Dashara holidays the industrial workers leave their factories and move homewards to help agriculture. The same principle applies during the period of Holi holidays. There is a swing of workers from industries to agriculture when agriculture needs help and when the pressure of work has subsided they swing back to industries. This explains seasonal growth of absenteeism among the industrial workers. In India, there is no watertight division between the agricultural and the industrial labour.

Any incentive scheme in India must depend upon (a) a co-ordinated growth of the individual and the society, (b) education of the masses, (c) industrial organization, (d) morale boosting, and (e) the philosophy of work. Le Play and Durkheim both had very strongly emphasised the disruption in a mechanical society. A secured membership of the group is necessary for the healthy growth of the individual.⁵ The

individual is judged healthiest by psychiatric standard if he is capable of establishing the most secure and reciprocal relationships with others. Such relationships in the modern society is lacking. In Western civilisation lack of security has caused rampant neurotic anxiety; whilst in India insecure individuals seek relief in religious superstitions regarding life after death. It is one of the problems of the modern society to find freedom from neurotic anxiety. Neither virtues of poverty nor the terror whips can, nor should, goad the workers for hard work. An understanding of one's responsibility for psychologically adult persons is a sufficient stimulus for harder work. In a truly democratic State personal needs are subordinated to a reasoned appreciation of the needs of other individuals to whom one is knit by ties of associations. When the individual can discriminate between personal wants and the social requirements, restrictionism in work which was present even at the Hawthorne works in the year when the company had reached its peak of activity⁶ would be greatly diminished.

It devolves upon the State to arrange for security and for the provision of opportunities for the expression of inherent potentialities of the individuals. Free Health Service and Full Employment are the basis for any happy society, but the State has also to encourage the establishment of institutions which would facilitate the expression of creative faculties of its members. Only when the members lead a fuller life then frustration and monotony in one direction may be compensated by relief and happiness felt in another direction. Under such a situation work is not a separate function, it becomes the spontaneous expression of creative instincts of the person.

Lest these ideals do not appear Utopian education of the masses must be directed towards liberal and technical aspect of the training.⁷ Lessons in fundamental civics are imperative for the understanding of social obligations. Neither the religious teachers nor political leaders need such training but the 'swinish multitude' who controls seats of the government requires lessons in fundamental human rights. When individuals are aware of their status in the compli-

cated social pattern, the sense of responsibility may propel them to enthusiastic performances of their duties. Moreover, technical training is very necessary for the technicians. A blending of social sciences and technical training is very necessary. Those technicians who expect to be in charge of workers must have a good training in human psychology, technical know-how of the job and theoretical grounding in the fundamental principles of the trade. A planned education and direction of individuals to various vocations may be of great advantage in the long period. Bertrand Russell in his *Scientific Outlook* prophesied a situation when even births will be regulated according to requirements of the society and the persons from their birth would be kept under conditions best suited for the especial jobs for which they were born. Whether this is just a dream of a visionary or a thing to come is not right for us to predict but it is true that the attitude of the entire life depends upon early days of schooling. So the attitude we want to foster to our children should be decided a long period ahead. This will greatly smoothen the relationship between the employer and the employed.

The educational system must be co-ordinated with the planned industrialisation. It would not be very convenient to find jobs and technicians at distant places. Work and the worker must be close at hand. A decision about the location of industries is another assumption for co-ordination of the work and the workers. Mahatma Gandhi while emphasising the need for cottage industry looked as a prophet to the future of the national economy. India is an agricultural country and its social structure revolves round seasonal agricultural fluctuations. During slack periods there are workers who are not usefully employed. If they get some work to look forward to after the end of their agricultural work, they could work enthusiastically for both. The principle that "there must be something in the tray, if you want the worker to work harder" can be successfully adopted in Indian community if agriculture and cottage industries are synchronised. The cost of production will be much lower than in many other countries.⁸ The workers who are migratory in nature will be stabilised and this will give a firm basis for social reconstruction. The relationship between the individual and the society will be closer and the individual will be expected to discharge their share of obligation in producing the quota. If the individual does not come up to the expectation there may be apprehension of social stigma which the individual would like to escape. He would work harder to come up to social expectation.

There are certain industries where large-scale establishments are very economical, their concentration at one place might be beneficial. Where the scale of industries is to be large in order to gain economies of scale it is necessary that the State should regulate the localisation of firms. It has been found that sometimes it is harmful to keep all eggs in the same basket. Different types of firms should be encouraged to settle in the industrial estates. Localisation of different firms in the same region would produce external economies. An industrial community may grow in that locality. Technical skill and working habits will be imbibed among the younger member of the community. Moreover, external economies and various other advantages would cheapen the cost of production. The community and the country would gain from it. Workers of the region could watch the tangible result of their efforts and they could even know the importance of that region in the entire national economy. This may satisfy their ego and they may feel secure in their industrial community.

A harmonious relation between the workers and the managers is always a very great asset for the country. Selection of workers is as important for the industry as the training as how to order the subordinates. A harmonious relationship between the workers and the managers should be effective to break the factory walls: if within the four walls of the factory, the workers do not feel imprisoned, then the social adjustment of the workers and of the factory is perfect. Factory becomes just another place where the individual experiences the fulfilment of his personality. The worker who frankly frets and frowns at his job and sweats feverishly in his garden will take greater delight in working even for the soul-destroying repetitive works, if the barrier between the work and the life without is destroyed. Under such a situation there may be physical fatigue, psychological fatigue which is more annoying than the first will be completely absent. If the attitude to work can change, half the battle will be won.

There are various devices for boosting morale in an industry.⁹ The use and control of emotions could greatly aid to increase the co-operative tendencies of the individual. The efficacy of these devices is great in an agricultural community. A lower standard of intelligence and the lack of proper schooling provide very suitable opportunity for the success of morale-building factors. Use of the morale-building technique is accentuated for certain other reasons too. Agricultural industry is not very compact, it is very loosely orga-

B. Behari : "Technique of Morale-building in a British Industry," *The Modern Review*, June, 1952

nised. Mechanisation has not proceeded very far in agriculture. Poor peasants are ignorant of the improved techniques of cultivation. If these persons are taught their importance in the national economy and if they are taught better methods of cultivation, they are bound to react very favourably. A casual visitor to any cultivated field is aware of the carelessness of the peasants in sowing the crop. If the crop is sown at regular distances and economy in seed is made, the increase in yield is bound to be more than 15 per cent. We have been trying hard in this country to raise our production but do we consider that the yield can increase by a slightly greater attention even to the old system? The Publicity Department of the Government can be a very effective help in this direction.

For sustained effort the value of philosophy is very great. In ancient times the workers worked for his community, he worked harder than his fellows because he wanted a better reward for life after death. Even when the industrialisation was in its early days the workers derived sadistic-masochistic pleasure in the discomfort of hard work, sometimes the workers struggled hard for his personal end. Now the old values are crumbling into pieces. The State is satisfying most of the basic human requirements. Monetary incentive is not very effective. There is need for a new philosophy of life where the relationship between the individual and the society is considered afresh. If a reciprocal relation is established between the workers and the society, if the individual does

not feel frustrated, there would be happiness which will make him well adjusted at the work. We need certain social philosophers to set up a new standard of human expectation out of life and of ourselves.

CONCLUSION

We cannot forget human nature in our pursuit to raise production. The individual should be considered as a human being and the working group should be considered as a society not, as a host of idiots. It is necessary to take personal life into consideration for understanding the individual reactions.¹⁰ With the abandonment of the carrot-donkey-stick treatment it is necessary to accept complexity of personal motivation. Strength of groups is recognised. By reinstituting individuals in the proper setting of the society and by fostering a high social expectation individuals would be happier and more conducive to harder work. By gaining co-operation and by raising the morale of the people we can help the individual, can help the society and can raise the productivity of the country. We can survive in the struggle for existence if the individuals and the society work in close co-operation for the common good.*

—O:—

POLITICAL PHILOSOPHY OF CONFUCIUS

By CHOU HSIANG-KUANG,

Lecturer in History, University of Delhi

PHILOSOPHY, indeed if it is to be the systematic manifestation of thought, must necessarily find expression in the writings of private individuals. Prior to Confucius, there were no such writings. Confucius himself did not write any book; but what his disciples have recorded of him and the *Five Classics* edited by him, were the first step in the development of a true system of thought. Confucius is, therefore, the first individual to be studied in the history of Chinese political philosophy, because prior to him, there existed, in all probability, no system of thought worthy of being called philosophy.

In Chinese we speak of Kung Fu Tze—"Guru Kung." Confucius is largely a western name. He was born in 551 B.C. in the State of Lu (the present Shantung province in north China). When he was nineteen, he married, and at the same time, he was appointed a Director of the Public Lands by the King of Lu. At the

age of fifty, Confucius reached his highest post as Chief Minister of Lu. He held this post for about four years. After his resignation in 497 B.C., he was accompanied by many of his disciples when he set out for wanderings which were to last for 13 years. There had been many feudal states of China undergoing many hardships and dangers. At last he returned to his native state, where he spent the last three years of his life engaged in literary studies and in teaching his disciples. He died in 479 B.C., and was buried in the district of Chu-Fu of Shantung province, where his tomb is still to be seen.

To know what Confucianism is, it is essential to study its sacred books. They are commonly referred to as the "Four Books." These are: (1) The *Analects*, that is to say, the sayings of Confucius as recorded by his disciples, (2) the *Great Learning*, a treatise, written, probably by Tseng-tze, a disciple of Confucius, (3) the

POLITICAL PHILOSOPHY OF CONFUCIUS

Doctrine of the Mean, by Tze-ssu, a grandson of the Sage, and (4) the *Works of Mencius*.

The *Five Classics* are: (1) The *Yi-Ching* or *Book of Changes* used in divinations, (2) the *Shu Ching* or *Book of History*, (3) the *Shih Ching* or the *Book of Odes*, (4) the *Li Chi* or the *Book of Rites*, and (5) the *Chun Chiu* or the *Spring and Autumn Annals*.

The root of Confucian political philosophy lies in *Jen*. Without understanding the meaning of this word, one will not grasp the political idea of Confucius at all. Chinese ideograph for the word *Jen* represents two men in relationship to each other. Confucius once defined *Jen* as 'to love all people.' He also said that 'to subdue one's self and return to propriety is *Jen*. To be a man of *Jen* is to reach the highest of human possibilities in terms of the complete fulfilment of the mutual good. In *Yi Ching* or the *Book of Changes*, it has been said: "The superior gentleman reared in the virtue of *Jen* will nurture people." The passive aspect of *Jen* is *Shu*, the ideograph for which is a combination of 'Like' and 'Heart.' It means putting oneself in another's place. It is a principle of inference, the basis of the Chinese Golden Rule. When Tze Kung asked whether there is one word which could serve as a guide for action in one's life, Confucius answered, 'Shu,' and explained it to mean, "Don't do to others what you would not wish done to yourself."

From the standpoint of Confucian teachings, knowledge and virtue are closely connected. In fact, the purpose of education in ancient China was to cultivate a virtuous life. Tze Hsia, a disciple of Confucius, put it this way: "The superior men must learn in order to cultivate the highest moral principles." Only virtuous men should govern the state. Confucius wished to see politics based on ethical principles, which explains why he emphasized that virtue must be the foundation of government. He said:

"He who exercises government by means of virtue may be compared to the north polar star which holds to its place and all the stars turn toward it."

Again Confucius said:

"The moral character of the ruler is the wind; the moral character of those beneath him is the grass. When the grass has the wind upon it, it assuredly bends."

There is then only one ethical principle for both the individual life and the public life. If you are a good man, you will be able to be a good ruler, but the basic thing is to be a good man.

The ideal state of Confucian political thinking is that every man should develop his morality to the maximum degree, and so construct a world in which the doctrine of *Jen* rules. This is called the Grand Union. A full description of this is found in the following quotation from *Li Chi* or the *Book of Rites*:

"When the Great Doctrine (Tao) prevails, the world is a Grand Union. Officers are elected according to their wisdom and ability, and mutual confidence and peace reign. People regard not only

their parents as parents but also their children as children. All the aged will be provided for, and all the young employed in work. Infants will be fathered, widows and widowers, lonely orphans, the disabled and the sick will all be cared for. The men will have their occupations and women have homes. No goods will go to waste, nor need they be stored for personal possession. No energy should be retained in one's own body, nor used for private advantage. Self-interest ceases, and banditry and rebellion are not known. Therefore, the gates of the houses are in no need to be shut. This State is called the Grand Union (Ta Tung)."

Judging the above passage there follow three things. First, it conceives of a super-national organization having

像真聖孔祠石縣阜由裝部

Confucius

the whole world as its scope. No hereditary rights are recognized, but government is established by direct popular election and its administration is based on the spirit of *Jen*. Secondly, the tribal family is the unit of society, but its spirit transcends family considerations. Only biological differences are recognized, while emphasis is laid on "all the young men employed in work." The old and the children are all supported by the labour of those who are young and strong. Thirdly, natural wealth is exploited to the utmost but not for personal gains. The sacredness of labour is instituted, but no one is to work for his selfish end.

The Grand Union is the fullest expression of the perfect personality of the Universe. But the Universe will never reach its ideal; if it is realized, it would no longer be the Universe. And yet in this incomplete Universe what should human beings strive for? We should strive with all our energy to make the Universe approach its ideal

perfection one step nearer. To accomplish this, we must develop our fellow-feeling among mankind. In a situation where fellow-feeling is inactive, the first step is to awaken it to life again. There is a simple method for it, namely, to begin with one's personal relations—parents and children, brothers and sisters, husband and wife, the ruler and his subject, and friend and friend. These represent the five dimensions of life. These five relationships may be grouped into two, the solid relationship within the family and that without the family. The first three relations are relationship by blood or marriage, whereas the last two are relationships by righteousness (social or political ties).

When the five human relationships are properly observed, the two solid bodies necessary for the promotion of the family and the society and the relation between the former and the latter become complete. Therefore, Confucius held that harmony with the family is the root of good government in the State. The *Book of History* states:

"Some one asked Confucius, saying: 'Why? Sir, are you not in the public service?' The Master answered: 'Does not the *Shu* (the *Book of History*) say concerning filial piety: Filial piety and friendliness towards one's brethren can be displayed in the exercise of public service? These qualities then are at the root of public service. Why should only that idea of yours be considered as constituting public service?'"

Are there any moral rules for the family and for the government? These are contained in the *Spring and Autumn Annals* which was edited by Confucius himself. It is the political Bible of China. To each statement in the book, Confucius implied his approval or disapproval. The manner of recording is cryptic and the contents are not narrations but rather rules of approval or disapproval. The influence of the book doubtless has been very great. There is a proverb about this book: "His one word of approval and disapproval is as severe as the killing by a halberd and a battle-axe."

Here are samples of the statement found in the book of *Spring and Autumn Annals*.

(1) First year, Spring, the Imperial January.

This is one of the statements in its entirety. It was interpreted by the commentators as meaning the first year of the ascension to the throne by Duke Ying of the State of Lu (the present Shantung province). The year thus refers to this great event in the State of Lu. But the month refers to the Imperial calendar of the Chou Empire (1122-256 B.C.), of which Lu is merely a part. This recognition of the Imperial calendar denotes submission of all feudal lords and their subjects to Imperial authority.

(2) Fifth year, Spring, the Duke went to Tang to observe fishing.

This statement implies that this is an act not appropriate for a Prince. When the Duke proposed to go to observe fishing, one of his ministers told him that hunting during the four official hunting seasons can

contribute to the national defence and that consequently during these times it was proper for the Prince to appear. However, a small thing like fishing is beyond the scope of government and should not be attended to by the Prince.

(3) Second year, Spring, Imperial January, Sung-tu murdered his King Yu-Yi and his minister Kung-Fu.

The killing of a king by a subject is the greatest crime that can be committed. Confucius used the word *Shih* meaning crime-killing, instead of the word *Sah*, for killing.

(4) Hsuan-Kung—12th year, the Baron of Chu laid siege on the State of Cheng.

Summer 6th month. The Army of Chin led by the Commander Sin-Lin-Fu and the Baron of Chu fought in Pei and the army of Chin was defeated. Kung-Yang, commentator on this statement, said that Chu, while generally considered to be a state of barbarians, this time was favoured by Confucius. He made this personification of Chu in the name of the Baron because the Baron's conduct in battle was up to the Confucian standard of culture. The *Spring and Autumn Annals* emphasised the distinction between the Chinese feudatories and the barbarian tribes, and Chu, with this exception, came under the latter.

I do not wish further to multiply the examples of statements in the *Spring and Autumn Annals*. It is enough to say that the murder of a ruler was regarded as one of the greatest crimes and that incest was equally bad. The barbarian tribes, when they attacked a Chinese kingdom, were condemned by Confucius. Even when a Chinese kingdom committed an attack on its neighbours without any provocation he recorded the event with disapproval.

This manner of recording, according to Mencius, made the rebellious ministers and villainous sons tremble. This technique was borrowed from Confucius by later historians who distinguished between legitimate and illegitimate dynasties. A dynasty which was founded by a minister who had taken advantage of a period of disorder and had murdered the king was considered illegitimate. Tsao-chao was one who had taken such an advantage of the rule at the end of the latter Han dynasty (25-221 A.D.) and in the name of the Han Emperor had extended his own sphere of influence. Later his son built up his kingdom of Wei (220-265 A.D.) which became one of the Three Kingdoms. But Wei was styled the Usurper Dynasty.

Liu-Bei, ruler of the kingdom of Su, was considered the legitimate king, because he was the descendant of the Han royal family. Such distinctions between legitimate rule and usurper or puppet government exercised a very great influence upon the minds of the Chinese people, when they were asked to choose one of them to follow. This moral attitude persists till today.

We would like to mention that during the last Sino-Japanese War, the moral support by the people to

A PROBE INTO INDIAN PRICE TRENDS

461

the Chungking National Government springs from two psychological motives: one is that the Japanese, from the viewpoint of a Confucian, are a barbarian tribe which should be expelled, the other is that the Chungking National Government is the legitimate government but that of Nanking sponsored by Wang Chin-wei is a puppet government and therefore is illegitimate.

Readers may come to know now, why the twenty million Overseas Chinese abroad as well as the nine million Chinese in the Formosa Island are still supporting the Chiang government, and even the Chinese POW in Korea want to go to Formosa. This is not to mean that we Chinese people are still looking forward

to the leadership of KMT, but we sincerely follow our great Guru Confucius's teachings.

If you try to trace this mental attitude, you will find the source only in the book *Spring and Autumn Annals*. So you see how deeply rooted is the influence of this book on the Chinese mind. One who wishes to understand the political psychology of the Chinese can only find it out by reading the *Spring and Autumn Annals*.

We may conclude this article by saying that the victory of the Confucian school was achieved not merely through the support given by the emperor but also through the real contribution which this school made to the Chinese culture and civilization.

—:O:—

A PROBE INTO INDIAN PRICE TRENDS

By Prof. V. K. SHRIVASTAVA, M.A., F.R.ECON.S. (Lond.)

EARLY economists of the 18th and 19th centuries utterly disregarded the importance of consumption. The rise of Socialist thinkers and the Welfare school of Economics has brought to the fore the problem of 'wants and their satisfaction.' Satisfaction of human wants is now obtained indirectly through the system of money-exchange, split into two parts—sale and purchase of goods. The system of money-exchange works through price-mechanism. By price is meant the value-in-exchange of goods expressed in terms of money. Every one of us is a consumer. The man in the street always thinks in terms of rupees and annas. If he was buying one loaf for one anna before 1939 and now if he is required to pay two annas for it, he will at once conclude that 'bread has become dearer.' However, the economist thinks of the rupee as having a more or less fixed purchasing power. Purchasing power of money depends upon the total quantity of 'exchange-media' as related to the volume of goods and services produced in a country. Price-changes occur, when other things being equal, there are any changes in any of the two factors or in both in the opposite direction.

War or peace, both may equally account for causing disturbance in the price-system. A boom is as good as a slump. The last Great War and the period of depression in the 'thirties, were enough to teach the world a good lesson on price-control. In the case of the U. K. and the U.S.A., which had drawn upon their previous experience, prices did not rise as high as in several other countries. All leading economists of our country are alarmed at the rate of fall in the purchasing power of the Indian rupee. The main causes of the fall are (i) the Governmental financial policy, (ii) huge war-financing, (iii) the new 'created' money, (iv) production crisis, (v) restricted imports, (vi) depression psychology. Other factors

which accentuated the rise have been the continuation of deficit financing, the policy of decontrol and the continuous increase in salaries, wages and dearness allowances. The continuous spiral of rising prices may be better studied with the help of the following data:

Index Number of Prices and Cost of Living

Year	Base 1914	
	General Index	Cost of living Index
1939	137	113
1940	120	115
1941	149	139
1942	238	188
	Base 1939	
1945	242	231
1947	302	285
1948	383	292
1950	409	298
1951	434	314
1952	415	325

The following important conclusions may be arrived at from the study of the above data:

- Inflationary conditions had not assumed serious form as late as 1941.
- Prices rose considerably since 1942 and the spiral of rising prices went on till the end of 1951.
- The Index number showed decline from the beginning of 1952 to May 1952.
- Since May 1952, there has been a slight increase in the general index which remained almost constant till 15.9.1952.

Prices were almost stable during 1947 but in 1948, the rises were significant for every month from January to July. These rises coincided with a policy of decontrol of food and cloth. However, some economists do not consider decontrol as the villain of the piece. In their opinion, the stable relation between the money supply and the goods exchanging against them was established at a general index level of about 382.

The unhappy position of the Government finances starts from 1946-47 when deficit-financing was undertaken and a surplus on India's account, both revenue and capital of Rs. 276 and Rs. 248 crores in 1944-45 and 1945-46 were converted into a deficit, which in the year 1947-48 was Rs. 228 crores and in 1948-49, Rs. 224 crores. The index of effective money-supply increased from 116.3 in 1939-40 to 532.2 in 1948-49. While money-supply was the means by which high prices developed, the passive factor which was low production was also equally important.

In the country itself, there are sharp variations. Kanpur with the cost of living index at 466 is the dearest place. Nagpur had its index at 381, Calcutta 363 and Madras 328. Delhi, Jabbalpur, Jamshedpur and Ludhiana are comparatively cheaper. The un-weighted retail price index numbers for 18 urban and 12 rural centres have been given in February 1952 issue of the *Indian Labour Gazette*. In the urban centres, the index numbers for all articles of food showed a clear downward trend. This downward trend was due to a fall in the prices of miscellaneous articles of food, e.g., gur, potatoes, onions, chillies, and brinjals. There was a fall of 10 points or more during December, 1951, as compared to the year 1944 in the index numbers for Agra, Barcilly, Banaras, Patna, Howrah and Raniganj. In the rural centres, however, the index numbers for all articles of food recorded a rise of 15 points on account of rise in the prices of *jauar*, *bajra*, onions, kerosine oil, match-box, *dholi*, shirting, *sari* and tobacco in the rural centres. However, there was a general fall in the prices of cereals, including rice.

The trends of wholesale prices for six major countries, namely, Australia, Canada, Italy, Japan, U.K. and U.S.A. did not reveal any upward march up to June 1952 except in Australia. The data available in respect of these countries have been compared to 1948:

Year	Australia	Canada	Italy	Japan	U.K.	U.S.A.
1948	100	100	100	100	100	100
1949	112	103	95	163	105	95
1950	132	109	90	193	120	99
1951	163	124	103	267	146	110
1952 (June)	171	122	99	279	108	108

The living costs as compared to 1948 base year are 162, 124, 111, 166, 122 and 110 in Australia, Canada, Italy, Japan, U.K. and U.S.A. respectively for January, 1952. Evidently, living costs have revealed a rising tendency in all the countries except Italy.

It has been realised, however late, that the rise in prices cannot be followed up by a continuous rise in wages and salaries. Inflation is a serious handicap to Government budgets, production estimates as well as individual budgets. Labour leaders have realised that although they have succeeded in getting increased wages for the workers, they are not better off

because of rising wages. Inflation leads to hoarding of commodities and the tendency causes an artificial scarcity of essential commodities and the poor people have to suffer in consequence. It is believed that production increases when the prices fall. But continuous rise in prices must involve continuous rise in the cost of production. There are also difficulties of obtaining capital equipment, coal and raw materials. Labour unrest, transport difficulties and the partition have also accentuated the production crisis in the country. The businessmen are able to gather merely paper fortunes since the value of each rupee in terms of goods is less. The middle class with a fixed income is the worst sufferer. Commodities of everyday requirements go up in prices and their income does not rise in proportion. Consequently, the middle-class people either live on their savings or reduce their standard. The relation between the creditor and the debtor gets disturbed. In this way, inflation affects the very basis of economic life.

The Indian Government, as the guardian of the free people, had great responsibilities. Partition of the country had created new problems of rehabilitating not only the uprooted people but the entire economy on a new basis. Millions of starved, naked and homeless people looked askance at the Government. Thousands of journalists, educationists and lawyers who were in the first rank of fighters for freedom became overnight the worst critics of the Government policies. Persons who were expected to become nation-builders became groaning spectators. While there was the need for curtailing and restricting Government expenditure and increasing revenues the Government had to spend on schemes of social and educational developments. They had to increase the central grants to provinces. They had to undertake long-range schemes. They had to implement the abolition of Zamindari and the policy of prohibition. On the other hand, taxes had to be reduced. Naturally, this accentuated the pace of inflation in the country.

On the 4th October 1948, the Government of India enunciated the following broad policies:

- (i) To take all possible steps to keep the Government expenditure as low as possible;
- (ii) To make a concerted effort immediately to ensure that there is no further rise in prices and the cost of living;
- (iii) To order future policy so as to secure in the shortest possible time progressive reduction in prices to reasonable levels and the supply of an increasing volume of goods and services; and
- (iv) To curtail the purchasing power in the hands of the community and to prevent any further addition thereto.

Balanced or surplus budgets, stopping of financial assistances to provinces, intensification of campaigns for small savings, limitation of dividends, restriction on credit and price controls were some of the measures

which the Government of India adopted to meet inflation. necessarily increases the money income faster than production. There is, therefore, the inherent danger of inflation. The instruments of monetary and credit policy have to be used to obviate these dangers. The new Central Budget indicates optimism, yet it is the 'actuals' that will prove it. J. D. Sethi has estimated that our revenue has been inflated to the tune of nearly Rs. 31 crores. It is bound to increase the amount of deficit financing provided for in the capital budget as expenditure is generally considered to be rigid.

Now, the Government of India has launched the first Five-Year Plan. The normal result of development expenditure is that, to the extent that it is not met by the redirection of resources, it is inflationary. This argument has been set aside by the Government on the ground that the net expenditure abroad is so great that there is a tendency for rupee surpluses to emerge in the sense that the rupee receipts are in excess of rupee expenditures. The *Eastern Economist* has taken into consideration the question of the diminution in our assets and consequently the need for foreign aid. Great emphasis has been laid upon price policy, through which the fullest mobilisation of the available resources and their allocation has to be made so as to secure optimum results. The aim should be to maintain a structure of relative prices which will bring about an allocation of resources in conformity with the targets stated in the Plan. The Commission feels that financial and physical controls are necessary in order to secure these ends. In the early stages a development plan finance is only a wizard's game.

—:O:—

YOUNG BENGAL DISCOVERS INDIA

By NANIMADHAB CHAUDHURI, M.A.

THE emergence of the "Young Bengal" or the English-educated middle class Bengalis was a more important event than the great Sepoy Mutiny in the history of British administration in India. The history of the growth of nationalism in India is the history of the movement initiated and ideas propagated by this community.

The adoption of English as the medium of instruction was followed by a conflict between the English-educated middle class Bengalis and the English in this country. This conflict started on questions of racial prejudice and excessive pretensions of non-official Britishers in this country, whose example in this respect was followed by other European communities, the Armenians, Jews, etc., domiciled here. Gradually the volume of Indian resentment increased and as political consciousness arose relations between the educated community and European Government officials were affected. For a time, the educated community made a clear distinction between the English officials of the Government and the Government of the country, but within a few years, as an intelligent and independent Press began to function, the older sentiments towards the Government began to change. The real cause of the change, of the extension policy in dealing with the educated middle class and aggravation of the spirit of conflict, was much deeper and was to be attributed to the complete reversal of the old policy of the British Government in this country. A secondary cause was the undermining, as a result of governmental measures, of the implicit faith of the politically-minded community of this country in the Proclamation of 1858.

A great change came over the Indian policy of the British Government after the Wahabi and Sepoy rebellions. This change was mainly due to the emergence of the English-educated Young Bengal school and its attitude. For fifty years British politicians considered carefully the probable effects of the introduction of English education in India and in 1835, the Government adopted English as the medium of instruction. That the apprehensions of the critics of the Government were not baseless began to be perceived within a generation. Many members of the Young Bengal school became thoroughly anglicised; some of them adopted Christianity, but the total result of it was that the Young Bengal school discovered India, their motherland. As soon as the watchful English rulers got an inkling of this fact they considered it necessary to modify their older policy in dealing with the educated middle class

Bengalis. From that time this community came to be suspected and distrusted by the British Government. This was the first change in their policy.

The second change was the change effected in their old policy towards the Indian Moslems, whom they considered it prudent, to accord preferential treatment and use to balance the growing power of the numerically preponderant Hindus. This and other considerations of prudence, namely, the unity and fanaticism of Indian Moslems and Britain's relations with Moslem States in Asia, Africa and Europe, dictated this change of policy. Again, they realised that if it was advisable to balance the Moslems against the Hindus, it was equally advisable to balance the numerically preponderant but ignorant tenants against the landlords. The principal reason for which the Permanent Settlement was made, namely, creating a body of influential supporters of their rule, had lost its force after the suppression of the Sepoy Mutiny, when all doubts regarding the strength and stability of their rule were removed. Henceforth they began to take greater interest in the tenants. This was the third change in the old policy of the British Government and it became clearly manifest in Bengal under the regime of Sir John Campbell.

The Indian policy of the British Government, as reshaped by these great modifications in the beginning of the second half of the nineteenth century, remained unaltered up to the end of British rule.

To come to the attitude of the Young Bengal which necessitated such vital changes in the Indian policy of the British Government.

In the first half of the nineteenth century the Hindus of Bengal were full of gratitude to the English who had saved them, as they thought, from Moslem misgovernment, Mahratta raiders, Thugies and lawlessness prevailing in the country. This period was followed by a period of infatuation and destructivism after the introduction of English education. The cultural revolution which took place next largely helped the educated community to regain their mental balance. A revulsion of feeling against the English set in and a spirit of revolt took possession of the Young Bengal school. Educated Bengalis abandoned the old humility and servility towards Englishmen lording it over them, refused to *salam* any and every Tom and Dick they met in the streets and demanded to be treated as equals to the Englishman. Such was the personal aspect of the revolt.

To the Government of the country they made known their claim for appointment to the same high jobs as the English, and a larger share, in other ways, in the administration of the country. The monopoly of the high posts in the public services by Englishmen, their monopoly of the trade, commerce and industries of the country, the oppressions of European

indigo and tea-planters, discriminatory treatment to the European offenders in the law-courts, the arrogant and humiliating treatment of the children of the soil by Englishmen attracted the attention of the educated middle class community. The progressive Bengali newspapers which acted as their organ began to discuss these topics and vehemently attack the English. Their attacks were met by the *Friend of India*, *Vanity Fair*, *Hurkaru*, *Pioneer*, *Daily News* and other English-conducted newspapers of the time.

How the relations between the educated Bengalis and Englishmen had changed with a few years after the Sepoy Mutiny will be seen from the following extracts at random from a few contemporary Bengali newspapers:

"Enmity between the English and the natives seems to increase. An Englishman will never let slip an opportunity to attack a native and a native is sure to return the attack. This custom has been much practised since the Sepoy Mutiny, of the English and the natives trying to outstrip each other in pointing out one another's fault. Not content with abusing each other they have dragged women too."—*Som Prakash*.

"The English regard themselves in the presence of the natives as worthy of the worship of the gods. They think that their own heads are heads indeed, the heads of the natives are but the broken pots at the kilns of the potters. The object of our birth is to obey, to serve, to endure chastisement at their hands, their birth is to fulfil the work God delights in."—*Barisal Vartavaha*.

"The English come to this country for money and only seek how they can take wealth out of India. If a native has at any time an opportunity to strike an Englishman all have unmixed pleasure in it. If any misfortune happen to the English they inwardly rejoice. Being deficient in strength and intelligence they cannot do anything, but they nurse the spirit of rebellion in their hearts. Genuine loyalty is not to be found in the minds of most people now."—*Sulabha Samachar*.

Long-drawn hostilities commenced between English officials, non-official Englishmen in this country and Anglo-Indian newspapers on the one hand, and Bengali newspapers on the other. The latter kept a careful watch on all instances of misdeeds by Englishmen in tea gardens, indigo factories, in Government offices, in the domain of district administration, in the railways and brought them to the notice of the public, and criticised the offending parties. It is possible to give a factual and impartial sketch of the progress of political thought and political work in Bengal with the help of extracts from contemporary records. This sketch, as it proceeds, will touch on the various trends in the development of nationalism in Bengal from twenty years before the birth of the Indian National Congress.

Those who may be entrusted with the work of compiling the history of the Indian struggle for freedom should not ignore the details of the pre-Congress and pre-Swadeshi chapters of this history.

MODERN DANISH SCULPTURAL ART

By P. K. BANERJEE, N.K.I. (Sweden)

[The artistic genius of Ejner Trellund manifests itself through chunks of wood and lumps of root.]

VERY few in India, not even perhaps members of the artists' fraternity, have heard the name of the great Danish artist, Ejner Trellund whose unique artistic gift has led him to seek his moulding material in the vegetable kingdom. His instruments are few and primitive and he has gone back to the obsolete Middle Ages in carving

created in pure wood Tamerlane, Atilla, Asoka, Socrates, Abdul Hamid, etc. Other fantastically wonderful creations of his are, an Uhlan, a Matador, a blind Arab, a Teuton Kaiser and lots of other different representative types of men.

As I have said in the beginning, his grand total of

Kalmuk. 1946

Caucasian. 1944

out human heads from wood. His efforts extending over 20 long years, have resulted in his creating in all 50 'heads' so far. His representations include a varied and representative lot, including a Kalmuk, a Georgian, a Russian Pope, a Mandarin, a Buddhist Lama, a Sikh and several other types of people. Of the historically-famed personages of the world, he has re-

wooden heads is only 50 so far, as he has, of late, practically given up pursuing his hobby in the aforesaid direction.

Those connoisseurs of art who have seen his wonderful excutions in wood bewail his inexplicable desire of drawing himself within his shell.

What sort of man is Ejner Trellund and with what

degree of realism he has been able to unfold the creative impulses of his mind on woods?

Ejner Trellund is a middle-aged man of few words having a particularly gnarled countenance, which clearly bears the stamp of awful vicissitudes of fortune through which he had to pass. But there is something in his impassive face which eloquently expresses an indomitable will within, bent, as it were, on conquering all the hard knocks of life.

Hermit. 1942

His marked reticence is occasionally succeeded by a gentle flush of childlike enthusiasm when he is drawn into a conversation about art and philosophy. He is a straight talker and once engaged in expounding his extremely individual attitude towards life, he is in the habit of going straight at the root of the matter instead of trying first to clear the tangled mass of superfluous foliage which cover up the core of the matter.

A perceptible weak, under-current of irony runs through his talk and the grimness of his rugged exterior and the steel-like ring of his manly voice, gives one the inescapable impression that this great man of new ideas in the field of art has risen far above the sordid desires

of life and has been able to totally abjure the pomps and vanities of life.

This ascendancy of his art over circumstances and environments gives him the will and determination of a savant to carry out in toto the promptings of his inspired mind and see through to a finish the work he has in his hands without turning round or looking back for public applause or division.

Though he seriously believes in the dictum, art for

Darduce. 1941

art's sake, and steadily goes on giving shapes to his unique artistic ideas, he is always conscious that he owes it to himself to help his fellow brethren in pulling themselves out of the rut of a drab and dreary existence and help them understand the real values of life through a realistic expression of his thoughts through the medium of man's oldest and best friend—the wood.

Many critics of art find fault with Trellund's wooden faces, which always do not conform to the standard rules of art and, in certain cases, fall short of realistic excellence. They find in these a certain amount of crudity, which they think, takes off the edge of a realistic and artistic enjoyment of his creations. These art-

critics though fully conscious of his originality and the whole-heartedness of his efforts in trying to give expression to his burning ideas, nevertheless, cannot quite understand, why an artist of his stature should not try to arrive at a greater degree of perfection in his art by being a little more conventional.

The wooden images which he has carved out of the stumps of ordinary maple, poplar, birch, elm, oak and other common trees, have strange outlandish features and these seem to have come from another world, except for the fact that all these 'heads' have a sad human look,

to be and is content to convey only a realistic expression of his thoughts and feelings.

Many critics say that Trellund's method of carving reminds one of pastoral art of the Middle Ages, employed in ornamenting wooden pipes and bowls. But this analogy is totally misleading. Trellund's art is not the childish effort of engraving a piece or stem of wood with flowers, butterflies, birds or other cheap pictorial representations but altogether a novel way of giving shape to profoundest human thoughts, feelings and sentiments through the medium of any ordinary lump of

Apostle. 1938

reminding the critics that these are not mere phantoms but humans—very true humans, just as ourselves—only of the different yesterday or of the quick-changing to-day.

What marks him off from the rest of the so-called 'finished' artists of the world is his spontaneity of expression, shorn of all orthodox rules and conventions. His ideas are altogether different from those of the more orthodox school of thinking. He does not believe in hammering away at his piece of creation in order to make it look lovelier and brighter than he actually intends it

Emperor Abdul Hamid. 1941

root or block of wood. He tries to make these 'heads' as near to life as possible and to bring upon the observer the feeling of a close human presence and never allowing him to think that he is judging only the beauties or flaws of lifeless, inert wooden images.

His 'heads' seem to think, feel and be capable of instantaneous action like us when we are just awakened from a deep and refreshing sleep and are drowsily looking before us.

Johannes V. Jensen, the art-critic who personally knew Trellund, once said in talking about Trellund's art

Ejner Trellund, Danish Sculptor

as being "the art of caprice, the art of the mood, subjected to the power inherent in the materials, the forms and colours, to awaken the inner vision and the visionary's urge to reveal it to everybody."

Sometimes we see landscapes and figures in mosaic floors, in cloud formations and in the patches of damp on ceilings and walls; they appear so clearly that we are tempted to think that a few more strokes would suffice to fix the impression permanently.

Trellund who worked on roots and branches of trees had to have men with gnarled and twisted features, but all the same these do not suffer from a lack of animation or the fire of life.

Though none of his works are tastefully pretty, as we would want them to be, yet nobody can deny the unique visionary power of Trellund and the spontaneity with which he creates his images. His whole creations represent a conception of art which in profoundness is worthy of the highest ideals of art. This visionary—nay prophet, moulds his thoughts and canalises them in a way so that these are able to fashion their own beauties often kindling into strange beauteous shapes. The rhythm of poetry and the voice of prophecy seem interlaced in a miracle of design and craftsmanship in his creative art.

Trellund's art is the product of the profound intuition of genius rather than only the adroit manipulation of the artist's chisel.

THE JUANGS

By L. N. SAHU,

Member, Servants of India Society, Cuttack

The Juangs are a class of tribesmen who inhabit Keonjhar and Pal Lahara in the State of Orissa. Their population in 1931 was 15,024. They are short in stature, thick-set, copper-coloured, and rather ugly-looking, with curly hair, broad nose and thick lips. They are generally peace-loving.

They call themselves children of a saint (*rishiputra*). One of their ancestors was a man of forceful character and whatever he uttered bore fruit. He was therefore called a saint. According to tradition, he had hair on his tongue and it was because of this that he possessed such extraordinary powers. His enemies tried hard to deprive him of his powers by giving him various kinds of forbidden food, but their efforts failed to produce any effect. However, when he was forced to eat the

dhamana snake, the hair on his tongue fell and his powers disappeared. This is the traditional story of the first Juang. Even to-day the Juangs get angry if anybody calls them "eaters of the *dhamana* snake."

The Juangs wear few cloths. The women have tattoo marks on different parts of the body and go about with their breasts uncovered. They used to wear a leaf apron round the waist; but this is now seldom used since the introduction of cloth in 1868 by Mr. T. E. Ravenshaw, Commissioner of the Orissa Division when the leaf dresses were burnt. According to tradition, the Juangs were originally completely naked and it was their founder referred to above who advised them to adopt a leaf dress. Another tradition states that it was a deity who cursed the naked Juangs to

put on leaves or suffer destruction. The leaf-wearing Juangs may be identified with the *Patra Sauras* (*Patra*, leaf and *Sauras*, aboriginal) of tradition, whose goddess according to the *Sadhanamala* is called *Parna Savari*,

married boys and girls. Adultery is punished by divine vengeance and the adulterer is sometimes stripped naked and paraded through the village with a heavy stone tied to his genitalia. Another interesting feature

Patra Saura

the protector from cholera, small-pox and other diseases. As for ornaments, the Juangs wear heavy brass bangles and cowries. Their necklaces are sometimes very broad and even touch the ear. They wear in the nose iron or brass wires which look like elephant tusks.

Originally the Juangs had a food-gathering economy. But now shifting cultivation is the prevalent form of food production, and the hoe and the axe have replaced the digging-stick and the bill-hook as chief implements. They eat beef and the flesh of dead

Patra Saura dance

of Juang life is their dancing. Men and women dance together with forward and backward movements, like the Gadabas, after having drunk their home-made beer. Their favourite musical instrument is a tambourine called *chambu*. The animal dances of the Juangs, like those of the vulture, bear, deer and peacock, are justly famous.

The Juangs call themselves the first produce of the human race. They also think that they are sprung from the earth; so they do not sleep on beds. In the

Patra Saura dance

animals. Their method of killing cattle is very interesting. They tie a cow to a big tree, then cut round the tree till it is about to fall and leave it to the cow to bring it down with its dragging motions, as a result of which it is killed. The Juangs do not put salt in their food, but keep a lump of it in the middle and lick it by turns.

They have well-organised youth dormitories for un-

Patra Saura dance

winter they sleep in the open and put fire all around to keep off wild animals. They make attractive wooden combs and often remarkable carvings in the shape of breasts, etc., on the wooden door-posts of their youth dormitories. They are also good at knitting and making mats of date-palm leaves. Their culture shows some traces of the influence of the Panchasakha

Vaishnavas of Orissa. They have a distinct tribal language of their own, of which a specimen is given below:

Alpa misitian badmaharagian misan etadiyam

The writer

Kanade tileyikya khos arem aksariyan kibi kipika
(Translation: After a few days a great famine broke out and the child suffered terribly from want of food.)

The Juangs have also developed the art of song,

an example of which addressed to the daughter-in-law by the mother-in-law is as follows:

O, my dear daughter,
Do not wash the pot;
Black will soil your hand.
Do not pick cow-dung;
It will soil your hand.
I love you, dear daughter.
I want to keep you happy and well.
Love my son and make him happy too.

The Juangs do not possess private property in land. The area available round a village belongs to the whole community. Each takes as much as he can manage. In some Juang villages everyone pays the same amount of tax, whereas in Juangpir in Keonjhar taxes are paid by the village as a whole and not by the individuals. It was the grandfather of the present Raja of Keonjhar, Sri Dhanjaya Narayana Bhanja, who introduced a tax of one rupee per plough.

This is, in short, an account of the life and institutions of a fascinating tribe in eastern India. No doubt there are many gaps in our knowledge of their culture and it is to be hoped that anthropologists would soon proceed to record it in detail before it disappears under the impact of higher civilisations.*

* Thanks are due to Sri G. N. Das, M.A., LL.B., Research scholar, for help in preparing this paper. I am also indebted to Professor Banambar Acharya, Christ College, Cuttack, for much of the material supplied to me.

UNITS IN KOREA

Field Post Office Renders Efficient Service

A quiet bunch of twenty-five men under the command of a good-humoured and mild-tempered officer, Major L.A. Freitas, are rendering selfless and efficient service to the 6,000 Indian troops in Korea. They comprise the Field Post Office which receives and sends letters, bridging a distance of about 5,000 miles and bringing friends and relatives, families and dear ones together.

On an average over 6,000 letters are sent every day from "Hind Nagar" and over 14,000 are received in each delivery from India. The 'dak' goes five times a week from Korea and flies back from India with equal frequency through different air services. The tie up is with British and American A.P.Os.

From the 56 A.P.O. in New Delhi, where mail from all over India is collected, mail bags fly to Tokyo

Troops line up to purchase the special stamps issued for use in Korea

THE BIG PROJECT OF THE PUNJAB

Force to Seoul—the capital of South Korea. Through the American courier service Indian mail bags are delivered at the U.N. Warehouse situated just outside the Demilitarized Zone. There our postal boys collect the mail and bring it to the Base A. P. O. with the Custodian Force, located in the heart of Hind Nagar.

In addition to the Base A.P.O. there are two other Sub-Post Offices. One with the NNRC in Shanti Nagar called the 741 F.P.O. and the other—the 739 F.P.O.—with the Brigade Headquarters in Raj Nagar. Attached to these are a number of energetic and enthusiastic unit post orderlies who run up and down the unit lines and the post offices, collecting and delivering the much-awaited letters.

With the exception of receiving VPPs and insured articles, for which no adequate provision can be made here, the Indian F.P.Os in Korea transact all the normal business of any Post Office covering money orders, savings bank accounts and life insurance facilities. Telegrams and cables too are accepted. They are sent

through Seoul to Hongkong from where the wires radiate messages throughout the world.

It takes about seven days for letters from India to reach Korea. It has been the constant and earnest endeavour of the F.P.O. here to reduce this time but the difficulties are great many and the modus operandi tedious. In fact this is truly considered quick delivery.

All transactions of the F.P.O. here are made through Indian Postal stamps giving the men a feeling of being at home. The Post Office is fully equipped with a large quantity and variety of Indian stamps. In addition they distribute two free field air mail letters per man, per week. These are a great boon to the Indian troops who accept them with cheerful gratitude.

Said the O.C. of the Sixty Indian Field Ambulance Unit which has been in Korea since 1950, "Postal arrangements have been efficient from the day the Custodian Force landed in the Demilitarized Zone. As far as this Unit is concerned it is the first time the personnel are getting mail regularly after about three years."

—:O:—

THE BIG PROJECT OF THE PUNJAB

By BALESHWAR NATH, B.Sc., C.E. (Hons.), M.I.E.

The Sutlej is said to be the oldest river of all those traversing Indo-Gangetic Plain, and brings down to this mortal world the ever-purifying effluence of Mansarovar, from the very feet of Lord Shiva. In its valley today is growing up a new civilization unfettered by its traditional past. Just where the pre-historic river emerges out of its mountainous course, it flumes out of the clear-cut gorge and gravely meanders down to Rupar (East Punjab), where many decades ago, during the last century, it was barricaded across to enable the off-taking of the Sirhind Canal. The clear-cut gorge has, however, attracted attention of the Punjab administrators and engineers for a long time and it now forms the crucial point of the Bhakra-Nangal Project of the Punjab.

The scheme envisages building up a cement concrete gravity dam across the gorge thus empounding 7.4 million acres feet of water in the Sutlej Valley, the submergence extending to about 45 miles up-stream. This, when completed, will probably be the highest concrete dam in Asia. A subsidiary dam at Nangal, about 8 miles down-stream (already completed), will enable a 38 miles long concrete-lined Power Channel

The Sutlej at Bhakra Dam Site

Beas-Sutlej Doab and aptly called Bist Canal, will take off to the right from Rupar, depending for its supply on the pondage created with the construction of dams. Bhakra-Nangal Scheme is, therefore, a multipurpose project, promising plenty to the enterprising people of the Punjab.

NANGAL TOWNSHIP

Nangal township is the focal point of all activities. The railway destination is the Nangal Dam Station on the newly extended Rupar Nangal link of E.P.R., now a part of Northern Railway. As one reaches that far-off end, a feeling of cheer and alacrity greets the mind. Here is something going on. Probably, the red tape has turned saffron in this land of Guru Govind Singh. Driving from the railway station to the township is across an active engineering set-up. Beaming faces of Punjabi youths with their gestural mode of conversation and the alert demeanour of workers and craftsmen attract attention at every turning. The township itself is a well-laid-out colony. It is electrified and water-laid. Apart from cheerful living accommodation, there are a hospital, a school, a club, a bazaar and good connecting roads. A field hostel takes in visitors and guests. The pano-

ramic setting of Rest House No. 2 is beyond praise. This is a double-storeyed building and is uniquely placed on a convex water-front. The township in itself is indicative of a liberal and broad-based attitude with which the Punjab Administration deals with the officers and engineer-personnel engaged in the accomplishment of the great project.

There is an Engineering Workshop at Nangal, which is an acquisition of a great order. It is said that

A cement concrete Arch Bridge as built on the newly excavated Power Channel

the vast equipment installed therein, including the extensive aircraft hangers, which accommodate the workshop, had all been acquired from disposal dumps. In that installation there are many pieces of great-constructional utility and of rare availability, particularly in this country. The Punjab engineers undoubtedly grappled the situation well, when under a long-range planning directive they dug out from disposal dumps and acquired for themselves these invaluable pieces of equipment, in odds and bits and in a neglected and mutilated state. They have mostly been renovated and put into operational condition, and now make up a workshop worthy to meet the needs and requirements of a great constructional project. A broad-gauge railway siding connects the workshop with the rail-heads and other significant constructional points. The department owns some locomotives and wagons too, which considerably facilitate carriage of heavy materials, both across short and long distances. A transport section in the workshop looks after the departmental fleet of motor vehicles and is run almost on a military transport-unit basis. In short, the workshop makes up an impressionable asset of great utilitarian value, and undoubtedly renders the task of builders both assured and expeditious.

The profile of the proposed dam as marked out at site on hillsides

AN ENGINEERING TREAT

The dam site at Bhakra is about 7 miles up-stream on the river. It has been rendered approachable by a black-topped motor road built to double traffic width. A railway siding has also been laid along the mountainous course and has even been tunnelled across a precipitous location. As one approaches the site two suspension bridges thrown across the gorge catch the eye first of all. And, then the tunnel openings on both flanks of the gorge come into view. To be led across the constructional activities inside the tunnels involving superb engineering feat is really a treat. These are fifty feet diameter tunnels, each about half a mile long and will form diversion outlets for river water, even during floods, while construction of the main dam progresses along. The rock being sand-stone interspersed with indurated clay or shale, the tunnels are to be lined inside with cement concrete. This is a difficult engineering operation and is being carried out efficiently with the help of shuttering gantries and numerous other engineering devices. Cement concrete for the purpose is fed from suitably installed batching and mixing plants, and is mechanically pushed on to pouring locations, through leading-in pipes. Inside the tunnels, one is faced with slush and muck all round allied with a rattling noise of pneumatic appliances, serpent-like hissings from leaky pipes and nozzles and reverberating loud reports from explosive charges and rock-blowing operations, which combine to present a literally shaking experience to a casual visitor. To an engineer, however, the experience is thrilling to the core and is, at the same time, instructive and inspiring and educative.

Emerging out of the tunnels one can see a profile of the proposed dam marked out in white on the hill-sides of the gorge. From foundations to top, it will be a massive concrete structure almost 650 feet high. Looking to the apparent outcrops of rocks on either side of the gorge, which at places show up shattered sand-stone and visioning to oneself a gigantic structure of great dimensions resting thereon, a feeling of scepticism flashes across the mind. A re-assuring thought that the project must have been based on expert geological and engineering advice, however, lets one regain his composure. Construction of the dam will require laying of about 45,00,000 cubic yards of cement concrete and this will take a couple of years to get completed. Besides, the work involves technicalities of

a very complex nature, which needs must be taken care of during the construction of the dam. The administration has, therefore, requisitioned services of some foreign experts, who also stay at Nangal township. When a coffer dam is built across the stream, river water is diverted down through the tunnels, dam foundations are exposed and actual work on the dam is in progress, it will be a sight worth seeing; it will be the first work of its kind in the Himalayan range, and will be

Inside view of the aqueduct over Do-nala

singularly significant for its appurtenances and technique. Along with the construction of the dam two Hydro-electric Generation stations are also come up at Bhakra, with a generation capacity of 2,40,000 kilowatts. This energy when available will make Punjab a powerful State with power enough to meet its own agricultural and industrial requirements and have even a surplus to spare for its needy neighbours.

As the Sutlej winds down from the dam site, a few hill streams join the main river on its way to Nangal. At Nangal, the river gets confined within high banks almost in a canalised shape. This reach therefore affords an ideal site for putting a dam across, which has almost been completed. This dam will enable effective control being exercised over river supplies. In its construction can be noticed some marked deviation from old conservative ideas, governing designs of Hydraulic structure. Across and just above the head of the new Power Channel and below its entry level have been located silt excluders, which will tend to wash down into the river heavier charges of silt and shingle and will let in only comparatively clear water into the new channel. An instructive model of the dam and its appurtenant structures exists at site, which depicts in plan and cross-section an easy overall picture of the work. An observation pavilion

with glazed windows all round, stands significantly at the left hand down-stream end of Nangal dam. From within it, one gets a comprehensive view of the river, particularly on its down-stream side. A watch tower of that description is undoubtedly an asset to public works of that magnitude, for it affords to casual visitors a neat place from where to see and scan the works.

The Gurdwara at Anandpur Sahib

THE CRUSADING SPIRIT

Offtaking to the left from Nangal dam is the proposed Power Channel, also called Nangal Hydel Channel. A strikingly new cement concrete arch bridge built across the excavation and visible from the channel head is the first of the series of many interesting items of construction that one comes across, while driving along the venturesome enterprise. Alignment of this 38-mile channel is across an undulating and dented country along the foothills of the lower Shivalik range. Many a hill-torrent runs into the Sutlej, which follows a course almost parallel to the new channel. All these have to be negotiated with cross-drainage works of varying magnitude and of varying designs. While the aqueduct at Do-nala carries the canal across over a reinforced concrete flume, another stream is to be crossed over in the full section of the canal with even the outer slope lines intact. The whole

wetted perimeter. A casual visitor is hardly competent to comment on the course and the design adopted for the channel. Nevertheless, the crusading spirit with which the work is being carried on in the entire front will evoke admiration in the mind of even an apathetic individual. Maybe the historical background of the tract inculcates a spirit of adventure in the hearts of the builders. This is the cradle land of crusaders, who under the valiant leadership of Guru Govind Singh led a dauntless guerrilla struggle against the Moghul marauders almost three centuries ago. The magnificent Gurdwara at Anandpur Sahib magnificently adorns this land of retreat and tells a tale of manful mobilisation of human effort against the revengeful manoeuvres of their Moghul masters. The struggle is now against the misery of hunger and sloth. Looking across the active front one feels that the youth of the Punjab is shaping its destiny and is hammering out a prosperous future for his tormented and sheared-off homeland. He is working hard and it is indeed enlivening to look into his determined eyes and at his hopeful face.

There are two Hydro-electric Power Stations under construction on this Power Channel. They will be installed with 3 sets of 24,000 kilowatts each. Work on the first one is well under way, while the other foundations are being excavated. These Power Houses are being built to designs laid down by suppliers of the plant. Natural difficulties encountered at the site have been overcome efficiently. A special feature of the work is the cellular reinforced concrete foundations. It is said that the equipment for these Power Stations, which had been ordered from abroad, has

Head of Sirhind Canal taking off at Rupar

channel length almost arrived at site and erection of machines on Power House No. 1 will be taken up towards the

close of the year 1953. Electric energy available from these Hydro-electric Stations will bring about a phenomenal change in the countryside and will provide the much-wanted stimulus to cottage and other industries in the Punjab. Long distance transmission on Bhakra Project will be done at 220,000 volts bringing in almost the entire State within its orbit, including the neighbouring tract of Delhi, with its vast and ever-expanding capital town of New Delhi.

ANOTHER CANAL

Rupar is the next place of interest. The lower Shivalik range ends here. And, as though nature made a gift to man, the Sutlej at this point affords an ideal site for a canal head. This was built long ago and the off-taking Sirhind Canal is one of the oldest in the Punjab. On its banks at Rupar, can be seen joyful crowds of the young and the old enjoying bathing and doing their washing. The controlling weir is so happily located that neither any extensive river-training work is called for nor does the river ever try to break off the collar. With additional water available in the river from the proposed pondage in its upper reaches, it will become possible to take off another canal at the same site from right flank capable of commanding an extensive area in Beas-Sutlej Doab. Rupar had already been

a significant place but Bhakra Project has brought in so much activity within its precincts that it may soon outgrow its boundaries and may develop into a flourishing metropolis of a promising tract. And above all, it will have the unique honour of heading three important canals of the Punjab, namely, Sirhind, Bhakra and Bist.

This narration is in no way a complete or even a partial account of the big project. It represents only some rambling impressions of an engineer visitor. There may be in it some facts not quite adhering to the latest plans and policy. Nevertheless, it has to be stated that in the present-day factious atmosphere of the country, with politics getting the upper hand in everything, Bhakra Project is a commendable broad-ventured venture on the part of the Punjab engineers. Their cumulative talent has brought about in East Punjab an aromatic fragrance of progress and promise, in spite of an ugly stinking mess of internal turmoil. Apparently, the Administrative set-up of Bhakra Project enjoys high-power immunity from secretarial stinkers, from internal haloblasts and from individual angularities of high personages. It has thus been able to harness engineering potential of the State to its best advantage, and to convert a land of retreat into a land of marching forward.

—O—

THE PRESENT LONG-STAPLE COTTON CULTIVATION

Observations on Works in West Bengal, 1953-54

By SARADA CHARAN CHAKRABARTY

INDIA was deprived of its principal cotton- and jute-growing tracts by partition. The exchange policy of Pakistan made the problem very acute and necessity of increasing production in the Republic was keenly felt. Several meetings in Bombay and Delhi had been held in 1949-50 to find out ways and means to increase cotton production and the Central Government contributed about 40 lakhs to the Indian Central Cotton Committee for the work.

The suitability of Bengal for long-staple cotton had been proved by the working of different Government schemes in Bengal before partition. For some defects in the management it failed to impress the cultivators. From my long experience in cotton cultivation in Bengal, as agricultural officer of the Dhakeswari Cotton Mills, I had pointed out the necessity of improving and economising its efficient cultivation by use of some labour-saving agricultural implements and their practical demonstration. This I had widely published through many popular papers and magazines since 1940 by illustrations and by other means. Further, I had been from 1935 growing the superior Egyptian cotton every year, in different parts of Bengal, which in spite of many difficulties, I had succeeded in acclimatizing, with the help of the

Calcutta University. The Head of the Department of Botany, Prof. Agharkar, and his Mycologist, Dr.

Dacca Egyptian cotton

Banerjee, considered it a fit subject for study by their Post-graduate students. The quality of cotton produced by me, till now, is almost similar to that of its place of origin and according to opinions by experts spin warps of 80s with staple length of 1-7/16 inch. The increasing demand for such superior cotton by mills in India, for which they have to depend entirely on foreign imports, induced me to preserve seeds of this acclimatized superior cotton. As a refugee from East Bengal, I was without any employment, and had to

Dacca Egyptian grown in the fields

struggle hard, to maintain this strain, as the only grower of this cotton. I regularly published results of my works, with reports on the same by experts in papers and magazines and also of my difficulties. This moved a similar enthusiast Sri G. D. Naidu of Coimbatore to contribute Rs. 500 which he sent by Telegraphic Money Order. Such voluntary contribution from unknown persons is rare in India.

By the end of 1950, the secretary, Indian Central Cotton Committee, came to West Bengal and inspected some cotton fields grown with American varieties. He visited my cultivation of Egyptian cotton also and was convinced of the suitability of the cultivation of both

these varieties. He recommended a scheme of work for 3 years for the cultivation of American variety (Perbhani) at a cost of nearly 4 lakhs to be contributed by the Central Government and the State. The scheme was to be managed by the Agricultural Department. Another scheme for seed-multiplication of Egyptian cotton was also formed. I was to cultivate as an honorary worker, an acre of land, the cost of which will be contributed by the State. The report about the quality of the cotton by experts was very encouraging. It was found suitable to spin 80s warp with staple length of about 1 1/4" as stated before. That this cotton is indigenous to Bengal was proved by the fact, that from half an acre of land cultivated very carelessly in 24 Parganas, last season, 1952-53, a yield of 6 maunds of seed cotton was obtained, though the field remained water-logged for a month in the rainy season. The field was shown to the Chief Government Officers-in-charge of cotton works in Bengal. It is mysterious that the Agricultural Department had never succeeded in its growing till last season, 1952-53. They have all along disregarded rules laid down by me for its cultivation, specially about treatment of the seeds before sowing as advised by the Calcutta University and about the time of sowing which have to be completed in April or latest in early May, after a sinking shower, or after irrigation if necessary. This I have published widely in several papers and magazines. It may be stated that till last season, 1952-53, I was the only successful grower of this variety, which, if it can be introduced among cultivators, will mean crores to West Bengal.

The Agricultural Department, for reasons best known to them, stopped their contribution towards cultivation of an acre by me from this season though my produce has maintained its superior quality, which had been supported by experts. They have, however, taken the risk of growing it themselves, in several of their District Agricultural Farms, with the hope of success in at least one case. I have supplied them with seeds collected from the most healthy plants, and I learn that the seeds had been treated according to methods suggested by the Calcutta University. In my anxiety to see its cultivation successful, I had when supplying the seeds, requested them to inform me about the condition of the plants from time to time, which they had not done. They have a well-equipped Research Institute, which, though it has not studied the same during periods of my growing, may now undertake scientific investigations and study of the plants in different stages of their growth. As yet it has done nothing beyond what has been done by the Calcutta University before partition. The University has also been neglecting Research work on this important cotton after Professor Agharkar has retired from service. Nowhere in the world such indifference to reader

scientific help and study of such an important valuable strain can be seen.

As regards the working of the cotton scheme under

the direct management of the Agricultural Department for introducing American cotton (Perbhani) in West

Bengal, though it has worked three years, it has totally failed to interest the cultivators.

Responsible and extensive growers of the first year like the Jhargram Agricultural College, Messrs. J. N. Roy Chowdhury & Co., Baikunthapur Farm, etc., abandoned its cultivation from the second year. In the first year 3,500 acres had been sown with cotton from which crops from 1,000 acres could be collected. Nearly 8,000 cultivators participated in its growing. The cost of cultivation was Rs. 150 to Rs. 200 per acre and the average yield was on an average 3 maunds of seed-cotton per acre which, sold at Rs. 30 to Rs. 40 per acre, comes to Rs. 100 only. Thus there was a great loss to cultivators. If the amount spent in preparing soil and sowing of 2,500 acres is taken into consideration, from which no cotton could be obtained, the loss is tremendous. The working of the following two years was equally disappointing. It may be mentioned here that the working of similar schemes for ten years before partition did not succeed, and the same officers are in charge of the working of the present scheme also. The working of the present scheme has,

Dacca Egyptian cotton. Staple length 1 1/4 in. to 1 9/16 in. Writer of the article standing by the cotton plants to indicate the height of the plants

Dacca American cotton. Staple length 3/4 in. to 1 1/16 in.

however, succeeded in proving the suitability of this cotton both as regards quality and quantity of yield. The cotton can spin yarns of 30s to 40s and the yield in some cases had been 20 maunds of seed-cotton per acre.

REASONS FOR THE FAILURE OF GOVT. SCHEME OF COTTON CULTIVATION IN W. BENGAL AND ITS REMEDIES

Cotton is not a sow and reap crop. It requires many times more labour and care to grow than other crops generally cultivated here. Though most of the works are of minor nature, as can be done by children, cotton requires sufficient water for three months after sowing. So seeds are sown in well-cultivated prepared soil at regular intervals, after a sinking shower just before the rainy season in the end of May or in early June. Frequent use of hand hoes and ploughs in the first two months after sowing in loose soil and of one-bullock-driven ploughs and harrows after that, when soils grow a bit stiff due to protracted rains, is indispensable. I have been since 1940 advocating the use of the above implements in cotton cultivation, through many papers and magazines. But as yet, nothing has been done by the Agricultural Department to introduce them. Use of such implements will economise labour and increase yield by clean cultivation.

Long-protracted rains encourage rank growth of weeds in the rainy season. It becomes difficult and

costly to control them by hand labour. It may be noted that labour in this period becomes costly and difficult to procure, due to their demand in jute and paddy fields. As work has to be done in periods of dry days during rains, opportunities for work are also rare and that also is often missed due to sudden appearance of rains. So growers in most cases, in despair, destroy the cotton plants and prepare the field for other crops. This is the reason why out of an area of 3,500 acres originally sown with cotton 2,500 acres had to be destroyed in the first year's work under cotton scheme.

It is advisable to grow cotton as mixed crop with *aus* paddy, ground-nut, etc. The spaces between cotton lines being filled by a crop for which harrowing and weeding will be necessary, the field remains clear, weeds cannot easily grow. A few ploughings and cross-ploughings, after paddy or ground-nuts have been harvested during autumn, when soil remains moist, conserves moisture in the soil and encourage speedy development of the cotton plants.

The Agricultural Department will do well to work a Demonstration Farm on an economical basis. Both American and Egyptian cotton will be grown there as single crop and as mixed crop with *aus* paddy, ground-nut, etc. Labour-saving agricultural implements men-

Interculture implements used in cotton cultivation by the Dhakeswari Cotton Mills: (Fig. 1) Hand hoes and cultivator. (Fig. 2) One-bullock-driven harrow, 30 ins. wide. (Fig. 3) One-bullock-driven light plough

THE PRESENT LONG-STAPLE COTTON CULTIVATION

tioned before, on models as are used by small cotton plants in one's household lands, every family can get their cotton free for spinning. Thus it will be easy to cultivators in America have to be used. The management shall have to be trusted on persons who may become self-supporting, regarding supply of their own guarantee profitable working of such a farm. The clothings. The Charkha, though it may engage one

One-bullock-driven plough
Hand-driven plough

Community Development Department may also take up such work about which I sent my suggestions. In Fulea area, crops generally cultivated there, are not paying. The agricultural labourers suffer very much from unemployment, specially during slack periods of the agricultural year. Cotton cultivation, if it can be introduced there as a mixed crop with *aus* paddy, will much increase the value of the crops. Further, it will keep them engaged in the collection of cotton, ginning and spinning. The Commissioner, though appreciating it, did nothing to work out the same.

Successful working of such a farm at a comparatively small cost, and results of working in details in chronological order with income and expenses of growing, if widely published, will do more to enthuse people to its cultivation than thousands of acres of growing, as is being done now.

Cotton cultivation, if it can be introduced, will make cotton easily available in the State, and will do a good deal to revive *charkha* and spinning among the people. In all cotton-growing tracts in India, children even take to spinning as play and enjoyment.

Mills have to spend 60 per cent of the value of cloths in purchase of cotton. By growing a few cotton

in periods of unemployment, cannot be sufficiently paying. But by such work in periods of unemployment, need of one's clothings may be met without any loss in earning. It is a matter of great regret to observe that Congress members and Government have lost faith in Mahatma's *charkha*, else they would have utilised all opportunities to introduce it in the State. Of late, Government has been freely distributing rations, clothes and money in many places, as relief to needy people. If there had been any regard for spinning, such distribution on condition of daily spinning a tola or a half of cotton, would easily help to revive spinning in the State. Officers-in-charge of such distribution may be advised to treat such free distri-

Children spinning

tribution as subsidies towards spinning of cotton. Besides improvement in cotton cultivation works, Government may arrange an annual conference of successful growers of cotton for discussion among them about ways and means of improvement in cotton cultivation. There are cotton-growers' associations in almost all cotton-growing tracts of the world, through which wonderful improvement has been made in cotton cultivation and their

various requirements. The Government, as constituted now, seem to judge merits of their officers by the amount they can spend in a scheme, and not on the merits of results achieved. As one anxious to see cotton cultivation well established in Bengal I earnestly appeal to them to give my suggestions a fair consideration and act accordingly, by ignoring which, they have courted their previous failures.

The Indian Central Cotton Committee may also take up the working of a small Demonstration Farm on a

strictly economical basis and prove its great possibilities by results of the cultivation. Both American and Egyptian cotton may be grown in this form as mixed and single crop with some labour-saving agricultural implements as can be purchased by poor cultivators. The Research Institute of the Agricultural Department of the State may be requested to study the valuable Egyptian cotton plants at different stages of their growth and find out correct rules for its cultivation.

A STANZA FROM "AND THE AEONS ECHOED"

By HARINDRANATH CHATTOPADHYAYA

Hell's blood-red gates were barred
Resembling scarlet fires opaque and hard,
Congealed in the cold storm-blast of thy breath!
From outer world no more could wondering death
Enter at will and lure the unborn seers
Beyond the red gate and behind the white,
Into its realms of shadows and of tears
Caught in the ruthless cyclic grip of years
Gradually passing into fading light.

The white gate opened inwards with a calm
Movement as of thy slowly opening palm,
Revealing through sweet airs of myrrh and musk

Ancestral congregations in the dusk
Of the unborn, waiting to dribble through
Like starry emanations through the Blue
Of the transparent body which awaits
Their passage through such unpremeditated states
Since thou behind the inevitable Forget
Of all creation, dost remember yet
The detailed process of created things.

When suddenly I heard
In the interior spaces, an ominous Bird
Beat its own unborn hunger into Wings,
Glorious and regal, paradisaic-rude,
Sculptured to pure protective amplitude
Of presence that became
Divine self-offering of scented flame!
Under their glimmering shadow then
Began the natal day of soul-superior men
Invisible yet in tunnelled twilights streamed
Through hollowed ivory through which in silence ran
The only road of journeying brute and man,
Heavenward and undiscovered, at whose end
Just at the wind-swept bend

Lotus-allured, they linger for a span
And finally in a last splendour noise ascend
To there where I perceived, though could not see,
The passing into naught of memory.
A million million ancestors were they
Who rose and trod the way
Mile-stoned with whitest lotus in a wheel
Almost ascetic-still, although in drunken reel.

—:O:—

"Trade, Agriculture and Industry in West Bengal (1200-1625 A.D.) as found in the Persian and Arabic Sources"—a paper read by Prof. N. B. Roy in a meeting (November 2) of the Asiatic Society, Calcutta:

"The principal fact that emerges out of a careful and minute study of the contemporary Persian chronicles and Arabic epigraphs (1200-1625) is that West Bengal as at present constituted was a flourishing and prosperous region, drained by navigable rivers which offered facilities of inland trade and sea-borne commerce. Areas like Kajangal (north-west Murshidabad from Suti to Sekherdigi), which now present aspects of desolation, were hubs of an active and vigorous life. Equally interesting is the fact that both the banks of the Bhagirathi were dotted with thriving hamlets and villages, as attested by the revenue contributed

by the various *Mahals* during the Akbari age—and Sarkar Mandaran in Hughli district had a diamond mine out of which small bits of the precious metal were quarried out.

"In *Tarikh-i-Firuz Shahi* would be found statements about the liking of the Chaghtai monarchs (e.g., Babar, Jahangir and Shah Jahan) for the fruits of this province. Fishes swarmed in the Bengal rivers, and both Viceroy Islam Khan and Mirza Nathan had a great relish for them.

"Among the pursuits of the people, boat building and plying was the most important. Next in importance to this industry was the craft of the builders and the masons, the technician and the architect, the engravers and the artists who left memorials in such superb edifices, as Sona Masjid, Dakhil Darwaza and Firuza Minar.

THE LION-HEARTED LEADER

An Intimate Impression of Syama Prasad Mookerjee

Article Four

THE LION ROARS

By St. NIHAL SINGH

IX*

ALMOST half the sands of 1942 of Judea's Anointed One had run out. India had been dragged by power-intoxicated imperialist agents astride the country through crisis after crisis. They had been helping themselves to men and materials they required in any part of the globe for the prosecution of hostilities, from the outbreak of the (world) war (two), without morally strengthening themselves by obtaining legislative sanction. That callous, high-handed action had roiled politicals possessed of the least spark of manhood.

Resistance had been gathering. Largely through the persistent efforts of the high-souled Mohandas Karamchand ("Kaba") Gandhi, the opposition remained almost wholly non-violent.

Being patently in the wrong, the authorities, lacking the sanction that consent gives, had armed themselves with engines of repression that their wits, razor-sharpened mostly at Oxford and Cambridge, overworking all the time, could devise. These had been applied with ruthless savagery, particularly in Bengal, against the resisters who sought to awaken their countrymen to the enormity of executive lawlessness. A procession of publicists who spoke out what was in their minds were steam-rollered from platform to jail.

The curb was applied to pencil, pen and typewriter in newspaper offices. This offended the dignity of the users of these tools in the service of the nation. A surprisingly large number of them struck out against the ukases issued by the bureaucrats who had neither been put into power in any part of the Motherland by any Indian legislature nor owed any responsibility to any representative body in the Motherland.

Finding that even the courts set up by themselves administering laws that they had placed upon the statute book would not convict persons on the evidence trumped up by unscrupulous policemen hankering only to line their pockets with gold by pleasing their alien bosses, the officials dragooned workers in the nation's cause into detention without charge or trial. Such

arbitrariness more than any other species of oppression roused resentment in the breasts of even timorous Indians. Pent-up passions by what was to prove to be the middle of the war were seethed and sizzled.

X

At the moment when the climactic of the Indian struggle for freedom was none too far off, the loom of destiny clicked and clanged day and night in the Government House at Calcutta. The imperialist shuttle had been placed in the hands of a youngish Briton. Lieutenant-Colonel Sir John Arthur Herbert¹ had had the best of both worlds—the New and the Old. His mother was a Rhode Islander, bred and born along the United States of America's Atlantic sea-board. When he grew up he attended the oldest American University (Harvard).

His father, a sprig of an aristocratic Monmouth family, had gone into the British Diplomatic Service. He had been sent from capital to capital and was entrusted with missions of great importance requiring knowledge of foreign languages and of the people who spoke them and the most patient, tactful, delicate handling. That he performed these assignments to the satisfaction of the Foreign Office was attested by the bestowal upon him by the Sovereign of a G.C.V.O., and also by his appointment, in the evening of his service, to the legation at Mexico. There for reasons best known to him he politely declined to go.

The son might have done likewise and gone into the Foreign office. "Kaiser Bill's" troopers, who blasted their way to Brussels in the autumn of 1914, changed his course of life. Just then John Arthur Herbert was coming to man's estate. He answered the country's call—and the call in his blood, for he was of fighting stock,—by volunteering. Passing through the portals of the Military Academy at Wellington, he was commissioned in 1916 a lieutenant in the Royal Horse Guards. Five years later he became Master of the Foxhounds for his county—a dearly prized privilege, that pronounced him a skilled rider

* The section numbers are continuous with those in articles I, 2 and 3 in the September, October and November, 1953, numbers of *The Modern Review*.—Editor.

¹ Herbert is the family name of many peers. Among them are the Earl of Carnarvon, the Earl of Pembroke and the Earl of Powis.

and an intrepid huntsman. What more could a lover of sport desire?

More—much more—was waiting for him round destiny's corner. In 1926 he had the good fortune to find favour in the eyes of the Viceroy-designate, the Baron Irwin. I had become conscious of him when, in 1921, he, as Major Wood, became the Under-Secretary for the Colonies and told us ink-slingers in London not to "Major" him. "The war is over and done with," he said. So it was—temporarily.

Taken on the Viceroy's staff, the young, personable, pleasant-mannered officer spent two years at the Viceroy's "House." Of this only a little earlier Alice, Countess (later the Marchioness) Reading had been talking to me. "It is far, far too big," she said. "Who will be able to afford it?" India's money bags seemed to the imperialists to be without bottom.

Political storms raged all round Dame Britannia's Indian hub during Captain Herbert's stay there. He had the opportunity of watching his chief's way of handling Swarajists and the still more troublesome non-co-operators. This, in the eyes of men in power in Britain, must doubtless have helped to educate him in the ways of holding in some sort of check an enslaved nation in a bitter, rebellious mood.

What was, perhaps, more important from the imperialist angle of vision was that he saw something of the Muslim Leaguers. Under Mahommed Ali Jinnah's lead they were throwing monkey wrenches into the nationalist machinery.

At each pitching their demand went up. Now they negotiated with the Nationalists. Sometimes they took advantage of the good offices of the Liberals. All the time they were coaxing, cajoling and brow-beating the British into bettering the terms offered by the Indian (or, to use their word, the Hindu) side. I cannot recall off-hand if Gandhiji had as yet presented his fellow-Kathiawadi the "blank cheque" of which the world heard so much: but the generous impulse existed in the Mahatma's heart.

After his return "Home" and receiving his Majority, Herbert married, needless to say into a noble family. By 1934 he, then Lieutenant-Colonel, decided that he had had enough of soldiering. His thoughts turned to politics. In conformity with his background and with his own conservative inclinations, he stood for a Welsh constituency in Tory interest and, without any difficulty, entered the House of Commons.

2. I have seen this ancestral house. It is situated in the heart of that small peninsula, once again called Saurashtra as it was in our ancient forebears' time. The town—Dhoraji—is of some importance and was in Gondal State, now an integral part of the United States of Saurashtra.

An M.P. with his antecedents and experience, with his shrewdness and virility, is ever in the good books of the party leaders. John Arthur Herbert was soon promoted. Having no need to take the people's money, as did many of the poor Labourites—he elected to serve as an "unpaid" assistant whip.

While India's constitution was being hammered out on the British Parliamentary anvil, he bestirred himself to contribute his mite towards securing the acceptance of the Tory objectives. These were to whittle away, as much as possible, the powers to be transferred to the Indian electorates and to design provisions that would hamper the Indians who would, in due course, be sworn in as ministers.

Who would have a better chance to be assigned the superintendence over the working of the new legislation than he? That he should have been placed at the head of perhaps the most difficult province in the "Dependency" showed that his Majesty's Government of the day, presided over by the amiable if not brilliant gentleman from Birmingham bearing the illustrious name of Chamberlain, reposed faith in this parliamentarian.

XI

The loom of destiny that John Arthur Herbert was set to mind was the oldest in India. Clive built it, in fact, in the early days of the "John Company." Fumes from the powder blown at the field of Plassey still filled the air. Not only did he design it but he actually sat at it and worked it. The shade of Umi Chand is really needed to pay tribute to the skill with which the founder of the British Empire in India manipulated it.

Since then Fort William had witnessed many changes. Among these the most important was the shifting of the Capital from the banks of Ganga *Mat* (Hooghly) to those of her sister Yamuna (Jumna) at Delhi.

The loom had, in consequence, to be rebuilt. It ceased to be the master-machanism that it had been. It became semi-automatic. Impulses sent from Delhi by a secret process operated it: but not wholly.

A minder was needed in Calcutta (during the summer in Darjeeling) to keep it in efficient working order. In view of its age that, in itself, was for him no light task. Besides the subtle Bengalis might throw grit into it if they got the chance. He had to be sleeplessly vigilant. With the development of local needs certain operations supplementary to the Delhi-impelled ones had to be carried out.

A description of these constitutional respon-

sibilities is given in the Government of India Act, 1935. This can be scrutinised at will by any one who has the curiosity to do so.

The language employed by the constitutional pandits is, however, mystic. It may mean nothing or everything. This depends upon the ingenuity of the interpreter, particularly the interpreter given by the Act itself more than ample powers to enforce his own reading.

XII

Barrister that Syama Prasad Mookerjee was and with experience of working so large and so complex an organism as the Calcutta University, he must have understood all the implications when his Excellency Sir John Arthur Herbert administered to him the oath of office. This was done in the "House" in which the loom of destiny was kept well hidden from prying eyes and secure from meddling hands. So the Finance Minister never actually saw it at work or otherwise.

His Chief, Hon'ble Moulvi Fazlul Huq, had passed through the executive mill and was a qualified lawyer. Apart from this he had everything to gain and nothing to lose by working in concert with the non-Muslim wing of his Ministry and, in particular, with Syama. His existence as Bengal's Premier depended, to no small extent, upon such co-operation. They believed that so long as they all pulled together, they should be able to rule while his Excellency, like the wearer of the British Crown, only reigned.

In forming that expectation reason was on Syama's side:

Firstly, while the coalition was in being, the ministry enjoyed a majority in the Legislature. It could count upon sufficient votes to carry through any measure it desired.

Secondly, these constitutional advisers of Sir John Herbert's (as they were in terms of the Statute and as they regarded themselves) knew that he had been an assistant whip of the Conservative Party when the Act was pushed through both Houses of Parliament. Also that Lord Linlithgow, now in the seat of the Mighty in Delhi, had had much to do with the final shaping of the measure. It was, therefore, safe to presume that they would be interested in its working smoothly and successfully or at least strive to avoid a breakdown.

Thirdly, the Indian National Congress had accepted office in the provinces in which the electors had placed its candidates in a majority only upon coming to an understanding with the tardy, if not unwilling British agent in India. This was taken by them to imply that the Governor would function only as a constitutional

ruler—in other words, he would not intervene in the day-to-day administration by ministers responsible to the legislature.

Fourthly, in the autumn of 1939 these governments had been withdrawn by the Congress High Command because of the arbitrary manner in which that agent had rushed India into the war without obtaining legislative sanction. It was all the more advisable that the area of trouble be not further extended.

Fifthly, there had already been a breakdown in Calcutta. The Khwaja Nazim-ud-Din (of whom more a little later) suddenly found out-manoeuvred. He no longer could command enough votes in the legislature to carry on.

The reactionary elements in the "Writers' Buildings" gave him all the support they could muster. This they did with a shameless disregard of constitutional propriety. The Governor was wholeheartedly at his back. Quite openly, too (so Syama had assured me at that time).

Sanity, if not the safety of the province, left his Excellency no choice in the matter. Being the one man who, with Syama's and Syama's colleagues' adhesion, could carry on, Fazlul Huq should not be let down, particularly in the parlous conditions then obtaining in Bengal.

XIII

The probabilities were not with Syama, however reason was with him. These I shall list.

Firstly, the loom of destiny at which his Excellency Lieutenant-Colonel Sir John Arthur Herbert sat was only semi-automatic. The patterns were produced by waves sent out from Delhi, which, in turn, was subordinate to the one in Downing Street. He might vary the colouration, strengthen or weaken it. He might use thicker or thinner thread. He might produce flimsier or coarser material. Change of pattern, however, he could not attempt.

Secondly, there were the Governor's own proclivities, prejudices and passions. There was his inheritance. There was also his experience—experience in the Army—experience in the Viceroy's House when he was on the staff of the Marquis of Halifax (as Lord Irwin, upon succession to his father's title and estates, had become)—at Delhi—experience he had acquired while seated on the Tory benches of the House of Commons and more especially in the Conservative Whip's office during the days when the Indian constitution he was now working was in process of fabrication.

Thirdly, there was the great Khwaja. He had tasted the "sweets of office." He liked it. He yearned for more of it.

This he could have only if somehow or other Fazlul could be downed—driven out of office. He had not the knack nor the tact to cohort with the non-Muslims of the Syama type. Or (was it?) that they, because of his separatist creed, would not touch him with a ten-foot pole. And this Fazlul sat in the seat second only to that occupied by the Governor—and, according to the letter of the law, of fundamental importance.

Yet the good Khwaja had advantages. They were great advantages, at least to Sir John Herbert's way of thinking.

(a) He was of the same kidney as the Governor—a bit of an aristocrat.

(b) He had received education not so very dissimilar to that which the Governor had been vouchsafed. From the Mahomedan Anglo-Oriental College at Aligarh he had gone to the Dunstable Grammar School in England. I remember that he was at Cambridge in my early days of British journalism.

(c) Most important of all, he was Mohammed Ali Jinnah's No. 1 in Bengal. The imperialists might not have loved the generalissimo of the Muslim League. He had an annoying habit of posing—attitudinizing. He had a sharp tongue that could sting worse than any whip of scorpions known to man. One never knew when he would use it.

Without his manoeuvres, however, the Congress, bad as it was in their estimation, would be wholly insufferable. It could not be held down without Jinnah's counterpoise. He was, in the circumstance, indispensable. They knew, too, that that astute lawyer-orator-organizer could be trusted to split and to splinter India when India became too hot for the British.

For all these (and perhaps some other) reasons, the Khawaja (though he had, for the nonce failed his great leader) was the apple of the imperialist eye. The Governor and his bureaucrats were, as noted already, none too discreetly paving the way for him to win back the premiership, if only to squelch Fazlul, who was playing into Syama Prasad Mookerjee's hands.

XIV

There was one scheme that the Fazlul Cabinet was pressing for all it was worth, it was believed at Syama's instigation. The ex-guardsman sitting at the loom of Bengal's destiny, in fact, regarded it as more mischievous than any project or recommendation of his government, if not all the other added together.

Taking advantage of the situation that the westward push of the Japanese had created, they were asking him to organise the "Bengal Home

Guard." In his view this involved the reversal of the military policy that had been pursued since Thomas Babington Macaulay had penned his notorious diatribe (the "cowardly" Bengali). Only once had his people assented to allowing the *bhadralog* (Bengal's genteel classes) to enlist. Just a battalion had been raised. This was done as an experimental measure. That the experiment was not repeated told, at least to him, its own tale. He kept harping upon that failure.

This, however, did not daunt Fazlul—or turn Syama Mookerjee away from the project.

The Cabinet in its entirety—Muslims and non-Muslims with the Premier at their head—were asking, not merely for re-trying the experiment on a modest scale. No. Quite the contrary. They insisted upon "at least one lakh" officers and men being enlisted from amongst Bengalis.

Only in that way, they urged, could the emergency that might be upon them at any moment be met. So Bengal's manhood must be mobilised in defence of the Motherland. Whatever the difficulties, they must be overcome in view of the menace galloping towards them.

In this connection they pointed to the fate that had overtaken Burma. Britons had done nothing to rouse enthusiasm in the Burmese breast to withstand and to repel aggression. Burmese had not been enlisted, equipped, armed and trained effectively to deal with the invader. Britons, by themselves, had proved inadequate. They had to pack up their kit-bags and withdraw. The Japanese had overrun the country. There had been an exodus of Indian civilians too.

Per contra the Chinese had relied upon themselves. Answering the appeals made by Mai Ling (Madame Chang Kai Chek) they had turned out by the million. Under the general direction of the generalissimo, they had contested every inch of ground with the aggressor, who had been halted and was even being thrust back whence he had come.

Australia, too, was cited as an example...

And here in India, they pointed out, instead of following such splendid examples, only the policy of "scorched earth" was being advocated in anticipation of dread events. That policy, to be sure, was applied—ruthlessly applied—in Russia. The Russians did it, however. They were their own masters. They could do with their land, buildings and their contents, as they pleased.

With India the case was different. Indians were not their own masters. He—Sir John Arthur Herbert—sat at the loom of Fate set up in Government House, Calcutta. What moral right

could he have to scorch Bengal's earth—earth that to Bengalis was mother—if the enemy's advance westward could not be checked?

The Governor, however, contended that

(1) Bengal could not have an army of her own. To do otherwise would be to fly in the face of the established military policy.

(2) Even, for the sake of argument, were enlistment to be permitted, how could the Home Guard be armed and equipped? The country was already short of arms and ammunition.

(3) Who would train the Guard? Personnel for this purpose did not exist.

(4) Most important of all, the former experiment had foundered.

Syama, for one, rebutted:

(1) There may at present be regulations that stand in the way. The scheme might, in fact, be entirely against the Indian Army policy, as the Governor contended. Regulations were not, however, like the laws of the Medes and Persians. They must be amended as need arose. The need had now become clamant. All bars must be lifted. "To-day," he bluntly asserted, "the Army Policy must be determined first and foremost in the interests of India."

(2) If there be no arms and ammunition, the fault, he delicately suggested, was not Indian. He would not, however, waste the Governor's time by apportioning the blame to the party responsible for the situation—that there was "no longer production of" munitions "for India's use to-day." He insisted upon saying, however, "that we shall arrange for increased production to the best of our ability." He cited two instances. To quote him:

"...Here again, pray recall to your mind the stirring appeal made by Madame Chiang Kai Shek and also the Australian Prime Minister. China's supply of arms and ammunition was extremely limited and the lady declared with commendable pride that when the Chinese people started fighting Japan, they had nothing but their hands, their flesh and their blood. The Australian Prime Minister said that they had also suffered from lack of arms and when they started reorganising their Home Army, they had to use broomsticks at one stage of the training. Such objections as you have raised are indeed of no value at this critical hour."

This was blunt talking from a "cowardly Bengali" to the superman who represented, at Calcutta, the might of the British Empire. Without taking count of how hard he had hit, he went on insisting that if arms and munitions were not readily available, they must be "manufac-

tured by us or imported into India from other countries."

(3) Men to train the Guard must "be brought from other parts of India," or, if that be not possible from wherever they may be available elsewhere in the Empire."

As his aim was not to have a wordy joust but to carry the ex-guardsman with him to help solve a problem of considerable magnitude and of the greatest urgency, he appealed:

"Difficulties there are undoubtedly. I shall not even ask who has been responsible for India's helplessness, provided we really go ahead with a new policy. Difficulties must be faced and surmounted boldly, if we are to survive this crisis. The real obstacle will be want of trust. Are you prepared to trust us even to-day? The verdict of history will be against you if you deny us the elementary right of raising out Army according to our needs. Either, you say that you will protect us and military defence of an adequate measure will be available at the right time—this answer may be humiliating to the national sentiment of India who asks for the exercise of the right of self-defence; but even then an assurance of this character will have considerable practical importance. Or if you cannot give us the assurance that India will be saved, why should there be a hesitance on your part in allowing the people of the land to defend themselves in such a manner as they consider best even at this last hour? Let India's interests be the supreme factor to-day and let Indians themselves decide how best to tackle the grave peril into which you have thrown us."

What good would the Home Guard be to "save Bengal from air attacks," the Governor, in his *non possumus* attitude asked. To this Syama's rejoinder was:

"... If we can strengthen our own Air Force, a fight may be given. But is it not possible that Japan may some day in the near future land in Bengal and if that happens we may have to face the brutal realities of a guerilla warfare? How are we prepared to resist this menace? The Japs may spread themselves in different parts of the province. What forces are there to combat such an aggression? Then again there is the question of maintenance of internal security. It is only with the help of disciplined forces, mainly consisting of the people of the land, which may not even be fully armed at the beginning, that we can hope to rouse the true spirit of courage and fearlessness in the minds of the people at large. My idea is that every district, sub-division and thana would have its own Home Army under the unified control of a Government department. This will act as a watertight section but in full co-operation with the civil authorities. It will be the people's army for saving their hearth and home from the impending attack of the enemy and from internal chaos."

All this served to alarm the Governor rather than to allay his suspicions. He and Syama were virtually dead-locked—and dead-locked not only over this issue.

UNDEREMPLOYMENT IN INDIA

By PROF. SANTI KUMAR GHOSH, M.A.

AMONG underdeveloped countries the problem of unemployment arises from the shortage of capital. Cyclical business fluctuations are generated in industrially advanced countries. But their major effects in cases of backward economies are on incomes rather than on employment. As a matter of fact, none of these countries have experienced industrial mass unemployment. Although the great depression of the thirties meant lower prices and shrunken markets for the exports of underdeveloped countries, the labour force as a whole was still dependent on the land. These countries have, in fact, little fear of any widespread unemployment resulting from a deficiency in demand.

In India, the problem of unemployment has an individual character of its own. Most of the people thrown out of employment in the industrial sector are speedily reabsorbed in the rural centres. For, most of the workers maintain village ties. Unemployment is thus hidden in our villages. The low level of earning,¹ irregular unemployment in the villages and the excessive pressure on land are the symptoms of such a situation. In other words, the problem appears as "disguised unemployment" in agriculture, in which there is under-utilisation of man-power on account of a shortage of land and capital.

For the most part the marked under-utilisation of labour time is due to the seasonal nature of agricultural activity. In West Bengal, for instance, there are nine months' idleness for jute-growers and 7.5 months' for jute and rice growers.² In addition to seasonal under-employment, the community also suffers from chronic agricultural under-employment, in the sense that even at the peak of agricultural activity the potential amount of labour time still exceeds the amount of labour time actually utilised.

Since agriculture is notoriously unstable structural unemployment is a characteristic phenomenon of our country. Of the total cultivated area of about 341 million acres only about 60 million acres are under irrigation and the remaining part is dependent on the vagaries of rainfall. Moreover, some industries (e.g., cotton and sugar industries) are themselves of seasonal character. Further, in agriculture employment may be provided but income may collapse due to some natural

calamity (e.g., destruction of the crop) and the farmer may suffer. There are years of subnormal agricultural activity as a result of natural disasters. When there is severe drought or flood the situation changes into one of acute mass unemployment and emergency measures are required.

The increase in population pressure on land has forced a large number of able-bodied persons to leave the countryside to seek employment in towns and urban centres. Not possessing the skill and resources needed for most trades, the new-comers are driven into a small number of occupations,³ which are therefore characterised by an over-supply of labour. The levels of wages earned in these occupations are kept extremely low and the management has little incentive to raise its standard of efficiency. Thus, without any substitution of capital for labour and for the same volume of output, the labour requirements in those occupations could be considerably reduced through measures of rationalisation.

The solution of the problem of under-employment in a backward country like India can come only through patient, untiring constructive work. A planned economic development of the country can eliminate large-scale under-employment. Development plans must be launched and accelerated to bring about the maximum utilisation of resources. In addition to the action that should be taken by private enterprise governments should organise development works to absorb unemployment and should expand industry so as to provide employment for the excess agricultural population. Irrigation works designed to bring more land under cultivation and more of the existing cultivated land under irrigation may cause a shift of agricultural population from land now in use to newly-developed lands. In many cases cottage industries will prove very effective in providing supplementary employment for the rural population. In fact, for the same amount of capital investment small-scale industries can provide more employment than large-scale industries. A planned development of electric power will prepare the way for future industrial development and relieve present power shortage. Provision of new transport facilities and additional transport equipment may speed up the movement of men and goods

between cities and countryside and between ports and hinterland.

Where unemployment is entirely of a seasonal character, the sum-total of labour required at different periods of the year for a particular combination of crops under cultivation will have to be considered. If the different crops happen to be so combined that their respective seasonal peaks follow smoothly one after the other, then seasonal variations in the aggregate labour requirements may be fairly moderate, even though each individual crop is highly seasonal. The possibility of crop diversification varies from one region to another according to market conditions and the quality of the soil. Elimination of structural unemployment,⁴ however, will require a proper scheme of irrigation coupled with some form of crop insurance. Irrigation works and river valley schemes may go a long way to meet the crying need for water supply.

In an over-populated country like India, the way to improvement of agriculture lies partly through the development of industry, since substantial progress in agriculture is often not possible without reducing the number of workers engaged. Industrial progress in countries at the lowest level of development is not possible if the lack of skill and equipment is not overcome by government training schemes and construction programmes. In an economy where there is an acute shortage of both domestic capital and goods available for consumption, however, there is not only a physical limit to the productive resources that can be devoted to capital formation, but there is also a monetary limit to the amount of investment that can be undertaken without generating powerful inflationary pressures. In particular, one important problem during the initial period of construction will be to ensure that there is a sufficient marketable surplus of food available to meet the needs of workers who are newly employed on various projects of capital construction.

It is often argued that India must discover some means for holding her galloping population in leash, if she is not to allow all her programmes for economic and national reconstruction to founder on this bio-

logical rock. Whatever success in increasing production, it has been said, can be achieved, unless there is a decrease in the rate of population growth we shall be severely handicapped in our efforts and may fail to make any headway at all. There is no reason, however, why if vigorous efforts were devoted to development, national incomes should not rise faster than population. Raising of the legal age of marriage, provision of opportunities for women to earn an independent living and of recreational facilities in rural areas would also slow down population growth. At the present time, however, a deliberate state policy with the object of encouraging the practice of birth-control among the masses is impracticable both because of the low economic condition of the people and their lack of education. As a matter of fact, experience in other countries indicates that urbanization is, for various reasons, associated with a slackening of population growth, and increasing urbanization and industrialization in India may have a similar effect. It cannot, therefore, be concluded that economic development must inevitably be dissipated in population growth.

Among other conditions, a properly organized employment service has a notable part to play in the economic development of the country. Employment Exchanges can guide the worker and train man-power for job openings. The success of the Exchanges will, however, depend on the rate of expansion of the quantum of employment as well as on the degree of co-operation by the employers. Finally, a good deal depends on the character, attitude and responsiveness of the workers. The psychological resistance of workers to newer modes of life must be overcome if the employment policy is to achieve any measure of success.

In no country should there remain a large body of persons unemployed or under-employed, constituting as it does, an enormous waste of potential wealth, apart from the physical, moral and psychological losses which it entails upon the working-class community. The problem of under-employment in an under-developed region cannot, however, be solved in a night. Its solution can come only through the rebuilding of the entire economy from the bottom upwards.

4. See paragraph four above.

1. The average annual income of the Indian peasant is approximately Rs. 48.

2. The Report of the Congress Agrarian Reforms Committee (New Delhi, 1949).

3. The urban occupations which absorb most of the rural labour are, however, tertiary occupations (i.e., domestic service and petty trading).

MID-CENTURY 1953

By G. L. SCHANZLIN

If Western statesmen ten years ago could have foreseen the political horizon of our own decade, much of the present configuration of world politics would have come out different, and the dismay with which we look at the world today would have none of its elements of sharp regret and mutual incrimination. Generally speaking, we have greatly undervalued the undercurrents of public feeling, not only in countries largely populated by Caucasians, but especially so in Asiatic countries. What has happened during these last ten or twelve years? Dozens of the leading men, that were in power over world affairs, have disburdened their memories in memoirs, and we have had the privilege of deciding for ourselves whether such publications were factual confessions or mere alibis. Most of the actors on the war stage have spoken, but some of the most important have not, because not a few of those no longer are able to communicate with their earthly co-dwellers. Some of the most interesting sidelights on the disturbed period from 1904 to 1948, have been added to the panoramic world-view by outsiders, like Lin Yutang of China and other observers of non-political stripe.

It is rather astonishing how much attention the utterances of Asiatic writers and speakers get today, compared with the situation, let us say, at the close of World War Number One. Among the signers of the Versailles treaty was Baron Sinha, K.C., representing about 350 millions of people in India. The gentleman, (personally known to the present writer), had about as much to say, or far less, than Mr. Burgos of the Republic of Panama. Compare with this the uncommon interest with which the world today watches the latest statement of Mr. Nehru at Delhi, the remarks, or the silence of the Indian delegate at U.N. discussions, or in the daily press, what the latest ideas of Mr. Naguib of Egypt are. Hurried trips have been made by leading men of the West to gauge the opinion of high and low alike in places ranging from Beirut in Syria to Yokohama in Japan. Sensitive ears could have been aware of subterranean rumblings in Asia even thirty years ago, sensitive eyes might have more accurately measured the strength of lava eruptions of Asiatic craters, when Marshall, as late as 1946, spent a year in China to "bring the two warring factions together."

The case could not have stood, even in 1919, where we thought it was standing when Western statesmen divided the world. Economic, social, racial and political

forces clearly have played havoc with diplomatic desires, intentions and measures. The forces mentioned can, not passively differ so much when we find them in operation in oriental countries, from what such sources would, or could, effect nearer home. Perhaps we should get rid of our distrust in our own ability to judge and understand Asiatic mentality, Asiatic thinking and acting, judging and feeling.

The British empire is down, and the West has the eery feeling of facing grim giant, that has been hiding so far behind the giant screen of British might and sea power. We may have taken for reality what merely was a painted screen, and, perhaps we are filling in the empty space in our vision with creations of our own imagination.

As Toynbee reminded us recently, the onlaughts of Asia on the Western Christian world have happened periodically every few centuries. Beginning with the Hunnish eruption in the fifth century of our era, followed by the flood of Islam in the seventh and eighth, there came the Monogolian invasion of Europe in the 13th century, and the Osmanli Turks roughly again 400 years after that. It was perhaps the great centuries beginning with the great Genocse, who led Europe out into the new world, and the great Portuguese, who opened the seaway to ancient India, which made the West forget her great mother continent, Asia, at her back. The Victorian age with the realistic grimness of its arms, its idealistic greatness, and its maudlin smallness, the fitting anticlimax of the great age of discovery, colonisation and invention, also came to an end we are living in now, the totally different world of today. In unsteady whirl we find the great powers that have been released striving for mastery in every field of human endeavor. Race is no longer a hall-mark ensuring a privileged position in the world, and all the other standards of "civilisation" are undergoing serious severe and trying tests. Many things and ideas that were taken for granted appear today like relics of a past age, and new concepts, new valuation and standards are forcing themselves into daylight clamoring for our attention. Will there be a new feeling of security, of certainty, and of reliability on human ideals, thoughts and institutions after the holocaust of destroying and discarding has come to an end? The best of all nations hope so, and must prepare for the dawn of that happier age.

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.

EDITOR, *The Modern Review*

ENGLISH

BENGAL UNDER AKBAR AND JAHANGIR: A STUDY IN SOCIAL HISTORY: By Tapan K. Raychaudhuri, D.Phil. A. Mukherjee & Co., 2, College Square, Calcutta. Pp. x + 248. Price Rs. 12.

This book marks a distinct and long-awaited-for advance in the study of Bengal history. Hitherto works of more or less merit have been published on the political and biographical side, but the previous studies on our social history have been jejune, mainly because of their authors' poor linguistic equipment and failure to collect all the necessary materials,—their sole stock in trade having been Vaishnav poetry and English Factory Records. But Dr. T. Raychaudhuri has brought to bear on his task a knowledge of French, Dutch and Persian, besides the English and Bengali languages, and has laid under contribution, for the first time, all the detailed information scattered through Persian books and European traders' reports co-ordinating them with the Bengali literary evidence (mostly Vaishnav sources). His collection of materials embraces the limits of our present knowledge, and this mass has been digested and made to yield its latent conclusions with great sobriety and maturity of thought. This book will be indispensable to all serious students of Bengal history and Bengali culture.

The author begins with a minute and critical study of the actual operation and effects of Mughal rule in Bengal, in which he boldly differs from certain of his older predecessors, notably Moreland and Jadunath Sarkar. Next the coming of the European traders and the expansion of the Chaitanya sect, and the influence of these two on our social life and character are examined with depth and freshness of thought, and some unpleasant and unpopular truths are driven home (see pp. 113 *et seq.*). The economic background of these forty years, our people's mode of life, European society and business, and the trends in general culture during this period (with some unavoidable anticipations of the succeeding 80 years) are very lucidly and freshly described in the final section.

Particular praise is due to the author's style and manner of presentation. There is no verbosity, no commonplace observation, no slipshod English. It is an eminently readable book, and may well serve as a model to our writers of doctorate theses in contents and form alike.

We wait with great interest for the second volume which will cover the reigns of Shah Jahan and Aurangzib (1628-1707), because for these eighty years we have a plethora of manuscript materials in Persian despatches, *akhbarat*, official manuals and regular histories, while the English and French factories, which are absent from Bengal in the present volume,

went full steam ahead in the later 17th century and have left copious records, in contrast with the paucity of materials under this head in Jahangir's reign.

JADUNATH SARKAR

WOMEN IN "THE SACRED LAWS": By Shakuntala Rao Sastri. Bhavan's Book University No. 13. Bharatiya Vidya Bhavan, Bombay, 1953. Pp. 193. Price Rs. 1-12.

Written appropriately enough by a lady of high academic distinctions in the field of Sanskrit learning, this important monograph attempts with remarkable success to survey the branch of Hindu law relating to the status of women from the earliest times down to the present. A Preface by the General Editor, the Hon'ble Mr. K. M. Munshi, in explanation of his scheme of the Book University of the Bharatiya Vidya Bhavan (of which institution he is the life and soul) and a short Foreword by Dr. F. W. Thomas, introduce this meritorious work to the general reader.

The book consists, apart from a short Prologue, of six chapters. The first chapter deals with the material scattered through the four great *Dharmasutras*, viz., Gautama, Baudhayana, Apastamba and Vasistha. The second chapter (somewhat loosely entitled "Contemporary evidence") examines the supplementary data from Kautilya's *Arthashastra*, the works of classical Sanskrit literature as well as inscriptions and coins, down to comparatively late times. The third, fourth and fifth chapters analyse the extensive material of the *Manu-samhita*, the later *Smritis* and the *Smriti commentaries* as well as *Digests*. The sixth and last chapter gives us a critical estimate of the general tendencies and characteristics of Hindu law relating to women, and it ends with the statement that the clauses of the Hindu Code Bill, now on the legislative anvil of the Central Government, when passed, "will only re-establish the time-honoured customs and laws of ancient India and show the glory of Indian culture to the world."

The authoress's work is marked by exhaustive study of the available material, thorough grasp of its essential principles, and proper appraisal of its formative influences and its leading characteristics. These qualities make her work a valuable addition to the recent and growing literature on the subject. We may be permitted to mention here a few points for consideration by the authoress when a new edition of her work is called for. In the Prologue the authoress mentions (p. vii) certain *Smriti Digests* (instead of their authors) as flourishing or living in the 17th and 18th centuries, while her startling statement (p. x) that "the Satapatha Brahmana emphatically declares that kings are not entitled to make new laws or to modify the old ones" is without any foundation. On the next page (p. xi) she says without justification

that while Gautama, Baudhayana and Apastamba declared the Veda to be the source of Dharma, Manu as well as Yajnavalkya "made a departure" by taking the Veda to be the first, tradition to be the second, and usages of virtuous men to be the third source. In the first chapter the authoress repeatedly (pp. 5, 7, 39, 40, 44) finds in the *Dharmasutra* texts in favour of *Niyoga* sanction for the remarriage of women and this leads her, quite unjustifiably, to charge Gautama (p. 6) with incongruity. The *Dharmasutra* texts in favour of child-marriages of girls, according to the authoress (pp. 5, 39, 45), are later interpolations as they conflict with the implications of the contemporary *Grihyasutra* ritual. This ignores the alternative explanation suggested by Gautama (18.23), viz., that the text in question reflects the views of individual authorities no doubt after the practices of distinct localities and strata of the people. In the third chapter, the authoress while discussing Manu's attitude towards *Niyoga*, says (p. 90) that "the three differing views occurring in the same context cannot be the work of one author or of one period," but on the contrary, represent firstly, "the Vedic period," secondly, "the transitory Pauranic period," and thirdly, "a later period, perhaps later than that of Vishnu and Narada." Now apart from the authoress's inversion of the chronological order of the Puranas and the later Smritis, it appears more reasonable to hold that the different views represent Manu's picture of the different ideas on the subject in contemporary authoritative circles. In the fourth chapter, the authoress finds (p. 141) in the stories of the Jatakas about the general wickedness of women the clue to the changed attitude of the later law-givers beginning with Manu who are unsympathetic to women. This dictum on the one hand ignores the references to the noble types of womanhood idealised in the Ramayana, the Mahabharata and other works and realised in the picture of the good wife in Vatsyana's *Kama-sutra*. On the other hand, it takes no notice of the increased rights of property accorded to women in the later Smritis. In the concluding chapter, the authoress cautiously suggests (p. 173) that "the pathetic condition of women in India at the dawn of British rule" was due not to the laws but to the customs of the times. And yet in the same breath (p. 174) she quotes from Kaegi's work *The Rig-veda* "the glaring instance" of palpable falsification of an old Rigvedic hymn in support of the custom of *sati*, and she concludes that "this is just an example of the gross injustice done to our traditional and authoritative texts" by the later writers.

We have noticed a few slips, e.g., 'belonging to the same *gotra*' for *sapinda* (p. 52) and *nagarika* for *nagaraka* (p. 85). A few misprints, such as, Satatura (p. 63), derivations and bharyani (p. 150) and annas (p. 172) as well as the date of Bukka I, King of Vijayanagar (p. 177) require correction.

We cannot conclude this review without quoting some extracts from the authoress's estimate of the Hindu law about the position of women in her concluding chapter. Illustrating "the catholic and humanitarian character" of the old texts, she says (p. 176) that the laws of marriage lost sight of no type of love subject only to the condition of its solemnisation by sacrament, while the laws of sonship wiped out the word 'illegitimacy' from the fold of society. "In regard to property and inheritance, the status of women in India was far superior to that of her confreres in any other country of that age." These views are neatly summed up in the concluding lines (p. 193): "The laws of ancient India were so catholic in spirit and all-embrac-

ing, if they are taken in their true spirit, that they can cover the entire needs of humanity. At the time when these laws were framed, no country in the world produced better laws for womanhood, nor gave a higher status to woman in society."

U. N. GHOSHAL

TO ASHRAM SISTERS (Bapu's Letters—1): Edited by Kaka Kalelkar. Navajivan Publishing House, Ahmedabad, 1952. Pp. xx + 116. Price Rs. 1-8.

Mahatma Gandhi's letters are being printed in a series. The first of these is comprised by a batch which was addressed by him to the female members of the Ashram between 6-12-1926 and 30-12-1929. In his introduction, Kaka Kalelkar has brought out the salient lessons which Gandhiji wanted to impart to women in general, and female workers in particular who had dedicated themselves to the cause of social uplift.

SATYAGRAHA IN CHAMPARAN: By Rajendra Prasad. Navajivan Publishing House, Ahmedabad. Pp. xii + 224. Price Rs. 2-4.

This is the second revised edition of Rajendra Babu's account of Gandhiji's first Satyagraha in Champaran which led to the final overthrow of the indigo planters' oppression in the province of Bihar. As a shining example of the vindication of peasants' rights through the application of non-violence, Champaran will always occupy a deservedly high place in our country's political history. We hope, therefore, that this carefully written history by Rajendra Babu will be welcomed by the public.

NIRMAL KUMAR BOSE

MIND AND LIFE: By A. G. Tansley. George Allen and Unwin Ltd., London, 1952.

The author is a well-known writer and his book *The New Psychology* has made the science of psycho-analysis known to many students all over the world. The philosophical bent of his mind, however, which dimly revealed itself in that book published many years ago (1920) has found definite expression in the book under review. Throughout the volume he has made persistent efforts to reconcile the intuitions of the common man with the conclusions of the scientists regarding Life, Mind, and Spirit. His own view is that the contradictions that we notice between man's eternal beliefs and the modern scientific truths are apparent only and therefore, neither need be given up in the interest of the other.

His presentations of the scientific truths and of the Freudian discoveries are eminently fair. In fact, he has ably pointed out many of the fallacies involved in the reasonings of the critics of psycho-analysis, but, being definitely influenced by the writings of McDougall, he has in his own critical evaluation of the doctrines of psycho-analysis unfortunately repeated some of the errors committed by that eminent critic and psychologist.

The author has his quarrels with Freud regarding psycho-analytical terminology and holds that much of the opposition to psycho-analysis "would have been largely avoided if the more general conception of love as the urge to union, instead of a word (sex) conveying a sharply defined and much narrower concept, had been made the basis of exposition." (p. 104). Perhaps, the hostility could have been avoided but then the danger was that psycho-analysis would very probably not have remained psycho-analysis any longer. Freud himself was conscious of the 'hostility' aroused by his use of the term sex, but he deliberately

refused to alter his terminology. The following relevant passage may be quoted here from his book *Group Psychology and the Analysis of the Ego*: "I might have done so (used the more genteel expression, Eros and erotic) myself from the first and thus spared myself much opposition. But I did not want to, for I like to avoid concessions to faint-heartedness. One can never tell where that road may lead one, one gives way first in words, and then little by little in substance too" (p. 39).

The reviewer has nowhere found in Freud's writings any categorical statement regarding the inheritance of characters acquired by individuals as the result of their experiences during their lifetime and therefore is unable to agree with the author that Freud 'firmly believed' in that doctrine of inheritance.

The chapters on the Family and the Community, the Individual and the Community, are very well written though the author has not gone very deep into the problems raised by the topics. The weakest chapters from the systematic point of view, however, seem to be those dealing with 'Causation, Determinism and Free Will' (Ch. 6) and 'Psychological reality and the spiritual values' (Ch. 12). It is difficult to agree to the statement that "When a particular idea is very widespread in human race they do by that fact establish a claim to validity" (p. 162). In discussing about spiritual values the author seems to have lost his bearings and to be drifting hither and thither in the gulfs of logical sophistication, metaphysical speculations, and religious mysticism.

The reviewer is in full agreement with the author's view that all developmental processes may be brought under the concept of increasing approach to equilibrium. He himself formulated the same theory which was published in the *Indian Journal of Psychology*, Vol. VIII, 1933. In that article he elaborately described how the various developmental processes and the activities of the mind could be shown to be but the individual's attempts to regain the balance or equilibrium that had been disturbed by the act of birth. The book is written in an easy and pleasant style and a perusal of it though raises some doubts, definitely creates a feeling of satisfaction.

S. C. MITRA

BHOODAN YAJNA (Land-gifts Mission): By Vinoba Bhave. Navajivan Publishing House, Ahmedabad. Pp. viii + 134. Price Rs. 1-8.

Today peace has become synonymous with the maintenance of *status quo* and violence with revolution. Gandhi evolved a new approach which while maintaining peace would also usher in a revolution and bring in a rapid and radical change in society. That new approach is in ferment in the Bhoodan Yajna of Vinoba. A silent revolution is taking shape under his unique leadership. The book under review is an authoritative collection of some of Vinoba's speeches selected so as to cover in small compass the whole range of Bhoodan Yajna. The book seeks to present to the readers the case for the Bhoodan movement in the words of its author; a difficult task for Vinoba is ever growing and ever presenting new thoughts.

BIRENDRANATH GUHA

THE STORY OF THE NORTH BURMA EVACUATION: By A. R. Tainsh. Published by Orient Longmans Ltd., Calcutta, Bombay, Madras. Pp. 175. Price not mentioned.

The main title of the book "... And Some Fell by the Way" gives a human touch to the story which

the author, a Major in the R.I.A.S.C., relates. The memory of the refugee route, its partition into "White" and "Black" is faded today. And what is of more permanent value is the way in which problems of "refugees" have to be dealt with—by kindness, by trying to so act that their "morale" is kept up. The maps found at the end of the book have attained a new importance for India now that her Eastern frontiers are being stirred by forces that come directly or indirectly from China, gone Communist.

SURESH CHANDRA DEB

INDIA AND THE WORLD: By Nursingdas Agarwalla. Published by Atulananda Chakrabarti, 19A, Desapriya Park, West, Calcutta 26. Pages 119. Price Rs. 4.

The author, an industrialist, in this publication has included nine essays on topics, such as the story of State, Kingship in India, Secular State of India, Democracy, Nature of Capitalism, Evolution of Socialism, Socialism vs. Capitalism, Democracy and Communism. He has expressed noble sentiments and advocated world unity and universal brotherhood. He is an advocate of Capitalism but admits the responsibility of capitalists for social welfare. Many will not agree with some of the views of the author in defence of Capitalism but his advocacy for 'One World' has universal support. The problem still remains whether the basis of world unity shall be Capitalism, Socialism or Communism or an amalgam not yet discovered.

A. B. DUTTA

ANECDOTES FROM GANDHIJI'S LIFE, Parts I, II and III: National Heritage Series. Illustrated. Price As. 7, As. 9 and As. 11 respectively.

SHORT PLAYS FOR CHILDREN: National Heritage Series. Illustrated. Price As. 10.

MY EARLY LIFE: By Rabindranath Tagore. Abridged from his "Reminiscences" and edited by Rajendra Verma. Pp. 146. Price Re. 1-6.

MAKERS OF TO-DAY: By Diwan Chand Sharma. Card board-bound. Pp. 208. Price Rs. 2.

SPEECHES AND WRITINGS OF EMINENT INDIANS: Edited by M. M. Bhattacharjee. Cloth-bound. Pp. 235. Price Rs. 2-12.

Published by Macmillan and Co., Ltd., Calcutta, Bombay, Madras, London, 1952.

The first two books are intended for boys of lower classes, the last three for those of higher classes of Indian schools. There can be no better subjects chosen for the study of young children than *Anecdotes* from the life of the Father of our Nation, *Short Plays* are amusing folk tales dramatized for little children. *My Early Life* is well worth the study by students as the *Reminiscences* show the growth and development of the mind of a poet, one of the greatest world poets of today. In the fourth book, *Makers of Today*, short biographies of famous men of the world and of India, e.g., G. B. Shaw, Tagore, J. C. Bose, Edison, Henry Ford, Marconi, Madame Curie, Wright Brothers, Ronald Ross, M. K. Gandhi, Sun Yat-sen, Lenin, and Roosevelt, are narrated by D. C. Sharma in a lucid and elegant style. They are full of instructive and informative matter to make the students fully acquainted with the modern inventions and the progress of science and civilization of the world to-day. The last book is ably edited by M. M. Bhattacharjee by selecting masterpieces from the *Speeches and Writings of Eminent Indians*, e.g., Tagore, Vivekananda, J. C. Bose, Sri Aurobindo, Mahatma Gandhi, G. K. Gokhale,

Jawaharlal Nehru, Sachchidananda Sinha, Lala Lajpat Rai, Rajagopalachari, Rajendra Prasad, Radhakrishnan, C. V. Raman, Jayakar and Srinivasa Sastri. We hope that the school authorities will do well by selecting the books for the study and benefit of students for whom they are written.

B. K. SEAL

SANSKRIT-ENGLISH

THE DEVI-MAHATMYA OR SRI DURGA-SAPTASATI: By Swami Jagadiswarananda. Sri Ramakrishna Math, Mylapore, Madras-4. Pp. xx+170. Price Rs. 2.

We welcome this addition to the 'Sanskrit Scriptures Series' of the reputed publishers of Madras. It contains the sacred text of what is popularly called the Chandi in Devanagari type followed by a faithful and lucid English translation with occasional footnotes by Swami Jagadiswarananda. Swamiji's Bengali editions of the Gita and Chandi are extremely popular and his English translation of the Brihadaranyaka Upanishad has earned for him a place of great authority and honour. The present edition of the Chandi will, we doubt not, be warmly received by the English-knowing public—it removes a long-felt want of theirs. The translation is based on Pargiter and other authorities and has been revised by the eminent Dr. Raghavan of Madras. As the text is chanted on sacred occasions all the necessary accessories are printed in original, making the edition equally attractive for the public at large.

D. C. BHATTACHARYYA

BENGALI

PUERNACHHED (The Full-stop): By Srimati Lilī Devi. Barendra Library, 254, Cornwallis Street, Calcutta-6. Price Rs. 2.

A romantic novel, depicting the eternal triangle of love in a rather extraordinary setting. Saroj and Salil, two brothers, happen to fall in love with the same girl Sandhya, under circumstances, for which neither of them was prepared. The younger, when aware of the situation, joins war-service and sacrifices the prospect of his own marriage with the girl in order to make his elder brother happy. The presentation of the story is agreeable.

D. N. MOOKERJEE

HINDI

BHARATIYA TARKASHASTRA KI RUP-REKHA: By Dr. Umesh Mishra. Published by Ram Narain Lal, Allahabad. Pp. 118. Price Re. 1.

A highly praiseworthy outline of Indian Logic, which all students of Logic and Philosophy in our colleges, where the present medium of instruction is being gradually replaced by the national language, Hindi, will find very helpful. Lucidity is its outstanding merit.

SWATANTRA BHARAT KI BAHIKHATA PADDHATI PAR VICHAR: By Kasturmal Banthia. Published by Banthia and Co. Ltd., Ajmer. Pp. 40. Price eight annas.

An informative brochure on the Indian system of book-keeping, which has stood the test of time as well as of usefulness for centuries.

YEH SWARAJ KAISA: By Dharendra Majumdar. Pp. 39. Price six annas.

NAI TALIM: By Dharendra Majumdar. Pp. 63. Price fourteen annas.

HAMARI KHADYA SAMASYAEN: By Ramakrishna Sharma, Pp. 40. Price eight annas.

All available from Sarvodaya Sahitya Sangha, Kashi (Banaras).

Three thought-provoking pamphlets by two of Gandhi's well-known constructive workers. The first checks up the present phase of our Freedom against Gandhi's conception of Swaraj; the second deals with Gandhi's Basic Education project and shows its overall effectiveness; the third threats of the burning food problem in its production, consumption and consumer's health aspects.

G. M.

BAPU—MERI MA: By Miss Manu Gandhi. Published by the Navjivan Prakashan Mandir, Ahmedabad. 1949. Paper cover. Pp. 55. Price As. 10.

Miss Manu Gandhi a close relative of Gandhi, attended on Kasturba till her death and on Gandhi after that at the time of the Noakhali tour and thereafter till his tragic end. She calls Gandhi her mother as he brought her up in the way she should go. She kept a diary and her reminiscences as formed there are interesting. Her companion at Karachi in pre-Gandhi days, Mrs. Kurangi Desai of Khar, the grand-daughter of the late Mr. Devatia, has translated this little book from Gujarati into Hindi and a very creditable translation it is.

K. M. J.

GUJARATI

PREMO PANTH, YOJAN 2: By Desai Valji Govindji. Published by the Navjivan Prakashan Mandir, Ahmedabad. 1948. Paper cover. Pp. 80. Price As. 4.

From Gandhi's own writings, selections have been made to illustrate his life and incidents therein. Mr. Valji, a devout and scholarly follower of Gandhi, and saturated with his principles, was the proper person to do so, and he has done it. Part I or Yojan I of this *Panth* (Road) has been published by The Society for the Encouragement of Cheap Literature. The Navjivan Prakashan Mandir proposes to publish it also. This *Panth* is a charming performance.

EKNATHI BHAGVAT: By Dr. Varjivandas Damodardas Merchant. Published by The Society for the Encouragement of Cheap Literature, Ahmedabad and Bombay. 1949. Thick card-board. Pp. 576. Price Rs. 6.

Eknath Maharaj was one of the most popular saints of Maharashtra and deeply versed in our religious lore. The Eleventh Skandh of Shrimat Bhagvat carries in it the Secret (Rahasya) of Slavation. Many are the comments written on it. The commentary of Eknath is one of the best. Dr. Merchant put it in its Gujarati shape in 1931 and this second edition is brought out after thoroughly overhauling the first one.

PARAM PUJYA BAPU: By Sopanand G. Ramchandran. Published by The Society for the Encouragement of Cheap Literature, Ahmedabad and Bombay. 1949. Paper cover. Pp. 144. Price Re. 1.

Incidents in Gandhi's life, interviews with him and other happenings in his life are so arranged in this small book as to read like a connected narrative.

SANTNI VATO: By Gopalji Odhavji Thakkar. Published by The Society for the Encouragement of Cheap Literature, Ahmedabad and Bombay. 1948. Paper cover. Pp. 264. Price Re. 1-8.

This book is designed to take the place of Satsang (contact with holy men) where holy men discourse

DAYARAM GIDUMAL: By T. L. Mandhir Malani. Translated into Gujarati by C. R. Patel. Navajivan Karyalaya, Ahmedabad, 1953. Price twelve annas.

The name is that of the hero whose biography had been written in English by his son-in-law, who after the Partition settled in Nadiad, headquarters of Kheda in Gujarat. He was popularly known as Dada for his social activities.

Dayaram Gidumal was born in 1857 in Hyderabad, Sind. He was a student of Bombay Elphinstone College and studied under Prof. Wordsworth, a grandson of the great English poet who along with the Professor of Persian extended a good influence on Dayaram. Dayaram was later on taken on to Statutory Civil Service, and numbered among his friends, Malabari and H. S. Advani, both social reformers of repute, and Dayaram wrote and published life-sketches of both Government and the people.

When Dayaram was the Judicial Commissioner of Sind, he was invited to tea by the Viceroy at Karachi. But he would not take tea as it would be against his religious principles. He was tolerant of other religions and believed that peace could come to the world only through love of men. He had written a booklet in English, *The Alphabet of Discipline* in which there are three good prayers through

which the earth might be turned into paradise—prayers for morning and for evening.

From a District Judge he rose to the position of the Legal Remembrancer. In 1902, he served on the Police Commission and then as a Judicial Commissioner of Sind and in his capacity of a judge he showed alertness and independence of judgement. Many are the stories current about his honesty in the face of temptation. In days when politics was not altogether a taboo as in later times, he was a prominent member of Sind Sabha and contributed articles to *Sind Sudhar*. He had written more than a dozen in English and five in Sindhi. These were entirely on religious topics. He was quite modern in his outlook on education, and realised that modern aids must be utilised by the teachers' association and that the mother tongue must be the medium of instruction. His attitude towards social service bore fruit in D.M.D. Trust. He had started other organisations for the purpose and his thoughts on the subject did him credit. Once he remonstrated with Gandhiji regarding his fasts as in his opinion they were not strictly non-violent and also because they ran counter to the injunction of the Gita on Yukta Ahar and Yukta Bihar—restrained meals and restrained living.

His marriage a second time in 1913 made him extremely unpopular, and his son-in-law has quoted the letter written by Gidumal to his daughter and her husband, recounting the steps that led to it. Platonic friendship outstripped its bounds and so, marriage, which embittered the cup of his life. He died in 1927.

INDIAN PERIODICALS

Eva Gore-Booth

In the following article in *The Aryan Path* R. M. Fox presents his countrywoman, the Irish poet and pacifist, Eva Gore-Booth, a fine and sensitive soul, who deserves to be remembered also for the humanitarian spirit that kept her active in public causes uncongenial to poets of the Ivory Tower :

One of the poets of the Celtic Twilight period whose work has been neglected in recent years is Eva Gore-Booth, daughter of Sir Henry Gore-Booth and sister of Constance, better known in Irish history as the Countess Markievicz. In quantity as well as quality Eva Gore-Booth's work entitles her to a distinguished place, for she has written 10 books of poetry, a prose play, *The Sword of Justice*, and three books of essays. Her life spanned the period between May 22nd, 1870, and June 30th, 1926. She died in London.

She left Ireland in her early twenties, travelling first in the West Indies and America with her father and then—in 1897—settling in Manchester, where she was active in many progressive causes, particularly those concerned with the economic, cultural and political advancement of women. Perhaps her life and interests in Britain helped to detach her from that group whose names are usually associated with the Celtic Literary Revival. But the leaders of that movement fully accepted her as one of themselves, as indeed her work demonstrated.

In the years when the landowners and aristocrats in Ireland were not noted for their sympathy with the people, the Gore-Booths always had a reputation for it. The Secretary of a Relief Committee in Sligo wrote :

"In 1879-1880 we had a famine in Ireland, and Relief Committees in every parish. Her father, Henry Gore-Booth, kept an open store of food at Lissadell, giving out meal, etc. to the starving poor, free to all, at his own cost, and I believe all the members of his family assisted in doing so."

At this time Eva would have been 9 or 10 and always the formative influences of those early years stayed with her, evident in her poetry no less than in her social activities. Another lasting influence was the beauty of the Sligo mountains and the haunting memory of the sea at Lissadell.

As long ago as 1897 Eva Gore-Booth published her first book of poems and W. B. Yeats greeted it enthusiastically, saying : "I think it is full of poetic feeling and has great promise. 'Weariness' is really most imaginative and is, I think, in the mood in which you are most yourself. The last four lines are really magical."

THE closing verse of this poem reads :

For silence is the song sublime,
And every voice at last must cease,
And all the world at evening time
Floats downward through the gates of peace,
Beyond the gloom of shadowy caves
Where water washes on the stones,
And breaks with quiet, foamless waves

The night's persistent monotonies :

The stars are what the flowers seem,
And where the sea of thought is deep,
The moonlight glitters like a dream,
On weary waters gone to sleep.

Here is the authentic note of the Celtic Twilight period, the mood of shadowy splendour which Irish poets of the period expressed to the delight of the reading world. Eva Gore-Booth received much praise for her delicate, sensitive verses, rated by a leading English critic as second only to the work of one writer of the Celtic Revival. In 1904 she published the volume *Unseen Kings*, including a play on the death of Cuchulain.

About this last A. E. wrote to her : "I congratulate you on your *Cuchulain*. I think it is very beautiful and full of mystery. I always thought your imagination would incarnate finally in its best form in Irish subjects.... I think your work would do admirably for the Red Branch Cycle performances we hope to have in the autumn here.... I feel you belong to the spiritual clan of new Irish people, some of whom write and more do not, but all know that *Tir na nog* is no dream and that inwardly we are inhabitants of it and breathe a common air."

Later this play was performed at the Abbey Theatre by a company which Count Markievicz and his wife had founded.

Among her early poems I have found one, "Clouds," which shows how she was drawn to the idea of militant struggle in the cause of Irish independence. She writes :

See, amid the shadows where dead Ireland lies,
Justice stands, the future flashes from her eyes:
After thy new birth of travail and of pain,
Rise, she says, dead nation, live and hope again.
Nay, not dead but sleeping; surely she shall wake,
In her mighty hands her life and honour take,
Drink the wine of courage, break the bread of life,
Bear the sword of Freedom foremost in the strife.

A slim book of verse with a primrose-coloured cover was published in Dublin in 1918. She called it *Broken Glory*. Printed on the cover are the significant words "Passed by Censor." This refers to the military censorship of those troubled times. Here are the lines on "Easter Week":

Grief for the noble dead,
Of one who did not share their strife,
And mourned that any blood was shed,
Yet felt the broken glory of their state
Their strange heroic questioning of Fate
Ribbon with gold the rags of this our life.

A number of poems are written to her sister. One "To Constance—In Prison" succeeds in recapturing the glory of Lissadell where they had spent their childhood. The closing verse reads:

Yours is that inner Ireland beyond green fields
and brown
Where waves break dawn-enchanted on the
haunted Rosses shore.
And clouds above Ben Bulbin fling their
coloured shadows down
Whilst little rivers shine and sink in wet sands
at Crushmor.

In "The Triumph of Maeve" those early memories of Sligo rise again. She wrote these lines on her return after a visit to Sligo.

The foamless waves are falling soft on the sands
of Lissadell
And the world is wrapped in quiet and a floating
dream of gray;
But the wild winds of the twilight blow straight
from the haunted hill
And the stars come out of the darkness and shine
over Knocknarea—
I have seen Maeve of the Battles wandering
over the hill.

Her "Little Waves of Breffny" has long ago achieved recognition as one of the finest Irish lyrics:

The great waves of the Atlantic sweep storming
on their way,
Shining green and silver with the hidden herring
shoal;
But the little waves of Breffny have drenched
my heart in spray,
And the little waves of Breffny go stumbling
through my soul.

Although Eva Gore-Booth was delicate from childhood she was not content to devote her life to poetry alone. She had an eager sympathy for the poor and the suffering. At 22, when she went to Manchester, she interested herself at once in the organization of trade unions for women and also in movement for woman's suffrage. She acted as Secretary to the Manchester and Salford Women's

Trade Union Council. She edited a paper, *The Women's Labour News*, and did much public work, largely foreign to her temperament, because she felt it was necessary. In one verse she left a record of a public meeting at which she spoke. She called this "The Street Orator":

At Clitheroe from the Market Square
I saw rose-lit the mountains gleam
I stood before the people there
And spake as in a dream.

This reads like one of those gatherings at which the poet William Morris used to speak. But her work was practical for all her dreaming. Besides the activities already mentioned, she helped to run a reading circle and founded a dramatic group. Later, in London, she was active in social causes but still she poured out poems, verse plays and essays distinguished for beauty, grace and that eager giving of her personality which was a leading characteristic of her work.

Eva Gore-Booth was a true mystic always seeking to find and express the Inner Light behind the appearance of things. She was a confirmed pacifist and believed in the sword of the spirit. As she put it in her play, *The Sword of Justice*, "A sword alone is an uncertain weapon." I met her first early in the First World War, when she was speaking at a peace meeting in London. It was held in a small hall and I acted as her chairman. It was a stormy time but she had a peaceful tranquillity of spirit. I remember that she read her speech, but it was framed in such sensitive clear-cut words that there was none of the dullness usually associated with a written speech.

"I am," she began cheerfully, "one of those quite hopeless people who do not believe in fighting under any circumstances."

Although she was a fighting pacifist it was her fate to be introduced always as the sister of the Countess Markievicz who had fought so valiantly in the Easter Rising. She told me so, ruefully but with a smile, after

AMRUTANJAN LTD., P.O. BOX NO. 6825, CAL. 7

Estd-1893

I had mentioned this interesting fact to the audience. But actually the coupling of Eva Gore-Booth with her militant sister was not so incongruous as might appear. They were both united in their sympathy with suffering and their love of freedom. Though their methods differed they were working for the same end.

Always there was the greatest understanding between these sisters—one a warrior, other a pacifist. *The Death of Fionavar*, Eva's poetic play, was decorated by Constance Markievicz with drawings of wild, proud horses. Those streaming manes and tossing heads expressed as much the mood of the poet as of the artist. This play is dedicated to "The Many who died for Freedom and the One (Francis Sheehy Skeffington) who died for Peace."

Eva Gore-Booth was careless of fame and money. Her poems were given to obscure little journals standing for causes in which she believed. And yet some of the finest poets among her contemporaries in Ireland and in Britain gave generous recognition to her work. It was a time of unfolding and blossoming in the arts and this does not go with any petty, grudging spirit. After her death a complete edition of her poems was published by Longmans, Green and Company in 1929.

I saw her for the last time a few months before her death at her home in Hampstead. She had been very ill and was paler than usual. Her pale gold hair was loosely coiled and her blue eyes were filled as ever with eager interest. She was seated by a table piled with books and a reading lamp was at her elbow. She was wearing a blue velvet jacket and the brown rug over her knees kept slipping down as she talked with animation. She was as fragile as an arum lily. She spoke of plays and books, of the state of Europe, of the industrial depression which England was facing and of her hopes for Ireland. The only thing she refused to discuss was her illness.

The spirit of poetry has changed greatly from that Celtic Twilight splendour and the tranquil mystical beauty which she expressed in her work. But that work and her spirit remain to us a possession as real as the great shoulder of Ben Bulbin standing out of the Irish mists or the foamless waves which still fall on the sands of Lissadell.

Protest Against Race Oppression

The *National Christian Council Review* has reproduced the following open letter written by the Rev. Trevor Huddleston and published in the *Church of England Newspaper* on July 3, 1953:

A good deal has been written, and a great many conflicting views have been expressed about the rights and wrongs of Christian intervention from England in South African affairs. Put very bluntly, there are those who say: 'No one has a right to speak about the racial situation in the Union of South Africa unless all the factors are understood. In England they are not understood. And in any case the Church of the Province of South Africa can look after itself. Statements, resolutions and sermons in England are more of an embarrassment than a help.'

I have never personally believed argument which—in effect—rules out onlookers on the ground that they either of the game or that they have blink than not those of us who live inside caught up into the currents and cross-currents are biased or blinded by experience. And it is good for the solution of any problem that it should be subject to scrutiny and comparison with objective standards. If, for example, South Africa claims to be a democracy, it is not a bad thing that her standards should be compared with those of democracies centuries older and more experienced than herself.

TIME FOR SILENCE IS PAST

I believe with all my heart that the Church in England should use every weapon in her armoury to arouse the conscience of Christians all over the world. And I believe this not because I hate South Africa but because I love it.

And—let it be said with shame—the vast majority of European church people in South Africa are not giving the kind of lead which would inspire confidence in any one. If, in fact, we have begun to learn the lesson of Kenya, we should see to it that we implement our knowledge at once.

INVASION OF HUMAN RIGHTS

I am convinced that, first of all, people in England could be told again and again that what is happening in South Africa is an invasion of human rights. That in consequence, and because man is made in the image of God, it is an insult and an affront to God Himself. In face of this, all talk of 'interference' is simply absurd—unless, of course, one takes a purely humanist or materialist political viewpoint.

The Group Areas Act (which, when applied, effectively prevents any one racial group existing where it desires to exist, and may well bring ruin on certain groups such as the Transvaal Indians), The Suppression of Communism Act, The Public Safety Act and the Criminal Law Amendment Act (all of which in different ways destroy or gravely imperil freedom of speech and of opinion), The Pass Laws and the Native Urban Areas Act (which together destroy freedom of movement and create an atmosphere of progressive distrust, fear and resentment).

All these—and the multifarious regulations and proclamations which have been issued in recent years—are offensive *not* because they are merely discriminatory or undemocratic, but because they undermine the dignity of man himself.

I could list very many more such measures: I could give incidents descriptive of how they work: I could indeed paint a picture coloured with many an emotional streak.

But I want to end by reminding the readers of your paper of an event which is now being begun and which

may have repercussions all over Africa. And I want to ask your readers to protest, through their local M.P.s., to the representatives of the South African Government in England. For this is a simple issue, yet it is one which will affect 14,000 African families.

OUTRAGE IN JOHANNESBURG

The Minister of Native Affairs has ordered the expropriation, the eviction of all African native people from the 'Western Areas' of Johannesburg—i.e., Sophiatown, Martindale and Newclare.

For no other reason than a purely racial one, these people who have—many of them—had their homes in this area for a generation are to be deprived of those homes. At the same time, freehold-tenure—a privilege almost unique in the urban areas of South Africa—is to be taken from them and (wherever they may go) they will never recover it.

This is not a slum-clearance scheme: it is pure and simple expropriation. The people have never been consulted in the matter, nor have they any representation in the City Council. Their protests have been unheeded. Yet they are permanent labour-force of Johannesburg. Only because European suburbs have encroached upon a predominantly African area has this plan been moved. It is racialism in *excelsis*. Its consequences will be the uprooting of thousands of people and their settlement at least ten miles farther from their work. The removal of Sophiatown is the Naboth's Vineyard of white western Johannesburg. It should receive the same condemnation.

widely appreciated at home & abroad..

April 13, 1953

Gentlemen,
Enclosed please find Bank Draft for dollars (\$5.00) for which please send me another supply of Neem Tooth Paste.

I believe I have a small credit from my last order on May 6th 1951.

My dentist shakes his head and can not understand why I no longer need to come in every six months to have my teeth cleaned.

He has been my dentist for the past fifteen years and my last trip in was the first time my teeth had needed cleaning since just before I started on my round the world trip five years ago.

It seems ridiculous to send all the way to India for tooth paste when there are so many brands on the market here, but he admits now that it is worth the trouble.

That with diet and other factors the same I have found something that is preserving my teeth that I otherwise would have lost in a few more years.

Again I thank you.

Yours very truly,

Mr. A. W. Hunter

New York Marks 300 Years as International City

January 15, 1953. In 1653, 27 years after Dutch settlers in America bought Manhattan Island from the American Indians for \$24, they founded a city there. It was called New Amsterdam. Population: 600.

Today, on that spot stands New York City, the second largest metropolis in the world. Population: 7,846,009.

In 300 years New York has grown quickly as cities grow. Its history, if not long, like Rome, Paris or London has been colourful. A visitor to New York in February will see much of that city's past brought back to life when New Yorkers celebrate their city's 300th anniversary.

That some visitor might think that people have come from all over the world for the festivities. In a sense he will be right. The thousands of Italians, Greeks, Chinese, Spaniards, Germans, Russians and representatives of dozens of other countries he will see are from all points of the globe. But they are not visitors. They live in New York side by side with some 60 other nationalities.

New York's conglomerate citizenry dates from its very beginning. John Gunther, the American author and journalist, has observed in his book *Inside USA* that "from the early Du Ponts to Otto Hapsburg, from Leon Trotsky to Haya de la Torre, Manhattan has been traditionally generous to refugees. It has been a cosmopolitanism of the mind as well as the pocket. It may be built on an island, but it is not insular."

Today, more than 2,000,000 foreign-born persons live in New York City. Of this number the largest group is Italians (more than 400,000), followed by Russians (395,000), Germans (225,000), Poles (195,000), and Irish (160,000). In addition there are 28,500 Greeks, 25,000 Czechs and about 12,000 Chinese.

Many of the Chinese have settled in their own communities where they cling to homeland traditions. On the surface the Chinese settlement—"Chinatown"—seems mysterious to the tourist. But underneath it is a quiet, orderly society of former servicemen, college students, wage-earners and businessmen.

About 100 years ago when "Chinatown" first started to grow it was a noisy, dirty place. Around 1900 it became the battleground for the wars between the notorious tong associations. But today "Chinatown" is a quiet and law-abiding community, occupying a section several blocks from the Wall Street financial centre.

Spanish Harlem, the Puerto Rican section, is another of New York's famous foreign "cities within a city." An estimated 300,000 Puerto Ricans now live in New York, most of them in upper Manhattan and the Bronx. The first Puerto Ricans entered New York at the turn of the century, when Spain lost control of the West Indies. But Puerto Rican immigrants did not come to New York in large numbers till 1917 when U.S. citizenship was granted to them. The greatest influx, however, has occurred since the end of World War II.

New York's Negro community is one of the city's

oldest, dating back to the early Dutch settlement days. Like other peoples now living in this diversified city, the more than 600,000 Negroes comprise elements representing all faiths, creeds, political beliefs and occupations. Moreover, Negro cultural and political leaders work closely with their white colleagues to erase the vestiges of inequality among all groups.

The foreign-language press helps knit together other national groups. More than 220 non-English newspapers published in 15 languages offer foreign-born New Yorkers' news in their native tongue.

Through three centuries New York has indeed become an international city that has welcomed peoples from all over the world. The city's present mayor, Italian-born Vincent Impellitteri as well as his predecessor, were born outside the United States.

Commenting on New York's polyglot population, the American author E.B. White, wrote: "The collision and the intermingling to these millions of foreign-born people representing so many races and creeds make New York a permanent exhibit of the phenomenon of one world. The citizens of New York are tolerant not only from disposition but from necessity. If the people were to depart from the place of cosmopolitan intercourse, the town would blow up higher than a kite."—*USIS*.

College de France

In speaking of the cultural life of France it is worthwhile from time to time to turn from current movements to the great institutions which sustain it. College de France is such an institution, and one of the most successful. It is the highest educational institution in France, and yet gives no degrees or certificates.

For the purpose and mission of the College de France is that it shall be an establishment completely independent as regards the choice of both programme and of professors and style of teaching. Its motto "Docet Omnia" shows that nothing which is human knowledge can

be unfamiliar there. The branches of learning studied range from philosophy, taught in turn by Henri Bergson, Edouard Le Roy, Louis Lavalley and the present holder of the chair, professor Merleau Ponty, a rival of Jean-Paul Sartre, Political Economy with Md. Andre Siegfried lecturing from 1933 to 1945, to the history or religions with Alfred Loisy and then Jean Baruzi, orientalism so brilliantly served there by Ernest Renan and classical antiquity by Theodore. In science, Hadamard, Maurice de Broglie and Rene Lerche have held chairs made famous in the past by men like Ampere and Lannec.

The most striking thing about these names and those of holders of the forty-eight chairs to-day corresponding to the subjects taught, is their amazing variety. Variety of origin in the first place: the College de France is unique in being the only establishment of higher education where non-university men are given professorships: Paul Valery's only qualifications were his poems and his lectures on Poetry before the war brought large and unusual audiences to the College de France. Bergson too was not exactly what one would call a "university man." For the professors of the College de France, an institution that is directly dependent on the Ministry of National Education without belonging to the University of Paris, are appointed by the Minister from a list of four candidates, two proposed by the Professors' Assembly and two by one of the five Academies forming the Institute de France. The appointment is not therefore the result of any choice by the Civil Service or the Government, but by leading French thinkers who have selected one of their peers. There is variety also in the subjects taught, some being of educational or practical interest, like medicine, chemistry and political economy, —others being absolutely disinterested, as for instance ancient Sanskrit and paleo-Christian archaeology. Variety too in the popularity of the different courses: some only attract one or two listeners so that the professor at the College de France who apparently only had the chauffeur waiting to drive him home listening to him, has become a by-word among students. But others draw large and sometimes enthusiastic crowds.

For the sole purpose of the College de France, as its present Administrator, Mr. Edmond Farel has said, is to "contribute to the advancement of science" and not to award degrees, serve politics or provide a utilitarian and therefore limited formation. In a country steeped in humanism like France, the College de France is perhaps the most human of educational establishments. When he founded it, Francis I was not concerned with erecting premises for it but with finding suitable persons to teach there, "I do not wish to build a college of stones but of men," he said.

In the course of its four hundred years and more of existence, the College de France has also been built in stones: it is housed in an edifice erected in the 18th century and designed by the architect Chalgrin, on a site formerly occupied by the Colleges of Treguier and Cambrai. Outside this building, it has spread over into a group of more recent edifices, some built and some in course of completion, which as regards dimensions and modern equipment meet the requirements of up-to-date scientific research: some thirty laboratories in Paris, the Paris suburbs and the provinces, thus depend on the College. But this proliferation in stones, now common to so many establishments devoted to intellectual research, from the Bibliotheque Nationale which is slowly colonising the Rue de Richelieu and spreading to Versailles, to the Faculty of Medicine which has recently built an annexe on the site of a whole block of houses in old Rue des Saint-Peres, does not alter the fact that the main part of the College stands still in the immaterial flame kindled by Francis I and which to our day has never gone out: the freedom of teachers and the freedom of education.

Dr. Julian Huxley Awarded Kalinga Prize

Dr. Julian Huxley, D.Sc., F.R.S., has been awarded the Kalinga Prize for distinguished popular writing in science in a ceremony at Unesco House in Paris last month. The prize of one thousand pounds sterling was established in 1951 as a gift to Unesco from Mr. B. Patnaik, Indian industrialist. The first award, in 1952, went to Professor Louis de Broglie of Paris.

The prize is international and is awarded annually for outstanding and continued achievement in the dissemination and interpretation of science to the general public in books, articles, radio programmes or films. Dr. Huxley is the author of some 15 popular books, including the recent *Evolution in Action*, *Essays of a Biologist*, *Man in the Modern World* and *Evolution*. He had been nominated for the prize by both the Royal Society of Great Britain and the Institute de France.

The jury for the 1953 award was composed of Dr. M. N. Saha, Professor of Physics at the University of Calcutta, Mr. Paul Gaultier, Member of the Institute de France, and Professor A. J. Kluyver, Technische Hogeschool, Delft. The jury considered ten nominees from eight countries: Argentina, France, India, New Zealand, United States of America, Uruguay and Venezuela.

The prize bears the name of Kalinga, an Empire which covered part of India and Indonesia more than 2,000 years ago. It is also the name of the Kalinga Foundation Trust which has made generous grants for develop-

ment and social work in the State of Orissa. The President of the Trust is Dr. R. K. Mahatab, Indian Minister of Industry and Commerce, and Mr. B. Patnaik, member of the Orissa Legislative Assembly, is a director.

—UNESCO, October 1953.

V. K. R. Menon Appointed Director Of ILO India Branch

Mr. V. K. R. Menon, I.C.S., Labour Secretary to the Government of India, has been appointed Head of the International Labour Organisation's India Office at New Delhi. Mr. Menon is expected to take up his duties early in October.

After receiving his education at Madras, Mr. Menon graduated from Cambridge where he obtained a merit scholarship. He joined the Indian Civil Service

Jamini Roy's Art Hailed In New York

An exhibit of paintings by the eminent Indian painter Jamini Roy at a New York art gallery recently attracted considerable interest among the city's art lovers and critics.

In 45 years, Jamini Roy has rarely allowed his work to be exhibited outside his native India. Paris and London have seen his pictures but never before. With the exhibit in New York, he gave the outside world another look at his work.

The recent exhibit resulted largely through the efforts of an American serviceman, Harold Leventhal, an admirer of Roy. During World War II, Roy's studio in Calcutta was a popular haunt for American servicemen interested in art.

A tribute to Roy's genius is the fact that half of the paintings and drawings exhibited were sold by the end of the first week of showing. And art-critics of several leading newspapers and magazines wrote about him and his work.

New York Times critic Stuart Preston said: "The singular quality of Indian art is its emphasis on three-dimensionality, and Roy, though limited by the two dimensions of the canvas and further limiting himself by painting absolutely with neither shadows nor modeling, yet contrives to suggest maximum solidity and volume in his figures by the supple strength of contour alone. His calligraphic power is most impressively evident in the brush drawings of figures. . . . Roy's art is totally disciplined and thrives on its good humour and on its clear sense of form."

ART IN TEMPERA

Newsweek's critic wrote: "Roy's paintings reflect the peace he has made with himself and with the world. Flat, bright figures painted in the conventional forms of Bengalese artisans reveal his reverence for the dignity of India and Hindu lore. Roy usually grinds his own pigments and normally paints in tempera. His drawings are composed of simple and economical lamp-black lines. All express his belief that there is no evil in good-humoured men and women."

Roy is one of India's modern painters who have developed a personal idiom based on the glorious forms of Bengal's folk art. Unlike many of his contemporaries, he did not fall back upon the barren choice of revivalism or compromise with the Western art, but he found a forward solution.

Born in April 1887 in a village in West Bengal, Jamini Roy was brought up in an atmosphere permeated with local culture. The simple village craftsmen aroused in him his first interest in form and design. Though his early paintings revealed distinct Western influence, he soon began a lonely search for form. This became a great intellectual adventure which resulted in his paintings being hailed by critics as "pure and vital." His success has proved the truth of Cezanne's remark, "When colour has its richness, form has its plenitude."

Roy has not confined himself solely to the treatment of Indian subjects. Though a Hindu, he made a deep study of Christian subjects. Inspired by them, he painted a series of pictures on Christ, His Mother, and His disciples. These penetrating interpretations in colour and form won him international fame.—American Reporter.

Working of the Sindri Chemicals

At the first annual general meeting of the Sindri Fertilisers and Chemicals Ltd., held recently, the Chairman of the Company stated that the achievements of Sindri have been creditworthy, as measured by the target output and economic costs of production. Since the commencement of production operations in March 1952, the factory's output totalled 230,000 tons of ammonium sulphate during the thirteen months ended March 1953. The production in the last quarter of 1952-53 was 74,176 tons, as compared with the target of 87,000 tons. There has been a steady decline in the cost of production, and the prices charged have also been reduced. Even in the initial period, the price of Rs. 350 per ton was below the cost of imported sulphate. Following an intensive campaign launched in 1953 to popularise the use of fertilisers as a positive step towards self-sufficiency in foodgrains, the price was reduced by Rs. 65 per ton, a reduction of nearly 20 per cent. It is expected that production costs will be further reduced in the near future.

The offtake however caused some concern to the authorities. In February 1953, although the stock position showed huge accumulation, the production was not curtailed and actually a high level of production of nearly 27,000 tons was attained that month. The short-fall in offtake in 1952 is attributed to droughts in some parts of the country, financial difficulties of the State Governments and unsatisfactory arrangements for distribution made by them. Had the Company decided to export its products, it could have cleared the stocks and earned large profits on that account. The Company received a large number of requests at much higher prices. The Union Government's Food and Agricultural Ministry is responsible for administering the fertiliser pool to which the entire production of Sindri is contributed at present. The Company is not satisfied with the present distribution arrangements controlled by an outside authority. It demands that it must have the responsibility for marketing its own output. A proposal is being examined for the taking over of distribution arrangements by the Company from January 1, 1954. Steps are also being taken for popularising the use of fertilisers for intensive cultivation and a scheme for the purpose is being formulated in co-operation with the Food and Agricultural Ministry.

Located at the heart of India's coal belt and within easy reach of abundant resources of cheap electrical power and water, Sindri has large potentialities of industrial development. The Company has entered into an agreement with the Associated Cement Co. Ltd., for the sale of the calcium carbonate sludge, which is a by-product of ammonium sulphate production. The A.C.C. propose to construct a cement factory at Sindri for the production of 600 tons of cement per day, utilising this by-product as the main ingredient. Another agreement has also been concluded with the German firm of Messrs Karl Still for the

supply and installation of a battery of coke ovens for the production of 600 tons of coke a day, which will make Sindri self-sufficient and will also bring about substantial economies in the production costs. Plans are also under consideration with the US Technical Co-operation Administration for the utilisation of the coke oven gases for the manufacture of urea and ammonium nitrate to provide a diversity and balance in the availability of fertilisers from indigenous sources.

Indo-US Technical Co-Operation

The last two project agreements under the Indo-US technical co-operation programme for 1952-53 were recently concluded. The first agreement undertakes to provide some equipment and supplies to increase the existing facilities for an exploratory project for lignite excavation in South India. The object of the project is to determine the economic feasibility of the recovery and processing of lignite in the South Arcot District in the State of Madras. The joint cost of this project is estimated at \$250,000 and Rs. 25 lakhs. The experimental mining operation will make possible the recovery of about 16,000 tons of lignite which will be available for test purposes and actual consumption in plants having facilities for burning the raw lignite. A study of market conditions, fuel requirements of various users and other data relating to the sale, distribution and utilization of the lignite will be conducted during the period of the experimental pit excavation. Such information will be used as a basis for planning the full-scale mining operation of the lignite deposit.

The second agreement is supplementary to the Operational Agreement No. 10. It provides for the acquisition of certain items of additional equipment for the completion of the pilot plant of the Cellulose and Paper Branch of the Forest Research Institute, Dehra Dun, which is under construction. The total estimated joint cost of the project for the fiscal year 1953-54 is \$210,000 and Rs. 320,000. The completion of the pilot plant will enable the Cellulose and Paper Branch of the Institute to conduct experimentation, demonstrations and pilot operations on the production of pulp and paper from a wide variety of indigenous raw materials. The pulp and paper plant will also be used as a regional centre for research and training for nationals from other countries. The Technical Co-operation Administration will arrange for the engineering services in connection with the erection of the plant as well as for specialists required and requested from outside India under this project.

The dollar cost for these two agreements amounting to \$460,000 will be provided from the savings under supplementary agreement No. 1 regarding the fertilizer project. The agreement in respect of the malaria control project was amended to provide 15 additional malaria control units, thereby increasing the number of units from 75 to 90. About 90 million people will receive protection from malaria under the amended agreement. The amendment does not involve any additional dollar expen-

diture but the rupee cost of the project will be higher by about Rs. 29 lakhs.

Another Technical Assistance agreement was also concluded which provides for assistance in obtaining detailed proposals for expanding the Sindri Fertiliser plant for the production of urea and ammonium nitrate, and the productive utilisation of the coke oven gas of the plant. The USA Government will provide a sum not exceeding \$50,000 for this purpose.

Changes in Exchange Restrictions

Article XIV, section 4 of the Articles of the Agreement of the International Monetary Fund lays down that, not later than three years after the date on which the Fund begins operations and in each year thereafter, the Fund should report on exchange restrictions still in force under section 2 of the same Article. In pursuance of this provision, the Fund has submitted its Fourth Annual Report this year. The report indicates broadly the nature of the changes which had taken place during 1952 and early 1953 and thus assists an understanding of the general character of recent developments in exchange restrictions. Generally speaking, the period was one of consolidation for some countries and their changes in the exchange control were in the nature of technical simplification in the operation of their exchange systems. As regards the other countries, it was essentially a period of watching world development to see what would take place elsewhere before taking any decisive measures to lessen their own exchange restrictions.

The volume of world trade was smaller in 1952 than in the preceding year. But the Fund cannot say definitely to what extent this reduction is due to intensification of international trade or exchange restrictions, which began in the second half of 1951, as contrasted with other causes. There was no significant relaxation in exchange restrictions during the last year. While some countries lessened their exchange restrictions, others intensified theirs. Though some countries simplified their multiple exchange rate structures, others made them more complicated.

The slowing down of the scramble for raw materials in 1951 resulted in a decline in their prices in 1952 approximately to the level of June 1950. Although the decline in prices of raw materials undoubtedly helped the more industrialised countries, it tended to produce in the primary producing countries a more cautious and restrictive attitude towards the granting of exchange and the lessening of exchange restrictions. Thus in several leading countries there was a reduction in the amount of exchange made available for imports directly arising out of a recognition of adverse balance of payments positions and a desire to correct them. The general use of discrimination in the application of restrictions continued during 1952, so that payments in hard currencies were reduced to a larger extent than were payments in soft currencies.

No additional currencies became convertible during

the years 1951 and 1952. In more than half the number of member countries surveyed by the Fund, multiple currency practices continued to operate. A few of them slightly simplified their multiple exchange rate systems by reducing only the arithmetical number of rates employed, but six member countries expanded their multiple exchange rate systems. Among the latter, two countries introduced additional fluctuating exchange rates by the use of negotiable certificates. These certificates entitle the holder to obtain exchange in payment for imports not otherwise permissible. Another country introduced an "auction system" by which it allocated limited quantities of available exchange. This means of exchange distribution was not in use for some years past.

The report throws much interest on retention quota arrangements and similar practices. These arrangements are usually applied to dollar export receipts and confer special privileges on those obtaining such means of payment. Thus, during 1952, such arrangements were either introduced or expanded in three countries, but were discontinued in three others. Two of the member countries introduced "free" exchange markets in which certain segments of their international trade and payments were to be handled. Three members introduced exchange taxes or increased the existing taxes. Liberalisation of trade between countries which are members of the European Payments Union was in general maintained.

Jute Marketing Practices

A Commission has been appointed by the Government of India to institute an enquiry into the marketing practices in the raw jute and jute goods trade and the extent to which they are influenced by speculators and to recommend measures for ensuring a fair price not only to the grower of jute but also to the jute mills. Mr. K. R. P. Aiyangar, Joint Secretary to the Government of India, Ministry of Finance, has been appointed as the Chairman of the Commission. The terms of reference of the Commission are as follows:

(a) To examine and enquire into the operations of the tiers in the jute industry and trade from the grower of raw jute to the seller of jute goods; (b) to examine and enquire into the factors which determine the return to the grower of raw jute for his product and the part played in it by the cost and the adequacy or otherwise of transport, the lack of contact between the grower of raw jute and its consumer, the absence of market information to the growers of raw jute and all matters relating thereto; (c) to examine and enquire into the nature and the content of speculations both in raw jute trade and the jute goods trade, the extent to which market prices are affected by the operation of mill owners, jute dealers and the speculative operators in the market and to consider in relation to the circumstances which rendered the closing of the *fatka* market in Calcutta in December 1952, the malpractices indulged in by the various units that operated in the *fatka* market resulting in undue depression of prices of raw jute as well as jute goods;

and (d) after such examination, enquiry and consideration to make recommendations to the Central Government on the measures necessary: (i) to secure for the grower as well as the industry a fair price for raw jute and jute goods, (ii) to put down the malpractices engaged in by certain sectors of the jute industry in order to rig up or depress prices for their own ends, and (iii) to ensure that the jute export trade is not affected by frequent manipulation of the market by interested persons.

Plainly speaking, the democratic system of Government based on bureaucracy suffers from slow movement and red-tapism. Quickness goes at a discount with democracy. Since the days of the British rulers, committees and commissions have become essential adjuncts of the Indian administrative system and our independence has not brought any change in that respect, on the contrary they have become much too frequent. The appointment of the Commission on jute marketing is not only unwarranted, it is redundant too. That shows that the Government does not care to examine the reports of the previous commission on the same subject. The appointment of the Commission is just an evasion of the responsibility for some time to come. There already exists voluminous literature on the subject of jute marketing, viz., the report of the Central Jute Committee on the marketing of jute and jute products. Although it was published in 1941, it was almost brought up to date in the revised edition published last year. There is also the report of the Export Trade Promotion Committee (Chairman: Mr. A. D. Gorwala) which deals extensively with the practices of *fatka* and other futures markets. It may be recalled that a memorandum on the futures markets subscribed to by all sections of the jute trade and industry was submitted to Sir John Anderson, when he was the Governor of Bengal. It is regarded as a highly useful document. On the same subjects there are two excellent reports of Prof. Todd. If any action is really intended by the Government, all that it has to do is to make a thorough perusal of these reports and decide on the lines on which excessive speculation can be effectively checked. Moreover, the Forward Markets Commission is going to be appointed soon. It can be asked to tackle this problem of *fatka* in jute trade. It is really puzzling to think what useful purpose will be served by the present enquiry commission.

The terms of enquiry of the Commission are comprehensive enough as they cover every aspect of marketing raw jute and jute manufactures. But futures trading should be the main concern of the Commission in view of the diverse opinions on its utility or otherwise to the jute grower and manufacturer. According to a section of opinion, the *fatka* market serves no other purpose than encouraging gambling orgies, while others contend that it is essential for ensuring liquidity and smooth marketing of jute and jute goods and for providing a hedge against future uncertainties. They argue that the hectic heights and the sharp falls in prices are due to the high sensitiveness of the market which is not

in itself a defect. Unless the futures market is sensitive, they maintain, it cannot provide a cover against future risks at economic premium rates. A futures market, if it is to serve satisfactory, must allow keen competition among the operators and in the face of keen competition, wide fluctuations in prices are bound to follow.

Whatever may be the conflicting opinions about the utility of the futures market, it is imperative that violent fluctuations in prices must be avoided. The widely fluctuating prices have become a recurring feature of the jute industry resulting in hardship not only to the grower of jute and manufacturers of jute goods but also to members of the trade. Irresponsible and excessive speculation brings about business failures, results in defaults and ends in crashes destroying the utility of the futures market. When speculation exceeds the bounds of moderation and reasonable risk-taking, it degenerates into gambling. This is the problem that encompasses speculation and for the prevention of which no satisfactory solution has yet been found out. A solution is required which, while preserving the futures market intact, will eliminate over-speculation. The inherent weakness of Indian businessmen is to overtrade and even to condone defaults and to compromise with the worst defaulters. And the speculator having largely intruded and obtained control in industry, thanks to war-profiteering and black-marketing, Indian industries are being adversely affected.

Indian Tea Crop

From the point of view of production, the current season (1953-54) opens on a more secure basis. The last season (1952-53) ended with a short-fall in production by 4.75 million lbs. as compared with the previous season's output. The Indian tea crop will be lower this season due to the deliberate cut in production. The latest figures of production of North Indian tea reveal that the production will be lower by about 12½ million lbs. South India is endeavouring to bring about an automatic reduction in crop by producing better quality tea, although the planters have not been able to accept any definite agreement on restriction of crop. There has been decline in the output during the first five months of the current year. One of the causes for this fall in output is attributed to the effort on the part of a large number of estates to concentrate more on quality than on quantity. In recent years there has been a pronounced deterioration in the quality of the Indian tea and in consequence India is losing her export markets to her rivals, like Ceylon, Dutch East Indies, etc. It is said that house-wives in London prefer better quality packets even at higher prices, because of the fact that quality blends ultimately turn out to be economical.

The enquiries made by the Rao Committee revealed that 60 per cent of the total Indian production of tea was medium tea, 20 to 25 per cent superior quality and the balance residual tea including "rejections." The tea estates should pay special attention to quality plucking

and destruction of waste tea, sweeping and fluff, commonly known as "rejections." In South India, what is called premium tea forms about 25 to 33 per cent of the production. Some suggested to the Rao Committee that it would help to support tea prices, if the rejections could be completely destroyed, as they are used as adulterants and were depressing the price of good quality tea.

The Tea Act 1953, confers powers on the Union Government to improve quality of tea. But there is a great demand for tea waste as consumers belonging to the low income group provide a market for them, obviously because they cannot afford to buy the high-priced quality tea. It is stated that no amount of State control will succeed in preventing production of tea waste, as there will always be loopholes for evading it. Voluntary co-operation of the industry is therefore essential.

Oil Politics in the Persian Gulf

Nearly two years ago Persia's oil ceased to flow to world markets, and in this short period the face of the rest of the Persian Gulf has been transformed. In Saudi Arabia and Kuwait there has been so great expansion of the oilfields that by the end of 1952, their joint increase in output had more than replaced Persia's production in its last year of full flow. Besides, there are rising volumes of production of new fields in neighbouring deserts. Last year two affiliates of the Internationally owned Iraq Petroleum Company, operating near Basra in Iraq and in the desolate Qatar peninsula, respectively produced 17 million barrels and 25 million barrels. In 1953 there has been a new find by the American Independent Oil Company in the Neutral Zone shared by Kuwait and Saudi Arabia. Meanwhile the earliest field on the Arabian shore, run by Americans in Behrein, yields its steady 11 million barrels per annum. Just to the south of it a member of the Royal Dutch-Shell group has taken up a 10,000 square mile sea-bed concession of the coast of Qatar. Aramco has located, but has not yet commenced production from, another under-sea field off Saffaniya on the Saudi Arabian coast, and there are local conflicting claims over rights to the rest of the shallow floor of the gulf. The Aramco and the Iraq Petroleum Company affiliate, Petroleum Development Ltd., are meanwhile prospecting in the untried deserts to the south-east and south-west of the Qatar Peninsula.

In respect of the crude oil supply, it is said that a return of the Persian flow on to the world markets would now be an embarrassment, not a help, to everyone except the Persians; it would entail reduction of output elsewhere, and it would bedevil the relations between companies and rulers who now count on higher revenue from oil. But this is not true of refined products. The Abadan refinery with its potential output of over 500,000 barrels per day is the largest in the world. The only other two refineries of size on the Gulf—Aramco's at Ras Tanura and the Behrein Petroleum Company's plant at Behrein—can each put through about 200,000 barrels a day. Other refineries in the Middle East are small

topping plants only. Abadan's output will continue to be missed in Asia until, from 1954 onwards, the refineries now being built at Aden, in India, and in Australia come on stream. It is no longer missed in western Europe where self-sufficiency in refining capacity has been attained. The following table will make the present position clear:

Crude Oil Production (million barrels)				
	1950	1952	Management	
Persia	241.4	10.6	1950—British:	
			Anglo-Iranian	
			1952—Persian: NIOC	
Saudi Arabia	199.5	301.8	American: Aramco	
Kuwait	125.7	273.4	Half-British, half-	
			American: Kuwait	
			Oil Company	

Direct Payments By Oil Companies to the Governments of Oil Producing Countries (\$ million)

	Saudi Arabia	Kuwait	Iraq	Behrein	Qatar
1950	112.0	12.4	14.8	3.3	1.0
1951	155.0	30.0	38.5	3.8	3.8
1952	170.0	139.0	110.0	6.3	9.0

With the disappearance of Persia's oil from world markets and with the rising tide of world consumption, the oil companies operating in the Persian Gulf have stepped up production to meet the rising demand. Financially, the arrangements with the rulers of the oil bearing territories along the Persian Gulf are the so-called 50:50 basis on the Venezuelan model that has now become common. Under formulas, which differ slightly from territory to territory, they are based on the principle of an equal division of profits before deduction of foreign tax, and the concessionaire pays home taxation only on his share of the proceeds, and the owner Government's share is unaffected by foreign taxation. Oil provides one-quarter of the national income of Iraq, one-half in Saudi Arabia and over three quarters in the smaller principalities, the highest proportion being that of Kuwait.

Now the rulers are becoming conscious and demanding higher rates. If there is a 50:50 agreement, why not insist that it should be made retroactive? If a concessionaire sells oil under bulk contracts at special price, the rulers are demanding that the profit should be worked out on the full price. The Sheik of Behrein is disturbed at the greater production and in consequence the greater wealth of a neighbour in Qatar who has far fewer responsibilities than he. Thus local jealousies are developing. The Saudis are inquiring whether Aramco has a right to sell its crude oil to its parent companies below market price and whether they ought not to be receiving compensation for oilfields discovered but not yet operated owing to the state of world demand. The rulers are now contemplating to push the division of profits towards 60:40.

In recent months the relations in the USA between the oil companies operating overseas and the Administration are hardly in the halcyon state. The decision to raise the Middle East crude oil prices is the outcome of a series of embarrassing pressure and counter-pressures from the American domestic oil companies and the Administration. If the cheaper oil of the Middle East were to flood into the Western hemisphere markets, who would gain? Certainly, the overseas companies operating in the Middle East would reap the higher profits. There would be a political rumpus in Washington from American domestic producers by comparison with which the 1949 criticisms of "dumping" would be insignificant. Severe repercussions would follow on Venezuelan oil output and upon Venezuela's politics. There would be a grumble along the Persian Gulf from rulers asserting that the oil companies were not crediting them with a fair price for the Middle East crude oil. The American market is prepared to take a reasonable amount of foreign crude oil "to supplement but not supplant" its own domestic supplies; and it disapproves the idea of full and free competition from the Middle East. Of last year's crude oil imports by Britain, 93 per cent came from the Middle East and less than 7 per cent from Venezuela and the USA.

Developments in Iran

Recent developments in Iran have been bewildering. The results of the referendum in Teheran early in August suggested popular support to the Mossadeq regime. The referendum was instituted to obtain popular sanction for the dissolution of the Majlis—the Lower House of the Iranian Parliament. The Upper House—the Senate—had earlier been dissolved by Dr. Mossadeq. The Majlis had been virtually ineffective as all the supporters of Dr. Mossadeq had resigned from it, thus leaving the House without a quorum. Even some Opposition members had also resigned. The Shah appeared to wield little or no power at all and apart from the economic crisis, Dr. Mossadeq apparently was master of the situation.

Then came the news of the abortive Royalist coup and the Shah's flight from Iran. Teheran Radio announced that at 11-30 p.m. on August 15, the officers of the Shah's Imperial Guards under Colonel Nasiri attempted to overthrow the Mossadeq Government by a military *coup d'état*. Dr. Hussein Fatemi, the Foreign Minister and two other Government leaders had been arrested by the insurgents. The Government successfully dealt with the revolt, put Colonel Nasiri in jail and ordered disbandment of the Royal Guards. The royalist coup was directed to instal Gen. Zahedi as the Prime Minister.

The Shah, who was holidaying with the queen at Ramsar on the Caspian coast flew out of the country to Baghdad from where he went to Rome. He said that he had appointed Major-General Zahedi to succeed Dr. Mossadeq as Prime Minister. He said that

Gen. Zahedi had not staged a *coup d'état* but had conveyed Shah's orders dismissing Dr. Mossadeq. He said that he did not contemplate abdication and would be willing to return to Iran if Dr. Mossadeq obeyed his orders appointing Gen. Zahedi as Prime Minister.

Meanwhile Persian police had been on the trail of Gen. Zahedi who was believed to be hiding in the scrub-covered hills of Northern Teheran. At a secret rendezvous there he was reported to have issued to the Press photostat copies of an imperial decree purporting to be a letter from the Shah appointing him Prime Minister. The Government announced a reward of 100,000 rials for information leading to the arrest of Gen. Zahedi, who issued a statement saying that he was the legal Prime Minister and asked the security forces to obey his orders.

Dr. Fatemi, the Foreign Minister, told Pressmen in Teheran on August 17 that Iran had no intention of proclaiming herself a republic and Dr. Mossadeq was officially reported to have been considering forming a Regency Council to act in the absence of the Shah.

For the moment the Mossadeq regime looked like surviving the shock. But it was overthrown by another royalist coup on August 19. Royalist troops overpowered the supporters of Mossadeq and seized Teheran. The Shah was cabled to come back. Dr. Fatemi, the Foreign Minister, was reported to have been 'torn to pieces' but was subsequently reported to be in hiding. Dr. Mossadeq escaped and remained in hiding and later on surrendered after it had been announced that he would not be killed.

Demonstrators supporting the Shah burned buildings in the centre of Teheran and also set fire to a Theatre used by the Communist Party and wrecked a Russian shop.

Ayatullah Kashani and Hussein Makki, former supporters of Dr. Mossadeq, came out in support of the new regime.

On receiving the news of the overthrow of the Mossadeq Government, the Shah declared from Rome that he would return when the news was confirmed. He said: "This is not an insurrection. We now have a legal Government. Gen. Zahedi is the Prime Minister I appointed." He said that with the exception of the Communists, 99 per cent of the population were for him. He said that he had left the country to avoid bloodshed. In reply to a question he said that he had no reason to go to England. Regarding relations with the U.K., he said: "Our differences with the British remain. But any nation which would recognize our supreme interest and our sovereignty, and which tries to have decent relations based upon mutual respect, would have no difficulty in establishing normal relations with our people."

The Shah returned to Teheran on August 22. In an interview prior to his arrival he declared: "The Anglo-Iranian exists no more in Iran. The oil has been

and remains, nationalized." He was contemplating radical reforms, he said, and was going to start again the distribution of his personal fortune according to a programme he had himself chalked out.

Dr. Mossadeq had been arrested on August 20 along with Dr. Moazami, former Speaker of the Majlis and member of Dr. Mossadeq's oil nationalization team; Dr. Ghulam Hussain Sadiqi, Minister of the Interior, and Dr. Sayed Ali Shayegan, another member of the oil nationalization team. They were arrested from the house of Dr. Moazami.

The new Premier, General Zahedi, presented his Cabinet to the Shah on August 23, in which he himself retained the portfolio of Minister of War and Minister of Interior. The Cabinet included a number of former Premier Ali Razmara's colleagues as well as some from Dr. Mossadeq's Cabinet.

The new Government would continue the present Soviet-Iranian talks, Gen. Zahedi said. The Government announced on August 24 that all oil contracts made by the previous Government to sell oil to Japan and Italy at reduced rates would be fulfilled.

Reuter reports: "Resumption of parliamentary activity in the country might take the form of a new Senate being formed immediately rather than the old Senate being revived. The Senate consists of 60 members, half of whom could be nominated immediately by the Shah.

"Elections for a few seats might be held to provide the requisite quorum. This would be followed by elections for the suspended constituencies of the Lower House."

It was also reported that Britain had told the U.S.A. that she would fully support an American emergency dollar grant to Iran to help the consolidation of the new regime of General Zahedi. President Eisenhower had expressed full support to the new Government.

Earlier on August 15, the *Bombay Chronicle's* Teheran correspondent wrote: "As Iran is preparing for a fresh General Election, after the dissolution of the 17th Parliament on the strength of the results of the referendum, the cold war between the U.S. and the Soviet Union in this country has been fully intensified, and observers believe the present one would be a decisive round . . ."

The correspondent further wrote: "The United States seems to have changed its policy towards Iran almost completely and the increasing accusation by U.S. diplomats of the regime of Dr. Mossadeq is interpreted by informed quarters as an 'open offensive in the process of being launched against the present Government of Iran.' . . ." (*Bombay Chronicle*, August 19, 1953).

Commenting on the overthrow of Dr. Mossadeq's Government, the *Leader* wrote on August 22 that it would be regretted by progressive forces in Iran. The paper said that "intervention of the Iranian army in

politics does not augur well for the future of Iran." It characterised as "false" the allegation that Dr. Mossadeq was pro-Communist and considered it was wrong on the part of the U.S. Government to stop American economic aid because Iran had not been amenable to British wishes. Reiterating that Dr. Mossadeq had the popular backing, the paper said: "It is the army and the reactionary section of the people who have overthrown Dr. Mossadeq. If there is a fair and free election, Dr. Mossadeq will sweep the polls as he did last year."

The Foreign Policy of Indonesia

Djakarta (WP).—When Premier Wilopo returned his mandate to President Sukarno of Indonesia early in June, he had one satisfaction: for 14 months he had maintained a government, a longer time than any predecessor. But Wilopo was heading into a long series of difficulties as he and others sought to establish a successor regime.

Asia's newest republic is having its troubles. Many observers are pessimistic about the future. Dutch colonialists, of course, still hope the Indonesian people will admit their inability to govern themselves and will request the Netherlands to return. Federalists who spurn the van Mook divisions of the state (in the United States of Indonesia period) as a means of continuing Dutch control, believe the Republic must retrace its steps by granting the regions a large measure of self-rule. The central government is unable to suppress the bands in West Java which have been killing, burning and looting nightly; some of these are Islamic terrorists whose aim is to establish a theocracy by force; some are Communist-inspired; many are simply people who would rather rob than work.

There are conflicts within the army. National income does not equal necessary expenditures. The dependence of the people on selling a few products, such as rubber, tin and copra does not afford a sufficient spread to protect the nation's economy against fluctuations in world prices. There is as yet no representative parliament; politicians can only guess at the real popular will. Yet the Nationalist Party refused to back the policy of the government with respect to land distribution in Sumatra on the ground that it was against "the will of the people." The low literacy rate (some put it at only eight per cent) complicates the holding of national elections. The country's adherence to an independent foreign policy prevents it from securing adequate help from either of the two world blocs.

Yet a conviction prevails that if any land of Southeast Asia will survive, it will be Indonesia. With only a few trained leaders, the country is doing the best it can, on far too little, and that alone is ground for some encouragement. There is no whining, no "itching palm" for foreign gifts. In spite of all, the country believes in itself and generally in its future. Whoever picks up Wilopo's mandate, however, will have no easy job.

Dr. Mohammad Hatta, Vice-President of Indonesia, in an article in the *Foreign Affairs*, writes that the foreign policy of Indonesia is based on the *Panchasila*, the five postulates that constituted the basic national philosophy of Indonesia. The *Panchasila*, contained in the preamble to the constitution, carried the acknowledgement that the Indonesian Republic was based upon the belief in Divine Omnipotence, humanism, nationalism, democracy and social justice. Acknowledging the Divine Omnipotence, however, did not mean that Indonesia was a theocratic State but that the majority of the Indonesian people believed "in God, and as a corollary, acknowledge the existence of certain moral values."

In accordance with the provisions in the constitution of the Republic, the Government of Indonesia was to work for the inclusion of the Republic of Indonesia in international organizations.

The Republic was following a foreign policy designed to strengthen world peace and international co-operation and non-alignment with either of the power-blocs. The objectives in foreign policy were to defend the freedom of the people and guard the safety of the State; to obtain necessary capital and consumer goods from overseas for national reconstruction and betterment of the standard of living of the people; to strengthen principles of international law and to aid in achieving social justice on an international scale, in line with the U. N. Charter, in particular by endeavouring within the U. N. framework to help colonial people achieve freedom. The objective laid special emphasis on initiating good relations with neighbouring countries, the majority of which had in the past occupied a position similar to Indonesia.

The present world conditions of *apartheid* and cold war did not encourage ideals of world brotherhood. But the Indonesians believed in the common-sense of mankind, which desired peace, and were therefore confident that their ideals would be achieved in the long run. The desire to strengthen forces of world peace had impelled Indonesia to keep out of the power-blocs and explained "Why it is not prepared to participate in any third bloc designed to act as counterpoise of the two giant blocs."

This non-alignment did not mean that Indonesia was neutral. On the contrary, she was committed to international solidarity. As a member of the United Nations, Indonesia could not adopt an attitude of neutrality. But because international solidarity had not yet been achieved and the world was cracked into two pieces, under present conditions, Indonesia would remain neutral, in case, a war broke out. "Indonesia plays no favourites between the two opposed blocs and follows its own path through the various international problems. It terms this policy 'independent,' and further characterizes it by describing it as 'independent' and 'active.' By active is meant the effort to work energetically for the pre-

servation of peace and the relaxation of tension generated by the two blocs, through endeavours supported, if possible, by the majority of the members of the United Nations." This independent policy kept her from enmity with either party, preserved her from taking sides, and permitted her to be friends with all nations on a basis of mutual respect.

Dr. Hatta writes that the foundation of that policy had been laid by the Indonesian Government in 1948, while it had been still engaged in a struggle against the Netherlands. The former Prime Minister, Mr. Wilopo, had redefined the Government's policy and had declared that "the Republic of Indonesia has decided to adopt an independent attitude in the sense that

- (a) It does not permanently take sides by pledging itself to either of the two blocs which are in controversy with each other;
- (b) It does not pledge itself permanently to keep aloof or to remain neutral in every incident which may arise out of controversy between the two blocs."

This "independent attitude" was of a positive nature in the sense that in the event of a problem arising out of the controversy of the two contending camps "the Republic of Indonesia will continue to base its attitude on its independence of action taking into consideration

- (a) Its own conception of its aim and purpose as a sincere, loyal and serious member of the United Nations, and

- (b) Its belief in the importance of this State and nation as a factor of great influence in the immediate as well as remote future."

Indonesia's military strength was insufficient for her self-defence. Therefore, her foreign policy aimed to prevent the country from being attacked. "Indonesians believe," writes Dr. Hatta, "that this possibility of attack will be minimized so long as the country adheres to its independent policy and actively tries to prevent the outbreak of World War III."

Her internal objective situation also had tended to lead Indonesia to adopt this line of foreign policy. The primary task facing the Government was internal consideration after so many years of wars and disorganization. "A foreign policy that aligned the country with either bloc of Great Powers would render this internal task infinitely more difficult." She needed to keep on friendly with all nations for economic reasons also.

East and West Germany

What is the situation like, now, after the riots in East Germany? How will things shape now the Soviets have got their zone under control? The *Worldover Press* reports are as follows, as made on July 10:

Time alone will tell whether the Russians, now ruling sternly under martial law, will go back to a harsh

policy or eventually relax and resume their peace tactics. There is widespread expectation that the latter course will be followed. History indicates that once a dictatorship begins to abandon its toughness, the lid is off, and there must be further concessions. Two days before the riots, High Commissioner Semeonov had begun a program of greater co-operation; passports were freely granted, and those who had left farms in the East were told they could have them back, unmolested. Notwithstanding severe Russian controls, there have been numerous concessions to the East Germans, and it is widely believed that the harsh discipline now invoked by the Russians is directed as much against the inept Grotewohl East German regime as against pro-Westerners. If there are the usual purges and a new set-up is worked out, a regimen of moderation is anticipated, with the emphasis again on German unification.

CAN GERMAN UNITY BE ACHIEVED?

Suppose the best and most incredible thing should happen, asks German affairs expert Joachim Joesten, reporting to *Worldover Press*, and the Kremlin pulled its troops out of East Germany and permitted free elections? The outcome is certain—an *Anschluss* of the Soviet Zone to the Federal Republic. What then?

Western Germany has retained its traditional form of federal government and is composed of nine *laender* or states. Eastern Germany, which also started out as a federal republic, wiped out the traditional state lines in August, 1952, and is now divided into 14 *bezirke* or districts, named after their chief cities. If East Germany were added to West Germany, it would by itself make too big a state, arousing fears of its predominance; yet each of the 14 districts would be too small to constitute a state.

The new electoral law adopted by West Germany would reduce the Communist vote in East Germany still further. And in the economic field the task of finding a common denominator is appalling. The drastic land reform of 1945 has radically changed the face of Eastern Germany; former large estates have been cut up into small farmsteads grouped in co-operatives. Tens of thousands of "big peasants" have fled to the West and if the country is reunited they will clamor for the return of their properties, while the new settlers will fight to stay. East Germany's mines and factories have been expropriated; how can they be turned back? Perhaps a capitalist and a Communist society can co-exist, but can they be welded together into an integral whole?

When and if unification takes place, another formidable problem looms. A hint of it may be found in a pamphlet just issued by the Bonn "Ministry for All-German Affairs." It is wrong, this publication suggests, to refer to the Soviet Zone of occupation as "Eastern Germany." Rather, it should be called "Central Germany," for to the east of it are other provinces, now under Polish administration, that once belonged to the Reich, and will, perhaps, again.

Korean Political Conference

The four-nation proposal recommending India's participation in the coming political conference on Korea was passed by the U.N. Political Committee by 27 votes to 21 with 11 abstentions. Those voting against the proposal included Pakistan, the USA and Latin American countries. The margin, in favour of India's participation, if maintained in the General Assembly, would not be enough for a two-third majority. It was mainly due to strong U.S. opposition to the proposal that it failed to secure two-thirds majority in the Political Committee.

The proposal to invite Soviet Russia to participate in the Political Conference was adopted by 55 to 2, with two abstentions.

The main Allied resolution setting up the Korean peace Conference was approved in full by the U.N. Committee by 42 to five, with 12 abstentions.

The Soviet proposal for a 15-nation Conference was rejected.

There had been much wrangling inside the Political Committee as well as behind the scenes over the scope and composition of the Conference. The United States delegate put forward the point of view that the Conference should be limited to the powers contributing armed forces in Korea. This view was challenged by the British delegate and many others. They said that the U.N. was the party and the U.N. should participate in the talks. Then there was the stubborn opposition of the U.S. delegate to the proposal inviting India's participation in the Conference. In it her main supporter was the delegate from South Korea, who indulged in a diatribe against India in which India was charged with complicity with the Communists and scheming behind the backs of U.N. Mr. Pyun Yung Tao, the South Korean Foreign Minister, in a speech before the Committee on August 24, stated that South Korea found it impossible to collaborate with India on the same side. He accused India of being in 'mortal fear' of Communist China. India had appeased Communism and had not sent a single soldier to Korea. But she had now willingly dispatched thousands of troops to guard "the Kremlin" created in Korea, where defenceless anti-Communist prisoners "will be indoctrinated or brain-washed into Communism for many long months."

India was assiduously "laying schemes" to enhance the prestige of the Chinese Communists by inviting them into the U.N. and "handing Formosa" over to them. "With or without collusion with the enemy India master-minded an arrangement for the exchange of prisoners of war which was calculated to carry out the forced detention and forced repatriation of all anti-Communist prisoners to which so much ostentatious and hypocritical aversion was displayed," Mr. Pyun said.

"This is treachery of the first magnitude to be shown to a well-meaning neighbouring people," he declared.

"From the knowledge of how India has been behaving in Kashmir, my delegation gravely doubts whether

India would live up to the high moral standard it seems to expect the Republic of Korea to practise," he said.

The South Korean delegate was stopped and reproved, and not allowed to continue with his idiotic statements.

Sir Gladwin Jebb, the British delegate, said on August 26, "We think that India should participate in the Political Conference since she is not only a great Asian State, but it is also in a particularly good position to play a constructive role. After all, if it had not been for the efforts which the Indian Government made to persuade the Peking Government to accept what the majority of members of the Assembly thought was an honourable solution of the prisoners of war difficulty, we might well not at this moment be reaching back our prisoners of war."

The whole controversy was terminated by India's withdrawal as reported in the news below:

New York, Aug. 28.—India to-day dramatically withdrew her name from consideration as a member of the Korean Peace Conference.

Mr. V. K. Krishna Menon, the Indian delegate, asked the United Nations General Assembly not to press the resolution recommending a seat for India at the conference. His request came just before the Assembly was due to vote on the issue.

Mr. Menon said he hoped that the Assembly would not force the resolution concerning India to an issue.

The Assembly's Political Committee yesterday approved a recommendation that India should take part by a vote of 27 to 21 with 11 abstentions. This would not have been enough to have given India the necessary two-thirds vote in the Assembly.

As Mr. Menon left the rostrum the Assembly delegates warmly applauded him.

Mr. Menon told the Assembly that India's action was motivated by the consideration of creating the proper atmosphere for what he described as the "post-armistice period."

The recommendation that India should go to the conference was made by Britain, Canada, Australia and New Zealand and had been strongly opposed by the United States.

Britain and the United States split in the vote in the Political Committee yesterday. India's withdrawal today obliterated another Anglo-American division in the Assembly.

Mr. Menon declared that India had not been subjected to any pressure by Britain or any of the sponsors of the resolution.

Mr. Henry Cabot Lodge, the United States delegate, immediately paid a tribute to Mr. Menon for a "generous and statesmanlike" attitude.

Mr. Lodge said, Mr. Menon's statement that the purposes of peace would best be served by not forcing the resolution on Indian participation to a vote in the Assembly is generous and it is statesmanlike.

"His desire in his own words not to add to the heat of battle has come from a man whom we consider to be

a great representative of a great leader of a great nation," said Mr. Lodge.

"It is the kind of spirit which gives us hope for the future. Our position on this question was not directed at India as such. On the contrary we feel deeply that at any later discussions or conferences on Far Eastern matters, India must play a central and constructive role."

Mr. Leslie Munro of New Zealand, one of the sponsors of the recommendation for Indian participation, announced on behalf of the sponsors that in view of Mr. Menon's statement he would ask the Assembly President not to put the matter to a vote.

Mr. Munro said that India had not sought a place at the conference. If India had been given a place she could have given valuable service.

"We desired India to play her part and profoundly regret she is unable to do so," Mr. Munro said.

The representatives of the 16-member nation listened attentively as Mr. Menon began by saying that the main resolution on the setting up of the conference sponsored by 15 of the 16 countries which sent troops to Korea "contains the possibilities of bringing about the desirable results which should flow from the armistice, given goodwill on all sides and if the extensive possibilities are fully explored."

This was not the time to enter into controversies, Mr. Menon said.

India's approach to the matter he said was that "we are in a post-armistice period; we are marching towards peace rather than merely stopping the war."

India's own understanding was that the Chinese peoples and North Korean governments would approach the problem "in a mood of reasonableness and a desire to bring about a peaceful settlement."

For all these reasons Mr. Menon said India had not participated in the vote in the committee on the setting up of the conference.

That was not because India did not have any views or concern or was indifferent.

"But there are times when even silence is service," said Mr. Menon. "This is one of those occasions when even those who 'stand and wait' perform a service."

He asked that in the record of the proceedings of the committee the position of India would be recorded as not having participated in the vote. It would appear in the present report, said Mr. Menon, as though India had been absent.

The Situation in Indonesia

Giving the background of the protracted Cabinet crisis in Indonesia, S. Kenglov writes that Indonesia was facing an economic crisis. Agricultural production was declining. Unemployment was on the increase as a result of closing down of many plants unable to bear foreign competition. The foreign trade deficit was on the increase and reached the figure of 1,636 million rupees in 1952.

Mr. Kenglov ascribes this state of affairs to the fact that "Indonesia's economy is still controlled by foreign capital, which is interested solely in extracting the highest profit. The chief exploiter of the Indonesian people is Dutch capital, it controls some 80 per cent of all the foreign investments in the Republic and in 1951 netted a profit of 518 million guilders."

The Republic's economy was keenly feeling the adverse effects of the Washington-imposed Ban on trade with China. Rubber was Indonesia's key product. In a good year, the Republic produced 700,000 tons of rubber, over 8 million people depended for their livelihood on the rubber industry, which also brought in 51 per cent of all the foreign exchange.

Referring to the recent Cabinet crisis in Indonesia he writes that the Wilopo Cabinet had resigned because its Masjumi members had tried to return the Sumatra plantations, taken over by the peasants, to the Dutch planters, and restore the rights of Bataafsche Petroleum to the Sumatra oil fields. Masjumi had also resisted the popular demand for measures against the communal Dar-ul-Islam bands.

Four-Power Conference

The Governments of the U.S.A., U.K. and France, following decisions taken at the Washington Conference of Foreign Ministers of the three countries, had invited the Soviet Union at a Four-Power Conference at the end of September to discuss "organization of free elections in the Federal Republic, the Eastern zone of Germany and in Berlin;" and "conditions for the establishment of a free all-German Government, with freedom of action in national and international affairs." The notes, delivered on July 15, said that those were essential steps which must precede the opening of discussions with the Soviet Government for a German peace treaty. It was also stated that at the first meeting agreement should finally be reached on the Austrian treaty.

In a reply, delivered to the Western Powers on August 5, the Soviet Union declared her readiness to join a Four-Power Conference, but stated, she considered the participation of the Chinese Peoples' Republic as essential. The Soviet Union insisted that the agenda of the discussion must be widened and should include both Europe and Asia, and a discussion of measures for easing international tension including reduction of armaments and the prohibition of military bases on the territory of foreign States. The note said that with the "cessation of the war in Korea and conclusion of an armistice, favourable conditions have been created of securing relaxation of international tension." The primary responsibility for maintaining peace and international security rested—the U.N. Charter provided for it—with the five Powers, the U.S.A., Great Britain, France, Soviet Union and Peoples' Republic of China.

The reply said that the notes of the Western Powers avoided the fundamental question of the "national unification of Germany and conclusion of a peace treaty." The suggestion for an all-German election, the proposal to appoint an impartial commission of representatives of foreign States for investigation with a view to creating the conditions necessary for the holding of such elections would "not only fail to assist the unification of Germany, the foundation of an all-German democratic government and the conclusion of a peace treaty with Germany, but would have Germany divided into a Western and an Eastern part and would continue to delay the conclusion of a peace treaty. The reply also pointed to the dangers of remilitarization of Western Germany."

However, the Soviet Government attached "great importance to joint discussion by the Powers of the German question and hopes that such discussion will enable comprehensive examination of pertinent problems relating to the re-establishment of German unity and together with the solution of the question of a peace treaty with Germany, will conduce to the consolidation of peace in Europe."

The reaction of the British Foreign Office was that the Soviet reply was not a rejection of the proposals for a conference of Foreign Ministers. To that extent it was welcomed.

The *Times* reports that unofficial U.S. sources had expressed disappointment that the Russians had made no reference to the question of timing of the proposed talks. The *Times'* Washington correspondent says that it was noted with concern "that the Russians seem to be proposing a conference which is not only very much broader in scope than that envisaged in the Western invitation but which would seem also to depend on certain conditions, including agreement to discuss the question of 'banning of foreign military bases on territories of alien countries'—in other words, to discuss the North Atlantic Treaty Alliance which the U.S.A. is determined to avoid." (*Statesman*, August 8).

Commenting on the suggestion contained in the Soviet reply to the Western note, the *London Economist* writes: "But on such general matters the Allies would do best to say again they see no point in talking about each and every cause of international tension until they have tested possibility of negotiation and agreement about the main one, Germany. They cannot contemplate for a moment, Sir Winston Churchill least of all, another Yalta in which the great Powers attempt global bargaining—what the Russian Note calls 'a free discussion of the ripe international problems.'"

"Nothing would divide the Allies more quickly than any such conference; and it must remain the prime object of the Russian Government, however

sincerely it may seek a *detente*, to divide the United States from Britain and Europe."

The *New Statesman and Nation* wrote on August 8: "If the Western Powers could fairly be charged with making difficulties in seeking to confine the conference to the almost insoluble problem of Germany, the Soviet Union gives the impression of making her tactical purposes an equally unhelpful *riposte*. With the agenda widened to include the whole world from the Sakhalin Islands to Casablanca, the sort of conference for which the Russians are now asking would give limitless scope for mutual recriminations and reciprocal barrages of propaganda."

The *Observer* writes that the "immediate task of diplomacy today" was restoration of confidence between the Soviet Union and the West. The difficulties of a European settlement, though real and manifold, were not unprecedented and insurmountable. Suggesting a way in which this task might be furthered the paper proposed a meeting of Foreign Ministers provided it preserved "a measure of informality and a still greater measure of privacy and seclusion." The paper lay great stress on the secrecy of the talks and writes that if the Foreign Ministers' Conference could not guarantee that secrecy, the Powers should resume diplomatic contacts and discussions through ambassadors which had the advantage of being less spectacular and arousing fewer public expectations.

Wastage in Industry

While delivering the Acharya P. C. Roy Memorial Lecture on "Development and Utilisation of Scientific Talent in India" held under the auspices of the Indian Chemical Society at Bombay, Dr. J. N. Mukherji said that the country was annually losing about Rs. 100 crores due to the faulty process of recovery of sugar from the cane in the manufacture of *gur* and *khandasari*, reports the *Bombay Chronicle* on August 10.

"Dr. Mukherji stressed the importance of a scientific policy for the State which alone could tackle the problems of poverty and under-development facing the country. Recalling the vital role played by unofficial scientific institutions in promoting science and making available the fruits of science to the industry and the people at large in the Western countries, the lecturer pleaded for greater help to and better recognition of such institutions in the country."

"While welcoming the policy of the Government to accelerate the progress of industrialisation of the country with the help of foreign experts, Dr. Mukherji warned the authorities that there were a number of lines of development where such co-operation might not be available in the absence of common fields of interests if the interests collided."

He said that this dependence of our resources on outside help was like a lopsided industrial advancement and pleaded for building up the scientific, technical and engineering potential of the country. Expenditure would repay the outlay many times and quickly.

The Press in Pakistan

Discussing the condition of the Press in place she *Star's* special correspondent writes that the Pakistan was very weak because the readers were restricted on account of high prices and because of low incomes from advertisements which were only a few, owing to the lack of industrial development. As a result the newspapers depended upon foreign firms for advertisements and, as a fact, more than half of the entire advertisement revenue earned by newspapers in Pakistan came from establishments owned and run by foreign interests. "And advertisement money is not merely money! It is much more," writes the special correspondent. "Advertisers have been known to wield considerable influence stifling the truth. In our country if this baneful influence is a little more pronounced, it should not be surprising at all."

The other most disturbing element was the influence of politicians on newspapers or newspaper editors. "Most of the newspaper proprietors are running newspapers not as newspapers but as just another instrument to quench the pitch in their favour, be it in the field of politics or in some other field." Then there was too much interference by the proprietors. The journalists had no security of service. They had to say *ditto* to whatever the proprietor asked to write or to quit their services. Dismissals and resignations were frequent.

Such a situation could not fail to tell on the efficiency and ultimately on the financial position of the newspapers. "And from here there are only two ways open to the newspapers: to close down and bury the whole affair or to rake up money somehow to keep the disaster at bay."

"Money obtained 'somehow' is seldom productive of pleasant results. If not earlier, the newspaper finds itself in an alley when there is only one way out—blackmail, which we call irresponsible journalism."

The working journalist had no say in any matter. "The fact is that an average pressman seldom shares the vices of the press and equally seldom his virtues are afforded an opportunity to shine through the printed sheets you read as newspapers in Pakistan."

THE LION-HEARTED LEADER

An Intimate Impression of Syama Prasad Mookerjee

By Sr. NIHAL SINGH

(Specially written for *The Modern Review*)

Mr. Kenglov fact that "Indor foreign capital the highest pr people is D of all the f 1951 nette

The 1, first floor chamber in an opulent, adverse eff. neighbourhood in Calcutta was lined with Chinks from floor almost to ceiling, save a good ydoors and windows. In the centre near rubber, c farthest from the front, way be'ow which livelihood traffic ceaselessly flowed, was set an out-in 51 peout chair. It was none too big for the

Re'heavily moustached occupant. So filled he wilearning, Eastern and Western alike, was he, its Mosh Mookerjee, that his admirers—and playr number was legion—spoke of him as the p'atara (incarnation) of Sarasvati (the goddess of Wisdom) in this *Kaliyuga* (the iron age).

From him my eyes wandered towards the figure that, following my entry, had noiselessly glided into the Presence and stood with bowed head, ears attuned to some message or mandate. In build and feature the two bore unmistakable similitude. In years they were a generation apart.

This was, I learnt, Syama, the second son of the celebrated jurist, lawyer, linguist, scientist and, above all, educationist—Dr. Asutosh Mookerjee. By virtue of native intelligence and by dint of hard, conscientious work, the moustached Sarasvati had earned the title to append almost half of the alphabet to his name.

Possibly because of his size, the son looked remarkably mature, though he had but entered his twenties. His attitude towards the author of his being impressed and pleased me. Adoration was writ large upon his face. Eyes, ears, hands and feet were all eagerly devoted to the service of that embodiment of erudition he evidently loved more than life.

This was in 1921-23. I was back in India after my second globe-girdling—a decade spent largely in Europe.

An encounter had taken place shortly before between Asutosh and the satrap set up by Dame Britannia to rule in her name over Bengal. Of that set-to, many tales were current. Lord Lytton, whom I had met in my early days of English journalism, and who shared my interest in penology, had inherited Bulwer's brain as well as the title. He had authority at his back, too. Yet he had not have the best of the bout with his Bengali Vice-Chancellor of the Calcutta University, who could brook no interference with his administration of the institution, veiled or open.

I had a job of work in hand that kept me in

Calcutta for weeks, so I had some opportunity of observing the second son of that formidable personage. What under-study was more advantageously placed, I asked myself, or albeit was more capable of benefiting from that opportunity?

Fifteen years had bubbled up from Eternity's cauldron and had been sucked back into it before my gypsy feet were once again treading the Calcutta side-walks. In the meantime Syama had graduated from the University, had gone to Britain (while I was living somewhere else), there had pursued his legal studies, eaten his dinners, been called to the Bar, attended some conferences as the representative of his *alma mater* and returned to his natal city. He had shown no great keenness to practise law but had taken with avidity to educational administration. At three and thirty he had been inducted into the office that had given his father the spring-board for exalting Bengal.

Several letters typed on the Vice-Chancellor's letter-paper with Syama's bold, clear, firm signature, had been winged my way. Familiar with my writings from his school days, when he had devoured them as they appeared in *The Modern Review* and other Indian magazines, the epistles had been couched in terms that warmed the cockles of my heart. They whetted my desire to renew acquaintance with him.

I would fain have gone to meet him in his office or in his home: but he insisted that on the first occasion he must call on me. I appreciated his sentiment and respected his wish.

The difficulty was that just at that moment I had no fixed abode. I was, in fact, occupying what my good lady, in her expressive Americanese, called our "palace on wheels." My railway friends, who in the kindness of their hearts, had placed it at my disposal so that we may travel in comfort, had ordered it to be parked at a platform in the Howrah station, next the street. So airily dismissing her qualms born of propriety, I made an appointment for Syama to call one afternoon.

When railway men happen to be in the right mood they, in the words of the jingle, are

"...very, very good,

And when they are bad they are horrid."

That "O.C." (in their cant "officer's carriage") was "some" carriage indeed. It was, if I remember aright, 69 feet long and ran, I believe, over twelve wheels. There was a huge compartment that served as drawing-cum-dining-room during

the day and bed-room at night, in addition to another large bedroom across the entrance-aisle. The bath, I seem to recall, was seven feet long and four feet wide. The train in motion at anything like top speed set up such a wave action that I, used to a much humbler mode of living, never dared to get into it unless the saloon was parked at a siding. There was, however, another tub elsewhere which was much more like the one that a frequenter of (English and other) landlady's lodging houses was accustomed to. In addition to the two large bedrooms there were rooms for the secretary and staff and next to the lesser bath room a "cabin" for the servants almost as large as a first-class compartment, as was also the luggage room. Beyond it was the kitchen—roomy, light and airy, fitted with a real cook stove. This was my delight, for the recipes that appear in my cookery articles are all evolved by me and tested before they go into print.

Just as the hour set for Syama's coming was striking the floor of the carriage rocked, not too gently. The tea-things clattered.

"Oh, dear!" exclaimed my wife with some petulance, "oh, dear! they are moving the saloon again."

"What difference does it make?" I, no less disturbed, said in a tone calculated to soothe her nerves much jangled by prolonged "rambuncting" (to use her own expressive Americanese).

"You apparently have forgotten," she almost shrieked at me, "that an important caller is just about due. You told him that he would find this 'palace on wheels' parked alongside the No. 10 platform at the Howrah station. He, therefore, would have no difficulty in finding us."

This was only too true. The saloon was in motion while this colloquy proceeded. By the it was well into the yard. Except for a cabin from which men ever on the look-out manipulated levers that, according to the need of the split-second, shifted points, there was nothing in sight but rails, shining in the westering sun and carriages and waggons on some of them.

Alarmed—genuinely alarmed—Mrs. Singh gloomily predicted: "He will come and, finding no saloon at the spot you named, will go whence he came. Even if some one perchance tells him where this blessed carriage has been shifted to, he will never be able to locate it in this—wilderness—wilderness of rails. So that is that."

"A man who had the wits and the energy to climb into the seat of the Vice-Chancellor of the Calcutta University at an age when many of us have not finished cutting our wisdom teeth," I assured her, "would not be fazed by this little move for which there is doubtless good and ample cause. More than likely the Station Superintend-

ent's eye will pick Syama out of the multitude and he will personally conduct your august visitor to us. I promise you that you will presently see his smiling face beaming at you from that door through which he will be entering."

Sure enough. That was exactly what happened. Hardly were the words out of my mouth when there was a click and the door near which my good lady was sitting swung upon the carefully greased hinges and a man entered. From the size of the head I could recognize it as Syama's.

A bare head it was. Somewhat closely cropped.

A giant he looked as he, upon entering, straightened himself, advanced towards Mrs. Singh, bowed, shook hands and expressed his joy at seeing her. There was nothing of the lackadaisical Oriental in his step, speech or handshake.

As he next greeted me I saw how much he had matured since our last meeting. His manhood was, certainly, in flower.

"Our brother Asutosh has left us," I remarked, "since we were last in Calcutta."

"He died in 1924—on May 25th," he replied.

"The greatest tribute that ever was paid to him," I remarked, "emanated from Lord Lytton. Unconsciously, no doubt. When your father and he had scarcely ceased measuring swords, he, seated in the study in that grand mansion in Calcutta built in imitation of the Cu zonian country seat, confided in me:

Lytton: "If the schemes that you have in mind go through, the number of persons who would have passed through the portals of the University would outrun the number of jobs. You would hardly credit the remark he made."

Asutosh: "I shall not mind."

Lytton: "Not mind unemployment among the educated?"

Asutosh: "Precisely."

Lytton: "Why?"

Asutosh: "Don't you say over there that discontent is divine?"

"You see," commented Lytton, "Asutosh Mookerjee wishes to shake the very foundations of *pax Britannica* in the East."

Syama, who had not heard of this passage at arms, was patently impressed with it.

"You must write Father's *Life*," he said, with that downrightness that I had already learnt to associate with him. He seemed to know his mind—to possess the faculty of making up his mind quickly—resolutely.

I thanked him politely.

"No, no," he said, "this is no new brain-wave on my part."

"Indeed, no," interposed Mrs. St. Nihal Singh, "I remember you mentioned it in a letter—or was it in more than one?"

Bubbling with joy at this, he began to outline the book, child of the slow-moving East though he was supposed to be.

"There were four sides to Father," he explained, "at least four, each more or less distinct from the others."

"Firstly, there was the scientist. He had the mathematician's brain. In his B.A. he had worked out a problem that astonished mathematicians abroad. With that foundation he could have become a great physicist had he so willed—or tried to be."

"Secondly, there was his linguistic, literary side. His mastery over English did not so occupy his mind that he did not become proficient in Sanskrit. This was evident from the ease with which he won two degrees in Sanskrit learning. He had taken pains to learn all these as well as Bengali. What I must not fail to add is that he could use to effect all these languages both by word of mouth and by pen. This was indeed remarkable."

"Thirdly, after gaining distinction in his chosen profession, he went from the Bar to the Bench. The questions he put, the points he elucidated, were admired by the most eminent counsel, both in India and in Britain. The judgments he handed down were noteworthy equally for their grasp of law, appreciation of the finest points of law and equity, brevity, lucidity and precision of language."

"Fourthly and perhaps greatest of all, he was an educationist. As syndic of the University during his early years he made a mark. His terms of Vice-Chancellorship enabled him practically to rebuild that institution by developing science and technology, philosophy, culture, art and literature. He gave a new direction to life in Bengal. His keenness for the adoption of the mother-tongue as the vehicle of education was already exercising a profound influence before he passed away."

"Not the least good that he did was to fish out young men of promise and give them the opportunity to develop their gifts. Father installed a young Andhra at the University as head of the philosophic side. By his intellectual gifts and work Sarvapalli Radhakrishnan acquired a world-wide reputation. C. V. Raman was persuaded to leave the Accounts Department, where he had brilliant prospects, and devote himself to science, though to begin with he would be financially worse off. Meghnad Saha, too, he encouraged. You will observe that he did not confine himself to Bengal, but sought his men wherever he could find them."

III

"How about your own work at the University?" I asked. "There you have come into a great inheritance."

Almost everything Syama had to say about the University was associated in one way or another with his illustrious sire. His only thought was to go on consolidating and extending the work Asutosh had inaugurated. Fortunately no one in the wide world knew so well as, through association with him, Syama did of the plans that administrator had in mind when he vacated the Vice-Chancellor's chair. It was all to the good that the son who now occupied the chair relinquished by his sire carried the blue-print in his head.

More than that, he had ideas of his own. Born in the initial year of this century, brought up in an atmosphere of acute unrest—confusion—boy-cott—swadeshi—swaraj—and kindred waves, he had "urges" (as the Americans say). There also was the steadily accelerating tempo of the age. It had begun to go up with the Russo-Japanese war. The jazzed nerves—not only the jazzed music—that subsequently came in the wake of World War I. All this expressed itself in the matter of the time-table to which it seemed to me he had geared himself.

In the programme of what he wished to do that he outlined to me as we sat talking in that railway saloon on a siding at the Howrah station I noted that he was eager to develop the post-graduate teaching side of the University. Much had been done by his father. Much, however, remained to be done to put Calcutta University in the forefront in that domain.

I admired particularly the stress he was placing upon culture and art. He told me of the tour he had been making in Orissa, of the valuable figures and figurines he had been able to acquire. These he had put or was going to put in the University Museum.

The emphasis he placed upon the medium of education pleased me most of all. With the steps he had taken all teaching would soon be done, even in the graduate classes, through the Bengali. He seemed to derive much satisfaction from this achievement.

Had he found his *metier*?

Was he content with educational administration? Or did his heart hanker for . . . ?

We discussed these matters after he had taken leave of us and gone from the saloon long ere then taken back to the No. 10 platform. In discussing the state of Mother India, he had used a phrase more than once. It was "civil liberties." His mind seemed to be dwelling upon it. Of this more in the next article.

(Article Two of this series will appear in the October, 1953 issue of *The Modern Review*.—EDITOR.)

HISTORY AND GROWTH OF CO-OPERATIVE MOVEMENT IN INDIA

By PROF. C. B. MAMORIA, M.A., (Geog.), M.Com.

II

CO-OPERATIVE MOVEMENT DURING POST-WAR PERIOD

The abnormal conditions created by World War II led to some far-reaching developments in the co-operative movement. There has been an over-all improvement. Between 1938-39 and 1945-46, the increase in the number of societies, the number of members and the working capital have been respectively 41 per cent, 70 per cent and 54 per cent. Also the movement touched 6 per cent of the population in 1938-39 but 10 per cent in 1945-46. The war stimulated the growth of Consumers' Stores and Marketing Societies. Many new types of producers' societies like Weavers' Societies, Milk Supply Unions, Motor Transport Societies, Fruit Growers' and Cane Growers' Associations, etc., were formed during the war period. The credit societies extended their functions and the movement manifested its multi-purpose potentialities. Loan repayments were accelerated, turnover was brisk and working capital registered a substantial increase though not in proportion to the war-time inflation which means that a unique opportunity of augmenting working capital by increasing members' deposits was lost. Thus during the war, "with a large turnover, accelerated payments and shrinkage in the overdues the societies gained in strength and vigour." There was a temporary decline in the figures consequent on the partition, but the progress made subsequently has been so appreciable that the figures for 1949-50 have exceeded even the total for undivided India in 1945-46, the number, membership and working capital during 1949-50 having increased by 0.5 per cent, 37 per cent and 42 per cent respectively over 1945-46 figures.

The following table shows the development of the movement since 1909 up to date:

(See TABLE I on page 193)

Before we conclude this history of the co-operative movement in India we may point out its certain characteristic features:

Firstly, the co-operative movement in India has not sprung up from the people. It was initiated by the Government with a view to solve the problem of rural indebtedness; and even today it is based not on the voluntary efforts of the people determined to help themselves but on the Government support, which could not evoke the ready response and services of the young and the ardent, who looked with suspicion upon every movement so started. In the words of Mr. V. L. Mehta:

"Government are so out of touch with public feeling and sentiment that despite their control of the machinery of administration they fail in their efforts to seek an expansion of the movement."

In fact, it is not a spontaneous growth but a Government policy.¹¹ The distinction between co-

operation imposed by the Government and necessarily supervised, regulated, restricted and controlled on the one hand, and co-operation promoted by voluntary initiative and sustained by the co-operative spirit, which insures the loyalty of the members, on the other hand, cannot be over-emphasised.¹²

Secondly, started originally to provide the farmer with cheap credit, it has continued to this day a predominantly credit movement. So that the progress of non-credit co-operation has been slow and agricultural credit societies dominate the picture.

Thirdly, though there are inter-provincial differences, the structure of the co-operative organisation is uniform in almost all the provinces, e.g., in each province at the head of the movement there are three authorities, viz., the Registrar of the Co-operative Societies in charge of control and direction of the movement, Provincial or Apex Bank in charge of finance, and the Provincial Co-operative Institute or Union in charge of education and propaganda.

We close this note by quoting the remarks of the Reserve Bank of India in the following paragraphs:

"Apart from this general expansion, the working of the movement in recent years has been characterised by greater diversity of functions; co-operation has permeated several walks of life, some of which were perhaps no more than touched before. It has played an important part in the attempts to solve two big problems, viz., the rehabilitation of displaced persons and the augmentation of the food production. The rehabilitation of displaced persons through the formation of co-operatives received a great fillip, owing mainly to the aid extended by the Government, in the shape of loans, grants-in-aid, cheap land building materials and similar other concessions. Housing, industrial and farming societies were generally encouraged so that the displaced persons could be settled in colonies and provided with gainful occupations. In the field of food production co-operatives were entrusted with the distribution of manures, chemical fertilisers and agricultural implements. Credit facilities were liberalised for the members of co-operative credit societies by such measures as the relaxation of credit limits, financing at concessional rates, installations of pumping sets and oil engines. Thus by the introduction of modern methods there was sought to be brought about both more intensive and extensive cultivation of land.

"The full-scale development of the multipurpose idea in several States like Madras, Bombay, Mysore, U.P., is another notable trend in the primary credit structure. These societies were entrusted with the distribution of rationed and other essential commodities."

1949-50		173.09		125.61	23310000	

FUTURE TREND OF CO-OPERATIVE MOVEMENT

The Reserve Bank of India has brought out a comprehensive review of the progress made by the Co-operative movement in India in the two years of 1948-50. The publication outlines the future trend of the movement into Multipurpose Co-operative Societies, which should embrace complete economic activity of the agricultural and labouring class within its fold. These, as given out in the said publication, are:

- (1) The Organisation of Multipurpose Societies.
- (2) Financial accommodation from the Reserve Bank to the Co-operative movement, and
- (3) The training and education of staff working in the departments and the co-operative institutions.

THE MULTIPURPOSE IDEA

"Even as early as 1937, the Reserve Bank of India stressed the importance of organising multipurpose co-operative societies in our country where numerous single-purpose societies could not be easily worked on an effective and economic basis; the multipurpose society could embrace the whole life of the agriculturist. It was explained how the credit societies were catering only to one of the needs of the agriculturist, viz., credit, and even then they could meet only a part of the requirements. The agriculturist was, therefore, still largely dependent on the village sower for marketing his goods, for supplying him with his necessities of life, viz., consumer goods and numerous other services that he was in need of. The result has been that the idea of effecting an economic regeneration of the Indian peasantry through co-operation has remained

unfulfilled. Co-operators, official and non-official, have become increasingly aware of the limited utility of single-purpose societies and during the past few years, the credit society has been yielding place to the multipurpose society. Several States have drawn up schemes of organising such multipurpose societies afresh or at least have begun to enlarge the functions of the existing credit societies by entrusting them with the work of distribution of essential goods to start with. The multipurpose idea has thus obtained a firm footing.

"It has, however, to be observed, that there has not so far been a clear-cut scheme for defining the scope and activities of all the institutions in the multipurpose hierarchy. While all are agreed that at the bottom the primary society should be multipurpose, dispensing credit, distributing supplies, looking after better sanitation, better living and so on. It has to be examined as to which institutions these primary multipurpose societies should be federated into, at the taluk or district level, and what should be the function of these federal agencies. The trend appears to be in the direction of having a federal organisation at the taluk level. In this connection, it may be observed that there is a tendency to combine banking and trading. No doubt the village multipurpose societies can and must do banking because the volume of transactions under each activity will not be so large as to imperil the interests of any other section to any dangerous extent. Further, it has been found necessary to secure the undivided loyalty of the villager to the Co-operative movement and in the absence of facilities to be loyal to the society. On the other hand, the taluka multi-

purpose society should be a purely trading concern and it would be preferable to exclude banking from it completely for several reasons: Firstly, its business would be sizable and its profits in certain lines or losses in others might be considerable at times. And, the societies may not only trade as agents of the primary societies but on their own also in some types of goods and such business would naturally carry risks. If, therefore, the trading side suffers on account of some speculation or undue risks taken by a society, such a failure may have serious repercussions on its banking side. Secondly, trading calls for special business talents, different from those needed for carrying on banking. An enterprising businessman need not necessarily be an able banker, but on the other hand, might even bring the banking side into a dangerous position. Thirdly, the taluka multipurpose society might not be able to attract deposits of all kinds, and the hope that it would develop into a first class taluk bank might not materialise. So much so the banking section may not be a profitable section and apart from unnecessarily mixing up trading and banking, may not by itself cater for the credit needs of the affiliated societies satisfactorily. And from the Reserve Bank of India's point of view also, it would be doubtful, if the numerous taluka multipurpose societies can run separate credit sections on absolutely banking lines, to be considered fit enough for giving the second good signature under Section 17(2)(b) of the Reserve Bank of India Act.

"This would mean that the primary multipurpose societies would have to affiliate themselves to taluka multipurpose central financing agencies for their credit needs. And at the top, there would be the apex bank on the credit side and an apex society on the non-credit side. In short, the trading structure should be treated separately from the credit structure, and it is up to the Registrars of the States to clearly define the scope and functions of the various institutions, in the trading and credit hierarchy, in order to avoid mixing up of banking and trading."

RESERVE BANK AND THE MOVEMENT

"Another factor that has assumed increasing importance in recent years is the larger demand for funds made on the Reserve Bank of India by the Provincial Banks under Section 17(2)(b), (4)(a) and (4)(c) of the Reserve Bank of India Act. From Rs. 0.91 crores and Rs. 0.68 crores in 1947-48, the amount of loans applied and the amount sanctioned have increased to Rs. 4.82 crores and Rs. 2.14 crores in 1949-50 and still further to Rs. 10.46 crores and Rs. 7.62 crores respectively in 1950-51. The advances have been at concessional rates wherever they were utilised for financing seasonal agricultural operations and marketing of crops referred to in the Act. Recently, a few amendments have been made to the Reserve Bank of India Act with a view to liberalising the Bank's loan policy to the State Co-operative Banks. The amendments are:

(1) Section 17(2)(a) of the Reserve Bank of India Act, which relates to the discounting of bills arising out of bonafide commercial or trade transactions and which was not applicable to provincial co-operative banks before, has now been extended to co-operative banks also.

(2) The period of accommodation from the Reserve Bank specified in Section 17(2)(b) has been extended from 9 months to 15 months. The condition placed by the Bank that all the loans should be repaid by a fixed date irrespective of the maturity of the bills has also been removed.

(3) Another far-reaching step is the extension of the provisions of the Reserve Bank of India Act to the former Indian States which have now been reorganised into more homogeneous States Unions and which have so far been denied the facilities for accommodation available under the Act. To bring about a uniform development of the movement in these new States Unions, the Reserve Bank advocated as a first step, the formation of apex co-operative banks in them and have also conducted preliminary discussions with the authorities in some unions for taking speedy action in that regard. The need for organisation of apex banks is most necessary to enable them to take advantage of the Reserve Bank's accommodation facilities since under the Act, financial accommodation from the Reserve Bank could be made available only through a State Co-operative Bank or in its absence, any central society declared to be a State Co-operative Bank by a State Government for this purpose.

"In this connection, an Informal Conference was convened in 1951 to discuss the role of the Reserve Bank of India in the sphere of Rural Finance. As a result of the deliberations of the conference, an expert Standing Advisory Committee has been formed comprising prominent co-operators and others, both official and non-official. The main function of the body is to advise the Bank on matters pertaining to its Agricultural Credit Department and allied subjects."

CO-OPERATIVE EDUCATION AND TRAINING

"Lastly, the question of imparting training and education to the staff of the Co-operative Departments and the Co-operative Institutions is also of paramount importance. The responsibilities are becoming greater day by day, and it is very necessary that all the higher executives concerned with important co-operative societies should know their job thoroughly. At present, except in advanced States like Bombay and Madras, adequate arrangements do not exist either for imparting initial training or for refresher classes for departmental and non-departmental workers. In Bombay, the Poona Co-operative College is serving as a centre for training the higher staff. It is seen that some of the officers from other States are also being deputed to this college for training. Similarly, the staff of the co-operative institutions in Madras including depart-

mental staff, receive training in the Central Co-operative Training Institute in Madras City. Efforts should, therefore, be made to provide facilities for the satisfactory training of the personnel in the higher ranks like officers of the Co-operative Department, Managers and Secretaries of Banks and Societies in all the States. In the existing circumstances two kinds of training arrangements will have to be made, viz., long-term training in the theory as well as practice of co-operation. Banking inspection and audit and so on, for officers newly recruited and short-term intensive training for those who are already working in the Departments and Co-operative institutions and who must reinforce their knowledge by a refresher course.

"It, therefore, devolves on the departments to make suitable arrangements for such a thorough training. Perhaps they may consider utilising the existing higher training institutions, such as these in Bombay and Madras, to the fullest possible extent, until such time as the necessary steps are taken to set up similar institutions in the States themselves.

"In conclusion, it may be said that in spite of all the difficulties which it has had to face, the Co-operative movement had a fairly successful period of development during the two years under review. The potentialities are very great in view of the importance given to the movement in all nation-building activities in the various States. Guided properly by zealous co-operators and well-trained officials, the movement has every reason to look forward to an increasingly effective and useful role in shaping the future of the country."

CLASSIFICATION OF THE CO-OPERATIVE SOCIETIES

A proper classification of the co-operative societies is essential for three reasons: Firstly, it facilitates the study of the principles that should govern the working of the different kinds of societies. Secondly, it enables an easy study of the progress made by the different types of co-operative societies in different regions through independent and comparative study. Thirdly, it can help the propagation of certain theories and notions.

In regard to the international statistics classification of co-operatives by Dr. C. R. Fay is as follows: (i) Co-operative Banks, (ii) Agricultural Societies, (iii) Workers' Co-operative Societies, (iv) Co-operative Stores.

Dr. Faquet suggests the following classification: (i) Consumers' Co-operative Societies, (ii) Housing Societies, (iii) Occupational Co-operative (excluding agricultural societies but including Urban credit societies), (iv) Agricultural Societies (including the credit societies), (v) Various others.

The International Institute of Agriculture, Rome, has adopted the following classification: (i) Credit, (ii) Production, (iii) Production and Sale, (iv) Purchase, (v) Sale.

The fourth classification may be attempted as: (i) Credit Societies, (ii) Consumers' Societies, (iii) Producers' Societies, (iv) Insurance Societies, (v) Housing Societies and (vi) Others.

The classification given by Dr. Fay does not include the housing societies and the insurance societies; but from the point of view of co-operative development in the world it is essential to study the progress of these societies separately.

In the second classification, greater emphasis is placed on consumers. It does not have a separate group for credit societies. In view of the special importance of finance, it seems incorrect to include the credit co-operatives and producers' societies in one.

The third classification has no place for housing. Also it considers insurance societies as something which can be taken as auxiliary to one of the five forms while purchase societies include both supply societies and consumer's stores, and class production may be merged in "production and sale." Sale group may be included therein; and three groups could be together named, "Producers' Societies." So the third system is also not suitable.

The fourth classification does not distinguish between the Urban and the Rural societies. But the rural societies do not have to follow principles very much different from those that guide the urban co-operatives. It also seems unjust to have one class for agricultural societies and four or five for the non-agricultural societies. If a distinction is made between the urban and rural problems, let there be as many classes for agricultural societies as for the urban societies. If this is not agreed to, it will suffice to have a sub-head for "Urban Credit Societies" under "Credit Societies"; and for "Agricultural Producers' Societies" under "Producers' Societies."

(A) In India, the Reserve Bank has made the following classification: (i) Credit Societies, (ii) Purchase and Purchase and Sale Societies, (iii) Production Societies, (iv) Production and Sale Societies, (v) Others.

(B) Land Mortgage Banks.

(C) Non-Agricultural Societies: (i) Credit Societies, (ii) Purchase and Purchase and Sale Societies, (iii) Production Societies, (iv) Production and Sale Societies, (v) Others.

(D) Insurance Societies: (i) Ordinary and (ii) Cattle.

This grouping may be modified in view of the growing importance of the housing, marketing and multipurpose societies. Hence, the given classes under (A) and (C) group may be remodelled as (i) Credit Societies, (ii) Consumers' Societies, (iii) Production Societies, (iv) Marketing Societies, (v) Housing Societies and (vi) Others.

Under each of these classes, the number of societies which are multi-purpose in nature may be indicated within brackets. This will not only focus our attention

on the necessary aspects of co-operation, but will facilitate compilation of internal statistics for a comparative study.

It is difficult to give an exact classification of the different kinds of co-operative societies but for convenience we can divide them into two main categories, viz., (a) Agricultural and (b) Non-agricultural.

Agricultural societies are those societies in which the majority of the members are agriculturists, i.e., persons whose main occupation is cultivation of land or the rearing of livestock or of which the object is mainly agricultural. Whereas, non-agricultural societies are those which are not agricultural in character.

The diagram given below showing the classification of the co-operative societies will give a clear idea of the complex co-operative structure that has been built up in India:

CO-OPERATIVE SOCIETIES

(A) AGRICULTURAL SOCIETIES

The Agricultural Societies may be again sub-divided into credit and non-credit societies, and similarly non-agricultural societies may also be divided into credit and non-credit societies.

1. *Agricultural Credit Societies:* In the list of Agricultural Societies on credit side we have first the primary societies, the main purpose of which is to provide credit to their members and to encourage the habit of thrift. At the other end of the credit societies are the Provincial Banks which link the rural areas with the money markets of the country, and have their headquarters at the capital towns of the Province or States. Between these two extremes are the Banking Unions and Central Banks. Generally speaking, Primary

Co-operative Credit Societies are linked with the Banking Union or the Central Bank and the Central Bank is linked with the Provincial or the Apex Bank.

The primary societies are confined to small villages, the Central Banks to Taluka or District towns, and the Provincial Banks are the headquarters of the Province. If a borrower in a village needs money, he applies to his society. If the society has no fund at its disposal, it applies to the Central Bank, and if the Central Bank is in need of the funds, it applies to the Provincial Bank. That is why it is said that the co-operative movement links the farmer in the remote village with the money markets of the country. The objects of primary agricultural credit societies include the borrowing of funds from members or others to be utilised for loans to members and also for the promo-

tion of thrift. They also act as agent for the joint sale of its members' produce and the joint purchase of their agri-domestic requirements, for the hiring of implements, machinery or animals to members, the dissemination of information about improved farming practices, the encouragement of subsidiary industries and the reform of social practices.

2. *Agricultural Non-Credit Societies:* On the non-credit side, the agricultural societies deal with sale and marketing of goods, consolidation of holdings, better living and better farming, insurance of cattle, supply of seed, cattle breeding, co-operative farming, irrigation, milk and dairy products, ghee, poultry and eggs societies, crop-protection societies, colonisation societies and crop insurance societies, labour contract societies.

(B) NON-AGRICULTURAL SOCIETIES

The non-agricultural societies may also be conveniently sub-divided into credit and non-credit societies.

The credit societies are generally called Urban Banks. They provide credit to workers and artisans. They have no separate Provincial or Apex Bank of their own, though they have their own Central or District Banks.

On the non-credit side, the important societies are Employees' Societies, Consumers' Stores, Thrift and Life Insurance, Housing Societies, Artisans' and Weavers' Societies, Milk Societies, Communal Societies, Societies for Factory Workers and Societies for Depressed Classes, Societies for Women, etc.

Of India's co-operative undertakings in this century, credit societies which were launched the earliest still dominate the picture. In all Provinces and States, agricultural societies exceed by far both in number and in membership, though not in working capital, all other types of co-operative organisations put together.

Out of 169.66 thousand primary societies in 1949-50 124.06 thousand were credit societies forming 73.1 per cent of the total agricultural credit societies, their membership and percentage to the total being 116.53 thousand and 68.7 respectively. The number of agricultural credit societies rose from 112,339 in 1948-49 to 116,534 in 1949-50 consisting of 28,126 limited liability societies, 75,953 unlimited liability type and 12,455 grain banks.

The largest number of agricultural credit societies is to be found in U.P., 24,057 in 1949-50 followed by Madras 15,348, Bombay 8,928, West Bengal 9,598 and

Hyderabad 15,890. Madras leads in the number of members of such societies 1,191,027, followed by U. P. 813,726, Hyderabad 771,829, Bombay 611,873 and West Bengal only 220,698 and the Punjab 278,883. Whereas there were only 7.53 thousand non-agricultural societies in 1949-50, there were 48,17,545 and 20,65,990 members of the agricultural and non-agricultural societies respectively, representing 68.7 and 31.3 per cent of the total number. The working capital of the former was 3521.75 lakhs and Rs. 5160.24 lakhs of the latter.

Madras had 1,191 non-agricultural societies in 1949-50 followed by Bombay and West Bengal with 1,496 and 385 and by U.P. 616, Punjab 453 and Mysore 562. The number of members of such societies in Madras was 483,215, Bombay with 721,954 was followed by Bengal with 281,132, U.P. with 79,282, Punjab 25,537 and Mysore 112,970.

The details given below show the numerical position of credit and non-credit societies:

	1948-49		1949-50	
	No.	Percentage to total	No.	Percentage to total
<i>Credit Societies:</i>				
Agricultural	112.34	68.95	116.53	68.68
Non-agricultural	7.03	4.32	7.53	4.44
Total	119.37	73.27	124.06	73.12
<i>Non-credit Societies:</i>				
Agricultural	22.76	13.97	25.86	15.25
Non-agricultural	20.79	12.76	19.74	11.63
Total	43.55	26.73	45.60	26.88
Grand total	162.92	100.00	169.66	100.00

(Concluded)

THE FIRST CENSUS OF FREE INDIA

By ASHISH BOSE, M.Com.

The Census of 1951 was the eighth regular census of India and first census of free India. In the history of census operations in India it stands out as a remarkable census. It secured public co-operation in much more abundant measure than on any previous occasion. And it was probably the least inaccurate and the most scientific census in India.

THE CENSUS OPERATION

The Census was taken in all Part A, B and C States and Part D territories of India with the exception of (1) Jammu and Kashmir and (2) the Part B Tribal Areas of Assam. Sikkim was always included in former censuses and the practice has been retained in this census also. The counting started on the 9th February and the enumeration was completed by the 3rd March, 1951. 5,92,937 enumerators visited six crores and forty-four lakhs of houses. The enumeration records were assembled and checked at 52 Tabulation Offices opened temporarily for this purpose at

various centres in the country. Provisional figures of the total population were published in April 1951 and the final population totals were published in May 1952. A sample verification of the actual count was done before the end of 1951 and the result published in March 1953.

NEW FEATURES OF THE CENSUS

The useless collection of statistics and discussion regarding castes and sub-castes, which was the practice in previous censuses has been abandoned and more attention paid to the economic characteristics of the population. Further, the ambiguous concept of "community" which was introduced in the Census of 1941 has been discarded and statistics of religion collected.

The occupational distribution of population which was abandoned in the Census of 1941 has been introduced again with a more simple and scientific classification. The entire population of the country has been divided into two broad livelihood categories:

(1) Agricultural and (2) Non-agricultural. Each category is divided into four classes. The detailed classification is given in a subsequent table.

The 9 Part A States, 9 Part B States and 10 Part C States in addition to a few Part D Territories have been grouped into six Population Zones. They are: North India, East India, South India, West India, Central India and North-West India.

Independently of the above grouping the country as a whole is divided into five Natural Regions on the basis of physical features. They are: The Himalayan Region, the Northern Plains Region, the Peninsular Hills and Plateau Region, the Western Ghats and Coastal Region and the Eastern Ghats and Coastal Region. These five Regions are in turn divided into 15 Sub-Regions and 52 Divisions (the Bay Islands form the 53rd Division). Thus the study of population changes in relation to geographical and economic factors is made possible.

Another feature of the Census of 1951 is that instead of calculating the percentage variation as was done in past censuses, "the mean decennial growth rate" has been calculated. The latter is based on the average of the population of 1941 and 1951 taken together and not solely on the population of 1941 which is the base in the calculation of the percentage variation.

SAMPLE VERIFICATION OF THE CENSUS COUNT

For the first time in the history of census operations in India, a sample verification of the Census Count was conducted on a random sample basis and a precise estimate of the extent of error in the Count made. The area brought under verification contained 81 per cent of the total population. This verification reveals that the 1951 Census Count contains a net under-enumeration error of 1.1 per cent. As the Census Paper No. 1 of 1953 puts it:

"For every thousand persons included in the Census Count 11 other persons were probably omitted. It is a reasonably safe conclusion that the number of persons omitted (per thousand counted) could not have exceeded 12 or fallen short of 10."

It is encouraging to note that even in U.S.A. a net under-enumeration error of very nearly the same order was revealed by a post-enumeration survey conducted soon after the Census of 1950.

TOTAL POPULATION

The total population of India including the estimated population of Jammu and Kashmir (4.41 m) and the Part B Tribal Areas of Assam (0.66m.) on the 1st March, 1951 was 361.8 millions. The total land area was 1.27 million sq. miles. The following figures relate to the territories actually covered by the Census of 1951:

Total population in 1951: 356,829,485
Total population in 1941: 314,766,380
Net increase (1941-51): 42.06 millions
Mean decennial growth: 12.5 per cent

Percentage increase: 13.4 per cent.

On account of the merger of Chandernagore into India the population of India (in 1951) increased to 356,879,391.

THE BIGGEST STATES

The following table gives the population, density and the rate of growth of population in the ten biggest (on the basis of population) States in India:

	Population (in millions)	Density (persons per sq. mile)	Mean decen- nial growth rate (1941-51)
Uttar Pradesh	63.22	557	+11.2
Madras	57.02	446	+13.4
Bihar	40.23	572	+ 9.6
Bombay	35.96	323	+20.8
West Bengal	24.81	806	+12.7
Madhya Pradesh	21.25	163	+ 7.9
Hyderabad	18.66	227	+13.3
Rajasthan	15.29	117	+13.9
Orissa	14.65	244	+ 6.2
Punjab	12.64	338	- 0.5

In India, Uttar Pradesh has the biggest population, Madhya Pradesh the largest land area (130,272 sq. miles) and Delhi State the highest density (3,017 persons per sq. mile). Travancore-Cochin has the second highest density (1015). The density is lowest in Andaman and Nicobar Islands (10), Kutch (34) and Manipur (67).

RATE OF GROWTH

Among the six Population Zones, West India (Bombay, Saurashtra and Kutch) shows the highest rate of increase in population (20.1 per cent) and North-West India (Rajasthan, Punjab, Pepsu, etc.) the lowest (9.0 per cent). Likewise among the five Natural Regions, the Western Ghats and Coastal Region shows the highest rate of increase (20.5 per cent) and the Northern Plains Region the lowest (10.8 per cent). Among the individual States, the highest rate of growth is recorded in Delhi (62.1 per cent). Next come Coorg (30.5 per cent), Tripura (21.9 per cent), Mysore and Travancore-Cochin (21.2 per cent each) and Bombay (20.8 per cent). There is an actual decrease in population in Punjab (-0.5 per cent) and Andaman and Nicobar Islands (-8.6 per cent).

SEX-RATIO

Of the total population of 356.83 millions in 1951, 183.31 millions were males and 173.52 millions were females. Thus there were 947 females per 1000 males. There are more males than females in all States except Orissa, Madras, Travancore-Cochin, Manipur and Kutch where the reverse is the case. The sex-ratio is very unstable in Andaman and Nicobar Islands (625 females per 1000 males), Pepsu (844) and Punjab (863). It is worst in cities. In Calcutta, there are only 570 females per 1000 males, in Bombay 596 and in Kanpur 699.

RURAL-URBAN RATIO

The total rural population in 1951 was 295.0 millions or 82.7 per cent of the total population. There were 75 cities with a combined total population of

24.13 millions or 6.8 per cent of the total population. U.P. has the largest number of cities (16) while Bombay (State) has the biggest city population (5.1 m.). The biggest cities in India are Bombay (2.8 m.), Calcutta (2.5 m.), Madras (1.4 m.), Hyderabad (1.1 m.) and Old Delhi (915,000). Greater Calcutta, however, has a population of 3.5 millions. Since 1941, 27 new cities have sprung up in the area that is India today. There are 55 cities in the Part A States, 16 in the Part B States, 4 in the Part C States and none in the Part D Territories.

LIVELIHOOD CLASSES

The following table gives the livelihood classes and the percentage of population dependent on each class to the total population:

I.	Class	Percentage of total population
1.	Cultivators of land, wholly or mainly owned and their dependents	46.9
2.	Cultivators of land, wholly or mainly unowned and their dependents	8.9
3.	Cultivating labourers and their dependents	12.5
4.	Non-cultivating owners of land, agricultural rent receivers and their dependents	1.5
	Total agricultural population	69.8
II.	Persons including dependents who derive their principal means of livelihood from:	
5.	Production other than cultivation	10.6
6.	Commerce	6.0
7.	Transport	1.6
8.	Other services and miscellaneous sources	12.0
	Total non-agricultural population	30.2
	Total	100.0

Thus India still remains a predominantly agricultural country. In spite of 50 years of industrialisation and urbanisation 70 per cent of the people depend on agriculture for their livelihood and 83 per cent of the people live in rural areas. But the population has kept on increasing. In 1901, the population of India (excluding the areas of Pakistan and Jammu and Kashmir) was 235.5 millions. In 1951, it was 356.8 millions. Thus in 50 years the population increased by 121.3 millions or by 51 per cent.

RELIGION

In the Census of 1951 the concept of "community" was abandoned and religion was recorded as revealed by the person enumerated. The following table shows the religious composition of the population of India (excluding those living in Jammu and Kashmir and the Part B Tribal Areas of Assam):

Religion	Population (in millions)	Percentage of total population
1. Hindu	303.2	84.99
2. Muslim	35.4	9.93
3. Christian	8.2	2.30
4. Sikh	6.2	1.74
5. Jain	1.6	0.45

6. Buddhist	0.2	0.06
7. Zoroastrian	0.1	0.03
8. Jews (26,781)	...	...
9. Other religions (Tribal)	1.7	0.47
10. Other religions (Non-tribal)	0.1	0.03
	356.7*	100.00

Hindus form an absolute majority in every State of India except in Pepsu (where they are 49 per cent) and in Andaman and Nicobar Islands (where they are 30 per cent). The Muslim population is 22.08 per cent in Assam, 19.85 per cent in West Bengal, 15.4 per cent in Bhopal, 12.48 per cent in U.P., 11.82 per cent in Hyderabad and 11.34 per cent in Bihar. The Christian population was 32 per cent in Travancore-Cochin, 6.47 per cent in Assam and 4.15 per cent in Madras. In the Census of 1951, the great majority of the tribal people returned themselves as following Hinduism. The followers of tribal religions are concentrated in Bihar (52 per cent of the total followers of these religions in India are found in Chota Nagpur Division), West Bengal and Assam. The Jews are concentrated in Bombay State (75 per cent of the Jews in India live in this State). The Parsees are also concentrated in Bombay State (87 per cent of the Parsees in India live in this State). The majority of Jains live in Bombay State. The Buddhists are mostly found in West Bengal. The Sikhs are concentrated in the Punjab, Pepsu, Delhi and U.P. Among the followers of other non-tribal religions the majority are found in Assam, Bombay and Madras.

THE SECOND BIGGEST COUNTRY IN THE WORLD

Next to China India is the biggest country in the world. So far as land area is concerned, she ranks seventh in the world (next to U.S.S.R., China, Canada, Brazil, U.S.A. and Australia). India occupies 2.2 per cent of the total land area of the world and supports 15 per cent of the population of the world. In Asia, next to Japan, Lebanon and Korea, she has the highest density of population. The population of India is more than the combined population of North America and South America, about twice the population of Africa and about 44 times the population of Australia. It is 1.8 times the population of the U.S.S.R., 2.4 times the population of the U.S.A. and 7 times the population of United Kingdom. During a single decade, 1941-51 the population of India has increased by over 42 millions which is the present population of France. Every year a population almost equivalent to that of Denmark is added to the population of India. This will give us an idea of the magnitude of the population problem.†

* This figure does not include the returns of 268,602 persons in the Punjab whose records were destroyed by fire.

† The article gives the gist of all the Census Papers published so far, viz., Paper Nos. 1 and 2 of 1952 and Paper Nos. 1 and 2 of 1953.

EGYPT (1875-1953)

By PROF. SUDHANSU, BIMAL MOOKHERJI, M.A.

The world is sharply divided today between the two fundamentally opposite philosophies of life, namely, Communism and Capitalism. The world is not one in spite of Wilkie. It should be remembered at the same time that the down-trodden millions of Asia and Africa do not bother half as much about the rival 'isms' as about their own deliverance from the bondage of Western imperialism. Unless the capitalist imperialist nations face the facts, unless they respond to the challenge of the age and agree to liquidate their ill-gotten colonial empires, Communism will naturally appear to the exploited millions of colonies in the role of the liberator. They will do well to bear in mind the note of warning uttered years ago by Sumner Welles, a former Under-Secretary of the U.S.A. Government:

"As the result of this war (World War II) we must assume the sovereign equality of the peoples the world over. Our victory must bring in its train liberation for all peoples. The age of imperialism is ended. The right of people for freedom must be recognised."—A speech on May 30, 1942.

The Anglo-American Allies have won the war. Have they won the peace? No, we fear.

A great unhappiness "fills the feudal regions from Spain to Indo-China and, in addition, much of Africa and Latin America. Everywhere a thin wealthy upper caste shamelessly flaunts its luxury under the eyes of the hungry, diseased peasants and shepherds who are deprived of the education, organisation and political power to improve their lot. Techniques date back to Noah and the population increases faster than production. Industry is puny, the middle class weak, the working class small, and the farm population in feudal servitude. Army, bureaucracy, and police cruelly oppress and consciously delude the poor, and for these services to the rich they are allowed to consume the bulk of the national budget, politics by assassination flourishes and palace revolutions multiply. Leadership goes to the unenlightened nobility or plutocracy who pay or to the trigger-quick military and unscrupulous demagogues who inflame the patriotic passions or religious fanaticism of the mass. Masters come and go, foreigners are ousted, national independence is achieved, but bread, rice, milk, medicines, water, shoes, shelter, schools remain in short supply. Loans from abroad reach the pockets of the haves, the have-nots have only their envy and hate."—*The Life of Joseph Stalin* by Louis Fischer, pp. 287-88.

The description applies almost word for word to Egypt, which forms a part of the vast region indicated above and inhabited by more than a billion people. The happenings in that country during the last one year and more show that the national temper is rising. The Egyptians are in no mood to be tied to the apron strings of their masters—alien or otherwise. They want to be masters in their own house—masters in name as well as in fact.

Egypt came within the orbit of European politics

in the late 19th century. European statesmen and politicians were preoccupied with exclusively European affairs till 1878. It is only after 1878 that they began to take more and more active interest in extra-European affairs. For the generation of Europeans that lived after 1878 there was no European problem demanding immediate solution. Italian unity and nationality had been achieved. So also had the German, Prussia had successfully fought out her struggles with France and Austria. The Eastern Question was no longer explosive. There were besides, positive factors, which drew the attention of Europe to Asia and Africa. The growing population of Europe needed outlets. Her rapidly expanding industries needed fresh sources of raw materials and fresh markets.

Asia and Africa offered the best opening to an expanding Europe in the years after 1878 and international rivalries were transferred to these two continents. It was during this era that Egypt, a vassal State of the Ottoman Empire, came to be tied to the chariot wheel of Western imperialism. Turkish overlordship over Egypt it should be remembered had long ceased to be effective.

Khedive Ismail, who ascended the throne of Egypt in 1863, has been rightly described as a man "with an immense capacity for wasting money." Egypt's national debt rose from three million pounds to one hundred million during his reign. The burden of taxation literally broke the back of the people. The hapless Egyptian felakeen groaned under it. The country suffered from three C's—Coubash (a whip of hippopotamus skin with a tapering end used as a whip), Corvee (forced labour) and Corruption. Wholesale bribery and sale of concessions were openly practised and connived at. The Egyptian peasantry under Khedive Ismail was perhaps the most wretched people on earth. European intervention in the affairs of Egypt and the whole of her later history are in a very real sense the outcome of the "carnival of extravagance and oppression" of Khedive Ismail. Ismail sold his shares in the Suez Canal Company in 1875. Prime Minister Disraeli of England purchased them for four million pounds on behalf of Her Britannic Majesty's Government. The transaction was the proverbial thin end of the wedge—the first step towards the establishment of England's stranglehold over Egypt. The Khedive repudiated the national debt of Egypt in 1876. English and French creditors of the Khedive were alarmed. Mr. Goschen and M. Joubart were sent out by them to Egypt to look after their interests and the immediate result was the establishment of the *Caisse de la Delta* (May 2, 1878). The Anglo-French Commission was originally empowered "to receive the revenue set apart for the service of the debt and to sanction or veto

fresh loans." These functions were enlarged before long to include the entire financial administration of the country. Ismail abdicated in 1879 and was followed by his son Tewfik on the throne of Egypt. The country was placed under an Anglo-French condominium in the same year. The financial supervision was vested in two controllers—one English and one French. The administrative control of the country soon passed into the hands of the Controllers. This dual control was not destined to last long, however.

The revolt of Arabi Bey in 1881 is a very significant episode in the history of modern Egypt. Nobody denies that it was in part military. But it was anti-foreign at the same time. It was directed against Turkish sovereignty on the one hand and against European intervention on the other. It was Arabi Pasha who raised the slogan "Egypt for Egyptians" (*Masli—Mastriji*) for the first time. In a sense he may, therefore, be regarded as the father of modern Egyptian nationalism. Arabi secured the dismissal of some 1,200 foreign officials employed under the Anglo-French Condominium. He seized Alexandria in June, 1882, and set up his headquarters there. He had already forced the Khedive to promise that he (the Khedive) would dismiss two of the leading members of the Cabinet and accept a responsible ministry. He had further agreed to summon an Assembly of Notables before the end of 1881 and to limit the functions of the Condominium to the service of the debt.

The developments in Egypt frightened Europe. The Great powers met at Constantinople to formulate an agreed Egyptian policy. The conference decided nothing. Great Britain, particularly anxious for the Suez, her vital life-line, resolved to restore order by force. Admiral Sir Beauchamp Seymour bombarded Alexandria. Arabi withdrew after having burned the city. He was finally defeated at Tel-el-Kebir by Sir Garnet Wolsley, captured and deported to Ceylon. The Khedive's (!) power was restored and some British troops were left in the country, ostensibly to maintain peace and order. The Liberal British Foreign Secretary, Lord Granville solemnly assured the House of Lords: "We shall not keep our troops in Egypt any longer than is necessary." The promise has yet to be fulfilled as so many of Britain's promises to weaker peoples.

The failure of Arabi's rebellion was followed by the abolition of the Anglo-French Condominium (November, 1882) leaving the English sole masters of the Egyptian scene. Major Evelyn Baring (later Lord Cromer) was appointed the British Consul General in Egypt. The Khedive and his Ministers were responsible for the Government and carried on the administration of the country. But the British army was the real security for peace and the British treasury the real security for financial stability of Egypt. Baring was the Khedive *de facto* till his retirement in 1907.

When Arabi Pasha struck in Egypt proper in 1881,

Sudan, a dependency of Egypt, too, rose in revolt against the authority of the Khedive. A Sudanese proclaimed himself to be Mahdi, the Messiah. The rebellion, which assumed formidable proportions, was finally put down in 1898 when British troops under Kitchener crushed the rebels in the battle of Omdurman. As during Arabi's revolt, so also during the Mahdi's, British bayonets came to the rescue of the Khedive. England, of course, had her pound of flesh and Sudan was placed under joint Anglo-Egyptian rule in 1899.

The opening years of the 20th century were marked by a steadily mounting anti-British sentiment in all strata of Egyptian society. Discontent grew. National temper rose. Clear signs of unrest were discernible. Then came the Great War (1914-18) and Egypt, still a vassal of Turkey, was declared a British protectorate in December, 1914. The pro-Turkish Khedive Abbas was deposed. When the war came to an end in 1918, Zaghlul Pasha (Saa'd Zaghlul), the leader of the extreme nationalist party, presented a demand for complete independence of Egypt. Zaghlul's proposal was turned down. Prime Minister Rushdi Pasha next sought permission to go to England to confer with the British Government. The permission being refused, Rushdi Pasha resigned (1919). His resignation was the signal for riots and strikes all over the country. Even Government employees stayed away from work. Riots and strikes brought about a complete deadlock. The British Government sent out the Milner Commission to study the Egyptian problem at first hand and to suggest how peace and order was to be restored in Egypt. The Nationalist Party boycotted the Commission. Zaghlul Pasha, however, offered his co-operation and the Milner-Zaghlul Agreement recommended a treaty of alliance recognising the independence of Egypt as a constitutional monarchy with responsible institutions. Egypt was to recognise Britain's right to safeguard her special interests in Egypt, not to enter into any relations with a foreign power prejudicial to the interest of England and to permit England to maintain troops in Egypt. The Agreement was followed by a recrudescence of widespread riots. Zaghlul Pasha was deported. Egypt seethed with discontent.

England recognised the independence of Egypt in 1922. Certain questions were reserved for settlement later on. Zaghlul Pasha was allowed to return to Egypt. Supported by the Wafd (Nationalist) Party, he became the Prime Minister. The English Commander-in-Chief of the Egyptian forces was murdered in 1924. Anglo-Egyptian relations steadily deteriorated and Zaghlul Pasha was driven out of office.

The treaty of 1922 was revised in 1936. England agreed to remove her troops from Cairo and Alexandria, but not to evacuate Egypt. British troops were to remain in Egypt within prescribed limits.

Questions left for future consideration in 1922 were also settled. The expenses involved in the withdrawal of British troops from Cairo and Alexandria were borne by the Egyptian Government. Barracks and aerodromes for the British army were constructed in the Canal Zone at Egypt's cost. Britain was guaranteed the unfettered right of use of all Egyptian ports, railways and aerodromes. Needless to say, the terms did not satisfy the progressive section of the population.

World War II which has intensified the urge for independence everywhere in the world, may be rightly regarded as an important land-mark in the history of human emancipation. The repercussions of that War were felt in Egypt too. As a matter of fact, she had never reconciled herself to the idea of Britain's tutelage. The years 1945-52 were marked by persistent anti-British agitation and frequent conflicts all over Egypt. Britain's Labour Premier, Mr. Attlee, declared in 1946 that all British troops would be withdrawn from Egypt and that the Anglo-Egyptian treaty of 1936 would be replaced by an Anglo-American treaty to safeguard the security and independence of Egypt. We are not sure if Mr. Attlee really meant what he said. Britain's record in Egypt—one strewn with fragments of broken pledges—makes us dubious. The 1946 declaration was however well-timed and served a very useful purpose. It went a long way to pacify the impatient Egyptian progressive.

British imperialism was passing an anxious time in 1946. Britain and the U.S.A. held sharply divergent views over the future of India, Burma, Palestine and Malaya. Iran too was giving a headache. It would be unwise to antagonise Egypt at such a time. By 1947, the crisis had been tided over however and the Attlee declaration of the previous year was shelved. Egypt was disappointed. The national temper reached the boiling point. Egypt was convinced, if she had not been convinced earlier, that Britain would not quit Egypt unless forced to do so at the point of the bayonet.

Disappointed and disillusioned Egyptian public opinion forced the Wafdist Government of Nahas Pasha to abrogate the Anglo-Egyptian treaty (1936) in October, 1951. The Government declared at the same time that Egypt does not recognise British control over Sudan under the Anglo-Egyptian agreement of 1899. Students, labourers, peasants and the middle classes next launched a nationwide campaign against the occupation of the Suez Zone by British troops. Egyptian labourers in the Canal Zone organised a strike. Resistance groups sprang into existence in Cairo, Alexandria, Ismailia and other towns. Women did not lag behind their menfolk. For the first time in the long centuries of Egypt's chequered history women took an active part in politics. An anti-imperialist women's organisation came into existence. A nursing corps for those

wounded in mass demonstration was organised for the first time. In not a few places Egyptian police and military refused to deal sternly with the demonstrators. 35,000 Egyptian labourers in the Canal Zone refused to work. The Egyptian crew of British vessels refused to work for the British army. The country throbbed with a new life.

Egypt was a boiling cauldron during the three months from October to December, 1951. The Cairo correspondent of the United States News and World Report wrote at the time that Egypt's poverty-stricken masses were awake and described the awakening as resentful. It was at this critical juncture—at the crossroads of history—that the accredited leaders of the people failed them. The Wafd, which had been the spearhead of all Egypt's anti-British, anti-imperialist movements for a long time, took fright. They would not or could not keep pace with the awakened demos. The Wafdist Cabinet of Nahas Pasha was between the devil and the deep sea. It lacked the courage to condemn the mass struggle outright. Nor could it displease Britain. It nevertheless took stern steps to restore law and order in Britain's interest. The double-faced policy brought about the downfall of the Wafd. It forfeited the respect and confidence of the people on the one hand. On the other, Britain held it responsible for the growing mass militancy and accused it of conniving at anti-British demonstrations. A policy of vacillation and hesitance, an outcome of muddled thinking, makes enemies of all and friends of none. The dismissal of the Nahas Government was demanded by Britain. King Farouk meekly said, 'yes.' The excuse was not long in coming. About the middle of January, 1952, British troops in the Tel-el-Kebir area had minor skirmishes with the local Egyptians. Evidence from all sources shows that these were provoked by the former. British troops cordoned the palace of the Egyptian Governor and the police headquarters at Ismailia on January 25, 1952. Next day on January 26, the British Commander sent an ultimatum demanding the surrender of arms by the Egyptian police. The Governor ignored the ultimatum. An all-out assault was thereupon launched on the small Egyptian police force at Ismailia by British tanks, artillery and air force. Fifty Egyptian policemen lost their lives. Many more were wounded. There were riots and demonstrations all over the country in protest against the atrocities at Ismailia. This was exactly the opportunity Britain had been looking for—an opportunity of crushing the mass movement and of installing a government in Egypt that would faithfully carry out the dictates from the White Hall. She warned the Egyptian Government that unless it could bring the situation under control General Erskine, the Commander of British troops in Egypt, would place Cairo under military occupation. The American Ambassador at Cairo threw a hint to King Farouk on Janu-

ary 24 that the Nahas Cabinet must be dismissed. The Government acting on the advice of the King, proclaimed Martial Law in Cairo. More than 1,000 were arrested. Drastic as the measure was, it did not satisfy Great Britain. The Government was dismissed by the King immediately after the promulgation of the Martial Law. Aly Maher Pasha was asked to form a Cabinet. The Wafd, which had an absolute majority in the Parliament, once again betrayed the nation by meekly accepting the order of dismissal, by not raising its voice of protest against the unconstitutional act of the King. Reaction was triumphant.

There are very good reasons to believe that foreign powers had a hand in the fall of the Wafd. It came out in the press and over the radio of various European countries that King Farouk was forced to offer the Premiership to Aly Maher under pressure of foreign powers. General Robertson, Commander-in-Chief of the British troops in the Middle East, declared on December 31, 1951, that British troops would by no means be withdrawn from the Canal Zone and that other powers—the U.S.A., no doubt, among others—were behind this decision of Great Britain. Prime Minister Winston Churchill requested the Truman Government at the same time to send some American troops to Egypt. Some American papers gave out that a 6000 strong token army was actually being despatched to Egypt.

Ali Maher Pasha was soon dismissed. Hilaly Pasha succeeded him. Hilaly's first act was the suspension of the Parliament. A vigorous campaign of calumny against the Wafdist leaders sought to dis-

credit them in the eye of the people. In the meanwhile, the situation was steadily deteriorating, the martial law notwithstanding. Anti-foreign, progressive mass movement reached the climax.

The army had in the meanwhile lost its confidence in the monarchy. It had been thoroughly discredited and its leaders humiliated in the Palestine War. King Farouk and his relations and favourites had been responsible for the scandal in connection with the purchase of arms and ammunition for that war. Leaders of the army had begun to unite against the King and the political parties. At last on July 23, 1952, a successful *coup d'etat* made General Neguib the arbiter of the destinies of Egypt. King Farouk abdicated on July 26 and made an inglorious exit from the Egyptian scene "unwept, unhonoured and unsung." His infant son was declared King of Egypt as Fuad II. Monarchy has since been abolished (June 18, 1953) in Egypt, which is now a Republic with General Neguib as the provisional President and Prime Minister.

The fate of Egypt rests on the knees of the gods. In the meanwhile, the rise of Neguib has been interpreted by many as a victory of re-action over progress—a successful Anglo-American device to crush Egyptian nationalism. Others again there are who hail Neguib as Egypt's Man of Destiny, as the saviour of his country and of his people. The problems of Egypt are however no nearer solution today than they were at the time of Neguib's rise to power.

The time is not yet perhaps to pronounce a verdict. Let us wait and watch.

—:O:—

MOISM AND AHIMSA

By CHOU HSIANG-KUANG, M.A.

Lecturer in History, University of Delhi

FROM the 6th century (Confucius was born in 551 and died in 479 B.C.) to the time of Emperor Wu-ti of the Han Dynasty, who canonized the Classics of the Confucian School, it was about six hundred years. During this period, the Confucian School was only one of many schools of thought which ran parallel to one another. Besides the Confucian School there were the following schools: (1) Taoism, (2) Moism, (3) The Sophists, and (4) The Legalists.

Moism was founded by Motze who is one of most important figures in Chinese history, a man whose name was constantly linked with that of Confucius. Motze was born in 468 B.C. and died in 376 B.C. He seems to have been a great officer in the State of Sung.

He was skilful in maintaining military defence, and taught economy of use. Huai Nan Tze states:

"Confucius and Motze practised the arts of the ancient Sages and were learned in all the discourses on the Six Disciplines."

But there are many places in Motze's writings where he stands opposed to the Confucian School, the thought of which differed from his own. Confucius "tried to be correct in righteousness, without calculating profit; tried to be pure in principles, without considering whether this would bring material return." They were working tirelessly to rescue the world from its ills.

Anything must be of profit to the country and the people before it can possess value, and it is the wealth and

populousness of a country, Motze believed, which constitute its greatest profit. Although luxury and adornment are of no benefit to the country and the people, yet at the same time they are not its greatest harm. Harm lies rather in the incessant fighting of the people and states among themselves, caused, so Motze held, by the fact that men do not love one another. Motze, therefore, was preaching the doctrine of love. The practice of universal love not only benefits the one who is loved, but the one who loves, on the principle of reciprocity. Motze says:

"Heaven wishes people to love and benefit one another, and does not want people to hate and hurt one another. Why, Because He loves all and benefits all."

"How to follow the will and wish of Heaven? It is to love all people and Heaven."

Motze thought that the great benefits to the world come from men practising universal love, and its major calamities come from them fighting with one another. Thus he says:

"How were chaos and calamities caused? They were caused by people not loving each other. A thief loves his own house and does not love the other's house, he therefore steals from the other's house for the benefit of his own house. A murderer loves his own body and does not love the other's body, he therefore murders the other's body for the benefit of his own body. . . . Every officer loves his own family and does not love the other's family, he therefore exploits others' families for the benefit of his own family. A king loves his own country and does not love others' countries, he therefore attacks others' countries for the benefit of his country. . . . If a man looks upon another's house as his own house, who will steal? If a man looks upon another's body as his own body who will murder? If a man looks upon another's family as his own family who will exploit? If all look upon others' countries as their own country, who will attack? . . . Therefore, when all love one another, there will be peace; and when all hate one another there will be chaos and calamity."

Again:

"To kill one man is wrongful and must receive one death punishment. Accordingly, to kill ten men is ten times wrongful and must receive ten death punishments. And to kill hundred men is hundred times wrongful and must receive hundred death punishments. . . . Now the greatest wrong is to attack a country but he who attacks receives no punishment. . . . Is this right?"

Again:

"Which are the greater ones among the evils of the world? They are those actions of the big countries attacking the small countries, of the big families disturbing the small families; and those deeds of the strong robbing the weak, of the group of the many oppressing the group of the few, of the clever deceiving the dull, of the high class scorning the low. These are the greatest evils of the world."

Therefore, Motze thought that we should condemn warfare. He says:

"When the army sets out, the bamboos, arrows, plumed standards, house tents, armours, shields and sword-hilts will break and rot in innumerable quantities and never come back. . . . Innumerable horses and oxen will start out fat and come back lean, or will die and never come back at all. . . . Why, then does the government deprive the people of their opportunities and benefits to such a great extent? It has been answered: I covet the fame of the victor and the possession obtainable through conquest, and therefore I do it. But when we consider the victory as such, there is nothing useful about it. When we consider the possession obtained through it, it does not even make up for what has been lost."

Philosopher Bentham held that the purpose of morality and law is to procure the greatest happiness for the greatest number, a doctrine shared by Motze.

Although Motze held that the doctrine of universal love is the only way to save the world, he did not believe that men through their original nature can love one another. Because man's nature is like pure silk, and its goodness or evil is dependent entirely upon what it is 'dyed' with. We must strive to 'dye' others with the doctrine of universal love. But since the mass of people is short-sighted, it is difficult to make them see the benefit of universal love. Therefore, Motze laid stress on religious sanctions. He held that there is a God who rewards people, who practise universal love and punishes the perverse. He says:

"The ancient Sage-kings of the Three Dynasties, Yu, Tang, Wen and Wu, were those who obeyed the Will of Heaven and obtained reward. And the wicked kings of the Three Dynasties, Chieh, Chou, Yu and Li, were those who opposed the Will of Heaven and incurred punishment."

Motze loved all people without discrimination. Mencius described him by saying:

"If by grinding his whole body from the crown to the heel could have benefited the world, Motze would have done it."

Motze's idea of universal love is very similar to that of Ahimsa. Ahimsa is a word negative in form with a positive sense. We Chinese people prefer to use the positive form rather than the negative used by Indians. The philosophy of love of Motze and the Ahimsa of Hindû philosophy are the same gospel expressed in a slightly different way.

I have no better words to express my feelings about Motze's philosophy than the words which the Mahabharata uses: "Ahimsa is the Supreme Religion." Swami Sivanandaji says in the *Voice of the Himalayas*: "There is only one religion: the religion of love."

Prime Minister Jawaharlal Nehru, accompanied by Sm. Vijayalakshmi Pandit, arrived in Karachi on July 25. He was received at the Amuripur Airport by Mr. Mohammed Ali, Prime Minister of Pakistan.

Rajkumari Amrit Kaur gave a luncheon party in New Delhi on August 18, in honour of Mr. Mohammed Ali, Prime Minister of Pakistan and Begum Mohammed Ali. THE OUTBREAK AT BENARES IN 1799

By DR. S. B. CHAUDHURI, M.A., Ph.D.,
Presidency College, Calcutta

THE materials for the history of this episode have been taken from a nice little monograph, *Vizier Ali Khan or The Massacre at Benares: A Chapter in British Indian History*, written by Sir J. F. Davis, son of Mr. Samuel Davis, the brave Judge of Benares, who kept the insurgents at bay for a long time when they attacked his house. At the time of the incident, Davis, the son of the judge, was a child, but for this work he obtained, besides papers, the personal information and assistance of the Hon. Mount Stuart Elphinstone who was appointed on his first arrival in India as assistant to Mr. Davis, the Judge and Magistrate of Benares in 1799. By publishing this little volume of one hundred pages, Sir J. F. Davis has not only "done honour to his father's memory," but has laid the students of British Indian history under a deep obligation. Few narratives, indeed, can have "higher claims to implicit credit."

When Shuja-ud-daula, the Nawab-Vizier of Oudh died in 1775, he was succeeded by Asaf-ud-daula, who ceded to the Company the province of Benares, including "all the districts dependent on the Raja Chait Singh." The province was allowed to remain in charge of the Raja, subject to the control of a Resident at Benares. During the rule of Raja Mahip Narayan Singh, who was installed as successor to Chait Singh, an independent Magistrate was appointed for the city of Benares, the first to hold this post being Ali Ibrahim Khan. In 1794, Mahip Narayan was removed from the Government, as he was found incompetent to run it, and British officers were placed in charge of the administration. Benares remained quiet for a few years, but soon after the death of Asaf-ud-daula (1797) an insurrection broke out, the first of its kind during the British rule in India, which in many ways anticipated the political ideals of the Revolt of 1857.

The Company became the 'arbiters of the disposal of a kingdom,' as Lord Teignmouth wrote, 'by an extraordinary concurrence of circumstances.' The claim to succession lay between Vizier Ali, the son of the deceased Nawab and Saadat Ali Khan, the eldest surviving son of Shuja-ud-daula. Though the

former was installed by the British Resident at Lucknow, he was shortly afterwards deposed on account of his proved illegitimacy. By nature fearless and sanguinary, the young Nawab of seventeen, seems to have been conscious of his insecure position and even before his bonafides were doubted, the British Resident at Lucknow got the impression that Vizier Ali was entertaining hostile designs towards the English. The appearance of Lucknow is said to have been alarming on the day of Sir John Shore's intended visit to the city and Mr. Davis is of opinion that the assassination of the Governor-General was even planned by the Nawab's people.² But the Nawab was deserted by his friends including Almas Ali Khan, a powerful noble who denounced him before the Governor-General as spurious and profligate. The mother of the late sovereign, the Begam, also made similar complaints of the defective title of Vizier Ali, as a result of which he was deposed in favour of Saadat Ali Khan, and was removed to Benares where he was given as a residence the house known as Madho Das' garden with a pension of a lakh and a half annually. Saadat Ali was proclaimed Nawab-Vizier on 21st January, 1798.

The removal of Vizier Ali to Benares, on the frontier of his former domain, and the shadow of power sustained by the numerous retinue he was allowed to maintain, were by no means calculated to diminish the risks of future trouble and with a Mysore war in the offing and Tipu Sultan trafficking with the French, and Zaman Shah, the king of the Afghans, firmly entrenched at Lahore with a powerful army, the time indeed seemed ripe for a revolt of the Muslim princes of India.

The two chief civil authorities at Benares were: Mr. Samuel Davis, Judge and Magistrate of the district, and Mr. G. F. Cherry, the Resident at Benares, who, as Chief Judge of the Court of Appeal, was the channel of communication with the foreigners of rank at that city. By virtue of his position Mr. Cherry had some personal intercourse and interchange of visits with Vizier Ali, but he did not 'entertain any suspicions of sinister designs on the part of his charge' though Mr. Davis as well as the supreme government at Calcutta had repeatedly warned him to become 'cognizant of the suspicious conduct and disposition of Vizier Ali' and even suggested the removal of the

1. The book was published in 1811, but the impression having been exhausted, the second edition appeared in a limited number of copies meant chiefly for circulation among friends and relatives. The copy used by the writer of this article in the National Library at 'Belvedere,' bears an interesting notice—'purchased from the Hon'ble C. P. Ilbert. Date 26th October, 1886.'

2. Davis: *Op. cit.*, p. 7.

Muhammadans of influence from the district, as they might be induced 'to throw their weight into the scale of insurrection.'

Vizier Ali at Benares lived in right royal style with all the external marks of high rank which helped him to cherish views of independence in himself and at the same time offered an inducement to other disaffected chiefs to strengthen his cause. Davis quotes Lord Valentia and other authorities to show that the massacre at Benares was not a mere 'ebullition of rage' in Vizier Ali when he was ordered to live in Calcutta, but that the plan of the insurrection was arranged long before the arrival of that order.⁴ In fact, Vizier Ali looked forward to an invasion of India by the Afghans under Zaman Shah to whom he had sent an envoy, and depended much on the expected operations of the Afghan invader for the ultimate execution of his plan. He had also engaged some of the principal people of Benares to join him in an insurrection through a chain of conspiracy carried out by two of his accomplices Izzat Ali and Waris Ali, and was also in correspondence with other disaffected Musalman princes of Bengal devoted to his interest.⁵ Lord Mornington, on

3. Davis: *Op. cit.*, p. 23.

4. *Ibid.*, p. 94.

5. Among the letters of Vizier Ali seized after his flight, there is a letter from the brother of the Nawab of Dacca (perhaps a brother of Seyed Ali Khan Nasrit Jung, Nawab of Dacca) (*Hamilton Gazetteer*, i. p. 478) to Zaman Shah which gives us a glimpse of the working of the Muslim mind and the desperate nature of their attitude to British rule. After the customary eulogy, the letter proceeds: "... considering your majesty as the support and champion of the true faith, I am happy to offer my services in the most zealous manner and rank myself among the propagators of our holy religion. . . . However great were the obstacles to my submitting myself to your majesty's protection I have at length fortunately surmounted them, and, trusting to Providence have despatched this letter to your majesty's court by Sheikh Ali, or Amil, who will explain fully all circumstances relating to this country. I beg leave to observe that owing to the imbecility of the house of Timour, and the contempt into which it has fallen of late years, the powerful have been weakened and the weak become powerful. Worthless unbelievers and ambitious villains have started up at every corner, boldly conquered all these countries, and established themselves here. For these reasons, religion which should be so highly prized, is here lost, nothing of Islamism remains but that bare name. They have so stripped and reduced the principal Mussulmans that they have no resource, and are obliged implicitly to obey their orders. The Mussulmans have become vile and wretched, the honour of the great men is gone. Christians seize and keep by force, the daughters of Syeds and Mussulmans. Under these circumstances, when we can no longer act openly, it behoves us to exert ourselves secretly in the cause of religion. If your majesty's victorious standard shall be directed towards these parts for the establishment of religion and destruction of its enemies, by God's assistance your majesty will in a short time, and without any difficulty, conquer this country and annihilate your enemies." (Davis, *op. cit.*, pp. 96-98). These sentiments which Vizier Ali undoubtedly shared, made feasible the formation of a Mussulman league with Zaman Shah at its head to free India from the British. Kaye writes that Zaman Shah of Kabul had kept the British power in India in a chronic state of unrest. 'There was the fact,' he continues, 'of a minacious Muhammadan power beyond the frontier, not only meditating invasion, but stirring up the Muhammadan Princes of India to continue in a religious war against the usurping

being acquainted with the situation issued instructions to Mr. Cherry to remove the dangerous dethroned man from Benares to Calcutta. To Vizier Ali, it was a death-blow to all chances of success of his plan to overthrow the British rule, and so he was 'hurried into the execution of a desperate plot,' though he seemingly acquiesced in and gave out that he should proceed to Calcutta on the 15th or 16th of January (1799).

Mr. Cherry was too little inclined to suspect treachery on the part of the ex-Nawab, but the native Superintendent of Police reported to Mr. Davis on the 13th of January that Vizier Ali was engaging a number of armed men in his service, and seemed to make no preparations for his departure to Calcutta. On the night of the 13th Vizier Ali sent an information to Mr. Cherry that he would visit him on the following morning. Accordingly, on the morning of the 14th January 1799, he paid a State visit to Mr. Cherry, arriving at his house with a retinue of some 200 men fully armed. Unsuspectingly Mr. Cherry welcomed the party, and took Vizier Ali, Izzat Ali, Waris Ali and another attendant into the breakfast room who were accompanied by four armed followers. When tea was served to Vizier Ali he did not touch it, and began to complain in a loud voice, of the treatment he had received from Sir John Shore who promised him six lakhs of rupees per annum, but reduced it to a much smaller amount.

"On his departure," continued Vizier Ali confronting Mr. Cherry face to face, "Sir John Shore told me that you would take care of my interests and attend to my representations; but this you have never done. On the contrary, at the suggestion of Siadat Ali Khan you now wish me to go to Calcutta. . . . Saadat Ali Khan wishes for my death and the English are in league with him. . . ."

While he was thus speaking, Waris Ali drew himself near Mr. Cherry, and at a signal from Vizier Ali held him by the back, while Vizier Ali himself seized his victim by the collar and struck at him with his drawn sword. The Resident endeavoured to escape through the verandah but they followed him and cut him down to pieces. Mr. R. Evans, a young private secretary, and Captain Conway, who were living with Mr. Cherry, were also killed in the Residency. The assassins now swelling into a murderous gang then made for the house of Mr. Davis, the Judge of the district, and killed on the way Mr. Robert Graham, a young civilian, and Mr. Hill, a shopkeeper of Benares. Mr. Davis, just returning from his morning ride found the *cutwal* in his home who reported that he apprehended some mischief from Vizier Ali's visit to Mr. Cherry. Presently, they found the insurgents running up against the house. Without delay, Mr. Davis sent

Feringhee. Vizier Ali had intrigued with Zaman Shah, and would not only have welcomed, but have subsidised also an Afghan force in his own dominions (Kaye: *Sepoy War*, I, pp. 115-16).

6. Davis: *Op. cit.*, p. 30.

his wife with her two children, of which the writer of the book *Vizier Ali* was one, to the flat roof of his house. He saved himself and his family only by his presence of mind and a narrow winding staircase which he defended with wonderful tact and pluck. With a spear and none to help him, he disabled his assailants singly every time they wanted to reach the roof. For the space of an hour and a half, he converted this narrow winding staircase into a sort of 'Domestic Thermopylae' as Lord Valentia described it,⁷ till troops came to his rescue. In the meantime Vizier Ali and his desperadoes went to plunder and murder other English houses in Sikraul, but when Major-General Erskine, encamped within a short march of the city of Benares, arrived at the scene with his troops, Vizier Ali retired to his house at Madhu Das' garden and prepared for defence.

The force under Erskine while marching through one of the suburbs of Benares suffered by the fire from the houses and the narrow lanes on each side, but on reaching Madhu Das' garden, the Nawab's palace, the gateway was broken in, and the stronghold was captured just as the sun set. It is believed that if the contest had lasted until dark, a frightful massacre would have been committed and the city of Benares pillaged by numerous bandits and adventurers who were thronging round.⁸

But though the garden house was assailed, Vizier Ali could not be captured as he had already fled by the way of Azamgarh towards Beaul accompanied by most of his horsemen and a number of his armed foot followed during the night. The next day, the 15th of January 1799, the Raja of Benares, the Delhi princes from the Shivala, and many of the principal inhabitants of the city waited on Mr. Davis to prove their steadfast adherence to the British rule, which, of course, was not doubted, though it is certain as it turned out to be, that Jagat Singh of Saranath fame, a kinsman of the Raja, had been one of the emissaries in Vizier Ali's conspiracy.⁹ Early in his flight, Vizier halted to

7. *Ibid.*, p. 96. There is also a succinct statement in Thornton's *History of the British Empire in India*.

8. Meanwhile, the European residents assembled at the house of Mr. Davis, and it was freely acknowledged that they would have been discovered and massacred if the attention of the insurgents had not been occupied by his defence (Davis, *op. cit.*, pp. 40-41). Lord Wellesley, who was absent for a time on a visit to Madras at the period of the Benares insurrection subsequently expressed his appreciation of the arduous trial of prudence, activity and resolution of Mr. Davis and sent to his wife this autograph inscription: 'To Mrs. Davis, as a testimony of sincere respect and regard, and also a memorial of attachment founded upon long intimacy, to the honourable and virtuous memory of her deceased husband, from her faithful friend and servant, Wellesley.' (*Ibid.*, pp. 75-76).

9. The principal testimony was given by a Brahmin who was an astrologer to Vizier Ali. The Brahmin was sent by him to Jagat Singh, four months previous to the insurrection, to ascertain if he was well-disposed and if he would be a privy to his design of making war against the English. Jagat Singh in reply stated that he was a slave to the Nawab and that he would extend his dominions

address a letter to the Raja of Benares urging him to rise against the English which was miscarried into the hands of Mr. Davis,¹⁰ who, of course, found no reason to doubt the loyalty of the Raja and wrote back to him to calm his apprehensions as follows:

"Do not you be alarmed on this account, for though the Nawab wrote a letter to you, it is clear that you had no communication or correspondence with him, and I am well assured that you are a friend to the Company."¹¹

By the 18th of January public tranquillity seemed re-established but in the course of the enquiries, instituted by Mr. Davis and other servants of the Company, it was very clearly proved that not only a good number of Muhammadan chiefs, but also a considerable number of 'Hindu Babus' or nobles had promised assistance to Vizier Ali. These Hindu Chiefs were obviously waiting the result of the massacre, but their non-participation was not a proof of their innocence as definite evidence was found, that the Zamindar, Bhavani Sankar, and his son Sheo Deo Singh went to the fort of Pindra about 14 miles from Benares, on the Jaunapur road with two hundred men armed with guns and swords on the evening of Sunday, the 13th January where at nightfall they were joined by Nawab Vizier Ali. In the consultation that followed it was agreed that the Hindu Chiefs should prevent any force coming while the Nawab was fighting the English and that they should engage the troops from Beetabur.¹² After the flight of Vizier Ali, next day, Bhavani Sankar disappeared with the intention, it was supposed, of joining his master and Sheo Deo took up his residence in a small house in the city where he remained entrenched

as far as Calcutta. He is also reported to have said, "Let me assemble troops and raise money from the bankers to defray the expense of massacring the English." Vizier Ali being delighted sent a 'Kehlaut' to Jagat Singh who reciprocated by declaring that he had prepared a list of sixty of his friends, who would take an oath of fidelity to the cause. A secret interview took place one night between Jagat Singh and the ex-Nawab, when the latter seemed to have signed some promise or contract in the event of their plot, succeeding. But the Brahmin, later on, wanted to disclose the plot to Mr. Cherry and actually approached him for that reason, but the Resident declined to give him any audience. Jagat Singh, Davis says, had a great taste for Persian culture and refinement: his Persian Library and his compositions earned for him the title of the 'Nightingale of India' from a former Nawab. This might explain why he was so staunchly loyal to Muhammadan rule. (*Ibid.*, pp. 47-49).

10. The letter runs as follows: 'From Vizier Ali Khan to Rajah Udunt Narain Singh.' "By the grace and bounty of God, the life of the worthless Cherry, who disturbed and oppressed you, the hereditary servant of my family, has been terminated by the warriors of the army of Islam. You, who are my hereditary servant and ancient well-wisher, whose ancestry were always ready with heart and soul for the service of my family, must consider these joyful tidings, as the cause of your prosperity. Be ready with your people for my service, and guard well the roads about the city of Benares. Enjoin your people to permit no individual of the British or other European nations to pass the boundaries of Benares. . . ." (*Ibid.*, pp. 44-45).

11. *Ibid.*, p. 46.

12. *Ibid.*, pp. 88-99.

surrounded by a body of guards known as 'Bankas'.¹³ "It is well known," wrote Mr. Davis to General Erskine, "that this city abounds with armed adventurers who are ever ready to enter into any service at a moment's notice. There are in the district persons of rank who live and maintain their own guards without any limitation from government."¹⁴ The danger resulting from the existence of these mercenary elements was apparent in the use made of them by Vizier Ali.

It was further ascertained that a nephew of Jagat Singh had come up from Saran to Benares and agreed to join him in the conspiracy engaging to raise 20,000 men in Chapra. It was also established that a chief named Culb Ali Beg, otherwise known as Mogul Beg, had attended Vizier Ali during the insurrection.¹⁵ The extent and organisation of the conspiracy is also indicated by the evidence of a European inhabitant, McLean by name who was going to be despoiled on the evening of that day far off from Benares. A number of papers discovered after the flight of Vizier Ali contained lists of forces he was able to pull—about four thousand eight hundred foot and a hundred horse who would join Vizier Ali at once, and some eighty thousand who would subsequently espouse his cause on the day of massacre. But it has been estimated that not more than two or three thousand actually composed Vizier Ali's forces on that day, but the huge levy would certainly have been brought into action on a favourable opportunity had he been allowed to stay in Benares and develop his plans.

So the plot failed, but Vizier Ali, however, was still at large and the implicated 'chieftains' were not yet apprehended. The supreme government of Calcutta had sent instructions to secure the persons of those nobles who were privy to the conspiracy but it was difficult to execute the order as these refractory chiefs lived in houses that were fortified like castles and in particular in the stronghold of Pindra. Further, Sandat Ali, whose help was needed in the pursuit of Vizier Ali and his partisans, implored to be excused upon the ground that he could not trust his own soldiers; and all that he did was to issue orders that Vizier Ali should be seized.

The Honourable Mountstuart Elphinstone, then a very young man and assistant to the Judge and Magistrate of Benares, was deputed to capture Pindra. On the 18th of March he was furnished with four companies of infantry and twenty-four troopers. The

place was taken without resistance as the occupants had fled, but a seizure was made of fifty matchlocks, forty swords, and some powder and ball. On the same day Mr. Sealey and another officer of the civil service, surprised the residence of Jagat Singh and forced him to surrender. Sheo Deo, who occupied a strong house in the city of Benares, offered a gallant resistance to his friends who came to capture him. He held out a whole day and night without food and water and 'though every means was adopted to persuade him to surrender' and every assurance offered that no personal disgrace should be inflicted, he remained shut up in his impregnable position. At length he rushed out and furiously attacked the soldiers. In the desperate conflict that now ensued, Sheo Deo was slain, but not before he and his 'Bankas' had killed or wounded a number of the besieging party. The arrest of other leaders could not be made as many fled, only Bhavani Sankar and Jagat Singh were brought to trial and condemned to death. Of the two, Bhavani was executed, but the sentence of Jagat Singh was committed to transportation, but he committed suicide on his journey down the Ganges when he approached the sea, with a view to escaping the degradation of the loss of caste.

Subsequently, other measures were taken to break up this dangerous band of feudal retainers and to clear the country of the Bankas. In the meanwhile, Vizier Ali was ravaging Gorakhpur when he was joined by free-booters and adventurers of all kinds and with these lawless bands amounting to some thousands of men, he brought the eastern districts of Oude into a state of chaos and disorder, but chased by British force he moved from place to place and was eventually compelled to fly to Rajputana where he took refuge with the Raja of Jaipur. When pressure was brought to bear upon the Raja, he delivered him up to the English, but due to his 'scruples for the laws of hospitality' he stipulated for the life of Vizier Ali and also made it a condition that he should not be confined by fetters. Vizier Ali was taken to Benares, by a singular coincidence, on the anniversary of his rebellion and thence to Calcutta. Subsequently, after a long captivity in Fort William, he was transferred in the palace built for Tipu Sultan's family in the fort of Vellore, where the females of his family joined him.

Such was the outbreak at Benares in 1799. Considered from the aspect of affairs on the side of Mysore, brought about by the war with Tipu Sultan in February 1799, Vizier Ali's insurrection at Benares may not appear to be just a flutter on the political surface of India, and had it not been put down speedily, the spread of revolt at such a critical period might have taxed the resources of the government to the utmost. But the genesis of the insurrection calls for some remark. It was undoubtedly a political movement with definite political objectives, probably the earliest on record during British rule,—the Muslims and Hindu chiefs, joining in a conspiracy to overthrow the

government. The highhandedness of Warren Hastings, in the affairs of Chait Singh of Benares, left a back-wash of bitterness and resentment in the minds of the Hindus of Benares, who were unfortunately duped to join in a cause which was not worthy enough of their participation. The reckless ambition of a dastardly boy of nineteen of ignoble origin could not evoke much sympathy, and far less any widespread national sentiment, and the assassination of a half a dozen

Europeans, though an unprecedented event in the 90's of the eighteenth century, did not help the movement to gain any elevation. Even then, the insurrection served to generate a spirit of tension against British rule in India, and in spite of the pan-Islamic predictions of this young visionary to unfurl the green flag with the help of Zaman Shah, it furnished a precedent to the disaffected political elements to combine in a revolt to overthrow the rule of a foreign power.

—:O:—

TOWARDS ECONOMIC FREEDOM

By S. N. AGARWAL

THE Agra Session of the All-India Congress Committee devoted its attention mainly to the serious economic issues facing the country. We attach the greatest significance to the two resolutions on Unemployment and the Social and Economic programme passed by the A.-I. C. C. after careful consideration of all aspects of the problem. It will be wrong to regard these resolutions as mere "pious hopes and platitudes"; they embody the will and determination of the Congress to bring about a social and economic revolution in the country after the achievement of political freedom. We have, indeed, been able to achieve substantial results in various spheres of national development during the last few years. Thanks to the able guidance and wisdom of our great leaders, it has been possible for us to consolidate and stabilise our newly-won political independence. Besides, the country has made impressive progress in different fields of economic activity. But we are ourselves not satisfied with the pace of progress in the social and economic domains. The resolution, therefore, rightly points out that "the pace of progress must be quickened more specially in regard to land reform and industrial growth." The A.-I. C. C. "attaches the greatest importance to the introduction of far-reaching land reforms in India" in order to make "the actual tillers of the soil the owners of the land." The State Governments have been asked to "take immediate steps in regard to the collection of the requisite land data and the fixation of ceilings on land holdings" with a view to "redistribute the land, as far as possible, among the landless workers." Every effort is to be made "to add to the volume of investment for developmental purposes" through voluntary and, wherever possible, even compulsory savings. The machinery of administration and in particular the Services have also to be "reorganised with a view to deal effectively with the problems connected with the establishment of a Welfare State." The legal system which is "expensive and dilatory" should be revised

and made "simpler, less costly and more expeditious." The Planning Commission has been asked to "re-examine" the Five-Year Plan with a view to "its expansion in such directions as would lead to an increase in the volume of employment." The State has been enjoined to "assume a larger degree of responsibility in regard to cottage and small-scale industries" in order to provide fuller opportunities for the proper utilisation of country's man-power. The A.-I. C. C. has also stressed the need for the reorganisation of our educational system so that it may adapt itself better to the present requirements.

It is now necessary to follow up these important resolutions with definite lines of action, and we are confident that the Government of India as well as the State Governments will take early steps to secure for the country a true type of social and economic freedom for the common good of all citizens irrespective of any distinctions. It is essential to tackle our economic problems with a sense of urgency and in a crusading spirit. Time is of the essence in a fast-moving world of today; we cannot afford to follow a policy of over-caution and "gradualness." There is, of course, great risk in moving too fast; but the risk in not moving fast enough is no less. All of us have to realise that the quintessence of economic freedom is *economic equality* and reduction of glaring economic disparities in our present-day society. With a yawning gulf between the rich and the poor, all talk of economic freedom appears to be futile and meaningless. In order to establish real economic justice in society, it is necessary to fix ceilings on incomes either from land or from other kinds of property. The A.-I. C. C. has called upon the State Governments to take early steps to fix ceilings on land-holdings for redistributing land among the landless. We also welcome the Estate Duty Bill as a measure of achieving greater economic equality among the urban population. It will, however, be desirable to re-orient our taxation policy with a view to bridging

13. This set of braves called 'Bankas' were leagued together as a sect. They were men of all castes they affected a peculiar way of dressing, 'half bully and half dandy': strutted in the streets and were always ready to be hired for a crime. The term 'Banka' is derived from the peculiar movement of their swords which are proficiently exercised and so they were mostly maintained by the wealthy as their armed followers. (*Ibid*, pp. 68-72).

14. *Ibid*, p. 65.

15. It is interesting to note that one Mustapha Beg gave the signal for revolt to the people at Vellore in 1806. (*Kaye: Sepoy War in India*, I, p. 227, f.n.).

the existing gulf between the haves and have-nots.

In regard to land reforms, we would draw the attention of all the enthusiasts for large-scale farming in this country to the fate of collectivization in Eastern European countries like Yugoslavia, Poland and Hungary. In Tito's Yugoslavia, collective farms have not only "set peasant against peasant, but also peasant against the State." In Hungary, collectivization has recently been "slowed down," because it has "impoverished and antagonised the population and brought the country to the verge of economic collapse." (Vide London Times, July 6). In China, there is a movement for allowing more "liberty for the peasant" by making collectivization voluntary and doing nothing "to neglect or roughly hamper the peasant's activity as an individual economic unit." The history of collectivization in the U.S.S.R. also clearly indicates the need for great caution in trying similar experiments in India. As in Japan and several countries of Western Europe, small-scale farming with co-operative endeavour in different processes of agriculture is best suited to Indian conditions. Instead of trying to pool land on the basis of highly mechanized farming, we should try to persuade the individual small-scale peasants to pool their resources of production like cattle, irrigation, manuring, etc., as also processes of agriculture like sowing, weeding and harvesting on a co-operative or mutual-aid basis. That is why we have welcomed Acharya Vinoba Bhave's Bhoodan Yagna as a novel way of redistributing land to the landless on the basis of small-scale and intensive farming.

The problem of unemployment is, indeed, a serious problem which requires to be tackled on many fronts. We have expressed our views on this question on previous occasions also and have regarded unemployment as Enemy Number One in India. In order to liquidate it effectively, it is essential to provide the fullest scope for the development of small-scale and cottage industries. Unless our pattern of production becomes labour-absorbing rather than labour-saving, it would not be possible to solve the problem of unemployment or partial-employment in this country. This is not sentiment or a Gandhian "fad"; it is pure and simple arithmetic. Of course, the technique of cottage production has to be made as efficient as possible with the help of technical or scientific knowledge. The public has also to pay its own part in patronising the goods of cottage and small-scale industries as compared with those articles produced by big mills and

factories. The Government of India must re-orient its import policy with a view to protecting the interests of small-scale and decentralised production in India. The import of consumer goods which can be easily and efficiently produced in our own country through cottage and village industries must be rigidly curtailed and even completely stopped. Our educational system requires radical changes in order to impart to our youngmen the capacity to work hard physically for earning their living. The present schools and colleges have become veritable factories for quickly turning out armies of the educated unemployed who are proving to be a source of potential danger to the stability of our democratic traditions.

We welcome the reference to the Reorganisation of Services in the resolution of the A.-I.C.C. at Agra. We earnestly hope that the Government of India and the State Governments will now try to implement the recommendations of the Planning Commission in this regard with a strong will. Prof. Appleby's suggestions also deserve to be considered seriously for making our administrative machinery more flexible and less rigid. So far as the desirability of Legal Reforms is concerned, we suggest that the Government of India should soon appoint a High Powered Commission to go into this complicated question thoroughly and submit its definite recommendations within a year. Various schemes for tapping the idle capital resources, particularly in the rural areas, should be prepared by the Planning Commission in consultation with the Ministries of Finance and Communications. In such schemes, special facilities should be provided for earmarking funds for specific local projects in different areas.

It is also gratifying to know that the A.-I.C.C. has accepted most of the amendments to the Congress Constitution as proposed by the Working Committee. These amendments are meant to revitalise the Congress organisation with a view to making it a sharper and more efficient instrument for effecting an economic revolution in India. We feel confident that with the reorganisation of the Congress, the land and industrial systems, the administrative services, the educational system, the commercial policy and the legal procedure, we shall be able to achieve economic freedom for our great country within the next few years. Our first fight for political liberty began in 1857; we achieved independence in 1947; let our fight for economic freedom bear ample fruit before the beginning of 1957.

INDUSTRIAL DEVELOPMENT IN RAJASTHAN

By PROF. K. B. SAKSENA, M.COM.

It looks quite satirical on the very face of it that a big State of India, viz., Rajasthan, to which goes the credit of being the birth-place of the leading business magnates and industrialists, is itself to be categorized as a backward area both agriculturally and industrially. The State with a widespread area of about 1.28 lakh square miles is inhabited by approximately 1.53 crores of a sturdy class of males and females. Is it not a matter of deep thinking and concern that this region of the country with much less a density of population, as compared to other States in India—India as a whole and other developed parts of the world, is not in a position to provide a decent living standard to the existing population? To consider any scheme for the general economic development of the State would be unjust within the limited space. An attempt is therefore made here to study the industrial problems and prospects of an industrial development in the State.

HISTORICAL BACKGROUND

Before coming to any conclusion regarding the subject and suggesting proposals for the industrial development, it seems quite essential to look through the mirror the historical background for the present undeveloped condition of the State. Scanning the annals of the history of this State (though not in the form of present political configuration) we find that since the time we have got traces of its history, the land of Rajputs popularly known as Rajputana, had been a constant arena for political feuds among the various rulers of small States who were more anxious for establishing their political supremacy rather than aiming at a consolidated economic, political and social unity. This was one of the reasons for the fall of the brave people and the governments of this State before the Moghul and then the Britishers. The courage of the people can be well judged by the views of the learned authority Tod as expressed in the *Annals and Antiquities of Rajasthan*:

"Rajasthan exhibits the sole example in history of mankind of people withstanding every outrage barbarity can inflict or human nature sustain and bent to the earth, yet rising buoyant from the pressure and making calamity a whetstone to courage."

Despite the absence of warfare in this region during the British regime, the laissez-faire policy of the government could not do much for the industrialization of the country as a whole, nothing to talk of Rajasthan. Of course, the limited stimulus that was given to handicrafts and fine arts in the various States was due to the fascination of the rulers for decorating their capitals. It could be hoped that the liberation of the country and the

unification of small and big units into a compact group under one government, would be much helpful for *inter alia* the development of industries in the State. The State and the country as a whole immediately after the independence have confronted a great many political and economic difficulties plus the rehabilitation problems created after the partition of the country. The diversion of activities has been responsible now for the lack of due consideration for the problem under review. However, I do not stand to depreciate the steps taken by the Rajasthan Government in this connection, but the proposals for industrial development are not however sufficient.

REASONS FOR LACK OF INDUSTRIAL PROGRESS

Political reasons only do not account for the chequered growth of industries in the State; but there are many other reasons that can be attributed to this slackness. The position of raw-material and the financial problems are also to be considered in this connection. There has always been lack of co-operation and initiative in the State and the industrialists of today. The industrialists who have their origin in the State were never very anxious to develop industries in their birth-place, rather they invested a major portion of their stupendous earnings outside the State. The system of customs duty and the lack of facilities for the import of raw material and movement of goods to and from the State along with the lack of facilities for the maintenance of industrial units, were obstacles in the way. Seth Ghanshyamdas Birla once opined that the industrial development in the State could not be possible in the absence of facilities for transport and communication, industrial power and the taming of the water resources for industrial purposes. One of the most serious curses to this State is the incredibly low percentage of literacy which accounts for approximately 90 per cent of illiterates.

PLAN FOR DEVELOPMENT

Whenever we consider any plan for the industrialisation, the first question that comes up is the form which should be given to it. Not only Rajasthan, but the country as a whole is standing at the threshold of industrialisation and we have got an option between the Gandhian system wherein there is limited scope for the big industrial units run by huge machines and there is a major consideration for the cottage industries which would give employment to the 80% of the rural population who is out of work for about eight months in the year and the method suggested on the American lines which leads to surrender of man-power to the supremacy of the machines. Up to this time the State has

not advanced much towards the American method and the Gandhian economy has not yet been applied on satisfactory lines. Here, however, we should not ignore the methods adopted in the communist countries, particularly in U.S.S.R. which is a symbol of planning not only industrial but agricultural, fiscal, commercial, educational, credit and monetary as well.

The industrial policy for the State should be so construed as to lead an all-round development of our life and to respond closely to the needs of the society in a manner so as not to centralize the benefits within a small group or a particular class of the people, but it should be on an equitable basis.

A CASE FOR COTTAGE INDUSTRIES

Here it looks quite essential to look into the possibilities of developing cottage industries in Rajasthan. For such undeveloped areas it is always useful to stimulate cottage industries. These will provide work for the majority of persons at a lower cost and will prepare a background for industrial outlook. The success of cottage industries in Japan and Switzerland are amazing examples which are quite fascinating and alluring for the people of Rajasthan. A survey of the position of meagre cottage industries in the State has been made by the Rajasthan Government which does not reveal a desirable progress in this direction. The important cottage industries mainly consist of weaving and spinning, ivory goods, engraving, oil pressing, dyeing, Bidimaking and wood work.

Keeping in view the development of cottage industries it should not be missed that the development of such industries is to be stimulated which will provide the people with articles of domestic use and not with those which lead the cultivator to immoral habits, e.g., Bidis and local liquor which, though they may give employment to a number of persons, are like the noxious vermins which would infect society with evil germs. The Rajasthan Government has contemplated to spend an amount of Rs. 38.50 lakhs over a period of five years (1951-56 for the development of the cottage industries in the State of Rajasthan. This amount is not commensurate with the size of the population and the area of Rajasthan. As compared to other Part 'B' States of Mysore and Madhyabharat which provide for an expenditure of Rs. 135.38 lakhs and Rs. 50 lakhs respectively this amount seems to be too meagre. It is quite ridiculous that this meagre amount has been provided only for cottage industries when no amount has been provided for other major industries in the State. For the purpose of financing these cottage industries, the help of co-operative credit societies in the villages should

be obtained and every possible step should be taken to develop credit co-operation in the State.

MAJOR INDUSTRIES

The absence of any provision in the Five-Year plan for this State for the major industries should not be considered as to mean that there is no scope for the development of major industrial units. Rather this indifference of the State should be taken up by the private sector. Now in the democratic country, the big industrial units should flourish side by side with the cottage industries not with a view to competing with each other which will cause the ruin of cottage industries and massacre of the economic development of the State. It should, however, be aimed at that these two types of industries should work with fullest possible co-operation.

The working of the large industrial units creates problems regarding finance and labour. As far as the financial side is concerned, there are at present about four leading banks of Rajasthan origin and approximately an equal number of those who have been registered outside Rajasthan. These joint-stock banks can easily finance the requirements of the working capital. As far as the fixed capital is required for the establishment of new units or the expansion of the existing one, the facilities granted by the Industrial Finance Corporation can be availed of. The formation of a provincial corporation in Rajasthan does not look feasible or economically advantageous.

It should, however, not be lost sight of that the industrialists now should come forward with a generous motive for the welfare of the State and the people, and not with the only consideration of making profits. The problems of labour and capital relationship have become quite considerable these days and although the government is in constant effort to create amiable relations, individual effort from both the parties is quite indispensable. The capitalists should take lesson from the growing tendency towards socialisation and nationalisation of industrial units over vast regions of the world. The symbol of capitalism in U.S.A. and U.K. may not remain so forceful as it is today and even today the benefactors of capitalism and bureaucracy in the two countries are always on their guard to keep off socialism and communism at an arm's length. It is at this stage very essential for our capitalistic class to show goodwill towards the interests of the general masses and not to keep aloof for fear of nationalization of the industries in the future which is not in the offing as yet. Here they have got ample opportunity to save their skin from criticism by the public.

THE COLLEGE OF YOGA AT LONAVLA

By Dr. S. C. BHATTACHARYA, M.A., T.D., Ph.D.

To wander for nearly twenty years in the mountains and jungles of the sacred land of Bharat from Kedarnath in the Himalayas to Cape Comorin and from Girnar in Saurashtra to Tarakeshwar in Bengal in search of Yogis to get an inkling into the mysteries of Yoga and ultimately to be blessed by the

to dispel darkness from the 'terra incognita' of Yoga and

"to propagate Yoga in all its aspects—physical, mental and spiritual—by co-ordinating it with modern sciences and orienting it in such a way as to make it useful in everyday life."

To give effect to his mission in life Swamiji made a small start in the year 1924 with an Ashram *The Kaivalyadhama* at Lonavla which is nearly 80 miles from Bombay, en route to Poona, and is on an elevation of 2,000 ft. approximately. Later on, the research side of the Kaivalyadhama was separated and organised as a well-constituted Samiti and was registered under the Societies Registration Act 21 of 1860 under the name of Swami Kuvalayananda's Guru, His Holiness Paramhansa Shree Madhavadas Maharaj of Malsar (near Baroda). Kuvalayanandaji's selfless devotion to the cause of Yoga gave rise to two important off-shoots of the Kaivalyadhama of Lonavla—one at Bombay and the other at Rajkot in Saurashtra. The Bombay off-shoot is known as the Kaivalyadhama Ishwardas Chhunilal Yogic Health Centre where on an average about a thousand people

The view of the 'Valvan Lake' behind the 'College of Yoga'

teachings of a Yogi in the very heart of a modern metropolis of no less importance than Bombay, is indeed one of the greatest wonders as well as an irony of fate in a man's life. Such was destined for the present writer who, in the year 1949, came into contact at Bombay with Swami Kuvalayanandaji, the founder-Yogi of the 'Kaivalyadhama' at Lonavla, Bombay, etc. The love and kindness with which Swamiji accepted the neophyte, in spite of certain handicaps, could only be explained by a reference to some relation existing between us in the previous births. It was the occasion when Kuvalayanandaji was selecting the first batch of thirteen students, who should satisfy certain conditions, for his College of Yoga that had its beginning in Bombay before being shifted to Lonavla. I was selected by Swamiji, not because I could satisfy the required conditions, but mainly on account of my genuine interest in the subject of Yoga. Yet, what a perverted idea one possesses about Yoga before one receives true light and what a heavy price one has to pay for his sad mistakes! To some it is a hoax, to others it is a cure-all.

The subject of Yoga has an attraction or repulsion (both on false grounds) to a modern mind either due to the fantastic claims attributed to it or on account of the absence of a code suitable for the modern scientific mind. The present writer was no less a victim to the fog and mist in the domain of Yoga until he came to be guided by Kuvalayanandaji who has been fighting alone for the last thirty years

The 'College of Yoga'—Front view

(both men and women) undergo Yogic exercises every year. The Rajkot off-shoot maintains a hostel for college students and also carries on cultural work for the general public. The former institute gets an annual grant of Rs. 1200 from the Bombay Government and the latter Rs. 1,000 from the Saurashtra Government. The Kaivalyadhama has also deve-

loped an exclusive spiritual centre at Kanakeshwar-Bhuvaneshwar in the Kolaba district (off the Bombay coast). This centre is the *tapovana* of the Kaivalyadhama. Here Swami Kuvalayanandaji's Guru performed *tapas* for twelve years more than seven decades ago.

The first 'Ashrama of Kaivalyadhama' at Lonavla

But besides the afore-mentioned institutions Swamiji's mind all the time gazed at the temple which would be built up some day to enshrine the highest achievements of Yoga—both practical and theoretical. His dreams have, at last, been fulfilled by the starting of a full-fledged College of Yoga in 1950 at Lonavla ('The Gordhandas Seksaria College of Yoga and Cultural Synthesis') through the magnificent gift of Seth Makhanlal Seksaria of Bombay. Yet, how far it is from what it aspires to be and what immense potentialities are stored in it! The present assets of the College are only a few lakhs whereas it requires at least half a crore of rupees and there is no reason why it should not be possible for it to revive the ancient secrets of our hoary land reflecting through the prisms of modern science.

The College of Yoga at Lonavla being situated by the side of the first Ashrama of Kaivalyadhama over an extensive plot of land in the solitude of hills and lakes is a unique institute not only in our country but also in the whole world in the sense that the age-old Yogic lore of our motherland, is being investigated by the application of ultra-modern scientific instruments to the young men with bright university careers taken under training to serve as 'subjects'. In a short article as the present one it is not possible to give the details of the scientific experiments that are being carried on in the College of Yoga at Lonavla under the supervision of a Doctor of Science on the 'subjects' practising *pranayama*, *kapalabhati*, meditation, etc., to record and verify the truth of higher life experienced and described by our ancient sages. To use the words of Swami Kuvalayanandaji:

The aim of his College of Yoga is "to develop a philosophy and a culture based on the co-ordination of Yogic experiences and modern sciences that would lead to the establishment of human brotherhood. The principal science which will be used for this purpose is biology, although physics, chemistry, physiology, psychology, sociology, etc., will be fully taken advantage of . . . Life is trying to express itself in higher and still higher forms and endeavouring to obtain experiences of higher and still higher values. The science of biology which deals with life has stopped short with the study of the normal and abnormal man. That science will always remain truncated unless and until it extends its studies to the mystic. The effort of Dr. Julian Huxley and others to develop evolutionary ethics and scientific humanism will never have a sure foundation unless the mystic is scientifically taken into account. Cultures based upon an incomplete study of man will never eliminate conflict and war. If a man is to be happy, he must be studied in his entirety. . . . The experimental psychology that is developed in the West, however, has been concerning itself mainly with normal and abnormal or pathological psychology. The higher experiences of man have not yet been properly touched . . . Luckily for humanity the Indian Yoga taken in its most comprehensive sense, trains a man, stage by stage, from what may look to be merely physical exercises to the highest mystical experiences. Hence, the students trained in Yoga afford the best material for scientific investigation in Yoga."

A hostel for the students of the 'College of Yoga'

In this connection one may think of the Duke University of the U.S.A. where Dr. Rhine is engaged in scientific experiments with the facts of extra-sensory perception—now better known as parapsychology. But even Dr. Rhine is handicapped to reveal the inner side of Yoga as he is not interested in or qualified for the facts and experiences narrated by Patanjali and other Sanskrit writers on Yoga. I, therefore, again assert that the position of the College of Yoga at Lonavla is unrivalled—specially as it is situated in the motherland of Yoga and is being directed by an adept in the subject.

Nearly ten students are selected from all over India without any distinction of caste or creed every

year in June-July for the monthly scholarships of Rs. 60 offered by the College of Yoga at Lonavla which is a residential college and their courses of studies extend over two years. They are given lessons in practical

The view of another hostel

Yoga, Eastern and Western Philosophy, Indology, Comparative Religion, Anatomy and Physiology with reference to practical and scientific Yoga, experimental work on Yoga, etc. The professors consist of the Doctors of Indian as well as foreign Universities and well-versed Sanskrit scholars. Apart from the scientific study of Yoga, the College also encourages and gives facilities for research work in philosophy and literature. Several scholars of India and at least one from America (Mr. Behanan of the Yale University) have been awarded Doctorate Degrees by the different Universities for their research work done under the roof of the College of Yoga at Lonavla. The present writer is also one of them.

The 'Kaivalyadhama Yogic Health Centre' at Bombay

Excluding the two authentic books on *Asanas* and *Pranayama* by Swami Kuvalayananda, research work done by Om 'Kaivalyadhama' in the field of Yogic literature consists of the publication of a journal on Yoga called the *Yoga Mimamsa*, a critical edition of

the *Hathapradipika*, a critical edition of the *Brihad-Yogi-Yajnavalkya Smriti*, an *Index of Yogic Literature*, a *Concordance of the Yoga*, etc. In appreciation of the work put in by the College of Yoga at Lonavla the Central Government of the Indian Union and the Provincial Government of the Bombay State have allotted grants of Rs. 30,000 and Rs. 3,000 respectively to the institute so far. The College has also attracted no less world-famous visitors than Dr. J. B. S. Haldane and Prof. McBain from among the Western scientists, besides the Indian ones. The personality of Swami Kuvalayananda is a rare thing to come across even in the antiquated land of Yoga such as India. His vast erudition in the field of Yogic literature coupled with an equal amount of knowledge

The writer

of its practical side and a thorough grasp of the modern physiological investigations have made him well-known not only to the students of Yoga in India, but also in the Western countries which he has not yet visited. Though the main cause of his turning towards Yoga and the manner of his initiation at the hand of a greater Yogi, namely, the late Paramahansa Shree Madhavadasa Maharaj, will remain shrouded in mystery to us, yet we know this much that Swami Kuvalayananda was none but the principal Guru at Amalner more than a quarter of a century ago. His is a personality about whom the greatest living philosopher of India, Dr. S. Radhakrishnan, has said:

"I am impressed by the work which you have been doing all these years . . . I know that the lessons of Yoga in its different aspects are needed today, not only in our country but in the world outside. And you have the capacity and the training for undertaking this noble task. . . ."

Mr. Roswell P. Angier, Chairman, Department of Psychology, Yale University, New Haven, U.S.A., writes:

Some students of Yoga in the lap of Nature

"I wish on behalf of the Department and of the Yale University to express our sincerest appreciation of the facilities that were given him (Mr. Behanan) in his study of Yogic practices. Mr. Behanan has a very deep affection for you and is full of gratitude for the untiring attention and help that you gave to him. This sense of gratitude is also felt by the Department of Psychology at Yale University."

To quote the words of my revered Guruji: "Yoga has a complete message for humanity. It has a message for the human body, it has a message for the human mind, and it has also a message for the human spirit."

But the world, as it is constituted, requires material help even for spiritual progress. Let the benefactors of humanity and wealthy philanthropists in our country as well as abroad not forget this fact and allow the College of Yoga at Lonavla to close half-way for want of financial help that is urgently needed by it. The responsibility of our National Government is also by no means less towards the maintenance of this Institute, which has grown up independently to the credit of its founder-Yogi, for the revival of our cultural heritage.*

RAJESWAR DAS GUPTA The Pioneer Agriculturist of India

By INDU BHUSAN CHATTERJEE, MSc., L.Ac.,
Ex-Assistant Agricultural Commissioner with the Government of India

INDIA is an agricultural country and agriculture here is the most vital industry. In these days of widespread food shortage when huge quantities of foodstuff are being imported from abroad at enormous cost to the country, agriculture assumes even greater importance than ever. It has to be remembered, as once Sir Maurice Hallett remarked, that

"Whoever can make two ears of corn or two blades of grass to grow upon a spot of ground where only one grew before, deserves better of mankind and does more essential service to his country than the whole race of politicians put together."

In this connection the name of the late Rai Bahadur Rajeswar Das Gupta comes first to our mind. Realising the importance of agriculture he was one of the first to advocate research and improvement in our agricultural systems and their application to the field. Fittingly he has been called a pioneer in agricultural research in this province if not in India.

The late Rai Bahadur hailed from a distinguished Vaidya family of Vikrampur (Dacca). Undeterred by the loss of both the parents even at a very early age, he proceeded perseveringly with his studies and passed the F.A. Examination from the Dacca College. From

the very beginning he had a leaning for agricultural studies and this manifested itself in his taking admission in the Sibpur Engineering College with agriculture as a special subject. After passing the Final Examination he entered his service career. He was appointed Agricultural Inspector under the Government of Bengal in 1904. Later, after working for 2 years as the Superintendent of Agriculture, under the short-lived Eastern Bengal and Assam Government, he was promoted to the rank of Provincial Agricultural Superintendent. He conducted the cattle and jute census and prepared a *Year Book of Agriculture* which was of immense help to Indian Agriculturists. Mr. E. S. Miligan, the then Director of Agriculture, who was the first Agricultural expert to come out to India, was so much impressed by his work that he promoted him to the rank of Deputy Director of Agriculture.

Rajeswar Das Gupta officiated in the post of Deputy Director of Agriculture for two years and was then confirmed in the same post in the year 1919 and remained there till his death which, however, came too early in 1926 due to heavy extra departmental work which told on his health. He was made a Rai Bahadur in the year 1920. If he had lived a few years more, he was sure

to have been the first Indian Director of Agriculture in Bengal in those days of British bureaucracy. He lived only for 48 years, but in this short span of life his work is varied and voluminous. Regarding his success in service he was the first Indian I.A.S. in Bengal. He was not, however, merely a high Government official pinned

Rajeswar Das Gupta

to his official files. He was a practical farmer and carried his message to the door of the farmers and agriculturists. In this country the most difficult task before an agricultural officer is to bridge the wide gap between the agricultural experiment station and the vast mass of peasants who really form the backbone of Indian Agriculture. In the words of Sir John Russell:

"It is not so much new science as fuller use of existing science that is needed."

Rajeswar realised this and spared no efforts for the application of laboratory results and improvements in the field. When the Royal Commission on Agriculture came to India in 1926 he acted as Liaison Officer on behalf of the Government of Bengal. He was the recipient of many medals and prizes in agricultural shows and exhibitions.

Amidst his many and varied activities Rajeswar could find time to write down his experiences in agricultural science in the form of manuscripts which he obviously desired to publish in book-form. His untimely death, however, prevented him from doing this and he left this responsible task to his eldest son the late Romes Chandra Das Gupta. But for the latter, these valuable works would have been lost to us. Romes Chandra spared no pains to get the manuscripts of his father arranged in the form of books and get them published. This over-strain told on his already failing

health and he died very prematurely at the age of 42. The Rai Bahadur's work are now being published by the Calcutta University in three volumes covering, in general, almost all the aspects of agriculture including livestock farming which in the main relates to cattle-breeding and dairy farming. The *Krishi-Bijnan* (Volume I) of which a second edition has come out deals with the fundamentals of agricultural science in lucid Bengali so that it can be read and the contents utilised by all those interested in agriculture in the two Bengals. It is not merely a theoretical book compiled from different journals and text-books. It is a practical guide to the cultivators. It traces the development of agriculture in India from time immemorial, deals with the nature of soil, its origin and broad classification particularly in this country, then goes on to describe the mechanism of

Rajeswar plough

plant life. The author devotes a chapter on plant mechanism of plant life, a chapter on plant nutrients, soil micro-organisms, manures and fertilisers, etc., What the author intends is to bridge the gap between the student of Agricultural College or School and the cultivator. The school purpose and the farm purpose, though inter-allied, should be considered as separate and the author's aim is to serve both. It is only natural to expect that with the progress of civilisation and in years to come a more organised system of education will be introduced and the treatment of land will be more and more "thoughtful" to provide a decent living to those engaged. In the cultivation of the soil lies the wealth of the country. This can be achieved only by applying scientific knowledge, sound practice and reliable theory. As a text-book for examination it is more suggestive than exhaustive and it is sure to open the mind of the student to the many problems involved in practice.

Rajeswar Das Gupta was very thorough in his methods and in his *Krishi-Bijnan* he introduced for the first time very appropriate Bengali equivalents of Botanical terms which shows his profound knowledge of Sanskrit. He believed that cattle improvement in Bengal would only be possible if an indigenous Bengal Breed could be stabilised with fixed characters and he really started selection work on these lines at the Rangpur Cattle Farm. But unfortunately, his policy was not continued.

Great credit is due to Rai Bahadur Rajeswar Das Gupta for the design and execution of a new type of plough which has been named "Rajeswar Plough" after him. It is an improvement on the plough used in Bengal which is antiquated and out of date. The adoption of the new plough would not only save time and labour but also increase production. The book should find a place in the curriculum of the Agricultural teachings and syllabus of our University as well as the State Government. The Directorate of Agriculture, West Bengal, should also encourage wider circulation of this

book written by one of the ablest officers of the Department. He was admired by one and all for his unflinching devotion to work, and his generous heart. Rajeswar Das Gupta is no more with us. The best way to commemorate his work and memory is to push ahead with our plans for an all-round improvement in our agricultural system and carry the message of laboratory research and experiments to the very door of the farmer and help him to apply more systematic and scientific methods for crop production. Then and then only we shall breathe "the air promise-crammed."

—:O:—

TAMING THE TURBULENT TAPI

A new era of prosperity will dawn for the Surat farmer tomorrow when Shri Gulzarilal Nanda, Minister of Planning and Irrigation and Power, Government of India, will formally open the Kakrapar Weir and Canal Project on the Tapi River, and release the first irrigation waters into the Chalthan Branch of the Left Bank Main Canal system. No longer will the farmer have to gaze towards the sky for merciful showers at the end of the monsoon season to save his crops. On several occasions failure of rains at the most crucial period has been a frequent phenomenon in this region. Henceforth water from the project which, incidentally, is the first in the Five-Year Plan to be constructed and put into operation by the Central Water and Power Commission, will be available in plenty when needed most.

Kakrapar, a tiny village 50 miles from Surat on the lower reaches of the Tapi river, has given its name to the project. It was once famous for *kankar* used for making roads, and because investigations on the Tapi first started here, this village became associated with the project.

Rising in the dense forests of Madhya Pradesh, the Tapi courses through Betul, Amraoti and Nimar districts for about 200 miles and enters the Bombay State a little beyond Burhanpur. Collecting the waters of numerous tributaries, it meanders another 250 miles through the Khandesh and Surat districts of Bombay State before emptying itself into the Gulf of Cambay. In the region of Kakrapar, the Tapi has dug for itself a deep channel with high banks. On both sides stretch miles of cotton and *jowar* fields and banana orchards.

RICH SOIL

As one travels from Surat to Kakrapar over a country track encountering jerks and jolts, and clouds of dust, one is sustained by the thought that the new road now under construction nearby will soon be ready. The black soil on either side of the road is rich and good for cotton, but its fertility cannot be fully exploited due to unreliable monsoons. The waters from the weir will now help overcome Nature's whims.

The Tapi's catchment area is 26,000 sq. miles with an average rainfall of 29 inches, nearly all of which

occurs during the monsoon, yielding a mean annual run off of 16 million acre feet. A small part of this water is today being utilised for irrigation.

Similarly, the basin's abundant timber wealth which can be converted into paper, rayon and plywood, besides being used in construction, is lying unexploited for want of power. Navigation too has suffered from neglect, being possible only up to Surat, a distance of 12 miles from the sea.

C.W. & P.C. INVESTIGATIONS

The Central Water and Power Commission took up the investigation into the scientific and planned utilisation of the waters of the Tapi in 1946. It was found that the basin could be conveniently divided into three parts, each of which could be developed independently without prejudicing an integrated scheme for the entire valley.

The lower portion of the basin possessed attractive possibilities and its development was given priority. The work has been divided into three stages. The first stage is further sub-divided into two parts. The first part provides for a Weir at Kakrapar and canal systems on both sides; the second which is under investigation by experts, includes the building of a storage dam to a partial height and canals to irrigate an additional area of 4,79,000 acres. Its completion will permit considerable perennial irrigation. The second stage involves the raising of the storage dam to its full height, and installation of hydro-electric power and transmission lines. The third stage envisages the construction of a 16-mile long power canal from the Kakrapar Weir to the river edge opposite Piparia village to take advantage of a 107-foot drop for generating more electricity.

THE PROJECT

On a massive rocky outcrop stretching across the river from bank to bank, the Kakrapar Weir is 2,038 feet long and the height above the deepest point in the river bed is 45 feet. The Left and Right Bank Main Canal regulators tower over the weir to a height of 53 feet. The length of the weir originally was 2,500, but it was reduced to enable a better off-take of the Right Bank Canal which is an important component of the project,

The noise and din of machinery mingled with the voices of some 2,000 workers echoed and re-echoed in the valley for wellnigh over a year in order to complete the Kakrapur Weir within the time set. It was a race against the clock and everyone—workmen, officers, staff and contractors—worked with martial regularity and unison.

Draglines at work on the Left Bank Main Canal. Machines are here seen excavating the bed and shovelling the earth for bank formation

The weir will command a gross area of 8,00,000 acres, of which 6,51,000 acres will be irrigated annually. The scheme is an economical one as the cost of development per acre is about Rs. 100/-. The increase in the yield of foodgrains will be about 1.6 lakh tons and of cotton 16,000 tons per year.

CANAL SYSTEM

The irrigation system fans out from two main canals taking off from the regulators on both ends of the weir.

Of the total length of 850 miles of canals, branches, distributaries and minors, 600 miles have been dug and the entire system is expected to be completed by June 1955.

The progress of the Left Bank Main Canal has been behind schedule because a layer of hard morrum and rock underground was encountered. It was drilled with holes and dynamited. In other parts of the canal system bulldozers, draglines and tractors are busy in the work of excavation. Afflux bunds have been constructed on either side to form a reservoir.

The waters of the Left Bank Main Canal will be let

into the Moticher Khari which will serve as a canal for some distance. About half a mile above the Khari's confluence with the Tapi river, the Moticher Weir, a masonry structure across the Khari, has been built. This weir is 260 feet long and 48 feet high tapering from a base width of 299 feet to 24 feet at the top.

The country to be served by the canal system is traversed by several large rivers, necessitating construction of a number of huge and expensive aqueducts. Two major structures already constructed in the uppermost reach of Left Bank Main Canal are the Moticher Weir with spillway and an earthen dam at Ratania Khari. The number of masonry works on the canal system will exceed a thousand.

15,000 WORKERS EMPLOYED

Most of the work on the project was done by manual labour, but where the load, lift and operation by manpower was uneconomical, machinery consisting of dragline excavators, shovels, scrapers, etc., was used for economy and speed.

During 1951-52 the number of workers employed on canal digging reached a peak of 15,000. This helped considerably in giving employ-

Kakrapar Weir under construction

ment to a large number of persons from areas affected by scarcity and famine.

A large part of the equipment and stores was acquired from Disposals. All expensive and perishable stores were kept in godowns, while heavy material, like girders, plates and fencing, was stocked in an open yard.

Most of these will now be available for use on other projects.

Before work on the project started, a comprehensive soil survey of the commanded area was undertaken to determine the suitability of the soils for irrigation. This was done in the Project Laboratory at Kakrapar, which also tested concrete, mortar and engineering properties of soils.

The completion of the Weir at Kakrapar and the

supply of irrigation water to the areas on the Chalthan Branch marks the commencement of the systematic development of this part of the valley. By the middle of next year another large tract between the Mindhola and the Purna rivers will be provided with irrigation facilities and by June 1955 channels will be ready to serve the rest of the areas on this project. So the first step in taming the wild and turbulent Tapi in the service of man has been successfully taken.—*PIB*

PAPER : FOOD FOR THOUGHT

By A. G. MEZERIK

THE universal hunger for knowledge today has created a new need, a need for greater supplies of the raw materials for paper-making, since the printed word still is man's best means of communication.

In Sweden logs are towed to pulp mills in great rafts enclosed by a boom, as shown here

The oldest known bit of writing in the world, the Presse Papyrus, is in the municipal museum at Istanbul. It dates from about 6,000 years ago and the first sentence reads: "Alas, times are not what they used to be. Everyone wants to write a book and children are no longer obedient to their parents."

A long time has passed since then but the situation seems to be just the same—excepting that more people want to write books. There is another exception too. Papyrus leaves are no longer the basic ingredient for the manufacture of writing materials. Along with papyrus leaves the world has used—at one time or another—bones, stones and wood, slabs of clay and metal, fabrics, palm leaves, and finally sheepskin.

Now the world has turned to wood pulp, and

green forests are as essential to the printer as is movable type. And not only to the printer, for whether for ideas or confetti, for a poem or wrapping paper, or for postage stamps or wallpaper—paper winds itself about our lives from birth certificates through death certificates. The need for more paper—and more sources for paper—grows almost by the hour.

Governments and international organizations are committed to fighting literacy. The United Nations Educational, Scientific and Cultural Organization and other United Nations organizations are introducing new forms of education. Governments are exchanging knowledge and information. Every such action calls for books, newspapers and periodicals. Radio and television are newer forms of communication. They well may be in the long run most important, but now it remains true that more men, women and children in the world depend upon words and images printed on paper for their information and know-

ledge than on any other means of mass communication.

As education removes the cobwebs of ignorance, a new kind of hunger is spreading across the globe. That hunger is for newsprint—for paper. The new famine is robbing millions of people of their mental nourishment. World organizations are mobilizing to relieve this famine. A newsprint shortage has been obvious for some time but the general boom in raw materials which took place in 1951, accentuated by stock-piling demands, created an acute crisis. It was then Unesco became alarmed. Inadequate supplies of printing paper available prejudiced the success of its basic educational program. Unesco approached the Food and Agricultural Organization and initiated a campaign to meet the emergency.

The FAO assumed the major responsibility for high quality were made in Java wholly from rice straw. On the basis of the technical improvement in moved into the pine forests and out of them and the straw-pulping process, rice straw could be used to around them in quest of a source of the needed paper a much greater extent as a raw material in those

tropical countries where there is an insufficient supply of pulpwood. But the fly in the ointment is that rice-growing areas rapidly are mechanizing their farming operations. Harvesting by machines such as combines will cause the farmer to switch to short straw varieties of rice which will reduce the supplies of rice straw before the pulping business gets started.

Bagasse, the residue of sugarcane, today is receiving the most widespread and intensive consideration as a source of pulp. The world's potential supply of bagasse—more than 33,000,000 tons—could do much to alleviate the newsprint shortage. Bagasse makes a good pulp, suitable for various kinds of paper, including newsprint, provided it is produced by modern methods and mixed with groundwood. However, it too

This team of man and elephant is taking one of the first steps in moving the raw material for paper-making from the forest to the pulping mill

for printing. The quest has reached back into time—once again touching the very papyrus from which we started. Egypt, as the year 1952 ended, announced it would again try to produce paper from the plant from which paper got its name—the papyrus, on which the Pharaonic Egyptians wrote. The search covers the land. It ranges all through agriculture, although to be sure, it does not now encompass the prospect of reintroducing sheepskin. The record of 300 sheepskins required by Gutenberg to print his Bible on parchment is in no danger of being challenged.

Other ancient agricultural sources for paper-making are not so immune. Wheat straw was employed in making pulp before wood began to be used. Methods were primitive and the product reflected it—being cardboards, corrugating papers and low-grade wrapping papers. However, the art of making pulp from wheat straw has lasted through the centuries with many small straw pulp factories still in operation. Rice straw is also a source for the making of paper—and of much better grade than is possible from wheat straw.

Before World War II white papers of a very

From Canada, newsprint is shipped to many other countries. This picture shows great rolls being loaded for export

has drawbacks. Supplies will be limited as long as most of the world's bagasse is used as fuel to fire sugar processing and refining. Bagasse also has a relatively high pith content which must be removed before

actual processing.

It already is clear that, in spite of these and other difficulties, bagasse is going to be a useful supplement to wood pulp in those parts of the world which are in or near sugar-processing areas. Supplement is the word, however, because compared to the total pulp demand, its possibilities are limited to a ceiling estimated by experts to be about 10 per cent of the world's present pulp output. Today's production of bagasse pulp amounts to less than one per cent.

The same areas which produce bagasse grow bamboo, which already is the chief raw material for making pulp and paper in India. Of India's total pulp production of 128,000 tons, 60 per cent was made from bamboo in 1951. Bamboo has good fibre dimensions; it grows rapidly, and it produces a good quality of paper. In Burma, Pakistan, Indo-China and the Philippines, commercial plantations growing bamboo bring high financial returns.

Bamboo is a grass, as is esparto, which grows abundantly in northern Africa and in Spain. Esparto is shipped mostly to England and France for processing. Sabai is another grass. With two crops per year and a yield of about 3,200 pounds per acre, sabai today contributes about 22 per cent of the raw material for pulp production in India. Esparto and sabai are important locally—but that is about all. Along with the grasses, straw, bagasse and bamboo all can make a contribution. None can meet the ever-growing need for paper.

The world demand for pulp will continue to rise in the coming years at a rate of about five per cent a year. By 1960, the demand will reach—and it may exceed—54,000,000 tons, an increase of 20,000,000 tons over 1950. To satisfy this need it will take trees and forests. FAO has been looking at all kinds of trees in all kinds of places, seeking new forest sources for pulp.

One of the most promising future sources of pulp-wood from tropical regions is from pine plantations. Australians, New Zealanders and South Africans have demonstrated the practicability of obtaining very rapid growth and high volume yields from planted exotic pines. The world's largest man-made forest—Kaingaroa, in New Zealand—will shortly supply newsprint under a \$30,000,000 project.

In the green region of selva sweeping back from the eastern slopes of the Andes Mountains, Peru sees a solution for its chronic shortage of newsprint in the wood of the cético, a native tree which grows in weed-like profusion along the banks of the Amazon, the Marañon and the Ucayali Rivers. In his *Woods of Northern Peru*, Llewellyn Williams says that the cético (genus *cecropia*), although designated a hardwood, is really soft and not very heavy. It is one of the fastest growing pulp trees, growing more than 30 feet in three years. The trunk is 10 to 12 inches in diameter.

Palms, of which there are hundreds of species, also are being explored. Palm woods vary from soft and spongy to extremely hard and heavy, sometimes with a density greater than that of water. It is possible that certain species of palms can be grown for their wood just as others are grown for oil, dates and coconuts.

Hardwoods are not being ignored. Australia's pulp production of 136,000 tons is based almost 80 per cent on hardwoods, while in the world as a whole only 8 per cent of wood pulp is made from hardwoods. Certainly there are possibilities. Eighty years ago, a raw material shortage forced the paper industry to discover and develop new resources, to use softwoods instead of rags as the chief source of pulp for paper. Today the search goes on to meet the ever-increasing pressure of world demand on the raw materials currently being used to produce pulp for paper. Plants, cotton linters, roots, reeds, grasses and many other agricultural products are being tested.

In the United States, at Savannah, Georgia, and at Lufkin, Texas, are factories which work for American, African, Indian, Finnish, Mexican and New Zealand manufacturers. They are searching for raw material sources—and included in their studies are palmetto, sugarcane, fibre, straw, bamboo, African bango and cotton stalks.

Around the world the search goes on—prodded always by the insistent need. When FAO, not long ago, offered to survey cellulose resources and help establish factories for pulping, 25 countries in the Far East and Mediterranean Europe replied, asking for missions to survey their potential capacities for producing paper and newsprint. FAO, as its work develops, gets to know more about the possibilities. They are not pessimistic. The world's forests, they say, are capable of supplying sufficient raw materials. It should be technically possible to achieve the necessary increase in production to meet prospective pulp and paper needs.

The traditional raw material for pulping is, of course, spruce wood which is concentrated in North America and Europe. These two main producing regions had an output of 8,000,000 tons in 1913; by 1950 their joint output had risen to just under 31,000,000 tons.

A long time has passed since the French scientist Rene Antoine Ferchault de Reaumur observed that wasps made their nests from wood filaments which resembled paper. His associates were skeptical when he suggested that man, too, could make paper from wood. When Friedrich Gottlob Keller, a weaver from Saxony, discovered wood pulp in 1844, he proved Reaumur right. By 1854, collars, cuffs and shirt fronts made of paper were on sale in New York City. Ten years later, aprons, hats, carpets, casks and floorings were being made of it. It was used to make

MILE-STONES TO OUR FREEDOM STRUGGLE

223

coffins (but the Persians had thought of that idea long ago), houses, and at least two churches, one in Oslo, the other in London.

Now there are 14,000 uses and with every child who learns to read, a new consumer for paper enters the market. It will indeed take every kind of conservation, ingenuity and inventive resource to keep abreast of this demand. R. F. Taylor, a forester in charge of the Alaska Forestry Research Center, sug-

gested recently that Iceland's forests, practically non-existent after thousands of years of grazing and erosion, might be regrown with conifer seeds collected in Alaska. Alaska thinks that could be done and Iceland wants it done. Who knows; one day a child in Basutoland in Africa may use a book, the seed of which was truly borne near Juneau, though the author lived in Paris.—From *American Forests*.

MILE-STONES TO OUR FREEDOM STRUGGLE Patriotic Movements and Associations of the Early Nineteenth Century

By JOGESH C. BAGAL

INTRODUCTION: RAJA RAMMOHUN ROY

In the history of India's freedom struggle, the patriotic movements and associations of the early nineteenth century should form a distinct and important chapter. It is a fact that the English established factories in Western and Southern India earlier than in Bengal. But from the cultural point of view, the people in Bengal came into close contact with the English earlier than others. Western thought, culture and education laid a strong impress on the minds of the Bengalis so much so that they began to think and act for our national progress on the pattern of the West. The signs of such development were palpable even before the systematic inculcation of English education to the generality of the people. Raja Rammohun Roy, Dwarkanath Tagore, Radhakanta Deb, to name only a few, imbibed Western mode of thought and culture in the first decade of the century.

Rammohun Roy headed the progressive school of thought. His religious and social activities through the meetings of the "Atmiya Sabha," publication of religious books, issuing of pamphlets on social subjects, such as *Sattee*, and writings in the Press, had already made an impress on the minds of his co-religionists and the foreigners, mostly Christians. He assimilated the Western way of approach and reasoning so closely that at times he was hailed as a valuable addition to Christianity. But the Christians had to be disillusioned soon. Though he was a relentless critic of the religious and social habits of his countrymen, still at heart he was a staunch nationalist and ardent lover of his country and countrymen. Standing on this plane he came into conflict with the missionaries and challenged them to meet his arguments against the nefarious activities of the latter. Spread of Christianity amongst a dependent people by vilification of their social and religious customs could not be deemed as an act of chivalry. Rammohun asked them why they would not prove themselves zealous in propagating Christianity in independent countries like Turkey, Persia, etc., and follow the example of the founders of Christianity.¹ He

envisaged the gravity of the problem even in the twenties of the nineteenth century. Since then more than a century had passed, the country had also attained independence, but the missionary activities have

Raja Rammohun Roy

still remained a problem in the land. It may be safely said that our national movements and associations started, and very often received momentum, with our attempt to counteract this missionary menace.

1. *English Works of Raja Rammohun Roy*, Panini Edition, p. 145.

Rammohun was a pioneer in other directions also. The Hindu College had only been started in 1817. Systematic English education necessarily could not make much headway. In his political work he depended more or less on his colleagues who were mostly privately educated and acquainted themselves with the Western thought beforehand. Rammohun utilised the Press, then in the nascent stage, to propagate his progressive views on subjects which required to be tackled for the rapid improvement of his countrymen. He found in James Silk Buckingham, editor of *The Calcutta Journal*, a true well-wisher of India. Rammohun's Bengali and Persian writings in the two respective papers, *Sambad*

James Buckingham

Comrade and *Mirat-ul-Akhbar*, were Englished for the journal and published in it almost regularly. The governmental activities in the early twenties were severely criticised in Buckingham's *Journal* as well as in the Indian papers. Minutes on the English and the Vernacular Press—one on English by J. Adam and the other on Vernacular by W. W. Bayley—reveal broadly the critical attitude of the Press, especially of *The Calcutta Journal* and the vernacular papers towards the various ugly measures and actions of the Government. Instead of mending their ways in the light of these criticisms the Government of the day thought it prudent to pass the Press Regulation of 1823, which sought to prevent the free expression of opinion by the Press.

The Damocles' sword had already fallen on James Silk Buckingham. His licence was cancelled; he was banished from the country by April 1823. Rammohun also did not sit idle. Along with his associates, such as Dwarkanath Tagore, Prasanna Kumar Tagore and others, he sent a petition

to the Supreme Court against this measure. This, proving ineffective, he sent an address to the King in Council in England, in which he dwelt on the virtues of a free Press. This address was likened to the *Arcopagetica* of Milton for its lucidity of style, force of argument and for the defence of the freedom of the Press. Rammohun took a step forward. As a protest against the Regulation, he stopped publication of his Persian paper *Mirat-ul-Akhbar*, after bringing out its last issue on 4th April, 1823. In giving reasons for the stoppage, he quoted two Persian couplets, the purport of one of which is:

"The respect which is purchased with a hundred drops of blood
Do not thou, in the hope of a favor,
commit to mercy of a porter."

A great votary of the Bengali language, Rammohun desired its rapid improvement. He thought that the universal use of Bengali was urgently needed for political reasons also. In a paper, "On the possibility, practicability, and expediency of substituting the Bengali language for the English," Rammohun pleaded, for 'the reading of the vernacular languages of India by the English,' for, that 'would give us a better chance of obtaining justice than we have ever had yet.' Some cogent reasons were advanced in support of his proposition. He wrote in conclusion:

"... Surely it is much easier for two or three thousand of them (Englishmen) to adopt our language and character, than to expect sixty millions of Natives ... to give up that which have been used for centuries, and accept a new one."

In a dependent country, to hold and propagate such a radical view bespeaks of the vigour and foresight of the man that Rammohun was.

GAURIYA SOMAJ

Though most of his countrymen could not subscribe to his radical views regarding religious and social matters as also could not appreciate the far-sightedness of his political views, they, however, formed themselves into an association early in 1823 to devise ways and means for the rapid development of the Bengali language and literature and for the neutralisation of the missionary activities. Both the followers of Rammohun and those belonging to the orthodox section of the Hindu community joined the association in large number. The former included Dwarkanath Tagore, Prasanna Kumar Tagore and Tarachand Chakravarty and the latter the renowned Sanskrit scholars, such as, Ramjay Tarkalankar, Kashinath Tarkapanchanan and Raghuram Sironmani, as well as such other litterateurs and prominent Bengalis as Bhawani Charan Banerjee, Radhakanta Deb, Ram Comul Sen, Ramdulal De (Sarkar), Rasamay Datta and Kashinath Mallik.

2. "Rammohun Roy as a Journalist"—Brajendra Nath Banerjee, *The Modern Review* for August, 1931, p. 138.

3. *The Modern Review* for December, 1928, p. 636.

The Gauriya Somaj, rightly described at the time as "The Native Literary Society," issued a prospectus⁴ in Bengali in which its objects were explained in detail. The principal object of the society was the encouragement and diffusion of knowledge amongst our countrymen in their mother tongue. With this view the Society resolved that 'translations of works from other languages into Bengali shall be prepared and published at the Society's expense.' The prospectus proposes the following practical means for the fulfilment of this object in the following lines:

"We therefore beg to suggest, that the wise and well-informed men of this country should combine, and, as far as their respective abilities admit, or by the employment of pandits, and translators, the

twenty years, the English missionaries have treated the natives of Bengal.' The prospectus continues:

"What man of any observation is there who does not perceive its injurious operation on our existing laws, and who is uninformed of the lamentable condition of those who, deserting their own faith, have become native Christians? The missionary teachers, imperfectly informed of the principle of our Shastras, our *devtas*, and our institutes, have translated, as descriptive of them, detached passages; they have printed pamphlets against us, replete with most intemperate and abusing terms, and distributed these to the world ..."

The attitude of the English officials towards the Hindus and their religion was also deplorable. Influenced by their disposition to consider us as followers

Dwarkanath Tagore

of a false religion, they withhold all countenance from our pursuits, and feel little or no interest in our welfare.' The Hindus therefore could not look for any considerable encouragement and aid from this quarter. They must rely on their own strength to counteract the menace. They proposed in the prospectus:

"It thus appears that the Hindu, who has always been submissive, humble and inoffensive, is now exposed to unprovoked attacks, and is injured in his reputation, and consequently even in the means of subsistence, by persons who profess to seek his good. As yet this cruelty and calumny have been little heeded, and scarcely an effort to repel them been attempted; had such conduct been offered to the Mussalmans, they would instantly have combined to resent it; and in like manner it is now incumbent on the opulent and respectable Hindus, who delight not in the abuse of their Shastras and practices, and who wish to cherish and preserve them, to consider well these circum-

4. Published in English translation in *The Asiatic Journal*, December, 1823.

Ram Comul Sen

stances, and upon full deliberation, to unite to publish replies to the charge made against us, or to represent our grievances to the government, by whose wisdom no doubt a remedy will be devised."

The Somaj was inaugurated on 16th February 1823, in the Hindu College Hall, with Ram Comul Sen in the chair. The prospectus was read and discussed. Ram-comul Sen and Prasanna Kumar Tagore were appointed secretaries. In the second meeting of the Somaj, a committee of management was formed with Lally Mohun Tagore, Radhamadhub Banerjee, Kasikanta Ghosal, Chandra Kumar Tagore, Dwarkanath Tagore, Pandit Ramjay Tarkalankar, Radhakanta Deb, Tarini Charan Mitra and Kasinath Mallik. From the contemporary newspapers we get the record of only four

Prasanna Kumar Tagore

meetings of this Somaj, which were held in a rotating manner. The Somaj succeeded in focussing the attention of many influential and opulent persons, and it was hoped that the objects of the institution would be more than fulfilled. Though nothing of the Society was heard beyond the middle of June, 1821, still the impetus that it gave to the propagation of knowledge through the publication of Bengali translations or compilations from foreign authors as well as of the Hindu Sastras, such as the Ramayana, the Mahabharata and the Puranas; English and Bengali newspapers, periodicals, books on polite literature and poetry, grammars, dictionaries and even maps. The members of the Gauriya Somaj are found to engage in this work of

public good in their individual capacity. The Somaj could not continue for obvious reasons. But the objects for which it was founded, remained uppermost in the minds of our leading and enlightened countrymen who were its members. Very many associations were started later for literary or cultural pursuits. But the Gauriya Somaj may be rightly called the precursor of them all. Late in the twenties, associations of a newer and more radical nature grew up, due to the spread of the new education. Henceforward the people were more and more conscious of the evil consequences of the missionary propaganda in the country.

THE NEW EDUCATION: THE ACADEMIC ASSOCIATION AND OTHER COGNATE BODIES

During the first decade (1817-27) the Hindu College mostly imparted only rudimentary instruction in English. The appointment of Henry Louis Vivian Derozio, the young Eurasian poet, as teacher of History and English Literature in the Hindu College in 1826, signalled a new era in the teaching of these subjects. His instruction made it possible for the Indian youths to be acquainted with the currents of modern European thought and culture. The students no longer took things as they were. They applied reason to consider *pros and cons* of every subject and tried to arrive at an independent conclusion. They became habituated to stand for reason as against prejudice. The spirit of enquiry was abroad. To Derozio's pupils were gradually unravelled the secrets of European superiority over the rest of the world in every sphere of life. They began to preach and practise things which were disliked by their elders. They started debating societies at which they freely discussed social, moral, religious and political subjects. This transformation in the outlook of the Bengali youth was brought about within four or five years of Derozio's joining the Hindu College. Peary Chand Mitra, a student-disciple of Derozio, gave the credit for this historic transformation to the inspiring instruction of Derozio in and outside the Hindu College. He writes:

"Of all the teachers, Mr. H. L. V. Derozio gave the greatest impetus to free discussion on all subjects, social, moral and religious. He was himself a free-thinker, and possessed affable manners. He encouraged students to come and open their minds to him. The advanced students of the Hindu College frequently sought for his company during tiffin time, after school hours and at his house. He encouraged everyone to speak out. This led to free exchange of thought and reading of books which otherwise would not have been read." "The impetus to enquiry and promotion of thought given by Derozio manifested itself in debating clubs, which were encouraged by Hare."

The first and foremost of these debating clubs was the Academic Association started by the advanced students of the Hindu College in 1828, and over which

5. *A Biographical Sketch of David Hare*: By Peary Chand Mitra, p. 15.

6. *Ibid*, p. 16.

Derozio presided. This Association met once a fortnight for literary discussion in the garden-house of Sreekrishna Singh at Maniktala, where later on the Wards' Institution was situated. The subjects discussed at the meetings included free will, fate, faith, the sacredness of truth, the high duty of cultivating virtue, the narrowness of vice, the nobility of patriotism, the attribute of god, the hollowness of idolatry and the shams of priesthood. In these discussions Krishna Mohun Banerjee, Rasik Krishna Mallik, Dakshinaramjan Mukherjee, Rangopal Ghose, Ramtanoo Lahiri, Radhanath Sikdar, Gobinda Chandra Bysak, Peary Chand Mitra as well as many others took an active part. David Hare, the main projector of the Hindu College and a true friend and advocate of Indian advancement, was a regular visitor to the meetings of the Association and encouraged the deliberations of the young men on the above subjects. Sir Edward Rayan, Justice of the Supreme Court of Calcutta, and Colonel Benson, Private Secretary to Lord William Bentinck, used to visit the meetings occasionally. The example set by the students of the Hindu College was followed by those of the other seminaries also. We learn from a contemporary account that

"Seven associations of this kind are now in existence, the proceedings of which are conducted exclusively in the English language. Most of them meet once a week, and some at longer intervals, for discussing questions in literature and science; and sometimes in politics; the number of members belonging to each varies from 17 to 50. At some of the societies written essays are produced, which become the subjects of discussion; at one of them lectures on intellectual philosophy are delivered in rotation by members, and at another by the president, an East Indian gentleman of great talents. . . ."

The last one evidently refers to the Academic Association, and its President Derozio. According to this account, Derozio was connected with most of the others as a member. It further says:

"In short, he lends a very able and active hand in raising the intellectual character of the native youth; and many of the young men who have enjoyed the advantage of his instructions have distinguished themselves by their proficiency."

We learn also that

"The example thus set in English has been imitated in Bengalee literature, and two or three Associations have been formed principally of persons not connected with the schools above-mentioned, for writing upon and verbally discussing various subjects exclusively in the Bengalee language."

Students headed by Debendra Nath Tagore (later, Maharshi) and Ramaprasad Roy actually started an association in December, 1832, for the cultivation of the Bengali language.

7. "An Indian Correspondent on the Native Improvement" in *John Bull*, December 11, 1830.

This free discussion by the advanced students and young men soon led to activities that gave rise to a commotion in the Hindu society. Eating forbidden food, decrying idolatry, denouncing the social customs—constituted some of their chief planks of action to which the elders took serious exception. The latter made Derozio responsible for all this, and succeeded in inducing the Hindu College authorities to dispenze with his services. The young men were subjected to various kinds of torture and humiliation by their guardians. But they were undaunted. They remained votaries of their cherished opinions all their life. They fought against social evils and religious bigotry with youthful exuberance. Eager to diffuse the new educa-

David Hare

tion amongst their countrymen, these youths started free schools in and around Calcutta. Some of them took to journalism, literature, teaching or trade as their profession while others accepted posts in various departments of the Government. Whenever they went, they instilled the spirit of honesty and truth into the body politic. This paved the way for the removal of long-drawn abuses prevalent in the public offices and in private life. These young men, better known as "Young Bengal", later on, became the leaders of the community in politics and social activities. The lessons of association or combination, imbibed in their youthful days, stood them in good stead in after life. Guided by the noble motives of patriotism, they established religious, social, cultural and political associations for the all-round improvement of their countrymen.

The educated Bengali youths soon spread into the mofussil districts of Bengal, and gradually all over

Northern and Central India as well as Assam as the emissaries of new light, education and culture. They also took lead in the progressive movements of these regions.

THE ACTIVITIES OF THE ELDERS

Since the establishment of the Gauriya Somaj, the elders of the community took upon themselves the task of safeguarding our national interests in politics. They soon had an occasion to protest against the

Henry Louis Vivian Derozio

governmental action. The jury system was first introduced in our law courts in 1823. Here was made an invidious distinction by the powers-that-be between the Christians and the non-Christians. It was stipulated in the law that 'the Grand Jury in all cases, and all jurors for the trial of persons professing the Christian Religion, shall consist wholly of persons professing the Christian Religion.' Rammohun Roy, the most progressive leader of the period, protested strongly against this measure. While in England, he even brought the matter pertinently to the notice of the Parliamentary Joint Committee set up for the consideration of the Indian affairs in 1832. Here the public mind was so

much agitated over this unjust measure that both the Hindus and Mussalmans joined hands with one another for the first time for seeking redress of this political grievance and sent a petition to the Government here as well as in England either for rectification or for withdrawal of this ignoble measure. One Mr. John Crawford acted as agent of the Indians in England and presented a petition on the matter before the Parliament on their behalf. It was due to the continued agitation in India and abroad that the Jury Act was so amended as to remove the invidious distinction from the Statute Book in July, 1832.

Next in importance was the colonisation question mooted in late twenties by the non-official Europeans. The Europeans had to live in this country on sufferance, licences being issued to them for residence here. They were liable to be banished from the land even on suspicion by the Government. They, therefore, could not be permanent residents and have any stake in the land. For the removal of these disabilities, the colonisation movement was started. In the public meeting held for this purpose in the Calcutta Town Hall on 15th December, 1829, Rammohun Roy and Dwarkanath Tagore lent their cordial support to the cause. Dwarkanath even moved a resolution for abolishing the restrictions on the residence of Europeans in India. Rammohun supported this resolution. In their speeches they both emphasised the necessity of the Europeans living permanently in this country, as partners of the Indians in weal and woe. From personal experience, Rammohun said on the importance of European colonisation as follows:

"I am impressed with the conviction that the greater our intercourse with European gentlemen, the greater will be our improvement in literary, social and political affairs; a fact which can be easily proved by comparing the condition of those of my countrymen who have enjoyed this advantage with that of those who unfortunately have not had that opportunity; and a fact which I could, to the best of my belief, declare on solemn oath before any assembly."

Rammohun believed in his heart of hearts that European capital and enterprise, not to speak of Western education and culture only, would be fruitfully employed for the development of the country's resources, whereby the Indians would be largely benefited. But the Charter Act of 1833 and the invention of the steam engine conjured up together to belie these expectations of Rammohun and his friends. There was a party of elders, headed by Radhakanta Deb, who denounced the colonisation question; and the unforeseen circumstances that followed, proved their contention to be right.

Some sort of political consciousness was already in evidence in the newly educated in Bengal. Both the elders and the young men felt that their dependence on

others must end before they could rise to their full stature. And the process had already set in. In his "An Address to My Countrymen," in 1831, Prasanna Kumar Tagore declared that

"The influence of liberty and truth was spread and is spreading far and wide, and nothing can check its course. There was a time when the natives of this country were looked upon as a race of unprincipled and ignorant people, . . . But look at the contrast now. Is it possible that at the present day an impeachment of such a dark character will be allowed to bear the slightest colour of truth?"

On the social plane the conservative Hindus came into serious conflict with the progressive school of reformers headed by Rammohun. The *Suttee* question was solved once for all by Lord William Bentinck, the then Governor-General by the passage of the Anti-Suttee Act on 4th December 1829. The progressive leaders welcomed this measure and gave him an address of felicitation in the following January. The orthodox section also approached the Governor-General with a prayer to get the Act repealed, but failed to elicit a favourable reply. They, however, founded *Dharma Sabha* on 17th January, 1830, to conduct an agitation in India and England against the Anti-Suttee Act. They even appealed to the Privy Council for redress. But here also they could not succeed. At times the conflict between the Brahmo-Sabha, the religio-social body of Rammohun, and the *Dharma Sabha* of the orthodox Hindus grew serious. But the political grievances which both had to suffer equally, bridged the gulf of differences and they were united in no time to fight for the common cause.

THE CHARTER ACT OF 1833 AND AFTER

The 'reformist' and progressive activities of the Indians here and especially of Raja Rammohun Roy in England had their repercussions on the discussion over the renewal of Charter in the Select Parliamentary Committee there. The Charter Act was passed by the Parliament in 1833, and came into force early next year. By this Act the East India Company lost all its trading rights except those on salt, and the Indian Civil Service, a close preserve for the relations of the directors and influential share-holder of the Company, was opened theoretically to all, irrespective of caste, creed or colour. But, practically speaking, only the Britons could take advantage of this innovation for a long time. The most important change introduced by the Act, was, however, the centralisation of legislative power for all India in the Council of the

Governor-General, who now came to be designated as the Governor-General of India instead of the 'Governor-General of Fort William in Bengal.' This important change neutralised the fissiparous tendencies of the Governments of Madras and Bombay, who had hitherto acted practically independently of the Central Government at Calcutta. The spirit of governmental independence percolated to the rank and file of the newly educated there. Decades had to pass before this separatist tendency could be removed from their minds and a national outlook evolved. Being centralised, the Government became 'national' before our new nationalism could take a concrete shape. A fourth member was added to the Governor-General's Council as 'Legal Member.'

The colonisation movement succeeded so far as the removal of the licence-system was concerned. After the passage of the Charter Act, the Europeans were eligible to be an Indian citizen *par excellence*. They could settle here permanently, acquire property rights, engage in agriculture and carry on trade in the country. But the greatest anomaly remained, and they could move here like "free" Britons, by which they boasted to call themselves. Their privilege of being tried by the Supreme Court of Calcutta both in civil and criminal cases, was kept intact. This led to serious racial antagonism between the Indians and the Europeans afterwards. Even when in 1836, Macaulay, the first Legal Member, sought to remove this legal anomaly and racial discrimination partially by extending the jurisdiction of the Company's civil courts in the mofussil to try cases in which the Indians and Europeans were involved, the non-official Europeans in Calcutta held public meetings to denounce the measure and even then they nicknamed it as the 'Black Law.' This name persisted each time any attempt for the removal of this legal discrimination was made.

But the leaders of both the communities still acted together for the preservation of their common interests. The beneficent rule of Lord William Bentinck and his temporary successor Sir Charles Theophilus Metcalfe induced the Indians to unite and work for the good of their common Motherland. They did not hesitate to unite and protest against the administrative measures. The Press was set free in September, 1835. This gave no less impetus to free discussion of the State-measures.

Political associations soon cropped up to give vent to public feelings. Newspapers devoted themselves more and more to political discussion. Criticism of the public acts and measures as well as suggestions for the country's improvement became the order of the day.

HOW AMERICANS MISREPRESENT INDIA

Some Samples

By PREM NARAIN AGRAWAL

"AMERICAN editors like to publish articles, etc., about India by their own editors, writers, journalists and observers, etc., who are visiting India off and on rather than by Indians," said an important man of the U.S. Embassy in India. I agreed because it is perfectly natural to rely more on their own countrymen and their writings will have a greater appeal to American readers. They also write in a suitable style giving those very facts most needed by them and in a manner which attracts their imagination at once.

But it is risky too, particularly in these days when earnest efforts are being made by U.S. at tremendous cost to win Indian friendship and goodwill. Misrepresentations, wrong facts, or exaggerations in their writings tend to create ill-will among Indians, and the critical section in India, not favouring increasing Indo-American friendship, make a capital out of even small things innocently written. They are likely to confirm all kinds of suspicions of Indians about American intentions. Naturally therefore, it is essential for American editors to be extra-careful in not publishing wrong things about Indian affairs injuring their sentiments, thus cutting the root of growing friendship between the people of the two great democracies of the world.

An impartial analysis of these references to Indian affairs is very revealing and sometimes it appears as if a deliberate attempt is made to misrepresent India even by most eminent and responsible men. Sometimes such instances are more harmful and we have to guard against them.

In this article I propose to give some concrete instances to give you an idea how and what misrepresentations are being made.

Even so responsible a man like the former U. S. Ambassador in India who was always believed to be correct and who was expected to be more familiar with facts being on the spot often made grievously wrong statements.

In his article appearing in the *New York Times*, dated March 23, 1952, under "Asia Challenges U. S. through India," the former democrat U.S. Ambassador in India Mr. Chester Bowles wrote:

"Following the general pattern set in the point four pilot study at Etawah each project will lay heavy stress on increasing agricultural production."

Participating in a Columbia Broadcasting system programme "Capitol Clockroom" broadcast on January 18, 1952, Mr. Bowles again said:

"The U. S. is trying to help them help themselves. Horace Holmes (point four expert) went out there to help them . . ."

The pilot project work, Etawah, of which I am a resident, is not a point four work. Point four aid

implies financial as well as technical help but here there was more. In fact, on June 5, 1950, the President of the U.S.A. approved the act of international co-operation, authorising the point four programme. On September 6, 1950, the first annual appropriation of \$34,500,000 for the fiscal year 1951 became available on September 8, 1950. The point four programme became the responsibility of the Department of State by executive order.

Etawah pilot project work had been started in September, 1948.

It will thus be abundantly clear that point four came into existence after two years of Etawah work had started and nothing has yet been done by point four in any shape or form to take the credit.

Mrs. Eleanor Roosevelt, who visited India early in 1952 as a guest of India Government, paid a visit to Etawah and wrote about its work in her world-wide syndicated column "My Day" appearing under Allahabad (India), March 19, 1952 date-line in this way:

"When our point four people first arrived the farmers thought only of digging a big canal for irrigation purposes, which would have been an expensive project, but it was quite evident that no money was forthcoming for this, so Mr. Holmes started by inducing them to try better seeds in small sections of their fields. Then gradually tube-wells were put down and more irrigation was possible . . ."

In the same column in the concluding paragraph she wrote:

"Altogether I was so interested by Etawah that I wanted to tell the whole world about what Mr. Holmes of the U.S.A. working for the point four programme has started."

It implied that when work was started here there was no proper scheme of work, people entertained wild ideas or hopes, enough money was not arranged for and it was Mr. Holmes who gave the lead in driving away the confusion and that he was point four man.

All of these are however wrong. Before the work started experts had a definite well-thought-out scheme and ample funds at their disposal for executing it. People never thought of digging a canal and wanted to know what they would do as a big canal with so many tributaries already existed there, tube-wells were put down to supply more water and at will. There was no room for confusion of any kind and experts started the work according to pre-arranged plan. The biggest mistake, bordering on mischief, is the suggestion that it was started by or under point four. As explained above point four had nothing to do with it and Mr. Holmes who is now working in India with point four was then an employee of U.P. State and was imported into

HOW AMERICANS MISREPRESENT INDIA

231

India to work here as an assistant and later joined point four.

The last paragraph where she says it was started by him is again wrong. Mr. Albert Mayer, an American town planner, who conceived it, planned it and put it into work and who still continues to work for it, started it.

When I brought to the notice of Mrs. Roosevelt all these facts she corrected her previous writings by writing the following under "Hyde Park," July 10, 1952 headline:

"I have a letter from a gentleman in India who points out that I was incorrect, rather left an incorrect impression when I wrote a column on Etawah, India. I am sorry to have been inadequate and I hereby correct it immediately, but I also wish to say that in short column it is very difficult many times to tell the whole story about anything."

"The project of Etawah was started by the Indian Government. Albert Mayer, an American architect, who is building the new capital of upper Punjab, was responsible for the early recommendations on which was to be done and has continued to watch over it with interest. The Government had engaged Horace Holmes, an American extension agent, and he worked in India for two years before our point four programme came into the picture at all. Later Mr. Holmes was kept on under the point four arrangement."

"This information was kindly sent me by Prem Narain Agrawal, M.A., who is an author and journalist of Ajitmal, Etawah, India. I am very grateful to him that he corrected the impression that I had created. I have mentioned Mr. Mayer on several occasions. He has been interested in and guided much on the building in this area and in other Indian areas."

Such mis-statements and half-hearted corrections by such eminent persons like Mrs. Roosevelt create a lot of misunderstanding and confirm various suspicions already existing in India. She corrected her previous writing but not all the facts and that too not in clear language.

When she visited Etawah she was in the company of the U. P. Governor and this fact she mentions in the same column from whom she could have easily ascertained these facts. But she relied on her own countrymen which put her in such an awkward position and did a lot of harm not only to her prestige in India but to Indo-American friendship and good relations. In her Allahabad, March 18, 1952 date-line column she gave the source of her information which she later had to correct in this way:

"The evening before on the train Mr. Holmes, who is the point four man, who started this work and whose training was given at Cornell University, came in to talk with me about what they were doing, so I had a little background to help me observe."

Evidently she was misled deliberately by Holmes with some intentions.

Her previous column appeared in Indian papers

but not her corrections. She did not appear to have made any effort so far to enlighten the Indian people about her corrections, leaving them free to form any opinion about her intentions, those of the Americans whom she represented. But Mr. Chester Bowles, the former U.S. Ambassador in India, did not deem it fit to correct his statements referred to above, despite my rather lengthy correspondence with him, and the verbal admission of the mistakes by his assistant, probably because of the official position he held at the time.

Though unusual for Ambassadors he wrote several articles about India and might have committed equally serious and damaging statements. In another article captioned "New India" appearing in the American Quarterly Review *Foreign Affairs* in October 1952, which came to my notice recently, he wrote:

"In addition there were 584 princely States. Of those only Kashmir, Hyderabad and Mysore were of significant size, while 202 had areas of less than ten square miles."

While the number of States is not exactly the same his statement that Kashmir, Hyderabad and Mysore only were of significant size, is misleading. There were several other States of significant size like Baroda, Gwalior, Indore, Jaipur, Jodhpur, etc.

At another place in the same article he writes:

"The answer lies largely in making more consumers goods available in the village bazaars at reasonable prices. There are tens of millions of Indians who have never owned a pair of shoes or a change of clothing. The market for new cooking equipment and simple comfort is almost unlimited."

It gives an incorrect picture. There is plenty of consumers goods now in the market, barring a few things, but Indians have no money to buy them. Indians could not own a pair of shoes not because there was a dearth of shoes but they never had money to spare for them. Now with slump coming in there is a general complaint everywhere in India that consumers goods are lying in shops and stores, and there are no buyers. It is true that the market for cooking equipment and simple comfort is almost unlimited but they have no money to buy it.

It may be argued that neither Mrs. Roosevelt nor Mr. Bowles are professional writers and such mistakes are possible. But the truth is that their views and observations carry far greater weight than that of an ordinary writer, hence, they should have been more careful in their writings.

But professional and experienced editors have done no better.

Another very important man of the same embassy very proudly gave me a copy of Mr. Ralph McGill's report on India containing all the columns written by him during his stay in the interior of India, which had also appeared in the American daily *The Atlanta Constitution*, of which he was the editor, challenging me to point out wrong facts and wrong impressions as

he was sure it cannot contain such things. He gave it to me when I was discussing wrong facts, misrepresentations, exaggerations, etc., in American and Indian press about Etawah project in which the U.S. embassy had an hand.

Since he was in Etawah district for the most part of his stay and wrote about it, myself being in between Ayana and Mahewa, the two areas where he stayed and wrote about, I can give the correct factual picture.

Writing of Pandit Jawaharlal Nehru, under New York City date-line appearing in *The Atlanta Constitution*, dated November 21, 1951, he says, "He sold his beautiful, spacious house and gardens." Evidently he refers to Pandit Nehru's famous Anand Bhawan afterwards called Swaraj Bhawan, which was the headquarters of the All-India Congress Committee for a number of years. It was not sold but given free of all costs to the Congress to house its head office. There is plenty of difference in selling and giving free.

Writing of Mahatma Gandhi under Karachi date-line appearing in his paper on December 1, 1951, he says, "He (Gandhi) was shot on Sunday, January 25, 1948."

Gandhiji was shot on January 30, 1948 and it was Friday and not on the date and day he mentions.

Under Ayana, district Etawah, U.P., headline appearing in *The Atlanta Constitution* on December 10, 1951, he writes thus:

"So great is the shortage of fuel that cowdung is made into cakes and dried so that it resembles and burns like the peat of Ireland."

Cowdung cake is not used because of fuel shortage but because of the quality of fire it produces. Its fire is more suitable for good cooking. It is so cheap and convenient to make and use during monsoon when woods get moist, giving more smoke.

Writing about Etawah pilot project work, which he came to see in particular to shout about, under New York City date-line appearing in his paper, dated November 21, 1951, he writes, "There our agricultural aid has brought many changes."

Again he makes reference to this work under Ayana head-line appearing on December 10, 1951, in the following words:

"... Who is in charge of the farm project being conducted here by the Indian Government. With point four assistance ..."

He emphasises American aid in this area again under Ayana date-line appearing on December 11, 1951, in this way:

"Here thanks to ... and his associates, Indian and American. The administration of American aid has been sound and productive."

But the fact is that there was no American aid either technical or financial in the Etawah pilot project area. Etawah work had been started in Sept. 1, 1948, two years before point four was formed in the U.S.A. and much before it came to India. Some Americans who

worked in this area were employed and paid fully by the U. P. State.

Under Etawah headline appearing on December 12, 1951, he says, "Etawah which is the smallest of 48 districts in the State called the United Province," and goes on describing the annual livestock fair of the Etawah district as "the largest fair in all India." He called it the United Province though its name was changed to Uttar Pradesh in 1949 under the new Constitution.

Etawah is not the smallest district of this State nor the annual cattle fair 'the largest fair in all India.' It is not the largest fair even in our State of U.P.

Appearing on December 13, 1951, under Ayana headline he mentions, "There are in India 48 such other States." He would have been correct if he had said there are 48 such districts in U.P. There are only in all, big or small, 28 States, like Uttar Pradesh in the whole of India.

At places we also find confusion of thought. Under Ayana headline appearing on December 13, 1951, he writes:

"There is an area which is semi-desert. Irrigation necessary. There are two canals flowing more than 300 miles through the areas, deriving from Ganga (Ganges) the river."

Under Mahewa headline appearing on December 17, 1951, writing about another village Andawa a few miles from Ayana, he says:

"The land in this area, which is the vast Ganges river valley, is very fertile, but arid. Aside from the monsoon which brings rain in the late June and into late August, there is almost literally no rain at all."

In the first paragraph if he describes Ayana area it is wrong since there is only one canal and the land is not at all semi-desert. If he means the whole of Etawah district, which has two canals, the land again is not semi-desert.

The second paragraph makes the confusion and description more evident. The whole of Etawah district, not village Andawa alone, including Ayana village, lies in the vast Ganges river valley and the land is very fertile. I should rather say the land lying between the two famous rivers Ganges and Jamuna, called *doab* land is the most fertile land in the whole of India and Etawah is situated in this area. It looks ridiculously inspired to describe it as 'semi-desert.' Rainfall continues from late June to late August and also in September. In December and January, again there are showers of rain and often more than necessary for canal-irrigated land.

Under Ayana headline appearing on December 18, 1951, he writes:

"There were letters to mail and so we drove along bullock cart ruts to the canal bank, which flows from the Ganges 300 miles through this parched land and along it to the Post Office at Auraiya 11 miles away."

"It has a bank, with a policeman on guard in a uniform like a soldier's and armed with a rifle."

The first paragraph is a sad and incorrect reflection on the postal system of India. It implies he had to go to Auraiya 11 miles away just to post his letters as if there was no Post Office capable of carrying his mail nearby. There is a Post Office in the village of Ayana itself and another five miles away, as quick in carrying mails as Auraiya Post Office. It is wholly incorrect to say he had to go there for the sake of posting his mails. It would have been reasonable to say that he went to see what it was like.

It is equally wrong to say that Auraiya had one bank only as described above with a policeman. Auraiya has more than one bank and the man whom he described as policeman was not a policeman but a *senry* of the bank, employed to guard it. He seems to invent and develop a funny idea to boast American aid to impress his American readers. Under Mahewa headline appearing on December 20, 1951, he writes:

"The Indian masses were never given schools. ... Now they are being given schools and assistance in learning. The U.S.A. is playing a part in it, though always with and under the Indian Government as is proper."

There were schools not only in this region but all over India even during the British days and in some villages compulsory primary education existed. Their number was constantly increasing and reaching larger number of villages even in the remotest corners.

I do not know what part he thinks U.S.A. is playing in it. I have already stated in the Etawah project the U.S.A. has not contributed a single pice. There is no justification to say so when there was no such aid in any form.

While writing about the Prime Minister, with whom he lunched he shows the same ignorance. Under Mahewa headline appearing on December 22, 1951, he writes, "Even Nehru's daughters attained, etc."

Pandit Nehru has only one daughter, Mrs. Indira Gandhi. He should have written sisters, to be correct who are two.

Describing his lunch with Pandit Nehru under New Delhi headline appearing on January 6, 1952, he says:

"So we talked, and his gracious sister, Madame Pandit Nehru, and his charming and attractive daughter chatted briefly."

He did not even know that his gracious sister, who has been Indian Ambassador in his country, should have been mentioned as Madame Pandit only.

While writing on general conditions of India, under Mahewa headline appearing on December 29, 1951, he writes:

"A good half of the population does not drink milk, because it comes from an animal."

It is true that a large number of our people do not drink milk; they do not drink, not because it comes from animal but because they cannot afford to do it or

they do not get it. It is funny to think in this way, because the cow is called mother from time immemorial for the simple reason that it gives sweet healthy milk. It has become a sacred animal to Hindus mainly for this reason and they have been drinking her milk for centuries.

Even a casual glance on the railway ticket from Etawah to Delhi, would have caught his eye that the distance between these two places is only 185 miles, not 296 miles as he mentions in his column appearing on January 1, 1952, under New Delhi headline.

These are some of the major and most glaring lapses which I have discussed here from the writings of a very keen and sincere observer editor of U.S.A., about whose facts the U.S. Embassy man in India was so sure. Others may be committing larger and more serious mistakes, depending on their preconceived notions, objectives and places of visit. Fed on such stuff by their own countrymen, neglecting the other side by the Indian writers, what the American public will think of the Indian can be very well imagined. When such material is distributed widely in India and the U.S.A. by responsible official American sources, it only indicates their complicity with anti-Indian propaganda, uprooting the feelings of Indo-American friendship and goodwill.

The effect of such irresponsible writings is that the general press in America begin to believe in so many things which are not correct, forming an altogether wrong idea of what India is today. This is the time when we need better information about each other so that we may understand them with greater sympathies and be more friendly. But such an impression among them, while it misleads the American citizens, creates ill-will amongst Indians when they know of such erroneous views of those, whom they try to befriend. It can be easily explained by Communists or others as anti-Indian propaganda to lower their prestige in the U.S.A.

The impressions the Americans are forming as a result of such writings can be best illustrated reading the following paragraphs from *New Orleans*, an U.S.A. paper, printed on December 30, 1951, under the headline "Point Four in Miniature—A Country Agent at Work in India":

"And by adopting modern agricultural equipment and knowledge to local conditions and religious laws, he turned the barren valley of Etawah into a bountiful garden."

Another paragraph runs as follows:

"It will kill the plants before they have matured and that would be taking life which we are forbidden to do"—they explained—"when Holmes wanted to introduce use of the soil-enriching legumes."

As explained elsewhere in this article Etawah is not a barren valley, it is the most fertile and best irrigated land in the whole of India nor the American experts have succeeded in turning it into a 'bountiful

garden.' In fact, these experts have caused more harm to Indian farmers than good owing to their unfamiliarity with Indian soil and conditions of agriculture.

It is equally wrong to suggest that Indians never knew of green soil-enriching crops or religion stood in their way. They have been using Sanai, Indigo, etc., as such for decades and no religious ideas came in their way.

In fact, in everything I read about India by American writers or journalists, I find some such information which may very well be described as 'intentionally or deliberately done' and the reasons for it may be differently interpreted by different parties. Even their own correspondents in India have been reporting incorrect and damaging facts.

In an article entitled "Point Four Props Farmers in India" in the *Christian Science Monitor* by its special correspondent, Mr. Gordon Graham, appearing on 20.8.51, it appears:

"For example, sometime ago it was suggested to the Etawah farmers that they should try green manuring with Sanai (sunherp). But the farmers would not plough the green crop in, as this would

require, because, as Hindus, they considered it sinful to destroy anything living before maturity."

So many are the misrepresentations in the writings of these few persons, and numerous persons and papers in the U.S.A. have written about Etawah! We can well imagine the number and extent of such samples. And all this is about Etawah. There may be many more places like Etawah and the cumulative result is just shocking to our imagination.

Herecuan efforts on the one hand by the American government and such misrepresentations based on completely wrong facts, inventions and distortions on the other hand, are going together and I wonder if the result would be satisfactory to the liking either of the American people or their government or the Indian people, who now deserve better consideration, particularly after a lot of such misrepresentations indulged in by the then British rulers to prove India's incapacity for Swaraj before the Americans for decades. Instead of counteracting this, such things continue only to undermine the future pleasant relations of the peoples of the two great democracies of the world. There is still time to think and be careful.

—:—

THE CONCEPT OF JUSTICE IN OUR CONSTITUTION

By KUMARI SUSHILA RUDRA, M.A.

In our country for centuries, has the common man hankered and hungered for Justice. The one virtue which he admires most is "Insaf." The poets and bards of our ancient land have sung its praises, while legends tell us that the kings who have been revered and respected most were those who were imbued with a sense of justice. And now we find, according to the Preamble of the Constitution, that this much-sought-after virtue is almost within our grasp. For the Preamble of the Constitution states boldly:

"... to secure to all its citizens
Justice—Social, Economic and Political . . ."

Social justice is secured in our Constitution according to Article 17. "Untouchability is abolished and its practice in any form is forbidden. The enforcement of any disability arising out of 'Untouchability' shall be an offence punishable in accordance with law." Thus we see one of the greatest ideals of the Father of the Nation is realised by this Article. By the removal of this social injustice nearly 50 million people are assured of their dignity as individuals.

Social justice is also attained by Article 23 as traffic in human beings and *begar* and other forms of forced labour are prohibited and punishable by law. Justice—social—is specially taken into account for the weaker people, in particular the Scheduled Castes and Scheduled Tribes. According to Article 46, the State shall promote with special care their educational and economic interests and shall protect them from social injustice and all forms of exploitation.

Economic justice has not been fully realised. For economic justice is not to be found in Part III of our Constitution, namely, the Fundamental Rights, which are enforceable in a court of law if violated in any way. Justice—economic—is embodied in Part IV of the Constitution in the chapter dealing with the Directive Principles of State Policy. The articles therein are mere directives and principles which are to be followed and to be put into practice by each State. But no law-suits can be filed against the Union or State Governments if they are entirely indifferent or negligent regarding these Directives.

According to Article 38, the State is to secure a social order for the promotion and welfare of the people. The Directive Principles lay down certain specific measures which are to be carried out in order to promote economic justice. There we find especially in Article 39 of the Constitution as follows: "The State shall, in particular, direct its policy towards securing—

- (a) That the citizens, men and women equally, have the right to an adequate means of livelihood;
- (b) that the ownership and control of the material resources of the community are so distributed as best to subserve the common good;
- (c) that the operation of the economic system does not result in the concentration of wealth and means of production to the common detriment;

(d) that there is equal pay for equal work for both men and women;

(e) that the health and strength of workers, men and women, and the tender age of children are not abused and that citizens are not forced by economic necessity to enter avocations unsuited to their age or strength."

The Constitution also secures economic justice in the case of unemployment, old age, sickness and disablement (Article 41). For women too special consideration is given and humane conditions of work secured and maternity relief. Economic justice is secured for children as well according to Article 24, and Article 39 (f) states that "childhood and youth are protected against exploitation and against moral and material abandonment."

Article 43 seems to be almost a Utopia in itself. It sets out to achieve through suitable legislation or economic organisation or in any other way "to all workers, agricultural, industrial or otherwise, work, a living wage, conditions of work ensuring a decent standard of life and full enjoyment of leisure and social and cultural opportunities and, in particular, the State shall endeavour to promote cottage industries on an individual or co-operative basis in rural areas."

Political justice is secured for the individual in the form of one of the most important Rights, Article 14: "The State shall not deny to any person equality before law or the equal protection of the laws within the territory of India." Thus every individual is justly treated as equal.

As regards employment in the State too, we find that justice is meted. Article 16 states according to Clause 1: "There shall be equality of opportunity for all citizens in matters relating to employment or appointment to any office under the State." This is indeed a great step forward since employment in government is no longer on a narrow communal basis as it was before independence, but is dependent on ability to be judged by a system of examination to be held by the Public Service Commission. Thus ability is the criterion for employment in the secular State.

According to the Directive Principle of State Policy, Article 44, "The State shall endeavour to secure for the citizens a uniform civil code throughout the territory of India." But true political justice can only be achieved

—:—

COMMENT AND CRITICISM

"Quit English?"

I have read with great interest the article under the above title by Prof. Kamal Krishna Ghosh appearing in the June, 1952 issue of *The Modern Review*. I quite agree with him that even in free India, the former position of English should be retained and it should be begun soon after a child begins his vernacular. He has sounded a note of warning against growing deterioration among our

in our country when Article 50 of the Constitution is put into practice: "The State shall take steps to separate the judiciary from the executive in the public services of the State." For a certain amount of separation of powers is very essential for the success of a newly formed Democratic State like ours.

Social justice has been guaranteed by the State fully. But here we find the State striding and marching ahead, and a somewhat baffled and ignorant people slowly waking up to find, that overnight their traditions and customs and entire set of values have been changed by the State. But justice—social—must be preserved for the good of the nation. Thus it is for the individual to undergo a process of mental revolution and adjustment, while it is for the State to give every aid through a right system of education, to be able to make him realize the full implication and significance of the tremendous social change.

Economic justice is something which the individual cannot achieve by himself. The Directive Principles are like shining stars studded in the Constitution which the common man dare not even dream to touch. The gulf between the ideal and the reality is pathetic. It leaves the individual helpless and frustrated. It is here that the State must needs don the "Seven-League Boots" in order to meet the daily common needs of the individuals. It is in the matter of economic justice that the State should stride even farther ahead of the people than it has done in regard to social justice. For though social justice was the cry of the great reformers in our land in the nineteenth and till the first half of the twentieth century, yet within these few years since Independence they are looked upon as mere superficial reforms. Thus the cry of the hour in our country as in all other parts of the world is that of economic justice, and the State must realise this justice. But we must recall to mind the old dictum which tells us that State and Society are made up of individuals. Thus it should be indeed a matter of great enthusiasm and adventure for the State and Individual to tackle together this almost insurmountable Everest in Article 43.

Justice—political—has been guaranteed and a great deal has been achieved, but not enough, while there is a grave danger that these articles might tend to become mere dead letters, if selfish interest of individuals or party power-politics is allowed to get the upper hand.

students particularly with regard to English. My experience from a long career as a teacher in Bihar is that though after Independence, the pass mark in English was reduced to 30 p.c. from 37½ p.c., the percentage of failure in English has shot up and the greater number of failure in the Matriculation Examination of the last few years was entirely due to English. If this is the fate

of the boys who had been studying English in school for eight years, what will happen to those going up for the Secondary School Examination (formerly, Matriculation) in 1954, who will have read it only for four years?

With whatever end in view, we had been so long learning and teaching English—being our rulers' language or for Government jobs—we did not fail to perceive that it had been and would remain of great benefit for us, because :

(1) English is one of the richest literary languages of the modern age.

(2) It is an international language, understood almost everywhere in the world—in the Eastern and Western Hemispheres as well as in the Northern and Southern Hemispheres, and hence is most useful in world trade and world politics.

(3) It gives a wider outlook than Classics or Vernacular, and in it have been translated the best books of the world.

(4) In order to keep in touch with modern currents of thoughts, students all over the world should in addition to their vernacular, study the language of one modern progressive European nation. French or German can serve this purpose, but Indians have the best advantage to study English.

To-day independent countries are also doing this. Japan has made great progress through English education, Turkey has replaced Arabic by French. In Thailand (Siam), students have to learn both English and French, because it had been surrounded by British and French Indo-China. Multilingualism is a necessity for the day. But the common Indian student need not go beyond English for they have also to learn the Vernacular, the State Language and the Classical Language. As we cannot forget that we are Indians and hence must study the language or languages forming our cultural background, so we cannot afford to forget that we belong to the modern age and must not lag behind the modern progressive nations.

Now if our matriculates read English only for four years, from 11 to 15 years, what will they do with this meagre knowledge? They will not be able to read and understand a most simple book or a newspaper in English nor able to taste a bit of its literature nor talk with a foreigner. This would be a sheer waste of energy.

Let me say one word on the medium of instruction—a question Prof. Ghosh has evaded in his article. There will be no two opinions on the fact that in the school stage the vernacular should always be the medium. Many reformers are in favour of retaining the vernacular in the colleges too. But we already agreed to learn English as an international language. Why do we labour for it unless to get access to its rich storehouse?

Translation of any and every English book should not be allowed even if it is possible with the vast number of terms, for that is a discouragement to study the original works. It would not be proper to translate Darwin's *Origin of Species* into Hindi for our students' obtaining diploma in Biology. In the Osmania University where Urdu was the only medium, students could not follow the lectures of foreign visiting professors. Many of our students will seek higher education in foreign universities, hence education should not be too much vernacularised. Even English proves insufficient for some higher courses of the universities of England in which original French or German books have to be studied. Western thought loses much of its charm if translated into Indian languages and *vice versa*. For the same reason Sankhya, Jyotish, Ayurveda, etc., should be studied in original Sanskrit in the higher courses.

My views on the subject are quite singular. I say that neither Vernacular nor Classics nor English nor any language in particular should be the medium in the university stage. Whatever books serve best to teach the particular subject should be used, whether written in English, Vernacular or Sanskrit since the student is supposed to know all these languages. For them no particular "text-books" should be written nor any translated. The subject-matter is to be taught and not the language and the students should gather their knowledge from their professors' lecture-notes and books in any language approved by them. The individual professor's advantage to use a particular language out of the above three approved ones, is also to be looked into. If in any subject most of the books available be in English, the candidates may find it convenient to answer in English too. But it does not mean that they cannot answer in vernacular if they so like. In all non-language subjects, the candidate should previously fill in the form stating in what language he wants to answer the paper.

If we are to follow the ideal of Mahatma Gandhi, we cannot base our State on hatred, not even for the English people, far less for their language or literature. The Government of Bharat have not yet abolished English measures in space (yards, feet, inches) and weight (tons, pounds, ounces), nor have employed any clock-maker to construct clocks showing *danda*, *pala* and *vipala*, although they are not less scientific than the English system. We are still following the Christian Calendar, though Christians are a very small minority here. Perhaps every one wants to retain them for ever, for all-India matters. What harm is there in the English language, in the international numerals and the Roman Script which are at least easier to write than Devanagari?

Book Reviews

Books in the principal European and Indian languages are reviewed in *The Modern Review*. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.

Editor, *The Modern Review*.

ENGLISH

SHRI K. M. MUNSHI DIAMOND JUBILEE VOLUME—Part I, *Bharatiya Vidya*, Volume IX, 1948: Published by *Bharatiya Vidya Bhavan*, Bombay, 1949. Pp. 377. Price Rs. 15.

In this first part (all received by us up to now) of the Festschrift presented to the well-known President of the *Bharatiya Vidya Bhavan* by his friends and admirers on the happy occasion of his completing his sixtieth year, the editors have selected, for publication in the alphabetical orders of the authors' names, thirty papers bearing on different branches of Indian history and culture. The papers are of unequal merit. We propose to take up first the best papers which may be arranged under the head 'Indian Literature.' In the branch of Vedic exegesis Dr. V. M. Apte offers a new explanation of the symbolism of the goddess Diti, while Dr. H. R. Karnik gives similarly a learned interpretation of the Brahmana legend of the *Aptya-devatas*. Mention may also be made of the paper of Dr. Enrico Gerardo Carpani listing with his running comments twenty-one texts from the *Chandogya* and *Brihadaranyaka* Upanishads which illustrate the psychology of dream-phenomena in Vedic philosophy. In the field of classical Sanskrit literature, Dr. S. K. De (*The Curtain in Ancient Indian Theatre*) makes the ingenious suggestion that the variant *yamanika* signifying 'a covering' or 'a curtain' was the original form which was afterwards lost and replaced by the two familiar forms *yavanika* and *javanika*, of which the former has often been wrongly taken to be a proof of Greek influence on the Sanskrit drama. In another paper Dr. R. G. Harshe presents the text of two interesting, but fragmentary manuscripts on dreams together with a list of their book-illustrations numbering 113 in all. The former is a Jaina work not later than the fourteenth or fifteenth century, while the latter belongs to the seventeenth century. In another interesting paper, Shri S. V. Iyer introduces us to a Sanskrit play of the rare *vithi* type written by a Kerala poet shortly before 1750 A.D. More controversial is the paper of Shri S. L. Katre in which the author rejecting the sixth or seventh century date given for Harisvamin (the renowned commentator of the *Satapatha Brahmana*) by previous scholars, assigns his work to c. 54 B.C. in the time of Vikramaditya, the so-called founder of the Vikrama Era. This interpretation, the author claims, gives another support to the historicity of Vikramaditya of the first century B.C., while it fits into "the grand Age of Vedic culture" under Pushyaditya Mitra Sunga. In the branch of medieval literature Prof. H. C. Bhayani introduces us to a striking *apabhramsa* work of the class of *Samdesakavyas* belonging to the twelfth or the thirteenth century. This

is the *Samdesarasaka* of Abdala Rahamana of Multan (?), which, according to the author, is the first known Muslim contribution to the Indian literature and influenced the well-known work of Malik Muhammad Jayasi called *Padmavati*. Of more general interest is the paper of Dr. A. K. Coomaraswamy, in which the late lamented scholar gives a short list of parallel texts from Eastern and Western literatures under different heads. In these passages "identical doctrines have been enunciated as nearly as possible in the same terms and often indeed in the same idioms," thus suggesting their cognate origin. As regards other branches of Indian culture, social history is represented by a paper of Dr. B. C. Law on *Slavery as known to early Buddhists*, while science is represented by a contribution of Mm. P. V. Kane (*The Problem of the Introduction of Rasis in Indian Astronomy and Astrology*) and one of Dr. G. P. Majumdar (*The Genesis of the Science of Medicine in Ancient India*).

In contrast with the above the papers bearing on political history are devoid of any interest. Reference may also be made to a long and insipid paper on *Jainism in Gujarat* which is nothing but an undigested compilation of anecdotes, tales and authentic history with a distinctly chauvinistic bias and is unworthy of inclusion in the present volume.

U. N. GHOSHAL

IMAGES OF THE BUDDHA: By Luang Boribol Buriband. Translated by P. S. Sastri and A. B. Griswold. Published by the Chatra Press, 77 Rama V. Road, Bangkok, 1952. Twenty-five illustrations. Pp. 21. Price not stated.

This is an excellent little hand-book illustrated with 25 specimens of images, dealing very ably with the vexed question of the origin of the image of the Buddha. The author starts with the *chronicle* of the sandalwood image, attributed to Prasenajit, and very reasonably doubts if the tradition could have been current during the time of Asoka, though *prima facie* it is a legend coming into existence during the life-time of the Buddha. The author very frankly accepts the position that archaeologists agree that the first Buddha images were made shortly after the beginning of the Christian era, either in Gandhara or at Mathura and that the images of Mathura and of Gandhara began to influence each other, and "there is a merging of Greek plasticity with Indian ideals." Later schools adopt the same formula and gradually standardize them. With these preliminary discussions the author proceeds to examine the evolution of the various types of the Siamese schools: the Dvaravati style, the Srivijaya style, the Lopburi style, Early and Late Chiengsaen style, Sukhothaya style, the U-thong style and the Ayudhya style, demonstrated with appropriate illustrations. Altogether,

this little booklet comprises within a short compass a brilliant exposition of the evolution of the Buddha image which will be useful to scholars and students alike.

RENNELL'S MAPS: 1. Bahar—(Behar) North, 2. Bahar—South, 3. Conquered Provinces South of Bahar—containing Ramgur, Palamow and Chuta-Nagpur, 4. Bengal and Bahar—in Warren Hastings' time, 5. Bengal with the Bhootan, Morung and Assam Frontiers in 1779, 6. Delta of the Ganges with adjacent countries on the East: Printed between June and December, 1779. Photogravure reprints in Six Folio Sheets by The Book Company Ltd., College Square, Calcutta 12. Price: the set Rs. 12-8.

The Book Company has done well to reproduce in Folio-sheets by photo-litho process the original Maps by Rennell which have become very rare. The Maps are not only invaluable to research-workers and students of history but also as records for the delineation of boundaries.

K. N. C.

LECTURES ON THE RAMAYANA: By the Rt. Hon. V. S. Srinivasa Sastri. Published on behalf of the Madras Sanskrit Academy by S. Viswanathan. Price Rs. 10 (\$4, sh. 16).

Srinivasa Sastri was well-known as an astute politician and a great statesman. But that he was a Sanskritist and an enthusiastic admirer of Indian culture and especially of the Ramayana is not known as much and as widely. The volume under review—unfortunately a posthumous one—is a testimony to this latter aspect of the character of Sastri. The volume consists of thirty lectures delivered under the auspices of the Madras Sanskrit Academy. We have here critical and analytic studies of the different characters found in the Ramayana. Though full of reverence for Rama, the learned lecturer looked on the hero as an ideal human being occasionally manifesting the frailties that are inherent in a man. He does not, like the old commentators, seek to explain away these frailties with far-fetched interpretations and he has clearly stated the reasons of his disagreement with the commentators. The lectures which are of absorbing interest contain copious quotations from the text of the Ramayana and numerous references to the commentaries with discussions thereon. It appears that the lectures were delivered extempore and the Madras Sanskrit Academy did a very good thing in making special arrangements for taking shorthand reports of the lectures, publishing them in book-form and thereby making them accessible to the reading public who will be highly benefited to go through them. One who reads the book will come to like the Ramayana and appreciate its value and importance. Books of this type and not merely dry scholarly studies are necessary for attracting the sympathetic attention of the people to Sanskrit literature as well as to the greatness of Indian culture.

CHINTAHARAN CHAKRAVARTI

BUBBLES: By Satis Chandra Sinha. With two articles of Sir Jadunath Sarkar. S. C. Sarkar and Sons Ltd., 1-C, College Square, Calcutta 12. Price Rs. 5.

The book contains forty short articles or essays. The subjects dealt with in these essays range between social, legal, political and cultural. The author's views on these matters have been couched in easy and forceful but at times in a very caustic style. These essays have been written between June 30, 1948 and August

15, 1952 and necessarily cover the various problems that had raised their heads during this period. India has attained independence. But the country has been divided. This has given rise to many unforeseen problems. Mass-scale transfer of population has been a problem very difficult to tackle. Other problems have also cropped up. One, most vital and important from our national standpoint, was the fixing of Hindi as *rashtra bhasha* or State language, which would take effect in the early sixties. Problems confronting the Hindu social frame also demand solution. Women's position in modern Hindu society is yet to be determined. Such varied subjects as 'private endowments,' 'Debottar property' and 'censorship' also deserve to be thrashed out. The author has written on these as well as on many other topics. Some of them may seem trivial to the man in the street, but each one of them has some particular importance in our body politic. It appears from the book that the author is especially interested in matters cultural and those concerning the social position of women in the Hindu society. He has given the story of the Imperial Library, now called National Library, in a nutshell. His views on the Hindu code and other Bills and Acts affecting Hindu women, should be carefully considered by our reformers. The article on "Swayambar" is full of humour, and serves as a pointer to the problem of the marriage of modern educated Hindu girls. The two very thoughtful articles on "Compulsory Hindi" by Dr. Jadunath Sarkar, given in the Appendix, weigh the gain and loss that we have got to incur in our onward march to progress. It is regrettable that the balance is heavily on the side of loss. Our leaders should ponder hundred times before the use of Hindi is made compulsory in the affairs of the State, and it is made the medium in the higher studies in our Universities. The book deserves repeated perusal.

JOGESH C. BAGAL

THE LIFE OF JOSEPH STALIN: By Louis Fischer. Published by the Associated Advertisers and Printers, Ltd., Bombay. Price Rs. 2-4.

The volume under review is an apt commentary on the universally held belief that truth is the first casualty of war—cold and otherwise. In a biography of Joseph Stalin running to more than 300 pages the author has not a single good word about the hero of his work. He has painted Stalin in the darkest hue. Yet it is a fact that the transformation of Czarist Russia from medieval backwardness to her present position during the comparatively brief span of a little over 25 years is due in the main to Joseph Vissarionovitch Stalin. The man who began with many odds against him, not the least damaging being Lenin's verdict that the former "is too rude" and his (Lenin's) proposal that he (Stalin) be removed from the General Secretaryship of the Communist Party, succeeded in capturing power after Lenin's death in 1924 and in retaining it for more than a quarter of a century, proves conclusively that he was quite a few cuts above the ordinary. Mr. Fischer would, however, have his readers believe that the success was due to intrigues, unscrupulousness, ruthlessness, treachery and the like. "Stalin's four simple rules of success," says the biographer, were—"any method is justified if it helps achieve the desired end; men must be discarded when no longer useful; alliances are made to be broken; ideas have no existence unless chained to the chariot of power" (p. 18). Few, if any, impartial observers, will agree with him.

BENGALI

MANO-BAIJANIK: By Satyen Sinha. Published by Das Gupta and Co. Ltd., 54/3 College Street, Calcutta 12. Price Re. 1-8.

A modern drama deftly depicting certain psychological complexities. The author has been able to arouse and sustain the curiosity of the reader from the start to the finish. For a new writer—this is his first published work—it is no mean achievement.

RAUDRA-JYOTSNA: By Sushil Kumar Gupta. Published by Writers' Corner, 104/14 Gopal Lal Thakur Road, Calcutta 36. Price Re. 1.

A collection of thirty-two poems, most of which were published in periodicals. The poet is neither an escapist nor a propagandist. Conscious of the incongruities of the existing social order, he dreams of a brighter day and resolves to march ahead towards it with faith and conviction. His emotion is genuine and hence comes this directness of expression. Nowhere does he struggle to pose his 'modernism' with a queer jumble of words and halting rhythm.

D. N. MOOKERJEE

HINDI

MARUKUNJA: By Mathurdas Tricumji. Published by Navajivana Prakashan Mandir, Ahmedabad. Pp. 154. Price Re. 1-4.

The author suffered for a long time from the fell disease of tuberculosis. He has, therefore, turned wisely his experience and knowledge, gained additionally from books as well on the subject, into a practical handbook on how to prevent the incidence of the said wasting ailment, and if one has succumbed unfortunately to it, then how to co-operate with Nature and the doctor, together with those best of doctors, Doctor Diet and Doctor Quiet, in overcoming it.

G. M.

MARATHI

KAMALAN: By Arvind Gokhale. Published by Popular Book Depot, Bombay 7. Pp. 138. Price Rs. 3.

Shri Arvind Gokhale has made his mark in Marathi fiction and this book maintains his high reputation. Here the reader will find a well-got-up collection of twelve short stories, most of which have already appeared in popular magazines. Against the background of the social life of Maharashtra middle class, the writer depicts uncommon moods of common persons. It is through revealing the hidden links of emotional urges, rather than weaving novelty of situation that he succeeds in holding the interest of his readers. Unlike some, who overdo this psychological technique, he maintains a sound balance between plot and motive. This as well as keen observation, rich imagination and warm sympathies appear to be the secret of his craftsmanship. The book is sure to be hailed as a rich addition to Marathi short stories.

P. J. JAGIRDAR

GUJARATI

RASHTRA BHASHANO SAWAL: By Jawaharlal Nehru. Translated into Gujarati by Nagindas Parekh and published by the Navjivan Prakashan Mandir, Ahmedabad, 1949. Paper cover. Pp. 43. Price seven annas.

Panditji's views on our having a National Language are well-known. He has viewed the question fairly and impartially as well as practically and comprehensively. His thoughts are reproduced here faithfully.

K. M. J.

Mr. Fischer has, however, done a very great service to the intellectual not tied to any 'ism' by revealing many facts about Soviet Russia which are blocked out or glossed over by the champions and spokesmen of the Soviet system. His analysis of Soviet foreign policy in the thirties (Ch. XIX) is interesting, pleasant and substantially correct.

Mr. Fischer points out and rightly at that, "From the Iberian peninsula, around the Mediterranean littoral, through the entire Moslem world except Turkey . . . and Israel, on to Southeast Asia, the defenses against Communism and other forms of totalitarianism are weak. It is in this mammoth region, inhabited by more than a billion persons living in the 19th, 18th, 17th and 16th centuries, that the rivalry between Russia and the West will rage with special fury for years" (p. 287). He proceeds, "Unhappiness fills the feudal regions from Spain to Indo-China and, in addition, much of Africa and Latin America. Everywhere a thin wealthy upper caste shamelessly flaunts its luxury under the eyes of the hungry, diseased peasants and shepherds who are deprived of the education, organisation, and political power to improve their lot. . . . Masters come and go, foreigners are ousted, national independence is achieved, but bread, rice, milk, medicines, water, shoes, shelter, schools remain in short supply. Loans from abroad reach the pockets of the haves; the have-nots have only their envy and hate" (pp. 287-88). Mr. Fischer points out that the only way to save this vast area for democracy is revolutionisation from below and guiding it into the 20th century. "Stalin's fate," he concludes, "is in the hands of the non-Stalinists. They can write history's verdict on him. They will determine whether his life was a success or failure" (p. 307). We agree and know what that verdict will be.

SUDHANSU BIMAL MOOKHERJEE

SHOULD FATHERHOOD BEGIN AT FORTY?: By E. Orson Brower. Published by the author, 1952. U. S. A.

It should not begin earlier that seems to be the opinion of the author. Citing the cases of many famous men the author has shown that their parents were all above forty when they were born. He subscribes to the view of M. L. Steckel that "the younger the parents the less favourable is the prognosis for the intelligence of the offspring" (p. 6). In the techniques of the measurement of intelligence he has suggested a new factor 't' by which he means "ability to find the important meanings in the commonplace" (p. 23). He also attempts to find biological justification in support of his theory that the later the parenthood begins the better it is in all respects for the offspring.

The book is written in a highly emotional tone and controversial spirit throughout. It seems as if the author is standing with a club in his hand ready to smash down anyone who dares differ from him. In spite of his many quotations and references to authorities the reviewer is of opinion that he has not been able to establish his thesis and the question that he has posed (the title of the book) still remains an open one. Though the facts presented in the book are of considerable interest to all, the style adopted by the author is neither pleasant nor commendable. The book, however, is a thought-provoking one and would have aroused greater interest amongst professional psychologists and biologists had the author chosen to present his views in a more sober and dispassionate way.

S. C. MITRA

JIVATA TEHEVARO: By Dattatreya Bal-krishna Kalelkar. Printed by the Navjivan Prakashan Mandir, Ahmedabad. 1949. Paper cover. Pp. 30. Price Rs. 2.

This delightful and instructive book has undergone a fourth edition. "Living Holidays" were noticed in its earlier editions. Kaka Kalelkar has added fresh material to this—the latest edition—and added new Holidays like Rashtriya Saptah and Azadi Din. Jayantis of several saints are also set out, along with their significance and the precepts they have left behind them.

(1) **AMINA** (4th Edition), (2) **ZANDEVAN-DAN:** By "Shayda" (Harji Lovji Damni). Printed at the R. H. Printing Press, Bombay-8 and Be Ghadi Printing Press, Bombay-1. 1950. Thick card-board. Pp. 455: 412. Price Rs. 6 and Rs. 5 respectively.

Mr. Shayda has a long-established reputation for writing popular stories on various subjects. Amina, which has passed through four editions between 1923 and 1950, is a story of social life amongst Muslims which approximates, if not fully resembles, Hindu social life, paints the picture of a new bride going to her husband's house, sandwiched in between her sister-in-law and mother-in-law and acquitting herself creditably in winning them over and in doing so complying with her mother's parting advice—not to spoil her good name—advice which she had made to sink in her, while suckling her at her breast. There are various incidents such as of singers and others portrayed also. The second book, *Salutation to the Flag*, is written as an appeal to the Indian Nation, not to open only their temples, built of brick and mortar, to the Harijans but to open the temples of their Heart, and give them free access and equality in all pursuits of life. It emphasises the creed of Mahatma Gandhi in no uncertain terms. It is found to prove as popular as his other stories.

(1) **RAJAJI**, (2) **RAJENDRAPRASAD:** By Ambelal N. Joshi, B.A., LL.B., Advocate, High Court, Bombay. Published by the Brihad Gujarat Prakashan Mandir, Bombay-7. 1949. Thick card-board. Illustrated jacket with blocks. Pp. 239, 274. Price Rs. 4-8 each.

Shriji Ambelal Joshi is an enthusiastic student and writer in addition to being an Advocate. He has planned a Greater Gujarat series of Books—Granthavali—in which he desires to publish the Biographies of all eminent men and women of India. Pioneer work he has already done, and the two volumes under notice testify to the face that he has successfully passed that pioneer stage and entered on that of a practised writer. Rajaji and Dr. Rajendraprasad needed original biographies in Gujarati and Mr. Joshi has supplied that need. Almost all incidents in their lines have been set out here, with a sense of proportion and a terseness which are exemplary. He has not omitted to give due prominence to Rajen Babu's pleading for Hindi and has devoted a whole Appendix to it. We welcome his work and are looking forward to other works on similar lines.

MAHAN BANO: By Chandra Shankar Pranshankar Shukla. Published by Vora and Co., Bombay-2. 1948. Thick card-board. Illustrated jacket. Pp. 140. Price Rs. 2.

The title of the book means "Be Great," and in support of that advice Mr. Shukla has given, in simple Gujarati, outlines of the lives of twenty-five men and women, European and American, basing

them on D. Carnegie's three volumes on the subject. The object is to put before a rising generation a picture of those who have acquired a name for themselves so that it may furnish guidance and inspiration to all who care to profit by it.

GURJAR MAHILAO, Parts I and II: By A. R. Bhimani. Printed at the Unity Printing Press, Bombay 1. 1949, 1950. Illustrated jacket. Cloth-bound. Pp. 200 each. Price Rs. 20 each.

Women of Gujarat, (45+48=93 in all) young and old, of the old and the new generation figure in this work, with their photographs, an attractive feature of it. The good that they have been able to do, in their own families and in public, Hindu, Muslim, Parsi, is deservedly set-out in the sketches of their lives below their photographs. The number 93 is too small and Shri Bhimani is planning further parts of the compilation. We wish success to him and his enterprise.

1. **MAHABHARAT:** By K. K. Shastri.
2. **NAMAVALI OF PERSIAN MANUSCRIPTS IN THE LIBRARY OF THE FORBES GUJARATI SABHA, BOMBAY:** By Janab Mohammed Umar Kokil.

Both published by the Forbes Gujarati Sabha, Bombay 4. 1950. Paper cover. Pp. 80, 90. Prices Re. 1-8, Rs. 2.

The Mahabharat has been rendered into Gujarati verse by more than one poet of old Gujarat. In the first of the books under notice, the verses of poets Narak and Vishnudas, comprising four *parvas*, Shalya, Gada, Sautik, and Stri are edited by Mr. Shastri, a noted student of old Gujarati. The Sabha possesses a valuable collection of old Persian MSS. Mr. Kokil, a trusted and experienced hand at this sort of work, has catalogued them with short, informative notes. It is sure to prove of great use to research students.

GANDHI DARSHAN: By Bhanubhai Pandya. Published by Fulwadi Prakashan, Khamhaba. 1948. Paper cover. Pp. 7. Price four annas.

A Gandhi drama in verse played by the school children of St. Xavier's High School, Bombay. It contains prophetic verses put into the mouth of Gandhiji, when they were written (26-27 January), viz., "Take, take me as sacrifice" and within three days Mahatmaji was murdered. The *Darshan* offered is real and picturesque.

K. M. J.

A Monumental Work INDIAN ARCHITECTURE

Vol. I: Hindu and Buddhist Period
Vol. II: Islamic Period

By Percy Brown (former Principal, Government School of Arts, Calcutta). Both volumes profusely illustrated. Vol. I, Rs. 22; Vol. II, Rs. 19-12.

This masterly review extends to every development of architecture in India from the earliest times and the sources from which they were derived. The volumes are beautifully illustrated by numerous photographs and specially prepared drawings and diagrams of the most important examples of Indian Architecture.

TARAPOREVALA'S

INDIAN PERIODICALS

Trading Links of Old World Empires

Long before our days of swift transit and telecommunication the caravans were threading their slow and sometimes dangerous way across the deserts; and the mariners of different regions were braving the terrors of the seas. Edmund Roberts writes in *The Aryan Path*:

The history of civilization might be written around the story of trade routes between Europe and the East. During the course of centuries they have seen the camel and the packhorse followed by the age of sails; itself only to be superseded by the era of the steamship, and today the aeroplane has shortened the time of conveyance to days, as compared with the months during which goods were in transit in mediaeval days. Giant planes now cross in a few hours the very desert painfully trodden by the camel for centuries, such crossings in former days often lengthening into months.

The importance of these ancient trade routes in the story of human endeavour cannot be exaggerated, and historians and archaeologists are paying increasing attention to them.

Shortly before the last war, British archaeologists working in Lower Burma were concentrating on a study of one of the oldest of such routes, that between India and the Far East.

The route crossed peninsular Siam at the only latitude which provided sheltered anchorages on both coasts, which were at the same time connected by what were formerly deep rivers running from the narrow watershed, affording a nearly unbroken waterway across the peninsula. The ancient route begins at Takoapa (or Taikala), believed to be the site of the old mart of Takola, mentioned in the second century by Claudius Ptolemy, the famous Alexandrian geographer. The supposed site of the ancient port is an open sandy space, locally known as the "Plain of Monuments," on an island near the mouth of the Takoapa River. Several mounds were excavated, and the foundations of an extensive early Indian temple have been brought to light. Pottery and beads have also been found, proofs of habitation at some period or other.

After completing excavations in the neighbourhood of Takoapa, the expedition crossed to the east coast, following the old trade route leading to the Bay of Bandon. When this route was in use the crossing was comparatively easy, but the 20th century explorers found the task slow and difficult because of the low state of the rivers, which have silted up in the course of centuries. There were many rapids and shallows, all of which had to be negotiated with heavily laden boats. The villages along the route were reported still deeply impressed with Indian folklore and the tradition of an ancient Indian migration eastward.

South of the Bay of Bandon lies a remote city called Vieng Sva. It is enveloped by a dense thorn jungle and the archaeologists had to hack their way through this before they could reach a moated enclosure with a ruined

central shrine. There a beautiful statue of Buddha was brought to light, and it seems that in the remote past Vieng Sva was populated from India. The next city *en route* was Chaiya, which thrived about a thousand years ago and where thousands of bowls, made of porcelain, have been unearthed.

Two other trade routes of lesser importance, subsidiary to this great highway from the Far East to India, have also been investigated.

Near the western terminus of one of these, ancient stone baths carved out of the living rock, and still overflowing with hot salt water from underlying springs, were found deep in the jungle. The existence of this thermal establishment would appear to indicate the former existence of a highly developed civilization in the neighbourhood.

The few facts mentioned above show what riches remain to be revealed to us of the history and development of the ancient trade routes of the world. Up to the present, only the surface of the ground has been scratched, so to speak. There is certainly no more fascinating study than that of the growth of these ancient trade routes, along which flowed riches of gold, silver, precious stones, linen, silks, incense and spices. Trade was one of the earliest growths of civilization, and the lines of intercommunication in Europe between the Baltic and the Mediterranean, which were in existence as long ago as the Stone Age, are clearly visible.

The trade routes of the ancient world frequently afforded to explorers the only practicable routes along which to travel. This was so in the case of Marco Polo, who traversed those of Asia. During recent years explorers have been paying considerable attention to these old highways, and among those who have traced certain of them are Dr. Sven Hedin, the eminent Swedish explorer; Sir Aurel Stein; and M. Haardt.

Actually how far back in the mists of antiquity these trade routes began cannot be definitely discovered. Sir Halford Mackinder, who made a study of their evolution, suggested that some of them began as "raid routes," and in several cases the evidence seems to bear out this theory. The Norse pirates of Northern Europe, for example, sailed out every spring in search of spoil, and came back in the autumn laden with the fruits of their forays. In Africa, again, the routes followed by early European explorers were those originally marked out by the Arab slave traders on their nefarious business. Testimony given by such men as Livingstone relates to the terrible evidences of this trade that were found strewn the routes.

Long before the Christian era primitive commercial highways were in existence.

The Stone Age routes of Europe were touched upon in a previous paragraph. They came into being because the amber of the Baltic was in great demand. This led to the establishment of two well-trodden routes from that sea to the Mediterranean. Sir Flinders Petrie has proved that, further south, Gaza in Southern Palestine, mentioned in many places in the Bible, was a great mart

in ancient times, trading routes leading to it from the north and the south.

Early trade of this type was not confined to a small area, and it is astonishing to learn how widely scattered the products of the Old World countries became, undoubtedly by means of repeated exchanges. As a proof of this, what is believed to have been Irish gold has been found on the site of Troy, which was flourishing a thousand years B.C. In those days Ireland was one of the most important sources of gold in the world.

The two most powerful of the Old World empires to establish trading routes early in the history of civilization were Egypt and Babylonia.

In their cases it is possible that raids and forays marked the commencement of the interchange of goods. The fact that each had merchandise of value to the other may have been an accidental discovery resulting from the spoils of war but as time went on, it seems, the people discovered that peaceful trading was more profitable than constant fighting. Palestine lay between the two, and a great amount of merchandise passed through it, and whoever controlled that country had command of the routes leading to the east and the north, and then west to Europe. Thus for centuries there was extreme rivalry over the possession of it, which explains why the Israelites were always struggling for their freedom.

The earliest trade routes, therefore, were established, as it were, as a result of accidental discovery of the value of goods. Gradually, with the passage of time, these routes were extended further east, north and west, until both Europe and the Far East were contributing their quotas of wealth. Men became more venturesome, and the Phoenicians established the first great sea routes in the history of the world, sailing, we believe, as far west

as Britain. Overland another route traversed Asia Minor, East was brought to India, partly by the ancient route and linked up Europe. Pointing towards the East yet another route led to Persia, and the wealth of the Far East was brought to India, partly by the ancient route the British archaeologists have been exploring and then up the Persian Gulf and overland westwards.

The rise of the Greek Empire, which subdued Persia, led to changes and further developments in the routes, although their main directions were unaltered.

It was along the ancient trade routes between East and West that the riches of the world continued to flow in increasing volume. One of the routes led up the Red Sea, which was dotted with important commercial stations, and overland to Alexandria; and an alternative route from the Indian ports led to the head of the Persian Gulf, as mentioned above, from whence the goods were taken overland by desert caravan. It is believed that nearly 2,000 years ago the Greeks were aware of the sea route to China via India, for their venturesome pilots thought nothing of the crossing from the Red Sea to India, accomplishing it regularly.

These two main sea routes were supplemented by the great overland route through Asia and China, which it is believed established contact with Western civilization early in the Christian era. In times of peace this route was far more convenient and quicker for the goods of Northern India and China than the ocean routes. The cost of travelling by land was greater, but the expense was more than counterbalanced by the high value of the goods carried, which were generally light and of small bulk.

PRABUDDHA BHARATA

OR AWAKENED INDIA

(Started by SWAMI VIVEKANANDA in 1896)

Now in its 58th Year

The premier English monthly, conducted by the Monks of the Ramakrishna Mission, devoted to universal religion and philosophy, culture, education, and art and other topics of national and international interest. It keeps its readers in intimate touch with the cultural side of Indian national life, both ancient and modern.

The journal is popular and is widely circulated all over the world and is esteemed highly as the following opinions will show:

RABINDRANATH TAGORE: "Admire its writings as contributions to pure Indian culture."

DR. S. RADHAKRISHNAN: "I have been a regular reader of *Prabuddha Bharata* and can say that its sanity in dealing with religious doctrine and discipline has been its most impressive characteristic."

COUNT HERMANN KEYSERLING: "I think *Prabuddha Bharata* is one of the most interesting and important magazines that one can find today in any country."

SUBSCRIBERS ARE ENROLLED FROM JANUARY OR JULY

ADVAITA ASHRAMA, 4, Wellington Lane, CALCUTTA 13

Three notable routes stretched westwards from China overland, and they converged on the important markets of Samarkand and Bokhara.

These towns were great junctions, for there the caravans from China, traversing the silk route, met those coming from India; and there, too, the termini of the routes from the West were met. These ancient trade routes linking East and West maintained their supreme importance until the 15th century, when the discovery of the New World and the Cape route to India and the East completely altered the course of world trade and for a period the sea became predominant.

The Cape Route to the East played an increasingly important part in the commerce of Europe, and for practically three centuries it was unassailed. Not until the cutting of the Suez Canal was transport once more diverted through the Mediterranean. With the discovery and settlement of the New World came the establishment of what was destined to become the busiest world sea route, that to North America, and a little later that to South America was established. Then, towards the end of the 18th century came the settlement of Australia; and this was followed in the last century by the Australasian route. Today, strangely enough, along the routes linking East and West, traffic is being diverted back once more overland, via the air, and at the present time aeroplanes are regularly travelling over the track of the ancient trade route between Egypt and Babylonia, one of the very earliest to be established.

A First Glimpse of South Africa

Henry P. Van Dusen, President of Union Theological Seminary, New York, writes in *The National Christian Council Review*:

On this rapid round-the-world flight, I did not intend to visit South Africa. Indeed, if the whole truth be told, I did not very much want to visit South Africa. And for at least two reasons. On the one hand, while recognizing that it is never possible really to understand a situation or people without personal contact, I felt that, through *Cry, The Beloved Country* and countless first-hand accounts, one had a reasonably clear and reliable picture of South Africa which observation could only confirm. On the other hand, what could a visit to South Africa possibly lead to? What can any of us do about it?

THE PRESENT STATE OF THE NATIVE AFRICANS

I have spent many hours visiting residence-areas of every type inhabited by 'non-Europeans'—the mining company compounds into which native labourers recruited from up-country virtually on an indenture basis are herded for nine-month terms and then shipped back home; the unnumbered communities of one-family homes, many of them quite new, some sponsored by government, others privately owned and operated, which seem to ring Johannesburg; some of the worst of the 'shanty towns' pictured in Alan Paton's book and film; the independent towns owned and operated wholly by Africans outside the municipal limits.

In any ideal community, the 'company compounds' and the system of labour-employment which creates them should not exist. Their worst feature is not the living conditions provided but the uprooting of young men from their communal existence in the rural 'reserves' and their transplantation into the demoralizations and dissipations of a great metropolis. Even this is not without its parallels in the life of migrant labour in the United States. The most hopeful feature of this thoroughly bad system is not the provisions for health, recreation and education by some of the more enlightened mining companies, but the fact that here, as elsewhere throughout Africa, increasing family migration is replacing individual indenture and that the increasing provision of family dwellings is making this possible. In Northern Rhodesia, I was told that close to fifty per cent of the migration from native communities to industrial centres is now by families.

Some of the communities of one-family homes for native Africans are among the most attractive 'garden villages' which I have seen anywhere in the world—well-built two or three-room dwellings with plenty of open space between and acres of open ground about, many of them with well-cultivated flower and truck gardens, adequately supplied with school and recreation facilities. By comparison, the sweltering tenements of our large cities are festering incubators of physical and moral disease. Even the 'shanty towns' struck me as far less unhealthy and undesirable living places than the tumble-down Negro shacks on the outskirts of almost any city in our own deep South.

By all odds, the most disturbing type of residence situation is the independent communities outside the metropolitan boundaries which are entirely owned, operated, governed and policed by the Africans themselves. Not primarily because of crowded and unsanitary living conditions, but because of the absence of minimal structures of law and order. These must be the principal breeding grounds of lawlessness and immorality.

UNION DRUG

CALCUTTA

Scattered through the native residence areas are schools, playgrounds, and community centres, very largely church-sponsored, which, while far less plentiful and well-equipped than the ideal are less inadequate than corresponding facilities in many American cities. Even this present government with its futile cry of *apartheid* and vicious doctrine of race superiority is doing vastly more for its native population by way of health, educational and recreational facilities than I would have supposed; vastly more, be it confessed, than all too many American communities with congested Negro districts.

THE PRESENT POLITICAL SITUATION

In the States, we hear almost altogether of Dr. Malan and his Nationalist advocates of *apartheid*. Their grip upon South Africa today is far less secure than often supposed; their dominance over South Africa tomorrow is almost certainly doomed.

No one will venture a confident prediction of the outcome of the forthcoming general election, scheduled for April. Many believe the Nationalists will be crowded out by the Union Party (moderates) by a small margin. One of the leaders of the latter was quoted to me as saying he hoped his party would *not* come to power; their margin of control might be too slim to permit effective reversal of present policies.

The severest and most unqualified indictments of the Nationalists, and *apartheid* are not being framed in Europe or America but in South Africa. Johannesburg is a centre of British rather than Afrikaans influence. I have been reading every word of its two excellent daily papers. Their condemnation of Malan and all his works make Pittsburg's hatred of Truman and the New-Fair Deal seem, by comparison, mild approbation.

In any event, two facts about the future appear beyond challenge. First, the extremists within the Nationalist Party are gaining control of it. Whether they win or lose the next election, Malan will shortly retire and be replaced by a far more violent and irrational leader. Therefore, a Nationalist victory portends worse days for South Africa and the world in the immediate future. But, second, in the long run and probably not too long, the Nationalist extremism is doomed. Not only is the determined opposition of more moderate counsels and policies strong and steadily gaining strength. Extreme Nationalism is pitting itself against inexorable forces which in the very nature of the situation can be temporarily retarded but which cannot ultimately be halted. These forces are economic as well as political and humanitarian. Economic power lies largely with the non-Afrikaan elements of the population, indissolubly linked by tradition and by self-interest with foreign capital and overseas trade. Through these channels, the judgment and conscience of the world may make its influence most effectively felt within South Africa. The extremists, in the familiar Dutch figure, are desperate men, sticking their fingers into the ever more numerous and ever enlarging holes in the dyke. Many believe that, at least subconsciously, they sense this inevitability of history. The 'wave of the future' bears the cause not of Nationalism but of moderation.

Indeed, in the longer view, the most ominous current development on the African continent may be, not the temporary triumph of reaction in South Africa, but the pending Federation in Central Africa, which may impose on Northern Rhodesia and Tanganyika the scheme of white supremacy dominant in Southern Rhodesia, which is itself a projection of South African attitudes and policies northward.

Even the Afrikaans leadership is by no means without its elements of light and vision. Certainly the most exciting and possibly the most promising conference I have had was with the Commission on the Socio-Economic Development of the Native Areas within the Union of South Africa. The Commission was appointed by the present Government. Its nine members are all, or almost all, Afrikaans. But they are scholars of competence and wide knowledge, several of whom have studied at first hand the race problem in the United States and elsewhere. They are engaged in a three-year inquiry, and expect to present their findings and recommendations by the end of 1953. Their assignment is to develop a comprehensive, long-range, and inclusive policy for the 'reserved areas,' the vast and potentially rich tracts of land mostly along the east coast which are reserved exclusively for native residence and use where five-eighths of the native Africans still live.

I have seldom met a more competent or enlightened group of highly trained and informed social scientists. They have taken as the base-line, determinative of all their recommendations, 'the human factor,' that is, the welfare of the peoples concerned. And their guiding principle is that all proposals must hold in view and be devised to further the total advance of the population, not merely economic progress but economic, educational, social, cultural and spiritual factors in their organic unity (perhaps an echo of General Smuts' 'Holism?'). The fact that the focus of their attention is upon the 'native areas' and presupposes the continuing residence of a majority of the Africans within these 'reserved' territories opens their proposals to the suspicion of being 'enlightened apartheidism.' This they fully recognize and emphatically disavow. Their workrooms are crowded with maps, charts and data on every aspect of the African people, their potentialities and their problems. For example, they have detailed evidence of the well-nigh limitless economic potential of the 'reserved areas.' And recommendations they will sponsor supply great and soundly conceived plans for the progressive transformation of these areas. We know only too well the long step between formulation by experts and implementation by politicians. Nevertheless, this Commission is a heartening evidence that some Afrikaans are seeking to conceive a worthy future for the Africans, and it may hold promise that, once the curse of white superiority dogma is surrendered, the best elements of Dutch and British ancestry might join hands in constructive measures. In any event, the forthcoming report of the Commission is worth watching for.

The Test of Democracy

Asian Opinion writes editorially:

The test of democracy lies in the quality of the citizens it produces. There can never be a strong government over a weak people. Therefore, the Parliament and the subsidiary legislative bodies will have to take into account the day-to-day difficulties of the people which create greater friction than decisions which concern only a section of some class. Thus the supply of good quality of wheat and rice is more important than the establishment of a car-manufacturing industry. The courtesy of a constable is more important than the well ordered and methodic speech of a minister. The words of an inspector from the enforcement branch mean more to the people than a debate in Parliament. For one law that the Parliament passes for the people, there should be ten laws to guide the officers who are to enforce it. This can be the only way to preserve the freedom of the people. Once it is said an old woman came to Delhi and complained that her property had been looted by some officers of the State in an outlying province of the empire. The emperor replied that that was a far-off place and he could not manage the affairs so well as he could in Delhi. "Then my lord" the woman replied, "you should relinquish your hold on that province and permit it to be transferred to some other state." The emperor thought over her remarks and sent a large body of troops to restore order in that province.

The conditions as they are today show that minor irritations are taking the form of *dark and arid mountains*. Nothing can grow on them and the soil is fast ceasing to be fertile for further progress. The ministers are also responsible for the prevalence of these conditions. They have been mentally receding from the society as it exists in the villages and cities and are living in the air-castles of their own. Casual visits and inspections mean nothing to the people. They should walk through the streets like ordinary citizens making their own sundry purchases, mixing with the people, exchanging views with them. It is these small gestures that work for greater popularity. They should personally purchase their requirements from Chandni Chowk, Kalva Debi and Harrison Road. Grandiose schemes mean little to the people till they feel their effects after a generation or so.

Mahatma Ji delivering a speech in Mayavaram in 1915 said:

"I am in a position to say that I am to be at war with my leaders. Whatever they do or whatever they say does not somehow or other appeal to me. The major part of whatever they say does not seem to be appealing to me."

In another speech he said: "I do not want to be dragged in the carriage. There is a meaning in that. Let us not spoil our public men by dragging them. A charge is brought against us that we as a nation are too demonstrative and lack business-

like methods. We plead guilty to the charge. I give you a message: Establish Ram Raja in Mysore and have your minister a Vashishta who will command obedience."

And then Mahatma Ji said in Bangalore, May 1951: "God is with those whose garments are dusty and tattered. The dream of every Indian who loves his country should be not to glorify in language but to spiritualize the political life of the country and the political institutions of the country. I think the political life must be an echo of the private life and there cannot be any divorce between the two."

These are some of the important words of our Master. The laws must not divide the members of the Parliament and the people. Mahatma Ji and now Vinoba Ji have shown that greater changes can be wrought by mass contact than through laws. There is no compulsion and friction in direct contact. There is the essence of democracy in the direct ministerial approach to the people, common citizens who love those who remain by their side. The impression of Parliament that laws will bring about the necessary changes must go root and branch the sooner the better. The maxim of Mahatma Ji that the best government is that which governs least is all important and must be adhered to.

Atharva Veda (7.12) ushers the following prayer, "May the Samiti and the Sabha, the two daughters of Prajapati, concurrently aid me. May he whom I meet co-operate with me, May I O Ye Fathers, speak agreeably to those assembled." The Vadas described Samiti and Sabha as the two daughters of Prajapati, eternal councils, and gave them the name of Narishta "mirth" or "most favourable to men." They gave the name Gramani to the leareds who attended and called them "Sayata Manva" those who wandered about, suggesting that the duty of Gramani was to wander from place to place to study the conditions of the people. Thus the members of our Parliament should learn a lesson from this. They should be wanderers like Vinoba Ji rather than the guardians of the people. They hold India in trust.

Chaim Weizmann

The passing of Chaim Weizmann, first President of Israel, removed from our midst a phenomenal personality unequalled in our generation. He was not a theoretician of the Zionist movement. He was too educated, too wise, and perhaps also too skeptical to believe that it was possible to compress a national movement that was rooted in many centuries of suffering, struggle and hope into the constricting framework of a theory or an ideology. But all those who came in contact with him sensed that he was the bearer of historical forces, the repository of memories of a great past, sensitive to the sorrows of the present and conscious of the glory of the future. Having spent most of his life in western Europe, Weizmann never lost intimate contact with the milieu of east European Jewry from which he sprang and with which he maintained a tender and profound communion.

There already exists an extensive literature on Chaim Weizmann. Now, while all Jews, and important parts of the non-Jewish world mourn his passing, is not the time to evaluate his achievements and the debt which Jewry and the Zionist movement owe him. There had been times when parts of the Zionist movement disagreed with his political orientation. There were times when Weizmann disagreed with his own orientation. He was never a dogmatist in politics. He believed in adapting political policies to existing conditions. He was not a maximalist, in the sense of believing that the major part of the ideal must become reality in his own lifetime. Indeed he was aware of the threat to existing social values in the maximalist movements of our epoch—Bolshevism, extreme nationalism, fascism. It was in this sense that he often declared during the last years of his life that "I am not of the twentieth century. I am more nearly a man of the nineteenth century. I am perhaps one of the last of the liberals still wandering about in the world." It is possible that moods like these sometimes made him misunderstand certain activities and plans of the labor leadership in Eretz Israel, though, as a general rule, he gladly co-operated with the labor movement in the country in economic matters, in the preservation of the popular character of Zionism and in the defense of democratic principles.

Weizmann's non-maximalism in political matters should not be misunderstood. He was not a compromiser. His non-maximalism implied a preference for gradualism when he believed that more radical attempts to attain the goal might endanger the Yishuv in Eretz Israel or Jews elsewhere. He may have erred in his estimate of specific political situations, but in that case his error was motivated by a profound humanism and a deep concern for the welfare, the future and the good conscience of his people.

It was the above qualities that gave Weizmann his stature and that accounted for the fact that when the State of Israel came into being he was the sole undisputed candidate for the office of first president of Israel.

For many generations to come Weizmann's memory will live in Israel and in the Jewish people. It will be

a living inspiration and a goad to higher achievements. —*Jewish Frontier*, December, 1952.

The Values of Mankind

Excerpts from the address of Dr. Chaim Weizmann, the first President of Israel, at the opening of first *Knesset Israel* are reproduced from the *Jewish Frontier*, December, 1952 :

It is with a feeling of deep reverence and consecration that I rise to open the Constituent Assembly of the State of Israel, the first *Knesset Israel* of our time, in this Eternal City of Jerusalem.

Today we stand on the threshold of a new era. We leave the dawn-light of provisional authority and enter the full sunshine of orderly democratic rule. This Assembly was elected by the whole body of citizens of Israel. In this election the will of the entire people was fully and freely expressed. Thus at the outset we are building on fair and solid foundations, foundations of freedom and equality, collective responsibility and national self-discipline. It was no longer an isolated band of pioneers, subject to foreign rule, who elected this Assembly, but an independent nation dwelling in its own free country.

This nation is to be conceived as the ingathering of the exiles, for there is not a Jewish community in the world whose members have not their portion in the State of Israel. In these very days, to our heart's joy, thousands and tens of thousands of our brethren from countries near and far are entering the gates of our country that stand wide open to receive them. It is our hope and prayer that this gathering in of the exiles will go on increasing and will embrace ever larger multitudes of our people, who will strike roots here and will work side by side with us all in building up our state and making our desolate places fruitful again. We shall make this our goal before all else and devote to it our best powers of thought and action.

Heavy indeed is the responsibility laid on us here in this Assembly. What we began this same day nine months ago we are bringing to completion this evening: the restoration of the realm of Israel. If we are using state forms that have been moulded by the experience of the enlightened nations of the modern world, we know truly that these forms contain a treasured essence of the heritage of Israel.

In the ancient world this tiny country of ours raised the standard of spiritual revolt against the reign of tyranny and brute force. The Law of Israel and the vision of her prophets founded a new ethic of the relations of man to man and led to a new ordering of human society. The authority of the King in Israel was limited by the law and by tradition. The prophets of Israel did not fear to utter rebuke and reproof to kings and princes, and with their inspired word for weapon they defended the poor and the oppressed, the stranger and the slave, the orphan and the widow.

The very principle of the institution of kingship was hateful to the spiritual leaders of the people. "I shall not rule over you, nor shall my son rule over you, the Lord shall rule over you," declares the Judge to the assembled people. The warnings of the prophet against the dangers of tyranny thunder from on high in the ears of the people to the last generation. In Israel, this rising up against the authority of one man derived from the noble conception that the people, naturally free and freely accepting the rule of law and just judgement needs no compulsion from above to live as an ordered society. The root principle of the constitution of that novel State was the limit set to the authority of the King, and it is in this sense that the ancient Hebrew policy was the mother of constitutional government in the modern age.

And now it has fallen to our generation to weld anew the links of that life of freedom that were snapped by a tyrant's force nearly nineteen hundred years ago. I know not why it is precisely our generation that has been privileged to bring about what all the generations before us longed for and cleaved to in the darkness of Exile, unless it be that we have earned it by all the hardship and weariness, the sorrow and tribulation that have been our portion for the last seventy years—years when our body was stricken limb by limb until finally one-third of the entire nation was annihilated. We have suffered torture and affliction such as befell no other nation in the world until at long last the prophecy has been fulfilled. "The remnant shall return." But because we are the remnant, no more than a remnant, a double and treble responsibility is laid upon us to fill the terrible void in our national life that has been created by slaughter of the best sons of our people, the guardians of her spirit and the bearers of her culture.

It is our people that once gave the whole world a spiritual message fundamental to civilization. The world is watching us now to see what we shall choose for ourselves in ordering our lives, in what shape we shall fashion our State. The world is listening to hear whether a new message will go forth from Zion and what that message will be.

A new message is not born without some travail of the creative spirit. It does not see the light without much toil and weariness, difficulty and pain.

Having taken part in the great battles of the human spirit, having shed our blood and given our lives for the liberation of many peoples, we have at length won the right to toil and labor in order to give expression to our distinct national identity and make our contribution as a free people among other free peoples to the spiritual treasure of the world.

First of all let us strive to strengthen our constructive resources by enhancing the position of science and research in the life of Israel. Science and research are the basis of human achievement. All the scientific capacity that we have displayed in every country in the world must now be mobilized to help build up our motherland. Yet, for all the decisive importance of science, not by science alone shall we win through. We have to build a new bridge between science and the spirit of man. "Where there is no vision, the people perish," and we see what scientific progress leads to when it is not inspired by moral vision—to the atomic bomb that threatens to destroy the entire planet.

All my life I have labored to make science and research the basis of our national endeavour. But I have always known full well that there are values higher than science, the only values that offer healing for the ills of humanity, the supreme values of justice and righteousness, peace and love.

This day is a great day in our lives. Let us not be thought too arrogant if we say that it is a great day in the history of the world. At this hour a message of hope and good cheer goes forth from this place, from this sacred city to all those throughout the world who are persecuted and oppressed and who are struggling for freedom and equality. A just struggle is indeed of avail. If we, the people of sorrows and affliction have been vouchsafed this event of today, then truly there is hope at the end for all who long for justice.

From this place we send our fraternal blessing to all our people dispersed in exile in the four corners of the earth. We stretch out the hand of peace to neighboring countries, the hand of friendship to all the peace-loving peoples of the world. Our greetings go to all the States, great and small, that have recognized Israel, and a cordial welcome to the representatives of foreign States and to the religious dignitaries who have honoured this event by their presence.

Members of this Assembly! May your first gathering be blessed. Be mindful that the eyes of the entire Jewish people are lifted up toward you, and that the longings and prayers of past generations attend your steps. May it be given to all of us to be equal to our heavy charge.

The Growth of Labor Unions in the U.S.A.

Organized labor unions in the United States claimed a membership of between 14 and 16 million workers in 1952. Although it is difficult to obtain exact membership figures, probably about one out of every three employees in non-agricultural establishments today is a trade union

member. In 1913, by contrast, there were nearly 23¼ million union members, which meant 1 out of every 15 such workers was a union member.

One hundred years ago there were few unions and they were small. The first national union was formed by the cord-wainers in 1836. Within the next few years other national unions were formed by the printers, the comb-makers, the carpenters, and the hand-loom weavers. The only one that still exists as a national union was founded by the printers in 1852.

Several times the various unions tried to get together in an over-all national association, but with no more than temporary success, until the American Federation of Labor (AFL) was formed in 1881. At that time there were only 138,000 union members. By the end of the century there were more than half a million. But the importance of labor in World War I raised membership to about 5 million by 1920, of whom 4 out of 5 were in AFL unions and the rest in independent unions.

The growth of unions resulted in clashes between organized labor seeking to help the worker through united action, and some of the employers in big industries. Nevertheless, by 1920 the unions had succeeded in raising wages and limiting the hours of work.

For example, in 1909 average hourly earnings of workers in manufacturing were 19 cents, but in 1923, after the recovery from the depression of 1920-21, they were 52 cents. Allowing for price increases, the rise was still very significant. In 1909 the work-week was more than 51 hours, but in 1923, it was 46 hours.

In spite of these gains, the 'twenties were worrisome years for organized labor, and the depression of the 'thirties increased their difficulties. Some employers set up their own company unions. The membership of trade unions dropped to less than 3 million in 1933.

The government that came in at about that time passed laws guaranteeing workers the right to organize. The unions organized workers in some big industries where there had been little or no organization before. By 1935 some of the older unions had increased to as much as four times their 1930 memberships, and new organizations were formed.

During the years 1935 and 1936 certain unions broke away from the AFL and joined with some of the independents to form a separate national body now known as the Congress of Industrial Organization (CIO). The unions in this organization put their effort into signing up members by industry instead of occupation, while the old-line unions emphasized membership according to trade.

As a matter of fact the AFL and the CIO worked on both industrial and craft bases, but the one put more effort into craft unionism and the other put more into industrial unionism, at least at the start. Today this distinction is not so clear.

At first some thought that having two national federations in competition would destroy them both. Instead there was a great increase in the membership of both. Just before the United States entered World War II, in December 1941, total union membership had risen to over 10 million, more than double what it had been in 1936.

This vigorous growth of unions led to a great increase in strikes. Many of these were for the purpose of obtaining recognition of the union or strengthening its position, rather than for the union's customary objectives of higher wages, fewer hours of work and better working conditions.

Under war conditions labor agreed to limit wage demands and to refrain from striking. Most unions followed their leaders and there were few strikes.

Competition between the CIO and the AFL died down. Organized labor took an active part, together with employers and the government, in strengthening the war effort. Labor officials took important government posts for that purpose. Labor-management committees worked together at all levels, including the top defense agencies of government.

And with employment increasing in defense industries, union membership also increased. In some industries, such as shipbuilding and aircraft manufacture, membership doubled or tripled.

Going back from wartime to peacetime living did not generally result in the loss of union members, as had happened after World War I. Business remained good, trying to catch up with peacetime demands. But the number of strikes increased.

The objective of these strikes was to get higher wages, partly to make up for the loss of overtime pay, of which there had been a great deal during the war period.

After the early postwar disputes in 1945-46, both management and labor were looking for ways in which they could agree. In some industries they agreed that wages would go up or down with the cost of living as measured frequently and regularly by the United States Department of Labor. Many union agreements also provided for special old age pensions and other methods of protecting the health and welfare of the workers.

Today organized labor in the United States is stronger than it has ever been, even though many workers are still not organized.

WHAT LABOR UNIONS DO FOR THEIR MEMBERS

When a labor union is young it can do little more than fight for higher wages and shorter hours of work for its members, and spends much of its time and effort in increasing its membership. When it has more experience it is able to extend its activities. Most labor unions today are able to give their members much more in the way of service than they were able to give them ten, twenty, forty years ago.

Many labor unions publish their own newspapers and magazines to keep their members up to date on what is going on in the world both inside and outside the labor movement. Part of the newspaper or magazine is given to items of interest to the worker's family, such as marketing, cooking and fashions, and comics for the children. They report new developments in their own field of work and in their industry in general.

In many cases the labor newspaper tells its readers about what is going on in politics and labor, and explains what the developments mean to the worker. They discuss what is happening in the cities and States where the workers live so that they will be well informed.

The publications of the **SHIROMANI GURDWARA PARBANDHAK COMMITTEE**, Amritsar in Punjabi, Hindi and English are sold almost at their cost prices. The first editions of the Holy Guru Granth Sahib in Punjabi and Hindi are out and Bheta fixed is Rs. 40, and Rs. 16, respectively. Printing of Gurbani in Punjabi is done through Photo Blocks. "Muslim League Attack on Sikhs and Hindus in 1947" 20" x 26 8/8" size, antique paper with pages 453 is sold for Rs. 8 only.

For further information and free copy of the catalogue, please write to the Secretary.

They discuss the problems of workers in other countries and the joint efforts of the international workingmen's federations in the free world. They thus arouse their readers' interest in the community and the Nation and urge them to register and vote.

The union holds meetings at which problems are discussed. At those meetings it might be decided to make a special membership drive in a certain plant, or to help support workers who are on strike in some other place so they can exist until the strike is settled. Relations with other unions or union locals are discussed, and officials of State and Federal labour departments are asked to visit and explain what the government is doing to help solve the workers' problems. Experienced union members make studies of living and working conditions in various parts of the city, or of how workers should be trained in new kinds of jobs. In this connection the major unions of the country have done an outstanding job of co-operation in the retraining and rehabilitation of union members returning as veterans from World War II.

Trade union leaders together with representatives of industry and the public have worked on price and rationing committees. As individuals many of them have served on committees for the selection of men and women for the armed services, and on committees for getting money for the war effort. Many labor union members today take a direct part in State and city governments.

Unions also have life insurance, health, and pensions programs. Many union-sponsored health insurance plans provide maternity benefits for women employees and for the wives of men employees. Some unions maintain homes for their retired members. Many own their co-operative stores. They finance improved housing projects for workers. They arrange radio programs and recreational activities for their members. They run summer camps for members and their families. They also conduct charitable drives, to provide expensive hospital equipment or facilities for the treatment of major diseases.

In fact the modern labour union goes into nearly every field of living in which its members are interested, and frequently into related fields which help people who are not members of the union.

UNION TIES WITH WORKERS IN OTHER COUNTRIES

The interests of American labor unions go beyond the limits of the United States. They co-operate with workers in other countries, helping them to gain strength and develop into organized groups.

Shortly after World War II trade unions in many countries set up an organization known as the World Federation of Trade Unions. After a few years, however, it became clear that the Iron Curtain countries had taken over control of the organization and were using it to further Russian political objectives.

Thereupon in 1949 the free trade unions of the world which had been members quit the WFTU and set up the International Confederation of Free Trade Unions (ICFTU), to support "the rights of all peoples to full national freedom and self-government" and to combat totalitarianism. This Confederation now embraces more than 50 million workers in about 70 different countries. It includes the largest labor union groups in the United States—the AFL, the CIO, and the UMW—whose leaders have been active in the organization since its inception. Members of the Confederation advise each other how to keep their unions free, and give aid, including goods and money, to help those who are not free to overcome their oppressors. They advise their governments on how to deal with other governments in labor

matters, and often take active part in advising their governments in international affairs. And they send their own representatives to foreign countries to help fight oppression.

Altogether in the past forty years organized labor in the United States has grown from childhood into manhood. It is now a powerful influence, not only in the affairs of the Nation but of the whole world.

PUBLIC ATTITUDES ABOUT LABOR UNIONS

One of the most important developments during the past forty years has been the way in which people have changed in the way they feel about organized labor. Throughout American history until about the time of the depression in the 'thirties the general feeling, as shown in both the law-making and the law-interpreting branches of government, was that labor unions interfered with the freedom and rights of employers. But these feelings slowly changed as people came to see that workers need unions, and that it is possible for labor and management to agree on their mutual problems.

THE 46th ANNUAL REPORT
of the Hindusthan for 1952 once again reflects the soundness, integrity and strength as also the continued public confidence which have always attended its career.

Hindusthan Buildings, 4, Chittaranjan Avenue, Calcutta -13

During the past twenty years or so Congress has passed laws setting forth certain limits to what employers and their workers may or may not do in their dealings with each other. It has tried to write into law what might be considered fair or unfair labor practices, and how management and labor should go about arriving at agreement about them.

These laws have had results. They are showing the way in which organized labor and employers have responsibilities to each other and the public, and how they may in time work peaceably together for the good of everybody.

Some of the present laws will probably have to be changed to meet changing conditions, but there is no question that during the past twenty years or so they have served a useful purpose. The relations between employers and employees have greatly improved, and organized labor unions today are one of the most important forces in American industry. They are a part of our national life.—*The American Labor Review.*

"Progressive" Taxes Based on Ability to Pay

When an American made a million dollars in 1900 he had just that much money to spend. Today he may earn a million dollars but he can keep only 16 per cent or about \$160,000 for himself. It is still a lot of money but no longer can he "live like a king" as his millionaire predecessors did.

Where does the remaining money go? It goes back to the Government in the form of taxes. The shift in the position of the rich in the U.S. has been striking, and the income tax is in great measure responsible for this levelling up of real purchasing power of people with varied incomes. The shift downward of the rich is socially significant. It indicates a consistent trend toward the middle, with lower income groups rising, top brackets coming down, and both groups shifting gradually into an expanding middle class. Economists the world over claim that the middle class is the mainstay of any country's economy.

The income tax—first introduced in the U.S. in 1913—at first assessed only one per cent of net incomes up to \$20,000, with a modest surtax for larger incomes. It was initially designed solely to raise revenue for the Government. Little did the Government then realize the steam-rolling potentialities of the income tax as a leveller of inequalities in the distribution of incomes. It was this realization, coupled with the idea that an individual should "pay" according to his "ability," which gave birth to the "progression" in the present American income tax system.

ABILITY TO PAY

The average citizen's "ability to pay" takes into account the number of dependants upon him, his public contributions, and expenses he incurs in procuring his income. The system is based on a sliding scale and puts the heaviest tax on those with the highest income. This is in essence the progression in the income tax structure.

To maintain a basic standard of living which is considered an absolute minimum for economic efficiency, a certain portion of the income is exempt from taxation. This exemption limit has been put at \$600 per person. For incomes above this level, a single individual has to pay taxes.

This ensures that the poorest, who is least able to pay, pays nothing. If his income is \$800, he pays only about \$40. If his net income is \$280. The tax payment increases progressively as the income keeps mounting. Thus, a man with a net income of \$10,000 pays \$2,347; if his income is \$25,000, he pays \$9,362; with income of \$100,000, he pays \$63,541; and so on. A 1953 millionaire will pay about \$840,147 tax on an income of \$1 million.

One important feature of the American income tax law is that it takes cognizance of expenses which a family head to meet in supporting family.

DEDUCTIONS ALLOWED

This is reflected in the deductions that are allowed to such a person in the compilation of his tax return.

A family head may deduct \$600 from his income report for every dependent member. For instance, a married man with a wife but no children does not pay any income tax if his income is below \$1,200. On an income of \$2,000 he pays only about \$160.

The deductions are even higher if the married couple has any children or other dependants. For instance, a married couple with two children and with an income of less than \$2,675 does not pay any income tax. Such a family on an income of \$3,000 pays only \$133. As they go up in the income scale their tax payments increase at a progressive rate but the rate is still considerably lower than those for single individuals in the same income group. For example, a married couple with two dependants and with an income \$25,000 pays only \$7,004, compared with \$9,362 which is paid by a single person. Or a four-member family with an income of \$100,000 pays \$56,032, compared with \$63,541 which is paid by a single person having the same income.

These deductions are based on the principle of ability to pay. It is obvious that married people, and those having dependants, have lesser payment ability than those who have no encumbrances.

The U.S. Government relies on each person to keep his own income records and to see that the full accounting is received by the tax department. Every year more than about 50 million Americans must figure out how much tax on their incomes they must give to the Government, and they must mail their returns by the midnight of March 15.

The actual payment of taxes is less painful to the individual American, since for the last ten years the Government has been using a "pay as you go" scheme similar to that applied by the Indian Government. Under this scheme a fixed portion of the tax is deducted from each employee's weekly wage by his employer, who turns it over to the Government. Those who are self-employed or are in business must pay their tax dues in quarterly instalments.

CORPORATION TAX

Just as the individuals pay income taxes, so do companies and corporations. If the net income of a business exceeds \$50,000, the corporation must pay a flat tax of 52 per cent of its net profit. Lower tax rates apply to smaller companies. This has the effect of encouraging the growth of small, privately owned businesses in America, which, in turn, leads to the creation of more jobs, more employment, and, therefore, a greater share of the national income in the form of wages.

In the years since the first income tax was introduced in the U.S. more and more Americans have been made subject to the tax. Only one person in about 275 was required to pay under the first income tax law. Today, more than one person in three pays a share, large or small.

At the same time, the proportion of government revenue derived from the income tax has increased and the portion derived from indirect taxes, which usually ignore a person's ability to pay, has decreased. For instance, in the fiscal year 1953 (July 1, 1952, to June 30, 1953) personal and corporation income taxes yielded about 69 per cent of all U.S. Federal revenues.

America's tax structure as a whole still needs simplification, equalization, and revision, but it has come a long way toward mitigating the inequitable distribution of national income, and toward a more equitable distribution of the cost of a free democratic government.—*American Reporter.*

OUTSTANDING PRODUCTS OF HERING & KENT

ROYAL OONIM: Super vitalising Tonic for MEN and WOMEN. Restores youthful vigour and vitality at any age. Rs. 50 for 3 weeks course; Rs. 200 for complete course of 12 weeks.

New Horizons in Antibiotics

New York (M.P.I.B.)—Better understanding of the antibiotic drugs, and clues toward developing even more effective antibiotics, are expected to emerge from new knowledge of their highly complex make-up, outlined at a recent conference of experts here. At a meeting of the New York Academy of Sciences, three scientists, Drs. P. P. Regna, W. W. Umbreit and D. W. Wooley, described the chemical structure of terramycin, streptomycin, and chloromycetin, and analyzed the ways in which they act against disease.

The structure of terramycin, an earth-mold drug effective against more than 80 diseases, was worked out after two years of study by a team of eight scientists. These were Dr. F. J. Brunings and associates of Chas. Pfizer & Co., Inc., U. S. firm which discovered the antibiotic, and Dr. R. B. Woodward of Harvard University who pioneered in the synthesis of quinine and cortisone.

In "blueprinting" the structure of the terramycin molecule, the scientists found it to be unique among the antibiotics, and one of the most complex found in nature. Because of its complexity, terramycin cannot be synthesized commercially and will probably always be produced by fermentation, according to the team of chemists.

Determination of the structure of terramycin will help chemists to make minor changes in the molecule, some of which were described by Dr. Regna at the New York meeting, in the hope of producing new drugs with new medicinal possibilities. It also helps to show why

it is that terramycin goes to work in the body so rapidly and safely.

Pfizer scientists also are attempting to find out how so simple an organism as a mold can build so complex a substance as terramycin, and what raw materials it uses as building-blocks. If some of these raw materials can be supplied to the mold in already "prefabricated" form, terramycin production efficiency might be increased. —Medical and Pharmaceutical Information Bureau, New York.

Ernest Hemingway Wins Pulitzer Prize

Ernest Hemingway won the Pulitzer Prize for his book *The Old Man and The Sea* in the 36th annual Pulitzer awards, announced on 6th May by Columbia University.

The prizes were established by the late publisher Joseph Pulitzer in a bequest to Columbia University for merit in the field of journalism and letters.

Hemingway's Pulitzer Prize was his first, although his reputation as one of America's greatest writers extends more than 25 years through recent history.

The Old Man and The Sea, in length no more than a good-sized short story, was an immediate best seller. It dealt with an aged fisherman whose efforts to land prize catch paralleled the fight of man himself against the imponderable.

President Rajendra Prasad inspecting a guard of honour, provided by the passing out trainees at the I.N.S. Circars during his recent visit to the naval base, Visakhapatnam

General Mohamed Naguib with Lt. Commander Inder Singh and Commander Kohli. During their Goodwill visits three ships of the Indian Navy, (I. N. S.) *Ganga*, *Godavari* and *Gomati*, visited Alexandria recently, where President Naguib was among those who visited I.N.S. *Godavari*

THE 'MODERN REVIEW

1953

VOL. LXXXIV, No. 4

Whole No. 562

NOTES

Unemployment

The Government of India has at last awakened to the fact that one of the major causes of the unrest and discontentment in the country is unemployment on a titanic scale. After the realisation, which has caused quite a stir, attempts are being made to ascertain its magnitude and to devise remedies for the malady. We have no doubt that figures would be forthcoming, of very doubtful accuracy as usual, and that various schemes and plans would be set on foot to waste vast sums in order to obtain minor reliefs. If the ailing party, that is the general public, takes an interest in the matter and attempts to face the problem, then that would be another matter altogether. For in the assessment of both the quantum and the causative factors, public help is essential. And without that assessment, no real remedy can be prescribed. That overrated panacea, the Five-Year Plan, would be a mere quack nostrum. Therefore, the first step would be to arouse public opinion, overcoming its lassitude.

In most States, a sense of frustration is general, which in its turn is generating resentment against and lack of faith in the Congress Government. This sense of frustration is real, and is the reaction to nepotism, favouritism and corruption that is rampant in the administration, both at the Centre and in the States. Party and parochial considerations and personal influence, to say nothing of graft, has become the main factor in almost all appointments and contracts, without exception. A man may possess the highest qualifications or be highly efficient in business, but he stands no chance against the inferior person who has the capacity or opportunity to pull strings behind the scenes. This is the root cause of all frustration.

As a result of this frustration and resentment very large numbers of the unemployed are becoming unemployable. What is more, this is affecting the Employed person as well, lowering his efficiency by warping his sense of duty and integrity. The

Employees' efficiency being lowered the business, industry or institution is affected adversely and that in its turn effectively stops expansion. Indeed in most cases the drop in efficiency is so great that the concern or institution is obliged to retrench, instead of expanding and thereby providing further employment.

There are other factors too, some of them vital, affecting smaller concerns and institutions which are by far the largest sources of employment in the country. These have to be looked into with a real interest by a better type of official than the common stiff, wooden bureaucrat who owes his office to his—or his father's—oily tongue. Today the big fish are swallowing the little fish, centralizing the concerns and institutions into restricted areas, with considerable reduction in staff and personnel. Wide areas are thus being laid bare of the sources of employment and large-scale unemployment is the inevitable result.

Then again there is the question of the *unemployable*. Prolonged idleness and loafing converts the most efficient person into a lack-a-daisical lout. And if there be no sense of discipline and a total lack of a sense of duty to start with, then such a person becomes a menace to any concern or institution in which he might be employed. Unfortunately our schools and colleges are turning out today masses of such young men. Mere provision of jobs or doles would be worse than no remedy in such cases, unless there is a rectification of their sense of propriety and responsibility.

In some States, particularly in West Bengal, there are vast numbers of uprooted humanity, with almost all moral values destroyed, leaving only resentment and greed. This human flotsam is being utilized for the basest of motives by treacherous politicians and vile human sharks for the furthering of their own designs. Thus the entire mass of refugees in West Bengal are fast becoming unemployables. Even amongst those who have been given jobs, a large majority are

SAKUNTALA WATERING THE MADHABI PLANT

Prabasi Press, Calcutta

By Satindranath Baha

becoming more and more inefficient and unfit for employment, due to their warped ideas on duty and integrity, and are corrupting the efficiency of such of their colleagues who are still useful. Here again stern remedial measures are called for, to prevent total corruption of a very large section of the population.

A school or a college, or any public utility concern or institution, can only produce more unemployables if the staff possesses no sense of responsibility or if there be some members of the staff who are either active disruptionists or have a degraded sense of moral values. In giving jobs to the unemployed, special care should be taken in the appointment of teachers, supervisors, superintendents and others who are likely to come into contact with or to control large numbers of people with immature or undeveloped minds. Else in giving a job to one unemployed the Government will be sowing the seeds for a tenfold production of unemployables. Now let us turn to the official reactions. First of all there is the A.I.C.C. directive as given in the news below:

New Delhi, Sept. 21.—Following the adoption of the resolution on unemployment at the Agra session, the AICC has sought the help of State Congress Committees and individual Congressmen in collecting accurate data on the subject.

The data will supplement the sample surveys which the Planning Commission has decided to carry out in certain parts of India.

Congressmen have been asked to take a personal interest in the problem and collect reliable data regarding the extent of unemployment or under-employment in their constituencies or areas.

The AICC has advised them to pay special attention in the course of their inquiry to the working of village and cottage industries which are faced with a slump and to recommend new industries which might be started in their areas to provide fuller employment.

The information collected from State Congress Committees will form the basis of schemes which the AICC hopes to prepare to solve the unemployment problem.

Needless to say the directive will be futile, the Congress being what it is today. The few, very few, Congressmen who can still rise above selfish and party interests will cry in the wilderness, unless they can rouse public interest.

Then let us see what plans the Government envisages to combat unemployment. On the same day as the above news, there appeared in the daily press the following report:

The Government requires 10 years to solve the unemployment problem in India.

Mr. Deshmukh, the Finance Minister, gave this reply in the Council of States to a question from Mr. Sundarayya, leader of the Communist Party, during a debate on unemployment which covered much the

same ground as a similar debate in the House of the People some days ago.

In Mr. Deshmukh's long written reply to the debate, notable for its academic analysis of the economic trends of the last few years, only two specific remedies to the acute problem found brief, passing mention.

One related to minor irrigation schemes upon which much emphasis has already been laid in the Plan. Their scope will now be further enlarged. The second was educating the rural masses by employing a large number of educated persons.

Mr. Deshmukh was not puzzled by the phenomenon of rising unemployment when the Plan was being executed. He explained it by the fact that, during the first two years, expenditure had been 30 per cent of the total against the 40 per cent envisaged in the Plan.

He relied on the hope that the full impact of the Plan would be felt soon. During the current year, for instance, expenditure was stepped up by 8 per cent as compared with last year. It will amount to Rs. 400 crores. During next year, it will probably be about Rs. 500 crores, even if the proposed modifications were not taken into consideration.

The Finance Minister was satisfied that, having overcome inflationary trends, Indian economy was now better equipped for intensive overall development. Conditions were favourable for increasing investment to a greater scale than contemplated in the Plan.

Earlier, members asked for a courageous approach of the unemployment problem which, according to Mr. Reddy, was approaching staggering proportions.

Replying to the debate, Mr. Sundarayya said that the Finance Minister had categorically refused the demand for relief to the unemployed. "It is not for me but for the hundreds of millions of the unemployed of this country to get angry with this Government and storm the bastion of reaction."

The way the Ministers had spoken on the problem, he added, proved the Government's complacency. How many decades did the Government want to solve the problem?

When Mr. Deshmukh replied: "Ten years."

It is useless to remind Mr. Deshmukh about the old saw regarding "Hope deferred." If things do not improve much sooner than the date put by Mr. Deshmukh for the millenium, then Mr. Deshmukh and all others of that ilk, excepting a few agile turncoats, will have to fly the country or else face liquidation. The main bulwark between Order and Chaos in the country, the educated middle-class man is facing an imminent collapse.

Urban Middle-classes and Moneylenders

The *Clarion* draws attention to the sad plight of the urban middle-class. No statistics of urban indebted-

ness had even been attempted but it would not be surprising at all if over 75% of India's middle-classes were found to be in debt, the paper writes.

Rising cost of living and unemployment drove people to borrowing. And the "ignorance of the law, the sense of shame and the urgency of the situation makes many a borrower an easy prey to exploitation by unscrupulous moneylenders. The debtors often sign a bond for very much more than is borrowed." The paper then refers to a case where a man signed a bond for Rs. 1700 for a loan of Rs. 100 only. Illegally, high rates of interest—sometimes to the extent of 25% per month—were charged. And the moneylender with his knowledge of the law knew how to evade it. He generally did not give receipts for the interest he claimed. The paper writes that cases were common where capital had been more than doubled or trebled by interest payments within a year.

As a way-out the paper suggests the Government "to assist with loans, something on the principle of taccavi loans made to agriculturists. The security offered by the debtors would be their jobs, as arrangements for direct payments could easily, we think, be made by Government. Chances of non-payment would be reduced. In this way Government would be assisting the hard-hit middle-classes, adding perhaps a little to its revenue, and ensuring that debtors pay an interest which is reasonable and fair."

We are not in love with loans, having had long experience of Refugee and Rehabilitation schemes. Loans mean bribes and degradation. It would be better to devise a modified New Deal type scheme, to expand scope for work and profit. Co-operatives might be tried on a large scale.

The Five-Year Plan

Now let us turn to the universal panacea, the Five-Year Plan. Some time back there appeared in the *Asian Review* of London in its July issue, an interesting analysis of the Plan by Sir George Schuster. Sir George's long experience of India and his very deep knowledge of Indian economics makes the short analysis highly interesting. We give the following extracts:

"The main features as I see them are :

(a) India is an essentially agricultural country—(about three-quarters of its people dependent on agriculture)—and yet at present it is not producing enough food to feed its own people even at their present very low standards.

(b) The population is increasing at the rate of four and a quarter millions every year.

(c) On a long view there is no room to absorb great numbers of additional workers in agricultural production. Indeed if Indian agricultural industry is to make its best contribution to the Indian economy a reduction in the numbers on the land would be desirable.

(d) Therefore the great bulk of the working part of the 4½ millions added every year to the

population must be placed in industry or tertiary employment.

(e) Accordingly India needs a vast expansion of manufacturing industry if only as a means for providing bread-winning employment for her increasing population. (That is not the only reason for such an expansion. A greater proportion of industrial employment is necessary if there is to be any improvement in the general standard of living).

(f) But such an industrial expansion can have no sure foundation unless there can be first achieved a vast increase in agricultural production. This is necessary for a double reason. Unless more food can be produced it will be impossible to feed the increasing numbers employed in industry. Unless the purchasing power of the agricultural producer is greatly improved Indian industry will not be able to find markets for its products. (This is not to deny the possibility that Indian industry will be able to find export markets for some of its products. But this can only be a very small proportion of the total production if there is to be an expansion of industry on the scale which the national needs demand).

It is therefore necessary to concentrate first on the development of agricultural production.

It is because such a concentration is the main characteristic of the Five-Year Plan that I regard its broad lines as right. But the first five years must be regarded as no more than the first chapter of a much longer story of development—the first act of a much longer drama.

The essential purpose of this "first act" must accordingly be seen as two-fold: 1st: to achieve the maximum possible immediate increase in agricultural production. 2nd: to be a period of preparation for a great industrial expansion. Therefore, the practical questions to be asked are:

(i) What steps can be taken to aid the most rapid and effective development of agricultural production?

(ii) What can be done to "set the stage" for the great industrial expansion which should follow in the later acts of the Indian drama?

In the case of *agricultural development*, the Plan falls broadly under two heads, first, schemes for capital expenditure on works for irrigation and communications, and secondly, schemes for achieving a general uplift of production and life in the rural areas through measures such as the Community Development Projects."

Regarding the role of private enterprise in the field of economics, Sir George says:

"Private enterprise cannot hope to survive in modern conditions and in an educated democracy unless it can convince public opinion that it is serving the public interest in the sense that it is carrying out the necessary function of production more efficiently than any possible alternative system. I speak as one who believes that it can fulfil this condition, but only if it handles all its operations with this need constantly in mind. I must express the further belief that the Government of India is right in deciding to leave a great part of the task to private enterprise. There are powerful critics in India who

argue that the Plan falls neatly between two stools and that planned economic development can only succeed if the Government has complete control of all the resources for investment, and they point to the examples of Russia and China. But India is a country in which the ruthless methods of Russia could never be accepted or work successfully. Nevertheless, the fact that such opinions are held and that the Congress Party is essentially a left-wing party makes it all the more necessary that leaders of private enterprise should accept a high conception of their role and recognize that if they adopt practices which lay them open to legitimate public criticism they may create intolerable difficulties for Ministers of the present Government who are trying to pursue policies of moderation and leave scope for free enterprise.

There is no simple answer to my question, "What can private enterprise do to earn the confidence of the Government and public opinion?" But a combination of a number of steps might gradually have considerable effect. They include a high standard of managerial efficiency in all grades; educative publicity about financial results and a fair basis of distribution; action by big industry in the public interest in such matters as encouraging the development of small industries; a proper interpretation of the functions of industrial associations; and finally encouragement for the building up of responsible Trade Unions.

It is a commonplace to say that there can be no satisfactory industrial development unless human relations in industry are satisfactory, unless there is a general will to work and a readiness on the part of employers to recognize their obligation to pay adequate wages and, on the part of the workers, to realize that the level of wages must be related to the work effort and to the productivity of labour. One of the greatest needs in India to-day is the growth of a responsible Trade Union movement. There is a long way to go before this is achieved; but, on the other hand, I saw signs which justify me in expressing the view that a hopeful start has been made. Here is a field in which there is room for much helpful collaboration between this country and India. The value of this is recognized by the Trade Union movement in both countries and I can only express the hope that the British T.U.C. will do its utmost to develop effective collaboration."

Village Industries and Indian Government

In reply to a question in Parliament on August 6, the Minister for Commerce and Industries, Sri T. T. Krishnamachari had said that "the Government was considering the recommendation of the Planning Commission for the adoption of a policy of developing the production of edible oils through the village industry and the production of non-edible oils through the oil mills. In this connection another recommendation of the Planning Commission for the imposition of a small cess on mill oil for the benefit of the village

oil industry was also under the consideration of the Government, the Minister had said.

In reply to another question on the same day Sardar Swaran Singh, Minister of Works, Housing and Supply, had said that it had been decided that hand-made paper should be purchased for all demi-official correspondence of the Government of India. Of a total value of Rs. 4½ crores of paper purchased by the Government of India in 1951-52, hand-made paper had accounted for Rs. 90,000. No hand-made paper had been purchased in 1952-53 as Government had sufficient stock from the previous year's closing balance. The total value of paper purchased in that year was Rs. 5 crores approximately.

In an article in the *Harijan* on September 12, Sri Maganbhai P. Desai writes that these questions and their answers "tell eloquently well how lightly the Central Ministry take their responsibility to encourage and promote village industries. Apart from the patent indifference that is apparent from the answers, the more serious matter is where Sri T. T. Krishnamachari says that the recommendations of the Planning Commission are still not considered by the Government. . . . The indifference and delay revealed by the answers explain to an extent why unemployment is there in spite of the Plan." Pointing to the fact that the Five Year Plan had been put forward by the Government as their chief plank for the recovery of the national economy he urges upon the Government to hasten the implementation of their accepted policies laid down in the Plan.

We refrain from further comment. New brooms are indicated everywhere.

Community Project in West Bengal

Sometime back we had occasion to ask a high—and highly paid—official of the Project as to how the plans were developing. He said that he himself did not have anything much in the way of expectations where the Community Project was concerned, and so he would say that the results were not very disappointing so far. Needless to say we put no more questions. We append *infra* an extract from a recent issue of the *Vigil* more about the project. Unless a recasting of the plans and procedure is done while there is time, this experiment is going to be a howling failure in most States.

Sri B. K. Guha, Ex-Project Executive Officer, subjects the Community Projects administration in West Bengal to a close examination and his examination reveals some very instructive facts.

The writer notes that the early popular hopes and enthusiasm about the Community Projects had died down. The people had nearly lost all faith in the administration of the Community Development Projects.

Referring to the administration of the Projects of which he had personal experience, Sri Guha writes that

the duties of a Project Officer included everything except executing things. He was to work as a liaison between the Project and the normal state departments to which all allocations of money went. "The Project Officer," he writes, "is there to see that these monies are spent according to priorities determined by various departments in consultation with the Project Officer." The Project Officer had no control over those departments, which "do their utmost to have things in their own traditional way." Though responsible for everything relating to the Projects the Project Officer "can be frowned upon by any District Officer or Sub-divisional Officer." All his complaints were never seriously taken.

Another "important function" of the Project Officer was to act as a tourist's guide to visitors, mostly American "experts," who were "at best nothing more than salesmen of American machinery."

Sri Guha writes: "The various departments by their callous indifference do their best to ignore the very existence of the Project Administration." The District Magistrate was the District Development Officer, but "if he has got not the time or shows no inclinations to co-ordinate the different departments he cannot be blamed. Meanwhile the Project Officer becomes a spectator of departmental inefficiency, lethargy and heartlessness. . . . As long as the reports are sent in time with expert window-dressing nobody bothers about anything."

He cites various instances of departmental inefficiency and official bungling. An artificial insemination centre had been started with four bulls which had proved to be immature and meanwhile ten bulls giving natural servicing had been withdrawn. Illustrating the way the Departments moved Sri Guha writes: "When the Project officer asked the opinion of the Livestock officer about the bulls, the latter was clearly instructed by the Animal Husbandry Department not to give any reply. The Superintendent of Agriculture took a month and a half just to reply that he had nothing to do with the bulls."

The Agricultural Department did nothing more than pushing up "sales of manures on behalf of certain agencies and distributing seeds which very often do not go to the fields. Agricultural loans are given when the season is nearly over and that also to a fortunate few. Small irrigation schemes are undertaken under conditions that the beneficiaries would contribute one-third, now raised to half of the total cost. Contracts are deliberately made at an inflated rate and actual work is done at a much lower rate, the balance being shown as a book-entry for local contributions."

In another case a mobile medical unit had been started with the money of the Community Development Project. Doctors and assistants had been posted in a village without any medicine being provided. On enquiry it had been revealed that the Health Directorate "had not even drawn up any plans for work. So for full one month there was the doctor minus his medicine and the people getting bitter to the core." What was more

revealing was the fact that "when the doctor does get his stock of medicine and popularises himself to the village people he is transferred on some silly pretext."

Two primary schools have been completed but they could not be given recognition "because the district quota was already filled up." Nobody knew when the next quota was to come.

In view of all these Sri Guha says that the Government might as well abolish the establishment of the Project Executive officer. It would save a recurring expenditure of nearly Rs. 3000 per month.

Estate Duty Bill

The Estate Duty bill has now taken final shape. We were the first to point out the defects in the bill as originally framed, particularly with regard to the unjust burden on estates ruled by Dayabhaga laws. Those defects have been mostly removed.

New Delhi, Sept. 22.—The Council of States today passed the Estate Duty Bill as passed by the House of the People and adjourned till tomorrow.

The Finance Minister indicated yesterday that he would have to take the earliest opportunity to amend the provisions relating to exemptions in order to prevent evasion.

Under the clause as it stands, exemptions from Estate Duty is allowable in respect of an insurance policy on the life of the deceased for a sum not exceeding Rs. 50,000 for the purpose of paying Estate Duty. Another sub-clause provides that exemption will be granted in respect of amounts, not exceeding Rs. 50,000, deposited with the Government for purposes of meeting the duty on the estate of the deceased.

The second sub-clause had been introduced to meet the cases of persons who could not insure themselves due to over-age or other factors but would like to make a provision for payment of Estate Duty during their life time.

Mr. Deshmukh said there seemed to be a possibility of these two provisions being utilized cumulatively by an individual to escape Estate Duty up to the value of Rs. 1,00,000.

"I will have to take the earliest opportunity of bringing an amendment to this measure," he told the Council, though he would not say if he would bring forward an amending Bill in the next session.

Travancore-Cochin Assembly

The Travancore Cochin Ministry failed to obtain a majority in the confidence vote, in the State Assembly, on the 23rd of September as given in the news below:

Mr. A. J. John, Chief Minister of Travancore-Cochin, today failed to win a confidence vote in the State Assembly.

The Rajpramukh later issued a notification dissolving the Travancore-Cochin Assembly with effect from tomorrow.

The news of the fall of the John Cabinet came as no surprise in New Delhi. According to informed quarters, Mr. John is expected to advise the Rajpramukh to order fresh general elections.

Pending this, the Ministry is expected to continue in office though it will not initiate any new policies. It will be in the nature of a caretaker Ministry till fresh elections are held.

The 47 Congress members and four Independents today backed the confidence motion. The 32 members of the United Front of Leftists, the nine TTNC members, the 10 Socialists and five Independents voted against it. One Independent abstained.

Mr. John's Ministry assumed office on March 12, 1952, though the general election did not give the Congress a majority in the 109-member Assembly.

The Congress, however, emerged from the elections as the largest single party in the Assembly with 46 members. They managed to get last year's budget passed with the support of Independents.

Now, after the fall, Congress has to try for a working majority at the elections, which have to be completed by March, 1954.

Law and Order in Calcutta
